> The *Sacramento County General Plan Update Final EIR* (Sacramento County General Plan EIR) (Sacramento County 2010) determined that impacts of planned future development on wetland and riparian resources would be less than significant (County of Sacramento 2010, pp. 8-31 through 8-34) because future projects would continue to comply with the existing regulations and policies discussed above in Section 10.1.1. **In the Sacramento County General Plan EIR, the term "wetland" is used to encompass a variety of aquatic habitats, including both jurisdictional and non-jurisdictional wetlands and streams (i.e., aquatic habitats that could be affected through alteration of the bed and bank) (County of Sacramento 2010, p. 8-32).**

RTC 23.20 (EIS/EIR) – Text is provided in Chapter 8, *Natural Communities, Land Covers and Common Plant and Animal Species*, that explains why the loss of aquatic resources in Table 10-4 is greater than the acreage of aquatic resources re-established or established shown in Table 10-6. As described on page 8-42 of Chapter 8:

> The re-establishment and establishment acres of aquatic resources presented Table 8-5 reflect the Lead Agency assumption that the requirements of 2008 Compensatory Mitigation Rule to be re-established or established to replace lost aquatic resource functions and services at a minimum one-to-one acreage or one-to-one linear foot compensation-ratio would continue under the No Action/No Project Alternative. Table 8-5 assumes that compensatory mitigation for direct impact to Vernal Pools and Swales would occur within the Planning Area. However, compensatory mitigation for the other aquatic land covers (Stream/Creek VPIH, Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water) is assumed would continue to occur primarily by purchase of credits at an approved mitigation banks or an in-lieu fee program. However, several mitigation banks and in-lieu fee programs with service areas that overlap the Planning Area actually re-establish, establish, or enhance wetlands or other waters at locations outside the Planning Area. Therefore, Table 8-5 assumes that only one-half the necessary compensatory mitigation for direct impacts to Stream/Creek VPIH, Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water would occur inside the Planning Area.

The same acreages of aquatic resources impacts provided in Table 10-4 are provided in Table 8-4 and the same acreages of aquatic resources re-establishment and establishment provided in Table 10-6 are provided in Table 8-5. However, Chapter 10 of the Draft EIS/EIR did not include the explanatory text from Chapter 8. Text similar to that cited in the comment has been added to Chapter 10 of the Final EIS/EIR to further explain how acreages of compensatory mitigation were calculated under the No Action/No Project Alternative.

RTC 23.21 (EIS/EIR) – The evaluation of cumulative impacts for the No Action/No Project Alternative in Section 10.2.2.2 identifies that the combination of past and

present activities and projects have resulted in the existing condition regarding aquatic resources, and concludes that these combined past and present actions and projects have resulted in an existing significant cumulative impact on aquatic resources within the EIS/EIR Planning Area, and the larger resource study area. The Draft EIS/EIR does not conclude that the combination of past, present, and reasonably foreseeable future actions would not contribute to this significant effect, but only concludes:

1. many of the foreseeable other projects and actions discussed in Section 3.7.2 would not result in additional losses of aquatics resource functions and services from the study area;
2. a subset of the reasonably foreseeable future projects (e.g., foreseeable rural residential developments, agricultural activities on private lands) are likely to result in additional losses and additional adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period; and
3. the incremental effects of the No Action/No Project Alternative would not make a considerable contribution to the existing significant cumulative impact on aquatic resources within the study area.

Conclusion #1 is supported by the identification of regulations and policies applicable to the reasonably foreseeable future projects that would result in the protection of aquatic resources and the implementation of compensatory mitigation, and the results of the review of USACE's CWA 404 project authorizations within the Planning Area between 1979 and 2013.

Conclusion #2 is clarified with the following edits to text in Section 10.2.2.2:

> However, the foreseeable rural residential developments, the agricultural activities on private lands, and **certain** other future activities **may not always trigger the regulations and policies listed above, and in those** cases are likely to result in additional losses and additional adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period.

Conclusion #3 is clarified with the following edits to the last paragraph in Section 10.2.2.2. The explanation for meeting the one-to-one mitigation standard provided above in response to Comment 20 supports the added text provided below.

As described above, ~~implantation~~**implementation** of the No Action/No Project Alternative is assumed to meet **the requirements of the 2008 Compensatory Mitigation Rule and aquatic resources would be re-established or established to replace lost aquatic resource functions and services at a minimum one-to-one acreage or one-to-one linear foot compensation-ratio. Compensatory mitigation, under this alternative could occur both inside and outside the Plan Area. With the resulting no net loss of aquatic resource functions and services,** ~~W~~**w**hen the incremental direct and indirect effects of the No Action/ No Project Alternative are

viewed in connection with the effects of the past, present, and reasonably foreseeable future other projects and actions, the incremental effects of the No Action/No Project Alternative would not make a considerable contribution to the existing significant cumulative impact on aquatic resources within the study area.

RTC 23.22 (EIS/EIR) – Text identifying why it was assumed that there would be no riparian land cover preservation under the No Action/No Project Alternative has been added as shown in the paragraph below from the analysis of the No Action/No Project Alternative in Section 10.2.2.1 of the Final EIS/EIR.

> Table 10-5 provides the estimated acreages of aquatic resource land cover types that would be preserved under the No Action/No Project Alternative inside the UDA and outside the UDA. As discussed in Section 2.2.**3**~~2, 2.2.4~~, the lead agencies described the future No Action/No Project Alternative by estimating the minimum and maximum amounts of new urban development that could occur over a 50-year period inside the UDA under various mitigation scenarios. Under the scenario with the largest feasible acres of new development and the smallest feasible acres of aquatic-resource mitigation feasible, an estimated 1,740 acres of aquatic resources would be preserved in the Planning Area as project mitigation under the No Action/No Project Alternative (Table 10-5). **Table 10-5 identifies 0 acres of riparian land cover preservation under the No Action/No Project Alternative. This is because it is assumed that under the No Action/No Project Alternative all mitigation for unavoidable losses of riparian land cover would be achieved through re-establishment/ establishment of mixed riparian scrub and mixed riparian woodland land covers (see Table 10-6) and not by preservation of existing riparian land covers.**

RTC 23.23 (EIS/EIR) – See response to Comment 23.20. In addition, the Draft EIS/EIR text in Section 10.2.3.1 referenced in the comment has been edited in the Final EIS/EIR to read as shown below:

> Because the Proposed Action/Proposed Project Alternative would result in greater impacts to aquatic resources, the ~~a~~ total acreage of re-established/established aquatic resources would be greater under the Proposed Action/Proposed Project Alternative (Table 10-9) than that under the No Action/No Project Alternative (Table 10-6). The No Action/No Project Alternative results in 1,424 acres of re-establishment/establishment mitigation **in the Planning Area (see Section 10.2.2 for an explanation of the use of mitigation banks and in-lieu fee programs and potential for some compensatory mitigation to be located outside the Planning Area)**, and the Proposed Action/Proposed Project results in 1,740 acres of re-establishment /establishment mitigation **in the Planning Area**. For both alternatives, the amount of re-establishment/establishment is directly tied to the amount of impact, with each acre of land cover loss resulting in **at least** 1 acre of establishment**/**re-establishment. For the No Action/No Project Alternative, this

minimum one-to-one acreage is assumed based on the requirements of the 2008 Compensatory Mitigation Rule (33 CFR 332.3(f)).

RTC 23.24 (EIS/EIR) – The Draft EIS/EIR text in Section 10.2.3.2 referenced in the comment has been edited in the Final EIS/EIR to read as shown below. This text correlates with edits made in response to Comment 23.20.

> The effects of past **and** ~~,~~ present~~, and reasonably foreseeable other~~ projects on aquatic resources in the Planning Area were described above in Section 10.2.2.2, and represent a significant adverse cumulative impact on the aquatic resources within the study area. **A subset of the reasonably foreseeable other projects (e.g., foreseeable rural residential developments, agricultural activities on private lands) are likely to result in additional losses and additional adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period. However,** ~~A~~**a**s discussed in Section 10.2.2.2, when the incremental direct and indirect effects of the No Action/No Project Alternative are viewed in connection with the significant adverse effects of the past, present, and reasonably foreseeable future other projects and actions, the incremental effects of the No Action/No Project Alternative would not make a considerable contribution to the existing significant cumulative impact on aquatic resources within the study area. Therefore, the No Action/No Project alternative would result in a ***Less Than Significant Adverse Impact***.

RTC 23.25 (EIS/EIR) – The paragraph in question was mistakenly retained from an earlier version of Chapter 10 and has been deleted in the Final EIS/EIR. Prior to completing the Draft EIS/EIR, the USFWS and the County made the determination to not separate the effects of the Reduced Permit Term Alternative between the first 30-year and remaining 20-year portions of the study period. Effects of the Reduced Permit Term Alternative are expressed for the entire alternative.

RTC 23.26 (EIS/EIR) – The Draft EIS/EIR text in Section 10.2.4 referenced in the comment has been edited in the Final EIS/EIR to read as shown below. This text correlates with edits made in response to Comments 23.20 and 23.24.

> The effects of past **and** ~~,~~ present~~, and reasonably foreseeable other~~ projects on aquatic resources in the Planning Area were described above in Section 10.2.2.2, and represent a significant adverse cumulative impact on the aquatic resources within the study area. **A subset of the reasonably foreseeable other projects (e.g., foreseeable rural residential developments, agricultural activities on private lands) are likely to result in additional losses and additional adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period. However,** ~~A~~**a**s discussed in Section 10.2.2.2, when the incremental direct and indirect effects of the No Action/No Project Alternative are viewed in connection with the significant adverse effects of the past, present, and reasonably foreseeable future other projects and actions, the incremental effects of the No Action/No Project Alternative would not make a considerable contribution

to the existing significant cumulative impact on aquatic resources within the study area. Therefore, the No Action/No Project alternative would result in a ***Less Than Significant Adverse Impact***.

LETTER 24 U.S. ENVIRONMENTAL PROTECTION AGENCY (SSHCP AND CWA PERMIT STRATEGY)

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

Michael Jewell
Regulatory Division Chief
U.S. Army Corps of Engineers
Sacramento District
1325 J Street
Sacramento, CA 95814

Subject: Public Notice (PN) SPK-1995-00386, Proposed Section 404 Clean Water Act Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan, Sacramento County, CA

Dear ~~Mr. Jewell:~~ MIKE

Thank you for the opportunity to comment on the subject PN dated June 2nd, 2017. EPA continues to support the development of integrated regional aquatic resource and species habitat conservation strategies which enhance conservation of ecosystem functions and values while providing increased regulatory certainty to the public. The three-part permitting strategy described in this public notice applies to the Covered Activities defined in the South Sacramento Habitat Conservation Plan (SSHCP) and its associated Aquatic Resources Plan (ARP). It is EPA's opinion that the avoidance and minimization measures and preserve establishment approach set out in the SSHCP and ARP will result in improved aquatic resource conservation in the plan area, and that the proposed permitting strategy is consistent with the 404(b)(1) Guidelines [40 CFR 230.10]. 24.1

Of crucial importance to the success of the SSHCP and ARP will be the development and implementation of a regional species habitat and aquatic resources monitoring program to ensure that conservation objectives are being met and aquatic resource functions are being preserved. Chapter 8 of the Draft SSHCP outlines several benchmarks which need to be achieved in the first 18 months of Plan implementation. In working towards these goals, consulting with EPA, the California Wetlands Monitoring Workgroup, and any other sources of regional expertise in aquatic resources monitoring is highly recommended. 24.2

Thank you for the opportunity to provide comments on the Public Notice. Please have your project manager contact Joseph Morgan with any questions at (415) 972-3309, or morgan.joseph@epa.gov.

Sincerely,

Paul Amato
Acting Supervisor
Wetlands Office

RTC 24.1 (SSHCP and CWA Permit Strategy) – Comments regarding support for development of an "integrated regional aquatic resource and species habitat conservation strategies," with improved aquatic resource conservation in the SSHCP Plan Area resulting, and indicating consistency of the proposed Permit Strategy with the Section 404(b)(1) Guidelines, are noted.

RTC 24.2 (SSHCP and CWA Permit Strategy) – Comments regarding the importance of the SSHCP's monitoring program, as referenced in Chapter 8 of the SSHCP and encouraged to draw upon sources of regional expertise in monitoring of aquatic resources, are noted.

LETTER 25 U.S. ENVIRONMENTAL PROTECTION AGENCY (SSHCP AND EIS/EIR)

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

September 5, 2017

Ms. Jan C. Knight
Deputy Field Supervisor
Sacramento Fish and Wildlife Office
U.S. Fish and Wildlife Service
2800 Cottage Way, Room W-2605
Sacramento, California 95825

Subject: Draft Environmental Impact Statement for the South Sacramento Habitat Conservation Plan, Sacramento County, California (EIS No. 20170092)

Dear Ms. Knight:

The U.S. Environmental Protection Agency has reviewed the Draft Environmental Impact Statement (EIS) for the South Sacramento Habitat Conservation Plan (SSHCP) pursuant to the National Environmental Policy Act, Council on Environmental Quality regulations (40 CFR Parts 1500-1508), and Section 309 of the Clean Air Act.

The EPA commends the U.S. Fish and Wildlife Service (Service) and the County of Sacramento on the release of the draft SSHCP. The development of the SSHCP has been a study in dedicated and thoughtful land use and conservation planning. Crafting it required convening a diverse group of stakeholders, conducting extensive fieldwork, and synthesizing data across a range of scientific disciplines. We appreciate that EPA was invited to be a cooperating agency early in the development of the SSHCP, and the Service's close coordination with EPA throughout its preparation. EPA strongly supports the SSHCP and its core Conservation Strategy, including the commitment to create a landscape-scale network of interconnected preserves, and the requirement for Covered Activities to incorporate low impact development design measures such as stream and preserve setbacks. The remainder of this letter provides suggestions for your consideration as you prepare the Final EIS for the SSHCP. 25.1

EPA suggests that the Service include additional information in the Final EIS regarding the proposed Capital Southeast Connector project (Southeast Connector). The Draft EIS identifies the Southeast Connector project as a Covered Activity under the SSHCP, but does not provide a project-level analysis. Such an analysis would include a demonstration of project-specific avoidance and minimization of impacts to waters of the U.S. The information to support a project-level analysis appears to be readily available, given that an Environmental Impact Report (EIR) was prepared for that project to comply with the California Environmental Quality Act. EPA suggests that the Final EIS disclose when the Southeast Connector would be built and how it would be permitted under Clean Water Act Section 404 (i.e., in segments or as one complete project per the description in the prior EIR), and identify the NEPA lead agency, as well as any other government agencies that would be involved and what each of those agencies' roles and responsibilities would be (include Caltrans, U.S. Army Corps of Engineers, the Joint Powers Authority, EPA, and any other potentially involved agencies). To further promote a shared understanding of the remaining approvals needed and facilitate more efficient project delivery, we 25.2

suggest that the Service convene an interagency meeting with the above-listed agencies before publication of the Final EIS.

The success of the SSHCP and Aquatic Resources Plan will depend, in part, on the development and implementation of a regional species habitat and aquatic resources monitoring program to ensure that conservation objectives are being met and aquatic resource functions preserved. Chapter 8 of the Draft SSHCP outlines several benchmarks that need to be achieved in the first 18 months of implementation. We suggest that the Service consult with EPA, the California Wetlands Monitoring Workgroup (CWMW), and other institutions with regional expertise in aquatic resources monitoring, to achieve these implementation goals. The CWMW's efforts towards developing an integrated framework to coordinate water quality and wildlife monitoring in California HCPs/NCCPs may be of particular relevance. 25.3

The DEIS does not identify the Service's preferred alternative. It is EPA's policy to rate each alternative when a preferred alternative is not identified. Based on our review of the DEIS, we have rated each of the action alternatives as *Lack of Objections* (LO) (see the enclosed "Summary of EPA Rating Definitions"). We concur with the Service's identification of the Proposed Action/Proposed Project as the environmentally preferable alternative. 25.4

We appreciate the opportunity to review this Draft EIS, and are available to discuss our comments. When the Final EIS is released for public review, please send one hard copy and one CD to the address above (mail code: ENF-4-2). If you have any questions, please contact me at 415-972-3521, or contact Jason Gerdes, the lead reviewer for this project. Mr. Gerdes can be reached at 415-947-4221 or gerdes.jason@epa.gov. 25.5

Sincerely,

Kathleen Martyn Goforth, Manager
Environmental Review Section

Enclosure: Summary of EPA Rating Definitions

SUMMARY OF EPA RATING DEFINITIONS*

This rating system was developed as a means to summarize the U.S. Environmental Protection Agency's (EPA) level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the Environmental Impact Statement (EIS).

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

ADEQUACY OF THE IMPACT STATEMENT

"Category 1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

"Category 2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

"Category 3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. Because of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640, Policy and Procedures for the Review of Federal Actions Impacting the Environment

RTC 25.1 (SSHCP) –The Plan Preparers appreciate the guidance and technical assistance provided by the U.S. EPA during preparation of the SSHCP.

RTC 25.2 (EIS/EIR) – The lead agencies acknowledge the request from EPA to include additional information regarding the proposed Capital Southeast Connector project (Southeast Connector). The Southeast Connector is a planned 34-mile roadway through the southern area of Sacramento County and into western El Dorado County, connecting Elk Grove, Rancho Cordova, Folsom and El Dorado Hills. The Connector project will be constructed in five segments based on geographic and jurisdictional boundaries, roadway classification, adjacent community characteristics, projected traffic demand, and potential financing opportunities. As described on the Connector website, creation of these segments is guided by the National Environmental Policy Act (NEPA) and Council on Environmental Quality guidance for independent utility and logical termini. For increased flexibility related to the timing of funding availability, the five segments are also broken down into smaller sub-segments – identified as 1, 2, or 3 – based on the existing roadway network and Connector roadway classifications.

The five segments and sub-segments of the Connector are as follows:

--A1 – I-5 Hood Franklin Interchange to Bruceville Road

--A2 – Bruceville to CA-99

--B1 – CA-99 to Waterman

--B2 – Waterman to Bradshaw

--B3 – Bradshaw to Bond

--C – Bond to Calvine

--D1 – Calvine Road to SR-16 Jackson Highway

--D2 – SR-16 Jackson Highway to White Rock/Grant Line Road

--D3 - White Rock to El Dorado County line

--E1- El Dorado to Latrobe (outside the Plan Area, not a Covered Activity)

--E2 - Latrobe Road to US-50 (outside the Plan Area, not a Covered Activity)

--E3 - US-50 to Silva Valley (outside the Plan Area, not a Covered Activity)

As stated in the SSHCP in Section 5.2.1:

> "The entire footprint of the Capital Southeast Connector within the boundaries of Sacramento County is included in the SSHCP Plan Area, and activities related to the connector are SSHCP Covered Activities. Although the City of Folsom is not a Plan Permittee, the planned improvements to White Rock Road inside the Plan

> Area and the area needed for the expansion of White Rock Road as part of the Capital Southeast Connector or independently by a Plan Permittee are within the SSHCP Plan Area, and activities related to White Rock Road are SSHCP Covered Activities."

The EIS/EIR analyzes the effects of the segments within the Plan Area as Covered Activities, and the portions outside the Plan Area in El Dorado County are analyzed as part of the cumulative impact analysis. The segments of the Southeast Connector within Sacramento County are also analyzed as part of the No Action/No Project Alternative. The Connector has incorporated the SSHCP Conservation Strategy and Avoidance and Minimization Measures (AMMs) into its design and commitments, including SSHCP AMM ROAD-2, which provides for numerous wildlife crossings along the corridor. For example the previously prepared D2 segment mitigated negative declaration (as posted on the Connector website) and the NEPA Environmental Assessment (in preparation with the California Department of Transportation as lead agency) have incorporated several of the SSHCP AMMs, as will other project level environmental analyses for various segments when they are prepared.

Timing for construction of the Connector segments in the Plan Area, while difficult to predict precisely, could take up to 20 years and will depend primarily on funding availability. The NEPA lead agency for each of the segments will also depend in part on whether federal funding, a federal authorization, or a federal permit is involved. The California Department of Transportation has been granted authority by the Federal Highway Commission to serve as the NEPA lead agency for federal highway projects in California, including the D2 segment, and is also the NEPA lead agency for other segments that have initiated local approvals such asthe A1/A2 and D3/E1 segments. While it is not possible to predict exactly how future CWA Section 404 permitting would be sought for each segment, it will be in compliance with the USACE's draft Section 404 permit strategy (Appendix C of the Final EIS/EIR). In regards to project-specific avoidance and minimization of impacts to waters of the U.S., future Section 404 CWA permit evaluation by the USACE would follow the terms, conditions, and procedures described in the USACE's (draft) Section 404 CWA permit strategy for SSHCP covered projects. The USACE's permit strategy includes provisions for additional project-specific avoidance and minimization of impacts to waters of the U.S. as part of the abbreviated standard permit process (as described in Appendix C to the Final EIS/EIR).

For coverage under the PGP, applicants would need to substantiate avoidance and minimization of impacts to waters of the U.S. to the maximum extent practicable. As stated in the draft PGP, this would be considered satisfied when project applicants have designed and implemented activities to comply with all applicable avoidance and minimization measures contained in the SSHCP and the applicable local ARP ordinance. For the LOP and abbreviated standard permit processes, applicants would also need to incorporate all applicable avoidance and minimization measures contained in the SSHCP. Additionally, the USACE would consider project-level information in its evaluation of on-site avoidance and minimization of impacts to waters of the U.S. This includes information provided by the applicant regarding how the project has been designed to avoid and minimize impacts to waters of the U.S., and consideration of the site-specific landscape

context of the project. Where, for example, a project lies in close proximity to a stream, with a required SSHCP setback and potentially an adjacent wetland, the USACE envisions requiring minor adjustments (e.g., a wider stream setback).

The County, USFWS, and USACE welcome the opportunity to discuss the approvals of individual Connector segments located in the Plan Area with the EPA as a means to promote a greater understanding and more efficient project delivery for the Connector project, as the commenter suggests.

RTC 25.3 (SSHCP) –.The SSHCP Implementing Entity looks forward to coordinating with the U.S. EPA and the California Wetlands Monitoring Workgroup in the first 18 months of SSHCP implementation to gain information regarding the development of the regional species habitat and aquatic species monitoring and management protocols discussed in Chapter 8 of the Final SSHCP.

RTC 25.4 (EIS/EIR) – Section 17.7 of the Final EIS/EIR now identifies the Proposed Action/Proposed Project Alternative as the USFWS' preferred alternative.
We appreciate the EPA's concurrence that the Proposed Action/Proposed Project Alternative is also the environmentally preferable alternative.

RTC 25.5 (EIS/EIR) – The U.S. EPA's request for distribution of the Final EIS/EIR to EPA Region 9 has been noted.

LETTER 26 WILTON RANCHERIA (CWA PERMIT STRATEGY)

Wilton Rancheria

9728 Kent Street, Elk Grove, CA 95624

Monday, June 19, 2017

Mary R. Pakenham-walsh
1325 J Street
Sacramento Ca 95814

JUL 24 2017

RE: SPK 1995-00386 South Sacramento Habitat Conservation Plan

Dear Mary R. Pakenham-walsh,

Thank you for your letter dated June 2, 2017 regarding the proposed project. Wilton Rancheria ("Tribe") is a federally-recognized Tribe as listed in the Federal Register, Vol. 74, No. 132, p. 33468-33469, as "Wilton Rancheria of Wilton, California". The Tribe's Service Delivery Area ("SDA") as listed in the Federal Register, Vol. 78, No. 176, p. 55731, is Sacramento County. However, the Tribe's ancestral territory spans from Sacramento County to portions of the surrounding Counties. The Tribe is concerned about projects and undertakings that have potential to impact resources that are of cultural and environmental significance to the tribe.

After review of your letter we have determined the project lies within the Tribe's ancestral territory. We appreciate the opportunity to comment on this and any other projects within the Tribe's ancestral territory that may be in your jurisdiction. 26.1

The Environmental Resources Department would like to receive any cultural resources assessments or other assessments that have been completed on all or part of the project's area of potential effect (APE), and area surrounding the APE including, but not limited to:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:
    - A listing of any and all known cultural resources have already been recorded on or adjacent to the APE;
    - Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response; 26.2
    - If the probability is low, moderate, or high that cultural resources are located in the APE or area surrounding the APE.
    - Whether the records search indicates a low, moderate or high probability that unrecorded cultural resources are located in the potential APE or area surrounding the APE; and
    - If a field investigation survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

Ph: 916-683-6000 | Fax: 916-683-6015 | www.wiltonrancheria-nsn.gov

- ✦ The Tribe shall be present at any field investigation surveys conducted on the Applicants behalf. 26.2 cont'd

2. The results of any archaeological inventory survey that was conducted, including:
   - Any reports that may contain site forms, site significance, and suggested mitigation measures.
   - Any reports or inventories found under the Native American Graves Protection and Repatriation Act.
     - ✦ All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code Section 6254.10. All Wilton Rancheria correspondences shall be kept under this confidential section and only shared between the Tribe and lead agency. 26.3
3. The results of any Sacred Lands File (SLF) check conducted through Native American Heritage Commission. The request form can be found at http://www.nahc.ca.gov/slf_request.html. USGS 7.5-minute quadrangle name, township, range, and section required for the search. 26.4
4. Any ethnographic studies conducted for any area including all or part of the potential APE or areas surrounding the APE; and
5. Any geotechnical reports regarding all or part of the potential APE or areas surrounding the APE.
   - ✦ The Tribe shall be notified before any geotechnical testing is planned. Geotechnical testing has potential to impact Tribal Cultural Resources and should be part of this consultation. 26.5

The information gathered will provide us with a better understanding of the project and will allow the Tribe to compare your records with our database.

Thank you again for taking these matters into consideration, if you have any questions please contact Ed Silva, Tribal Resources Coordinator via email at esilva@wiltonrancheria-nsn.gov.

Sincerely,

Antonio Ruiz

Antonio Ruiz, Jr.
Cultural Resources Officer
Wilton Rancheria

RTC 26.1 (CWA Permit Strategy) – The comment, in response to the USACE's June 2017 public notice "Proposed Section 404 Clean Water Act Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan," regarding the project (SSHCP) lying within the Wilton Rancheria's ("Tribe's") ancestral territory is noted.

RTC 26.2 (CWA Permit Strategy) - The comment, in response to the USACE's June 2, 2017, public notice referenced in response to comment 26.1 requests copies of any record searches and/or cultural reports that have been completed within the project's "area of potential effect" (APE). Chapter 11 of the SSHCP EIS/EIR describes existing conditions and environmental consequences of the proposed project. As stated in Section 11.2.1 of the EIS/EIR, no systematic survey of the 317,655-acre SSHCP Plan Area has been done. As described in Section 11.2.3 of the EIS/EIR, the proposed project (SSHCP) would include a multilevel CWA 404 permit strategy (as contained in the June 2, 2017 public notice, and also Appendix C to the SSHCP EIS/EIR). Authorization of individual projects under the CWA 404 permit strategy would require compliance with Section 106 of the National Historic Preservation Act, and related laws and policies concerning Tribal consultation. In addition, as explained in Section 10.4.2.7 of the final SSHCP, all future SSHCP covered projects and activities would comply with Section 106, including the SSHCP Covered Activities that do not utilize the USACE's Section 404 CWA Permit Strategy aligned with the SSHCP.

RTC 26.3 (CWA Permit Strategy) – Please see the response to Comment 26.2.

RTC 26.4 (CWA Permit Strategy) – Please see the response to Comment 26.2.

RTC 26.5 (CWA Permit Strategy) – Please see the response to Comment 26.2.

Richard Radmacher, Senior Planner
County of Sacramento,
Department of Water Resources
827 7th Street, Room 230
Sacramento, CA 95814

Dear Mr. Radmacher:

Please find enclosed copies (both hardcopy and e-copy) of our Memorandum for Record (MFR) titled *Cumulative Impact Analysis for the South Sacramento Habitat Plan Area* (dated September 4, 2014).

The MFR provides a summary of the U.S. Army Corps of Engineers, Sacramento District's evaluation of cumulative impacts to waters of the United States within the South Sacramento Habitat Conservation Plan (SSHCP) Area, as determined by our office's review of past, present and reasonably foreseeable Regulatory Program actions. Information from this study is recommended to be utilized as a component of the cumulative impacts section under development as part of the SSHCP's Environmental Impact Statement/Environmental Impact Report (EIS/EIR).

Please refer to identification number SPK-1995-00386 in any correspondence concerning this project. If you have any questions, please contact Mary Pakenham-Walsh at the U.S. Army Corps of Engineers, Regulatory Division, California South Branch, 1325 J Street, Room 1350, Sacramento, California 95814-2922, by email at *Mary.R.Pakenham-Walsh@usace.army.mil*, or telephone at 916-557-7718. For more information regarding our program, please visit our website at *www.spk.usace.army.mil/Missions/Regulatory.aspx*.

Sincerely,

Kathleen A. Dadey, Ph.D
Chief, CA South Branch

MEMORANDUM FOR RECORD

SUBJECT: Cumulative Impact Analysis for the South Sacramento Habitat Conservation Plan Area (SPK-1995-00386)

1. **Introduction:** This document provides a summary of the U.S. Army Corps of Engineers, Sacramento District's evaluation of cumulative impacts to waters of the United States (WOUS) within the South Sacramento Habitat Conservation Plan (SSHCP) Area (also known as Plan or Plan Area; hereafter also referred to as "study area"), as determined by our review of past, present and reasonably foreseeable Regulatory Program actions (hereafter, "Regulatory actions").

   An evaluation of cumulative impacts of a proposed activity on the human environment is required under the National Environmental Policy Act (NEPA), and is defined as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time" (40 CFR 1508.7).

   Please note that this analysis (hereafter called "study) considers cumulative impacts solely for aquatic resources, including impacts attributable to the collective effect of a number of individual discharges of dredged or fill material associated with authorized and unauthorized activities (UA) known to the Corps. This study is intended to be utilized as a component of a comprehensive cumulative impact analysis under development for the SSHCP's Environmental Impact Statement/Environmental Impact Report (EIS/EIR), which is intended to evaluate the full range of potential cumulative effects of the proposed SSHCP (for additional information about the EIS/EIR, see Section 3).

2. **Location:** The study area encompasses approximately 374,000 acres within southern Sacramento County, and includes unincorporated Sacramento County, and the cities of Galt and Rancho Cordova. The geographical boundaries of the Plan Area are U.S. Highway 50 to the north, the Sacramento River east levee and County Road J11 to the west, and the Sacramento County line to the east and south. The study

area excludes the cities of Sacramento, Elk Grove[1], Folsom, the lands of the Miwok tribe, and the Sacramento County community of Rancho Murieta (see **Figure 1, Appendix A**).

3. **Activity Description:** The proposed activity is the SSHCP, a habitat conservation plan (HCP) that would cover the 374,000-acre study area described above. The SSHCP is currently under preparation by a group of six local jurisdictions, who, with the addition of an HCP implementing entity (not yet formed), will be the "Plan Permittees" in coordination with the U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW). The "Plan Permittees" consist of: the County of Sacramento, City of Rancho Cordova, City of Galt, Capital Southeast Connector Joint Powers Authority, Sacramento Regional County Sanitation District, Sacramento County Water Agency, and a (to be formed) SSHCP Implementing Entity.

   The Plan would include a conservation strategy developed to benefit 30 plant and animal species, referred to as "covered species." In addition, the Plan would serve as part of the Plan Partners' application for a 30- or 50-year incidental take permit (ITP) under section 10(a)(1)(B) of the federal Endangered Species Act (ESA). If issued, the ITP would authorize the incidental take of seven covered federally-listed plant and animal species. A separate ITP, if issued, would cover six state-listed species under the authority of the California Endangered Species Act[2] (CESA, administered by the CDFW). Due to overlapping state/federal designations, there are a total of 10 species that are federal- and/or state-listed. If issued, both ITPs would provide take coverage for "covered activities" implemented by the Plan Partners. Examples of "covered activities" include, but are not limited to, private development projects, transportation facilities, utility and public works projects, recreation facilities, and future habitat management activities.

   The covered activities proposed by the Plan Partners in the SSHCP would directly affect a maximum total of approximately 42,243 acres of land (overall) within the study area[3]. Most of these direct effects (an estimated 40,000 acres) would occur within the 123,000-acre urban development area (UDA). Additionally, in the SSHCP, the Plan Partners propose to preserve or restore 49,930 acres of land within the study area. In combination with existing preserve lands, this would result in a larger, interconnected habitat preserve system of approximately 113,623 acres[3].

   Independent of this study, the most recent, comprehensive data available to-date describing the SSHCP's proposed impacts to WOUS is represented in *Chapter 6.0,*

[1] The SSHCP Plan Area boundaries were updated nearly 1 ½ years into the Corps' cumulative impact analysis study (in late April, 2014). The Corps was in final data processing stages for the study at this time. Therefore, project data within the City of Elk Grove is included in this analysis. As a region of rapid-paced development in Sacramento County, inclusion of data from the City of Elk Grove serves to inform cumulative impacts in the northwestern portion of the study area. Additionally, the end-users of this study have the ability to query the electronic geodatabase (Appendix C) to estimate cumulative impacts without the inclusion of project data from within the City of Elk Grove. The revised Plan Area boundary is shown on Figure 1, in addition to the pre-April, 2014 study area boundary used for this analysis.

[2] California Fish and Game Code, Section 2050 et seq.

[3] According to the Notice of Intent to prepare a joint EIS/Environmental Impact Report (EIR), published in the Federal Register (Nov. 3, 2013) by the USFWS. As the SSHCP continues to progress toward finalization, it is noted that these acreages may be revised.

Effects of the July 2013 administrative draft SSHCP. Table 6-2, *Direct Effects to Native and Naturalized Land Cover Types Within and Outside the UDA* summarizes the Plan's anticipated direct effects to each of the "land cover types," including aquatic resources (e.g. seasonal wetlands and vernal pools).

Table 6-2 of the administrative draft SSHCP estimates that a maximum of approximately 5,477 acres of potential waters would be directly affected. Of these direct effects, up to 1,163 acres would be to wetland "land cover types" (consistent with the terms used in *Table 6-2*, "Freshwater Marsh," "Seasonal Wetland," "Vernal Pool," and "Swale"), up to 3,674 acres would be to potential wetland cover type ("Irrigated Pasture-Grassland") for a total of 4,837 acres of wetland/potential wetland cover types, and up to 643 acres would be to stream and open water cover types ("Ephemeral Streams," "Streams/Creeks," and "Open Water").

It is noted here that the maximum estimated direct effects identified in Table 6-2 of the administrative draft SSHCP include both temporary and permanent effects to aquatic resources. In addition, this table does not identify whether the aquatic resources are WOUS subject to Corps' jurisdiction, nor does it identify the extent to which the direct effects would result in a "loss" of WOUS. See Section 4(a) of this document for clarification of the usage of the term "loss" (of WOUS) in this document.

The SSHCP requires evaluation under NEPA. The USFWS is serving as the lead agency for the EIS component of an EIS/EIR that would describe, in accordance with NEPA requirements, the underlying purposes, needs, and objectives for developing, approving and implementing the SSHCP, including identifying alternatives to the proposed plan, describing the existing environment, and analyzing the potential effects of each alternative on the environment.

One of the SSHCP's goals is to streamline the existing development-permitting process with regard to, at minimum, reviews associated with federally-listed plant and animal species. In addition, the SSHCP is proposing to include an Aquatic Resources Program (ARP) that would describe actions expected to avoid, minimize and compensate for impacts of "covered activities" to WOUS. The proposed ARP would facilitate the Corps' development of a permitting strategy for the SSHCP, under Section 404 of the Clean Water Act. The Corps' role in the EIS as a cooperating agency includes meetings and document review to provide input on the Corps' jurisdiction, authorities, and other applicable Regulatory Program guidance, such as procedural considerations for future regulatory reviews of projects.

4. Purpose of this Cumulative Impact Analysis: This study has been conducted to assess, to the extent reasonable and practical, the cumulative impact to the aquatic ecosystem[4] within the study area attributable to the collective effect of individual discharges of dredged or fill material associated with authorized and unauthorized actions. To accomplish this, the Corps:

[4] This description of cumulative impacts to the aquatic ecosystem is similar to that found in Section 404(b)(1) [40 CFR 230.11(a)].

a. Determined the approximate extent (i.e., acreage) of loss[5] of WOUS from past, present and reasonably foreseeable future Regulatory actions within the study area;

b. Determined the approximate extent of compensatory mitigation of WOUS associated with past, present and reasonably foreseeable Regulatory actions in the study area; and,

c. Determined the general extent to which loss and/or compensatory mitigation of WOUS attributable to past, present and reasonably foreseeable Regulatory actions in the study area exhibited geographic association relative to the UDA.

From the above data, several sub-categories of data were analyzed to inform general patterns and trends in Regulatory actions relevant to the cumulative impact analysis. For example, one of the data queries resulted in a frequency distribution of relative levels of permanent impact to waters resulting from past and present Regulatory actions. Another data query addressed geographic patterns of impacts to waters resulting from Regulatory actions, relative to the UDA.

5. Geographic and Temporal Scopes of Analysis: The geographic (review area) and temporal scopes considered in this cumulative impact analysis (CIA) are described in this section.

a. Geographic Scope: The geographic scope for this CIA consists of the SSHCP Plan Area, as described in Sections 1 and 2 of this document. The study area is depicted in **Figure 1** (**Appendix A**), and includes all or portions of ten 10-digit Hydrologic Unit Code (HUC) watersheds within the study area (see **Figure 2**, **Appendix A**). For purposes of this study, it was determined to be appropriate to utilize portions of the 10-digit HUC watersheds that conformed to the boundaries of the SSHCP's Plan Area, rather than entire watersheds or larger (e.g., 8-digit) HUCs, based on the following rationale:

(1) Utilizing entire 10-digit HUCs that extend outside of the SSHCP Plan Area would have increased the review area from 374,000 acres to 866,922 acres, and the number of Regulatory actions to review from 1627 to an estimated 3,286[6]. To balance study resources (e.g., time and cost) with accomplishing the study's purpose at an appropriate level of detail, it was determined that use of entire 10-digit HUCs that extended beyond the Plan Area was not practicable. Following on this logic, utilizing 8-digit HUCs (which would result in a substantially larger review area and greater number of Regulatory actions than utilizing entire 10-digit HUCs) would exacerbate limitations on study resources.

[5] "Loss" of WOUS in this document follows the definition provided in the 2012 Nationwide Permits effective March 19, 2012 (FR Vo. 77, No. 34, p. 10289).
[6] This estimate was obtained by querying the ORM2 database; the query was conducted by the Corps' Institute for Water Resources (IWR), which provides nationwide ORM2 database support for the Regulatory Division.

(2) In addition to resource limitations, the Council of Environmental Quality's (CEQ) handbook *Considering Cumulative Effects Under the National Environmental Policy Act*, published in January 1997, suggests that for water impacts, that "watershed boundaries are useful for cumulative effects analysis" and that one way to determine the geographic boundary is to "consider the distance an effect can travel." Extending the study area for up to 23[7] miles outside of the SSHCP Plan Area for the 10-digit HUCs and an even greater distance for the 8-digit HUCs, would result in consideration of impacts to waters that are often off-stream (e.g., vernal pools) in the study region, and while likely resulting in cumulative effects to downstream waters, quantifying the magnitude of such impacts is, we believe, likely too speculative to be meaningful in the context of this analysis.

It was further determined that the study area boundary should be adjusted to exclude projects within the primary channels of the Sacramento River and Mokelumne River. The majority of projects on these rivers include those that primarily affect fish species (e.g. dock installation, levee repair), which are not covered in the SSHCP. While levee repair projects could potentially affect some HCP-covered species, the "loss of waters" is often minimal as a result of typical levee work, such as rip-rap placement.

b. Temporal Scope: The temporal scope for this analysis extends from approximately 35 years in the past (to the beginning of the Corps' Regulatory action documented file history in the study area, which was 1979) to the "reasonably foreseeable" future.

Reasonably foreseeable actions were not explicitly defined in terms of years (e.g., 5, 10 or 20), since time frames cannot be predicted. As an example, the Sacramento District has to-date been involved in re-authorizing several projects that had been previously authorized before or during the economic downturn in the latter part of the 2000-2010 decade. For purposes of this analysis, reasonably foreseeable projects were considered to be those that:

- Have applications that are currently being evaluated by the Corps;
- Have applications that have been withdrawn from Corps evaluation, but based on available information, may be reactivated within the reasonably foreseeable future;
- The Corps has received information that an application is anticipated to be submitted in the reasonably foreseeable future. This may include, for example, a scheduled or completed pre-application meeting for the project, a request for comments from the Corps on a project's EIR.

[7] Boundaries of some HUC-10 watersheds would extend as much as 23 miles toward the southwest, and approximately 20 miles toward the east.

6. Methodology: This section describes the procedures followed in conducting this study. The first step of the CIA involved identifying Regulatory actions and data categories of relevance to the analysis.

a. Data Setup and Acquisition

(1) Relevant data categories to populate from Regulatory actions were identified, taking into consideration the level of resolution available in files and/or database history for actions. A master spreadsheet was created in Microsoft Excel reflecting data structure and categories.

(2) The appropriate temporal scale for data collection, and project status (past, present, reasonably foreseeable) was confirmed (see also Section 5.b, above). The decision was made to combine "past " and "present" projects, interpreted as all projects the Corps has finalized, due to the size of the study area and number of actions. Separating these categories would have involved researching the status of projects previously finalized. This would have involved substantial resources to accomplish, and was not relevant to the key questions to be addressed by this CIA.

(3) Study area base mapping was set up in ArcGIS 10.0 Desktop geographic information system (GIS) software by importing externally-sourced geographic features including the study area boundary, UDA, and 10-digit HUC watershed boundaries.

(4) Utilizing ArcGIS, Regulatory actions within the ORM2 database were compared against the study area boundary, and actions located inside the study area boundary were identified. This generated a raw, comprehensive list of Regulatory actions. The ORM2 database contains actions originating from both ORM2 (post-July 2007), and the previous database, RAMS.

(5) A geodatabase was constructed from the raw list of Regulatory actions resulting from the step above, that summarized Regulatory actions by identification number, unique geometry type (polygon, line, point), type of action (e.g., permit, UA, mitigation bank), impact/mitigation acreage, and status (e.g., pending, finalized). This resulted in an initial data set consisting of 1627 Regulatory actions, which were in turn related to 713 (unique) project numbers[8].

(6) Refinement of the initial data was conducted, including:

(a) River-based projects such as docks were eliminated from the database by adjusting the study area boundary inward to the east and north

[8] Many Regulatory project numbers have several associated actions, for example, SPK-2000-00010 may have a permit action, a permit modification action, and a UA action. All of these actions generate a separate "row" in the dataset, with relevant baseline, impact and/or mitigation data.

banks of the Sacramento and Mokelumne Rivers, respectively (see Section 5.b).

(b) A number of projects were identified where the associated project location (confirmed by file research) differed from what was recorded in the Corps database. If a project location was determined to be located outside of the study area, it was removed.

(c) Projects having no potential[9] for impact losses or mitigation gains were identified and removed.

These steps resulted in a final data set of 540 unique project numbers and 1400 associated Regulatory actions.

b. Data Review and Compilation

(1) After the steps described in Section 6.a were completed, the final set of 540 unique project numbers and associated 1400 Regulatory actions, populated with the "raw" database-generated data (see Section 6.a[5]), was exported to Excel.

(2) For each of the 540 Regulatory project numbers, the associated Regulatory project file was located and researched, either in hardcopy or digital (older file actions have been converted to PDF format for archiving). Because of the high potential for inconsistency of data resolution and clarity in database records, in order to get the most accurate estimates of impacts and mitigation, every file associated with the 540 Regulatory projects was reviewed.

For each Regulatory action, raw data populating the Excel spreadsheet (derived from the ArcGIS table export described above in 6.b[1]) was updated, as necessary, with information acquired from the associated project file.

File review included reviewing available data from in prior cumulative impact studies conducted by the Corps within the study area[10]. A substantial effort was made to evaluate all available electronic and hardcopy data for Regulatory actions within the study area, at the most efficient level of effort necessary to accomplish the study's objectives.

[9] "No potential" for purposes of this study means that the database record for the project met both of the following two criteria: 1) There was no impact or mitigation record associated with the project, and 2) All actions associated with the project were of a type that would not be associated with impacts (e.g., pre-application, no permit required). This two-criteria test did not remove any projects for which an ORM2 impact or mitigation entry existed, even if the recorded impact values were 0. Any project having an ORM2 impact or mitigation entry was included in the final geodatabase, and was reviewed individually to confirm impact and/or mitigation values.

[10] *Residences of Murieta Hills (*SPK-2005-00305*), Glenborough at Easton and Easton Place (*SPK-2004-00515*, Florin-Vineyard Specific Plan Area (*SPK-2004-00244 & SPK-2009-00080*), and Sunridge Properties (*SPK-2009-00511*).*

All data were input directly into Excel spreadsheets. As file review was conducted, data gaps (resulting when the initial file review failed to provide sufficient information regarding impacts and/or mitigation) were "flagged" on the spreadsheets to address during a final data QA/QC stage.

(3) Based on an overview of both database- and file-generated data in terms of relative raw data quality, it was determined appropriate to create two separate datasets from the refined (see Section 6.a[6]) raw dataset of 1400 Regulatory actions, representing 540 unique project numbers. During file review, it became apparent that the information regarding impacts and mitigation in older projects was not as specific as the information available for projects completed more recently (e.g. a project authorized in 1996 may not specify the type impact, the type of aquatic resource impacted, or the type of mitigation required, whereas a project from 2011 would contain that information). Because of the discrepancy in the quality of data, an accurate comparison could not be made. Therefore, the data were divided according to the following criteria:

(a) The first dataset (hereafter, "higher-resolution" dataset), consists primarily of projects from 1999 to January 2013. The higher-resolution dataset contains the highest level of data available that is relevant to this study, an achievable standard based on the higher quality of the generally more recent file and database documentation. This dataset identifies the amount of each type of waters impacted (e.g., wetlands vs. streams), includes project-related mitigation required by both the Corps and associated with USFWS Sec. 7 ESA consultations, and includes the location of required mitigation relative to the UDA. This dataset also includes several reasonably foreseeable projects. Data categories in the higher-resolution dataset are summarized in **Table 1** (**Appendix B**).

(b) The second dataset (hereafter, "lower-resolution" dataset), consists primarily of projects from the beginning of the Corps' record to 1998. This dataset contains substantially less data than that obtained for the higher-resolution data set. This dataset does not identify the amount of each type of waters impacted, does not include project-related USFWS mitigation, and does not provide the location of mitigation. The dataset does include the total amount of waters impacted and mitigation required by the Corps. In addition to older Regulatory actions, this dataset also includes several reasonably foreseeable projects. Reasonably foreseeable projects exhibit varying levels of project description detail, and all related data is, at best, pre-decisional. Data categories in the higher-resolution dataset are summarized in **Table 2**, **Appendix B**.

(4) In the final stages of data collection, the lower-resolution dataset was combined with a copy of the higher-resolution dataset to create a single,

"complete lower-resolution" (CLR) dataset that exhibits the same categories used by the lower-resolution dataset. Therefore, two datasets were analyzed for the purposes of this study, the higher-resolution dataset (as described above), and the CLR dataset. The CLR dataset was created in order to compare "apples to apples" across the full temporal scope of the study. Higher-resolution data could be combined into broader categories, but lower-resolution data was not able to consistently be made more precise. Thus the CLR dataset is able to meaningfully describe broader categories of data.

c. Decision Rules and Assumptions for the Higher-resolution Dataset

As described in Section 6.b(3), data for this study is contained within two datasets, higher-resolution and CLR. The following section describes decision rules and assumptions for the higher-resolution dataset, which contains the higher quality data. Please see Section 6.d for decision rules and assumptions for the CLR dataset.

(1) Excel table structure: In the higher-resolution dataset, some Regulatory file numbers have multiple rows associated with them. This may be because a single Regulatory file number has multiple related Regulatory actions (e.g., one file number had one action resulting in a Nationwide [NWP] verification, and several years later, an individual permit [IP] was issued for a different action associated with the same project), or because data needed to be kept separated during review for the sake of clarity (e.g., USFWS requirements associated with ESA Section 7 consultation). After the initial data set-up, hardcopy or electronic files of those Regulatory file numbers with multiple actions were reviewed, and the tables were updated appropriately. In some cases, information was consolidated into a single row (e.g., permit modification actions that did not introduce changes to impact/mitigation acreages).

(2) Recording Delineated Acres: To simplify the analysis as much as possible but utilize relevant categories, Delineated Acres consisted of four aquatic resource types: Wetlands, Streams, Other, and Unknown. The acreage of an aquatic resource type was only included in one of these categories if: a) it was determined jurisdictional, AND (b) a Regulatory action on the site resulted in a permanent or temporary impact. Only one set of delineated acreage figures was recorded per Regulatory project number, so the Excel spreadsheets contain many rows without delineation acreage/figures. An additional category was created to record acreage of any features that were determined to be non-jurisdictional (e.g., isolated). This category was not broken down by aquatic resource type; it is an undifferentiated summation of acreage determined to be non-jurisdictional waters.

(a) "Wetlands" included all types of wetlands, for example, vernal pools, seeps, seasonal wetlands, freshwater marsh, and swales. Further

subdivision of the wetland category was determined to be unreasonably resource-consuming, and in some cased impossible due to the lack of documentation (particularly in older files). Given that the entire data set could not be consistently differentiated by wetland type, the decision was to not address just a portion of it.

(b) "Streams" included ephemeral, intermittent and perennial streams, creeks, and rivers. Ditches (if determined to be jurisdictional) were also included in the stream category. While some ditches may have wetland characteristics in addition to (or instead of) stream characteristics, separating ditches that are categorized as wetlands from ditches categorized as streams was determined to be unreasonably resource-consuming, and in some cases impossible due to the lack of documentation (particularly in older files).

(c) "Other" included ponds, retention/detention basins (if determined to be jurisdictional), and open water (if not obviously in one of the two categories of [a] or [b], above).

(d) "Unknown" included delineated acreage that was determined to be jurisdictional, but for which the specific aquatic resource type (e.g., seasonal wetland) was unknown based on the lack of specificity available in file documentation.

(e) If a JD was verified and a Corps action resulted in temporary and/or permanent impacts to WOUS, but the amount of delineated acres could not be determined, then an estimate of delineated acres was assumed to equal the sum of impacts (temporary and permanent) and, if applicable, any identified on-site preservation requirements.

(f) If delineated acreage was known and any of the above aquatic resource types were specified, but it was unknown exactly how many acres of each aquatic resource type was delineated, the known delineated acreage was divided evenly between the four aquatic resource types.

(3) Recording Impacts to WOUS:

(a) This study focused on permanent impacts that resulted in a "loss of" WOUS[11]. Permanent impacts were recorded for each of the four aquatic resource types identified in Section 6.c(2).

(b) Temporary impacts to waters were not recorded as part of this analysis, since once restored, temporary impacts do not result in a loss of WOUS.

[11] As defined in the Corps' 2012 Reissuance of Nationwide Permit (FR Vol. 77, No. 34, p. 10289, February 21, 2012).

(c) Impacts to waters recorded as "permanent" in Regulatory actions were typically assumed to result in a loss of WOUS. In more obvious cases in which permanent impacts appeared to not result in a loss of WOUS, the data were recorded in a separate category of "permanent impact, not loss of WOUS." Examples include outfall replacements within approximately the same footprint as an existing outfall, rip-rap installation, impacts associated with certain types of maintenance, and dredging. The Corps' ORM2 database only recently (in 2011) included a waters impact data field that specified "permanent impact, not a loss of WOUS." Regulatory actions prior to this time were flagged, then individually reviewed to determine if an associated impact belonged in this particular data category.

(d) Regulatory actions involving stream realignments were assumed to have resulted in permanent impact (loss of WOUS); an equal accompanying acreage of stream establishment was entered in the dataset to offset the loss resulting from the realignment, unless the record indicated differently (e.g., establishment of the same, less, or more waters in the new stream alignment.

(4) Recording Mitigation and Activities Increasing and/or Preserving WOUS:

(a) This study focused on compensatory mitigation required by special condition of DA authorizations, and other forms of "gain" in WOUS acreage within the study area (e.g., wetland re-establishment done under the authorization of NWP 27). It also acknowledges preservation (which does not result in a gain of WOUS acreage, however does afford more protection against future potential impacts) that was required in association with Regulatory actions[12]. A "gain" in WOUS involves establishment and/or re-establishment (i.e., restoration) of waters, most typically wetlands. In the higher-resolution dataset, mitigation also includes establishment/re-establishment and preservation of waters required by the USFWS as an outcome of Section 7 consultation under the ESA (a key distinction from the CLR dataset; see Section 6.b(3)(a). Compensatory mitigation requirements were recorded for each aquatic resource type category, or as "unknown" if file information failed to yield sufficient information regarding the type of waters involved in mitigation. Other types of mitigation not resulting in new acreage of WOUS were also recorded, as described below.

(b) If permanent impacts were identified for a Regulatory action, and file information indicated that compensatory mitigation was required, but

[12] Typically, preservation requirements associated with Regulatory actions include preservation acreage required by the USFWS as a condition of compliance with the ESA vis-à-vis Section 7 consultation. Another typical example of preservation requirements is permittee-responsible on-site preserves that include "avoided" waters and associated uplands (e.g., demarcated as an outlot, drainage corridor, etc. of a subdivision).

the acreage of the compensatory mitigation was unknown, the assumption was made that compensatory mitigation consisted of establishment of an in-kind aquatic resource type at a 1:1 ratio (e.g., if permanent impacts to 1 acre of wetlands was authorized, it was assumed that the compensatory mitigation requirement was for the establishment/re-establishment of 1 acre of wetlands). This assumption was not applied to UAs (finalized, or pending resolution), due to the less predictable nature of enforcement cases. If mitigation was not indicated in the database and/or Regulatory action for a UA, then its mitigation fields were left blank.

(c) Mitigation location was recorded relative to the UDA (inside UDA, outside UDA, or outside of study area). If the mitigation location could not be determined based on available information, it was recorded as "unknown."

(d) For Regulatory actions for which compensatory mitigation was required in the form of payment into an in-lieu fee program (ILF), the type of ILF was recorded as either "Wetland" or "Stream," based on file information. If the type of ILF mitigation was unknown based on file information, an assumption was made that the ILF payment was for in-kind mitigation (i.e., the same as the type of waters impacted). During the Regulatory permitting process, ILF requirements are often calculated by applying a ratio (determined on a project-specific basis) to an established cost-per-acre of resource type. For example, a project impacting 0.10-acre of wetlands may have been mitigated for at a 3:1 ratio, such that the required ILF fee was equivalent to purchasing 0.30-acre of wetlands. Due to historical challenges in determining the certainty, type and location of projects actually constructed using the ILF funds, the decision was made to conservatively document the amount of compensatory mitigation for projects that required payment into an ILF, as being equal to the acreage of authorized impact. Using the example above, the figure recorded for this study would have been 0.10-acre. It was also assumed that mitigation location for compensatory mitigation required through the payment into an ILF fund was best characterized as "unknown."

(e) For Regulatory actions in which the requirement of the DA authorization provided a choice that required compensatory mitigation be done in the form of *either* purchase of bank credits *or* payment into an ILF, when the outcome of that decision was unknown based on file information, the assumption was made that bank credits had been purchased. Consistent with Section 6.c(4)(c), mitigation location was recorded as "unknown."

(f) Other types of compensatory mitigation (e.g., enhancement) were recorded in an "other mitigation" category with associated acreage.

(g) Incorporation of mitigation required by the USFWS as a result of Section 7 ESA consultation (as noted above, this assessment was only made for this [higher-resolution] dataset, not for the CLR dataset), when:

(i) In general, if a Regulatory action had an associated Section 7 ESA BO, it was reviewed for potential mitigation requirements (specifically, involving aquatic habitats) that may either have overlapped with, or have been in addition to, Corps Regulatory-required mitigation. If a Regulatory action had an associated letter of concurrence (instead of a BO) as a result of a determination that the action was not likely to adversely affect Federally-listed threatened and/or endangered species, no further review was conducted (as an informal consultation letter of concurrence does not require compensatory mitigation).

(ii) If preservation was recorded as a mitigation requirement, this was often (but not always) in association with a USFWS Sec. 7 ESA consultation action. This study recognizes that USFWS-required preservation may address indirect as well as direct impacts to aquatic habitats for species. Our analysis did not commit resources to parsing out indirect vs. direct impacts as a basis for requiring preservation; the resulting outcome of preserved acres was determined to be the most relevant metric.

(iii) Mitigation for the federally-threatened giant garter snake (*Thamnophis gigas*) was considered when a Regulatory action contained a BO that required it. Wetland establishment was generally estimated to be one-third of the acreage requirement expressed in the project's BO (e.g., if the BO required 9 acres of giant garter snake habitat establishment, the recorded acreage of freshwater marsh establishment was 3 acres). This is based on the habitat ratios outlined in the *Programmatic Formal Consultation for U.S. Army Corps of Engineers 404 Permitted Projects with Relatively Small Effects on the Giant Garter Snake within Butte, Colusa, Glenn, Fresno, Merced, Sacramento, San Joaquin, Solano, Stanislaus, Sutter, and Yolo Counties, California*[13]. If the BO specified an aquatic acreage requirement that differed from the one-third estimate, the acreage required by the BO was entered into this data category.

(h) If a Regulatory action contained "as-built" drawings for compensatory mitigation, the acreage of WOUS reported on the as-builts was

[13] Sacramento Fish and Wildlife Office, USFWS, dated November 13, 1997, which requires that for every 1 acre of aquatic habitat established for giant garter snake, 2 acres of surrounding upland habitat for giant garter snake are also included.

recorded for mitigation, rather than the acreage required by the action's authorization. The as-builts were assumed to provide the most accurate record of compensatory mitigation, if available.

(i) All mitigation was assumed to have been completed and to be functioning successfully (e.g., constructed, or mitigation bank credits purchased). Resource limitations prevented confirming the compliance status of mitigation across the data set (see also Section 9 of this document).

(5) Treatment of mitigation sites including mitigation banks and permittee-responsible mitigation sites:

(a) Mitigation sites were individually reviewed to determine whether any on-site established/re-established aquatic resource acreage was documented as having been utilized as compensatory mitigation for other projects. If this was determined to be the case, all established/re-established aquatic resource acreage was removed from the mitigation site record in the database, unless that acreage was associated with a "self-mitigating" activity (i.e., an impact from the mitigation project itself, that was mitigated by the project's own establishment/re-establishment acreage). All other data categories were left unchanged. If a mitigation site had no acreage being utilized as compensatory mitigation for other projects, its record was left unchanged. Rationale for these decisions is as follows:

(i) A general analysis using the above-identified records in an unmodified state would result in "double-counting" establishment/re-establishment acreage alongside mitigation acreage that was reported for the projects "using" the establishment/re-establishment acreage for their own required compensatory mitigation. In a sense, these other projects "debit" acreage available at the mitigation sites.

(ii) Calculating the exact amount of "debited" and remaining acres for each mitigation site was beyond the scope of this study. A decision was made to conservatively estimate the overall mitigation acreage by removing all established/re-established acres from the records of mitigation sites *confirmed as* having been utilized (in full, or in part) as compensatory mitigation by other projects (excepting self-mitigating acreage, as described above).

(b) Unaltered records for all mitigation banks and permittee-responsible mitigation sites located within the study area have been placed in separate tables for review if needed.

(6) Treatment of linear projects: The dataset was scanned for linear projects (e.g., transportation projects), which were recognized to have the potential to span the study area boundary. Geometry and database information was reviewed for linear projects with permanent impacts of more than 0.5 acre. This resulted in confirming that no linear projects exceeding 0.5 acre of impacts were contained in the dataset. No further action was necessary given that confirmation.

(7) Treatment of Related Regulatory actions. In cases in which a Regulatory action became merged with another action, an attempt was made to not double-count associated information, by summarizing data from the merged actions as appropriate. An example of this scenario includes several unique Regulatory actions falling under a larger "Specific Plan Area" or other master planning area (e.g., Suncreek). In such cases, data were typically merged into one row/master project number, with annotations in the datasheet's "notes" field, as appropriate.

d. Decision Rules and Assumptions for the CLR Dataset:

As described in Section 6.b(3), data for this study are contained within two datasets, higher-resolution and CLR. The following section describes decision rules and assumptions for the CLR dataset, which exhibits the lower degree of resolution. Please see Section 6.c for decision rules and assumptions for the higher-resolution dataset.

(1) Excel table structure: As described in Section 6.c(1) for the higher-resolution dataset, in the CLR dataset, some Regulatory file numbers have multiple rows associated with them. Please refer to Section 6.c(1) for explanation.

(2) Recording Delineated Acres: For the CLR data set, delineated acres is a catch-all category, and is not broken into individual aquatic resource types (e.g., wetlands, streams) due to inconsistent data availability. Similar to the higher-resolution dataset, delineated acres of aquatic resources were only recorded if: (a) it was determined jurisdictional, AND (b) a Regulatory action on the site resulted in a permanent or temporary impact. Only one set of delineated acreage figures was recorded per Regulatory file. A separate catch-all aquatic resources category was created to record acreage of any features that were determined to be non-jurisdictional (e.g., isolated).

(3) Recording Impacts to WOUS:

(a) Permanent impacts were recorded in one catch-all category of waters.

(b) Temporary impacts to waters were not recorded as part of this analysis, since once restored, temporary impacts do not result in a loss of WOUS.

(c) Impacts to waters recorded as “permanent” in Regulatory actions were assumed to result in a loss of WOUS.

(d) Regulatory actions involving stream realignments were assumed to have resulted in a permanent impact (loss of WOUS); an equal accompanying acreage of stream establishment was entered in the dataset to offset the loss resulting from the realignment, unless the record indicated differently (e.g., establishment of the same, less, or more waters in the new stream alignment.

(4) Recording Mitigation and Activities Increasing and/or Preserving WOUS:

(a) This study focused on compensatory mitigation required by special condition of DA authorizations and other forms of “gain” in WOUS acreage within the study area. It also includes an acknowledgement of preservation (which does not result in a gain of WOUS acreage, however does afford more protection against future potential impacts) that was required in association with Regulatory actions. A “gain” in WOUS involves establishment and/or re-establishment of waters, most typically wetlands. For this dataset, compensatory mitigation requirements were recorded in catch-all waters categories for establishment/re-establishment or preservation types of mitigation. Other types of mitigation not resulting in new acreage of WOUS were also recorded, as described below.

(b) If permanent project impacts were known for a Regulatory action, and compensatory mitigation was obviously required, but the acreage of the compensatory mitigation was unknown, the assumption was made that compensatory mitigation consisted of establishment of an in-kind aquatic resource type at a 1:1 ratio (e.g., if permanent impacts to 1 acre of wetlands was authorized, it was assumed that the compensatory mitigation requirement was for the establishment/re-establishment of 1 acre of wetlands).

(c) The CLR dataset did not include the location of compensatory mitigation, thus no assumptions were made about mitigation location.

(d) Other types of compensatory mitigation (e.g., enhancement) were recorded in an “other mitigation” category, including associated acreage.

(e) As a combination of the higher-resolution and lower-resolution datasets, the CLR dataset is mixed in terms of documenting mitigation

required by the USFWS. Records associated with the higher-resolution dataset were reviewed for applicable USFWS-related mitigation. Records associated with the lower-resolution dataset (as described in Section 6.b[3][b]) were not reviewed for applicable USFWS-related mitigation. As a result of the mixture of both types of records in the CLR dataset, any query done for purposes of this study on that dataset would under represent USFWS-related mitigation.

(f) If a Regulatory action contained "as-built" drawings for compensatory mitigation, the acreage of WOUS reported on the as-builts was recorded for mitigation, rather than the mitigation acreage required by the action's authorization. The as-builts were assumed to provide the most accurate record of mitigation results, if available.

(g) All mitigation was assumed to have been completed and to be functioning successfully (e.g., constructed, or mitigation bank credits purchased). Resource limitations prevented confirming the compliance status of mitigation across the data set (see also Section 9 of this document).

(5) Treatment of mitigation sites including mitigation banks and permittee-responsible mitigation sites: Please see Section 6.c(5).

(6) Treatment of linear projects: Please see Section 6.c(6).

(7) Treatment of Related Regulatory actions: Please see Section 6.c(7).

7. Cumulative Impact Results: From the beginning of the Corps' record (1979) to 2013, 1627 Regulatory actions were reviewed for this analysis. After the initial data culling procedures described in Section 6.a, the number of actions eligible for inclusion in the study dropped to 1400. These actions are in turn related to 540 unique project numbers. The majority of these were permit actions. Other fairly common actions included pre-application, UAs, and mitigation bank development.

In accordance with the study's two datasets, higher-resolution and CLR, results are presented separately for each. Results for past and present projects are presented for each dataset (the CLR dataset serves as the most comprehensive summary; results are not additive between the two datasets). Results for reasonably foreseeable projects are presented in the format of just the CLR dataset (again, as the most complete summary). An acknowledgment of limited impacts and mitigation documented in the record using alternative quantifications (e.g., cubic yards, dollars) or types of activity (e.g., enhancement of WOUS) are also presented in the format of just the CLR dataset.

A summary of the types (e.g., NWPs) of past and present, and reasonably foreseeable Regulatory actions resulting in a loss of WOUS is provided just for the CLR dataset, since it is the most comprehensive of the two datasets.

a. Past and Present Projects - Higher-resolution Dataset:

(1) Summary of delineated acres: Delineated acres for past and present projects in the higher-resolution dataset includes approximately 1,190 acres of wetlands, 309 acres of streams, 124 acres of other types of waters, and 5 acres of "unknown" (total of 1627 acres) (**Table 3, Appendix B**).

(2) Summary of loss of WOUS: For past and present projects in the study area, the Corps has authorized the placement of fill material (resulting in permanent loss of WOUS) into approximately 218 acres of WOUS (**see Table 3**). This includes approximately 152 acres of wetlands, 46 acres of streams, 18 acres of other types of waters, and 2 acres of "unknown." Loss of WOUS in and out of the UDA is summarized in **Table 3**; approximately 89% (193 acres) of loss of WOUS as a result of Regulatory projects occurred within the UDA, and 11% (25 acres) of loss of WOUS occurred outside the UDA. As noted in the methods section, this analysis did not address temporary impacts that did not result in the loss of WOUS.

(3) Summary of Activities Increasing and/or Preserving WOUS for past and present projects: Information by aquatic resource types is summarized in **Table 3**.

(a) Acres of WOUS established/re-established ("gained" acreage): A total of 496 acres of WOUS (all types) were established/re-established, including: 97 acres inside the UDA, 275 acres outside of the UDA (but in the study area), 58 acres outside of the study area, and 66 acres in unknown locations. This represents all types of mitigation, including banks and other types of mitigation sites (see Section 6.c[5] and **Table 3**). The total of 496 acres of established/re-established WOUS associated with Regulatory projects is considered to be the most reliable minimum "gained" acreage of WOUS for purposes of this study, due to the consideration of double-counting discussed in Section 6.c(5).

Of establishment/re-establishment in known locations (430 acres; all types), 97 acres (22.6%) of WOUS were established/re-established within the UDA, and 333 acres (77.4%) of WOUS were established/re-established outside of the UDA either in, or out of the study area. Considering only wetlands (other types of waters are also shown on **Table 3**), of a total of 399 acres with known location information, 74 acres (18.7%) of wetlands were established/re-established within the UDA, and 324 acres (81.3%) of wetlands were established/re-established outside of the UDA, either in or out of the study area.

(b) Acres of WOUS preserved (no "gain"): A total of 422 acres of WOUS (all types) were preserved (219 acres in, and 130 acres outside of UDA) as a result of all types of mitigation, including banks (and other types of) mitigation sites (see Section 6.c[5]) (see **Table 3**). In addition to the 130 acres preserved outside of the UDA, another 21 acres were preserved outside of the study area, and 52 acres were preserved in unknown locations (based on the extent of file information; this includes the potential to be located outside of the study area). The total of 422 acres of preserved WOUS associated with Regulatory projects is considered to be the most reliable minimum preserved acreage of WOUS, due to the consideration of double-counting discussed in Section 6.c(5). Some additional insights into this data include:

Of WOUS preservation in known locations (370 acres; all types), 219 acres (59.3%) of WOUS were preserved in the UDA, and 151 acres (40.7%) of WOUS were preserved outside of the UDA and either in, or out of the study area. Considering only wetlands (other types of waters are also shown on **Table 3**), of a total of 315 acres with known location information, 172 acres (54.8%) of wetlands were preserved within the UDA, and 142 acres (45.2%) of wetlands were preserved outside of the UDA, either in or out of the study area.

(4) Net gain/loss of WOUS as a result of past and present projects within the study area associated with Regulatory projects[14]: Considering the above-described results, as summarized in **Table 3**, there has been approximately 218 acres of loss of (all types of) WOUS, and 496 acres of gain (establishment/re-establishment) of (all types of) WOUS. Therefore, there has been a net gain of approximately 278 acres of WOUS within the study area associated with past and present Regulatory projects (**Table 3**).

Specific to types of WOUS, wetlands exhibited a net gain of 313 acres, streams a net loss of 18 acres, other types of waters a net loss of 16 acres, and "unknown" types of waters, zero net loss. The data show a distinct pattern of net loss within the UDA, and in the case of wetlands, net gain outside of the UDA (both in and out of the study area). Within the UDA, there was a net loss of 59 acres of wetlands. Outside of the UDA (both in and out of the study area), there was a net gain of 307 acres of wetlands. Loss of streams and other types of waters within the UDA does not appear to be offset by gains in these types of waters outside of the UDA. Implications may include the relative difficulty of creating/restoring streams and other waters to offset permanent loss.

[14] Note: The net gain/loss assessment is limited to Regulatory actions, not a study-area wide analysis of baseline WOUS conditions (for example, based on remote sensing using National Wetland Inventory maps, and/or a series of historical aerial images. The assessment is limited in applicability to the Regulatory actions reviewed for this study. See also Section 8 of this document (Limitations).

b. Past and Present Projects - CLR Dataset

(1) Summary of delineated acres: Delineated acres for past and present projects in the CLR dataset includes approximately 2766 acres of WOUS (per Section 6.d[2][a], WOUS are not separated into aquatic resource types). Please see the CLR dataset results summary in **Table 4** (**Appendix B**).

(2) Summary of loss of WOUS: For past and present projects in the study area, the Corps has authorized the placement of fill material (resulting in permanent loss of WOUS) into approximately 772 acres of WOUS (all types; per Section 6.d[2], WOUS are not separated into aquatic resource types). Loss of WOUS within and outside of the UDA is summarized in **Table 4**; approximately 82.4% (636 acres) of loss of WOUS as a result of Regulatory projects occurred within the UDA, and 17.7% (137 acres) of loss occurred outside of the UDA. **Figure 3** (**Appendix A**) shows the "impact intensity" within the study area. This is a GIS-generated visualization, combining the geographic "density" of Regulatory projects and relative level of impact to WOUS associated with the projects.

Due the size of this study, and the fact that one project number may contain several Regulatory actions, it is not practicable to accurately report results in terms of the number of permits or other applicable actions. However, a summary of the types (e.g., NWPs) of past and present Regulatory actions, and the relative contribution of the type of Regulatory action to loss of WOUS, can be accurately described. For past and present projects, of the 772[15] acres of loss of the WOUS:

(a) SP actions resulted in 607 acres of loss of WOUS;

(b) Letter of Permission (LOP) actions resulted in 17 acres of loss of WOUS;

(c) NWP actions resulted in 147 acres of loss of WOUS;

(d) UA actions resulted in 2 acres of loss of WOUS.

Table 5 (**Appendix B**) summarizes some alternative quantifications of impacts to WOUS (e.g., reported in linear feet or cubic yards) associated with Regulatory projects. This information is provided for completeness as it was documented during review of Regulatory actions.

(3) Summary of Activities Increasing and/or Preserving WOUS for past and present projects:

[15] Due to rounding, the below acreages when added, total 773 acres; this is noted as a rounding issue, not a mathematical error.

(a) Acres of WOUS established/re-established ("gained" acreage): A total of 1,137 acres of WOUS (all types) were established/re-established as a result of all types of mitigation, including banks and other types of mitigation sites (see Section 6.d[4]). This is considered to be the most reliable minimum "gained" acreage of WOUS, due to the consideration of double-counting discussed in Section 6.c(5). Please note that as described in Section 6.d(4)(c), the CLR dataset did not include georeferencing of mitigation location, thus mitigation-related WOUS acreage gains are not described relative to being in/out of the UDA.

(b) Acres of WOUS preserved (no "gain"): A total of 996 acres of WOUS (all types) were preserved as a result of all types of mitigation, including banks and other types of mitigation sites (see Section 6.d[4]). This is considered to be the most reliable minimum preserved acreage of WOUS, due to the consideration of double-counting discussed in Section 6.d(5). Please note that as described above, the CLR dataset did not include georeferencing of mitigation location, thus mitigation-related WOUS acreage preservation is not described relative to being in/out of the UDA.

Table 5 summarizes some other forms of compensatory mitigation for impacts to WOUS associated with Regulatory projects. This information is provided for completeness as it was documented during review of Regulatory actions.

(4) Net gain/loss of WOUS as a result of past and present projects associated with Regulatory projects: Considering the above-described results, approximately 773 acres of loss of WOUS and 1,137 acres of gain (establishment/re-establishment; preserved acreage of waters does not contribute to gain, thus is not considered), there has been a net gain of approximately 365 acres of WOUS as a result of past and present Regulatory projects (**Table 4**). Geographic patterns associated with net gain/loss were not assessed for the CLR dataset (assessment was only conducted for loss, as noted above).

c. Reasonably Foreseeable Projects - CLR Dataset

(1) Preliminary review was conducted for approximately 44 projects obtained from the ORM2 database as potentially reasonably foreseeable projects. As a result of the review, 36 projects were determined to indeed be reasonably foreseeable. The remaining 8 projects were determined to be too speculative, not meeting one or more of the parameters for reasonably foreseeable projects summarized in Section 5.b; these 8 projects were thus determined not to be reasonably foreseeable.

(2) Summary of loss of WOUS: The results of reviewing the reasonably foreseeable projects are presented in **Table 6** (**Appendix B**). If all of the reasonably foreseeable projects are implemented, available file information

indicates that there would be a loss of up to 349 acres of WOUS (all types), consisting of 193 acres (55%) inside the UDA, and 156 acres (45%) outside the UDA.

Due the size of this study, and the fact that one project number may contain several Regulatory actions, it is not practicable to accurately report results in terms of the number of permits or other applicable actions. However, a summary of the types (e.g., NWPs) of reasonably foreseeable Regulatory actions, and the relative contribution of the type of Regulatory action to loss of WOUS, can be accurately described. For reasonably foreseeable projects, of the up to 349 acres of projected loss of the WOUS:

(a) SP actions, if all projects are implemented, would result in up to 203 acres of loss of WOUS;

(b) Pre-application actions, if all projects are implemented, would result in up to 128 acres of loss of WOUS;

(c) UA actions, if resolved with the documented loss of WOUS available in the project records, would be confirmed as resulting in up to 17 acres of loss of WOUS.

(3) Summary of "gain" and preservation of WOUS: Available file information indicates that to offset the loss of WOUS described above, 398 acres of WOUS (all types) would be established/re-established, and 248 acres of WOUS (all types) would be preserved (**Table 6**).

(4) Net gain/loss of WOUS attributable to reasonably foreseeable Regulatory projects: As shown in **Table 6**, available file information indicates that there would be 47 acres of net gain of WOUS (all types) if all 36 reasonably foreseeable projects were implemented. Geographic patterns associated with net gain/loss were not assessed for the CLR dataset (assessment was only conducted for loss, as noted above).

(5) There were 18 reasonably foreseeable projects with at least 1 acre of projected[16] loss of waters (range = 1 to 128 acres; average = 22 acres, median = 10 acres), as summarized in **Table 7** (**Appendix B**). If all 18 of these reasonably foreseeable projects are implemented in the future, approximately 350 acres of WOUS may be permanently lost.

(6) In addition to available file information that was reviewed in order to project anticipated "gain" and preservation of WOUS associated with reasonably foreseeable projects, an assumption is made that based on the requirements of mitigation-related regulations found in 33 CFR 332, and the EPA's Section 404(b)(1) Guidelines (40 CFR 230), future projects authorized by the Corps would require avoidance and minimization of

[16] Based on current design; future modifications of project design could alter impact estimates.

WOUS to the maximum extent practicable. For unavoidable discharges of fill material into WOUS, it is expected that compensatory mitigation for the loss of the functions of WOUS within the study area would be required. Commensurate with guidance found in the Corps' mitigation regulations, the required mitigation ratio would generally be at least 1:1.

(7) In addition to the projects already known and reviewed for this study, the Regulatory Program receives permit applications for projects (of various sizes) without having any prior knowledge regarding the project's planning. Thus, it is anticipated that an as-of-yet unknown variety of actions (e.g., residential, commercial and infrastructure) will be proposed in the future within the study area, resulting in additional impacts to WOUS that have not been projected as part of this study.

8. Limitations of this Cumulative Impact Analysis: This study was conducted to estimate the "loss of WOUS" in the study area resulting from Regulatory actions in the past, present and reasonably foreseeable future. The following limitations apply to this study:

a. This analysis covers actions identified within the Corps' database, and does not include impacts that occurred without a permit (or associated investigation of a potential unauthorized activity), or other activities that occurred within the knowledge of the Corps', impacts that occurred as a result of exempt activities in accordance with 33 CFR 323.4 (i.e. normal farming practices), impacts that occurred prior to the enactment of the Clean Water Act, or impacts that occurred after the passage of the Clean Water Act, but before information was documented in the Corps' database (see Section 5.b).

b. The data set for this analysis was queried in January 2013. As such, it represents a recent "snapshot" of past and present actions, but would not account for every project that was authorized from 2013 to present, particularly if the action was a new (i.e., 2013 or 2014) action rather than a pending action present in our database when the query was completed in 2013.

c. To the best of our knowledge, reasonably foreseeable projects that meet the inclusion criteria for the CIA have been included in this analysis. The Regulatory Program conducts pre-application meetings and receives new permit applications on nearly a weekly basis, therefore there will inevitably be certain projects that are "in the pipeline" that are not included within this study.

d. This analysis did not take into account relative functions or services of either lost or mitigation WOUS, only acreages. Nor did it take into account potential adverse impacts to functions/services of waters that were temporarily impacted or otherwise not "lost." Related, due to limitations in wetland nomenclature (see Sections 6.c[2][a] and 6.d[2]), impact/mitigation distinctions were not made between seasonal wetlands and "vernal pool" types of seasonal wetlands. Although non-vernal pool seasonal wetlands often provide potential habitat for

vernal pool plant and animal species, not all seasonal wetlands provide these habitats.

e. This analysis assumes that compensatory mitigation has been completed and is successfully functioning, inclusive of mitigation banks from which credits have been purchased, mitigation by purchase of ILF credits, and/or permittee-responsible mitigation. The breadth of this analysis did not offer the ability to confirm mitigation compliance status on a case-by-case basis. However, part of the Corps' Regulatory Program involves mitigation compliance, and it is known that at any given time, there are projects that have been authorized whose associated mitigation has not yet met full compliance. See also Sections 6.c(4)(i) and 6.d(4)(g).

f. This analysis only looks at Corps Regulatory projects, and only evaluates cumulative impacts to WOUS. It does not evaluate any other factors (e.g. air quality, traffic, etc) which may have cumulative impacts, nor does it take into consideration the actions of other agencies.

g. Since this analysis looks only at Corps Regulatory projects (i.e., not inclusive of Corps Civil Works projects), involving an extensive effort due to the study area's size and level of activity in the Sacramento area, it does not include a full baseline assessment of inventoried waters, for example, the USFWS's National Wetland Inventory (NWI) (www.http://www.fws.gov/wetlands/) and/or the (regionally-based) Six County Aquatic Resources Inventory (SCARI) (www.http://mapping.sacog.org/scari/). The Corps assumes that future users of this analysis can incorporate a remote sensing baseline inventory and draw relevant comparisons.

APPENDIX B

TABLES

Table 1: Higher-Resolution Dataset Data Categories

Category (As Termed in Database)	Description
DA Number	Dept. of the Army File number associated with action
Past and Present or Reasonably Foreseeable	Appropriate time category for action
Action Status - Finalized, Pending or Withdrawn	Status of action in Regulatory Program
Permit or Action Type	Type of action, e.g., NWP, LOP
Project Name	Project name that is associated with the action
Isolated or Non-Jurisdictional Waters Present (Y/N)	Y/N on isolated or other non-jurisdictional waters associated with the action (all water types)
Isolated or Non-Jurisdictional Waters Total Acres	If isolated or other non-jurisdictional waters present, the acreage
Delineated Acres Stream Linear	Acreage of delineated stream features, including ditches
Delineated Acres Wetland	Acreage of delineated wetlands (including vernal pools)
Delineated Acres Other	Acreage of delineated other types of waters, including but not limited to ponds
Delineated Acres Unknown Resource (Water) Type	Acreage of delineated waters of an unknown type
Permanent Impact Not a Loss Present (Y/N)	Y/N if action involved a permanent impact that did not result in a loss of WOUS
Permanent Impact Not a Loss Total Acres	If a permanent impact did not result in a loss of WOUS, the impact acreage was reported here (all water types)
Loss Acres Stream Linear	Acreage of loss of stream (including ditches) types of WOUS
Loss Acres Wetland	Acreage of loss of wetland types of WOUS
Loss Acres Other	Acreage of loss of other types of WOUS
Loss Acres Unknown Resource Type	Acreage of loss of unknown types of WOUS
ILF Compensation Acres Stream Linear	Acreage of ILF compensation in the form of stream types of WOUS
ILF Compensation Acres Wetland	Acreage of ILF compensation in the form of wetland types of WOUS
Creation Mitigation Acres Stream Linear	Acreage of establishment (creation) and/or re-establishment (restoration) of stream types of WOUS
Creation Mitigation Acres Wetland	Acreage of establishment (creation) and/or re-establishment (restoration) of wetland types of WOUS
Creation Mitigation Acres Other	Acreage of establishment (creation) and/or re-establishment (restoration) of other types of WOUS
Creation Mitigation Acres Unknown Resource (Water) Type	Acreage of establishment (creation) and/or re-establishment (restoration) of unknown types of WOUS
Creation Relative to UDA (In/Out/Unknown)	Acreage of establishment (creation) and/or re-establishment (restoration) in/out/unknown location relative to UDA

Table 1: Higher-Resolution Dataset Data Categories

Category (As Termed in Database)	Description
Preservation Mitigation Acres Stream Linear	Acreage of preservation of stream types of WOUS
Preservation Mitigation Acres Wetland	Acreage of preservation of wetland types of WOUS
Preservation Mitigation Acres Other	Acreage of preservation of other types of WOUS
Preservation Mitigation Acres Unknown Resource Type	Acreage of preservation of unknown types of WOUS
Preservation Relative to UDA (In/Out/Unknown)	Acreage of preservation in/out/unknown location relative to UDA
Specifics for Mitigation Not in Other Categories	Notes field for mitigation not in other categories

Table 2: Complete Lower-Resolution (CLR) Dataset Data Categories

Category (As Termed in Database)	Description
DA Number	Dept. of the Army File number associated with action
Past and Present or Reasonably Foreseeable	Appropriate time category for action
Action Status - Finalized, Pending or Withdrawn	Status of action in Regulatory Program
Permit or Action Type	Type of action, e.g., NWP, LOP
Project Name	Project name that is associated with the action
Isolated or Non-Jurisdictional Waters Present (Y/N)	Y/N on isolated or other non-jurisdictional waters associated with the action (all water types)
Isolated or Non-Jurisdictional Waters Total Acres	If isolated or other non-jurisdictional waters present, acreage (all water types)
Delineated Acres WOUS	Acreage of delineated WOUS (all water types)
Permanent Impact Not a Loss Present (Y/N)	Y/N if action involved a permanent impact that did not result in a loss of WOUS
Permanent Impact Not a Loss Total Acres	If a permanent impact did not result in a loss of WOUS, the impact acreage was reported here (all water types)
Loss Acres WOUS	Acreage of loss of WOUS (all types)
Creation Mitigation Acres WOUS	Acreage of establishment (creation) and/or re-establishment (restoration) of WOUS (all water types)
Preservation Mitigation Acres WOUS	Acreage of preservation of WOUS (all water types)
Specifics for Mitigation Not in Other Categories	Notes field for mitigation not in other categories
Alternative Impact Quantifications	Recorded alternative impact quantifications (e.g., reporting in cubic yards instead of acreage)

Table 3: Higher-Resolution Dataset Results Summary (Past and Present Projects)

Data Category	Type of Water				
	Wetlands	Streams (Acres)	Other Types of Waters	Unknown (UK)	Total: All Water Types
Delineated Acres					
In UDA:	405.38	153.46	64.02	0.10	622.95
Out UDA:	783.51	155.38	60.28	4.50	1003.68
Total:	1188.89	308.84	124.30	4.60	1626.63
Acres of Loss					
In UDA:	133.74	41.16	18.26	0.01	193.16
Out UDA:	17.98	4.89	0.01	1.80	24.68
Total:	151.72	46.05	18.27	1.81	217.84
Acres of Impact (Not a Loss)					
In UDA:	N/A	N/A	N/A	N/A	0.96

In UDA:	74.66	20.21	2.17	0.00	97.04
Out UDA:	272.04	1.37	0.00	1.80	275.21
Out of Study Area:	52.51	5.20	0.10	0.00	57.80
Location Unknown:	65.08	1.13	0.00	0.00	66.21
Total:	464.28	27.91	2.27	1.80	496.26
Mitigation					
Acres Preservation					
In UDA:	172.40	38.85	8.06	0.00	219.30
Out UDA:	121.44	3.34	4.89	0.00	129.67
Out of Study Area:	20.90	0.00	0.00	0.00	20.90
Location Unknown:	52.33	0.00	0.00	0.00	52.33
Total:	367.08	42.19	12.95	0.00	422.21
Acres ILF Mitigation					
Total:	7.64	0.27	0.00	0.00	7.91
Acres Net Gain/Loss					
In UDA:	-59.08	-20.95	-16.09	-0.01	-96.12
Out UDA (In Study Area):	254.06	-3.52	-0.01	0.00	250.53
Out UDA (In + Out of Study Area):	306.57	1.68	0.09	0.00	308.34
***Total (All Locations):**	320.21	-17.86	-16.01	-0.01	286.33

*** These figures are not location-dependent. "Total" equals all restoration/creation whether location is known or unknown, plus ILF mitigation, minus all loss whether in or out of the UDA.**

Table 4: Complete Lower-Resolution (CLR) Dataset Results Summary (Past and Present Projects)

Data Category	All Types of Waters (ac)
Delineated Acres	
In UDA:	1396.93
Out UDA:	1368.92
Total:	2765.85
Acres of Loss	
In UDA:	635.83
Out UDA:	136.66
Total:	772.49
Acres of Impact (Not a Loss)	
In UDA:	0.97
Out UDA:	7.13
Total :	8.10
Acres Loss Isolated/Non-Jurisdictional Waters	
In UDA:	75.27
Out UDA:	0.96
Total:	76.23
Mitigation	
Total Acres Restoration/Creation:	1137.22
Total Acres Preservation:	996.00
Acres Net Gain (Total acres Restoration/Creation) - (Total acres loss jurisdictional waters):	364.73

Table 5: Complete Lower-Resolution (CLR) Dataset Alternative Impact Quantifications and "Other" Types of Mitigation (Past and Present Projects)

Alternative Impact Quantifications*		
Amount	**Unit**	**Type**
6000	Linear Feet	Dredge/Excavation in Stream
1940	Linear Feet	Impact Not Loss (Rip-Rap/Bulkhead) to Stream
2652	Cubic Yards	Dredge/Excavation in Stream
915	Cubic Yards	Fill in Stream
55,000	Cubic Yards	Fill in Unknown Water Type
997	Tons	Rip-Rap in Stream
"Other" Types of Mitigation Quantifications*		
Amount	**Unit**	**Type**
$2,100	U.S. Dollars	Stone Lakes Wildlife Fund for GGS Habitat Creation
2.248	**	Fund for Creating Wetland
0.834	**	Fund for Preserving Wetland
0.387	**	Credits OR Fund for Creating Wetland
0.592	**	Credits OR Fund for Preserving Wetland
1.321	Acres	Rehabilitate Wetland Out of UDA
1.113	Acres	Rehabilitate Stream Out of UDA
4.74	Acres	Enhance Wetland In UDA
430.65	Acres	Enhance Wetland Out UDA
0.473	Acres	Enhance Stream In UDA
16.91	Acres	Enhance Stream Out UDA
2.708	Acres	Riparian Habitat Out UDA
1.38	Acres	Splittail Shallow Water Habitat Out of UDA

* Each row is a separate and distinct impact, unrelated to any other row.

** Unit is assumed to be representative of acres mitigation.

Table 6: Reasonably Foreseeable Projects Summary (Complete Lower-Resolution [CLR] Dataset)

Data Category	All Types of Waters (ac)
Estimated Acres Loss of WOUS	
In UDA:	192.96
Out UDA:	155.63
Total:	348.59
Proposed Mitigation	
Total Acres Restoration/Creation:	395.32
Total Acres Preservation:	255.04
Acres Net Gain:	46.73

Table 7: Reasonably Foreseeable Projects with Projected Loss of At Least One Acre

Project Name	Estimated Impacts (Loss) - Waters of the U.S. (ac)
Capital Southeast Connector	127.60
Mather Specific Plan (Multiple Projects)	48.28
Cordova Hills	39.63
Arboretum	30.13
Excelsior Estates	28.77
Suncreek EIS	19.13
The Ranch at Sunridge	10.48
Stoneridge Quarry	10.42
Calosso Property - UA	10.29
Teichert - Aspen VIII & IX	4.95
East Sacramento Ranch	4.48
Clay Station Properties, LLC - UA	4.00
Vineyard Investors Associates - UA	3.33
Teichert Aggregates Quarry	3.15
Douglas Jaeger Widening	1.51
Emerald Estates	1.06
Total:	**347.22**

199000244		Finalized	NWP 26	HACKARD-MULLANEY LAND INVESTMENTS	Same as Shadowbrook (1999-110, 2003-105). Delineation for all of these is included here only.			0.42	0.57					0.42	0.32					0.42	0.47			IN						
199000244		Finalized	NWP 26 Inclusion	HACKARD-MULLANEY LAND INVESTMENTS	Row for addl off site mit.			0	0	0	0										0.4			UK						
199900060		Finalized	LOP	FRANKLIN BLVD/THORNTON RD BRIDGE REPLACE	Approx half of project is in study area. Affects wetlands. Mokolumne, south side of study area. 0.74 "riparian habitat" credits and 1.38 shallow water hab credits for splittail both OUT STUDY AREA.			2.23	1.27					0.22	0.34															0.74 "riparian habitat" credits and 1.38 "shallow water habitat" credits for splittail both OUT STUDY AREA
199900069		Finalized	NWP 26	REMINGTON ESTATES	Records Holding 1037120. There is a BO.			0.75	0.13					0.75	0.13						0.75			UK						
199900069		Finalized	NWP 26 Inclusion	REMINGTON ESTATES	Row for FWS reqd mit			0	0	0	0										0.13			UK		0.26			UK	
199900110		Finalized	NWP 26	SHADOWBROOK SUBDIVISION	See 199000244. This is the same project, delineated acres are included in 199000244, not here. FWS mitigation was the only mitigation. All contents of this file have been transferred to 200700602.			0	0	0	0				0.257						0.257			OUT		0.514			IN	
199900110		Finalized	NWP 26 Inclusion	SHADOWBROOK SUBDIVISION	Row for GGS amendment (33% used). Fund.			0	0	0	0																			0.09 (Create wet) GGS FUND
199900118		Finalized	NWP 26	HARRIS RANCH	This project is the same as 1999-00312. Data is recorded here, but 99-00312 is likely the current file number (all it contains is a modification). There is an indication that applicant wanted to put remainder of wetland on-site into a preserve, but there is no record of vehicle to do so, therefore no on-site preservation was recorded here. Records Holding 1037122				13.33						0.96						0.63			OUT						
199900118		Finalized	NWP 26 Inclusion	HARRIS RANCH	Row for FWS reqd mit			0	0	0	0										0.33			OUT		1.82			OUT	
199900195		Finalized	PREAPPCONS	COSUMNES CORRECTIONAL FACILITY FENCE	No action in record.			0	0	0	0																			
199900200		Finalized	NWP 14	MATHER SANITARY SEWER SYSTEM REHAB	No physical records. Sec 7 consult was initiated, for 0.06 permanent and 4.6 indirect, to (wet). No response or further info in record. Conservative estimate of FWS reqd mit was logged, but is actually uk.				4.66						0.06															
199900200		Finalized	NWP 14 Inclusion	MATHER SANITARY SEWER SYSTEM REHAB	Row for assumed 1:1, 2:1 FWS reqd mit.			0	0	0	0										0.06			UK		0.12			UK	
199900212		Finalized	NWP 12	LAGUNA CREEK WATERLINE CROSSING - AKT	Temp impacts only.			0.3																						
199900299		Finalized	SP	GRANT LINE ROAD/SR 99 INTERCHANGE IMPROV	See 200701064. Impact and delineation info is confusing. Best estimates made from conflicting sources.			0.073	1.547					0.073	1.3512					0.09	2.54			OUT STUDY AREA						
199900299		Finalized	SP Inclusion	GRANT LINE ROAD/SR 99 INTERCHANGE IMPROV	Row for FWS reqd mit.			0	0	0	0										0.89			UK		1.78			UK	
199900299		Finalized	SP PERMITMOD	GRANT LINE ROAD/SR 99 INTERCHANGE IMPROV	Delineated a combo of temp and permanent impacts.			0.046						0.033							0.04			OUT STUDY AREA						
199900312		Finalized	NWP 26	HARRIS RANCH	Same project as 1999-00118. Data is recorded there, though this number is likely the current file number. Records Holding 1037128			0	0	0	0																			
199900412		Finalized	NWP 26, 7	BOND ROAD FAMILY FITNESS CENTER OUTFALL	Records Holding 1037130. FWS mit is only mit. 0.04 perm imp (wet) not a loss.				0.04			Y	0.04								0.01			UK		0.02			UK	
199900412		Finalized	NWP 26, 7 Inclusion	BOND ROAD FAMILY FITNESS CENTER OUTFALL	Row for GGS mit (33.3% used), but was to be paid into PRES fund.			0	0	0	0																			0.03 (Preserve Wet) paid into GGS FUND
199900436		Finalized	NWP 7	LIVE OAK NORTH DRAINAGE IMPROVEMENT	Records Holding 1037132			0.94						0.94						1.01				IN						
199900437		Finalized	NWP 26	SUMMERGATE PROPERTY NWP 26 REQUEST	Records Holding 1037132. FWS mit was only mit.				0.31						0.31						0.31			UK		0.62			UK	
199900439		Finalized	NWP 26	OAK BROOK APARTMENT COMPLEX-SPANOS,FOLSO	Delineation is estimated, from impacts.				0.02						0.02															
199900449		Finalized	UNAUTHACT	HOBDAY ROAD AND WOODS ROAD HOUSE CONSTRU	No Further action. Records Holding 1037132				4.242						0.112															
199900459		Finalized	NWP 26	RIO CONSUMES CORRECTIONAL PERIMETER	Records Holding 1037133. FWS mit was only mit reqd.				0.72						0.26						0.046			UK		0.092			UK

0		Finalized	SP	BORDEN RANCH (MISC)	See 1995-00428.			0			0	0	0		
190107036		Finalized	SP	R J SYSTEMS	Permit Expired, no work performed.			0			0	0	0		
190109312		Finalized	SP	MJ BROCK & SONS	Permit type is actually unknown, but judging from reqd creation, we are assuming it was an SP. 55,000cy fill.			11.7				2.6			55,000 cy fill
190109596		Finalized	SP	LAGUNA SOUTH CANAL/H.C. ELLIOT, INC.	Delineated taken from impact.			0.17			0.17	1			
190110021		Finalized	SP	ANATOLIA PHASES I - III				85.52			44.22	46.5	44		
190110079		Finalized	SP	DIXON, JIM				10.4			10.4	10.5			
190110119		Finalized	SP	NORTHEAST AREA - GALT PROJECT - SPINK				8.5			8.5	27.1			
190110156		Withdrawn	SP	SAC-YOLO MOSQUITO DIST.				0			0	0	0		
190110159		Finalized	SP	FALLBROOK	Delineated UK, used impact figure.			6.67			6.67	6.7			
191200302		Finalized	NWP	CHETCUTI, JEROME	No records.			0			0	0	0		
198800077		Finalized	NWP 26	QUAIL RANCH ESTATES - N26-262	Unable to locate records.			0			0	0	0		
198900050		Finalized	NWP 26	NEWTON SUBDIVISION	Delineated acres 1.05, no impact info found, but two NWP 26s. Mitigation UK. Should we consider all delineated impacted?			1.05			1.05				
198900074		Finalized	SP	TEICHERT ASPEN VI MINING PROJECT	Note: 65 acres of creation mitigation was required for this project and 1989-00076, but it appears only 25 acres is successful at this point. This is the figure that has been logged.			42.88			42.88	25			
198900076		Finalized	SP	GRANITE I MINING PROJECT	Mitigation acres are part of 1989-00074			16.16			16.16				
198900090		Finalized	SP	ELLIOTT RANCH	See 1998-00645. That project is a modification to this SP. Delineated acres are only recorded here. Addl 39.4 acre lake, probably considered non-jd, since it was not mentioned as a resource in permit. Include?	Y	39.4	93.2			66.2	113.04	24		
198900134		Finalized	NWP 26	POWERS HOUSE	Records Holding 0957928.			8.19			4.11	10.57	4.08		
198900179		Finalized	SP	FIRST BAPTIST CHURCH LAGUNA & WHITEHOUSE				2.662			0.59	0.59			
198900209		Finalized	NWP 26	LAGUNA CREEK RANCH UNIT 4				10.67			2.83	5.66	7.84		
198900230		Finalized	RGP	PRIVATE DOCK	Location incorrectly mapped. Actually in Sac River, mile 39.7, outside study area.			0			0	0	0		
198900253				CLAY STATION	No records. Maybe under a different number?			0			0	0	0		
198900284		Finalized	NWP	SHALAKO GOLF & COUNTRY CLUB	No Records except that it was a NWP (orm)			0			0	0	0		
199000001		Finalized	NWP 26	CALVINE MEADOWS PROJECT				2.4			0.89	2.2			
199000027		Finalized	NWP 26	N. FORK BADGER CREEK FILL	Only info is permitted for <1 acre. Delineated estimated from impact.			1			1				
199000126		Finalized	SP	CHURCHILL DOWNS				27.34			17.45	23.92	17.45		
199000152		Finalized	NWP 14	EAGLES NEST ROAD BRIDGE REPLACEMENT	See 1993-00152. Same project. Data is logged there.			0			0	0	0		
199000155		Finalized	SP	ELK GROVE BLVD EXTENSION	Delineated acres contained in 1989-00090. There are multiple permits associated with this project in ORM, though the record seems to indicate only one SP.			0			3	6

199300152		Finalized	NWP 14	EAGLES NEST ROAD BRIDGE - LAGUNA CREEK	Same as 1990-00152 (newly added). Data is only logged here. Only data is 70 cy area impacted: 45 cy is perm excavation (imp not a loss?), 25 cy is backfilled (temp). Unable to determine delineated from info.			0	Y		0	0	0		
199300191		Finalized	NWP 3, 33	CALVINE ROAD BRIDGE REPLACEMENT, SAC CO	Temp impacts only.			0.013							
199300197		Finalized	NWP 12	SHELDON PASSAGE/WHITEHOUSE CR/UTILITY L	See 1991-00272. Additional work on Sheldon Passage Subdivision. Buried Utility lines, no perm impacts, no mit.			0			0	0	0		
199300239		Finalized	NPR	CARSON ENERGY SITE - NPR				0			0	0	0		
199300246		Finalized	NPR	ELDER CREEK WIDENING/FRENCH ROAD ESTATES				0			0	0	0		
199300283		Finalized	NWP 26	SMUD BIGHORN SUBSTATION -LAGUNA SPGS #3				0.007			0.007				
199300334		Finalized	NWP 14, 26	COSUMNES RIVER BLVD/CALVINE INTERCHANGE				2.24			2.24	2.24	0		
199300366		Finalized	NWP 26	RANCHO SECO/CALIFORNIA MUNI GOLF	Appears project not built, but mitigation was built. Delin 199.48 wous, (now within SMUD mit bank 2007-02104). Intended impacts 4.28 acres, intended mit 6.9 creation, actual creation was 3.4 acres. Did not log impacts and delineated acres in this case. Records Holding 0960602, 2 vols, 05 MIT box 1006897.							3.4			
199300367		Finalized	NWP 13	RD 2110, MCCORMACK-WILLIAMSON TRACT	498 linear feet revetment = 0.047 perm impact not loss. Partial OUT. 19 sites, 4 of which are in Mokolumne. Impacts calculated from one cy per linear ft, minus four of the 19 sites. Delineated is from impacts.			0.047	Y	0.047					
199300372		Finalized	NWP 26	SILVER SPRINGS SUBDIVISION	See 1999-00712, and 2005-00325. This project mandated Lot P (10.72 acres wetlands) be used as preserve site in perpetuity. However, Lot P was later proposed to be filled, and AKT 184 (2000-00780) used in it's place for mitigation, with an addl 10.72 acres created wetlands. The proposed fill of Lot P is still pending, so only foreseeable impacts should be used.			12.39			0.83	0.83

1 INTRODUCTION

This scoping summary report reviews the additional public scoping effort conducted in 2013 for the South Sacramento Habitat Conservation Plan (SSHCP) (Plan) environmental impact statement (EIS) and environmental impact report (EIR). Public scoping processes occurred twice: once in 2008 and once in 2013. In 2013, the draft SSHCP had been further refined, some conditions had changed, and sufficient time had elapsed that the applicants felt that a second scoping process was warranted. The 2013 scoping was primarily directed to stakeholders that had not been approached during the 2008 scoping process.

Lead agencies must solicit appropriate information from the public and must make a diligent effort to involve the public in their NEPA and CEQA processes. An early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action is required by the Council on Environmental Quality (CEQ) regulations and the Department of Interior regulations for implementing the National Environmental Policy Act (NEPA), as well as the California Environmental Quality Act (CEQA) Statues and Guidelines for preparation of an EIR. The process of public and inter-agency scoping is an integral part of the environmental review process. Scoping includes refining the proposed action and identifying all reasonable alternatives, identifying preliminary issues deserving of study, deemphasizing insignificant issues to narrow the scope of the environmental document, and identifying interested and affected persons. The results of the scoping process are used by lead agencies to determine the "scope" of their environmental document. The "scope" of an environmental document consists of the range of actions, alternatives, environmental effects, and mitigation measures to be considered and analyzed in the document.

The United States Fish and Wildlife Service (USFWS) (for the National Environmental Policy Act [NEPA]) and Sacramento County (for CEQA) are the lead agencies for preparation of this EIS/EIR. In addition, the U.S. Army Corps of Engineers (USACE), the US Environmental Protection Agency (USEPA), and the California Department of Fish and Wildlife (CDFW) will act as cooperating agencies under NEPA due to the nexus between the SSHCP and other federal and state environmental-permits required to implement the SSHCP. For the preparation of this EIS/EIR, the document must be in compliance with NEPA as amended, the NEPA regulations, and all other applicable federal laws, executive orders, regulations, and direction, and the EIS/EIR must be in compliance with the CEQA statute and guidelines and all other applicable state laws and regulations.

1.1 PUBLIC AND AGENCY INVOLVEMENT

1.1.1 Public Notices – Scoping

The 2013 public scoping began on October 28, 2013 with a Notice of Preparation (NOP) provided to the California State Clearinghouse (pursuant to CEQA) and on November 4, 2013 with the publication of a Notice of Intent (NOI) in the *Federal Register* (pursuant to NEPA). These documents are provided in Appendix A.

The NOP was distributed to state agencies on October 28, 2013 through the California State Clearinghouse and posted on the Clearinghouse website (http://www.derasearch.saccounty.net/portals/0/docs/EnvDocs_Notices/20030637020131028083136.pdf). The NOP was also posted on a project website developed by the County specifically for the SSHCP (http://www.per.saccounty.net/PlansandProjectsIn-Progress/Pages/SSHCPPlan.aspx). The NOP was sent to 60 recipients via US Postal Service and on November 12, 2013, Sacramento County staff sent an email to 178 recipients providing a link to the NOI and NOP and information about the scoping meetings. The announcements and their distribution are included in Appendix A.

The NOI was published in the federal register and was available on the website starting on October 28, 2013 (https://www.federalregister.gov/public-inspection).A news release prepared by the USFWS announcing the NOI and scoping meeting was sent by the USFWS Sacramento Regional Office, via e-mail to 153 recipients in and around Sacramento County on November 4, 2013. . Beginning on November 3, 2013, the NOI and News Release was also available for review on the USFWS's website at http://www.fws.gov/sacramento/. The announcements and their distribution are included in Appendix A.

The NOI and NOP provided the public information on the proposed SSHCP, notified the public of the intent to prepare the EIS/EIR, and provided details on how to participate in public scoping meetings to be held on November 20 and 21st, 2013. Both the NOI and NOP included a project description and a list of the covered species; the NOP also included a map of the plan area. The NOI informed the public that written comments would be accepted for 45 days after the start of the scoping period, or until December 19, 2013, while the NOP stated comments would be accepted for 30 days after the start of the scoping period, or until December 13, 2013.

Both the NOI and NOP identified various mechanisms to provide input during the scoping process including the two scoping meetings, Sacramento County email, USFWS facsimile, and mailing addresses for USFWS and the County.

1.1.2 Media Coverage

Although information was provided to media outlets, no articles concerning the project and habitat conservation issues in the Plan Area were published as a result of the 2013 NOI or NOP.

1.1.3 Public Scoping Meetings

The first 2013 public scoping meeting was held on Wednesday, November 20, from 6:30 p.m. to 8:30 p.m., at the Anthony Pescetti Community Room, Galt Police Facility, 455 Industrial Drive, Galt, CA 95632. Thirteen participants signed in for the Galt meeting. The meeting included an open house prior to and following the presentation of the proposed action, a summary of the NEPA process, and receipt of oral and written comments from the public.

The second 2013 scoping meeting was held on Thursday November 21, from 2:00 p.m. to 4:00 p.m., at the Governor's Office of Planning and Research, Large Conference Room 202, 2nd Floor, 1400 Tenth Street, Sacramento, California, 95814. Sixteen participants signed in for the Sacramento meeting. The meeting included an open house prior to and following the presentation of the proposed action, a summary of the NEPA process, and receipt of oral and written comments from the public.

Only one individual or group submitted a written comment during the two scoping meetings. All verbal and written scoping comments received from the agencies and the general public are provided in Appendix A and are summarized in Table 1 below.

1.1.4 Collaboration and Consultation with Tribes

The County coordinated with the Native American Heritage Commission to compile a list of individuals and organizations that may have knowledge of heritage lands or other resources of interest that the project could potentially affect. The NOP was sent to the State Clearing House and the Native American Heritage Commission was one of the reviewing agencies. The County also mailed the NOP to the Buena Vista Rancheria. The USFWS Sacramento Regional Office emailed the news release regarding the NOI and scoping

meetings to Rhonda Morningstar Pope (Tribal Chairwoman) and Roselynn Lwenya (Environmental Resources Director/THPO) at the Buena Vista Rancheria.

2 SIGNIFICANT ISSUES IDENTIFIED IN SCOPING COMMENTS

During the 2013 scoping period, a total of eight individuals or groups submitted letters. Many of these letters included multiple comments. Written comments via U.S. mail and e-mail came from state agencies, local agencies, non-profit groups, and concerned citizens. The written commenters included: Stone Lakes Wildlife Refuge and Association, the Delta Protection Commission, Lynn Wheat, Delta Stewardship Council, California Department of Transportation, Sacramento-Yolo Mosquito and Vector Control District, Friends of the Swainson's Hawk, and U.S. Department of the Interior National Park Service (National Park Service. Only one written comment was received during the two scoping meetings, from the Friends of the Swainson's Hawk.

In addition to the written comments received, individuals provided verbal comments. Verbal comments were provided via telephone to USFWS from the staff of Assemblyman Richard Pan on November 4, 2013 and from the Stone Lakes National Wildlife Refuge staff during a meeting with refuge staff, at the refuge, on January 21, 2014. In addition, a total of 19 verbal comments were provided at the two scoping meetings from those who attended. The scoping meeting comments are listed below in the "Scoping Meeting Comments" section in Appendix A. Most of the comments pertain to the SSHCP, while some apply to both the Plan and the EIS/EIR processes.

Eighty-four total written and verbal comments were received during scoping which were organized into 10 general topic areas. Table 1 summarizes the number and percentages of comments received related to each general topic area. Table 2 summarizes the comments received during scoping, organized by general topic area.

Table 1 Scoping Issue Summary

Air Quality	2	2%
Consistency with Local and Regional Planning Documents	14	17%
Economics	3	4%
Grazing and Mining	2	2%
Mitigation	9	11%
Permitted Activities	13	15%
Planning Process	19	23%
Preserves	6	7%
Sensitive Species	12	14%
Water Resources and Hydrology	4	5%
Total	**84**	

Table 2	Scoping Comment Summary		
Issue Category	**Comment Received**	**Commenter**	**Date**
Air Quality			
	If approved, the HCP and related incidental take permit (ITP) seems to apply to a wide range of activities that could be mitigated to an accepted level of protection for listed species. This appears to be a convenient approach for the benefit of development in the region. However, the EIR/EIS should discuss the mechanisms that are/are not in place to ensure that those approved activities comply either individually or cumulatively with the federal Environmental Protection Agency (EPA) air quality standards for the region.	Lynn Wheat	12/18/2013
	Wouldn't deteriorating air quality (and the ability of member jurisdictions to easily adopt CEQA statements of Overriding Considerations) eventually jeopardize the sustainability of the habitat of the species this HCP is intended to protect (not to mention human health)?	Lynn Wheat	12/18/2013
Consistency with Local and Regional Planning Documents			
	The Delta Plan, including its policies and recommendations, should be acknowledged in the EIR's description of the project's environmental setting.	Delta Stewardship Council	12/17/2013
	Discuss or include in the EIR any inconsistencies with the Delta Plan as required by 15125(d) of the CEQA Guidelines.	Delta Stewardship Council	12/17/2013
	The EIR should include an analysis of the potential loss of agricultural land in the Delta caused by urban development covered by the SSHCP to be consistent with the Delta Plan Policy (DP P1 923 CCR Section 5010). Please quantify the aerial extent of the proposed urban development area (UDA) within the Delta, and discuss any potential impacts to agricultural resources.	Delta Stewardship Council	12/17/2013
	The EIR should analyze the impact of any urbanization or the placement of permanent agricultural easements on the opportunity to restore seasonal floodplain and riparian habitat within the Delta Plan's Cosumnes-Mokelumne Confluence area as per Delta Plan Policies- ER P2 (23 CCR Section 5006) and ER P3 (23 CCR Section 5007). The EIR should assess impacts to the opportunity to restore these areas for the habitat uses encouraged by the Delta Plan or the conservation measures recommended in the draft Bay Delta Conservation Plan.	Delta Stewardship Council	12/17/2013
	The Delta Plan Policy ER P5 (23 CCR Section 5009) calls for avoiding introductions of and habitat improvements for invasive non-native species. The EIR should analyze the project's potential to introduce or improve habitat for non-native invasive species.	Delta Stewardship Council	12/17/2013
	The NOP states that the EIR will analyze hydrology and presumably, flooding. The Delta Plan contains three policies that are most relevant to the County's consideration of this issue: Policy RR P2 (23 CCR section 5013) requires flood protection for residential development in rural areas, Policy RR P3 (23 CCR section 5014) restricts encroachment in floodways, and Policy RR P4 (23 CCR Section 5015) restricts encroachments in floodplains, including the Cosumnes-Mokelumne Confluence. Policy RR P4 states that "no encroachment shall be allowed or constructed unless it can be demonstrated by appropriate analysis that the encroachment will not have a significant impact on the floodplain values and functions."	Delta Stewardship Council	12/17/2013
	In addition, the Delta Plan contains a recommendation (RR R6) encouraging the Central Valley Flood Protection Board to evaluate designating additional floodways. Flood risk reduction should be included as a factor when evaluating various conservation and development scenarios. The EIR should include an analysis of potential conflicts between proposed activities in the SSHCP and the	Delta Stewardship Council	12/17/2013

Table 2	Scoping Comment Summary		
Issue Category	**Comment Received**	**Commenter**	**Date**
	implementation of the project.		
	The Delta Reform Act specifically established a certification process for compliance with the Delta Plan's regulatory policies. If the South Sacramento Habitat Conservation Plan is a covered action under the Delta Plan, a way to streamline the process and make full use of the EIS/EIR is to include the information and analysis needed to support the certification of the Delta Plan consistency within the EIS/EIR, potentially including a draft certification as an appendix to the EIS/EIR.	Delta Stewardship Council	12/17/2013
	A portion of the project lies within the Primary Zone of the Sacramento-San Joaquin Delta (predominantly the land located west of Interstate 5) and is subject to consistency requirements with the Delta Protection Commission's Land Use and Resource Management Plan (LURMP) for the Primary Zone of the Delta. Please review the LURMP and ensure that the EIR is consistent with the goals and policies related to land use agriculture, natural resources, recreation access, water, levees and utilities infrastructure.	Delta Stewardship Council	12/17/2013
	The NOP indicates a list of covered activities that may not be supported in the Primary Zone of the Delta and may be inconsistent with Delta Protection Commission's Land Use and Resource Management Plan (LURMP) Policy P-2. Please specify which covered activities are being proposed in the Primary Zone of the Delta.	Delta Protection Commission	12/18/2013
	Please review the Delta Protection Commission's Land Use and Resource Management Plan to ensure consistency with agricultural policies.	Delta Protection Commission	12/18/2013
	Please review the Delta Protection Commission's Economic Sustainability Plan for the Sacramento-San Joaquin Delta (2011) which is an important document guiding future activities in the legal Delta. Proposals for habitat management activities should consider the recommendations on Economic Sustainability for Agriculture, Recreation and Tourism; and Habitat and Ecosystem Improvements (pg. 274, 276).	Delta Protection Commission	12/18/2013
	Scott Finley and Bart McDermott noted that the Bay Delta Conservation Plan (BDCP) applicants have proposed that the BDCP could "swap out" future BDCP preserves established in areas where the BDCP Plan Area overlaps the Plan Area of another HCPs— if that habitat is needed later by the other HCP. Bill Ziebron and Jan Knight said that BDCP proposal lacked sufficient detail and did not explain how a preserve "land swap" could be implemented.	Stone Lakes NWR Association	01/21/2014 Meeting at Stone Lakes NWR
	What is the relationship between the SSCHP and the BDCP?	Assemblyman Richard Pan's Office via Robert Moler	11/04/2013 Phone Call with USFWS
Economics			
	How will the HCP be financed? How will the Plan Partners/Regulatory Agencies factor in inflation over the life of the permit?	Scoping Meeting Comment	11/21/2013
	Bart McDermott (Refuge Manager) asked how the SSHCP will assure that their wetland habitats can be managed for a 50 year permit term, and then in perpetuity— managing wetland habitats on the Refuge are much more "hands on" and expensive than managing their upland habitats. Rob Burness asked if the SSHCP will be able to fund the long-term management of the SSHCP preserve lands, especially those that are inside the Refuge boundary or in the area between the Refuge and the Cosumnes Preserve.	Stone Lakes NWR	01/21/2014 Meeting at Stone Lakes NWR
	Rob Burness asked how SSHCP covered-activity mitigation fees will be determined.	Stone Lakes NWR Association	01/21/2014 Meeting
	Bart McDermott (Refuge Manager) noted that the Refuge has extensive information	Stone Lakes NWR	01/21/2014

Table 2	Scoping Comment Summary		
Issue Category	**Comment Received**	**Commenter**	**Date**
	on costs for wetland management, and could provide this information to the SSHCP. Bart estimates that seasonal wetland management on the Refuge is $200-$300 per acre; most of that cost is from water pumping and weed control.		Meeting at Stone Lakes NWR
Grazing and Mining			
	Is grazing land considered "agriculture" or "annual (non-native) grassland"?	Scoping Meeting Comment	11/21/2013
	Draft SSHCP Conservation Strategy (most recent version available at the time) p7-180 Tri-Colored Blackbird. Paragraph 4 discusses possible threats to the species. Please document all unsubstantiated claims with scientific and supportive evidence, and utilize current research as it pertains to mosquito control for all species	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
Mitigation			
	How do proposed or existing mitigation banks relate to the proposed HCP?	Scoping Meeting Comment	11/20/2013
	The EIS/EIR should discuss the time lag that will likely exist between the pace of new development (the immediate loss of habitat) and the timing of acquisition of new, replacement mitigation land.	Lynn Wheat	12/18/2013
	Can eminent domain ever be used to assist in purchasing new land if the time gap between immediate loss of habitat and the acquisition of new habitat ever becomes unacceptable?	Lynn Wheat	12/18/2013
	What measures will be adopted to ensure that the SSHCP covered-activity impact fees will always correlate with the market prices of mitigation land?	Lynn Wheat	12/18/2013
	Page 6-63 paragraph 3- "No vehicle access or traffic would be able to access preserves." Please ensure that the Sacramento-Yolo Mosquito and Vector Control District has the appropriate provisions contained with the SSHCP to allow for District access to all SSHCP preserve and buffer areas.	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
	Can the area of mitigation originally proposed for Swainson's hawk be considered again? Similarly, the eastern and western portions of the Plan Area differ in importance to Swainson's hawk; therefore, can the conservation for Swainson's hawk be concentrated east of I-5 as much as possible?	Scoping Meeting Comment	11/21/2013
	Mitigation in the area west of I-5 and west of Snodgrass Slough may not be effective or a good long term solution because these areas are below sea level.	Scoping Meeting Comment	11/21/2013
	Will ratio for Swainson's hawk mitigation be 1:1, and be dependent on the land cover type?	Scoping Meeting Comment	11/21/2013
	If the SSHCP is a covered action under the Delta Plan, it would be affected by the Delta Plan's Policy G P1 (23 CCR Section 5002(b)(2) which states " Covered actions not exempt from CEQA must include applicable feasible mitigation measures identified in the Delta Plan's Program EIR or substitute mitigation measures that the proposing agency finds are equally or more effective"	Delta Stewardship Council	12/17/2013
SSHCP Permitted (Covered) Activities			
	While many of the potential impacts remain unknown at this time, failure to address mosquito breeding issues during the planning, construction and management process of aquatic habitats may result in enforcement actions to the landowner.	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
	Excavation Activities: The cubic yard removal thresholds for beaver dam and related blockage removal may exceed the limits provided by the SSHCP. Please include a recognition of the impacts to public health cause be beaver dams and other blockages by creating mosquito habitat and by following the provisions contained in this SSHCP, allow these dams to be removed in excess of the allowable cubic yards	Sacramento-Yolo Mosquito Vector Control District	12/12/2013

	on an as needed basis.		
	Chapters 6.8.2/6.8.3 page 6-84 and 6-87, Uses and Activities Not Permitted within Stream Buffer Zones: To the exception list under "clearing or cutting of riparian woodland vegetation," please add "Vegetation removal for the purpose of mosquito control and BMP implementation."	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
	Please include Drainage Maintenance and Mosquito Reduction Best Management Practices (BMP) Implementation to the list of SSHCP management activities	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
	Add AMM16- Implement Mosquito Reducing BMPs in all designs, management and construction plans.	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
	Restoration and Creation Guidelines: Please add a section under Project Design to include a requirement to reference, construct, and manage any habitat restoration or creation projects following the Sacramento-Yolo Mosquito and Vector Control District BMP manual.	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
	The HCP must recognize that in certain instances the health and safety code may be the more restrictive of landowner regulatory requirements, thus requiring BMP implementation to reduce mosquito breeding.	Sacramento-Yolo Mosquito Vector Control District	12/12/2013
	Scott Finley noted that the Stone Lakes NWR Refuge Association is very concerned about rapid loss of grazing lands and wildlife habitat inside the Refuge planning boundary to new vineyards. He would like information on any SSHCP plans for early preservation of habitat and the SSHCP conservation strategy's "get ahead/stay ahead" component	Stone Lakes NWR Association	01/21/2014 Meeting at Stone Lakes NWR
	Rob Burness and Scott Finley asked about current acres in the SSHCP's "take area" (the UDA), and asked if acres presented in the NOI and NOP will change because of LAFCo's recent decision denying the proposed Elk Grove sphere of influence (SOI) expansion. Rob Burness noted that the lands within the proposed SOI expansion area are critical foraging habitat for several Refuge species, and that area is essential to providing a habitat link between the Cosumnes Preserve and the Refuge	Stone Lakes NWR Association	01/21/2014 Meeting at Stone Lakes NWR
	Bart McDermott noted that sandhill cranes, curlews, and other species use the proposed Elk Grove SOI expansion area to go back and forth between the Refuge and the Preserve; however, farmland throughout this linkage area is being lost to vineyards and solar, and the dairies present during the Refuge scoping period (20 year ago) are now closed. Species on the Refuge will need this adjacent area to remain as farmland. Also, this linkage area is important in the long run, because other areas of existing species-habitat will likely be lost to rising sea level and saltwater intrusion over time. Bart stated that the SSHCP is a good mechanism to preserve farmland habitats east of Interstate 5 (I-5).	Stone Lakes NWR Association	01/21/2014 Meeting at Stone Lakes NWR
	Scott Finley asked how the SSHCP will incorporate Climate Change information in future land-acquisition decisions for preserves—has expected salt water intrusion and land-subsidence been considered in development of alternative conservation strategies? Will expected sea level rise be included in the SSHCP analysis?	Stone Lakes NWR Association	01/21/2014 Meeting at Stone Lakes NWR
	Rob Burness asked a question about the Kammerer Road improvement project, and if this work would be part of the Capitol Connector highway project (a SSHCP Covered Activity), or if it will be a separate project constructed by the City of Elk Grove.	Stone Lakes NWR Association	01/21/2014 Meeting at Stone Lakes NWR

NOTICE OF PREPARATION

OCTOBER 28, 2013

TO: ALL INTERESTED PARTIES

SUBJECT: NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR SOUTH SACRAMENTO HABITAT CONSERVATION PLAN (CONTROL NUMBER 2003-PLE-0637)

Sacramento County will be the Lead Agency under the California Environmental Quality Act (CEQA) for preparation of an Environmental Impact Statement and Environmental Impact Report (EIS/EIR) for a project known as the SOUTH SACRAMENTO HABITAT CONSERVATION PLAN (SSHCP). This Notice of Preparation has been sent to responsible and trustee agencies and involved federal agencies pursuant to Section 15082 of the CEQA Guidelines. Agencies should comment on the scope and content of the environmental information that is germane to the agencies' statutory responsibilities in connection with the proposed project. Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice. Late comments received prior to 5:00 PM Friday December 13, 2013, will be considered.

The project description, location, and the probable environmental effects are contained in the attached materials and may also be viewed online at:
http://www.per.saccounty.net/EnvironmentalDocuments/Pages/SearchPublicNotices.aspx

The SSHCP has not been finalized or distributed for agency or public review. Requests for details beyond the attached project description or other specific questions about the project may be directed to Marianne Biner at 916-874-7520 or Catherine Hack at 916-874-8783.

Two scoping meetings will be held for the public and agencies to provide input on the scope and content of the EIS/EIR. The first scoping meeting will be tailored towards information and input with the general public on **Wednesday, November 20,** from 6:30 p.m. to 8:30 p.m., at the Anthony Pescetti Community Room, Galt Police Facility, 455 Industrial Drive, Galt, CA 95632. The second scoping meeting will be directed towards government agencies on **Thursday November 21,** from 2:00 p.m. to 4:00 p.m., at 1400 10th Street, Sacramento, CA 95814, Governor's Office of Planning and Research, Large Conference Room 202.

Please send your Agency's response to this Notice to:

Catherine Hack, Environmental Coordinator
Department of Community Development
Planning and Environmental Review Division
827 7th Street, Room 220, Sacramento, CA 95814
or via e-mail at: DERA@saccounty.net

Your response should include the name of a contact person in your agency.

PROJECT TITLE
SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

CONTROL NUMBER
03-PLE-0637

PROJECT APPLICANTS (PLAN PARTNERS)

- County of Sacramento
- City of Elk Grove
- City of Rancho Cordova
- City of Galt
- Capital Southeast Connector JPA
- Sacramento Regional County Sanitation District
- Sacramento County Water Agency
- Future SSHCP JPA

INTENT OF PROJECT
The intent of the proposed project is to provide development and infrastructure projects with streamlined, predictable federal and state permitting processes while creating a robust preserve system to protect habitat, open space, and agricultural lands.

Pursuant to the California Environmental Quality Act (CEQA) the County of Sacramento is circulating this Notice of Preparation (NOP) to inform the public that the County intends to gather information to prepare a joint Environmental Impact Report (EIR) and Environmental Impact Statement (EIS) on the proposed South Sacramento Habitat Conservation Plan (SSHCP). The EIS/EIR may include additional analysis in response to comments on the NOP. The joint EIS/EIR will analyze the environmental effects of the United States Fish and Wildlife Service (USFWS) proposed issuance of an incidental take permit (ITP) under Section 10(a)(1)(B) of the Federal Endangered Species Act of 1973, as amended (ESA), the California Department of Fish and Wildlife (CDFW) proposed issuance of an incidental take permit under Section 2081(b)(2) of the California Endangered Species Act, as amended (CESA). The joint EIS/EIR will also analyze the approval and implementation of the SSHCP and Aquatic Resources Program (ARP) required for the proposed incidental take permit and permits pursuant to Section 404 of the Clean Water Act. The SSHCP will provide habitat and protection for 30 species of plants and animals, 10 of which are either state or federally listed as protected pursuant to ESA and/or CESA. The anticipated ITPs would be in effect for a period of 30 to 50 years.

The SSHCP also seeks a Master Streambed Alteration Agreement (MSAA) under California Fish and Game Code, Section 1600 et seq.. The Plan Partners are also seeking a variety of permits pursuant to Section 404 of the Clean Water Act from the U.S. Army Corps of Engineers (Corps) and a Water Quality Certification pursuant to Section 401 of the Clean Water Act from the Regional Water Quality Control Board. The SSHCP would protect vernal pool, wetland, and stream habitats that are subject to the federal Clean Water Act (CWA) and California's Porter–Cologne Water Quality Control Act.

In addition to local actions, the Plan Partners are seeking the following federal and state permits and actions:

- A Programmatic General Permit from the Corps authorizing discharge of dredged or fill materials into waters of the US for private and public projects that are consistent with the SSHCP.
- A Letter of Permission process from the Corps that will result in an expedited District Engineer review and authorization of discharge of dredged or fill materials into waters of the US for private and public projects that do not qualify under the Programmatic General Permit and are approved through the SSHCP Incidental Take Permit.
- A streamlined Individual Permit process from the Corps that will result in an expedited District Engineer review and authorization of discharge of dredged or fill materials into waters of the US for large private and public projects that do not qualify under the Programmatic General Permit or Letter of Permission and are approved through a SSHCP Incidental Take Permit. The streamlining would be based on a regional Section 404(b)(1) alternative site analysis, and minimization based on the SSHCP conservation strategy, which would be included in the SSHCP EIS Record of Decision. It is anticipated that large projects that are SSHCP covered activities will be able to rely heavily on the SSHCP EIS for the Corp's NEPA compliance, and those projects that do require site-specific NEPA analysis will generally be able to meet NEPA requirements by preparing a tiered EA.
- A Water Quality Certification (or waiver) pursuant to Section 401 of the Clean Water Act from the Central Valley Regional Water Quality Control Board authorizing discharge of dredged or fill materials into waters of the US for private and public projects approved under a SSHCP ITP.
- A Master Streambed Alteration Agreement pursuant to Section 1600 et seq. of the California Fish and Game Code from CDFW authorizing modifications to river, stream, or lake.
- An incidental take permit pursuant to Section 2081(b)(2) of the CESA from CDFW.
- An incidental take permit pursuant to Section 10(a)(1)(B) of the ESA from the USFWS.
- A Corps approved in-lieu-fee and/or land dedication program providing required compensatory mitigation beyond the compensatory mitigation already provided in the SSHCP.

PROJECT SUMMARY -- SSHCP AND AQUATIC RESOURCE PROGRAM:
The SSHCP identifies urban development and public infrastructure projects within an Urban Development Area (UDA) and defines mitigation and avoidance measures for covered species and habitat that will be affected by the covered activities identified in the SSHCP. The SSHCP will consolidate mitigation in areas with high habitat value, thereby enhancing the long-term viability of species populations and habitat.

The ARP is a regional conservation approach for aquatic resources located within the SSHCP Plan Area; this approach minimizes impacts to aquatic resources, avoids impacts to a significant amount of high quality aquatic resources and directs mitigation at a landscape level to preserve largely intact watersheds including their associated aquatic resources. A primary goal of ARP implementation is

to achieve no net loss of aquatic function and services. The ARP is directly tied to, and is a fully integrated element of the SSHCP.

In order to implement the SSHCP, the County and its Plan Partners would adopt a participant-paid fee that would be based on loss of habitat acreage, habitat type, long-term management costs and costs to administer the SSHCP. Fees would fund the habitat conservation restoration/creation, management elements of the proposed SSHCP and administration. Supplementary funding sources would be sought from grants or other sources to acquire preserve lands that would contribute to the recovery of covered species, but which are not required as mitigation for covered activities.

The SSHCP includes a mitigation strategy that is consistent with the intent of federal and state wetland regulations. The intent of the ARP is to explain how implementation of the SSHCP, in conjunction with the ARP, will satisfy the requirements of the CWA (Sections 404 and 401), California Fish and Game Code Section 1600 et seq., and Porter-Cologne Act for covered activities, and how the ARP will streamline wetlands permitting in a coordinated fashion.

PROJECT LOCATION
The geographic location of the proposed SSHCP includes approximately 374,000 acres within south Sacramento County (unincorporated area) and the cities of Rancho Cordova, Elk Grove, and Galt (Plate NOP-1, Project Location). The geographical boundaries of the Plan Area are U.S. Highway 50 to the north, the Sacramento River levee and County Road J11 to the west, the Sacramento County line with El Dorado and Amador counties to the east, and the San Joaquin county line to the south. The Plan Area excludes the City of Sacramento, the City of Folsom, the lands of the Miwok tribe, and the Sacramento County community of Rancho Murieta.

Almost all incidental take of SSHCP covered-species is expected to occur inside an area referred to as the Urban Development Area or UDA. The UDA corresponds to land within the County's Urban Services Boundary (USB), and to land within the city limits of Rancho Cordova, Elk Grove, and Galt, and within Elk Grove's proposed sphere of influence and Galt's adopted sphere of influence. A limited amount of infrastructure development, such as planned road widening projects and recycled water conveyance pipelines would occur in the SSHCP Planning Area outside the UDA.

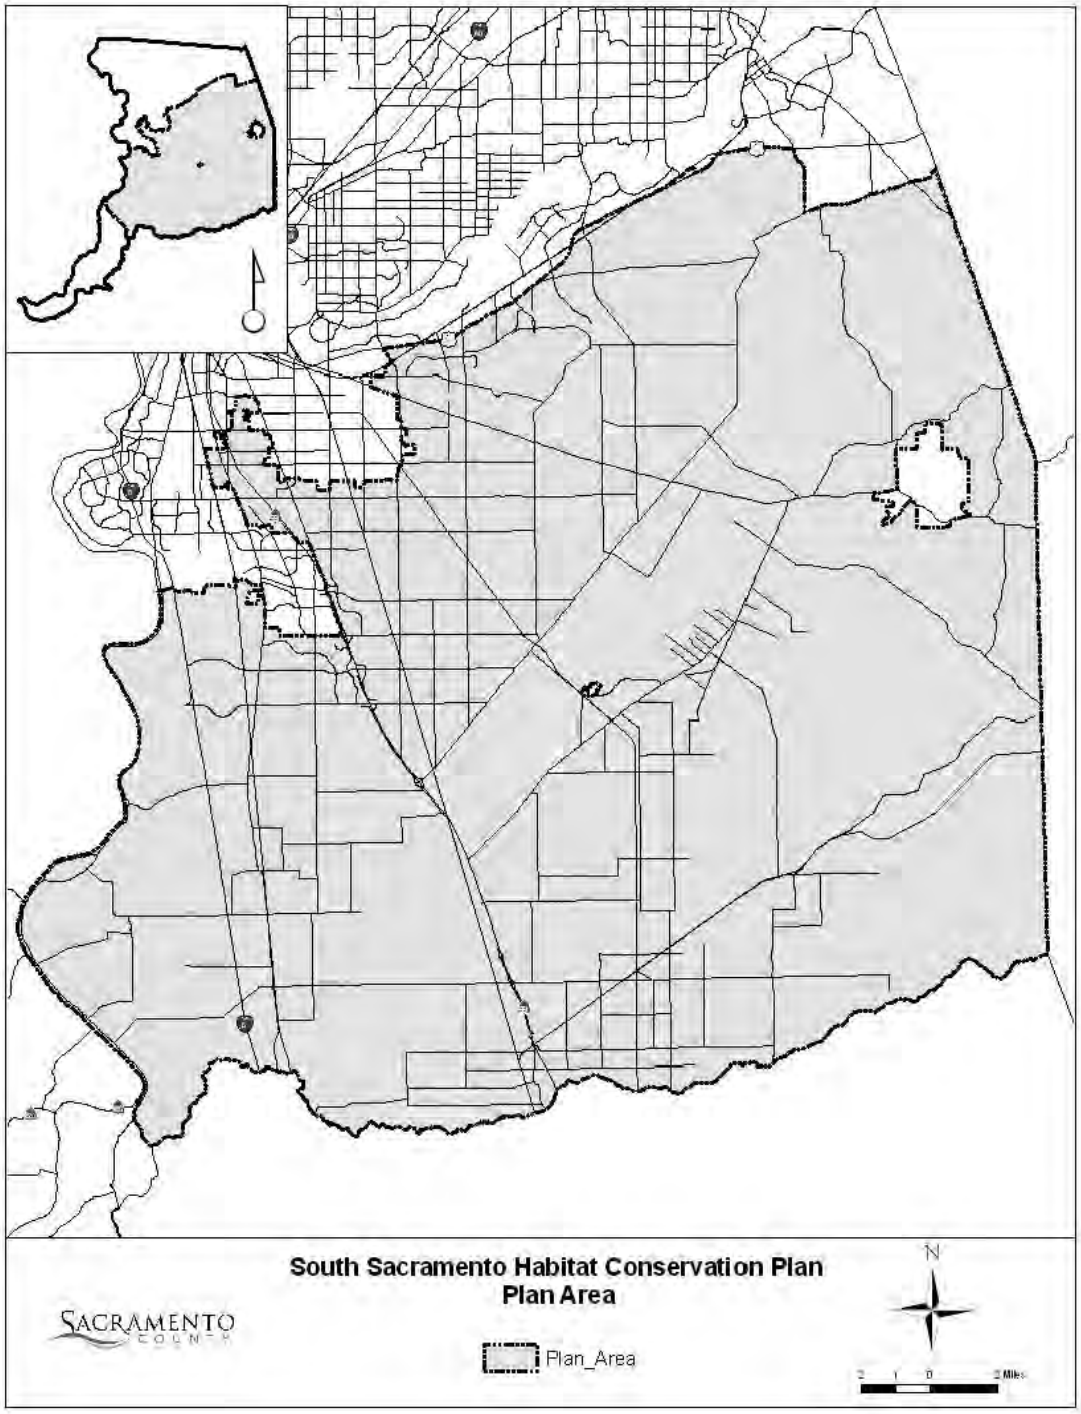
PROJECT OBJECTIVE:
The objective of the SSHCP is to implement a regional conservation strategy that will provide private and public projects with streamlined, predictable federal and state permitting processes while creating a comprehensive preserve system to protect habitat, open space, and agricultural lands.

PROJECT DESCRIPTION:
The proposed conservation strategy for the SSHCP provides for the conservation of covered species and their associated habitat types in order to aid recovery of the species, fully mitigate for the impacts of covered activities on the species and their habitats, and provide a regional approach to the avoidance and mitigation of biological and aquatic resource impacts. The SSHCP and ARP are based on the concepts of conservation biology and landscape ecology, the ecological needs of the covered species and the nature, quality, and geographic distribution of the different habitat types.

The SSHCP would minimize and mitigate incidental take and provide for the conservation of 30 covered species that may occur in the Plan Area, 10 of which are either state or federally listed as

protected pursuant to ESA and/or CESA. The anticipated ITP would be in effect for a period of 30 to 50 years. The plan identifies 20 different habitat cover types including vernal pool aquatic and upland habitat, other wetland habitats, riparian woodland, blue oak woodland, and rural agricultural crops. Bisecting the Plan Area is the Cosumnes River and Deer Creek corridor which contains agricultural lands and extensive riparian habitat (Plate NOP-2).

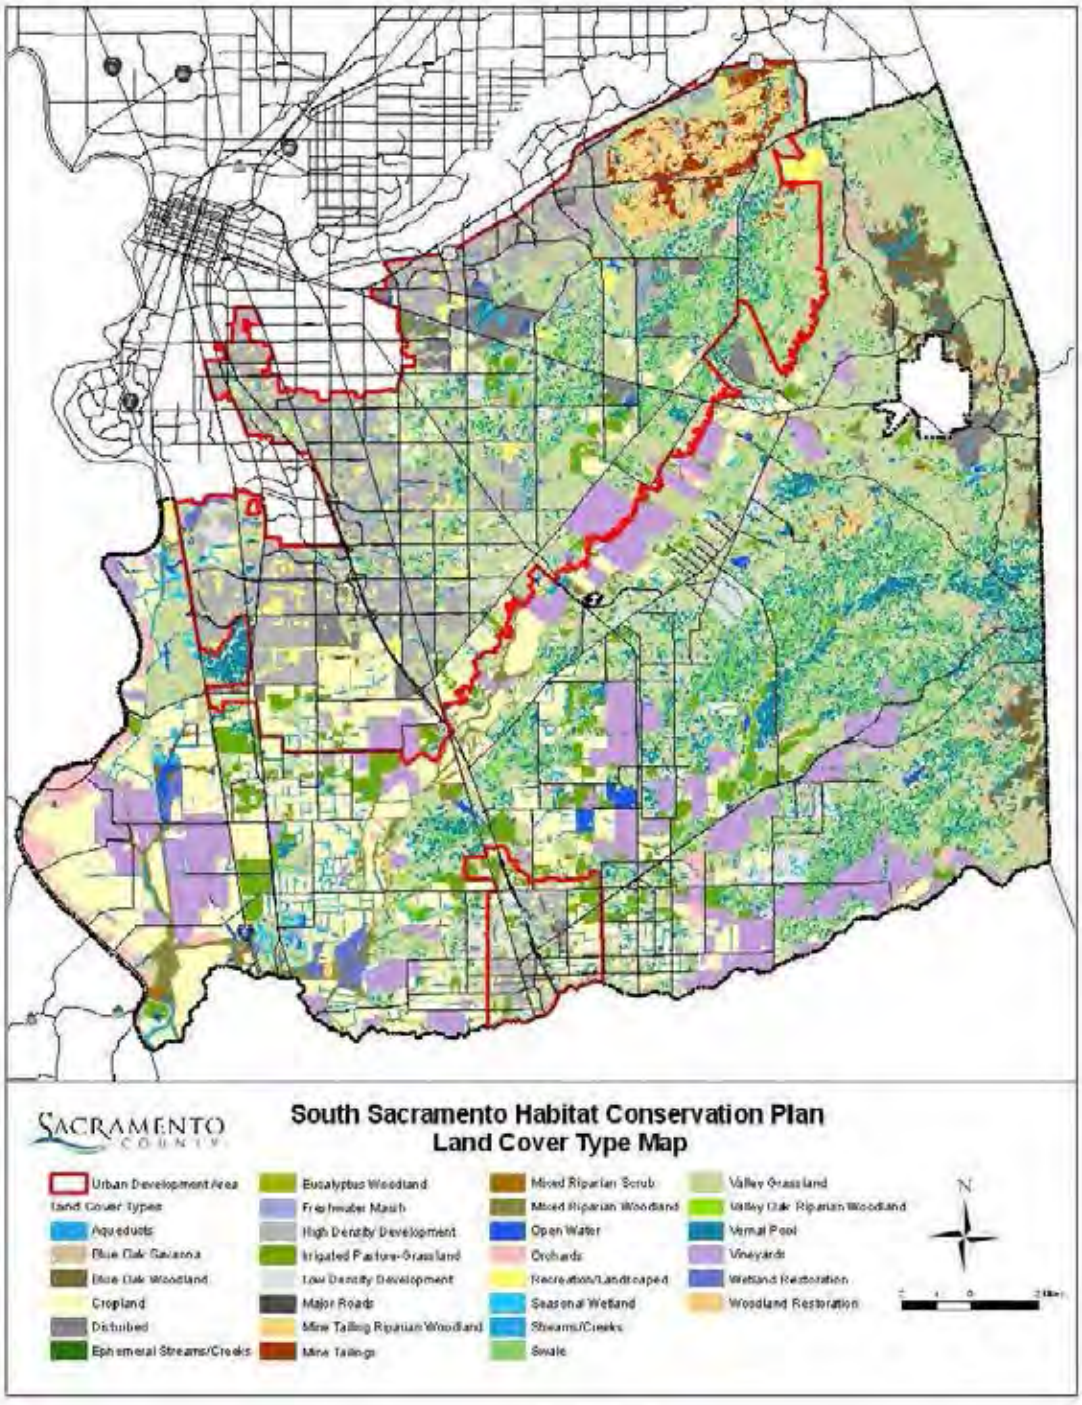
With an approved SSHCP, larger habitat preserves that are linked by habitat corridors would be created outside the UDA, and smaller habitat preserves would be created inside the UDA, also linked by corridors. The key principles of conservation biology that guide the design for the SSHCP include minimizing habitat fragmentation, minimizing edge effects, establishing linkages amongst preserves, establishing buffers and setbacks, maintaining heterogeneity within preserves, protecting watersheds, maintaining or increasing species population size, maintaining species distribution across their native range, and establishing large preserves. The ultimate preserve system is designed to fit into the larger landscape of protected open space within the permit area and connect existing habitat areas. Existing and proposed conservation areas within the reserve system are identified on Plate NOP-3.



Planned Conservation Inside the UDA

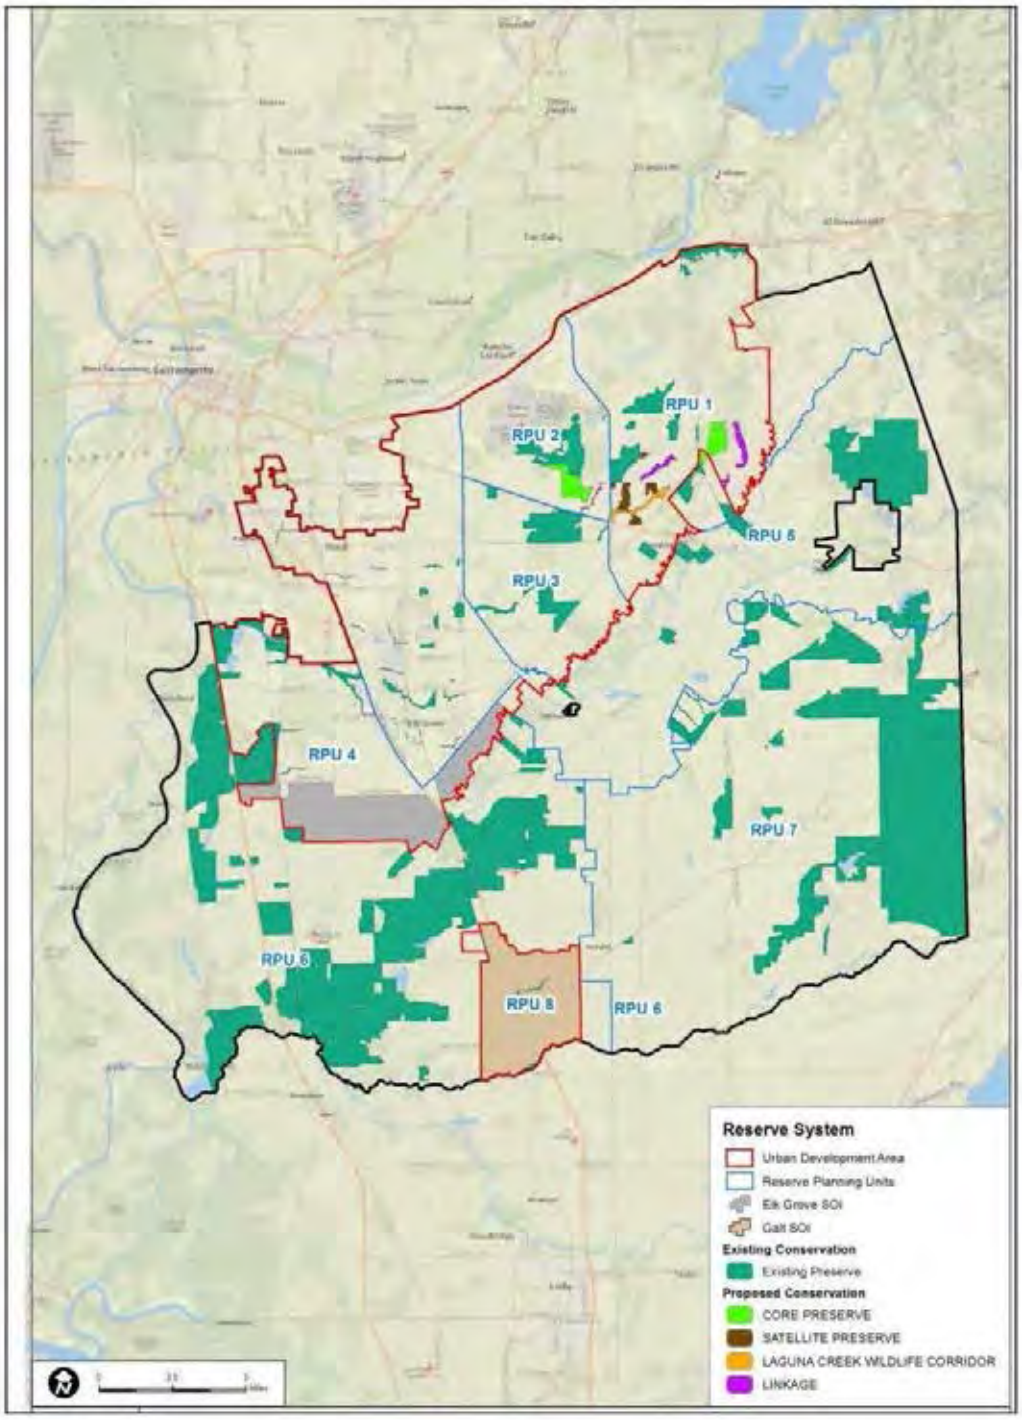
Given that the effects of covered activities would be concentrated mostly within the UDA and these effects cannot be completely offset outside the UDA (particularly vernal pools), establishing preserves and linkages inside the UDA is critical to the conservation strategy. Reserve assembly inside the UDA, including new preserves and linkages, generally would build on the framework of existing and planned preserves and linkages using specific design methods. The following preserve and habitat linkage categories are employed to establish the Reserve System within the UDA: Landscape Preserve, Core Preserve, Minor Preserve, Satellite Preserve, Linkage, Laguna Creek Wildlife Corridor, Flexible Preserve, and Soft-lined Criteria-based Preserve.

Planned Conservation Outside the UDA



Outside the UDA, where fewer effects of covered activities would result (primarily related to infrastructure), reserve design can be more directly focused on the biological goals and objectives for the covered species and natural communities. In general, conservation opportunities are much more available and reserve design can be more flexible outside the UDA with regard to preserve location because large contiguous parcels that could support covered species are more abundant and are not constrained by the more site-specific urban development pressures inside the UDA. Therefore, reserve design outside the UDA employs a narrative set of criteria that articulates the biological goals and objectives and corresponding conservation actions intended to guide and direct conservation outside the UDA.

Plate NOP-1 Project Location



Notice of Preparation NOP-6 03-PLE-0637

Plate NOP-2 SSHCP Habitat Types

Notice of Preparation NOP-7 03-PLE-0637

Plate NOP-3 Proposed Reserve System

Notice of Preparation NOP-8 03-PLE-0637

Reserve Planning Units

To assist with Plan implementation, the Plan Area is further divided into Reserve Planning Units; these Reserve Planning Units are geographic subdivisions of the Plan Area designed to ensure that habitat for covered species is conserved across the Plan Area; that the conserved habitat is heterogeneous across the Plan Area; and that large-scale ecological functions and processes are maintained. Each Reserve Planning Unit is designed to encompass habitat for a suite of covered species and known species occurrences based on existing information. By designating spatially diverse Reserve Planning Units and using the SSHCP biological goals and objectives to set conservation criteria for each unit, the Conservation Strategy will assure that the covered species are adequately and representatively conserved throughout the Plan Area. In total, the SSHCP could preserve or restore nearly 50,000 acres of native and naturalized landcovers within the Plan Area boundary. When combined with existing preserve lands, the SSHCP could result in a large and interconnected reserve system encompassing approximately 113,600 acres within the SSHCP Plan Area. The total amount of preserve land proposed under the SSHCP is subject to further refinement prior to release of the public Draft SSHCP.

The timing and sequence of land acquisition relative to impacts is critical to the success of the Plan. A "stay ahead" provision of the SSHCP was developed to adhere to California Department of Fish and Wildlife's requirements that all impacts of a particular project must be mitigated prior to the impact occurring. The "stay ahead" provision will ensure that conservation measures occur prior to impacts.

Covered Species

There are 30 wildlife and plant species proposed for coverage under the Plan including 10 state or federally listed species. **Table NOP-1 Covered Species**, lists those species and their current status. Species may be added or deleted from this list as Plan development continues.

Covered Activities

Potential ground disturbance from proposed covered-activities of the SSHCP may encompass up to 42,400 acres (40,000 acres within the UDA and 2,400 acres outside the UDA). The total amount of potential ground disturbance from covered activities is subject to further refinement prior to release of the public Draft SSHCP. Covered activities may include the construction, installation, or extension of:

- Private development projects
- Transportation facilities
- Surface and groundwater delivery facilities
- Water treatment facilities
- Sewer and recycled water treatment and conveyance facilities
- Solid waste sanitation facilities
- Public facilities (fire station, police stations, hospitals, schools, community centers, cemeteries, and administration centers)
- Indoor and outdoor recreation facilities
- Energy utility facilities
- Aggregate mining activities
- Habitat management activities

American Badger, *Taxidae taxus*	Mid-Valley Fairy Shrimp, *Branchinecta mesovallensis*
Pallid Bat, *Antrozous pallidus*	Ricksecker's Water Scavenger Beetle, *Hydrochara ricksecker*i
Western Red Bat, *Lasirus blossevillii*	Valley Elderberry Longhorn Beetle, *Desmocerus californicus dimorphus*, (FT)
Yuma Myotis Bat, *Myotis yumanensis*	Vernal Pool Fairy Shrimp, *Branchinecta lynch*i, (FT)
	Vernal Pool Tadpole Shrimp, *Lepidurus packardi,* (FE)
Birds	**Plants**
White-Tailed Kite, *Elanus leucurus*	Ahart's Dwarf Rush, *Juncus leiospermus var. ahartii*
Cooper's Hawk, *Accipiter cooperii*	Boggs Lake Hedge-Hyssop, *Gratiola heterosepala* (SE)
Ferruginous Hawk, *Buteo regalis*	Dwarf Downingia, *Downingia pusilla*
Greater Sandhill Crane, *Grus Canadensis tabida* (ST)	Legenere, *Legenere limosa*
Loggerhead Shrike, *Lanius ludovicianus*	Pincushion Navarretia, *Navarretia myertsii*
Northern Harrier, *Circus cyaneus*	Sacramento Orcutt Grass, *Orcuttia viscida*, (SE, FE)
Swainson's Hawk, *Buteo swainsoni* (ST)	Slender Orcutt Grass, *Orcuttia tenuis,* (SE, FE)
Tricolored Blackbird, *Agelaius tricolor*	Sanford's Arrowhead, Sagittaria sanfortii
Western Burrowing Owl, *Athene cunicularia hypugaea*	
Amphibians	**Reptiles**
California Tiger Salamander, *Ambystoma californiense* (central valley, DPS), (FT)	Giant Garter Snake, *Thamnophis gigas* (FT)
Western Spadefoot Toad, *Scaphiopus hammondii*	Western Pond Turtle, *Actinemys marmorata marmorata* and *A. m. pallida* (2 sub-species: Northwestern and Southwestern)

Biological Goals and Objectives

Habitat loss and fragmentation is a threat common to the covered species in the Plan Area. Loss and fragmentation of land cover types that provide habitat for the covered species will be among the main effects of covered activities in the Plan Area; therefore, the biological goals and objectives focus on land cover type protection and connectivity as key components of the SSHCP Conservation

[1]: F - federal, S – State, E – endangered, T – threatened

Strategy. Through protecting and connecting large contiguous areas of the different land cover types, the Conservation Strategy will preserve broad landscape ecological functions, maintain the abundance and heterogeneity of land cover types, and preserve populations of individual species.

Biological goals provide the broad guiding principles of the Conservation Strategy and are required by the USFWS' 5-Point Policy to be included in HCPs. Biological objectives are measureable objectives that, when implemented collectively, achieve the biological goals.

For each biological goal and objective there is a set of conservation actions that would be implemented and monitored.

Landscape Level Conservation

Land conservation is a key component of the Conservation Strategy, which calls for the establishment, enhancement, and long-term management of a Reserve System for the benefit of natural communities, covered species, and overall biodiversity and ecosystem functions. The system of new reserves is anticipated to be linked to existing protected lands to form a network of protected areas.

Community Level Conservation

Reserve assembly actions have been divided into natural community and other land cover categories that link to the biological goals and objectives. The natural communities include agriculture, valley grassland, vernal wetland, blue oak woodland and savanna, riparian, non-vernal wetlands, open water, and stream and creek. Conservation will occur through acquisition of lands in fee title or placement of conservation easements. The conservation actions associated with each of the eight communities are listed below.

- Agriculture—Conserving agriculture to benefit covered species in the Plan Area includes protecting and managing (including enhancement of) cropland and irrigated pasture. The agricultural conservation strategy is designed to maintain a mosaic of agricultural crop types distributed throughout the main agricultural area of the Plan Area as a method of conserving agricultural habitats that benefit the covered species. A diverse array of agricultural types will allow for variation in crop types from year to year in specific fields but overall will maintain important habitat functions. Agriculture will also be preserved to allow for management actions that will enhance the habitat value of these areas for covered species, such as increasing prey.
- Valley Grassland—Valley grassland will be conserved to benefit covered species and protect grassland ecological functions in the Plan Area. Conservation of large tracts of valley grassland will provide watershed functions and water filtration for vernal pools, other ephemeral wetlands, streams/creeks, and open water.
- Vernal Pool—To benefit covered species and to maintain ecological functions, vernal pools will be restored and conserved in the Plan Area. To conserve the full diversity of ecological conditions, mitigation for the loss of vernal pool habitat should occur through the conservation of vernal pool habitat in the same geologic formation where impacts occur, when it would be beneficial for the covered species.

- Blue Oak Woodland and Savanna—Conserving and restoring blue oak woodland and savanna will benefit covered species in the Plan Area. The main conservation focus will be connectivity to the existing Deer Creek Hills Preserve, which will be connected to lands inside and outside the UDA by protected preserve linkages.
- Riparian—The conservation strategy for riparian includes conserving mixed riparian woodland, mixed riparian scrub, and valley oak riparian woodland to benefit covered species populations in the Plan Area.
- Non-vernal Wetland—The conservation strategy for community would include conservation, restoration or creation of seasonal wetland, freshwater marsh, and swale.
- Open Water—Conserving, restoring and creating open water will benefit covered species and ecological functions in the Plan Area.
- Stream and Creek—Conserving and/or creating stream/creek will benefit covered species and protect ecological functions in the Plan Area.

Species Level Conservation

The plan provides a framework for conservation of known occurrences of covered species as well as habitat that would allow target populations to expand. These species-by-species biological goals and objectives take into account the opportunities for expansion of existing populations keeping in mind the various life cycle requirements of each species.

Management Measures

The SSHCP includes specific actions for the management of the Reserve System for the conservation and enhancement of natural communities and the covered species. Management measures would include both routine management and adaptive management depending on the identified management needs of each preserve and linkage. Routine management is expected to include common open space management activities such as controlling public access to sensitive areas, fencing, signage, trail repair, trash removal, patrols, etc. Adaptive management, in both an "active" and "passive" context would occur throughout the term of the ICP and may include full-scale actions, pilot programs, and research.

Potential management activities, particularly in the context of vernal pool and grassland habitat, will likely include invasive species control, thatch management (grazing or fire), manipulation of percent suspended organic matter in vernal pool environments, hydrology studies to determine watershed and vernal pool function, predator control, and disease control (treatment of water source).

As it is assembled, the Reserve System will be routinely monitored to ensure habitat health and reserve functionality. Typical monitoring activities would include surveys for covered species.

PROBABLE ENVIRONMENTAL EFFECTS OF THE PROPOSED SSHCP

The analysis within the EIS/EIR is expected to include the following environmental topical areas of probable effects: land use; agriculture; soils; geology; mining; hydrology; water quality; drainage;

biological resources; wetlands and waters of the U.S. and State; transportation; air quality; climate change; cultural, historic, and paleontological resources; and public facilities and services.

INTENDED USES OF THE EIS/EIR

The Plan Partners including: Sacramento County, City of Elk Grove, City of Galt, City of Rancho Cordova, Sacramento County Water Agency, Sacramento Regional County Sanitation District, and Capital Southeast Connector Joint Powers Authority, are seeking concurrent and parallel authorizations from federal and state regulatory wetland programs for covered activities authorized through the SSHCP and the associated ITPs. The EIS/EIR will serve as the environmental document for actions taken by the federal, state, and local agencies.

2013 NOP – Email Alert

From: Radmacher. Richard [mailto:RADMACHERR@saccounty.net]
Sent: Tuesday, November 12, 2013 1:56 PM
To: [redacted]
Subject: South Sacramento Habitat Conservation Plan NOI/NOP

Dear SSHCP Stakeholders,

The South Sacramento Habitat Conservation Plan (SSHCP) Partners and the US Fish and Wildlife Service (USFWS) are pleased to announce the release of the Notice of Intent (NOI) and Notice of Preparation (NOP) to prepare a joint Environmental Impact Statement/ Environmental Impact Report (EIS/EIR) for the South Sacramento Habitat Conservation Plan. To view links to the NOI and/or NOP please follow the link below.

http://www.per.saccounty.net/PlansandProjectsIn-Progress/Pages/SSHCPPlan.aspx

Two scoping meetings will be held in November for the public and agencies to provide input on the scope of the EIR/EIS. The first scoping meeting will be held on Wednesday, November 20th in Galt from 6:30 to 8:30 pm. This scoping meeting will be tailored to the general public. A second scoping meeting will be held on Thursday, November 21th in Sacramento from 2:00 to 4:00 pm and is tailored to the agencies. The public is welcome to attend either meeting, but due to limited space is encouraged to attend the November 20th meeting in Galt. More information regarding the two scoping meetings can be found in the attached flyer.

For those of you that are unable to attend one of our scoping meetings, but would still like to provide input, a commnet card is attached for your convenience. If you have any questions or concerns regarding the SSHCP please don't hesitate to contact me. For additional information regarding the EIS/EIR please direct your inquires to Marianna Biner at (916) 874-7520 or by email at binerm@saccounty.net.

Sincerely,

Richard Radmacher

2013 Notice of Intent (NOI)

2013 Scoping Meeting Announcements and Distribution Lists

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

[FWS–R8–ES–2013–N209]; [FF08E00000–FXES11120800000F2–123–F2]

Habitat Conservation Plan for South Sacramento County, California

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of intent, request for comments, and notice of public scoping meetings.

SUMMARY: We, the U.S. Fish and Wildlife Service (Service), intend to gather additional information and to prepare, in coordination with the County of Sacramento, California, a joint environmental impact statement and environmental impact report (EIS/EIR) under the National Environmental Policy Act and the California Environmental Quality Act for the proposed South Sacramento Habitat Conservation Plan (HCP). The draft EIS/EIR will evaluate the impacts of several alternatives related to the proposed issuance of Endangered Species Act permits to eight permit applicants in south Sacramento County, California. The permit applicants intend to apply for either a 30-year or a 50-year permit from the Service that would authorize the incidental take resulting from implementation or approval of covered activities, including various kinds of development projects. We also announce public scoping meetings and the opening of a public comment period. We request data, comments, new information, or suggestions from other concerned governmental agencies, the scientific community, Tribes, industry, or any other interested party.

DATES: To ensure consideration, please send your written comments by December 19, 2013. We will hold two public scoping meetings at different locations in the plan area (see *Public Meetings* under **SUPPLEMENTARY INFORMATION** for dates, times, and locations). In addition to this notice, we will also announce the public scoping meetings in local news media and on the Internet at *http://www.fws.gov/sacramento.*

ADDRESSES: Please address written comments to Nina Bicknese, Senior Fish and Wildlife Biologist, Sacramento Fish and Wildlife Office, 2800 Cottage Way, W–2605, Sacramento, CA 95825. Alternatively, you may send comments by facsimile to (916) 414–6713.

FOR FURTHER INFORMATION CONTACT: Mike Thomas, Chief, Conservation Planning Division, or Eric Tattersall,

Deputy Assistant Field Supervisor, at the address shown above (see **ADDRESSES**) or at (916) 414–6600 (telephone). If you use a telecommunications device for the deaf, please call the Federal Information Relay Service at (800) 877–8339.

SUPPLEMENTARY INFORMATION: We intend to gather additional information and to prepare, in coordination with the County of Sacramento, California, a joint environmental impact statement and environmental impact report (EIS/ EIR) under the National Environmental Policy Act and the California Environmental Quality Act for the proposed South Sacramento Habitat Conservation Plan (HCP). This notice revises information on the proposed HCP previously published on June 10, 2008 (73 FR 32729). The draft EIS/ EIR will evaluate the impacts of several alternatives related to the proposed issuance of Endangered Species Act permits to eight permit applicants (the County of Sacramento, City of Elk Grove, City of Rancho Cordova, City of Galt, the Capital Southeast Connector Joint Powers Authority, the Sacramento Regional County Sanitation District, the Sacramento County Water Agency, and a South Sacramento Habitat Conservation Plan Joint Powers Authority) for activities they would conduct or approve within a proposed 374,000-acre plan area located in south Sacramento County, California.

The permit applicants intend to apply for either a 30-year or a 50-year permit from the Service that would authorize the incidental take of 22 animal species. Incidental take would result from implementation or approval of covered activities, including private development projects, transportation facilities, surface and groundwater delivery facilities, water treatment facilities, solid waste sanitation facilities, public facilities, recreation facilities, energy utility facilities, aggregate mining activities, and future preserve land-management activities. We also announce public scoping meetings and the opening of a public comment period. We request data, comments, new information, or suggestions from other concerned governmental agencies, the scientific community, Tribes, industry, or any other interested party.

We publish this notice in accordance with the National Environmental Policy Act of 1969, as amended (42 U.S.C. 4321 *et seq.;* NEPA), and its implementing regulations in the Code of Federal Regulations (CFR) at 40 CFR 1500–1508, as well as in compliance with section 10(c) of the Endangered Species Act (16 U.S.C. 1531 *et seq.;* Act), and in compliance with the California Environmental Quality Act (CEQA). We intend to prepare a joint draft EIS/ EIR to evaluate the impacts of several alternatives related to the potential issuance of an incidental take permit (ITP) to the permit applicants, as well as impacts of the implementation of the supporting proposed habitat conservation plan (HCP).

The permit applicants propose to prepare the South Sacramento Habitat Conservation Plan as part of their application for an ITP under section 10(a)(1)(B) of the Act. The proposed HCP will include measures necessary to minimize and mitigate the impacts, to the maximum extent practicable, of potential proposed taking of federally listed species to be covered by the ITP, and the habitats upon which they depend. The covered activities and projects proposed by the HCP would disturb a maximum total of 42,243 acres within the plan area and would include the construction of residential and commercial development projects, improvements to existing transportation facilities, new transportation facilities (including the proposed Capital Southeast Connector highway), new surface water and groundwater delivery facilities, water treatment facilities, solid waste sanitation facilities, public facilities (including fire stations, police stations, hospitals, schools, community centers, cemeteries, and administration centers), indoor and outdoor recreation facilities, energy utility facilities, aggregate mining activities, and future habitat-management activities.

The plan area, the area in which all impacts would be evaluated and all conservation actions will be implemented, is approximately 374,000 acres within unincorporated south Sacramento County and within the cities of Rancho Cordova, Elk Grove, and Galt. The approximate geographical boundary of the plan area would be the area bound by U.S. Highway 50 in the north, the San Joaquin County line to the south, the Sacramento River levee and County Road J11 to the west, and the Sacramento County line with El Dorado and Amador counties to the east. The 374,000-acre plan area would include a 123,000-acre urban development area (UDA) where most ground-disturbing development, infrastructure activities, and projects would occur. The UDA corresponds to land within the County's urban services boundary (USB); and to land within the city limits of Rancho Cordova, Elk Grove, and Galt; land within Elk Grove's proposed sphere of influence; and land within Galt's adopted sphere of influence.

Almost all ground disturbance and incidental take of federally listed endangered and threatened species would occur on approximately 40,000 acres within the UDA. A limited amount of infrastructure development, such as planned road widening projects and recycled water conveyance pipelines, would disturb or remove approximately 2,443 acres of native and naturalized landcovers outside the UDA. In addition, the HCP would include an aquatic resource program that would avoid, minimize, or fully mitigate potential covered activity impacts to existing aquatic resources within the plan area, and would facilitate the U.S. Army Corps of Engineers' development of a process for permit applicant compliance with the Clean Water Act (33 U.S.C. 1251 *et seq.*). The permit applicants also propose to permanently preserve or restore approximately 8,950 acres of the UDA and preserve approximately 40,980 acres outside the UDA, following criteria that would expand the size of existing preserves and create linkages and corridors between existing preserves. In total, the HCP proposes to permanently preserve or restore 49,930 acres of native and naturalized landcovers within the plan area boundary. When combined with the existing preserve lands, the HCP would result in a large and interconnected 113,623-acre habitat reserve system within the 374,000-acre plan area.

Background Information

Section 9 of the Act and Federal regulations prohibit the taking of fish and wildlife species listed as endangered or threatened under section 4 of the Act. Take of federally listed fish or wildlife is defined under the Act as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect listed species, or attempt to engage in such conduct. The term ''harass'' is defined in the regulations as to carry out actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavioral patterns, which include, but are not limited to, breeding, feeding, or sheltering (50 CFR 17.3). The term ''harm'' is defined in the regulations as significant habitat modification or degradation that results in death or injury of listed species by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering (50 CFR 17.3).

However, under specified circumstances, the Service may issue permits that allow the take of federally

listed species, provided that the take is incidental to, but not the purpose of, an otherwise lawful activity. Regulations governing permits for endangered and threatened species can be found at 50 CFR 17.22 and 17.32, respectively. Section 10(a)(1)(B) of the Act contains provisions for issuing such incidental take permits to non-Federal entities for the take of endangered and threatened species, provided the following criteria are met:

1. The taking will be incidental;
2. The applicants will, to the maximum extent practicable, minimize and mitigate the impact of such taking;
3. The applicants will develop a proposed HCP and ensure that adequate funding for the HCP will be provided;
4. The taking will not appreciably reduce the likelihood of the survival and recovery of the species in the wild; and
5. The applicants will carry out any other measures that the Service may require as being necessary or appropriate for the purposes of the HCP.

Thus, the purpose of issuing ITPs is to allow the permit applicants, under their respective authorities, to authorize new development and infrastructure, while conserving covered species and their habitats. Implementation of a regional habitat conservation plan, rather than a species-by-species or project-by-project approach, would enhance benefits of conservation measures for covered species and would eliminate expensive and time-consuming efforts associated with processing individual ITPs for each project within the applicants' proposed plan area. The Service expects that the permit applicants will request ITP coverage for a period of 30 to 50 years.

Alternatives in the Draft Environmental Impact Statement

The proposed action alternative presented in the draft EIS/EIR will be compared to a no-action alternative. The no-action alternative represents estimated future conditions to which the proposed action's estimated conditions can be compared. Other action alternatives considered, including their potential impacts, will also be addressed in the draft EIS/ EIR and compared to a no-action condition.

No-Action Alternative

Because the proposed covered activities would provide needed regional infrastructure and economic development, these types of activities would occur within the plan area regardless of whether a 10(a)(1)(B) ITP is requested or issued. Although future activities would be similar to the covered activities proposed by the HCP, not all activities would necessitate an incidental take permit or consultation with the Service. Under the no action alternative, the permit applicants could implement a covered activity that fully avoids impacts to protected species and their habitats. Where potential impacts to federally protected species could not be avoided, the permit applicants could minimize and mitigate their impacts through individual formal or informal consultations with the Service. When applicable, the permit applicants would potentially seek individual section 10(a)(1)(B) ITPs on a project-by-project basis. Under the no-action alternative, the permit applicants may also satisfy the requirement of the Clean Water Act's sections 404 and 401, the California Fish and Game code section 1600, and the Porter-Cologne Act, and other applicable law, on a project-by-project basis. Thus, under the no-action alternative, various permit applicants would likely need to develop and file numerous separate permit applications over the 30-to-50-year project period. This activity-by-activity approach could be more time consuming and less efficient and could result in smaller and fragmented mitigation areas.

Proposed Action Alternative

The proposed action alternative is the issuance of an ITP for the take of covered species, caused by covered activities within the proposed plan area, for a period of 30 to 50 years. The proposed action HCP, developed and implemented by the permit applicants, must meet the requirements of section 10(a)(2)(A) of the Act by providing measures to minimize and mitigate the effects of the potential incidental take of covered species to the maximum extent practicable. The proposed HCP allows for a comprehensive mitigation approach for unavoidable impacts, and reduces permit processing times and efforts for the permit applicants and the Service.

Covered activities under the proposed HCP are otherwise lawful activities that applicants carry out consistent with all HCP requirements, including, but not limited to:

1. Construction of private development projects within the UDA (e.g., single- and multi-family homes, residential subdivisions, commercial or industrial projects, offices, and park infrastructure);
2. Installation and/or maintenance of utility infrastructure within the UDA (e.g., transmission or distribution lines and facilities related to electric, telecommunication, natural gas, and other types of energy utilities);
3. Installation and/or maintenance of surface and groundwater delivery facilities within the UDA;
4. Construction, maintenance, and/or improvement of water treatment facilities within the UDA;
5. Construction, maintenance, and/or improvement of solid waste sanitation facilities within the UDA;
6. Construction, use, and maintenance of public facilities (e.g., fire stations, police stations, schools, hospitals, community centers, cemeteries, and administration centers) within the UDA;
7. Construction, use, or maintenance of other public infrastructure, including indoor and outdoor recreation facilities, within the UDA;
8. Excavation, use, maintenance, and/or expansion of quarries, gravel mining, or other aggregate mining activities within the UDA;
9. Construction, maintenance, and/or improvement of new roads, bridges, and other transportation infrastructure facilities outside the UDA and within the UDA, including the proposed Southeast Connector highway;
10. Construction, maintenance, and/or improvement of recycled water conveyance pipelines and outside the UDA and within the UDA; and
11. Maintenance and land management activities on conservation lands outside the UDA and within the UDA.

We anticipate that the following 30 species of plants and animals, including seven federally listed threatened (T) or endangered (E) species, will be included as covered species in the permit applicants' proposed HCP:

Mid-valley fairy shrimp *(Branchinecta mesovallensis)*
Ricksecker's water scavenger beetle *(Hydrochara ricksecker)*
Valley elderberry longhorn beetle *(Desmocerus californicus dimorphus)* (T)
Vernal pool fairy shrimp *(Branchinecta lynchi)* (E)
Vernal pool tadpole shrimp *(Lepidurus packardi)* (E)
California tiger salamander, central California distinct population segment (*Ambystoma californiense)* (T)
Western spadefoot toad *(Scaphiopus hammondii)*
Giant garter snake *(Thamnophis gigas)* (T)
Western pond turtle *(Actinemys marmorata marmorata* and *A. m. pallida)* (two subspecies)
American badger *(Taxidea taxus)*
Pallid bat *(Antrozous pallidus)*
Western red bat *(Lasiurus blossevillii)*
Yuma myotis bat *(Myotis yumanensis)*
White-tailed kite *(Elanus leucurus)*
Cooper's hawk *(Accipiter cooperii)*
Ferruginous hawk *(Buteo regalis)*
Greater sandhill crane *(Grus canadensis tabida)*
Loggerhead shrike *(Lanius ludovicianus)*

Northern harrier *(Circus cyaneus)*
Swainson's hawk *(Buteo swainsoni)*
Tricolored blackbird *(Agelaius tricolor)*
Western burrowing owl *(Athene cunicularia hypugaea)*
Ahart's dwarf rush *(Juncus leiospermus var. ahartii)*
Boggs Lake hedge hyssop *(Gratiola heterosepala)*
Dwarf downingia *(Downingia pusilla)*
Legenere *(Legenere limosa)*
Pincushion navarretia (*Navarretia myersii*)
Sacramento Orcutt grass (*Orcuttia viscida*) (T)
Slender Orcutt grass (*Orcuttia tenuis*) (T)
Sanford's arrowhead (*Sagittaria sanfordii*)

The permit applicants seek incidental take authorization for all applicable covered species. Candidate and federally listed species that are not likely to be taken by the covered activities, and therefore not covered by the proposed ITP, may also be addressed in the proposed HCP, to explain why the permit applicants believe these species will not be taken.

Environmental Review and Next Steps

The Service will conduct an environmental review to analyze the proposed action, along with other alternatives evaluated, and the associated impacts of each. The draft EIS/EIR will be the basis for the impact evaluation for each covered species. The draft EIS/EIR is expected to provide biological descriptions of the affected species and habitats, as well as the effects of the proposed action and other alternatives on other resources, such as soils, geology, water quality, agriculture, vegetation, wetlands, wildlife, cultural resources, transportation, air quality, land use, recreation, water use, local economy, and environmental justice.

Following completion of the environmental review, the Service will publish a notice of availability and a request for comment on the draft EIS/EIR and on the permit applications, which will include the proposed HCP. We anticipate that the draft EIS/EIR and proposed HCP will be completed and available to the public in March or April 2014.

Public Comments

We request data, comments, new information, or suggestions from other concerned governmental agencies, the scientific community, Tribes, industry, or any other interested party on this notice. We will consider these comments in developing an EIS/EIR and in the development of a South Sacramento Habitat Conservation Plan and incidental take permit. We particularly seek comments on the following:

1. Biological information concerning the proposed covered species;
2. Relevant data concerning the proposed covered species;
3. Additional information concerning the range, distribution, population size, and population trends of the proposed covered species;
4. Current or planned activities in the subject area and their possible impacts on the proposed covered species;
5. The presence of archeological sites, buildings and structures, historic events, sacred and traditional areas, and other historic preservation concerns that are required to be considered in project planning by the National Historic Preservation Act (16 U.S.C. 470 *et seq.*); and
6. Identification of any other environmental issues that should be considered with regard to the proposed development and the permit action.

You may submit your comments and materials by one of the methods listed in the **ADDRESSES** section.

Comments and materials we receive on this notice will be available for public inspection by appointment, during normal business hours, at our office (see **FOR FURTHER INFORMATION CONTACT**).

Public Availability of Comments

Written comments we receive become part of the public record associated with this action. Before including your address, phone number, email address, or other personal identifying information in your comments, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Public Scoping Meetings

The purpose of scoping meetings is to provide the public with a general understanding on the background of the proposed HCP and activities it would cover, alternative proposals under consideration for the draft EIS/EIR, the Service's role, and steps to be taken to develop the draft EIS/EIR for the proposed HCP. Two public scoping meetings will be held:

1. Wednesday, November 20, from 6:30 p.m. to 8:30 p.m., at the Anthony Pescetti Community Room, Galt Police Facility, 455 Industrial Drive, Galt, CA 95632.
2. Thursday November 21, from 2:00 p.m. to 4:00 p.m., at the Governor's Office of Planning and Research, Large Conference Room 202, 2nd Floor, 1400 Tenth Street, Sacramento, California, 95814.

The meeting will include a 1-hour open house prior to the formal scoping meeting. The open house will provide an opportunity to learn about the proposed action, permit area, and species covered. The open house will be followed by a presentation of the proposed action, a summary of the NEPA process, and comments from the public. The primary purpose of these meetings and public comment period is to solicit suggestions and information on the scope of issues and scope of alternatives for the Service to consider when drafting the EIS/EIR. Written comments will be accepted at the meetings. Comments can also be submitted by methods listed in the **ADDRESSES** section. Once the draft EIS/EIR and proposed HCP are complete and made available for review, there will be additional opportunity for public comment on the content of these documents during a 90-day draft EIS/EIR public comment period.

Meeting Location Accommodations

Please note that the meeting locations are accessible to wheelchair users. If you require additional accommodations, please notify us at least 1 week in advance of the meeting (see **FOR FURTHER INFORMATION CONTACT**).

Authority

We provide this notice under section 10 of the Act (16 U.S.C. 1531 *et seq.*) and by NEPA regulations (40 CFR 1501.7, 1506.6, and 1508.22).

Dated: October 29, 2013.

Alexandra Pitts,

Deputy Regional Director, Pacific Southwest Region, Sacramento, California.

NOI Published and Scoping Meetings Scheduled for the South Sacramento Habitat Conservation Plan

Plan to Help Offset Impacts to Threatened and Endangered Species

Sacramento – The U.S. Fish and Wildlife Service (Service) and Sacramento County announce a Notice of Intent (NOI) to prepare a joint Environmental Impact Statement/ Environmental Impact Report (EIS/EIR) for the proposed South Sacramento Habitat Conservation Plan (HCP). The Service and the HCP permit-applicants intend to work together to preserve endangered species and to streamline the existing development-permitting process. To do that, a habitat conservation plan will be prepared for a 374,000-acre area of south Sacramento County, California. The HCP is being prepared to preserve natural lands in Sacramento County and protect habitat for 30 special-status plant and animal species, including seven federally listed species.

This announcement opens a 45-day comment period on the NOI. **All comments should be received by December 19, 2013.**

Two scoping meetings will be held for the public and agencies to provide input on the scope and content of the EIS/EIR. The first scoping meetings will be held **Wednesday, November 20,** from 6:30 p.m. to 8:30 p.m., at the Anthony Pesetti Community Room, Galt Police Facility, 455 Industrial Drive, Galt, CA 95632. The second scoping meeting will be held **Thursday, November 21,** from 2:00 p.m. to 4:00 p.m., at the Governor's Office of Planning and Research, Large Conference Room 202, Second Floor, 1400 Tenth Street, Sacramento, California, 95814.

The Notice of Intent was published today and is available for review in the Federal Register and on the Service's website at http://www.fws.gov/sacramento/. The California Environmental Quality Act's Notice of Preparation (NOP) for the EIS/EIR was also released today and is available for review at http://www.per.saccounty.net/EnvironmentalDocuments/Pages/SearchPublicNotices.aspx.

America's fish, wildlife, and plant resources belong to all of us, and ensuring the health of imperiled species is a shared responsibility. Together with the local community, the state and federal agencies are working to actively engage conservation partners and the public in the search for improved and innovative ways to conserve and recover imperiled species.

The HCP is being prepared to support compliance with the federal Endangered Species Act. The HCP will also provide the basis for an Incidental Take Permit from the California Department of Fish and Wildlife, and the basis for streamlining U.S. Army Corps of Engineers permits under the Clean Water Act.

The EIS/EIR will be prepared in compliance with the National Environmental Policy Act and the California Environmental Quality Act. The EIS/EIR will describe the underlying purposes, needs, and objectives for developing, approving and implementing a HCP in south Sacramento County; will identify alternatives, including the proposed HCP; describe the existing environment conditions that could be affected by each alternative; and will analyze the potential effects of each alternative on the environment.

To submit written comments, please use one of the following methods and note that your comment is in reference to the South Sacramento Habitat Conservation Plan (SSHCP):

- *U.S. Mail*: Nina Bicknese, Senior Fish and Wildlife Biologist, U.S. Fish and Wildlife Service, Sacramento Fish and Wildlife Office, 2800 Cottage Way, Room W-2605, Sacramento, CA 95825.
- *Fax*: U.S. Fish and Wildlife Service, 916-414-6713, Attn: Nina Bicknese.

The mission of the U.S. Fish and Wildlife Service is working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people. We are both a leader and trusted partner in fish and wildlife conservation, known for our scientific excellence, stewardship of lands and natural resources, dedicated professionals, and commitment to public service. Subject: NOI Published and Scoping Meetings Scheduled for the South Sacramento Habitat Conservation Plan: Plan to Help Offset Impacts to Threatened and Endangered Species

NOI Published and Scoping Meetings Scheduled for the South Sacramento Habitat Conservation Plan

Plan to Help Offset Impacts to Threatened and Endangered Species

Sacramento – The U.S. Fish and Wildlife Service (Service) and Sacramento County announce a Notice of Intent (NOI) to prepare a joint Environmental Impact Statement/ Environmental Impact Report (EIS/EIR) for the proposed South Sacramento Habitat Conservation Plan (HCP). The Service and the HCP permit-applicants intend to work together to preserve endangered species and to streamline the existing development-permitting process. To do that, a habitat conservation plan will be prepared for a 374,000-acre area of south Sacramento County, California. The HCP is being prepared to preserve natural lands in Sacramento County and protect habitat for 30 special-status plant and animal species, including seven federally listed species.

This announcement opens a 45-day comment period on the NOI. **All comments should be received by December 19, 2013.**

Two scoping meetings will be held for the public and agencies to provide input on the scope and content of the EIS/EIR. The first scoping meetings will be held **Wednesday, November 20,** from 6:30 p.m. to 8:30 p.m., at the Anthony Pescetti Community Room, Galt Police Facility, 455 Industrial Drive, Galt, CA 95632. The second scoping meeting will be held **Thursday November 21,** from 2:00 p.m. to 4:00 p.m., at the Governor's Office of Planning and Research, Large Conference Room 202, Second Floor, 1400 Tenth Street, Sacramento, California, 95814.

The Notice of Intent was published today and is available for review in the Federal Register and on the Service's website at http://www.fws.gov/sacramento/. The California Environmental Quality Act's Notice of Preparation (NOP) for the EIS/EIR was also released today and is available for review at http://www.per.saccounty.net/EnvironmentalDocuments/Pages/SearchPublicNotices.aspx.

America's fish, wildlife, and plant resources belong to all of us, and ensuring the health of imperiled species is a shared responsibility. Together with the local community, the state and federal agencies are working to actively engage conservation partners and the public in the search for improved and innovative ways to conserve and recover imperiled species.

The HCP is being prepared to support compliance with the federal Endangered Species Act. The HCP will also provide the basis for an Incidental Take Permit from the California Department of Fish and Wildlife, and the basis for streamlining U.S. Army Corps of Engineers permits under the Clean Water Act.

The EIS/EIR will be prepared in compliance with the National Environmental Policy Act and the California Environmental Quality Act. The EIS/EIR will describe the underlying purposes, needs, and objectives for developing, approving and implementing a HCP in south Sacramento County; will identify alternatives, including the proposed HCP; describe the existing environment conditions that could be affected by each alternative; and will analyze the potential effects of each alternative on the environment.

To submit written comments, please use one of the following methods and note that your comment is in reference to the South Sacramento Habitat Conservation Plan (SSHCP):

• *U.S. Mail*: Nina Bicknese, Senior Fish and Wildlife Biologist, U.S. Fish and Wildlife Service, Sacramento Fish and Wildlife Office, 2800 Cottage Way, Room W-2605, Sacramento, CA 95825.

South Sacramento Habitat Conservation Plan

Please help us prepare the EIS/EIR for a South Sacramento Habitat Conservation Plan.

We need your help. The County of Sacramento and U.S. Fish and Wildlife Service are working together to prepare a joint Environmental Impact Statement/Environmental Impact Report (EIS/EIR) that will analyze impacts of a Habitat Conservation Plan (HCP) proposed for south Sacramento County. The HCP will provide a framework under the Endangered Species Act to help local communities accommodate development while conserving plant and animal species. The Draft EIS/EIR is expected to be publicized by the spring of 2014.

What is your role during this public scoping process?

Your help is needed to inform the County and the Service of the important issues you want studied in the EIS/EIR. Please focus your comments on:

- Potential impacts that the EIS/EIR should study in depth.
- Problems the proposal may cause, and ways to solve them.
- Better, more effective mitigation measures.
- Suggestions for reasonable alternatives to the proposal.
- Questions you want addressed in the EIS/EIR
- Specific habitat locations inside the Urban Development Area that you think should be preserved.

Please make your comments as specific as you can.

Sometimes participants identify issues during scoping meetings that are too broad to be useful for EIS/EIR analytical purposes - For example, "cultural impacts" - what does this mean? What precisely are the impacts or issues that you want examined? When we encounter a comment as broad as this, we have to guess about what you meant, and you may find that your issues are not covered in the EIS/EIR. Thus, you should refine broad general topics, and specify which issues need evaluation and analysis.

South Sacramento Habitat Conservation Plan

What information will the Draft EIR/EIS contain?

- Descriptions of a proposed HCP and alternative HCPs under consideration.
- A detailed analysis of direct, indirect, and cumulative impacts of all HCP alternatives on the human and environmental resources that you identify in your scoping comments.
- Resources and topics that will be analyzed in the draft EIS/EIR may include, but may not be limited to: Soils, Hydrology, Water Quality, Land Use, Mining, Agriculture, Wildlife and Plants, Wetlands, Cultural Resources, Socio-economics, Public Services, and Transportation.

Public Comment: What's Next?

- Your scoping comments and the comments others submit will appear in a Scoping Report. The report will be available this winter on the South Sacramento HCP web site: *www.per.saccounty.net/ PlansandProjectsInProgress/Pages/SSHCPPlan.aspx*
- You will have opportunities to provide additional comments in the spring of 2014 when the Draft EIS/EIR is expected to be released for public review.

Please submit your written comments from this scoping meeting, the Notice of Preparation (NOP), or the Notice of Intent (NOI) **before December 13, 2013 to:**

South Sacramento Habitat Conservation Plan

Environmental Review Process – EIS/EIR

Comment Card

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please tell us of any potential impacts that should be studied, any alternatives or mitigating measures that offer promise, any problems or issues the proposed plan may cause, or your recommendations for improving the proposed plan. It helps us if you are specific.

Would you like to be added to the SSHCP mailing list? □ Yes □ No

If so, please provide your contact information.

SCOPING MEETING NOTES

Meeting Title:	Scoping Meeting #1
Meeting Date:	November 20, 2013
Location:	Galt Police Headquarters, Galt, California
Attendees:	**County of Sacramento:** Marianne Biner, Rich Radmacher, Bill Ziebron **USFWS:** Nina Bicknese **Dudek:** Sarah Lozano **Ascent:** Sean Bechta Members of the public

1. Can the powerpoint and maps shared at tonight's meeting be provided to the public through the County's Website?
2. Provide a rationale for why species were dropped between the 2008 and 2013 HCP efforts.
3. What does it mean to "take" a species or its habitat?
4. How will the HCP and HCP EIS/EIR public comment period and approval process proceed?
5. How can the public get involved with this process? How can the public get minutes from the LAWG and RAWG meetings?
6. Why won't the use of eminent domain be utilized during implementation of the HCP?
7. To what extent will the construction of new water delivery structures/systems be evaluated in the cumulative impacts analysis? Similarly, will the EIS/EIR evaluate indirect effects/impacts on water resources?
8. How do existing or proposed mitigation banks relate to the proposed HCP?
9. How can farmland coexist with preserves?
10. What role will PMC play in the EIS/EIR?

Notes prepared by Sarah Lozano, Dudek, December 3, 2013

South Sacramento HCP/NCCP/EIS/EIR
Subject: EIS/EIR Scoping Meeting Notes

MEETING NOTES

Meeting Title:	Scoping Meeting #2
Meeting Date:	November 21, 2013
Location:	Governor's Office of Planning and Research, Sacramento, California
Attendees:	**County of Sacramento:** Marianne Biner, Cathy Hack, Rich Radmacher, Bill Ziebron **USFWS:** Nina Bicknese **USACE:** Mary Pekenham-Walsh **Dudek:** Sarah Lozano **Ascent:** Curtis Alling, Claudia Funari Members of the public

1. Who are the CEQA/NEPA lead/cooperating agencies?
2. What role will CDFW plan in this process? What action will CDFW take on the HCP?
3. Will there be a cumulative effects/impacts analysis?
4. What alternatives would be evaluated in the EIS/EIR? Can the area of mitigation for originally proposed for Swainson's hawk be considered once again? Similarly, the eastern and western portions of the Plan Area differ in importance to Swainson's hawk, therefore, can the conservation for Swainson's hawk be concentrated east of I-5 as much as possible?
5. Mitigation in the area west of I-5 and west of Stodgrass Slough may not be effective or a good long term solution because these areas are below sea level.
6. How will the HCP be financed? How will the Plan Partners Regulatory Agencies factor in inflation over the life of the permit?
7. Will the ratio for Swainson's hawk mitigation be 1:1 and dependent on the land cover type?
8. Is grazing land considered "agriculture" or "annual (non-native) grassland"?
9. Will the powerpoint and maps shared at today's meeting be available on the County's website? And if, so, by when?

Notes prepared by Sarah Lozano, Dudek, December 3, 2013

Notice of Preparation

October 28, 2013

To: Reviewing Agencies

Re: South Sacramento Habitat Conservation Plan (SSHCP)
SCH# 2008062030

Attached for your review and comment is the Notice of Preparation (NOP) for the South Sacramento Habitat Conservation Plan (SSHCP) draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Catherine Hack
Sacramento County
827 Seventh Street, Room 220
Sacramento, CA 95818

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Re: Notice of Preparation of the Draft Environmental Impact Report for South Sacramento Habitat Conservation Plan # 2003-PLE-0637

DAVID BROWN, MANAGER

2013 BOARD OF TRUSTEES

The Sacramento-Yolo Mosquito and Vector Control District (District) appreciates the opportunity to review and comment on the Notice of Preparation of the Draft Environmental Impact Report for South Sacramento Habitat Conservation Plan (SSHCP).

The District has reviewed the SSHCP and is providing comments and concerns relating to the preparation of the Environmental Impact Report (EIR) to be incorporated into the Plan.

General Comment:
Drawing on previous work by the Central Valley Joint Venture Working Group, the District has compiled and published a list of Mosquito Reduction Best Management Practices (BMPs) for a variety of land uses including managed wetlands, habitats, and preserves. The SSHCP should reference the BMP manual for BMP implementation on all preserve areas in an effort to reduce mosquito breeding and subsequent pesticide applications. The Districts' BMP Manual may be viewed and downloaded from our website at: http://www.fightthebite.net/physical-control. Furthermore, the SSHC must recognize that in certain instances the HSC may be the more restrictive of landowner regulatory requirements, thus requiring BMP implementation to reduce mosquito breeding

The following are comments relating to specific issues contained within the SSHCP:

Chapter 5.6.1 *Land Management and Monitoring*
Comment: Please include Drainage Maintenance and BMP Implementation to the list of management activities. (BMP Manual)

Chapter 6.6.2 *Avoidance and Minimization Measures*
Comment: Add AMM 16 – Implement Mosquito Reducing BMPs in all designs, management and construction plans.

Chapter 6.6.3 *Avoidance and Minimization Analyses*
Comment: Page 6-63 paragraph 3 - "*No vehicle access or traffic would be able to access preserves.*" Please ensure that District has the appropriate provisions contained within the SSHCP to allow for District access to all preserve and buffer areas.

Chapter 6.7.1 *Excavation Activities, Table 6-46*
Comment: Every year the District works with the appropriate permitting agencies and landowners to remove multiple beaver dams and related blockages that are causing immediate mosquito breeding. The cubic yard removal thresholds for these public health threats may exceed the limits provided by the SSHCP. Please include a recognition of the impacts to public health caused by beaver dams and other blockages, and by following the provisions contained in this SSHCP, allow these dams to be removed in excess of the allowable cubic yards on an as needed basis.

Chapters 6.8.2/ 6.8.3 *page 6-84 and 6-87 Uses and Activities Not Permitted Within Stream Buffer Zones*
Comment: Add to the exception list under *"clearing or cutting of riparian woodland vegetation"* - Vegetation removal for the purpose of mosquito control and BMP implementation.

Chapter 7 *Draft SSHCP Conservation Strategy, p7-180 Tri-Colored Blackbird*
Comment: Paragraph 4 discusses possible threats to the species. Please document all unsubstantiated claims with scientific and supportive evidence, and utilize current research as it pertains to mosquito control for all species.

Appendix M – *Restoration and Creation Guidelines*
Comment: Please add a section under *Project Design* to include a requirement to reference, construct, and manage any habitat restoration or creation projects following the Districts BMP manual.

While many of the potential impacts remain unknown at this time, failure to address mosquito breeding issues during the planning, construction, and management process of aquatic habitats may result in enforcement actions to the landowner. The District has the authority to abate a public nuisance as defined in Section 2010 of the California Health and Safety Code (HSC) and may pursue enforcement actions pursuant to Sections 2060 of the HSC which can involve civil fines of up to $1000/per day.

The District remains committed to working with and assisting the SSHCP's Federal, State, and Local permitting agencies as well as local landowners to develop reasonable mosquito control measures as site specific projects are implemented and managed. It is important to include mosquito control operations as an integral component of the overall SSHCP to ensure effective mosquito control over the life of this permit. Please do not hesitate to contact me at 916-405-2085 with any questions or concerns as the SSHCP continues to be developed.

Sincerely,

Marty Scholl

Attn: Herb Garms

Dear Mr. Garms,

I have attached the 2013 monitoring report, which references the Conservation Easement on your Milgate Associates L.P. property that was recorded on November 29, 2012 and the Baseline Documentation Report (BDR) completed in October 2012.

Section 10 of your Conservation Easement requires you to give notice to SVC if you are planning on selling your property or transferring an interest in your property. SVC reminds you of this requirement to make sure we can fulfill our responsibilities in the easement and so we can promptly communicate with any new owners.

We had a lovely day monitoring the property and I greatly appreciate the CE boundary markers you placed. SVC appreciates the opportunity to work with you to protect the special resources on your property. We hope to see you at our upcoming events. For a full list of events visit our website at www.sacramentovalleyconservancy.org.

Please call or email me if you have any questions concerning this report.

Sincerely,

Lucie A. Adams

Telephone: (916) 358-2912

Purpose

The Milgate Conservation Easement Area possesses wildlife and habitat values of great importance and includes oak woodlands, oak grasslands and natural habitat for Swainson's hawk (*Buteo swainsoni*). This Conservation Easement Deed for Oak and Hawk Habitat on Agricultural Land and Agreement Creating Enforceable Restrictions in Perpetuity protects 78.68 acres of oak tree canopy and grasslands as Swainson's hawk (*Buteo swainsoni*) habitat as mitigation requirements by Sacramento County. The area protected by the Conservation Easement will offset the loss of oak tree canopy and Swainson's hawk foraging habitat for the proposed development Easton Place and Glenborough at Easton. Both Sacramento County and the California Department of Fish and Wildlife have approved the establishment of the mitigation.

The purpose of the Conservation Easement is to identify, protect, sustain and forever protect the Conservation Values (oak woodlands, oak grasslands and natural habitat for Swainson's hawk) from impairment by retaining the Easement Area predominantly in its agricultural and open space condition. The Conservation Purposes will be achieved through continues agricultural uses of the easement as provided in the Covenants, Terms, Conditions and Restriction of the Conservation Easement Deed.

Location

The property is located in the northeast section of Sacramento County, south of the city of Folsom. The entrance to the Easement Area is approximately 4.4 miles south on Scott Road from its intersection with White Rock Road. Access to the property is through a locked gate on the east side of Scott Road just past the bridge at Carson Creek.

Description of Uses

The Easement Area consists of annual grassland and oak woodlands and is used for livestock grazing and is part of the larger 3000 acre Barton Ranch. The 78.68 acre Milgate Easement is directly adjacent to the 241 acre Barton-Mosher Conservation Easement. Together they create a 320 acre area of Conservation Easements on the Barton Ranch.

The Easement Area has been owned by the Barton family since the late 1800's. The original homestead is north of the entrance to the Easement Area. Approximately 75 head of cattle graze the property from November to May.

A portion of the Conservation Area is reserved for the future development of a public recreational trail. The future trail is part of a plan for a public trail system connecting the American and Consumnes Watersheds to include 10,000 acre recreational wildlife habitat corridor.

Man made alterations

The Easement area contains a double track dirt road and numerous single track trails. East of the Easement area is Wall Town, an abandoned mining town. Along the eastern section of the Easement Area are several disturbed areas from past mining operations. Barbed wire fencing is adjacent to the eastern and northern boundaries and in other portions of the Easement Area. The Easement Area has been surveyed and boundaries and corners have been marked with metal t-posts.

Are restrictions in the Conservation Easement being complied with?

Yes, I observed property to be in compliance with the easement and management plan.

The property is in good condition. All gates and fences are in good condition. There is no sign of public access, illegal dumping of trash, or excavation on the property. No buildings and no paving or impervious materials was observed. No road building or alteration of the topography was observed. No equipment or fuel storage was observed. No unseasonable watering or use of fertilizers, herbicides or pesticides was observed. There is no off road vehicle disturbance.

Preserve Manager Comments:

Herb Garms, Ranch Manager, said everything went well this year and he had little to report. Herb said about 75 head of cattle graze on the total 3000 acres. Herb has had no trouble with dumping and only occasional trespassing from people wishing to fish in Carson Creek.

Other Observations:

Residual Dry Matter values were between 700 -1500 lbs/acre.

Date of Inspection and Method: November 7, 2013

The SVC monitors parked on the ranch road heading north, and walked to all the photo points. Monitors began at PP 4 and then followed the green t- post stakes marking the easement boundary to PP 3, 2 then 1.

Weather: Sunny, warm and clear

Photo Log:
Photo reference is from the Milgate Associates L.P Conservation Easement Baseline Documentation Report (October 2012). Photo point (PP).

RE: South Sacramento Habitat Conservation Plan NOP, SCH# 2008062030

Dear Ms. Hack:

This letter responds to your Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) for the South Sacramento Habitat Conservation Plan (SSHCP) and its request for comments on the scope and content of the environmental information that is relevant to our agency's responsibility in connection with the proposed project.

State law specifically directs the DSC to provide "advice to local and regional planning agencies regarding the consistency of local and regional planning documents with the Delta Plan" (Water Code sec 85212). The Delta Stewardship Council adopted the Delta Plan on May 16, 2013, and the Plan's regulatory policies became effective on September 1, 2013. The Delta Plan, including its policies and recommendations, should be acknowledged in the EIR's description of the project's environmental setting.

The NOP's project summary states that the South Sacramento Habitat Conservation Plan "identifies urban development and public infrastructure projects within an Urban Development Area (UDA) and defines mitigation and avoidance measures for covered species and habitat that will be affected by the covered activities identified in the SSHCP." The NOP indicates that the covered activities may include the construction, installation, or extension of:

- Private development projects.
- Surface and groundwater delivery facilities.
- Water treatment facilities.
- Sewer and recycled water treatment and conveyance facilities.
- Solid waste sanitation facilities.
- Public facilities (police station, hospitals, schools, community centers, and administration centers).
- Indoor and outdoor recreation facilities.
- Energy utility facilities.
- Aggregate mining activities.
- Habitat management activities.

"Coequal goals" means the two goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem. The coequal goals shall be achieved in a manner that protects and enhances the unique cultural, recreational, natural resource, and agricultural values of the Delta as an evolving place."
– CA Water Code §85054

We recommend the following matters be discussed or included in the EIR:

- **Inconsistencies with the Delta Plan.** The EIR should discuss any inconsistencies between the project and the Delta Plan, as required by 15125(d) of the CEQA Guidelines. Note, too, that the CEQA Guidelines' Appendix G states that a project that is inconsistent with any applicable land use plan, policy, or regulation may result in a finding of significant impact on biological resources.

- **Agricultural Resources:** The EIR should include an analysis of the potential loss of agricultural land in the Delta caused by urban development covered by the SSHCP. Delta Plan Policy **DP P1** (23 CCR Section 5010) states that new residential, commercial, or industrial development is permitted outside the urban boundaries only if it is consistent with the land use designated in the relevant county general plan. It is intended to strengthen existing Delta communities while protecting farmland and open space, providing land for ecosystem restoration needs, and reducing flood risk. Please quantify the areal extent of the proposed UDA within the Delta, and discuss any potential impacts to agricultural resources.

- **Biological Resources:** The NOP states that the EIR will identify any potential impacts of the SSHCP on biological resources. Delta Plan Policy **ER P2** (23 CCR Section 5006) states that habitat restoration must be carried out consistent with Appendix 3 of the Delta Plan regulations, which is an excerpt from the California Department of Fish and Wildlife's Draft Ecosystem Restoration Program *Conservation Strategy*, which calls for restoring habitats at appropriate elevations. Further guidance is provided by Delta Plan Recommendation **ER R2**, which states, for the Cosumnes-Mokelumne Confluence, "Allow these unregulated and minimally regulated rivers to flood over their banks during winter and spring frequently and regularly to create seasonal floodplains and riparian habitats that grade into tidal marsh and shallow subtidal habitats."

  The Delta Plan establishes six habitat restoration areas in the Delta, one of which, the Cosumnes-Mokelumne Confluence, is located within the SSHCP Plan Area. Delta Plan Policy **ER P3** (23 CCR Section 5007) calls for protecting opportunities to restore habitat in these areas. More specifically, the policy states that "significant adverse impacts to the opportunity to restore as described in section 5006 must be avoided or mitigated." Potential mitigation measures could include elevating facilities so that water can flow underneath to allow for future restoration of habitats dependent on tides or periodic flooding, or locating facilities at the edge of the restoration area, rather than in the middle, to improve opportunities for restoring habitat connectivity. The mitigation shall be determined, in consultation with the California Department of Fish and Wildlife, considering the size of the project area and the type and value of habitat that could be restored in that area.

  We recommend that the EIR analysis include the impact of any urbanization or the placement of permanent agricultural easements on the opportunity to restore these types of habitat within the Delta Plan's Cosumnes-Mokelumne Confluence area.[1] The EIR should assess impacts to the opportunity to restore these areas for the habitat uses encouraged by the Delta Plan or the conservation measures recommended in the draft Bay Delta Conservation Plan.

[1] The boundaries of the priority habitat restoration areas are depicted in Appendix 5 of the Delta Plan regulations.

Delta Plan Policy **ER P5** (23 CCR Section 5009), calls for avoiding introductions of and habitat improvements for invasive nonnative species. It states, "The potential for new introductions of or improved habitat conditions for nonnative invasive species, striped bass, or bass must be fully considered and avoided or mitigated in a way that appropriately protects the ecosystem." The EIR should analyze the project's potential to introduce or improve habitat for nonnative invasive species.

- **Hydrology:** The NOP states that the EIR will analyze hydrology, which we presume includes flooding. The Delta Plan contains three policies that are most relevant to the County's consideration of this issue: Policy **RR P2** (23 CCR section 5013) requires flood protection for residential development in rural areas, Policy **RR P3** (23 CCR section 5014) restricts encroachment in floodways, and Policy **RR P4** (23 CCR Section 5015) restricts encroachments in floodplains, including the Cosumnes-Mokelumne Confluence.[2] Policy **RR P4** states that "no encroachment shall be allowed or constructed unless it can be demonstrated by appropriate analysis that the encroachment will not have a significant impact on the floodplain values and functions."

  In addition, the Delta Plan contains a recommendation (**RR R6**) encouraging the Central Valley Flood Protection Board to evaluate designating additional floodways. Flood risk reduction should be included as a factor when evaluating various conservation and development scenarios. We recommend that the EIR include analysis of potential conflicts between proposed activities in the SSHCP and the implementation of the project.

Other matters for your consideration

The Delta Reform Act specifically established a certification process for compliance with the Delta Plan's regulatory policies (See attachment on Covered Actions for details). According to the Delta Reform Act, it is the state or local agency approving, funding, or carrying out the project that must certify consistency with the Delta Plan. This certification is subject to appeal to the DSC. Should you determine the South Sacramento Habitat Conservation Plan is a covered action, a way to streamline the process and make full use of the EIS/EIR is to include the information and analysis needed to support the certification of Delta Plan consistency within the EIS/EIR, potentially including a draft certification as an appendix to the EIS/EIR.

Please also note that the final EIR for the Delta Plan includes a Mitigation Monitoring and Reporting Plan that describes the mitigation required for covered actions. If you should determine the South Sacramento Habitat Conservation Plan is a covered action, it would be affected by the Delta Plan's Policy **G P1** (23 CCR Section 5002(b)(2)), which states, "Covered actions not exempt from CEQA must include applicable feasible mitigation measures identified in the Delta Plan's Program EIR or substitute mitigation measures that the proposing agency finds are equally or more effective."

I encourage you to contact Jessica Davenport at jdavenport@deltacouncil.ca.gov or (916) 445-2168 with your questions, comments, or concerns. We would like to work with you to ensure the consistency of the South Sacramento Habitat Conservation Plan with the Delta Plan while also avoiding, minimizing or mitigating potential environmental impacts and we look forward to continued coordination between our agencies to further our related efforts. We are available to continue discussions about how to ensure that your project is consistent with the Delta Plan.

---

[2] RR P4 refers to the "Cosumnes River-Mokelumne River Confluence, as defined by the North Delta Flood Control and Ecosystem Restoration Project (McCormack-Williamson), or as modified in the future by the Department of Water Resources or U.S. Army Corps of Engineers."

South Sacramento Habitat Conservation Plan (SSHCP)—Notice of Preparation (NOP)

Dear Ms. Hack:

Thank you for including the California Department of Transportation (Caltrans) in the review and comment process for the South Sacramento Habitat Conservation Plan (Plan) NOP. The Plan proposes a regional conservation strategy to provide private and public projects with streamlined, predictable federal and state permitting processes while creating a comprehensive and regional preserve system to protect habitat, open space, and agricultural lands through avoidance and mitigation of impacts. The geographic location of the Plan includes 374,000 acres within south Sacramento County (unincorporated area) and the cities of Rancho Cordova, Elk Grove, and Galt. Generally the Plan limits are United States Highway (US) 50 to the north, the Sacramento River levee and County Road J11 to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and the San Joaquin County line to the south.

As the responsible agency, Caltrans is committed to coordinate with Sacramento County and the other federal, State, and local partners as the SSHCP is being developed. Please include Caltrans in any interagency working groups that may be formed and provide us with any information on project actions.

If you have any questions regarding these comments or require additional information, please contact Melody L. Friberg, Intergovernmental Review Coordinator, at (916) 263-1625 or by email at: melody.friberg@dot.ca.gov

Sincerely,

Tracey Frost

Subject: Notice of Preparation of A Draft Environmental Impact Report for South Sacramento Habitat Conservation Plan (Control Number 2003-PLE-0637)

Dear Ms. Hack:

Delta Protection Commission (Commission) staff have reviewed the *Notice of Preparation (NOP) of A Draft Environmental Impact Report (EIR) for South Sacramento Habitat Conservation Plan (SSHCP)*. A portion of the project lies within the Primary Zone of the Sacramento-San Joaquin Delta (predominately the land located west of Interstate 5), and is subject to consistency requirements with the Delta Protection Commission's Land Use and Resource Management Plan (LURMP) for the Primary Zone of the Delta.

At this stage in your project we recommend that you review the LURMP to ensure that the EIR is consistent with our goals and policies related to land use, agriculture, natural resources, recreation access, water, levees and utilities infrastructure. You can access the LURMP on our website at: http://www.delta.ca.gov/plan.htm . We also recommend that the following matters be addressed in the EIR:

1. Please note that LURMP Land Use Policy P-2 states: "local governments general plans and zoning codes shall continue to promote and facilitate agriculture and agriculturally-supporting commercial and industrial uses as the primary land uses in the Primary Zone; recreation and natural resources land uses shall be supported in appropriate locations and where conflicts with agricultural land uses or other beneficial uses can be minimized." That said, the NOP

indicates a list of covered activities that may not be supported in the Primary Zone of the Delta. Please specify which covered activities are being proposed in the Primary Zone.

2. The Commission is that the SSHCP "support the long-term economic viability of agriculture; support the continued capability for agricultural operations to diversify and remain flexible to meet changing market demands and crop production technology; and encourage compatibility between agricultural practices and wildlife habitat (LURMP Agriculture Goals, pg. 13)." Please review the LURMP to ensure consistency with the agriculture policies.

3. Please review the DPC's Economic Sustainability Plan (ESP) for the Sacramento-San Joaquin Delta (2011),which is an important document guiding future activities in the legal Delta. Proposals for habitat management activities should consider the recommendations on Economic Sustainability for Agriculture, Recreation and Tourism; and Habitat and Ecosystem Improvements (pg. 274, 276). You can access the ESP on our website at: http://www.delta.ca.gov/Final_ESP_Jan_2012.htm .

Thank you for the opportunity to provide input on the NOP. If you have any questions please contact Raymond Costantino, Associate Environmental Planner, or myself at (916) 375-4800.

Sincerely,

Erik Vink
Executive Director

Comments on NOP for the South Sacramento Habitat Conservation Plan (2003-PLE_0637)

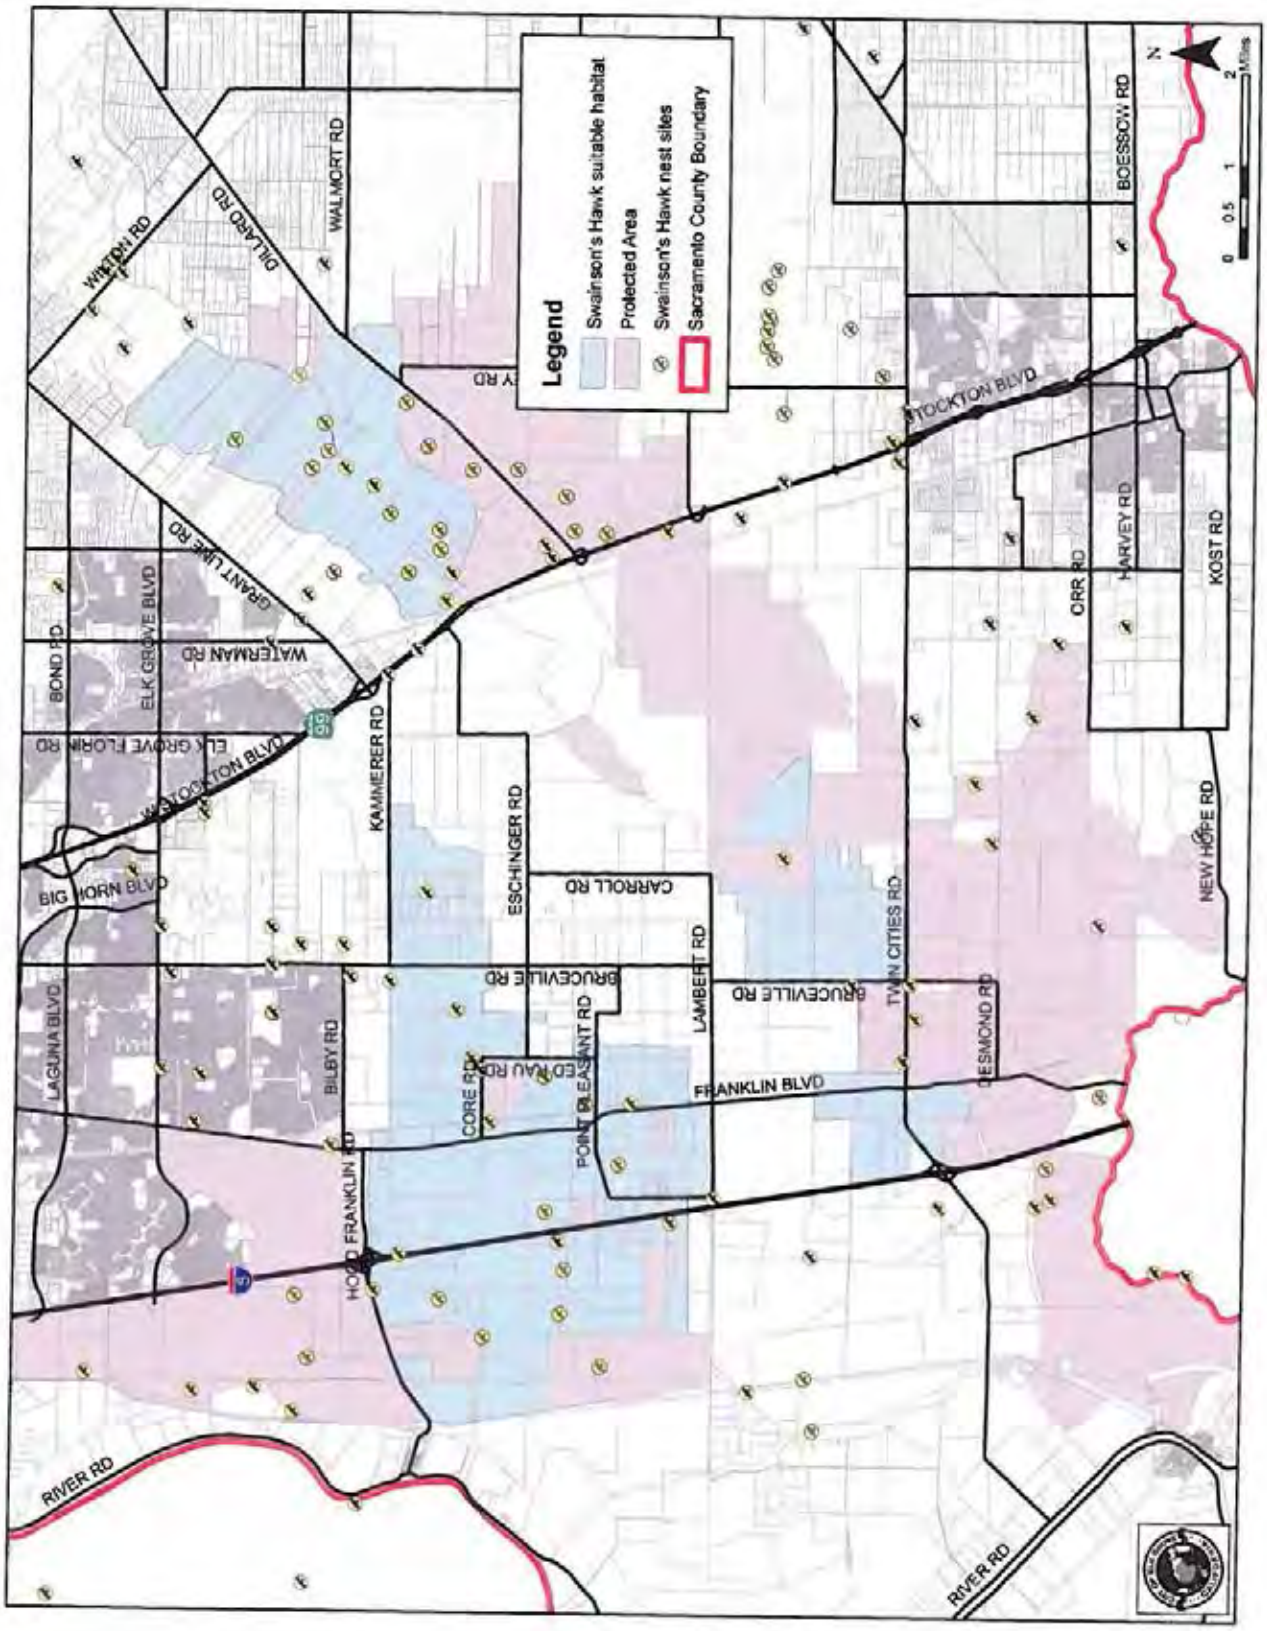
At the Scoping meeting November 21, 2013 I submitted comments orally and in writing. The following comments supplement my previously submitted comments.

1. The DEIR should address the direct, indirect and cumulative impacts on the state listed species, the Swainson's Hawk, in terms of both loss of nesting habitat, nesting pairs, foraging habitat, and the loss of range of a threatened species? An estimated 52 nest sites will be lost; where will these nesting pairs nest? What will be the effect on the species reproduction? What is the anticipated level of direct, indirect and cumulative "take" of this threatened species. Does the EIR serve, as we would expect, as a foundation document for DFW issuance of a 2081 permit for take of Swainson's Hawk?

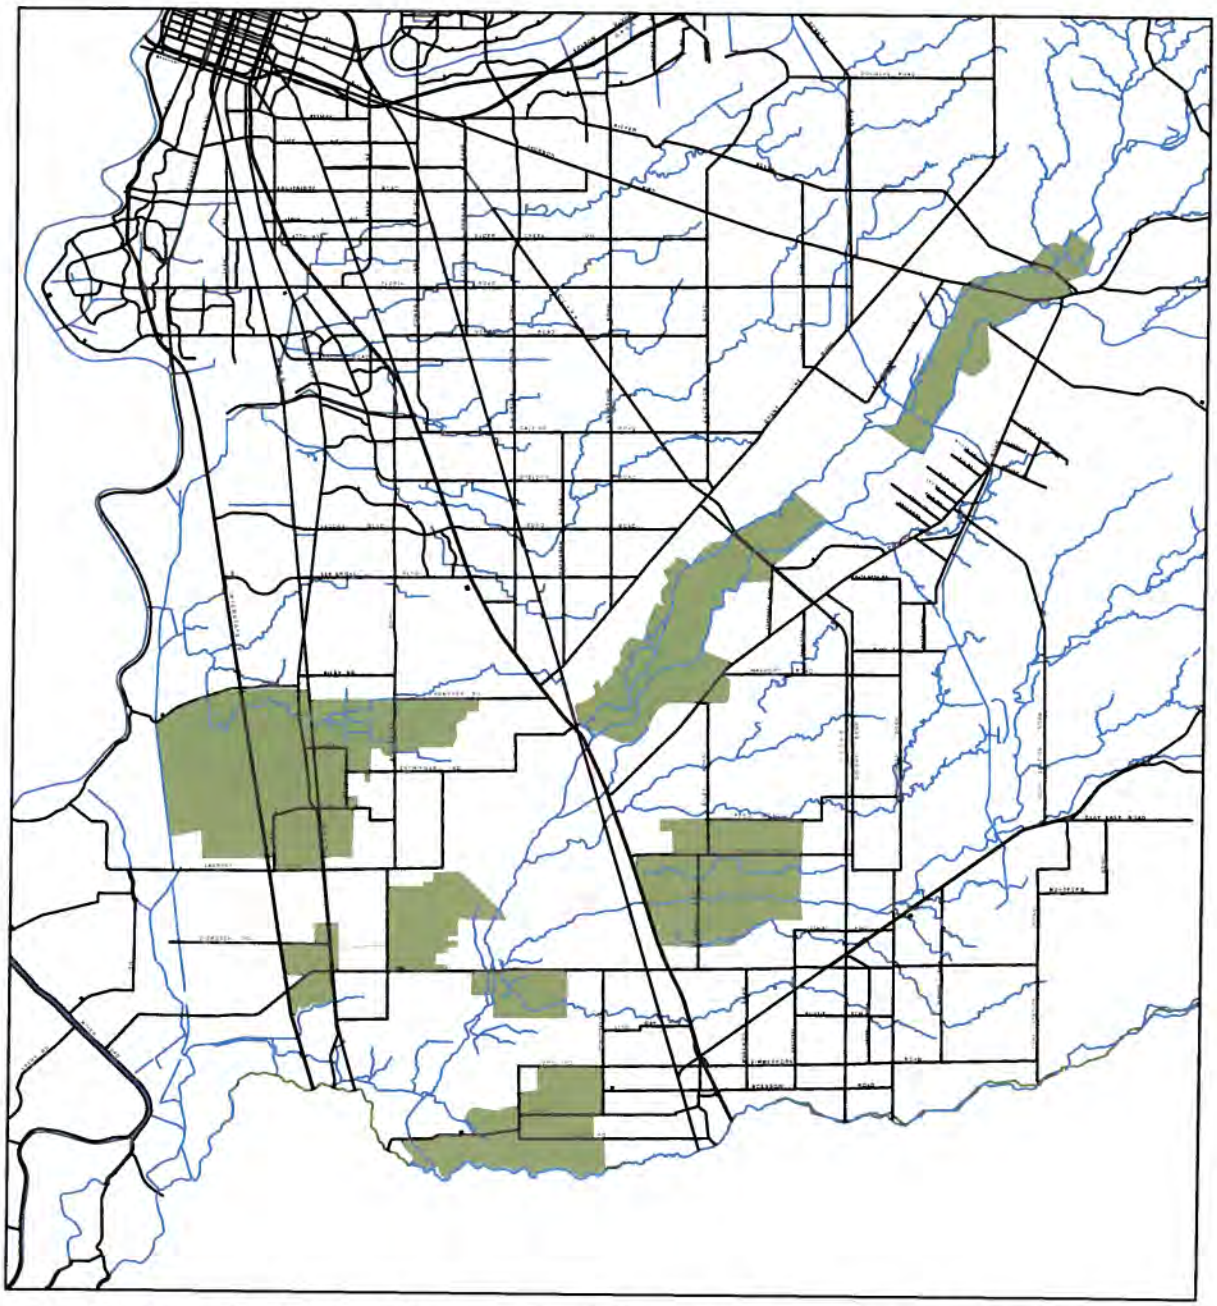
2. What is the comparative quality of the foraging habitat that you expect in the anticipated area of expansion of Swainson's Hawk nesting and foraging? Please compare each of the alternatives with these issues in mind. Please note that the success of

1

Swainson's Hawk reproductive activity and survival of young is directly dependent upon availability of food supply which is reasonably available to nesting hawks during the breeding and nesting season. Destruction of foraging habitat eliminates food supply and forces hawks to travel greater distances to find prey, resulting in less food for the nest and a greater likelihood of nest failure, nestling mortality and reduced reproductive performance.



2. Please do not rely on the CNDDB which is not intended as a census of existing threatened species, but instead use the several recent surveys by California Department of Fish and Wildlife, the City of Rancho Cordova, the City of Elk Grove and records of the County of Sacramento on nesting sites. CNDDB is known to be incomplete by the preparers of the SSCHCP. The CNDDB is not intended by the Department of Fish and Wildlife to be used in CEQA review as a comprehensive inventory.



3. Alternatives. The preferred alternative area of take should be limited to the area within the adopted USB. There are several reasons why this should be the preferred alternative:
1) Areas outside the USB are not included in the federally and state approved plans for transportation and air quality planning and are not planned for urban growth. (SACOG MTP/SCS and SMAQMD Air Quality Plans)
2) The SACOG Blueprint for regional urbanization which anticipates long term growth does not include any anticipated urbanization south of Elk Grove before 2050. The possibility of urbanization after 2050 is far too speculative to consider.
3) The Elk Grove SOIA Final EIR (October, 2013) identified significant and unavoidable biological impacts and other impacts if the Elk Grove SOI was extended to either the 8,000 acres requested, or the Regional Enhanced Alternative (approximately 4000 acres).
4) The Elk Grove SOI Final EIR and LAFCo staff report identifies over 3,000 acres available inside the City limit, and 2,000 acres adjacent to Elk Grove and inside the USB that would be available for annexation and urbanization. For the area inside the USB in the Elk Grove application for expansion, see attachment showing 485 acres is west of 99 and 1477 acres is east of 99 and south of Grant Line Road.) The available 3,000 acres inside the City and the additional 2000 acres inside the USB but outside the City would be more than enough to meet the expected land demand for urban uses in the foreseeable future. There is a 1200 acre vacant, undeveloped and unplanned area within the City which could be zoned entirely for job related uses, but the City has not done so. SACOG also said in its July 2013 comment letter on the SOI proposal that the area outside the City but inside the USB "is the next logical extension of the City of Elk Grove SOI."
5) The Sacramento LAFCo Commission denied Elk Grove's application to expand its Sphere of Influence into the area south of Elk Grove (vote of 5-2 on November 6, 2013). The reasons given by the Commissioners included lack of consistency with regional planning for infrastructure, particularly concern for water supply, need to protect farmland, biological impacts, and availability of ample opportunity within Elk Grove's current city limits to develop urban uses desired by Elk Grove. We can provide further documentation of what Commissioners said were reasons for denial if this information would be helpful.

6) The area south of Elk Grove has been identified in the past by DFW, County and City of Elk Grove, as a prime area for mitigation for take of Swainson's Hawk foraging habitat inside the USB. (See attached maps)
7) If land south of Elk Grove is not included in the area of mitigation, owners in this area will be denied the opportunity to voluntarily sell their land or conservation easements for mitigation, and the pool of available land to mitigate for Swainson's Hawk impact will be diminished with serious consequences for both the economics and the feasibility of the plan as well as the rights of landowners in this area.

Thank you for considering our comments on the NOP.

Potential Swainson's Hawk Mitigation Areas

Disclaimer: The green regions on this map represent information provided to the Planning Department from the California Department of Fish and Game. The purpose is to guide project applicants in selecting areas for potential Swainson's Hawk mitigtion lands. Not all areas shown in green will be acceptable, however the green regions represent geographic areas where there is a high likelyhood that a particular parcel will be approved for Swainson's Hawk mitigation. It is possible that areas outside the green regions will be approved as mitigation as well. All requests for approval of a particular parcel for mitigation should be directed to the Planning Department. A form and instructions to request approval of a parcel(s) for mitigation is available at www.saccounty.net/planning/swainsons-hawk-ordinance/index.html.

- Environmental Analysis Overview
- Roundtable Questions and Comments from Agencies
- Next Steps/Schedule

South Sacramento Habitat Conservation Plan

Environmental Review Process – EIS/EIR

Comment Card

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please tell us of any potential environmental topics that should be studied, any alternatives or mitigating measures that offer promise, any problems or issues the proposed plan may cause, or your recommendations for improving the proposed plan. It helps us if you are specific.

Alternatives – Analysis include original boundary of I-5 alternative with higher mitigation ratio for SWH

Analysis of take – " "

Include future reproductive potential of current known nest sites of Swainson's hawk because of loss of foraging habitat

Include potential impact on nesting sites outside plan area within 2-5 miles because of loss of foraging habitat

Include loss of nourishment to migrating Swainson's hawks, esp juvenile

Available data – use all available data on nesting Swainson's hawks nesting in Sac County

How to assure that SWH habitat loss is mitigated by preservation of land at 1:1 ratio – & and quality is adequate to ensure no loss of range of Swainson's hawk?

Would you like to be added to the SSHCP mailing list? ☒ Yes ☐ No

If so, please provide your contact information.

Subject: South Sacramento HCP NOP comments

Ms. Bicknese,

Please accept the following NOP comments:

1. The EIR/EIS should address the potential impact if cities within the HCP area either opt out of the HCP at a later date, and/or independently acquire mitigation lands (inside or outside of their jurisdiction) to reserve that land as mitigation for development projects occurring within their own jurisdiction.

For example, several years ago the City of Elk Grove purchased Swainson Hawk mitigation land outside of their proposed Sphere of Influence and adopted a policy to reserve that land for development projects within their jurisdiction. If this trend were to continue, the EIR should address the problems associated with competing territorial mitigation lands undermining the HCP's effort to acquire mitigation lands to support regional development.

2. If approved, the HCP and related ITP seems to apply to a wide range of activities that could be mitigated to an accepted level of protection for listed species. This appears to be a convenient approach for the benefit of development in the region. However, the EIR/EIS should discuss the mechanisms that are/are not in place to ensure that those approved activities comply either individually or cumulatively with the federal EPA air quality standards for the region.

Wouldn't deteriorating air quality (and the ability of member jurisdictions to easily adopt CEQA Statements of Overriding Considerations) eventually jeopardize the sustainability of the habitat of the species this HCP is intended to protect (not to mention human health)?

3. The EIR/EIS should discuss the time lag that will likely exist between the pace of new development (the immediate loss of habitat) and the timing of acquisition of new, replacement mitigation land. Can eminent domain ever be used to assist in purchasing new land if the time gap between immediate loss of habitat and the acquisition of new habitat ever becomes unacceptable? What measures will be adopted to ensure that the impact fees will always correlate with the market prices of mitigation land?

4. The EIR/EIS should summarize the regional allocation of water within the HCP area and the known projects that are awaiting approval of the HCP.
To the extent that any existing and/or future habitat may rely upon water on the site (or immediate vicinity), the EIR/EIS should discuss the potential for land owners to sell/ransfer water rights that may have an adverse impact to species protection.

5. The EIR/EIS should clearly articulate the processes that would be involved if the HCP is being subjected to an amendment request. The public is interested in assessing the political arena in which this final document will exist so we may be confident in the HCP's ability to provide long-term protection of the species in the region.

Thank you,

Lynn Wheat

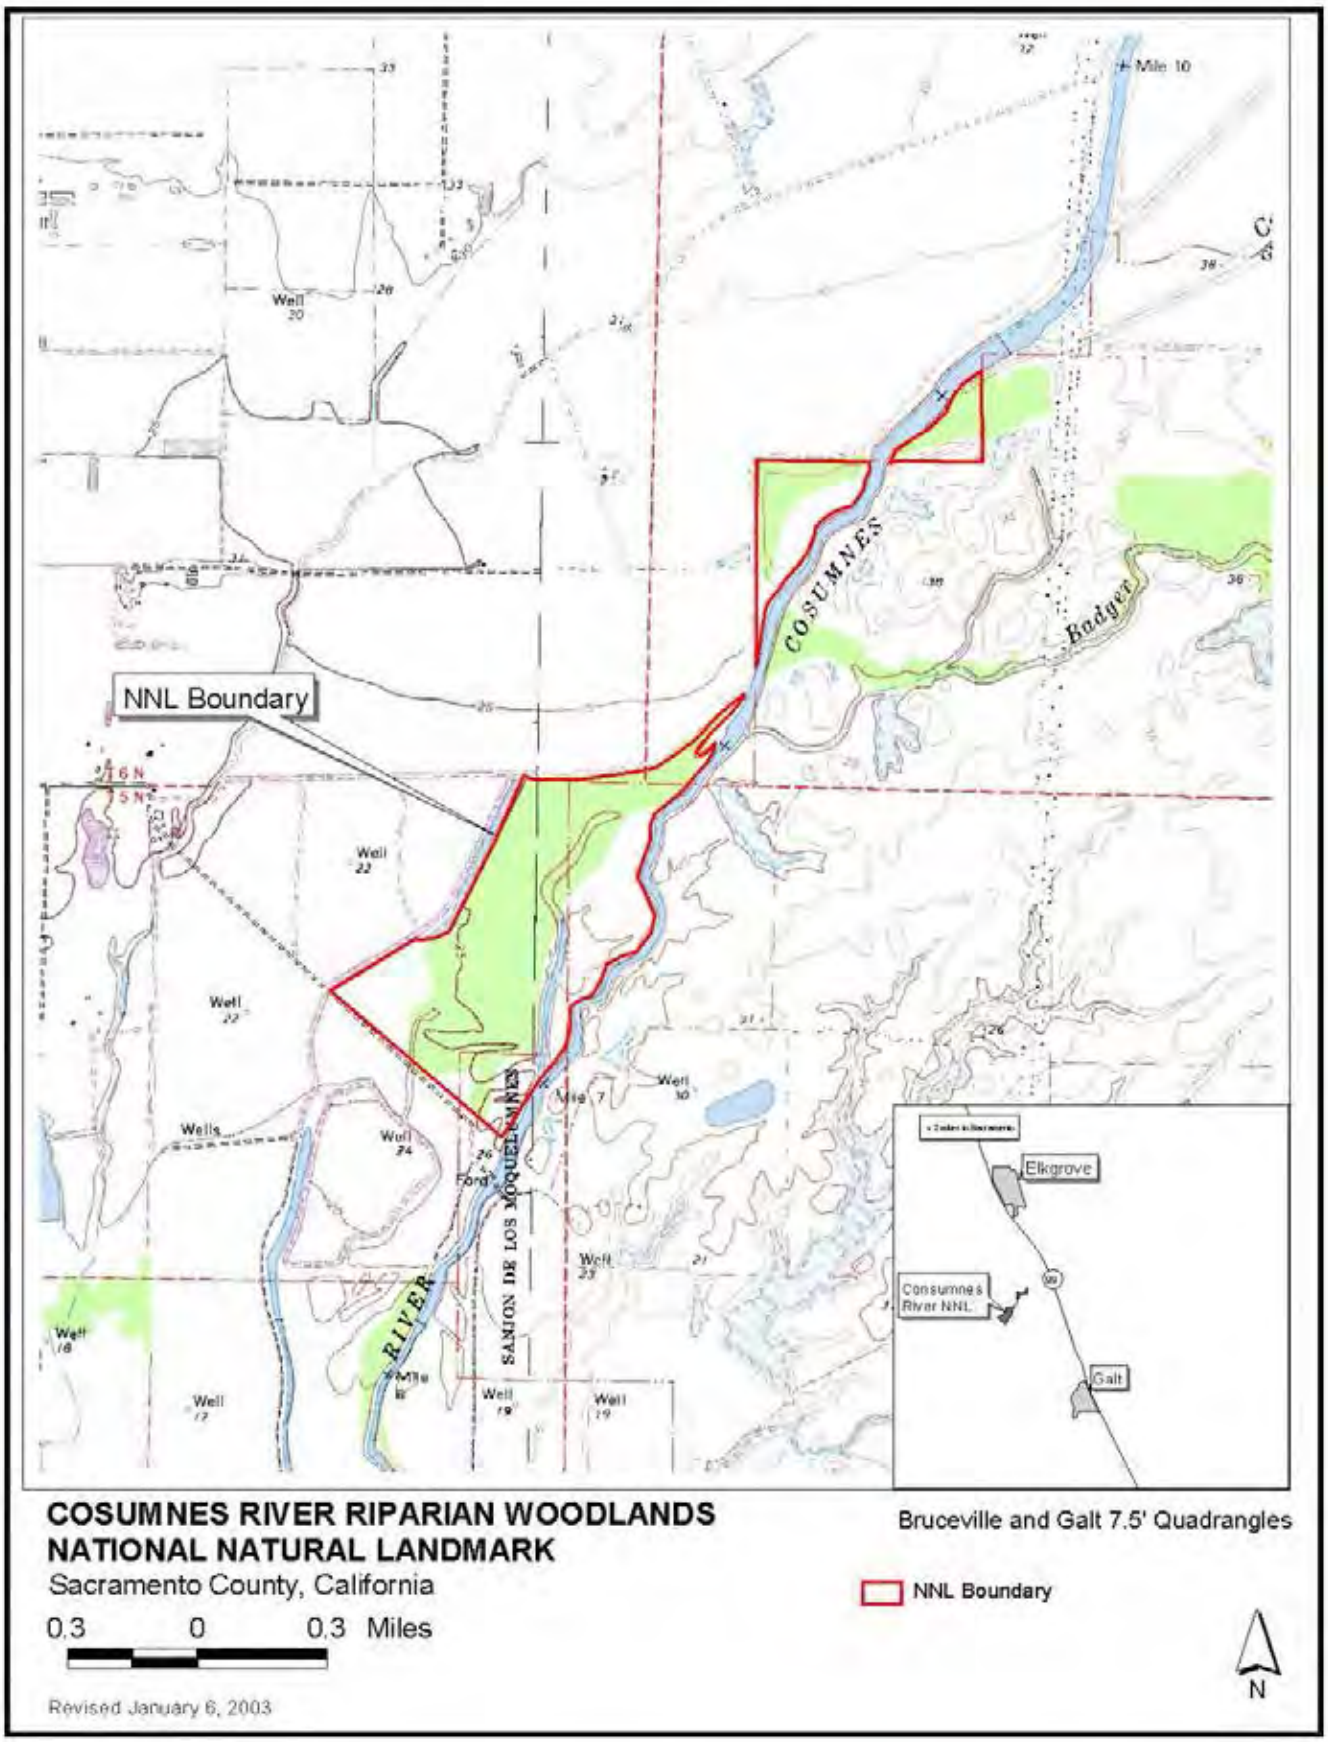
Subject: National Park Service Comments on Notice of Intent to Prepare EIS/EIR: Habitat Conservation Plan for South Sacramento County, California

We commend the U.S. Fish and Wildlife Service (USFWS) and County of Sacramento, California on their intent to prepare cooperatively a Habitat Conservation Plan for South Sacramento County. Thank you for the extension in time and opportunity to provide comments on the above subject, and we hope our comments that follow will be helpful.

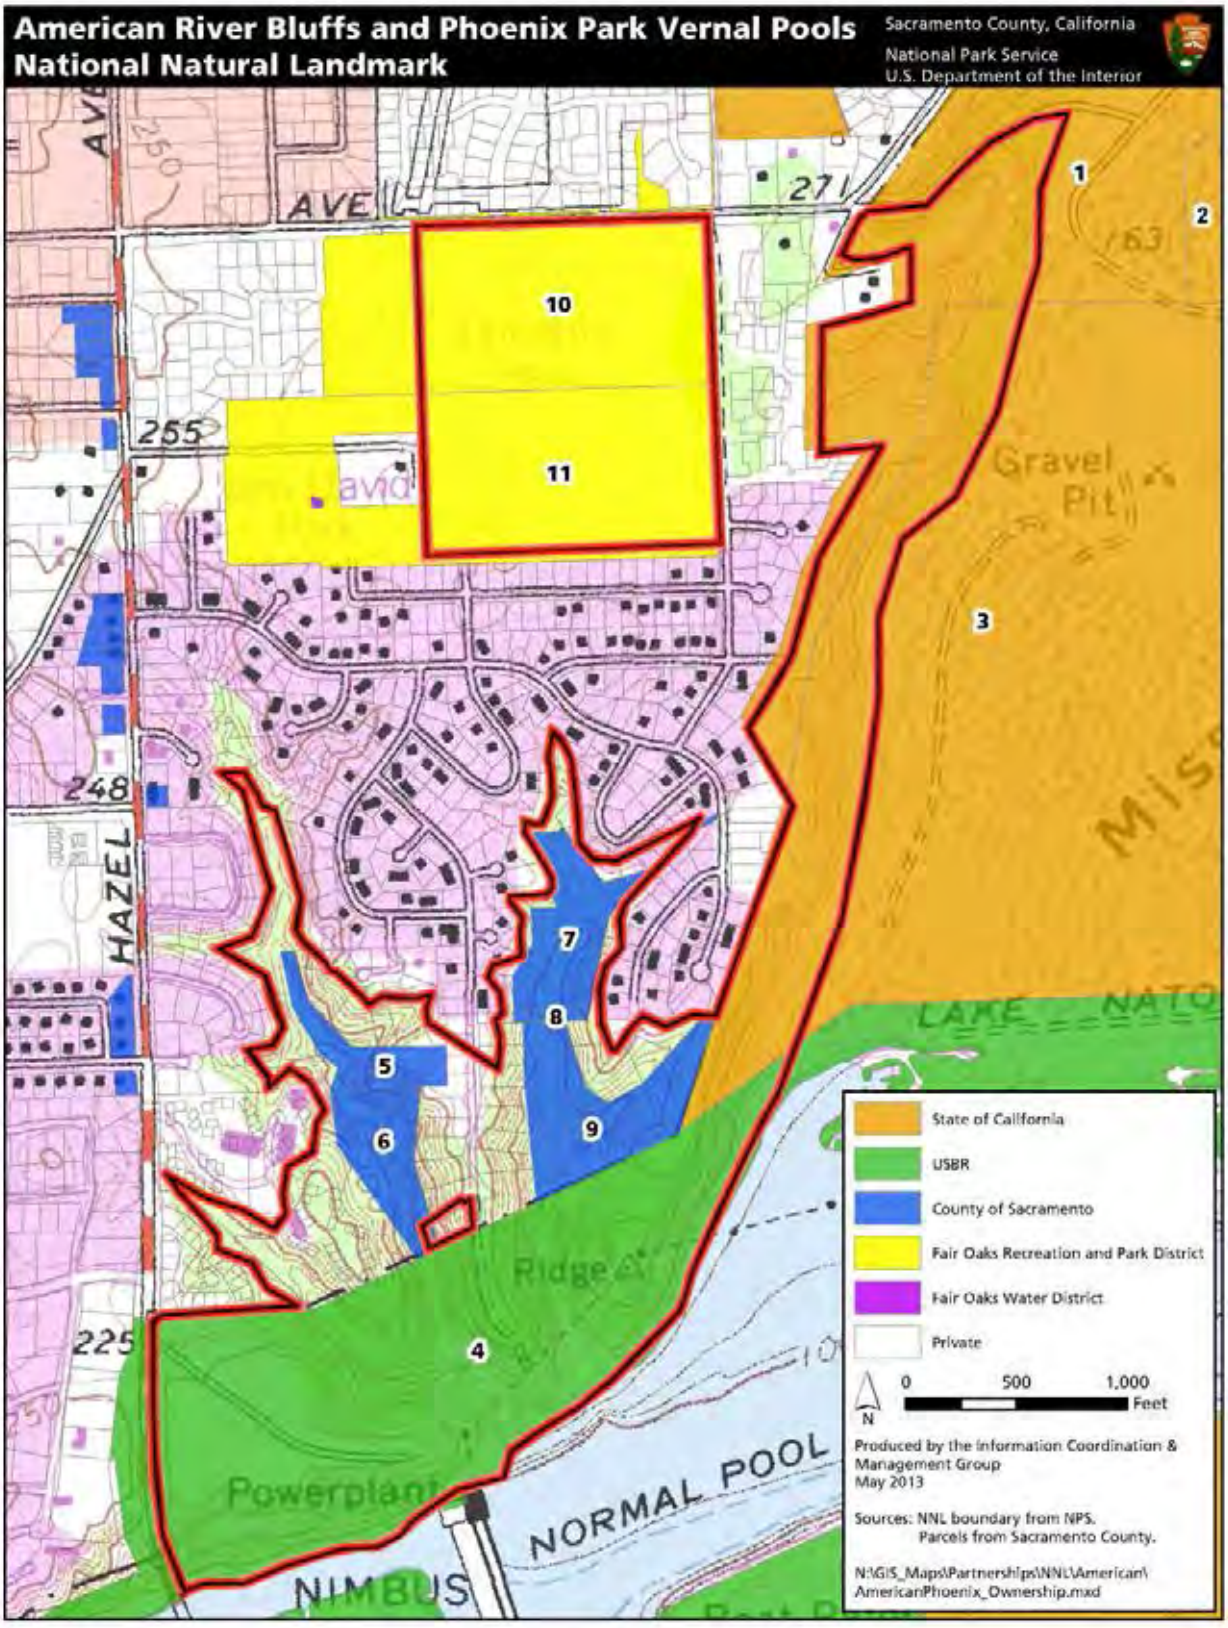
It should be noted that both the Cosumnes River Riparian Woodland National Natural Landmark (NNL) and American River Bluffs and Phoenix Park Vernal Pools NNL appear to be within the plan area of approximately 374,000 acres or quite possibly within the smaller 123,000-acre Urban Development Area (UDA).

In the case of the Cosumnes River Riparian Woodland NNL, it was designated by the Secretary of the Interior in January 1976, and it envelops three adjacent tracts consisting of approximately 255 acres. This NNL is nationally significant in that it represents a small remnant of a biotic community type, riparian woodland, that once formed a major and integral part of the California Central Valley. These three tracts along the Cosumnes River are some of the very few still remaining (see attached map: CosumnesRiverRiparianNNL).

Currently, the two landowners within the Cosumnes River Riparian Woodland NNL are the CA Department of Fish and Wildlife and a private landowner, Mr. John Belcher. The natural landmark is wholly within the Cosumnes Preserve which is managed by the Bureau of Land Management in cooperation with other state, federal, and private landowners. It should also be mentioned that the boundary of the landmark is currently being evaluated for possible expansion by the National Park Service. If expanded, the landmark would continue to be part of the much larger Cosumnes Preserve, which encompasses an additional 820 acres. If expanded, additional landowners would include The Nature Conservancy, CA Department of Water Resources, Sacramento County, and a private landowner, Mr. Chuck Williams.



In the case of American River Bluffs and Phoenix Park Vernal Pools NNL, it too was designated in January 1976 and is composed of two noncontiguous units, blue oak woodland and a vernal pool field (see attached map: AmericanPhoenixOwnershipBluffs&PoolsNNL.pdf). The woodland includes a portion of the American River bluffs that have eroded over time, creating four steep south-trending ravines. The vernal pool field contains a unique grouping of species of *Brodiaea* including several hybrid forms, and as such is an important research and teaching site for plant evolution, genetics, and ecology. Landownership within American River Bluffs and Phoenix Park Vernal Pools NNL includes the CA Department of Parks and Recreation, Sacramento County, U.S. Bureau of Reclamation, Fair Oaks Recreation and Parks District, and several private landowners.



The National Natural Landmarks (NNL) program was established in 1962 and is managed by the National Park Service in cooperation with other state, federal, municipal, and private landowners. The Cosumnes River Riparian Woodland NNL is one of ninety-nine NNLs within the Pacific West Region of the National Park

Service. If you have any questions related to the National Natural Landmarks program, please contact Pacific West Region NNL coordinator, Mr. Steve Gibbons, at (360-854-7203) or steve_gibbons@nps.gov .

If your agency requires further information or has questions about the above comments, please do not hesitate to contact Mietek Kolipinski, PhD, Pacific West Region, Natural Resources Programs Specialist, at 415 623 2204 or mietek_kolipinski@nps.gov.

Subject: Request that covered species model information be provided and evaluated in CEQA and NEPA documents

Dear Ms. Bicknese and Ms. Hack,

Representatives of the Stone Lakes NWR staff and the Stone Lakes NWR Association recently met with Sacramento County staff working on the South Sacramento Habitat Conservation Plan (SSHCP) concerning the plan and its relationship with the Stone Lakes NWR. As a consequence of that meeting we are very much interested in gaining a better understanding on how the covered species models were derived, especially for those species found in and around the Stone Lakes NWR. The Swainson's hawk is of particular interest, as substantial high quality foraging acreage is necessary in order to support the important concentration of hawks in southwest Sacramento County.

The Stone Lakes NWR Association is an independent organization that, by agreement, works as a "Friends Group" to advance the goals and the objectives of the Stone Lakes NWR. We feel that it is important that the SSHCP clearly identify the assumptions, criteria and process used in developing the species models. The Stone Lakes NWR Association has requested that the preparers of the draft SSHCP provide us with additional details regarding the development of the species models. In particular, we are interested in the habitat inventory assumptions and data associated with Swainson's hawk foraging acreage, including the acreages and maps of habitat that is potentially problematic, such as included habitat currently in vineyards and orchards (and presumed to be restorable to foraging habitat), included habitat below sea level and/or potentially below sea level as determined by climate change modelling, and excluded foraging habitat anticipated to be developed for other uses or designated for restoration to non foraging habitat.

We have requested that the SSHCP preparers provide us with this information at their earliest opportunity. In addition, we are requesting as part of the Notice of Preparation Process, that the CEQA and NEPA documents for the Plan incorporate the above information in the impacts analysis.

In recognition of the important role that the Stone Lakes NWR will play in realizing the habitat protection objectives of the SSHCP, we hope that Refuge staff and Association members will be able to establish ongoing cooperation and coordination with your respective agencies as the SSHCP finally moves into the environmental analysis, hearing approval and implementation phases.

Sincerely,

Rob Burness
Conservation Chair
Stone Lakes NWR Association

Subject: Followup to Stone Lakes Meeting and request for covered species model information.

Dear Mr. Ziebron,

We appreciated the opportunity to meet on January 21st with you and Mr. Radmacher to discuss the South Sacramento Habitat Conservation Plan (SSHCP) and its relationship with the Stone Lakes NWR. We are very much interested in gaining a better understanding on how the covered species models were derived, especially for those species found in and around the Stone Lakes NWR. The Swainson's hawk is of particular interest, as substantial high quality foraging acreage is necessary in order to support the important concentration of hawks in southwest Sacramento County.

The Stone Lakes NWR Association is an independent organization that, by agreement, works as a "Friends Group" to advance the goals and the objectives of the Stone Lakes NWR. We feel that it is important that the SSHCP clearly identify the assumptions, criteria and process used in developing the species models. The Stone Lakes NWR Association requests that you provide us with additional details regarding the development of the species models. In particular, we are interested in the habitat inventory assumptions and data associated with Swainson's hawk foraging acreage, including the acreages and maps of habitat that is potentially problematic, such as included habitat currently in vineyards and orchards (and presumed to be restorable to foraging habitat), included habitat below sea level and/or potentially below sea level as determined by climate change modelling, and excluded foraging habitat anticipated to be developed for other uses or designated for restoration to non foraging habitat. We would very much appreciate your providing us with this information at your earliest opportunity.

In recognition of the important role that the Stone Lakes NWR will play in realizing the habitat protection objectives of the SSHCP, we hope that Refuge staff and Association members will be able to establish ongoing cooperation and coordination as the HCP finally moves to hearing, approval and implementation. Thanks for your assistance in this request.

Subject: South Sacramento HCP Comment Opportunity

Hi Nina. We just noticed the NOI on this plan and were wondering if we should work with you on our comments that pertain to the covered species that are associated with the Refuge and surrounding area. We have an active Friends Group that is also planning to attend the public meetings and submit comments. Do you think we can set up a meeting with the County POC for this plan to discuss any concerns and issues regarding the Refuge?
Thanks,

Bart McDermott

Table NOP-1 Covered Species[1]

Mammals	Invertebrates
American Badger, *Taxidae taxus*	Mid-Valley Fairy Shrimp, *Branchinecta mesovallensis*
Pallid Bat, *Antrozous pallidus*	Ricksecker's Water Scavenger Beetle, *Hydrochara rickseckeri*
Western Red Bat, *Lasirus blossevillii*	Valley Elderberry Longhorn Beetle, *Desmocerus californicus dimorphus*, (FT)
Yuma Myotis Bat, *Myotis yumanensis*	Vernal Pool Fairy Shrimp, *Branchinecta lynchi*, (FT)
	Vernal Pool Tadpole Shrimp, *Lepidurus packardi*, (FE)
Birds	**Plants**
White-Tailed Kite, *Elanus leucurus*	Ahart's Dwarf Rush, *Juncus leiospermus var. ahartii*
Cooper's Hawk, *Accipiter cooperii*	Boggs Lake Hedge-Hyssop, *Gratiola heterosepala* (SE)
Ferruginous Hawk, *Buteo regalis*	Dwarf Downingia, *Downingia pusilla*
Greater Sandhill Crane, *Grus Canadensis tabida* (ST)	Legenere, *Legenere limosa*
Loggerhead Shrike, *Lanius ludovicianus*	Pincushion Navarretia, *Navarretia myertsii*
Northern Harrier, *Circus cyaneus*	Sacramento Orcutt Grass, *Orcuttia viscida*, (SE, FE)
Swainson's Hawk, *Buteo swainsoni* (ST)	Slender Orcutt Grass, *Orcuttia tenuis*, (SE, FE)
Tricolored Blackbird, *Agelaius tricolor*	Sanford's Arrowhead, Sagittaria sanfortii
Western Burrowing Owl, *Athene cunicularia hypugaea*	
Amphibians	**Reptiles**
California Tiger Salamander, *Ambystoma californiense* (central valley, DPS), (FT)	Giant Garter Snake, *Thamnophis gigas* (FT)
Western Spadefoot Toad, *Scaphiopus hammondii*	Western Pond Turtle, *Actinemys marmorata marmorata* and *A. m. pallida* (2 sub-species: Northwestern and Southwestern)

Biological Goals and Objectives

Habitat loss and fragmentation is a threat common to the covered species in the Plan Area. Loss and fragmentation of land cover types that provide habitat for the covered species will be among the main effects of covered activities in the Plan Area; therefore, the biological goals and objectives focus on land cover type protection and connectivity as key components of the SSHCP Conservation

Participants

Bart McDermott, Refuge Manager
Beatrix Treiterer, Deputy Refuge Manager
Rob Burness, Stone Lakes NWR Association
Scott Finley, Stone Lakes NWR Association
Dale Claypoole, Stone Lakes NWR Association
Sean Wirth, Sierra Club/ECOS
Jan Knight, SFWO Deputy Field Supervisor
Nina Bicknese, SFWO Senior Fish and Wildlife Biologist
Rich Radmacher, Sacramento County
Bill Ziebron, Ziebron Group

- Bart McDermott asked how much public scoping has been done for the SSHCP. Nina summarized previous scoping meetings in 2008. Bill reviewed 2013 scoping meetings and current status of the HCP and the EIS/EIR: Draft HCP expected in late spring 2014, EIS/EIR and draft Implementing Agreement expected in late summer 2014. Public draft documents will have a 90 day public review. Final documents expected in spring 2015. A Sacramento Board of Supervisors workshop is scheduled for January 28, 2014.

- Rich reviewed map of Planning Area, UDA boundary and acres.

- Bart McDermott provided map of the Refuge boundary, which includes 17,900 acres; Refuge is currently 35% complete; all of Refuge boundary overlaps with current SSHCP Planning Area.
    1. Refuge staff and the Association have been involved with the Bay Delta Conservation Plan (BDCP) and are developing appropriate avoidance and minimization measures for BDCP actions expected inside the Refuge boundary.
    2. Refuge staff and the Association would like information on the SSHCP Covered Species that use the Refuge, and information on SSHCP activities that could occur within the Refuge boundary.
    3. Refuge staff and Association have been involved in the proposed Elk Grove SOI expansion on the eastern border of the Refuge boundary, and the potential effects of future development in that expansion area on the species that travel between the Refuge and Cosumnes Preserve lands.
    4. The Refuge cannot purchase land outside of their designated boundary, but FWS may be able to secure agricultural easements to preserve habitat links between the Refuge and Cosumnes, possibly in association with the Sacramento National Wildlife Refuge.

- Scott Finley noted that the Refuge Association is very concerned about rapid loss of grazing lands and wildlife habitat inside the Refuge boundary to vineyards. He would like information on any SSHCP plans for early preservation of habitat and the SSHCP conservation strategy's "get ahead/stay ahead" component.

- Beatrix Treiterer noted that 11 BDCP covered species overlap with the Refuge boundary; she would like to know how many of the 30 SSHCP covered species have habitat inside the Refuge boundary. After discussion, the Refuge staff and Association decided to review the species list presented in the NOI and NOP and then will provide a comment letter that identifies which SSHCP covered species are also Stone Lakes NWR species.

- Rob Burness and Scott Finley asked about current acres in the SSHCP's take area" (the UDA), and asked if acres presented in the NOI and NOP will change because of LAFCo's recent decision denying the proposed Elk Grove SOI expansion.

- Bill Ziebron summarized the history of the proposed Elk Grove SOI expansion, and explained that the 2008 scoping and the 2010 administrative draft SSHCP addressed the proposed SOI expansion as part of the SSHCP's "UDA" because the SOI expansion was "reasonably foreseeable" at that time. Bill noted that the November 2013 LAFCo decision changes this assumption; however, exactly what 2014 public draft SSHCP will present regarding the UDA boundary near Elk Grove is still being determined. Bill noted that the City of Elk Grove presented an idea at last week's SSHCP "RAWG" meeting, but the permitting agencies expressed concerns. Bill noted that the primary concern is that urban development is not approved for areas outside the USB and incorporated city limits. Bill Ziebron and County staff are meeting with Elk Grove on Friday 1/24/14, which may result in an agreement on what the SSHCP analysis will assume about the UDA boundary near Elk Grove.

- Rob Burness noted that the lands within the proposed SOI expansion area are critical foraging habitat for several Refuge species, and that area is essential to providing a habitat link between the Cosumnes Preserve and the Refuge.

- Bart McDermott noted that Sandhill cranes, curlews, and other species use the proposed expansion area to go back and forth between the Refuge and the Preserve, however, farmland throughout this linkage area is being lost to vineyards and solar, and the dairies present during the Refuge scoping period (20 year ago) are now closed. Species on the Refuge will need this adjacent area to remain as farmland. Also, this linkage area is important in the long run, because other areas of existing species-habitat will likely be lost to rising sea level and saltwater intrusion over time. Bart stated that the SSHCP is a good mechanism to preserve farmland habitats east of I-5.

- Scott Finley and Bart McDermott noted that the BDCP applicants have proposed that the BDCP could "swap out" future BDCP preserves established in areas where the BDCP Plan Area overlaps the Plan Area of another HCPs— if that habitat is needed later by the other HCP. Bill Ziebron and Jan Knight said that BDCP proposal lacked sufficient detail and did not explain how a preserve "land swap" could be implemented.

- Scott Finley asked how the SSHCP will incorporate Climate Change information in future land-acquisition decisions for preserves has expected salt water intrusion and land-subsidence been considered in development of alternative conservation strategies? Will expected sea level rise be included in the SSHCP analysis?

- Rich Radmacher stated that details of the SSHCP's Preserve Assembly Criteria/Process are still being developed, and he noted that the Service has requested additional detail about the proposed Preserve Assembly Process. Rich noted that approximately 6000 acres of the SSHCP Plan Area could be below sea level, but the current Conservation Strategy requires any preserved land that becomes below sea-level would be replaced with new preserves that are above sea-level. Rich thinks SSHCP mitigation requirements will need to preserve 10,000 to 15,000 acres of existing "high-value" Swainson's hawk habitat. After the recent LAFCo decision, approximately 45,000 acres of "high-value" habitat are currently available for preservation in the SSHCP Plan Area. Rich noted that the proposed BDCP "fore bay" project area was not included in the 45,000 acres of high-value Swainson's hawk habitat.

- Bart McDermott asked what was minimum "patch size" used by the SSHCP when estimating availability of species habitat for preservation? Rich Radmacher stated that he thinks minimum patch size used was 20 acres for all landcover types. Rich noted that this minimum patch size assured that small undeveloped lots within areas of existing ag-residential development were not included in the SSHCP' inventory of existing land/habitat available for habitat preservation.

- Sean Wirth noted that the Refuge Association believes lands below sea level should not be included in the inventory of land/habitat available for preservation under the SSHCP.

- Rob Burness requested detailed information on methods the SSHCP used to determine which lands were suitable for preservation and included in the SSHCP "habitat inventory." Rob asked if the Refuge Association would be able to "weigh in" on the assumptions and methods used by the SSHCP to quantify the amount of suitable habitat available for future preservation. Bill and Nina requested the Refuge Association describe their concerns, questions, and ideas as EIS/EIR Scoping comments.

- Rob Burness stated that the Refuge Association will submit these scoping comments: 1) that the SSHCP EIS/EIR analysis needs to present assumptions used about the acres and locations of species habitat currently available for preservation, and 2) that the Refuge Association be provided with copies of the GIS data that the SSHCP used to quantify/inventory the amount and locations of available habitat. Rob stated the Refuge Association is requesting this information now in order to provide well-informed scoping comments. Nina asked if the Refuge Association will be requesting this information for all 30 SSHCP species models; Rob stated that the Refuge is primarily interested in how the SSHCP is quantifying amount and locations of existing habitat for Sandhill crane and Swainson's hawk.

- Sean Wirth noted that Todd Gardner (CDFW) did a lot of work identifying criteria for defining Swainson's hawk high-value habitat inside the Plan Area, but this information was not integrated into recent drafts of those HCP chapters—which resulted in a lot of EIS/EIR scoping comments from the Friends of Swainson's Hawk (FOSH).

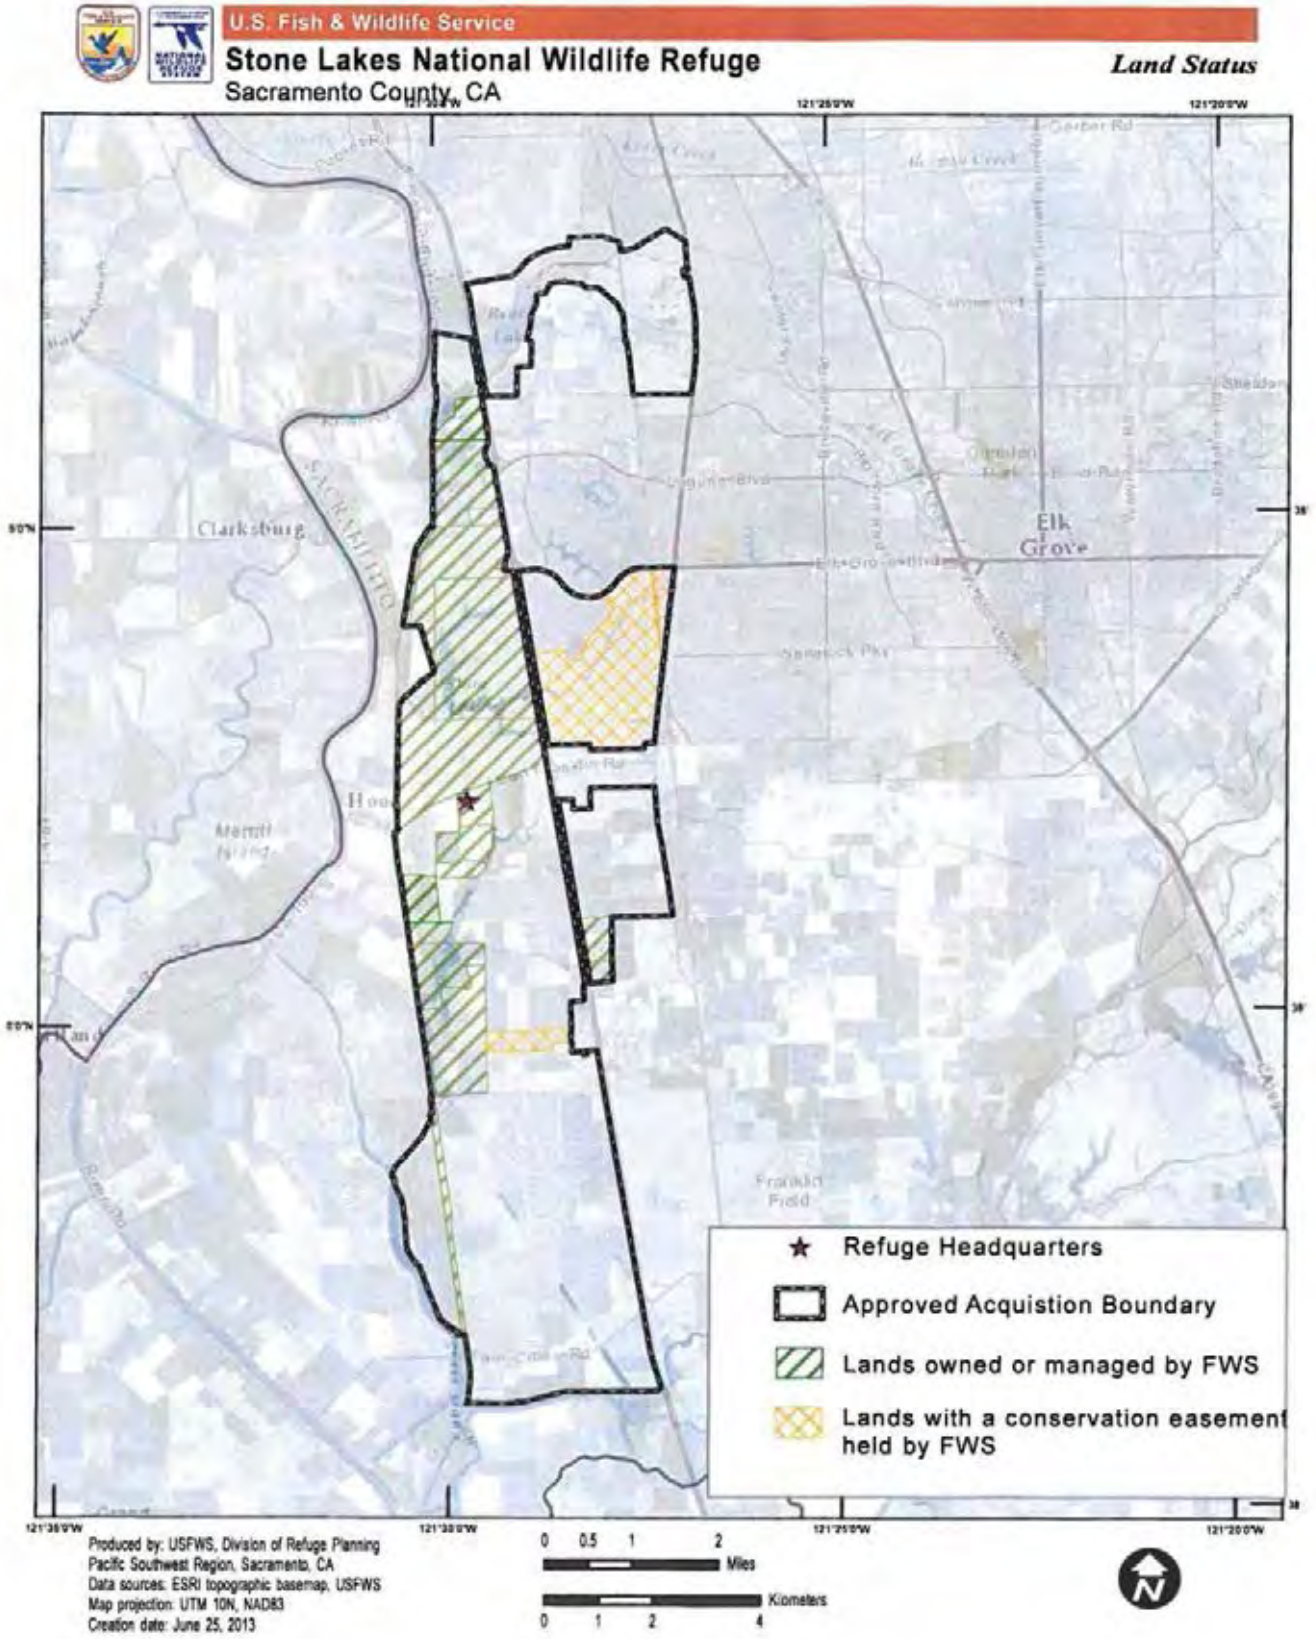
- Beatrix Treiterer asked for information about the future SSHCP Implementing Entity (IE)—has the IE format has been determined, or will alternative IE formats be included in the EIS/EIR and the final format determined later? Bill Ziebron stated that the SSHCP Implementing Entity format is still being determined, but believes the SSHCP's IE will include a JPA, similar to the Santa Clara HCP Implementing Entity. Bill stated that the SSHCP Implementing entity will not be structured like a habitat-conservancy, as in the Natomas HCP, but the SSHCP format will likely include some type of day-to-day manager. Bill stated that this two-part SSHCP Implementing Entity format will assure that SSHCP biological decisions will remain separated from any local planning process or politics.

- Bart McDermott asked how the SSHCP will assure that their wetland habitats can be managed for 50 year permit term, and then in perpetuity – managing wetland habitats on the Refuge are much more "hands on" and expensive than managing their upland habitats. Rob Burness asked if the SSHCP will be able to fund the long-term management of the SSHCP preserve lands, especially those that are inside the Refuge boundary or in the area between the Refuge and the Cosumnes Preserve. Rob asked how SSHCP covered-activity fees will be determined.

- Rich Radmacher stated that a new consulting firm (EPS, in Berkley CA) is under contract to conduct the economic analysis. Their analysis will incorporate land cost differences in each Plan Area zone, and costs for vernal pool and other land management will be based on recent local examples and discussions with

local preserve managers. In addition, Dudek (consultant writing the HCP document) has extensive experience managing HCP preserve lands in southern California.

- Bart McDermott noted that the Refuge has extensive information on costs for wetland management, and could provide this information to the SSHCP. Bart estimates that seasonal wetland management on the Refuge is $200-$300 per acre; most of that cost is from water pumping and weed control. Rich requested the Refuge provide that information for use in the SSHCP economic analysis.



- Rob Burness asked a question about the Kammerer Road improvement project, and if this work would be part of the Capitol Connector highway project, or if it will be an Elk Grove project. Rich Radmacher stated that regardless of who completes those improvements, the improvements on Kammerer Road will be a SSHCP covered activity. Bart McDermott noted that the Refuge and Refuge Association have met with the Connector JPA.

- Bart Mc Dermott summarized that the Refuge will be submitting the following scoping comments to the County and the USFWS contacts listed on the NOP and NOI:
    1. Comments on the SSHCP covered species that occur within the Refuge boundary area;
    2. Comments on SSHCP conservation strategy elements proposed within the Refuge boundary and in the area between the Refuge and the Cosumnes Preserve, and any suggestions for alternative SSHCP conservation strategies in these areas;

    3. Comments on Covered Activity projects the SSHCP would allow inside the Refuge boundary and in the area between the Refuge and the Cosumnes Preserve (including the 5 "major" projects, private development, and the Capitol Connector highway project).

Overview

Stone Lakes National Wildlife Refuge

The Stone Lakes National Wildlife Refuge, located south of Sacramento, California, lies within the Sacramento-San Joaquin delta, the destination of thousands of migrating waterfowl, shorebirds, and other water birds. The refuge was established in 1994 and is one of the few urban refuges that have the potential to attract and educate thousands of visitors in a region that is becoming the new Silicon Valley of California.

Through a number of innovative partnerships, the refuge is protecting scarce natural habitats and agricultural resources in an area threatened by urban sprawl and agricultural changes. Stone Lakes Refuge contains both seasonal and permanent wetlands, riparian forest, and grasslands, as well as some of the last remaining freshwater lakes in the central valley.

These habitats support large populations of migratory water birds, a major rookery for several colonial nesting species such as great blue herons, and a warm water fishery. Several endangered, threatened, and special-status species benefit from these habitats: the valley elderberry longhorn beetle, Swainson's hawk, and greater sandhill crane.

Visitor numbers increase every year; they topped 8,500 in 2001, despite a lack of developed facilities such as a visitor education center and restrooms. Volunteers from the local area dedicate their time on weekends guiding visitors through grasslands and tree-lined waterways to educate the public about the refuge in their backyard.

Management Activities

The primary focus of management on the refuge is to restore and maintain wetland and riparian habitats. Wetland habitats include seasonal, permanent wetlands, and vernal pools. The wetlands are managed through manipulation of water levels through pumping and vegetation control.

Impoundments are flooded in early fall; and water is maintained through spring. Vegetation such as cattails and bulrush is manipulated through mowing and disking. The refuge also works cooperatively with local agencies to chemically control water hyacinth.

Impoundments are managed by the local mosquito district to control mosquitoes through the use of mosquito fish and other means. Riparian restorations involve the planting of native vegetation including valley oak, cottonwood, willow, Oregon ash, box-elder, rose, elderberry, and native blackberry in appropriate areas.

A grazing program is used to manage the grasslands to promote native species and control exotics such as pepper grass and star thistle. Refuge staff and volunteers survey wildlife

The refuge headquarters is located at 1624 Hood Franklin Road. Take Interstate 5 south from Sacramento, approximately 12 miles to the Hood Franklin exit. Turn west (right) about 1 mile. The office is a two story building with a red tile roof on the south (left) side of the road.

A self-guided hike to the universally accessible wildlife viewing platform is open to the public every second and fourth Saturday of each month except July and August. The trail is normally open from 9 a.m. to 3 p.m.; but please call the information line (916-775-4420) for any updates to the schedule.

To find the entrance to the hiking trail, take Interstate 5 south from Sacramento, approximately 10 miles, to the Elk Grove exit. After exiting, turn right on the off-ramp before going back over the overpass, and meet at the gate for special events and public access days.

2008 Scoping Report

South Sacramento Habitat Conservation Plan's Joint Environmental Impact Report/Environmental Impact Statement Scoping Report

INTRODUCTION

Primary principles of the California Environmental Quality Act (CEQA) and the National Environmental Policy Act of 1969 as amended (NEPA) process include full public disclosure and open public participation in the decision-making process. To support preparation of a joint Environmental Impact Statement and Environmental Impact Report (EIS/EIR), the lead agencies solicited input from the public to help identify issues and concerns that they feel should be addressed in the joint document. To initiate the scoping process, the County, the lead CEQA agency, sent a Notice of Preparation (NOP) to the State Clearing House on June 10, 2008 (Control No. 03-0637). The NOP was published and distributed by the California State Clearing House on July 11, 2008. On June 10, 2008, the U.S. Fish and Wildlife Service (USFWS), the lead NEPA agency, published a Notice of Intent (NOI) in the Federal Register on July 10, 2008 (73 FR 3279). The NOP and NOI included a comment period of 50 days. Copies of the NOP and NOI are contained in Appendix A of this Scoping Report.

The published notices provided a brief summary of the project and the lead agencies intention to prepare a joint EIR/EIS. During the NOI and NOP comment period, the lead agencies held four public scoping meetings and one public workshop to solicit information on alternative actions, including the proposed project.

Under NEPA regulations, any agency which has jurisdiction by law or has special expertise with respect to any environmental issue which should be addressed in an EIS may be a cooperating agency upon request of the NEPA lead agency. Roles of a cooperating agency, include participation in the scoping process, and development of the NEPA document (40 CFR §1501.6). Under CEQA (State CEQA Guidelines §15381), those state or local agencies that issue permits, have approval authority, or provide funding for the project are referred to as Responsible Agencies. CEQA Responsible Agencies play a similar role to a NEPA Cooperating Agency, but in practice generally limit their participation to a commenting role.

The California Department of Fish and Game (CDFG) and the Army Corps of Engineers (USACE) participated in one or more public scoping meetings and alternatives formulation workshop (see Appendix G of this scoping report for Cooperating agency letters).

PUBLIC OUTREACH

The public was invited to participate in the scoping process through a variety of media. Email that included a flyer announcement of the scoping meeting purpose, locations, and dates were sent by the County to some 1,400 interested parties and organizations. Display ads of the meeting announcement were published in the following newspapers at least one week prior to each public meeting:

Sacramento Bee (Metro Section):	July 1, 2008
Grapevine:	July 4, 2008
Galt Herald and River Valley Times:	July 2, 2008

In addition, the City of Elk Grove sent a meeting announcement attached to each resident's utility bill informing them of the scoping meetings.

The public announcements are included in Appendix B of this scoping report.

MEETING LOCATION AND FORMAT

Public scoping meetings were held on the following dates and times:

July 8, 2008	from 6:30 pm to 8:30 pm in Galt
July 11, 2008	from 10 am to 12:00 pm in Sacramento
July 15, 2008	from 6:30 pm to 8:30 pm in Rancho Cordova
July 16, 2008	from 6:30 p.m. to 8:30 pm in Elk Grove

Each meeting was held in an open house format, beginning with a short presentation to explain the purpose of the scoping meeting, followed by a 15-minuite Power Point presentation by Rich Radmacher (the County's Project Manager for the SSHCP) which summarized available information on the proposed SSHCP project. Approximately 12 information poster boards summarizing the proposed SSHCP and the environmental resources within the SSHCP planning area were available for public review and comment during the open-house portion of the meeting. Staff from the Lead and the Cooperating Agencies was available at each informational poster board to provide information on the natural resources in the SSHCP planning area and solicit public comments (See Appendix C and D for meeting materials).

ISSUES IDENTIFIED IN COMMENTS RECEIVED

A total of approximately eighty comment letters, including e-mails, from individuals, businesses, organizations, and agencies were received. The primary issues identified by the public they wished to be addressed in the EIS/EIR are:

1. Geographic Areas to be Addressed
   - Dry Creek
   - Borden Ranch
   - Highway 99, Zone 9
   - Cordova Hills
   - Highway 50 to 99 connector
   - City of Elk Grove sphere of influence
   - Cosumnes River flood plain
   - Adjacent counties and impacts of agriculture to urban/agricultural activities
   - UDA development impact on adjacent areas including agriculture

2. Resource Topics/Issues
   - Gravel mining and processing
   - Livestock grazing
   - Grazing leases
   - Impacts to agriculture
   - Urban sprawl

3. Regulatory Topics
   - Mitigation banking
   - In lieu fee program
   - Consistency with Corps mitigation regulations

4. Corrections to poster board Maps presented at the public meetings
   - Arno and Valensin Rd & Rily is a vineyard, not vernal pool
   - Waegell Home Ranch has no vineyards, cropland shown as grazing land, and pond south of Florin Road is Tri-Colored Blackbird habitat

5. Agency involvement
   - RWQCB involvement

6. Cumulative Impacts Analysis
   - South of Elk Grove South of Kammerer Road
   - Cordova Hills infrastructure impact, including roads
   - Elk Grove sphere of influence
   -Galt outside UDA development impact

Copies of each written comment received are included in Appendix E and F of this scoping report.

MEETING AND COMMENT TRANSCRIPTS

The following section includes the scoping meeting date and location, and a transcript of each comment (See Appendix D for sign-in sheets and Appendix E for each comment card).

July 8, 2008, Galt, CA, at the Anthony Pescetti Community Room, Galt Police Facility, 455 Industrial Drive, Galt, CA 95632

Thirteen public and three agency participants registered on the meeting's sign-in sheets. (See Appendix D.)

Eight written comments and one verbal comment were received at this meeting (see Appendix E and F for all comment cards) :

Tina B. Holt (1)--The Herald area in Southeast Sacramento County are open agricultural and flood plain lands. Rich with diverse species such as Swainson's Hawk; Tiger Salamander; Bald Eagle; Elderberry Beetle. Chiefly the Borden Ranch is the most preservable land in the area consisting of riparian creek, oaks, cottonwood, elderberry, Prime Ag land when it is not in flood plain stage during winder & early spring. The land is 400 acres on a historic family ranch 'Borden.' The rest of the area approx. 1200 acres are in productive vineyards.

Gary Patterson (1)--I want this E.I.R. to address the specific impacts of surface gravel mining and its related activities, i.e. blacktop, concrete production, topsoil removal, etc. Impacts on all listed species and impacts on the local communities must be addressed in the E.I.R. Impacts of water supply to adjacent properties, traffic on these rural roads, dust on adjacent agricultural operations, noise impacts on neighbors, etc. Also the impact on public utilities like roads & drainages. I also want the E.I.R. to address the specific right to farm ordinances in Sac. County and those rights in relation to its neighbors.

Gary Patterson (2)--I believe this E.I.R. needs to specifically address the area of Dry Creek at the south edge of the county. Impacts on all species listed and the local communities by operations other than what zoning allows. This E.I.R. needs to address the cumulative impact of these species protections on adjacent counties. Specifically the Borden gravel mining proposal along Dry Creek at the south each side of the county. This E.I.R. needs to address the impacts of agriculture/urban interaction.

Kathleen Amos --What habitat issues are involved in the area just west of Hwy 99 (in Zone 9) along Twin Cities Rd.? (A group wants to put a senior housing project there—the group is called, "Citizens to Protect the Future of Galt" even though the land is OUTSIDE the city limits of Galt). We @ Galt Parks & Rec want to support as large a regional area for "passive rec" activities (like hiking, bird-watching, etc.) around the city of Galt.

Jerry Stribling (Verbal comments)--
Livestock grazing needs to be preserved,
Limitations on grazing/farming
Leased land—will HCP reduce availability of land for lease
Native pasture
Concerned about urban sprawl

Doug Trimble --Arno and Valensin Rd & Rily is a vineyard not a vernal pool

Tina Holt (2)--Traffic noise from increased activity in Herald where a mining proposal threatens the community; suggesting 285 rock trucks would use the narrow roads. This is the equivalent of 12,000 cars a day. The air quality and noise would be unbearable.

Tina B. Holt (3) --As a resident of the rural community of Herald my concerns are about mining and the negative cumulative impacts that increased rock truck traffic will have. Also I fear the loss of important Ag land on Borden by mining Borden Ranch. The damage to Dry Creek watershed of Borden Ranch would be an environmental disaster. Also the amount of water consumption by a mining operation on Borden Ranch would be devastating to the residential wells in the neighborhood. I know of 7 wells that have been depleted. The air quality would be degraded. The road damage from rock truck traffic is a costly negative impact: over $600,000.00 a mile to replace.

Mining of Borden Ranch and the increased truck, traffic, noise pollution is not wanted in the rural residential community of Herald.

While the loss of prime ag land on Borden Ranch would be most unfortunate; if mining were to occur; a railroad spur line must be developed for the efficient removal of mined materials to a High Way 104 location that will in no way burden Herald residents.

July 11, 2008, Sacramento, CA, at the Sixth Floor Meeting Room, Sacramento County Administration Building, 700 H Street, Sacramento, CA 95814

Twenty-two people, including thirteen public and seven agency participants registered on the meeting's sign-in sheets (see Appendix D).

The four written comments (See Appendix E for all comments) included:

Michael Devereaux (1)--Will the Corps of Engineers consider the new South Sacramento Habitat an approved:

1. Mitigation bank; or

2. an in lieu fee program; or

3. a permittee-responsible mitigation project for purposes on the new Corps rulemaking issued earlier this year?

[no name provided]--Did the team consider involving the Regional Water Quality Control Board. Most of the time, the Corp requirements are in-line with the NPDFS require., but there may be additional measures that applicants should know about.

Thanks.

Michael Devereaux (2)--Will the SSHCP have a feature that would allow it to incorporate private wetland preserve areas into the preserve system managed by the SSHCP?

Judy Waegell --Waegell Home Ranch map designation connections. We have no vineyards, some parcels that are cropland are designated as grassland, Pond south of Florin Road not colored Blue = Tri Colored Blackbird habitat.

July 15, 2008, Rancho Cordova, at the American River Room, Rancho Cordova City Hall, 2729 Prospect Park Drive, Rancho Cordova, CA 95670

Thirteen public and two agency participants registered on the meeting's sign-in sheets. (See Appendix D.)

The two written comments (See Appendix E for all comments) included:

Mark Hanson --Regarding Cordova Hills, the impacts outside the UDA for roadway, sewer, water, dry utilities should be taken into account (covered activities). Cordova Hills project is 2,419 acres all within the USB, but will require a 4-6 lane roadway crossing & possibly other infrastructure through the northeastern side of the Keifer Landfill's bufferlands. Cordova Hills will require 3 access points & due to spacing requirements the southern entrance to Cordova Hills must traverse through the bufferlands outside the USA. Cordova Hills owns this portion of the bufferlands & no uses requiring urban services are proposed, but construction of necessary project infrastructure outside the UDA will be needed.

Michael Devereaux--

1. The EIR/EIS needs to cover the impacts on the South Sac HCP of the proposed Highway 50 to Highway 99 connector road, for which a joint powers agency was just created; the HCP also needs to provide permit coverage for the connector.

2. The EIR/EIS needs to include development in the City of Elk Grove's "South of Kammerer Road" areas as a future development area covered by the permits to be issued for the South Sac HCP.

July 16, 2008, Elk Grove, at the City Council Chambers, Elk Grove City Hall, 8400 Laguna Palms Way, Elk Grove, CA 95758

Twenty-four public and two agency participants registered on the meeting's sign-in sheets. (See Appendix D.)

The three written comments (See Appendix E for all comments) included:

bwackford@aol.com --Continue to look at City of Elk Grove sphere of influence and annexing proposal. Area should be addressed in EIR. Potential for future growth should be assessed. Avenues for EG to blend these areas into plan should be kept open. A "50 year" plan should clearly look to the future & the reality that growth will occur. we trust you'll continue to listen with an open mind and include the City of Elk Grove & its current & future residents in the decision making process.

Michael Winn --With the City of Elk Grove's formal application to amend the city's sphere of influence, the SSHCP environmental review should address that acreage for future development (or "take" habitat). The EIR/EIS should also evaluate the mitigation type and quantity for the proposed SOI areas.

Don Smith --We are very concerned about protecting the resources of the Cosumnes River floodplain area. Specifically riparian habitat protection in zones 3c [illegible] 8, 9 near Grantline Road, Highway 99, and Kammerer Road. At a minimum the area within the 200 year floodplain of Cosumnes River & Deer Creek.

It is a sensitive area with wetlands, vernal pools endangered species habitat. It is being threatened by the development and expansion of the City of Elk Grove. The analysis should consider the impacts of expansion of the City of Elk Grove. Identification of resources in the sensitive areas and mitigation (if any).

I believe that keeping City of Elk Grove expansion outside the 200 year floodplain will cover the zone & concerns.

WORKSHOP

The workshop was held on Tuesday, August 19, at the Florin Service Center, 7000 65th Street, Sacramento, CA 95823, and was attended by 35 public and three agency participants (see Appendix H). Workshop announcements were e-mailed to those individuals who attended the previous four scoping meetings and to the individuals, organizations, and agencies on the mailing list previously used for the public scoping meetings.

The purpose of the workshop was to gather information regarding specific natural areas and natural resources inside the UDA where participants would like to see habitat conserved, know of specific biological information, believe inappropriate for a preserve, or may cause concern if preserved.

Alternatives Workshop Comments Received

Participants in the Alternatives Workshop identified areas of concern by pointing out some 230 specific locations on maps of Zones 1, 2, 3, 4, 5, and 12.

REPORT SECTION ON AGENCY COMMENTS RECEIVED? (I.E. APPENDIX F)

At a minimum, a scoping report must include some discussion of comments received from any regulatory agency – determines level of "controversy" under NEPA (for our letters received, this is EPA and CDFG).

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

[FWS-R8-ES-2008-N0106; 1112-0000-81420-F2]

Habitat Conservation Plan for South Sacramento, Sacramento County, CA

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of intent to prepare an Environmental Impact Statement/ Environmental Impact Report (EIS/EIR) and notice of public scoping meetings.

SUMMARY: Pursuant to the National Environmental Policy Act (NEPA) we, the Fish and Wildlife Service (Service), advise the public that we intend to gather information necessary to prepare, in coordination with the County of Sacramento (the County), a joint Environmental Impact Statement/Environmental Impact Report (EIS/EIR). The EIS/EIR will analyze the environmental effects of the Service's proposed issuance of an incidental take permit under section 10(a)(1)(B) of the Federal Endangered Species Act of 1973 as amended (ESA), for a habitat conservation plan (HCP) within a portion of south Sacramento County, California. The County, along with their local partners (the cities of Elk Grove, Rancho Cordova, Galt, the Sacramento Regional County Sanitation District, and the Sacramento County Water Agency), is facilitating the preparation of the South Sacramento HCP (SSHCP) in compliance with section 10(a)(2) of the ESA. The County and their local partners intend to apply to the Service for a 30-year permit that would authorized the incidental take of 40 species due to ground-disturbing private activities implemented under the SSHCP. The County, in accordance with the California Environmental Quality Act (CEQA) and with 40 CFR 1506.6(b)(3), has published a similar notice of preparation

for this EIS/EIR with the State Clearinghouse.

We provide this notice to (1) Describe the proposed action and possible alternatives; (2) announce the initiation of a public scoping period, including when and where scoping meetings will be held; (3) advise other interested Federal, State, and local agencies, affected Tribes, and the public of our intent to prepare an EIS/EIR and invite their participation in the scoping process and; (4) obtain suggestions, comments, and useful information from interested parties and other agencies on the range of actions, the significant issues, range of alternatives, and impacts to be considered in the EIS/EIR document. We invite written comments on this notice from any interested party.

DATES: Submit written comments on or before July 30, 2008. Four public scoping meeting will be held on:

1. Tuesday, July 8, 2008, from 6:30 p.m. to 8:30 p.m., Galt, CA.
2. Friday, July 11, 2008, from 10 a.m. to 12:00 p.m., Sacramento, CA.
3. Tuesday, July 15, 2008, from 6:30 p.m. to 8:30 p.m., Rancho Cordova, CA.
4. Wednesday, July 16, 2008, from 6:30 p.m. to 8:30 p.m., Elk Grove, CA.

ADDRESSES: The public meetings will be held at the following locations:

1. Tuesday, July 8, 2008, at the Anthony Pescetti Community Room, Galt Police Facility, 455 Industrial Drive, Galt, CA 95632.
2. Friday, July 11, 2008, at the Sixth Floor Meeting Room, Sacramento County Administration Building, 700 H Street, Sacramento, CA 95814.
3. Tuesday, July 15, 2008, at the American River Room, Rancho Cordova City Hall, 2729 Prospect Park Drive, Rancho Cordova, CA 95670.
4. Wednesday, July 16, 2008, at the City Council Chambers, Elk Grove City Hall, 8400 Laguna Palms Way, Elk Grove, CA 95758.

Submit written comments to Nina Bicknese, Conservation Planning Branch, Sacramento Fish and Wildlife Office, Fish and Wildlife Service, 2800 Cottage Way, Room W-2605,

[[Page 32730]]

Sacramento, CA 95825. Comments may also be sent by facsimile to (916) 414-6713.

FOR FURTHER INFORMATION CONTACT: Nina Bicknese, Senior Fish and Wildlife Biologist, Sacramento Fish and Wildlife Office at (916) 414-6600. Additional details of the County's proposed South Sacramento Habitat Conservation Plan are available at http://frwebgate.access.gpo.gov/cgi-bin/leaving.cgi?from=leavingFR.html&log=linklog&to=http://

www.planning.saccounty.net/habitat-conservation/overview/html.

SUPPLEMENTARY INFORMATION:

Reasonable Accommodation

Persons needing reasonable accommodations in order to attend and participate in a public meeting should contact Nina Bicknese at (916) 414-6600 as soon as possible. In order to allow sufficient time to process requests, please call no later than one week before the public meeting. Information regarding this proposed action is available in alternative formats upon request.

Background

The County and their local partners anticipate that landowners and individuals will continue to request their discretionary or ministerial approval of ground-disturbing land development projects in portions of south Sacramento County where species listed as threatened or endangered under the ESA are present. The County and their local partners intend to apply for a permit from the Service for the incidental take of listed species resulting from their approval of otherwise lawful land-use changes within portions of south Sacramento County over the next 30 years. Pursuant to the ESA and federal regulations governing incidental take permits (ITPs), the County and their local partners are in the process of preparing a habitat conservation plan titled South Sacramento HCP (SSHCP). Development of the SSHCP involved a public process that has included open meetings of a stakeholder Steering Committee.

Section 9 of the ESA (16 U.S.C. 1538) and Federal regulations (50 CFR 17.21 and 17.31) prohibit the ``take'' of wildlife species listed as endangered or threatened. The term ``take'' means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect listed species, or to attempt to engage in such conduct (16 U.S.C. 1532). ``Harm'' in the definition of ``take'' includes significant habitat modifications or degradations (50 CFR 17.3). Pursuant to section 10(a)(1)(B) of the ESA, the Service may permit authorized take of species other wise prohibited by Section 9 of the ESA if such taking is incidental to, and not the purpose of, carrying out an otherwise lawful activity (16 U.S.C. 1539). Federal regulations governing ITPs for threatened and endangered wildlife species, respectively, are promulgated in 50 CFR 17.32 and 50 CFR 17.22 and in Section 10(a)(2) of the ESA. Pursuant to these regulations, no permit authorizing incidental take may be issued unless the applicant prepares a Habitat Conservation Plan (HCP). An HCP must include: a description of the activities sought to be authorized; the names of the species sought to

be covered by the ITP; the impacts that will likely result from the proposed taking; steps the applicant will take to minimize and mitigate such taking to the maximum extent practicable; the funding that will be available to implement such steps; biological goals and objectives; a monitoring plan; an adaptive management plan; alternatives to the proposed taking the applicant considered and reasons why such alternatives are not proposed for implementation; other measures that may be necessary or appropriate for the purposes of the HCP; and the procedures the applicant will use to deal with unforeseen circumstances over the term of the ITP.

The SSHCP Planning Area--the area in which all impacts would be evaluated and all conservation actions will be implemented--is approximately 341,000-acres within south Sacramento County. The approximate geographical boundary of the SSHCP Planning Area is the area bound by U.S. Highway 50 in the north, the county line dividing Sacramento County with San Joaquin County on the south, the county line dividing Sacramento County with Amador and El Dorado counties in the east, and Interstate 5 on the west. The SSHCP's 341,000-acre Planning Area includes a 123,000-acre Urban Development Area (UDA) where most ground-disturbing development and infrastructure projects would be approved by the County and its local partners over the next 30 years. The 123,000-acre UDA includes lands within Sacramento County's Urban Service Boundary, lands within the city limits of Rancho Cordova, Elk Grove, and Galt, and lands within Galt's adopted sphere of influence area. The County and its partners propose that approximately 43,500 acres within the 123,000-acre UDA would be developed or otherwise disturbed, while approximately 8,000 acres of the UDA would be permanently preserved or restored. The County and its partners also propose that approximately 40,500 acres of the Planning Area outside the UDA would be permanently preserved or restored, and only approximately 2,000 acres of the Planning Area outside the UDA would be developed or otherwise disturbed.

The species proposed for coverage in the SSHCP are those that occur within the SSHCP Planning Area and are currently listed as federally threatened or endangered, or that may become federally listed during the term of the proposed permit. The County intends to request an ESA section 10(a)(1)(B) permit to authorize the incidental take of 40 species (7 federally listed and 33 unlisted). The proposed SSHCP would provide for the long-term conservation and management of these 40 covered-species and their habitats within the SSHCP Planning Area. Species may be added or deleted during the course of the SSHCP development based on public comment, new information, further analysis, and agency consultation. Listed animal species proposed to be covered under the SSHCP permit are the federally-endangered vernal pool tadpole shrimp (Lepidurus packardi), the federally-threatened California tiger salamander (Ambystoma californiense), the federally-threatened giant

garter snake (Thamnophis gigas), the federally-threatened valley elderberry longhorn beetle (Desmocerus californicus dimorphus), and the federally-threatened vernal pool fairy shrimp (Branchinecta lynchi). Listed plant species proposed to be covered are the federally endangered Sacramento Orcutt grass (Orcuttia viscida) and the federally endangered slender Orcutt grass (Orcuttia tenuis).

The 33 unlisted species (27 animal and 6 plant species) proposed to be covered under the SSHCP permit are the mid-valley fairy shrimp (Branchinecta mesovallensis), Ricksecker's water scavenger beetle (Hydrochara ricksecker), western pond turtle (2 sub-species) (Actinemys marmorata marmorata and Actinemys marmorata pallida), western spadefoot toad (Scaphiopus hammondii), the white-tailed kite (Elanus leucurus), Cooper's hawk (Accipiter cooperii), the ferruginous hawk (wintering) (Buteo regalis), golden eagle (Aquila chrysaetos), the state-threatened Swainson's hawk (Buteo swainsoni), bald eagle (Haliaeetus leucocephalus), loggerhead shrike (Lanius ludovicianus), northern harrier (nesting) (Circus cyaneus), sharp-shinned hawk (Accipiter striatus), the state-endangered American peregrine falcon (wintering) (Falco peregrinus anatum), tricolored blackbird (nesting) (Agelaius tricolor),

[[Page 32731]]

western burrowing owl (Athene cunicularia hypugaea), long-eared owl (Asio otus), merlin (Falco columbarius), short-eared owl (Asio flammeus), white-faced ibis (Plegadis chihi), yellow breasted chat (Icteria virens) the state-threatened greater sandhill crane (Grus canadensis tabida), American badger (Taxidae taxus), pallid bat (Antrozous pallidus), ringtail (Bassariscus astutas), western red bat (Lasirus blossevilli),Yuma myotis bat (Myotis yumanensis), Ahart's dwarf rush (Juncus leiospermus var. ahartii), dwarf downingia (Downingia pusilla), legenere (Legenere limosa), pincushion navarretia (Navarretia myersii), Sanford's arrowhead (Sagittaria sanfordii) and the state-endangered Bogg's Lake hedge-hyssop (Gratiola heterosepala). Should any of these unlisted covered-species become listed under the ESA during the term of the permit, take authorization for those species would become effective upon listing. The County proposes to include 8 plant species (2 listed and 6 unlisted) in the SSHCP. The ESA does not prohibit the incidental take of federally listed plants on private lands unless the take is a violation of state law or regulation. We propose to include these plant species on the ITP in recognition of the conservation benefits that would be provided for these plant species under the SSHCP and to meet regulatory obligations under Section 7 of the ESA and the California Endangered Species Act (CESA). All wildlife and plant species included on the proposed ITP would receive assurances under the Service's ``No Surprises'' regulations found in 50 CFR

17.22(b)(5) and 17.32(b)(5).

The activities proposed for coverage in the SSHCP are wide-ranging, but are generally related to urban-suburban development on city and unincorporated lands. Proposed covered-activities presently include the construction, installation, extension, or removal of: (1) Private and commercial developments, (2) transportation facilities, (3) surface water and groundwater supply and delivery facilities, (4) water treatment facilities, (5) flood control facilities, (6) sanitation facilities (landfills, transfer stations, recycling stations), (7) public facilities (fire stations, police stations, hospitals, schools, community centers, cemeteries, and administration centers), (8) outdoor and indoor recreation facilities, (9) utility facilities, (10) aggregate mining activities, and (11) conservation activities (habitat restoration, creation, and enhancement; preserve management and monitoring). These covered activities are expected to impact 18 existing habitat and agricultural land-cover types within the 341,000-acre Planning Area. Approximately 43,500 acres of the existing natural habitat and agricultural land-cover in the Planning Area would be converted to a developed condition under the proposed SSHCP.

The proposed SSHCP Conservation Strategy would provide a regional approach for the conservation of the 40 covered-species and their 18 habitat types so as to aid recovery of the species and to minimize and mitigate impacts of the covered activities on the species and their habitats within the Planning Area. The 18 species habitat types include vernal pools and associated uplands, valley grasslands, other wetlands, woodlands, riparian habitats, and several agricultural land-cover types. The proposed SSHCP Conservation Strategy would protect a total of approximately 47,000 acres and restore or create a total of approximately 1,500 acres within the 341,000-acre Planning Area. The SSHCP Planning Area would be divided into a system of 12 conservation zones with an explicit amount of species habitat preservation directed to specific zones. The County and its partners anticipate that large landscape preserves and linkage corridors would be established outside of the UDA, and that these habitat preserves would be established within a matrix of open space and agricultural land uses. The proposed Conservation Strategy also includes approximately 8,000 acres of habitat preserves within the UDA, but these UDA habitat preserves would be much smaller and would eventually be surrounded by urban or suburban development. Components of the proposed SSHCP conservation program are now under consideration by the Service and the County. These components may include monitoring, adaptive management, species avoidance measures, and species mitigation measures including the preservation, restoration, and enhancement of suitable habitat. It is anticipated the SSHCP would be implemented through a section 10(a)(1)(B) incidental take permit and an Implementation Agreement.

Environmental Impact Statement/Report

The proposed EIS/EIR will consider (1) The proposed action (i.e. the Service issues an ITP for the SSHCP proposed by the County and its partners), (2) a no-action alternative (i.e. the Service does not issue an ITP and a SSHCP is not implemented) and, (3) reasonable alternatives to the proposed action (i.e. the Service considers alternative versions of the SSHCP, and then permits alternative). We anticipate that several alternatives will be developed for analysis in the EIS/EIR. These alternatives might vary by the number of covered species; the covered activities, different strategies for avoiding, minimizing, and mitigating the impacts of incidental take; the amount of land preserved or restored, the type of future conservation efforts; or a combination of these factors. A detailed description of all reasonable alternatives, including the proposed action, will be included in the EIS/EIR.

The EIS/EIR will analyze in depth all significant environmental issues identified through this scoping process. These issues may include biological resources, agricultural resources, land use, housing, hydrology and water resources, cultural resources, aesthetics, transportation and circulation, mineral resources, recreation, air quality, noise and vibration, or other components of the human environment that could be directly, indirectly, or cumulatively impacted by the proposed action or by the alternatives.

We anticipate that a draft EIS/EIR and the draft SSHCP will be available in late 2009 and will have a 60-day public review period. The environmental review of the EIS/EIR will be conducted in accordance with the requirements of NEPA (42 U.S.C. 4321 et seq.), its implementing regulations (40 CFR 1500-1508), other applicable regulations, and Service policy and guidance on compliance with those regulations. We expect to complete the final EIS/EIR in the middle of 2010 and to make the decision on issuing a section 10(a)(1)(B) permit for a SSHCP in late 2010.

The U.S. Army Corps of Engineers (Corps) will be a NEPA Cooperating Agency on the proposed EIS/EIR pursuant to 40 CFR 1501.6, 1506.3(c), and 1508.5. The County and their partners expect to apply to the Corps for a Programmatic General Permit (PGP) under Section 404 of the Clean Water Act (CWA). Section 404 of the CWA regulates and requires Corps authorizations for discharges of dredged or fill material into waters of the United States. A PGP is among the types of general permits which can be issued for any category of activities involving discharges of dredged or fill material if the Corps makes certain determinations (33 U.S.C. 1344(e)). Corps regulations promulgated under the CWA define dredged or fill material in detail at 33 CFR 323.2 and regulations concerning processing of Corps permits are at 33 CFR part 325. The Corps may use the

[[Page 32732]]

EIS/EIR to inform their discretionary decision to issue to a PGP for certain components of the proposed SSHCP.

The California Department of Fish and Game (CDFG) will be a NEPA Cooperating Agency on the proposed EIS/EIR pursuant to 40 CFR 1501.6 and 1508.5. The County and their partners expect to apply to CDFG for an incidental take permit under Section 2081 of the California Fish and Game code and to apply for a Lake or Streambed Alteration Agreement under Section 1600 of the California Fish and Game code. CDFG intends to use the EIS/EIR in conducting its review of the SSHCP as a CEQA Trustee Agency. CDFG will also use the EIS/EIR in makings its CEQA findings in their decision to issue an incidental take permit under Section 2081 of the California Fish and Game Code. As a CEQA Responsible Agency, CDFG may also use the EIS/EIR during their consideration to approve a Lake or Streambed Alteration Agreement under Section 1600 of the California Fish and Game Code. The SSHCP will incorporate best management practices that have been developed in cooperation with, and approved by, CDFG.

This notice of intent is being furnished in accordance with 40 CFR Sections 1501.2, 1501.7, 1506.6, and 1508.22 to obtain suggestions, comments, and useful information from other agencies and the public on the scope of the proposed EIS/EIR, including the significant environmental issues deserving of study, the range of actions, the range of alternatives, and the range of impacts to be considered. Written comments from interested parties are invited to ensure that all issues related to the proposed section 10(a)(1)(B) incidental-take permit application are identified. Comments will only be accepted in written form. You may submit written comments by mail, facsimile transmission, or in person (see ADDRESSES). All comments received will become part of the official administrative record. Our practice is to make comment letters (including names, home addresses, home phone numbers and email addresses of respondents) available for public review. You may request that we withhold personal information, if so, please state this prominently at the beginning of your comments. However, we cannot guarantee that we will be able to do so.

Dated: June 4, 2008.

John Engbring,

Deputy Regional Director, California and Nevada Region, Sacramento, California.

NOTICE OF PREPARATION

JUNE 11, 2008

TO: ALL INTERESTED PARTIES

SUBJECT: NOTICE OF PREPARATION OF A JOINT DRAFT ENVIRONMENTAL IMPACT REPORT AND ENVIRONMENTAL IMPACT STATEMENT FOR SOUTH SACRAMENTO HABITAT CONSERVATION PLAN (CONTROL NUMBER 03-PLE-0637)

Sacramento County will be the California Environmental Quality Act (CEQA) lead local agency and the US Fish and Wildlife Service will be the National Environmental Policy Act (NEPA) lead federal agency for preparation of a joint Environmental Impact Statement/Environmental Impact Report/ (EIS/R) for a project known as the SOUTH SACRAMENTO HABITAT CONSERVATION PLAN. This Notice of Preparation (NOP) has been sent to responsible and trustee agencies, involved federal agencies, and interested persons pursuant to Section 15082 of the CEQA Guidelines and section 1506.2 and 1506.6 of the NEPA regulations. A similar NEPA Notice of Intent (NOI) was published in the Federal Register on June 10, 2008 (73 FR 32729). Agencies should comment on the scope and content of the environmental information that is germane to the agencies' statutory responsibilities in connection with the proposed project. Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 50 days after receipt of this notice. The County and USFWS will hold four public scoping meetings on the proposed SSHCP to solicit information from the public on the proposed plan, alternatives, and the scope of issues and impacts to be addressed in the Environmental Impact Statement/Environmental Impact Report. Scoping meeting dates, time and location follow.

1. **Galt, Tuesday, July 8, 6:30 to 8:30 pm,** Galt Police Department, Anthony Pescetti Community Room, 455 Industrial Dr., Galt, CA. 95632.

2. **County of Sacramento, Friday, July 11, 10:00 am to 12:00 pm**, Sacramento County Administration Building, Sixth Floor Training Room, 700 H Street, Sacramento, CA. 95814

3. **Rancho Cordova, Tuesday, July 15, 6:30 to 8:30 pm**, Rancho Cordova City Hall, American River Room, 2729 Prospect Park Dr., Rancho Cordova, CA. 95670

4. **Elk Grove, Wednesday, July 16, 6:30 to 8:30 pm**, Elk Grove City Council Chambers, 8400 Laguna Palms Way, Elk Grove, CA. 95758

Dates and location of the public meetings will, among other methods, also be advertised on the following website: http://www.DERA.SacCounty.net .

The SSHCP proposed location, project description, and the probable environmental effects are contained in the attached materials. This NOP may also be viewed online at: http://www.DERA.SacCounty.net. Please send your Agency's response to this Notice to:

Ms. Joyce Horizumi, Environmental Coordinator
Department of Environmental Review and Assessment
827 7th Street, Room 220, Sacramento, CA 95814
or via e-mail at: DERA@saccounty.net.

Your response should reference the DERA Control Number (03-PLE-0637) and include the name of a contact person in your agency.

Persons and agencies with specific questions about the project should contact Mr. Peter Morse, Department of Environmental Review and Assessment (DERA), Project Manager, at (916) 874-7914 for further information. Additional details of the County's proposed draft SSHCP are available at http://www.planning.saccounty.net/habitat-conservation/overview.html.

PROJECT TITLE
SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

CONTROL NUMBER
03-PLE-0637

PROJECT PROPONENT
County of Sacramento

PROJECT PERMITTEES (PARTNERS)
County of Sacramento
City of Elk Grove
City of Rancho Cordova
City of Galt
Sacramento Regional County Sanitation District (includes County Sanitation District-1)
Sacramento County Water Agency

INTENT
Pursuant to the California Environmental Quality Act (CEQA) the County of Sacramento is circulating this Notice of Preparation (NOP) to inform the public that the County intends to gather information to prepare, in coordination with US Fish and Wildlife Service (USFWS), a joint Environmental Impact Statement/Environmental Impact Report (EIS/EIR) on the proposed South Sacramento Habitat Conservation Plan (SSHCP). The joint EIS/EIR will analyze the environmental effects of the USFWS's proposed issuance of an incidental take permit under Section 10(a)(1)(B) of the federal Endangered Species Act of 1973, as amended (FESA), the California Department of Fish and Game's proposed issuance of an incidental take permit under Section 2081(b)(2) of the state Endangered Species Act, as amended (CESA), and local approval and implementation of the habitat conservation plan associated with the proposed incidental take permit. The County of Sacramento is facilitating preparation of the joint environmental document with project permittees and is the lead agency under the California Environmental Quality Act (CEQA). The SSHCP will cover 40 species, 10 of which are either state or federally listed. The County and its partners intend to apply for permits from the USFWS and the CDFG for the incidental take of covered species resulting from otherwise lawful activities. Anticipated permit life is 30 years. Pursuant to the Federal Endangered Species Act (FESA), the County and its partners must prepare a regional habitat conservation plan (HCP) as part of their application for the Federal incidental take[1] permit. In addition, the County and its partners expect to apply to the US Army Corps of Engineers (Corps) for a Programmatic General Permit under Section 404 of the Clean Water Act. Such a permit would be issued to allow the discharge of dredge or fill materials into waters within the regulatory jurisdiction of the Corps.

[1] The term "take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect listed species, or to attempt to engage in such conduct, and includes take resulting from significant habitat modifications or degradations.

PROJECT SUMMARY

The proposed SSHCP is a regional approach to conserving species and addressing issues related to urban development, habitat conservation, open space protection, and agricultural protection. The SSHCP would minimize regulatory hurdles and streamline the permitting process for projects that engage in development related activities inside the urban development area or UDA. The SSHCP would consolidate environmental efforts to protect and enhance vernal pool habitat and other aquatic and upland habitats to provide ecologically viable conservation areas in south Sacramento County for numerous species. Adoption of the SSHCP would authorize the County and its partners to issue permits that allow landowners to engage in specific development activities (covered activities) that could result in the incidental take of listed species. The County and its partners would adopt a developer-paid fee based on loss of habitat acreage, habitat type and long-term management costs. Fees would fund the habitat preservation, restoration and management elements of the proposed SSHCP.

PROJECT LOCATION

The geographic location of the proposed SSHCP includes a combined 341,000 acres within south Sacramento County (unincorporated area) and the cities of Rancho Cordova, Elk Grove, and Galt. The geographic boundaries of the SSHCP planning area are Highway 50 to the north, the County line to the east and south, and Interstate 5 to the west. The plan area excludes the City of Sacramento, the City of Folsom, Folsom's Sphere of Influence, the Sacramento-San Joaquin Delta, and the Sacramento County community of Rancho Murieta (Plate NOP-1 SSHCP Planning Area).

PROPOSED SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

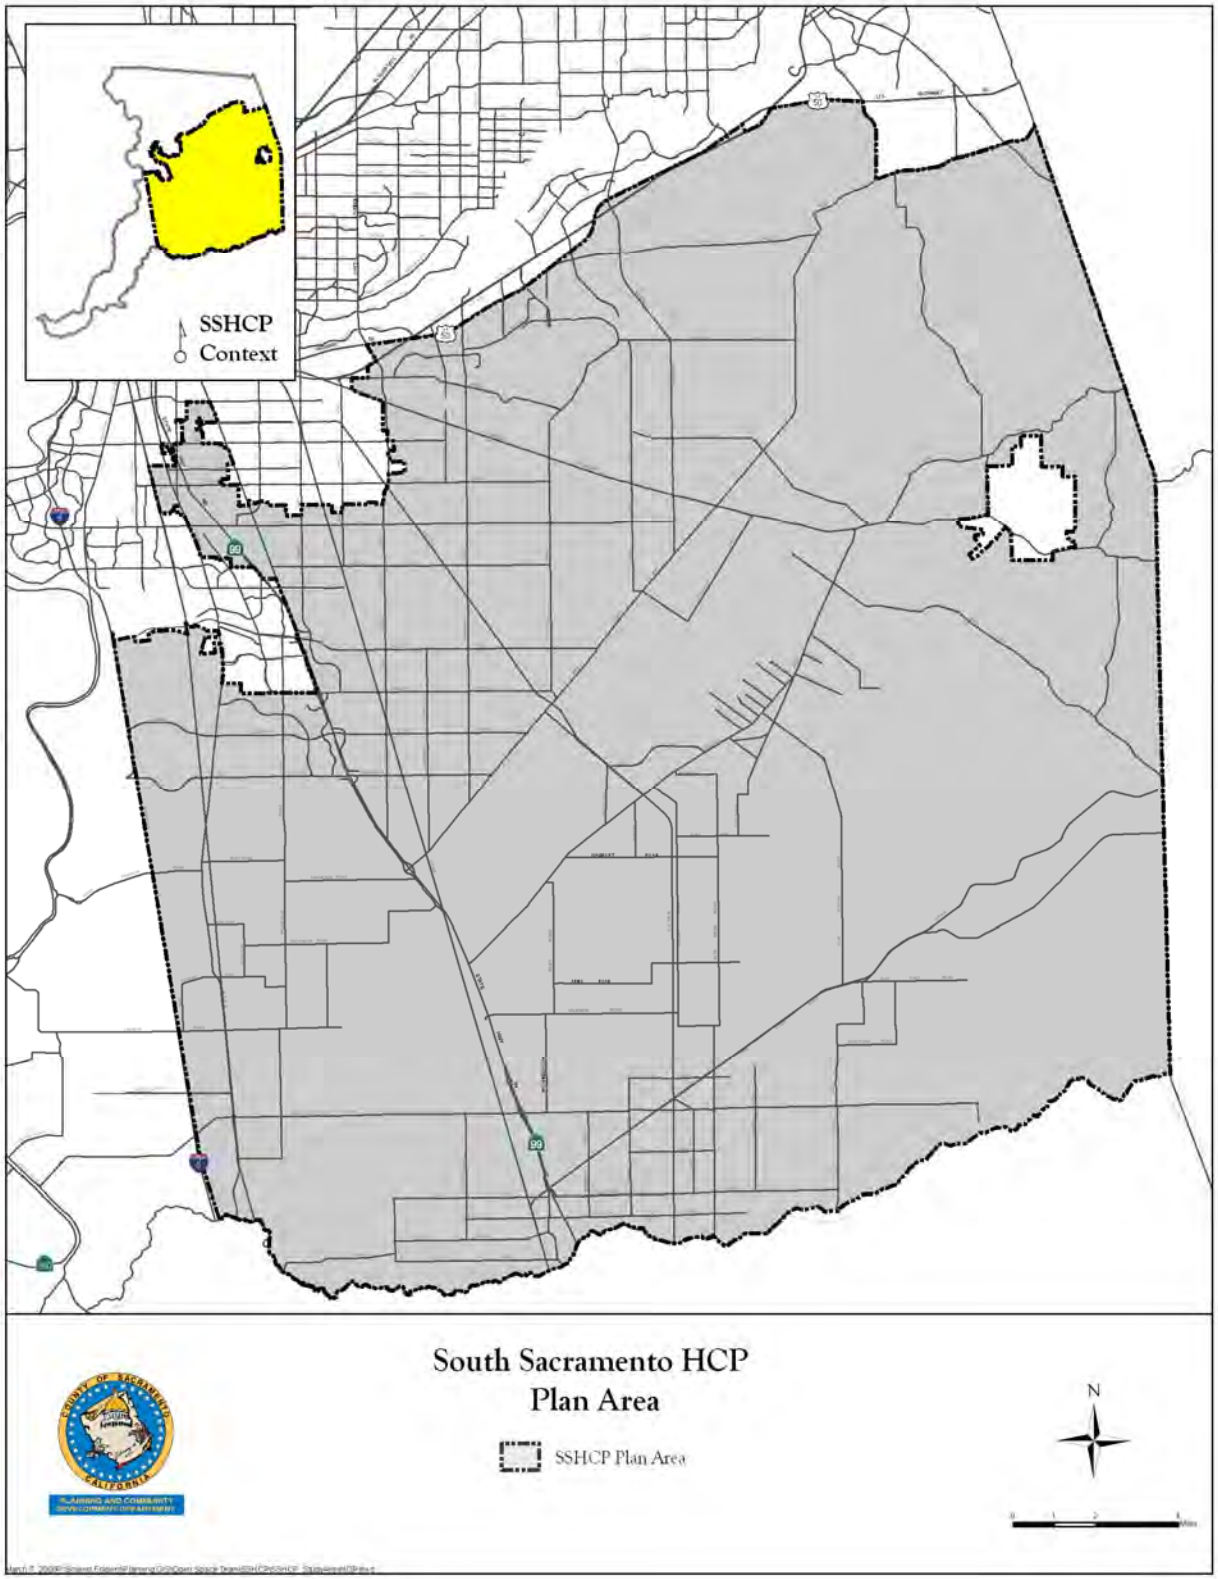
The proposed conservation strategy for the SSHCP provides for the conservation of covered species and their associated habitat types so as to aid recovery of the species, fully mitigate for the impacts of covered activities on the species and their habitats, and provide a regional approach to the avoidance, minimization and mitigation of impacts on the Waters of the United States. It is based on the concepts of conservation biology and landscape ecology, the ecological needs of the covered species and the nature, quality and geographical distribution of the different habitat types.

The permits issued for implementing the SSHCP would minimize and mitigate incidental take and provide for the conservation of 40 covered species that may occur in the plan area. The plan identifies 18 different habitat types including vernal pool aquatic and upland habitat, other wetland habitats, oak woodland, and rural agricultural crops. Bisecting the plan area is Cosumnes and Deer Creek corridor which contains agricultural lands and extensive riparian habitat (Plate NOP-2 SSHCP Habitat Types).

The proposed SSHCP conservation strategy includes the following elements:

- Protect approximately 8,000 acres of habitat inside the UDA.
- Protect approximately 39,000 acres outside the UDA.
- Restore approximately 1,500 acres of habitat in the plan area.

Plate NOP-1 SSHCP Planning Area



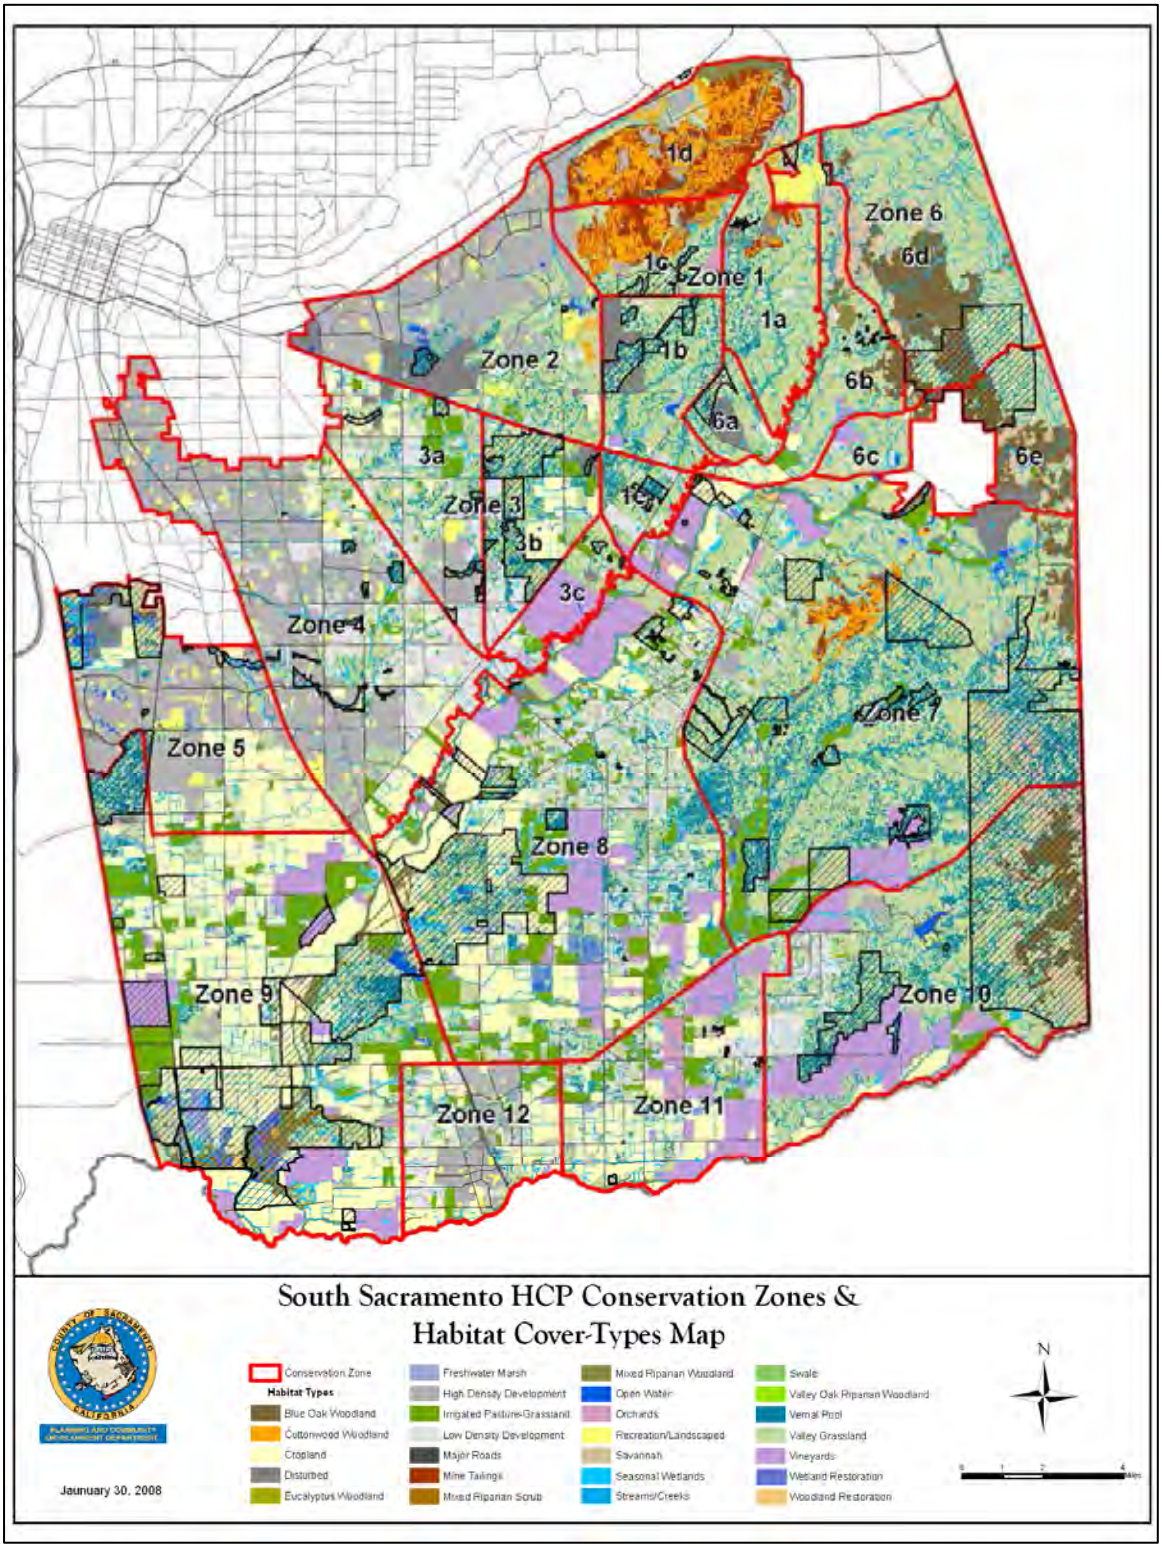


Plate NOP-2 SSHCP Habitat Types[2]

[2] The plan area is divided into 12 zones to assist in implementing and managing habitat conservation.

The plan anticipates larger habitat preserves and linked habitat corridors outside the UDA. Habitat preserves inside the UDA would be smaller, also linked by corridors, and would eventually be a component of the urban/suburban landscape. Specific location of preserves would occur over time during plan implementation. Habitat preserves purchased or conservation easements acquired would be selected based on a number of important biological criteria, including:

- Protect habitat areas that are considered core elements of the SSHCP.
- Add parcels onto existing preserves to increase their size and reduce habitat fragmentation and edge effect.
- Provide connections to existing preserves and/or preserve areas that are currently isolated from each other.

Covered Species

There are 40 wildlife and plant species proposed for coverage under the Plan including 10 state or federally listed species. Table NOP-1 Covered Species lists those species and their current status. Species may be added or deleted from this list as Plan development continues.

Covered Activities

Activities considered under this Plan are wide ranging and may result in incidental take but are primarily related to urban-suburban development. Proposed covered-activities may include the construction, installation, or extension of:

- Private and commercial developments
- Transportation facilities
- Surface and groundwater delivery facilities
- Water treatment facilities
- Solid waste sanitation facilities
- Public facilities (fire station, police stations, hospitals, schools, community centers, cemeteries, and administration centers)
- Indoor and outdoor recreation facilities
- Energy utility facilities
- Aggregate mining activities
- Habitat management activities

Covered activities will continue to be refined as the Plan is developed further.

Incidental Take

Almost all incidental take of SSHCP covered-species is expected to occur inside an area referred to as the urban development area or UDA. The UDA corresponds to land within the County's urban services boundary (USB), and to land within the city limits of Rancho Cordova, Elk Grove and Galt, and Galt's adopted sphere of influence. A limited amount of infrastructure development, such as planned road widening projects and water conveyance pipelines would occur in the SSHCP planning area outside the UDA.

Table NOP-1 Covered Species[3]

Mammals	**Invertebrates**
American Badger, *Taxidae taxus*	Mid-Valley Fairy Shrimp, *Branchinecta mesovallensis*
Pallid Bat, *Antrozous pallidus*	Ricksecker's Water Scavenger Beetle, *Hydrochara ricksecker*i
Ringtail, *Bassariscus astutas*	Valley Elderberry Longhorn Beetle, *Desmocerus californicus dimorphus*, (FT)
Western Red Bat, *Lasirus blossevillii*	Vernal Pool Fairy Shrimp, *Branchinecta lynch*i, (FT)
Yuma Myotis Bat, *Myotis yumanensis*	Vernal Pool Tadpole Shrimp, *Lepidurus packardi,* (FE)
Birds	**Plants**
American Peregrine Falcon, *Falco peregrinus anatum*	Ahart's Dwarf Rush, *Juncus leiospermus var. ahartii*
Bald Eagle, *Haliaeetus leucocephalus*	Boggs Lake Hedge-Hyssop, *Gratiola heterosepala* (SE)
White-Tailed Kite, *Elanus leucurus*	Dwarf Downingia, *Downingia pusilla*
Cooper's Hawk, *Accipiter cooperii*	Legenere, *Legenere limosa*
Ferruginous Hawk, *Buteo regalis*	Pincushion Navarretia, *Navarretia myertsii*
Golden Eagle, *Aquila chrysaetos*	Sacramento Orcutt Grass, *Orcuttia viscida*, (SE, FE)
Greater Sandhill Crane, *Grus Canadensis tabida* (ST)	Slender Orcutt Grass, *Orcuttia tenuis,* (SE, FE)
Loggerhead Shrike, *Lanius ludovicianus*	Sanford's Arrowhead, Sagittaria sanfortii
Long-Eared Owl, *Asio otus*	
Merlin, *Falco columbarius*	**Amphibians**
Northern Harrier, *Circus cyaneus*	California Tiger Salamander, *Ambystoma californiense* (central valley, DPS*)*, (FT)
Sharp-Shinned Hawk, *Accipiter striatus*	Western Spadefoot Toad, *Scaphiopus hammondii*
Short-Eared Owl, *Asio flammeus*	
Swainson's Hawk, *Buteo swainsoni* (ST)	**Reptiles**
Tricolored Blackbird, *Agelaius tricolor*	Giant Garter Snake, *Thamnophis gigas* (FT)

[3] : F - federal, S – State, E – endangered, T – threatened

Western Burrowing Owl, *Athene cunicularia hypugaea*	Pond Turtle, *Actinemys marmorata marmorata* and *A. m. pallida* (2 sub-species: Western and Northeastern)
White-Faced Ibis, *Plegadis chihi*	
Yellow Breasted Chat, *Icteria virens*	

Current assumptions of take include:

- Take will occur on approximately 43,500 acres within the UDA on land already identified for urbanization.
- Take will occur on approximately 2,000 acres outside the UDA for public roadway or utility projects already identified in master plans or other projections.

Permits

Six permits may be required to implement the proposed SSHCP or any alternative:

- Federal Endangered Species Act (FESA), Section 10(a)(1)(B) permit (incidental take) issued by the US Fish and Wildlife Service
- California Endangered Species Act (CESA), Section 2081 permit (incidental take) issued by the Department of Fish and Game
- Clean Water Act, Section 404 permit (wetland fill) issued by the US Army Corps of Engineers (USACE)[4]
- Clean Water Act, Section 401 compliance (water quality) administered by the Regional Water Quality Control Board
- Fish and Game Code, Section 1600 agreement (stream bed alteration) issued by Department of Fish and Game

POSSIBLE ENVIRONMENTAL EFFECTS OF THE PROPOSED SSHCP

Land Use

Assess how habitat preserves inside the UDA may affect development densities and land use patterns within UDA to accommodate anticipated future population growth. Assess how preserves or easements may also affect existing agricultural use.

Public Facilities

Assess how habitat preserves may affect placement of future public service extensions inside the UDA, such as water, sewer and power lines. Agencies involved in providing public services include Sacramento County Water Agency (SCWA), County Sanitation District-1 (CSD-1), Sacramento Municipal Utility District (SMUD), and Pacific Gas and Electric (PG&E).

Transportation/Circulation

Assess how habitat preserves may affect the placement of future roadways and/or redirect traffic to nearby roadways, potentially increasing congestion.

[4] It is unclear whether or not the USACE can issue a Clean Water Act permit for SSHCP.

Emergency services
Assess how the presence of grassland habitat preserves adjacent to urban development may increase exposure to fire risks or other natural hazards.

Hydrology/Flooding
Assess how habitat protection and enhancement along local stream channels may increase existing habitat values and potentially affect existing floodway capacities and floodwater velocities.

Biological Resources
Assess the effectiveness of habitat conservation as prescribed by the SSHCP for providing long-term habitat protection and population enhancements for 40 covered species inside the plan area. Assess proposed interface between habitat and non-habitat land uses. Consider effectiveness of elements of habitat conservation preserves including preserve size, shape, location, water availability, connectivity, critical habitat designation, vegetation cover, enhancement potential, and other elements.

Water Quality
Assess how proposed habitat enhancement, restoration, and creation of habitat may affect existing stormwater runoff, especially during restoration/creation of wetland habitat. Analysis will consider consistency with various water quality permits, including the National Pollution Discharge Elimination System, and state and local policies and regulations.

Recreational Access
Assess impacts on existing recreation opportunities in the Plan Area. Assess the potential for illicit passive recreation activities on proposed habitat preserves.

Noise
Assess impacts of construction noise associated with proposed habitat enhancement and restoration.

Air Quality
Assess impacts of construction dust and exhaust associated with proposed habitat enhancement and restoration.

Mineral Resource
Assess impacts on existing aggregate resources.

Climate Change
Assess impacts of green house gas emissions in relation to proposed habitat protection, enhancement and restoration.

Cultural/Historical Resources
Assess impacts to cultural resources, especially given general proximity of historical human habitation to water courses.

Agriculture
Assess impacts to agricultural productivity in relation to the conservation or conversion of agricultural lands for wildlife habitat uses. Assess any effect of wildlife habitat lands on adjacent agricultural uses.

Other Studies
Other sections, such as aesthetics, health and human hazards, and vector control may be added.

INTENDED USES OF THE EIR
The County of Sacramento as Lead CEQA Agency, must consider the information provided in the joint EIS/EIR prior to its approval or denial of the proposed SSHCP. The EIS/EIR will also provide environmental information for other agencies that may have permitting authority or an interest in various aspects of the project. Responsible agencies may include, but are not limited to:

- City of Rancho Cordova
- City of Elk Grove
- City of Galt
- Sacramento Regional County Sanitation District, including County Sanitation District-1
- Sacramento County Water Agency
- US Army Corps of Engineers
- US Fish and Wildlife Service
- US Environmental Protection Agency
- California Department of Fish and Game
- California Department of Water Resources
- California Regional Water Quality Control Board
- State Historic Preservation Office

South Sacramento Habitat Conservation Plan

Help Scope the Environmental Review Process!

What is the SSHCP?

The proposed SSHCP is a regional plan to address issues related to species conservation, agricultural protection, and urban development. The proposed SSHCP will consolidate environmental efforts to protect and enhance wetland and upland habitats to provide ecologically functional conservation areas while also streamlining the permitting process and minimizing regulatory hurdles for future development projects.

For more information about the proposed SSHCP visit the SSHCP website at: www.planning.saccounty.net/habitat-conservation/overview.html or contact Vince King at kingv@saccounty.net or (916)874-3257

The proposed South Sacramento Habitat Conservation Plan (SSHCP) is beginning environmental review. Please join us at one of the four meetings in July to discuss the proposal, alternatives, and scope of issues and impacts to be addressed in the environmental review process:

Galt
Tuesday, July 8 - 6:30 to 8:30 pm
Galt Police Department,
Anthony Pescetti Community Room
455 Industrial Drive
Galt, CA 95632

County of Sacramento
Friday, July 11 - 10:00 am to 12:00 pm
Sacramento County Admin. Building, Sixth Floor Training Room
700 H Street, Sacramento, CA 95814

Rancho Cordova
Tuesday, July 15 - 6:30 to 8:30 pm
Rancho Cordova City Hall,
American River Room
2729 Prospect Park Drive
Rancho Cordova, CA 95670

Elk Grove
Wednesday, July 16 - 6:30 to 8:30 pm
Elk Grove City Council Chambers
8400 Laguna Palms Way
Elk Grove, CA 95758

Following these scoping meetings, the County will host a community workshop in August to help identify alternatives to analyze during the environmental review process. Stay tuned for details!

For more information on the environmental review process, please contact Peter Morse at (916)874-6929, morsep@saccounty.net or visit the DERA web site at: www.dera.saccounty.net and goto the South Sacramento Habitat link

South Sacramento Habitat Conservation Plan

Help Design the South Sac HCP Conservation Alternatives!

What is the SSHCP?

The proposed SSHCP is a regional plan to address issues related to species conservation, agricultural protection, and urban development. The proposed SSHCP will consolidate environmental efforts to protect and enhance wetland and upland habitats to provide ecologically functional conservation areas while also streamlining the permitting process and minimizing regulatory hurdles for future development projects.

The proposed South Sacramento Habitat Conservation Plan (SSHCP) is undergoing environmental review. A significant step in the environmental review process is identifying and analyzing conservation alternatives in the Environmental Impact Statement. The SSHCP must balance the need to conserve sensitive habitat with urban growth. This workshop is designed to allow you to map particular locations within the SSHCP's Urban Development Area (UDA) that you feel are important to sensitive species and habitats in the region. Your maps will be used to help inform the conservation alternatives analyzed during environmental review.

What will you do at the workshop?

* Learn about the proposed plan
* Join a workgroup to map conservation alternatives
* Enjoy food and beverages courtesy of Sacramento County

When and Where?

Tuesday, August 19th
6:00 - 9:00 PM
Florin Service Center
7000 65th Street
Sacramento, CA 95823

For more information about the proposed SSHCP visit the SSHCP website at: www.planning.saccounty.net/habitat-conservation/overview.html or contact Vince King at kingv@saccounty.net or (916)874-3257

For more information on the environmental review process, please contact Tim Hawkins at (916)874-7914, hawkinst@saccounty.net or visit the DERA web site at: www.dera.saccounty.net and goto the South Sacramento Habitat link

The proposed South Sacramento Habitat Conservation Plan (SSHCP) is beginning environmental review. Please join us at one of the following scoping meetings to help us scope issues and impacts you would like analyzed in the environmental document. **Click here** for the EIR/EIS scoping meetings flyer, which provides the following information as well as additional information and links for the proposed SSHCP. A direct link to the Federal Register notice is: **http://edocket.access.gpo.gov/2008/pdf/E8-12963.pdf**

1. **Galt, Tuesday, July 8, 6:30 to 8:30 pm**, Galt Police Department, Anthony Pescetti Community Room, 455 Industrial Dr., Galt, CA. 95632.
2. **County of Sacramento, Friday, July 11, 10:00 am to 12:00 pm**, Sacramento County Administration Building, Sixth Floor Training Room, 700 H Street, Sacramento, CA. 95814
3. **Rancho Cordova, Tuesday, July 15, 6:30 to 8:30 pm**, Rancho Cordova City Hall, American River Room, 2729 Prospect Park Dr., Rancho Cordova, CA. 95670
4. **Elk Grove, Wednesday, July 16, 6:30 to 8:30 pm**, Elk Grove City Council Chambers, 8400 Laguna Palms Way, Elk Grove, CA. 95758

If you are unable to attend one of the scoping meetings, you may provide written comments germane to drafting the environmental document by July 30, 2008. Please submit written comments to:

Residents can chime in on habitat conservation plan

By Loretta Kalb - lkalb@sacbee.com

Published 3:14 pm PDT Wednesday, August 13, 2008

Urban growth and habitat conservation in the south county will be the topic of a workshop at 6 p.m. Tuesday. Residents can lend their voice to the issue during a discussion of the proposed South Sacramento Habitat Conservation Plan, which is undergoing environmental review.

Participants in the three-hour session will be able to map locations within the plan's urban development area they deem important to sensitive species and habitats. The maps will be used to analyze conservation alternatives during the environmental review.

The workshop will be held at 7000 65th Street.

For information or to reserve a seat, call Vince King at (916) 874-3257. Or e-mail King at kingv@saccounty.net.

For more information on the plan, go to www.planning.saccounty.net and search for "habitat."

South Sacramento Habitat Conservation Plan

Help Shape the Environmental Review Process!

What is the SSHCP?

The proposed SSHCP is a regional plan to address issues related to species conservation, agricultural protection, and urban development. The proposed SSHCP will consolidate environmental efforts to protect and enhance wetland and upland habitats to provide ecologically functional conservation areas while also streamlining the permitting process and minimizing regulatory hurdles for future development projects.

For more information about the proposed SSHCP visit the SSHCP website at: www.planning.saccounty.net/habitat-conservation/overview.html or contact Vince King at kingv@saccounty.net or (916)874-3257

The proposed South Sacramento Habitat Conservation Plan (SSHCP) is beginning environmental review. Please join us at one of the four meetings in July to discuss the proposal, alternatives, and scope of issues and impacts to be addressed in the environmental review process:

Galt
Tuesday, July 8 - 6:30 to 8:30 pm
Galt Police Department,
Anthony Pescetti Community Room
455 Industrial Drive
Galt, CA 95632

County of Sacramento
Friday, July 11 - 10:00 am to 12:00 pm
Sacramento County Admin. Building, Sixth Floor Training Room
700 H Street, Sacramento, CA 95814

Rancho Cordova
Tuesday, July 15 - 6:30 to 8:30 pm
Rancho Cordova City Hall,
American River Room
2729 Prospect Park Drive
Rancho Cordova, CA 95670

Elk Grove
Wednesday, July 16 - 6:30 to 8:30 pm
Elk Grove City Council Chambers
8400 Laguna Palms Way
Elk Grove, CA 95758

Following these scoping meetings, the County will host a community workshop in August to help identify alternatives to analyze during the environmental review process. Stay tuned for details!

For more information on the environmental review process, please contact Peter Morse at (916)874-6929, morsep@saccounty.net or visit the DERA web site at: www.dera.saccounty.net and goto the South Sacramento Habitat link

South Sacramento Habitat Conservation Plan

Please help us prepare the EIS/EIR for a South Sacramento Habitat Conservation Plan

We need your help. The County of Sacramento and U.S. Fish and Wildlife Service are working together to prepare a joint Environmental Impact Statement/Environmental Impact Report (EIS/EIR) that will analyze impacts of a Habitat Conservation Plan (HCP) proposed for south Sacramento County. The HCP will provide a framework under the Endangered Species Act to help local communities accommodate development while conserving plant and animal species. The Draft EIS/EIR will be published in the summer of 2009.

What is your role during this public scoping process?

Your help is needed to inform the County and the Service of the important issues you want studied in the EIR/EIS. Please focus your comments on:

- Potential impacts that the EIS/EIR should study in depth.
- Problems the proposal may cause, and ways to solve them.
- Better, more effective mitigation measures.
- Suggestions for reasonable alternatives to the proposal.
- Questions you want addressed in the EIS/EIR
- Specific habitat locations inside the Urban Development Area that you think should be preserved.

Please make your comments as specific as you can.

Sometimes participants identify issues during scoping meetings that are too broad to be useful for EIS/EIR analytical purposes - For example, "cultural impacts" - what does this mean? What precisely are the impacts or issues that you want examined? When we encounter a comment as broad as this, we have to guess about what you meant, and you may find that your issues are not covered in the EIS/EIR. Thus, you should refine broad general topics, and specify which issues need evaluation and analysis.

What information will the Draft EIR/EIS contain?

- Descriptions of a proposed HCP and alternative HCPs under consideration.
- A detailed analysis of direct, indirect, and cumulative impacts of all HCP alternatives on the human and environmental resources that you identify in your scoping comments.
- Resources and topics that will be analyzed in the draft EIS/EIR may include, but may not be limited to: Soils, Hydrology, Water Quality, Land Use, Mining, Agriculture, Wildlife and Plants, Wetlands, Cultural Resources, Socio-economics, Public Services, and Transportation

The Proposed South Sacramento Habitat Conservation Plan (SSHCP)

Sacramento County, City of Rancho Cordova, City of Elk Grove, City of Galt, the County Water Agency & Sacramento County Regional Sanitation District

AGENDA ITEM 11.1

5700

SSHCP

Welcome!

South Sacramento Habitat Conservation Plan (SSHCP) Scoping Meetings:

1. Galt (July 8th)
2. Downtown Sacramento (July 11th - day)
3. Rancho Cordova (July 15th)
4. Elk Grove (July 16th)

AGENDA ITEM 11.1

5701

SSHCP

Your role at this Meeting

- Tell us about issues you want analyzed in the EIR/EIS
- Tell us your ideas about the SSHCP proposal
  - Potential Impacts
  - Problems/resolutions
  - Reasonable alternatives
  - Specific questions
  - Specific habitat locations

SSHCP

Agenda for Tonight

- Brief overview of the proposed SSHCP
- Information and comment stations

SSHCP

HCP & EIR/EIS Staff

- Rich Radmacher, Sac. County Planning Dept.
- Vince King, Sac. County Planning Dept.
- Peter Morse, Sac. County DERA
- Nina Bicknese, US Fish & Wildlife Service
- Kate Dadey, US Army Corps of Engineers
- Dan Gifford, CA Dept. of Fish & Game

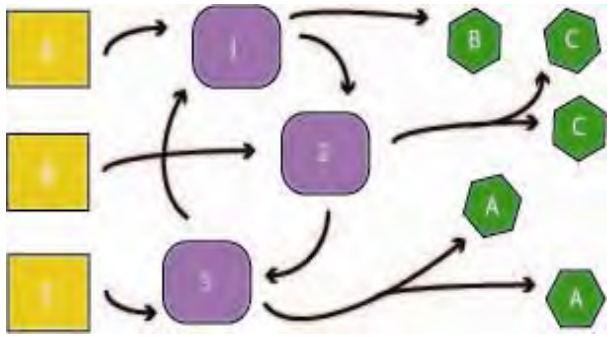
SSHCP

What is a Habitat Conservation Plan?

HCPs are:

- A document that outlines measures to conserve species and their habitats.

- The document results in the issuance of an incidental take permit to local jurisdictions that can then be extended to a project proponent.



SSHCP

Habitat Conservation Planning

- The Issues

  It is unlawful to “take” listed wildlife species under ESA.

  Desire to avoid time consuming & costly individual negotiations

- The Solution

  Permits development while addressing wetland & endangered species interests in a coordinated & predictable manner

SSHCP

Benefits to:

The Public

Developers

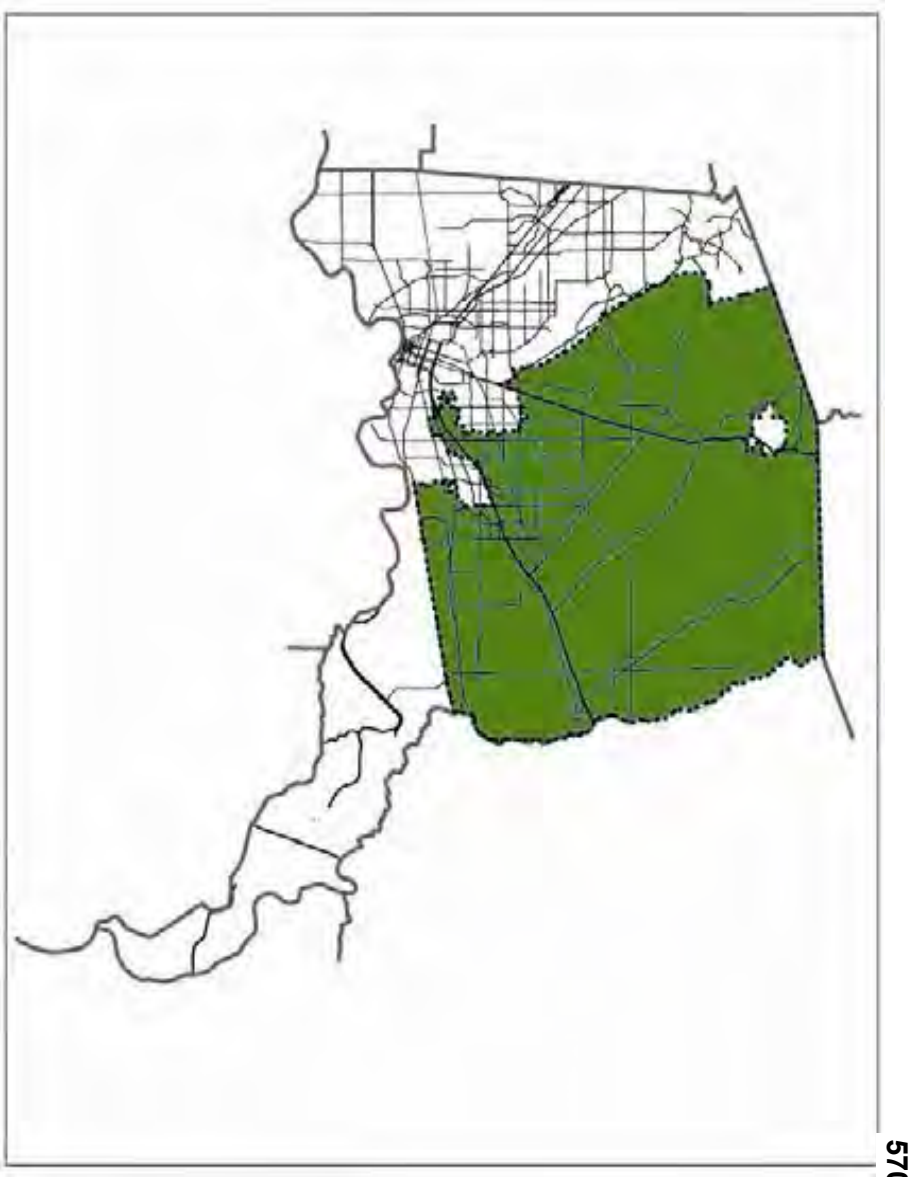
Environmentalists

Agriculture

Landowners

- Preserve floodplains
- Community buffers
- Recreational opportunities
- Attract businesses & jobs
- Protect biological resources
- Reduce development permitting costs & complexity
- Adaptive management specific to species needs
- Create opportunities to seek grants to benefit regional conservation
- Provide assurances & means to voluntarily sell land or conservation easements while continuing agricultural operations

SSHCP

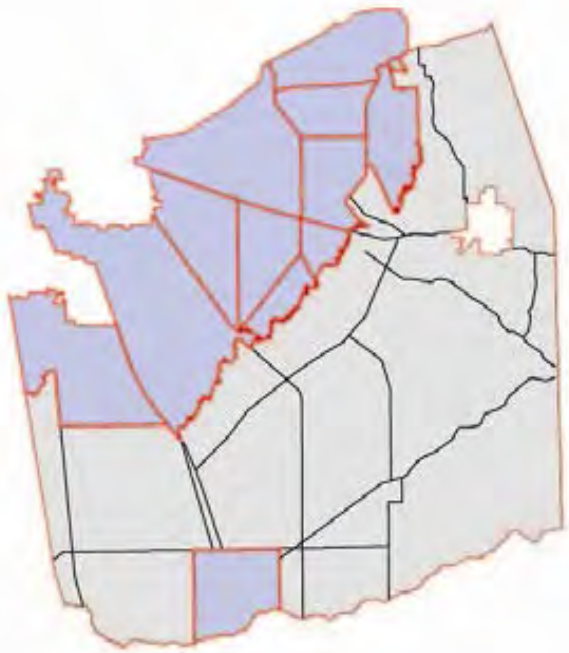


Boundaries:

North - Highway 50

West - Interstate 5

South & East - County Line



Encompasses 341,000 acres

SSHCP

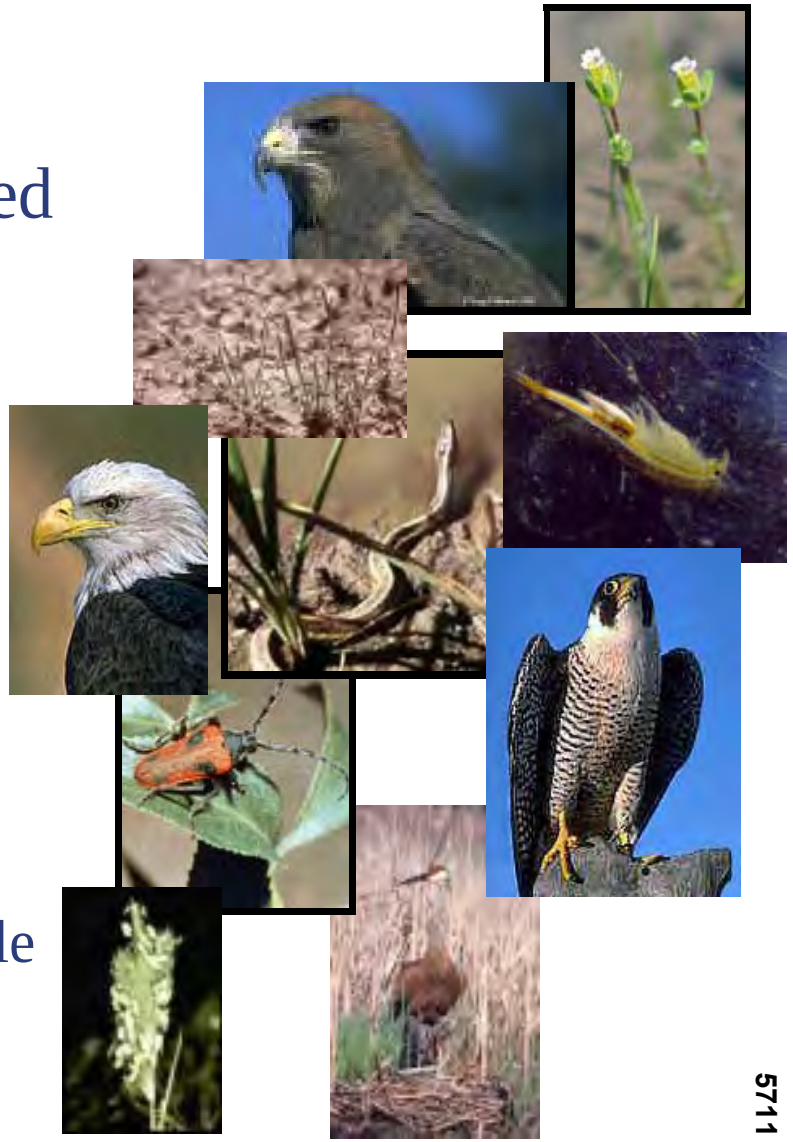
Urban Development Area (UDA)

- Majority of take covered under the plan
- Does not preclude species recovery
- Predictable streamlined permitting process

SSHCP

Outside the UDA

- Some transportation and Infrastructure projects
- Consolidate and direct mitigation
- Contribute to species recovery
- Address adjacent landowner concerns



SSHCP

Covered Species

40 total, 10 State/Federally Listed

- Vernal Pool Fairy Shrimp
- Vernal Pool Tadpole Shrimp
- Swainson's Hawk
- Giant Garter Snake
- California Tiger Salamander
- Sacramento Orcutt Grass
- Slender Orcutt Grass
- Boggs Lake Hedge-Hyssop
- Valley Elderberry Longhorn Beetle
- Greater Sandhill Crane

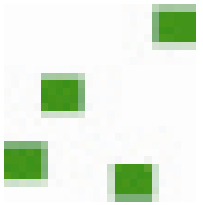
SSHCP

Habitat Types

- Agricultural Lands
- Riparian / Stream
- Upland Grassland
- Vernal Pool & Associated Uplands
- Wetlands, Ponds & Lakes
- Oak Woodlands

SSHCP

Conservation Principles



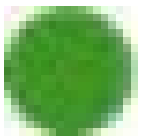
- Minimize Fragmentation

  Fragmentation disrupts movement and lowers species diversity.

Good

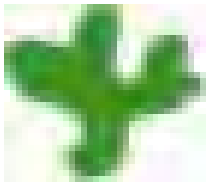
Poor

AGENDA ITEM 11.1



SSHCP

Conservation Principles



- Minimize Edge Effects

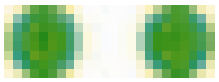
  Non-compatible uses adjacent to preserves lowers habitat values and species abundance/diversity

Good

Poor

SSHCP

Conservation Principles



- Establish Connectivity

  Linking preserves allows for increased movement amongst interacting landscapes.

Good

Poor

SSHCP

Conservation Principles

- Maximize Heterogeneity

  Preserves with greater mix of habitats tend to support greater biodiversity.

Good

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

GROW • ENHANCE • PRESERVE

An Introduction to the Proposed Plan

June
2008

City of Elk Grove • City of Galt • City of Rancho Cordova • Sacramento County
Sacramento County Water Agency • Sacramento Regional County Sanitation District

Introduction

Southern Sacramento County gradually slopes eastward from the rich flat agricultural lands of the untamed Cosumnes River floodplain towards stretching vernal pool landscapes and rolling blue oak woodlands. The interplay between fertile agricultural lands, open rangelands scattered with thousands of vernal pools, and the annual cycle of inundated winters and parched summers provides a key stop for millions of migratory birds, and crucial home to an array of threatened and endangered species.

These features in company with its proximity to the urban capital core and access to the Bay and Tahoe regions have also made the plan area an attractive home for thousands of new residents. Regional estimates predict that by 2050, the area will need to accommodate over 200,000 new housing units. This degree of growth has led local jurisdictions to partner with State and Federal regulatory agencies to develop the proposed South Sacramento Habitat Conservation Plan (SSHCP) to study how to accommodate continued growth while maintaining lasting environmental stewardship.

This brochure outlines some of the key concepts addressed in developing the proposed SSHCP and how the SSHCP may help guide development and conservation in the SSHCP plan area. For further information please contact staff listed on the back of or visit the web site at http://www.planning.saccounty.net/habitat-conservation/overview.html.

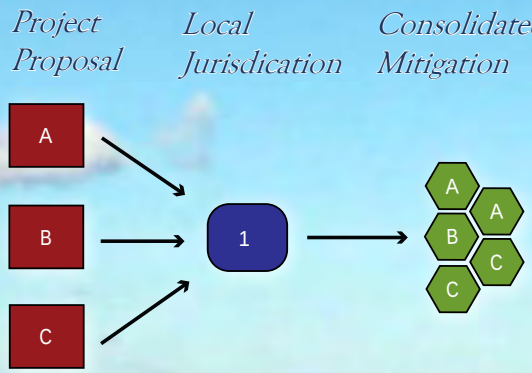
Implementation.....9
Costs & Funding.....10
Partnerships.....11



The Need

Currently, individual project proponents must address regulatory agencies on an individual basis when seeking compliance with wetland and species regulations. The resulting process can be confusing, and potentially ineffective. Years of negotiation can result in not only costly expenses and lost time, but also scattered and less than desirable habitat preserves.

The Solution

The proposed SSHCP would consolidate wetland and endangered species interests to address them in a coordinated and predictable manner. Project-by-project permitting would be avoided, which would benefit all interests involved from the project proponents, State, Federal and Local agencies, environmental interests, landowners, agricultural production, to the local residents.

Benefits to:

The Public

A large preserve system will help sustain healthy balanced communities by protecting view sheds, preserving floodplains, buffering distinct communities, increasing recreational opportunities, attracting businesses and jobs, and protecting our biological resources for future generations.

Developers

A single regional conservation plan greatly reduces the cost and complexity of meeting regulatory requirements. It also provides predictable mitigation costs and constraints up-front so that those costs can be anticipated at the onset of a project.

Environmentalists

Large-scale conservation avoids isolated, postage stamp preserves. HCPs also provide for perpetual adaptive management specific to species needs. They can also create opportunities to seek grants to augment HCP funds and to benefit regional conservation.

Agriculturists

The proposed SSHCP provides landowners the opportunity to voluntarily sell land or conservation easements while providing assurances that they can continue their own operations without affecting their neighbors. Landowners and agricultural operators are not subject to increased regulation.

SSHCP Principles

- Involve all stakeholders
- Inform the public
- Build consensus

SSHCP Goals

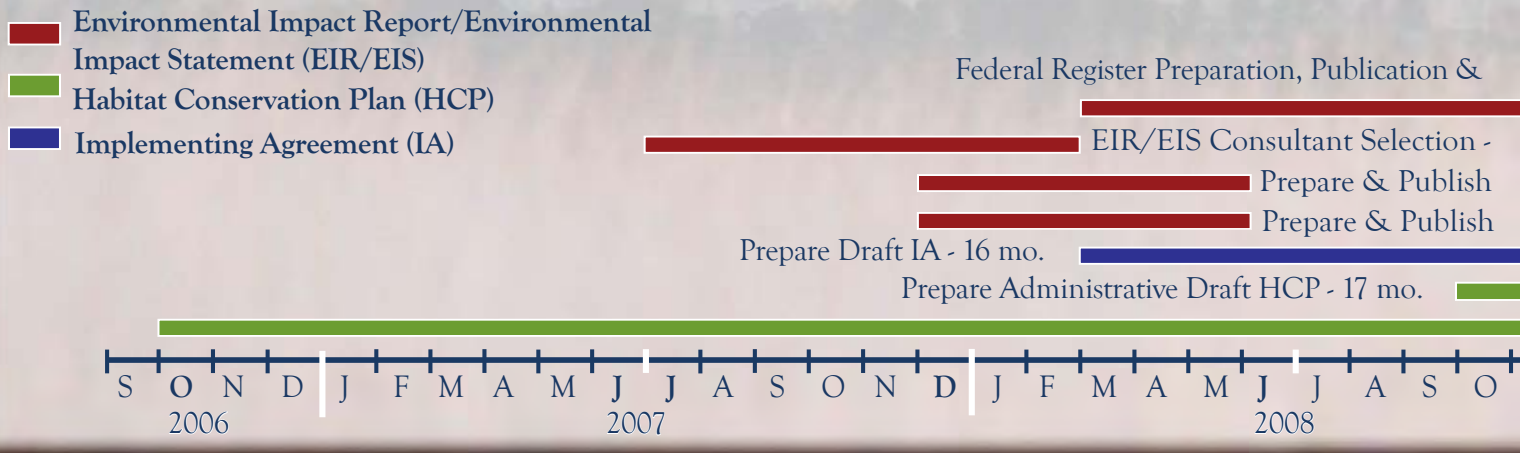
Aid and enhance the recovery of species. Conservation will be guided by science and expert opinion to link local land use programs. Funding will ensure adaptive management of the preserve system in perpetuity.

Streamline development in appropriate sites. The proposed SSHCP would guide and facilitate growth in a consistent and predictable manner. Mitigation fees are collected for impacts to natural resources.

Protect agricultural lands and operations. The proposed SSHCP would incorporate "safe harbor" agreements to provide assurances to landowners surrounding existing and future preserves.

Fairly consider stakeholder interests. Development and implementation of the proposed SSHCP would rely heavily on all constituents to provide input and comment on document content.

Rely on voluntary participation. The proposed SSHCP is a willing seller plan. Selling land or conservation easements on land also not required, but would be an option to interested landowners.



SSHCP Overview

The SSHCP plan area encompasses 341,270 acres of land in south Sacramento County. The area includes the Cities of Rancho Cordova, Elk Grove, Galt, and the unincorporated County. The Plan is a regional approach to addressing urban development, infrastructure improvements, habitat and open space conservation, and agricultural protection. It provides for ecologically viable conservation and minimizes regulatory hurdles for development by streamlining the permitting process.

The proposed SSHCP covers 40 species of plants and animals including 10 that are state or federally listed as threatened or endangered. The Plan is an agreement between state and federal wildlife and wetland regulators and local jurisdictions. The Plan would permit landowners to engage in the "incidental take" of listed species in return for conservation commitments consistent with the Plan goals.

Through the duration of the 30-year plan, the SSHCP may permit approximately 45,000 acres of habitat loss and will protect approximately 60,000 acres. Conservation commitments will be fulfilled through take avoidance, paying per-acre fees, conservation easement dedications, grants and other funding sources. Fees will be directed to public and private mitigation sites that provide large-scale habitat preservation and restoration. Supplementary grants and other monies will be sought to acquire additional preserve lands to support covered species.

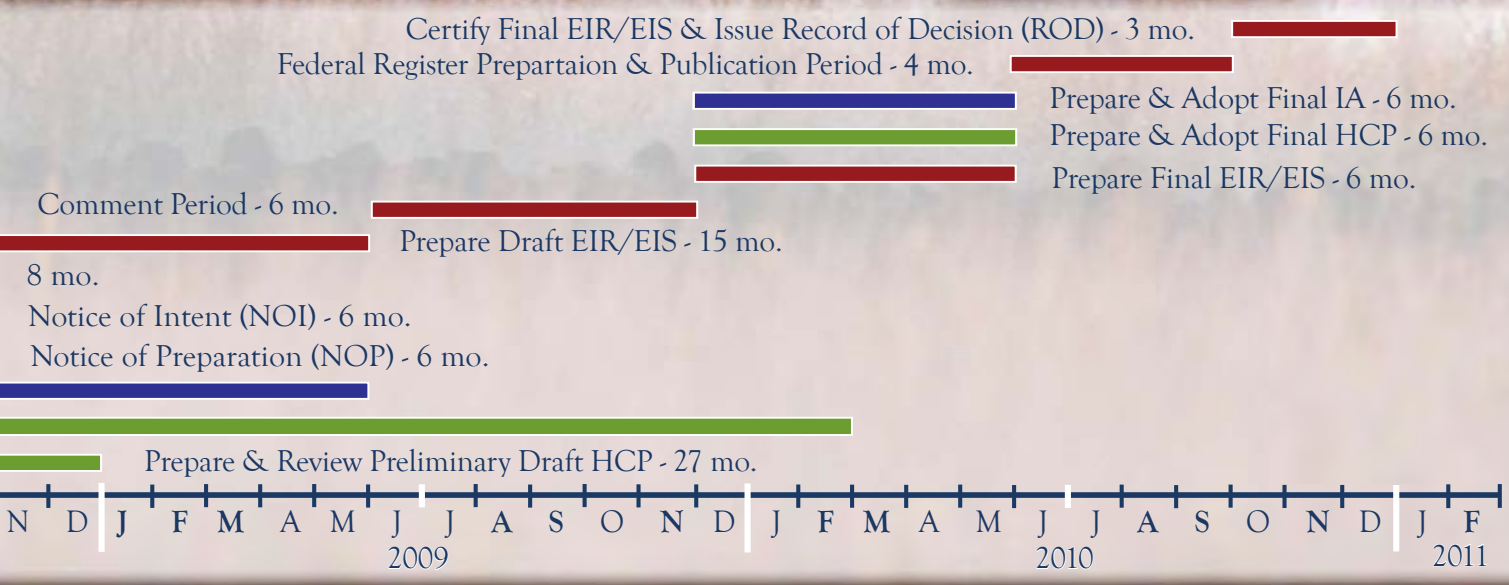
SSHCP Timeline

Plan Development

The SSHCP began in 1992 as a watershed study. The regulatory agencies proposed shifting to a more comprehensive plan a year later, which led to investigating the feasibility of the SSHCP. In 1995, the Board of Supervisors approved the Steering Committee composed of members from State and Federal regulatory agencies, local jurisdictions, homebuilders, environmentalists, scientists, landowners, agriculturalists, and business interests to consolidate often polar interests and develop an equitable solution for all parties.

The Committee drafted plan goals, principles, and formed the biological and economic subcommittees in September 1996. In February 1997, the County hired consulting firms to assist with the SSHCP. The consultant, with direction from the committees and the County, researched and wrote text for the SSHCP.

After a hiatus, due to a lack of funding and loss of key personnel, the County reassessed the feasibility of the SSHCP in 2001. Major alterations were made. It was concluded that the County would handle all aspects of project management and document preparation. Individual experts were hired to prepare forty-six specialized documents that County staff have used to prepare various chapters of the SSHCP. Draft HCP chapters were reviewed beginning in November 2006 and a comprehensive draft is expected in the fall of 2008.



Definitions

HCP - A Habitat Conservation Plan provides regional permitting of species impacts through the Endangered Species Act. Potential impacts to species are authorized in exchange for well-designed preserves.

USB - Sacramento County has established an Urban Services Boundary. Urban growth is not anticipated beyond the USB, which runs roughly west of Scott Rd., along the Cosumnes River floodplain, and across Kammerer Rd.

SOI - A Sphere of Influence is established by a local agency as a probable service area. SOIs are regulated by the Local Agency Formation Commission (LAFCO).

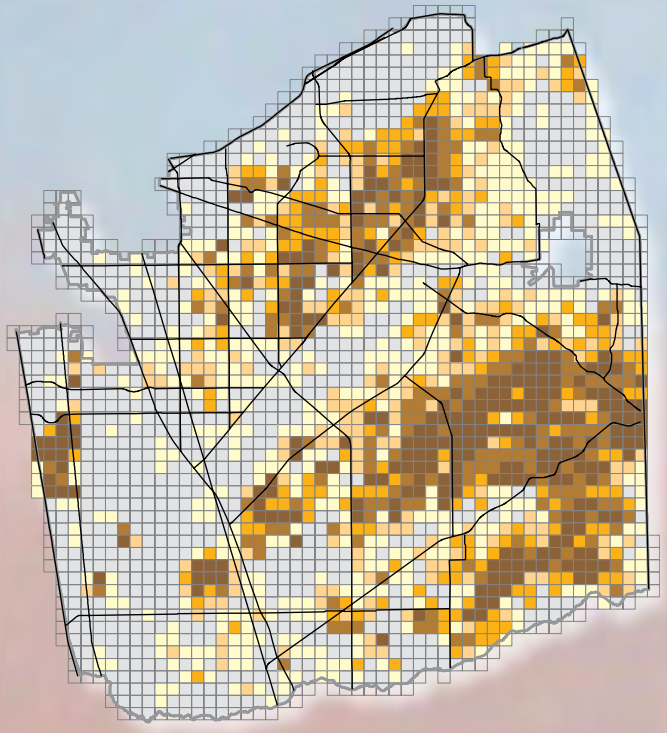
UDA - The Urban Development Area is a term introduced in the SSHCP. It encompasses land where most development and species impacts will occur. The boundary includes the Sacramento County USB, the City limits of Rancho Cordova and Elk Grove, and the City of Galt's adopted SOI.

Conservation Strategy

The SSHCP plan area is home and wintering grounds for an abundance of wildlife, including many threatened and endangered species. One of which, Sacramento Orcutt grass (*Orcuttia tenuis*), is only found in Sacramento County.

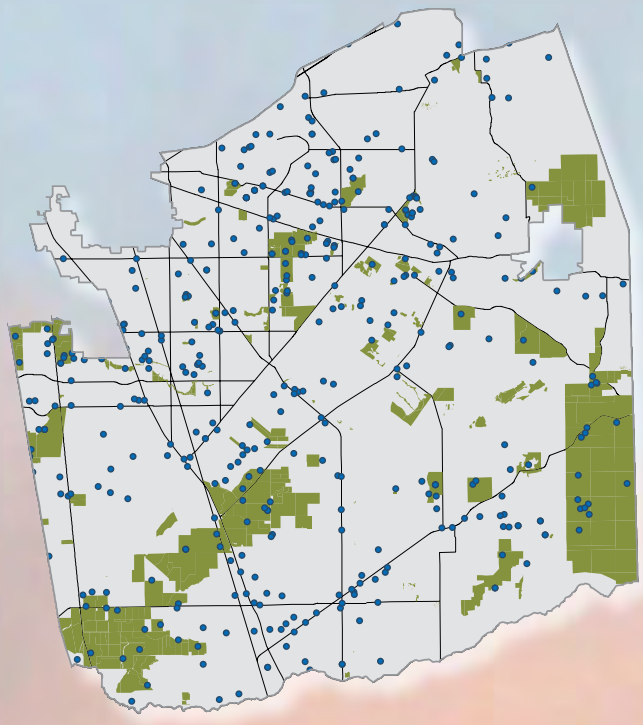
The proposed SSHCP approaches conservation on a habitat and landscape scale while considering the specific ecological needs of each species covered by the plan. The strategy guides implementation to preserve important habitat, restore degraded habitat, avoid impacts to species, minimize impacts and enhance habitat to support covered species.

In brief, the proposed SSHCP would preserve 47,000 acres of vernal pool grasslands, blue oak woodlands, agricultural croplands, riparian woodlands, and wetlands as mitigation, and fund preservation of an additional 13,000 acres. The Plan would also include 1,488 acres of compensatory restoration and 1,500 acres of additional restoration.



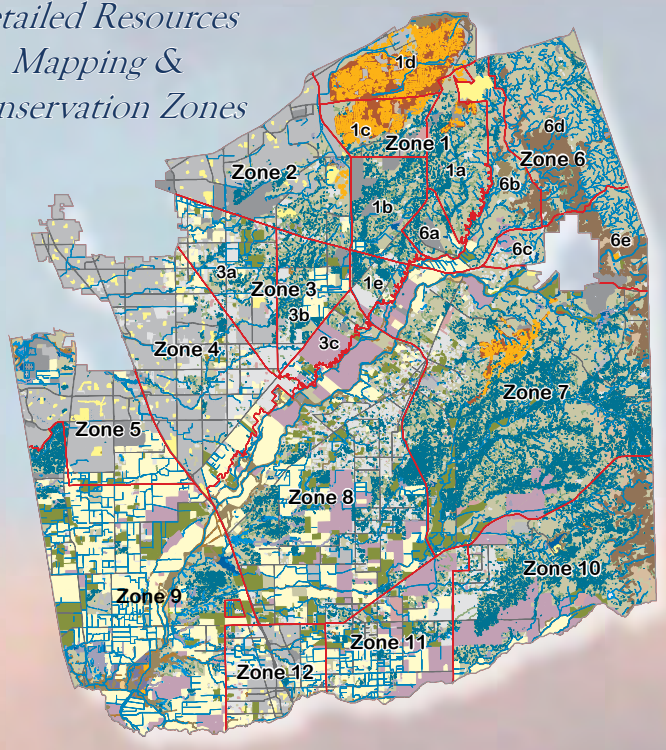
Adaptive Management

Conventional preserve management often lacks mechanisms to alert managers of any threats to species in due time to save the species. The SSHCP monitoring program would evaluate mitigation compliance, determines if specific biological goals and objectives are being met, and provides feedback information to inform a management strategy. It also provides safeguards against reasonably foreseeable changed circumstances.



Specifically, the proposed SSHCP adaptive management strategy would (1) integrate a monitoring program that ensures compliance; (2) develop management strategies and determines which strategies to implement; (3) identify uncertainty and how to resolve the uncertainty; and (4) incorporate feedback loops to inform preserve management. In this way, the program will monitor the success of conservation strategy and help inform changes to the strategy.

Vernal Pool Wet Acre Density Index



Existing Conservation Sites & Documented Species Occurences

Preserve Design - 8 Guiding Principles

Goal	Effect	Poor	Good	Example
Minimize Fragmentation	Fragmentation disrupts movement and lowers species diversity.			Roads bisecting preserves can prevent movement between preserves.
Minimize Edge Effects	Non-compatible uses adjacent to preserves lowers habitat values and species abundance/diversity.			Feral cats from residential development dramatically reduce song bird populations.
Establish Connectivity	Linking preserves allows for increased movement amongst interacting landscapes.			A corridor between grasslands and a lake allows species to utilize both habitats.
Establish Buffers	Buffers help reduce edge effects to protect preserve integrity.			A vegetated buffer absorbs pollutants to protect waterways.
Maximize Heterogeneity	Preserves with greater mix of habitats tend to support greater biodiversity.			An oak preserve with a stream may support greater biodiversity than an oak preserve without a stream.
Protect Watersheds	Preserving watersheds helps maintain hydrologic stability and water quality.			Nutrients from landscaping upstream flows into the preserve and harms species.
Maximize Population	Larger populations are less vulnerable to disease and local disturbances.			If 10% of a populations is resistant to a disease, 10 individual will not persist, but 20 may.
Maintain Distribution	Allows species to repopulate after disturbances, protects metapopulations and genetic variation.			Individuals in one preserve are able to repopulate another after a fire.

Detailed Resources Mapping & Conservation Zones

Preserve Linkages

The SSHCP planning area was divided into a system of 12 Zones to aid conservation planning. Some Zones are further divided into Subzones. The proposed SSHCP would use these Zones to delineate preserve requirements. In the absence of known willing sellers, the proposed SSHCP does not delineate boundaries of future preserves with hard lines on a map, but rather establishes conservation criteria for each Zone and Subzone. Criteria include securing sufficient acreage and quality habitat for each preserve.

The general area for preserves was determined based on resource mapping, existing conservation sites and known occurrences of covered species within the SSHCP plan area (*see diagrams*).

SSHCP Permitting

In the absence of an HCP, project proponents have to negotiate individually with the federal and state agencies to mitigate for species take and habitat loss. This process has proven expensive and typically requires lengthy negotiations.

The proposed SSHCP offers an expedited and predictable endangered species and wetland permitting process, controlled by local jurisdictions, at a reduced cost. The proposed SSHCP would allow the local jurisdictions to issue permits for up to 43,500 acres inside the urban development area (UDA) in exchange for conservation commitments within and outside the UDA.

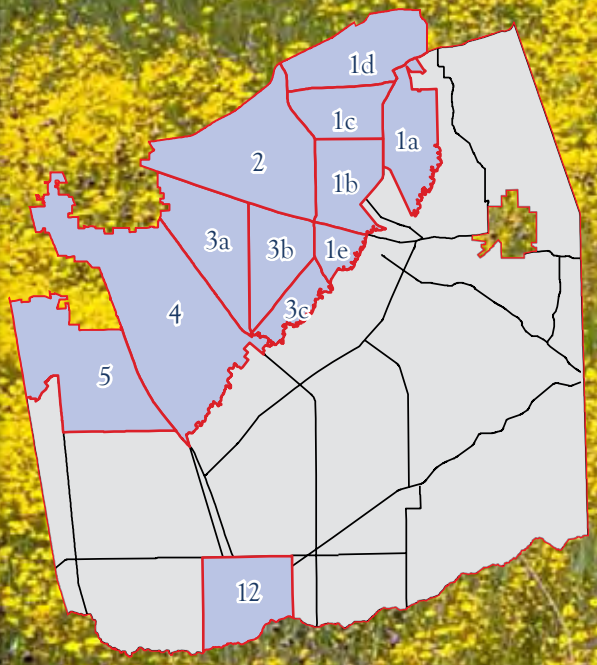
Participation in the plan would be voluntary. The regulatory community would benefit from reduced project oversight and the protection of sensitive species.

Local Jurisdiction Permit Holders

• City of Elk Grove • City of Galt • City of Rancho Cordova • County of Sacramento • Sacramento County Water Agency • Sacramento Regional County Sanitation District

Permit Duration

• 30-year incidental take permit



Urban Development Area (UDA)

• Covered activities will primarily be permitted inside the UDA, conservation zones 1-5 and 12. These areas correspond to locations identified for urban development by participating jurisdictions (see diagram).

Permits

• Endangered Species Act (FESA, CESA) - federal Sec. 7 & 10, state Sec. 2081.
• Clean Water Act (CWA) - federal 404, state 401.
• California Fish & Game Code - Sec. 1601 agreement.

Urban Development Area

SSHCP Covered Activities

- Development: Public and private residential, commercial, and industrial construction.
- Transportation: Planned projects by local jurisdictions.
- Water: Projects in adopted master drainage plans.
- Flood Control: Projects adopted in flood control plans.
- Sanitation: Construction, growth and maintenance of landfill, transfer, and recycling stations.
- Public Facilities: Construction of public stations/centers, hospitals, & schools.
- Recreation Facilities: Construction of recreation facilities.
- Utility Services: Construction of stations and gas/transmission lines.
- Mining: Extraction of aggregate resources and construction of roads and facilities.
- Preserve Management: Habitat restoration, creation and enhancement.

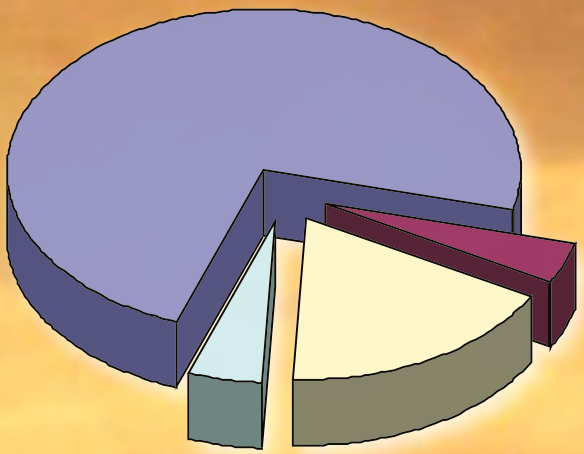
Implementation

It is anticipated that a **joint powers authority** (JPA) created from representatives of the local jurisdiction permit holders will ensure project compliance with the SSHCP and conditions of SSHCP permits. The JPA will also oversee the **implementing conservancy**; a non-profit organization established to administer day-to-day preserve operations. The conservancy's duties include acquiring land or easements, monitoring and managing preserved lands, and general administration.

Wetland Permitting

The U.S. Army Corps of Engineers (Corps) has permitting authority pursuant to Section 404 of the Clean Water Act. They are responsible for ensuring no net loss to acres and functions of waters of the U.S. In coordination with the SSHCP planning effort, the Corps is developing a general functional assessment of aquatic resources for the SSHCP plan area. Permit actions must comply with the Section 404(b)(1) Guidelines, which prohibit the Corps from issuing a permit for any project that is not the least environmentally damaging practicable alternative. The Corps is developing a streamlined permitting strategy consistent with the SSHCP conservation strategy. Key elements may include: (1) A Regional General Permit (RGP) for less complex activities with minimal adverse effects to aquatic resources, (2) a Programmatic General Permit (PGP) for projects with small to medium range of impacts, and/or (3) a Letter of Permission (LOP) process for projects with greater impacts that subscribe to the terms of the SSHCP. Non-conformance with the SSHCP will be a consideration in Corps permit decisions.

How it Works

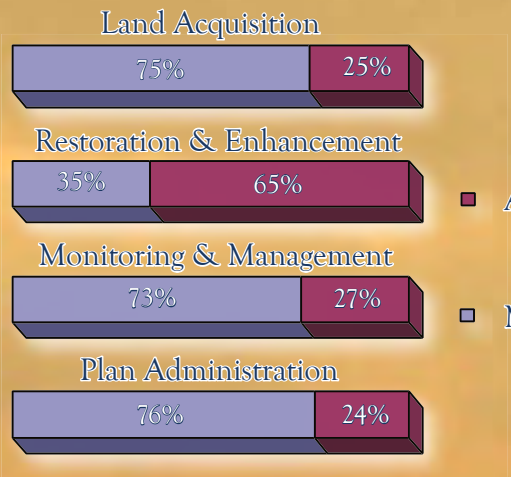


Sensitive Species & Streambed Alteration: Incidental take permits & CDFG streambed alteration agreements will be held by the local jurisdictions. Project proponents will approach the appropriate jurisdiction to identify possible impacts, mitigation needs, and requirements to participate in the SSHCP. Once a project is submitted to the local jurisdiction, participating projects will undergo environmental review and be assessed impacts & costs based on the proposed SSHCP tiered fee structure. Approved projects will be covered under the SSHCP incidental take permits in exchange for mitigation funds. The mitigation funds will be transferred to the SSHCP implementing conservancy for the acquisition of land or conservation easements, the restoration of degraded habitat, the enhancement of existing habitat, and the perpetual adaptive management of the preserves.

Covered Species (Bold indicates state or federal threatened or endangered species)

Birds • Total (18): American Peregrine Falcon, Bald Eagle, Cooper's Hawk, Ferruginous Hawk, Golden Eagle, **Greater Sandhill Crane**, Loggerhead Shrike, Long-Eared Owl, Merlin, Northern Harrier, Sharp-Shinned Hawk, Short Eared-Owl, **Swainson's Hawk**, Tricolored Blackbird, Western Burrowing Owl, White-Faced Ibis, White-Tailed Kite, & Yellow Breasted Chat.
Invertebrates • Total (5): Mid-Valley Fairy Shrimp, Ricksecker's Water Scavenger Beetle, **Valley Elderberry Longhorn Beetle**, **Vernal Pool Fairy Shrimp**, & **Vernal Pool Tadpole Shrimp**.
Plants • Total (8): Ahart's Dwarf Rush, **Boggs Lake Hedge-Hyssop**, Dwarf Downingia, Legenere, Pincushion Navarretia, **Sacramento Orcutt Grass**, Sanford's Arrowhead & **Slender Orcutt Grass**.
Mammals • Total (5): American Badger, Pallid Bat, Ringtail, Western Red Bat & Yuma Myotis Bat.
Reptiles & Amphibians • Total (4): **California Tiger Salamander**, **Giant Garter Snake**, Western Pond Turtle, & Western Spadefoot Toad.

Costs



The cost of implementing the SSHCP over the 30-year life of the plan is estimated at $1.6 billion. This includes land & easement acquisition, habitat restoration & enhancements, perpetual management, and administration. The chart below depicts the relative proportion of those costs.

- Land Acquisition 73%
- Restoration & Enhancement 4%
- Monitoring & Management 18%
- Plan Administration 5%

Funding

The SSHCP seeks funding from a variety of sources. Mitigation fees from private development projects and public infrastructure projects will provide the majority of the funds. The adopted SSHCP is also eligible for state and federal grants, which will support the "above-and-beyond" conservation goals of the proposed SSHCP.

Participants

Steering Committee
The SSHCP is overseen by a Steering Committee comprised of representatives from the development, environmental, agricultural, landowner, and regulatory communities. The Steering Committee was formed at the request of the Board of Supervisors, but members do not have the authority to act on behalf of elected officials. The Committee's primary responsibility is to review work products and provide advice to local jurisdictions who are crafting the Plan document.

Biological Subcommittee
The Biological Subcommittee was formed to provide rigorous scientific review of documents. The Committee is made up of members of the Steering Committee, but includes experts in various fields.

Economic Subcommittee
Much like the Biological Subcommittee, the Economic Subcommittee was formed to address complex economic issues and help guide the Plan to make economic sense.

Technical Advisory Committee
The Technical Advisory Committee was formed early on to evaluate and establish species lists, habitat cover-types and biological goals and objectives. The members included professional scientists from relevant disciplines and Agency representatives.

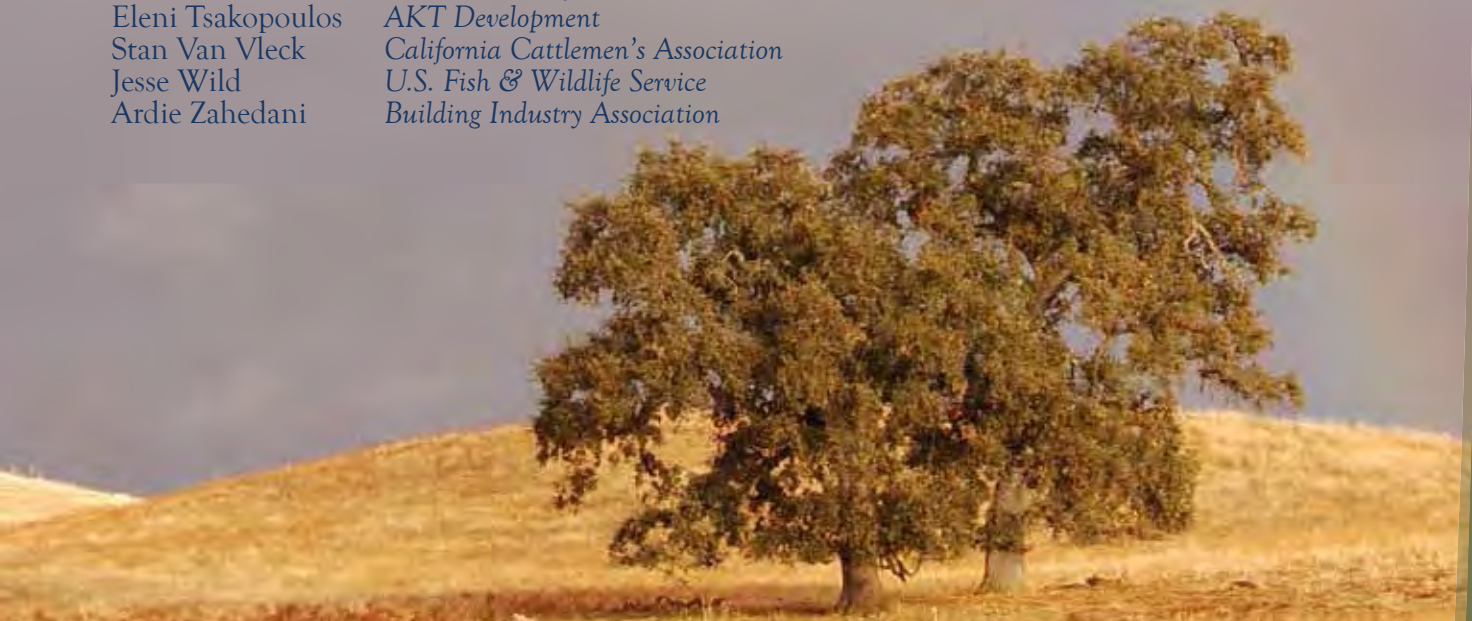
Science Advisors
The SSHCP recognized early on the importance of independent scientific review of plan documents. The County chose to utilize local experts on a case by case basis as they were needed. This method proved useful as it enabled consultants and planners to seek answers to specific questions.

Public Review

The County of Sacramento strives to ensure that the public is afforded every opportunity to be part of the planning process and to provide comments and feedback as the Plan is developed. To ensure public participation every planning meeting was open to the public. The County maintains an e-mail list of interested individuals and posted draft materials on a SSHCP Web site. The County has held a number of outreach meetings for the public, has made many presentations to organizations, and met with many landowners in the plan area. Additional public outreach workshops and presentations to organizations will be conducted including outreach for preparation of the EIS/EIR as required under CEQA and NEPA. Extensive outreach will continue in the fall of 2008.

Partnerships

The SSHCP has been developed with assistance and input from countless individuals and organizations. They have provided expert opinions, time, and resources. Likewise, implementation and realization of the goals set forth within the SSHCP will necessitate continued involvement.



The SSHCP implementing conservancy will work cooperatively with other conservancies and organizations, such as The Nature Conservancy, The Center for Natural Lands Management, and Sacramento Valley Conservancy, to better their management practices through shared knowledge. They will also work cooperatively to help realize the preserve linkage system outlined in the SSHCP. Doing so can better ensure biologically rich preserves are established for future residents to enjoy and appreciate.

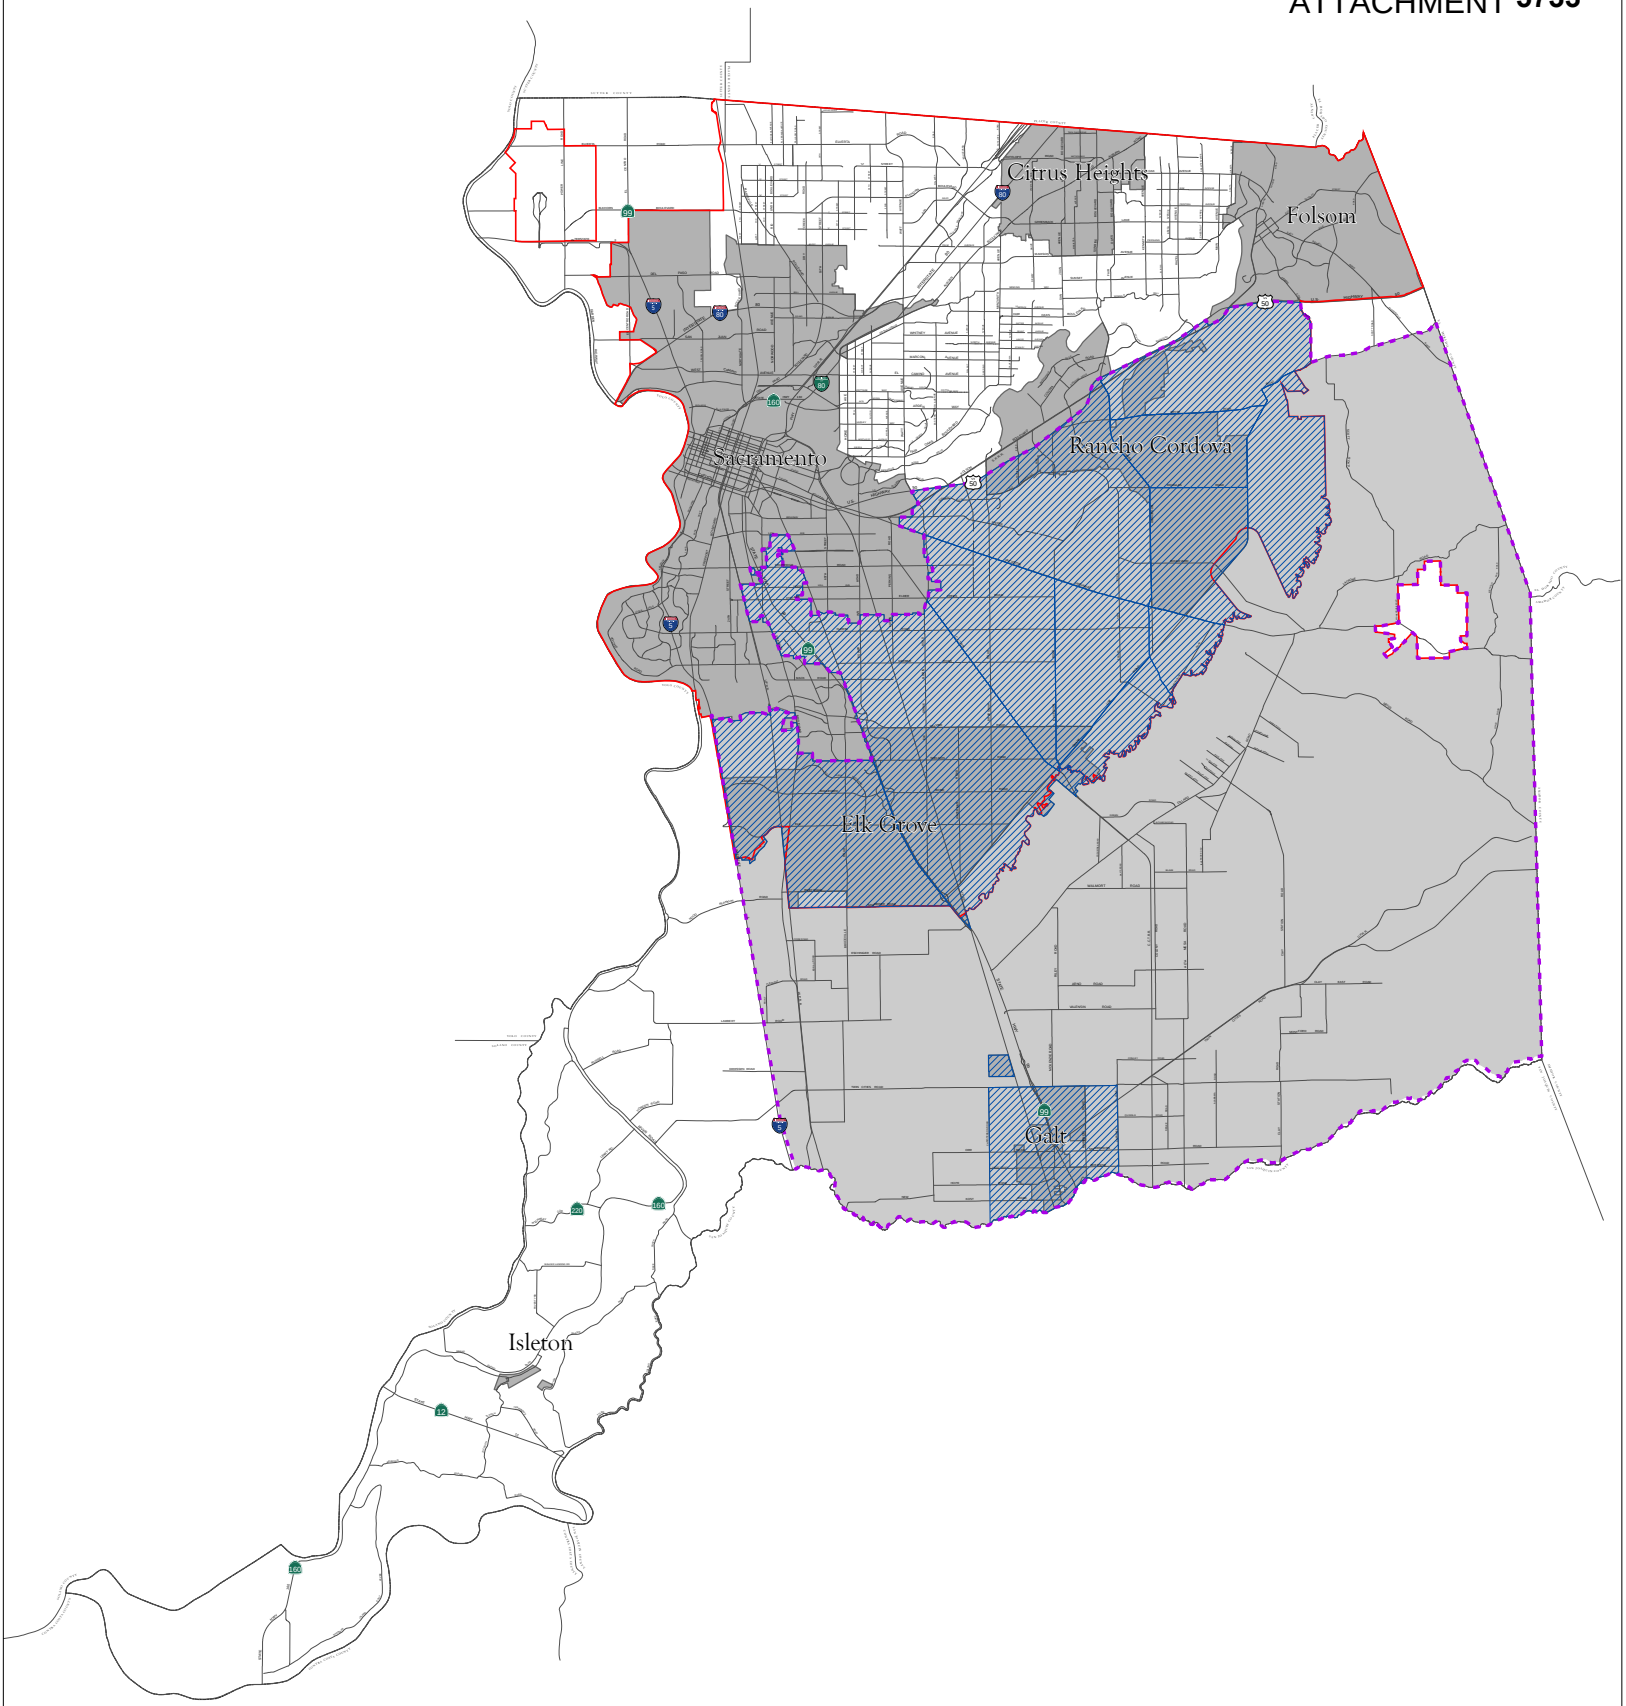
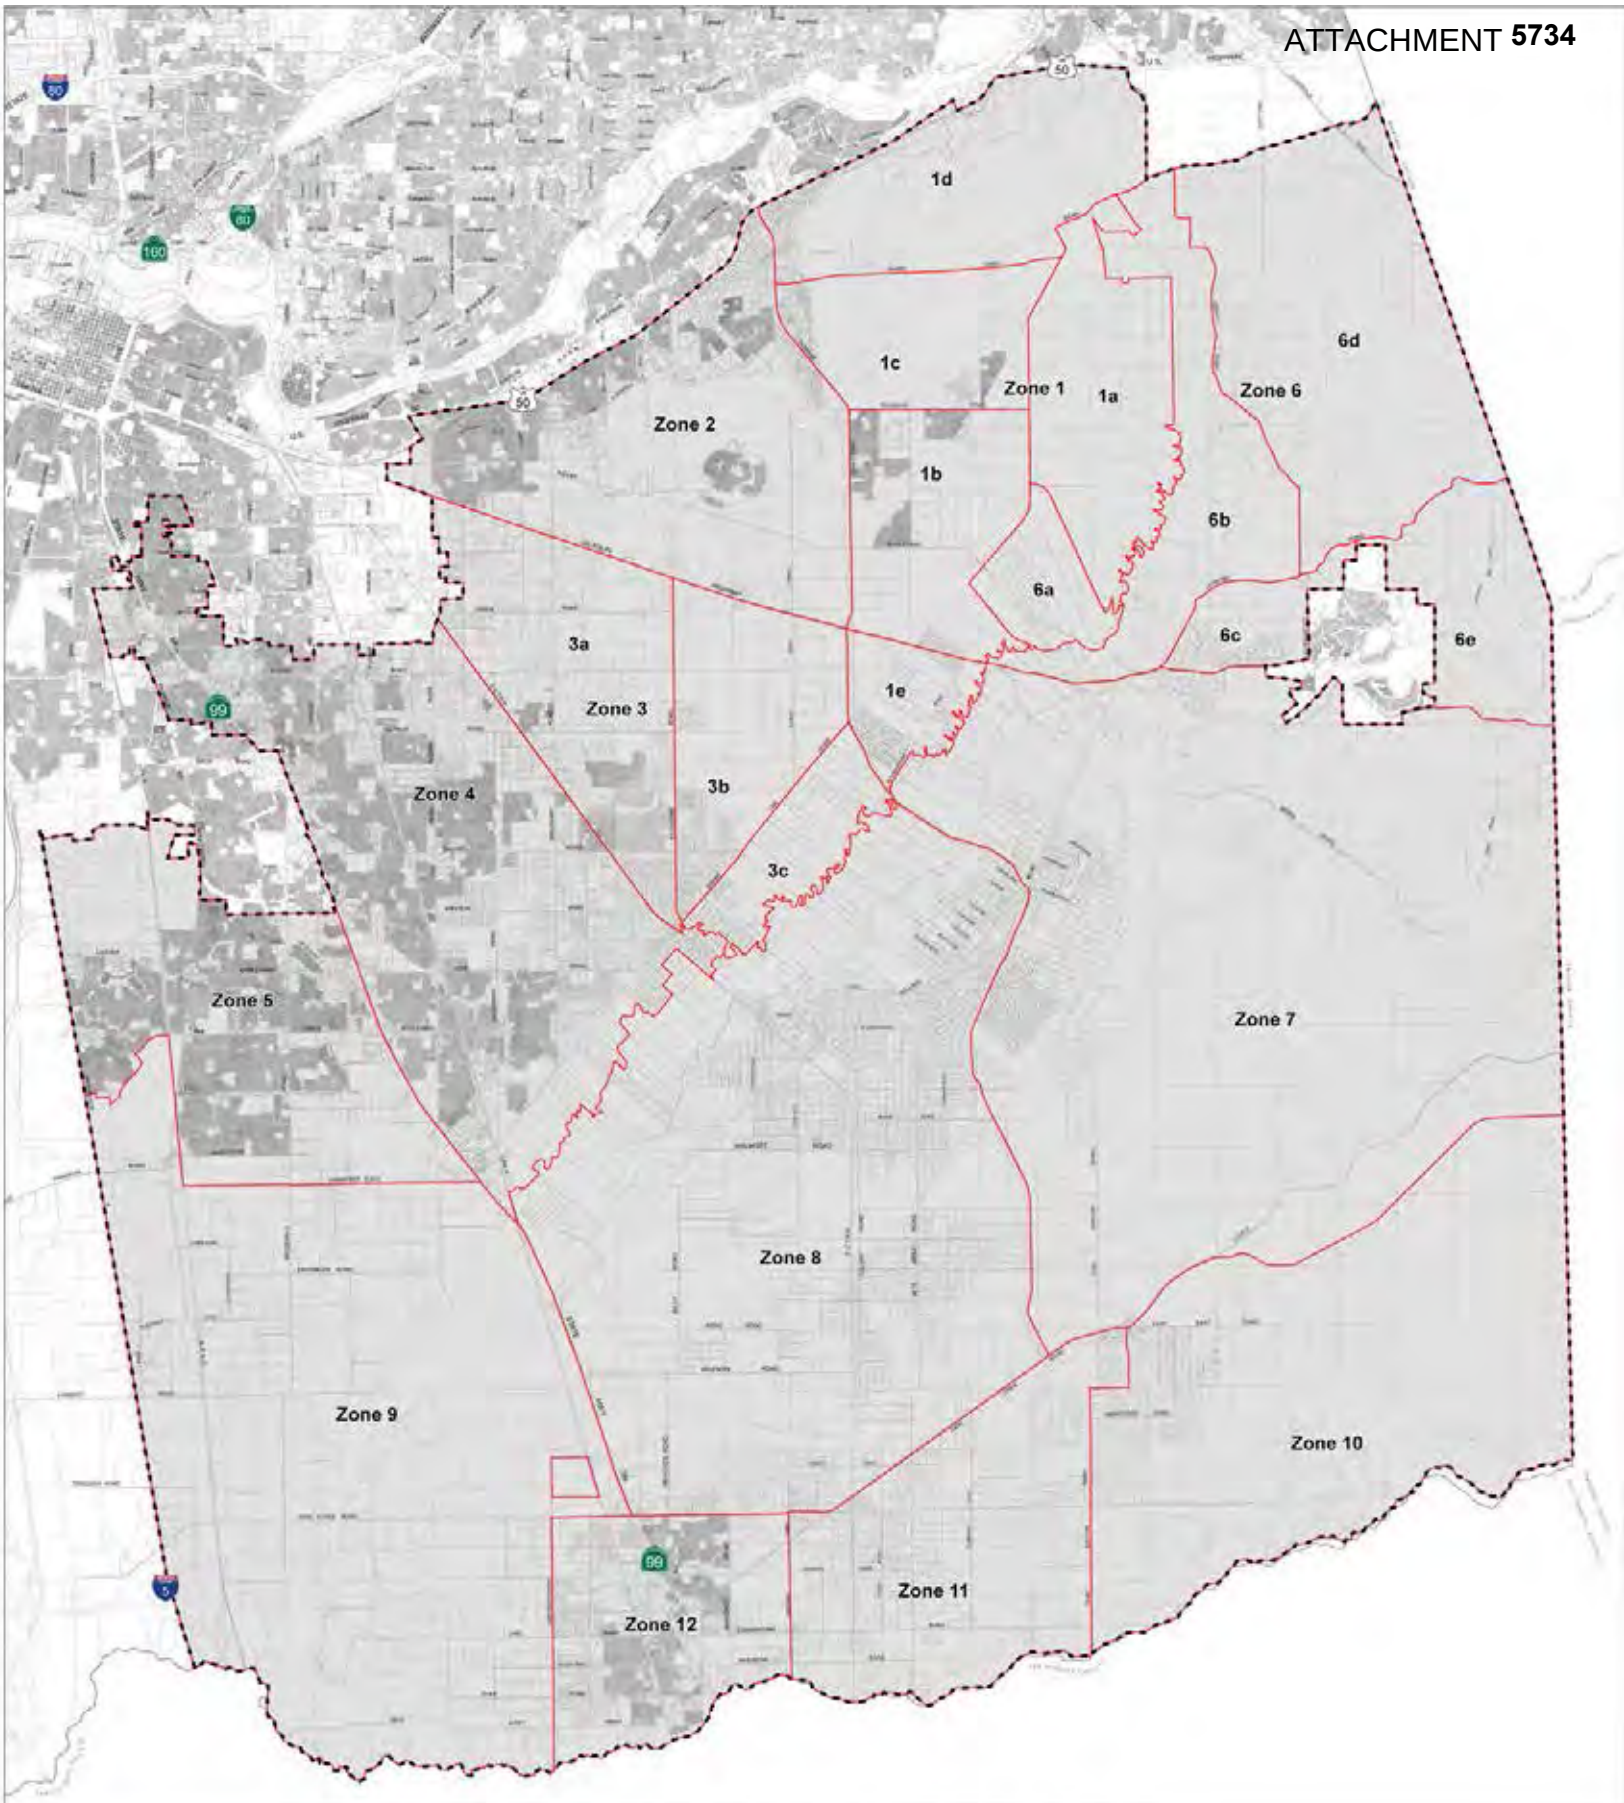
South Sacramento Habitat Conservation Plan



COVERED ACTIVITIES

The activities proposed for coverage in the SSHCP are wide-ranging, but are generally related to urban-suburban development on city and unincorporated lands. Approximately 43,500 acres of the existing natural habitat and agricultural land-cover in the SSHCP Urban Development Area (UDA) would be converted to a developed condition under the proposed SSHCP.

Proposed covered-activities presently include the construction, installation, extension, or removal of:



- Private and public residential, commercial, and industrial developments
- Transportation facilities
- Surface water and groundwater supply and delivery facilities
- Water and Wastewater treatment and delivery facilities
- Flood control facilities
- Sanitation facilities (landfills, transfer stations, recycling stations)
- Public facilities (fire stations, police stations, hospitals, schools, community centers, cemeteries, and administration centers)
- Outdoor and indoor recreation facilities
- Utility facilities
- Aggregate mining activities
- Conservation activities (habitat restoration, creation, and enhancement; preserve management and monitoring)

While a majority of the SSHCP Covered Activities occur inside the UDA, certain SSHCP Covered Activities will occur in the Planning Area outside of the UDA. These are limited to the specific public infrastructure improvement projects that have been approved and adopted through various transportation master plans, public infrastructure plans, and local jurisdiction General Plans. Approximately 2,000 acres of the existing natural habitat and agricultural land-cover outside the UDA would be converted to a developed condition under the proposed SSHCP.

Public Comment Opportunities During the Preparation of the EIR/EIS

Notice of Preparation and *Notice of Intent* Released

Provide Written Comments

June 10 – July 30, 2008

Provide Comments at Scoping Meetings

July 8, 2008 Galt
July 11, 2008 Sacramento
July 15, 2008 Rancho Cordova
July 16, 2008 Elk Grove

Provide Comments at Community Workshops

Locations and Dates to be determined

August 2008

County and Service write the Draft EIR/EIS

- ✓ Consider Public Comments
- ✓ Compare Alternatives
- ✓ Analyze Substantive Effects
- ✓ Evaluate Mitigation Measures

Summer 2008-Summer 2009

Draft EIR/EIS

Provide Comments During the 60-day Public Comment Period

Summer 2009

Provide Comments at Meetings and Public Hearing on the Draft EIR/EIS

Summer 2009

County and Service write the Final EIR/EIS

- ✓ Respond to Substantive Comments
- ✓ Revise Text Based on Comments

Summer 2009-Summer 2010

Final EIR/EIS

Provide Comments During the 30-day Review Period

Summer 2010

Agency Decisions

- ✓ Consider any Public Comments
- ✓ County prepares Findings
- ✓ Service prepares Record of Decision

Fall/Winter 2010

GREEN indicates opportunities to provide input

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 1	Specific Requirements	**1a**	Establish a Core preserve at least 1,000 acres in size that incorporates 60 vernal pool acres, 2 occurrences of Sacramento Orcutt Grass at least 300' from the preserve edge and is no less than 1,500' wide at any given point	1
			Establish two landscape linkages at least 1,000' wide: one to Zone 1b and one to Zone 6a.	1,41,43
			Preserve 80 Vernal Pool Ac on Surficial Alluvial Deposits, Laguna & Mehrten Formations (60 Ac must occur on category 1 or 2 LAU)	1
			Preserve 1,500 Valley Grassland Ac	1
		1b	Establish a Minor preserve at least 750 acres in size that incorporates one occurrence of Western Spadefoot Toad 300' from the preserve edge	2
			Establish two landscape linkages; one to Zone 1e and one to Zone 6a	2
			Preserve 54 Vernal Pool Ac on Surficial Alluvial Deposits, Laguna & Riverbank Formations (44 Ac must occur on category 1 or 2 LAU)	2
		1c	Establish a Satellite preserve that incorporates an occurrence of Slender Orcutt Grass at least 300' from the preserve edge	3
			Preserve 2 Vernal Pool Ac	3
			Preserve 140 Valley Grassland Ac	3
		1d	(none)	
		1e	Establish a Minor preserve at least 466 acres in size that is no less than 2,000' wide at any given point	4
			Establish two landscape linkages at least 700' wide; one to Zone 1b and one to Zone 3b	4
			Preserve 23 Vernal Pool Ac on Laguna & Riverbank Formations (15 Ac must occur on category 1 LAU and 5 Ac must occur on category 1 or 2 LAU)	4
			Preserve 443 Valley Grassland Ac	4
	Shared Requirements	**1**,2,3,4,5,12	Preserve 10 Vernal Pool, 50 Freshwater Marsh, 60 Open Water, 38 Seasonal Impoundment, 8 Seasonal Wetland, 10 Mixed Riparian Scrub, 300 Mixed Riparian Woodland, and 11 Valley Oak Riparian Woodland acres	7,13,14
		1a,**1b**,**1c**,**1e**,2,3b,12	Preserve 161 Swale acres	13
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		1c,**1d**	Preserve 250 Cottonwood Woodland acres	14
		1,3,4,5	Preserve a 600' wide corridor along undeveloped portions of North Laguna Creek	24
		1,2,3,4,5,12	Preserve a 100' wide corridor along undeveloped portions of all remaining Creeks, tributaries and significant swale systems	26
		1c,3b	Preserve all known occurrences of Sacramento and Slender Orcutt Grasses	67
		1,2,3	Preserve six (6) Western Burrowing Owl nesting colonies (at least one in each zone and within 3 miles of 6,000 acres of suitable foraging habitat)	64
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		1,2,3	Restore or Create 12.7 Vernal Pool acres	30
		1,2,3,4,5,6,7,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,5,6,7,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		1,2,3,4,5,6,7,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		1a,2,3b,7,8,10	Incorporate/establish 2 Western Burrowing Owl nesting areas in all core and landscape preserves and create at least 20 burrows per area	62
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 2	Specific Requirements	**2**	Establish a Core preserve at least 1,040 acres in size that incorporates 40 vernal pool acres, and 1,000 valley grassland acres	5
			Establish one landscape linkages at least 1000' wide to Zone 3b	5
			Preserve 40 Vernal Pool Ac on Surficial Alluvial Deposits, Laguna & Modesto Formations (17 Ac must occur on category 1 or 2 LAU)	5,42
			Preserve 1,000 Valley Grassland Ac	5
	Shared Requirements	1,**2**,3,4,5,12	Preserve 10 Vernal Pool, 50 Freshwater Marsh, 60 Open Water, 38 Seasonal Impoundment, 8 Seasonal Wetland, 10 Mixed Riparian Scrub, 300 Mixed Riparian Woodland, and 11 Valley Oak Riparian Woodland acres	7,13,14
		1a,1b,1c,1e,**2**,3b,12	Preserve 161 Swale acres	13
		1,**2**,3,4,5,6,7,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,**2**,3,4,5,6,7,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		2,3,4	Preserve a 300' wide corridor along undeveloped portions of Elder and Morrison Creeks	25
		1,**2**,3,4,5,12	Preserve a 100' wide corridor along undeveloped portions of all remaining Creeks, tributaries and significant swale systems	26
		1,**2**,3	Preserve six (6) Western Burrowing Owl nesting colonies (at least one in each zone and within 3 miles of 6,000 acres of suitable foraging habitat)	64
		1,**2**,3,4,5,6,7,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,**2**,3,4,5,6,7,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		1,**2**,3	Restore or Create 12.7 Vernal Pool acres	30
		1,**2**,3,4,5,6,7,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,**2**,3,4,5,6,7,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		1,**2**,3,4,5,6,7,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		1a,**2**,3b,7,8,10	Incorporate/establish 2 Western Burrowing Owl nesting areas in all core and landscape preserves and create at least 20 burrows per area	62
		1,**2**,3,4,5,6,7,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,**2**,3,4,5,6,7,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,**2**,3,4,5,6,7,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,**2**,3,4,5,6,7,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,**2**,3,4,5,6,7,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 3	Specific Requirements	**3a**	(none)	
		3b	Establish a Core preserve at least 3,000 acres in size that incorporates one occurrence of Slender Orcutt Grass 300' from the preserve edge that is no less than 2,500' wide at any given point.	6
			Establish two landscape linkages; one to Zone 1e that is at least 600' wide and one to Zone 2 that is at least 1,000' wide	6
			Preserve 45 Vernal Pool Ac on Laguna, Riverbank, and Turlock Formations (30 Ac must occur on category 1 or 2 LAU)	6
			Preserve 300 Cropland and/or Irrigated Pasture-Grassland in fee title that incorporates known Tri-colored Blackbird colonies	21
		3c	Establish a landscape linkage that is at least 1,000' wide connecting Zone 3b to Zone 8.	44
	Shared Requirements	1,2,**3**,4,5,12	Preserve 10 Vernal Pool, 50 Freshwater Marsh, 60 Open Water, 38 Seasonal Impoundment, 8 Seasonal Wetland, 10 Mixed Riparian Scrub, 300 Mixed Riparian Woodland, and 11 Valley Oak Riparian Woodland acres	7,13,14
		1a,1b,1c,1e,2,**3b**,12	Preserve 161 Swale acres	13
		1,2,**3**,4,5,6,7,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,**3**,4,5,6,7,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		1,**3**,4,5	Preserve a 600' wide corridor along undeveloped portions of North Laguna Creek	24
		2,**3**,4	Preserve a 300' wide corridor along undeveloped portions of Elder, Gerber and Morrison Creeks	25
		1,2,**3**,4,5,12	Preserve a 100' wide corridor along undeveloped portions of all remaining Creeks, tributaries and significant swale systems	26
		1c,**3b**	Preserve all known occurrences of Sacramento and Slender Orcutt Grasses	67
		1,2,**3**	Preserve six (6) Western Burrowing Owl nesting colonies (at least one in each zone and within 3 miles of 6,000 acres of suitable foraging habitat)	64
		3a,**3b**,6b,6e,7,8	Preserve six (6) Tricolored Blackbird nesting colonies (colonies shall be within 3 miles of 6,000 acres of suitable foraging habitat)	65
		1,**2**,3,4,5,6,7,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,**2**,3,4,5,6,7,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		1,2,**3**	Restore or Create 12.7 Vernal Pool acres	30
		1,2,**3**,4,5,6,7,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,**3**,4,5,6,7,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,5,6,7,8,9,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		1,2,**3**,4,5,6,7,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		3,4,5,6,7,8,9,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		3,4,5,7,8,9	Restore Valley Elderberry Longhorn Beetle habitat in conjunction with native vegetation along portions of Deer, S. Laguna & N. Laguna Creeks, and the Cosumnes River	49,50,51,52
		3b,6,7,8,9,11	Incorporate/establish 20 Himalayan blackberry sites for Tricolored Blackbird nesting sites within new and existing preserves	61
		1a,2,**3b**,7,8,10	Incorporate/establish 2 Western Burrowing Owl nesting areas in all core and landscape preserves and create at least 20 burrows per area	62
		1,2,**3**,4,5,6,7,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,**3**,4,5,6,7,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,**3**,4,5,6,7,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,**3**,4,5,6,7,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,**3**,4,5,6,7,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 4	Specific Requirements	**4**	(none)	
	Shared Requirements	1,2,3,**4**,5,12	Preserve 10 Vernal Pool, 50 Freshwater Marsh, 60 Open Water, 38 Seasonal Impoundment, 8 Seasonal Wetland, 10 Mixed Riparian Scrub, 300 Mixed Riparian Woodland, and 11 Valley Oak Riparian Woodland acres	7,13,14
		1,2,3,**4**,5,6,7,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,**4**,5,6,7,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		1,3,**4**,5	Preserve a 600' wide corridor along undeveloped portions of North Laguna Creek	24
		2,3,**4**	Preserve a 300' wide corridor along undeveloped portions of Elder and Gerber Creeks	25
		1,2,3,**4**,5,12	Preserve a 100' wide corridor along undeveloped portions of all remaining Creeks, tributaries and significant swale systems	26
		1,2,3,**4**,5,6,7,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,**4**,5,6,7,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		1,2,3,**4**,5,6,7,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,**4**,5,6,7,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,**4**,5,6,7,8,9,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		1,2,3,**4**,5,6,7,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		3,**4**,5,6,7,8,9,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		3,**4**,5,7,8,9	Restore Valley Elderberry Longhorn Beetle habitat in conjunction with native vegetation along portions of Deer, S. Laguna & N. Laguna Creeks, and the Cosumnes River	49,50,51,52
		1,2,3,**4**,5,6,7,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,**4**,5,6,7,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,**4**,5,6,7,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,**4**,5,6,7,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,**4**,5,6,7,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 5	Specific Requirements	**5**	(none)	
	Shared Requirements	1,2,3,4,**5**,12	Preserve 10 Vernal Pool, 50 Freshwater Marsh, 60 Open Water, 38 Seasonal Impoundment, 8 Seasonal Wetland, 10 Mixed Riparian Scrub, 300 Mixed Riparian Woodland, and 11 Valley Oak Riparian Woodland acres	7,13,14
		1,2,3,4,**5**,6,7,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,**5**,6,7,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		1,3,4,**5**	Preserve a 600' wide corridor along undeveloped portions of North Laguna Creek	24
		1,2,3,4,**5**,12	Preserve a 100' wide corridor along undeveloped portions of all remaining Creeks, tributaries and significant swale systems	26
		1,2,3,4,**5**,6,7,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,**5**,6,7,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		1,2,3,4,**5**,6,7,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,**5**,6,7,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,**5**,6,7,8,9,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		1,2,3,4,**5**,6,7,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		3,4,**5**,6,7,8,9,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		3,4,**5**,7,8,9	Restore Valley Elderberry Longhorn Beetle habitat in conjunction with native vegetation along portions of Deer, S. Laguna & N. Laguna Creeks, and the Cosumnes River	49,50,51,52
		1,2,3,4,**5**,6,7,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,4,**5**,6,7,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,4,**5**,6,7,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,4,**5**,6,7,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,4,**5**,6,7,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 6	Specific Requirements	**6a**	Establish a Minor preserve at least 400 acres in size that is no less than 1,000' wide at any given point.	8
			Establish two landscape linkages that are at least 1,000' wide; one to Zone 1a and one to Zone 1b	8
			Preserve 10 Vernal Pool Ac on Laguna Formation (10 Ac must occur on category 1, 2, or 3 LAU)	8
		6b	(none)	
		6c	(none)	
		6d	(none)	
		6e	(none)	
		6f	Establish a landscape linkage that is at least 2,640' wide to Zone 7	45
	Shared Requirements	**6**,7,8,9,10,11	Preserve 191 Freshwater Marsh, 182 Open Water, 187 Seasonal Impoundment, 135 Seasonal Wetland, 95 Mixed Riparian Scrub, and 663 Mixed Riparian Woodland acres	13,14
		6a,7,8,9,10,11	Preserve 207 Swale acres	13
		1,2,3,4,5,**6**,7,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,5,**6**,7,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		6b,**6e**,**6f**	Preserve 48 Blue Oak Woodland acres	15
		6,7,8,9,10,11,12	Preserve 141 linear miles of Stream channel within a habitat corridor (800' wide, 2,000' wide along the Cosumnes R.)	21,22,23,63
		6b,**6e**,**6f**,7	Preserve 2,500 Blue Oak Woodland and 1,500 Savannah acres beyond compensatory mitigation	27
		6,7,8,9,10,11	Preserve 6,500 Valley Grassland acres beyond compensatory mitigation	26
		3a,3b,**6b**,**6e**,7,8	Preserve six (6) Tricolored Blackbird nesting colonies (colonies shall be within 3 miles of 6,000 acres of suitable foraging habitat)	65
		1,2,3,4,5,**6**,7,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,5,**6**,7,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		1,2,3,4,5,**6**,7,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,5,**6**,7,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,5,**6**,7,8,9,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		1,2,3,4,5,**6**,7,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		6b,**6e**,**6f**	Restore 48 Blue Oak Woodland acres	37
		3,4,5,**6**,7,8,9,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		6,7,8,9,10	Incorporate clusters of native shrubs in 20 locations and up to 1,000 hunting perches (100 perches/20Ac) within new and existing preserves for Loggerhead Shrike	59,60
		3b,**6**,7,8,9,11	Incorporate/establish 20 Himalayan blackberry sites for Tricolored Blackbird nesting sites within new and existing preserves	61
		1,2,3,4,5,**6**,7,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,4,5,**6**,7,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,4,5,**6**,7,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,4,5,**6**,7,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,4,5,**6**,7,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 7	Specific Requirements	**7**	Establish a Landscape preserve at least 10,242 acres in size that is no less than 2,500' wide at any given point.	9
			Establish two landscape linkages that are at least 1,000' wide; one to Zone 8 (between Wilton & Alta Mesa) and one to Zone 10	9,46
			Preserve 242 Vernal Pool Ac (242 Ac must occur on category 1 or 2 LAU)	9
			Preserve 10,000 valley grassland acres	9
			Preserve a minimum of 200 Cropland Ac in fee title to be maintained in for Alfalfa production (1 plot - 200 Ac/plot)	18,55
	Shared Requirements	6,**7**,8,9,10,11	Preserve 191 Freshwater Marsh, 182 Open Water, 187 Seasonal Impoundment, 135 Seasonal Wetland, 95 Mixed Riparian Scrub, and 663 Mixed Riparian Woodland acres	13,14
		6a,**7**,8,9,10,11	Preserve 207 Swale acres	13
		7,10	Preserve 81 Seasonal Impoundment acres	13
		1,2,3,4,5,6,**7**,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,5,6,**7**,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		7,8,9,10,11	Preserve 4,571 Cropland and/or Irrigated Pasture Ac	17
		7,8,9	Preserve 30 Valley Oak Riparian Woodland acres	14
		6,**7**,8,9,10,11,12	Preserve 196 linear miles of Stream channel within a corridor (800' wide, 2,000' wide along the Cosumnes R.) ensuring that 55 linear miles is preserved to support Giant Garter Snake	21,22,23,63
		6b,6e,6f,**7**	Preserve 2,500 Blue Oak Woodland and 1,500 Savannah acres beyond compensatory mitigation	27
		6,**7**,8,9,10,11	Preserve 6,500 Valley Grassland acres beyond compensatory mitigation	26
		7,8,9,10,11	Preserve 2,000 Cropland acres beyond compensatory mitigation	29
		3a,3b,6b,6e,**7**,8	Preserve six (6) Tricolored Blackbird nesting colonies (colonies shall be within 3 miles of 6,000 acres of suitable foraging habitat)	65
		1,2,3,4,5,6,**7**,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,5,6,**7**,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		7,8,9,10,11	Restore or Create 241.3 Vernal Pool and 184 Swale acres	31
		1,2,3,4,5,6,**7**,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,5,6,**7**,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,5,6,**7**,8,9,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		1,2,3,4,5,6,**7**,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		1,2,3,4,5,6,**7**,8,9,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		3,4,5,**7**,8,9	Restore Valley Elderberry Longhorn Beetle habitat in conjunction with native vegetation along portions of Deer, S. Laguna & N. Laguna Creeks, and the Cosumnes River	49,50,51,52
		6,**7**,8,9,10	Incorporate clusters of native shrubs in 20 locations and up to 1,000 hunting perches (100 perches/20Ac) within new and existing preserves for Loggerhead Shrike	59,60
		3b,6,**7**,8,9,11	Incorporate/establish 20 Himalayan blackberry sites for Tricolored Blackbird nesting sites within new and existing preserves	61
		1a,2,3b,**7**,8,10	Incorporate/establish 2 Western Burrowing Owl nesting areas in all core and landscape preserves and create at least 20 burrows per area	62
		1,2,3,4,5,6,**7**,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,4,5,6,**7**,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,4,5,6,**7**,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,4,5,6,**7**,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,4,5,6,**7**,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 8	Specific Requirements	**8**	Establish a Core preserve at least 1,500 acres in size that is no less than 2,500' wide at any given point.	10
			Establish two landscape linkages that are at least 1,000' wide; one to Zone 3b and one to Zone 7	10
			Preserve 79 Vernal Pool Ac on Laguna and Riverbank formations (55 Ac must occur on category 1 or 2 LAU)	10
			Preserve 2,500 valley grassland acres	10
			Preserve 1,000 Cropland and/or Irrigated Pasture Ac	17
			Preserve a minimum of 1,000 Cropland Ac in fee title to be maintained in for Alfalfa production (5 plots - 200 Ac/plot: 3 north and 2 south of Dillard Rd.)	18,55
	Shared Requirements	6,7,**8**,9,10,11	Preserve 191 Freshwater Marsh, 182 Open Water, 187 Seasonal Impoundment, 135 Seasonal Wetland, 95 Mixed Riparian Scrub, and 663 Mixed Riparian Woodland acres	13,14
		6a,7,**8**,9,10,11	Preserve 207 Swale acres	13
		1,2,3,4,5,6,7,**8**,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,5,6,7,**8**,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		7,**8**,9,10,11	Preserve 4,571 Cropland and/or Irrigated Pasture Ac	17
		7,**8**,9	Preserve 30 Valley Oak Riparian Woodland acres	14
		6,7,**8**,9,10,11,12	Preserve 196 linear miles of Stream channel within a corridor (800' wide, 2,000' wide along the Cosumnes R.) ensuring that 55 linear miles is preserved to support Giant Garter Snake	21,22,23,63
		6,7,**8**,9,10,11	Preserve 6,500 Valley Grassland acres beyond compensatory mitigation	26
		7,**8**,9,10,11	Preserve 2,000 Cropland acres beyond compensatory mitigation	29
		3a,3b,6b,6e,7,**8**	Preserve six (6) Tricolored Blackbird nesting colonies (colonies shall be within 3 miles of 6,000 acres of suitable foraging habitat)	65
		1,2,3,4,5,6,7,**8**,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,5,6,7,**8**,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		7,**8**,9,10,11	Restore or Create 241.3 Vernal Pool and 184 Swale acres	31
		1,2,3,4,5,6,7,**8**,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,5,6,7,**8**,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,5,6,7,**8**,9,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		8,9,11	Restore 60 Valley Oak Riparian Woodland acres	35
		1,2,3,4,5,6,7,**8**,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		1,2,3,4,5,6,7,**8**,9,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		3,4,5,7,**8**,9	Restore Valley Elderberry Longhorn Beetle habitat in conjunction with native vegetation along portions of Deer, S. Laguna & N. Laguna Creeks, and the Cosumnes River	49,50,51,52
		6,7,**8**,9,10	Incorporate clusters of native shrubs in 20 locations and up to 1,000 hunting perches (100 perches/20Ac) within new and existing preserves for Loggerhead Shrike	59,60
		8,9	Incorporate 5,000 linear feet of hedgerows and 500 suitable trees within the agricultural cropland matrix	57,58
		3b,6,7,**8**,9,11	Incorporate/establish 20 Himalayan blackberry sites for Tricolored Blackbird nesting sites within new and existing preserves	61
		1a,2,3b,7,**8**,10	Incorporate/establish 2 Western Burrowing Owl nesting areas in all core and landscape preserves and create at least 20 burrows per area	62
		1,2,3,4,5,6,7,**8**,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,4,5,6,7,**8**,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,4,5,6,7,**8**,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,4,5,6,7,**8**,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,4,5,6,7,**8**,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 9	Specific Requirements	**9**	Establish two Satellite preserves that are no less than 2,500' wide at any given point; one that is 700 Ac and one that is 200 Ac.	11
			Preserve 80 Vernal Pool Ac on Riverbank formation (50 Ac must occur on category 1 or 2 LAU)	11
			Preserve 29 Seasonal Wetland acres	13
			Preserve 7,200 Cropland and/or Irrigated Pasture Ac	17
			Preserve a minimum of 800 Cropland Ac in fee title to be maintained in for Alfalfa production (4 plots - 200 Ac/plot: 2 north and 2 south of Twin Cities Rd.)	18,55
			Preserve a minimum of 200 Cropland Ac in fee title to be maintained in for Greater Sandhill Crane food plots (10 plots - 20 Ac/plot)	19,56
			Restore 29 Seasonal Wetland acres	36
	Shared Requirements	6,7,8,**9**,10,11	Preserve 191 Freshwater Marsh, 182 Open Water, 187 Seasonal Impoundment, 135 Seasonal Wetland, 95 Mixed Riparian Scrub, and 663 Mixed Riparian Woodland acres	13,14
		6a,7,8,**9**,10,11	Preserve 207 Swale acres	13
		1,2,3,4,5,6,7,8,**9**,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,5,6,7,8,**9**,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		7,8,**9**,10,11	Preserve 4,571 Cropland and/or Irrigated Pasture Ac	17
		7,8,**9**	Preserve 30 Valley Oak Riparian Woodland acres	14
		6,7,8,**9**,10,11,12	Preserve 196 linear miles of Stream channel within a corridor (800' wide, 2,000' wide along the Cosumnes R.) ensuring that 55 linear miles is preserved to support Giant Garter Snake	21,22,23,63
		6,7,8,**9**,10,11	Preserve 6,500 Valley Grassland acres beyond compensatory mitigation	26
		7,8,**9**,10,11	Preserve 2,000 Cropland acres beyond compensatory mitigation	29
		1,2,3,4,5,6,7,8,**9**,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,5,6,7,8,**9**,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		7,8,**9**,10,11	Restore or Create 241.3 Vernal Pool and 184 Swale acres	31
		1,2,3,4,5,6,7,8,**9**,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,5,6,7,8,**9**,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,5,6,7,8,**9**,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		8,**9**,11	Restore 60 Valley Oak Riparian Woodland acres	35
		1,2,3,4,5,6,7,8,**9**,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		1,2,3,4,5,6,7,8,**9**,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		3,4,5,7,8,**9**	Restore Valley Elderberry Longhorn Beetle habitat in conjunction with native vegetation along portions of Deer, S. Laguna & N. Laguna Creeks, and the Cosumnes River	49,50,51,52
		6,7,8,**9**,10	Incorporate clusters of native shrubs in 20 locations and up to 1,000 hunting perches (100 perches/20Ac) within new and existing preserves for Loggerhead Shrike	59,60
		8,**9**	Incorporate 5,000 linear feet of hedgerows and 500 suitable trees within the agricultural cropland matrix	57,58
		3b,6,7,8,9,11	Incorporate/establish 20 Himalayan blackberry sites for Tricolored Blackbird nesting sites within new and existing preserves	61
		1,2,3,4,5,6,7,8,**9**,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,4,5,6,7,8,**9**,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,4,5,6,7,8,**9**,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,4,5,6,7,8,**9**,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,4,5,6,7,8,**9**,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 10	Specific Requirements	**10**	Establish a Core preserve at least 3,100 acres in size that is no less than 2,500' wide at any given point.	12
			Establish a landscape linkage to Zone 7 that is at least 1,000' wide	47
			Establish and maintain connectivity to/from Chase Ranch by preserving habitat or establish landscape linkages to new or existing preserves	12
			Preserve 100 Vernal Pool Ac on Surficial Alluvial Deposits, Laguna, Mehrten & Modesto Formations (80 Ac must occur on category 1 or 2 LAU)	12
			Preserve 3,000 valley grassland acres	12
	Shared Requirements	6,7,8,9,**10**,11	Preserve 191 Freshwater Marsh, 182 Open Water, 187 Seasonal Impoundment, 135 Seasonal Wetland, 95 Mixed Riparian Scrub, and 663 Mixed Riparian Woodland acres	13,14
		6a,7,8,9,**10**,11	Preserve 207 Swale acres	13
		7,**10**	Preserve 81 Seasonal Impoundment acres	13
		1,2,3,4,5,6,7,8,9,**10**,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,5,6,7,8,9,**10**,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		7,8,9,**10**,11	Preserve 4,571 Cropland and/or Irrigated Pasture Ac	17
		6,7,8,9,**10**,11,12	Preserve 141 linear miles of Stream channel within a habitat corridor (800' wide)	21,22,23,63
		6,7,8,9,**10**,11	Preserve 6,500 Valley Grassland acres beyond compensatory mitigation	26
		7,8,9,**10**,11	Preserve 2,000 Cropland acres beyond compensatory mitigation	29
		1,2,3,4,5,6,7,8,9,**10**,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,5,6,7,8,9,**10**,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		7,8,9,**10**,11	Restore or Create 241.3 Vernal Pool and 184 Swale acres	31
		1,2,3,4,5,6,7,8,9,**10**,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,5,6,7,8,9,**10**,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,5,6,7,8,9,**10**,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		1,2,3,4,5,6,7,8,9,**10**,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36

Comment - South Sacramento HCP, Environmental Review Process

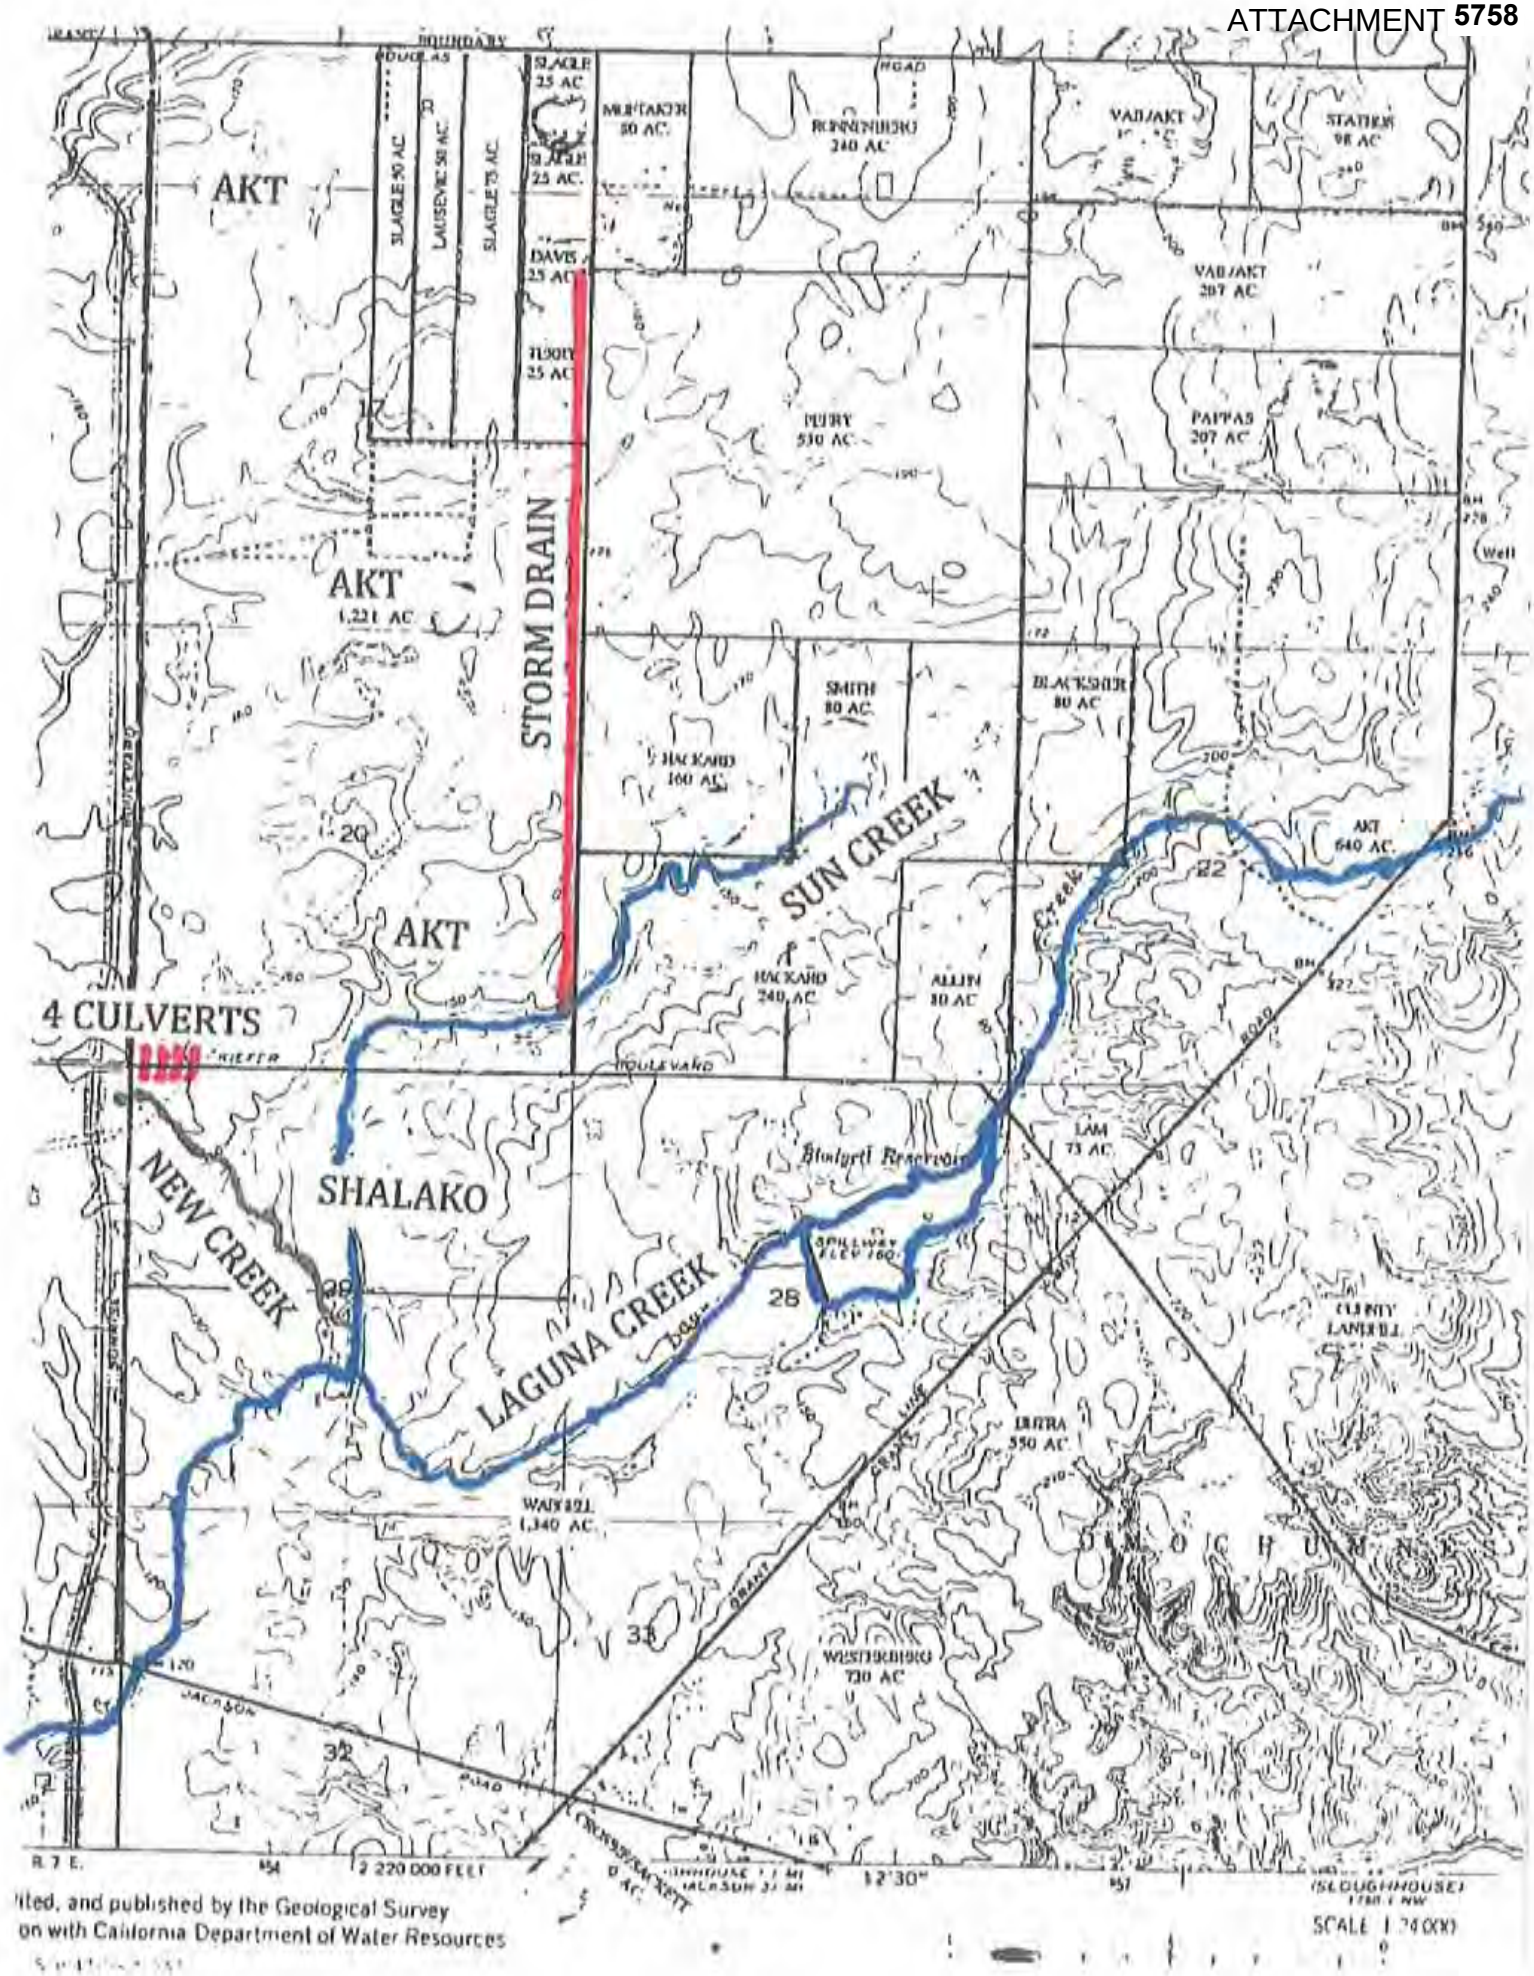
MORRISON CREEK SHED JUMP

Historically there was little shed jump from Morrison Creek south across Kiefer Blvd into the Laguna creek watershed at Sunrise Blvd.

There is a1937 aerial photo that shows only swales and not the new channel cutting southeast across the Shalako Property, APN 067-0090-026-0000. On Dec 30, 2005 heavy runoff from the new AKT Sun Ridge development flooded Sunrise Blvd and Folsom South Canal, and eroded a new tributary to Laguna Creek east of Sunrise Barn.

In the fifties and sixties I dry farmed wheat in the swales south of Kiefer Road. In the late 1960's when Sunrise Blvd was built an 18 inch culvert was installed to carry road runoff from the west side to the east side into the swales farmed to wheat. In 2005 with Sun Ridge streets and housing in place this culvert was completely overwhelmed as water backed up and poured across Sunrise. With added flooding from the east side a new 2 ft by 2t channel was cut down these swales to Laguna Creek.

There is currently serious back cutting on both sides of Sunrise near the black walnut tree. This is caused by a 10 ft drop in elevation in a distance of 400 ft. The 2005 unprecedented flooding results from two inadequate flumes across Folsom South Canal and minimal catchment basins on the AKT SunRidge development.



County Drainage is memorializing this untenable situation with a dozen pipes crisscrossing Sunrise and four 30 inch pipes under Kiefer Road. These pipes will flood a vernal pool complex and cause serious erosion compromising the ecological functioning of these pools.

When only minor elevations separate watersheds, shed jump can occur with deeply set storm drains. This is evidenced by the 3 ft diameter storm drain emerging at the Jaeger Road bridge over Sun Creek. Running north along the west side of Jaeger Road this pipe will deliver Morrison Creek water to the Laguna Creek watershed via Sun Creek. It is also possible that storm drains could deliver Morrison water into a tributary of Laguna that drains into Blodgett Reservoir. Sun Ridge storm drains will have a serious impact on the Laguna Creek floodplain.

Shed jump flooding, deep set storm drains, and inadequate catchment basins are causing serious problems for those downstream. These issues must be addressed.

Sincerely,

[redacted]

Richard:

Could you see that the attached comments get to the right persons (unless you believe they should not see the light of day!) for me?

thanks

Sam Miller

Notice of Preparation of an EIR/EIS for the South Sacramento Habitat Conservation Plan.

1. It might be useful to change an element of the plan. The National Academy of Sciences recommendations have been the reference point for definition of compensation for loss of wetlands. Those six recommendations are:

a. Avoid wetlands that cannot be restored
b. Maintain watershed diversity, connectivity, etc.
c. Ensure that mitigation sites become self sustaining
d. Mitigate before or concurrent with impacts
e. Develop clear, enforceable, compliance requirements
f. Give authority and funding to third party stewards.

The plan as written includes a finance section. The first obligation of this effort has been to define the costs of the plan implementation. My consideration is this

It appears to be that a seventh recommendations has been added. The addition is the continuing study of the wetlands set aside in landscape, core, satellite and minor preserves. This commitment appears to go beyond assurance of the accomplishment of the six recommendations, particularly c – e, and to creation of research opportunity.

While there is no question that the continued research of wetlands is a valuable effort, the focus should be clearly upon maintenance and assurance and not upon investigation and assessment of the wetlands. As is true of all environments, the valley floor and margins are dynamic environments. The cost of plan implementation is a significant element of the plan viability. The EIR should address the cost differential for conservation plus research as against conservation only from the perspective of cost being an inhibitor of plan viability. Please address the value of making the long term mitigation and monitoring plan a conservation only effort and not conservation plus research.

2. It has been my understanding for some years now that the Garter Snake is an entirely "timid/asocial critter". The plan at several places would have habitat enhancement/creation in areas near by urban/suburban development. This characteristic of the snake should help to direct the identification of suitable mitigation/restoration locations for this snake. The EIR/EIS should identify and include a list or some presentation of geographic areas where restoration of habitat and/or creation of habitat is likely to be ineffective.

3. The recently distributed General Plan visioning efforts in both the Grant Line and the Jackson area suggest land uses in contradiction of the HCP. The consequence of these alternatives should be discussed.

4. The plan appears to have a strong bias against restoration efforts as a form of mitigation. The EIR/EIS should explore the potential for expansion of the use of restoration. The commonly cited basis for the current threats against Special Status species, particularly vernal pool species, is the over 160 years of farming and urban/suburban development that has occurred throughout the original range of the species. To the extent that significant likelihood of success of restoration is possible within, adjacent to or within or on an annexation basis to a Core or Landscape scale preserve, restoration should have equal value to preservation.

5. The use of terms fundamental to understanding of the EIR/EIS need to be defined up front in the document.

Subject: SSHCP=public comment for record
To: Peter Morse County of Sacramento DERA
To: Nina Bicknese U.S. Fish and Wildlife NEPA

Regarding: South Sacramento Habitat Conservation Plan. NOP

The following are comments I would like evaluated and placed into the record.

I attended the Public Meeting in Elk Grove on July 16th and at the time shared my concerns regarding property situated within the City limits of Elk Grove located at Bond and Waterman Roads. This area (230 acres) is home to many migratory species, endangered and threatened plant and animal species. Located on the property are high grade quality vernal pools and wetlands that support the local habitat (Considered a preservation site in the 1980's).

It is my opinion after much investigation into this property that this site should not be ignored in evaluating the SSHCP.

This area preserved would be a wonderful site for preservation of species and natural resources.

- Currently Sacramento Area Sewer District owns this property.

- Located on this site of vernal pools and wetlands is Whitehouse Creek that flows into Laguna Creek.

? **What will be the cumulative impacts of channeling the waters of the wetlands and Whitehouse Creek into Laguna Creek?**

? **How will this impact local flood issues?**

? Currently the vernal pool and wetland waters are filtered through the soils renewing local water table levels. **What will this loss do to the water table on residential use by residents of Sheldon area?**

? In a 1993 EIR the vernal pools and wetland were not going to be filled-I suppose because of their importance. **What happened to make this change with the Elk Grove City plans for development? How has this been evaluated with the SSHCP?**

• This site is home to various bird species as identified by a biological consultant of Sacramento Area Sewer District.

? 27 bird species were identified: note in particular White-tailed Kite, Red Winged Blackbird, Tri Colored Blackbird, Snowy egret, Red Tailed Hawk, Kill deer, Western Kingbird, Swallows, Cedar Waxwing, Western Meadowlark.

? How is the area habitat being protected for these species? Where will these species relocate? Are there enough mitigation banks available to support the various bird species? Has is been determined when banks are full? Are the banks accessible to the public? Is reconstructing an area for the species as cost effect as preserving what is already available? Is there documentation available to support either?

• As previously reported/documented this site is home to federally listed species: Vernal Pool Tadpole Shrimp, Vernal Pool Fairy Shrimp, threatened slender Orcutt Grass and Sacramento Orcutt Grass.

? What impact will developing this site have in regards to habitat preservation for the region?

? When do the mitigation banks reach capacity? Will net loss be significantly more than net gain?

? **What documentation information will be used supporting the decisions in the EIR?**

Elk Grove City supposedly supports the habitat conservation plan, however I would suggest with the city's behavior of mitigating away the vernal pools and wetlands and accepting dollars for Swainson Hawk valuable specie habitat has been lost within the city.

Through FOIA I attempted to obtain information regarding vernal pools and wetland mitigation and the amounts filled/lost and the city did not have a record of the totals. The city was able to provide the habitat areas of Swainson Hawk loss only because of dollars accepted.

I requested all records of development that included wetland/vernal pool mitigation. In every recent situation the vernal pools were mitigated away and there was not any onsite preservation.

? **As citizens are there any guarantees when the plan is implemented the cities will be amenable and follow the plan/ guidelines as developed?**

? **Who will be overseeing the implementation of the plan? Will it be individual agencies/cities? How will the coordination look?**

? **Is Elk Grove willing to rezone an area for an urban preserve?** (Elk Grove has rezoned many many areas changing site designations from the approved general plan).

? **How cooperative is the City of Elk Grove in this plan? Are they demonstrating by any actions that habitat preservation is important?**

? **Will this be addressed in the EIR?**

I recommend and suggest the following:

Cities need to have available urban preserves allowing open spaces within the city and allowing wildlife species to remain and continue on their current sites. I was told by the city Swainson Hawk and Kite would not be in this area-to urban….How come the species are here?

Urban preserves with interpretive centers are an excellent resource for youth and adults alike. The preserves provide walkable areas within the city allowing for outdoor exercise and a nature experience. In particular the site at Bond and Waterman would allow natural, undisturbed connectivity between Whitehouse Creek and Laguna Creek.

This property is situated such that the local elementary, middle and high school could use this as a valuable area for science/natural resource studies. I was told by one professional biologist this particular site was one used during her college days for study as an example of quality vernal pools and habitat.

As the life style of Americans change with the change in our natural/ energy resources looking forward and envisioning urban preserves will offer local interaction with nature while providing the exercise of walking or riding a bike and at the same time will prevent car emissions/pollutants as one won't have to drive to experience nature in the outdoors.

Urban Preserves will allow species an opportunity to choose to remain and live in their current environment.

OCT 27 2008
BOARD OF SUPERVISORS

From: William H. Geyer
To: Don Nottoli, Supervisor, Sacramento County
Date: Oct 24, 2008
Subject: HCP Comments

Dear Don,

Two weeks ago I was unable to attend the session that Herb Garms invited me to, with you and other county officials, to discuss the implementation of the proposed HCP in our area. I understand comments are due today. Here are some preliminary thoughts.

1. I attended one of your community input workshops. Whether they have any value as public comment exercises, I will leave for you to decide. However, regarding HCPs, landowners are far more than a part of the general public, and I believe those workshops are an insufficient and ineffective tool for communicating with them.

2. We spent two years and a lot of time and effort on the East County Open Space Committee earlier this decade, trying to learn what kind of programs the landowners would be willing to consider participating in for open space enhancements and protection. They recommended a smorgasbord approach, and suggested more than a dozen possible approaches. From conversations with them, and personal observations since, I fear the county may have learned little or nothing from that valuable exercise. I suggest you revisit those proposals with the local ranchers, and use them to help shape a viable approach to the HCP if you want any substantial participation.

3. I have had extensive experience with HCPs and NCCPs, primarily in southern California, and have a good grasp of what makes them work or not work for landowners. I also know that neither the state (DFG) nor federal (USFW) wildlife people have ever had a very good approach to dealing with working landscapes (like ranches) other than forcing them into permanent single purpose reserves as urban mitigation. I also know that tying up extensive land areas through regulatory means far ahead of the need for actual mitigation and ahead of the ability of either the governments' or developers' ability to pay for it at prices that reflect its long-term amenity value to the urban community it is designed to serve, is an environmentalist's dream, a landowner's nightmare, and a recipe for gridlock.

4. As a result of my experiences, I am acquainted with a number of environmental and planning consultants with development experience who I think have the capability of suggesting approaches that might help you. I would be willing to impose on some of these people to either meet with you, or to work with both of us, to critique your present situation and help you construct successful real-world approaches that would ultimately allow the ranchers who wished to remain to become compensated stewards, and help those who do not, to control the timing and economics of their exit strategy.

Let me know if I can be of help.

Sincerely, William H. Geyer

To: Morse. Peter
Subject: South Sacramento Habitat Conservation Plan

Dear: Mr. Morse

I am very short on time with up coming travel.
In case I can't make the meetings or respond specifically to the EIR pleas consider this a response.
Understanding that I have not looked at the EIR but will soon.

My response is -

Any EIR or Habitat Conservation Plan plan prepared today or in the future can only be considered incomplete or invalid if it does not address Outdoor Lighting, Light Trespass (into the havitat, and Light Pollution.

For a partial basis of my statement please see my Ecological Light Pollution Page on skykeepers web site.
http://www.skykeepers.org/ecol-lp.html

Many references on that page address the wildlife of the area and the adverse effects of light at night.

Ecological Consequences of Artificial Night Lighting (ECANL) By Catherine Rich, Travis Longcore is a good starting point.

Some of the species noted on that page and ECANL are-

Salmon, Bats, Frogs, Zooplanktion, Moths, Salamanders etc.

In my opinion -
Outdoor Lighting constitute a "taking" under the ESA.

"Harm" includes "significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering."

Outdoor Lighting is - a "significant habitat modification or degradation"
Outdoor Lighting can - "significantly impairing essential behavioral patterns"
Outdoor Lighting can - affect breeding
Outdoor Lighting can - affect feeding (reduced foraging)

How much light? Very low levels in the case of Zooplanktion, some Frogs and even fish.
In most cases levels well below that produced by the full moon can have a negative effect on various aspects of breeding, foraging while somewhat higher levels effect predation and navigation.

In closing this is a Habitat Conservation Plan, the natural night time is a part of the "Habitat" and any degradation of the natural levels must be considered.

Regards

Sacramento County Department of Environmental Review and Assessment
827 7th Street, Room 220, Sacramento, CA 95814

Re: South Sacramento Habitat Conservation Plan Notice of Preparation (Control Number 03-PLE-0637)

Dear Ms. Horizumi:

Wildlands, Inc. ("Wildlands") would like to thank you for the ongoing efforts to reach out to stakeholders within Sacramento County and provide an opportunity to participate in the creation of the South Sacramento Habitat Conservation Plan ("HCP"). Wildlands owns and operates several Mitigation and Conservation Banks throughout the HCP Planning Area, and we applaud your efforts to create a document that provides the regulated community with identifiable preservation goals while maintaining adequate organizational flexibility to allow the HCP to adapt to changes in the environment and development outlook for the County.

As a land owner in Sacramento County, an active contributor to the overall environmental health and well-being of the County, and an interested party in the development of the HCP, Wildlands is providing the following general comments for incorporation into the Draft Environmental Impact Report/Environmental Impact Statement ("EIR/EIS").

Incorporation of Existing Tools to Guarantee Restoration and Protection.
Private and non-profit Conservation and Mitigation Organizations such as Wildlands have been pursuing restoration and preservation goals within Sacramento County for over 15 years, and have protected thousands of acres within the County through the establishment of Mitigation and Conservation Banks ("Banks").

The maintenance and protection of these Bank habitats are guaranteed through Agency-reviewed cost models for endowment requirements, formalization of legally defensible Conservation Easement templates, and standardization of monitoring and reporting programs for long term management activities which are designed to ensure protection of environmental resources in perpetuity. Through almost two decades of fine tuning and regulatory oversight, these Banks are now able to allocate costs for land acquisition, endowment funding, and long term management through the sale of credits within each individual preserve. We suggest incorporation of these same tools into the HCP will provide a mechanism to determine HCP costs, and therefore habitat fees, in a manner which ensures a sustainable program.

We therefore believe a discussion of these items needs to be included in the scope and content of the environmental information provided in the EIR/EIS such that Agencies and Interested Parties

3855 Atherton Road • Rocklin, CA 95765 (916) 435-3555 • Fax (916) 435-3556

may understand the mechanisms by which fees will be established, the HCP program will be made sustainable, and mitigation for impacts will be generated and protected in perpetuity.

Use of Existing Restoration Resources.
Conservation and Mitigation Bank market-ready credits within the HCP Planning Area represent fully entitled, restored, and/or protected habitats which can be used by the HCP as a front loading mechanism upon initiation of the HCP, or can be used to achieve the HCP "get ahead and stay ahead" goals.

We therefore believe that a discussion of the role which market ready credits in entitled bank properties may play in the achievement of HCP goals needs to be included in the scope and content of the environmental information provided in the EIR/EIS.

Consistency with the Federal Final Rule on Compensatory Mitigation.
Effective June 2008, the U.S. Army Corps of Engineers ("Corps") and Environmental Protection Agency ("EPA") adopted 33 CFR Part 332 and 40 CFR Part 230, which established their Final Rule on mitigation for impacts to wetlands and aquatic resources. The Rule applies equivalent standards to permittee-responsible compensatory mitigation, mitigation banks and in-lieu fee mitigation. Since Banks must have approved management plans and long term financial assurances in place before all of their credits can be used to offset permitted impacts, Sections 332.3 and 230.93 of the Rule establish a priority preference for the use of Banks for compensatory mitigation. Simply put, the Rule recognizes that the use of Banks requires successful mitigation prior to permitting an impact, while an HCP may allow impacts prior to successful mitigation. The Rule also recognizes deferred mitigation can increase the risks and uncertainties associated with successful mitigation as well as create inconsistency with the Corps "no net loss policy".

We therefore believe that a discussion needs to be provided in the EIR/EIS on the consistency of the HCP mitigation policy with the Final Rule priority preferences and requirements for HCP – Bank biological equivalency, as well as the national policy of "no net loss" of wetlands.

We look forward to continuing to work with your office during the development of the EIR/EIS and the HCP documents. If you have any questions on these comments, do not hesitate to contact me at (916) 435-3555.

Regards,

Paul Sherman

Re: Notice of Preparation of a Joint Draft Environmental Impact Report and Environmental Impact Statement for South Sacramento Habitat Conservation Plan (Control Number 03-PLE-0637)

Dear Ms. Horizumi:

Please accept the following comments and suggestions submitted on behalf of the Harry Family, the owners of approximately 700 acres (Harry Ranch) located within the South Sacramento Habitat Conservation Plan (SSHCP) Zone 9. More specifically, Harry Ranch is located directly south of Eschinger Road and west of State Route 99 (see attached Exhibit 1).

The Harry Ranch property is a working cattle ranch, of which this land use is defined in the SSHCP as "irrigated pasture". In addition, the property provides habitat value for Swainson's Hawk, Greater Sandhill Crane, Tricolored Blackbird, Western Burrowing Owl, White-faced Ibis, and White-tailed Kite to name a few.

We have reviewed the subject Notice of Preparation and offer the following comments.

Land Use

Harry Ranch is located outside the Urban Development Area (UDA), just south of Eschinger Road, which is the southern boundary of the City of Elk Grove's proposed Sphere of Influence (SOI) Amendment application currently on file with Sacramento County LAFCo. As such, future urban development is being considered to move south of Kammerer Road (the current city limits of Elk Grove and Urban Services Boundary) to Eschinger Road. The SOI Amendment application should be considered when identifying strategic properties for permanent preservation as part of the SSHCP. Given this scenario, the Harry Ranch property is strategically located to provide permanent conservation land between potential future development and existing preserve land contiguous to and located directly southeast. A 700 acre irrigated pasture / farmland preserve in this location is consistent with the Conservation Principals of the SSHCP, including 1) minimizing fragmentation, 2) minimizing edge effects, 3) establishing connectivity, and 4) maximizing heterogeneity. Establishing a permanent conservation area directly south of Eschinger Road should be addressed in the SSHCP Draft EIR / EIS as the Elk Grove SOI Amendment application should be considered a reasonably foreseeable project under CEQA.

Agriculture

The Harry Ranch property and other similar properties in the area should be analyzed in the SSHCP Draft EIR/EIS as the first areas to be targeted for mitigation of impacts to irrigated pasture and farmland in order to establish a buffer line where future urban development in this area cannot occur south of this boundary. In addition, The SSHCP Draft EIR/EIS should analyze a requirement for future development

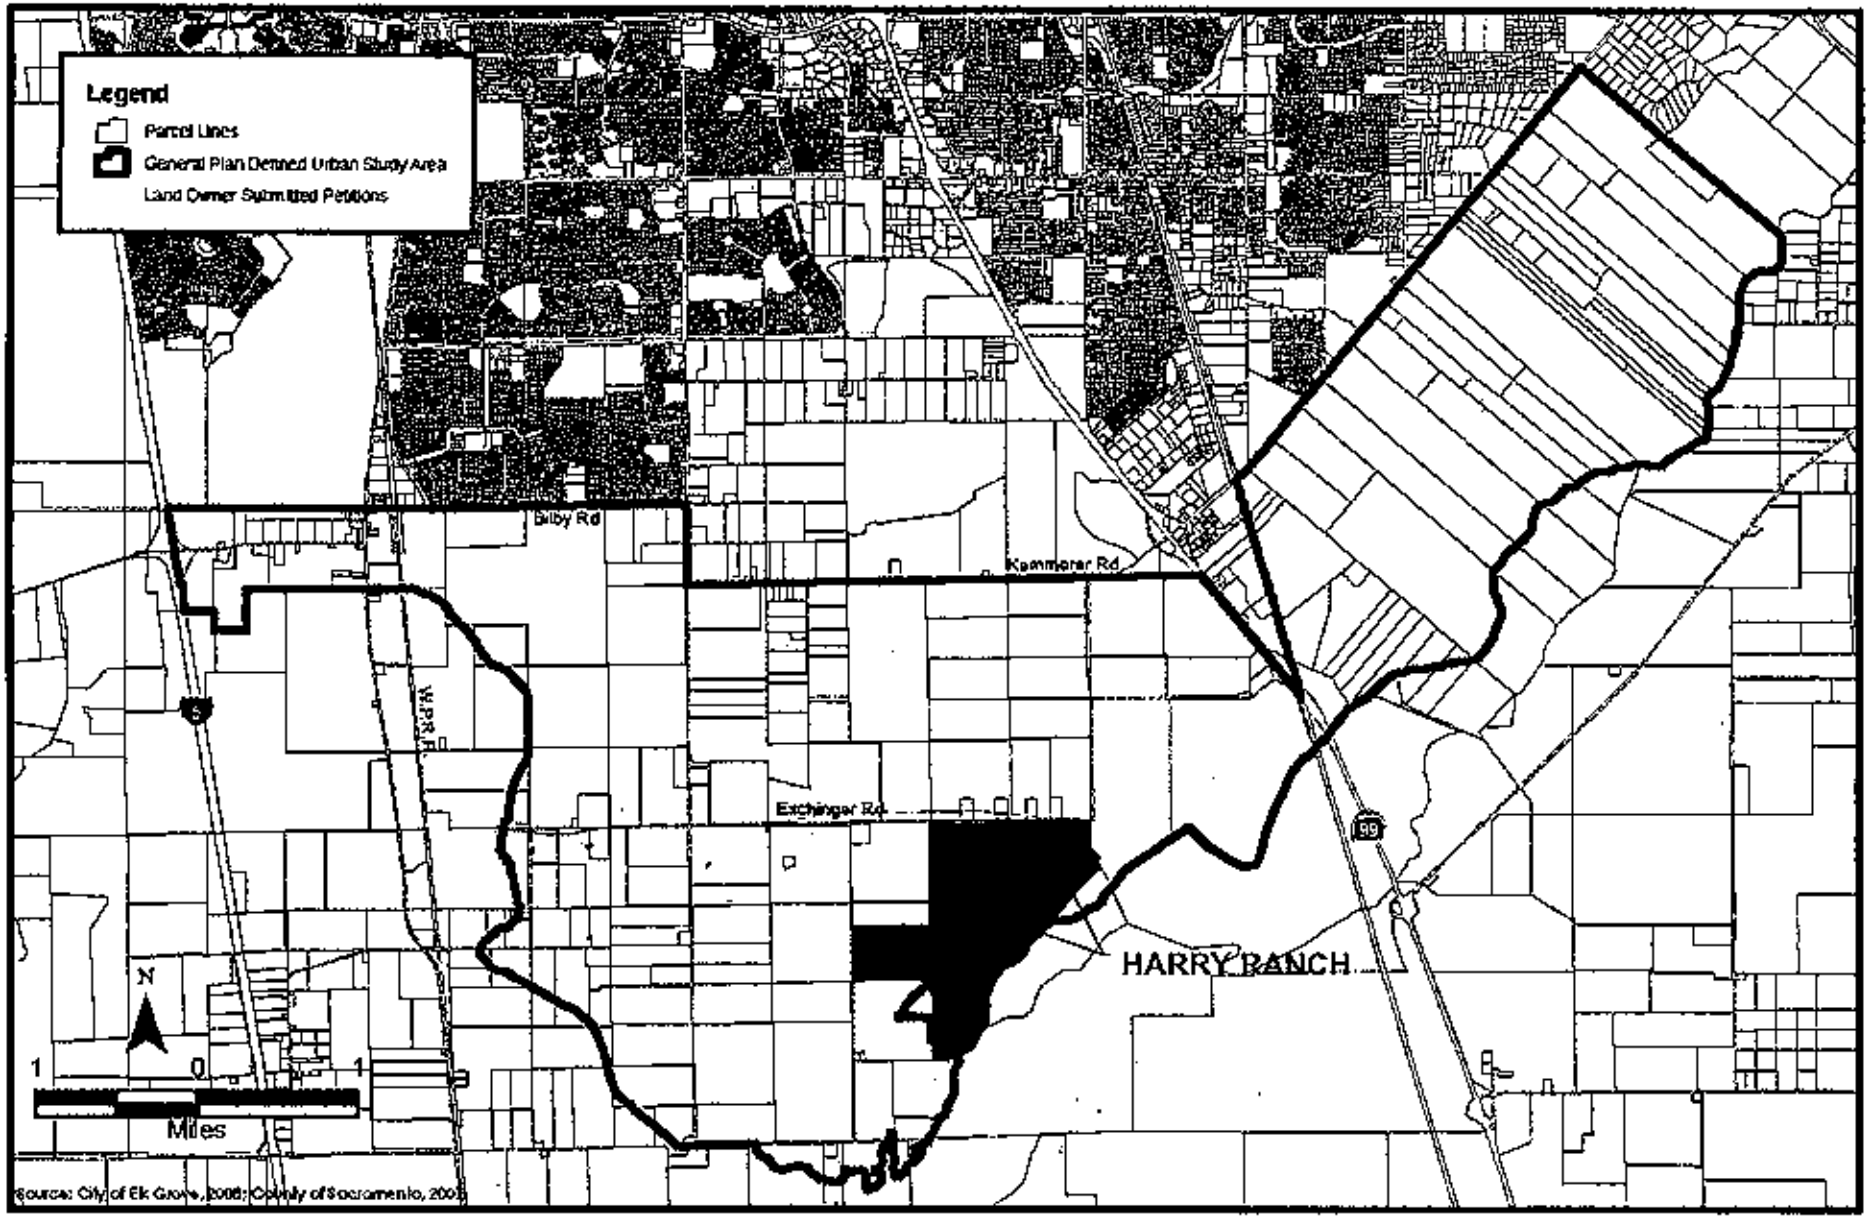
occurring within Zone 5 and impacting irrigated pasture and farmland in Zone 5, to mitigate for the loss of agricultural land impacts in Zone 9. As more irrigated pasture and farmland with "like" habitat is developed to the north of Harry Ranch, the more critical it becomes to preserve the Harry Ranch property and other properties with similar value in the immediate area. Having this area under permanent conservation early on in the implementation of the SSHCP will set a precedent for establishing other conversation land in this area of Sacramento County.

Economic Analysis

The SSHCP Draft EIR/EIS should include an Economic Analysis Section that analyzes a provision for additional credit beyond one acre of impact equals one acre of mitigation for irrigated pasture and farmland. The SSHCP Draft EIR/EIS should analyze a requirement for providing 3 acres of credit for every one acre of land on those properties extending ½ mile south of Eschinger Road, including Harry Ranch (see attached Exhibit 2). The additional credit consideration would provide an incentive for landowners in this area to voluntarily participate in the SSHCP program, thus directly assisting in meeting the established Conservation Principals and providing a clear buffer or boundary between urban development to the north and permanent preservation land. The value of having a permanent conservation buffer on the edge of future urban development in this area of the County should be recognized in the SSHCP as this concept is strongly desired by the local community and environmental stakeholders. This provides the County an opportunity to implement this buffer concept. In addition, future development should be required to directly acquire needed habitat mitigation land in lieu of simply paying a established fee for the land acquisition component of the program. This will ensure that the land acquisition fee component of the program is not outpaced by land values.

In summary, we believe that the properties located south of Eschinger Road including Harry Ranch provide a strategic aspect of establishing a permanent preserve boundary between future urban development and existing / future open space habitat. Therefore, providing additional economic incentive in the form of enhanced credit value for landowners in this area to place their land under permanent conservation is warranted.

Thank you for the opportunity to comment on the subject NOP. If you have any questions regarding this information, please contact me at (916) 837-2266



Sincerely,

Todd Chambers
The Chambers Company

South Sacramento Habitat Conservation Plan

Environmental Review Process – EIS/EIR

Comment Card

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please tell us of any potential impacts that should be studied, any alternatives or mitigating measures that offer promise, any problems or issues the proposed plan may cause, or your recommendations for improving the proposed plan. It helps us if you are specific.

the "current" water consumption depletes the Mehrten aquifer by 8" a year without further development. A mining operation will consume as much water a day as a family of 4 can use in a year. The roads are not up to D.O.T. code. These specifications have a cost of 800,000.00 a mile to construct: 30' across; 6 foot shoulders on each side; 15" sub grade w/ 4" asphaltic overlay.

The Herald Area in South East Sacramento County are open agricultural and flood plain lands. Rich with diverse species such as Swainsons Hawk; Tiger Salamader, Bald Eagle, Elderberry Beetle. Cheifly the Borden Ranch is the most preservable land in the area consisting of Riparian Creek, Oaks, Cotton Wood, Elderberry, prime ag land when it is not in flood stage during winter & early spring. the land is 400 acres on a historic family ranch 'Borden'. The rest of the area approx. 1200 acres is in productive vineyards.

I want this E.I.R. to address the specific impacts of surface gravel mining and its related activities ie. blacktop, concrete production, Topsoil removal etc.. Impacts on all listed species and impacts on the local communities must be addressed in in this E.I.R. Impacts of water supply to adjacent properties, traffic on these rural roads, dust on adjacent agricultural operations, noise impacts on neighbors, etc. ALSO THE impact on public utilities like roads & drainages.
I also want the E.I.R. to address the specific right to farm ordinances in Sac. County and those rights in relation to its neighbors.

I BELIEVE THIS EIR NEEDS TO SPECIFICALLY ADDRESS THE AREA OF DRY CREEK AT THE SOUTH EDGE OF THE COUNTY. IMPACTS ON ALL SPECIES LISTED AND THE LOCAL COMMUNITIES BY OPERATIONS OTHER THAN WHAT ~~2006 AMG~~ 2010 UG ALLOWS.

THIS E.I.R. NEEDS TO ADDRESS THE CUMULATIVE IMPACTS OF THESE SPECIES PROTECTIONS ON ADJACENT COUNTIES. SPECIFICALLY THE BORDEN GRAVEL MINING PROPOSAL ALONG DRY CREEK AT THE SOUTH EAST SIDE OF THE COUNTY.

THIS EIR NEEDS TO ADDRESS THE IMPACTS OF AGRICULTURE/URBAN INTERACTION

What Habitat issues are involved in the area just west of Hwy 99 (in Zone 9) along Twin Cities Rd.? (a group wants to put a senior housing project there- the group is called, "Citizens to Protect the Future of Galt" even tho the land is OUTSIDE the city limits of Galt). We @ Galt Parks & Rec want to support as large a regional area for "passive use" activities (like hiking, bird-watching etc.) around the city of Galt.

traffic noise from increased activity in Herald where a mining proposal threatens the community; Suggesting 285 rock trucks would use the narrow roads. This is the equivalent of 12,000 cars a day. The air quality & noise would be unbearable.

As a resident of the rural community of HERALD my concerns are about mining and the negative cumulative impacts that increased ROCK-TRUCK traffic will have. Also I fear the loss of important Ag land on BORDEN RANCH. The damage to DRY CREEK watershed on BORDEN Ranch would be an ENVIRONMENTAL DISASTER. Also the amount of water consumption by a mining operation on BORDEN Ranch would be devasting to the residential wells in the neighborhood I know of 4 wells that have been depleated. The air quality would be degraded by mining Borden Ranch. The Road damages from ROCK TRUCK traffic is a costly negative impact: over $600,000.00 a mile to replace. OVER→

<CONTINUED;

Mining of BORDEN RANCH and the increased truck traffic, noise, pollution is not wanted in the rural residential community of HERALD.

While the loss of prime agland on BORDEN RANCH would be most unfortunate; if mining were to occur; a railroad spur line must be developed for the efficient removal of mined materials to a Hi Way 104 location that will in no way a Burden HERALD residents.

Recall effort underway in Galt

Group seeks to unseat City Council members Meredith, Haines

By Chris Nichols
NEWS-SENTINEL STAFF WRITER

A long-threatened campaign to unseat two slow-growth Galt City Council members is now underway.

Members of Protect Galt's Future, a political action committee formed to push a pro-growth agenda, said Tuesday they plan to file a notice of intent to recall Mayor Andrew Meredith and Councilman Don Haines.

"They have not provided good stewardship ... they have stymied any real development," said Jim Ferguson, a retired Galt resident and PGF member.

"We've been (speaking) in front of the City Council for about a year, talking about Delta Greens and other projects, (and) it's become very, very obvious that they're simply not listening to us," added Dick Smith, another PGF member.

Delta Greens is a senior living center proposed off Twin Cities Road west of Galt. An earlier version of the project, backed by the Del Webb company, was nixed from city growth plans in January 2007 by a majority of the current council, including Meredith and Haines.

Andrew Meredith

Advocates continue to argue the senior project would generate millions in revenue and hundreds of jobs for Galt.

Haines and Meredith had been elected the previous fall on campaign promises to scale back Galt's growth plans.

Don Haines

Reached for comment, the two city leaders said they've followed the community's vision for responsible growth.

"I don't think the public is going to let them steal these seats from us," Haines noted. "This isn't going to go far."

Meredith said he wasn't surprised hear of the recall effort. noted he has heard threats a recall from members of t group since he was elected November 2006.

The earliest a recall vo could be held is during March 2009 special electio City Clerk Liz Aguire sai Several requirements — i cluding the collection roughly 1,800 signatures fro registered Galt voters — mu be met before a recall vote can be set motion.

Please see Galt, Page 8

Jerry Stribling (verbal comments)

- Livestock grazing needs to be preserved in Sacramento County

- Concerned that the SSHCP will place additional limitations on grazing/farming.

- Leased land—Concerned the Conservation Strategy of purchasing land in fee title will HCP reduce availability of land for lease. Many farmers, in particular ranchers, lease land. These ranchers may be impacted if the land is taken off the market.

- Native pasture—concerned about the management of native pasture. Will the SSHCP understand how to manage grazing land.

- Concerned about urban sprawl impact to agriculture throughout Sacramento County.

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please tell us of any potential impacts that should be studied, any alternatives or mitigating measures that offer promise, any problems or issues the proposed plan may cause, or your recommendations for improving the proposed plan. It helps us if you are specific.

Did the team consider involving the Regional Water Quality Control Board. Most of the time, the CORP requirements are in-line with NPDES requirem., but there maybe additional measures that applicants should know about.

Thanks.

Will the SSHCP have a feature that would allow it to incorporate private wetland preserve areas into the preserve system managed by the SSHCP?

Would you like to be added to the SSHCP mailing list? ☑ Yes ☐ No

Regarding Cordova Hills, the impacts outside the UDA for roadway, sewer, water, dry utilities should be taken into account. (covered activities) Cordova Hills project is 2,419 acres all within the USB, but will require a 4-6 lane roadway crossing & possibly other infrastructure through the northern eastern side of the Kiefer landfill's bufferlands. Cordova Hills will require 3 access points & due to spacing requirements the southern entrance into Cordova Hills must traverse through the bufferlands outside the UDA. Cordova Hills owns this portion of the bufferlands & no [redacted] uses requiring urban services are proposed but construction of necessary project infrastructure outside the UDA will be needed.

(1) The EIR/EIS needs to cover the impacts on the South Sac HCP of the proposed Highway 50 to Highway 99 connector road, for which a joint powers agency was just created; The HCP also needs to provide permit coverage for the connector.

(2) The EIR/EIS needs to include development in the City of Elk Grove's "South of Kammerer Road" area as a future development area covered by the permits to be issued for the South Sac HCP.

Continue to look at City of Elk Grove Sphere of Influence and annexation proposal. Area should be addressed in EIR. Potential for future growth should be assessed. Avenues for EG to blend these areas into the plan should be kept open. A "50 year" plan should clearly look to the future & the reality that growth will occur. We trust you'll continue to listen with an open mind and include the City of Elk Grove & it's current & future residents in the decision making process

With the City of Elk Grove's formal application to Amend the City's sphere of influence, the SSHCP environmental review should address that acreage for future development (or "take" habitat).
The EIR/EIS should also evaluate the mitigation type and quantity for these proposed SOI AREAS.

We are very concerned about protecting the resources of the Cosumnes River floodplain area, specifically Riparian habitat protection in zones 35, 1e & 39 near Grantline Road and Highway 99 and Kammerer Road. At a minimum the area within the 200 year floodplain of Cosumnes River & Dear Creek - include Dear Creek

It is a sensitive area with wetlands, vernal pools endangered species habitat. It is being threatened by the development and expansion of the City of Elk Grove. The analysis should conside the impacts of expansion of the City of Elk Grove. Identification of resources in the sensitive areas and mitigation (if any).

		Applicable Zones	Measure - Abbreviations	Measure - Reference
Zone 8	Specific Requirements	8		10
				10
			Preserve 79 Vernal Pool Ac on Laguna and Riverbank formations (55 Ac must occur on category 1 or 2 LAU)	10
			Preserve 2,500 valley grassland acres	10
			Preserve 1,000 Cropland and/or Irrigated Pasture Ac	17
			Preserve a minimum of 1,000 Cropland Ac in fee title to be maintained in for Alfalfa production (5 plots - 200 Ac/plot; 3 north and 2 south of Dillard Rd.)	18,55
	Shared Requirements	6,7,8,9,10,11	Preserve 191 Freshwater Marsh, 182 Open Water, 187 Seasonal Impoundment, 135 Seasonal Wetland, 95 Mixed Riparian Scrub, and 663 Mixed Riparian Woodland acres	13,14
		6a,7,8,9,10,11	Preserve 207 Swale acres	13
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve 88 Freshwater Marsh acres along select stream reaches for Giant Garter Snake	13
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve a total of 24,667 Valley Grassland acres	16
		7,8,9,10,11	Preserve 4,571 Cropland and/or Irrigated Pasture Ac	17
		7,8,9	Preserve 30 Valley Oak Riparian Woodland acres	14
		6,7,8,9,10,11,12	Preserve 196 linear miles of Stream channel within a corridor (800' wide, 2,000' wide along the Cosumnes R.) ensuring that 55 linear miles is preserved to support Giant Garter Snake	21,22,23,63
		6,7,8,9,10,11	Preserve 6,500 Valley Grassland acres beyond compensatory mitigation	26
		7,8,9,10,11	Preserve 2,000 Cropland acres beyond compensatory mitigation	29
		3a,3b,6b,6e,7,8	Preserve six (6) Tricolored Blackbird nesting colonies (colonies shall be within 3 miles of 6,000 acres of suitable foraging habitat)	65
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve all newly discovered occurrences of Sacramento and Slender Orcutt Grasses in as large a preserve as possible	68
		1,2,3,4,5,6,7,8,9,10,11,12	Preserve up to 10 occurrences of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia (5 occurrences must be protected before permitting take of the species and shall be located within a core/landscape preserve	66
		7,8,9,10,11	Restore or Create 241.3 Vernal Pool and 184 Swale acres	31
		1,2,3,4,5,6,7,8,9,10,11,12	Restore 242 Open Water and 153 Seasonal Impoundment acres	33
		1,2,3,4,5,6,7,8,9,10,11,12	Restore 79 Freshwater Marsh Ac ensuring that 50 acres are preserved to support Giant Garter Snake	34
		3,4,5,6,7,8,9,10,11,12	Restore 35 Mixed Riparian Scrub and 120 Mixed Riparian Woodland ensuring that 30 MRS and 95 MRW acres are preserved in zones 8, 9, and/or 11, and 20 MRW are restored along North Laguna Creek	35
		8,9,11	Restore 60 Valley Oak Riparian Woodland acres	35
		1,2,3,4,5,6,7,8,9,10,11,12	Restore 57 Seasonal Wetlands acres ensuring 36 acres occur outside the UDA and specifically 29 acres in zone 9.	36
		1,2,3,4,5,6,7,8,9,10,11,12	Restore 1,000 Mixed Riparian Woodland and 500 Valley Oak Riparian Woodland beyond compensatory mitigation	38
		3,4,5,7,8,9	Restore Valley Elderberry Longhorn Beetle habitat in conjunction with native vegetation along portions of Deer, S. Laguna & N. Laguna Creeks, and the Cosumnes River	49,50,51,52
		6,7,8,9,10	Incorporate clusters of native shrubs in 20 locations and up to 1,000 hunting perches (100 perches/20Ac) within new and existing preserves for Loggerhead Shrike	59,60
		8,9	Incorporate 5,000 linear feet of hedgerows and 500 suitable trees within the agricultural cropland matrix	57,58
		3b,6,7,8,9,11	Incorporate/establish 20 Himalayan blackberry sites for Tricolored Blackbird nesting sites within new and existing preserves	61
		1a,2,3b,7,8,10	Incorporate/establish 2 Western Burrowing Owl nesting areas in all core and landscape preserves and create at least 20 burrows per area	62
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate three (3) outlier populations of Sacramento and Slender Orcutt Grasses from populations in Zones 1, 2, & 3 into preserves no smaller than 500 acres in size	70
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate five (5) outlier populations of Ahart's Dwarf Rush, Bogg's Lake Hedge-Hyssop, Dwarf Downingia, and Pincushion Navarretia from populations in Zones 2, 3 & 4 into core/landscape preserves	69
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate 400 bat roost structures within new and existing preserves (one structure per 60 preserved acres), bat roosting structures into new bridges and culverts and retrofit 10 existing bridges/culverts with bat roosts	53,54
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate management plans and assess the current biological value for all preserves	39,40
		1,2,3,4,5,6,7,8,9,10,11,12	Incorporate avoidance and minimization measures while performing covered activities to prevent impacts to covered species	71,72,73,74,75,76,78,79

I believe that keeping City of Elk Grove Expansion outside the 200 year floodplain will cover Ahart Zone 8 & encourage

Don Smith

Ms. Nina Bicknese
Conservation Planning Branch
U.S. Fish and Wildlife Service
2800 Cottage Way, Room W-2605
Sacramento, CA 95825

Subject: Notice of Intent to Prepare an Environmental Impact Statement (EIS) for the South Sacramento Habitat Conservation Plan, Sacramento County, California.

Dear Ms. Bicknese:

The U.S. Environmental Protection Agency (EPA) has reviewed the U.S. Fish and Wildlife Service (Service) Notice of Intent to Prepare an Environmental Impact Statement (EIS) for the South Sacramento Habitat Conservation Plan (HCP) pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and Section 309 of the Clean Air Act. These comments were also prepared under the authority of, and in accordance with, the provisions of the Federal Guidelines (Guidelines) promulgated at 40 CFR 230 under Section 404(b)(1) of the Clean Water Act (CWA). Our detailed comments are enclosed.

The proposed HCP would result in a 30-year permit, issued by the Service that would authorize incidental take of 40 covered species due to ground disturbing activities implemented under the HCP. Sacramento County, the cities of Elk Grove, Rancho Cordova, Galt, the Sacramento Regional County Sanitation District, and the Sacramento County Water Agency (Local Partners) would apply to the Service for incidental take authorization under the HCP. Incidental take would occur from a wide range of activities but would generally be related to urban and suburban development and supporting infrastructure, including roads, water supply, water and sewage treatment, flood control, utilities, land fills, police, fire and medical services, open space and recreation, as well as mining operations, and conservation activities. The local partners are facilitating the preparation of the HCP in coordination with the Service. The U.S.

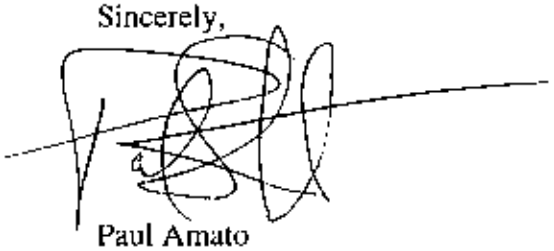
Printed on Recycled Paper

Army Corps of Engineers (Corps), as a cooperating agency, will consider using the EIS to inform their discretionary decision to issue a programmatic general permit (PGP) for certain components proposed under the HCP.

EPA recognizes the level of effort that has gone into the HCP thus far; however, we remain concerned with various impacts to environmental resources. We have been involved with the development of the HCP since its inception, both through our direct participation and through awarding of a $750,000 grant. Since that time, we note that the HCP development process has benefited from the efforts of Richard Radmacher, Senior Planner with the Sacramento County Planning Department. We acknowledge Richard's good efforts and look forward to continued coordination with him, the Service, Corps, and other participants in this process.

Significant impacts would occur to many acres of vernal pools and other aquatic resources in the HCP area. This is in addition to a long history of direct and indirect impacts, as well as impacts from future planned development near the HCP area. The EIS should clearly describe the cumulative impacts to these resources, impacts to the species that depend on them, and how they will be adequately mitigated through the HCP conservation strategy. EPA recognizes the level of effort that has gone into the mapping, species accounts, and review of biological resources in the HCP area and we anticipate the EIS will clearly disclose how this information has informed the conservation strategy. The EIS should also assess a reasonable range of alternatives that maximize avoidance of aquatic resources and comply with Clean Water Act Section 404 (b)(1) Guidelines. EPA is concerned with the significant amount of fill that would occur as a result of development plans approved by the Local Partners and authorized under the HCP.

The EIS should also provide a science-based discussion of vernal pool mitigation in the HCP area and describe how vernal pool mitigation predominantly in the southern portion will provide adequate mitigation for impacts to the north. EPA is especially concerned that this approach could compromise biological and genetic diversity in the area.



EPA encourages the Service and Local Partners to integrate Smart Growth, Low Impact Development (LID), and Green Building principles into the conservation strategy of the HCP to reduce impacts to environmental resources and improve living conditions for future residents. We are concerned that the planning and developments that would occur in the HCP area would be a continuation of urban and suburban sprawl that has been shown to result in greater environmental impacts than Smart Growth, LID, and Green Building alternatives. The HCP is an opportunity to demonstrate how these principles can be used to design developments that have reduced impacts and improved living conditions for future occupants.

The EIS should also provide a detailed analysis of groundwater impacts, water availability, impacts to air quality and traffic, and the potential impacts from induced growth that would result from projects approved under the HCP.

Due to the potential significant impacts from projects likely seeking approval under the HCP, and a possible Corps PGP, EPA encourages the Corps and Local Partners to continue to coordinate with EPA and other environmental resource agencies prior to the release of the EIS for public review. When the EIS is released for review, please send one hard copy and two CD

copies to the address above (mailcode: CED-2) at the same time the EIS is formally filed with EPA Headquarters. If you have any questions, please contact me at 415-972-3847 or amato.paul@epa.gov.

Sincerely,

Paul Amato
Environmental Protection Specialist
Environmental Review Office

Enclosure:
EPA's Detailed Comments

Cc:
Mr. Richard Radmacher, Sacramento County Planning Department
Mr. Patrick Gillum, Central Valley Regional Water Quality Control Board
Mr. Jeff Finn, California Department of Fish and Game

ENVIRONMENTAL PROTECTION AGENCY'S (EPA) DETAILED COMMENTS ON THE NOTICE OF INTENT (NOI) TO PREPARE AN ENVIRONMENTAL IMPACT STATEMENT (EIS) FOR THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN PROJECT (HCP), JULY 30, 2008

Waters of the US

Though not described in the NOI, EPA is very concerned with the amount of direct and indirect impacts to vernal pools and other aquatic resources that would occur under the HCP. The EIS should describe the potential direct, indirect, and cumulative impacts to these resources that could result from HCP approved projects. Mitigation for these impacts should also be described. Continued urban and suburban development in South Sacramento and surrounding regions have had a significant impact on vernal pool habitat and species, and insufficient opportunities to adequately mitigate for these impacts is an ongoing and increasing concern for EPA. EPA recommends the Service and Local Partners reduce impacts to all aquatic resources, including vernal pools, to the maximum extent feasible. For further discussion of these concerns, the Service should contact Paul Jones, EPA Water Division at (415) 972-3470, or by email at jones.paul@epa.gov.

Conservation Strategy

The EIS should clearly demonstrate how the HCP will contribute to the recovery of the covered species and provide adequate conservation of their habitats. The NOI states that the HCP would provide a regional approach for the conservation of the 40 covered species and their 18 habitat types so as to aid in the recovery of the species. Key to this is the protection of approximately 47,000 acres and creation or restoration of approximately 1,500 acres, out of the 341,000 acre HCP area. This would result in the protection of less that 14% and creation or restoration of approximately 0.4% of the total HCP area. Of this, approximately 8,000 acres would be spread throughout the Urban Development Area (UDA) and eventually be surrounded by development, resulting in fragmentation, increased edge effects, and habitat degradation. EPA is concerned with the small percentage of larger protected areas, and the creation and restoration components of the HCP conservation strategy. We recommend increasing these areas and providing a clear analysis in the EIS that demonstrates how they will provide adequate conservation and aid in the recovery of the 40 covered species.

The EIS should demonstrate how the conservation and mitigation areas selected to protect and compensate for high quality habitats will adequately benefit the species in the development areas that have been identified through on-the-ground species accounts. While not stated in the NOI, we understand that a significant amount of mitigation for development in the northern portion of the HCP area will occur in the south. This redistribution of habitat and species could result in reduced genetic integrity for various vernal pool species. The EIS should provide a scientific basis for the adequacy and appropriateness of the conservation strategy and mitigation measures. The EIS should also clarify whether any activities, such as agriculture, are expected to occur in the conservation areas and if so, what their impacts would be.

Statements in the NOI regarding acres conserved and developed are contradictory and should be clarified in the EIS. Page 32730 of the Federal Register states that approximately 43,500 acres within the 123,000 acre UDA and 2,000 acres outside the UDA would be developed, for a total of 45,500 acres developed under the HCP. Page 32731 states that approximately 43,500 acres of land would be developed within the 341,000 acre Planning Area.

The NOI states that components of the proposed HCP conservation program are under consideration and that "...these components may include monitoring, adaptive management, species avoidance measures, and species mitigation measures including preservation, restoration, and enhancement of suitable habitat" (emphasis added). The EIS should include these components, at a minimum, and describe how they will aid to the recovery of the 40 species.

Finally, as stated above, the Service and Local Sponsors should commit to implementing Smart Growth, LID, and Green Building principles as part of the conservation strategy for the HCP.

Alternatives

The EIS should clearly describe and equally assess a reasonable range of alternatives, including the no action alternative. Alternatives previously considered but not carried forward in the EIS should be described, and reasons to not be considered further explained. Because of the large area of the proposed HCP and the potential for significant impacts from covered actions to several environmental resources, including 7 listed and 33 nonlisted species under the Federal Endangered Species Act (ESA), the Service and Local Partners should consider a range of alternatives that includes avoiding impacts to resources to the maximum extent practicable. We note that the NOI anticipates the development of several alternatives for analysis in the EIS.

As stated in the NOI, the Corps will be a NEPA cooperating agency and may use the EIS to inform their discretionary decision to issue a programmatic general permit (PGP) for certain components of the HCP involving fill and dredging activities. EPA supports efforts to properly integrate the Corps' Clean Water Act (CWA) Section 404 authority into the HCP; however, the EIS should analyze alternatives that avoid, minimize, and mitigate impacts to waters of the US (WOUS), identify the least damaging practical alternative (LEDPA) consistent with CWA Section 404 (b)(1) Guidelines, and conduct a robust comparative analysis of these alternatives. This information is necessary to inform the decision maker as to which alternative is the LEDPA prior to integration of Corps 404 authority. EPA also recommends the County of Sacramento adopt an ordinance that would protect conservation and mitigation areas within the HCP area from impacts to WOUS in.

As part of the alternatives analysis, EPA strongly encourages the HCP proponents to conduct a detailed, accurate, and comprehensive assessment of the environmental resources at the proposed HCP site. Areas with higher functions and values should be preserved in perpetuity, including protection of WOUS through the HCP, 404 integration, and a County ordinance. The results of this analysis should be described in the EIS, including how this

information has been used to inform development of alternatives that avoid and protect environmental resources identified at the site.

Smart Growth, Low Impact Development, and Green Building Principles

The NOI states that activities covered by the HCP are wide-ranging, but generally will be urban and suburban development, supporting infrastructure and services. EPA strongly encourages the Service, Corps and Local Partners to commit to implementing Smart Growth, Low Impact Development (LID), and Green Building principles as conservation measure that will avoidance and minimize impacts to covered species and their habitats, including aquatic resources. Urban and suburban sprawl continues to contribute significant negative impacts to terrestrial and aquatic habitats, air quality, traffic, water supply, water quality, archeological resources, agriculture, and other environmental and human resources. Smart Growth, LID, and Green Building principles provide opportunities to design and construct urban and suburban developments in a way that minimizes these impacts. The Service and Corps, along with the Local Partners should seize the opportunity to integrate these principles as conservation and impact minimization measures for covered species, WOUS, and to enhance the daily lives of future residents.

By implementing Smart Growth, LID, and Green Building principles, environmental impacts of the projects covered under the HCP can be reduced within and beyond the HCP Area. For example, high density, transit oriented and bicycle and pedestrian-friendly villages reduce the need for residents to drive to services and amenities thus reducing the amount of tailpipe emissions like nitrogen oxides, and other ozone precursors, that compromise respiratory function in Sacramento County. In addition to reduced vehicle emissions, integrating solar power and other sources of renewable energy generation can reduce greenhouse gas emissions and help improve efforts to stem climate change impacts. Project footprints can also be configured to avoid impacts to terrestrial and aquatic habitat and preserve more open space. Building materials selected from sustainable sources such as lumber from sustainably managed forests, lumber alternatives, and building products made from recycled materials reduce the impacts from natural resource demands. EPA encourages the Service, Corps and Local Partners to commit to maximizing the implementation of these principles.

More information on Smart Growth, LID, and Green Building can be found in publications at EPA's websites at www.epa.gov/smartgrowth, http://www.epa.gov/nps/lid/, and www.epa.gov/greenbuilding/index.htm. Information about the Leadership in Energy and Environmental Design (LEED) for Neighborhood Development Rating System can be found at the US Green Building Council website at http://www.usgbc.org/.

Groundwater

Development and water supply projects approved for incidental take under the HCP have the potential to result in significant impacts to groundwater in the HCP area. The EIS should clearly describe existing groundwater conditions, potential cumulative impacts to groundwater

quantity and quality, and avoidance measures to prevent impacts. EPA is especially concerned with groundwater in the HCP area due to the relationship between existing conditions and vernal pools, and other aquatic resources that exist due to these conditions. Any direct, indirect and cumulative impacts to groundwater that may occur as a result of the HCP should be clearly assessed in the EIS in light of these relationships.

Water Availability

The EIS should describe existing and/or proposed sources of water supply for projects that would be covered under the HCP and include direct, indirect and cumulative impacts to water resources that may occur. Projects approved under the HCP and actions potentially approved under a Corps programmatic general permit could result in thousands of new residences, businesses, and services in the area, resulting in significant increases in water demands for an indefinite period of time. EPA strongly encourages the Service and Local Partners include in the EIS a description of all water conservation measures that will be implemented to reduce water demands for projects that would be covered under the HCP. Project designs should maximize conservation measures such as appropriate use or recycled water for landscaping and industry, xeric landscaping, a water pricing structure that accurately reflects the economic and environmental costs of water use, and water conservation education. Water saving strategies can be found in the EPA's publications *Protecting Water Resources with Smart Growth* at www.epa.gov/piedpage/pdf/waterresources_with_sg.pdf, and *USEPA Water Conservation Guidelines* at www.epa.gov/watersense/docs/app_a508.pdf.

In addition, the EIS should describe water reliability for development projects approved under the HCP and clarify how existing and/or proposed sources will be affected by climate change. At a minimum, EPA expects a qualitative discussion of impacts to water supply and adaptability of the projects to these changes, as part of the EIS impacts analysis.

Air Quality and Traffic

Projects approved under the HCP will result in increased impacts to air quality in Sacramento County; an area designated nonattainment for 8-hour ozone and particulate matter smaller than 10 microns (PM_{10}). Specifically, the air basin is designated serious nonattainment for 8-hour ozone and moderate nonattainment for PM_{10}. The EIS should provide a discussion of the baseline air quality conditions in the HCP area and a description of federal and state air quality regulations, and a rigorous assessment of direct, indirect, and cumulative effects of the projects authorized under the HCP on air quality. The analysis of air quality impacts should include direct, indirect and cumulative impacts from construction and post construction conditions, including increased traffic. The Service should describe in the EIS specific commitments to mitigate emissions that will prevent further degradation of air quality in the basin. In short, the cumulative impacts analysis should consider all new sources of emissions that are likely to result from the federal action of issuing the proposed HCP. The EIS should also describe coordination with EPA, California Air Resources Board, and the Sacramento Metropolitan Air Quality Management District to reduce air quality impacts in the air basin.

The EIS should describe whether emissions from projects approved under the HCP will or will not meet general conformity requirements with the associated state implementation plans for the air basin. If the federal action is determined to potentially interfere with the attainment of Clean Air Act national ambient air quality standards (NAAQS), the Service is required to conduct a conformity analysis to determine the likelihood and extent of interference. For conformity-related questions, the Corps is encouraged to consult with EPA and should contact Ms. Karina O'Connor at (775) 833-1276 or by email at oconnor.karina@epa.gov.

To prevent degradation of air quality from construction-caused PM_{10} in Sacramento County, we suggest the following fugitive dust control measures be committed to in the EIS to reduce impacts to existing air quality conditions:

Fugitive Dust Source Controls:

- Stabilize open storage piles and disturbed areas by covering and/or applying water or chemical/organic dust palliative where appropriate. This applies to both inactive and active sites, during workdays, weekends, holidays, and windy conditions.
- Install wind fencing and phase grading operations where appropriate, and operate water trucks for stabilization of surfaces under windy conditions.
- When hauling material and operating non-earthmoving equipment, prevent spillage and limit speeds to 15 miles per hour (mph). Limit speed of earth-moving equipment to 10 mph.

Mobile and Stationary Source Controls:

- Reduce use, trips, and unnecessary idling from heavy equipment.
- Maintain and tune engines per manufacturer's specifications to perform at EPA certification levels and to perform at verified standards applicable to retrofit technologies. Employ periodic, unscheduled inspections to limit unnecessary idling and to ensure that construction equipment is properly maintained, tuned, and modified consistent with established specifications.
- Prohibit any tampering with engines and require continuing adherence to manufacturers recommendations
- If practicable, lease newer and cleaner equipment meeting the most stringent of applicable Federal or State Standards.
- Utilize EPA-registered particulate traps and other appropriate controls where suitable to reduce emissions of diesel particulate matter and other pollutants at the construction site.

Administrative controls:

- Identify where implementation of mitigation measures is rejected based on economic infeasibility.
- Prepare an inventory of all equipment prior to construction and identify the suitability of add-on emission controls for each piece of equipment before groundbreaking. (Suitability of control devices is based on: whether there is reduced normal availability of the construction equipment due to increased downtime and/or power output, whether there may be significant damage caused to the construction equipment engine, or whether there may be a significant risk to nearby workers or the public.)

- Utilize cleanest available fuel engines in construction equipment and identify opportunities for electrification. Use low sulfur fuel (diesel with 15 parts per million or less) in engines where alternative fuels such as biodiesel and natural gas are not possible.
- Develop a construction traffic and parking management plan that minimizes traffic interference and maintain traffic flow.

The EIS should identify sensitive receptors in the project area, such as schools, daycare centers, nursing homes, and hospitals and specify the means by which impacts to these receptors will be minimized due to both construction and long term land use associated with the new development . For example, locate construction equipment and staging zones away from sensitive receptors away from fresh air intakes and buildings and design neighborhoods such that activity centers (ball fields, etc.) and sensitive receptors are not proximate to emissions sources, such as highways.

Due to the scale of the proposed HCP area and the amount of new residents, businesses, and services that could occur, it is reasonable to anticipate increased traffic and congestion in the local surface streets, freeways and highways. The EIS should include a traffic analysis to determine how the proposed projects will affect traffic in the region and contribute to cumulative air quality impacts.

Cumulative Effects

The proposed HCP would issue incidental take permits for the construction of several developments, in addition to several in the area that have occurred in the recent past or are proposed and under various stages of development. As a result, it is critical that the cumulative effects analysis be comprehensive and rigorous, and that it consider an appropriate scope of activities, and spatial and temporal scales when assessing project effects. EPA suggests referring to the Council on Environmental Quality 1997, guidance *Considering Cumulative Effects Under the National Environmental Policy Act* found at http://www.nepa.gov/nepa/ccenepa/ccenepa.htm, and 1999 EPA guidance, *Consideration of Cumulative Impacts in EPA Review of NEPA Documents* found at http://www.epa.gov/compliance/resources/policies/nepa/cumulative.pdf. In addition, we recommend referring to the EPA, California Department of Transportation, and Federal Highway Administration Guidance for Preparers of Cumulative Impact Analysis found at http://www.dot.ca.gov/ser/cumulative_guidance/purpose.htm. While this guidance was developed for transportation projects, the principles and the 8-step process in this guidance can be applied to other types of projects, both within and outside of California. We recommend the principles and steps in this guidance to other agencies as a systematic way to analyze cumulative impacts for their projects.

Induced Growth

The EIS should describe how the proposed HCP could result in environmental impacts due to induced-growth. New development and anticipated population growth that could occur

from projects covered under the HCP could result in increased pressure for more development, increased transportation infrastructure and other essential services in the area. Taken into account with the other proposed projects in the project area, induced growth impacts could be significant. EPA's recommendation is to make both the methodology and the assumptions in the growth inducing analysis as transparent as possible to the public and decision makers. To do this, EPA recommends that Service and Local Sponsors:

(1) Identify which land use model will be used, discuss its strengths and weaknesses, and describe why it was selected.

(2) Identify the assumptions used in the model and why those assumptions were selected. For example, describe which method will be used to allocate growth to analysis zones, its strengths and weaknesses, and why that method was selected.

(3) Ground truth the results of the land use model by enlisting local expertise involved in land use issues, such as local government officials, land use and transportation planners, home loan officers, and real estate representatives. Use their collective knowledge to validate or modify the results of the land use model.

(4) Use the results of the growth inducing analysis to inform transit options, neighborhood design, and recommendations for land use as well as mitigation measures to reduce environmental impacts.

Covered Species

The NOI states that species may be added or deleted from the HCP during the course of the 30-year permit. The EIS should clearly describe the process, criteria, and authority under which adding or deleting species would occur.

Project Purpose and Need

The purpose and need statement in the EIS should be clearly stated and briefly describe the underlying purpose and need to which Service is responding in proposing alternatives, including the proposed action (40 C.F.R. 1502.13.) The statement of purpose and need should explain why the Service and Local Partners are undertaking the proposed South Sacramento Habitat Conservation Plan (HCP) and the objectives that the action is intended to achieve. A clear purpose and need statement is important under the National Environmental Policy Act (NEPA) and to EPA's review in that it should be directly linked to the proposed alternative designs and clarify the potential impacts of a range of reasonable alternatives for the proposed HCP.

Sacramento, CA 95814

Dear Ms. Horizumi:

Thank you for the opportunity to review and comment on the South Sacramento Habitat Conservation Plan Notice of Preparation document. Our comments are as follows:

- Caltrans would like to coordinate with Sacramento County and other participants regarding the South Sacramento Habitat Conservation Plan as it is being developed. Please include Caltrans on any inter-agency working group that may be formed.

- A buffer between land designated as habitat conservation areas in the Plan and existing transportation facility right of way should be considered to avoid conflict between transportation facility operation or improvements and the long term viability of habitat conservation areas.

If you have any questions regarding these comments, please contact Ken Champion at (916) 274-0615.

Sincerely,

ALYSSA BEGLEY, Chief
Office of Transportation Planning – South

Subject: South Sacramento Habitat Conservation Plan Notice of Preparation
SCH# 2008062030

Dear Mr. Morse:

The Department of Conservation's (Department) Division of Land Resource Protection (Division) has reviewed the Notice of Preparation (NOP) for the referenced project. The Division monitors farmland conversion on a statewide basis and administers the California Land Conservation (Williamson) Act and other agricultural land conservation programs. We offer the following comments and recommendations with respect to the project's impacts on agricultural land and resources.

Project Description

The South Sacramento Habitat Conservation Plan (SSHCP) project is a regional plan to conserve species and address issues related to urban development, habitat conservation, open space protection and agricultural protection. The Division recommends that the Environmental Impact Report (EIR) address the following items to provide a comprehensive discussion of potential impacts of the project on agricultural land and activities.

Agricultural Setting of the Project

- Location and extent of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and other types of farmland in and adjacent to the project area.
- Current and past agricultural use of the project area. Please include data on the types of crops grown, and crop yields and farm gate sales values.

To help describe the full agricultural resource value of the soils on the site, the Department recommends the use of economic multipliers to assess the total contribution of the site's potential or actual agricultural production to the local, regional

and state economies. Two sources of economic multipliers can be found at the University of California Cooperative Extension Service and the United States Department of Agriculture (USDA).

Project Impacts on Agricultural Land

- Type, amount, and location of farmland conversion resulting directly and indirectly from project implementation and growth inducement, respectively.
- Impacts on current and future agricultural operations; e.g., land-use conflicts, increases in land values and taxes, vandalism, etc.
- Incremental project impacts leading to cumulative impacts on agricultural land. This would include impacts from the proposed project, as well as impacts from past, current, and likely projects in the future.

Under California Code of Regulations Section 15064.7, impacts on agricultural resources may also be both quantified and qualified by use of established thresholds of significance. As such, the Division has developed a California version of the USDA Land Evaluation and Site Assessment (LESA) Model. The California LESA model is a semi-quantitative rating system for establishing the environmental significance of project-specific impacts on farmland. The model may also be used to rate the relative value of alternative project sites. The LESA Model is available on the Division's website at:

http://www.consrv.ca.gov/DLRP/qh_lesa.htm

Williamson Act Lands

Under California Code of Regulations Section 15206(b)(3), a project is deemed to be of statewide, regional or area-wide significance if it will result in cancellation of a Williamson Act contract for a parcel of 100 or more acres. If lands under Williamson Act contracts and/or in agricultural preserves exist in the project area, the Department recommends that the following information be discussed and/or provided in the EIR:

- A map detailing the location of agricultural preserves and contracted land within each preserve. The EIR should also tabulate the number of Williamson Act acres, according to land type (e.g., prime or non-prime agricultural land), which could be impacted directly or indirectly by the project.
- A discussion of Williamson Act contracts that may be terminated in order to implement the project. The EIR should discuss the probable impacts on nearby properties resulting from the termination of adjacent Williamson Act contracts. For example, a termination of a Williamson Act contract may have a growth-inducing impact. In other words, a termination may not only lift a barrier to development, but also result in higher property taxes, and thus, an incentive to shift to a more intensive land use, such as urban development.

- As a general rule, land can only be withdrawn from a Williamson Act contract through the nine-year non-renewal process. Immediate termination via cancellation is reserved for "extraordinary circumstances" (See Sierra Club v. City of Hayward (1981) 28 Cal.3d 840, 852-855). Under Government Code Section 51282, the city or county must approve a request for cancellation and base that approval on specific findings that are supported by substantial evidence. When cancellation is proposed, the Department recommends that a discussion of the findings be included in the EIR. Finally, a notice of the hearing to approve the tentative cancellation and a copy of the landowner's petition must be mailed to the Director of the Department ten working days prior to the hearing. (The notice should be mailed to Bridgett Luther, Director, Department of Conservation, c/o Division of Land Resource Protection, 801 K Street MS 18-01, Sacramento, CA 95814-3528.)
- Under Government Code Section 51243, if a city annexes land under a Williamson Act contract, the city must succeed to all rights, duties, and powers of the county under the contract. However, under Section 51243.5, a city may exercise its option not to succeed to the contract if certain conditions are met. LAFCO must notify the Department within 10 days of a city's proposal to annex land under a contract (Government Code Section 56753.5). Additionally, LAFCO must not approve a change to a sphere of influence or annexation of contracted land to a city unless certain conditions are met (see Government Code Sections 51296.3, 56426, 56426.5, 56749 and 56856.5).
- If portions of the planning area are under Williamson Act contracts (and will continue to be under contract after project implementation) the EIR should discuss the proposed uses for those lands. Uses of contracted land must meet compatibility standards identified in Government Code Sections 51238 - 51238.3. Otherwise, contract termination (see paragraph above) must occur prior to the initiation of the land use.
- An agricultural preserve is a zone authorized by the Williamson Act and established by the local government to designate qualified land to be placed under the Williamson Act's 10-year contracts. Preserves are also intended to create a setting for contract-protected lands that is conducive to continuing agricultural use. Under Government Code Section 51230, "An agricultural preserve may contain land other than agricultural land, but the use of any land within the preserve and not under contract shall within two years of the effective date of any contract on land within the preserve be restricted by zoning, including appropriate minimum parcel sizes that are at a minimum consistent with this chapter, in such a way as not to be incompatible with the agricultural use of the land." Therefore, the EIR should also discuss any proposed general plan designation or zoning within agricultural preserves affected by the project.

Thank you for giving us the opportunity to comment on this NOP. If you have questions regarding our comments, or require technical assistance or information on agricultural land conservation, please contact Elliott Lum, Environmental Planner, at 801 K Street, MS 18-01, Sacramento, California 95814; or, phone (916) 324-0869.

Sincerely,

Brian Leahy
Assistant Director

RECEIVED
JUN 30 2008
DEPARTMENT OF ENVIRONMENTAL REVIEW AND ASSESSMENT

June 24, 2008

Mr. Peter Morse
Joint Sacramento County/USFWS
827 Seventh Street, Room 220
Sacramento, CA 95818

Dear Mr. Morse:

The Department of Fish and Game (DFG) has reviewed the Notice of Preparation of a draft Environmental Impact Report (DEIR) for the South Sacramento Habitat Conservation Plan (SSHCP), (SCH #2008060230). The project consists of a regional approach to conserving species and addressing issues related to urban development, habitat conservation, open space and agricultural protection. The SSHCP will authorize Sacramento County, and the cities of Elk Grove, Rancho Cordova, and Galt, and two public utility agencies to issue permits allowing landowners to engage in specific development activities that could result in incidental take of listed species. The SSHCP plan area includes the Cities of Elk Grove, Rancho Cordova, and Galt, and the portion of Sacramento County south of the American River and east of Highway I-5 all the way to the County-line boundaries with Amador and San Joaquin Counties.

Wildlife habitat resources consist of a wide variety of habitats including vernal pool grasslands, oak woodlands, agricultural lands, and riparian and other wetland habitats. Significant natural resources of the project include habitat for sensitive species including 10 species listed under either the State or Federal Endangered Species Act.

We recommend that the DEIR discuss and provide adequate mitigation for the following concerns:

1. The project's impact upon fish and wildlife and their habitat. The SSHCP will replace actions previously taken to protect wildlife and their habitat. Examples include: individual project review under CEQA, individual incidental take permits issued under State and Federal Endangered Species Acts, individual permits under section 404 of the River and Harbors Act, Streambed Alteration Agreements (1600 permits), etc. The DEIR should discuss the value of the SSHCP in comparison with existing or alternative strategies for conserving wildlife and habitat in the SSHCP plan area.

2. The DEIR should identify and discuss potential areas of conflict in conservation planning. Examples may include conserving one species or group of species at the expense of other species of wildlife, SSHCP Preserve designs which differ significantly from USFWS critical habitat or recovery units, or conflicts with the conservation efforts of private organizations like The Nature Conservancy, or Sacramento Valley Conservancy.

3. The project's impact upon wetlands including vernal pools and riparian habitat. The SSHCP's Conservation Strategy will likely effect the location and amount of the remaining wetland habitat in south Sacramento County. The DEIR should discuss the impact of the SSHCP's Conservation Strategy on wetlands and wetland dependant species. Among other things, the analysis should center on whether the proposed configuration of preserved habitat will permit long-term viability of habitats and species.

4. The SSHCP Covered Species list includes endemic species that have a narrow distribution (Sacramento Orcutt grass), as well as species which have important parts of their range within the plan area (vernal pool tadpole shrimp). The DEIR should discuss the potential for the project to impact these species, or other species, such that their populations might drop below a self-sustaining level.

5. The SSHCP affords Incidental Take coverage for infrastructure projects like roads, water conveyance, etc., both inside and outside the Urban Development Area. These types of projects may act as barriers to the movement of wildlife across the landscape, or between preserves. The DEIR should contain a discussion of, and provide mitigation for, any adverse effects that these barriers may have upon wildlife.

6. The DEIR will form the basis for DFG's issuance of a 2081(b) Incidental Take Permit for the SSHCP. Therefore, mitigation for State-listed species must meet DFG's full mitigation standard contained in California Code of Regulation Title 14, Section 783.4.

7. The DEIR should contain an evaluation of the SSHCP's consistency with applicable land use plans (General Plans, Specific Plans, etc.), as well as other habitat conservation plans (San Joaquin HCP, Natomas HCP).

This project will have an impact to fish and/or wildlife habitat. Assessment of fees under Public Resources Code Section 21089 and as defined by Fish and Game Code Section 711.4 is necessary. Fees are payable by the project applicant upon filing the Notice of Determination by the lead agency.

Pursuant to Public Resources Code Sections 21092 and 21092.2, the DFG requests written notification of proposed actions and pending decisions regarding this project. Written notifications should be directed to this office.

Thank you for the opportunity to review this project. If the DFG can be of further assistance, please contact Mr. Dan Gifford, Staff Environmental Scientist, telephone (209) 369-8851 or, Mr. Jeff Drongesen, Supervising Environmental Scientist, telephone (916) 358-2382.

Sincerely,

for Sandra Morey

Subject: Comments – Notice of Preparation (NOP) of a Joint DEIR and DEIS for South Sacramento Habitat Conservation Plan (SSHCP)
DERA Control Number 03-PLE-0637

Dear Ms. Horizumi and Ms. Bicknese:

This letter conveys the comments and recommendations of the Sacramento County Airport System (County Airport System) in response to the NOP issued by the Sacramento County Department of Environmental Review and Assessment (DERA) on June 11, 2008, and published in the *Federal Register* on June 10, 2008 by the United States Fish and Wildlife Service (Service). In summary, we strongly recommend that the Joint DEIR/DEIS consider current and future projected aircraft operational requirements at three airports operated by the County Airport System in the southern portion of the County: Executive Airport (SAC), Mather Airport (MHR), and Franklin Field (F72). In particular, the goal of the SSHCP to protect and conserve 40 wildlife species could increase the areal extent and concentration of habitat for avian species particularly hazardous to commercial aircraft operations.

Our comments begin with an overview of the three airports. Mather Airport and Franklin Field are located within the SSHCP Study Area depicted in Figure 2-1 of Chapter 2 (Physical Resources) of the Draft SSHCP. In addition, the western boundary of the Study Area appears to be within one mile or less of Executive Airport. We then summarize the requirements of the Federal Aviation Administration (FAA) relative to wildlife hazards near airports, and the involvement of the County Airport System in efforts that resulted in approval by the Sacramento County Board of Supervisors of changes in County land use plans for South Mather (Resolution 2006-0210, February 26, 2006).

(1) Overview of Mather Airport

Mather Airport is one of four airports operated by the County Airport System. (The aviation operations at McClellan Airport are managed by the County Airport System on behalf of the County's Department of Economic Development and Intergovernmental Affairs.) MHR is the County Airport System's designated cargo airport, and it also supports a significant number of general aviation operations. During 2007, MHR supported 87,617 flight operations, including cargo, general aviation, air taxi, and military. (An "operation" is either an aircraft landing or take-off.) As an indication of Mather Airport's regional economic importance, during the first five months of 2008, MHR accommodated 69,401,179 pounds of freight, almost evenly divided between arriving and departing shipments. The total represents an increase of 8.6 percent over the same five-month period in 2007.

The County Airport System initiated a Master Plan for Mather Airport in April 2001. On February 17, 2004, the Sacramento County Board of Supervisors accepted the draft Master Plan and directed that DERA initiate preparation of environmental review, a process that is ongoing. The draft MHR Master Plan forecast update projects an annual average growth rate in operations of 1.3 percent for the period between 2007 and 2025, resulting in annual operations growth from 87,617 in 2007 to 110,634 in 2025. In addition to existing available commercial space at MHR, over 200 acres of land is planned for new construction once the Mather Airport Master Plan is complete. The Mather Airport Master Plan may be viewed on the County Airport System website, by accessing the Planning and Development tab:
http://www.sacairports.org/mather/planning/index.html.

(2) Overview of Executive Airport

Located on 540 acres in the City of Sacramento on Freeport Boulevard, Executive Airport (SAC) is the County Airport System's designated General Aviation airport. For the five months ending May 2008, SAC had a total of 39,144 flight operations, consisting of 38,691 general aviation operations and 453 military operations, or a monthly average of 7,829. Over 30 businesses operate at SAC, offering a wide variety of aviation related services including flight schools, aircraft maintenance, avionics, insurance, and aerial photography. Both MHR and SAC have been designated as reliever airports for Sacramento International Airport pursuant to the Federal Aviation Administration (FAA) National Plan of Integrated Airport Systems (NPIAS).

(3) Overview of Franklin Field

Franklin Field Airport (F 72) is currently a public use airport owned and operated by the County of Sacramento. The facility is considered an "uncontrolled airport" because it does not have an operating air traffic control tower.. There are approximately 36,000

annual flight operations at F72, including flight training. In 1947 the airport was acquired by the County of Sacramento from the federal government. It is located at 12480 Bruceville Road, Elk Grove.

(4) Executive Airport/Franklin Field Master Plan Update

The County Airport System is preparing Master Plan Updates (MPUs) for Executive Airport and Franklin Field Airport. The MPUs will establish guidelines for improving the facilities at each airport over a 20-year period. It will also represent a vision for each airport in the future, recognizing the operational, economic, and environmental factors likely to influence physical development. The MPUs will identify the type and extent of facilities required to meet forecast aviation demand, and will evaluate a range of alternatives for improving facilities consistent with forecast requirements. We recommend that the SSHCP and the Joint DEIR/DEIS take into account that the MPUs, when completed, may encompass physical and operational expansion parameters that will need to be reconciled with the conservation goals of the SSHCP.

(5) Hazardous Wildlife Implications and Concerns

The FAA establishes, updates and enforces policies and guidance relative to the placement of hazardous wildlife attractants on and near airports, in particular with regard to projects within a five-mile radius of airports subject to FAA grant assurances. The FAA Wildlife Hazards Advisory Circular (AC) referenced herein specifies two geographic areas of concern relative to hazardous wildlife:

- The "Critical Zone," which is defined as a 10,000-foot radius from the runway centerline for airports serving turbine-powered (jet) aircraft, and a 5,000-foot radius for airports serving piston-powered aircraft; and
- A five-mile radius from the outer edge of the Airport Operating Area (AOA).

The FAA strongly discourages hazardous wildlife attractants within the Critical Zone, and requires airport operators such as the County Airport System to evaluate all proposed development projects within a five-mile radius for potential hazardous wildlife attractants. Exhibits depicting the Critical Zone and Five-Mile radius for MHR are enclosed. Certain aquatic components of the habitat preserves contemplated in the SSHCP, when implemented, could attract avian species that can inflict significant damage to aircraft, in addition to endangering passengers and crew members.
We therefore request that the environmental analysis of the draft EIR/EIS for the SSHCP include a detailed analysis of the HCP's potential to increase hazardous wildlife activity within the five-mile radius of MHR, in addition to potential impacts to SAC and F72 in consideration of the projected increases in aviation activity at the three facilities.

(6) Federal Aviation Administration Policies Addressing Hazardous Wildlife

The FAA is the federal agency responsible for the safe design, operation and maintenance of airports. As the human population and number of aircraft operations have increased in the United States, collisions involving avian species and aircraft have become more common, costly, and threatening to human safety. Aquatic features such as wetlands, golf course ponds, water and sewage treatment plants and compensatory wetland mitigation projects are among the landscape characteristics most likely to attract waterfowl and other birds that have a high likelihood of inflicting damage to aircraft. The FAA is therefore understandably concerned with minimizing hazardous wildlife attractants near airports. Pursuant to FAA policy, airport operators such as the County Airport System are responsible for monitoring proposed developments that could lessen airport viability. A few of the FAA hazardous wildlife policies and guidance documents are described below.

- Title 14, Code of Federal Regulations (CFR), Part 139, Certification of Airports, Subpart D.
- "Hazardous Wildlife Attractants On Or Near Airports," FAA Advisory Circular (AC) No. 150/5200-33B, August 28, 2007 (enclosed). Please note that the 2007 revision replaces all previous versions of this AC.
- *Memorandum of Agreement Between the Federal Aviation Administration, the U.S. Air Force, the U.S. Army, the U.S. Environmental Protection Agency, the U.S. Fish and Wildlife Service and the U.S. Department of Agriculture to Address Aircraft-Wildlife Strikes* (hereinafter "Interagency MOA"), executed by the six agencies between December 9, 2002 and May 2, 2003 (enclosed).
- *Wildlife Hazard Management At Airports – A Manual for Airport Personnel*, FAA and USDA, Second Edition - July 2005.

Environmental staff specialists assigned to the FAA's San Francisco Airports District Office (ADO) recently clarified the "guidance" and "advisory" nature of the first two documents listed above: "Although the term 'guidance' is used to refer to the hazardous wildlife criteria, Part 139 airport operators, such as the Sacramento County Airport System, are **required** (emphasis added) to comply with the standards provided." Attachment 1 comprises a more complete list of FAA policies and requirements. The County Airport System strongly recommends that DERA and the U.S. Fish and Wildlife Service (Service) incorporate those documents into the environmental analysis for the SSHCP. Moreover, pursuant to the Interagency MOA, the Service has an affirmative obligation to consult with the FAA during preparation of the DEIS, and to collaborate in reducing the likelihood of bird-aircraft strikes that may result from implementation of the SSHCP.

(7) Regional Commercial Aviation Considerations

The County Airport System also requests that the DEIR and DEIS include consideration of the following factors.

Temporary Relocation of Commercial Service

As stated above, MHR is the County Airport System's designated cargo airport. However, a "Continuity of Operations Plan" (Continuity Plan) is now in the initial stages of preparation for Sacramento International Airport (SMF). The lessons learned during Hurricane Katrina warrant such a contingency plan. It is contemplated that the Continuity Plan will address means by which limited commercial passenger service operations could be temporarily transferred to MHR in the event of a levee breach or other natural disaster that could cause commercial passenger operations to be temporarily interrupted at SMF. (No permanent facilities or related developments at MHR are contemplated to address the temporary relocation of operations to that facility.)

Although the number of flights diverted to MHR would be limited to those necessary to sustain the Sacramento region's access to the national air transportation system, the passengers and crews aboard such aircraft could be confronted with unnecessary risk of collision with birds as a result of implementing the SSHCP. The County Airport System therefore recommends that the potential for temporary relocation of commercial passenger aviation activity to MHR be thoroughly considered in the environmental analysis.

Potential Expansion and/or Relocation of Aviation Activity

As noted, the Master Plan Update process for SAC and F72 was recently begun. At this stage of the master plan studies, it is impossible to predict the roles and functions for the two airports that will ultimately be recommended for approval by the Board of Supervisors. Given the continued population growth and economic development of the Sacramento - Stockton region, it is quite possible that over time Franklin Field Airport could experience a substantial increase in general aviation, ground support services such as aircraft maintenance and flight training, and as a base of operations for entities such as the California Division of Forestry (CDF). No actions, therefore, should be taken near F72 under the auspices of the SSHCP if those measures could constrain expansion of aviation activity. An example of a constraining action would be establishment of conservation easements near the airport, which could reduce the County Airport System's ability to carry out FAA-mandated hazardous wildlife control activities. The potential interaction of the SSHCP and potential increases at F72 should be evaluated in the DEIR/DEIS.

(8) Mather-Related General Plan Amendments

Efforts begun in late 2005, among a number of County agencies and a diverse stakeholders group, resulted in the above referenced directive by the Sacramento County Board of Supervisors to proceed with County General Plan amendments and federal

wetland fill permits at South Mather. Those efforts are described in the February 22, 2006, Board report that recommended approval of Resolution 2006-0210. During the stakeholder process the County Airport System emphasized the need for flexibility in the designation of wetland features in the MHR Airport Operations Area (AOA). The result was the attached exhibit titled "South Mather Draft Master Plan Wetlands & Land Uses," which comprised Attachment A to the February 22, 2006 Board report. As noted on the exhibit, vernal pools at the airport are designated as "Protected" rather than "Preserved." This distinction is articulated on Page 3 of Attachment B to the Board report (enclosed), which makes clear that while no development may occur in those vernal pools, operations and development consistent with the Mather Airport Master Plan may occur.

Despite the efforts made by the stakeholder group to accommodate both aviation activity and wetland habitat protection, the FAA subsequently indicated concern regarding variance from FAA policy with respect to federally obligated land, and potential hazardous wildlife attractants. The County Airport System therefore recommends that DERA and the Service take the FAA's enclosed March 29, 2006 letter into account in preparing the DEIR/DEIS, which will no doubt require close coordination with the FAA's San Francisco ADO.

(9) Recommendations

The Sacramento County Airport System recommends that the Draft EIR/EIS for the SSHCP include the following:

- A complete and thorough evaluation of the hazardous wildlife implications associated with the proposed project, as identified in Sections 5 and 6 of this letter, and any project alternatives that may be considered.
- Based on the federal "Interagency MOA" described in Section 6, we believe the Service has an affirmative obligation to actively consult with the FAA regarding measures to minimize hazardous wildlife attractants associated with the proposed project and any alternatives that may be considered. Such consultation should be initiated immediately.

Project Review by FAA and California Department of Transportation (Caltrans)

The FAA wildlife Advisory Circular obligates commercial airports to a number of responsibilities related to nearby changes in land-use practices (Section 4-3-a of AC 150/5200-33B). Pursuant to the AC, the County Airport System will submit this project to the FAA San Francisco ADO for review and comment, utilizing FAA Form 7460-1, "Notice of Proposed Construction or Alteration." In addition, the Caltrans Division of Aeronautics will typically comment on proposed projects, such as the SSHCP, which are located near airports.

CEQA Requirements

The County Airport System also requests that the DEIR fully address the potential for the wetland components of the SSHCP to create a safety hazard for aircraft operations. Please refer to CEQA Guideline 15154 – Projects Near Airports (below).[1]

> 15154. Projects Near Airports
>
> (a) When a lead agency prepares an EIR for a project within the boundaries of a comprehensive airport land use plan or, if a comprehensive airport land use plan has not been adopted for a project within two nautical miles of a public airport or public use airport, the agency shall utilize the Airport Land Use Planning Handbook published by Caltrans' Division of Aeronautics to assist in the preparation of the EIR relative to potential airport-related safety hazards and noise problems.
>
> (b) A lead agency shall not adopt a negative declaration or mitigated negative declaration for a project described in subdivision (a) unless the lead agency considers whether the project will result in a safety hazard or noise problem for persons using the airport or for persons residing or working in the project area.

Thank you for the opportunity to provide scoping comments in response to the NOP for the South Sacramento Habitat Conservation Plan. Questions may be directed to me at the telephone number below. Alternatively, information on the Mather Master Plan CEQA/NEPA process may be obtained by contacting Airport Planner George Munson at 874-0767. Information on hazardous wildlife may be obtained by contacting Senior Natural Resource Specialist Janae Scruggs at 874-0820.

Sincerely,

J. Glen Rickelton
Manager – Planning and Environment (P&E)

Federal Aviation Administration

Advisory Circular

Subject: HAZARDOUS WILDLIFE ATTRACTANTS ON OR NEAR AIRPORTS	Date: 8/28/2007	AC No: 150/5200-33B
	Initiated by: AAS-300	Change:

1. **PURPOSE.** This Advisory Circular (AC) provides guidance on certain land uses that have the potential to attract hazardous wildlife on or near public-use airports. It also discusses airport development projects (including airport construction, expansion, and renovation) affecting aircraft movement near hazardous wildlife attractants. Appendix 1 provides definitions of terms used in this AC.

2. **APPLICABILITY.** The Federal Aviation Administration (FAA) recommends that public-use airport operators implement the standards and practices contained in this AC. The holders of Airport Operating Certificates issued under Title 14, Code of Federal Regulations (CFR), Part 139, Certification of Airports, Subpart D (Part 139), may use the standards, practices, and recommendations contained in this AC to comply with the wildlife hazard management requirements of Part 139. Airports that have received Federal grant-in-aid assistance must use these standards. The FAA also recommends the guidance in this AC for land-use planners, operators of non-certificated airports, and developers of projects, facilities, and activities on or near airports.

3. **CANCELLATION.** This AC cancels AC 150/5200-33A, *Hazardous Wildlife Attractants on or near Airports*, dated July 27, 2004.

4. **PRINCIPAL CHANGES.** This AC contains the following major changes, which are marked with vertical bars in the margin:

   a. Technical changes to paragraph references.

   b. Wording on storm water detention ponds.

   c. Deleted paragraph 4-3.b, *Additional Coordination.*

5. **BACKGROUND.** Information about the risks posed to aircraft by certain wildlife species has increased a great deal in recent years. Improved reporting, studies, documentation, and statistics clearly show that aircraft collisions with birds and other wildlife are a serious economic and public safety problem. While many species of wildlife can pose a threat to aircraft safety, they are not equally hazardous. Table 1

ranks the wildlife groups commonly involved in damaging strikes in the United States according to their relative hazard to aircraft. The ranking is based on the 47,212 records in the FAA National Wildlife Strike Database for the years 1990 through 2003. These hazard rankings, in conjunction with site-specific Wildlife Hazards Assessments (WHA), will help airport operators determine the relative abundance and use patterns of wildlife species and help focus hazardous wildlife management efforts on those species most likely to cause problems at an airport.

Most public-use airports have large tracts of open, undeveloped land that provide added margins of safety and noise mitigation. These areas can also present potential hazards to aviation if they encourage wildlife to enter an airport's approach or departure airspace or air operations area (AOA). Constructed or natural areas—such as poorly drained locations, detention/retention ponds, roosting habitats on buildings, landscaping, odor-causing rotting organic matter (putrescible waste) disposal operations, wastewater treatment plants, agricultural or aquaculture activities, surface mining, or wetlands—can provide wildlife with ideal locations for feeding, loafing, reproduction, and escape. Even small facilities, such as fast food restaurants, taxicab staging areas, rental car facilities, aircraft viewing areas, and public parks, can produce substantial attractions for hazardous wildlife.

During the past century, wildlife-aircraft strikes have resulted in the loss of hundreds of lives worldwide, as well as billions of dollars in aircraft damage. Hazardous wildlife attractants on and near airports can jeopardize future airport expansion, making proper community land-use planning essential. This AC provides airport operators and those parties with whom they cooperate with the guidance they need to assess and address potentially hazardous wildlife attractants when locating new facilities and implementing certain land-use practices on or near public-use airports.

6. MEMORANDUM OF AGREEMENT BETWEEN FEDERAL RESOURCE AGENCIES. The FAA, the U.S. Air Force, the U.S. Army Corps of Engineers, the U.S. Environmental Protection Agency, the U.S. Fish and Wildlife Service, and the U.S. Department of Agriculture - Wildlife Services signed a Memorandum of Agreement (MOA) in July 2003 to acknowledge their respective missions in protecting aviation from wildlife hazards. Through the MOA, the agencies established procedures necessary to coordinate their missions to address more effectively existing and future environmental conditions contributing to collisions between wildlife and aircraft (wildlife strikes) throughout the United States. These efforts are intended to minimize wildlife risks to aviation and human safety while protecting the Nation's valuable environmental resources.

DAVID L. BENNETT
Director, Office of Airport Safety
and Standards

Table 1. Ranking of 25 species groups as to relative hazard to aircraft (1=most hazardous) based on three criteria (damage, major damage, and effect-on-flight), a composite ranking based on all three rankings, and a relative hazard score. Data were derived from the FAA National Wildlife Strike Database, January 1990–April 2003.[1]

Species group	Ranking by criteria			Composite ranking[2]	Relative hazard score[3]
	Damage[4]	Major damage[5]	Effect on flight[6]		
Deer	1	1	1	1	100
Vultures	2	2	2	2	64
Geese	3	3	6	3	55
Cormorants/pelicans	4	5	3	4	54
Cranes	7	6	4	5	47
Eagles	6	9	7	6	41
Ducks	5	8	10	7	39
Osprey	8	4	8	8	39
Turkey/pheasants	9	7	11	9	33
Herons	11	14	9	10	27
Hawks (buteos)	10	12	12	11	25
Gulls	12	11	13	12	24
Rock pigeon	13	10	14	13	23
Owls	14	13	20	14	23
H. lark/s. bunting	18	15	15	15	17
Crows/ravens	15	16	16	16	16
Coyote	16	19	5	17	14
Mourning dove	17	17	17	18	14
Shorebirds	19	21	18	19	10
Blackbirds/starling	20	22	19	20	10
American kestrel	21	18	21	21	9
Meadowlarks	22	20	22	22	7
Swallows	24	23	24	23	4
Sparrows	25	24	23	24	4
Nighthawks	23	25	25	25	1

[1] Excerpted from the *Special Report for the FAA, "Ranking the Hazard Level of Wildlife Species to Civil Aviation in the USA: Update #1, July 2, 2003".* Refer to this report for additional explanations of criteria and method of ranking.

[2] Relative rank of each species group was compared with every other group for the three variables, placing the species group with the greatest hazard rank for ≥ 2 of the 3 variables above the next highest ranked group, then proceeding down the list.

[3] Percentage values, from Tables 3 and 4 in Footnote 1 of the *Special Report*, for the three criteria were summed and scaled down from 100, with 100 as the score for the species group with the maximum summed values and the greatest potential hazard to aircraft.

[4] Aircraft incurred at least some damage (destroyed, substantial, minor, or unknown) from strike.

[5] Aircraft incurred damage or structural failure, which adversely affected the structure strength, performance, or flight characteristics, and which would normally require major repair or replacement of the affected component, or the damage sustained makes it inadvisable to restore aircraft to airworthy condition.

[6] Aborted takeoff, engine shutdown, precautionary landing, or other.

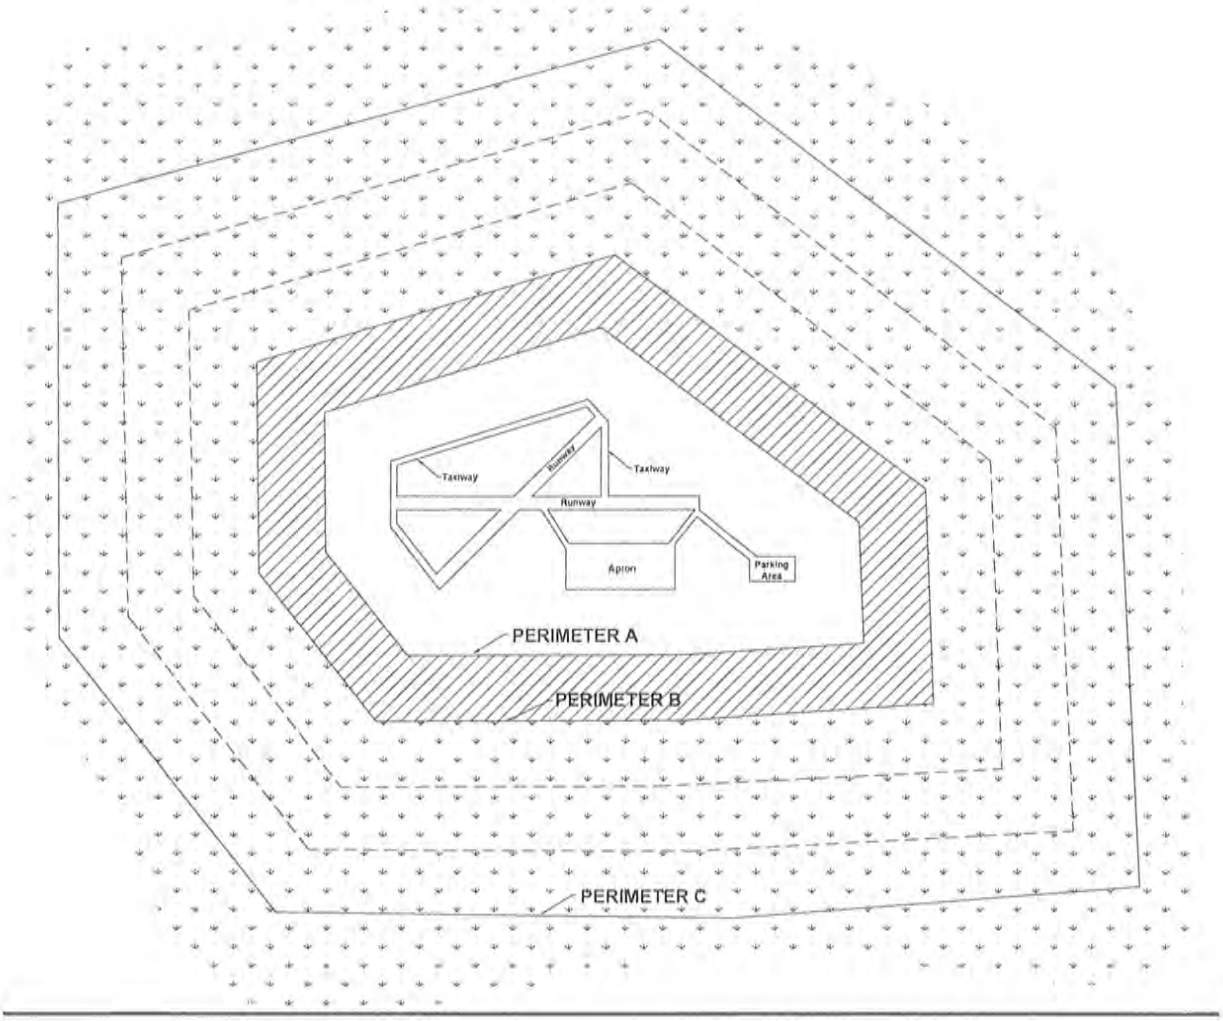
SECTION 1.

GENERAL SEPARATION CRITERIA FOR HAZARDOUS WILDLIFE ATTRACTANTS ON OR NEAR AIRPORTS.

1-1. INTRODUCTION. When considering proposed land uses, airport operators, local planners, and developers must take into account whether the proposed land uses, including new development projects, will increase wildlife hazards. Land-use practices that attract or sustain hazardous wildlife populations on or near airports can significantly increase the potential for wildlife strikes.

The FAA recommends the minimum separation criteria outlined below for land-use practices that attract hazardous wildlife to the vicinity of airports. Please note that FAA criteria include land uses that cause movement of hazardous wildlife onto, into, or across the airport's approach or departure airspace or air operations area (AOA). (See the discussion of the synergistic effects of surrounding land uses in Section 2-8 of this AC.)



The basis for the separation criteria contained in this section can be found in existing FAA regulations. The separation distances are based on (1) flight patterns of piston-powered aircraft and turbine-powered aircraft, (2) the altitude at which most strikes happen (78 percent occur under 1,000 feet and 90 percent occur under 3,000 feet above ground level), and (3) National Transportation Safety Board (NTSB) recommendations.

1-2. AIRPORTS SERVING PISTON-POWERED AIRCRAFT. Airports that do not sell Jet-A fuel normally serve piston-powered aircraft. Notwithstanding more stringent requirements for specific land uses, the FAA recommends a separation distance of 5,000 feet at these airports for any of the hazardous wildlife attractants mentioned in Section 2 or for new airport development projects meant to accommodate aircraft movement. This distance is to be maintained between an airport's AOA and the hazardous wildlife attractant. Figure 1 depicts this separation distance measured from the nearest aircraft operations areas.

1-3. AIRPORTS SERVING TURBINE-POWERED AIRCRAFT. Airports selling Jet-A fuel normally serve turbine-powered aircraft. Notwithstanding more stringent requirements for specific land uses, the FAA recommends a separation distance of 10,000 feet at these airports for any of the hazardous wildlife attractants mentioned in Section 2 or for new airport development projects meant to accommodate aircraft movement. This distance is to be maintained between an airport's AOA and the hazardous wildlife attractant. Figure 1 depicts this separation distance from the nearest aircraft movement areas.

1-4. PROTECTION OF APPROACH, DEPARTURE, AND CIRCLING AIRSPACE. For all airports, the FAA recommends a distance of 5 statute miles between the farthest edge of the airport's AOA and the hazardous wildlife attractant if the attractant could cause hazardous wildlife movement into or across the approach or departure airspace.

Figure 1. Separation distances within which hazardous wildlife attractants should be avoided, eliminated, or mitigated.

PERIMETER A: For airports serving piston-powered aircraft, hazardous wildlife attractants must be 5,000 feet from the nearest air operations area.

PERIMETER B: For airports serving turbine-powered aircraft, hazardous wildlife attractants must be 10,000 feet from the nearest air operations area.

PERIMETER C: 5-mile range to protect approach, departure and circling airspace.

SECTION 2.

LAND-USE PRACTICES ON OR NEAR AIRPORTS THAT POTENTIALLY ATTRACT HAZARDOUS WILDLIFE.

2-1. GENERAL. The wildlife species and the size of the populations attracted to the airport environment vary considerably, depending on several factors, including land-use practices on or near the airport. This section discusses land-use practices having the potential to attract hazardous wildlife and threaten aviation safety. In addition to the specific considerations outlined below, airport operators should refer to *Wildlife Hazard Management at Airports*, prepared by FAA and U.S. Department of Agriculture (USDA) staff. (This manual is available in English, Spanish, and French. It can be viewed and downloaded free of charge from the FAA's wildlife hazard mitigation web site: http://wildlife-mitigation.tc.FAA.gov.). And, *Prevention and Control of Wildlife Damage,* compiled by the University of Nebraska Cooperative Extension Division. (This manual is available online in a periodically updated version at: ianrwww.unl.edu/wildlife/solutions/handbook/.)

2-2. WASTE DISPOSAL OPERATIONS. Municipal solid waste landfills (MSWLF) are known to attract large numbers of hazardous wildlife, particularly birds. Because of this, these operations, when located within the separations identified in the siting criteria in Sections 1-2 through 1-4, are considered incompatible with safe airport operations.

a. **Siting for new municipal solid waste landfills subject to AIR 21.** Section 503 of the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (Public Law 106-181) (AIR 21) prohibits the construction or establishment of a new MSWLF within 6 statute miles of certain public-use airports. Before these prohibitions apply, both the airport and the landfill must meet the very specific conditions described below. These restrictions do not apply to airports or landfills located within the state of Alaska.

   The airport must (1) have received a Federal grant(s) under 49 U.S.C. § 47101, et. seq.; (2) be under control of a public agency; (3) serve some scheduled air carrier operations conducted in aircraft with less than 60 seats; and (4) have total annual enplanements consisting of at least 51 percent of scheduled air carrier enplanements conducted in aircraft with less than 60 passenger seats.

   The proposed MSWLF must (1) be within 6 miles of the airport, as measured from airport property line to MSWLF property line, and (2) have started construction or establishment on or after April 5, 2001. Public Law 106-181 only limits the construction or establishment of some new MSWLF. It does not limit the expansion, either vertical or horizontal, of existing landfills.

   NOTE: Consult the most recent version of AC 150/5200-34, *Construction or Establishment of Landfills Near Public Airports,* for a more detailed discussion of these restrictions.

b. **Siting for new MSWLF not subject to AIR 21.** If an airport and MSWLF do not meet the restrictions of Public Law 106-181, the FAA recommends against locating MSWLF within the separation distances identified in Sections 1-2 through 1-4. The separation distances should be measured from the closest point of the airport's AOA to the closest planned MSWLF cell.

c. **Considerations for existing waste disposal facilities within the limits of separation criteria.** The FAA recommends against airport development projects that would increase the number of aircraft operations or accommodate larger or faster aircraft near MSWLF operations located within the separations identified in Sections 1-2 through 1-4. In addition, in accordance with 40 CFR 258.10, owners or operators of existing MSWLF units that are located within the separations listed in Sections 1-2 through 1-4 must demonstrate that the unit is designed and operated so it does not pose a bird hazard to aircraft. (See Section 4-2(b) of this AC for a discussion of this demonstration requirement.)

d. **Enclosed trash transfer stations.** Enclosed waste-handling facilities that receive garbage behind closed doors; process it via compaction, incineration, or similar manner; and remove all residue by enclosed vehicles generally are compatible with safe airport operations, provided they are not located on airport property or within the Runway Protection Zone (RPZ). These facilities should not handle or store putrescible waste outside or in a partially enclosed structure accessible to hazardous wildlife. Trash transfer facilities that are open on one or more sides; that store uncovered quantities of municipal solid waste outside, even if only for a short time; that use semi-trailers that leak or have trash clinging to the outside; or that do not control odors by ventilation and filtration systems (odor masking is not acceptable) do not meet the FAA's definition of fully enclosed trash transfer stations. The FAA considers these facilities incompatible with safe airport operations if they are located closer than the separation distances specified in Sections 1-2 through 1-4.

e. **Composting operations on or near airport property.** Composting operations that accept only yard waste (e.g., leaves, lawn clippings, or branches) generally do not attract hazardous wildlife. Sewage sludge, woodchips, and similar material are not municipal solid wastes and may be used as compost bulking agents. The compost, however, must never include food or other municipal solid waste. Composting operations should not be located on airport property. Off-airport property composting operations should be located no closer than the greater of the following distances: 1,200 feet from any AOA or the distance called for by airport design requirements (see AC 150/5300-13, *Airport Design*). This spacing should prevent material, personnel, or equipment from penetrating any Object Free Area (OFA), Obstacle Free Zone (OFZ), Threshold Siting Surface (TSS), or Clearway. Airport operators should monitor composting operations located in proximity to the airport to ensure that steam or thermal rise does not adversely affect air traffic. On-airport disposal of compost by-products should not be conducted for the reasons stated in 2-3f.

f. **Underwater waste discharges.** The FAA recommends against the underwater discharge of any food waste (e.g., fish processing offal) within the separations identified in Sections 1-2 through 1-4 because it could attract scavenging hazardous wildlife.

g. **Recycling centers.** Recycling centers that accept previously sorted non-food items, such as glass, newspaper, cardboard, or aluminum, are, in most cases, not attractive to hazardous wildlife and are acceptable.

h. **Construction and demolition (C&D) debris facilities.** C&D landfills do not generally attract hazardous wildlife and are acceptable if maintained in an orderly manner, admit no putrescible waste, and are not co-located with other waste disposal operations. However, C&D landfills have similar visual and operational characteristics to putrescible waste disposal sites. When co-located with putrescible waste disposal operations, C&D landfills are more likely to attract hazardous wildlife because of the similarities between these disposal facilities. Therefore, a C&D landfill co-located with another waste disposal operation should be located outside of the separations identified in Sections 1-2 through 1-4.

i. **Fly ash disposal.** The incinerated residue from resource recovery power/heat-generating facilities that are fired by municipal solid waste, coal, or wood is generally not a wildlife attractant because it no longer contains putrescible matter. Landfills accepting only fly ash are generally not considered to be wildlife attractants and are acceptable as long as they are maintained in an orderly manner, admit no putrescible waste of any kind, and are not co-located with other disposal operations that attract hazardous wildlife.

   Since varying degrees of waste consumption are associated with general incineration (not resource recovery power/heat-generating facilities), the FAA considers the ash from general incinerators a regular waste disposal by-product and, therefore, a hazardous wildlife attractant if disposed of within the separation criteria outlined in Sections 1-2 through 1-4.

2-3. WATER MANAGEMENT FACILITIES. Drinking water intake and treatment facilities, storm water and wastewater treatment facilities, associated retention and settling ponds, ponds built for recreational use, and ponds that result from mining activities often attract large numbers of potentially hazardous wildlife. To prevent wildlife hazards, land-use developers and airport operators may need to develop management plans, in compliance with local and state regulations, to support the operation of storm water management facilities on or near all public-use airports to ensure a safe airport environment.

a. **Existing storm water management facilities.** On-airport storm water management facilities allow the quick removal of surface water, including discharges related to aircraft deicing, from impervious surfaces, such as pavement and terminal/hangar building roofs. Existing on-airport detention ponds collect storm water, protect water quality, and control runoff. Because they slowly release water

after storms, they create standing bodies of water that can attract hazardous wildlife. Where the airport has developed a Wildlife Hazard Management Plan (WHMP) in accordance with Part 139, the FAA requires immediate correction of any wildlife hazards arising from existing storm water facilities located on or near airports, using appropriate wildlife hazard mitigation techniques. Airport operators should develop measures to minimize hazardous wildlife attraction in consultation with a wildlife damage management biologist.

Where possible, airport operators should modify storm water detention ponds to allow a maximum 48-hour detention period for the design storm. The FAA recommends that airport operators avoid or remove retention ponds and detention ponds featuring dead storage to eliminate standing water. Detention basins should remain totally dry between rainfalls. Where constant flow of water is anticipated through the basin, or where any portion of the basin bottom may remain wet, the detention facility should include a concrete or paved pad and/or ditch/swale in the bottom to prevent vegetation that may provide nesting habitat.

When it is not possible to drain a large detention pond completely, airport operators may use physical barriers, such as bird balls, wires grids, pillows, or netting, to deter birds and other hazardous wildlife. When physical barriers are used, airport operators must evaluate their use and ensure they will not adversely affect water rescue. Before installing any physical barriers over detention ponds on Part 139 airports, airport operators must get approval from the appropriate FAA Regional Airports Division Office.

The FAA recommends that airport operators encourage off-airport storm water treatment facility operators to incorporate appropriate wildlife hazard mitigation techniques into storm water treatment facility operating practices when their facility is located within the separation criteria specified in Sections 1-2 through 1-4.

b. **New storm water management facilities.** The FAA strongly recommends that off-airport storm water management systems located within the separations identified in Sections 1-2 through 1-4 be designed and operated so as not to create above-ground standing water. Stormwater detention ponds should be designed, engineered, constructed, and maintained for a maximum 48–hour detention period after the design storm and remain completely dry between storms. To facilitate the control of hazardous wildlife, the FAA recommends the use of steep-sided, rip-rap lined, narrow, linearly shaped water detention basins. When it is not possible to place these ponds away from an airport's AOA, airport operators should use physical barriers, such as bird balls, wires grids, pillows, or netting, to prevent access of hazardous wildlife to open water and minimize aircraft-wildlife interactions. When physical barriers are used, airport operators must evaluate their use and ensure they will not adversely affect water rescue. Before installing any physical barriers over detention ponds on Part 139 airports, airport operators must get approval from the appropriate FAA Regional Airports Division Office. All vegetation in or around detention basins that provide food or cover for hazardous wildlife should be eliminated. If soil conditions and other requirements allow, the FAA encourages

the use of underground storm water infiltration systems, such as French drains or buried rock fields, because they are less attractive to wildlife.

c. **Existing wastewater treatment facilities.** The FAA strongly recommends that airport operators immediately correct any wildlife hazards arising from existing wastewater treatment facilities located on or near the airport. Where required, a WHMP developed in accordance with Part 139 will outline appropriate wildlife hazard mitigation techniques. Accordingly, airport operators should encourage wastewater treatment facility operators to incorporate measures, developed in consultation with a wildlife damage management biologist, to minimize hazardous wildlife attractants. Airport operators should also encourage those wastewater treatment facility operators to incorporate these mitigation techniques into their standard operating practices. In addition, airport operators should consider the existence of wastewater treatment facilities when evaluating proposed sites for new airport development projects and avoid such sites when practicable.

d. **New wastewater treatment facilities.** The FAA strongly recommends against the construction of new wastewater treatment facilities or associated settling ponds within the separations identified in Sections 1-2 through 1-4. Appendix 1 defines wastewater treatment facility as "any devices and/or systems used to store, treat, recycle, or reclaim municipal sewage or liquid industrial wastes." The definition includes any pretreatment involving the reduction of the amount of pollutants or the elimination of pollutants prior to introducing such pollutants into a publicly owned treatment works (wastewater treatment facility). During the site-location analysis for wastewater treatment facilities, developers should consider the potential to attract hazardous wildlife if an airport is in the vicinity of the proposed site, and airport operators should voice their opposition to such facilities if they are in proximity to the airport.

e. **Artificial marshes.** In warmer climates, wastewater treatment facilities sometimes employ artificial marshes and use submergent and emergent aquatic vegetation as natural filters. These artificial marshes may be used by some species of flocking birds, such as blackbirds and waterfowl, for breeding or roosting activities. The FAA strongly recommends against establishing artificial marshes within the separations identified in Sections 1-2 through 1-4.

f. **Wastewater discharge and sludge disposal.** The FAA recommends against the discharge of wastewater or sludge on airport property because it may improve soil moisture and quality on unpaved areas and lead to improved turf growth that can be an attractive food source for many species of animals. Also, the turf requires more frequent mowing, which in turn may mutilate or flush insects or small animals and produce straw, both of which can attract hazardous wildlife. In addition, the improved turf may attract grazing wildlife, such as deer and geese. Problems may also occur when discharges saturate unpaved airport areas. The resultant soft, muddy conditions can severely restrict or prevent emergency vehicles from reaching accident sites in a timely manner.

2-4. WETLANDS. Wetlands provide a variety of functions and can be regulated by local, state, and Federal laws. Normally, wetlands are attractive to many types of wildlife, including many which rank high on the list of hazardous wildlife species (Table 1).

NOTE: If questions exist as to whether an area qualifies as a wetland, contact the local division of the U.S. Army Corps of Engineers, the Natural Resources Conservation Service, or a wetland consultant qualified to delineate wetlands.

a. **Existing wetlands on or near airport property.** If wetlands are located on or near airport property, airport operators should be alert to any wildlife use or habitat changes in these areas that could affect safe aircraft operations. At public-use airports, the FAA recommends immediately correcting, in cooperation with local, state, and Federal regulatory agencies, any wildlife hazards arising from existing wetlands located on or near airports. Where required, a WHMP will outline appropriate wildlife hazard mitigation techniques. Accordingly, airport operators should develop measures to minimize hazardous wildlife attraction in consultation with a wildlife damage management biologist.

b. **New airport development.** Whenever possible, the FAA recommends locating new airports using the separations from wetlands identified in Sections 1-2 through 1-4. Where alternative sites are not practicable, or when airport operators are expanding an existing airport into or near wetlands, a wildlife damage management biologist, in consultation with the U.S. Fish and Wildlife Service, the U.S. Army Corps of Engineers, and the state wildlife management agency should evaluate the wildlife hazards and prepare a WHMP that indicates methods of minimizing the hazards.

c. **Mitigation for wetland impacts from airport projects.** Wetland mitigation may be necessary when unavoidable wetland disturbances result from new airport development projects or projects required to correct wildlife hazards from wetlands. Wetland mitigation must be designed so it does not create a wildlife hazard. The FAA recommends that wetland mitigation projects that may attract hazardous wildlife be sited outside of the separations identified in Sections 1-2 through 1-4.

   (1) Onsite mitigation of wetland functions. The FAA may consider exceptions to locating mitigation activities outside the separations identified in Sections 1-2 through 1-4 if the affected wetlands provide unique ecological functions, such as critical habitat for threatened or endangered species or ground water recharge, which cannot be replicated when moved to a different location. Using existing airport property is sometimes the only feasible way to achieve the mitigation ratios mandated in regulatory orders and/or settlement agreements with the resource agencies. Conservation easements are an additional means of providing mitigation for project impacts. Typically the airport operator continues to own the property, and an easement is created stipulating that the property will be maintained as habitat for state or Federally listed species.

Mitigation must not inhibit the airport operator's ability to effectively control hazardous wildlife on or near the mitigation site or effectively maintain other aspects of safe airport operations. Enhancing such mitigation areas to attract hazardous wildlife must be avoided. The FAA will review any onsite mitigation proposals to determine compatibility with safe airport operations. A wildlife damage management biologist should evaluate any wetland mitigation projects that are needed to protect unique wetland functions and that must be located in the separation criteria in Sections 1-2 through 1-4 before the mitigation is implemented. A WHMP should be developed to reduce the wildlife hazards.

(2) Offsite mitigation of wetland functions. The FAA recommends that wetland mitigation projects that may attract hazardous wildlife be sited outside of the separations identified in Sections 1-2 through 1-4 unless they provide unique functions that must remain onsite (see 2-4c(1)). Agencies that regulate impacts to or around wetlands recognize that it may be necessary to split wetland functions in mitigation schemes. Therefore, regulatory agencies may, under certain circumstances, allow portions of mitigation to take place in different locations.

(3) Mitigation banking. Wetland mitigation banking is the creation or restoration of wetlands in order to provide mitigation credits that can be used to offset permitted wetland losses. Mitigation banking benefits wetland resources by providing advance replacement for permitted wetland losses; consolidating small projects into larger, better-designed and managed units; and encouraging integration of wetland mitigation projects with watershed planning. This last benefit is most helpful for airport projects, as wetland impacts mitigated outside of the separations identified in Sections 1-2 through 1-4 can still be located within the same watershed. Wetland mitigation banks meeting the separation criteria offer an ecologically sound approach to mitigation in these situations. Airport operators should work with local watershed management agencies or organizations to develop mitigation banking for wetland impacts on airport property.

2-5. DREDGE SPOIL CONTAINMENT AREAS. The FAA recommends against locating dredge spoil containment areas (also known as Confined Disposal Facilities) within the separations identified in Sections 1-2 through 1-4 if the containment area or the spoils contain material that would attract hazardous wildlife.

2-6. AGRICULTURAL ACTIVITIES. Because most, if not all, agricultural crops can attract hazardous wildlife during some phase of production, the FAA recommends against the used of airport property for agricultural production, including hay crops, within the separations identified in Sections 1-2 through 1-4. . If the airport has no financial alternative to agricultural crops to produce income necessary to maintain the viability of the airport, then the airport shall follow the crop distance guidelines listed in the table titled "Minimum Distances between Certain Airport Features and Any On-Airport Agricultural Crops" found in AC 150/5300-13, *Airport Design*, Appendix 17. The cost of wildlife control and potential accidents should be weighed against the income produced by the on-airport crops when deciding whether to allow crops on the airport.

a. **Livestock production.** Confined livestock operations (i.e., feedlots, dairy operations, hog or chicken production facilities, or egg laying operations) often attract flocking birds, such as starlings, that pose a hazard to aviation. Therefore, The FAA recommends against such facilities within the separations identified in Sections 1-2 through 1-4. Any livestock operation within these separations should have a program developed to reduce the attractiveness of the site to species that are hazardous to aviation safety. Free-ranging livestock must not be grazed on airport property because the animals may wander onto the AOA. Furthermore, livestock feed, water, and manure may attract birds.

b. **Aquaculture.** Aquaculture activities (i.e. catfish or trout production) conducted outside of fully enclosed buildings are inherently attractive to a wide variety of birds. Existing aquaculture facilities/activities within the separations listed in Sections 1-2 through 1-4 must have a program developed to reduce the attractiveness of the sites to species that are hazardous to aviation safety. Airport operators should also oppose the establishment of new aquaculture facilities/activities within the separations listed in Sections 1-2 through 1-4.

c. **Alternative uses of agricultural land.** Some airports are surrounded by vast areas of farmed land within the distances specified in Sections 1-2 through 1-4. Seasonal uses of agricultural land for activities such as hunting can create a hazardous wildlife situation. In some areas, farmers will rent their land for hunting purposes. Rice farmers, for example, flood their land during waterfowl hunting season and obtain additional revenue by renting out duck blinds. The duck hunters then use decoys and call in hundreds, if not thousands, of birds, creating a tremendous threat to aircraft safety. A wildlife damage management biologist should review, in coordination with local farmers and producers, these types of seasonal land uses and incorporate them into the WHMP.

2-7. GOLF COURSES, LANDSCAPING AND OTHER LAND-USE CONSIDERATIONS.

a. **Golf courses.** The large grassy areas and open water found on most golf courses are attractive to hazardous wildlife, particularly Canada geese and some species of gulls. These species can pose a threat to aviation safety. The FAA recommends against construction of new golf courses within the separations identified in Sections 1-2 through 1-4. Existing golf courses located within these separations must develop a program to reduce the attractiveness of the sites to species that are hazardous to aviation safety. Airport operators should ensure these golf courses are monitored on a continuing basis for the presence of hazardous wildlife. If hazardous wildlife is detected, corrective actions should be immediately implemented.

b. **Landscaping and landscape maintenance.** Depending on its geographic location, landscaping can attract hazardous wildlife. The FAA recommends that airport operators approach landscaping with caution and confine it to airport areas not associated with aircraft movements. A wildlife damage management biologist should review all landscaping plans. Airport operators should also monitor all landscaped areas on a continuing basis for the presence of hazardous wildlife. If

hazardous wildlife is detected, corrective actions should be immediately implemented.

Turf grass areas can be highly attractive to a variety of hazardous wildlife species. Research conducted by the USDA Wildlife Services' National Wildlife Research Center has shown that no one grass management regime will deter all species of hazardous wildlife in all situations. In cooperation with wildlife damage management biologist, airport operators should develop airport turf grass management plans on a prescription basis, depending on the airport's geographic locations and the type of hazardous wildlife likely to frequent the airport

Airport operators should ensure that plant varieties attractive to hazardous wildlife are not used on the airport. Disturbed areas or areas in need of re-vegetating should not be planted with seed mixtures containing millet or any other large-seed producing grass. For airport property already planted with seed mixtures containing millet, rye grass, or other large-seed producing grasses, the FAA recommends disking, plowing, or another suitable agricultural practice to prevent plant maturation and seed head production. Plantings should follow the specific recommendations for grass management and seed and plant selection made by the State University Cooperative Extension Service, the local office of Wildlife Services, or a qualified wildlife damage management biologist. Airport operators should also consider developing and implementing a preferred/prohibited plant species list, reviewed by a wildlife damage management biologist, which has been designed for the geographic location to reduce the attractiveness to hazardous wildlife for landscaping airport property.

c. **Airports surrounded by wildlife habitat.** The FAA recommends that operators of airports surrounded by woodlands, water, or wetlands refer to Section 2.4 of this AC. Operators of such airports should provide for a Wildlife Hazard Assessment (WHA) conducted by a wildlife damage management biologist. This WHA is the first step in preparing a WHMP, where required.

d. **Other hazardous wildlife attractants.** Other specific land uses or activities (e.g., sport or commercial fishing, shellfish harvesting, etc.), perhaps unique to certain regions of the country, have the potential to attract hazardous wildlife. Regardless of the source of the attraction, when hazardous wildlife is noted on a public-use airport, airport operators must take prompt remedial action(s) to protect aviation safety.

2-8. SYNERGISTIC EFFECTS OF SURROUNDING LAND USES. There may be circumstances where two (or more) different land uses that would not, by themselves, be considered hazardous wildlife attractants or that are located outside of the separations identified in Sections 1-2 through 1-4 that are in such an alignment with the airport as to create a wildlife corridor directly through the airport and/or surrounding airspace. An example of this situation may involve a lake located outside of the separation criteria on the east side of an airport and a large hayfield on the west side of an airport, land uses that together could create a flyway for Canada geese directly across the airspace of the airport. There are numerous examples of such situations;

therefore, airport operators and the wildlife damage management biologist must consider the entire surrounding landscape and community when developing the WHMP.

SECTION 3.

PROCEDURES FOR WILDLIFE HAZARD MANAGEMENT BY OPERATORS OF PUBLIC-USE AIRPORTS.

3.1. INTRODUCTION. In recognition of the increased risk of serious aircraft damage or the loss of human life that can result from a wildlife strike, the FAA may require the development of a Wildlife Hazard Management Plan (WHMP) when specific triggering events occur on or near the airport. Part 139.337 discusses the specific events that trigger a Wildlife Hazard Assessment (WHA) and the specific issues that a WHMP must address for FAA approval and inclusion in an Airport Certification Manual.

3.2. COORDINATION WITH USDA WILDLIFE SERVICES OR OTHER QUALIFIED WILDLIFE DAMAGE MANAGEMENT BIOLOGISTS. The FAA will use the Wildlife Hazard Assessment (WHA) conducted in accordance with Part 139 to determine if the airport needs a WHMP. Therefore, persons having the education, training, and expertise necessary to assess wildlife hazards must conduct the WHA. The airport operator may look to Wildlife Services or to qualified private consultants to conduct the WHA. When the services of a wildlife damage management biologist are required, the FAA recommends that land-use developers or airport operators contact a consultant specializing in wildlife damage management or the appropriate state director of Wildlife Services.

NOTE: Telephone numbers for the respective USDA Wildlife Services state offices can be obtained by contacting USDA Wildlife Services Operational Support Staff, 4700 River Road, Unit 87, Riverdale, MD, 20737-1234, Telephone (301) 734-7921, Fax (301) 734-5157 *(http://www.aphis.usda.gov/ws/)*.

3-3. WILDLIFE HAZARD MANAGEMENT AT AIRPORTS: A MANUAL FOR AIRPORT PERSONNEL. This manual, prepared by FAA and USDA Wildlife Services staff, contains a compilation of information to assist airport personnel in the development, implementation, and evaluation of WHMPs at airports. The manual includes specific information on the nature of wildlife strikes, legal authority, regulations, wildlife management techniques, WHAs, WHMPs, and sources of help and information. The manual is available in three languages: English, Spanish, and French. It can be viewed and downloaded free of charge from the FAA's wildlife hazard mitigation web site: http://wildlife-mitigation.tc.FAA.gov/. This manual only provides a starting point for addressing wildlife hazard issues at airports. Hazardous wildlife management is a complex discipline and conditions vary widely across the United States. Therefore, qualified wildlife damage management biologists must direct the development of a WHMP and the implementation of management actions by airport personnel.

There are many other resources complementary to this manual for use in developing and implementing WHMPs. Several are listed in the manual's bibliography.

3-4. WILDLIFE HAZARD ASSESSMENTS, TITLE 14, CODE OF FEDERAL REGULATIONS, PART 139. Part 139.337(b) requires airport operators to conduct a Wildlife Hazard Assessment (WHA) when certain events occur on or near the airport.

Part 139.337 (c) provides specific guidance as to what facts must be addressed in a WHA.

3-5. WILDLIFE HAZARD MANAGEMENT PLAN (WHMP). The FAA will consider the results of the WHA, along with the aeronautical activity at the airport and the views of the airport operator and airport users, in determining whether a formal WHMP is needed, in accordance with Part 139.337. If the FAA determines that a WHMP is needed, the airport operator must formulate and implement a WHMP, using the WHA as the basis for the plan.

The goal of an airport's Wildlife Hazard Management Plan is to minimize the risk to aviation safety, airport structures or equipment, or human health posed by populations of hazardous wildlife on and around the airport.

The WHMP must identify hazardous wildlife attractants on or near the airport and the appropriate wildlife damage management techniques to minimize the wildlife hazard. It must also prioritize the management measures.

3-6. LOCAL COORDINATION. The establishment of a Wildlife Hazards Working Group (WHWG) will facilitate the communication, cooperation, and coordination of the airport and its surrounding community necessary to ensure the effectiveness of the WHMP. The cooperation of the airport community is also necessary when new projects are considered. Whether on or off the airport, the input from all involved parties must be considered when a potentially hazardous wildlife attractant is being proposed. Airport operators should also incorporate public education activities with the local coordination efforts because some activities in the vicinity of your airport, while harmless under normal leisure conditions, can attract wildlife and present a danger to aircraft. For example, if public trails are planned near wetlands or in parks adjoining airport property, the public should know that feeding birds and other wildlife in the area may pose a risk to aircraft.

Airport operators should work with local and regional planning and zoning boards so as to be aware of proposed land-use changes, or modification of existing land uses, that could create hazardous wildlife attractants within the separations identified in Sections 1-2 through 1-4. Pay particular attention to proposed land uses involving creation or expansion of waste water treatment facilities, development of wetland mitigation sites, or development or expansion of dredge spoil containment areas. At the very least, airport operators must ensure they are on the notification list of the local planning board or equivalent review entity for all communities located within 5 miles of the airport, so they will receive notification of any proposed project and have the opportunity to review it for attractiveness to hazardous wildlife.

3-7 COORDINATION/NOTIFICATION OF AIRMEN OF WILDLIFE HAZARDS. If an existing land-use practice creates a wildlife hazard and the land-use practice or wildlife hazard cannot be immediately eliminated, airport operators must issue a Notice to Airmen (NOTAM) and encourage the land–owner or manager to take steps to control the wildlife hazard and minimize further attraction.

SECTION 4.

FAA NOTIFICATION AND REVIEW OF PROPOSED LAND-USE PRACTICE CHANGES IN THE VICINITY OF PUBLIC-USE AIRPORTS

4-1. FAA REVIEW OF PROPOSED LAND-USE PRACTICE CHANGES IN THE VICINITY OF PUBLIC-USE AIRPORTS.

a. The FAA discourages the development of waste disposal and other facilities, discussed in Section 2, located within the 5,000/10,000-foot criteria specified in Sections 1-2 through 1-4.

b. For projects that are located outside the 5,000/10,000-foot criteria but within 5 statute miles of the airport's AOA, the FAA may review development plans, proposed land-use changes, operational changes, or wetland mitigation plans to determine if such changes present potential wildlife hazards to aircraft operations. The FAA considers sensitive airport areas as those that lie under or next to approach or departure airspace. This brief examination should indicate if further investigation is warranted.

c. Where a wildlife damage management biologist has conducted a further study to evaluate a site's compatibility with airport operations, the FAA may use the study results to make a determination.

4-2. WASTE MANAGEMENT FACILITIES.

a. **Notification of new/expanded project proposal.** Section 503 of the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (Public Law 106-181) limits the construction or establishment of new MSWLF within 6 statute miles of certain public-use airports, when both the airport and the landfill meet very specific conditions. See Section 2-2 of this AC and AC 150/5200-34 for a more detailed discussion of these restrictions.

The Environmental Protection Agency (EPA) requires any MSWLF operator proposing a new or expanded waste disposal operation within 5 statute miles of a runway end to notify the appropriate FAA Regional Airports Division Office and the airport operator of the proposal (40 CFR 258, *Criteria for Municipal Solid Waste Landfills*, Section 258.10, *Airport Safety*). The EPA also requires owners or operators of new MSWLF units, or lateral expansions of existing MSWLF units, that are located within 10,000 feet of any airport runway end used by turbojet aircraft, or within 5,000 feet of any airport runway end used only by piston-type aircraft, to demonstrate successfully that such units are not hazards to aircraft. (See 4-2.b below.)

When new or expanded MSWLF are being proposed near airports, MSWLF operators must notify the airport operator and the FAA of the proposal as early as possible pursuant to 40 CFR 258.

b. **Waste handling facilities within separations identified in Sections 1-2 through 1-4.** To claim successfully that a waste-handling facility sited within the separations identified in Sections 1-2 through 1-4 does not attract hazardous wildlife and does not threaten aviation, the developer must establish convincingly that the facility will not handle putrescible material other than that as outlined in 2-2.d. The FAA strongly recommends against any facility other than that as outlined in 2-2.d (enclosed transfer stations). The FAA will use this information to determine if the facility will be a hazard to aviation.

c. **Putrescible-Waste Facilities.** In their effort to satisfy the EPA requirement, some putrescible-waste facility proponents may offer to undertake experimental measures to demonstrate that their proposed facility will not be a hazard to aircraft. To date, no such facility has been able to demonstrate an ability to reduce and sustain hazardous wildlife to levels that existed before the putrescible-waste landfill began operating. For this reason, demonstrations of experimental wildlife control measures may not be conducted within the separation identified in Sections 1-2 through 1-4.

4-3. OTHER LAND-USE PRACTICE CHANGES. As a matter of policy, the FAA encourages operators of public-use airports who become aware of proposed land use practice changes that may attract hazardous wildlife within 5 statute miles of their airports to promptly notify the FAA. The FAA also encourages proponents of such land use changes to notify the FAA as early in the planning process as possible. Advanced notice affords the FAA an opportunity (1) to evaluate the effect of a particular land-use change on aviation safety and (2) to support efforts by the airport sponsor to restrict the use of land next to or near the airport to uses that are compatible with the airport.

The airport operator, project proponent, or land-use operator may use FAA Form 7460-1, *Notice of Proposed Construction or Alteration*, or other suitable documents similar to FAA Form 7460-1 to notify the appropriate FAA Regional Airports Division Office. Project proponents can contact the appropriate FAA Regional Airports Division Office for assistance with the notification process.

It is helpful if the notification includes a 15-minute quadrangle map of the area identifying the location of the proposed activity. The land-use operator or project proponent should also forward specific details of the proposed land-use change or operational change or expansion. In the case of solid waste landfills, the information should include the type of waste to be handled, how the waste will be processed, and final disposal methods.

a. **Airports that have received Federal grant-in-aid assistance.** Airports that have received Federal grant-in-aid assistance are required by their grant assurances to take appropriate actions to restrict the use of land next to or near the airport to uses that are compatible with normal airport operations. The FAA recommends that airport operators to the extent practicable oppose off-airport land-use changes or practices within the separations identified in Sections 1-2 through 1-4 that may attract hazardous wildlife. Failure to do so may lead to noncompliance with applicable grant assurances. The FAA will not approve the placement of airport

development projects pertaining to aircraft movement in the vicinity of hazardous wildlife attractants without appropriate mitigating measures. Increasing the intensity of wildlife control efforts is not a substitute for eliminating or reducing a proposed wildlife hazard. Airport operators should identify hazardous wildlife attractants and any associated wildlife hazards during any planning process for new airport development projects.

This page intentionally left blank.

APPENDIX 1. DEFINITIONS OF TERMS USED IN THIS ADVISORY CIRCULAR.

1. **GENERAL.** This appendix provides definitions of terms used throughout this AC.

   1. **Air operations area.** Any area of an airport used or intended to be used for landing, takeoff, or surface maneuvering of aircraft. An air operations area includes such paved areas or unpaved areas that are used or intended to be used for the unobstructed movement of aircraft in addition to its associated runway, taxiways, or apron.

   2. **Airport operator.** The operator (private or public) or sponsor of a public-use airport.

   3. **Approach or departure airspace.** The airspace, within 5 statute miles of an airport, through which aircraft move during landing or takeoff.

   4. **Bird balls.** High-density plastic floating balls that can be used to cover ponds and prevent birds from using the sites.

   5. **Certificate holder.** The holder of an Airport Operating Certificate issued under Title 14, Code of Federal Regulations, Part 139.

   6. **Construct a new MSWLF.** To begin to excavate, grade land, or raise structures to prepare a municipal solid waste landfill as permitted by the appropriate regulatory or permitting agency.

   7. **Detention ponds.** Storm water management ponds that hold storm water for short periods of time, a few hours to a few days.

   8. **Establish a new MSWLF.** When the first load of putrescible waste is received on-site for placement in a prepared municipal solid waste landfill.

   9. **Fly ash.** The fine, sand-like residue resulting from the complete incineration of an organic fuel source. Fly ash typically results from the combustion of coal or waste used to operate a power generating plant.

   10. **General aviation aircraft.** Any civil aviation aircraft not operating under 14 CFR Part 119, Certification: Air Carriers and Commercial Operators.

   11. **Hazardous wildlife.** Species of wildlife (birds, mammals, reptiles), including feral animals and domesticated animals not under control, that are associated with aircraft strike problems, are capable of causing structural damage to airport facilities, or act as attractants to other wildlife that pose a strike hazard

   12. **Municipal Solid Waste Landfill (MSWLF).** A publicly or privately owned discrete area of land or an excavation that receives household waste and that is not a land application unit, surface impoundment, injection well, or waste pile, as those terms are defined under 40 CFR § 257.2. An MSWLF may receive

other types wastes, such as commercial solid waste, non-hazardous sludge, small-quantity generator waste, and industrial solid waste, as defined under 40 CFR § 258.2. An MSWLF can consist of either a stand alone unit or several cells that receive household waste.

13. **New MSWLF.** A municipal solid waste landfill that was established or constructed after April 5, 2001.

14. **Piston-powered aircraft.** Fixed-wing aircraft powered by piston engines.

15. **Piston-use airport.** Any airport that does not sell Jet-A fuel for fixed-wing turbine-powered aircraft, and primarily serves fixed-wing, piston-powered aircraft. Incidental use of the airport by turbine-powered, fixed-wing aircraft would not affect this designation. However, such aircraft should not be based at the airport.

16. **Public agency.** A State or political subdivision of a State, a tax-supported organization, or an Indian tribe or pueblo (49 U.S.C. § 47102(19)).

17. **Public airport.** An airport used or intended to be used for public purposes that is under the control of a public agency; and of which the area used or intended to be used for landing, taking off, or surface maneuvering of aircraft is publicly owned (49 U.S.C. § 47102(20)).

18. **Public-use airport.** An airport used or intended to be used for public purposes, and of which the area used or intended to be used for landing, taking off, or surface maneuvering of aircraft may be under the control of a public agency or privately owned and used for public purposes (49 U.S.C. § 47102(21)).

19. **Putrescible waste.** Solid waste that contains organic matter capable of being decomposed by micro-organisms and of such a character and proportion as to be capable of attracting or providing food for birds (40 CFR §257.3-8).

20. **Putrescible-waste disposal operation.** Landfills, garbage dumps, underwater waste discharges, or similar facilities where activities include processing, burying, storing, or otherwise disposing of putrescible material, trash, and refuse.

21. **Retention ponds.** Storm water management ponds that hold water for several months.

22. **Runway protection zone (RPZ).** An area off the runway end to enhance the protection of people and property on the ground (see AC 150/5300-13). The dimensions of this zone vary with the airport design, aircraft, type of operation, and visibility minimum.

23. **Scheduled air carrier operation.** Any common carriage passenger-carrying operation for compensation or hire conducted by an air carrier or commercial

operator for which the air carrier, commercial operator, or their representative offers in advance the departure location, departure time, and arrival location. It does not include any operation that is conducted as a supplemental operation under 14 CFR Part 119 or as a public charter operation under 14 CFR Part 380 (14 CFR § 119.3).

24. **Sewage sludge.** Any solid, semi-solid, or liquid residue generated during the treatment of domestic sewage in a treatment works. Sewage sludge includes, but is not limited to, domestic septage; scum or solids removed in primary, secondary, or advanced wastewater treatment process; and a material derived from sewage sludge. Sewage does not include ash generated during the firing of sewage sludge in a sewage sludge incinerator or grit and screenings generated during preliminary treatment of domestic sewage in a treatment works. (40 CFR 257.2)

25. **Sludge.** Any solid, semi-solid, or liquid waste generated form a municipal, commercial or industrial wastewater treatment plant, water supply treatment plant, or air pollution control facility or any other such waste having similar characteristics and effect. (40 CFR 257.2)

26. **Solid waste.** Any garbage, refuse, sludge, from a waste treatment plant, water supply treatment plant or air pollution control facility and other discarded material, including, solid liquid, semisolid, or contained gaseous material resulting from industrial, commercial, mining, and agricultural operations, and from community activities, but does not include solid or dissolved materials in domestic sewage, or solid or dissolved material in irrigation return flows or industrial discharges which are point sources subject to permits under section 402 of the Federal Water Pollution Control Act, as amended (86 Stat. 880), or source, special nuclear, or by product material as defined by the Atomic Energy Act of 1954, as amended, (68 Stat. 923). (40 CFR 257.2)

27. **Turbine-powered aircraft.** Aircraft powered by turbine engines including turbojets and turboprops but excluding turbo-shaft rotary-wing aircraft.

28. **Turbine-use airport.** Any airport that sells Jet-A fuel for fixed-wing turbine-powered aircraft.

29. **Wastewater treatment facility.** Any devices and/or systems used to store, treat, recycle, or reclaim municipal sewage or liquid industrial wastes, including Publicly Owned Treatment Works (POTW), as defined by Section 212 of the Federal Water Pollution Control Act (P.L. 92-500) as amended by the Clean Water Act of 1977 (P.L. 95-576) and the Water Quality Act of 1987 (P.L. 100-4). This definition includes any pretreatment involving the reduction of the amount of pollutants, the elimination of pollutants, or the alteration of the nature of pollutant properties in wastewater prior to or in lieu of discharging or otherwise introducing such pollutants into a POTW. (See 40 CFR Section 403.3 (q), (r), & (s)).

30. **Wildlife.** Any wild animal, including without limitation any wild mammal, bird, reptile, fish, amphibian, mollusk, crustacean, arthropod, coelenterate, or other invertebrate, including any part, product, egg, or offspring thereof (50 CFR 10.12, *Taking, Possession, Transportation, Sale, Purchase, Barter, Exportation, and Importation of Wildlife and Plants*). As used in this AC, wildlife includes feral animals and domestic animals out of the control of their owners (14 CFR Part 139, Certification of Airports).

31. **Wildlife attractants.** Any human-made structure, land-use practice, or human-made or natural geographic feature that can attract or sustain hazardous wildlife within the landing or departure airspace or the airport's AOA. These attractants can include architectural features, landscaping, waste disposal sites, wastewater treatment facilities, agricultural or aquaculture activities, surface mining, or wetlands.

32. **Wildlife hazard.** A potential for a damaging aircraft collision with wildlife on or near an airport.

33. **Wildlife strike.** A wildlife strike is deemed to have occurred when:

    a. A pilot reports striking 1 or more birds or other wildlife;

    b. Aircraft maintenance personnel identify aircraft damage as having been caused by a wildlife strike;

    c. Personnel on the ground report seeing an aircraft strike 1 or more birds or other wildlife;

    d. Bird or other wildlife remains, whether in whole or in part, are found within 200 feet of a runway centerline, unless another reason for the animal's death is identified;

    e. The animal's presence on the airport had a significant negative effect on a flight (i.e., aborted takeoff, aborted landing, high-speed emergency stop, aircraft left pavement area to avoid collision with animal) (Transport Canada, Airports Group, *Wildlife Control Procedures Manual*, Technical Publication 11500E, 1994).

2. RESERVED.

Memorandum of Agreement Between the Federal Aviation Administration, the U.S. Air Force, the U.S. Army, the U.S. Environmental Protection Agency, the U.S. Fish and Wildlife Service, and the U.S. Department of Agriculture to Address Aircraft-Wildlife Strikes

PURPOSE

The signatory agencies know the risks that aircraft-wildlife strikes pose to safe aviation.

This Memorandum of Agreement (MOA) acknowledges each signatory agency's respective missions. Through this MOA, the agencies establish procedures necessary to coordinate their missions to more effectively address existing and future environmental conditions contributing to aircraft-wildlife strikes throughout the United States. These efforts are intended to minimize wildlife risks to aviation and human safety, while protecting the Nation's valuable environmental resources.

BACKGROUND

Aircraft-wildlife strikes are the second leading causes of aviation-related fatalities. Globally, these strikes have killed over 400 people and destroyed more than 420 aircraft. While these extreme events are rare when compared to the millions of annual aircraft operations, the potential for catastrophic loss of human life resulting from one incident is substantial. The most recent accident demonstrating the grievous nature of these strikes occurred in September 1995, when a U.S. Air Force reconnaissance jet struck a flock of Canada geese during takeoff, killing all 24 people aboard.

The Federal Aviation Administration (FAA) and the United States Air Force (USAF) databases contain information on more than 54,000 United States civilian and military aircraft-wildlife strikes reported to them between 1990 and 1999[1]. During that decade, the FAA received reports indicating that aircraft-wildlife strikes, damaged 4,500 civilian U.S. aircraft (1,500 substantially), destroyed 19 aircraft, injured 91 people, and killed 6 people. Additionally, there were 216 incidents where birds struck two or more engines on civilian aircraft, with damage occurring to 26 percent of the 449 engines involved in these incidents. The FAA estimates that during the same decade, civilian U.S. aircraft sustained $4 billion worth of damages and associated losses and 4.7 million hours of aircraft downtime due to aircraft-wildlife strikes. For the same period,

[1] FAA estimates that the 28,150 aircraft-wildlife strike reports it received represent less than 20% of the actual number of strikes that occurred during the decade.

USAF planes colliding with wildlife resulted in 10 Class A Mishaps[2], 26 airmen deaths, and over $217 million in damages.

Approximately 97 percent of the reported civilian aircraft-wildlife strikes involved common, large-bodied birds or large flocks of small birds. Almost 70 percent of these events involved gulls, waterfowl, and raptors (Table 1).

About 90 percent of aircraft-wildlife strikes occur on or near airports, when aircraft are below altitudes of 2,000 feet. Aircraft-wildlife strikes at these elevations are especially dangerous because aircraft are moving at high speeds and are close to or on the ground. Aircrews are intently focused on complex take-off or landing procedures and monitoring the movements of other aircraft in the airport vicinity. Aircrew attention to these activities while at low altitudes often compromises their ability to successfully recover from unexpected collisions with wildlife and to deal with rapidly changing flight procedures. As a result, crews have minimal time and space to recover from aircraft-wildlife strikes.

Increasing bird and wildlife populations in urban and suburban areas near airports contribute to escalating aircraft-wildlife strike rates. FAA, USAF, and Wildlife Services (WS) experts expect the risks, frequencies, and potential severities of aircraft-wildlife strikes to increase during the next decade as the numbers of civilian and military aircraft operations grow to meet expanding transportation and military demands.

SECTION I.

SCOPE OF COOPERATION AND COORDINATION

Based on the preceding information and to achieve this MOA's purpose, the signatory agencies:

A. Agree to strongly encourage their respective regional and local offices, as appropriate, to develop interagency coordination procedures necessary to effectively and efficiently implement this MOA. Local procedures should clarify time frames and other general coordination guidelines.

B. Agree that the term "airport" applies only to those facilities as defined in the attached glossary.

C. Agree that the three major activities of most concern include, but are not limited to:

    1. airport siting and expansion;

[2] See glossary for the definition of a Class A Mishap and similar terms.

2. development of conservation/mitigation habitats or other land uses that could attract hazardous wildlife to airports or nearby areas; and

3. responses to known wildlife hazards or aircraft-wildlife strikes.

D. Agree that "hazardous wildlife" are those animals, identified to species and listed in FAA and USAF databases, that are most often involved in aircraft-wildlife strikes. Many of the species frequently inhabit areas on or near airports, cause structural damage to airport facilities, or attract other wildlife that pose an aircraft-wildlife strike hazard. Table 1 lists many of these species. It is included solely to provide information on identified wildlife species that have been involved in aircraft-wildlife strikes. It is not intended to represent the universe of species concerning the signatory agencies, since more than 50 percent of the aircraft-wildlife strikes reported to FAA or the USAF did not identify the species involved.

E. Agree to focus on habitats attractive to the species noted in Table 1, but the signatory agencies realize that it is imperative to recognize that wildlife hazard determinations discussed in Paragraph L of this section may involve other animals.

F. Agree that not all habitat types attract hazardous wildlife. The signatory agencies, during their consultative or decisionmaking activities, will inform regional and local land use authorities of this MOA's purpose. The signatory agencies will consider regional, local, and site-specific factors (e.g., geographic setting and/or ecological concerns) when conducting these activities and will work cooperatively with the authorities as they develop and implement local land use programs under their respective jurisdictions. The signatory agencies will encourage these stakeholders to develop land uses within the siting criteria noted in Section 1-3 of FAA Advisory Circular (AC) 150.5200-33 (Attachment A) that do not attract hazardous wildlife. Conversely, the agencies will promote the establishment of land uses attractive to hazardous wildlife outside those siting criteria. Exceptions to the above siting criteria, as described in Section 2.4.b of the AC, will be considered because they typically involve habitats that provide unique ecological functions or values (e.g., critical habitat for federally-listed endangered or threatened species, ground water recharge).

G. Agree that wetlands provide many important ecological functions and values, including fish and wildlife habitats; flood protection; shoreline erosion control; water quality improvement; and recreational, educational, and research opportunities. To protect jurisdictional wetlands, Section 404 of the Clean Water Act (CWA) establishes a program to regulate dredge and/or fill activities in these wetlands and navigable waters. In recognizing Section 404 requirements and the Clean Water Action Plan's goal to annually increase the Nation's net wetland acreage by 100,000 acres through 2005, the signatory agencies agree to resolve aircraft-wildlife conflicts. They will do so by

avoiding and minimizing wetland impacts to the maximum extent practicable, and will work to compensate for all associated unavoidable wetland impacts. The agencies agree to work with landowners and communities to encourage and support wetland restoration or enhancement efforts that do not increase aircraft-wildlife strike potentials.

H. Agree that the: U.S. Army Corps of Engineers (ACOE) has expertise in protecting and managing jurisdictional wetlands and their associated wildlife; U.S. Environmental Protection Agency (EPA) has expertise in protecting environmental resources; and the U.S. Fish and Wildlife Service (USFWS) has expertise in protecting and managing wildlife and their habitats, including migratory birds and wetlands. Appropriate signatory agencies will cooperatively review proposals to develop or expand wetland mitigation sites, or wildlife refuges that may attract hazardous wildlife. When planning these sites or refuges, the signatory agencies will diligently consider the siting criteria and land use practice recommendations stated in FAA AC 150/5200-33. The agencies will make every effort to undertake actions that are consistent with those criteria and recommendations, but recognize that exceptions to the siting criteria may be appropriate (see Paragraph F of this section).

I. Agree to consult with airport proponents during initial airport planning efforts. As appropriate, the FAA or USAF will initiate signatory agency participation in these efforts. When evaluating proposals to build new civilian or military aviation facilities or to expand existing ones, the FAA or the USAF, will work with appropriate signatory agencies to diligently evaluate alternatives that may avoid adverse effects on wetlands, other aquatic resources, and Federal wildlife refuges. If these or other habitats support hazardous wildlife, and there is no practicable alternative location for the proposed aviation project, the appropriate signatory agencies, consistent with applicable laws, regulations, and policies, will develop mutually acceptable measures, to protect aviation safety and mitigate any unavoidable wildlife impacts.

J. Agree that a variety of other land uses (e.g., storm water management facilities, wastewater treatment systems, landfills, golf courses, parks, agricultural or aquacultural facilities, and landscapes) attract hazardous wildlife and are, therefore, normally incompatible with airports. Accordingly, new, federally-funded airport construction or airport expansion projects near habitats or other land uses that may attract hazardous wildlife must conform to the siting criteria established in the FAA Advisory Circular (AC) 150/5200-33, Section 1-3.

K. Agree to encourage and advise owners and/or operators of non-airport facilities that are known hazardous wildlife attractants (See Paragraph J) to follow the siting criteria in Section 1-3 of AC 150/5200-33. As appropriate, each signatory agency will inform proponents of these or other land uses about the land use's potential to attract hazardous species to airport areas.

The signatory agencies will urge facility owners and/or operators about the critical need to consider the land uses' effects on aviation safety.

L. Agree that FAA, USAF, and WS personnel have the expertise necessary to determine the aircraft-wildlife strike potentials of various land uses. When there is disagreement among signatory agencies about a particular land use and its potential to attract hazardous wildlife, the FAA, USAF, or WS will prepare a wildlife hazard assessment. Then, the appropriate signatory agencies will meet at the local level to review the assessment. At a minimum, that assessment will:

   1. identify each species causing the aviation hazard, its seasonal and daily populations, and the population's local movements;

   2. discuss locations and features on and near the airport or land use attractive to hazardous wildlife; and

   3. evaluate the extent of the wildlife hazard to aviation.

M. Agree to cooperate with the airport operator to develop a specific, wildlife hazard management plan for a given location, when a potential wildlife hazard is identified. The plan will meet applicable FAA, USAF, and other relevant requirements. In developing the plan, the appropriate agencies will use their expertise and attempt to integrate their respective programmatic responsibilities, while complying with existing laws, regulations, and policies. The plan should avoid adverse impacts to wildlife populations, wetlands, or other sensitive habitats to the maximum extent practical. Unavoidable impacts resulting from implementing the plan will be fully compensated pursuant to all applicable Federal laws, regulations, and policies.

N. Agree that whenever a significant aircraft-wildlife strike occurs or a potential for one is identified, any signatory agency may initiate actions with other appropriate signatory agencies to evaluate the situation and develop mutually acceptable solutions to reduce the identified strike probability. The agencies will work cooperatively, preferably at the local level, to determine the causes of the strike and what can and should be done at the airport or in its vicinity to reduce potential strikes involving that species.

O. Agree that information and analyses relating to mitigation that could cause or contribute to aircraft-wildlife strikes should, whenever possible, be included in documents prepared to satisfy the National Environmental Policy Act (NEPA). This should be done in coordination with appropriate signatory agencies to inform the public and Federal decision makers about important ecological factors that may affect aviation. This concurrent review of environmental issues will promote the streamlining of the NEPA review process.

P. Agree to cooperatively develop mutually acceptable and consistent guidance, manuals, or procedures addressing the management of habitats attractive to

hazardous wildlife, when those habitats are or will be within the siting criteria noted in Section 1-3 of FAA AC 5200-33. As appropriate, the signatory agencies will also consult each other when they propose revisions to any regulations or guidance relevant to the purpose of this MOA, and agree to modify this MOA accordingly.

SECTION II.
GENERAL RULES AND INFORMATION

A. Development of this MOA fulfills the National Transportation Safety Board's recommendation of November 19, 1999, to form an inter-departmental task force to address aircraft-wildlife strike issues.

B. This MOA does not nullify any obligations of the signatory agencies to enter into separate MOAs with the USFWS addressing the conservation of migratory birds, as outlined in Executive Order 13186, *Responsibilities of Federal Agencies to Protect Migratory Birds*, dated January 10, 2001 (66 *Federal Register*, No. 11, pg. 3853).

C. This MOA in no way restricts a signatory agency's participation in similar activities or arrangements with other public or private agencies, organizations, or individuals.

D. This MOA does not alter or modify compliance with any Federal law, regulation or guidance (e.g., Clean Water Act; Endangered Species Act; Migratory Bird Treaty Act; National Environmental Policy Act; North American Wetlands Conservation Act; Safe Drinking Water Act; or the "no-net loss" policy for wetland protection). The signatory agencies will employ this MOA in concert with the Federal guidance addressing wetland mitigation banking dated March 6, 1995 (60 *Federal Register*, No. 43, pg. 12286).

E. The statutory provisions and regulations mentioned above contain legally binding requirements. However, this MOA does not substitute for those provisions or regulations, nor is it a regulation itself. This MOA does not impose legally binding requirements on the signatory agencies or any other party, and may not apply to a particular situation in certain circumstances. The signatory agencies retain the discretion to adopt approaches on a case-by-case basis that differ from this MOA when they determine it is appropriate to do so. Such decisions will be based on the facts of a particular case and applicable legal requirements. Therefore, interested parties are free to raise questions and objections about the substance of this MOA and the appropriateness of its application to a particular situation.

F. This MOA is based on evolving information and may be revised periodically without public notice. The signatory agencies welcome public comments on this MOA at any time and will consider those comments in any future revision of this MOA.

G. This MOA is intended to improve the internal management of the Executive Branch to address conflicts between aviation safety and wildlife. This MOA does not create any right, benefit, or trust responsibility, either substantively or procedurally. No party, by law or equity, may enforce this MOA against the United States, its agencies, its officers, or any person.

H. This MOA does not obligate any signatory agency to allocate or spend appropriations or enter into any contract or other obligations.

I. This MOA does not reduce or affect the authority of Federal, State, or local agencies regarding land uses under their respective purviews. When requested, the signatory agencies will provide technical expertise to agencies making decisions regarding land uses within the siting criteria in Section 1-3 of FAA AC 150/5200-33 to minimize or prevent attracting hazardous wildlife to airport areas.

J. Any signatory agency may request changes to this MOA by submitting a written request to any other signatory agency and subsequently obtaining the written concurrence of all signatory agencies.

K. Any signatory agency may terminate its participation in this MOA within 60 days of providing written notice to the other agencies. This MOA will remain in effect until all signatory agencies terminate their participation in it.

SECTION III. PRINCIPAL SIGNATORY AGENCY CONTACTS

The following list identifies contact offices for each signatory agency.

Federal Aviation Administration

GLOSSARY

This glossary defines terms used in this MOA.

Airport. All USAF airfields or all public use airports in the FAA's National Plan of Integrated Airport Systems (NPIAS). Note: There are over 18,000 civil-use airports in the U.S., but only 3,344 of them are in the NPIAS and, therefore, under FAA's jurisdiction.

Aircraft-wildlife strike. An aircraft-wildlife strike is deemed to have occurred when:

1. a pilot reports that an aircraft struck 1 or more birds or other wildlife;
2. aircraft maintenance personnel identify aircraft damage as having been caused by an aircraft-wildlife strike;
3. personnel on the ground report seeing an aircraft strike 1 or more birds or other wildlife;
4. bird or other wildlife remains, whether in whole or in part, are found within 200 feet of a runway centerline, unless another reason for the animal's death is identified; or
5. the animal's presence on the airport had a significant, negative effect on a flight (i.e., aborted takeoff, aborted landing, high-speed emergency stop, aircraft left pavement area to avoid collision with animal)

(Source: *Wildlife Control Procedures Manual*, Technical Publication 11500E, 1994).

Aircraft-wildlife strike hazard. A potential for a damaging aircraft collision with wildlife on or near an airport (14 CFR 139.3).

Bird Sizes. Title 40, Code of Federal Regulations, Part 33.76 classifies birds according to weight:

small birds weigh less than 3 ounces (oz).
medium birds weigh more than 3 oz and less than 2.5 lbs.
large birds weigh greater than 2.5 lbs.

Civil aircraft damage classifications. The following damage descriptions are based on the *Manual on the International Civil Aviation Organization Bird Strike Information System*:

Minor: The aircraft is deemed airworthy upon completing simple repairs or replacing minor parts and an extensive inspection is not necessary.

Substantial: Damage or structural failure adversely affects an aircraft's structural integrity, performance, or flight characteristics. The damage normally requires major repairs or the replacement of the entire affected component. Bent fairings or cowlings; small dents; skin punctures; damage to wing tips, antenna, tires or brakes, or engine blade damage not requiring blade replacement are specifically excluded.

Destroyed: The damage sustained makes it inadvisable to restore the aircraft to an airworthy condition.

Significant Aircraft-Wildlife Strikes. A significant aircraft-wildlife strike is deemed to have occurred when any of the following applies:

1. a civilian, U.S. air carrier aircraft experiences a multiple aircraft-bird strike or engine ingestion;
2. a civilian, U.S. air carrier aircraft experiences a damaging collision with wildlife other than birds; or
3. a USAF aircraft experiences a Class A, B, or C mishap as described below:

    A. **Class A Mishap:** Occurs when at least one of the following applies:
        1. total mishap cost is $1,000,000 or more;
        2. a fatality or permanent total disability occurs; and/or
        3. an Air Force aircraft is destroyed.
    B. **Class B Mishap:** Occurs when at least one of the following applies:
        1. total mishap cost is $200,000 or more and less than $1,000,000; and/or
        2. a permanent partial disability occurs and/or 3 or more people are hospitalized;
    C. **Class C Mishap:** Occurs when at least one of the following applies:
        1. cost of reported damage is between $20,000 and $200,000;
        2. an injury causes a lost workday (i.e., duration of absence is at least 8 hours beyond the day or shift during which mishap occurred); and/or
        3. an occupational illness causing absence from work at any time.

Wetlands. An ecosystem requiring constant or recurrent, shallow inundation or saturation at or near the surface of the substrate. The minimum essential characteristics of a wetland are recurrent, sustained inundation or saturation at or

near the surface and the presence of physical, chemical, and biological features indicating recurrent, sustained inundation, or saturation. Common diagnostic wetland features are hydric soils and hydrophytic vegetation. These features will be present, except where specific physiochemical, biotic, or anthropogenic factors have removed them or prevented their development.

(Source the 1987 Delineation Manual; 40 CFR 230.3(t)).

Wildlife. Any wild animal, including without limitation any wild mammal, bird, reptile, fish, amphibian, mollusk, crustacean, arthropod, coelenterate, or other invertebrate, including any part, product, egg, or offspring there of (50 CFR 10.12, *Taking, Possession, Transportation, Sale, Purchase, Barter, Exportation, and Importation of Wildlife and Plants*). As used in this MOA, "wildlife" includes feral animals and domestic animals while out of their owner's control (14 CFR 139.3, *Certification and Operations: Land Airports Serving CAB-Certificated Scheduled Air Carriers Operating Large Aircraft (Other Than Helicopters)*)

Table 1. Identified wildlife species, or groups, that were involved in two or more aircraft-wildlife strikes, that caused damage to one or more aircraft components, or that had an adverse effect on an aircraft's flight. Data are for 1990-1999 and involve only civilian U.S. aircraft.

Birds	No. reported strikes
Gulls (all spp.)	874
Geese (primarily, Canada geese)	458
Hawks (primarily, Red-tailed hawks)	182
Ducks (primarily Mallards.)	166
Vultures (primarily, Turkey vulture)	142
Rock doves	122
Doves (primarily, mourning doves)	109
Blackbirds	81
European starlings	55
Sparrows	52
Egrets	41
Shore birds (primarily, Killdeer & Sandpipers)	40
Crows	31
Owls	24
Sandhill cranes	22
American kestrels	15
Great blue herons	15
Pelicans	14
Swallows	14
Eagles (Bald and Golden)	14
Ospreys	13
Ring-necked pheasants	11
Herons	11
Barn-owls	9
American robins	8
Meadowlarks	8
Buntings (snow)	7
Cormorants	6
Snow buntings	6
Brants	5
Terns (all spp.)	5
Great horned owls	5
Horned larks	4
Turkeys	4
Swans	3
Mockingbirds	3
Quails	3
Homing pigeons	3
Snowy owls	3
Anhingas	2

Ravens	2
Kites	2
Falcons	2
Peregrine falcons	2
Merlins	2
Grouse	2
Hungarian partridges	2
Spotted doves	2
Thrushes	2
Mynas	2
Finches	2
Total known birds	2,612

Mammals	**No. reported strikes**
Deer (primarily, White-tailed deer)	285
Coyotes	16
Dogs	10
Elk	6
Cattle	5
Bats	4
Horses	3
Pronghorn antelopes	3
Foxes	2
Raccoons	2
Rabbits	2
Moose	2
Total known mammals	340

Ring-billed gulls were the most commonly struck gulls. The U.S. ring-billed gull population increased steadily at about 6% annually from 1966-1988. Canada geese were involved in about 90% of the aircraft-goose strikes involving civilian, U.S. aircraft from 1990-1998. Resident (non-migratory) Canada goose populations increased annually at 13% from 1966-1998. Red-tailed hawks accounted for 90% of the identified aircraft-hawk strikes for the 10-year period. Red-tailed hawk populations increased annually at 3% from 1966 to 1998. Turkey vultures were involved in 93% of he identified aircraft-vulture strikes. The U.S. Turkey vulture populations increased at annually at 1% between 1966 and 1998. Deer, primarily white-tailed deer, have also adapted to urban and airport areas and their populations have increased dramatically. In the early 1900's, there were about 100,000 white-tailed deer in the U.S. Current estimates are that the U.S. population is about 24 million.

Federal Aviation Administration (FAA) Regulations and Related Requirements - Hazardous Wildlife

The FAA has developed a number of regulations, policies and guidance documents related to the minimization of bird strike hazards and to habitat restoration and management on airport lands. These documents include:

- Federal Aviation Regulation (FAR), CFR Part 139 (as amended February 2004); in particular Part 139.337 *Wildlife Hazard Management*.
- Advisory Circular 50/5200-33B, *Hazardous Wildlife Attractants on or Near Airports*, August 28, 2007 (replaces 33A published July 27, 2004, and all previous versions).
- FAA Certification Alert 06-07, *Requests by State Wildlife Agencies to Facilitate and Encourage Habitat for State-Listed Threatened and Endangered Species and Species of Special Concern on Airports*, November 21, 2006.
- FAA Advisory Circular 150/5200-32A, *Reporting Wildlife Aircraft Strikes*, December 22, 2004.
- FAA Advisory Circular 150/5200-36, *Qualifications for Wildlife Biologist Conducting Wildlife Hazard Assessments and Training Curriculum for Airport Personnel in Controlling Wildlife Hazards at Airports*. June 28, 2006.
- *Wildlife Hazard Management at Airports – A Handbook for Airport Personnel.* FAA Office of Airport Safety and Standards and United States Department of Agriculture (USDA), Animal and Plant Health Inspection Services (APHIS) - Wildlife Services, 2nd Edition July 2005.
- FAA Advisory Circular 150/5200-34 *Construction or Establishment of Landfills Near Public Airports*, August 26, 2000.
- FAA Advisory Circular 150/5300-13 *Airport Design*, Appendix 19, "Minimum Distances Between Certain Airport Features and Any On-Airport Agriculture Crops." Amended periodically.
- FAA Order 5050.4B, *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions*, April 28, 2006. Section 209.a – Wildlife Hazard Management Plans (WHMP) specifies that when the FAA Administrator determines that an airport must prepare a WHMP to address wildlife hazards, the airport must submit the WHMP to the FAA for approval prior to implementation. Order 5050.4B further specifies that FAA approval of a WHMP is a "federal action" requiring a NEPA analysis.
- *Memorandum of Agreement Between the FAA, U.S. Air Force, U.S. Army, U.S. Environmental Protection Agency, U.S. Fish and Wildlife Service, and U.S. Department of Agriculture to Address Aircraft-Wildlife Strikes.* Signed by the six agencies between December 2002 and July 2003.
- Animal Damage Control Act, 7 USC, Section 426-426c, enacted in 1931 and amended in 19378 and 1991; grants the Secretary of Agriculture broad authority to investigate and control certain predatory and wild animals and nuisance mammals and birds.
- FAA Office of Airport Safety and Standards – Program Policies and Guidance, Airport Certification – 14 CFR 130; Policies 77, 78,79 and 82 specify procedures with regard to wildlife hazard management, waste disposal, and coordination with regard to the federal Endangered Species Act. These policies comprise Appendix D of the 2005 FAA-USDA Hazard Wildlife Management handbook referenced above.

In general, these documents direct airport operators, in this case the Sacramento County Airport System (SCAS), to discourage wildlife usage of airport lands by managing vegetation to decrease wildlife attractiveness. Additionally, these policy documents generally discourage habitat restoration activities and the creation of wetlands, waste disposal facilities and open bodies of water on and adjacent to airports unless it can be shown that those activities will not increase bird strike hazards. The FAA may revoke an airport's operating certificate if the FAA determines that the airport has created or failed to vigorously oppose the creation of such hazards on or near the airport. FAA safety certification personnel conduct periodic inspections of public airports to ascertain compliance with the above regulations, policies and guidance documents.

Subject: **Initiation Of Mather-Related General Plan Amendments And Approval To Proceed With Application For Federal Wetland Fill Permits At South Mather**

Contact: Paul Lake, Special Projects Manager (874-8537)
David Norris, Senior Civil Engineer (874-5049)

Overview
This report recommends changes to the land use plans for South Mather. These include: new boundaries for a Wetlands Preserve of approximately 1,070 acres; designating certain vernal pools outside of the Wetlands Preserve for protection, new routes for extensions of Douglas Road and Eagles Nest Road, and to accommodate future development which may include a university. To accomplish these plans, staff is recommending initiating amendments to the General Plan, Mather Specific Plan, and Mather Special Planning Area.

On December 5, 2005, a group of stakeholders representing thirteen outside entities and seven county departments endorsed the proposed boundaries, pending official review and approval by regulatory federal and state agencies. The Board's approval of these recommendations would initiate CEQA (California Environmental Quality Act) review. It would also initiate preparation of applications to regulatory agencies for fill permits of identified wetlands, stream bed alteration permits, and other necessary permits and authorizations.

Recommendations
Staff recommends that the Board of Supervisors:

1. **Receive And File** information on the proposed initiation of Mather-Related General Plan and Specific Plan Amendments;

2. **Accept** testimony from the general public;

3. **Conceptually Endorse** the use map for South Mather presented in Attachment A, including the boundaries for a Wetlands Preserve, future County land use for economic development and parks, protected vernal pools, airport commercial development, and airport operations. This endorsement will allow staff to move forward with seeking fill permits from federal regulators. It does not create definitive boundaries or finalize protected pools, which will depend on future mutual agreement on local, state, and federal mitigation requirements.

4. **Conceptually Endorse** the realignments of Eagles Nest and Douglas Roads as shown on the map in Attachment A.

5. **Adopt** the attached resolution initiating General Plan, Mather Specific Plan, and Mather Special Planning Area amendments to change the designation of the Economic Development Conveyance area and the munitions area at South Mather, and to modify the locations of Douglas Road and Eagles Nest Road. This will allow for a possible university and accompanying development. The attached resolution initiates General Plan amendments to change designations from Recreational to Commercial-Office for areas that may be developed for a university and accompanying residential and retail development. It also initiates an amendment to the Mather Field Specific Plan to permit the same uses listed above. Finally, it initiates an amendment to the Mather Field Special Planning Area to allow mixed-use development and a University without need for conditional use permits. Development Plan Review to the Board of Supervisors will be required.

6. **Endorse** the language in Attachment B that proscribes activities and development within preserved, protected, and developed areas;

7. **Direct** the Department of Economic Development and Intergovernmental Affairs (DEDIA) to apply for federal Clean Water Act Section 404 and related state and federal permits associated with the proposed land uses.

Fiscal Impact
General Plan: The proposed actions to initiate General and Specific Plans amendments, including CEQA review, and preparing an application package for federal and state permits will not result in a net County (general fund) cost. DEDIA costs related to the proposed actions will be funded with Mather funds in DEDIA's budget. Expenditures for the Department's staff time dedicated to this effort have been anticipated and sufficient funding is available. Estimated costs for amending the General and Specific Plans, including CEQA review, are in the low- to mid-$100,000s.

Potential Mitigation: The proposed plan would fill approximately sixteen acres of vernal wetlands, approximately seventeen acres of seasonal wetlands, and approximately six acres of lakes and ponds. The permitting process will determine the exact mitigation requirements for these fills. Precise mitigation costs and funding sources are therefore unknown at this time, but staff estimates it could be in excess of $4 million.

BACKGROUND:
In December 1988, the Department of Defense officially announced the decision to close Mather Air Force Base. The Air Force issued a Record of Decision (ROD) for the disposal of the base in March 1993. The Base closed in September 1993.

In May 1997, the Board of Supervisors adopted a Specific Plan to facilitate the conversion of Mather from a base to public and private uses. (See Attachment C for Specific Plan map) The Plan established (1) the location, intensity, and character of land uses; (2) circulation patterns and necessary infrastructure improvements to support development (Attachment D); (3) the location and general configuration of parks and open space; (4) community facilities necessary to support

new development and contribute to the quality and livability of the region as a whole; and (5) implementing actions required to realize the Plan's objectives.

In March 1999, the United States Fish and Wildlife Service issued a Biological Opinion (BO) relating to water service contracts to deliver water out of the American River for utilization within Sacramento County Water Agency's Zone 40 Service Area, which includes Mather. The Board of Supervisors approved the Water Contract, thereby agreeing to the BO conditions. The BO requires, in part, the County to develop a vernal pool management plan and to dedicate conservation easements over vernal pools on the County airport and park properties at Mather.

In April 2004, the Board of Supervisors conceptually endorsed creation of a Wetlands Preserve at Mather. The Board directed staff to work with stakeholders to develop a plan for creating the Wetlands Preserve and for addressing other uses, including roadways, economic development, parks, and easement restrictions for conservation and resource protection.

CONSENSUS-BUILDING PROCESS:

In June 2005, staff brought together representatives of key stakeholders interested in the future of South Mather. Attachment E provides a full list of the stakeholder group, including environmental advocates, park supporters, community residents, the City of Rancho Cordova, the Air Force, federal regulators, County departments, and others.

Using an interest-based approach, the stakeholders group developed alternatives for the boundaries of the Wetlands Preserve, identified other vernal pools to be protected, and discussed the alignments of Eagles Nest and Douglas Roads. After several meetings, the group unanimously voted to support staff presenting the current plan to the Board to initiate the General and Specific Plan Amendment process and the federal permitting processes.*

RECOMMENDED CHANGES TO MATHER MAP AND LAND USE AREAS:

Attachment B describes the land use areas presented in this report These descriptions summarize intended and allowed uses in the Wetlands Preserve, Protected Pool Areas, and Future County Land Use Areas. In general, the designations are:

- Preserve Area: Development limited to controlled public access for observing and viewing pools by pedestrians and bicyclists, including some trails. One important unresolved issue is the location of a "staging" area for the Wetlands Preserve. This will provide a location for bus and other parking that viewers of the Wetlands Preserve will need. Regulators and some environmental advocates may request that the County locate the staging area within parks or economic development areas, while County staff suggests that it be located within the Wetlands Preserve, in an area that would not impact vernal habitat. The stakeholders did not discuss this issue in detail and their endorsement of the plan on December 5 did not include any agreement to a location for the staging area.

* The Institute for Ecological Health (IEH) and the Army Corps of Engineers were not present at the final meeting. A separate meeting with IEH garnered its endorsement. Efforts to meet with the Corps were not successful, due to the Corps' staffing limitations.

- Future County Use: The County would seek fill permits for most of the pools in these areas. To the extent that some pools are compatible with approved development, we would not impact them. Nonetheless, staff recommends seeking maximum flexibility for filling these pools to meet the County's economic and parks development objectives at South Mather.

- Protected Pool Areas (including Ahart's Dwarf Rush Area and Spadefoot Toad Pool): These are pools that we would not fill nor develop within buffered zones. The public would not have access to these areas other than for viewing from outside the zones. We would limit other access to stipulated maintenance activities and emergencies. (Note difference in access to Airport Protected Pools below.)

- Airport: These are designated for airport operations, commercial development, or both. The Mather Airport Master Plan specifies activities that will occur. Except for necessary maintenance or other airport operations, no one would access protected pools within the Airport. Maintenance in these pools would be different than maintenance activities outside of Airport areas, due to FAA regulations and air traffic safety needs.

ROAD ALIGNMENTS:

- Roadway Sizing: The Department of Transportation contracted with Fehr & Peers Associates to evaluate the transportation needs related to future development in South Mather, including the projected need along Eagles Nest and Douglas Roads through 2030. In summary, the study (Attachment F) found a definite need for both roads to be four-lane arterials. The most pressing need is for the Douglas Road extension, to take pressure off Excelsior Road, which now runs directly through Independence at Mather. Many commuters are using this as a "short-cut" through Mather, creating potential hazards for residents.

- Douglas Road Extension: Attachment D shows the proposed alternative alignment of the extension of Douglas Road from Sunrise Boulevard. Currently, the General Plan shows the extension running near the western edge of Independence at Mather. Many of the stakeholders expressed concern about a four-lane road running close to homes and through the Wetlands Preserve.

A subcommittee of the stakeholders group analyzed alternatives to the General Plan route and selected the proposed alignment as optimal. The proposed route would take Douglas away from the residential areas and keep it away from habitat in the proposed preserve. The Department of Transportation has determined that this alignment will meet the future traffic needs and can be designed adequately to move commuter traffic away from Independence at Mather.

The table below compares estimated costs of the original (straight) Douglas Road alignment and the proposed alignment.

Project Limit	Length (miles)	Estimated Construction Cost (millions)
Original Alignment	2.43	$ 11.5
Proposed Alignment	3.09	$ 15.5
Difference	0.66	$ 4.0

* Note: Costs do not reflect potential right-of-way or contingency costs, only estimated construction costs.

- Eagles Nest Road: Attachment D shows the proposed alternative alignment of Eagles Nest Road. Currently, the General Plan shows Eagles Nest Road as a straight road between Douglas Road and Kiefer Boulevard. Many of the stakeholders expressed concern about a four-lane "straightaway" in the community and its potential for impacting the vernal pools that are just north of Kiefer Boulevard, considered important by the group to protect.

The stakeholders subcommittee analyzed alternatives to the General Plan route (see Attachment G showing the options that the subcommittee considered). The challenge was to find a route that would minimize impact on the pools and still meet the road standards for curves that would connect Eagles Nest at its intended point on Kiefer. The proposed route would meet these interests.

Eagles Nest will also be relatively close to a pool that contains the Western Spadefoot Toad (shown as "Protected", right next to the proposed road curve). DEDIA is funding a study to recommend measures to protect the Spadefoot from the traffic hazards of Eagles Nest, such as an elevated road, curbing, or expanded buffers around the pool. The results of the study and the recommendations for the pool will be part of discussions with the federal regulators who are concerned about this species.

The table below compares estimated costs of the original (straight) Eagles Nest alignment and the proposed alignment.

Project Limit	Length (miles)	Estimated Total Project Cost (millions)
Original Alignment	2.16	$ 12.0
Proposed Alignment	2.23	$ 12.2
Difference	0.07	$ 0.2

* Note: Costs do not reflect potential right-of-way or contingency costs, only estimated construction costs.

The proposed realignment of Eagles Nest shifts more land area into the proposed wetlands preserve and protected areas. Staff recommends including this property in the Wetlands Preserve in order to save habitat and species.

WETLANDS PRESERVE:
The Wetlands Preserve as shown in Attachment A would serve some critical functions.

1. It would be one of the largest set-asides of natural habitat in Sacramento County and an important anchor to the South Sacramento Habitat Conservation Plan (HCP).

2. It would ensure a large open space area south of Highway 50 to be enjoyed by current and future generations.

3. It would provide educational opportunities for the public to learn about and appreciate wildlife and water resources.

4. It would provide potential areas for mitigation of restoration of vernal features and wetlands that proposed development outside of the Wetlands Preserve at South Mather could damage.

The proposed preserve encompasses 1,070 total acres of land and protects nearly 56 acres of vernal wetlands and 33 acres of seasonal wetlands. Changes to the boundary of the Wetlands Preserve from that proposed in April 2004 include the area to the west of proposed Eagles Nest Road alignment (discussed above) and some habitat north of Woodring Road (Attachment H). The recommended boundary represents a compromise between the land needs for future County use and environmental needs.

The County would own the Wetlands Preserve and the Parks Department would oversee management and maintenance. A combination of development-related activities on the economic development, park and airport properties at Mather, and the HCP would fund the management and maintenance of the Wetlands Preserve.

FUTURE COUNTY USE:
Areas identified in Attachment A as "Future County Use" are for the Department of Regional Parks, Recreation, and Open Space ("Parks") and DEDIA. Parks would use the area north of Woodring for soccer and rugby fields and festival grounds. Future parks master planning will recommend specific uses for the remaining areas.

This plan identifies four sets of vernal pools for protection within the Future County Land Use areas (shown with red circles and as "Protected" in Attachment A).

- North of Woodring, just south of Morrison Creek: Protecting this pool would provide some connectivity between the creek and the northernmost portion of the proposed Wetland Preserve. The only reason it is not in the Wetlands Preserve is that Parks needs connectivity between the proposed soccer and rugby fields, which may include pedestrian and bicycle throughways. Parks would limit development near this pool to what would be necessary and to minimize impact to the pool.

- Southwest corner of Douglas Road and Eagles Nest: These large pools would serve as an entryway into the Regional Park. Protecting vernal pools at the entry would be appropriate, representing an important aspect of the regional park site.

- Western Spadefoot Toad (WST) Pool: This 1.7 acre pool is south of Mather Golf Course and just east of the proposed alternative Eagles Nest alignment. Although the WST is not a federally protected species, the Planning Department will likely write the HCP to protect it as a species of interest.

  At this time, staff cannot determine how much land would be used for this pool set aside, for two reasons:

  1. The map in Attachment A shows a 250-foot buffer around the pool, taking up approximately 17 acres of land. It is not known whether this is an appropriate buffer for the WST. DEDIA is funding a study to help answer that question, pending review and approval from regulators.

  2. The pool's close location to Eagles Nest may not be the best location for long-term survivability of the WST, even with protection measures. DEDIA is funding an additional survey to identify other pools at Mather and elsewhere within the HCP boundaries that have WST that have stronger chances at survival. If this succeeds, we will re-visit these pools in the Mather Plan.

- Ahart's Dwarf Rush (ADR) pools: This cluster of pools lies just north of Kiefer Boulevard. They include 1.9 acres of vernal features, with approximately 35 acres set aside for protection (including buffers).

  The HCP will also be targeting this plant species for protection. This pool cluster is one of the few identified locations of ADR in the County. DEDIA is funding a survey to identify ADR pools at Mather and elsewhere within the HCP boundaries that might have stronger chances at survival. If this succeeds, we will re-visit these pools in the Mather Plan. (Note: The market value of the 35 acres protected could be worth $18 million or more in today's real estate market.)

AIRPORT USES:

The Airport Development Areas as shown in Attachment A would be for future airport commercial development and airport operations. Staff proposes seeking fill permits for most of these pools, as necessary to carry out the Mather Airport Master Plan. The management and maintenance (M&M) of pools noted as "Protected" at the end of the runway will be substantively different from M&M of protected pools elsewhere at South Mather, because the practices cannot conflict with Federal Aviation Administration (FAA) regulations governing operations of Mather Airport. Specifically:

1. The restrictions must not impede aircraft operations (including the ability to retrieve/rescue aircraft that may leave the runway or taxiways and end up in such preserves).

2. The maintenance and management requirements, including vegetation maintenance requirements, must be acceptable to the FAA as well as the Fish and Wildlife Service and other regulators.
3. Conditions must not penalize the County for any aircraft leaving the runway and damaging pools.

In total, we are recommending applying for fill permits impacting approximately 18 wet acres for Airport uses.

MATHER LAKE:
Staff is making no recommendations to change the current uses or plans for Mather Lake. The County will not be seeking fill permits for the wetland and marsh features around the lake. We will however seek approval for appropriate construction that allows use of the lake without damaging the habitat, such as some minor trails and piers. Mather Lake and ponds at Mather total 130 acres.

POSSIBLE FUTURE MINING:
Natural Resource studies show that the area marked "Possible Future Mining" in Attachment A could be a valuable source of aggregate, which could generate substantial revenues for the County. There remain questions however whether mining could pose a threat to the adjacent wetlands. The stakeholders group agreed to support mining as one possible use only if it can be shown that the mining would not directly or indirectly endanger the wetlands. The stakeholders also asked that the County consider using the area for potential wetlands restoration or for appropriate economic development use compatible with adjacent uses.

TOTAL IMPACT AND PRESERVATION:
The tables below summarize the total take proposed in this plan.

Jurisdictional – Overall				
Wetlands/Water Type	**Acres Avoided**	**Acres Impacted**	**Total**	**Avoidance**
Vernal (Pool, Swale, Marsh)	53.9	16.3	70.3	77%
Seasonal Wetlands/Ditches	32.0	12.5	44.6	72%

Critical Habitat Designation Only				
Wetlands/Water Type	**Acres Avoided**	**Acres Impacted**	**Total**	**Avoidance**
Vernal (Pool, Swale, Marsh)	36	3.7	39.7	91%

Non-Jurisdictional – Overall				
Wetlands/Water Type	Acres Avoided	Acres Impacted	Total	Avoidance
Vernal (Pool, Swale, Marsh)	0.014	0.74	0.75	2%
Seasonal Wetlands/Ditches	0.6	6.3	7.0	9%

FEDERAL PERMITTING PROCESS:

Attachment I provides an estimated time table for completing the federal regulatory process and having approvals that will allow the County to move forward with appropriate development. Two key factors will play a major role in this process.

- Management Plan: The Fish and Wildlife Service will require a management plan as part of the conveyance of the Mather property from the Air Force. It will detail how the County will ensure preservation of the protected pools, including maintenance, construction, allowable uses, etc. Approval of the Management Plan will require sign-off by the United States Environmental Protection Agency, Fish and Wildlife Service, Army Corps of Engineers, and the State Department of Fish and Game. Staff will also seek review and approval from the FAA, due to the proximity of the airport and potential regulatory restrictions regarding maintenance regimens.

- Programmatic Permit for Infrastructure and EIS: The Army Corps of Engineers will not issue a blanket permit for filling wetlands at Mather. Their interpretation of regulations requires a specific project (not a master project) in order to grant a fill permit. For this reason, staff is following two parallel paths that will position us to seek expedited individual project permits at the end of the process. The first path is to seek a Programmatic Environmental Impact Statement (EIS). This allows for review of environmental impacts of a large, master-planned project as a whole. The EIS will establish conditions and mitigation requirements for all areas within the project area. The second path is to seek a Programmatic Permit for Infrastructure, a fill permit based on the plan's road and utility needs. All other permits, for individual parks and economic development projects, will tier off the conditions established by the EIS and Infrastructure Permit.

To the extent that federal regulators are satisfied that the project is consistent with the EIS and Infrastructure Permit, they will grant the individual permit in relatively rapid fashion. Where possible, staff will also attempt to process individual permits simultaneously with efforts to obtain the larger infrastructure permit. This will expedite projects now under consideration.

LOCAL LAND USE PLAN UPDATES:

- General Plan: The General Plan for South Mather designates the area east of Eagles Nest Road as Recreation, which does not permit a university or residential uses that are contemplated for the EDC property in the southeast corner (as discussed above). Staff is seeking a redesignation to Commercial-Office, which would permit the university. Additionally, staff is seeking the Board's approval to initiate the process to amend the

General Plan to include the new proposed routes of Eagles Nest Road and Douglas Boulevard, as discussed earlier in this report.

- Mather Specific Plan: The Mather Specific Plan also regulates uses in this portion of South Mather. The EDC parcel is designated by the Special Plan as a Commercial-Recreation District, with the property to the north designated as a Recreation District. Part of the property in the Recreation District is the former munitions area of Mather Air Force Base. This area may be unsuitable for the regional park due to demolition and development costs. Staff is seeking flexibility to include this in the Commercial-Recreation District, which would still allow for parks use as well as the economic development uses under consideration (e.g., the University of Sacramento). To attain the desired flexibility, staff is seeking to move the boundary of the current Commercial-Recreation District to the northern edge of the munitions area and including that in the General Plan Commercial-Office designation.

- Special Planning Area: Staff is also seeking amendments to the Special Planning Area to allow mixed-use development in the Commercial-Recreation District. The university and its related uses would be allowed without need for conditional use permits, but Development Plan Review to the Board of Supervisors would be required. It would not permit residential other than dormitories without a use permit approved by the Board of Supervisors.

MITIGATION IMPLICATIONS:
Staff has met with federal regulators to get a general idea of the mitigation requirements that might come out of this plan. While no specific mitigation requirements can be established until the environmental process is completed, it appears we will be required to mitigate approximately 30 acres of filled wetlands on a 1:1 basis, through either restoration, enhancement, creation, or purchasing banked acreage.

RESOLUTION NO. 2006-0210

RESOLUTION OF THE BOARD OF SUPERVISORS OF THE COUNTY OF SACRAMENTO, STATE OF CALIFORNIA INITIATING AMENDMENTS TO THE GENERAL PLAN, MATHER SPECIFIC PLAN, AND MATHER SPECIAL PLANNING AREA:

MODIFY LAND USE ZONING AND PROTECTION OF WETLANDS AND VERNAL POOLS AT THE FORMER MATHER AIR FORCE BASE

WHEREAS, the United States Air Force has issued a Record of Decision to transfer ownership of property at the former Mather Air Force Base, and,

WHEREAS, the Sacramento County Board of Supervisors approved the Mather Specific Plan and Special Planning Area in 1997 to direct development at Mather as envisioned at that time; and,

WHEREAS, the County desires to integrate vernal habitat preservation with development at Mather, and,

WHEREAS, the County's intended uses at Mather have changed since the Board adopted the Mather Specific Plan and Special Planning Area;

THEREFORE, BE IT RESOLVED that the Board of Supervisors of the County of Sacramento does hereby initiate General Plan amendments to change the designation of the Economic Development Conveyance area and the munitions area at South Mather from Recreational to Commercial-Office for areas that may be developed for a university and accompanying residential and retail development, and to modify the locations of Douglas Road and Eagles Nest Road..

BE IT FURTHER RESOLVED that the Board of Supervisors of the County of Sacramento does hereby initiate an amendment to the Mather Field Specific Plan to permit the same uses listed above and to initiate an amendment to the Mather Field Special Planning Area to allow mixed-use development and a University without need for conditional use permits.

On a motion by Supervisor Nottoli, Seconded by Supervisor Dickinson, the foregoing resolution was passed and adopted by the Board of Supervisors of the County of Sacramento, State of California, at a regular meeting thereof this 22nd day of February, 2006, by the following vote, to wit:

AYES: Supervisors: Collin, Dickinson, Nottoli, Peters, MacGlashan

NOES: Supervisors: None

ABSENT: Supervisors: None

ABSTAIN: Supervisors: None

Attachment B - Mather Area Designations

These designations correspond to areas identified on the map in Attachment A. The table below generally describes activities and facilities allowable in each area. The terms in parenthesis under "Type of Area" are terms that will be used in the South Sacramento Habitat Conservation Plan. Future versions of the Mather map will include the SSHCP nomenclature.

Area	Purpose	Activities	Permitted Facilities
PRESERVE AREA **(SSHCP - Preserve Area)**	☐ To allow minimal public use that does not disturb environmentally sensitive areas. ☐ Intended for study of the natural environment and interpretive education ☐ Scientific study	☐ Individuals permitted on designated trails. ☐ Groups may use areas only under supervision. ☐ Science experiments ☐ Monitoring, maintenance, and management activities ☐ Activities must be authorized by preserve management entity ☐ Maintenance of existing infrastructure ☐ Emergency & Fire response	☐ Minor trail improvements ☐ Trail stops ☐ Observation points ☐ Interpretive signs
PRESERVE AREA – STAGING AREA	☐ An as-yet-to-be-determined location within the preserve will be designated for access and staging areas for public tours in the preserve. This area will in a location that is convenient and will not disturb the vernal habitat.	Staging activities	☐ Parking lots ☐ Bus turn-around ☐ Restrooms ☐ Drinking fountains ☐ Remediation Facilities
PROTECTED AHART'S DWARF RUSH POOLS (Within "Future County Use" Area East of Eagles Nest Road) (SSHCP - Protected)	☐ Avoidance areas with no public access ☐ To preserve value of areas in their present state. ☐ Requires measures to remain undeveloped.	☐ Human activity prohibited except for maintenance & management activities. Some scientific study allowed. ☐ Existing infrastructure maintenance ☐ Emergency response and fire control	☐ None, except as required for public health, safety, and welfare. ☐ Does not allow buildings, trails, etc.

Area	Purpose	Activities	Permitted Facilities
PROTECTED – SPADEFOOT TOAD POOL (Within "Future County Use" Area East of Eagles Nest Road) **(SSHCP - Protected)**	☐ Avoidance area with no public access ☐ To preserve value of area in its present state. ☐ Requires measures to remain undeveloped.	☐ Human activity prohibited except for maintenance & management activities. ☐ Some scientific study. ☐ Existing infrastructure maintenance ☐ Emergency response and fire control	☐ None, except as required for public health, safety, and welfare. ☐ Does not allow buildings, trails, etc.
PROTECTED POOL AREAS (Within "Future County Use" Area West of Eagles Nest Road) **(SSHCP – Nature Study Area)**	☐ Areas that can sustain light to moderate use, but not heavy use. ☐ Intended for general public access and use, while still preserving natural areas. ☐ Generally applied to large areas that can sustain public use.	☐ Individuals and small groups, with occasional large groups. ☐ Limited picnicking along trails. ☐ Monitoring, maintenance, and management activities	☐ Drinking fountains ☐ Portable restrooms ☐ Trails (surfaced and un-surfaced) ☐ Trail stops ☐ Observation points ☐ Interpretive signs ☐ Some family picnic tables ☐ Roads and/or parking only if no other alternatives in less restrictive areas. ☐ Facilities that provide for preserve maintenance & management. ☐ Education facilities ☐ Fishing pier
FUTURE COUNTY USE **(SSHCP – Same)**	☐ Set-aside land for future park or economic development use.	Can be used for immediate use if project meets uses listed in Mather Specific Plan and Mather Park Master Plan. All permitted active and passive recreation as well as urban development.	Park facilities or urban development. Not limited to, but could include the following: ☐ Caretaker facilities ☐ Trails for maintenance and emergency access ☐ Many, including interpretive centers, trails, large picnic areas, playgrounds, etc. ☐ Utilities ☐ Economic development

Area	Purpose	Activities	Permitted Facilities
AIRPORT **(SSHCP – Sacramento Mather Airport)**	☐ To support the regional economy by providing air cargo hub operations and ancillary commercial facilities	Operations and commercial development consistent with the Mather Airport Master Plan	Commercial and general aviation operations combined with supportive infrastructure (including commercial buildings and offices)
PROTECTED POOL AREAS WITHIN "AIRPORT" AREAS **(SSHCP – Protected Mather Airport)**	☐ Avoidance areas with no public access ☐ To preserve value of areas in their present state. ☐ Requires measures to remain undeveloped, but minor work maybe be needed periodically for installation or upgrading of aircraft navigational equipment, etc. ☐ Land use compatible with aircraft operations	☐ Human activity prohibited except for maintenance and management activities, including mowing and vegetation control on airport property necessary to comply with Federal Aviation Regulation (FAR) Part 139 and FAA Advisory Circular 150/5200-33A "Hazardous Wildlife Attractants On Or Near Airports." Such activities are typically conducted during dry periods. Due to safety and security requirements, scientific study will not be allowed within the Airport Operations Area (AOA) ☐ Emergency response and fire control ☐ Biological monitoring	☐ None, except as required for public health, safety, and welfare, including those required for safe aircraft operations. ☐ Any installation of navigational and related equipment will be done in accordance with FAA requirements and will be subject to environmental assessments pursuant to CEQA and NEPA

Area	Purpose	Activities	Permitted Facilities
POSSIBLE AGGREGATE MINING AREA **(SSHCP – Future County Use – Subarea)**	□ For uses approved by County that are compatible with uses on adjacent properties including aggregate mining, economic development uses, park uses or creation/restoration of vernal feature for mitigation purposes	Available for immediate use if project is consistent with uses authorized in Mather Specific Plan. All permitted mining, urban development, recreation and vernal pool creation/restoration uses. Aggregate mining will only be considered if mining activities will not impact vernal pools on adjacent vernal pool preserve.	All facilities that will support the use(s) that are approved by County for this area provided the facilities are consistent with the Mather Specific Plan development standards and guidelines.

Dear Mr. Lake:

Subject: Initiation Of Mather-Related General Plan Amendment And Approval To Proceed With Application For Federal Wetland Fill Permits At South Mather

This letter is regarding the contents of the above referenced document that was on the County of Sacramento, Board of Supervisors Meeting Agenda for February 22, 2006. The document, or report, discussed plans to change land uses for South Mather that appears to affect Sacramento Mather Airport. The Federal Aviation Administration (FAA) San Francisco Airports District (ADO) Office reviewed the contents of that document and provides the following comments.

Sacramento Mather Airport is a federally funded obligated airport, having received Airport Improvement Program (AIP) funds for maintenance and the safe operation of the airport. As such, the airport is required to comply with all of its signed Airport Sponsor Assurances, which includes compliance with certain compatible land use assurances. Compatible land uses are uses of airport property that provide the greatest amount of safety to persons and property using the airport. The airport sponsor is also required to reasonably maintain, through zoning, outright ownership, or other avenues, control of adjacent land areas where incompatible land use could affect the safe operation of aircraft using the airport, such as uses that attract large numbers of people. Of concern, also, is the environmental impact that any land use may have on airport property. Any action that might affect the operation of the airport must be reviewed and approved by the Federal Aviation Administration (FAA).

The document makes reference to a Wetlands Preserve, pools, protected species of wildlife (Western Spadefoot Toad), recreational land-use of dedicated airport property and possibly, some sort of university environment. We have also concerns regarding to operation of landfill sites on airport property. Having not seen the complete "Plan", inclusive of maps and attachments, showing proposed road realignments, and the location of these wildlife areas and possible university, our analysis of this plan from an aviation

compatibility standpoint is incomplete. Also, it is not know whether the airport sponsor supports this plan. However, it must be noted that any use that introduces wildlife, or wildlife attractants, to the airport environment is incompatible with safe airport operations.

Prior FAA approval, the ADO needs to review the Airport Development Areas, contained in Attachment A, as well as, the entire plan, complete with attachments. It is the responsibility of the airport sponsor to coordinate with FAA proposed projects affecting the airport. Information on this project can be sent to my attention at the following address:

RE: SSHCP EIR/EIS Scoping Comments - DERA Control Number (03-PLE-0637)

Dear Ms. Horizumi;

On behalf of the **Sacramento County Farm Bureau and the Amador, El Dorado, Sacramento Cattlemen's Association**, we wish to express our concern regarding the joint draft environmental impact report and environmental impact statement for South Sacramento Habitat Conservation Plan (SSHCP).

Farm Bureau is California's largest farm organization representing roughly 91,000 members throughout the state. Farm Bureau strives to protect and improve the ability of farmers and ranchers engaged in production agriculture to provide a reliable supply of food and fiber through responsible stewardship of the land's resources. The Sacramento County Farm Bureau's purpose is to protect and promote agricultural interest throughout Sacramento County and to find solutions to farm, farm home and rural community problems.

Agriculture provides society with not only open space, wildlife habitat, and flood protection but also food and fiber. Sacramento County agriculture represents more than a $365 million industry in farm gate sales. The SSHCP must fully acknowledge the importance of production agriculture for the sake of producing food and fiber. Not just for its ability to provide habitat. The conservation easements that will be offered by the implementing agency to a willing seller must provide for the continuance of farming practices. Agriculture must have the ability to move from one crop to the other without any additional restrictions beyond state or federal law. All agricultural practices must be covered and provided for its continuation for easements established pursuant to the SSHCP. Activities covered should include but are not limited to discing, spraying, planting, harvesting, irrigating, ditch cleaning, etc. Without the ability of an agricultural landowner to perform the tasks of normal farming practices; the SSHCP will have little benefit to anyone in agriculture.

With climate change, changing soil conditions, and the varying supply of water, farmers must often plant new types of crops in order to continue farming. For example, the conditions may make it more efficient and profitable for a farmer to change from row crops to vineyards. The SSHCP must not impose additional requirements that would prevent this from occurring.

In addition, the SSHCP must integrate a non-participating neighboring landowner assurance ("Good Neighbor") Policy. The "Good Neighbor" policies and "Safe Harbor" policies established under state or federal law must be incorporated into the SSHCP so that participants can work directly with the implementing SSCHP authority instead of having to work with multiple agencies for approval.

Furthermore, the SSHCP must include a provision that use of land that does NOT have an easement on it can not be limited by the County because it is "targeted" or "desirable" land for habitat mitigation.

To conclude, the EIR/EIS must assess impacts to agricultural productivity given the conservation easements provided to landowners. The SSHCP must also include a 'Good Neighbor Policy' and a 'Safe Harbor Agreement'. These must be clearly defined and provided for those who are enrolled in the SSHCP and to their neighbors not enrolled into the SSHCP.

Thank you for your consideration.

Sincerely,

Ken Oneto

Subject: **Notice of Preparation of a Joint Draft Environmental Impact Report and Environmental Impact Statement for the South Sacramento Habitat Conservation Plan (Control Number 03-PLE-0637)**

Dear Ms. Horizumi:

Sacramento Regional County Sanitation District (SRCSD) and Sacramento Area Sewer District (formerly known as CSD-1) have reviewed the Notice of Preparation of a Draft Environmental Impact Report for the South Sacramento Habitat Conservation Plan and have the following comments:

The Sacramento Area Sewer District (SASD) provides local wastewater collection and conveyance to the urbanized, unincorporated areas of Sacramento County, the cities of Rancho Cordova, Elk Grove and Citrus Heights as well as portions of the City of Sacramento and Folsom. These local pipelines are designed to carry peak wet weather flows of less than 10 million gallons per day (MGD).

Wastewater from local collection agencies (SASD, the City of Sacramento and City of Folsom) is discharged into the SRCSD interceptor system and treated at SRCSD's Sacramento Regional Wastewater Treatment Plant (SRWTP) in Elk Grove. SRCSD facilities (interceptor pipelines and pump stations) are designed to carry peak wet weather flows of greater than 10 MGD.

SASD's *Draft Sewerage Facilities Expansion Master Plan Update 2006* (Master Plan Update 2006) and its associated Supplemental Environmental Impact Review (SEIR) is expected to be adopted by the SASD Board of Directors in August 2008.

SRCSD is currently working on an Interceptor Sequencing Study to evaluate the *Interceptor Master Plan 2000* (MP 2000) and determine when its next master planning document will be developed.

SRCSD and SASD are two separate agencies. Each should be listed separately under "Project Permittees (Partners)" and under the section "Intended Uses of the EIR."

Board of Directors
Representing:

County of Sacramento

County of Yolo

City of Citrus Heights

City of Elk Grove

City of Folsom

City of Rancho Cordova

City of Sacramento

City of West Sacramento

Mary K. Snyder
District Engineer

Stan R. Dean
Plant Manager

Wendell H. Kido
District Manager

Marcia Maurer
Chief Financial Officer

Under **Covered Activities**, sanitary sewer facilities for both SASD and SRCSD (i.e. lift stations, pipelines and pump stations) as well as recycled water facilities should be included along with wastewater treatment facilities.

Under the section **Possible Environmental Effects of the Proposed SSHCP** Public Facilities, assessment of how habitat preserves may affect placement of future public service extensions should be expanded to include recycled water along with water, sewer and power lines. Agencies involved in providing public services should include SRCSD as well as SASD.

If you have any questions regarding these comments please contact me at (916) 876.9994.

Sincerely,

Sarenna Deeble

Sacramento, CA 95814

SUBJECT: Comments on the Notice of Preparation of a Joint Draft Environmental Impact Report and Environmental Impact Statement for the South Sacramento Habitat Conservation Plan (Control Number 03-PLE-0637)

Dear Ms. Horizumi;

Thank you for the opportunity to review and comment on the Joint Draft Environmental Impact Report (DEIR) and Environmental Impact Statement (DEIS) for the South Sacramento Habitat Conservation Plan (SSHCP). The SSHCP will provide for the conservation of 40 covered species and their associated habitat types. The plan identifies 18 different habitat types including vernal pool aquatic and upland habitat, other wetland habitats, oak woodland, and rural agricultural crops. The SSHCP project area is approximately 341,000 acres within south Sacramento County (unincorporated area) and includes the cities of Rancho Cordova, Elk Grove, and Galt. Southgate Recreation and Park District lies entirely within the SSHCP project area and is included within the following SSHCP Conservation Zones: 1e, 3a, 3b, and 4 (Attachment A).

The District is responsible for the planning of parkland, open space and recreational facilities and the ownership and maintenance of existing and planned facilities within the District boundaries. The District is committed to providing recreational opportunities, and safe and attractive parks and open spaces that make a positive contribution to the quality of life in the South Sacramento area. It may be helpful for you to review the District map of the District boundaries and the respective facilities, which would potentially be impacted by the South Sacramento Habitat Conservation Plan (Attachment B).

The District requests that the following comments, which were approved by the Southgate Board of Directors at their August 19, 2008 meeting, be considered and included in the DEIR/DEIS where applicable.

LAND USE

The proposed SSHCP conservation strategy will protect approximately 8,000 acres of habitat inside the Urban Development Area (UDA). The UDA corresponds to land within the County's Urban Services Boundary (USB), and to land within the city limits of Rancho Cordova, Elk Grove, Galt, and Galt's adopted sphere of influence.

Assistant General Manager
Maureen Casey

Of the 8,000 acres of habitat to be preserved within the UDA, a measure to establish a core preserve of at least 3,000 acres has been identified within the District's Boundaries as part of Conservation Zone 3b.

The District requests that the DEIR/DEIS assess how the establishment of habitat preserves and mitigation measures proposed for Zones 3a and 3b will affect the land use plans for the following County Planning Areas: Florin-Vineyard "GAP", North Vineyard Station, and Vineyard Springs. The District has cooperated with Developers and the County to identify park sites and open space, using smart-growth principles, within these adopted land use plans.

In addition, the SSHCP has measures to preserve a 600 foot wide habitat corridor along Laguna Creek and a 300 foot wide habitat corridor with variances along Morrison, Elder and Gerber Creeks. These creeks are within the District's boundaries and are part of multiple planning efforts for open space corridors including a recreational trail system.

The District requests that the DEIR/DEIS also assess how the establishment of habitat preserves and mitigation measures proposed for these creekways will affect the District's planning efforts. The District is an active participant in the Upper Laguna Creek Collaborative (ULCC) and is planning to provide a recreational trail through the Laguna Creek Open Space Corridor. The District is also working with the County to provide recreational trails within the Gerber/Elder Creek Open Space Corridors and the Morrison Creek Open Space Corridor.

The District wants to ensure that the SSHCP is not in conflict with the District's Master Plan. If it is determined that the SSHCP will impact the District's existing facilities or its opportunities to acquire parkland and open space, the District requests to work with the County to resolve any differences and to jointly plan any preserves that will be adjacent to the District's existing and/or future facilities.

PUBLIC FACILITIES

State laws authorize recreation and park districts to provide recreation programs, local parks, and open spaces. (Public Resources Code Section 5780) The District's Level of Service goal is to provide 5 acres of parkland per 1,000 people and to maintain a balance of open space and recreation facility development. The District accepts, through its planning process, the responsibility of stewardship and habitat conservation of these open space areas in cooperation with the County and other regulatory agencies.

The District is concerned that the SSHCP's Conservation Strategy and Plan Implementation may affect the District's opportunities to own and manage open space properties with established habitat preserves and requests that the DEIR/DEIS evaluate the organizational structure and criteria of the SSHCP and the restrictions that it may place on local recreation and park district's authority to own and manage such properties.

As mentioned in the previous section, the District is also concerned about the effects that the SSHCP's may have on parkland and open space acquisition by the District. The SSHCP may affect the placement of future park sites, recreational trails and public facilities, thereby limiting the District's ability to provide recreational opportunities to the residents of the community.

TRANSPORTATION/CIRCULATION

As roadways become more congested the need for alternative transportation options increases; bicycle and pedestrian recreational trails can serve as commuter routes and provide community linkages that may decrease the number of personal vehicle trips for residents. The District is planning recreational trails within the Laguna Creek and Gerber/Elder Creek Corridors that will serve the residents of the Vineyard Springs, Florin-Vineyard GAP, and North Vineyard Station communities. These trails will serve as alternate transportation routes and will provide linkages to parks, schools, offices and shopping centers.

The District requests that the DEIR/DEIS assess the impacts on the Districts ability to provide these recreational trails and evaluate the possible loss of alternate transportation routes in these communities.

BIOLOGICAL RESOURCES

The District currently manages approximately 195 acres of open space which includes the Laguna Creek Parkway, Dunmore Preserve, and Kingsbridge Open Space Preserve (Attachment B). The District is also expected to acquire an additional 210 acres of open space within the North Vineyard Station Specific Plan Area and will be the designated Preserve Manager for the Gerber/Elder Creek Preserve. These open space areas include habitats and biological resources that are identified within the SSHCP for preservation.

Currently, the Laguna Creek Parkway offers a recreational trail within the creek's open space corridor and the Kingsbridge Open Space Preserve is adjacent to the Tillotson Parkway and Churchill Downs Community Park. The District successfully manages these open spaces and minimizes the impacts and edge effects of the active and passive recreational activities that occur within or adjacent to these properties.

Providing passive recreational opportunities such as bicycle and pedestrian trails, interpretative signage and nature viewing areas can offer environmental education experiences, promote stewardship and increase public awareness and support for natural preserve areas.

The District requests that the DEIR/DEIS consider passive recreational land-uses compatible with the conservation goals of the SSHCP. The District also encourages the establishment of preserve buffers and requests the DEIR/DEIS evaluate the benefits of allowing passive recreational activities within established preserve buffers.

RECREATIONAL ACCESS

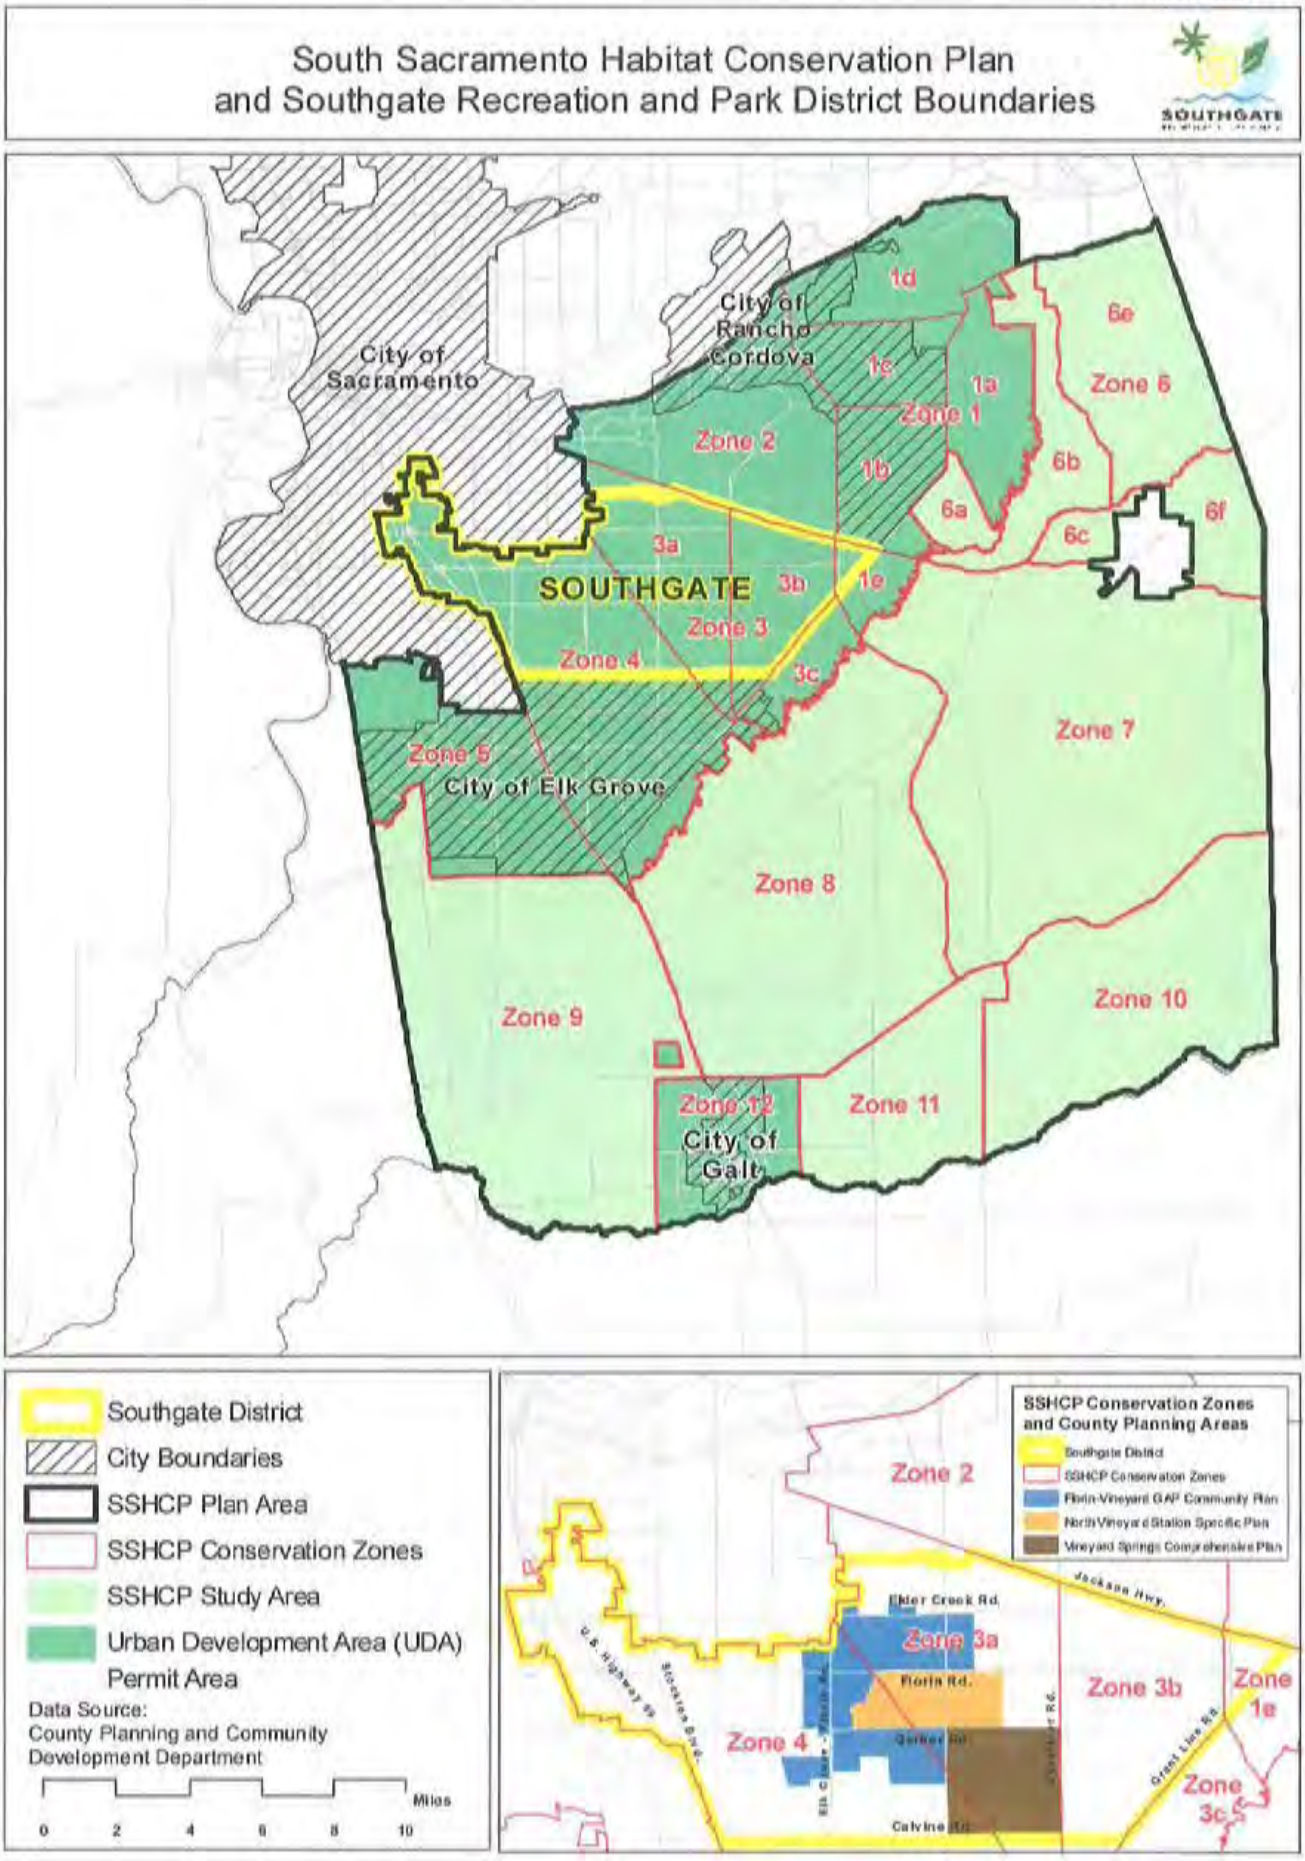
The District offers passive recreational access to open space areas by creating bicycle and pedestrian trails with minimal landscaping around the perimeter of open space preserves or within open space creek corridors. Public access to open space areas with sensitive habitat is limited by post and cable fencing and signage. The District also minimizes the edge effects of active and passive recreational land use by managing and maintaining open space preserves in accordance with Operations and Management Plans developed by regulatory agencies.

The SSHCP considers passive recreational activities such as hiking, bicycling, equestrian, and bird watching generally compatible with conservation goals. The District supports this consideration and requests that the DEIR/DEIS assess the potential to allow limited active and passive recreational activities within or adjacent to habitat preserves.

Once again the District would like to thank the County of Sacramento Department of Environmental Review and Assessment for the opportunity to comment on the Notice of Preparation of a Joint Draft Environmental Impact Report and Environmental Impact Statement for the South Sacramento Habitat Conservation Plan. The District appreciates the County's consideration of the comments and requests in this letter. The District shall coordinate with the County and all related agencies to minimize the effects of significant impacts and maximize the availability of parkland, open space and recreational facilities throughout the project area for the community.

Please continue to forward documentation related to this project to the District. If you require additional information or assistance please do not hesitate to contact me at (916) 428-1171, ext. 29, or via e-mail at mcasey@southgaterecandpark.net.

Sincerely,



Maureen Casey

Workshop Script

South Sacramento Habitat Conservation Plan
UDA Conservation Strategy Alternatives Workshop
August 19, 2008

Following is the draft script for the August 19 UDA Conservation Strategy Alternatives Workshop as outlined at the August 8 Dry Run meeting.

1. Upon arrival workshop attendees will sign in and receive a numbered nametag, comment card/map packet and numbered stickers.
    a. Attendees will be directed to the refreshment area and then to the workshop tables.

The workshop will begin with a brief introduction by Michele McCormick. She will describe the evenings' workshop activities. The introduction will provide attendees with the following information:

- Why are we here tonight?
    i. We are going to begin mapping conservation alternatives for six zones within the Urban Development Area (UDA). This information will be considered in the EIR/EIS.

- What are we doing?
    i. Each attendee has been given numbered comment sheets and stickers to coincide with their numbered nametags.
    ii. The stickers are green and red. Please use the green stickers to indicate areas where you would like to see habitat conserved. Use the red stickers to indicate where you do not feel are appropriate for a preserve or you may have a particular concern with a preserve in a given area.
    iii. It is essential to provide a brief explanation of your selections that correlate to the sticker number ("sticker 17-a: …there is an occurrence of Orcutt grasses at this location…sticker 17-b"). You can provide written descriptions of the habitats or species populations you would like to conserve and/or indicate habitat areas that might not be highlighted.

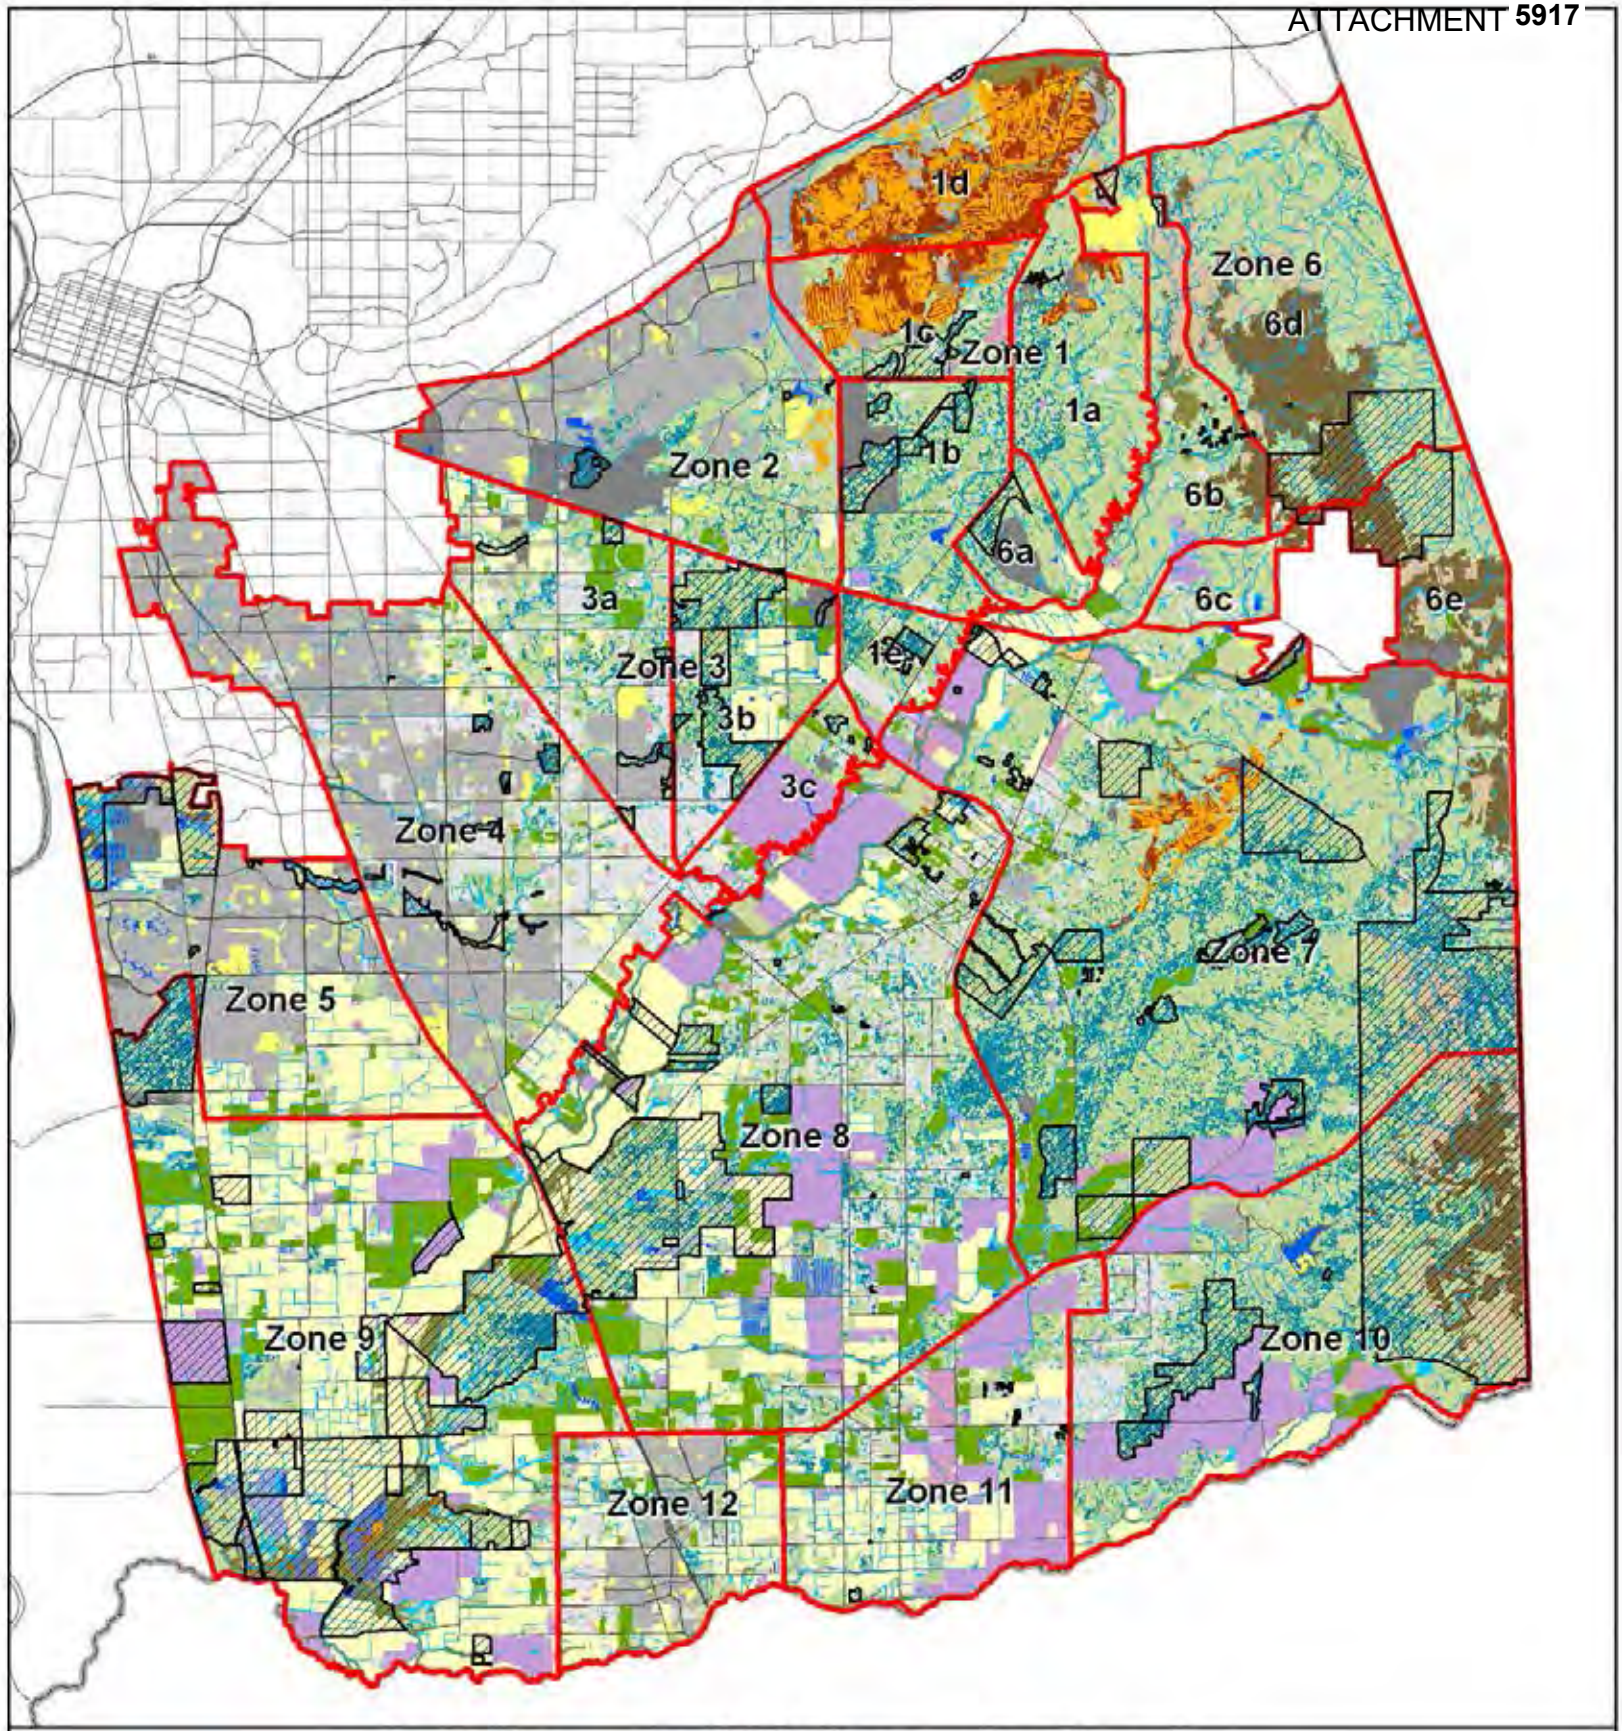
    iv. Please try to provide fairly specific geographic information of where you placed your stickers and do not overlap stickers with other participants ("…north of intersection of Grantline at Sunrise…"). We will be collecting the comment cards tonight and collating them with the stickers on the maps.

    v. Each table will have staff available to assist with the exercise and moderate the group.

vi. Towards the end of the mapping exercise, **if we have time** (about 30 minutes) we will re-convene and briefly review the maps. We should be able to see some obvious preferences after the exercise is complete.

- How will the data obtained tonight be used?
  i. The information obtained tonight will be used to help identify conservation alternatives for the EIR/EIS.
  ii. A summary of the results will be published to in a scoping report due for release towards the end of September or early October.

II. After the workshop format is explained, Rich Radmacher is introduced and gives a very brief explanation of the SSHCP.
- UDA
- Riparian
- Vernal Pools
- Grasslands



III. After Rich's explanation, meeting attendees are released to begin the mapping exercise.

Participant Number: 1

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

1-a Preserve a creek buffer the length of Laguna creek that averages 600 feet eg 300' each side of the creek or 100' one side & 500' the other side. the width would vary based on the resource & constraints. Creek corridor can connect vernal pools as well as uplands preserves.

1-b Preserve vernal pools - important & unique pools here -

1-c another important vernal pool area that needs to have land preserved - both Carpenter Hills & to N

1-d important to preserve Morrison Creek with buffer

1-e Heritage Falls - Preserve VP's

1-f Early Triangle - Vernal pools should be preserved.

1-g Preserve vernal pools in a long connected preserve.

1-h Important for riparian. Established & regenerating oaks. Use

1-i Preserve Runway pools

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

3-a: This section of the map seems to contain the vernal pools or other "water parts" that start the Laguna Creek water system

3-b: This section seems to contain critical habitat for vernal pools. If development continues into this habitat how does stormwater run-off affect the vernal pools and creeks?

3-c: From Folsom-South Canal to ~~Bo~~ Vinyard there shows the Upper Laguna Creek Watershed that ~~contains~~ demonstrates potential to be protected for riparian habitat, pedestrian walkways and possibly a wildlife corridor

3-D: If this section is existing farm land then it should be set aside as such with the possibility of also using it as a buffer zone for nearby vernal pools and creeks.

21-a RED - AREA Along GRANT Line Rd is adjacent to city of ELK Grove and has been Farmed Continuously for >100 years, so Little Preservation Value

21-b RED - Area is NOT suitable for preservation because it Could be used for PASSIVE RECREATION since it is close to city of Elk Grove & INCONSISTENT with Farming.

23a & 23b:

Land south of Eschinger Rd. (outside UDA) adjacent to future Elk Grove SOI Amendment area should be considered as a critical buffer between future development in the SOI area and permanent preserve land. As such, this area provides / supports some of the key elements of the ITCP including:

1. Interconnecting future and existing preserves
2. Minimization of Edge effects
3. Support of greater biodiversity in the form of corridors allowing for animal movement and hawk foraging

This land area South of Eschinger should be given additional credit ~~in~~ for preserving land as a permanent preserve line against future development.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

- For vernal pool reserves, please include uplands with resources for salamanders (burrows from ground squirrels, etc.)

27-a Connect to the nearby existing reserves. Use large culverts to hydrologically connect the reserves across roads.
27-b Connect this area to 27-a
27-c connect this area to 27-a also
27-d restore Morrison Creek – use it for a riparian reserve/ flood control system – make the floodplain wide enough to incorporate riparian trees and shrubs (willow-cottonwood)
27-e Restore this portion of Morrison Creek and connect it to the City of Sacramento
27-f protect the vernal pools and Elder Creek
27-g connect to 27-f area
27-h connect this area to the existing reserves nearby
27-i connect this area to the existing reserves nearby
27-j connect these pools to the nearby reserve (across Florin Rd)
27-K connect these pools to the nearby reserve and restore the creek (Laguna) – connect the vernal pool area to the creek.
27-l connect all parts of Laguna Creek and restore it – protect a wide portion of the floodplain. How wide? wide enough to have large trees growing along the creek
27-m this should be connected to the rest of the creek restoration area and vernal pools nearby
27-n connect this part of the creek to the existing reserve → same comments in 27-l apply here

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

27-o connect the creek to the two existing reserves on both ends – restore the creek – same comments apply from comment 27-l

27-p connect the creek to the existing reserves and to 27-q – the idea is to have a creek system protected

27-r connect this area of vernal pools to the Galt water treatment plant area

27-s Connect this area to the existing reserve nearby

27-t connect this area to the nearby reserves – expand the floodplain of the creek also

27-u Connect this area to the nearby reserves to west & South

27-v same system → keep it hydrologically connected

27-w high density of vernal pools should be preserved

27-x this whole system (From North to South) needs protection, especially because of the density of pools

27-y connect this area to the reserves to the north

27-z connect this area to 27-y and the existing reserve to the South

27-aa connect this area of Laguna Creek to the reserves downstream – these are valuable headwater areas of Laguna Creek and will preserve water quality and wildlife/plants.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

28a – Green High concentration of high quality vernal pools running from Anatolia east toward Kiefer Landfill. Still potential for large-scale preserver in this area.

28b – Green vernal pools critical habitat area. Opportunity for connectivity between Mather to North + preserve (S) of Jackson Hwy.

28a Red – Preserve not feasible near "node" on Jackson Hwy / Excelsior. This is area being considered for next stage of logical growth for County. New growth area. Also – preserve/open space inconsistent w/ Blueprint policies.

28b – Red Elder Creek is very disturbed in this area. Could be improved through restoration but doesn't make sense to preserve in current state.

28c – Green High concentration of vernal pools in close proximity to Laguna Creek. Also – Laguna Creek is habitat for variety of protected species

28d – High concentration vernal pools w/ potential to connect to Anatolia preserve

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

Red 49a – Adjacent to Grant Line Rd. is an ideal ~~location~~ ↓ylable for a major retail center for Cordova Hills.

Green 49a – ~~Mgbe~~ The highest density of vernal pools exist in this area. A core preserve in this area should entail a preserve boundary associated with watersheds & clear hydrological barriers such as topo.

Red 49b – ~~Mobile~~ Only viable location within Cordova Hills for a regional shopping center / town center.

Red 49c – ~~Min~~ Minimal wetland resources exist in this area. Does not make sense to preserve Swainson Hawk ~~with~~ foraging habitat on non-prime ag land with minimal wetlands & no alfae. Preserving foraging habitat within the urban services boundary only pushes development further out, which worsens air quality, increases traffic, & ultimately leads to economic losses for the region. Need a balance between Swainson Hawk needs & human needs.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

502 – ALL AREAS EAST OF CRAWFORD, NORTH OF THE KIEFER LANDFILL, AND NORTH TO THE ALIGNMENT OF WHITELOCK ROAD SHOULD BE PRESERVED. THIS AREA INCLUDES ONE OF THE MOST OUTSTANDING LARGE VERNAL POOL LANDSCAPES IN THE WORLD INCLUDING SIGNIFICANT ENDANGERED SPECIES POPULATIONS. FOR EXAMPLE THE MOST SIGNIFICANT POPULATION OF ORCUTTIA VIRIDIS IS HERE. FARTHER EAST IS THE ARCHENT VALLEY OAK RIPARIAN FOREST NEAR THE EASTERN EDGE OF THE URBAN SERVICES BOUNDARY. ROLLING PRAIRIE HILLSIDES BETWEEN THESE TWO AREAS ARE AMONG THE MOST SIGNIFICANT PRAIRIE HABITAT NEAR SACRAMENTO. IT IS IMPORTANT FOR RAPTOR FORAGING AND HAS HIGH POTENTIAL FOR URBAN RECREATION BECAUSE OF ITS OUTSTANDING VIEW SHEDS. THIS LINKED COMPLEX HAS EXTREMELY HIGH PRESERVE POTENTIAL.

506 VERNAL COMPLEXES SOUTHWEST OF THE CORNER OF CRAWFORD AND DOUGLAS ARE EXTREMELY DENSE AND HAVE A DOCUMENTED FULL RANGE OF SPECIES INCLUDING NUMEROUS LISTED THREATENED AND ENDANGERED SPECIES ASSOCIATED WITH VERNAL POOLS. VALLEY AREAS ARE OUTSTANDINGLY INTACT AND CAN PROVIDE THE FULL RANGE OF UPLAND PRAIRIE ECOLOGICAL SERVICES. THESE RANGE FROM POLLINATION NEST AREAS REQUIRED FOR VERNAL POOL PLANT SEED SET TO FORAGING BY MIGRATORY RAPTORS LIKE SWAINSON, ROUGH-LEGGED AND FERRUGINOUS HAWKS

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

51a West Fork Vernal pools into Deer Creek adjacent to Mitigation Bank. watershed should be studied for expansion of bank/preserves.

51b-h Vernal pools, esp. Those w/ connectivity & other habitat/ecological value and connectivity should be conserved in preserves. (zone 2)

51j Frye Creek, west of Eagles nest, should be added to existing preserves due to wetland/ecological value & connectivity

51k East of Excelsior, 160 acres possible habitat value, vernal pools.

51l West of Eagles nest – wetland/vernal pool habitat, adjacent to protected area – value for connectivity.

51m&o Laguna Creek (north) – habitat value, wetlands. Habitat like this should be considered in preserves, as they support a wide range of species. m whole ½ section south

51p&t Laguna (north) Creek – whole section (SP) = Quarter N/W section and section northeast (51t) wetland-ecological values need preserving. Valuable to ecosystem

51qr-whole section – wetland, vernal pool values – irreplacable, unique eco. value habitat (entire habitat type marked green in Zone 1) (i applies to)

51 Y-YY entire watershed of Deer Creek into Mitigation bank and south, should be included in conservation/protection areas due to value to species and systems. Deer Creek is also habitat to bats in places – though bats aren't listed, they are in need of protection.

51s Fork (west) of Coyote Creek into Coyote Creek/Canyon Creek would have ecological habitat value to wildlife and ecolog. systems important to wildlife (tho they may not live in the habitat). This applies to all habitat of this character.

51v – along with areas marked by 51 Q & t, this watershed has ecological value that needs to be considered for preservation.

51 v & w Alder Creek and habitat south (oak woodland? grazing) has habitat value and needs to be conserved for connectivity value since areas north of 50 are developed. In fact the

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

Environmental Review Process – EIS/EIR **Comment Card** Participant Number: 51

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

51 v & w cont. being pushed out. It is critical that large swaths of contiguous habitat are preserved. Habitat that includes creeks & streams & wetlands are especially needed.

51 x wetland habitat & open space (for wildlife) value, though I see a seasonal impound there, so habitat may be degraded from grazing? If so, the vernal pools wetlands need to be protected from the cattle.

51 aa – west of Prairie City Road – Buffalo Creek watershed. Same reasons as above. Additional wetland value occurs outside USA boundary to the southeast

51 bb – watershed & vernal pools 51 ee/ff: Same comments.

51 cc – west of South Canal & east of Grantline & watershed/vernal pools habitat has high value & needs to be included in conservation/protected area. 51 dd: Morrison Creek watershed – rapid surrounding development necessitates protection in this watershed

NOTE: Zone 1 has concentrations of vernal pools, creeks with nearby vernal pools & wetland areas and these habitats are unique enough and important enough ecologically to be seriously planned for preservation, protection, limitations on use/development, etc. This habitat ecological value cannot be re-created, nor is it more common in the area. Rapid development in the County is reducing habitat and the ecological purposes that occur within Conservation is now or never for this region.

Zone 2 51 gg, hh, ii, jj (plus 51 b–i from pg 1) – watershed of Morrison Creek & scattered wetlands/vernal pools need to be considered for protection, whether in preserves, easements, mitigation banks, or via limitations from within permitting requirements/restrictions. Development is encroaching and displacing wildlife & reducing habitat, and so protected areas and linkages need to be retained. This includes wildlife movement corridors.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

Environmental Review Process – EIS/EIR

Comment Card

Participant Number: 51

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

zone 3

51 KK Elder Creek, west of Bradshaw – watershed, wetland, vernal pool habitat is of value & needs protecting.

51 LL area south of Jackson Rd / north of Elder Creek, west of protected easement is wetland habitat adjacent to existing easement & would be of benefit to include into this protected area in a contiguous way.

51 mm South of Jackson Rd – include into existing protected area to south.

51 oo any development in this watershed needs to be set back at least 200', with riparian habitat maintained or restored. This should apply to any & all development/"improvement" along creeks, streams or wetlands.

zone 4 51 pp area south of Vintage Park Drive (NW corner of SE ¼ section) suggest adding this Qtr section to mitigation ~~section~~ area to North.

51 QQ Add to mitigation protected parts of creek to west.

zone 5 51 rr/ss/tt/ww Include in mitigation area already protected. Any other habitat that is of ecological value or that would connect two or more protected areas should be acquired. This applies to entire HCP area.

51 a, b, c (red) infeasible to protect

zone 12 51 yy include in mitigation area – would enable protected connectivity & protection of ecological value

51 zz Deadman's Gulch, east of Christensen Rd: wetland habitat / creek has ecological value that needs protecting. watershed protection enables movement corridors along creeks / riparian zones. Very important habitat ~~area~~ Applies to all my comments where creeks/streams or "dots" of vernal pools occur.

51 aaa patchwork of wetlands may be important to gene exchange if movement is occurring or able to occur → conserve this value

bbb wildlife movement corridors are critical! They need to be studied and built into HCP. This is a #1 priority.

59 – We are landowners of the area that comes down in a "V" in zone one. There is a lot of land for mitigation to the east of this property that is within the Urban Service Boundary line. ~~this~~ This, we feel the V ~~should~~. since it is within the USB should be developed. The fact that a Catholic University is close by is an additional reason to allow development in the "V" area.

1-a Preserve a creek buffer the length of Laguna creek that averages 600 feet eg 300' each side of the creek or 100' one side & 500' the other side. The width would vary based on the resource & constraints. Creek corridor can connect vernal pools as well as uplands preserves.

1-b Preserve vernal pools - important & unique pools here -

1-c another important vernal pool area that needs to have large preserves - both Cordova Hills & to N

1-d Important to preserve Morrison Creek with buffer

1-e Heritage Falls - Preserve VP's

1-f Early Triangle - Vernal pools should be preserved.

1-g Preserve vernal pools in a long connected preserve.

1-h Important for riparian. Established & regenerating oaks. Dne

1-i Preserve runway pools

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

3-a: This section of the map seems to contain the vernal pools or other "water parts" that start the Laguna Creek water system

3-b: This section seems to contain critical habitat for vernal pools. If development continues into this habitat how does stormwater run-off affect the vernal pools and creeks?

3-c: From Folsom South Canal to ~~be~~ Vinyard there shows the Upper Laguna Creek Watershed that ~~remains~~ demonstrates potential to be protected for riparian habitat, pedestrian walkways and possibly a wildlife corridor

3-D: If this section is existing farm land then it should be set aside as such with the possibility of also using it as a buffer zone for nearby vernal pools and creeks.

Antonio Gonzalez

19 a - Find a name for the creek. Widen Creeks add native plants + trees to the area to prevent wash out.

19B Preserve as many Vernal pools in the largest area as possible. The houses can be concentrated in one areas

19 a red Developments need to be slowed
19b " or even stopped until the problems are fixed in those housing areas. (such as traffic lights.) etc.

19 c Extend preserve to include this area.

19d-e Marsh areas should be preserved also.

19 c red Again problems should b fixed concerning Strip malls + housing + traffic. Continued housing ruins habitat for wild life. Increased traffic also destroys wild life

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to. County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

23a & 23b:

Land south of Eschinger Rd. (outside UDA) adjacent to future Elk Grove SOI Amendment area should be considered as a critical buffer between future development in the SOI area and permanent preserve land. As such, this area provides / supports some of the key elements of the HCP including:

1. Interconnecting future and existing preserves
2. Minimization of Edge effects
3. Support of greater biodiversity in the form of corridors allowing for animal movement and hawk foraging

This land area South of Eschinger should be given additional credit ~~in~~ for preserving land as a permanent preserve line against future development.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

- For vernal pool reserves, please include uplands with resources for salamanders (burrows from ground squirrels, etc.)

27-a Connect to the nearby existing reserves. Use large culverts to hydrologically connect the reserves across roads.

27-b Connect this area to 27-a

27-c connect this area to 27-a also

27-d restore Morrison Creek – use it for a riparian reserve/flood control system – make the floodplain wide enough to incorporate riparian trees and shrubs (willow-cottonwood)

27-e Restore this portion of Morrison Creek and connect it to the City of Sacramento

27-f protect the vernal pools and Elder Creek

27-g connect to 27-f area

27-h connect this area to the existing reserves nearby

27-i connect this area to the existing reserves nearby

27-j connect these pools to the nearby reserve (across Florin Rd)

27-K connect these pools to the nearby reserve and restore the creek (Laguna) – connect the vernal pool area to the creek.

27-l connect all parts of Laguna Creek and restore it – protect a wide portion of the floodplain. How wide? wide enough to have large trees growing along the creek

27-m this should be connected to the rest of the creek restoration area and vernal pools nearby

27-n connect this part of the creek to the existing reserve → same comments in 27-l apply here

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

27-o connect the creek to the two existing reserves on both ends – restore the creek – same comments apply from comment 27-l

27-p connect the creek to the existing reserves and to 27-q – the idea is to have a creek system protected

27-r connect this area of vernal pools to the Galt water treatment plant area

27-s Connect this area to the existing reserve nearby

27-t connect this area to the nearby reserves – expand the floodplain of the creek also

27-u Connect this area to the nearby reserves to west & South

27-v same system → keep it hydrologically connected

27-w high density of vernal pools should be preserved

27-x this whole system (From North to South) needs protection, especially because of the density of pools

27-y connect this area to the reserves to the north

27-z connect this area to 27-y and the existing reserve to the South

27-aa connect this area of Laguna Creek to the reserves downstream – these are valuable headwater areas of Laguna Creek and will preserve water quality and wildlife/plants.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

28a – green – High concentration of high quality vernal pools running from Anatolia north east toward Kiefer Landfill. Still potential for large-scale preserver in this area.

28b – green – vernal pool – critical habitat area. Opportunity for connectivity between Matter to North + preserve (S) of Jackson Hwy.

28a red – Preserve not feasible near "node" on Jackson Hwy / Excelsior. This is area being considered for next stage of logical growth for County. New growth area. Also – preserve/open space inconsistent w/ Blueprint policies.

28b – red – Elder Creek is very disturbed in this area. Could be improved through restoration but doesn't make sense to preserve in current state.

28c – green – High concentration of vernal pools in close proximity to Laguna creek. Also – Laguna Creek is habitat for variety of protected species

28d – High concentration vernal pools w/ potential to connect to Anatolia preserve

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

47 a Preserve Blodgett Lake

47 B John Tracy 1000 acres has vernal pools

47 C Carli property has good vernal pools + creek

47 D SE half of Wakita proputy good vernal pools

47 E oaks on Mathes park tributary of Morrison Creek

47 F Wakita creek tributary of Morrison creek.

47 G Triangle Rock Frye creek preserve has 41 shelters for oak trees 37 living?

47 H Preserve Werre property for vernal pools and its proximity to large wetland area

47 I Lot was dedicated by A K T when Vineyard Springs was built

47 J Shehadeh property has vernal pools and Laguna creek. Frye creek joins Laguna on Shehadeh property

47 K Preserve Laguna Creek oak riparian habitat on Waegell property

Red 47 A Major flooding from Sunridge that shed jumps from Morrison creek headwaters down into Laguna creek

Red 47 B Inadequate flumes across Folsom S canal move water south flooding into Folsom S canal and cutting a new creek across Shalako onto Laguna Creek

Red 47 C Kiefer Landfill sits in an outcrop of Mehrten sands that are the aquifer under Sacto County. This a direct pipeline into aquifer.

over

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report for the proposed South Sacramento Habitat Conservation Plan. Please record a clearly legible **comment** correlating with **every** red and green **dot** placed on the Zone maps.

Red 49a – Adjacent to Grant Line Rd. is an ideal viable location for a major retail center for Cordova Hills.

Green 49a – The highest density of vernal pools exist in this area. A core preserve in this area should entail a preserve boundary associated with water sheds & clear hydrological barriers such as topo.

Red 49b – Only viable location within Cordova Hills for a regional shopping center/town center.

Red 49c – Minimal wetland resources exist in this area. Does not make sense to preserve Swainson Hawk ~~Hdg~~ foraging habitat on non-prime ag land with minimal wetlands & no alfae. Preserving foraging habitat within the urban services boundary only pushes development further out, which worsens air quality, increases traffic, & ultimately leads to economic losses for the region. Need a balance between Swainson Hawk needs & human needs.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Department of Environmental Review and Assessment, ATTN: Peter Morse, 827 7th Street, Room 220, Sacramento, CA 95814

SOA – ALL AREAS EAST OF CHANTLINE, NORTH OF THE KIEFER LANDFILL, AND NEXT TO THE ALIGNMENT OF WHITERACK ROAD SHOULD BE PRESERVED. THIS AREA INCLUDES ONE OF THE MOST OUTSTANDING LARGE VERNAL POOL LANDSCAPES IN THE WORLD INCLUDING SIGNIFICANT ENDANGERED SPECIES POPULATIONS. FOR EXAMPLE THE MOST SIGNIFICANT POPULATION OF ORCUTTIA VISCIDA IS HERE. FARTHER EAST IS THE ARCHENT VALLEY OAK RIPARIAN FOREST NEAR THE EASTERN EDGE OF THE URBAN SERVICES BOUNDARY. ROLLING PRAIRIE HILLSIDES BETWEEN THESE TWO AREAS ARE THE MOST SIGNIFICANT PRAIRIE HABITAT NEAR SACRAMENTO. IT IS IMPORTANT FOR RAPTOR FORAGING AND HAS HIGH POTENTIAL FOR URBAN RECREATION BECAUSE OF ITS OUTSTANDING VIEW SHEDS. THIS LINKED COMPLEX HAS EXTREMELY HIGH PRESERVE POTENTIAL.

SOB VERNAL COMPLEXES SOUTHWEST OF THE CORNER OF CHANTLINE AND DUNCAN ARE EXTREMELY DENSE AND HAVE A DOCUMENTED FULL RANGE OF SPECIES INCLUDING NUMEROUS LISTED THREATENED AND ENDANGERED SPECIES ASSOCIATED WITH VERNAL POOLS. VALLEY AREAS ARE OUTSTANDINGLY INTACT AND CAN PROVIDE THE FULL RANGE OF VALLEY PRAIRIE ECOLOGICAL SERVICES. THESE RANGE FROM POLLINATION NEST AREAS REQUIRED FOR VERNAL POOL PLANT SEED SET TO FORAGING BY MIGRATORY RAPTORS LIKE SWAINSON, ROUGH-LEGGED AND FERRUGINOUS HAWKS

51 v & w Cont.

being pushed out. It is critical that large swaths of contiguous habitat are preserved. Habitat that includes creeks & streams & wetlands are especially needed.

51 x wetland habitat & open space (for wildlife) value, though I see a seasonal impound there, so habitat may be degraded from grazing? If so, the vernal pools wetlands need to be protected from the cattle.

51 aa – west of Prairie City Road – Buffalo Creek watershed. Same reasons as above. Additional wetland value occurs outside UDA boundary to the southeast

51 bb – watershed & vernal pools 51 ee/ff: Same comments.

51 cc – west of South Canal & east of Grantline & watershed/vernal pools habitat has high value & needs to be included in conservation/protected area. 51 dd: Morrison Creek watershed – rapid surrounding development necessitates protection in this watershed

NOTE: Zone 1 has concentrations of vernal pools, creeks with nearby vernal pools & wetland areas and these habitats are unique enough and important enough ecologically to be seriously planned for preservation, protection, limitations on use/development etc. This habitat ecological value cannot be re-created, nor is it more common even in the area. Rapid development in the County is reducing habitat and the ecological processes that occur within. Conservation is now or never for this region.

Zone 2 51 gg, hh, ii, jj (plus 51 b–i from pg 1) – watershed of Morrison Creek & scattered wetlands/vernal pools need to be considered for protection, whether in preserves, easements, mitigation banks, or via limitations from within permitting requirements/restrictions. Development is encroaching and displacing wildlife & reducing habitat, and so protected areas and linkages need to be retained. This includes wildlife movement corridors.

zone 3

51 KK Elder Creek, west of Bradshaw – watershed, wetland, vernal pool hab. tat is of value & needs protecting.

51 LL area south of Jackson Rd / north of Elder Creek, west of protected easement is wetland habitat adjacent to existing easement & would be of benefit to include into this protected area in a contiguous way.

51 mm South of Jackson Rd – include into existing protected area to south.

51 oo any development in this watershed needs to be set back at least 200', with riparian habitat maintained or restored. This should apply to any & all development/"improvement" along creeks, streams or wetlands.

zone 4

51 pp area south of Vintage Park Drive (NW corner of SE ¼ section) suggest adding this Qtr section to mitigation ~~area~~ area to North.

51 QQ Add to mitigation protected parts of creek to WEST.

zone 5

51 rr/ss/~~tt~~/uu Include in mitigation area already protected. Any other habitat that is of ecological value or that would connect two or more protected areas should be acquired. This applies to entire HCP area.

51 a, b, c (red) infeasible to protect

zone 12

51 yy include in mitigation area – would enable protected connectivity & protection of ecological value

51 zz Deadman's Gulch, east of Christensen Rd: wetland habitat / creek has ecological value that needs protecting. watershed protection enables movement corridors along creeks / riparian zones. Very important habitat. ~~of~~ Applies to all my comments where creeks / streams or "dots" of vernal pools occur.

51 aaa bbb patchwork of wetlands may be important to gene exchange if movement is occurring or able to occur → conserve this value

Wildlife movement corridors are critical! They need to be studied and built in to HCP. This is a #1 priority.

EIS/EIR APPENDIX C-1

Draft CWA 404 Permit Strategy

CWA 404 Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan

U.S. ARMY CORPS OF ENGINEERS **BUILDING STRONG®**

February 2018

Background

The South Sacramento Habitat Conservation Plan (SSHCP) covers twenty-eight species of plants and wildlife, including ten that are state and/or federally-listed as threatened or endangered. The SSHCP is a regional approach to address issues related to planned development and species habitat conservation, following a comprehensive conservation strategy, over a 50-year period. The boundaries of the 317,655-acre SSHCP Plan Area are generally U.S. Highway 50 to the north, the Sacramento River levee and County Road J11 to the west, the county line with El Dorado and Amador Counties to the east, and the county line with San Joaquin County to the south. The six SSHCP Plan Partners are the County of Sacramento, City of Galt, City of Rancho Cordova, Sacramento County Water Agency, Sacramento Regional County Sanitation District, and the Southeast Connector Joint Powers Authority. The Plan Partners have formed a SSHCP Implementing Entity to carry out the HCP's commitments and requirements. The U.S. Fish and Wildlife Service's Sacramento Field Office (USFWS) will approve the SSHCP through a species incidental take permit issued to five of the Plan Partners and the SSHCP Implementing Entity under Section 10 of the Endangered Species Act (ESA 10), collectively termed "SSHCP Permittees" upon approval of ESA 10. Before it can issue its incidental take permit, the USFWS must internally consult under Section 7 of the ESA (ESA 7) and is required to comply with the National Environmental Policy Act (NEPA) and other related laws.

The U.S. Army Corps of Engineers (Corps) regulates discharges of dredged or fill material into waters of the U.S., including wetlands, under Section 404 of the Clean Water Act (CWA 404) through its Regulatory Program. Permits are issued to applicants only after a determination has been made that the proposed activity is the least environmentally damaging practicable alternative under the U.S. Environmental Protection Agency's (USEPA) 404(b)(1) Guidelines, which involves evaluating avoidance, minimization and compensation for impacts to waters of the U.S. Further, the Corps must comply with ESA 7, NEPA, Section 401 of the Clean Water Act (CWA 401), and Section 106 of the National Historic Preservation Act (NHPA 106) before authorizing an activity under CWA 404. Types of permits the Corps issues include general permits issued on a regional, nationwide, or programmatic basis for activities with minimal impacts on the aquatic environment, individually and cumulatively, and individual permits (standard and letters of permission) for those activities which do not fall under a general permit or have greater than minimal impacts. The Corps' Sacramento District (Sacramento District) administers the Regulatory Program in the Central Valley and Sierra Nevada California, the States of Nevada and Utah, and the Western Slope of Colorado.

Currently, the Corps reviews permit applications on an individual or case-by-case basis, which sometimes makes it challenging to evaluate avoiding, minimizing and compensating impacts to aquatic resources on a broader scale. As a result, the Corps' review is generally on the merits of the individual activity and the characteristics of the proposed project site, with limited ability to comprehensively assess where the risks, trade-offs and interactions among several projects and aquatic resources can be considered. Over time, environmental issues and development demands, especially in urbanizing areas, have resulted in adverse effects to the aquatic ecosystem that are not necessarily surprising, but fall short of more

ecologically meaningful and sustainable outcomes that a landscape-scale permitting solution may afford. For instance, permits issued by the Corps have led to a patchwork of wetland mitigation sites in certain areas, which may have disjointed or inconsistent preserve boundaries and be functionally compromised by abutting development. Furthermore, the distance between the permitted impact location and its mitigation site may be considerable, especially in cases where the compensation was accomplished through the purchase of credits at a mitigation bank or through an in-lieu fee (ILF) program.

The Sacramento District views the SSHCP as a remarkable opportunity to improve both species and aquatic resource protection in a coordinated way on a regional scale, taking into account planned development and providing greater certainty for the regulated public. With this in mind, the Sacramento District has been coordinating with the USFWS and Plan Partners, and others, since 2004 to develop and implement a "streamlined" approach to permitting under CWA 404 that encompasses a number of different permit types and processes. The Corps' "CWA 404 permit strategy" is intended to provide for better assurances and quicker permit decisions for the regulated public, while protecting aquatic resources to an equal or greater level in a manner consistent with existing regulations, policies and processes. The expectation of putting in place an effective and efficient CWA 404 permit strategy is based on a number of tenets upon which the SSHCP is founded including, but not limited to:

The Sacramento District views the SSHCP as a remarkable opportunity to improve both species and aquatic resource protection in a coordinated way on a regional scale, taking into account planned development and providing greater certainty for the regulated public.

- Protection of a broad range of species and habitats;
- Implementation of Low Impact Development Strategies (LIDS);
- Consistency with general plans;
- Avoidance of high quality vernal pool landscapes; and
- Preservation of watershed functions and stream corridors, and development of large, contiguous preserves, with particular focus on the Mather Core Recovery Area.

The CWA 404 permit strategy is being vetted through a public review process, inclusive of NEPA (as described in further detail below) and public notices distributed by the Sacramento District.

Benefits of CWA 404 Alignment

In addition to providing a regional platform to inform better and faster CWA 404 permit decisions, a USFWS-approved SSHCP provides several other benefits to the Sacramento District and its customers. Because the SSHCP is an action that may potentially significantly affect the quality of the human environment, the USFWS is in the process of completing an Environmental Impact Statement (EIS) under NEPA that will include impact analyses over a 50 year period of all SSHCP covered activities within the Plan Area. As a cooperating agency, the Sacramento District intends to use the EIS in a programmatic manner to underpin its CWA 404 permit strategy. Because the EIS will examine a range of reasonable HCP alternatives affecting waters of the U.S., it can serve as the basis for the Sacramento District's evaluation of alternatives under NEPA, and along with supplemental information provided to the Corps, the primary basis for evaluation of less damaging alternatives and mitigation under USEPA's 404(b)(1) Guidelines. The Sacramento

As a cooperating agency, the Sacramento District intends to use the EIS in a programmatic manner to underpin its CWA 404 permit strategy.

District will adopt the EIS and make its own Record of Decision (ROD) regarding the CWA 404 permit strategy's compliance with the 404(b)(1) Guidelines at the regional scale. Any necessary subsequent NEPA documentation prepared by the Sacramento District will tier from the EIS.

The CWA 404 permit strategy will rely, at all levels of permitting, on the SSHCP to address avoidance, minimization and requirements for compensatory mitigation for impacts to aquatic resources. Key to satisfying compensatory mitigation requirements, payment of HCP-required fees will dually fulfill a Corps-approved SSHCP In-lieu Fee (ILF) Program established by the Plan Partners. Substantial processing efficiency and improving aquatic resource protection at the regional level will result from the CWA 404 permit strategy's reliance on the compensatory mitigation ratio requirements for aquatic resources contained in the SSHCP. Implementation of on-the-ground compensatory mitigation projects would be consistent with the SSHCP conservation strategy, located within SSHCP preserve areas.

The Sacramento District will further streamline the CWA 404 regulatory review process by requesting the USFWS to consult once programmatically for all SSHCP covered activities that require a CWA 404 permit, eliminating the need for individual project-by-project ESA 7 consultations. Furthermore, the Sacramento District will request programmatic water quality certification under CWA 401 from the Central Valley Regional Water Quality Control Board for all activities under the CWA 404 permit strategy. This will eliminate the need for permit applicants to apply individually for CWA 401 certification. Finally, to comply with NHPA 106, the Sacramento District will seek to develop a programmatic agreement with the California State Historic Preservation Officer, following coordination with tribes and others, for the CWA 404 permit strategy.

CWA 404 Permitting Strategy

The Sacramento District has developed a multi-tiered approach to CWA 404 permitting that will address activities which involve discharges of dredged or fill material into waters of the U.S. covered by the USFWS-approved SSHCP. This strategy consists of the use of:

- A programmatic general permit (PGP) founded on a local aquatic resources protection program to be implemented through local aquatic resource ordinances, and designed to reduce duplication with that program, for activities with minimal individual and cumulative effects on the aquatic environment;

- A procedure for issuing Letters of Permission (LOPs) for activities with more than minimal but less than significant effects on the human environment, including aquatic resources; and

- An abbreviated process for issuing standard permits (SPs) for other activities consistent with the SSHCP that may have a significant impact on the human environment, and require the preparation of an EIS under NEPA.

PGP

Based on the SSHCP and local aquatic resource ordinances (Sacramento County, City of Galt, City of Rancho Cordova and SSHCP Implementing Entity) that implement a locally-based Aquatic Resources Program (ARP), the Sacramento District will establish a PGP for covered activities that have minimal impacts on the aquatic environment. The PGP is premised on the ordinances resulting in the same or better level of protection to waters of the U.S. as currently in place under CWA 404. The PGP includes

limits and thresholds that exceed those found in many of the Nationwide Permits, such as an upper threshold for most projects of 2 acres instead of 0.5 acre. The PGP will not impose additional requirements or conditions on individual activities for avoiding, minimizing, or compensating for the loss of aquatic resources beyond those in the SSHCP, ARP and ordinances. The Corps will rely on the agencies responsible for administering the ARP/ordinances to regularly report to the Sacramento District on use of the ordinances and coverage under the PGP, not requiring a project-by-project notification or review process, thus eliminating to the maximum extent possible the Sacramento District's review of activities with minimal impacts on waters of the U.S. The PGP will result in CWA 404 authorization in under 30 days. The process for the Corps to establish the PGP follows the standard permit process, which requires a public notice. The PGP will be addressed in the Sacramento District's ROD prepared for the SSHCP EIS. The PGP will be effective once the local aquatic resources ordinances are approved.

The PGP will not impose additional requirements or conditions on individual activities for avoiding, minimizing, or compensating for the loss of aquatic resources.

LOP Procedure

For covered activities found to be consistent with the SSHCP requirements which would have more than minimal impacts to aquatic resources but less than significant impacts on the human environment under NEPA, the Sacramento District will institute an procedure for issuing LOPs under CWA 404. For purposes of the permit strategy, activities that are determined to not require an EIS will be eligible for authorization under the LOP procedure. As such, the procedure will not have a specific limitations or thresholds. The LOP procedure will streamline the standard permit process by eliminating the need for a public notice and only require the preparation of a simplified decision document that tiers from the SSHCP EIS. Most on-site avoidance and minimization requirements will be satisfied when proposed activities are designed to comply with all applicable avoidance and minimization measures contained in the SSHCP and ARP. As a type of individual permit, the LOP procedure will require evaluation of on-site avoidance and minimization in compliance with CWA 404, including USEPA's 404(b)(1) Guidelines. For example, the USACE may require evaluation of alternatives to avoid and minimize effects to waters of the U.S. within and adjacent to streams. This may result in minor adjustments to features such as stream setback width requirements imposed by the SSHCP, in an area of a project site containing a wetland adjacent to the stream setback. Like the other types of CWA 404 permits in the Sacramento District's permit strategy, compensatory mitigation requirements will be the same as those in the SSHCP. The goal is to issue LOPs in 60 days or less, assuming compliance (programmatic or otherwise) with other laws is in place.

The LOP procedure will rely on the SSHCP to address avoidance, minimization, and compensatory mitigation for impacts to aquatic resources.

The process for establishing the LOP procedure requires the development of a list of categories or activities proposed for authorization (which consists of the SSHCP covered activity categories) through coordination with federal, state and local agencies, a public notice, and a 401 WQC issued or waived on a generic or individual basis. The decision to implement the LOP procedures will be addressed in the Sacramento District's ROD.

SP Abbreviated Process

A small number of SSHCP covered activities requiring CWA 404 will not fall under the PGP or LOP procedure and will require a SP. These activities are those that may have a significant impact on the human environment and require the preparation of an EIS under NEPA. If the Sacramento District serves as the federal lead agency for an activity under NEPA, the EIS requirement would be determined on a case-by-case basis upon receipt of a CWA 404 permit application by the Corps, consistent with the CWA 404 implementing regulations for NEPA (33 CFR Part 325, Appendix B). If the Corps is a cooperating agency to a federal lead agency who has determined an EIS is required under NEPA, the SP abbreviated process would apply if the Corps determines potential significant individual and/or cumulative impacts to the human environment could occur as a result of the proposed activities.

The extent of analysis in the project EIS will be reduced by tiering from the SSHCP EIS, alternatives will be limited to the project site because avoidance has been addressed at the regional level, and compensatory mitigation requirements will align with those of the SSHCP.

Even for activities that require a SP, the process and amount of time it takes to reach a permit decision can be compressed significantly by relying on the SSHCP. For instance, the extent of analysis in the project EIS will be lessened by tiering from the SSHCP EIS. Similar to the LOP procedure, most on-site avoidance and minimization requirements will be satisfied when proposed activities are designed to comply with all applicable avoidance and minimization measures contained in the SSHCP and ARP. The primary additional evaluation necessary for the SP process is an alternatives analysis required for compliance with USEPA's 404(b)(1) Guidelines. This will be limited to just the project site ("on-site alternatives"), because avoidance and minimization assessment that would normally be done via evaluation of off-site alternatives as part of a typical SP process has already been addressed at the regional level. Please refer to the LOP procedure, above, for an example of how minor adjustments in project design may be sought to support compliance with avoidance and minimization requirements. Compensatory mitigation requirements will align with those of the SSHCP, as described above. Time may further be shortened through the preparation of a joint EIS/EIRs for projects (the Corps' preference). In addition, the Corps will pursue programmatic compliance with ESA, NHPA 106 and CWA 401 to provide for greater assurances and further streamline the process. With reliance on the SSHCP EIS and programmatic compliance with related laws, the Corps expects to complete SP decisions for activities under the SSHCP within six to nine months.

Activities not Covered by the SSHCP

Activities involving a discharge of fill material into waters of the U.S. that are not covered under the SSHCP would be subject to the normal Corps' regulatory permit processes.

Next Steps

The Sacramento District's proposed CWA 404 permit strategy was provided in the Draft EIS for the SSHCP published in June 2017. Following public input on the Draft EIS, coordination with the Plan Partners, resource agencies and others, and review of any new information that becomes available, the Sacramento District's CWA 404 permit strategy and final draft permit instruments were updated and included for public review in the Final EIS for the SSHCP. With adoption of the EIS, the Sacramento District will complete its ROD, issue final permit instruments, finalize establishment of the SSHCP ILF Program, and implement the CWA 404 permit strategy.

EIS/EIR APPENDIX C-2

Draft Programmatic General Permit

MINIMAL IMPACT COVERED ACTIVITIES UNDER THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

EFFECTIVE:
EXPIRES: (*5 years from effective date*)

The U.S. Army Corps of Engineers, Sacramento District (Corps), hereby issues a programmatic general permit (PGP) for certain covered activities under the South Sacramento Habitat Conservation Plan that result in the discharge of dredged and/or fill material into waters of the United States (U.S.) resulting in no more than minimal individual and cumulative impacts on aquatic resources, and have been authorized by a local Aquatic Resource Impact Permit pursuant to local Aquatic Resource Protection (ARP) ordinances, implemented by SSHCP "Land Use Authority Permittees" (SSHCP LUAPs) or the SSHCP Implementing Entity (SSHCP IE). The ARP ordinances are associated with, and refer directly to, the SSHCP and an associated locally-based Aquatic Resources Program.

An activity is verified under the PGP when a SSHCP LUAP or the SSHCP IE approves a local Aquatic Resource Impact Permit, in compliance with the [*INSERT FINAL DATE*] SSHCP Aquatic Resources Program, a local ARP ordinance and all applicable terms and conditions of the SSHCP.

ISSUING OFFICE: U.S. Army Corps of Engineers, Sacramento District

ACTION ID: SPK-1995-00386

AUTHORITY: Section 404 of the Clean Water Act (CWA 404)

LOCATION: The South Sacramento SSHCP Plan Area encompasses approximately 317,655 acres within Sacramento County (*Figure 1 [showing SSHCP Plan Area; figure to be developed*], attached). The Plan Area includes the City of Galt and the City of Galt's sphere of influence, and the portion of the City of Rancho Cordova that is located south of U.S. Highway 50. The geographical boundaries of the Plan Area are U.S. Highway 50 and White Rock Road to the north, the Sacramento River levee and County Road J11 (Walnut Grove-Thornton Road) to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and with the San Joaquin County to the south.

PURPOSE: This PGP is intended to minimize duplication between the SSHCP LUAPs' and SSHCP IE's local ARP and the Corps' Regulatory Program, for authorization of SSHCP covered activities subject to CWA 404 that are substantially similar in nature, and would result in minimal individual and cumulative impacts on the aquatic environment. The PGP is premised on local ARP ordinances, resulting in the same or better level of protection of waters of the U.S. as currently exists under CWA 404. Subject to certain exclusions and conditions, the PGP eliminates the need for project applicants to seek separate review from the Corps for many activities that result in minimal impacts to waters of the U.S., when such activities are authorized by a SSHCP LUAP or SSHCP IE in compliance with the SSHCP Aquatic Resources Program, under a local ARP ordinance. In addition to reducing duplication with the SSHCP Aquatic Resources Program and local ARP ordinances, the PGP is designed to

expedite review of certain covered activities through other programmatic elements, such as compliance with Section 7 of the federal Endangered Species Act (ESA) and Section 106 of the National Historic Preservation Act (NHPA). The PGP will increase certainty, reduce time, and improve efficiency for project applicants through synergies with processes implemented by local jurisdictions, such as those associated with land use entitlements, while protecting aquatic resources, including waters of the U.S.

BACKGROUND: The SSHCP is a regional approach to address issues related to planned development and species habitat conservation. The SSHCP provides coverage for twenty-eight species of plants and wildlife, including ten that are state and/or federally-listed as threatened or endangered. The Plan Permittees consist of Sacramento County, the City of Galt, the City of Rancho Cordova, the Sacramento County Water Agency, Sacramento Regional County Sanitation District, the Southeast Connector Joint Powers Authority, and the SSHCP IE. The U.S. Fish and Wildlife Service's Sacramento Field Office (USFWS) [*has approved*] the SSHCP through a species incidental take permit (ITP) issued to the SSHCP's Plan Permittees under Section 10 of the ESA.

ACTIVITIES COVERED: This PGP applies only to SSHCP covered activities that are substantially similar in nature, would result in minimal individual and cumulative impacts on the aquatic environment, and have been authorized under the local Aquatic Resources Program. SSHCP covered activities are described briefly below and in greater detail in Chapter 5 of the SSHCP.

1. **Urban Development in the UDA:** Activities associated with the construction and maintenance of urban development projects and associated facilities/activities, including but not limited to structures (residential, commercial, industrial), parks/recreation facilities, water supply facilities, flood control and stormwater management, utilities (e.g., electric), solid waste management, wastewater, transportation and stream channel modification.

2. **Mining in the UDA:** Activities associated with surface extraction of rock or mineral resources, construction of associated infrastructure (e.g., buildings and facilities including surface mining pits, processing sites, conveyors, access roads and detention basins), and reclamation of previously mined land in accordance with the applicable federal and state laws.

3. **Rural Transportation Projects:** Activities associated with transportation projects outside of the UDA that are approved by the Sacramento County's 2030 General Plan, inclusive of construction, improvement and operation-related maintenance. For example, road widening, realignment and interchange improvement. Chapter 5 of the SSHCP describes specific rural transportation projects that fit into this category (e.g., widening of nine segments of arterial roads).

4. **Recycled Water Projects:** Activities associated with construction and maintenance of facilities associated with two specific recycled water projects; one that would serve the existing Bartley-Cavanaugh Golf Course, and the other known as the South Sacramento County Agriculture and Habitat Lands Recycled Water Project (South County Agricultural Program).

5. **Covered Activities in Preserve Setbacks in the UDA:** Activities associated with construction and maintenance of permeable and semi-permeable trails, bio-retention swales, fencing, firebreaks, benches, shade structures, shade trees, trash receptacles, interpretive signs and kiosks, outdoor lighting and livestock access facilities (e.g., access points) for livestock utilized pursuant to preserve management plans.

6. **Covered Activities in Stream Setbacks in the UDA:** Activities associated with construction and maintenance of permeable and semi-permeable trails, bio-retention swales, crossings perpendicular to streams (e.g., new roads, bike or pedestrian trails and utility lines), stream bank stabilization projects, fencing, firebreaks, benches, shade structures, shade trees, interpretive signs and kiosks, riparian habitat re-establishment or establishment, outfalls, flood control structures and stormwater management.

7. **SSHCP Preserve System Covered Activities:** Activities associated with implementation of the SSHCP Conservation Strategy, including preserve management, monitoring, habitat (including aquatic) enhancement, re-establishment establishment, "low-impact" nature trails, removal or breeching of farm levees, research activities (e.g., species surveys), livestock water supply, groundwater monitoring and extraction wells (specific to Kiefer Landfill), detention basins, and maintenance of existing utility facilities within SSHCP preserves.

8. **Covered Activities in the Laguna Creek Wildlife Corridor of the SSHCP Preserve System:** Activities associated with construction and maintenance of permeable and semi-permeable trails, benches, trash receptacles, bio-retention swales, fencing, shade structures, shade trees, crossings perpendicular to streams (e.g., new roads, bike or pedestrian trails and utility lines), stream bank stabilization projects, interpretive signs and kiosks, riparian habitat re-establishment and establishment, outfalls, flood control structures and stormwater management.

EXCLUSIONS:

1. This PGP may not be used to authorize discharges of dredged and/or fill material into waters of the U.S. for activities that do not require authorization from a SSHCP LUAP or SSHCP IE pursuant to a local ARP ordinance.

2. After-the-fact authorizations: This PGP may not be used to authorize activities that resulted in the discharge of dredged or fill material into waters of the U.S. without Department of the Army (DA) authorization.

TERMS OF AUTHORIZATION:

1. Activity Completion: Activities authorized by the Corps under this PGP may be conducted until the expiration date of the PGP, or the expiration date of the local Aquatic Resource Impact Permit issued by a SSHCP LUAP or SSHCP IE, whichever occurs sooner.

2. Applying for PGP Authorization: Prior to commencing a proposed activity, project applicants seeking authorization under this PGP shall notify the applicable SSHCP LUAP or SSHCP IE as required by the Aquatic Resources Program and local ARP ordinances, and in accordance with PGP general condition number 13 (*Notification*).

3. Compliance with SSHCP Conditions: Activities to be authorized under this PGP must be covered activities as identified above and in Chapter 5 of the SSHCP, and must comply with any applicable terms and conditions contained in the SSHCP. Project applicants must receive written concurrence from a SSHCP LUAP of SSHCP IE that the proposed project is eligible for coverage under the SSHCP. Compliance with the SSHCP requires project applicants to implement the applicable and

appropriate avoidance and minimization measures contained in Chapter 5 of the SSHCP, and other applicable terms and conditions as contained in the SSHCP.

4. Discretionary Authority: The Corps has the discretion to suspend, modify, or revoke authorizations under this PGP. This discretionary authority may be used by the Corps to further condition or restrict the applicability of the PGP for cases in which it has concerns associated with the Clean Water Act Section 404(b)(1) Guidelines, or regarding any factor of the public interest. Should the Corps determine that a proposed activity may have more than minimal individual or cumulative adverse impacts to waters of the U.S. or otherwise be contrary to the public interest, the Corps will modify the authorization to reduce or eliminate those adverse effects, or notify the project applicant that the proposed activity is not authorized by the PGP and provide instructions on how to apply for authorization under another type of DA permit. Activities not meeting the terms and conditions of this permit may be authorized through another type of permit from the Corps, such as a Nationwide Permit, , Regional General Permit, Letter of Permission or Standard Permit. The Corps will determine on a case-by-case basis, as needed, whether an activity has a more than minimal impact, individually or cumulatively, on the aquatic environment or may be contrary to the public interest. The Corps may restore authorization under the PGP at any time it determines the reason for asserting discretionary authority has been resolved or satisfied by a condition, project modification, or new information. The Corps may also use its discretionary authority to modify, suspend, or revoke the PGP at any time.

5. Avoidance and Minimization: Impacts to waters of the U.S. shall be avoided and minimized to the maximum extent practicable. For purposes of the PGP, notwithstanding the Corps' discretionary authority described above, this term shall be considered satisfied when project applicants have designed and implemented activities to comply with all applicable avoidance and minimization measures contained in both Chapter 5 of the SSHCP and the applicable ARP ordinance.

6. Impact Thresholds for Losses of Waters of the U.S.: Loss of waters of the U.S. shall be determined using the definition in Section F of the January 6, 2017, Federal Register Notice for *Issuance and Reissuance of Nationwide Permits; Final Rule* (82 FR 1860), which can be found at: http://www.usace.army.mil/Portals/2/docs/civilworks/nwp/2017/nwp2017_final_rule_FR_06jan2017.pdf?ver=2017-01-06-092409-457

a. Except for as specified in b – c below, the loss of waters of the U.S. (including wetlands) resulting from authorization of a single and complete project under this PGP shall not exceed a total of 2.0 acres, and/or a total of 500 linear feet of perennial, intermittent, or third or higher order of ephemeral streams, and/or a total of 1,000 linear feet of irrigation or drainage ditch (provided the irrigation or drainage ditch is not a relocated or channelized stream, as verified by the Corps). The acreage of loss of streambed for streams and/or ditches shall be included in the acreage threshold for loss of waters of the U.S.

b. The loss of vernal pool waters of the U.S., as verified in writing by the Corps, in the Mather Core Recovery Area resulting from authorization of a single and complete project under this PGP shall not exceed 1.5 acres.

c. The cumulative loss of waters of the U.S. authorized under this PGP shall not exceed 120 acres of waters of the U.S., including wetlands, within the Plan Area. Additional restrictions are listed in the General Conditions, below.

DRAFT

7. Single and Complete: The activity must be a single and complete project as defined in the Section F of the January 6, 2017, Federal Register Notice for *Issuance and Reissuance of Nationwide Permits; Final Rule* (82 FR 1860), which can be found at: http://www.usace.army.mil/Portals/2/docs/civilworks/nwp/2017/nwp2017_final_rule_FR_06jan2017.pdf?ver=2017-01-06-092409-457.

8. Section 401 Water Quality Certification: In order for authorization to be valid under this PGP, an approved Section 401 Water Quality Certification (WQC) or waiver thereof is required to be obtained and evidence thereof in possession by the applicable SSHCP LUAP or SSHCP IE, prior to the commencement of activities authorized by this PGP (see General Condition 10 [*Water Quality Certification*]).

9. Reporting Requirements for Local Implementing Entities: Each of the four implementing entities of the local ARP ordinances (the SSHCP LUAPs and the SSHCP IE) shall submit reports to the Corps documenting usage of the PGP. Reporting will include the activity name, type of SSHCP covered activity, acreage and/or linear feet of permanent and temporary discharges of dredged and/or fill material into waters of the U.S. by aquatic resource type, acreage and/or linear feet of loss of waters of the U.S. by aquatic resource type, and evidence of the project applicant's fulfillment of CWA 404 compensatory mitigation requirements. Reporting shall be provided on a quarterly basis for Year 1, biannually for Year 2, and annually for Years 3-to-5 of this PGP. For this PGP to be applicable, a memorandum of understanding between the Corps and each LUAP or IE will need to be executed to record processing, tracking, and reporting of SSHCP covered activities.

GENERAL CONDITIONS:

1. Compensatory Mitigation: Compensatory mitigation for impacts to waters of the U.S. shall be accomplished at the ratios specified in the *Compensatory Mitigation Standards* specified in the local ARP ordinances (which mirror requirements contained the SSHCP), and shall be accomplished by payment into a Corps-approved SSHCP in-lieu fee (ILF) program.

2. Compliance Inspections: The project applicant must allow representatives from the Corps to inspect the authorized activity at any time deemed necessary to ensure that the activity is being, or has been, accomplished in accordance with the terms and conditions of the permit. The Corps will notify the project applicant at least 48 hours advance of an inspection.

3. Threatened and Endangered Species: No activity is authorized under this PGP which is likely to directly or indirectly jeopardize the continued existence of a threatened or endangered species or a species proposed for such designation, as identified under the Federal ESA. Activities authorized under this PGP must comply with the mandatory terms and conditions of the USFWS's [programmatic Biological Opinion (BO) for this PGP] (USFWS #___, dated ___) (copy [to be] attached). The BO contains mandatory terms and conditions to implement the reasonable and prudent measures that are associated with "incidental take" authorization under this PGP. Authorization under this PGP is conditional upon your compliance with all of the mandatory terms and conditions of the Biological Opinion. Failure to comply with the terms and conditions of the Biological Opinion would constitute non-compliance with the PGP. The USFWS is the appropriate authority to determine compliance with the terms and conditions of the Biological Opinion, and with the ESA. The project applicant must comply with all applicable conditions of this Biological Opinion, including those ascribed to the Corps.

4. Historic Properties: No activity is authorized under the PGP if the activity may affect historic properties listed, or eligible for listing, in the National Register of Historic Places, until the requirements of Section 106 of the National Historic Preservation Act (NHPA), as amended, have been satisfied. If NHPA compliance is not addressed programmatically, e.g., by a Programmatic Agreement (PA), project applicants must notify the Corps if the activity may have the potential to cause effects to any historic properties listed, determined to be eligible for listing on, or potentially eligible for listing on, the National Register of Historic Places, including previously unidentified historic properties. The notification shall consist of the application identified in General Condition 5, and two hard copies and one electronic copy of a cultural resources report meeting the Corps Guidelines for Compliance with Section 106 of the National Historic Preservation Act of 1966 (http://www.spk.usace.army.mil/Portals/12/documents/regulatory/sec-106-tribal/FINAL_2014-03-24_Section-106-Guidelines.pdf). The Corps will consult with the State Historic Preservation Officer (SHPO), as appropriate, following the policy and procedural standards of 33 CFR Part 325 Appendix C.

5. Notification: The prospective project applicant shall submit an application to the applicable SSHCP LUAP or SSHCP IE, in accordance with the procedures specified in the SSHCP Aquatic Resources Program and local ARP ordinances. No notification is required to be made to the Corps, except as provided by General Condition 4.

6. Permit Transfer: If the property associated with this permit is sold, the project applicant shall transfer the permit verification to the new owner by submitting a letter to the applicable SSHCP LUAP or SSHCP IE, with a copy provided to the Corps, to validate the transfer. A copy of the local Aquatic Resource Impact Permit authorization issued by the applicable SSHCP or SSHCP IE must be attached to the letter, and the letter must contain the name and address of the transferee, as well as the following statement and signature of the transferee

> When the structures or work authorized by this programmatic general permit (PGP) are still in existence at the time the property is transferred, the terms and conditions of this PGP, including any special conditions, will continue to be binding on the new owner(s) of the property. To validate the transfer of this PGP and the associated liabilities associated with compliance with its terms and conditions, have the transferee sign and date below.
>
> _____
> (Transferee)
>
> _____
> (Date)

7. Wetland and Stream Setbacks: Project applicants shall establish wetland and stream setback standards consistent with the minimum standards as described in the SSHCP Aquatic Resources Program and local ARP ordinances (mirroring requirements contained the SSHCP). Associated terms of the local ARP ordinances concerning setbacks, including (but not limited to) land use, allowable uses within setbacks, exemptions, and waivers shall apply as described in the SSHCP Aquatic Resources Program and applicable local ordinance. These terms shall meet or exceed all applicable standards and terms contained within Chapter 5 of the SSHCP.

8. Tribal Rights: No activity or its operation shall impair reserved Tribal rights, including, but not limited to, reserved water rights and treaty fishing and hunting rights.

DRAFT

9. Unanticipated Discovery: If the project applicant discovers any previously unknown historic, cultural or archeological remains and/or artifacts while accomplishing the activity authorized by this PGP, the project applicant shall immediately notify the Corps of what has been found, and to the maximum extent practicable, shall avoid construction activities that may affect the remains and artifacts until the required coordination has been completed. Notification to the Corps shall include a copy of the local Aquatic Resource Impact Permit issued by the applicable SSHCP LUAP or SSHCP IE. The Corps will initiate the Federal, Tribal, and state coordination required to determine if the items or remains warrant a recovery effort or if the site is eligible for listing in the National Register of Historic Places.

10. Water Quality Certification: Water Quality Certification (WQC), or waiver thereof, under Section 401 of the Clean Water Act is required for activities to be authorized by this PGP. The project applicant shall comply with the terms and conditions of any individual or programmatic WQC provided by the State Water Resources Control Board and/or Central Valley Regional Water Quality Control Board.

FURTHER INFORMATION:

1. Congressional Authorities: Section 404 of the Clean Water Act (33 U.S.C. 1344)

2. Limits of this authorization:

a. The Corps has authority to determine if an activity complies with the terms and conditions of the PGP.

b. This permit does not obviate the need to obtain other federal, state, or local authorizations required by law.

c. This permit does not grant any property rights or exclusive privileges.

d. This permit does not authorize any injury to the property or rights of others.

e. This permit does not authorize interference with any existing or proposed federal projects.

3. Limits of Federal Liability: In issuing this permit, the Federal Government does not assume any liability for the following:

a. Damages to the permitted project or uses thereof as a result of other permitted or unpermitted activities or from natural causes.

b. Damages to the permitted project or uses thereof as a result of current or future activities undertaken by or on behalf of the United States in the public interest.

c. Damages to persons, property, or to other permitted or unpermitted activities or structures caused by the activity authorized by this permit.

d. Design or construction deficiencies associated with the permitted work.

DRAFT

e. Damage claims associated with any future modification, suspension, or revocation of this permit.

4. Reliance on Applicant's Data: The determination of the Corps that issuance of this PGP is not contrary to the public interest was made in reliance on the information provided by the SSHCP Plan Permittees.

5. Reevaluation of Permit Decision: The Corps may reevaluate its decision on this PGP at any time the circumstances warrant. Circumstances that could require a reevaluation include, but are not limited to, the following:

a. The project applicant fails to comply with the terms and conditions of this permit.

b. The information provided by the project applicant in support of a permit application proves to have been false, incomplete, or inaccurate (see 4 above).

c. Significant new information surfaces which the Corps did not consider in reaching the original public interest decision.

Such a reevaluation may result in a determination that it is appropriate to use the suspension, modification, and revocation procedures contained in 33 CFR 325.7 or enforcement procedures such as those contained in 33 CFR 326.4 and 326.5.

PERMIT DURATION: This PGP is valid for five (5) years from the date of issuance. It will expire on [Day, Month, 20XX]. At least sixty (60) calendar days prior to expiration, the Corps will issue a public notice, with an opportunity for public comment, describing the reasons for reissuing the PGP for another five years with or without modification, or not reissuing the PGP. If the Corps has not reissued the PGP by the expiration date, the PGP will no longer be valid. This PGP may also be modified, suspended, or revoked by the Corps at any time deemed necessary. In such instance, the Corps will issue a public notice concerning the proposed action.

CONTACTS AND ADDITIONAL INFORMATION: For additional information about this PGP, please contact the U.S. Army Corps of Engineers, Sacramento District.

This permit becomes effective when the federal official, designated to act for the Secretary of the Army has signed below.

EIS/EIR APPENDIX C-3

Draft Letter of Permission Procedure

LETTER OF PERMISSION PROCEDURES FOR COVERED ACTIVITIES UNDER THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN WITH LESS THAN SIGNIFICANT IMPACTS ON THE HUMAN ENVIRONMENT

DATE: *[Insert Date of Issuance]*

ACTION ID: SPK-1995-00386

AUTHORITY: 33 CFR 325.2(e)(1)(ii)

LOCATION: The South Sacramento Habitat Conservation Plan (SSHCP) Plan Area encompasses approximately 317,655 acres in southern Sacramento County (*Figure 1 [showing SSHCP Plan Area; figure to be developed*], attached). The Plan Area includes the City of Galt, including its sphere of influence, and the area of the City of Rancho Cordova located south of U.S. Highway 50. The geographical boundaries of the Plan Area are U.S. Highway 50 and White Rock Road to the north, the Sacramento River levee and County Road J11 (Walnut Grove-Thornton Road) to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and with the San Joaquin County to the south.

PURPOSE: The U.S. Army Corps of Engineers (Corps), Sacramento District has established this Letter of Permission (LOP) procedure to efficiently authorize SSCHP covered activities which involve discharges of dredged or fill material into waters of the United States (U.S.) under Section 404 of the Clean Water Act (CWA 404) with more than minimal on the aquatic environment but less than significant impacts on the human environment under the National Environmental Policy Act.

The SSHCP LOP Procedure is an optional abbreviated process for issuing an individual permit, available to all applicants for Department of the Army (DA) permits for SSHCP covered activities meeting the criteria and conditions described in this notice. If the proposed activity does not meet LOP criteria or the applicant chooses not to use this process, the activity may be evaluated under a different permit type or procedure.

BACKGROUND: In accordance with Title 33 of the Code of Federal Regulations (CFR) Part 325, district engineers are authorized to use alternative procedures to authorize activities under the Corps Regulatory Program. LOPs are a type of individual permit that is issued through an abbreviated process which includes coordination with federal and state fish and wildlife agencies and a public interest evaluation, but without publishing an individual public notice.

The SSHCP provides coverage for twenty-eight species of plants and wildlife, including ten that are state and/or federally-listed as threatened or endangered. The SSHCP is a regional approach to address issues related to planned development and species habitat conservation. The U.S. Fish and Wildlife Service's Sacramento Field Office (USFWS) [*has approved*] the SSHCP through a species

incidental take permit (ITP) issued to the SSHCP's Plan Permittees under Section 10 of the ESA. The Plan Permittees have additionally developed a SSHCP Aquatic Resources Program (ARP), complementary to the SSHCP, with a locally-based permit program for activities resulting in no more than minimal individual and cumulative impacts on aquatic resources.

PROPOSED CATEGORIES OF ACTIVITIES: This LOP procedure applies only to SSHCP covered activities that have been authorized by a SSHCP "Land Use Authority Permittees" (SSHCP LUAPs) or the SSHCP Implementing Entity (SSHCP IE), consistent with the SSHCP and locally-based ARP. SSHCP covered activities are described briefly below, and in greater detail in the SSHCP.

Activities to be authorized under an LOP following the procedure described herein must be SSHCP covered activities. Applicants must receive a consistency determination from a SSHCP LUAP of SSHCP IE that the proposed project is a covered activity under the SSHCP. Compliance with the SSHCP requires applicants to implement applicable and appropriate avoidance and minimization measures contained in Chapter 5 of the SSHCP, and other applicable terms and conditions as contained in the SSHCP.

An LOP will be issued only for those activities which meet all of the procedures and criteria identified in this notice, including the general conditions, and which do not result in a potentially significant impact(s) on the human environment. The Corps reserves the use of its discretionary authority to determine that an activity may be authorized under an LOP, to add special conditions to LOP authorizations, or to determine that an activity may not be authorized by a LOP and will instead require authorization under another permit type.

For a SSHCP covered activity to be authorized under an LOP following this procedure, impacts to waters of the U.S. shall be avoided and minimized to the maximum extent practicable. All applicable avoidance and minimization measures contained in Chapter 5 of the SSHCP and the ARP shall be required, resulting in fulfillment of most on-site avoidance and minimization requirements necessary to comply with CWA 404 requirements. Evaluation of project-level, on-site avoidance and minimization opportunities will be assessed on a case-specific basis. For example, the USACE may require evaluation of alternatives to avoid and minimize effects to waters of the U.S. within and adjacent to streams. This may result in minor adjustments to features such as stream setback width requirements imposed by the SSHCP in an area of a project site containing a wetland adjacent to the stream setback.

To qualify for a LOP under this procedure; activities must meet the following criteria:

1. The proposed activity does not result in a potentially significant impact(s) on the human environment that requires preparation of an environmental impact statement (EIS) under the National Environmental Policy Act (NEPA).

2. Compensatory mitigation for impacts to waters of the U.S. shall be accomplished at the ratios specified in the SSHCP, and shall be accomplished by payment into a Corps-approved SSHCP in-lieu fee (ILF) program.

Covered Activities under the SSHCP: The following SSHCP covered activities, described in greater detail in Chapter 5 of the SSHCP, are applicable to this LOP procedure.

1. **Urban Development in the UDA:** Activities associated with the construction and maintenance of urban development projects and associated facilities/activities, including but not limited to structures (residential, commercial, industrial), parks/recreation facilities, water supply facilities, flood control and stormwater management, utilities (e.g., electric), solid waste management, wastewater, transportation and stream channel modification.

2. **Mining in the UDA:** Activities associated with surface extraction of rock or mineral resources, construction of associated infrastructure (e.g., buildings and facilities including surface mining pits, processing sites, conveyors, access roads and detention basins), and reclamation of previously mined land in accordance with the applicable federal and state laws.

3. **Rural Transportation Projects:** Activities associated with transportation projects outside of the UDA that are approved by the Sacramento County's 2030 General Plan, inclusive of construction, improvement and operation-related maintenance. For example, road widening, realignment and interchange improvement. Chapter 5 of the SSHCP describes specific rural transportation projects that fit into this category (e.g., widening of nine segments of arterial roads).

4. **Recycled Water Projects:** Activities associated with construction and maintenance of facilities associated with two specific recycled water projects; one that would serve the existing Bartley-Cavanaugh Golf Course, and the other known as the South Sacramento County Agriculture and Habitat Lands Recycled Water Project (South County Agricultural Program).

5. **Covered Activities in Preserve Setbacks in the UDA:** Activities associated with construction and maintenance of permeable and semi-permeable trails, bio-retention swales, fencing, firebreaks, benches, shade structures, shade trees, trash receptacles, interpretive signs and kiosks, outdoor lighting and livestock access facilities (e.g., access points) for livestock utilized pursuant to preserve management plans.

6. **Covered Activities in Stream Setbacks in the UDA:** Activities associated with construction and maintenance of permeable and semi-permeable trails, bio-retention swales, crossings perpendicular to streams (e.g., new roads, bike or pedestrian trails and utility lines), stream bank stabilization projects, fencing, firebreaks, benches, shade structures, shade trees, interpretive signs and kiosks, riparian habitat re-establishment or establishment, outfalls, flood control structures and stormwater management.

7. **SSHCP Preserve System Covered Activities:** Activities associated with implementation of the SSHCP Conservation Strategy, including preserve management, monitoring, habitat (including aquatic) enhancement, re-establishment establishment, "low-impact" nature trails, removal or breeching of farm levees, research activities (e.g., species surveys), livestock water supply, groundwater monitoring and extraction wells (specific to Kiefer Landfill), detention basins, and maintenance of existing utility facilities within SSHCP preserves.

8. **Covered Activities in the Laguna Creek Wildlife Corridor of the SSHCP Preserve System:** Activities associated with construction and maintenance of permeable and semi-permeable trails, benches, trash receptacles, bio-retention swales, fencing, shade structures, shade trees, crossings perpendicular to streams (e.g., new roads, bike or pedestrian trails and utility lines), stream bank stabilization projects, interpretive signs and kiosks, riparian habitat re-establishment and establishment, outfalls, flood control structures and stormwater management.

DRAFT

EXCLUSIONS:

1. The LOP procedure does not apply to any activities in waters of the U.S. that are not considered covered activities under the SSHCP.

2. The LOP procedure does not apply to any activities in waters of the U.S. that have a potential to significantly impact the human environment.

LOP PROCEDURE:

1. **Before submitting an application**:

The applicant must attend a pre-application meeting with the Sacramento District. Applicants are encouraged to invite the applicable SSHCP LUAP or SSHCP IE (i.e., the anticipated reviewer of the local Aquatic Resource Impact Permit) to the pre-application meeting.

2. **Application submittal**:

To be considered for authorization by LOP, the application must include all information required for a standard permit application, pursuant to 33 CFR 325.1. The application package must be submitted to the Sacramento District in both paper and electronic form (pdf), suitable for electronic transmittal and/or posting to an FTP site, and include the following:

a. A cover letter from the applicant requesting an LOP under the SSHCP LOP procedure for the proposed activity, referencing the Sacramento District's identification number and including contact information for the applicant and their designated agents or primary points-of-contact. This must include mailing and e-mail addresses and telephone and fax numbers.

b. A completed and signed Department of the Army Engineering Form 4345.

c. A copy (hardcopy, and electronic on CD) of the Aquatic Resource Impact Permit application submitted to the SSHCP LUAP and/or SSHCP IE.

d. An aquatic resources delineation for the activity area, conducted in accordance with the Sacramento District's minimum standards for aquatic resource delineations, or information that an aquatic resources delineation has been verified and is still valid.

e. Site location map(s), including the proposed activity, clearly outlined on USGS 7.5' quad sheet drawings, with latitudes and longitudes for the site(s), name of the quad sheet(s) and directions to the site, as well as all appropriate aerial and other imagery available.

f. A complete description of the proposed activity, including all of the information identified under 33 CFR 325.1(d) "Content of application."

g. Plan and profile views of the proposed work, relative to potential or approved waters of the U.S. (e.g., wetlands and open waters below the Ordinary High Water Mark), showing areas, types and acreages of waters of the U.S. proposed to be impacted by the proposed activity. All available

DRAFT

drawings must be provided and must show proposed impacts on appropriately scaled figures, in accordance with the Corps' map and drawing standards. All maps and drawings shall follow the South Pacific Division February 2016, Updated Map and Drawing Standards for the South Pacific Division Regulatory Program, or most recent update (available on the South Pacific Division website at: http://www.spd.usace.army.mil/Missions/Regulatory/PublicNoticesandReferences.aspx/), unless specifically waived by the Corps.

h. The total area (acreage and/or linear feet) and types of waters of the U.S. to be directly and/or indirectly affected by the proposed activity, the volume (in cubic yards) and type of material to be discharged into each type of aquatic resource(s), acreage and/or linear feet of loss of waters of the U.S. by aquatic resources type, a description of habitat types, including plant communities, within and surrounding the activity site, and a description of how the proposed activity would affect all of the above resources.

i. A description and graphical representation of how impacts to waters of the U.S. and associated functions (e.g., water quality and habitat) have been avoided and minimized to the maximum extent practicable on the project site. A summary of all applicable avoidance and minimization conditions proposed to be implemented, as required by the SSHCP, shall also be provided. This may be fulfilled by submitting a copy of the applicant's documentation provided to the SSHCP LUAP and/or SSHCP IE, including but not limited to the submittal of documentation to support the local permitting entity's Determination of Environmentally Equivalent or Superior Alternative (DEESA), provided these documents clearly identify avoidance and minimization measures related to waters of the U.S.

j. A description of potential indirect (secondary) and cumulative impacts to waters of the U.S. and the human environment in the watershed and vicinity of the proposed activity.

k. Documentation and record of all pre-application coordination with the Sacramento District and other agencies (as applicable), including any activity-specific comments or concerns provided by agencies, as well as the applicant's response(s) to the comments or concerns.

l. Information, in report form, concerning on-site practicable alternatives and the relative environmental impacts of those alternatives as compared to the environmental impacts of the proposed activity, in accordance with 33 CFR 325.1 (e) and 323.6 (a). The information must address compliance with the Environmental Protection Agency's 404(b)(1) Guidelines at 40 CFR part 230.

m. A statement providing the proposed compensatory mitigation for offset of unavoidable losses of waters of the U.S., indicating proposed compliance with General Condition 3, *Compensatory Mitigation*.

n. Copies of state and local approvals, pending applications or approvals, and any other evidence that the proposed activity has been or is currently being reviewed by the appropriate state and local agencies and is consistent with their land use plans and policies, particularly wetland policies, programs, ordinances and/or laws.

3. Review and Decision:

a. The Sacramento District will review the applicant's submittal for completeness within approximately fifteen (15) calendar days of receipt. If the application is incomplete, the appropriate Sacramento District staff person will notify the applicant and request the additional information necessary to complete the application for further processing.

b. If the Sacramento District determines the application is complete but the activity cannot be authorized by a LOP, the Sacramento District will notify the applicant within 15 calendar days of that determination and proceed to an alternate permitting process (General Permit or Standard Permit).

c. If the application is determined to be complete and appears to meet LOP criteria, the Sacramento District will notify the applicant that the proposed activity is being evaluated for LOP authorization. The Sacramento District will notify the applicable SSHCP LUAP and SSHCP IE, and applicable state and federal coordination agencies via e-mail of the proposed LOP for the activity, and request any comments within fifteen (15) calendar days of such notice. The Sacramento District will also request any additional information necessary to complete processing of the permit application, and, if sufficient information has been submitted, initiate any required consultation(s) with other agencies, to the extent necessary (e.g., in lieu of programmatic consultations).

d. The Sacramento District will review the comments received and, if otherwise complete (e.g., Endangered Species Act [ESA], National Historic Preservation Act [NHPA] consultations and 401 Water Quality Certification done), make a determination within 30 calendar days after the close of the comment period as to whether LOP authorization is warranted, and whether special conditions are needed. If the Sacramento District determines the activity (1) meets the criteria for LOP authorization, (2) would have a less than significant impact on aquatic resources and the human environment, (3) meets the requirements of the U.S. Environmental Protection Agency's Section 404(b)(1) Guidelines for Specification of Disposal Sites, (4) would not be contrary to the public interest, (5) is in compliance with other applicable laws (e.g. ESA, NHPA, Section 401 WQC), and (6) has been provided evidence of a consistency determination from the applicable SSHCP LUAP or SSHCP IE that the project is covered under the SSHCP, an LOP will be issued.

e. If at any time during the process the Sacramento District determines the activity may not be authorized by a LOP, Sacramento District staff will immediately notify the applicant, terminate the LOP process, and proceed to an alternate permitting process, as described in C(3)(b) above.

f. Evidence of Section 401 Water Quality Certification must be provided to the Sacramento District before any final LOP decision is made. A LOP will not be issued until and unless all necessary certifications, consultations and/or authorizations (e.g., 401 Water Quality Certification, ESA and/or NHPA) have been completed and/or issued.

g. The Sacramento District will add special conditions to LOP authorizations as necessary.

DRAFT

EIS/EIR APPENDIX C-4

Abbreviated Standard Permit Process

South Sacramento HCP
Abbreviated Standard Permit Process

U.S. ARMY CORPS OF ENGINEERS **BUILDING STRONG®**

February 2018

ABBREVIATED STANDARD PERMIT PROCESS FOR COVERED ACTIVITIES UNDER THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN WITH MORE THAN SIGNIFICANT IMPACTS ON THE HUMAN ENVIRONMENT

Background

The South Sacramento Habitat Conservation Plan (SSHCP) covers twenty-eight species of plants and wildlife, including ten that are state and/or federally-listed as threatened or endangered. The SSHCP is a regional approach to address issues related to planned development and species habitat conservation, following a comprehensive conservation strategy. Additional background information on the SSHCP and the U.S. Army Corps of Engineers (Corps) Sacramento District's long-term coordination with the U.S. Fish and Wildlife Service (USFWS), other state and federal agencies, and the SSHCP Plan Partners is provided in the document titled "CWA 404 Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan" (dated February 2018, hereafter "CWA 404 Permit Strategy"). The goal of the Sacramento District's coordination "from the ground up" with development of the SSHCP is to develop and implement a "streamlined" approach to permitting under Section 404 of the Clean Water Act (CWA 404) that encompasses a number of different permit types and processes. The following provides approaches and mechanisms to be utilized in the abbreviated SP process for issuing standard permits (SP) for SSHCP covered activities.

When Would the Abbreviated Standard Permit Process Apply?

The abbreviated standard permit process will be used for the small number of SSHCP covered activities requiring authorization under CWA 404 that may significantly affect the human environment under the National Environmental Policy Act (NEPA), requiring the preparation of an Environmental Impact Statement (EIS). As a result of coordination and alignment with the SSHCP and a locally-based Aquatic Resources Program (ARP) the Sacramento District's' evaluation process for SP applications can be streamlined or "abbreviated" to produce higher quality and faster decisions.

EIS Trigger for SSHCP Abbreviated SP Process

If an EIS is required for a SSHCP covered activity, the abbreviated SP process would apply when the Corps determines an EIS is required. The determination that a proposed activity may significantly affect the human environment is based on an analysis of the direct and indirect effects of the proposed action, within the Corps' scope of analysis as defined in 33 CFR Part 325, Appendix B.

The Sacramento District recognizes that identifying the appropriate type of CWA 404 permit appropriate for processing SSHCP covered activities needing CWA 404 authorization is of paramount interest to project applicants, particularly early in project planning and design. Although a final determination of the need for an EIS can only be made by the Corps in response to receiving a complete permit application, the Sacramento District encourages project applicants to engage during the early planning stages of projects to discuss CWA 404 regulatory strategies. Following this approach, project applicants would have limited unknowns in terms of which type of SSHCP aligned CWA 404 permit is anticipated to be required.

Abbreviated Standard Permit Process

While the procedural requirements for CWA 404 SPs would follow the same process as identified by regulations found at 33 CFR Part 325, *Applications for Permits*, the anticipated timeline for completing this process would be substantially reduced as a result of streamlining. Certain SP processing components are required by regulation; examples include contents of a complete application, and public notices. A top objective of the abbreviated SP process is to address, in the most efficient way possible and with reliance on the SSHCP, including its EIS and other related documents including the ARP, the most information-intensive and time-consuming aspects of SP evaluation and streamline these to the maximum extent possible. Key processing elements of the SSHCP abbreviated SP process are described below, and summarized (with some additional procedural examples) in comparison to a typical SP process in **Table 1**.

Pre-application Meeting

The abbreviated SP process will include a required pre-application meeting between the project applicant, Corps and SSHCP Implementing Entity. As an outcome of the pre-application meeting, the Corps will provide feedback on whether it appears and EIS may be necessary, as well as guidance on alternatives the applicant may consider to avoid and minimize effects to the human environment, and reduce the likelihood of an EIS being required.

Complete Permit Application and Supplemental Information

Reducing the review time for an SP under the SSHCP will be in part achieved through the applicant's submittal of a complete Department of the Army (DA) permit application and supplemental information. The information necessary to reduce processing times includes: (1) Providing information required for a complete application as defined at 33 CFR 325, *Applications for Permits*; (2) Information to show the project is in compliance with all applicable requirements of the SSHCP; (3) Information to show the project is in compliance with the U.S. Environmental Protection Agency's (EPA) *Section 404(b)(1) Guidelines for Specification of Disposal Sites for Dredged or Fill Material* (404(b)(1) Guidelines) as relates to on-site alternatives to avoid and minimize adverse effects to waters of the U.S.; (4) Information to show the project is in compliance with Section 7 of the Endangered Species Act, Section 106 of the National Historic Preservation Act, and Section 401 of the Clean Water Act, as appropriate; and (5) A proposed plan for compensating for the loss of waters of the U.S. on the project site, consistent with the SSHCP In-Lieu Fee (ILF) Program.

Information Requirements for Aquatic Resources in SP Application's EIS

The level of information and/or extent of analysis necessary in the project EIS to comply with NEPA at the project level will be reduced as a result of tiering from the SSHCP EIS. While timelines for review required by NEPA regulations will remain the same (e.g. Draft EIS comment period of 45 days, Final EIS review period of 30 days), submittal of information necessary for a complete application and tiering from

the SSHCP EIS will substantially reduce the required preparation time of the EIS, including using applicable information regarding the direct, indirect, and cumulative effects, incorporation of applicable avoidance and minimization measures, and elimination of the evaluation of off-site alternatives.

Compliance with CWA 404 Avoidance and Minimization Requirements, Including EPA's 404(b)(1) Guidelines

Because the SSHCP EIS examines a range of reasonable HCP alternatives affecting waters of the U.S., it can serve as the basis for the Sacramento District's landscape-level evaluation of alternatives under NEPA. Similarly, the SSHCP EIS and supplemental information submitted concurrently with EIS processing to the Corps, provide the fundamental basis for the Corps' evaluation of avoidance, minimization and less damaging practicable alternatives at the regional scale. Most project-level avoidance and minimization requirements will be satisfied when proposed activities are designed to comply with all applicable avoidance and minimization measures contained in the SSHCP and ARP.

An on-site alternatives analysis will still be required, but the off-site alternatives analysis normally required for SP evaluation under EPA's 404(b)(1) Guidelines would have been addressed at the regional level in the Corps' ROD for the SSHCP EIS. Most on-site avoidance and minimization will be achieved by incorporating applicable avoidance and minimization measures from the documents noted above. The Corps will exercise its discretionary judgment, consistent with CWA 404 regulations, in evaluating avoidance and minimization of on-site impacts to waters of the U.S. This will be accomplished within the context of recognizing regional, plan-wide trade-offs in aquatic resource impacts, avoidance, minimization and compensatory mitigation, resulting in an overall enhanced quality of regional aquatic resource protection offered by the SSHCP and associated local ARP. For example, a stream setback may have opportunity to be reasonably expanded to include the outer boundary of an adjacent wetland. Assessment of avoidance and minimization opportunities is necessarily site-specific, however the Sacramento District expresses the intent to apply case-specific analysis in consideration of the SSHCP regulatory context within which the proposed action would processed toward decision-making.

Compensatory Mitigation Requirements

Compensatory mitigation requirements for unavoidable impacts to waters of the U.S. would align to the mitigation requirements contained in the SSHCP, and would be satisfied by a "one-fee" system in which the SSHCP's fees required for impacts to aquatic resources would cover both the SSHCP's requirements and the Corps' compensatory mitigation requirements, vis-à-vis a SSHCP ILF Program that would be established consistent with requirements of the Federal Mitigation Rule (33 CFR Part 332).

Compliance with Other Laws

The Corps will pursue programmatic compliance with ESA, NHPA 106 and CWA 401 to provide for greater assurances and streamline these processes. In comparison to a typical SP process, programmatic approaches to complying with these laws is anticipated to save significant amounts of time and cost to project applicants.

DRAFT

Table 1. SSHCP Abbreviated Standard Permit vs. Normal Standard Permit Requirements

Requirements	SSHCP Abbreviated SP	Normal SP
Pre-application Meeting	Required	Recommended
Complete Application	Required. See 33 CFR Part 325.1(d)	Required. See 33 CFR Part 325.1(d)
Public Notice	Required. See Under 33 CFR Part 325.3	Required. See under 33 CFR Part 325.3
EIS Level of Analysis	Reduced, Due to "Tiering" from SSHCP EIS/EIR	Required. Stand-Alone, Project-Specific
Alternatives for NEPA, 404(b)(1) and Public Interest Review	Reduced, Due to "Tiering" from SSHCP EIS/EIR, and Incorporating SSHCP Avoidance/Minimization Measures	Required. Stand-Alone, Project Specific
Evaluation of Off-site Alternatives Analysis	Not Required	Required
Evaluation of On-site Alternatives Analysis	Required. See 33 CFR Part 325, Appendix B.9(5). Primarily Satisfied through Incorporation of SSHCP Avoidance/Minimization Measures; Minor Adjustments Along Preserve Boundaries may be Necessary	Required. See Under 33 CFR Part 325, Appendix B.9(5). Project-Specific Avoidance and Minimization
Applicant Information About Avoidance and Minimization for Impacts to Waters of the US	Required. Most On-site Avoidance and Minimization Requirements Satisfied by Incorporating SSHCP Avoidance/Minimization Measures; Additional Supporting Information Will be Required	Required. No Standardized Design and Construction Avoidance/Minimization Measures to Rely Upon
Compensation for Impacts to Waters of the U.S.	Required. Compensatory Mitigation Achieved through SSHCP In-Lieu Fee Program	Required. Project-specific mitigation plan subject to Corps approval. Compensatory mitigation Achieved through Mitigation Bank, Corps-Approved (Non-SSHCP) In-Lieu Fee Program, and/or Permittee-Responsible Mitigation; See 33 CFR Part 332.
Compliance with Section 7 of the Endangered Species Act (ESA)	Required. Project Covered by Programmatic Biological Opinion (BO)	Required. Project-Specific Biological Assessment, Consultation, and BO
Compliance with Section 401 of the Clean Water Act (Section 401 Water Quality Certification [WQC])	Required. Project Covered by Programmatic Section 401 Water Quality Certification (WQC)	Required. Project-Specific Section 401 WQC Application
Compliance with Section 106 of the National Historic Preservation Act (NHPA)	Required. Project Covered by Programmatic Agreement (PA)	Required. Project-Specific Information and Consultation

DRAFT

BENEFITS OF THE ABBREVIATED STANDARD PERMIT PROCESS

Alignment with the SSHCP is an opportunity to streamline the standard permit process under the Corps Regulatory Program for covered actions which require the preparation of an EIS. The abbreviated SP process will reduce Corps review time by more than half. With NEPA tiering and programmatic consultations, a permit decision can be made in 6 to 9 months (excluding any delays attributable to the permit applicant). Additional reduction in processing times would also occur if reviews are conducted concurrent with local agency review, including completing a joint EIS' and Environmental Impact Report (EIR) with the local agency. As shown in **Table 1**, reduction in length of processing of SPs under the abbreviated SP process will result from:

1. A reduction in time necessary to complete a Draft and Final EIS, as a result of tiering from the SSHCP EIS.

2. A reduction in the level of information required to show compliance with EPA's Section 404(b)(1) Guidelines, which would be limited to evaluation of on-site avoidance and minimization alternatives, most of which would be satisfied by incorporating SSHCP avoidance/minimization measures. This would result in a reduction in the review time by the Corps.

3. A reduction in Corps review time for proposed compensatory mitigation, as compensatory mitigation would occur through the purchase of ILF program credits consistent with the SSHCP.

4. A reduction in processing time for Section 7 ESA compliance due to issuance of a programmatic BO by USFWS.

5. A reduction in processing time for Section 401 WQC due to issuance of a programmatic 401 WQC by the Central Valley Regional Water Quality Control Board.

6. A reduction in processing time for Section 106 of the NHPA, due to development of a PA with the California State Historic Preservation Officer.

DRAFT

EIS/EIR APPENDIX D

Impact Avoidance and Minimization Measures (AMMs)

As required by the ESA (Section 10(a)(2)(A)(ii)), Fish and Game Code Section 2081, and the 2008 Mitigation Rule (USACE and USEPA 2008), the action alternatives evaluated in this EIS/EIR include measures to avoid and minimize take of Covered Species and measures to avoid and minimize impacts to aquatic resources. This appendix describes the Avoidance and Minimization Measures (AMMs) that would be included in the projects and activities implemented under the Proposed Action/Proposed Project Alternative, and implemented under the Reduced Permit Term HCP (i.e. the HCP Covered Activities). The AMMs presented in this EIS/EIR Appendix are conditions on each HCP Covered Activity. Each condition contains several AMMs that are intended to eliminate or to reduce direct or indirect effects to species habitats and to aquatic resources.

GENERAL AVOIDANCE AND MINIMIZATION MEASURES

General AMMs are designed to avoid or minimize effects of Covered Activities on natural land covers and Covered Species.

Condition 1. Avoid and Minimize Urban Development Impacts to Watershed Hydrology and Water Quality

Urban development Covered Activities may adversely alter watershed hydrology and degrade water quality. Condition 1 is designed to conserve and/or rehabilitate on-site natural creeks and streams. This condition would require project designs to include low-impact development (LID) drainage control measures and would require the implementation of BMPs during construction and during other ground disturbance. These AMMs would assure that rainwater runoff from newly developed lands would not change the pre-development hydrographs of receiving waterways, and these aquatic resources would retain most pre-development functions and services.

LID-1 (Stormwater Quality): When the size of a Covered Activity project exceeds the thresholds established by the State Water Resources Control Board (SWRCB) (see the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions, or future SWRCB-approved design manuals applicable to the Planning Area), incorporate stormwater management into site design to satisfy the requirements outlined in the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions. Stormwater management may include groundwater recharge (LID-2) and natural site features (LID-3).

LID-2 (Groundwater Recharge): When siting new HCP Preserves containing Riparian, Open Water, or Freshwater Marsh land cover types, the HCP Implementing Entity will prioritize locations that are suitable for groundwater recharge.

LID-3 (Natural Site Features): Incorporate preservation of a site's natural aquatic features (such as creeks and streams) into the project's design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species.

Condition 2. Avoid and Minimize Urban Development Direct and Indirect Impacts to Existing Preserved Lands and HCP Preserves

New Urban Development adjacent to existing natural lands or HCP Preserves may indirectly impact species habitat and species that use those lands. Condition 2 seeks to avoid or minimize these environmental stressors, which could n direct and indirect impacts to species habitats and aquatic resources existing preserves or the HCP Preserve System:

- Alterations to landscape hydrology from new impervious surfaces may adversely affect natural communities in the lower watershed, the ecology of preserved lands, and/or downstream aquatic resources.
- Water runoff from development or from roadways directed into preserved lands may introduce harmful substances into existing preserves and HCP Preserves. Unseasonal and/or additional water entering Preserved Lands may eliminate vernal pools and other seasonal wetlands native to the region by converting them to low-functioning perennial wetlands.
- New development adjacent to existing or HCP Preserves may alter or remove the soil's "perched aquifer" (see Appendix G), reducing or eliminating the micro-watersheds that support the natural hydrology of vernal pools within the preserve boundary. These changes may adversely affect the existing hydrologic regime of vernal pools by changing the timing, depth, and/or duration of vernal pool saturation and/or ponding, causing long-term changes to a suite of vernal pool functions. For example, changes to water chemistry could adversely affect species habitat, and although the vernal pool may remain, the environmental conditions of the pools may no longer provide habitat for vernal pool Covered Species, or provide the benefit of other wetland functions (e.g., stormwater attenuation) compared to pre-project conditions.
- Introduction or proliferation of non-native or invasive plant and wildlife species may displace native species.
- Urban landscaping in the interface of a new development and a vernal pool ecosystem Preserve often includes native or non-native trees and other plant species that are not found in California grasslands, and therefore, cannot survive in the interface without intensive irrigation and cultivation. In addition to adverse effects from artificial irrigation and landscape maintenance, adult trees may become landscape barriers that inhibit species movement and may act to isolate individual Preserves from the larger HCP Preserve System.

- Recreational use of HCP Preserves near developed areas may compact soils, eliminate vegetation, impair hydrologic functions, introduce weeds or invasive plant species, and disturb plants and wildlife.
- Introduction of light, noise, or vibrations may disrupt normal nocturnal and diurnal cycles of native species.

AMMs associated with Condition 2 must be applied to all Covered Activities implemented within the UDA that border an existing Preserve or a planned HCP Preserve.

EDGE-1 (Compatible Land Uses): To the maximum extent practicable, unban development project Covered Activities will locate compatible land uses (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) in areas immediately adjacent to existing preserves or planned HCP Preserve boundaries. The compatible land use will provide additional buffering of existing preserves or HCP Preserves from potential indirect effects of adjacent urban development. However, the soil surfaces in a compatible land use area may be re-contoured slightly, provided that the soil restrictive layer remains undamaged and most of the soil profile above the restrictive layer remains intact. The Land Use Authority Permit Applicant will determine when it is not practicable for a new project to locate a compatible land use adjacent to existing preserve or a planned HCP Preserve boundary.

EDGE-2 (Single-Loaded Streets): To the maximum extent practicable, the design of new urban development Covered Activities will locate single-loaded streets adjacent to existing preserves or planned HCP Preserves. The Land Use Authority Permit Applicant will determine when it is not practicable for a new project to locate single-loaded streets adjacent to existing preserves or planned HCP Preserves.

EDGE-3 (Preserve Setbacks): New urban development Covered Activities constructed adjacent to existing preserves or planned HCP Preserves must establish a minimum 50-foot-wide setback, measured outward from the boundary of any existing Preserve or a planned HCP Preserve. This minimum 50-foot-wide setback will function as a transition between urban development and the preserved lands, and must be managed to maintain the natural community of vegetation present in the adjacent preserved lands. As much of the setback as possible should remain in the same natural habitat as the preserved lands.

However, some recreational Covered Activities would be allowed in the Preserve Setbacks. Also, where an existing preserve or planned HCP Preserve is adjacent to an existing roadway (e.g., collectors, arterials, thoroughfares), the 50-foot

Preserve Setback will not be required, and any bicycle or pedestrian trails will be located in the road right-of-way. In addition, where a roadway Covered Activity crosses an existing preserve or planned HCP Preserve, no Preserve Setback will be required at the crossing, and any bicycle or pedestrian trail will be located in the road right-of-way.

EDGE-3a (Setback Recreational Trails): Trails are best suited outside of the setback; however, certain types of recreational trails or facilities (e.g., benches, trash receptacles, shade structures, fencing) that can be constructed with minimum ground disturbance and in compliance with EDGE-7 may be allowed within a Preserve Setback, as specified in Section 5.2.5 of the SSHCP document. Preserve Setback design must locate trails on the side nearest development, away from the Preserve boundary. Trails may be permeable or semi-permeable hiking trails or paved community trials. The maximum trail width will be 16 feet total, including 2-foot-wide shoulders. Post and cable fencing, split rail, or other open fencing will be installed adjacent to recreation trails to keep pedestrians on the trail.

EDGE-3b (Setback Firebreaks): If approved by the local authorities, the Preserve Setback trail may also be used as a firebreak. In instances where a trail cannot act as a firebreak, the firebreak will be located between the trail and the Preserve boundary (see Section 5.2.7 of the SSHCP document). Firebreaks allowed inside the setbacks must be created by methods that will not disturb the soil's restrictive layer or perched aquifer, such as mowing, minor scraping of surface vegetation, or shallow tilling, to comply with EDGE-7. Firebreak width within Preserve Setbacks is the minimum width needed to comply with applicable local codes.

EDGE-3c (Setback Shade Trees and Landscaping): To prevent potential impacts from landscaping irrigation water or from accumulation of landscaping leaf litter onto the grasslands or vernal pools of a n existing or HCP Preserve, planting of shade trees or landscaping vegetation will be limited to the area of the Preserve Setback that is located between the recreation trail and the adjacent urban development (i.e., away from the Preserve).

- Only drought-tolerant plant species will be planted. The planting pallet used for Preserve Setback landscaping will not include invasive plant species listed in the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory Database or listed in the Cal-IPC California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/). Any shade trees planted along Preserve Setback trails will be native species that are

found in California grasslands and that can survive in the Vernal Pool Ecosystem/ Valley Grassland border without long-term irrigation or fertilization (e.g., valley oak, black oak, blue oak, oracle oak). In general, no more than 30% of any 1,000-foot-long segment of a Preserve Setback trail will have canopy cover from tree plantings (to be consistent with maximum tree densities naturally found within native California grasslands and savanna).

- Drip irrigation will be allowed for a maximum of 5 years to establish native shade trees or other native landscape vegetation planted between the recreation trail and adjacent urban development. The HCP Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation will not affect the Preserve. Any irrigation systems located within Preserve Setbacks will be inspected quarterly to determine if such systems are affecting soils or vegetation not part of the intended plantings. Irrigation system repairs will be completed immediately if it is determined that the irrigation system is affecting vegetation or soil moisture not part of the intended tree planting.
- If, during annual monitoring of the adjacent preserve (see Chapter 8 of the SSHCP document), adverse indirect effects (e.g., leaf litter accumulation, irrigation runoff, plant encroachment) of the Preserve Setback's planted vegetation are detected, then the HCP Implementing Entity, the HCP Preserve Manager, and the entity responsible for the Preserve Setback will identify appropriate adaptive management of the Preserve Setback tree or landscape plantings in accordance with the Preserve Setback Easement (see Section 5.2.5 and Chapter 9 of the SSHCP document).

EDGE-4 (Locate Stormwater Control Outside Preserves): Roads, sidewalks, and other impermeable surfaces of urban development Covered Activities adjacent to existing preserves or new HCP Preserves will slope away from preserved lands and Preserve Setbacks, or will intercept drainage with swales or curbs and gutters outside the Preserve Setbacks to preclude drainage from entering preserves and Preserve Setbacks. Stormwater flows must be directed away from preserved lands and Preserve Setbacks and directed into stormwater control facilities inside the development (outside Preserves and Preserve Setbacks)[1] (see EDGE-6 for exception to EDGE-4 in certain Linkage Preserves).

[1] However, detention basins are allowed in certain Linkage Preserves, consistent with the requirements of EDGE-6. At the time of SSHCP preparation, seven Linkage Preserves with drainages are planned SSHCP

EDGE-5 (Stormwater Control in Preserve Setbacks): If recreation trails are established in any Preserve Setback in compliance with EDGE-3, the trail must be sloped away from the Preserve, and rainwater leaving the trail surface must flow into an adjacent low-velocity bio-retention swale or cell to keep rainwater runoff and trail contaminants from entering the Preserve. Low-velocity bio-retention swales or cells are typically small linear features placed on one or both sides of a trail. As required by EDGE-3, trails and their adjacent bio-retention swales or cells must be located on the side of the Preserve Setback nearest development.

EDGE-6 (Detention Basins in Linkage Preserves): Because planned Linkage Preserves L1, L2, L4, L7, L8, L9, and L10 (see Section 7.5) surround natural creeks or streams that must receive stormwater from the planned adjacent urban development Covered Activities, a limited number of stormwater detention basins will be allowed on those Linkage Preserves. Detention basins within Linkage Preserves (see Section 5.2.7) will be designed and constructed with fill material to build up the perimeter of the detention basin so as not to impact the soil restrictive layer (duripan or hardpan) and functions of the soil perched aquifer. Detention basins within Linkage Preserves will capture stormwater flows and runoff, and will discharge water to the stream/creek or percolate collected water to the soil perched aquifer. Detention basin structures that collect stormwater entering the basin or convey stormwater leaving the basin must be designed to avoid and minimize effects to Covered Species habitat in the Linkage Preserve.

EDGE-7 (Hardpan/Duripan Protection): To protect the soil perched aquifer in the watersheds supporting existing vernal pool hydrology, activities that have the potential to cut into, disrupt, or remove the soil's restrictive layer (hardpan or duripan) will not occur within preserved lands or Preserve Setbacks. However, in certain circumstances, the Covered Activities (defined in Section 5.2.6 of the SSHCP document), Covered Activities in Stream Setbacks within the UDA, and Covered Activities discussed in Section 5.2.8 (Covered Activities in the Laguna Creek Wildlife Corridor of the HCP Preserve System), may result in small punctures[2] or other minor disruptions of the soil hardpan or duripan, if approved by the HCP Implementing Entity and the HCP Technical Advisory Committee according to the process described in Chapter 9 of the SSHCP document. If a Covered Activity on a Preserve or Preserve Setback results in a puncture or other disruption to the soil hardpan or duripan, the puncture will be sealed using bentonite clay or other

Preserves: L1, L2, L4, L7, L8, L9, and L10 (see Section 5.2.7 and Section 7.5). Also see project-specific measures in Section 5.5.1.

[2] Punctures may include small holes that penetrate the soil hardpan or duripan such as might occur when digging or drilling holes for the installation of fence posts, sign posts, or trees.

material that maintains the functionality of the soil's restrictive layer and associated perched aquifer.

EDGE-8 (Outdoor Lighting): All outdoor lighting in urban development Covered Activity projects will be designed to minimize light pollution into existing and planned HCP Preserves, except where a Land Use Authority Permit Applicant determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from HCP Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target Covered Species (e.g., western spadefoot (*Spea hammondii*) and Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*)).

EDGE-9 (Livestock Access to Preserves): urban development Covered Activity projects that include on-site HCP Preserves will include in their design an adequate number of access points and facilities for delivery and pick up of grazing animals (livestock), such that these activities will not significantly alter the Preserve's habitat and are consistent with the protection of livestock and protection of adjacent public property, and include adequate public safety measures.

EDGE-10 (Prevent Invasive Species Spread): Completed Covered Activities (including roads) will be maintained in a manner that avoids the spread of invasive species into Preserve and Open Space areas. Such maintenance measures will include the following:

- To prevent the transport of non-native invasive species onto HCP Preserves, before bringing any equipment onto an Preserve or Preserve Setback, equipment must be cleaned of mud, dirt, and plant material. Cleaning will occur in the infested area or another appropriate location as approved by a Permit Applicant.
- Mowing rotation will start in un-infested areas and move to infested areas.
- Invasive plant prevention techniques will be incorporated into maintenance plans.
- The HCP Implementing Entity will survey road shoulders, ditches, and rights-of-way that border HCP Preserves for invasive weeds or other exotic plant species. Where roadside weed infestations have reached a critical control point, the HCP Implementing Entity or Land Use Authority Permit Applicant will apply the appropriate manual, mechanical, or chemical treatment.

Condition 3. Implement Construction Best Management Practices

AMMs associated with Condition 3 must be applied to all Covered Activities.

BMP-1 (Construction Fencing): Orange construction fencing will be installed to ensure that ground disturbance does not extend beyond the allowed construction footprint (i.e., the limit of project construction plus equipment staging areas and access roads). Permit Applicants and their "Third-Party Project Proponents" implementing ground-disturbing Covered Activities will mark the outer boundary of any Preserve Setback or Stream Setback adjacent to or within the project site with orange construction fencing prior to ground disturbance. This fencing will remain in place until project completion, as identified by the Permit Applicant.

BMP-2 (Erosion Control): Permit Applicants and their Third-Party Project Proponents implementing ground-disturbing Covered Activities will install temporary control measures for sediment, stormwater, and pollutant runoff as required by the Permit Applicant to protect water quality and species habitat. Silt fencing or other appropriate sediment control device(s) will be installed downslope of any Covered Activity that disturbs soils.

Fiber rolls and seed mixtures used for erosion control will be certified as free of viable noxious weed seed. As discussed in Section 5.4.2, Covered Species Take Avoidance and Minimization Measures, erosion controls installed in or adjacent to Planning Area modeled habitat for giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), California tiger salamander (*California tiger salamander*), or western spadefoot (see Chapter 3 of the SSHCP document) must be of appropriate design and materials that will not entrap the species (e.g., not contain mesh netting). Regular monitoring and maintenance of the project's erosion control measures will be conducted until project completion to ensure effective operation of erosion control measures.

BMP-3 (Equipment Storage and Fueling): Permit Applicants and their Third-Party Project Proponents implementing ground-disturbing Covered Activities will ensure that equipment storage and staging will occur in the development footprint only (not sited in any existing on-site Preserve, planned on-site Preserve, Preserve Setback, Stream Setback, or aquatic land cover type). Fuel storage and equipment fueling will occur away from waterways, stream channels, stream banks, and other environmentally sensitive areas within the development footprint.

However, certain equipment storage and fueling activities can be allowed on HCP Preserves within habitat re-establishment/establishment sites (refer to Section

5.2.7) if no location outside of the site is available. If a Covered Activity results in a spill of fuel, hydraulic fluid, lubricants, or other petroleum products, the spill will be absorbed and waste disposed of in a manner to prevent pollutants from entering a waterway, Preserve, Preserve Setback, or Stream Setback.

BMP-4 (Erodible Materials): Permit Applicants and their Third-Party Project Proponents implementing Covered Activities must not deposit erodible materials into waterways. Vegetation clippings, brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks. Erodible material must be disposed of such that it cannot enter a waterway, Preserve, Preserve Setback, Stream Setback, or aquatic land cover type. If water and sludge must be pumped from a subdrain or other structure, the material will be conveyed to a temporary settling basin to prevent sediment from entering a waterway.

BMP-5 (Dust Control): Permit Applicants and their Third-Party Project Proponents implementing ground-disturbing Covered Activities will water active construction sites regularly, if warranted, to avoid or minimize impacts from construction dust on adjacent vegetation and wildlife habitats. No surface water will be used from aquatic land covers; water will be obtained from a municipal source or existing groundwater well.

BMP-6 (Construction Lighting): Permit Applicants and their Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas.

BMP-7 (Biological Monitor): If a Covered Activity includes ground disturbance within Covered Species modeled habitat, an approved biologist will be on site during the period of ground disturbance, and may need to be on site during other construction activities depending on the Covered Species affected. After ground-disturbing project activities are complete, the approved biologist will train an individual to act as the on-site construction monitor for the remainder of construction, with the concurrence of the Permitting Agencies. The on-site monitor will attend the training described in BMP-8. The approved biologist and the on-site monitor will have oversight over implementation of Avoidance and Minimization Measures, and will have the authority to stop activities if any of the requirements associated with those measures are not met. If the monitor requests that work be stopped, the Wildlife Agencies will be notified within one working day by email. The approved biologist and/or on-site monitor will record all observations

of listed species on California Natural Diversity Database field sheets and submit them to the California Department of Fish and Wildlife. The approved biologist or on-site monitor will be the contact source for any employee or contractor who might inadvertently kill or injure a Covered Species or who finds a dead, injured or entrapped individual. The approved biologist and on-site monitor's names and telephone numbers will be provided to the Wildlife Agencies prior to the initiation of ground-disturbing activities. Refer to species-specific measures for details on requirements for biological monitors.

BMP-8 (Training of Construction Staff): A mandatory Worker Environmental Awareness Program will be conducted by an approved biologist for all construction workers, including contractors, prior to the commencement of construction activities. The training will include how to identify Covered Species that might enter the construction site, relevant life history information and habitats, HCP and statutory requirements and the consequences of non-compliance, the boundaries of the construction area and permitted disturbance zones, litter control training (SPECIES-2), and appropriate protocols if a Covered Species is encountered. Supporting materials containing training information will be prepared and distributed by the approved biologist. When necessary, training and supporting materials will also be provided in Spanish. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all of the Avoidance and Minimization Measures (AMMs). Written documentation of the training must be submitted to the HCP Implementing Entity within 30 days of completion of the training, and the HCP Implementing Entity will provide this information to the Wildlife Agencies.

BMP-9 (Soil Compaction): After construction is complete, all temporarily disturbed areas will be restored similar to pre-project conditions, including impacts relating to soil compaction, water infiltration capacity, and soil hydrologic characteristics.

BMP-10 (Revegetation): Permit Applicants and their Third-Party Project Proponents implementing ground-disturbing Covered Activities will revegetate any cut-and-fill slopes with native or existing non-invasive, non-native plants (e.g., non-native grasses) suitable for the altered soil conditions and in compliance with EDGE-2 and EDGE-8, if applicable.

BMP-11 (Speed Limit): Project-related vehicles will observe the posted speed limits on paved roads and a 10-mile-per-hour speed limit on unpaved roads and during travel in project areas. Construction crews will be given weekly tailgate instruction to travel only on designated and marked existing, cross-country, and project-only roads.

Condition 4. Avoid and Minimize Impacts that May Result from Implementation of Covered Transportation Projects

Urban development transportation projects and Rural Transportation Project Covered Activities, including bridge projects, can affect Covered Species. AMMs included for Condition 4 seek to avoid or minimize direct and indirect impacts that may result from construction of roadways or roadway improvements. Condition 4 applies to all transportation-related Covered Activities (see Sections 5.2.1 and 5.2.3).

Permit Applicants and their Third-Party Project Proponents implementing Urban Development transportation or Rural Transportation Project Covered Activities must comply with the roadway siting, design, and construction AMMs described below.

ROAD-1 (Road Project Location): Road projects will be located in the least environmentally sensitive area to avoid, to the maximum extent practicable, impacts on Covered Species, Covered Species habitat, and waters of the United States. Road project alignments will follow existing roads, road easements, and rights-of-way, or be sited in disturbed areas to minimize habitat loss and additional habitat fragmentation.

ROAD-2 (Wildlife Crossing Structures): Road projects that are identified as Urban Development Covered Activities (see Section 5.2.1) (including the Capital Southeast Connector, see Section 5.2.1.1) or are identified as Rural Transportation Covered Activities (see Section 5.2.3) will include an adequate number of wildlife crossing structures, as depicted in Figure 5-10 of the SSHCP document. An adequate number of wildlife crossing structures within the Urban Development Area (UDA) and outside the UDA will provide for continued dispersal and movement of native wildlife throughout the Planning Area, as required by the HCP Biological Goals and Objectives.

The HCP defines “wildlife crossing structure” as a physical structure specifically designed or retrofitted to facilitate undercrossing for target wildlife species. The Plan further classifies wildlife crossings as hydrologic crossings and dry crossings. Hydrologic crossings are built where there is an existing stream, creek, or intermittent drainage to maintain existing hydrologic connectivity within the Planning Area. As described below, hydrologic crossings require specialized features to be built into the crossing structure, such as elevated platforms to allow wildlife to pass under a crossing structure when it is inundated with water. Dry wildlife crossings are built where there is no hydrologic feature but where a crossing is needed to provide for overland connectivity. wildlife crossing structures may include structures such as bridges, arches, or box and pipe culverts.

Permit Applicants expect that future wildlife movement and dispersal within the UDA will occur almost entirely within the boundaries of the future interconnected HCP Preserve System (see Section 7.5). Therefore, wildlife crossings are needed wherever a roadway crosses (bisects) the conceptual HCP Preserve System. Wildlife crossing structures inside the UDA will be sized to accommodate movement of a highly mobile native indicator species (i.e., coyote (*Canis latrans*)). By designing UDA wildlife crossing structures to meet the movement and dispersal requirements of coyote, the Permit Applicants anticipate that the crossing structure will also accommodate most native wildlife species that currently occupy the UDA (see Chapter 8 in the EIS/EIR).

The Permit Applicants expect that most of the Planning Area outside of the UDA will remain as Open Space over the 50-year EIS/EIR Study Period (see Chapter 3 of the EIS/EIR). Therefore, the Permit Applicants expect that the Rural Transportation Project Covered Activities proposed outside the UDA will have a relatively small effect on the movement and dispersal of larger or more mobile native wildlife species, including coyote. Consequently, the Permit Applicants anticipate that the design of Rural Transportation Project Covered Activities outside the UDA will need to include wildlife crossing structures primarily where the Rural Transportation Project Covered Activities occur within California tiger salamander modeled habitat (see AMM CTS-3 and also EIS/EIR Chapter 9, and Figure 3-16 of the SSHCP document).

The design and location of wildlife crossing structures both inside the UDA and outside the UDA will be determined by collaboration between the Third-Party Project Proponent, the Land Use Authority Permit Applicant, and the HCP Implementing Entity. Crossing design will use the best available scientific and commercial information for the target species. The design of crossing structures will be based on demonstrated effectiveness of design for the target species when such information is available, or will be designed with a high level of certainty of success based on studies of similar taxa in similar environmental settings. The proposed wildlife crossing structures designs will be reviewed and approved by the HCP Implementing Entity prior to final design.

The HCP Implementing Entity will develop a Wildlife Crossing Maintenance Manual to be provided to the entity responsible for maintaining the wildlife crossing. The Wildlife Crossing Maintenance Manual will identify vegetation management, clearing of obstructions, and other techniques to maintain the desired movement and hydrologic connectivity, and to avoid effects to adjacent HCP Preserves.

All HCP wildlife crossing structures in the UDA will include the following design elements:

- Open-bottom bridges or arches where the roadway crosses a river or stream. Where an open-bottom bridge or arch is used, the span of the crossing will be at least 1.2 times the bankfull width of the stream and span the banks to allow for dry wildlife passage along each side of the stream and to avoid or minimize piers or footings within the stream. (Bankfull width refers to the width of a stream channel at the point where over-bank flow begins during a flood event.)
- Any wildlife crossing structure that also maintains hydrologic connectivity will be designed to maintain pre-construction water capacity, depth, and velocity. The crossing structure will not restrict or impede normal flows or flood flows, unless a primary purpose of the structure is to manage such flow(s). Wildlife crossing structures must be designed to provide a dry passage (e.g., a platform ledge) higher than flows for a 10-year storm event to allow wildlife to pass through an inundated crossing structure.
- Wildlife crossing structures in the UDA will be designed and sized to accommodate movement of at least medium-sized mammals (e.g., coyote). The opening must be at least 3 feet high and the crossing structure must have a minimum openness ratio of at least 0.4.
- Vegetation leading up to the entrance of a crossing structure and the substrate leading into and within the crossing structure will be natural and appropriate to provide for continuity of habitat, attract the target animal species for which the crossing is designed, and facilitate use of the crossing structure.
- A wildlife crossing under six-lane roads or larger will be designed to provide ambient light and temperature in the longer crossing structures (e.g., either by providing a larger opening or a grate at the top of the structure to improve the attractiveness of the crossing to certain Covered Species and wildlife that may hesitate to cross through dark, confined structures or one with a temperature gradient (Jackson and Griffin 2000)). If a road is less than six lanes in width, these designs will be optional.
- Lighting will not be placed at or near the entrance of a wildlife crossing structure to maintain natural ambient light conditions at night and to increase chances of wildlife use. However, a Land Use Authority Permit Applicants may allow lighting if necessary for human health or safety.

Outside the UDA, wildlife crossing structures may be required for California tiger salamander (refer to AMM CTS-1), and could also be required for other native species.

ROAD-3 (Roadside Pesticide Use[3]): If pesticide use is necessary along roadsides, the appropriate HCP Permit Applicant will ensure that the pesticide application strictly complies with the pesticide label and all other applicable federal, state, and local authorities pertaining to the use, safety, storage, disposal, and reporting of the pesticide. Where roadside weed infestations have reached a critical control point, the HCP Implementing Entity or a Land Use Authority Permit Applicant will apply the appropriate manual, mechanical, or chemical treatment. In addition, the HCP Implementing Entity or appropriate Land Use Authority Permit Applicant will post signs along road shoulders adjacent to sensitive areas (e.g., California tiger salamander breeding ponds, endemic plant populations). The signs will identify pesticide use restrictions or other roadside maintenance restrictions.

Condition 5. Avoid and Minimize Impacts that Result from Public Use of Low-Impact Nature Trails in HCP Preserves

HCP Preserves within the UDA are likely to be surrounded by urban development. As discussed in Section 5.2.7, allowing limited use of HCP Preserves will help to foster a sense of community ownership and will provide an opportunity to educate the community about the natural resources to be protected within the HCP Preserve System.

Low-impact nature trails will be designed following the AMMs outlined below.

NATURE TRAIL-1 (Nature Trail Plan): A nature trail plan must be prepared for each Preserve where a trail is allowed by the HCP Preserve Management Plan. Nature trails will be unpaved trails that vary in width depending on terrain and existing constraints, but will never exceed 4 feet in width. Where a trail crosses a swale, wooden walkways elevated to a height no greater than 2 feet will be installed. Trail improvements may include mowing vegetation to create or maintain a trail, minor grading to remove trip hazards, and signs providing directional and educational information. Public access to land acquired for preservation will be prohibited until a trail plan can be prepared by the HCP Implementing Entity and approved by the Permitting Agencies. A trail plan will include the following:

- Maps identifying areas that contain sensitive habitats or species occurrences.

[3] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and conforms to all conditions in Section 5.4.

- Maps that show the location and footprint of proposed trails.
- Methods used to control public access.
- Trail and use monitoring methods, schedules, and responsibilities.
- Trail operation and maintenance guidelines and responsibilities.
- Clear triggers for use restrictions or closure based on sensitive biological indicators (e.g., seasonal closures of some trails on the basis of activity periods of Covered Species or sensitive species).

NATURE TRAIL-2 (Nature Trail Protection of Duripan): Nature trails will be sited and constructed so as not to interfere with existing soil duripan and the perched aquifer that support the existing hydrologic regime of the Vernal Pool Ecosystem and Valley Grassland, and will not interfere with existing pool hydrology. Trails within HCP Preserves will not be paved.

NATURE TRAIL-3 (Nature Trail Location): Nature trails will be located away from sensitive natural resources (e.g., vernal pools, riparian habitat, woodland habitat, Covered Species occurrences, raptor nesting sites, tricolored blackbird (*Agelaius tricolor*) colony sites). The Wildlife Agencies will determine the distance necessary to avoid impacts to sensitive natural resources.

NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design): Biological studies will be conducted within the area being considered for nature trail construction prior to project design. The studies will include land cover type mapping and focused species surveys and/or wetland delineations. The biological studies will include assessments of potential effects of trail construction on HCP Preserve System resources, and recommendations for avoidance and minimization that may be incorporated into project siting, design, construction, and operation.

NATURE TRAIL-5 (Monitoring of Nature Trail Impacts): Impacts that could result from use of a nature trail within a Preserve will be monitored according to the HCP Preserve Management Plan to ensure that uses do not conflict with the individual Preserve Management Plan. If use of a trail is found to conflict with the individual Preserve Management Plan, use of that trail will be discontinued until adjustments in the use can be made to reduce or eliminate conflicts. The HCP Implementing Entity will make decisions about discontinuing or modifying use of a trail in consultation with the HCP Preserve Manager or other applicable Preserve management agency or organization.

Condition 6. Avoid and Minimize Impacts When Re-Establishing or Establishing Wetlands

As discussed in Chapter 7 of the SSHCP document, the Permit Applicants anticipate that approximately 389 acres of Vernal Pool habitat will be re-established or established[4] within the Planning Area as part of the HCP Conservation Strategy. Although re-establishment or establishment of vernal pools is a Measurable Objective under this Plan, if not done correctly, the action could have an adverse impact on existing vernal pools.

RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool): Re-establish or establish Vernal Pool Wetland according to the following guidelines:

- Re-establishment will always take priority over establishment of vernal pools. Establishment will be permitted only after it has been determined that sites with the potential to re-establish vernal pools no longer exist in the Planning Area or cannot be acquired through a willing seller/buyer agreement.
- When possible, re-established or established sites will be located adjacent to an existing Preserve(s) to maximize connectivity and Preserve area.
- Re-establishment or establishment will not result in direct or indirect adverse impacts to the hydrologic regime of existing vernal pools. Vernal pool re-establishment or establishment actions will not remove more than 10% of any existing vernal pool watershed, as defined by the HCP LIDAR analysis (see Section 3.6 of the EIS/EIR document and Conservation Action VPI1.2 in Table 2-7 of the EIS/EIR).
- Vernal pool re-establishment will attempt to restore the historical density and range of vernal pool sizes to the maximum extent feasible using historical aerial photography of the site, if available. Where aerial photography of the site's historical conditions is not available, vernal pool re-establishment will include a range of pool sizes (area and depth) to accommodate the different habitat needs and life history characteristics of the vernal pool invertebrate Covered Species.
- Established vernal pools must be located on sites with vernal pool soils, defined as any Planning Area soil type where vernal pools currently exist.
- Established vernal pool sites will include a range of pool sizes to accommodate the different habitat needs and life history characteristics of the three vernal pool invertebrate Covered Species.

[4] In the context of this Plan, "establish" is synonymous with "create."

- The total density of vernal pools will not exceed 10% of the suitable soil areas in any vernal pool re-establishment and/or establishment site, unless it can be shown that the suitable areas of that site historically supported greater densities.
- Re-establishment or establishment may include inoculation when it is likely that no seed or cyst bank of vernal pool species remains at a site. Vernal Pool inocula will come from nearby vernal pools that are on the same geologic formation and soil type.

RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank): Vernal pool re-establishment or establishment may include "soil inoculation" when it is likely that no seed or cyst bank of vernal pool species remains at a re-establishment or establishment site.

- During conversion of Urban Development Area vernal pools to a developed land cover type, project proponents will excavate and retain soil from vernal pools following protocols developed by the HCP Technical Advisory Committee (see Chapter 9 of the SSHCP document).
- Inocula applied in re-established or established vernal pools must be harvested from a vernal pool that is on the same geologic formation and soil type shown on the County General Soil Map as the re-establishment/establishment site. Geologic formations and soil types will follow U.S. Department of Agriculture Soil Conservation Service's 1993 Soil Survey of Sacramento County, California. Proposed off-site inocula sources must be approved by the Wildlife Agencies.

RE-ESTABLISHMENT/ESTABLISHMENT-3 (Re-Establishment/Establishment of Freshwater Marsh or Open Water near Airports): During review of proposed re-establishment/ establishment projects for freshwater marsh or open water on HCP Preserves, the HCP Implementing Entity shall consider the potential for the location of the re-establishment/establishment projects to increase the risk of wildlife strikes or generation of ground fog at airports. If a re-establishment/ establishment project would result in (1) a net increase in open water or freshwater marsh acreage over baseline conditions[5] within 5 miles of Mather Field, Sacramento Executive Airport, or Franklin Field; or (2) replacement of open water/freshwater marsh habitat that is located 2 or more miles from Mather Field or Sacramento Executive Airport with open

[5] For purposes of establishing baseline conditions, Freshwater Marsh and Open Water acreages will be calculated using that version of the SSHCP Land Cover Type Map in existence as of the date that the SSHCP ITP permit is issued to the Permit Applicants by the USFWS.

water/freshwater marsh habitat that is located less than 2 miles from those airports, a qualified biologist shall prepare a concise letter report. The letter report shall summarize the biologist's findings regarding (1) the species likely to use the re-established/established habitat, (2) a rough order of magnitude estimate on the peak number of birds that might use the re-established/established habitat, and (3) potential movement patterns for birds using the re-established/established habitat and whether they might cross through the airport safety zones (e.g., to reach foraging habitat or another wildlife attractant). The letter report will also provide recommendations to the HCP Implementing Entity on how they could reduce any of the identified wildlife hazards if there are any feasible means to do so that would not conflict with the biological goals and measurable objectives of the Conservation Plan.

Condition 7. Avoid and Minimize Impacts to Streams and Creeks

AMMs associated with Condition 7 must be applied to all Covered Activities where a stream or creek is located within a project footprint.

STREAM-1 (Laguna Creek Wildlife Corridor): A 150-foot setback measured from the top of the bank on both sides of the stream will be applied to Laguna Creek within the Urban Development Area (minimum 300-foot corridor width). If trails are located within the Laguna Creek Wildlife Corridor, the nearest edge of the trail will be located at least 80 feet from the top of the bank.

STREAM-2 (UDA Stream Setbacks): A 100-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all streams listed in Table 1 below (see also Figure 2-4 of the SSHCP document). If a stream reach supports woody riparian vegetation, the setback will be equal to the riparian edge plus 25 feet or will be the setback defined above, whichever is greater. If trails are located within the Stream Setback, the nearest edge of the trail will be located at least 50 feet from the top of the bank.

Table 1. Stream Setback Minimum Requirements in the Urban Development Area

Stream	Minimum Setback (from the Top of Bank Measured in Aerial Perspective) on Both Sides of the Stream
Elder Creek	100 feet
Frye Creek	100 feet or as depicted as part of the NewBridge development project hardline Preserve (see Appendix K of the SSHCP Document)
Gerber Creek	100 feet
Morrison Creek	100 feet
Central Paseo	100 feet or as depicted as part of the Cordova Hills development project hardline Preserve (Appendix K of the SSHCP Document)
Sun Creek	100 feet or as depicted as part of the Sun Creek development project hardline Preserve (see Appendix K of the SSHCP Document)

STREAM-3 (Minor Tributaries to UDA Streams): A 25-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all avoided first and second order tributaries to the streams listed in Table 1 and Laguna Creek. Refer to Objective W6 in Table 2-7 of the EIS/EIR regarding avoided first and second order tributaries. Trails are not permitted within headwater ephemeral Stream Setbacks.

STREAM-4 (Minimize Effects from Temporary Channel Re-Routing): When an Urban Development Covered Activity temporarily re-routes a stream, creek, or drainage, the re-routing will be completed in a manner that minimizes impacts to beneficial uses and habitat. The following measures will be employed to minimize disturbances that will adversely impact water quality:

- No equipment will be operated in areas of flowing or standing water.
- Construction materials and heavy equipment must be stored outside of the active flow of any waters.
- When work within waters is necessary, the entire stream flow will be diverted around the work area.
- In the event of rain, the disturbed in-water work area will be temporarily stabilized before water body flow exceeds the capacity of the diversion structure. The disturbed water body will be stabilized so that the disturbed areas will not come in contact with the flow.
- Once construction is complete, all project-introduced material (e.g., pipes, gravel, cofferdam, sandbags) must be removed, leaving the water as it was before construction. Excess materials will be disposed of at an appropriate disposal site.
- All work areas will be effectively isolated from stream flows using suitable control measures before commencement of any in-water work. The diverted stream flow will not be contaminated by construction activities. Structures for isolating the in-water work area and/or diverting the stream flow (e.g., cofferdam, geo-textile silt curtain) will not be removed until all disturbed areas are cleaned and stabilized.
- Any flow diversion used during construction will be designed in a manner to prevent pollution and minimize siltation, and will provide flows to downstream reaches. Flows will be maintained to support existing aquatic life, riparian wetlands, and habitat that may be located upstream and downstream from any temporary diversion.

- All surface waters, including ponded waters, will be diverted away from areas undergoing grading, construction, excavation, vegetation removal, and/or any other activity that may result in a discharge to waters.
- All temporary dewatering methods will be designed to have the minimum necessary impacts to waters to isolate the immediate work area. All dewatering methods will be installed such that natural flow is maintained upstream and downstream of the diversion area. Any temporary dams and diversions will be installed such that the diversion does not cause sedimentation, siltation, or erosion upstream or downstream of the diversion area. All dewatering methods will be removed immediately upon completion of diversion activities.
- A method of containment must be used below any bridge, boardwalk, and/or temporary crossing to prevent debris from falling into the waters through the entire duration of a project.
- If temporary surface water diversions and/or dewatering are anticipated, the Permit Applicant or their Third-Party Project Proponent will develop and maintain on site a surface water diversion and/or dewatering plan. The plan(s) must be developed prior to initiation of any water diversions and will include the proposed method and duration of diversion activities. The plan(s) must be made available to Central Valley Water Board staff upon request.
- When work in a flowing stream is unavoidable and any dam or other artificial obstruction is being constructed, maintained, or placed in operation, sufficient water will be allowed at all times to pass downstream to maintain beneficial uses of waters below the dam. Construction, dewatering, and removal of temporary cofferdams will not violate the turbidity, settle-able matter, pH, temperature, or dissolved oxygen requirements of any project water quality control Plan.
- Any temporary dam or other artificial obstruction will only be built from clean materials such as sandbags, gravel bags, water dams, or clean/washed gravel that will cause little or no siltation. Stream flow will be temporarily diverted using gravity flow through temporary culverts or pipes, or pumped around the work site with the use of hoses.

STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening): When an urban development Covered Activity alters a stream, creek, or drainage by re-routing, widening, or deepening a channel, the project design will include the following:

- The main channel of a re-routed channel will be free to migrate laterally over its active and terrace floodplain.
- Channel geometry (plan, profile, and cross-section) of the site will be appropriate for the watershed location and physical/hydrologic condition.
- Local, native materials will be used as fill material to the extent practicable.
- Bioengineering techniques will be used for construction and maintenance of bank stabilization. Bioengineered bank stabilization structures will use vegetation in combination with bank reshaping; biodegradeable geotextile materials; and, in some cases, a minimal amount of rock or wood to the extent practicable to dissipate erosive energy. The Permit Applicant or their Third-Party Project Proponents will consult a professional engineer when considering using bioengineering techniques.
- All re-routed, widened, or deepened streams are required to establish Stream Setbacks with minimum widths required under AMMs STREAM-1, STREAM-2, or STREAM-3. All re-routed, widened, or deepened streams must re-establish/ establish and maintain native Woody Riparian land cover and/or native Grassland Riparian land cover in the entire Stream Setback.

Condition 8. Avoid and Minimize Impacts to Covered Species from Utility and Utility Maintenance Covered Activities

AMMs associated with Condition 8 must be applied to all Covered Activities associated with construction and maintenance of infrastructure projects.

UTILITY-1 (Avian Collision Avoidance): Installation of new, or relocation of existing, utility poles, lines, and cell towers located within the HCP Preserve System or within 1,000 feet of a Preserve boundary will be coordinated with the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife. The applicant or relevant utility/service provider will install utility poles, lines, and cell towers in conformance with Avian Powerline Interaction Committee (APLIC) standards for collision-reducing techniques, as outlined in Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012), or any superseding document issued by the APLIC.

UTILITY-2 (Utility Maintenance on Preserves): Utility maintenance inside HCP Preserves and Preserve Setbacks containing vernal pools will occur only when vernal pools have been dry for 30 days, except in emergency situations related to human health and safety.

UTILITY-3 (Trenchless Construction Methods): Where a pipeline or conduit crosses an existing or HCP Preserve or will be located between adjacent Preserves (e.g., under a roadway that has a Preserve on both sides), trenchless construction methods will be used to minimize impacts to the existing soil profile (including impacts to a hardpan or duripan) to maintain the perched aquifer in Vernal Pool Ecosystem and Valley Grassland land cover type.

UTILITY-4 (Siting of Entry and Exit Location): The entry and exit locations for the trenchless construction method (see Utility-3) will be sited to avoid impacts to vernal pools and Riparian Woodland, and to avoid direct take of HCP Covered Species.

Condition 9. Avoid and Minimize Impacts That Might Result From Removing or Breaching Levees to Establish or Re-establish Riparian Habitat

LEVEE-1 (Preparation of Hydrologic Analysis): Prior to approving a draft Preserve Management Plan that includes (1) modifying or breaching an existing levee, or (2) would place a potential impedance to high-water event flood-flows on the water side of an existing levee (including new riparian vegetation plantings or other new Preserve facilities), a hydrologic analysis will be conducted. The Preserve activity will only be implemented if the hydrologic analysis concludes that the activity will not result in a substantial increase in flood stage elevations or flood risk on lands outside the Preserve.

Condition 10. Avoid and Minimize Impacts That Might Result From Potential Residual Contamination of Preserves and Related Exposure of People to Such Hazardous Materials

HAZARDOUS MATERIALS-1 (Preparation of Phase I Environmental Site Assessment): Prior to the acquisition of a HCP Preserve site or implementation of a stream or riparian restoration project, a Phase I Environmental Site Assessment shall be conducted in general accordance with the American Society for Testing and Materials Standard Practice E1527-05. The purpose of this Environmental Site Assessment is to identify, to the extent feasible pursuant to the American Society for Testing and Materials Standard, recognized environmental conditions in connection with the potential site. The term “recognized environmental condition” means the presence or likely presence of hazardous substances or petroleum products on the property under conditions that may indicate an existing release, a past release, or a material threat of release of these substances to the property. If the Phase 1 Environmental Site Assessment indicates the presence of a recognized

environmental condition, the HCP Implementing Entity shall consider the following options.

- Determine that the acquisition/project can proceed on the basis that the Habitat Plan goals and objectives can be met on the site even with the presence of a recognized environmental condition.
- Conduct a Phase II Environmental Site Assessment, including soil and groundwater testing, to further study the potential for contamination to limit the HCP Implementing Entity's management activities.
- If the results of the Phase I (or Phase II) Environmental Site Assessment indicate that the Habitat Plan goals and objectives cannot be met on the site, the HCP Implementing Entity should not acquire the site.

HAZARDOUS MATERIALS-2 (Contingency Plan): As part of each Preserve Management Plan or site restoration plan, a Contingency Plan shall be prepared to address the actions that would be taken during construction in the event that unexpected contaminated soil or groundwater is discovered. The Contingency Plan shall include health and safety considerations, handling and disposal of wastes, reporting requirements, and emergency procedures. The Contingency Plan shall include a requirement that if evidence of contaminated materials is encountered during construction, construction would cease immediately and applicable requirements of the Comprehensive Environmental Release Compensation and Liability Act and the California Code of Regulations Title 22 regarding the disposal of waste would be implemented.

COVERED SPECIES TAKE AVOIDANCE AND MINIMIZATION MEASURES

The following section describes measures to avoid or minimize effects of Covered Activities on specific HCP Covered Species. Species-specific AMMs include species surveys, pre-construction surveys, and construction monitoring. Most species-specific AMMs require that species surveys be conducted if Covered Species modeled habitat is within the proposed Covered Activity footprint or within a specified distance of the proposed Covered Activity. Section 3.4 of SSHCP document and Appendix G of the EIS/EIR provides maps and descriptions of modeled habitat for each Covered Species. The AMMs described below apply to Covered Activities when Covered Species modeled habitat or a Covered Species occurrence are at a project site. The HCP Implementing Entity and the Wildlife Agencies may update specific HCP AMMs over the HCP Permit Term to provide the best and most appropriate protective measures for a Covered Species.

General Covered Species Take Avoidance and Minimization Measures

The following AMMs will apply to all Covered Activities that are required to implement Covered Species take AMMs.

SPECIES-1 (Litter Removal Program): A litter control program will be instituted for the entire project site. All workers will ensure that their food scraps, paper wrappers, food containers, cans, bottles, and other trash are deposited in covered or closed trash containers. All garbage will be removed from the project site at the end of each work day, and construction personnel will not feed or otherwise attract wildlife to the area where construction activities are taking place.

SPECIES-2 (No Pets in Construction Areas): To avoid harm and harassment of native species, workers and visitors will not bring pets onto a project site.

SPECIES-3 (Take Report): If accidental injury or death of any Covered Species occurs, workers will immediately inform the approved biologist or on-site monitor and site supervisor. The approved biologist or on-site monitor will phone the appropriate contact person at the HCP Implementing Entity. The HCP Implementing Entity will immediately contact the Wildlife Agencies by telephone. A memorandum will be provided to the HCP Implementing Entity and Wildlife Agencies within 1 working day of the incident. The report will provide the date and location of the incident, number of individuals taken, the circumstances resulting in the take, and any corrective measures taken to prevent additional take.

SPECIES-4 (Post-Construction Compliance Report): A post-construction compliance report will be submitted to the HCP Implementing Entity within 30 calendar days of completion of construction activities or within 30 calendar days of any break in construction activity that lasts more than 30 days. The report will detail the construction start and completion dates, any information about meeting or failing to meet species take Avoidance and Minimization Measures (AMM), effectiveness of each AMM that was applied at the project site, and any known project effects to Covered Species.

Rare Plants

PLANT-1 (Rare Plant Surveys): If a Covered Activity project site contains modeled habitat for Ahart's dwarf rush (*Juncus leiospermus* var*. ahartii)*, Bogg's Lake hedge-hyssop (*Gratiola heterosepala)*, dwarf downingia (*Downingia pusilla),* Legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii),* or Sanford's arrowhead (*Sagittaria sanfordii*), the Covered Activity project site will be surveyed for the rare plant by an approved biologist and following

the California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or the most recent CDFW rare plant survey protocols. An approved biologist will conduct the field surveys and will identify and map plant species occurrences according to the protocols. See Chapter 10 of the SSHCP document for the process to submit survey information to the Permit Applicant and the Permitting Agencies.

PLANT-2 (Rare Plant Protection): If a rare plant listed in AMM PLANT-1 is detected within an area proposed to be disturbed by a Covered Activity or is detected within 250 feet of the area proposed to be disturbed by a Covered Activity, the HCP Implementing Entity will assure one unprotected occurrence of the species is protected within a HCP Preserve before any ground disturbance occurs a the project site.

Sacramento and Slender Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is a federally and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Slender Orcutt grass (*Orcuttia tenuis*) is a federally threatened and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Both Orcutt grasses are very rare, and the likelihood of finding new occurrences within the Planning Area is low. Due to their rarity, take of either of these species is not permitted under the HCP, with the exception of take related to Preserve management and monitoring (see Section 5.2.7, HCP Preserve System Covered Activities).

ORCUTT-1 (Orcutt Grass Surveys): If a Covered Activity project site is located within 1 mile of the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for Sacramento and slender Orcutt grass by an approved biologist following California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or most recent CDFW guidelines to determine if Sacramento and/or slender Orcutt grass is present. An approved biologist will conduct the field investigation to identify and map occurrences. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

ORCUTT-2 (Orcutt Grass Protection): Where known or new Sacramento or slender Orcutt grass occurrences are found, they will be protected within an HCP Preserve that is at least 50 acres. The occurrence will be located interior to the Preserve at a distance of no less than 300 feet from the edge of the Preserve boundary. If a Third-Party Project Proponent encounters a previously undiscovered occurrence of Sacramento or slender Orcutt grass on a Covered Activity project site, the Third-Party Project Proponent will contact the HCP Implementing Entity or Land

Use Authority Permit Applicant with authority over the project, who will coordinate with the Wildlife Agencies for written concurrence of avoidance to ensure that the project does not cause take of the species.

California Tiger Salamander

To avoid direct and indirect effects of Covered Activities on California tiger salamander (*Ambystoma californiense*), the following AMMs will be implemented.

CTS-1 (California Tiger Salamander Daily Construction Schedule): Ground-disturbing Covered Activities within California tiger salamander modeled habitat (Figure 3-16 of the SSHCP document) will occur outside the breeding and dispersal season (occur after July 31 and before October 15), to the maximum extent practicable. If Covered Activities must be implemented in modeled habitat (Figure 3-16 of the SSHCP document) during the breeding and dispersal season (after October 15 and before July 31), construction activities will not start until 30 minutes after sunrise and must be complete 30 minutes prior to sunset.

CTS-2 (California Tiger Salamander Exclusion Fencing): If a Covered Activity must be implemented in modeled habitat (Figure 3-16 of the SSHCP document) during the breeding and dispersal season (after October 15 and before July 31), exclusion fencing will be installed around the project footprint before October 15. Temporary high-visibility construction fencing will be installed along the edge of work areas, and exclusion fencing will be installed immediately outside of the temporary high-visibility construction fencing to exclude California tiger salamanders from entering the construction area or becoming entangled in the construction fencing. Exclusion fencing will be at least 1 foot tall and be buried at least 6 inches below the ground to prevent salamanders from going under the fencing. Fencing will remain in place until all construction activities within the construction area are complete. No project activities will occur outside the delineated project footprint. An approved biologist must inspect the exclusion fencing and project site every morning before 7:00 a.m. for integrity and for any entrapped California tiger salamanders. If a California tiger salamander is encountered, refer to CTS-5, below. (However, the HCP Implementing Entity may, with approval of the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), determine that it is appropriate for a Covered Activity project to not implement CTS-2 for certain long and linear roadway Covered Activity projects if it appears that the exclusion fencing will likely trap individuals or cause more take of California tiger salamander than it would prevent.)

CTS-3 (California Tiger Salamander Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-16 of the SSHCP document), an approved biologist experienced with California tiger salamander identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site for California tiger salamander every morning before 7:00 a.m., or prior to construction activities. As required by AMM BMP-8 (Training of Construction Staff), the approved biologist will also train construction personnel on the required California tiger salamander avoidance procedures, exclusion fencing, and correct protocols in the event that a California tiger salamander enters an active construction zone. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-4 (Avoid California Tiger Salamander Entrapment): If Covered Activities must be implemented in modeled habitat, all excavated steep-walled holes or trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes or trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within California tiger salamander modeled habitat will be inspected for California tiger salamanders by the approved biologist prior to being moved. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-5 (California Tiger Salamander Encounter Protocol): If a California tiger salamander is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately (California Department of Fish and Wildlife (CDFW) and U.S. Fish and Wildlife Service (USFWS)). Construction activities will be suspended in a 100-foot radius of the animal until the animal is relocated by an approved biologist with appropriate handling permits from the Wildlife Agencies. Prior to relocation, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the salamander, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to USFWS and CDFW immediately. Any worker who inadvertently injures or kills a California tiger salamander or who finds dead,

injured, or entrapped California tiger salamander(s) must immediately report the incident to the approved biologist.

CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat): If erosion control (BMP-2) is implemented within California tiger salamander modeled habitat (Figure 3-16 of the SSHCP document), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that salamanders are not trapped (no monofilament). Coconut coir matting and fiber rolls with burlap are examples of acceptable erosion control materials. This limitation will be communicated to the contractor through use of special provisions included in the bid solicitation package.

CTS-7 (Rodent Control): CTS-7 only applies to projects that are within California tiger salamander modeled habitat (Figure 3-16 of the SSHCP document) and on Covered Activities. Rodent control will be allowed only in developed portions of a Covered Activity project site. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Western Spadefoot

To avoid direct and indirect effects of Covered Activities on western spadefoot (*Spea hammondii*), the following AMMs will be implemented.

WS-1 (Western Spadefoot Work Window): Ground-disturbing Covered Activities within western spadefoot modeled habitat (Figure 3-17 of the SSHCP document) will occur outside the breeding and dispersal season (after May 15 and before October 15), to the maximum extent practicable.

WS-2 (Western Spadefoot Exclusion Fencing): If Covered Activities must be implemented in modeled habitat (Figure 3-17 of the SSHCP document) after October 15 and before May 15, exclusion fencing will be installed around the project footprint before October 15, and the project site must be monitored by an approved biologist following rain events. Temporary high-visibility construction fencing will be installed along the edge of work areas, and silt fencing will be installed immediately behind the temporary high-visibility construction fencing to exclude western spadefoot from entering the construction area. Fencing will remain in place until all construction activities within the construction area are completed.

No project activities will occur outside the delineated project footprint. If a western spadefoot is encountered, refer to WS-6, below.

WS-3 (Western Spadefoot Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-17 of the SSHCP document) in the breeding and dispersal season (after October 15 and before May 15), an approved biologist experienced with western spadefoot identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site daily for western spadefoot prior to construction activities. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western spadefoot enters an active construction zone (i.e., outside the buffer zone). If a western spadefoot is encountered, refer to WS-6, below.

WS-4 (Avoid Western Spadefoot Entrapment): If a Covered Activity occurs in western spadefoot modeled habitat (Figure 3-17 of the SSHCP document), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western spadefoot modeled habitat will be inspected for western spadefoot by the approved biologist prior to being moved. If a western spadefoot is encountered, refer to WS-6, below.

WS-5 (Erosion Control Materials in Western Spadefoot Habitat): If erosion control (BMP-2) is implemented within western spadefoot modeled habitat (Figure 3-17 of the SSHCP document), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that western spadefoots are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WS-6 (Western Spadefoot Encounter Protocol): If Covered Activities must be implemented in modeled habitat (Figure 3-17 of the SSHCP document) during the breeding and dispersal season (after October 15 and before May 15), and a western spadefoot is encountered during construction activities, the approved biologist will notify

the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the western spadefoot within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife immediately. Any worker who inadvertently injures or kills a western spadefoot or who finds dead, injured, or entrapped western spadefoot(s) must immediately report the incident to the approved biologist.

Giant Gartersnake

To avoid direct and indirect effects of Covered Activities on giant gartersnake (*Thamnophis gigas*), the following AMMs will be implemented.

GGS-1 (Giant Gartersnake Surveys): If the HCP giant gartersnake modeled habitat maps (Figure 3-18 of the SSHCP document) show that modeled habitat for giant gartersnake is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate giant gartersnake aquatic habitat within the project footprint and adjacent areas within 300 feet of the project footprint. In addition to the HCP land cover types shown in Figure 3-18 of the SSHCP document, giant gartersnake aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, agricultural ditches, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide these maps to the Local Land Use Permit Applicants and the HCP Implementing Entity. Locations of delineated giant gartersnake habitat must also be noted on plans that are submitted to a Local Land Use Permit Applicant. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as giant gartersnake habitat is identified and fully avoided. Otherwise, Covered Activities must comply with GGS-2 through GGS-8, below. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

GGS-2 (Giant Gartersnake Work Window): Covered Activities that do not fully avoid giant gartersnake modeled habitat (Figure 3-18 of the SSHCP document) will be

conducted during the snake's active season. Construction and ground-disturbing activities will be initiated after May 1 and will end prior to September 15. If it appears that construction activities may go beyond September 15, the Local Land Use Permit Applicant or their Third-Party Project Proponent will contact the HCP Implementing Entity as soon as possible, but not later than September 1. The Local Land Use Permit Applicant and the HCP Implementing Entity will discuss with the Wildlife Agencies additional measures necessary to minimize take.

GGS-3 (Giant Gartersnake Monitoring): If a Covered Activity is occurring in giant gartersnake modeled habitat (Figure 3-18 of the SSHCP document), an approved biologist experienced with giant gartersnake identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for giant gartersnake prior to construction activities. If a giant gartersnake is encountered, refer to GGS-7. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a giant gartersnake enters an active construction zone (i.e., outside the buffer zone).

GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion): If construction activities will occur in giant gartersnake aquatic habitat, aquatic habitat will be dewatered and then remain dry and absent of aquatic prey (e.g., fish and tadpoles) for 15 days prior to initiation of construction activities. If complete dewatering is not possible, the HCP Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to giant gartersnake. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent snakes from attempting to move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify the construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Giant gartersnake habitat outside construction fencing will be avoided by all construction personnel. The fencing and the work area will be inspected by the approved biologist to ensure that the fencing is intact and that no snakes have entered the work area before the start of each work day. The fencing will be maintained by the contractor until completion of the project. If giant gartersnake is encountered, refer to GGS-7, below.

GGS-5 (Avoid Giant Gartersnake Entrapment): If a Covered Activity occurs in giant gartersnake modeled habitat (Figure 3-18 of the SSHCP document), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within giant gartersnake modeled habitat will be inspected for giant gartersnake by the approved biologist prior to being moved. If a giant gartersnake is encountered, refer to GGS-7.

GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat): If erosion control (BMP-2) is implemented within giant gartersnake modeled habitat (Figure 3-18 of the SSHCP document), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure snakes are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

GGS-7 (Giant Gartersnake Encounter Protocol): If a giant gartersnake is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the giant gartersnake within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a giant gartersnake or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

GGS-8 (Giant Gartersnake Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a

site-specific basis in consultation with the HCP Implementing Entity. Restoration work may include replanting emergent aquatic vegetation. Refer to the U.S. Fish and Wildlife Service's (USFWS) Guidelines for the Restoration and/or Replacement of Giant Gartersnake Habitat (USFWS 1997), or the most current USFWS guidelines at the time of the activity. A photo documentation report showing pre- and post-project conditions will be submitted to the HCP Implementing Entity 1 month after implementation of the restoration.

Western Pond Turtle

To avoid direct and indirect effects of Covered Activities on western pond turtle (*Actinemys marmorata*), the following AMMs will be implemented.

WPT-1 (Western Pond Turtle Surveys): If the HCP western pond turtle modeled habitat maps (Figure 3-19 of the SSHCP document) show that modeled habitat for western pond turtle is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate western pond turtle aquatic habitat within the project footprint and within 300 feet of the project footprint. In addition to the HCP land cover types shown in Figure 3-19 of the SSHCP document, western pond turtle aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide those maps to the Local Land Use Permit Applicants and the HCP Implementing Entity. Locations of delineated western pond turtle habitat must also be noted on plans that are submitted to a Local Land Use Permit Applicant. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as western pond turtle habitat is identified and fully avoided. Otherwise, Covered Activities must comply with WPT-2 through WPT-9. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

WPT-2 (Western Pond Turtle Work Window): Maintenance and improvements to existing structures may occur throughout the year as long as western pond turtle habitat is identified and avoided, and movement of equipment is confined to existing roads. Otherwise, construction and ground-disturbing Covered Activities must be conducted outside of western pond turtle's active season. Construction and ground-disturbing activities will be initiated after May 1 and will commence prior to September 15. If it appears that construction activities may go beyond

September 15, the appropriate Permit Applicant will contact the Local Land Use Permit Applicant and the HCP Implementing Entity as soon as possible, but not later than September 1, to determine if additional measures are necessary to minimize take.

WPT-3 (Western Pond Turtle Monitoring): If a Covered Activity is occurring in western pond turtle modeled habitat (Figure 3-19 of the SSHCP document), an approved biologist experienced with western pond turtle identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for western pond turtle prior to construction activities. The approved biologist will also training construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western pond turtle enters an active construction zone (i.e., outside the buffer zone).

WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion): If construction activities will occur in western pond turtle aquatic habitat, aquatic habitat for the turtle will be dewatered and then remain dry and absent of aquatic prey (e.g., crustaceans and other aquatic invertebrates) for 15 days prior to the initiation of construction activities. If complete dewatering is not possible, the HCP Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to western pond turtle. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent turtles from attempting to burrow or move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Western pond turtle habitat outside construction fencing will be avoided by all construction personnel. The fencing and work area will be inspected by the approved biologist to ensure that the fencing is intact and that no turtles have entered the work area before the start of each work day. Fencing will be maintained by the contractor until completion of the project. If, after exclusion fencing and dewatering, western pond turtles are found within the project footprint or within 300 feet of the project footprint, the

Third-Party Project Proponent will discuss the next best steps with the HCP Implementing Entity and Wildlife Agencies.

WPT-5 (Avoid Western Pond Turtle Entrapment): If a Covered Activity occurs within western pond turtle modeled habitat (Figure 3-19 of the SSHCP document), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western pond turtle modeled habitat will be inspected for western pond turtle by the approved biologist prior to being moved.

WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat): If erosion control (BMP-2) is implemented within western pond turtle modeled habitat (Figure 3-19 of the SSHCP document), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that turtles are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit): Covered Activity construction and maintenance vehicles will observe a 20-mile-per-hour speed limit within western pond turtle modeled upland habitat (Figure 3-19 of the SSHCP document).

WPT-8 (Western Pond Turtle Encounter Protocol): If a western pond turtle is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the turtle, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a western pond turtle or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

WPT-9 (Western Pond Turtle Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the HCP Implementing Entity. Restoration work may include replanting emergent aquatic vegetation and placing appropriate artificial or natural basking areas in waterways and wetlands. A photo documentation report showing pre- and post-project conditions will be submitted to the HCP Implementing Entity 1 month after implementation of the restoration.

Tricolored Blackbird

To avoid direct and indirect effects of Covered Activities on tricolored blackbird (*Agelaius tricolor*), the following AMMs will be implemented.

TCB-1 (Tricolored Blackbird Surveys): If modeled habitat for tricolored blackbird is present within a Covered Activity's project footprint or within 500 feet of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting or foraging sites are present within the project footprint and adjacent areas within 500 feet of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Within the Planning Area, potential tricolor blackbird nest sites are often associated with freshwater marsh and seasonal wetlands, or in thickets of willow, blackberry, wild rose, thistle, and other thorny vegetation. Tricolored blackbirds are also known to nest in crops associated with dairy farms. Foraging habitat is associated with annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields (such as large tracts of alfalfa and pastures with continuous haying schedules and recently tilled fields), cattle feedlots, and dairies. The Third-Party Project Proponent will map all existing or potential nesting or foraging sites and provide these maps to the Local Land Use Permit Applicants and HCP Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permit Applicant. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

TCB-2 (Tricolored Blackbird Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 500

feet of a project footprint if existing or potential nest sites were found during design surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and within 3 days of ground-disturbing activities, and within the proposed project footprint and 500 feet of the proposed project footprint to determine the presence of nesting tricolored blackbird. Pre-construction surveys will be conducted during the breeding season (March 1 through August 31). Surveys conducted in February (to meet pre-construction survey requirements for work starting in March) must be conducted within 14 days and 3 days in advance of ground-disturbing activities. If a nest is present, then TCB-3 and TCB-4 will be implemented. The approved biologist will inform the Land Use Authority Permit Applicant and the HCP Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

TCB-3 (Tricolored Blackbird Nest Buffer): If active nests are found within the project footprint or within 500 feet of any project-related Covered Activity, the Third-Party Project Proponent will establish a 500-foot temporary buffer around the active nest until the young have fledged.

TCB-4 (Tricolored Blackbird Nest Buffer Monitoring): If nesting tricolored blackbirds are present within the project footprint or within 500 feet of any project-related Covered Activity, then an approved biologist experienced with tricolored blackbird behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place near the disturbance buffer. Work within the nest disturbance buffer will not be permitted. If the approved biologist determines that tricolored blackbirds are exhibiting agitated behavior, construction will cease until the buffer size is increased to a distance necessary to result in no harm or harassment to the nesting tricolored blackbirds. If the biologist determines that the colonies are at risk, a meeting with the Third-Party Project Proponent, HCP Implementing Entity, and Wildlife Agencies will be held to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a tricolored blackbird flies into an active construction zone (i.e., outside the buffer zone).

TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves): On HCP Farmland/Agricultural Preserves, pesticides (including herbicides) will not be applied from January 1 through July 15.

Swainson's Hawk

To avoid direct and indirect effects of Covered Activities on Swainson's hawk (*Buteo swainsoni*), the following AMMs will be implemented.

SWHA-1 (Swainson's Hawk Surveys): If modeled habitat for Swainson's hawk (Figure 3-25 of the SSHCP document) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a survey to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Nest sites are often associated with Riparian land cover, but also include lone trees in fields, trees along roadways, and trees around structures. Nest trees may include, but are not limited to, Fremont's cottonwood (*Populus fremontii*), oaks (*Quercus* spp.), willows (*Salix* spp.), walnuts (*Juglans* spp.), eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and Deodar cedar (*Cedrus deodara*). The Third-Party Project Proponent will map all existing and potential nesting sites and provide these maps to the Local Land Use Permit Applicants and HCP Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permit Applicant. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

SWHA-2 (Swainson's Hawk Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites were found during initial surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities to determine presence of nesting Swainson's hawk. Pre-construction surveys will be conducted during the breeding season (March 1 through September 15). If a nest is present, then SWHA-3 and SWHA-4 will be implemented. The approved biologist will inform the Land Use Authority Permit Applicant and HCP Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

SWHA-3 (Swainson's Hawk Nest Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.25 mile disturbance buffer around the active nest until the young have fledged, with concurrence from the Wildlife Agencies.

SWHA-4 (Swainson's Hawk Nest Buffer Monitoring): If nesting Swainson's hawks are present within the project footprint or within 0.25 mile of any project-related Covered Activity, then an approved biologist experienced with Swainson's hawk behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the HCP Implementing Entity and Wildlife Agencies. If nesting Swainson's hawks begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, HCP Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a Swainson's hawk flies into an active construction zone (i.e., outside the buffer zone).

Greater Sandhill Crane

To avoid direct and indirect effects of Covered Activities on greater sandhill crane (*Grus canadensis*), the following AMMs will be implemented.

GSC-1 (Greater Sandhill Crane Surveys): If modeled habitat for greater sandhill crane (Figure 3-22 of the SSHCP document) is present within a Covered Activity's project footprint or within 0.5 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential roosting sites are present within the project footprint and adjacent areas within 0.5 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Roosting sites within the Planning Area are often associated with flooded fields, seasonal wetlands, and freshwater marsh. The Third-Party Project Proponent will map all existing or potential roosting sites and provide these maps to the Local Land Use Permit Applicants and HCP Implementing Entity.

Roosting sites must also be noted on plans that are submitted to a Local Land Use Permit Applicant. See Chapter 10 for the process to conduct and submit survey information.

GSC-2 (Greater Sandhill Crane Pre-Construction Surveys): Pre-construction surveys will be required to determine if active roosting sites are present within a project footprint or within 0.5 mile of a project footprint if existing or potential roosting sites were found during initial surveys and construction activities will occur when wintering flocks are present within the Planning Area (September 1 through March 15). An approved biologist will conduct pre-construction surveys within 15 days of ground-disturbing activities, and within 0.5 mile of a project footprint, to determine presence of roosting greater sandhill cranes. Pre-construction surveys will be conducted September 1 through March 15, when wintering flocks are present within the Planning Area. If birds are present, then GSC-3, GSC-4, and GSC-5 will be implemented. The approved biologist will inform the Land Use Authority Permit Applicant and HCP Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

GSC-3 (Greater Sandhill Crane Roosting Buffer): If active roosting sites are found within the project footprint or within 0.5 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.5 mile temporary roosting disturbance buffer around the roosting site until the cranes have left.

GSC-4 (Greater Sandhill Crane Visual Barrier): Greater sandhill cranes have low tolerance for human disturbance, and such disturbance has caused cranes to abandon foraging and roosting sites. Repeat disturbance affects their ability to feed and store energy needed for survival. If project-related activities occur within 0.5 mile of a known roosting site as identified by surveys conducted during implementation of GSC-1 or GSC-2, a visual barrier will be constructed.

GSC-5 (Greater Sandhill Crane Roosting Buffer Monitoring): If roosting sites are found within the project footprint or within 0.50 mile of any project-related Covered Activity, an approved biologist experienced with greater sandhill crane behavior will be retained by the Third-Party Project Proponent to monitor the roosting site throughout the roosting season and to determine when the birds have left. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary disturbance buffer can only occur with the written permission of the HCP Implementing Entity and Wildlife Agencies. If greater sandhill cranes are abandoning their roosting and/or forage sites, the approved biologist will have the authority to shut down construction activities. If

roost abandonment occurs, the approved biologist, Third-Party Project Proponent, HCP Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid harm and harassment of individuals. The approved biologist will also train construction personnel on the avoidance procedures, buffer zones, and protocols in the event that greater sandhill cranes move into an active construction zone (i.e., outside the buffer zone).

Western Burrowing Owl

To avoid direct and indirect effects of Covered Activities on western burrowing owl (*Athene cunicularia*), the following AMMs will be implemented.

WBO-1 (Western Burrowing Owl Surveys): Surveys within modeled habitat are required for both the breeding and non-breeding season. If the project site falls within modeled habitat, an approved biologist will survey the project site and map all burrows, noting any burrows that may be occupied. Occupied burrows are often (but not always) indicated by tracks, feathers, egg shell fragments, pellets, prey remains, and/or excrement. Surveying and mapping will be conducted by the approved biologist while walking transects throughout the entire project site plus all accessible areas within a 250-foot radius from the project site. The centerline of these transects will be no more than 50 feet apart and will vary in width to account for changes in terrain and vegetation that can preclude complete visual coverage of the area. For example, in hilly terrain with patches of tall grass, transects will be closer together, and in open areas with little vegetation, they can be 50 feet apart. This methodology is consistent with current survey protocols for this species (California Burrowing Owl Consortium 1993). Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If suitable habitat is identified during the initial survey, and if the project does not fully avoid the habitat, pre-construction surveys will be required. Burrowing owl habitat is fully avoided if project-related activities do not impinge on a 250-foot buffer established by the approved biologist around suitable burrows. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

WBO-2 (Western Burrowing Owl Pre-Construction Surveys): Prior to any Covered Activity ground disturbance, an approved biologist will conduct pre-construction surveys in all areas that were identified as suitable habitat during the initial surveys. The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the project site, particularly in areas within 250 feet of construction activities. To maximize the likelihood of detecting owls, the pre-construction

survey will last a minimum of 3 hours. The survey will begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total), or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites. A minimum of two pre-construction surveys will be conducted (if owls are detected on the first survey, a second survey is not needed). All owls observed will be counted and their location will be mapped. Surveys will conclude no more than 2 calendar days prior to construction. Therefore, the Third-Party Project Proponent must begin surveys no more than 4 days prior to construction (2 days of surveying plus up to 2 days between surveys and construction). To avoid last-minute changes in schedule or contracting that may occur if burrowing owls are found, the Third-Party Project Proponent may also conduct a preliminary survey up to 15 days before construction. This preliminary survey may count as the first of the two required surveys as long as the second survey concludes no more than 2 calendar days in advance of construction.

WBO-3 (Burrowing Owl Avoidance): If western burrowing owl or evidence of western burrowing owl is observed on the project site or within 250 feet of the project site during pre-construction surveys, then the following will occur:

During Breeding Season: If the approved biologist finds evidence of western burrowing owls within a project site during the breeding season (February 1 through August 31), all project-related activities will avoid nest sites during the remainder of the breeding season or while the nest remains occupied by adults or young (nest occupation includes individuals or family groups foraging on or near the site following fledging). Avoidance is establishment of a minimum 250-foot buffer zone around nests. Construction and other project-related activities may occur outside of the 250-foot buffer zone. Construction and other project-related activities may be allowed inside of the 250-foot non-disturbance buffer during the breeding season if the nest is not disturbed, and the Third-Party Project Proponent develops an avoidance, minimization, and monitoring plan that is approved by the HCP Implementing Entity and Wildlife Agencies prior to project construction based on the following criteria:

- The HCP Implementing Entity and Wildlife Agencies approve of the avoidance and minimization plan provided by the project applicant.
- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline nesting and foraging behavior (i.e., behavior without construction).

- The same approved biologist monitors the owls during construction and finds no change in owl nesting and foraging behavior in response to construction activities.

If there is any change in owl nesting and foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer. Construction cannot resume within the 250-foot buffer until any owls present are no longer affected by nearby construction activities, and with written concurrence from the Wildlife Agencies.

If monitoring by the approved biologist indicates that the nest is abandoned prior to the end of nesting season and the burrow is no longer in use, the non-disturbance buffer zone may be removed if approved by the Wildlife Agencies. The approved biologist will excavate the burrow in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl to prevent reoccupation after receiving approval from the Wildlife Agencies.

The HCP Implementing Entity and Wildlife Agencies will respond to a request from the Third-Party Project Proponent to review the proposed construction monitoring plan within 21 days.

During Non-Breeding Season: During the non-breeding season (September 1 through January 31), the approved biologist will establish a minimum 250-foot non-disturbance buffer around occupied burrows. Construction activities outside of this 250-foot buffer will be allowed. Construction activities within the non-disturbance buffer will be allowed if the following criteria are met to prevent owls from abandoning over-wintering sites:

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities.
- If there is any change in owl foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer.
- If the owls are gone for at least 1 week, the Third-Party Project Proponent may request approval from the HCP Implementing Entity and Wildlife Agencies that an approved biologist excavate usable burrows and

install one-way exclusionary devices to prevent owls from re-occupying the site. After all usable burrows are excavated, the buffer zone will be removed and construction may continue.

Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.

WBO-4 (Burrowing Owl Construction Monitoring): During construction of Covered Activities, 250-foot construction buffer zones will be established and maintained around any occupied burrow. An approved biologist will monitor the site to ensure that buffers are enforced and owls are not disturbed. The approved biologist will also train construction personnel on avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.

WBO-5 (Burrowing Owl Passive Relocation): Passive relocation is not allowed without the express written approval of the Wildlife Agencies. Passive owl relocation may be allowed on a case-by-case basis on project sites during the non-breeding season (September 1 through January 31) with the written approval of the Wildlife Agencies if the other measures described in this condition preclude work from continuing. Passive relocation must be done in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl. Passive relocation will only be proposed if the burrow needing to be removed or with the potential to collapse from construction activities is the result of a Covered Activity. If passive relocation is approved by the Wildlife Agencies, an approved biologist can passively exclude birds from their burrows during the non-breeding season by installing one-way doors in burrow entrances. These doors will be in place for 48 hours to ensure that owls have left the burrow, and then the biologist will excavate the burrow to prevent reoccupation. Burrows will be excavated using hand tools only. During excavation, an escape route will be maintained at all times. This may include inserting an artificial structure into the burrow to avoid having materials collapse into the burrow and trap owls inside. Other methods of passive relocation, based on best available science, may be approved by the Wildlife Agencies over the HCP Permit Term.

WBO-6 (Burrowing Owl Timing of Maintenance Activities): All activities adjacent to existing or planned HCP Preserves, Preserve Setbacks, or Stream Setback areas will be seasonally timed, when safety permits, to avoid or minimize adverse effects on occupied burrows.

WBO-7 (Rodent Control): Rodent control will be allowed only in developed portions of a Covered Activity project site within western burrowing owl modeled habitat. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Covered Raptor Species

To avoid direct and indirect effects of Covered Activities on covered raptor species, the following AMMs will be implemented. This measure applies to Cooper's hawk (*Accipiter cooperii*), loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). The following AMMs do not apply to ferruginous hawk (*Buteo regalis*), as they do not nest in the Planning Area. The following AMMs also do not apply to Swainson's hawk or burrowing owl, as specific AMMs have been developed for these covered raptor species.

RAPTOR-1 (Raptor Surveys): If modeled habitat for a covered raptor species (Figures 3-20, 3-23, 3-24, or 3-28 of the SSHCP document) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential nesting sites and provide these maps to the Local Land Use Permit Applicants and HCP Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permit Applicant. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

RAPTOR-2 (Raptor Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present with a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites are found during initial surveys and construction activities will occur during the raptor breeding season. An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities within the proposed project footprint and within 0.25 mile of the proposed project footprint to determine presence of nesting covered raptor species. Pre-construction surveys will be conducted during the raptor breeding season. If a nest is present, then RAPTOR-3 and RAPTOR-4 will be implemented. The approved biologist will inform the Land Use

Authority Permit Applicant and HCP Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

RAPTOR-3 (Raptor Nest/Roost Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.25 mile temporary nest disturbance buffer around the active nest until the young have fledged.

RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring): If project-related Covered Activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an approved biologist experienced with raptor behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the HCP Implementing Entity and Wildlife Agencies. If nesting raptors begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist/monitor will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, the Third-Party Project Proponent, HCP Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a covered raptor species flies into an active construction zone (i.e., outside the buffer zone).

Western Red Bat

To avoid direct and indirect effects of Covered Activities on western red bat (*Lasiurus blossevillii*), the following AMMs will be implemented.

BAT-1 (Winter Hibernaculum Surveys): If modeled habitat (Figure 3-30 of the SSHCP document) for western red bat is present within 300 feet of a Covered Activity's project footprint, then an approved biologist will conduct a field investigation of the project footprint and adjacent areas within 300 feet of a project footprint to determine if a potential winter hibernaculum is present, and to identify and map potential hibernaculum sites. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If potential hibernaculum sites are found, the Third-Party Project Proponent

will note their locations on project designs and will design the project to avoid all areas within a 300-foot buffer around the potential hibernaculum sites. Winter hibernaculum habitat is fully avoided if project-related activities do not impinge on a 300-foot buffer established by the approved biologist around an existing or potential winter hibernaculum site. See Chapter 10 of the SSHCP document for the process to conduct and submit survey information.

BAT-2 (Winter Hibernaculum Pre-Construction Surveys): If the Third-Party Project Proponent elects not to avoid potential winter hibernaculum sites within the project footprint plus a 300-foot buffer, additional surveys are required. Prior to any ground disturbance related to Covered Activities, an approved biologist will conduct a pre-construction survey within 3 days of ground-disturbing activities within the project footprint and 300 feet of the project footprint to determine the presence of winter hibernaculum sites. Pre-construction surveys will be conducted during the winter hibernaculum season (November 1 through March 31). If a winter hibernaculum is present, then BAT-3 and BAT-4 will be implemented. The approved biologist will inform the Land Use Authority Permit Applicant and HCP Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

BAT-3 (Winter Hibernaculum Buffer): If active winter hibernaculum sites are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will establish a 300-foot temporary disturbance buffer around the active winter hibernaculum site until bats have vacated the hibernaculum and the HCP Implementing Entity and Wildlife Agencies concur.

BAT-4 (Bat Eviction Methods): An approved biologist will determine if non-maternity and non-hibernaculum day and night roosts are present on the project site. If necessary, an approved biologist will use safe eviction methods to remove bats if direct impacts to non-maternity and non-hibernaculum day and night roosts cannot be avoided. If a winter hibernaculum site is present, Covered Activities will not occur until the hibernaculum is vacated, or, if necessary, safely evicted using methods acceptable to the Wildlife Agencies.

Table 2. Summary of Actions Associated with Covered Activities

EIS/EIR APPENDIX E

Alternative Formulation and Screening

Table E-1. First Tier Alternatives Screening

Remove Lands Outside USB From the Planning Area Boundary	Remove Lands West of Interstate-5 From the Planning Area Boundary	All Habitat Preservation and Project Mitigation Is Located Outside of the USB	Preserve 50% of all Vernal Pools in the Planning Area	Recovery Plan Alternative (Preserve 95% of Total Acreage of the MCRA)	Preserve 76% of the Total Acreage of the MCRA	Preserve 49% of the Vernal Pools within the MCRA	Preserve More of the Highest-Quality Swainson's Hawk Habitat	SSHCP	Reduced Permit Term
Would the potential alternative include an interconnected preserve system throughout the Planning Area that is large enough to maintain in perpetuity each type of natural community that is native to the Planning Area, maintain in perpetuity each type of native plant and animal species present within the Planning Area, and maintain in perpetuity or expand the existing distribution of each native animal and plant species within the Planning Area?									
Not likely because the USB is already highly developed and the opportunities for preserve establishment are limited.	Not likely because it would not allow for establishment of preserves in lands that provide valuable habitat for greater sandhill crane.	Not likely because it would not include any additional conservation in the MCRA, which would likely make conservation of vernal pool tadpole shrimp not possible.	Not likely because it would not include sufficient preservation of vernal pools to maintain the existing distribution of native animal and plant species in the Planning Area.	Not likely because it would not be possible to establish a preserve system that meets the mandate of 95% vernal pool preservation in the MCRA.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative locate preserves in areas that maximize protection of native plant and animal species and the ecosystems on which they depend?									
Not likely because it would not allow for establishment of preserves in the areas of the Planning Area that retain the most intact habitat.	Not likely because it would not allow for establishment of preserves in lands that provide valuable habitat for greater sandhill crane.	Not likely because it would not allow for protection of special-status plant species that only occur within the USB.	Not likely because it would not include sufficient preservation of vernal pools to maximize protection of native plant and animals species and their ecosystems.	Not likely, as the high burden for preservation in the MCRA would reduce the amount of development fees available for preservation of other habitat types outside the MCRA.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative locate preserves in areas that maximize the protection of intact watersheds and watershed functions?									
Not likely because the watersheds in the USB are the most disturbed in the Planning Area; the intact watersheds are generally located outside the USB.	Possibly.	Not likely because it would not allow for establishment of preserves in all watersheds of the Planning Area.	Not likely because it would not prioritize preservation of vernal pools in the MCRA, resulting in preservation of vernal pools scattered around the Planning Area.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative protect large, contiguous blocks of species habitat. Provide habitat linkages between preserves that are wide enough to allow dispersal of individual native animals and plants and allow genetic exchange between species populations?									
Not likely because large, contiguous blocks of species habitat are mostly gone from the USB.	Possibly.	Not likely because it would not allow for establishment of linkage preserves in the USB to connect existing preserves.	Possibly.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative protect sufficient cropland and irrigated pasture to provide important foraging habitat on which some native animal species now depend (e.g., Swainson's hawk, white-tailed kite)?									
Not likely, because most of the habitat for these species is outside the USB. Although no Covered Activities would occur outside the USB, it is likely that development would still proceed outside the USB. However, it would not occur under the mitigation framework of an HCP.	Not likely because it would not allow for establishment of preserves in lands that provide valuable habitat for greater sandhill crane.	Possibly.	Possibly.	Not likely, as the high burden for preservation in the MCRA would reduce the amount of development fees available for preservation of other habitat types outside the MCRA.	Not likely, because the high avoidance within the MCRA would limit the available mitigation fees that would allow for acquisition of cropland and irrigated pasture. Preventing development in the MCRA would also shift development pressure to other lands, including those that currently contain cropland and irrigated pasture.	Possibly.	Possibly.	Possibly.	Possibly.

AGENDA ITEM 11.1
6100

Table E-1. First Tier Alternatives Screening

Remove Lands Outside USB From the Planning Area Boundary	Remove Lands West of Interstate-5 From the Planning Area Boundary	All Habitat Preservation and Project Mitigation Is Located Outside of the USB	Preserve 50% of all Vernal Pools in the Planning Area	Recovery Plan Alternative (Preserve 95% of Total Acreage of the MCRA)	Preserve 76% of the Total Acreage of the MCRA	Preserve 49% of the Vernal Pools within the MCRA	Preserve More of the Highest-Quality Swainson's Hawk Habitat	SSHCP	Reduced Permit Term
Would the potential alternative preserve adequate greater sandhill crane roosting habitat and foraging habitat between the existing Stone Lakes National Wildlife Refuge and the existing Cosumnes River Preserve, to maintain or increase the population of greater sandhill crane over-wintering within the Planning Area?									
Not likely because it would not allow for establishment of preserves in lands that provide connectivity between Stone Lakes and the Cosumnes River Preserve.	Not likely because it would not allow for establishment of preserves in lands that provide connectivity between Stone Lakes and the Cosumnes River Preserve.	Possibly.	Possibly.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative protect the long-term viability of ranching and farming operations in the Planning Area (consistent with other objectives)?									
Not likely, as some ranching and farming operations outside the USB would be threatened by development if it is not included in the Plan Area.	Possibly.	Possibly.	Possibly.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative protect all currently documented and any newly discovered occurrences of Sacramento Orcutt grass and slender Orcutt grass in the Planning Area?									
Not likely, because if Orcutt grasses are found outside the USB they could not be included in the Preserve System.	Possibly.	Not likely, because Orcutt grasses are located inside the USB and then could not be included in the preserve system.	Possibly.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative avoid or minimize impacts to state and federally listed species and their habitats, to the maximum extent practicable?									
Possibly.	Not likely because it would not allow for establishment of preserves in lands that provide valuable habitat for greater sandhill crane.	Not likely, because Orcutt grasses are located inside the USB and then could not be included in the preserve system.	Not likely because it would not include sufficient preservation of vernal pools to avoid or minimize impacts to state and federally listed species to the maximum extent practicable.	Not likely, as the high burden for preservation in the MCRA would reduce the amount of development fees available for preservation of other habitat types outside the MCRA.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative avoid or minimize impacts to the existing physical, chemical, and biological functions and services of wetlands and streams in the Planning Area, to the maximum extent practicable?									
Possibly.	Possibly.	Not likely, because wetlands and streams in the USB would not be protected in preserves.	Possibly.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative achieve no net loss of the existing functions and services of aquatic resources in the Planning Area? Methods used to achieve no net loss may include the re-establishment and establishment of vernal pools, riparian, and other aquatic land cover types?									
Possibly.	Possibly.	Possibly.	Not likely because it would result in insufficient preservation of vernal pools than to mitigate Covered Activities and achieve no net loss.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.

AGENDA ITEM 11.1
6101

Table E-1. First Tier Alternatives Screening

Remove Lands Outside USB From the Planning Area Boundary	Remove Lands West of Interstate-5 From the Planning Area Boundary	All Habitat Preservation and Project Mitigation Is Located Outside of the USB	Preserve 50% of all Vernal Pools in the Planning Area	Recovery Plan Alternative (Preserve 95% of Total Acreage of the MCRA)	Preserve 76% of the Total Acreage of the MCRA	Preserve 49% of the Vernal Pools within the MCRA	Preserve More of the Highest-Quality Swainson's Hawk Habitat	SSHCP	Reduced Permit Term
Would the potential alternative include a long-term preserve monitoring and habitat management program sufficient to maintain or improve habitats of targeted native plant and animal species in perpetuity?									
Possibly.	Possibly.	Possibly.	Possibly.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative support the development and implementation of streamlined water-resource permitting programs under CWA Section 404, CWA 401, the Porter–Cologne Water Quality Control Act, and Section 1600 of the California Fish and Game Code (Streambed Alteration Agreements) by the federal and state agencies with responsibility for implementing those statues within the Planning Area?									
Possibly.	Possibly.	Possibly.	Possibly.	Possibly, although this alternative is not feasible for the reasons listed under Screening Criteria #1.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative facilitate the recovery of federally listed species, and provide sufficient preservation of federally designated recovery areas within the Planning Area?									
Not likely, as it would not result in preservation of habitat in the Cosumnes/Rancho Seco Core Recovery Area.	Possibly.	Not likely because it would not include any additional conservation in the MCRA, which would likely make conservation of vernal pool tadpole shrimp not possible.	Not likely because it would include sufficient preservation of vernal pools ESA core recovery areas that are now designated within the Planning Area.	Not likely, as the high burden for preservation in the MCRA would reduce the amount of development fees available for preservation of other habitat types outside the MCRA including the Cosumnes/Rancho Seco Core Area.	Possibly.	Possibly.	Possibly.	Possibly.	Possibly.

Table E-2. Second Tier Alternatives Screening

Preserve 76% of the Total Acreage of the MCRA	Preserve 49% of the Vernal Pools within the MCRA	Preserve More of the Highest-Quality Swainson's Hawk Habitat	SSHCP	Reduced Permit Term
Would the potential alternative avoid or substantially lessen any of the significant environmental effects of the proposed project?				
Possibly.	Possibly	Not likely, because the proposed project would have minimal effects on Swainson's hawk. This is especially true since the withdrawal of the City of Elk Grove from the Plan Area, as that was the area with by far the greatest impacts to Swainson's hawk habitat from Covered Activities.	Does not apply, as this alternative is the proposed project.	Possibly.
Would the potential alternative address one or more significant issues related to the proposed action?				
Possibly.	Possibly	Not likely, because the proposed project would have minimal effects on Swainson's hawk. This is especially true since the withdrawal of the City of Elk Grove from the Plan Area, as that was the area with by far the greatest impacts to Swainson's hawk habitat from Covered Activities.	Does not apply, as this alternative is the proposed project.	Possibly.
Score (# of "Possibly")

Carried Forward to Third Tier Screening?				
Yes	Yes	No	Yes	Yes

AGENDA ITEM 11.1
6103

Table E-3. Third Tier Alternatives Screening

Preserve 76% of the Total Acreage of the MCRA	Preserve 49% of the Vernal Pools within the MCRA	SSHCP	Reduced Permit Term
Would the potential alternative accommodate the existing transportation, utility, and other infrastructure master plans that have been prepared by the SSHCP permit Applicants (County of Sacramento, City of Galt, City of Rancho Cordova, SCWA, SRCSD, and Connector JPA)?			
Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative allow an adequate amount of urban development within the currently adopted spheres of influence for the City of Rancho Cordova and the City of Galt, and the currently adopted USB for Sacramento County, to discourage expansion beyond these boundaries and maintain the sound land use planning principles these boundaries encourage (e.g., preventing sprawl outside the USB and leap-frog development; consolidating development to support the efficient provision of utilities and infrastructure; promoting compact mixed use development that supports viable transit and walkable areas; creating communities with a variety of housing types that support different income levels and socioeconomic conditions; and maintaining compliance with air quality laws and regulations that influence, or are influenced by land use decisions such as Assembly Bill 32, Senate Bill 375, and the Clean Air Act).			
Not likely, because "displaced" development outside the USB would require additional development of utilities and infrastructure, lead to more urban sprawl with more vehicle trips, and would not promote compact mixed-use development that supports viable transit and walkable areas. This development outside the USB may also conflict with requirements of AB32 and SB375 to reduce greenhouse gas emissions through land use planning that minimizes vehicle trips.	Not likely, because "displaced" development outside the USB would require additional development of utilities and infrastructure, lead to more urban sprawl with more vehicle trips, and would not promote compact mixed-use development that supports viable transit and walkable areas. This development outside the USB may also conflict with requirements of AB32 and SB375 to reduce greenhouse gas emissions through land use planning that minimizes vehicle trips.	Possibly.	Possibly.
Would the potential alternative include an adequate amount of urban development with associated fees to meet first tier screening criteria, above? In addition, the associated mitigation-fee structure must be practicable, with fees that are analogous to fees collected under other Northern California permitted HCPs that have similar species habitats and similar impacts.			
Not likely, because the resource agencies did not take into account the feasibility of obtaining these lands for permanent habitat preservation when the 2011 Agency Conceptual Design was prepared. In order to acquire these lands, the development fee would need to be increased to such an extent that it would not be consistent with fees charged by other HCPs.	Possibly.	Possibly.	Possibly.
Would the potential alternative include as covered activities the SSHCP Permit Applicant's transportation, utility, and other infrastructure activities and projects as described in the approved master plans of the SSHCP permit Applicants (County of Sacramento, City of Galt, City of Rancho Cordova, SCWA, and Connector JPA)?			
Possibly.	Possibly.	Possibly.	Possibly.
Would the potential alternative rely on willing sellers for the purchase of land or easements when establishing habitat preserves; do not include condemnation or imminent domain to meet the project needs, purposes, and objectives?			
Not likely, as this alternative would require establishing preserves in nearly all of the remaining undeveloped land within the MCRA. One or more landowners would most likely refuse to sell.	Not likely, as this alternative would require establishing preserves in nearly all of the remaining undeveloped land within the MCRA. One or more landowners would most likely refuse to sell.	Possibly.	Possibly.

EIS/EIR APPENDIX F

CEQA Environmental Checklist Form

INITIAL STUDY CHECKLIST

Appendix G of the California Environmental Quality Act (CEQA) provides guidance for assessing the significance of potential environmental impacts. Based on this guidance, Sacramento County has developed the following Initial Study Checklist. The Checklist identifies a range of potential significant effects by topical area. The words "significant" and "significance" used throughout the following checklist are related to impacts as defined by the California Environmental Quality Act as follows:

1 Potentially Significant indicates there is substantial evidence that an effect MAY be significant. If there are one or more “Potentially Significant” entries an Environmental Impact Report (EIR) is required. Further research of a potentially significant impact may reveal that the impact is actually less than significant or less than significant with mitigation.

2 Less than Significant with Mitigation applies where an impact could be significant but specific mitigation has been identified that reduces the impact to a less than significant level.

3 Less than Significant or No Impact indicates that either a project will have an impact but the impact is considered minor or that a project does not impact the particular resource.

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
1. **LAND USE** - Would the project:				
a. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to a general plan, specific plan or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	X			See Chapter 4.
b. Physically disrupt or divide an established community?	X			See Chapter 4.
2. **POPULATION/HOUSING -** Would the project:				
a. Induce substantial unplanned population growth in an area either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of infrastructure)?	X			See Chapter 4 and 16.
b. Displace substantial amounts of existing housing, necessitating the construction of replacement housing elsewhere?	X			See Chapter 4.
3. **AGRICULTURAL RESOURCES** - Would the project:				
a. Convert Prime Farmland, Unique Farmland, Farmland of Statewide Importance or areas containing prime soils to uses not conducive to agricultural production?	X			See Chapter 6.
b. Conflict with any existing Williamson Act contract?	X			See Chapter 6.
c. Introduce incompatible uses in the vicinity of existing agricultural uses?	X			See Chapter 4 and Chapter 6. .

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
4. **AESTHETICS -** Would the project:				
a. Substantially alter existing viewsheds such as scenic highways, corridors or vistas?			X	Given its nature, the project is not expected to substantially alter the viewshed associated with Highway 16, the River Road or other corridors or vistas when compared to the No Action/No Project Baseline.
b. Substantially degrade the existing visual character or quality of the site and its surroundings?			X	Construction will not substantially degrade the visual character or quality of the project site when compared to the No Action/No Project Baseline.
c. Create a new source of substantial light, glare, or shadow that would result in safety hazards or adversely affect day or nighttime views in the area?			X	The project will not result in a new source of substantial light, glare or shadow that would result in safety hazards or adversely affect day or nighttime views in the area when compared to the No Action/No Project Baseline.
5. **AIRPORTS -** Would the project:				
a. Result in a safety hazard for people residing or working in the vicinity of an airport/airstrip?	X			See Chapter 4.
b. Expose people residing or working in the project area to aircraft noise levels in excess of applicable standards?	X			See Chapter 4.
c. Result in a substantial adverse effect upon the safe and efficient use of navigable airspace by aircraft?	X			See Chapter 4.
d. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	X			See Chapter 4.
6. **PUBLIC SERVICES -** Would the project:				
a. Have an adequate water supply for full buildout of the project?	X			See Chapter 12.

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
b. Have adequate wastewater treatment and disposal facilities for full buildout of the project?	X			See Chapter 12.
c. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	X			See Chapter 12.
d. Result in substantial adverse physical impacts associated with the construction of new water supply or wastewater treatment and disposal facilities or expansion of existing facilities?	X			See Chapter 12.
e. Result in substantial adverse physical impacts associated with the provision of storm water drainage facilities?	X			See Chapter 7 and Chapter 12.
f. Result in substantial adverse physical impacts associated with the provision of electric or natural gas service?	X			See Chapter 12.
g. Result in substantial adverse physical impacts associated with the provision of emergency services?	X			See chapter 12.
h. Result in substantial adverse physical impacts associated with the provision of public school services?			X	The project would not require the construction/expansion of additional new unplanned school facilities compared to the No Action/No Project Alternative. Established case law, *Goleta Union School District v. The Regents of the University of California* (36 Cal-App. 4th 1121, 1995), indicates that school overcrowding, standing alone, is not a change in the physical conditions, and cannot be treated as an impact on the environment.
i. Result in substantial adverse physical impacts associated with the provision of park and recreation services?	X			See Chapter 12.

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
7. **TRANSPORTATION/TRAFFIC** - Would the project:				
a. Result in a substantial increase in vehicle trips that would exceed, either individually or cumulatively, a level of service standard established by the County?	X			See Chapter 13.
b. Result in a substantial adverse impact to access and/or circulation?	X			See Chapter 13.
c. Result in a substantial adverse impact to public safety on area roadways?	X			See Chapter 13.
d. Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	X			See Chapter 13.
8. **AIR QUALITY** - Would the project:				
a. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard?	X			See Chapter 14.
b. Expose sensitive receptors to pollutant concentrations in excess of standards?	X			See Chapter 14
c. Create objectionable odors affecting a substantial number of people?	X			See Chapter 14
9. **NOISE -** Would the project:				
a. Result in exposure of persons to, or generation of, noise levels in excess of standards established by the local general plan, noise ordinance or applicable standards of other agencies?			X	Compared to the No Action/No Project alternative, the project is not expected to result in exposure of persons to, or generation of, noise levels in excess of applicable standards.

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
b. Result in a substantial temporary increase in ambient noise levels in the project vicinity?			X	Project construction will result in a temporary increase in ambient noise levels in the project vicinity. This impact is less than significant due to the temporary nature of the these activities, limits on the duration of noise, and evening and nighttime restrictions imposed by the County Noise Ordinance (Chapter 6.68 of the County Code).
10. **HYDROLOGY AND WATER QUALITY** - Would the project:				
a. Substantially deplete groundwater supplies or substantially interfere with groundwater recharge?	X			See Chapter 7.
b. Substantially alter the existing drainage pattern of the project area and/or increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site?	X			See Chapter 7.
c. Develop within a 100-year floodplain as mapped on a federal Flood Insurance Rate Map or within a local flood hazard area?	X			See Chapter 7
d. Place structures that would impede or redirect flood flows within a 100-year floodplain?	X			See Chapter 7.
e. Expose people or structures to a substantial risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	X			See Chapter 7
f. Create or contribute runoff that would exceed the capacity of existing or planned stormwater drainage systems?	X			See Chapter 7
g. Create substantial sources of polluted runoff or otherwise substantially degrade ground or surface water quality?	X			See Chapter 7.

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
11. **GEOLOGY AND SOILS** - Would the project:				
a. Expose people or structures to substantial risk of loss, injury or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	X			See Chapter 5.
b. Result in substantial soil erosion, siltation or loss of topsoil?	X			See Chapter 5.
c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, soil expansion, liquefaction or collapse?	X			See Chapter 5.
d. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available?	X			See Chapter 5.
e. Result in a substantial loss of an important mineral resource?	X			See Chapter 5.
f. Directly or indirectly destroy a unique paleontological resource or site?	X			See Chapter 5.
12. **BIOLOGICAL RESOURCES** - Would the project:				
a. Have a substantial adverse effect on any special status species, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop	X			See Chapters 8 and 9.

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
below self-sustaining levels, or threaten to eliminate a plant or animal community?				
b. Have a substantial adverse effect on riparian habitat or other sensitive natural communities?	X			See Chapter 8.
c. Have a substantial adverse effect on streams, wetlands, or other surface waters that are protected by federal, state, or local regulations and policies?	X			See Chapters 8 and 9.
d. Have a substantial adverse effect on the movement of any native resident or migratory fish or wildlife species?	X			See Chapters 8 and 9.
e. Adversely affect or result in the removal of native or landmark trees?	X			See chapter 8.
f. Conflict with any local policies or ordinances protecting biological resources?	X			See Chapters 1, 8 and 9.
g. Conflict with the provisions of an adopted Habitat Conservation Plan or other approved local, regional, state or federal plan for the conservation of habitat?	X			See Chapter 4.
13. **CULTURAL RESOURCES -** Would the project:				
a. Cause a substantial adverse change in the significance of a historical resource?	X			See Chapter 11.
b. Have a substantial adverse effect on an archaeological resource?	X			See Chapter 11.
c. Disturb any human remains, including those interred outside of formal cemeteries?	X			See Chapter 11.

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
d. Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code 21074?	X			See Chapter 11,
14. **HAZARDS AND HAZARDOUS MATERIALS** - Would the project:				
a. Create a substantial hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			X	Chapter 5, condition 10 of the SSHCP identifies responsibilities of the implementing agency, which will reduce impacts associated with hazardous materials to less than significant levels. The responsibilities are described below: *Prior to the acquisition of a preserve site or implementation of a stream or riparian restoration project, a Phase I Environmental Site Assessment shall be conducted in general accordance with the American Society for Testing and Materials Standard Practice E1527-05. The purpose of this Environmental Site Assessment is to identify, to the extent feasible pursuant to the American Society for Testing and Materials Standard, recognized environmental conditions in connection with the potential site. The term "recognized environmental condition" means the presence or likely presence of hazardous substances or petroleum products on the property under conditions that may indicate an existing release, a past release, or a material threat of release of these substances to the property. If the Phase 1 Environmental Site Assessment indicates the presence of a recognized environmental condition, the Implementing Entity shall consider the following options.* • *Determine that the acquisition/project can proceed on the basis that the Habitat Plan goals and objectives can be met on the site even with the presence of a recognized environmental condition.* • *Conduct a Phase II Environmental Site Assessment, including soil and groundwater testing, to further study the potential for contamination to limit the Implementing Entity's management activities.*

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
				• *If the results of the Phase I (or Phase II) Environmental Site Assessment indicate that the Habitat Plan goals and objectives cannot be met on the site, the Implementing Entity should not acquire the site.* *As part of each Preserve Management Plan or site restoration plan, a Contingency Plan shall be prepared to address the actions that would be taken during construction in the event that unexpected contaminated soil or groundwater is discovered. The Contingency Plan shall include health and safety considerations, handling and disposal of wastes, reporting requirements, and emergency procedures. The Contingency Plan shall include a requirement that if evidence of contaminated materials is encountered during construction, construction would cease immediately and applicable requirements of the Comprehensive Environmental Release Compensation and Liability Act and the California Code of Regulations Title 22 regarding the disposal of waste would be implemented.*
b. Expose the public or the environment to a substantial hazard through reasonably foreseeable upset conditions involving the release of hazardous materials?			X	See 14.a (above).
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances or waste within one-quarter mile of an existing or proposed school?			X	See 14.a (above)
d. Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, resulting in a substantial hazard to the public or the environment?			X	See 14.a (above). The project would not interfere with any ongoing clean-up efforts of known hazardous materials sites. *The Implementing Entity will take the following steps when reviewing and considering any fee title or conservation easement acquisition, in addition to any steps required to comply with applicable federal and state laws governing real estate transactions:* *Determine landowner interest in selling an easement or selling in*

	Potentially Significant	Less Than Significant with Mitigation	Less Than Significant or No Impact	Comments
				fee title. Approach property owner with proposal to acquire land through conservation easement or fee title. *The Implementing Entity will obtain a title report to determine if there are encumbrances that might exclude property from acquisition. Properties with encumbered water rights or surface mineral rights that cannot be subordinated to a conservation easement or habitat protection interest will be excluded from acquisition unless these encumbrances do not influence the integrity of the proposed Preserve. A Phase I survey with an environmental determination document for the presence of hazardous materials will be included with the title report.*
e. Impair implementation of or physically interfere with an adopted emergency response or emergency evacuation plan?			X	The project would not interfere with any known emergency response or evacuation plan.
15. GREENHOUSE GAS EMISSIONS – Would the project:				
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	X			See Chapter 15 of the EIS/EIR.

EIS/EIR APPENDIX G-1

Environmental Stressors from Urban Development Projects and Activities

This section describes environmental stressors resulting from actions considered under the alternativesthat may affect land covers, species habitat, and individuals of species. Twenty-four environmental stressors are described below, organized by: (1) environmental stressors that would occur on an ongoing and permanent basis for activities over the 50-year study period considered in the EIS/EIR, and (2) those that would be temporary and occur only during and immediately after construction of an activity. These environmental stressors are listed below, then a narrative discussion is provided for each stressor. Table G-1.1 (tables are provided at the end of Appendix G-1) presents a matrix identifying which environmental stressors could result from different categories of projects or activities. Table G-1.2 provides a matrix indicating which environmental stressors have potential to affect each of the 28 proposed covered species included in the Propsoed Action/Proposed Project and the Reduced Permit Term Alternative.

ENVIRONMENTAL STRESSORS OF URBAN DEVELOPMENT

- Loss of land covers and species habitat
- Permanent alterations to watershed hydrographs and downstream water quality effects
- Habitat fragmentation
- Increased wildfire
- Vernal pool hydrologic alterations
- Chronic ground vibration and noise
- Lighting
- Increased human activity
- Wildlife community alterations
- Invasive plants
- Invasive animals
- Mesopredators
- Wildlife disease
- Pesticides and fertilizers
- Vehicle and aircraft collisions with wildlife
- Aboveground electrical utilities collision and electrocution

TEMPORARY ENVIRONMENTAL STRESSORS DURING CONSTRUCTION

- Temporary alterations to hydrographs and construction water quality effects
- Laydown or trampling of vegetation
- Construction noise
- Construction ground vibration

- Construction lighting
- Construction dust
- Increased human presence during construction
- Construction trash and debris.

PERMANENT ENVIRONMENTAL STRESSORS

Loss of Land Covers and Species Habitat

The major effect of new urban development, transportation, and utility projects is conversion from undeveloped to developed land cover types. In addition to the net loss of undeveloped land cover in the Planning Area, such conversion may further isolate remaining natural habitat rendering it less suitable or unsuitable for wildlife and plant species.

Natural land covers would be permanently converted to developed uses from construction of residential, commercial, and industrial structures, park and recreation facilities, some public and private utilities, solid waste management facilities, urban and rural transportation, and wastewater facilities.

Habitat Fragmentation

Fragmentation and isolation of plant and wildlife populations can affect wildlife movement and dispersal as well as seed dispersal and movement and dispersal of plant pollinators. These may cause extinction of local populations as a result of two processes: (1) reduction in total habitat area, which reduces effective population sizes; and (2) isolation of local populations, which affects dispersal and immigration rates (Wilcox and Murphy 1985). Because of complex community-level interactions (e.g., mutualistic species, habitat guilds, and keystone species), the loss of one or a few species from a habitat patch as a direct result of habitat fragmentation ("primary" extinctions) also may result in multiple "secondary" extinctions within the habitat patch (Wilcox and Murphy 1985). At the larger landscape scale, change in regional abundance and distribution of habitat may change the migration and habitat use patterns of some wildlife species, which in turn affects the metapopulation dynamics of numerous organisms and alters multiple landscape-scale ecological functions. For example, many species will either not cross roads, drainages, disturbed lands, and urbanized areas or do so infrequently or unsuccessfully. The necessity of crossing roads also increases the risk of vehicle collisions, especially for small rodents, reptiles, amphibians, and low- or slow-flying birds. Roadway mortality or limitations on species movement leads to a variety of problems, including reduction and isolation of populations. As populations become isolated and smaller, they become particularly vulnerable to negative demographic trends, including genetic bottlenecks, genetic drift, and inbreeding depression. These changes in turn can affect ecological functions and the long-term viability of

species, including those for which roads are not a major barrier, but which have important ecological relationships with high-risk species (e.g., predator/prey relationships, mutualisms such as burrow construction and use, pollination). This disruption may also affect vegetation communities if the spatial behavior of plant dispersers and pollinators is altered.

Fragmentation also decreases the functional size of conserved habitat patches. As remaining habitat areas diminish in size, the ratio of vulnerable edge to preserved interior area increases, especially with narrow or irregularly shaped habitat patches. Ecological consequences arise because, as this ratio increases, any given interior point (habitat or organism) is closer to potential threats existing outside the preserve boundary. Increased edge effects heighten species' vulnerability to stochastic disturbances, pollution, and invasion by non-native plant and animal species.

Fencing may inhibit the movement of some species that have large home ranges, such as badgers (*Taxidea taxus*), coyotes (*Canis latrans*), and mule deer (*Odocoileus hemionus*). Disrupting the ability of these species to move freely throughout their ranges may alter their foraging and social behavior, and may expose them to greater risks in other areas they may normally avoid or use less frequently due to lower habitat suitability, greater risks of predation, or greater risks of vehicle collisions.

Wildlife Community Alterations

Wildlife community alterations will occur in developed areas, and may occur along the open space–urban interface due to development-induced habitat degradation. Rottenborn (1999), for example, characterized wildlife species as being "tolerant" or "sensitive" to urbanization. The "tolerant" species include several birds that are commonly thought of as urban-related, such as pigeons (*Columbia livia*), mourning doves (Zenaida macroura), western scrub-jays (*Aphelocoma californica*), American crows (*Corvus brachyrhynchos*), northern mockingbirds (Mimus polyglottos), European starlings (*Sturnus vulgaris*), and bushtits (Psaltriparus minimus). Urban "sensitive" species included both year-long resident species, such as California quail (Callipepla californica), acorn woodpecker (Melanerpes formicivorus), and Bewick's wren (Thryomanes bewickii), as well as migrants, such as willow flycatcher (Empidonax traillii) and yellow warbler (Setophaga petechia). Permeability to invasive or urban-tolerant species may be increased through reductions in plant structure and cover related to increased human activity in the area, and especially related to fuel-modification activities along habitat edges. These species may out-compete resident native species for resources (e.g., habitat, food, nesting locations) or directly prey on or parasitize the native residents. European starlings, for example, may directly compete with native cavity nesters for nest sites in urban settings.

Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects

By permanently increasing the extent of impermeable surfaces, urban development results in increased runoff, especially during storm events. Such increases can change the hydrograph of local creeks and streams, result in greater levels of scour and/or incision of local creeks, increased sediment loads downstream, alterations of downstream hydrology, and decreased groundwater recharge. Also, addition of new development may permanently increase the amount of pollutants such as grease, oil, and lawn pesticides in local creeks and streams transported from residences during wet weather. An increase in the quantity of pollutants reaching local creeks through higher runoff may affect the biological and physical characteristics of aquatic habitats. Pollutants can also enter groundwater when development occurs over percolation zones in streams, which can affect drinking water quality. High runoff temperature may also result in an increase of in-stream water temperatures when runoff enters local streams. Permanent increases in impermeable surfaces or compaction of soils may also inhibit natural percolation of stormwater into groundwater basins, which may lead to a drawdown in groundwater levels.

Activities increase the potential for permanent ongoing discharge of point and non-point source pollutants to the natural landscape through surface and subterranean water flows, windblown trash accumulation, windblown dispersion of chemicals, and illegal dumping of industrial and household trash and garden waste in natural ecosystems. Pesticides, herbicides, and fertilizers may enter adjacent landscapes through runoff from irrigated landscapes or from storm events on a frequent basis. Contaminants from automobiles that collect on roadways, parking lots, and driveways and enter natural landscapes during storm events include oil, gas, brake dust, and other fluids. Road materials, leaks, and spills also permanently adversely affect riparian, wetland, aquatic, and semiaquatic species by contaminating their habitats. Illegal dumping of unwanted items such as trash, tires, and appliances in vacant habitat areas also crush vegetation and restrict photosynthesis by blocking the sun. Discarded electronics (i.e., e-waste) can introduce various toxic chemicals into the environment, including heavy metals that may leach into soil and water. These waste materials may chronically disrupt natural hydrology by forming obstructions and blocking flows and may create permanent habitat for pest species, such as non-native rats.

Effects from Vernal Pool Hydrologic Alterations

Vernal pool ecosystems are especially vulnerable to hydrologic alteration, because the timing and period of inundation dictates whether vernal pool plants and vernal pool crustaceans are able to reproduce. Vernal pool ecology is directly linked to vernal pool hydrology. The vernal pool hydrologic cycle consists of multiple steps, several of which are susceptible to disruption

or disturbance. The vernal pool hydrologic cycle for vernal pools within this Plan Area consists of rainfall, soil saturation, formation of a perched aquifer, filling of the pools, surface swale flows, discharge to a stream or creek, and drying, as discussed below.

Water enters the vernal pool ecosystem through rainfall. In the Mediterranean climate of the Planning Area, rainfall in the Planning Area primarily occurs during the winter months, followed by a hot, dry season during the summer months. The winter rainy season, when there is sufficient precipitation to initiate and maintain filling of vernal pools, typically begins in November and ends in March or April.

Before vernal pools begin to fill, the soil under and around the vernal pools first becomes saturated. The rainfall percolates through the soil until it is stopped by an impervious layer in the soil profile. Soil series that contain vernal pools include an impermeable layer, which can be a claypan, a cemented hardpan (duripan), or rock (Solomeshch et al. 2007).

As water accumulates in the soil above the impermeable layer, a perched water table (a perched aquifer) forms. A perched aquifer is an area of saturated soil that is separated from underlying deeper groundwater by an impermeable layer of rock, clay, or other material. Seasonal perched groundwater is an important category of groundwater in the Planning Area with respect to the hydrologic functioning of vernal pools. Up to 60% of the water entering a vernal pool does so from the perched water table (Rains et al. 2006). The perched water table allows rainfall that falls some distance from the vernal pool to be retained in the soil and flow into the vernal pool. Subsurface flows from perched water tables stabilize vernal pool water levels, causing them to be inundated for longer periods of time than would be the case if the vernal pools were recharged only by rainfall (Rains et al. 2006).

Once the soils in the vernal pool ecosystem is saturated and the perched aquifer fills, water accumulates in the pool itself, resulting in the filling of the pool and inundation of the ground surface. Although vernal pools may temporarily hold water at the surface during and immediately after rainfall events, pools that are dependant on a perched aquifer will not remain inundated until the soil is saturated and the perched aquifer fills.

Most of the vernal pools in the Planning Area are types that occur on soils or soil layers impermeable to water, such as a hardpan, claypan, or volcanic basalt (Smith and Verrill 1998) that can result in a perched aquifer. However, another vernal pool type in the Planning Area, drainageway vernal pools, occur on recent alluvial deposits adjacent to the incised channels of active watercourses. Consequently, drainageway vernal pools are interspersed throughout the other vernal pool types present in the Planning Area. Drainageway vernal pools fill and drain rapidly, and may depend more on overland runoff and direct precipitation to maintain their hydrology relative to the other vernal pool types (Jones and Stokes 1990). In some cases, soils

above the restricting claypan or hardpan layers in these pool types may be too deep for perched water tables to become exposed in shallow vernal pools. Additionally, the basins of these types of pools are often shallow, increasing susceptibility to evaporation, or slightly sloped, which encourages drainage.

Once a vernal pool fills completely, water exits the pool via surface flows. The movement of surface water between vernal pools can occur in a network of narrow and intermittent surface "swales" (Solomeshch et al. 2007). In the Planning Area swales are defined as shallow seasonal drainages typically found in flat to gently rolling valley grassland in association with vernal pool complexes on soils with an impermeable claypan or hardpan layer. Swales convey rainwater runoff as broad gently sloping ephemeral drainages during, and for short periods after, winter rainstorms. All swales mapped in the Planning Area are associated with vernal pools. The swales provide intermittent conduits between vernal pools for movement of surface water and vernal pool plant and animal propogules (seeds, cysts, eggs, and spores), and adult amphibians that use vedrnal pools, such as California tiger salamanders and western spadefoot toads. The swale land cover type also provide habitat for these amphibian species (USFWS 2006). Many of the native plants that grow in vernal pools also grow in swales. Swales also often include smaller shallow depressional features that may pond during the rainy season to provide suitable reproductive habitat for some vernal pool associated species, and may be considered vernal pools. Generally, the swale land cover provides suitable habitat for portions or all of the life cycle of many of the species that occur in the vernal pool land cover type.

Water moving within a vernal pool complex via surface swale flows ultimately discharges from the complex if there is sufficient rainfall. Typically, at the topographic lowpoint of a vernal pool complex the surface discharge will be to a stream or creek.

Surface swale flows and discharges to streams and creeks are associated with rainfall events when additional water enters a vernal pool complex. Depending on the timing and volume of rainfall through the winter and spring, the depth of vernal pools may fluctuate somewhat as water enters and leaves the system, but the vernal pools will remain inundated. However, vernal pools begin to dry in spring as temperatures rise and rainfall diminishes. Without further rainfall adding water to the vernal pool ecosystem, water in the pools is lost through evaporation and transpiration. Many pools will no longer have surface water by March or April. The soil in the pool may remain moist through April and May, and then desiccates and stays dry until the next rainy season.

Vernal pools support endemic plants and animals that are adapted to living under the hydrologica cycle and inundation regime of vernal pools. The inundation regime is too short and unpredictable to support aquatic species but long enough to eliminate upland species, which characterizes vernal pools as ephemeral wetlands and differentiates them from other

aquatic ecosystems such as alkali meadows and seasonally flooded emergent bulrush or tule marshes (Solomeshch et al. 2007). Almost all plants that occur in vernal pools live their entire lifecycle within one year, but have seeds that could remain dormant for many years, allowing them to survive annual periods of drought. Similarly, species of crustaceans, amphibians, and insects that occur in vernal pools have adaptations to respond to periods of drying, such as a single year life cycle and eggs or cysts resitant to drought, or finding underground refugia during the dry season.

Urban development can affect vernal pool hydrology in three major ways: (1) by permanently interrupting connection to surface water flows from up-gradient swales; (2) by damaging or permanently interrupting hydrologic connections to the perched water table; and (3) by puncturing the duripan within the vernal pool's micro-watershed, permanently increasing rate of water loss from the vernal pool and its associated perched aquifer, and allowing that water to drain into deeper groundwater tables.

Reduced groundwater infiltration through development of increased impervious surfaces also may reduce the amount of seasonal perched groundwater available to support vernal pools. Increased impervious surfaces may also result in increased stormwater runoff rates and volumes from development sites. If increases in flows are sufficient, they could cause soil erosion and offsite sedimentation, including sedimentation of vernal pools.

Invasive Plants

Development, including roads and utility corridors, can promote invasive, non-native plant species that negatively affect habitat in a variety of ways, ultimately changing ecological functions and adversely affecting native species. As new urban development and infrastructure encroach into natural landscapes, newly disturbed areas and/or the new interface between developed areas and native habitats provide an opportunity for invasive plant species to establish and eventually invade natural habitat settings, degrading habitat and potentially displacing native species. Ornamental plants and native cultivars may spread to adjacent protected habitats and outcompete and displace native plant species; they can also hybridize (interbreed) with local native plants and thereby disrupt the genetics of the native population. Such hybridization can cause a number of problems for the native plant population, including poor growth and reproduction.

According to the *Invasive Plants of California's Wildlands* (Bossard et al. 2000), non-native invasive plant species can alter ecosystem processes, such as nutrient cycling, hydrologic cycles, frequencies of wildfires, and erosion and sediment deposition. Invasive plants interfere in ecosystem functions by outcompeting and displacing native plants and wildlife by providing refuge for non-native animals and by hybridizing with native species (Bossard et al. 2000).

Several organizations, such as the California Native Plant Society (CNPS) and the California Invasive Plant Council (Cal-IPC) (formerly known as the California Exotic Pest Plant Council), have provided detailed documentation regarding invasive plant species that threaten California's native plants and animals.

Invasive plant species, and especially upland species, are often identified as an indirect "edge effect" of new urban development because invasive plants generally colonize modified or otherwise disturbed zones between development and remaining natural areas. However, invasive species can colonize virtually any upland area that is subject to some kind of disturbance, such as road shoulders, cleared zones along railroad lines, clearings along utility easements, areas affected by fire, fire breaks, and grazed areas.

Future development in the Planning Area will likely increase local sources of nitrogenous air pollutants, primarily due to increased transportation and demand for electricity generation. Increased nitrogen deposition (N-deposition) facilitates the growth of non-native plant species, especially invasive annual grasses in low-biomass ecosystems. Increased abundance of non-native plants, and invasive annual grasses in particular, represents a potentially significant effect to native vegetation communities and wildlife habitat. Nitrogen deposition can be locally elevated near roadways, with nitrogen flux along busy roads up to four times above background levels (Redling et al. 2013). However, nitrogen deposition can also result from emissions within the greater air basin.

Broadleaved pepperweed (*Lepidium latifolium*), yellow star-thistle (*Centaurea solstitialis*), and medusahead (*Elymus caput-medusae*) are common invasive species in grasslands and/or along Planning Area roadsides (Kleinschmidt Associates 2008).

Riparian and wetland ecosystems are also extremely vulnerable to invasive plants because of the highly effective transport of invasive species along rivers and streams. Invasive species can dominate the biomass of riparian and wetland communities where they become established, virtually choking out the native vegetation. Invasive plants commonly found in wetlands, riparian systems, and/or waterways in the Planning Area include broadleaved pepperweed, common water hyacinth (*Eichhornia crassipes*), Brazilian waterweed (*Egeria densa*), and Himalayan blackberry (*Rubus armeniacus*) (Kleinschmidt Associates 2008). Several other invasive species potentially affecting vernal pools and associated watersheds have also been identified, including waxy mannagrass (*Glyceria declinata*), barbed goatgrass (*Aegilops triuncialis*), Italian thistle (*Carduus pycnocephalus*), stinkwort (*Dittrichia graveolens*), Klamath weed (common St. Johnswort) (*Hypericum perforatum*), yellow glandweed (*Parentucellia viscosa*), and milk thistle (*Silybum marianum*) (Sacramento County Department of Economic Development 2013).

Invasive Animals

Human activities associated with urban development can exacerbate the introduction or spread of non-native animal species. Non-native aquatic wildlife is known to have serious effects on native amphibian populations, including California tiger salamander (*Ambystoma californiense*). For example, aquarium species released in the wild may introduce new diseases to wild amphibian or fish populations. Feral cats (*Felis catus*) are a serious threat to native birds, especially birds that nest on or near the ground, as well as native reptiles and amphibians. They can also cause a shift in small mammal populations from native to non-native species. An increase in year-round water availability due to irrigation and water features can result in increased abundance of bullfrogs.

Invasive wildlife can negatively affect extant native wildlife and plants in many ways. Common native wildlife (e.g., ravens (*Corvus corax*), crows, pigeons, raccoons (*Procyon lotor*), skunks (*Mephitis mephitis)*, and gopher snakes (*Pituophis catenifer*)) and non-native species (e.g., Argentine ants (*Linepithema humile*), European starlings, wild turkeys (*Meleagris gallopavo*), bullfrogs (*Rana catesbeiana*), opossums (*Didelphimorphia*), house mice (*Mus musculus*), rats (*Rattus* spp.), and feral cats and dogs (*Canis lupus familiaris*)) may thrive in disturbed or otherwise marginal habitats and can harm native species through predation, competition, and displacement. Some of these non-native species may also have the potential to spread diseases and parasites to other native wildlife, as discussed below.

Urban development activities in the Urban Development Area (UDA) will increase the number of pet cats and dogs, and increase the potential for stray and feral animals. Unconstrained pets at the interface between habitat preserves and residential development can have significant predation effects on native wildlife, including birds, rodents, reptiles, and amphibians (e.g., Churcher and Lawton 1987; Kelly and Rotenberry 1993). Lost or abandoned pets may penetrate even farther into open space areas in search of food or refugia, including native prey.

Also, as noted below in the discussion of disease, domestic cats and dogs may be vectors for diseases that affect native wildlife, such as feline immunodeficiency virus, feline leukemia virus, feline infectious peritonitis, feline and canine distemper, panleukopenia, and rabies (Foley et al. 1999).

Mesopredators

A related indirect consequence of habitat fragmentation and isolation is an increase in urban-adapted or urban-tolerant mesopredators, such as raccoons, skunks, opossums, and foxes (*Vulpes* spp.), in small habitat fragments where top predators, such as coyotes and bobcats (*Lynx rufus*), have been removed (i.e., the “mesopredator release” effect) (Crooks and Soulé

1999). Non-native mesopredators also may include free-roaming stray and feral cats and dogs, which can have the same effects as wild mesopredators. These species can out-compete smaller native species for available resources and increase predation rates, thus reducing the distribution and populations of vulnerable native species (Crooks and Soulé 1999). The increase in mesopredators in fragmented habitats is often considered an indirect edge effect, but because some of these species can penetrate long distances in natural habitats in the absence of top predators (e.g., coyotes, bobcats), they also have landscape-level ecosystem effects.

Pesticides and Fertilizers

Pesticide (including fungicide, herbicide, and rodenticide) and fertilizer use associated with urban development may affect vegetation communities and habitat quality, be directly toxic to species, or indirectly toxic through prey vectors, or reduce prey abundance. These substances may penetrate the open space–urban interface through urban runoff from residential and commercial landscape areas and golf courses, overspray, wind, direct application in interface areas, soil penetration, and wildlife vectors.

Pesticides, for example, can act in several ways. The original pesticide can be toxic, its decomposed elements can be even more toxic, and it can "bioaccumulate," whereby the contaminant concentrates further in each successive link of the food chain, and thus reaches higher concentrations at higher levels of the food chain. Dichlorodiphenyltrichloroethane (DDT) and other chlorinated hydrocarbon pesticides have been used worldwide to control crop pests and disease-carrying insects since the 1940s. DDT was banned in the United States by the U.S. Environmental Protection Agency (EPA) in 1972 because of unacceptable risks to the environment and potential harm to human health (EPA 1972). Long-term ecological exposure and accumulation resulted in eggshell thinning and loss of young in many raptorial bird species, resulting in serious declines in reproductive success (Terres 1980; Henny and Wight 1972).

In a similar manner, fertilizers can enter wetland and riparian systems and cause eutrophication (excessive nutrients in water bodies) and result in large algae blooms. They also can enhance growth of non-native species in edge areas.

Rodenticides may also affect wildlife in various ways. Rodenticides are directly toxic to rodents, but may also indirectly affect rodent predators, such as hawks and owls, coyotes, snakes, etc., either through loss or contamination of prey. Eradication of rodents can also affect habitat quality for other species, such as burrowing owls (*Athene cunicularia*) that use ground squirrel (*Otospermophilus beecheyi*) burrows and many species of reptiles, amphibians, and insects that use rodent burrows as refugia and aestivation and hibernation habitat.

Chronic Ground Vibration and Noise

Chronic increases in noise related to urban development primarily result from increased traffic volumes at all hours. Other sources of development-related increases in noise that may affect native wildlife include operation of landscape maintenance equipment and tools (e.g., mowers, blowers, trimmers, wood chippers), active recreation at parks (particularly at night), loud music from vehicles and residences, noise from aircraft operations at Mather Airport, and on-site heavy equipment and machinery use by commercial and industrial businesses.

Some of these noise sources, such as traffic noise, are relatively constant (although with daily cycles related to peak traffic periods), and some wildlife species may habituate and adapt to the chronic ambient noise levels, while others may avoid noisy areas. Other noise sources are more occasional or discrete and are more likely to startle wildlife and at least temporarily disrupt their behavior at the time. Noise may affect wildlife in several ways that disrupt both their behavior and physiology in complex and interactive ways, including startling or annoying, raising stress levels, interrupting sleep and rest, interfering with acoustic communications, interfering with prey detection, and in the case of loud abrupt noises, causing permanent injury to the auditory system (Dooling 2006; Barrass and Cohn 1984; Brattstrom and Bondello 1983).

Lighting

Ecological light pollution associated with development, particularly in the UDA, would increase ambient light and direct glare from sky glare, lighted buildings, streetlights, and security lights, and would generally be chronic. Lighting from vehicles would be both chronic and unexpected.

Longcore and Rich (2004) address the ecological effects of light pollution at three levels: (1) behavioral and population ecology, (2) community ecology, and (3) large-scale ecosystem functions. Effects at the behavioral and population ecology level include orientation/ disorientation and attraction/repulsion, reproduction, and communication, and are the main effects of lighting related to construction activities. Orientation and disorientation are responses to ambient light levels, while attraction and repulsion are responses to the source of light (e.g., moths attracted to a light bulb). Orientation includes artificially expanding behavioral repertoires of normally diurnal (active during the day) or crepuscular (active during dawn or twilight hours) species, such as foraging or territorial advertisement or mate attraction (e.g., singing birds), into nighttime periods. Disorientation may occur in nocturnal species that normally orient during dark periods and whose visual systems are adapted to low light levels. Attraction to lights affects birds, which may suffer injury or mortality due to collisions with permanent lighted structures. Many insects are attracted to light sources, resulting in high numbers of prey being taken by nocturnal insectivores such as bats. Repulsion of nocturnal wildlife by lights is probably quite common and may cause them to avoid lighted areas in their normal home ranges.

Wildlife reproduction may be affected by lighting in various ways. Movement to breeding areas, chorus behavior, and mate selection by some amphibians may be affected (Longcore and Rich 2004). Lighting may disturb the nighttime rest and sleep periods of diurnal species, including most passerine (perching) birds, having effects similar to noise, including annoying individuals and causing them to abandon nests that are otherwise perfectly suitable. Nest site selection by some birds may be affected by light, with nests being established farther from light sources (Longcore and Rich 2004). Artificial light may simulate increased day length, affecting reproductive cycles by triggering premature reproductive activity at a time when environmental conditions are not conducive to successful reproduction (e.g., cold temperatures and/or poor food resources). Because light may interfere with sleep, it can be stressful and may disrupt normal biological rhythms and raise the level of stress hormones, which may in turn affect reproductive capacity.

At the level of community ecology, light pollution may affect competition and predation (Longcore and Rich 2004). Behavioral interactions by groups of species may be affected by lighting as species move into the "light niche" (Longcore and Rich 2004). Species groups that normally partition foraging periods in relation to ambient light levels may be in direct competition under artificial light conditions (e.g., some bats). Likewise, species that are adapted to higher light levels (e.g., crepuscular species) may out-compete strictly nocturnal species, which normally forage in the darkest part of the night.

Lighting may increase the risk of predation of both nocturnal and diurnal species because they may be more detectable to nocturnal predators. Some species, such as amphibians, may be attracted to light because insect prey may congregate around light sources, which may in turn increase the risk of the amphibians being preyed upon. Longcore and Rich (2004) characterize this as a tradeoff in the benefit of foraging longer (or at richer sources) with the cost of higher predation risk. Many small species, such as rodents, rabbits, snakes, and bats, actually forage at lower rates at high illumination levels (Longcore and Rich 2004), which may be a biological adaptation to high levels of moonlight. Chronic ecological light pollution may favor light-tolerant species over those that are dark-adapted (Longcore and Rich 2004).

Lighting can also indirectly affect vegetation communities, potentially by altering the behavior of seed dispersers (e.g., small rodents and ants); other potential plant dispersers, such as larger mammals and birds that transport seeds and plant parts over longer distances; and pollinators.

Increased Human Activity

Urban development results in permanent increases in human presence from adjacent development. Increased human presence near preserves will affect essential and normal behavioral patterns and physiology of wildlife. Similar to noise and lighting effects, permanent

increases in human activity from adjacent urban development will disturb nocturnal animals during their rest or sleep periods, annoying them and causing harm to them if they abandon nests or den sites, as well as harming them by disrupting their normal biological rhythms and raising the level of stress hormones. Abandonment (even temporary) of active nests or dens increases the risk to eggs, nestlings, fledglings, and other dependent young. Flushing animals from nests, dens, and other refuges also increases their risk of injury or mortality from collisions with vehicles, as well as predation. Human presence may also alter the spatial behavior of animals, causing them to avoid certain parts of their home range, which may prevent them from using critical resources such as water.

Increases in human activity along the open space–urban interface may also result in trampling of vegetation and compaction of soils, affecting the viability of vegetation communities, wildlife habitat quality, and species that are sensitive to habitat structure, such as shrub and herbaceous vegetation integrity, soil friability, and burrowing substrate quality (e.g., rodents, reptiles, amphibians, and invertebrates). Increased human activity near preserves will also increase the amount of trash and debris that enters preserves and natural communities. Trash and debris can degrade vegetation communities and wildlife habitat, and can attract nuisance and pest species. Trash and debris include discarded packaging materials, plastic bags, and plastic and other lighter materials may be dispersed into natural areas by wind or along creeks and streams.

Increased Wildfire

Increased human activity related to urban development activities can result in increased wildfires. These fires are a result of human activities at the habitat preserve–urban interface, including accidental ignitions from sparks from equipment (e.g., mowers striking rocks), cigarettes, children playing with matches, etc., as well as intentional ignitions (i.e., arson). However, fires also may be ignited by downed or arcing power lines or cars catching on fire along roadways.

In most cases, wildfires in the UDA would be quickly suppressed for public safety and to protect property, but in some cases wildfires become uncontrollable and catastrophic. Wildfire suppression activities (e.g., grading, fire line construction) can also affect plant and animals through ground disturbance.

Outside the UDA, activities would not result in increased frequency, duration, or intensity of wildfire in that portion of the Planning Area.

Wildlife Disease

The increased human and associated pet population can increase the risk of disease transmission to native wildlife in the Planning Area. For example, free-ranging domestic cats and dogs can transmit new diseases to wild animals. Native wildlife in the Planning Area,

including American badger, gray fox (*Urocyon cinereoargenteus*), and coyote, may be at risk of canine distemper (Deem et al. 2000). Diseases transmitted from humans and pets also may affect raptors, such as Cooper's hawk (*Accipiter cooperii*). Boal and Mannan (1999) found that mortality of nestling Cooper's hawks in urban settings primarily was from trichomoniasis, which is caused by the parasitic protozoan *Trichomonas gallinae* that occurs in the digestive and urogenital tracts of many animals and humans. This parasite causes lesions in the mouth, throat, and crop of birds and prevents infected individuals from eating. An important vector of trichomoniasis in urban areas may be domestic pigeons and potentially wild doves, which are preyed on by hawks and falcons. Stabler (1941), for example, found that of 242 pigeons originating from Pennsylvania, Maryland, and New Jersey, 64.5% were infected with *Trichomonas gallinae*. West Nile virus has been identified as a potential factor in loggerhead shrike (*Lanius ludovicianus*) declines in the Central Valley based on a correlation between higher infection rates of the virus and greater declines in shrike abundance in Central Valley counties compared to other counties (Pandolfino 2008). Chytrid fungus is implicated in the decline of several amphibian species, and can infect California tiger salamander. However, chytrid fungus has not been found to be responsible for California tiger salamander mortality in the lab or the field (CDFG 2010).

Vehicle and Aircraft Collisions with Wildlife

The increased capacity of roads in urban areas and increased capacity of roads from rural transportation projects likely will increase the risk of vehicle collisions where wildlife use or attempt to cross roadways, particularly in areas that were frequently used by wildlife before roads were constructed or improved and other development was built. Wildlife may be able to cross two-lane, low-density, and lower-speed roads in relative safety, but if roads are expanded to four and six lanes, and traffic densities and speeds increase, vehicle strikes can increase dramatically. Factors related to the number and types of species affected therefore include vehicle speeds, traffic volume, traffic pulses, accessibility of cover, structure of the road (e.g., whether the road is raised or at grade level with the surrounding environment), barrier walls to prevent access to a roadway, and availability of alternative crossings, such as bridges and culverts (Dodd et al. 2004).

Increased use of Mather Airport following proposed expansions will also result in increased chance of bird strikes; however, such strikes are relatively uncommon and are not included in take estimates for bird species.

Aboveground Utilities

Power lines, transmission towers, and utility poles can cause collisions, entanglements, and electrocution of birds, especially raptors (Franson et al. 1995; Lehman et al. 2007). Bird

species known to be at particular risk of collisions with aboveground utilities include ferruginous hawk (*Buteo regalis*) and greater sandhill crane (*Grus canadensis*), as discussed in more detail in Section 6.6.

TEMPORARY ENVIRONMENTAL STRESSORS DURING CONSTRUCTION

Construction Noise

Temporary direct effects related to noise will be generated during construction, including vegetation clearing, grading and earthmoving, excavation, trenching and tunneling, pouring of concrete and asphalt, and vehicle use. Construction may affect normal or essential behavioral patterns of wildlife in several ways. Excessive noise may affect bird species, for example, in at least four ways: (1) noise may annoy and cause birds to abandon nests that are otherwise suitable; (2) noise can raise the level of stress hormones, interfering with sleep and other activities; (3) intense noise can cause permanent injury to the auditory system; and (4) noise can interfere with acoustic communication by masking important sounds or sound components (Dooling 2006). Similar effects may occur in other taxa. For example, noise may interfere with communication in toads and frogs that use calls to advertise their location and attract mates (e.g., Barrass and Cohn 1984). Loud noise, such as off-road vehicles, may damage the hearing of some terrestrial species (Berry 1980; Brattstrom and Bondello 1983).

Construction Ground Vibration

Ground vibration will be generated during construction, including grading and earthmoving, excavation, trenching, and tunneling. Vibration caused by construction equipment may affect normal and essential behavioral patterns and the habitat of wildlife in several ways. Vibration from equipment operating in or near vernal pools, creeks, and other aquatic habitats may affect semi-aquatic species, such as giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), western spadefoot (*Spea hammondii*), and California tiger salamander, possibly causing them to alter their behavior and potentially abandon areas. For example, vibration can cause western spadefoot to emerge from burrow sites at inappropriate times because vibration created by machinery and construction equipment can mimic the effect of rainfall, which triggers western spadefoot emergence (Dimmitt and Ruibal 1980). Vibration may also directly disturb fossorial species that occupy burrows, dens, and depressions, including western burrowing owl and American badger, as well as rodents, coyotes, and lagomorphs (rabbits and hares), causing them to abandon these areas and increase predation and vehicle collision risks. Excessive vibration might also cause the collapse of burrow systems and dens of fossorial species in areas with highly friable soils.

Construction Lighting

Ecological light pollution directly associated with construction ultimately would be temporary, but it may be considered chronic to some extent in terms of effects on wildlife. For example, lighting for security and public safety in some construction areas may extend for several months or more, thus potentially disrupting critical phases of species' life cycles, such as reproduction, or causing animals to abandon lighted areas. Other lighting effects may be short term or unexpected. Lighting during urban development construction primarily would occur during concrete and asphalt pouring and from vehicular use, but also may be used for security and public safety and off-hours equipment maintenance (e.g., at staging areas). Lighting for nighttime construction or maintenance of construction equipment typically involves high-intensity lighting systems that may have very wide lightsheds and high glare values. Vehicle ingress and egress at construction sites may occur during twilight or nighttime hours (especially during winter months), resulting in unexpected light changes.

Construction Dust

Fugitive dust generated by construction, especially vegetation clearing and grading and earthmoving, can decrease photosynthesis and can kill individual plants by blocking or reducing light and penetration as well as photosynthesis, respiration, and transpiration; increased penetration of phytotoxic gaseous pollutants; and increased incidence of pests and diseases. The loss of plant vigor and productivity can directly affect plant species and wildlife that depend on plants for food or refuge. Construction vehicle traffic can also result in construction dust.

Increased Human Presence during Construction

Temporary construction effects include activity at the construction site and ingress and egress to and from the construction area. Increased human presence during construction will temporarily affect essential and normal behavioral patterns and physiology of wildlife. Similar to noise and lighting effects, temporary increased human activity during construction would disturb nocturnal animals during their rest or sleep periods, annoying them and causing harm to them if they abandon nests or den sites, as well as harming them by disrupting their normal biological rhythms and raising the level of stress hormones. Abandonment (even temporary) of active nests or dens increases the risk to eggs, nestlings, fledglings, and other dependent young. Flushing animals from nests, dens, and other refuges also increases their risk of injury or mortality from collisions with construction equipment and other vehicles, as well as predation. Human presence may also alter the spatial behavior of animals, causing them to avoid certain parts of their home range, which may prevent them from using critical resources such as water. In addition, construction traffic can result in crushing or disturbance of animal and plant species in and near construction sites.

Laydown or Trampling of Vegetation

Trampling of vegetation communities and wildlife habitat in designated construction zones may occur during construction activities such as vegetation clearing, equipment storage, and vehicle use. Accidental trampling of vegetation communities and wildlife habitat may also occur outside designated construction zones. These effects may occur for various reasons, including incorrect construction plans, human error in interpreting plans, human error or accidents in operating construction equipment, and misunderstandings or disregard by construction personnel in adhering to construction planning requirements, including avoidance of natural resources.

Construction Trash and Debris

Construction may cause trash and other non-toxic debris to enter species habitat. Trash and debris can degrade vegetation communities and wildlife habitat, and can attract nuisance and pest species. Trash and debris include discarded construction-related materials, such as packaging materials, plastic bags, and plastic sheeting that may be dispersed into natural areas by wind or along creeks and streams. Trash generated by construction personnel, such as food packaging and cigarette butts, also can be dispersed by wind and water into natural areas. Pest and predatory species, such as crows and ravens, gulls (*Laridae*), coyotes, skunks, and raccoons, may be attracted to discarded food. Certain kinds of construction debris, such as fiberglass insulation, can be directly dangerous to wildlife. Trash and debris may also blow into preserves from adjacent development and roadways.

Temporary Alterations to Hydrographs and Water Quality Effects

Construction may result in temporary release of contaminants in uplands during activities such as vegetation clearing, grading and earthmoving, excavation, trenching and tunneling, pouring concrete or asphalt, and landscaping, and equipment and vehicle refueling and maintenance. Chemical and toxic compound pollution (fuel, oil, lubricants, paints, release agents, and other construction materials) may affect the health of upland vegetation communities, wildlife habitats, and wildlife species. Wildlife may be affected by contaminants through direct exposure (e.g., to the skin, fur, or feathers), through consumption of contaminated food, or by reduced habitat quality.

Temporary hydrologic alterations potentially occurring from construction, including dewatering activities, include changes in flow rates and patterns in streams and small drainages that may temporarily affect adjacent and downstream aquatic, wetland, and riparian vegetation communities, and aquatic species (e.g., fish), semi-aquatic species (including reptiles such as giant gartersnake and western pond turtle), and riparian nesting birds. Construction of some activities may require temporary diversions or impoundments of

surface waters and thus remove or degrade wetland and aquatic habitats during the period of diversion or impoundment.

Temporary water temperature changes also may occur due to temporary changes in the active channel morphology, thus affecting species associated with aquatic habitats (such as giant gartersnake, western pond turtle, western spadefoot, and California tiger salamander) that may have specific thermal tolerances.

EIS/EIR APPENDIX G-2

Selection of Special-Status Species to be Analyzed in this EIS/EIR

This appendix summarizes the review process and criteria used to identify individual plant and animal species evaluated in Chapter 9 of the EIS/EIR. The list of species evaluated in Chapter 9 includes the species proposed for coverage under the SSHCP incidental take permits (Table G-2.1), as well as additional special-status species that occur in the Planning Area and may be adversely affected by the implementation of the EIS/EIR Alternatives. The following section summarizes the process used by the EIS/EIR to determine special-status species, beyond the proposed covered species, to be addressed and analyzed in the EIS/EIR Alternatives. Tables G-2.2 and G-2.3 show the list of special-status plant and animal species, respectively, that are considered and the reasoning for inclusion or elimination in the EIS/EIR detailed analysis.

DEFINITION OF SPECIAL-STATUS SPECIES

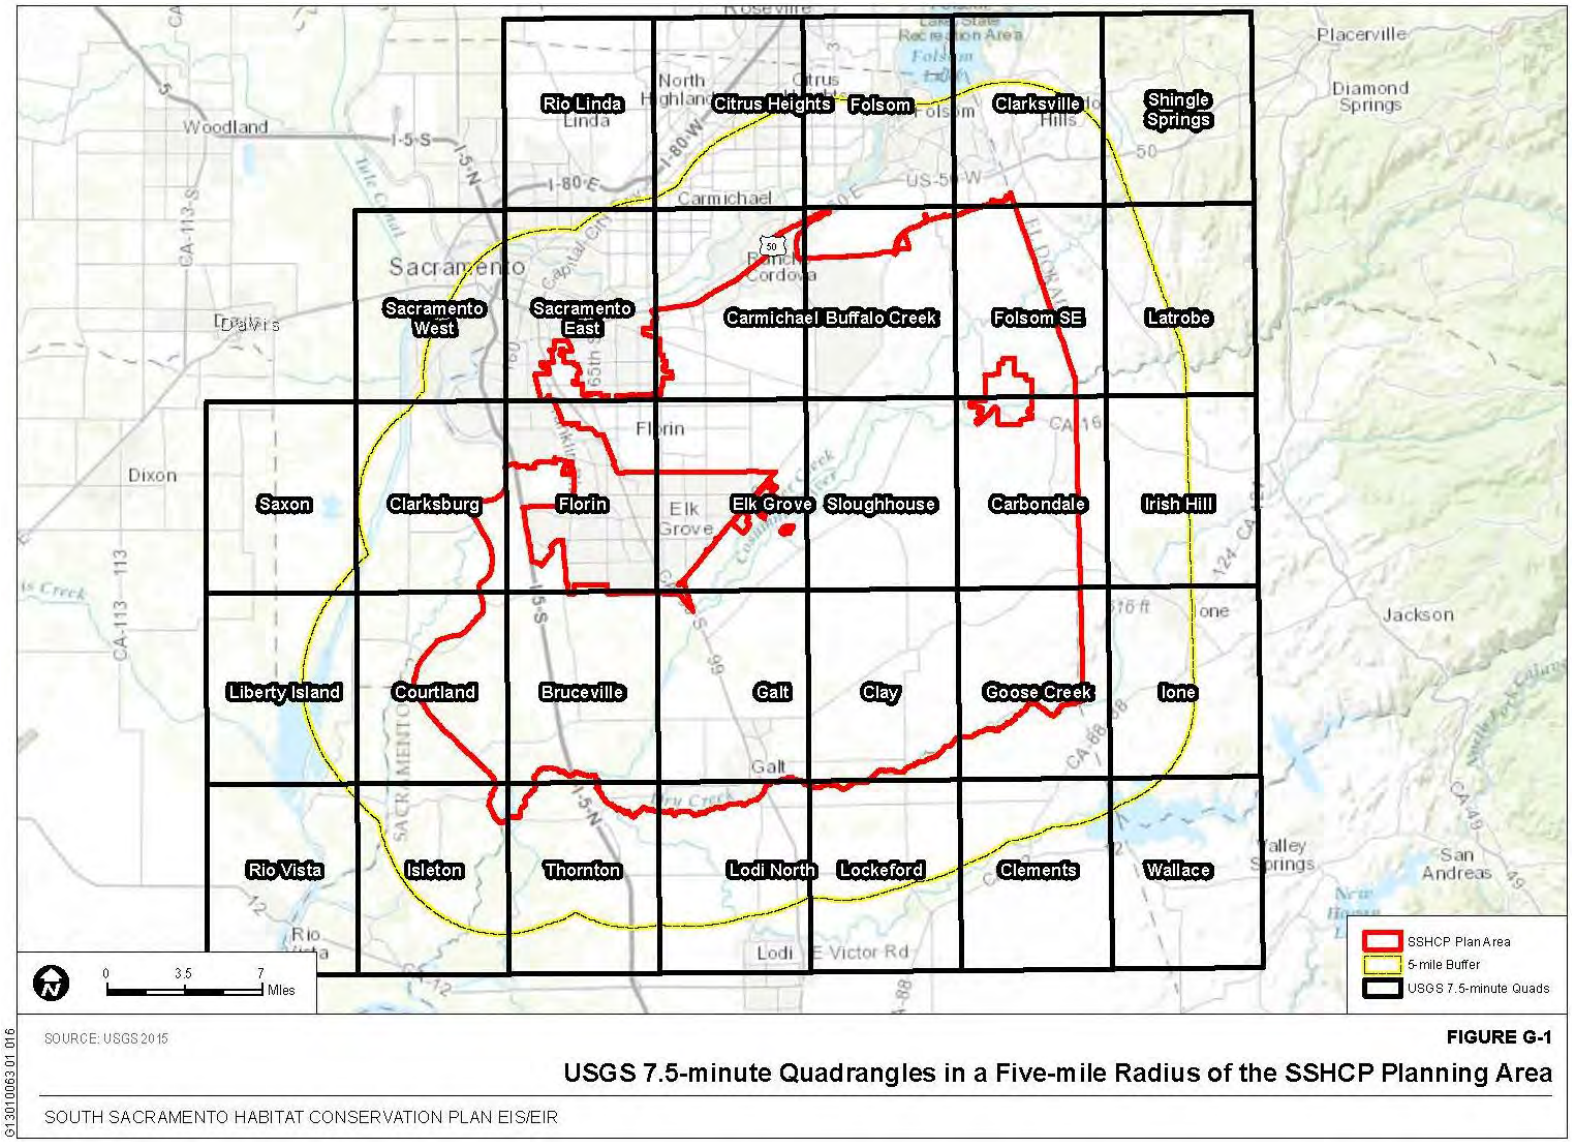
As first defined in Section 9.1.2, Planning Area special-status species are plants and animals that are protected under state and/or federal law, or are species considered sufficiently rare or unique that they are given special consideration by a state and/or a federal resource agencies or they are given special consideration by a non-government conservation organization, as discussed below:

- Listed or proposed for listing under the federal Enangered Species Act (ESA) or the California Endangered Species Act (CESA) as endangered, threatened, or rare;
- a candidate for listing under the ESA or the CESA as endangered, threatened, or rare ;
- taxa (i.e., taxonomic category or group) that meet the criteria for ESA or CESA listing, even if not currently included on any list, as described in California Code of Regulations (CCR) Section 15380 of the CEQA Guidelines;
- Planning Area species that are included in a ESA species recovery plan prepared by the USFWS;
- Planning Area species identified by California Fish and Game Code as a Species of Special Concern. The term “California Species of Special Concern” is applied to animals not listed under the federal ESA or CESA, but that are nonetheless declining at a rate that could result in listing, or historically occurred in low numbers and known threats to their persistence currently exist;
- species identified by California Fish and Game Code as a Watch List Species;
- species afforded protection under the General Plans or codes or ordinances for Sacramento County or the Cities of Rancho Cordova and Galtn.
- species assigned a California Rare Plant Rank (CRPR) of 1A, 1B, and 2 by the California Native Plant Society.

The designations used by the CRPR are defined as follows:

- 1A = Presumed extirpated in California and either rare or extinct elsewhere
- 1B = Rare, threatened, or endangered in California and elsewhere
- 2A = Presumed extirpated in California, but more common elsewhere
- 2B = Rare, threatened, or endangered in California, but more common elsewhere
- 3 = Plants which need more information and on the Review list
- 4 = Plants of limited Distribution – Watch List

The CRPR designations correspond with and replace former CNPS listings. While these rankings do not afford the same type of legal protection as ESA or CESA, the uniqueness of these species affords special consideration.



SPECIAL STATUS SPECIES EVALUATED IN THE EIS/EIR

All species proposed by the SSHCP permit applicants to be included as covered species in the SSHCP were selected for evaluation in the EIS/EIR, as these species were considered as part of the Proposed Action/Proposed Project Alternative. These species are identified first below. All other plant and wildlife species that meet the definition of "special-status" above, and were reported by various data sources reviewed for the analyis, were then considered for evaluation in the EIS/EIR. The data sources used to identify the list of species to be considered for inclusion in the EIS/EIR are described further below.

In addition to the species selected by the Permit Applicants to be Covered Species under the proposed SSHCP, a list of special-status plant and wildlife species known to occur in the EIS/EIR Chapter 9 Study Area, or with potential to occur in the Chapter 9 Study Area, was developed based on review of the following:

- a records search and GIS query of the California Natural Diversity Database (CNDDB) (CDFW 2015a) within 5 miles of the Planning Area. The use of a 5-mile search radius is based on typical best practices for environmental impact analyses to identify CNDDB recorded species with potential to occur in an action/project area;
- a review of the USFWS Environmenal Conservation Online System (ECOS) within the 29 US Geological Survey 7.5 minute quadrangles encompassing the Chapter 9 Study Area that are listed as endangered or threatened under the ESA, or are proposed for listing under the ESA (USFWS 2016) (Figure G-1);
- the CNPS online Inventory of Rare and Endangered Plants (CNPS 2014); The 29 U.S. Geological Survey 7.5 minute quadrangle topographic maps encompassing the Chapter 9 Study Area (Figure G-1) were used for the this data search;
- CalFlora database (CalFlora 2014), an electronic inventory operated by a non-profit organization

Figure G-1 USGS 7.5-minute Quadrangles in a Five-mile Radius of the SSHCP Planning Area

AGENDA ITEM 11.1

INTENTIONALLY LEFT BLANK

HCP Covered Species

As first discussed in Section 2.3.3, "Covered Species" are the species proposed by the permit applicants to be included on the federal Endangered Species Act (ESA) Incidental Take Permits that have been requested by the Permit Applicants (See Section 9.1.1). The 28 proposed SSHCP Covered Species includes 20 wildlife species and 8 plant species, of which, 10 are currently listed as threatened or endangered under the ESA and/or CESA (Table G-2.1).

Table F-2.1 below presents the ESA, CESA, and CRPR status for each Covered Species under the Proposed SSHCP, as well as a brief description of the species' biology, a description of the species habitat model and information on occurrences within the Planning Area.

Other Special Status Species Evaluated in the EIS/EIR

Other Special Status Plant Species Evaluated in the EIS/EIR

The review of the data sources listed above identifed 37 special-status plant species known, or with potential to occur in the Chapter 9 Study Area. Of the total 37 plants liidentified in this review, eight were already selected by the Permit Applicants to be Covered Species under the proposed SSHCP.

For the other 29 special-status plants identified in the review, 18 species were selected for evaluation in the EIS/EIR. These species are listed in in Table G-2.2 with information on their legal status and rationale for evaluation in the EIS/EIR. These determinations were based primarily on the types, extent, and quality of habitats in the Chapter 9 Study Area; the proximity of the Study Area to known occurrences of the species; and the regional distribution and abundance of the species.

Table G-2.1. The Proposed Covered Species; their Listing Status, Biology, and Habitat Requirements

Scientific Name Common Name	Regulatory Status			Description
	ESA	*CESA*	*CRPR*	
Invertebrates				
Lepidurus packardi Vernal pool tadpole shrimp	E*	—	—	Occurs in a variety of natural and artificial seasonally inundated habitats that are wet for at least 7 weeks and dry in summer (Gallagher 1996). This species is typically associated with low-alkalinity seasonal pools in unplowed grasslands throughout the northern and eastern portions of the Central Valley. The vernal pool tadpole shrimp needs cold winter waters to hatch and develop, typically appearing after the first frosts, and dry summers to dry the resting cysts and prevent them from being attacked by fungi. Habitats supporting the vernal pool tadpole shrimp are typically in Central Valley California floristic provinces below 984 feet in elevation. There are 851 documented occurrences of vernal pool tadpole shrimp within the Planning Area. There are 587 occurrences within the UDA and 264 occurrences outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Branchinecta lynchi Vernal pool fairy shrimp	T*	—	—	Inhabits vernal pools with clear to tea-colored water, most commonly in grass or mud-bottomed swales, or basalt flow depression pools in unplowed grasslands. Occupied pools typically have highly turbid waters, but also occurs in pools with clear water with aquatic vegetation that provides shelter from predators, and range in size from 54 square feet to 84 acres (USFWS 2007). This species is entirely dependent upon the aquatic environment provided by vernal pool wetland ecosystems. They depend upon the presence of water in the winter and early spring and the absence of water during the summer (USFWS 2007). These fairy shrimp need cold winter waters to hatch and grow, typically appearing after the first frosts, and dry summers to dry the resting cysts and prevent them from being attacked by fungi. The vernal pool fairy shrimp were first officially reported from the Planning Area in 1982 (CDFW 2014a). Numerous surveys related to development projects have been conducted within and adjacent to the Planning Area (CDFW 2014a), but the area has not been thoroughly surveyed for vernal pool fairy shrimp, and the total extent of potential habitat is unknown. There are 581 documented occurrences of vernal pool fairy shrimp within the Planning Area, There are 193 occurrences inside the UDA and 388 occurrences outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Branchinecta mesovallensis Mid-valley fairy shrimp	—	—	—	Endemic to the Central Valley, but its distribution is poorly understood. Habitat requirements for this species are similar to other local fairy shrimp species, although they tend to occupy shallower pools (USFWS 2005). As with other freshwater branchiopods, mid-valley fairy shrimp lay eggs in vernal pools during the wet season. These eggs are stored in the basin of the pool and stay dormant until the next rainy season. Since these shrimp are restricted to temporary pools, habitat loss increases the vulnerability of local populations to decline. The mid-valley fairy shrimp was first officially reported from the Planning Area in the species' original description (USFWS 2005). Numerous surveys related to development projects have been conducted within and adjacent to the Planning Area (CDFG 2014a), but the area has not been thoroughly surveyed for mid-valley fairy shrimp, and the total extent of potential habitat is unknown. There are 37 documented occurrences of mid-valley fairy shrimp within the Planning Area. There are 22 occurrences within the UDA and 15 occurrences outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.

AGENDA ITEM 11.1
6161

Table G-2.1. The Proposed Covered Species; their Listing Status, Biology, and Habitat Requirements

Scientific Name Common Name	Regulatory Status			Description
	ESA	*CESA*	*CRPR*	
Desmocerus californicus dimorphus Valley elderberry longhorn beetle	T	—	—	Dependent on elderberry shrubs (*Sambucus* spp.) for breeding and feeding habitat. Elderberry shrubs are a common component of riparian forests and adjacent upland habitats in California's Central Valley (USFWS 1999a). The VELB spends most of its life in the larval stage, living within the stems of the elderberry plant. USFWS considers all elderberry shrubs 2.5 centimeters (1 inch) or greater diameter at ground level within the species' range to be potential habitat (USFWS 1999a). Because comprehensive surveys for VELB in the Planning Area have not been conducted and because known occurrences throughout the species range are based mostly on incidental observations, the population size and locations of this species in the Planning Area are not known. There are 156 documented occurrences of valley elderberry longhorn beetle within the Planning Area. Within the UDA there is 1 occurrence and outside the UDA there are 155 occurrences. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
*Hydrochara ricksecker*i Ricksecker's water scavenger beetle	—	—	—	An aquatic beetle, it lives in weedy, shallow, open water associated fresh water seeps, springs, farm ponds, vernal pools, and slow moving stream habitats. This species is entirely dependent upon the aquatic environment provided by vernal pool wetland ecosystems. The Ricksecker's water scavenger beetle depends upon the presence of water in the winter and early spring and the absence of water during the summer. This species is able to fly and presumably can aerially disperse from one area to another, at least within the immediate vicinity (Sacramento County 2016). Ricksecker's water scavenger beetle is closely associated with temporary pools that contain a diversity of vernal pool plants and that support a complex vernal pool invertebrate community, including copepods, cladocerans, and ostracods, as well as flatworms and a number of other species of beetles (Rogers 1998). Ricksecker's water scavenger beetle co-occurs with the mid-valley shrimp, the vernal pool fairy shrimp, and the vernal pool tadpole shrimp. The Ricksecker's water scavenger beetle was first reported from the Planning Area from Mather Airport (Sacramento County 2016). No surveys focused on Ricksecker's beetle have been conducted within and adjacent to the Planning Area and the total extent of potential habitat is unknown. There are eight documented occurrences of Ricksecker's water scavenger beetle in the Planning Area. Four of these occurrences are located inside the UDA and four are outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Amphibians				
Ambystoma californiense California tiger salamander, (Central Valley population)	T*	T	—	This species may be found in riparian and wet meadow habitats, but is more common in grasslands. Adults are terrestrial outside of the breeding season, often inhabiting rodent burrows located up to 1.24 miles (2 kilometers) from breeding ponds (Orloff 2011). The CTS spends most of its life cycle underground in adjacent valley oak woodland or grassland habitat, primarily in rodent burrows. Research has shown that dispersing juveniles can roam up to 2 miles from their breeding ponds and that a minimum of several hundred acres of uplands habitat is needed surrounding a breeding pond in order for the species to survive over the long term (69 FR 47212–47248; Trenham 2001). Breeding takes place following the first heavy winter rains. Temporary or permanent freshwater pools or slowly flowing streams are required for egg-laying and larval development. They appear to be absent in waters containing predatory game fish (65 FR 3096–3109). There are 31 documented occurrences in the Planning Area. Two of these

AGENDA ITEM 11.1

	ESA	*CESA*	*CRPR*	
				occurrences are within the UDA and 29 are located outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Spea hammondii Western spadefoot toad	—	CSC	—	Occurs in shallow temporary pools (i.e., vernal pools and seasonal wetlands) adjacent to annual grassland habitat. They prefer open areas with sandy or gravelly soils in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Western spadefoot eggs and larvae have been observed in a variety of permanent and temporary wetlands including rivers, creeks, pools in intermittent streams, vernal pools, and temporary rain pools (CDFW 2014a). They have also been found in altered wetlands including vernal pools that have been disturbed by activities such as earthmoving, disking, intensive livestock use, and off-road vehicle use, and man-made wetlands such as artificial ponds, livestock ponds, sedimentation and flood control ponds, irrigation and roadside ditches, roadside puddles, tire ruts, and borrow pits (Fisher and Shaffer 1996; CDFW 2014). Western spadefoot toads typically breed from January to May in temporary pools that do not contain bullfrogs, fish, or crayfish. According to Fisher and Shaffer (1996), the western spadefoot has suffered a severe decline with virtually complete extirpation from the Sacramento Valley, a reduced density of populations in the eastern San Joaquin Valley and modest declines in the Coast Ranges. There are 41 documented occurrences of western spadefoot in the southeastern portion of the Planning Area. Twenty occurrences are inside the UDA and twenty-one are outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Reptiles				
Actinemys marmorata Western pond turtle	—	CSC	—	The Planning Area falls within the introgression zone for the two subspecies of western pond turtle: the northwestern pond turtle (*A. m. marmorata*) and the southwestern pond turtle (*A. m. pallida*). Western pond turtles inhabit a variety of aquatic habitats from sea level to elevations of 1,980 meters (6,500 feet). They are found in fresh to brackish aquatic habitats including marshes, rivers, ponds, and streams. Western pond turtles may also occur in man-made habitats, such as irrigation ditches, reservoirs, and sewage and millponds, but seem to become more active in water that consistently reaches 15° Celsius (60° Fahrenheit) (Jennings and Hayes 1994). They require still or slow moving water with in-stream emergent woody debris, rocks, or other similar features for basking sites. Western pond turtles typically forage on land and in quiet pools of water and, as omnivores with a broad feeding niche, they eat almost anything they can capture (Bury 1986). Reproductive activity by western pond turtles has been observed from February through November (Buskirk 2002). Depending on latitude, peak nesting season is from late May through early July but extends from late April through August (Rosenberg et al. 2009). Nests are typically located on unshaded upland slopes in dry substrates with clay or silt soils. There are 16 documented occurrences of western pond turtle in a patchy distribution within the Planning Area. Fourteen occurrences are outside of the UDA and two are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.

AGENDA ITEM 11.1

Scientific Name Common Name	Regulatory Status			Description
	ESA	*CESA*	*CRPR*	
Thamnophis gigas Giant gartersnake	T	T	—	The giant garter snake inhabits marshes, sloughs, ponds, small lakes, low gradient streams, other waterways, agricultural wetlands, such as irrigation and drainage canals and rice fields, and the adjacent uplands (USFWS 1999b). Recent field studies have shown giant garter snakes to be associated with aquatic environments that contain: (1) sufficient water during the active summer season (May 1 through September 30) to supply food (fish and amphibians) and cover; (2) vegetated banks for basking located immediately adjacent to water; (3) emergent vegetation for cover during the active season; and (4) high ground or uplands, such as levees or railroad grades, that provide cover and refugia from floodwaters during the dormant winter season (USFWS 1999b). The giant garter snake inhabits dense emergent vegetation in and directly adjacent to water bodies during its active season, and upland habitat above ordinary high water mark throughout its winter dormancy period. The snake may utilize upland habitat during its active season, although upland habitat is utilized much less frequently during the active season. During the dormant season, giant garter snakes typically select small mammal burrows and other soil crevices in upland habitat within 200 feet of ordinary high water mark with sunny exposure along south- and west-facing slopes (USFWS 1999b). The dormant season typically extends from October 2 to April 31, although this is largely weather-dependent. The active season extends from May 1 to October 1. There are 11 documented occurrences of giant garter snake within the Planning Area, including two within the UDA and nine outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Birds				
Accipiter cooperii Cooper's hawk	—	WL	—	Throughout its range, the Cooper's hawk nests in a wide variety of woodland and forest habitats, including oak woodland, riparian woodland, coniferous, deciduous, and mixed forest, woodlots, and suburban and urban areas. In much of California's lowland valley and foothill landscapes, including those within the Planning Area, this species appears strongly associated with live oak woodland (Curtis et al. 2006; Asay 1987).Cooper's hawks breed from approximately March to August (Curtis et al. 2006; Asay 1987). Nesting usually occurs in a deciduous tree near open water or riparian vegetation. They prefer to nest in open interrupted or marginal type woodland habitats. Nest sites are mainly found in live oaks and in riparian habitats with deciduous trees, as in canyon bottoms of river floodplains. Foraging occurs while flying quickly through dense vegetation, and Cooper's hawks prey almost exclusively on small to mid-sized birds (Curtis et al. 2006). There are 20 documented occurrences of Cooper's hawk within the Planning Area. Thirteen occurrences are outside of the UDA and 7 are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Agelaius tricolor Tricolored blackbird	BCC	CE	—	This species typically nests in a freshwater marsh or other areas with dense, emergent vegetation such as dense cattails or tules and also in thickets of blackberry and willow. While the vast majority of tricolored blackbirds are permanent residents of California, they make extensive migrations and movements within California (Beedy 2008). Major wintering areas include the Sacramento–San Joaquin River Delta and coastal area, with smaller flocks occurring from Sonoma County south to San Diego County (Beedy 2008). Breeding begins in late March and early April and extends into late July. Clutch size is

AGENDA ITEM 11.1

Table G-2.1. The Proposed Covered Species; their Listing Status, Biology, and Habitat Requirements

Scientific Name Common Name	Regulatory Status			Description
	ESA	*CESA*	*CRPR*	
				typically three or four eggs, with clutches of two and five eggs occasionally observed (Emlen 1941). The tricolored blackbird primarily feeds on seeds and invertebrates, and requires an abundant, concentrated supply of insects for successful breeding colonies. It may also forage in wet and dry vernal pools, seasonal wetlands, riparian scrub, and open marsh borders. Most foraging occurs within 3.1 miles of colony sites (Beedy 2008). There are 36 documented occurrences of tricolored blackbird within the Planning Area. Fourteen occurrences are outside of the UDA and 22 are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Athene cunicularia hypugea Western burrowing owl	BCC	CSC	—	Suitable habitat within the Planning Area is found in annual and perennial grasslands, fallow agricultural fields, and open oak savannah. While Burrowing owls prefer grasslands, they may also be found in habitats with trees and shrubs if the canopy covers less than 30% of the ground surface (DeSante et al. 1997). Burrows are the essential component of burrowing owl habitat. Both natural and artificial burrows provide protection, shelter, and nests for burrowing owls. Burrowing owls typically use burrows made by fossorial mammals, such as ground squirrels or badgers, but also may use man-made structures, such as cement culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement. Suitable habitat is present within the annual grasslands or ruderal habitat and cropland edges within the Planning Area. Western burrowing owls exhibit high site fidelity and reuse burrows year after year (Gervais et al. 2008). Western burrowing owls are opportunistic feeders, primarily feeding on arthropods, small mammals and birds found in grasslands, mowed areas, overgrazed grasslands, and agricultural areas near nest sites (Gervais et al. 2008). Western burrowing owls breed from March through August, with a peak in April and May. The Planning Area occurs within the Middle Central Valley portion of the burrowing owl's range. DeSante et al. (1997) estimated that the Central Valley supports 14% of the total California burrowing owl population. Although burrowing owl populations have declined or disappeared from much of their historical habitat, outlying areas of the County still provide suitable habitat for the species (Sacramento County 2016). There are 97 documented occurrences of western burrowing owl within the Planning Area. Sixty-one occurrences are outside of the UDA and 36 are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Buteo regalis Ferruginous hawk	BCC	—	—	This bird is also protected under the MBTA. Ferruginous hawks do not regularly breed in California (Bechard and Schmutz 1995). Ferruginous hawks are birds of open country. They are found in habitats, such as grasslands, sagebrush, deserts, shrublands, and the outer edges of pinyon–pine and other forests. Since the species does not regularly nest in California, only the habitat requirements and ecology of wintering ferruginous hawks are included in this section. During the winter, ferruginous hawks use grasslands and arid areas, particularly where pocket gophers, ground squirrels, rabbits, or prairie dogs are abundant. Ferruginous hawks also winter near cultivated fields that support populations of pocket gophers (Bechard and Schmutz 1995). The spatial requirements of ferruginous hawks during winter have not been widely reported (Bechard and Schmutz 1995) and what constitutes the minimum size of suitable winter foraging habitat is unknown for most areas. Ferruginous hawk is only expected within the Planning Area as a migrant or overwintering visitor. Most observations

Table G-2.1. The Proposed Covered Species; their Listing Status, Biology, and Habitat Requirements

Scientific Name Common Name	Regulatory Status			Description
	ESA	*CESA*	*CRPR*	
				of ferruginous hawks have been reported from open grassland habitats in the eastern portion of the Planning Area from U.S. Highway 50 south to Howard Ranch. Winter observations have also been recorded from non-vineyard agricultural habitats in the south and southwestern portions of the Planning Area. There are 26 documented occurrences of Ferruginous hawk within the Planning Area. Eighteen occurrences are outside of the UDA and 8 are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Buteo swainsoni Swainson's hawk	BCC	T	—	Swainson's hawks typically nest in riparian habitats or isolated trees bordered by suitable foraging habitat. This species migrates into California from South America in the spring to establish breeding territories for the summer and typically migrates out of California by the end of September. Throughout the North American breeding range, adults arrive on nesting territories in March to May, lay eggs between April and June, and the young fledge between June and August (Bechard et al. 2010). The Central Valley provides optimal nesting habitat for this species due to the abundance of agricultural fields and riparian woodlands, which this species uses for foraging and nesting, respectively. The Swainson's hawk is considered to be largely insectivorous, but breeding pairs are thought to switch to vertebrate prey due to the energetic demands of reproduction. In the Central Valley a wide variety of prey items are taken including small mammals, birds, reptiles, and insects; however, the California vole (*Microtus californicus*) is the preferred prey item (Bechard et al. 2010). Key components in this success involve prey densities, prey availability, and distance to the nest site. There are 410 documented occurrences of Swainson's hawk within the Planning Area. Three hundred forty-eight occurrences are outside of the UDA and 62 are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Circus cyaneus Northern harrier	—	CSC	—	This species is found in meadows, grasslands, open rangelands, desert sinks, and freshwater and saltwater emergent wetlands. The northern harrier nests on the ground, usually at marsh edge in emergent wetland or along rivers or lakes, but may also nest in grasslands or grain fields several miles from water (Smith et al. 2011). This species breeds approximately from March through May. Northern harriers almost always forage on the wing and take small and medium sized prey, including mammals and birds (Smith et al. 2011). Northern harrier breeding populations in the northern portions of the species' range are more migratory than those at more southern latitudes (Smith et al. 2011). In the United States, migrating northern harriers depart their breeding grounds in August to December, and leave their wintering grounds in February to March. Migratory birds may winter in California, and some migrate south through Central and South America (Smith et al. 2011). Northern harriers occur in suitable habitat within the Planning Area and are probably regular breeders (County of Sacramento 2015). There are 70 documented occurrences of northern harrier within the Planning Area. Fifty-eight occurrences are outside of the UDA and 12 are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.

AGENDA ITEM 11.1

Table G-2.1. The Proposed Covered Species; their Listing Status, Biology, and Habitat Requirements

Scientific Name Common Name	Regulatory Status			Description
	ESA	*CESA*	*CRPR*	
Elanus leucurus White-tailed kite	—	CFP	—	White-tailed kites roost individually or communally during winter and often reuse roost sites annually (Dunk 1995). This year-round resident breeds from February to October, with a peak from May to August. The species hunts almost exclusively by hovering at heights between 5 to 25 meters, often facing into the wind. White-tailed kites are known to forage for small rodents and insects in agricultural areas, especially alfalfa fields (Dunk 1995). White-tailed kites generally inhabit low-elevation grasslands, wetlands dominated by grasses, oak woodlands, and agricultural and riparian areas (Dunk 1995). Nests are built in trees that occur in isolation or in riparian areas. Nest sites are closely associated with suitable foraging habitat with high rodent populations in the immediate vicinity of the nest. White-tailed kites occur in suitable habitat throughout the Planning Area; their overall distribution, abundance, and population structure are not well known. There are 62 documented occurrences of white-tailed kite within the Planning Area. Forty-two occurrences are outside of the UDA and 20 are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Grus canadensis tabida Greater sandhill crane	—	T; CFP	—	Greater sandhill cranes winter within and around the Planning Area. They use open agricultural habitats, natural vegetation communities, and seasonally managed wetlands. They feed mostly in marshes and grain fields, consuming seeds, grains (including waste grain) and some invertebrates. They need shallow flooded fields for roosting where they can be protected for terrestrial predators. They rarely roost in areas with heavy emergent vegetation. Greater sandhill crane use in the Planning Area principally in the Cosumnes River floodplain. Greater sandhill cranes that are foraging and roosting at the Cosumnes River Preserve tend to be concentrated in the roadless area south of Desmond Road, 1 to 2 miles east of Franklin Boulevard, and north of the Cosumnes River. Greater sandhill cranes also use the area immediately west of the Planning Area south of Lambert Road (County of Sacramento 2015). There are 210 documented occurrences of greater sandhill crane within the Planning Area. Of these, 202 occurrences are outside of the UDA and eight are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Lanius ludovicianus Loggerhead shrike	BCC	CSC	—	Loggerhead shrikes occur most frequently in riparian areas along the woodland edge, grasslands with sufficient perch and butcher sites, scrublands, and open canopied woodlands, although they can be quite common in agricultural and grazing areas, and can sometimes be found in mowed roadsides, cemeteries, and golf courses. Preferred habitats for the loggerhead shrike are open areas that include scattered shrubs, trees, posts, fences, utility lines, or other structures that provide hunting perches with views of open ground, as well as nearby spiny vegetation or man-made structures (such as chain link fences or barbed wire) that provide a location to impale prey items for storage or manipulation (Humple 2008). They inhabit open areas with clear visibility for hunting, perches for scanning, and fairly dense trees and shrubs for nesting. In many areas, loggerhead shrike abundance is correlated with the amount of pastureland and available perches and hunting perches are especially important for loggerhead shrike foraging (Yosef 1996). Loggerhead shrikes prey mainly on arthropods, but also take reptiles, amphibians, fish, small birds, and rodents (Humple 2008). Loggerhead shrikes occur year-round in suitable habitat throughout the Planning Area. They are probably regular breeders in the Planning Area in low

Table G-2.1. The Proposed Covered Species; their Listing Status, Biology, and Habitat Requirements

Scientific Name Common Name	Regulatory Status			Description
	ESA	*CESA*	*CRPR*	
				densities; however, their overall distribution, abundance, and population structure are not well known. There are 34 documented occurrences of loggerhead shrike within the Planning Area. Twenty-seven occurrences are outside of the UDA and seven are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Mammals				
Lasiurus blossevillii Western red bat	—	CSC	—	These bats are found along the West Coast and in the southwestern United States and into Mexico, where they are thought to hibernate in the winter and use torpor to conserve energy during the day when it is inactive (Shump and Shump 1982). They are solitary creatures that roost in broad-leaved trees, especially cottonwoods and willows in the foothills and lower mountains of the Southwest, and in the fruit and nut orchards of the west, where they resemble dried leaves when roosting. They are often found near streams. Red bats take a variety of prey, including moths, crickets, flies, true bugs, beetles, and cicadas (Shump and Shump 1982). They generally forage in grasslands, shrublands, open woodlands, and croplands, but they also take advantage of congregations of insects attracted to streetlights and building floodlights. There are seven documented occurrences of western red bat within the Planning Area. Two occurrences are outside of the UDA and five are within the UDA. Additionally, western red bat records were obtained from the numerous bat specimens annually submitted for rabies testing to the Sacramento County Public Health Laboratory; localities reported were the City of Sacramento, Folsom, Rancho Cordova, Wilton, Elk Grove, or Galt. These specimens included females and immature bats, which indicate the presence of reproductive populations (Sacramento County 2016). The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Taxidea taxus American badger	—	CSC	—	The Species' Habitat Model considers the land covers with potentially suitable habitat for badgers to be, blue oak savanna, vernal pool seasonal wetland, swale and valley grassland. Badgers occupy dry, open, treeless regions; prairies; parklands; and cold desert areas with friable soils. American badgers are large members of the weasel family that inhabit a wide range of natural communities and throughout the state (Ahlborn 1990). Badgers are ground-dwelling animals, and require friable soils that support burrows for den sites and permit digging for prey (e.g., ground squirrels and other small animals). Within the Planning Area, valley grasslands likely provide the most suitable badger habitat, although badgers also could occur in other habitat types with appropriate soil conditions. They require sufficient food (burrowing rodents), friable soils for burrowing, and open, uncultivated ground. Badgers have large home ranges and spend inactive periods in underground burrows. Badgers typically mate in mid-to-late summer and give birth between March and April (Ahlborn 1990). American badgers have been documented in the northeastern portion of the Planning Area. There are 9 documented occurrences of American badger within the Planning Area. One occurrence is outside of the UDA and 8 occurrences are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.

Plants				
Downingia pusilla Dwarf downingia	—	—	2B.2	Dwarf downingia is an annual herb that grows along the margins of several types of vernal pools as well as mesic sites within valley and foothill grasslands at elevations between 3 and 1,591 feet (CNPS 2014). Occurrences are associated mainly with northern claypan vernal pools in central Sacramento County, with northern hardpan vernal pools in the foothills of the Sierra Nevada, and with vernal pools of the Interior Valleys of the Coast Range in Napa and Sonoma Counties (CDFW 2014a). In Sacramento County, dwarf downingia occurs primarily on the Laguna and Riverbank geologic formations. Flowers from March to May (CNPS 2014). There are 10 documented occurrences of dwarf downingia distributed in concentrated patches within the Planning Area. None of the occurrences are located within the UDA. Two occurrences are located outside of the UDA within the Planning Area. One of these is encompassed within the 16,420-acre Nature Conservancy Cosumnes River Preserve and the other is located within the Howard Ranch preserve (Sacramento County 2016). The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Gratiola heterosepala Boggs Lake hedge-hyssop	—	E	1B.2	Bogg's Lake hedge-hyssop is a semi-aquatic annual herb that is strictly associated with the vernal pool-type hydrologic cycle. In Sacramento County, Bogg's Lake hedge-hyssop is associated with vernal pools located on ancient weathered alluvial terraces of the Laguna Geologic formation, with soils of the Redding, Red Bluff and related Series. Bogg's Lake hedge-hyssop shares the annual growth habit with the vast majority of other endemic vernal pool plants. Flowers from April to August. There are 31 documented occurrences of Boggs Lake hedge-hyssop within the Planning Area. Twenty occurrences are located within the UDA, and 11 occurrences are located outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Juncus leiospemus var. ahartii Ahart's dwarf rush	—	—	1B.2	This annual rush species is found in mesic valley and foothill grassland between 98 and 751 feet mean sea level (msl) (CNPS 2014). This species is restricted to wetlands possessing vernal pool-type hydrology. The blooming period is between March and May. Currently, there are two documented occurrences of Ahart's dwarf rush in the Planning Area, both in the UDA. One of the recorded occurrences is possibly extirpated and is located southeast of Rancho Cordova on private land southeast of the intersection of Kiefer Boulevard and Sunrise Boulevard. The other recorded occurrence is extant and located approximately 1.75 miles to the northwest of the Kiefer Blvd. occurrence on Mather Airport (Sacramento County 2016). The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Legenere limosa Legenere	—	—	1B.1	Legenere is an annual herb that flowers and sets seeds during the dry-down phase of the vernal pool hydrologic cycle, sometimes while shallow water or inundated soil remains in the deepest parts of the pool basin. Flowers from April to June or can be without flowers and self-pollinates. Legenere occurs at elevations between 3 and 2,887 feet (CNPS 2014). Many historical occurrences are extirpated (CDFW 2014a). There are 62 documented occurrences of legenere patchily distributed

	ESA	*CESA*	*CRPR*	
				in the Planning Area. Thirty-six are located within the UDA and 26 are outside the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Navarretia myserii Pincushion navarretia	—	—	1B.1	This annual herb is found in vernal features that are often acidic between 65 and 1,082 feet in elevation, and is considered a strict vernal pool endemic. This species blooms in May. There are 49 documented occurrences of pincushion navarretia within 5 miles of the Planning Area. The vast majority (48) of the documented occurrences are located outside the UDA in the southeast corner of the Planning Area. Most of these occurrences are on the 13,000-acre Howard Ranch property. The remaining Sacramento County occurrence is located outside of the Planning Area, just north of the American River at the Phoenix Field Ecological Reserve (Sacramento County 2016). The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Orcuttia tenuis Slender Orcutt grass	T*	E	1B.1	Like all grasses in the genus *Orcuttia*, slender Orcutt grass is strictly adapted to the vernal pool hydrological cycle. Slender Orcutt grass can tolerate a wider range of vernal pool sizes and vernal wetland types than other *Orcuttia* species. It also occurs over a greater geographical area and landform types, and a larger number of occurrences as well. This annual grass is found in vernal pools between 114 and 5,774 feet in elevation. This species blooms between May and September, sometimes until October (CNPS 2014). There are four documented occurrences of slender Orcutt grass distributed in the Planning Area. All four occurrences are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.
Orcuttia viscida Sacramento Orcutt grass	E*	E	1B.1	This annual grass is found in vernal features between 98 and 328 feet in elevation (CNPS 2014) and is generally restricted to the largest pools. This species blooms between April and July. There are 40 documented occurrences of Sacramento Orcutt grass within the Planning Area, 10 are located within the UDA and 30 are outside the UDA. The central population center is located on the terrace landscape east of Mather Air Force Base in the vicinity of the Laguna Creek watershed. As measured by the number of CNDDB occurrences, number of occupied pools, and past estimates of the number of individuals, this population center comprises the core of the species' currently known distribution. All four occurrences are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.

	ESA	*CESA*	*CRPR*	
Sagittaria sanfordii Sanford's arrowhead	—	—	1B.2	Sanford's arrowhead is a perennial rhizomatous, emergent herb whose blooming period is between May and October (CNPS 2014). This plant species grows in water bodies located between sea level and 2,132 feet in elevation (CNPS 2014). Sanford's Arrowhead is strictly associated with freshwater marsh hydrology. Sanford's Arrowhead shares the perennial clonal growth habit with the vast majority of other endemic emergent marsh plants. Thin elongate rhizomes produce ovoid tubers (corms) at their tips that allow the plant to persist within the submersed substrate through the dormant winter season. The ability of colonies to withstand at least 1 year of unfavorable hydrologic conditions and then reappear with vigor is likely attributable to the dormant rhizome and associated tubers/corms. This species is extirpated from Southern California and mostly extirpated from the Central Valley (CNPS 2014). There are 64 documented occurrences of Sanford's arrowhead in the Planning Area. Fifteen occurrences are located within the UDA, and 49 occurrences are located outside the UDA. All four occurrences are within the UDA. The habitat model for this species along with the acres of existing modeled habitat within the Planning Area is shown in Section 3 below.

Status Definitions

Federal ESA:

E = listed as endangered under the ESA
T = listed as threatened under the ESA
* = species has designated Critical Habitat located within the Planning Area.
— = no ESA listing
BCC = Bird of Conservation Concern, USFWS 2008.

State CESA:

E = listed as endangered under CESA
T = listed as threatened under CESA
CFP = fully protected under the California Fish and Game Code
CSC = species of special concern in California
WL = Watch List
CE = Candidate for listing as endangered by CDFW
— = no state status

California Native Plant Society

California Rare Plant Rank (CRPR)
1B = Rare, threatened, or endangered in California and elsewhere
2 = Rare, threatened, or endangered in California but more common elsewhere
CRPR Threat Ranks
0.1 = Seriously threatened in California (high degree/immediacy of threat)
0.2 = Fairly threatened in California (moderate degree/immediacy of threat)
0.3 = Not very threatened in California (low degree/immediacy of threats or no current threats known)

Table G-2.2. Other Special-Status Plant Species Analyzed in the EIS/EIR

						Species Habitat Requirements	*Conditions in the Planning Area*
Brasenia schreberi Watershield	—	S2	2B.3	Y	Y	Found in freshwater marshes and swamps. Grows in aquatic waterbodies both natural and artificial. Elev. 98-7,218 ft. Blooms: June-September.	One record within 0.5 miles of Planning Area is located near the Stone Lake Duck club east of Highway 5 (CDFW 2015a, CalFlora 2014). This record is historic but considered extant. Suitable habitat and elevation occurs in the Planning Area. Potentially affected by wetland or riparian removal or damage from activities such as road development or preserve maintenance.
Carex comosa Bristly Sedge	—	S2	2B.1	Y	Y	Found in and on the edges of marshes and swamps; on edge of riparian areas. Valley and foothill grasslands and coastal prairies. Prefers wet places like lake margins. Elev.: 0-2,051 ft. Blooms: May- September.	Found in 10 recent locations (within the last 5 years) within and six locations outside the Planning Area near or following Snodgrass Slough and tributaries. Recorded in Delta Meadows River Park in the Sacramento River Delta. Suitable habitat and elevation occurs in the Planning Area. No records within the UDA. Could be affected by alternatives that result in wetland or riparian removal or damage in the Planning Area.
Castilleja campestris var. *succulent* Succulent owl's clover	T	E/S2	1B.2	N	Y	Found in vernal pools. Pools can be acidic. Elev. 164-2,460 ft. Blooms: April-May.	One record found outside of the Planning Area at UC Cooperative Extension Angraves Nature Study Area, just south of Dry Creek and Galt. Critical habitat is located just inside the southern boundary of the Planning Area along Dry Creek, just east of the

							City of Galt. Suitable habitat and elevation occurs in the Planning Area. Could be affected by disturbance or removal of vernal pools.
Clarkia biloba ssp. *Brandegeeae* Brandegee's clarkia	—	S4	4.2	N	Y	Found in the foothills within chaparral, cismontane woodland, and lower montane coniferous forest. Elev. 0-1,640 ft. Blooms: April-June	One historic occurrence located within the UDA. Two occurrences outside of the Planning Area. One near American River bluffs in Folsom, and the other outside the County in El Dorado Hills near Marble Valley. Suitable habitat located in blue oak woodland and savannah in the western section of the Planning Area. Could be affected by disturbance or removal of blue oak woodland or savannah in the Planning Area.
Cicuta maculata var. *bolanderi* Bolander's Water-hemlock	—	S2	2B.1	Y	Y	Found in coastal, fresh, or brackish water marshes. Elev. 0-656 ft. Blooms: July-September.	One 1993 record for the Planning Area near Snodgrass Slough and Delta Meadows River Park. No records in the UDA. Suitable habitat exists within Planning Area. Could be affected by wetland or riparian removal or damage in the Planning Area.
Cuscuta obtusiflora var. *glandulosa* Peruvian Dodder	—	—	2B.2	Y	Y	Generally found in freshwater marshes and swamps. Parasitic to host plant. A native species that is classified as a noxious weed by CA Department of Food and Agriculture. Elev. 49-919 ft. Blooms: July-October.	One record near Franklin/Big Horn Blvd and Laguna Lake just outside the Planning Area in Elk Grove (CDFW 2015a, CalFlora 2014). No records within the UDA. Suitable habitat and elevation occurs in the Planning Area. Could be affected by wetland or riparian removal or damage.

						Species Habitat Requirements	*Conditions in the Planning Area*
Eryngium pinnatisectum Tuolumne Button-celery	—	S2	1B.2	Y	Y	Found in freshwater wetlands, vernal pools, wetland riparian and foothill woodland communities. Elev. 100 -5,610 ft. Blooms: May-August.	One historic record within the Planning Area from 1941 by Michigan Bar and Rancho Murieta. Five more records occur on the eastern outskirts of the Planning Area just south of Rancho Murieta. No records within the UDA. Suitable habitat and elevation occurs in the Planning Area. Potential effects from wetland or riparian removal.
Fritillaria agrestis Stinkbells	—	S3	4.2	Y	Y	Found in chaparral, cismontane woodlands, and valley and foothill grasslands. Elev. 0-1,640 ft. Blooms March-June.	One recent record within the Planning Area along Sloughhouse Road (CalFlora 2014). One record from dirt parking lot in Citrus Heights outside the Planning Area. Suitable habitat and elevation exists on the eastern edge of the Planning Area. Potential effects in the Planning Area from disturbance or removal of blue oak woodland and savannah and valley grasslands.
Hibiscus lasiocarpos var. *occidentalis* Woolly Rose-Mallow	—	S2	1B.2	Y	Y	Found in freshwater marshes and swamps, along freshwater soaked river banks and low peat island sloughs. Can also occur on riprap and levees. Known in the Delta watershed. Elev. 0-394 ft. Blooms: June-September.	27 records within the Study Areas; ten are found within the Planning Area near and along Snodgrass slough. Remainder are along the Sacramento River or Mokelumne River and tributaries running into the Delta. No records within the UDA. Suitable habitat and elevation occurs in the Planning Area. Potential effects from wetland or riparian removal or damage.

							habitat from implementation of alternatives.
Lilaeopsis masonii Mason's lilaeopsis	—	S2	1B.1	Y	Y	Found in riparian scrub and brackish or freshwater marshes and swamps. Elev. 3-33 ft. Blooms: April-November.	Known from areas south of the Planning Area. Concentrated in region of southern Sacramento County. Recent records occur all along the Sacramento Deep Water Ship Channel outside the Planning Area and along the Mokelumne river and tributaries of the Delta. Older records found in Snodgrass Slough within the Planning Area. No records within the UDA. Suitable habitat and elevation range occurs in Planning Area. Potential effects from wetland or riparian removal or damage.
Limosella australis Delta Mudwort	—	S2	2B.1	Y	Y	Found in mud banks in riparian scrub and freshwater or brackish marshes and swamps. Elev. 0-10 ft. Blooms: May-August.	Suitable habitat and elevation range occurs in Planning Area. Six records in the Study Area with most outside the Planning Area on the Mokelumne River and tributaries. Two records in the Planning Area along Snodgrass Slough at the edge of the Planning Area. Potential effects from wetland or riparian removal or damage.
Scutellaria galericulata Marsh Skullcap	—	S1	2B.2	Y	Y	Found in Lower montane coniferous forest, meadows, seeps, marshes and swamps. Elev. 0-6,980 ft. Blooms: June-	Two recent records are located within the Planning Area along Snodgrass Slough. Preferred higher elevation range does not occur within Planning

						September.	Area. Likely restricted to the western section of the Planning near recent occurrences. Potential effects from wetland or riparian removal or damage.
Scutellaria lateriflora Side-flowering Skullcap	—	S1	2B.2	Y	Y	Found in marshes, swamps, mesic meadows and seeps. Elev. 0-1,640 ft. Blooms: July-September.	Ten occurrences within the Study Area. The majority of them (eight) occurring in the Planning Area along Snodgrass Slough and the Mokelumne River. Suitable habitat and elevation range occurs within Planning Area. Potential effects from wetland or riparian removal or damage.
Symphyotrichum lentum Suisun Marsh aster	—	S2	1B.2	Y	Y	Found in brackish and freshwater marshes and swamps. Elev. 0-10ft. Blooms: May-November.	Suitable habitat and elevation range occurs in Planning Area. Eight occurrences within the Study Area. The majority of them occur outside the Planning Area (six) in the Sacramento Deep Water Ship Channel. Within the Planning Area, occurrence found on tributaries of Snodgrass Slough. No records within the UDA. Potential effects from wetland or riparian removal or damage.
Trifolium hydrophilum Saline Clover	—	S2	1B.2	Y	Y	Found in marshes and swamps, valley and foothill grasslands, and vernal pools. Elev. 0-984 ft. Blooms: April-June	There are five recent occurrences within the Planning Area around Stone Lake. Colonies located within seasonally wet grasslands and vernal pools.Suitable habitat and elevation range occurs in Planning Area.

2B = Rare, threatened, or endangered in California, but more common elsewhere
3 = Plants which need more information and on the Review list
4= Plants of limited Distribution – Watch List

CRPR Threat Ranks:
0.1 = Seriously threatened in California (high degree/immediacy of threat)
0.2 = Fairly threatened in California (moderate degree/immediacy of threat)
0.3 = Not very threatened in California (low degree/immediacy of threats or no current threats known)

Other Special Status Wildlife Species Evaluated in the EIS/EIR

The review of the data sources listed in the introduction to this section identifed 53 special-status wildlife species known, or with potential to occur in the Chapter 9 Study Area. Of the total 53 wildlife species identified in this review, 20 were already selected by the Permit Applicants to be Covered Species under the proposed SSHCP.

For the other 33 special-status wildlife species identified in the review, four species were selected for evaluation in the EIS/EIR. These species are listed in Table G-2.3 with information on their legal status and rationale for evaluation in the EIS/EIR. These determinations were based primarily on the types, extent, and quality of habitats in the Chapter 9 Study Area; the proximity of the Study Area to known occurrences of the species; and the regional distribution and abundance of the species.

Table G-2.3. Other Special Status Wildlife Species Analyzed in the EIS/EIR

Scientific Name Common Name	Status				Rationale	
	ESA (Federal) Status	*State Status*	*CNDDB Records within Planning Area*	*Analyzed in the EIS/EIR*	*Species Habitat Requirements*	*Conditions in the Planning Area*
Birds						
Ammodramus savannarum Grasshopper sparrow (nesting)	—	CSC	Y	Y	Nests and forages in dense grasslands; favors a mix of native grasses, forbs, and scattered shrubs.	Suitable habitat occurs in Planning Area. Could nest in annual grassland habitat in the Planning Area. Known to occur in southern half of Sacramento County. Two records within the Planning Area. Potential affected by disturbance or removal of grasslands.
Grus canadensis canadensis Lesser sandhill crane (wintering)	—	CSC	N	Y	Wintering habitats include crop fields, grazed and mowed grasslands, pastures, alfalfa fields, and shallow wetlands.	Winters in Planning Area. A regular winter visitor to the Bufferlands, Cosumnes River Preserve and other waterfowl preserves in the Sacramento area. Primary range is in Central Valley, with fall and winter occurrences within the Sacramento–San Joaquin River Delta and Sacramento Valley within the Study Area. Suitable wintering habitat occurs in Planning Area. Potential effects from disturbance and removal of roosting areas in crop fields, grasslands, and wetlands.
Melospiza melodia Song sparrow (Modesto population)	—	CSC	Y	Y	Breeding and wintering habitat is in emergent freshwater marshes, riparian forests, vegetated irrigation canals, levees, and newly planted valley oak restoration sites.	Suitable habitat occurs within Planning Area. 17 occurrences within the Planning Area. Two occurrences within the UDA. Generally known to occur within Sacramento County in southwestern corner of the County. Potential effects from disturbance and removal of emergent freshwater marshes, riparian forests, vegetated irrigation canals and levees or oak restoration sites.

Species Scientific Name Common Name	ESA (Federal) Status	State Status	CRPR Plant Rank	CNDDB or CalFlora records within Planning Area	Analyzed in the EIS/EIR	Rationale for EIS/EIR Analysis Decision	
						Species Habitat Requirements	*Conditions in the Planning Area*
Amsinckia grandiflora Large-flowered Fiddleneck	E	E	1.B.1	N	N	Cismontane woodland and valley grassland in Alameda, Contra Cost and western San Joaquin Counties. Elevation: 886 – 1,804 ft. Blooms: March-May	No records in the County or Planning Area. Suitable habitat exists in the Planning Area; however , the Planning Area is outside the known range of the species. Not likely to be affected by alternatives.
Arctostaphylos myrtifolia Ione Manzanita	T	—	1B.2	N	N	Chaparral habitat. Restricted to the Ione Formation in Amador and Calaveras Counties, along an approximate 19.5 mile stretch, with the central distribution being the large exposure of the Ione Formation in western Amador County around the City of Ione. Elev.: 229-2,526 ft. Blooms: November-March.	Eight occurrences within 0.5 miles of the Planning Area. No records in the County or Planning Area. No suitable habitat exists in the Planning Area. Not likely to be affected by alternatives.
Calystegia stebbinsii Stebbins' morning-glory	E	E/S1	1B.1	N	N	Found in gabbroic or serpentine soils in chaparral or cismontane woodland openings. Elev. 606-3,576 ft. Blooms: April-July.	Not found within the Study Areas. No suitable habitat within Planning Area. Not likely to be affected by alternatives.
Ceanothus roderickii Pine Hill ceanothus	E	S1	1B.1	N	N	Found in gabbroic or serpentine soils in chaparral or cismontane woodland openings. Elev. 803-2,066 ft. Blooms: April-July	Not found within the Study Areas. Suitable habitat and elevation does not occur in the Planning Area. Not likely to be affected by alternatives.
Crocanthemum suffrutescens Bisbee Peak rush-rose	—	S2	3.2	N	N	Found in chaparral openings on Serpentine, Gabbroic, or Ione Formation Soils. Elev. 328-2,296 ft. Blooms: March-June.	Seven records outside the eastern edge of the Planning Area on Ione Formation soils. No records within the UDA. No suitable habitat exists in the Planning Area. Would not be affected by alternatives.

Other Special Status Wildlife Species not Evaluated in the EIS/EIR

As described previously, the review of the data sources listed in the introduction to this section identified 53 special-status wildlife species known, or with potential to occur in the Chapter 9 Study Area. Of the total 53 wildlife species identified, 29 were not included in the EIS/EIR analysis. These species are listed in Table G-2.5 with information on their legal status and rationale for not being included in the EIS/EIR evaluation. These determinations were based primarily on the types, extent, and quality of habitats in the Chapter 9 Study Area; the proximity of the Study Area to known occurrences of the species; and the regional distribution and abundance of the species.

Table G-2.5. Other Special Status Wildlife Species not Analyzed in the EIS/EIR

Scientific Name Common Name	Status				Rationale	
	ESA (Federal) Status	*State Status*	*CNDDB Records within Planning Area*	*Analyzed in the EIS/EIR*	*Species Habitat Requirements*	*Conditions in the Planning Area*
Fish						
Acipenser medirostris North American Green Sturgeon (Southern DPS)	T*	CSC	N	N	Spawn in deep pools in large, turbulent, freshwater rivers. Adults live in oceanic waters, bays, and estuaries. In the Sacramento River, spawning occurs near Red Bluff and in the Feather River. Can be found at other life stages in the Sacramento River and the Sacramento-San Joaquin Delta. Critical habitat in Snodgrass Slough area along the Sacramento River.	No CNDDB records in the Planning Area. The Planning Area boundary is the Sacramento River levee and does not extend into habitat or critical habitat for North American green sturgeon (Southern DPS) in the River. The species would not be affected by activities considered in the alternatives along other rivers/waterways in the Planning Area that could provide habitat for the species. Not included for analysis because the activities and projects included in the EIS/EIR alternatives would not directly or indirectly impact North American green sturgeon (Southern DPS).
Archoplites interruptus Sacramento perch (within native range only)	_	CSC	N	N	Historically existed in vegetated sloughs, and pooling areas of rivers and lakes. More recently found in ponds and impoundments where it has been translocated. Prefers warm water. Historically, native to the Central Valley, it is mostly likely extirpated from its native range (Crain and Moyle 2011).	Only one record in the Study Area by Lake Greenhaven between I-5 and the Sacramento River. No CNDDB records in the Planning Area. Known only from translocations. No currently recorded or persistent populations in the Sacramento River (Crain and Moyle 2011) or other areas with the Planning Area. While suitable habitat exists in the Planning Area, it is not likely that this species persists in the natural waterways within the County. Not included for analysis because the activities and projects included in the EIS/EIR alternatives would not directly or indirectly impact Sacramento perch.

AGENDA ITEM 11.1
6187

Table G-2.5. Other Special Status Wildlife Species not Analyzed in the EIS/EIR

Scientific Name Common Name	Status				Rationale	
	ESA (Federal) Status	*State Status*	*CNDDB Records within Planning Area*	*Analyzed in the EIS/EIR*	*Species Habitat Requirements*	*Conditions in the Planning Area*
Hypomesus transpacificus Delta smelt	T*	E	N	N	Found in estuaries. Able to occur in brackish and freshwater. Pelagic and anadromous. Occurs in Sacramento-San Joaquin Delta most of the year. Spawns in tidally influenced freshwater wetlands and seasonally submerged uplands along the Sacramento River, downstream from its confluence with the American River (City of Sacramento, 2009).	Critical habitat within the Planning Area from the Sacramento River to just east of I-5; includes Snodgrass Slough. No CNDDB records in the Planning Area. The Planning Area boundary is the Sacramento River levee and does not extend into habitat or critical habitat for Delta smelt in the River. The species would not be affected by activities considered in the alternatives along other rivers/waterways in the Planning Area that could provide habitat for the species. Not included for analysis because the activities and projects included in the EIS/EIR alternatives would not directly or indirectly impact Delta smelt.
Lampetra ayresii River lamprey	_	CSC	N	N	Found in estuaries and the ocean, migrating to clear gravel riffles of streams to spawn. Known to occur in the lower Sacramento River and other tributaries within the County, but it is uncommon.	No CNDDB records in the Planning Area. The Planning Area boundary is the inside toe of the Sacramento River levee and does not extend into habitat for river lamprey within the River. The species would not be affected by activities considered in the alternatives along other rivers/waterways in the Planning Area that could provide habitat for the species. Not included for analysis because the activities and projects included in the EIS/EIR alternatives would not directly or indirectly impact river lamprey.
Oncorhynchus mykiss irideus Central Valley steelhead	T*	—	Y	N	All river reaches and estuarine areas accessible to listed steelhead in the Sacramento and San Joaquin Rivers and their tributaries in California. Widely distributed in the Sacramento River and its	Three recent CNDDB occurrences within the Planning Area: the Sacramento-San Joaquin Delta area, the Mokelumne River and the Cosumnes River. Critical habitat on the Sacramento, American and Mokelumne Rivers (including Dry Creek) along the edge of the Planning Area. The Planning Area boundary is the

Table G-2.5. Other Special Status Wildlife Species not Analyzed in the EIS/EIR

Scientific Name Common Name	Status				Rationale	
	ESA (Federal) Status	*State Status*	*CNDDB Records within Planning Area*	*Analyzed in the EIS/EIR*	*Species Habitat Requirements*	*Conditions in the Planning Area*
					tributaries.	inside toe of theSacramento River levee and does not extend into habitat or critical habitat for Central Valley steelhead in the River. The species would not be affected by activities considered in the alternatives along other rivers/waterways in the Planning Area that could provide habitat for the species. Not included for analysis because the activities and projects included in the EIS/EIR alternatives would not directly or indirectly impact Central Valley steelhead.
Oncorhynchus tshawytscha Chinook salmon - Central Valley spring-run Evolutionary Significant Unit (ESU)	T*	T	N	N	Chinook salmon tend to spawn in the mainstems of rivers (or larger tributaries) in areas of gravel and cobble substrate. Migrate to and from oceanic environments to natal streams. Requires cool winter and spring flows for migration, spawning and cool summer water temperatures for fry and juvenile rearing, Also found in lakes up to 375 meters in depth. Occurs in the Pacific Ocean for most of its life. Travels to clean gravel beds in the upper Sacramento and portions of the American River for spawning.	No CNDDB records within the Planning Area. Spring-run Chinook enter the Sacramento River from late March through September. Adults hold in cool water habitats through the summer, then spawn in the fall from mid-August through early October. Spring-run juveniles migrate soon after emergence as young-of-the-year, or remain in freshwater and migrate as yearlings (CDFW 2014b). Rearing habitat may be found in the Cosumnes River and tributaries. Critical habitat occurs along the Sacramento and American Rivers It also occurs in the Delta Cross Channel leading into Snodgrass Slough. The Planning Area boundary is the inside toe of the Sacramento River levee and does not extend into Chinook salmon habitat or critical habitat for the Central Valley spring-run ESU. The species would not be affected by activities considered in the alternatives along the Cosumnes or its tributaries or Snoddgrass Slough. Not included for analysis because the activities and projects included in the

Scientific Name Common Name	Status				Rationale	
	ESA (Federal) Status	*State Status*	*CNDDB Records within Planning Area*	*Analyzed in the EIS/EIR*	*Species Habitat Requirements*	*Conditions in the Planning Area*
						EIS/EIR alternatives would not directly or indirectly impact Chinook salmon – Central Valley spring-run ESU.
Oncorhynchus tshawytscha Chinook salmon - Sacramento River winter-run ESU	E	E	N	N	Chinook salmon tend to spawn in the mainstems of rivers (or larger tributaries) in areas of gravel and cobble substrate. Migrate to and from oceanic environments to natal streams. Occurs in the Pacific Ocean for most of its life. Travels to clean gravel beds in the upper Sacramento and portions of the American River for spawning.	No CNDDB records within the Planning Area. The Sacramento River winter-run Chinook salmon occur as far upstream as the Keswick Dam and depend on cold water releases from the Shasta dam (located 9 miles upstream of Keswick Dam) to allow them to hold for several months until they spawn in early summer in the 70 miles below the Dam (Moyle 2002). Adult winter-run pass under the Golden Gate Bridge from November through May, and pass into the Sacramento River from December through early August. (CDFW 2014b). Planning Area boundary is the Sacramento River levee and does not extend into Chinook salmon habitat. Not included for analysis because there is no habitat within the Planning Area.
Oncorhynchus tshawytscha Chinook salmon – Central Valley fall / late-fall-run ESU	C	CSC	N	N	Chinook salmon tend to spawn in the mainstems of rivers (or larger tributaries) in areas of gravel and cobble substrate. Migrate to and from oceanic environments to natal streams. Requires cool summer flows for fry and juvenile rearing.	No CNDDB records within the Planning Area. Present in Sacramento-San Joaquin Delta and associated marshes. Presently fall and late-fall run chinook spawn in the Sacramento and San Joaquin rivers and their tributaries (including the American River) between Keswick Dam (near Redding) and the Merced River (NMFS 2014, CDFW 2014b). Rearing may occur in the Cosumnes River and tributaries. The Planning Area boundary is the Sacramento River levee and does not extend into Chinook salmon habitat. The species would not be affected by activities considered in the alternatives along the

Table G-2.5. Other Special Status Wildlife Species not Analyzed in the EIS/EIR

						Cosumnes or its tributaries. Not included for analysis because the activities and projects included in the EIS/EIR alternatives would not directly or indirectly impact Chinook salmon – Central Valley fall / late-fall-run ESU.
Pogonichthys macrolepidotus Sacramento splittail	—	CSC	N	N	Found in pooling areas of rivers and lakes as well as backwaters. Able to survive in brackish waters as well. Requires flooded vegetation for spawning and juvenile foraging habitat. Spawning occurs over flooded stream bank vegetation in sloughs and in slow moving large rivers Requires flooded vegetation for spawning and juvenile foraging habitat. Spawning occurs over flooded stream bank vegetation in sloughs and in slow moving large rivers.	Small amount of appropriate habitat along the Sacramento River. One CNDDB record from 1995 within the Sacramento River along the border of the Planning Area was found in CNDDB records. However, the Planning Area boundary is the Sacramento River levee and does not extend into Sacramento splittail habitat in the river. Young of the year found in the Cosumnes River Preserve (Whitener and Kennedy 1999). Present in Sacramento-San Joaquin Delta and associated marshes. The species would not be affected by activities considered in the alternatives along the Cosumnes or its tributaries. Not included for analysis because the activities and projects included in the EIS/EIR alternatives would not directly or indirectly impact Sacramento splittail.
Spirinchus thaleichthys Longfin smelt	C	T	N	N	Found in the California's bay, estuary, and nearshore coastal environments from San Francisco Bay north to Lake Earl, near the Oregon border. The San Francisco Estuary and the Sacramento-San Joaquin Delta supports the largest longfin smelt population in California.	While there are two recent CNDDB occurrences along the Sacramento River, the Planning Area boundary is the inside toe of theSacramento River levee and does not extend to longfin smelt habitat. The majority of the population's habitat is in the Delta region south and east of the Planning Area. Would not be affected by the alternatives because is found outside Sacramento County or on its borders, it has no known distribution within the

						Planning Area, and is not located near UDA activities.
Birds						
Aquila chrysaetos Golden eagle (nesting and wintering)	—	CFP (Breeding and Wintering)	Y	N	Occurs in mountainous canyon land, rimrock terrain of open desert, and grassland areas. Potential foraging habitat is in shrublands, grasslands, farmland, and riparian areas. Occurs in foothills and mountain areas of California with known occurrences in central Sacramento County.	Two historic records from the Planning Area. Only one record in the UDA of a wintering golden eagle by Mather Airport is located within the Planning Area. Golden eagles likely to do not nest in the Planning Area due to the lack of rocky ledges and cliffs. Limited suitable nesting habitat within the Planning Area. Low likelihood of nesting in the Planning Area and being affected by the alternatives.
Asio flammeus Short-eared owl (nesting)	—	CSC	N	N	Open areas with few trees including grasslands, prairies, dunes, meadows, and irrigated lands. Potential habitat within the Planning Area includes valley grasslands, wetlands, and agriculture lands. A winter migrant that is found primarily in the Central Valley, the western Sierra Nevada foothills and along the coastline.	No observations were found within the CNDDB within the Study Area. Highest concentrations are in Solano County. There is a low likelihood of nesting in the Planning Area and being affected by the alternatives.
Asio otus Long-eared owl (nesting)	—	CSC	N	N	Requires riparian habitat breeding and wintering; also uses live oak thickets and other dense stands of trees.	Some suitable habitat in Planning Area. No known occurrences within Sacramento County or surrounding region. A year-round resident in California, although it has been nearly extirpated from the central valley. Low likelihood of nesting in the Planning Area and being affected by the alternatives.

Table G-2.5. Other Special Status Wildlife Species not Analyzed in the EIS/EIR

Scientific Name Common Name	Status				Rationale	
	ESA (Federal) Status	*State Status*	*CNDDB Records within Planning Area*	*Analyzed in the EIS/EIR*	*Species Habitat Requirements*	*Conditions in the Planning Area*
Coccyzus americanus occidentalis Western yellow-billed cuckoo (nesting)	T	E	Y	N	Open woodland; deciduous riparian woodland; nests in tall cottonwood and willow riparian woodland.	Found along the Sacramento River north of the Study Area. Does not nest within the Planning Area or Sacramento County. CNDDB record in Planning Area is from 1896. Low likelihood of nesting in the Planning Area and being affected by the alternatives.
Falco peregrinus anatum American peregrine falcon (nesting)	Delisted, Taxon Recovered;	Delisted, CFP	N	N	Occurs in a wide range of habitats. Breeds mostly in woodland, forest, and coastal habitats with high cliff faces. Year-around habitats include riparian areas, inland and coastal wetlands. Wintering may occur within the Planning Area.	Limited suitable habitat in Planning Area, and no known occurrences within Sacramento County. Low likelihood of nesting in the Planning Area and being affected by the alternatives.
Haliaeetus leucocephalus Bald eagle (nesting and wintering)	Delisted, Taxon Recovered;	E, CFP	N	N	Breeds in forested areas adjacent to large bodies of water. Usually nests in trees. Wintering birds may occur within Planning Area.	No known occurrences within Sacramento County. Limited suitable habitat within the Planning Area. Low likelihood of nesting in the Planning Area and being affected by the alternatives.
Icteria virens Yellow-breasted chat (nesting)	—	CSC	N	N	Breeds in early-successional, riparian habitats with well-developed shrub layer and open canopy.	Species is a rare spring and summer visitor to the region. Nesting has not been documented within the Planning Area. Limited habitat within Planning Area. Not known to occur in Sacramento County. Low likelihood of nesting and being affected by the alternatives.
Progne subis Purple Martin (nesting)	—	CSC	N	N	Within species range breeds in wooded, low elevation habitats including riparian, coniferous, and valley foothill and montane woodlands, and structures. Within the Planning Area, uses	Suitable habitat occurs within Planning Area and known from Sacramento County, but no known occurrences from the Planning Area. Only documented occurrences are within the City of Sacramento along freeway overpasses. Not likely to be affected by the alternatives.

					weep holes in freeway overpasses.	
Rallus longirostris obsoletus California clapper rail	E	E	N	N	Tidal marshes, shallow freshwater margins, wet meadows and flooded grassy vegetation. May breeding and winter in the Planning Area.	Some potential habitat occurs in Planning Area, but no known occurrences in Sacramento County. Low likelihood of being affected by the alternatives.
Setophaga petechia Yellow warbler (nesting)	—	CSC	N	N	Breeds in riparian woodlands, montane chaparral, open ponderosa pine, and mixed conifer habitats.	Yellow warblers currently occupy much of their former breeding range, except in the Central Valley, where they are close to extirpation (Shuford and Gardali, 2008). Limited suitable habitat and elevation within Planning Area. Not known to occur within Sacramento County. There is a low likelihood of being affected by the alternatives.
Vireo bellii pusillus Least Bell's vireo (nesting)	E	E	N	N	Breeds in dense, riparian scrub. Prefers early successional stages in riparian areas, brushy fields, young second-growth forest or woodland, scrub oak, coastal chaparral, and mesquite brushlands, often near water in arid regions.	While suitable riparian scrub may be found within the Planning Area, these birds are considered extirpated from Sacramento County. Therefore, there is a low likelihood of being affected by the alternatives.
Xanthocephalus xanthocephalus Yellow-headed blackbird (nesting)	—	CSC	Y	N	Marshes with tall emergent vegetation are used for breeding and wintering.	Some suitable habitat within the Planning Area. Not known to currently occur within Sacramento County. The one CNDDB record within the Planning Area is from 1899. Therefore, there is a low likelihood of being affected by the alternatives.

Mammals						
Bassariscus astutus Ringtail	—	CFP	N	N	Mixed forests and shrublands near rocky area or riparian habitats. Forages near water and is seldom found more than 0.62 mile from a water source.	There are no records of the species in CNDDB, and due to the limited occurrence of rocky habitats along rivers and within riparian areas of the Planning Area and the level of human disturbance within these habitats in the Planning Area this species is not likely to occur. There is a low likelihood of being affected by the alternatives.
Corynorhinus townsendii Townsend's Big-eared bat	—	CSC/ CT	N	N	Prefers mesic habitats characterized by coniferous and deciduous forests and riparian habitat, but also xeric areas. Roosts in limestone caves and lava tubes, also man-made structures and tunnels.	Limited suitable habitat within Planning Area. Not known to occur in Sacramento County. There is a low likelihood of being affected by the alternatives.
Sylvilagus bachmani riparius Riparian brush rabbit	E	E	N	N	Large patches of riparian vegetation composed of wild roses, grapes, willow or blackberries, edges of brushy species to grasses and herbaceous forbs. High ground refugia from flooding needed.	Limited habitat within the Planning Area. The range of this species is located within San Joaquin County and the Delta near Paradise Cut. There is a low likelihood of being affected by the alternatives.
Amphibians						
Rana boylii Foothill yellow-legged frog	—	CSC	N	N	Rocky streams and rivers with open banks in forest, chaparral, and woodland habitat. Generally found in the foothills.	No known occurrences within Sacramento County. Limited suitable habitat within Planning Area. Only CNDDB record in Study Area is from 1958. There is a low likelihood of being affected by the alternatives.

AGENDA ITEM 11.1
6195

Table G-2.5. Other Special Status Wildlife Species not Analyzed in the EIS/EIR

Scientific Name Common Name	Status				Rationale	
	ESA (Federal) Status	*State Status*	*CNDDB Records within Planning Area*	*Analyzed in the EIS/EIR*	*Species Habitat Requirements*	*Conditions in the Planning Area*
Invertebrates						
Branchinecta conservatio Conservancy fairy shrimp	E	—	N	N	Larger more turbid vernal pools, playa pools.	Not known to occur in Sacramento County. Limited suitable habitat in Planning Area. Not likely to be affected by the alternatives.
Callophrys mossii bayensis San Bruno Elfin Butterfly	E	—	N	N	Coastal chaparral with populations of the larval food plant broadleaf stonecrop (*Sedum spathulifolium*). Known from these habitats in Northern San Mateo, Marin and Contra Costa Counties (Black and Vaughn 2005).	Not known to occur in Sacramento County. Found only in San Mateo, Marin and Contra Costa Counties. There is a low likelihood of being affected by the alternatives.
Elaphrus viridis delta green ground beetle	T	—	N	N	Vernal pool habitat.	Not known to occur in Sacramento County. Found only in Solano County at Jepson Prairie Preserve. There is a low likelihood of being affected by the alternatives.

Source: Black and Vaughn 2005,CDFW 2015a, USFWS 2016.
Note: CNDDB = California Natural Diversity Database; USFWS = U.S. Fish and Wildlife Service
The federal and state status of species primarily is based on the Special Animals List (October 2015) (CDFW 2015b).

Legal Status Definitions
Federal:
E = listed as endangered under the ESA
T = listed as threatened under the ESA
C = candidate for listing under the ESA
— = no ESA listing
*= species has designated Critical Habitat located within the Planning Area.

State:
E = listed as endangered under CESA
T= listed as threatened under CESA
C = Candidate for listing under CESA
CT = Candidate Threatened
CSC= Species of special concern (no formal protection other than CEQA consideration)
CFP = Fully protected (legally protected)
— = no state status
** Analysis of impacts to rookeries are a requirement under CEQA

INTENTIONALLY LEFT BLANK

EIS/EIR APPENDIX G-3

Species Accounts for

Proposed Covered Species

The following species accounts describe each of the species proposed by the Project Aplicant for coverage under the South Sacramento Habitat Conervation Plan (SSHCP). Each account gives the listing status, life history, genetics, habitat and ecology of the species, including its distribute on within the Planning Area. These species accounts provide additional detailed information on these potential covered species and potential conservation strategy actions in support of the analysis found in Chapter 9 of the EIS/EIR. The information used to create these species accounts is found in the literature cited section at the end of each account. To reduce the amount of text in each profile, a three or four letter abbreviation is identified for each species. The abreviations either reflect abreviations already in common use for a species, such as VELB for valley-elderberry longhorn beetle, or were developed in support of SSHCP preparation based on the common name of the species.

DWARF DOWNINGIA (DWDO)

Dwarf Downingia (DWDO)

(Downingia pusilla)

Status USFWS: None

Status CDFW: None

Status CNPS:2.2

© 2004 Carol W. Witham

DWDO Listing Status

Dwarf downingia (*Downingia pusilla*) is considered to be rare, threatened or endangered in California, but more common elsewhere, thus qualifying its designation as a list 2.2 species by the California Native Plant Society (CNPS), meaning it is fairly threatened in California with a moderate degree/immediacy of threat, but it is more common outside of California (CNPS 2010). It has been assigned an R-E-D Code of 1-2-1, meaning it is rare, but found in sufficient numbers and distributed widely enough that the potential for extinction is low at this time, it is endangered in a portion of its range, and it is more or less widespread outside of California.

Being a CNPS List 2 plant species, dwarf downingia meets the California Department of Fish and Wildlife (CDFW) definition of a special plant though it has no formal protection status by the CDFW or United States Fish and Wildlife Service (USFWS).

DWDO Life History and Ecology

DWDO Species Description and Life History

DWDO Morphology

Dwarf downingia, a strict endemic of the vernal pool hydrologic regime, is an annual member of the Bellflower family (Campanulaceae). This inconspicuous species is variable with regard to stem length (Mason 1957). Single small-stature plants can be erect and less than three centimeters in height at maturity, or longer branched stems (up to 15 cm) can sprawl horizontally, forming relatively dense colonies, or mix with the other sprawling vernal pool species (Dittes pers. obs.). Small (five to ten millimeter-long) narrowly linear leaves are alternately arranged on the stems. Single flowers are borne in the leaf axils towards the tips of the stems.

Dwarf downingia possesses atypical flowers within the genus with regard to size and symmetry. Typical *Downingia* flowers, ranging from five to 19 millimeters in length, are bilaterally symmetrical, with two narrow "upper petals" and a broad, three-lobed "lower petal." These five corolla lobes, mostly blue or blue-purple with varying combinations of white and yellow, are united into a tube below their bases. The flower is borne at the apex of a long narrow stalk-like ovary (inferior ovary).

In comparison to characteristically showy *Downingia* flowers, the flowers of dwarf downingia are very small, ranging from only 2.5 to 5.4 millimeters in length. In addition, they lack the strong bilateral symmetry characteristic of other *Downingia* species; dwarf downingia flowers appear almost radial or star-like, with five narrow, triangular lobes that barely exceed the green calyx lobes. Dwarf downingia flowers can be white or blue, with two small yellow spots near the throat (Hickman 1993). This is a very inconspicuous plant and must be surveyed for while in flower, as there is no other way to identify this species.

DWDO Ecological Life Cycle

Other than field observations recorded in the California Natural Diversity Data Base (CNDDB) (CDFG 2010), basic taxonomy and biogeographic treatments, dwarf downingia remains mostly unstudied. Since all vernal pool plant species share similar environmental selective pressures, they likely also share similar adaptive traits. For this reason, studies addressing the life history and ecology of other more common vernal pool plant species may provide some insight into the life history and ecology of dwarf downingia.

Dwarf downingia shares the annual growth habit with the vast majority of other endemic vernal pool plants. This adaptive trait allows populations to persist through the regular and extreme

summer drought that characterizes vernal pools and the Mediterranean Climate (Griggs and Jain 1983; Holland 1987; Stone et al. 1988; Zedler 1990).

DWDO Seed Germination

The specific timing of the germination of dwarf downingia seeds relative to the timing of the vernal pool inundation cycle has not been studied or described in detail. In general, *Downingia* seeds germinate during the early stages of vernal pool inundation (Zedler 1987). Studies involving germination of *Downingia cuspidata* have demonstrated a required pretreatment for germination at high percentages, although complete submersion was not required (Myers 1975). Studies involving *D. concolor* have had erratic to poor germination results (Hoover 1937; Linhart 1972 as reported in Zedler 1987). Seeds of other more common *Downingia* spp. occurring in the Sacramento Valley (*D. bicornuta, D. ornatissima, D. cuspidata, D. bella*) germinate under water in pool basins or in inundated soil at shallow edges of filled pools (Dittes pers. obs.). Germination requirements and optima for dwarf downingia have not been investigated. Seed dormancy and required environmental cues for in-situ germination may exist, but are presently unknown.

DWDO Vegetative Growth

One of the challenges posed to many vernal pool plant species is optimization of photosynthesis and other metabolic processes in both the early season aquatic and later season terrestrial phases of the vernal pool cycle. *Downingia* and many other vernal pool species, being amphibious, possess differing aquatic and terrestrial growth forms. After germination, seedlings and young plants growing under water produce thickened, elongate, spongy stems with large air chambers, and narrowly linear leaves that lack waxy cuticle (Weiler 1962). Stems produced in the terrestrial phase are thinner with denser tissue, and leaves are somewhat wider, thicker and posses waxy cuticle. The air-filled aquatic stems hold the plant vertical in the water column and with the thinner leaves, facilitate light exposure and gas exchange. This in effect lengthens the growing season by maximizing growth while vernal pools are still inundated.

DWDO Reproduction

Dwarf downingia and other species in the genus flower and set seeds during the dry-down and terrestrial phase of the vernal pool hydrologic cycle, typically during March through May (CNPS 2010). The very small, reduced flowers and included anthers and stigma reflect a self-fertilizing breeding system for dwarf downingia, in contrast to the outcrossing strategy for almost all other Downingias (Weiler 1962; Zedler 1987; Thorp 1990). Once fertilized, the inferior ovary elongates into a narrow stalk like capsule that can reach two to three centimeters in length. The mature capsules produce numerous minute dust-like seeds that are released as the capsule

disintegrates through the late spring, summer and fall months. Fecundity and variation in seed production have not been investigated in dwarf downingia.

DWDO Dispersal

In many other vernal pool species, seed dispersal is naturally limited, although this has not been stated specifically for *Downingia*. Limited seed dispersal in vernal pool species is thought to represent an adaptation to spatially unpredictable and limited vernal pool habitat (Griggs 1974, 1980). Natural dispersal of dwarf downingia seeds likely occurs via flowing water, transport on feet and feathers of waterfowl, and in mud on hooves and legs of livestock.

Evidence of dwarf downingia dispersal and colonization exists in occupancy of man-made topo-hydrologic features within occupied vernal pool landscapes (stock pond margins, roadside ditches, rutted tire tracks, gravel pits and scraped depressions (Witham 1991; CDFG 2010). As with all other vernal pool species, natural dispersal of seeds was likely a more frequent event when there were many more vernal pools, more pool interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming ungulates (Griggs 1980). Dwarf downingia, and about 10-15 other vernal pool species occur both in Californian and South American vernal pool habitats (amphitropical); a distribution most likely resulting in historic long-distance dispersal by migratory waterfowl (Zedler 1987).

DWDO Seed Dormancy

The existence of a dormant soil seed bank is unknown for dwarf downingia. The presence of a persistent soil seed bank provides insurance against localized extirpation resulting from the unpredictable occurrence and duration of appropriate growing conditions. If total seed crop failure occurs in a given year or set of years (failure to germinate, loss to late season flooding or fire, excessive grazing by livestock or grasshopper herbivory), additional stored seeds are available for another year's effort.

DWDO Population Genetics

The population biology and genetics of dwarf downingia have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. Elam (1998) provides a good overview of the different issues that should be considered in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon. Given the limited number of occurrences and the scattered geographical distribution, each dwarf downingia population should be considered unique, and for species conservation, are unique genetic entities.

DWDO Habitat Requirements and Ecology

DWDO Biogeography and Landform Relations

It is generally held that many of the endemic vernal pool plant species, including downingias, are relatively recent evolutionary derivations of more common and widespread upland progenitors (Stebbins 1976; Stone 1990; Raven and Axlerod 1978; Thorne 1984). These neoendemic vernal pool species are thought to have evolved from terrestrial habitat into seasonally aquatic vernal pool habitat made available as the Mediterranean Climate developed and the inland Tertiary-age Sea dried.

Dwarf downingia occurrences are associated mainly with northern claypan vernal pools in central Sacramento County, with northern hardpan vernal pools in the foothills of the Sierra Nevada, and with vernal pools of the Interior Valleys of the Coast Range in Napa and Sonoma Counties (CDFG 2010). Throughout this area, the species occurs on a variety of landforms and soil associations. In Sacramento County, dwarf downingia occurs primarily on the Laguna and Riverbank.

DWDO Hydrology Relations

Dwarf downingia is a strict endemic of the vernal pool hydrologic cycle. It is of importance to conservation however, that in contrast to the "deeply-adapted" vernal pool grasses of the Orcuttiae Tribe, and legenere (*Legenere limosa*), dwarf downingia occupies more commonly occurring, smaller and/or shallower vernal pools with comparatively more "flashy" hydrology (CDFG 2010; Dittes pers. obs.). In a survey of eight dwarf downingia-occupied vernal pools at Beale Air Force Base, the mean vernal pool area was found to be 299 square meters (357.6 square yards) and the mean vernal pool depth was 20.8 centimeters (8.2 inches). These are reported as being of average area and depth among the pools measured in that study (Platenkamp 1998). Vernal pool dimensions or reference to size are not given for any of the other CDFW occurrences. Dwarf downingia is also known to occupy the margins of larger or deeper vernal pools, and the seasonally fluctuating vernal pool-like edges of more severely inundated systems, including seasonal marsh, slough and stock pond habitats.

DWDO Biological Community Relations

Floristic associations provide further indication of preference for less extreme (more typical) vernal pool hydrological cycles. Dwarf downingia grows in the same hydro-topographical position as more commonly occurring vernal pool associates, including Fremont's goldfields (*Lasthenia fremontii*), smooth goldfields (*L. glaberrima*), dwarf wooly marbles (*Psilocarphus brevissimus*), Oregon wooly marbles (*P. oregonus*), annual hairgrass (*Deschampsia danthonoides*), popcorn-flowers (*Plagiobothrys stipitatus* var. *micranthus, P. bracteatus),* double-horned downingia (*Downingia bicornuta*), mousetail (*Myosurus minimus*), American

pillwort (*Pilularia americana*), quillwort (*Isoetes howellii*), coyote thistle (*Eryngium* spp.), and others. All species reported as associates of dwarf downingia in Sacramento County (CDFG 2010). Most of these are commonly occurring vernal pool species that inhabit small to medium size vernal pools and swales, and the slopes and margins of larger and/or deeper pools. It is interesting to note that at least one population has been reported as growing among deeper pool associations [e.g., smooth goldfields, common spikerush (*Eleocharis macrostachya*), and water starwort (*Callitriche marginata)].*

DWDO Non-Native Weed Relations

Hydrological stresses associated with vernal pools exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian wild rye (*Lolium multiflorum*) and Mediterranean barley (*Hordeum marinum* ssp, *gussoneanum*), two non-native facultative wetland species typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types. Some suggest that built-up thatch from Italian wild rye, Mediterranean barley, Medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species as well by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2002).

Since dwarf downingia occupies the smaller to medium size, “more typical” vernal pool types and the margins of larger or deeper pools, it may be more susceptible to the effects of excessive growth of Italian wild rye and Mediterranean barley and thatch buildup than the Orcuttiae grasses, or the more deeply adapted legenere.

Other weedy hydrophytic species reported as growing with dwarf downingia include lippia (*Phyla nodiflora*), and swamp pricklegrass (*Crypsis schoenoides*). Although none of the following are specifically reported to co-inhabit vernal pools with dwarf downingia, other non-native weedy hydrophytes may present future problems, including European mannagrass (*Glyceria declinata*), field bindweed (*Convolvulus arvensis*), Common unicorn plant (*Probiscidea louisianica*), Bermuda-grass (*Cynodon dactylon*) and paradox canary-grass (*Phalaris paradoxa*). Cocklebur (*Xanthium strumarium*), another native species, can also dominate vernal pools (Schlising, Unger pers. comms.).

DWDO Livestock Grazing Relations

Specific interactions between livestock grazing and dwarf downingia are largely unknown. In general, appropriately timed dry-pasture livestock grazing regimes are thought to be compatible with the development and persistence of vernal pool vegetation. Robins and Vollmer (2002) provide a review of information pertaining to livestock grazing in vernal pool ecosystems.

Many extant populations of dwarf downingia inhabit long-operating cattle ranches, so persistence indicates tolerance for at least some level of grazing. Timing of livestock grazing is likely more important than stocking rates in affecting persistence of dwarf downingia. During the period when pools are inundated and upland forage is still green and attractive, cattle tend to not congregate in pools and trampling and grazing pressures to vernal pool plant species in their seedling or juvenile aquatic phase are minimized. Once the upland forage cures and the vernal pools are in their flowering and seed-producing terrestrial phase, moist pools become more attractive to livestock and grazing and trampling pressures are increased. It should be noted however, as with many other vernal pool annuals, small stature and high plant densities ensure that in all but extreme cases, a portion of every year's cohort escapes destruction, matures and sets seed. Grazing in the summer and fall months, after seeds have set and plants have died likely has little negative effect on dwarf downingia.

DWDO Disturbance Response

Observations of field workers provide some evidence of the potential response of dwarf downingia populations to particular disturbance regimes. Several dwarf downingia populations persist despite periodic disking of the vernal pool substrates over decades (Kelsey pers. comm.; Dittes pers. obs.; CDFG 2010). It is very important to note that in these cases, disking is not so deep as to significantly affect the subtending impermeable layer or the vernal pool hydrological cycle. In addition, the disking is performed in the late summer or fall months in preparation for dryland winter grain crops, so vernal pool plants have set seed and dried. Persistence of populations in fall-disked and planted dryland winter wheat fields has also been noted for several of the Orcuttiae grasses (Hoover 1941; Crampton 1959; Stone et al. 1988). This has been observed for other more common vernal pool species as well (Ahart pers. comm. 2003).

If this disking occurs earlier in the growing season, before seeds are mature, over consecutive years, population extirpation is probable through exhaustion of soil seed bank. These are outstanding examples of the overriding selective force of the vernal pool hydrologic cycle in affecting floristic composition, and the importance of timing of management-related disturbances relative to specific life-history stages.

DWDO Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for dwarf downingia in this Planning Area are identified in Table G-3.1-1 with from input from agency and local species experts.

Table G-3.1-1. Habitat Elements for Dwarf Downingia

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

DWDO Species Distribution and Population Trends

DWDO Species Range

Presently, dwarf downingia is recorded from 117 CNDDB occurrences, all in California (CDFG 2010). These are distributed primarily in the Great Central Valley from Fresno County in the south, to Tehama County in the north. Dwarf downingia also occurs at scattered sites in the interior valleys of the southern North Coast Ranges, in Napa and Sonoma Counties. These occurrences are all situated at sites ranging from 10 to 1,600 feet elevation above mean sea level (CNPS 2010), and lie within the California Floristic Province (Sacramento Valley and San Joaquin Valley Sub-regions of the Great Valley Region; Sierra Nevada Foothill Subregion of the Sierra Nevada Region; North Coast Range Subregion of the Northwest Region; Hickman 1993). At least two additional occurrences, not yet registered in the CNDDB, occur in Sacramento County (Gibson and Skordal 1994; TNC *date unknown*).

Throughout its range, dwarf downingia occupies a variety of landforms and numerous soil associations.

DWDO Central Valley Distribution

Dwarf downingia is known from three geographically defined population centers in the Central Valley. The northernmost is located in Tehama County, between the vicinity of Red Bluff in the north and Black Butte Lake in the south. The southernmost population center occupies a narrow band in the San Joaquin Valley along the eastern edge of Merced County and a single occurrence on the northern edge of Fresno County. The central population center, located in

the southern Sacramento Valley, is comprised of occurrences within Solano, Placer, Sacramento, and Yuba Counties.

DWDO Distribution within the Planning Area

Of the 10 occurrences of dwarf downingia recorded from Sacramento County (eight CNDDB occurrences and two occurrences not-yet registered), five are located outside of the Planning Area (CNDDB occurrence #32, #56, #57, #58, and #59). Of the remaining five occurrences, three are located within the UDA in the City of Elk Grove (Figure DWDO-1) (CNDDB occurrence #54, #55, and an occurrence not yet registered); and two occurrences are located outside of the UDA within the Planning Area. One of these is encompassed within the 16,420-acre The Nature Conservancy (TNC) Cosumnes River Preserve (CNDDB occurrence #53) and the other is located within the Howard Ranch preserve and is not yet registered with the CNDDB.

It is important to note that owing to its small stature, preference for small to medium-sized vernal pools and the area of remaining unsurveyed or partially surveyed habitat, moderate to high potential exists for discovery of additional populations within the Planning Area.

Table G-3.1-2 shows the soil series, geological formation and landform associations for each known occurrence in Sacramento County. Generally, dwarf downingia is associated with Lower Unit Riverbank and old terrace remnant alluvial deposits of the Laguna Formation.,The modeled habitat of dwarf downingia is described in Section G-4 of this Appendix.

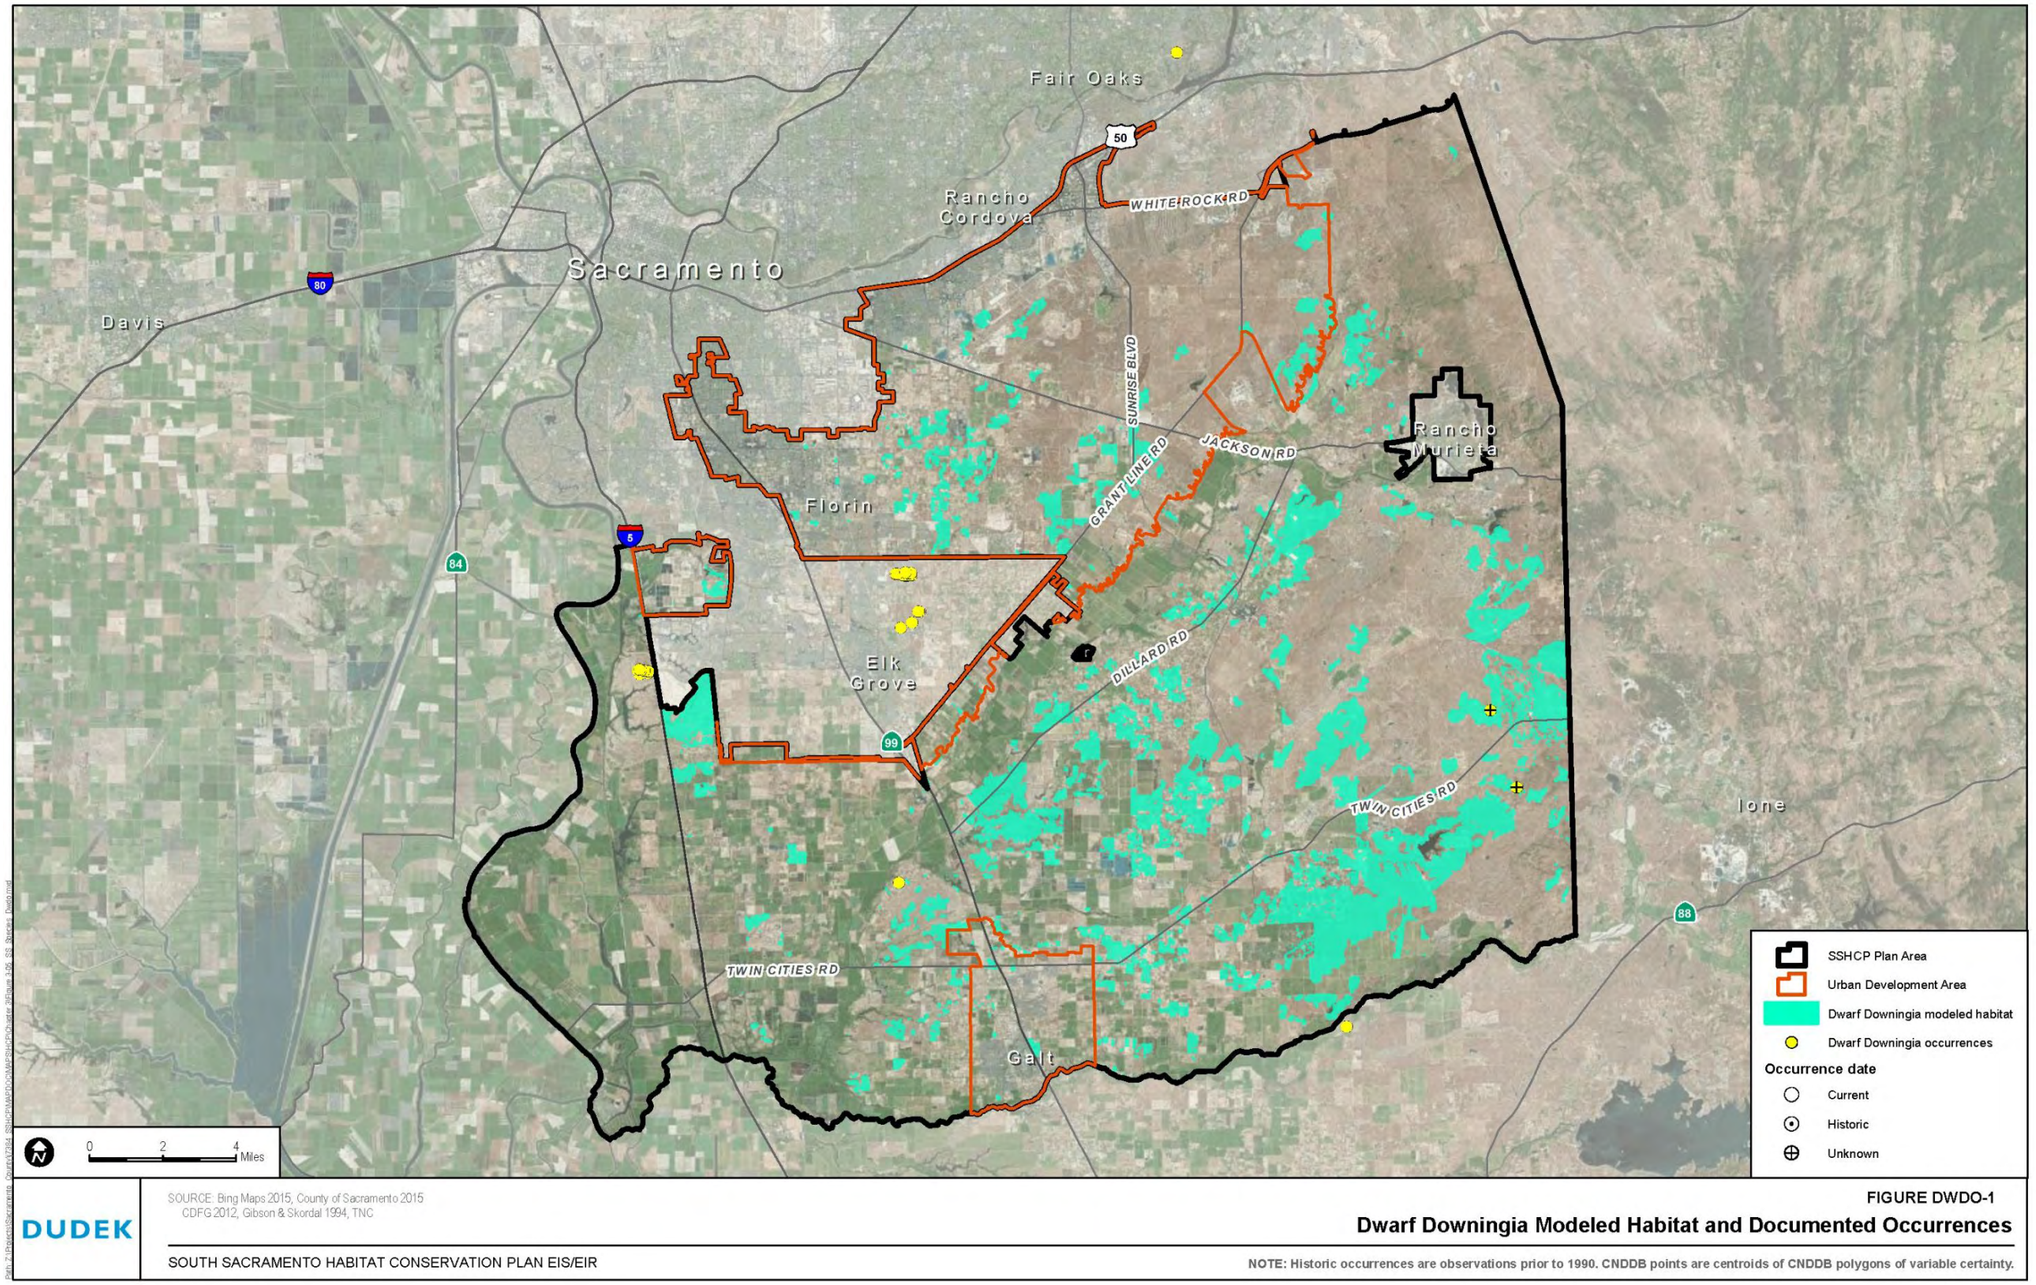
Table G-3.1-2. CNDDB Occurrence Numbers, Distribution, Associated Soil Series and Landform Formations for Dwarf downingia In Sacramento County

Occurrence #	Quadrangle	Soil Series[a]	Geological Formation and Landform
32	Rio Linda	San Joaquin Fine Sandy Loam (0-3% slopes and 3-8% slopes)	Lower Unit Riverbank Formation
53	Galt	Adjacent to Clear Lake Clay, Partially Drained, 0-2% Slopes	Adjacent to Qfa
54	Elk Grove	Redding Gravelly Loam, 0-8% Slopes	Laguna
55	Elk Grove	Redding Gravelly Loam, 0-8% Slopes	Laguna
56	Florin	San Joaquin-Galt Complex, 0-3% Slopes	Lower Unit Riverbank Formation
57	Rio Linda	San Joaquin Fine Sandy Loam (0-3% Slopes and 3-8% Slopes)	Lower Unit Riverbank Formation
58	Rio Linda	San Joaquin Fine Sandy Loam (0-3% Slopes and 3-8% Slopes)	Lower Unit Riverbank Formation
59	Rio Linda	San Joaquin Fine Sandy Loam (0-3% Slopes and 3-8% Slopes)	Lower Unit Riverbank Formation

[a] Soil series information based on what USDA soil survey type occurs at the CNDDB species location (USDA 1993)

DWDO Distribution Status and Trends

Dwarf downingia is known from a total of 117 CNDDB occurrences in California. Of the 117 CNDDB occurrences, two are extirpated and one possibly extirpated from Sonoma County, one is extirpated from Napa County, one is extirpated and another possibly extirpated from Placer County, and one is extirpated from Sacramento County. Of the remaining 110 CNDDB occurrences presumed extant, 26 have not been revisited since before 1983 (CDFG 2010). Of the 84 CNDDB occurrences reported since 1983 and presumed extant, one is listed as experiencing a decreasing trend, and the rest are listed as trend "unknown" (CDFG 2010). It should be noted though, that the vast majority of these 84 occurrences are located on private lands and most are reported as being subject to one or more threats.



It is impossible to determine the number of historically occurring dwarf downingia populations or the acreage of suitable habitat lost to historic agricultural and urban land-use conversions, since so much had happened before these species first received attention. Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978). Since dwarf downingia is adapted to the smaller, more "flashy" types of vernal pools, as well as to the margins of larger or deeper pools, estimates of vernal pool habitat lost may reflect loss of potentially suitable dwarf downingia habitat as well. Effects of historic livestock grazing combined with drought cycles and habitat alterations relating to development of non-native annual grassland are not quantifiable (Table G-3.1-3).

Table G-3.1-3. Dwarf downingia Population Estimates Recorded for Sacramento County

CNDDB Occurrence #	# of Pools Observed	Range of Population Estimates
32	unknown	1994: 100 plants
53	Large vernal marsh	1991: 1000 plants
54	1	1991: 200 plants
55	6 vernal pools and 2 scraped areas	1991: 300
56	2 vernal pools	1990: varied from 100's to 1000's
57	Created depression	1991:50 plants
58	Vernal pool	1993: 50 plants
59	Vernal pool	1993: 150 plants

Between-year variation in population numbers has been documented for several of the dwarf downingia occurrences outside of Sacramento County, although none have been studied in detail. One occurrence is reported as supporting 300 plants in 1988, and 10,000 in 1989 (CNDDB occurrence #29). Another occurrence (CNDDB occurrence #60) was reported as supporting more than 1,000 plants in 1989 and 237 plants in 1990. CNDDB occurrence #62 was found to support 200-400 plants in 1989 and 36 plants in 1990 (CDFG 2010).

Figure DWDO-1 Dwarf Downingia Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

AGENDA ITEM 11.1
6217

Studies involving other vernal pool plant rarities, including Orcuttiae grasses and Hoover's spurge (*Chamaesyce hooveri*) have demonstrated marked fluctuation in numbers of individuals within populations between years (Griggs 1983; Holland 1987; Alexander and Schlising 1997). This extreme population variability is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). It is not known however, to what degree dwarf downingia exhibits a similar between-year pattern.

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given dwarf downingia population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another critical aspect of population demography is the presence and nature of the soil seed bank, which is unknown for dwarf downingia.

DWDO Threats to the Species

Potential direct threats to dwarf downingia include: loss of vernal pool habitat to agricultural or urban/industrial land-use conversions; construction and maintenance of firebreaks, roads, and utility corridors; inappropriate livestock grazing regimes (later spring/summer rotations, sheep versus cattle); grassland fires; recreational vehicles; equestrian and pedestrian traffic, and refuse dumping.

Potential Indirect threats to dwarf downingia include hydrological alteration of sub-watersheds by surrounding developments and land uses, shifts in competitive interactions (hydrology-mediated or invasive weeds), windblown refuse accumulation, point and non-point source water pollution, air pollution, and global climate change.

DWDO Data Gaps and Conservation Implications

Despite its distinctive appearance and relative rarity, dwarf downingia has received little research attention from botanists or ecologists. Aside from general observations of field workers provided in the CNDDB, detailed studies have not been conducted regarding the biology, ecology, pollinators, breeding system, population genetics, habitat relationships, population levels, trends or threats associated with this species. Pertinent data gaps, implications for conservation, and operating assumptions include:

DWDO Unknown Number of Undiscovered Populations

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Planning Area and elsewhere within the range of the species. In the Planning Area, discovery of

new populations may occur on the large dry-land ranchlands, public quasi-public lands and vernal pool-grassland preserves already established in the eastern portion of the County.

DWDO Unknown Relationship between Landform/Soil Chemistry and Bio-Geographic Distribution

Throughout its range, dwarf downingia is associated with a variety of geological formations and associated soil types. In Sacramento County, this species is occurs on the Lower Unit Riverbank Formation (five occurrences) and on the Laguna Formation (two occurrences) (CDFG 2010). The exact nature of relationship to landform is however, unknown. It is unknown if soil pH or other edaphic factors influence dwarf downingia distribution and population vigor. It is possible that the presence of functioning vernal pools, regardless of landform, soil series and soil pH indicates suitable habitat.

DWDO Unknown Pollination Ecology

Dwarf downingia possesses the smallest flowers of any of the species in the genus, and is thought to be a self-pollinator; however, without knowing specific breeding abilities and pollinator relationships, it is difficult to ascertain habitat needs for potentially co-evolved insect pollinators.

DWDO What Constitutes Population Vigor, and How to Measure?

Population dynamics, including year-to-year variability in abundance, have not been studied for dwarf downingia. The existence of a dormant soil seed bank, a critical contributor to population stability in some other vernal pool species, is unknown for dwarf downingia as well. Other rare vernal pool species have been shown to be highly variable in abundance from year-to-year (Holland 1987; Griggs pers. comm. 2003), and causative factors contributing to year-to-year population fluctuations may be difficult to identify (Alexander and Schlising 1997).

Trends may occur that are not discernable and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

DWDO Specific Hydrological Requirements

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting dwarf downingia populations (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate).

The general lack of numerical hydrological data limits the ability to precisely monitor and/or assess hydrological suitability of dwarf downingia-vernal pool habitat within established

preserves. Similarly, assessment of potentially suitable dwarf downingia habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing dwarf downingia populations are established, assessed and monitored over time, a more quantifiable definition of suitable dwarf downingia -vernal pool hydrology may be developed.

DWDO Hydrological Trends of Vernal Pools

Extant dwarf downingia populations in the Planning Area may have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

Existing dwarf downingia conditions within the planning area may not be pristine, so if trends in vigor or habitat quality become apparent over time, it may be difficult to attribute trend to any specific management activity.

DWDO Buffer Sizes to Protect Habitat

There is no standard for appropriate scale of effective buffers between new urban development and vernal pools that provide dwarf downingia habitat, to assure no indirect impact to the vernal pool's existing hydrologic regime, because the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by landform, geologic formation, and soil type (Holland and Dains 1990).

Proposed preserve designs may not afford complete protection to the hydrological systems that support dwarf downingia and other species assemblages dependent on them.

Definition of Appropriate Scale Dwarf Downingia-Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective dwarf downingia-vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale vernal pool preserve that includes dwarf downingia at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et al. 1998).

DWDO Determination of Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the dwarf downingia-vernal pool preserves, because livestock grazing is used for upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with dwarf downingia-occupied pools, although grazing and monitoring in similar systems have been addressed (Barry 1998; TNC 2000; Griggs 2000; Robins and Vollmar 2002). It is important to note that dwarf downingia does persist though, in historically and contemporary operating livestock ranches. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems.

Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

DWDO Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in vernal pools include European mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, field bindweed, lippia, paradox canary grass, hairy hawkbit, cocklebur and cattails. None of these are reported to co-inhabit dwarf downingia-occupied vernal pools in Sacramento County. Any of these and others now unknown may appear or change in abundance in dwarf downingia-occupied pools over time. Italian wild rye and Mediterranean barley, two common non-native inhabitants of shallow vernal pools and vernal pool margins, might be of management concern to dwarf downingia, owing to the latter's preference for small to medium size vernal pools.

Potential competitive interactions with these species may affect the vigor of dwarf downingia populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect dwarf downingia populations.

DWDO Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to design preserves for multi-species conservation. Suitability of dwarf downingia habitat for supporting other rare plant species has not been specifically addressed, although in Sacramento County natural populations of legenere and Sanford's arrowhead (*Sagittaria sanfordii*) are documented as sharing habitat with it. Many of these pool complexes also may provide habitat for rare invertebrates, amphibians, mammals, and bird species as well.

Management for multiple species maximizes the effectiveness of habitat conservation and requires coordinated monitoring and actions. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime

between November 1st and April 15th may be compatible with or even benefit some dwarf downingia-associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

DWDO Genetic Considerations (Spatial and Temporal Variation, Seed Bank, Drift, Bottlenecks)

Population genetics for dwarf downingia are completely unknown. For an overview of genetic considerations of vernal pool plant species see Elam (1998).

Current limitations in our understanding of dwarf downingia population genetics have little immediate conservation implication, given the extreme rarity of dwarf downingia.

DWDO Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, the existence and potential role of a dormant soil seed bank in population dynamics is completely unknown for dwarf downingia. There have been no studies addressing the presence of a soil seed bank, seed dormancy or longevity.

From the perspective of conservation, knowledge of site-specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

DWDO Inoculation

Since there are so few natural populations of dwarf downingia in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied dwarf downingia habitat, create meta-population structure at extant occurrences where single pools may support the species, and ensure existence should any natural populations become compromised.

DWDO Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter, ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant dwarf downingia occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of dwarf downingia, if existing air quality

can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect dwarf downingia and other native plant species.

DWDO Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology.

It is likely that given the expected global climate trends, a vigor response of some kind could be expected for dwarf downingia populations within the study period of this EIS/EIR, or at some time beyond.

BOGG'S LAKE HEDGE-HYSSOP (BLHH)

Bogg's Lake hedge-hyssop (BLHH)

(Gratiola heteropepala)

Status USFWS: None

Status CDFW: Endangered

Status CNPS: List 1B.2

© 2005 Robert E. Preston, Ph.D.

BLHH Listing Status

Bogg's Lake hedge-hyssop (*Gratiola heterosepala*) was listed by the California Department of Fish and Wildlife (CDFW), as State Endangered under the California Endangered Species Act (CESA) in 1978. The California Native Plant Society (CNPS) includes Bogg's Lake hedge-hyssop as

a CNPS List 1B.2 species which means it is a plant species that is fairly threatened in California with moderate degree or immediacy of threat (CNPS 2010). CNPS has also assigned an R-E-D Code of 1-2-2, meaning it is rare but found in sufficient numbers and distributed widely enough that the potential for extinction is low at this time, it is endangered in a portion of its range, and it is rare outside of California (CNPS 2010).

BLHH Life History and Ecology

BLHH Species Description and Life History

Bogg's Lake hedge-hyssop is a small-stature annual in the figwort family (Scrophulariaceae). This diminutive species has an erect, un-branched stem that can reach from two to 10 cm in height. Small one to two centimeter-long leaves are arranged oppositely on the stem; the lower ones are linear-lanceolate and the upper ones are shorter, proportionally wider and more blunt (obtuse) at the tip. The inflorescence is comprised of one to several six to eight millimeter-long flowers arranged in a terminal raceme. Individual pale-yellow and white, tubular flowers are born on 10 to 20 millimeter-long stalks (pedicels). The pedicels and upper stem are glandular puberulent. The calyx is comprised of five round-tipped sepals, three of which are united about 1/3 the distance from their base, and two that are more–or-less separate. Of the three united sepals, the central one is wider and longer. Numerous small seeds are produced in pear-shaped (pyriform) capsules that usually equal the mature calyx in length (four to six millimeter).

The more common and potentially co-occurring bractless hedge-hyssop (*Gratiola ebracteata*) is distinguished from its rare relative on the basis of having more elongate and sharply pointed sepals that are mostly separate to their bases, and white, versus mostly yellow flowers (Mason and Bacigalupi 1954; Hickman 1993). A third species, clammy hedge-hyssop (*Gratiola neglecta*), is distinguished from *G. bracteata,* and *G. heterosepala* on the basis of having two small bracts subtending the flowers, and flowers that are at least two to three times as long as the calyx.

Bogg's Lake hedge-hyssop, and the genus *Gratiola* in general, has received little attention from biologists or ecologists. Other than basic taxonomic and biogeographic treatments, and a single study of pollinator ecology (Kaye et al. 1990), Bogg's Lake hedge-hyssop remains mostly unstudied. Ecological information, mostly from observations of field workers, exists mostly as a result of land management and agency-mandated resource management activities (Corbin 2000; Corbin et al. 1994; Schoolcraft 2000; Plantenkamp 1998; Jones and Stokes 1994).

BLLH Ecological Life Cycle

Bogg's Lake hedge-hyssop shares the annual growth habit with the vast majority of other endemic vernal pool plants. This adaptive trait confers to the populations avoidance of the

regular and extreme seasonal drought that characterizes vernal pool habitat and the Mediterranean Climate (Griggs and Jain 1983; Holland 1987; Stone et al. 1988; Zedler 1990).

BLLH Seed Germination

The specific timing of germination of Bogg's Lake hedge-hyssop seeds relative to the timing of the vernal pool inundation cycle has not been described in detail. Observations indicate that Bogg's Lake hedge-hyssop seeds germinate and begin juvenile growth under water (Kaye et al. 1990; Corbin et al. 1994). Seed longevity, germination requirements and germination optima for Bogg's Lake hedge-hyssop have not been investigated.

BLLH Vegetative Growth

One of the challenges to many vernal pool plant species is optimization of physiological processes in both the early season aquatic and later season terrestrial phases of the vernal pool cycle. For Bogg's Lake hedge-hyssop, the hollow (fistulous) stem is the principal structural adaptation to growth in the aquatic habitat. The air-filled stems hold the plant vertical in the water column, thus facilitating light exposure and gas exchange. This in effect lengthens the growing season by maximizing growth while vernal pools are still inundated. It is interesting to note that, although the species inhabits the basins and slopes of deeper/larger vernal pools, it lacks distinctly different juvenile aquatic morphology, an adaptation that is shared by many other deep pool annual species with which it occurs (e.g., *Orcuttia* spp., *Downingia* spp., *Navarretia* spp., *Eryngium* spp., *Callitriche* spp.).

BLLH Reproduction

Bogg's Lake hedge-hyssop flowers and sets seeds during the dry-down phase of the vernal pool hydrologic cycle, typically while shallow water up to two inches (five centimeters) deep remains in the pool basin (Corbin et al. 1994). Flowering occurs in the Central Valley from April to June (CNPS 2010), and at higher elevations as late as August (Corbin et al. 1994; CNPS 2010; CDFG 2010). Bogg's Lake hedge-hyssop is completely self-compatible as indicated by pollinator exclusion experiments (Kaye et al. 1990). Fruits mature quickly, usually within one to two weeks after the flowers appear (Corbin et al. 1994). The mature capsules produce numerous minute seeds that are released as the 4-valved capsule opens, and as the parent plant disintegrates. Fecundity and variation in seed production have not been investigated in Bogg's Lake hedge-hyssop.

BLLH Dispersal

In many other vernal pool species, seed dispersal is naturally limited, although this has not been stated specifically for *Gratiola*. Limited seed dispersal in vernal pool species is thought to represent an adaptation to spatially unpredictable and limited vernal pool habitat (Griggs 1974,

1980, 1990). Bogg's Lake hedge-hyssop does not appear to have dispersal-limiting traits (e.g., fruit adherent to parent plant, fruit not opening).

Evidence of natural Bogg's Lake hedge-hyssop dispersal and colonization exists in occupancy of man-made topo-hydrologic features located within or near occupied vernal pool landscapes (created vernal pools, stock pond and reservoir margins, ditches, and other excavated or scraped depressions (CDFG 2010). Further evidence of long-range dispersal exists in the relatively widespread range of this species in northern California. Natural dispersal of Bogg's Lake hedge-hyssop seeds likely occurs via flowing water, transport on feet and feathers of waterfowl, and in mud on hooves and legs of livestock. As with all other vernal pool species, natural dispersal of seeds was likely a more frequent event when there were many more vernal pools, more pool interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming native ungulates (Griggs 1980).

BLLH Seed Dormancy

Seed dormancy is indicated by observation of a three-year period where Bogg's Lake hedge-hyssop plants were absent, followed by reappearance during the favorable growing season of the fourth year (Corbin et al. 1994). Seed longevity and seed abundance in the soil has not been investigated. The presence of a persistent soil seed bank provides insurance against localized extirpation resulting from the unpredictable occurrence and duration of appropriate growing conditions. If total seed crop failure occurs in a given year or set of years (failure to germinate, loss to late season flooding or fire, excessive grazing by livestock or grasshopper herbivory), additional stored seeds are available for another year's effort.

BLLH Population Genetics

Population genetics of Bogg's Lake hedge-hyssop have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. Elam (1996) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon. Given the limited number of occurrences in the Planning Area and the scattered geographical distribution, all Bogg's Lake hedge-hyssop populations should be considered unique, and important genetic entities.

BLHH Habitat Requirements and Ecology

BLLH Biogeography and Landform Relations

Bogg's Lake hedge-hyssop is strictly associated with the vernal pool-type hydrologic cycle. Over its geographic range, this species is found in a number of distinct physiographic/edaphic settings. In Sacramento County, Bogg's Lake hedge-hyssop is associated with vernal pools

located on ancient weathered alluvial terraces of the Laguna Geologic formation, with soils of the Redding, Red Bluff and related Series. Soils of the Redding Series tend to be strongly acidic (indication of age and weathering) and are generally gravelly with cobble. These soils also typically possess a shallow, water-impermeable iron-silica hardpan that favors the development of vernal pools (SCS 1993). In Tehama County, Bogg's Lake hedge-hyssop occurs in vernal pools associated with cemented hardpan of the Tuscan, Toomes and related series, as well as in more shallow volcanic soils (CDFG 2010). The montane occurrences of Lassen, Shasta and Modoc Counties are also associated with volcanic soils, but in addition to volcanic mudflow and basalt substrates, wetlands formed on large hydric clay flats also support the species. Similarly, in Lake County, and Solano County, Bogg's Lake hedge-hyssop is associated with large seasonal Playa Lake-type pools formed on clay substrates.

BLLH Hydrology Relations

Bogg's Lake hedge-hyssop is a strict endemic of the vernal pool hydrologic cycle. This species is reported to grow in well-developed vernal pools, and playa lakes, as well as along the seasonally fluctuating margins of more permanent water bodies (small lakes, reservoirs, stock ponds, seasonally saturated clay flats in meadows). It is significant to note that most of the other rare species with which Bogg's Lake hedge-hyssop grows are also associated with well-developed large or deep vernal pools that exhibit more extreme, longer duration inundation such as slender Orcutt grass (*Orcuttia tenuis*), San Joaquin Valley Orcutt grass (*O. ineaequalis*), Sacramento Orcutt grass (*O. viscida*), Greene's tuctoria (*Tuctoria greenei*), hairy Orcutt grass (*Orcuttia pilosa*), legenere (*Legenere limosa*), and Hoover's spurge (*Chamaesyce hooveri)* (CDFG 2010). Specific pool area, pool depth, or other measures of pool hydrology are not reported for any of the Bogg's Lake hedge-hyssop occurrences. It has been observed that the species germinates and grows underwater, and quickly flowers and sets seed as the pool dries, while two to five inches of water remain in the pool basin.

BLLH Biological Community Relations

Floristic associations provide further indication of preference for more extreme vernal pool hydrological cycles. Like the Orcuttiae grasses, Bogg's Lake hedge-hyssop often grows in comparatively barren areas within deeper portions of vernal pools, sometimes in barren openings with common spikerush (*Eleocharis macrostachya*). In addition to the fore-mentioned rarities, other associated species indicative of well-developed vernal pool hydrology, including hairy pepperwort (*Marsilea vestida*), coyote thistle (*Eryngium castrense, E. vaseyi*), Alisma-leaved coyote thistle (*E. alismifolium),* bee-thistle (*E. arictulatum*), Mathia's thistle (*E. mathiasae),* bractless hedge-hyssop, downingias (*Downingia bicornuta, D. bacigalupi, D. cuspidata, D. ornatissima*), quillwort (*Isoetes howellii, I. orcuttii and I. nuttallii*), flowering

quillwort (*Lilaea scilloides*), smooth goldfields (*Lasthenia glaberrima*), California elatine (*Elatine californica*), and winged water starwort (*Callitriche marginata*),

Other vernal pool endemics reported as occurring with Bogg's Lake hedge-hyssop include common inhabitants of shallower or smaller to medium-size vernal pools with shorter duration ponding, or the slopes and edges of larger or deeper pools. These species include Fremont's goldfields (*Lasthenia fremontii*), white-headed navarretia (*Navarretia leucocephala*), stalked popcorn-flower (*Plagiobothrys stipitatus*), bracted popcorn-flower (*P. bracteatus*), dwarf wooly marbles (*Psilocarphus brevissimus*), dwarf downingia (*Downingia pusilla*), annual hairgrass (*Deschampsia danthonioides*), Douglas' meadowfoam (*Limnanthes douglasii*), tricolored monkey-flower (*Mimulus tricolor*).

BLLH Non-Native Weed Relations

Hydrological stresses associated with vernal pools exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian Rye and Mediterranean Barley, two non-native facultative wetland species typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types. Some suggest that built-up thatch from Italian wild rye (*Lolium multiflorum*), Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), Medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species as well by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2001).

Since Bogg's Lake hedge-hyssop occupies medium to larger or deeper vernal pools, it may not be particularly susceptible to the effects of excessive growth of Italian wild rye and Mediterranean barley and thatch buildup, as with the more deeply-adapted legenere and Orcuttiae grasses.

No weedy hydrophytic species are presently reported as growing with Bogg's Lake hedge-hyssop. Although none of the following are specifically reported to co-inhabit vernal pools with Bogg's Lake hedge-hyssop, other non-native weedy hydrophytes may present future problems, including mannagrass (*Glyceria declinata*), lippia (*Phyla nodiflora*), swamp pricklegrass (*Crypsis schoenoides*), field bindweed (*Convolvulus arvensis*), common unicorn plant (*Probiscidea louisianica*), Bermuda grass (*Cynodon dactylon*) and paradox canary grass (*Phalaris paradoxa*). Cocklebur (*Xanthium strumarium*), a native species, can also dominate vernal pools (Schlising pers. comm.; Unger pers. comm.).

BLLH Livestock Grazing Relations

In general, appropriately timed dry-pasture livestock grazing regimes are thought to be compatible with the persistence of vernal pool vegetation. Robins and Vollmer (2002) provide a review of information pertaining to livestock grazing in vernal pool ecosystems. Observations made on (U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS) grazing allotments indicate that Bogg's Lake hedge-hyssop populations are somewhat resistant to grazing and trampling pressures, with abundant and vigorous flowering and fruiting plants present despite hoof-pocked surfaces. Others have indicated livestock grazing as a threat (CDFG 2010).

Many extant populations of Bogg's Lake hedge-hyssop inhabit long-operating cattle ranches and USFS and BLM grazing allotments. Persistence in un-irrigated pasture systems indicates tolerance for at least some level of grazing. In most cases, timing of livestock grazing is likely more important than stocking rates in affecting persistence of Bogg's Lake hedge-hyssop, as it is for the Orcuttiae grasses (Stone et al. 1988). During the period when pools are inundated and upland forage is still green and attractive, cattle tend to not congregate in pools and trampling and grazing pressures to vernal pool plant species in their seedling or juvenile aquatic phase are minimized. As the upland forage cures and the vernal pools are in their flowering and seed-producing terrestrial phase, moist pools become more attractive to livestock and grazing and trampling pressures are increased. Excessive trampling and grazing during this period may negatively affect Bogg's Lake hedge-hyssop, and other vernal pool species. Grazing in the summer and fall months, after seeds have set and plants have died likely has little negative effect on Bogg's Lake hedge-hyssop (Mason and Bacigalupi 1954; CDFG 1987) especially since the plant usually disintegrates rapidly once pools have dried (Corbin et al. 1994).

It should be noted however, as with many other vernal pool annuals, small stature and high plant densities ensure that in all but extreme cases, a portion of every year's cohort escapes destruction, matures and sets seed.

BLLH Disturbance Response

Observations of field workers provide some evidence of the potential response of Bogg's Lake hedge-hyssop populations to particular disturbance regimes. One occurrence has been extirpated as a result of disking and harrowing. It is interesting to note that several rare and common vernal pool species, including Bogg's Lake hedge-hyssop and Orcuttiae grasses are recorded to persist despite periodic disking of the vernal pool substrates over decades (Hoover 1941; Crampton 1959; Stone et al. 1988; CDFG 2010; Ahart pers. comm.; Kelsey pers. comm.; Dittes pers. obs.). It is very important to note that in these cases, disking is not so deep as to significantly affect the subtending impermeable layer or the vernal pool hydrological cycle. In addition, the disking is performed in the late summer or fall months in preparation for dry land

winter grain crops, so vernal pool plants have set seed and dried. If this disking occurs earlier in the growing season, before seeds are mature, over consecutive years, population extirpation is probable through exhaustion of soil seed bank.

BLLH Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for Bogg's Lake hedge-hyssop are identified in Table G-3.2-1 and have been derived from input from local species experts.

Table G-3.2-1. Habitat Elements for Bogg's Lake Hedge Hyssop

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, and vernal pool.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

BLHH Species Distribution and Population Trends

BLHH Species Distribution

Bogg's Lake hedge-hyssop was first collected from Bogg's Lake in Lake County, California in 1954. Since that time, 90 total occurrences have been recorded (CDFG 2010), ranging from Fresno County in the south to northern Modoc County in northeast California. Bogg's Lake hedge-hyssop occurrences are distributed among five of the Geographic Sub-regions of the California Floristic Province, as described by Hickman (1993); the San Joaquin Valley, Sacramento Valley, Inner Coast Range, Cascade Range Foothill, High Cascade Range, and the non-Warner Mountain and Warner Mountain Sub-regions of the Modoc Plateau Region. Bogg's Lake hedge-hyssop is among the most widespread of the rare vernal pool species in the Chapter 8 and Chapter 9 Study Areas and exhibits the widest range in elevations (25 to 7,900 feet elevation) (CNPS 2010).

Tehama and Modoc Counties together support 40 percent of the 90 presently known Bogg's Lake hedge-hyssop occurrences, with 17 and 19 occurrences for each county, respectively. Shasta County supports 14 occurrences (16 percent of total), while Sacramento County supports 11 occurrences (12 percent of total) and Solano County supports six occurrences (seven percent of total). San Joaquin, Fresno, Lake, Placer, Lassen, Madera, Siskiyou, Merced, and Fresno Counties each support five or fewer occurrences (CDFG 2010).

This comparatively wide geographic and elevation distribution of Bogg's Lake hedge-hyssop may partially reflect comparatively broad habitat requirements relative to some of the other vernal pool rarities (e.g., Sacramento Orcutt Grass). It may also reflect a different propensity for seed dispersal by waterfowl, or perhaps even a different "biogeographic legacy" (e.g., timeline of evolution and geographic distribution of ancestral taxon).

BLHH Central Valley Distribution

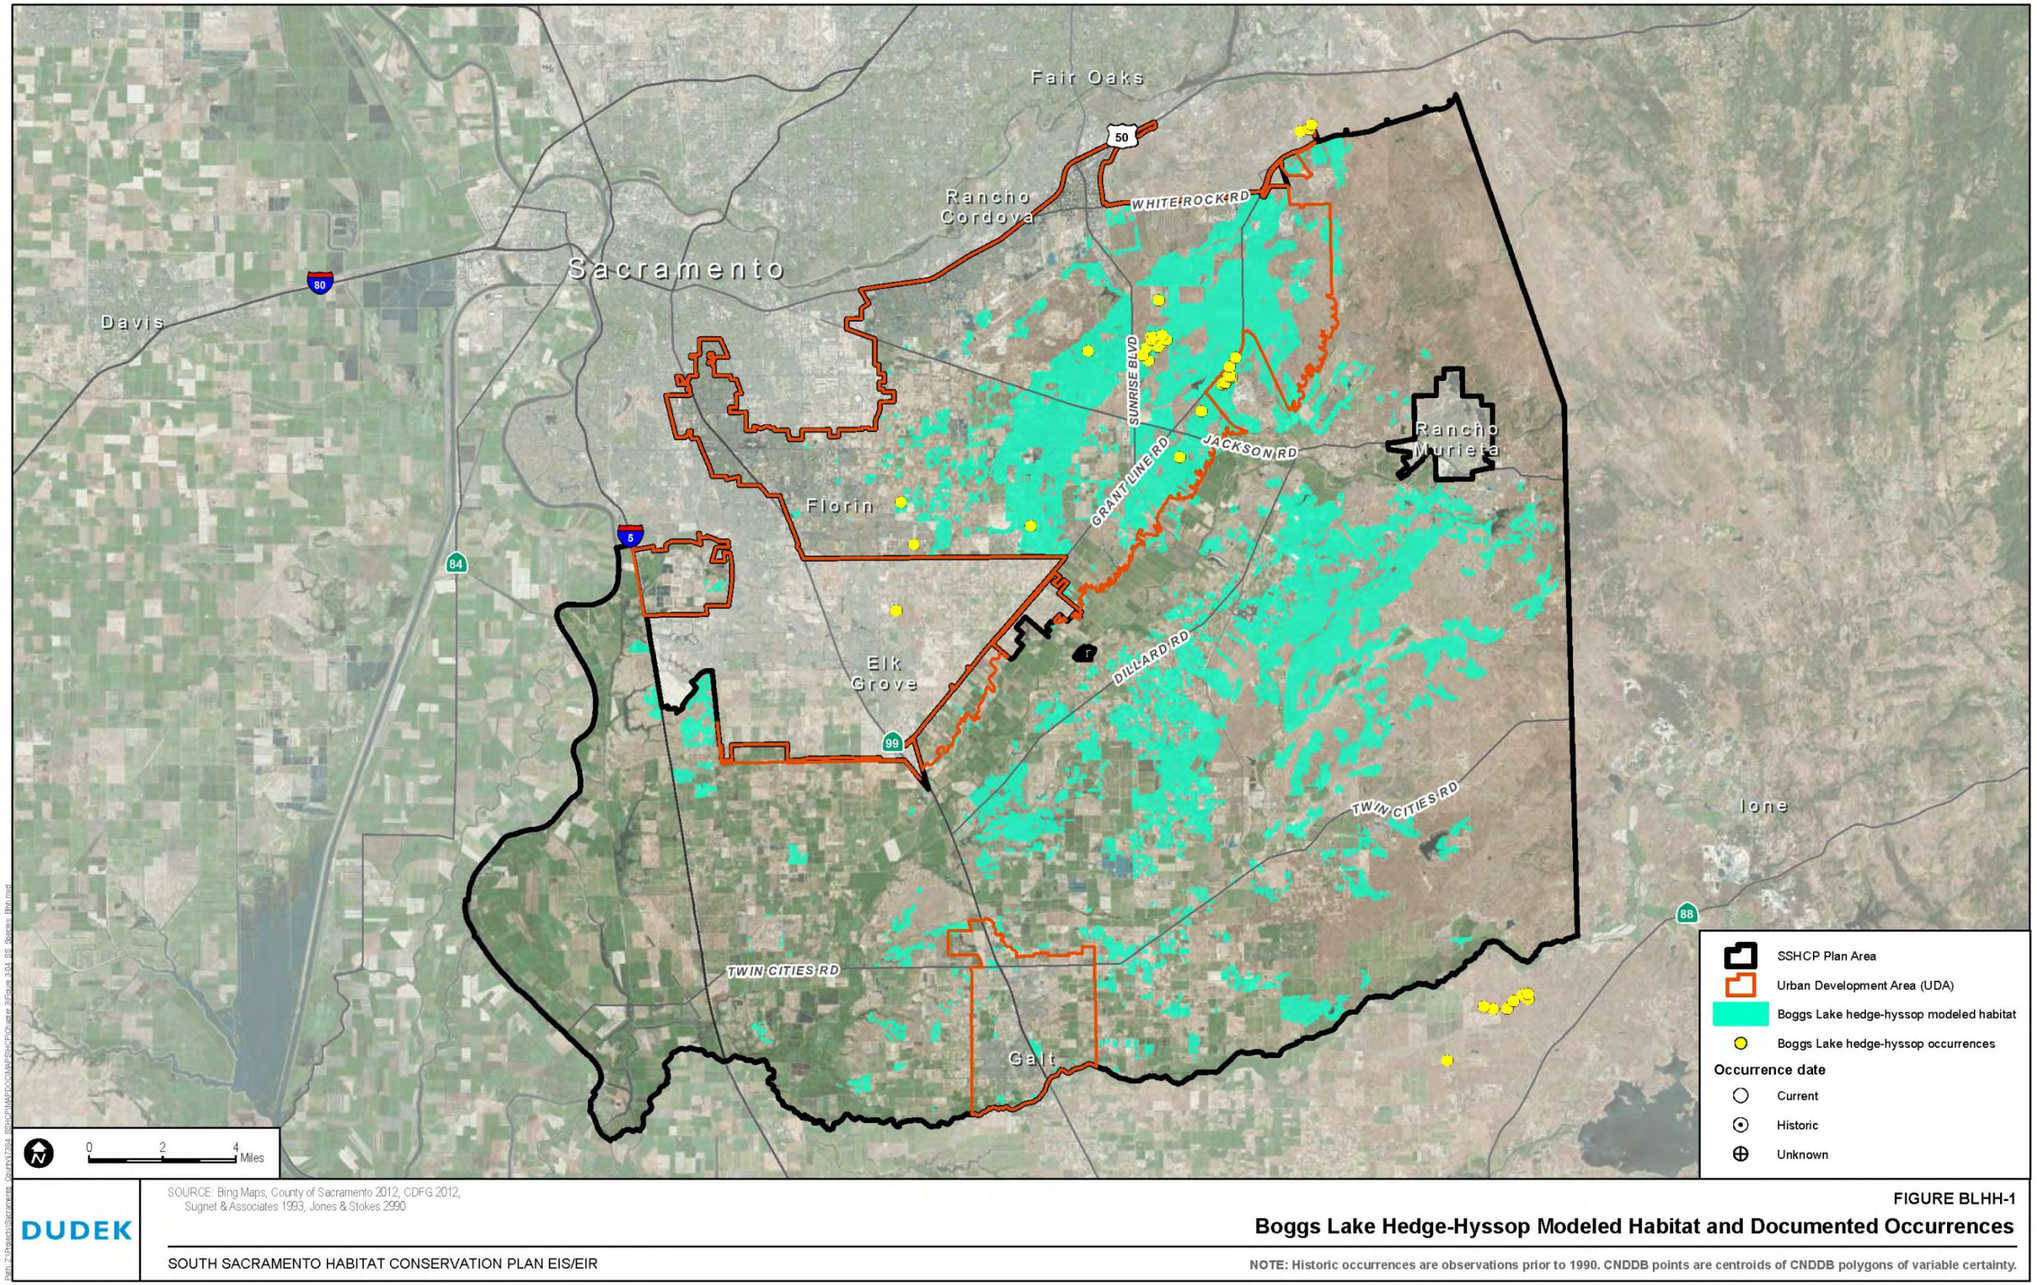
In the Central Valley, Bogg's Lake hedge-hyssop occurs among five roughly defined population centers. The southernmost of these, comprising four CNNDB occurrences, is located along the eastern edge of the Great Central Valley near the Fresno and Madera County lines. The next population center to the northwest, comprised of a single occurrence, is located approximately 45 miles away in eastern Merced County. A third population center is located 75 miles to the north and is comprised of 18 occurrences. These occurrences extend approximately 45 miles north-to-south along the eastern edge of the Great Central Valley from northern San Joaquin County north through Sacramento County, to western Placer County. A fourth population center, comprised of six occurrences, is located approximately 30 miles to the west near the Sacramento-San Joaquin River Delta in Solano County. The northernmost Great Central Valley population center, comprised of four occurrences, is located in southern Tehama County, approximately 75 miles north of the northernmost Placer County occurrence. Another Tehama County population center, comprised of 13 additional occurrences, is located approximately 20 miles further northeast at higher elevations on the volcanic mudflow formations of the Cascade Range Foothills, east of the Great Central Valley.

BLHH Distribution within the Planning Area

Currently, there are ten CNDDB occurrences of Bogg's Lake hedge-hyssop within the Planning Area (Figure BLHH-1), all of which are located within the Urban Development Area (UDA). Within the UDA, the northeastern-most occurrence (CNDDB occurrence #48) is located northwest of the intersection of White Rock and Prairie City Roads. This occurrence is located on private land and is comprised of an unrecorded number of occupied pools. The next occurrence to the southwest is located approximately seven mi away (CNDDB occurrence #57)

at the proposed Sunrise-Douglas Subdivision development. With 12 occupied pools, this is the largest Bogg's Lake hedge-hyssop occurrence in Sacramento County (CDFG 2010).

The next occurrence to the west (CNDDB occurrence #84) is located approximately two miles from the Sunrise Douglas site, just north of Morrison Creek and west of Eagles Nest Road near the southern edge of Mather Field. This occurrence is comprised of an unrecorded number of occupied vernal pools.



Another occurrence (CNDDB occurrence #30), associated with the 138-acre Sheldon Mitigation Site, is located approximately 2.5 miles south of the Sunrise-Douglas occurrence, just north of the Cosumnes River Floodplain. The number of occupied pools at this site is not recorded. CNDDB occurrence #81, comprised of a single occupied pool, is located on private land near Laguna Creek east of Excelsior Road, approximately 4.5 miles west by southwest of CNDDB occurrence #30.

The three westernmost occurrences (CNDDB occurrence #33, #34, and #35) are distributed along a north-south oriented axis with Elk Grove-Florin Road on the west, and Gerber Road and Elk Grove Boulevard on the north and south, respectively. The southernmost of these three occurrences (CNDDB occurrence #33) is located on private land, and is comprised of one occupied vernal pool. CNDDB occurrence #34, located on private land approximately 1.8 miles to the north, is comprised of an unrecorded number pools. The northernmost of these three occurrences (CNDDB occurrence #35) is located approximately one mile north of the central occurrence, and is also comprised of an unrecorded number of occupied pools.

Two additional occurrences are associated with the Kiefer Landfill development (CNDDB occurrence #18 and #82). Occurrence #18 is composed of seven occupied vernal pools, and occurrence #82 is reported to support one occupied vernal pool (Jones and Stokes 1998; CDFG 2010).

In Sacramento County, eight of the nine (89 percent) extant Bogg's Lake hedge-hyssop occurrences are associated with the Laguna Formation. Associated soils include those of the Redding and Red Bluff/Redding Series. This geological landform is comprised of remnant old-terrace alluvial deposits of ancestral river channels and pediment gravels, which were deposited during the early Pleistocene, between 600,000 and 1,500,000 years ago. Laguna Formation and associated soils are strongly associated with the distribution of vernal pools. Table G-3.2-2 shows the soil series, geological formation and landform associations for each known occurrence in Sacramento County. It is significant to note that owing to the diminutive size of the species, its ability to inter-mingle with the more common species bractless hedge-hyssop, and the area of unsurveyed or partially surveyed area of Laguna Formation, other occurrences are likely to be present in Sacramento County. In addition, well-developed vernal pools on landforms other than Laguna could provide suitable habitat. The modeled habitat of Bogg's Lake hedge-hyssop is described in Section G-4 of this Appendix.

Figure BLHH-1 Boggs Lake Hedge-Hyssop Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

Table G-3.2-2. CNDDB Occurrence Numbers, Distribution, Associated Soil Series and Landform Formations for Bogg's Lake hedge-hyssop in Sacramento County

CNDDB Occurrence #	Quadrangle	Soil Series[a]	Geological Formation and Landform
3 (possibly extirpated)	Rio Linda	San Joaquin Fine Sandy Loam, 3-8% Slopes	Lower Unit, Riverbank Formation
18	Buffalo Creek	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
30	Sloughhouse	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
33	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
34	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	North Merced Gravel (Arroyo Seco gravel)
35	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
48	Buffalo Creek	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
57	Buffalo Creek	Red Bluff-Redding Complex, 0-5% Slopes	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
81 (extirpated)	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
82	Buffalo Creek	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
84	Carmichael	Red Bluff-Redding Complex, 0-5% Slopes	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.

[a] Soil series information based on what USDA soil survey type occurs at the CNDDB species location (USDA 1993)

BLHH Population Levels and Trends

Of the 90 documented CNDDB occurrences, all but two are presumed extant. One occurrence in Sacramento County is listed as "possibly extirpated" after the vernal pools were plowed, harrowed, and leveled for a housing development in 1977 (CNNDB occurrence #3) (CDFG 2010). The extirpated occurrence is located in the City of Elk Grove where the site had been disked and partially leveled and is slated for development (CDFG 2010).

Downward population trends have been reported for five populations (two in Sacramento County and one each in Placer, Lake, and Tehama Counties); while three occurrences from Shasta County are classified as "fluctuating" and one Shasta County occurrence is classified as "increasing." The population trends for the remaining occurrences are listed as "unknown."

It should be noted that Bogg's Lake hedge-hyssop is a diminutive and a relatively ephemeral species that easily escapes the notice of botanists, particularly since the taxonomic features used to circumscribe it are subtle, and it often grows intermingled with the more common and

superficially similar species. Given these considerations and the amount of unsurveyed or partially surveyed potentially suitable habitat, additional occurrences will likely be discovered.

It is impossible to determine the number of historically occurring Bogg's Lake hedge-hyssop populations lost or the acreage of suitable habitat lost to historic agricultural land-use conversions, since so much had happened before these species first received attention (Stone et al. 1988). Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978; Jones and Stokes 1990), however owing to habitat specificity (restriction to), only a subset of the vernal pool habitat lost within the natural range of the species likely provided suitable habitat for Bogg's Lake hedge-hyssop.

There has been no comprehensive effort to monitor all populations of Bogg's Lake hedge-hyssop although various monitoring projects have been conducted by the BLM and USFS. However, the population estimates for some of the occurrences in Sacramento County occurrences have been made (Table G-3.2-3).

Observations of Bogg's Lake hedge-hyssop indicate that abundance of individuals in a population can vary greatly from year-to year, depending at least in part on precipitation of the season. Abundance estimates made at several occurrences range from a complete lack of plants to thousands in subsequent years (CDFG 2010). Population variability in some vernal pools species is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). Fluctuations of similar magnitude are also recorded for Hoover's spurge, hairy Orcutt grass, and Greene's tuctoria at the Vina Plains Preserve in Tehama County (Alexander and Schlising 1997).

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given Bogg's Lake hedge-hyssop population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another aspect of population demography is the quantity and age of stored seed in the soil profile. Undoubtedly, the number of stored seeds in the soil profile has bearing on how many plants can be produced in a given favorable year.

Table G-3.2-3. Bogg's Lake Hedge-hyssop Population Estimates for Sacramento County (CNDDB)

CNDDB Occurrence #	Occurrence # of pools observed	Range of population estimates
3	Reported from "several vernal pools:	Possibly extirpated
18	7	10,000 + plants
30	1	1990: 0 plants 1993: 1,000 + plants
33	1	1991: 20 plants
34	1	1991: 200 plants
35	3	?
48	Ponds	?
57	12	Several thousand to several hundred thousand
81	1	1998: 1 plant
82	1	?
84	1	2000: 1,000's of plants

BLHH Threats to the Species

Potential direct threats to Bogg's Lake hedge-hyssop include loss of vernal pool habitat to agricultural or urban/industrial land-use conversions; construction and maintenance of firebreaks, roads, and utility corridors; timber harvest activities (in montane Occurrences); inappropriate livestock grazing regimes (later spring/summer rotations); grassland fires; recreational vehicles; equestrian and pedestrian traffic; and refuse dumping (CDFG 1992, 1998; CDFG 2010; Corbin et al. 1994; Kaye et al. 1990).

Potential Indirect threats to Bogg's Lake hedge-hyssop include hydrological alteration of sub-watersheds by surrounding developments and land uses; shifts in competitive interactions (hydrology-mediated or invasive weeds); windblown refuse accumulation; point and non-point source water pollution; air pollution, and global climate change.

BLHH Data Gaps and Conservation Implications

With exception to an investigation into the breeding system (Kaye et al. 1990), various monitoring projects, and the visual observations of field workers (Corbin et al. 1994; Schoolcraft 2000; CDFG 2010; Witham pers. comm.), Bogg's Lake hedge-hyssop has received limited research attention. Detailed studies have not been conducted regarding the biology, ecology, potential for cross pollination, population genetics, habitat relationships, population dynamics, trends or threats. Pertinent data gaps, implications for conservation, and operating assumptions include the following.

BLHH Unknown Number of Undiscovered Populations

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Planning Area and elsewhere within the range of the species. In the Planning Area, discovery of new populations of Bogg's Lake hedge-hyssop may occur on the large dry-land ranchlands, public/quasi-public lands and vernal pool-grassland preserves already established in Sacramento County.

BLHH Unknown Relationship between Landform/Soil Chemistry and Bio-Geographic Distribution

In Sacramento County, Bogg's Lake hedge-hyssop has a geographic association with old alluvial terraces possessing acidic soils, primarily of the Redding and Red Bluff Families (Laguna Geological Formation). The exact nature of this relationship is, however, unknown. It is unknown if soil pH or other edaphic factors influence the species distribution and population vigor. It is possible that functioning vernal pools with well-developed hydrology, regardless of landform, soil series and soil pH may provide suitable habitat for this species. This is supported by the occurrence of this species in vernal pools and wetlands with vernal pool-type hydrology on other landforms, with different soil types, at varying locations. In the Planning Area, vernal pools are most frequent and best developed on the Laguna Formation.

BLHH Unknown Pollination Ecology

In a study conducted in Oregon, Bogg's Lake hedge-hyssop has been shown to be completely self-compatible, and insects were never observed visiting its flowers (Kaye et al. 1990). It is not known though whether or not out-crossing ability exists, and if so, whether or not insect pollinators are associated with the species anywhere in its range.

BLHH What Constitutes Population Vigor, and How to Measure?

Population vigor and population dynamics, including year-to-year variability in abundance, have not been described in detail for any of the occurrences in Sacramento County. In other areas, Bogg's Lake hedge-hyssop population estimates have been made over varying periods of time. Population estimates range from 1,000,000 plants at CNDDB occurrence #36, to a single individual at CNDDB occurrence #64. Observations made over time also indicate that Bogg's Lake hedge-hyssop populations can vary by several orders of magnitude between years, with low numbers present during years with sub-optimal hydrology (CDFG 2010; Corbin et al. 1994). Other rare vernal pool species have been shown to be variable in population abundance from year-to-year (Holland 1987; Griggs pers. comm.), and causative factors contributing to year-to-year population fluctuations in rare species may be difficult to identify (Alexander and Schlising 1997).

Population vigor will be difficult to assess based on number of individuals present over short intervals of time. Trends occurring over longer periods may occur that are not discernable, and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

BLHH Specific Hydrological Requirements of Bogg's Lake hedge-hyssop

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting Bogg's Lake hedge-hyssop populations in the Planning Area (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate).

The general lack of numerical hydrological data limits the ability to precisely monitor or assess hydrological suitability of Bogg's Lake hedge-hyssop -vernal pool habitat within established preserves. Similarly, assessment of potentially suitable Bogg's Lake hedge-hyssop habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing Bogg's Lake hedge-hyssop populations are established, assessed and monitored over time, a more quantifiable definition of suitable Bogg's Lake hedge-hyssop - vernal pool hydrology will emerge based on learned information.

BLHH Existing Hydrological Trend of Pools and Existing Indirect Effects

Extant Bogg's Lake hedge-hyssop populations in the Planning Area may have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

Existing Bogg's Lake hedge-hyssop habitat existing conditions may not be pristine, so if trends in vigor or habitat quality become apparent over time, it may be difficult to attribute trend to any specific management activity.

BLHH Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by geography (Holland and Dains 1990).

Proposed preserve designs may not afford complete protection to the hydrological systems that support Bogg's Lake hedge-hyssop and other species assemblages dependent on them.

BLHH Definition of Appropriate Scale Bogg's Lake hedge-hyssop -Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective Bogg's Lake hedge-hyssop -vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale vernal pool preserve that includes rare plant populations at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et al. 1998).

BLHH Determination of an Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the Bogg's Lake hedge-hyssop -vernal pool preserves, primarily for upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with Bogg's Lake hedge-hyssop -occupied pools, although grazing and monitoring in similar systems have been addressed (Barry 1998; TNC 2000; Griggs 2000; Robins and Vollmar 2002). It is important to note that Bogg's Lake hedge-hyssop does persist though, in historically and contemporary operating livestock ranches and USFS and BLM grazing allotments. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems. Since Bogg's Lake hedge-hyssop occupies medium to large-size vernal pools, management of Italian wild rye and Mediterranean barley around the margins of vernal pools, and Medusa-head grass in uplands should be monitored and managed but not primarily for the needs of Bogg's Lake hedge-hyssop specifically.

Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

BLHH Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in vernal pools include western mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, filed bindweed, lippia, paradox canary-grass, hairy hawkbit, Cocklebur and cattails. None of these are reported to co-inhabit Bogg's Lake hedge-hyssop -occupied vernal pools in Sacramento County. Any of these and others now unknown may appear and/or change in abundance in Bogg's Lake hedge-hyssop -occupied pools over time. Italian wild rye and Mediterranean barley, two common non-native inhabitants of shallow vernal pools and vernal pool margins, might be of management concern to Bogg's Lake hedge-hyssop if they are allowed to completely dominate the vernal pool margins and adjacent uplands. Potential competitive interactions with these species may affect the vigor of Bogg's Lake hedge-hyssop populations. In addition, any eradication or control

methods implemented for these species may in turn potentially affect Bogg's Lake hedge-hyssop populations.

BLHH Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to combine to design preserves for multi-species conservation. Bogg's Lake hedge-hyssop has been reported as sharing vernal pools with other rare plant species, including Sacramento Orcutt grass, hairy Orcutt grass, slender Orcutt grass, Greene's tuctoria, San Joaquin Valley Orcutt grass, Bogg's Lake hedge-hyssop, Hoover's spurge, legenere, succulent owl's-clover. Many of these pool complexes supporting rare species also provide habitat for rare invertebrates, amphibians, mammals, and bird species as well.

Management for multiple species maximizes the effectiveness of habitat conservation and requires coordinated monitoring and actions. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime between July 1 and April 1 may be compatible with or even benefit some Bogg's Lake hedge-hyssop -associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

BLHH Genetic Variation (Spatial and Temporal [Seed Bank], Genetic Drift, Genetic Bottlenecks)

Population genetics for Bogg's Lake hedge-hyssop are completely unknown. For an overview of genetic considerations of vernal pool plant species, see Elam 1998). Current limitations in our understanding of Bogg's Lake hedge-hyssop population genetics have little immediate conservation implication, given the relatively few number of Bogg's Lake hedge-hyssop occurrences in the Planning Area.

BLHH Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, the existence and potential role of a dormant soil seed bank in population dynamics is indicated by the observation of a three-year period during which plants were absent, followed by abundant plants the following favorable hydrologic season. Beyond this observation though, there have been no empirical studies addressing the presence of a soil seed bank, seed dormancy or longevity for Bogg's Lake hedge-hyssop.

From the perspective of conservation, knowledge of site specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

BLHH Inoculation

Since there are so few natural populations of Bogg's Lake hedge-hyssop in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied Bogg's Lake hedge-hyssop habitat, create meta-population structure at extant occurrences where single pools may support the species, and help ensure existence should any natural populations become compromised. Dispersal into, and colonization of created or enhanced vernal pools, stock-ponds, reservoirs and even rutted tire tracks in already occupied vernal pool landscapes has been documented (CDFG 2010; Sanger pers. comm. 2003). Bogg's Lake hedge-hyssop is a fully self-compatible species, which is a pre-adaptation for colonization.

BLHH Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter, ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant Bogg's Lake hedge-hyssop occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of Bogg's Lake hedge-hyssop, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect Bogg's Lake hedge-hyssop and other native plant species in the future.

BLHH Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology.

It is likely that given the expected global climate trends, a vigor response of some kind could be expected for Bogg's Lake hedge-hyssop populations within the study period of this EIS/EIR, or at some time beyond.

AHART'S DWARF RUSH (ADR)

Ahart's dwarf rush (ADR)

(Juncus leiospermus ahartii)

Status USFWS: None

Status CDFW: None

Status CNPS: 1B.2

photo courtesy BCAG

ADR Listing Status

Ahart's dwarf rush is considered to be rare, threatened or endangered throughout its range, thus qualifying its designation as a list 1B.2 species by the California Native Plant Society (CNPS 2010). It has been assigned an R-E-D Code of 3-2-3, meaning it is distributed in one to several highly restricted occurrences, endangered in a portion of its range, and entirely restricted to California.

Being a CNPS List 1B plant species, Ahart's dwarf rush meets the California Department of Fish and Wildlife's (CDFW's) definition of a special plant though it has no formal protection status by the CDFW or United States Fish and Wildlife Service (USFWS).

ADR Life History and Ecology

ADR Species Description and Life History

Dwarf rush (*Juncus leiospermus* F.J. Herm.), is represented by two varieties, var. *leiospermus* (Red Bluff dwarf rush), and var. *ahartii* (Ahart's dwarf rush), both of which are rare and endemic to California. The species is an annual in the rush family (Juncaceae) that is restricted to wetlands possessing vernal pool-type hydrology.

This inconspicuous species exhibits a tufted growth form, with a basal cluster of thread-like leaves exceeded by one to several erect, 1.9 to 11.6 centimeter-long, stiff, thread-like stems. One to seven flowers are born together in a compact cluster at the tip of each stem. The flower clusters are subtended by small (0.7 to 2.4 millimeters) bract scales. Flowers are small (1.5 to 4.6 millimeters) and comprised of 6 to 10 dark brown, pointed scales, three stamens, and a single ovary with a long (1.5 to 3 millimeters), three-branched style. The mature fruit capsule is similar to the flower scales in color and is equal, or slightly exceeding them in length. Ahart's

dwarf rush (*J.leiospermus* var. *ahartii*) is distinguished from the rare Red Bluff dwarf rush (*J.leiospermus* var. *leiospermus*) on the basis of the former having only one to two flowers per cluster, overall smaller size and fewer parts (Ertter 1986).

Other small annual rushes also occur in vernal pool habitat and may co-occur with Ahart's dwarf rush. Dwarf rush is distinguished from the closely related Yosemite rush (*J. triformis*) by the latter having slightly narrower stems (less than 0.4 millimeter), capsules shorter than flower scales, and flower scales that are unequal in length. Dwarf rush is most easily distinguished from toad rush (*J. bufonius* vars.) on the basis of having a simple versus a branched stem and terminal versus axillary flowers. Dwarf rush is readily distinguished from leafy-bracted dwarf rush (*J. capitatus*) by the former having a shorter inflorescence bract (0.7 to 2.4 millimeters versus five to 15 millimeters). Dwarf rush is distinguished from inch-high rush (*J. uncialis*) and vernal pool dwarf rush (*J. hemiendytus* vars.) by its comparatively long (1.5 to 3 millimeters) long style.

Ahart's dwarf rush, and annual vernal pool rushes in general, have received little attention from biologists or ecologists. Other than observations of field botanists and basic taxonomic and biogeographic treatments (Ertter 1986), the biology and ecology of Ahart's dwarf rush remains unstudied.

Since all vernal pool plant species share similar environmental selective pressures, they likely also share similar adaptive traits. For this reason, studies addressing the life history and ecology of other more common vernal pool plant species may provide some insight into the life history and ecology of Ahart's dwarf rush.

Ahart's dwarf rush shares the annual growth habit with the vast majority of other endemic vernal pool plants. This adaptive trait confers to population's avoidance of the regular and extreme seasonal drought that characterizes vernal pool habitat and the Mediterranean climate (Griggs and Jain 1983; Holland 1987; Stone et al. 1988; Zedler 1990).

The specific timing of the germination of Ahart's dwarf rush seeds relative to the timing of the vernal pool inundation cycle has not been studied or described. In general, a given vernal pool species may germinate either during the wetting phase or the inundation-phase of the vernal pool cycle (Keeley and Zedler 1998). Based on the preference of Ahart's dwarf rush for the outer margins of larger vernal pools, the margins of shallow vernal pools, and shallow swales (CDFG 2010; Dittes and Guardino pers. obs.) and its relatively early flowering date (late March), it might be expected that it germinates relatively early in the hydrological season during the wetting or early inundated-phase, in saturated, as opposed to inundated soil. Germination requirements, optima and the potential presence of seed dormancy for Ahart's dwarf rush have not been investigated.

One of the challenges posed to "deeply adapted" vernal pool plants is the need to photosynthesize and grow while submersed, and then transition into a terrestrial growth phase. Many vernal pool species exhibit an aquatic juvenile growth form that is different from the adult form. These morphological adaptations, not exhibited by Ahart's dwarf rush, facilitate light exposure and gas exchange under aquatic conditions, thus lengthening the growing season by maximizing growth while vernal pools are still inundated. The lack of this specialized dimorphism is further indicative of preference to the less-extreme inundation regimes of those encountered in the spectrum of vernal wetland types.

Dwarf rush flowers and sets seeds during the terrestrial phase of the vernal pool hydrologic cycle, typically in March and April (CNPS 2010). The very long style, and large stamens generally indicate an outcrossing breeding strategy (Hickman 1993), although breeding system and pollination strategies have not been investigated for this species. It is likely that these and other outcrossing annual *Juncus* are mainly wind-pollinated, although the potential for flower-visiting insects has not been studied.

Mature fruit capsules dehisce and release mature seeds by late spring to early summer (Dittes pers. obs.). Unlike some other vernal pool species (e.g., Orcuttiae grasses, pincushion navarretia), Ahart's dwarf rush does not appear to exhibit anti-dispersal adaptations, although the species often appears in small discrete aggregations amid larger areas of available habitat (Dittes pers. obs.). Natural dispersal of seeds, however limited, likely occurs via flowing water, transport on feet and feathers of waterfowl, and in mud on hooves and legs of livestock. As with all other vernal pool species, natural dispersal of seeds was likely a more frequent event when there were many more vernal pools, more pool interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming ungulates (Griggs 1980).

The existence of a dormant soil seed bank is unknown for Ahart's dwarf rush. The presence of a persistent soil seed bank provides insurance against localized extirpation resulting from the unpredictable occurrence and duration of appropriate growing conditions. If total seed crop failure occurs in a given year or set of years (failure to germinate, loss to late season flooding or fire, excessive grazing by livestock or grasshopper herbivory), additional stored seeds are available for another year's effort.

The population biology and genetics of Ahart's dwarf rush have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. Elam (1996) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon. Given the highly limited number of occurrences and the scattered geographical distribution, all Ahart's dwarf rush populations should be considered unique, and important genetic entities.

ADR Habitat Requirements and Ecology

It is generally held that many of the endemic vernal pool plant species are relatively recent evolutionary derivations of more common and widespread upland progenitors (Stebbins 1976; Stone 1990; Raven and Axlerod 1978; Thorne 1984), likely including Ahart's dwarf rush. These neoendemic vernal pool species are thought to have evolved from terrestrial habitat into seasonally aquatic vernal pool habitat made available as the Mediterranean Climate developed and the inland Tertiary-age Sea dried.

In Eastern Sacramento County, the two Ahart's dwarf rush occurrences are associated with the Redding Gravelly Loam Series of the Arroyo Seco Formation. This soil series has a very gravelly hardpan approximately 28 inches below the surface and is strongly cemented with silica. These soils are typically acidic and conducive to the development of vernal pool hydrology).

Ahart's dwarf rush is strictly adapted to the vernal pool hydrologic cycle. It is of importance to conservation however, that in contrast to most of the more "deeply-adapted" vernal pool endemics, Ahart's dwarf rush occupies the more "flashy" hydrology of vernal pool margins, shallow vernal pools, and swales (Ahart pers. comm.; Dittes and Guardino pers. obs.; CDFG 2010). The closely related and comparatively more widespread Red Bluff dwarf rush is also known from vernally moist edges of groundwater seep areas as well. Quantified vernal pool dimensions are not given for any of the CNDDB occurrences.

Floristic associations provide further indication of preference for the more "flashy" portion of the spectrum of vernal pool hydrological cycles. In Butte County, Ahart's dwarf rush is most often observed with other "shallow pool" or "edge" species, including other annual rushes (toad rush; *Juncus bufonius*, leaf-bracted rush; *J. capitatus*, inch-high rush; *J. capitatus*), annual hairgrass (*Deschampsia danthonoides*), Sacramento Valley pogogyne (*Pogogyne zizyphoroides*), marigold navarretia (*Navarretia tagetina*), smooth cat's-ear (*Hypochaeris glabra*), hyssop loosestrife (*Lythrum hyssopifolium*), long-beaked hawkbit (*Leontodon taraxicoides*), cowbag clover (*Trifolium depauperatum*) and Fremont's goldfields (*Lasthenia fremontii*) (Dittes and Guardino pers. obs.; Ahart pers. comm.).

Although Ahart's dwarf rush is also recorded as occurring with the more "deeply-adapted" vernal pool endemics, including coyote thistle (*Eryngium castrense*), bractless hedge-hyssop (*Gratiola ebracteata*), tricolor monkey-flower (*Mimulus tricolor*), American pillwort (*Pilularia americana*), double-horned downingia (*Downingia bicornuta*), ornate downingia (*Downingia ornatissima*), white-headed navarretia (*Navarretia leucocephala*) and water pygmyweed (*Crassula aquatica*) (CDFG 2010), it usually is growing at the higher-drier edge of hydro-topographic position preferred by the latter species (Dittes and Guardino pers. obs.; Ahart pers. comm.). Interestingly,

Ahart's dwarf rush is also known to do well on disturbed gopher mounds along the margins of the wetlands as well (Ahart pers. comm.; Dittes and Guardino pers. obs.; CDFG 2010).

Hydrological stresses associated with vernal pools exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural areas, and ruderal habitats. Italian wild rye (*Lolium multiflorum*) and Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), two non-native facultative wetland species, typically dominate vernal pool portions of disturbed wetlands in the Central Valley and can be invasive around vernal pool margins and in smaller, more ephemeral vernal pool types. Similarly, long-beaked hawkbit (*Leontodon taraxicoides*), another non-native annual, can dominate the edges of vernal pool and the basins of smaller pools and swales. Some suggest that built-up thatch from Italian wild rye, Mediterranean barley, Medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species as well by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2002).

Since Ahart's dwarf rush occupies the margins of pools and smaller pools and swales, it may be more susceptible to the effects of excessive growth of Italian wild rye, Mediterranean barley, long-beaked hawkbit, and thatch buildup, than many of the other "more deeply-adapted" vernal pool rarities. As a case in point, Ahart mentions that some populations of Ahart's dwarf rush and other vernal pool species in his area have diminished over the years with concomitant increase in cover of European annual grasses (Ahart 2003 and pers. comm.).

Specific interactions between livestock grazing and Ahart's dwarf rush have not been investigated empirically. Some regimes of livestock grazing have been shown to benefit the floristic composition of vernal pools and associated upland annual grassland. Vernal pools included within livestock exclosures have demonstrated a "simplification" of floral composition with a shift towards dominance by Italian wild rye and Mediterranean barley (Robins and Vollmar 2002; Dittes pers. obs.). Uplands that are not grazed can shift in dominance towards Medusa-head grass and yellow-star thistle (*Centaurea solstitialis*). Appropriate livestock grazing regimes can result in reduction of cover by weedy grasses and thatch and opening of habitat at vernal pool margins by hoof-pocking. This in turn increases micro-habitat heterogeneity and provides germination and colonization opportunities for other native vernal pool species.

Field observations indicate that annual rushes, and many other associated vernal pool annuals do well on gopher mounds and between deep hoof print depressions in wetter areas, and within the puddled hoof prints around drier margins (Dittes pers. obs.). It has also been observed though, that in some cases at the Vina Plains Preserve in Tehama County, excessive trampling of shallow vernal pools can result in their obliteration as distinct topographical features, particularly on heavy clay soils (Schlising pers. comm.). Robins and Vollmer (2002)

provide a recent review of information pertaining to livestock grazing in vernal pool-annual grassland ecosystems.

Timing of grazing appears more important than stocking rates in affecting persistence of some vernal pool rarities (Stone *et. al*. 1988; Robins and Vollmer 2002). During the period when pools are inundated and upland forage is still green and attractive (late fall to early spring), cattle tend to not congregate in pools, and trampling and grazing pressures to vernal pool plant species in their seedling or juvenile aquatic phase are minimized. Once the upland forage cures and the vernal pools are in the flowering and seed-producing terrestrial phase (mid-spring to early summer), moist pools become more attractive to livestock, and trampling pressures are increased. Grazing in the summer and fall months, after seeds have set and plants have died likely has little negative effect on most vernal pool annuals, and may enhance the habitat by further reducing thatch and exposing soil for the following growing season (Ahart pers. comm.).

Ahart's dwarf rush is small enough to escape grazing pressures by livestock (except perhaps sheep). The most vulnerable stage of Ahart's dwarf rush is probably after pool margins have dried and the plant is in flower, before seed matures. It likely will not attract grazers, but if trampled at this point in the life cycle, seed production may be limited. However, with many vernal pool species of such small stature, at least some individuals escape livestock trampling pressures during most years except under all, but the most severe grazing regimes.

Although none are specifically reported to co-inhabit vernal pools with Ahart's dwarf rush, several non-native weedy hydrophytes may present future problems. Mannagrass (*Glyceria occidentalis*), an aggressive weed of irrigated agriculture and degraded vernal pools, has already been reported as a potential problem at vernal pools in the region. Additional species to consider include rosy lippia (*Phyla nodiflora* var. *rosea*), field bindweed (*Convolvulus arvensis*), common unicorn plant (*Probiscidea louisianica*), swamp pricklegrass (*Crypsis schoenoides*), crabgrass (*Cynodon dactylon*) and paradox canary-grass (*Phalaris paradoxa*). Cocklebur (*Xanthium strumarium*), another native species, can also dominate vernal pools (Schlising pers. comm.; Unger pers. comm.).

ADR Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for Ahart's dwarf rush are identified in Table G-3.3-1 and have been derived from input from local species experts.

Table G-3.3-1. Habitat Elements for Ahart's Dwarf Rush

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

ADR Species Distribution and Population Trends

ADR Range Wide Distribution

Presently, Ahart's dwarf rush is recorded from 10 CNDDB occurrences scattered throughout the Great Central Valley, from Calaveras County in the south to Tehama County in the north (CDFG 2010). These occurrences are all situated at sites ranging from 100 to 320 feet in elevation, and with the exception of the occurrence in Calaveras County (San Joaquin Valley Subregion) and the occurrence in Tehama County (North Coast Ranges Subregion), all lie within the Sacramento Valley Subregion of the Great Valley Region of the California Floristic Province (Hickman 1993).

ADR Central Valley Distribution

The northernmost occurrence of Ahart's dwarf rush is located in Tehama County. Four occurrences are found in Butte County, one in the vicinity of the Oroville Municipal Airport, south of Chico and three on the Peter Ahart Ranch, near Honcut (CDFG 2010). The single occurrence in Yuba County is located south of Honcut Creek near the Butte County line. Two occurrences are located in central Sacramento County, and the southernmost occurrence is located in the northwest portion of Calaveras County (CDFG 2010).

ADR Distribution within the Planning Area

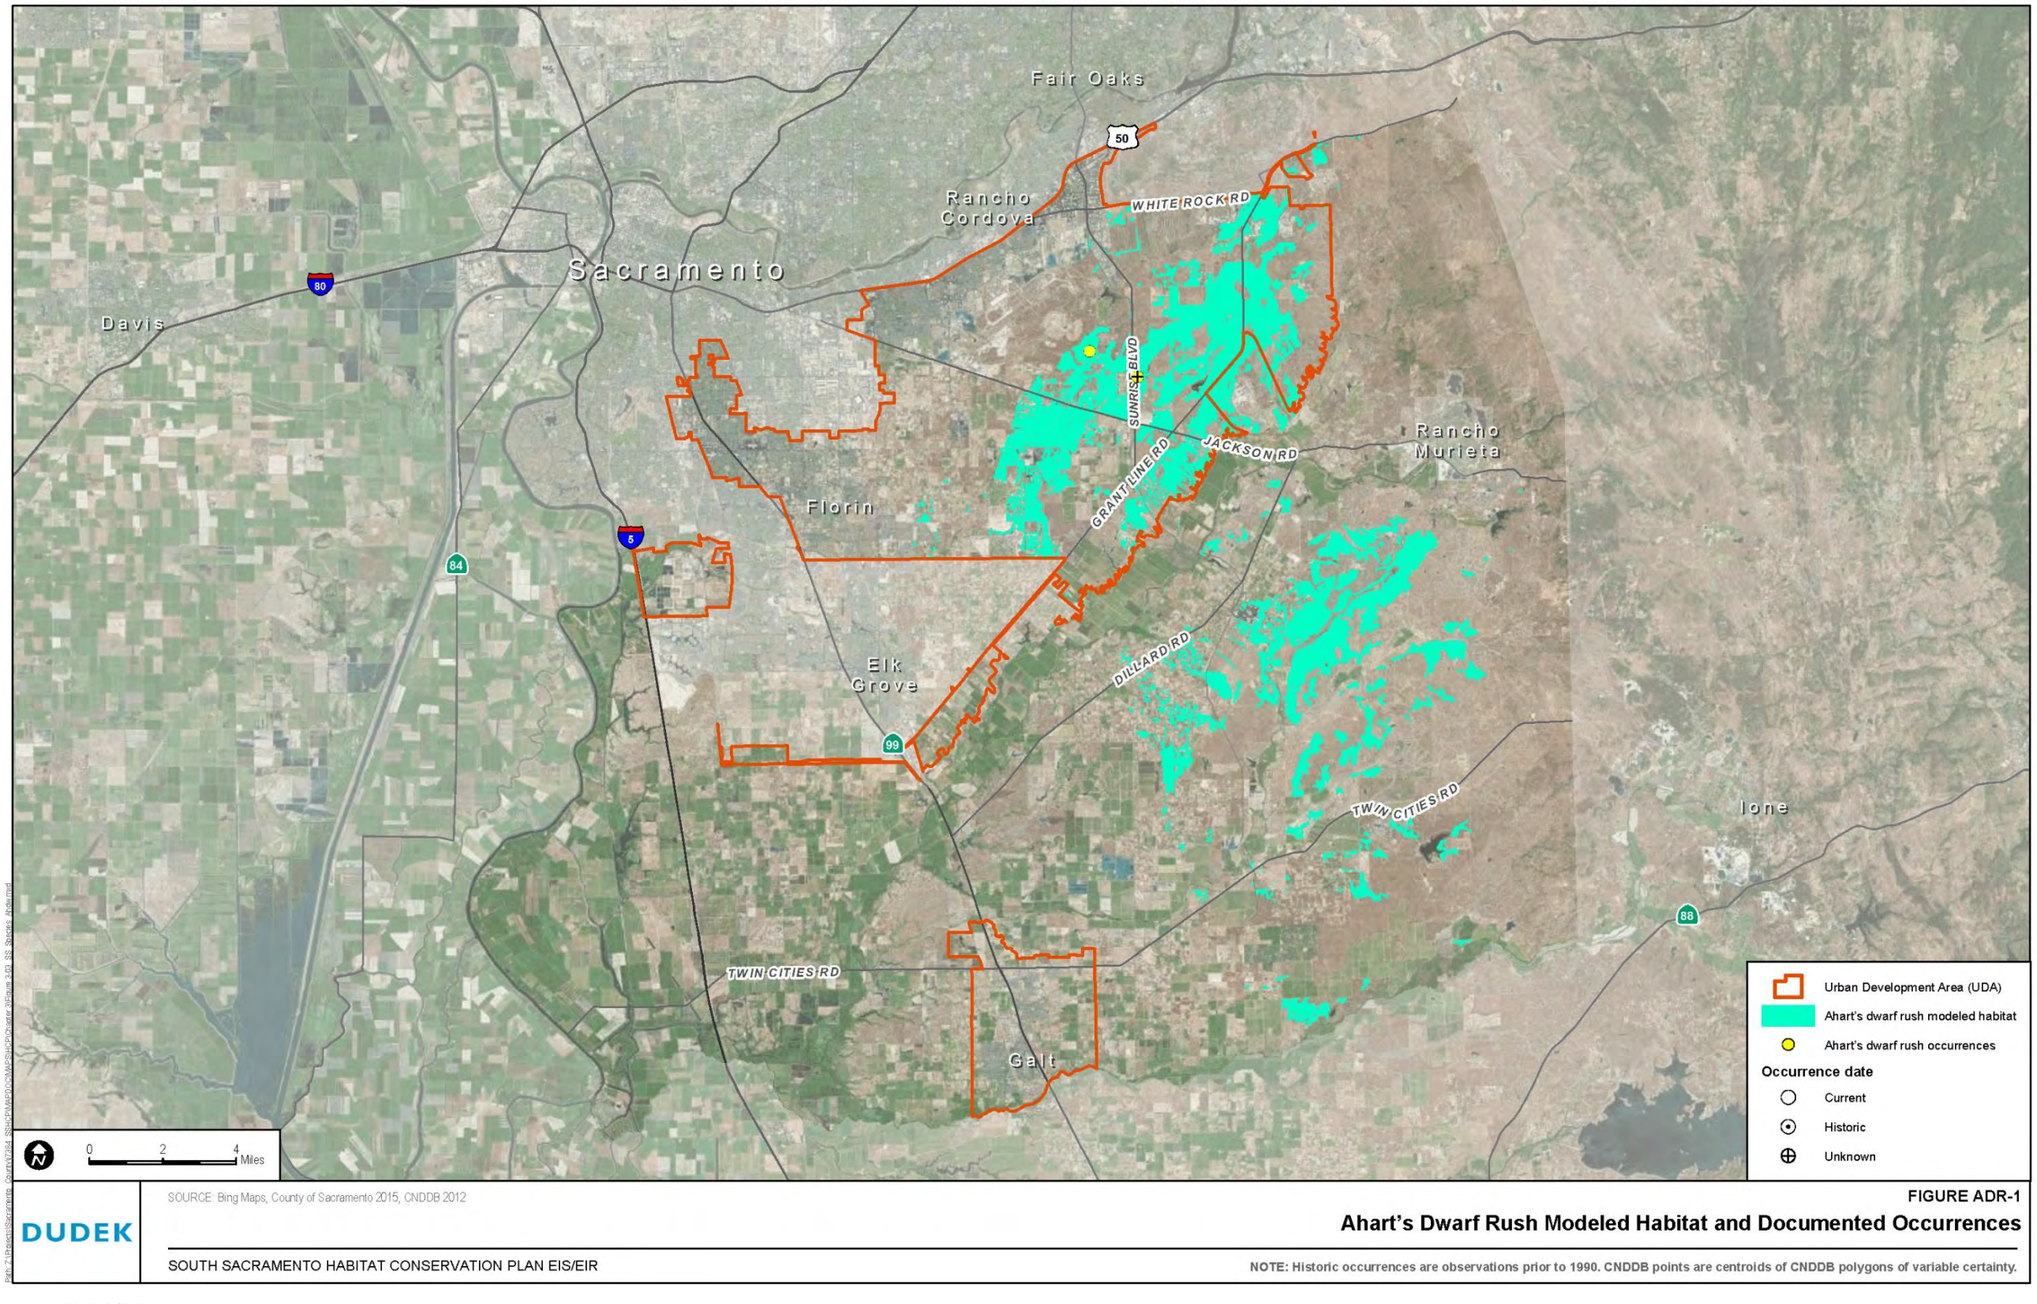
Currently, there are two documented CNDDB occurrences of Ahart's dwarf rush in Sacramento County and the two not-yet-recorded occurrences, each of which is found within both the Planning Area and UDA (CDFG 2010; Mather Field date unknown; Wetland Research Associates 2004). Figure ADR-1 shows these occurrences. One of the occurrences (CNDDB occurrence #7)

is located southeast of Rancho Cordova on private land southeast of the intersection of Kiefer Boulevard and Sunrise Boulevard. The other occurrence (CNDDB occurrence #8) is located approximately 1.75 miles to the northwest on Mather Field. The two occurrences not yet recorded are located on Mather Field north of Kiefer Boulevard.

It is important to note that owing to its small stature, preference for vernal pool margins and swales, early flowering season, and the area of remaining unsurveyed or partially surveyed habitat, moderate to high potential exists for discovery of additional populations of Ahart's dwarf rush within the Planning Area.

Table G-3.3-2 shows the soil series, geological formation and landform associations for the two Ahart's dwarf rush occurrences in Sacramento County that are recorded in the CNDDB. Generally, this species is associated with old terrace remnant alluvial deposits of ancestral river channels and pediment gravels, which were deposited during the early Pleistocene between 600,000 and 1,500,000 years ago. Though the distribution of the taxon is extremely disjunct, the modeled habitat of Ahart's dwarf rush is discussed in Section F-4 of this appendix.

Table G-3.3-2. Extant CNDDB Occurrence Numbers, Distribution, Associated Soil Series and Landform Formations For Ahart's dwarf rush In Sacramento County



CNDDB Occurrence #	Quadrangle	Soil Series[a]	Geological Formation and Landform
7	Buffalo Creek	Redding gravelly loam	Arroyo Seco Formation Remnant high terraces
8	Carmichael	Redding gravelly loam	Arroyo Seco Formation Remnant high terraces

[a] Soil series information based on what USDA soil survey type occurs at the CNDDB species location (USDA 1993)

ADR Population Levels and Trends

Ahart's dwarf rush is known from a total of 10 CNDDB occurrences, all in California, including four in Butte County, two in Sacramento County, and one in each of Calaveras, Placer, Tehama and Yuba Counties (CDFG 2010).

Figure ADR-1 Ahart's Dwarf Rush Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

Of the 10 documented occurrences presumed extant, one in Sacramento County (CNDDB occurrence #7) is listed as "Possibly Extirpated" (CDFG 2010). The other Sacramento County occurrence, presumed extant (CNDDB occurrence #8), was observed to support approximately 300 plants in 2001 (CDFG 2010). The Tehama County occurrence is reported as supporting 750 plants as of 2004. The Calaveras County population was observed to support approximately 100 plants among three vernal pools in 1987, the last time this population was recorded (CDFG 2010). The Placer County occurrence, reported as supporting 45 plants in 1990, is on land proposed for development. The Yuba County occurrence was reported as supporting several hundred plants among three colonies in 1998 (CDFG 2010). The northernmost occurrence (CNDDB occurrence #4) was observed to support several hundred plants in the spring of 2003 (Dittes and Guardino pers. obs.). The occurrences on the Peter Ahart Ranch are presumed extant, but it and other vernal pool species in the area likely have diminished over the last few decades concomitant with an overall increase in range productivity and increasing abundance of weedy annual European grasses (Ahart pers. comm. 2003). Table G-3.3-3 shows the population estimates of the CNDDB occurrences.

Table G-3.3-3. Population Estimates for CNDDB Occurrences

CNDDB #	# of Pools Observed	Range of Population Estimates
7	Unknown	1999: 4 plants
8	Unknown	2000: 300 plants

It is impossible to determine the number of historically occurring Ahart's dwarf rush populations or the acreage of suitable habitat lost to historic agricultural and urban land-use conversions, since so much had happened before these species first received attention. Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978); however, owing to habitat specificity, only a subset of the vernal pool habitat lost within the natural range of the species may have provided suitable habitat for Ahart's dwarf rush. Effects of historic livestock grazing combined with drought and habitat alterations relating to development of non-native annual grassland are unknown as well.

There has been no comprehensive effort to monitor any of the known populations of Ahart's dwarf rush. Numbers of individuals have not been recorded for the populations since their discovery and the overall population dynamics for this plant are unknown.

Studies involving other vernal pool plant rarities, including Orcuttiae grasses and Hoover's Spurge have demonstrated marked fluctuation in numbers of individuals within populations between years (Griggs and Jain 1983; Holland 1987; Alexander and Schlising 1997). This extreme population variability is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and

between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). It is not known however, if Ahart's dwarf rush exhibits a similar between-year pattern.

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given Ahart's dwarf rush population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another critical aspect of population demography is the presence and nature of the soil seed bank, which is unknown for Ahart's dwarf rush.

ADR Threats to the Species

Potential threats to Ahart's dwarf rush include loss of vernal pool habitat to agricultural or urban/industrial land-use conversions, hydrological alteration of sub-watersheds and associated vernal pool habitat, shifts in competitive interactions (hydrological mediated or invasive weedy species), inappropriate livestock grazing regimes (none, mid-spring rotations, sheep vs. cattle), recreational vehicle use, equestrian and pedestrian traffic, refuse dumping, windblown refuse accumulation, air pollution and global climate change.

Proposed development is a threat to one of the Sacramento County Occurrences (CNDDB occurrence # 7). This population is now listed as "Possibly Extirpated" (CDFG 2010). Proposed development of an aggregate mine was stated as a threat to the only other Sacramento County Occurrence (CNDDB occurrence #8) in 2000. This occurrence is now within the boundaries of the proposed Mather Field Vernal Pool Preserve. Off-road vehicle traffic, road construction, cattle grazing, surrounding development and a proposed subdivision are stated as threats for the single Placer County occurrence (CNDDB occurrence #3). Power line corridor maintenance activities are stated as a threat to the single Yuba County Occurrence (CNDDB occurrence #9). No threats are stated for the Calaveras County population (CNDDB occurrence #2). The Butte County occurrences in the vicinity of Honcut (CNDDB #1, #5, and #6) have no threats stated in the CNDDB. According to Ahart though (pers. comm. 2003), these populations may be experiencing a decline in vigor associated with increasing range productivity and increasing abundance of annual European grasses.

ADR Data Gaps and Conservation Implications

Despite its distinctive appearance and extreme rarity, Ahart's dwarf rush has received little research attention from botanists or ecologists. Aside from general observations of field workers provided in the CNDDB and the taxonomic work of Ertter (1986), nothing else exists regarding the biology, ecology, pollinators, breeding system, population genetics, habitat

relationships, population levels, trends or threats associated with this taxon. Pertinent data gaps, implications for conservation, and operating assumptions include:

ADR Unknown Number of Undiscovered Populations

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Planning Area and elsewhere within the range of the species. In the Planning Area, discovery of new populations may occur on the large dry-land ranchlands, public and quasi-public lands and vernal pool-grassland preserves already established in the eastern portion of Sacramento County.

ADR Unknown Relationship between Landform/Soil Chemistry and Bio-Geographic Distribution

Ahart's dwarf rush has a geographic association with old alluvial terraces possessing acidic soils primarily of the Redding Series. The exact nature of this relationship is however, unknown. It is unknown if soil pH or other edaphic factors influence Ahart's dwarf rush distribution and population vigor. It is possible that the presence of functioning vernal pools, regardless of landform, soil series and soil pH can provide suitable habitat.

ADR Unknown Pollination Ecology

The pollination ecology of Ahart's dwarf rush has not been studied. Floral morphology (long style and style branches, exerted anthers) suggests an outcrossing breeding strategy. The inconspicuous scale-like flower parts and lack of nectar suggest wind pollination, as with most other graminoids (grasses, sedges, rushes, and other grass-like plants). Without knowing specific aspects of pollination ecology, it is difficult to ascertain the importance of associated uplands in the design and management of preserves supporting Ahart's dwarf rush.

It is well documented that specific co-evolved bee species are depended on by a guild of vernal pool plant species. Conservation of these vernal pool plant communities depends on inclusion of adequate areas of surrounding functioning upland habitat to maintain populations of the co-evolved ground-dwelling bees. Some suggest that buffers of up to ½-mile around vernal pools might be needed (Robin Thorp, e-mail to D. Burmester 2003).

ADR What Constitutes Population Vigor, and How to Measure?

Population vigor and population dynamics, including year-to-year variability in abundance, have not been studied for Ahart's dwarf rush. The existence of a dormant soil seed bank, a critical contributor to population stability in some other vernal pool species, is unknown for Ahart's dwarf rush as well. Other rare vernal pool species have been shown to be highly variable in abundance from year-to-year (Holland 1987; Griggs pers. comm. 2003), and causative factors

contributing to year-to-year population fluctuations may be difficult to identify (Alexander and Schlising 1997). Trends may occur that are not discernable and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

ADR Specific Hydrological Requirements of Ahart's dwarf rush

Data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting Ahart's dwarf rush populations (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate).

The general lack of numerical hydrological data limits the ability to precisely monitor and/or assess hydrological suitability of Ahart's dwarf rush-vernal pool habitat within established preserves. Similarly, assessment of potentially suitable Ahart's dwarf rush habitat for preserve establishment or for detection of the species at this time must rely on generalities.

ADR Existing Hydrological Trend of Pools and Existing Indirect Effects

Extant Ahart's dwarf rush populations may have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown Existing Conditions Ahart's dwarf rush conditions may not be pristine, so if trends in vigor or habitat quality become apparent over time, it may be difficult to attribute trend to any specific management activity.

ADR Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by geography (Holland and Dains 1990).Proposed preserve designs may not afford complete protection to the hydrological systems that support Ahart's dwarf rush and other species assemblages dependent on them.

ADR Definition of Appropriate Scale Ahart's dwarf rush-Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective Ahart's dwarf rush-vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale vernal pool preserve

at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark *et. al*. 1998).

ADR Determination of an Appropriate Livestock Grazing Regime

Specific grazing regimes have not been formulated for annual grassland pasture systems with Ahart's dwarf rush-occupied pools, although grazing and monitoring of vernal pool-annual grassland stems have been addressed (Barry 1998; TNC 2000; Griggs 2002; Robins and Vollmar 2002).

Ahart (2003 and pers. comm.) emphasizes the need to graze vernal pool-annual grasslands, particularly those supporting Ahart's dwarf rush, to maintain vernal pool diversity and the "vernal pool edge" habitat that Ahart's dwarf rush and many of the showy vernal pool annuals require. This upper, drier topographic-hydrologic microhabitat on the edge of a vernal pool has been termed the "transition zone" between the wetter vernal pool habitat and the surrounding upland annual grassland matrix (Schlising and Sanders 1982).

Since Ahart's dwarf rush occupies small and/or shallow vernal pools, or the edges of larger pools, management of Italian wild rye and Mediterranean barley in and around pools and Medusa-head grass in surrounding uplands should be of particular management concern. Ahart states that for this species, it is better to err on the side of overgrazing (Ahart pers. comm. 2003).

Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

ADR Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in vernal pools include western mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, bindweed, lippia, paradox canary-grass, long-beaked hawkbit, cocklebur and cattails. None of these are reported to co-inhabit Ahart's dwarf rush-occupied vernal pools in Sacramento County. Any of these and others now unknown may appear or change in abundance in Ahart's dwarf rush-occupied pools over time. Italian Rye and Mediterranean Barley, two common non-native inhabitants of shallow vernal pools and vernal pool margins, might be of management concern to Ahart's dwarf rush, owing to the latter's preference for small to medium size vernal pools. Similarly, Medusa-head grass in uplands should be monitored and controlled. Potential competitive interactions with these species may affect the vigor of Ahart's dwarf rush populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect Ahart's dwarf rush populations.

ADR Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to combine design preserves for multi-species conservation. Suitability of Ahart's dwarf rush habitat for supporting other rare plant species has not been specifically addressed. Many of these pool complexes also may provide habitat for rare invertebrates, amphibians, mammals, and bird species as well. Management for multiple species maximizes the effectiveness of habitat conservation and requires coordinated monitoring and actions. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime after May 15 may be compatible with or even benefit some Ahart's dwarf rush-associated pool complexes, but may be detrimental to other later-flowering species depending on those complexes (e.g., slender Orcutt grass).

ADR Genetic Variation (Spatial and Temporal [Seed Bank], Genetic Drift, Genetic Bottlenecks)

Population genetics for Ahart's dwarf rush are completely unknown. Current limitations in our understanding of Ahart's dwarf rush population genetics have little immediate conservation implication, given the extreme rarity of Ahart's dwarf rush.

ADR Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, the existence and potential role of a dormant soil seed bank in population dynamics is completely unknown for Ahart's dwarf rush. There have been no studies addressing the presence of a soil seed bank, seed dormancy or longevity. From the perspective of conservation, knowledge of site specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

ADR Inoculation

Since there are so few natural populations of Ahart's dwarf rush in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied Ahart's dwarf rush habitat, create meta-population structure at extant occurrences where single pools may support the species, and ensure existence should any natural populations become compromised.

ADR Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter. ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant Ahart's dwarf rush occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of Ahart's dwarf rush, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect Ahart's dwarf rush and other native plant species.

ADR Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology. It is likely that given the expected global climate trends, a vigor response of some kind could be expected for Ahart's dwarf rush populations within the study period of this EIS/EIR, or at some time beyond.

LEGENERE (LEG)

Legenere (LEG)

(Legenere limosae)

Status USFWS: None

Status CDFW: None

Status CNPS: 1B.1

© 2000 John Game (Calphotos)

LEG Listing Status

Legenere (*Legenere limosa*), a vernal pool endemic, is considered to be rare, threatened or endangered throughout its range, thus qualifying its designation as a List 1B Species by the California Native Plant Society (CNPS) (CNPS 2010). It has been assigned an R-E-D Code of 2-3-3, meaning it is distributed in a limited number of occurrences, occasionally more if each occurrence is small, it is endangered throughout its range, and entirely restricted to California.

Being a CNPS List 1B plant species, legenere meets the California Department of Fish and Wildlife (CDFW) definition of a special plant though it has no formal protection status by the CDFW or United States Fish and Wildlife Service (USFWS).

LEG Life History and Ecology

LEG Species Description and Life History

Legenere is an inconspicuous annual in the Bellflower family (Campanulaceae). This species has slender, sprawling, sometimes branched stems that can grow from 10 to 30 centimeters in length. These stems may also root at the nodes. Small one to three centimeter-long leaves are arranged alternately on the stem; the lower (submersed) ones are linear and early deciduous and the upper ones (emersed) are proportionally shorter, wider and oblong-lanceolate to oblanceolate (Mason 1957), or narrowly triangular (Hickman 1993; Oswald 1994). The inflorescence is a terminal raceme with flowers and fruit born on slender six to 20 millimeter-long stalks (pedicels). These flowers are alternately arranged along an often zig-zag central axis. Each flower stalk is subtended by a six to 12 millimeter-long leaf-like bract. Flowers consist of an inferior ovary, five narrowly triangular green sepals that are 1/2 to 1/3 the length of the

ovary, and five greenish-white to yellowish petals (two to four millimeter-long) that are unequally united into a two-lipped, five-lobed corolla with a tubular base. The lower flowers often lack petals entirely. The +3.5 millimeter-long obconic ovary elongates as it matures, eventually becoming a cylindrical fruit that reaches six to 10 millimeter in length and one to two millimeter diameter.

Legenere is a monotypic genus with no close relatives in North America Stone (1990). When in full fruit and without petals present however, legenere might be confused with potentially co-occurring with downingia (*Downingia* spp.). Mature downingias, however, lack the often up-curved, narrow pedicel (stalk) that subtends each cylindrical fruit. Downingias also do not exhibit the often zig-zag central axis of the inflorescence.

The genus *Legenere* has received little empirical study from biologists or ecologists and other than basic taxonomic and biogeographic treatments, legenere remains mostly unstudied. Ecological information resulting from observations of field botanists exists primarily as a result of land management and Agency-related resource surveys (Holland 1983; Platenkamp 1998; CDFG 2010).

LEG Ecological Life Cycle

Legenere shares the annual growth habit with the vast majority of other endemic vernal pool plants. This adaptive trait confers to the population's avoidance of the regular and extreme seasonal drought that characterizes vernal pool habitat and the Mediterranean climate (Griggs and Jain 1983; Holland 1987; Stone et al. 1988; Zedler 1990).

LEG Seed Germination

The specific timing of germination of legenere seeds relative to the timing of the vernal pool inundation cycle has not been described in detail. Seeds are reported to germinate under water in late February to April (Holland 1983). Seed longevity, dormancy characteristics, germination requirements and germination optima for legenere have not been investigated.

LEG Vegetative Growth

One of the challenges to many vernal pool plant species is optimization of physiological processes in both the early season aquatic and later season terrestrial phases of the vernal pool cycle. For legenere, the principal structural adaptation to amphibious growth appears to be production of thin linear aquatic leaves, and thicker, proportionately wider aerial leaves. Although not determined for legenere, it has been shown in other amphibious vernal pool plants that the aquatic leaves lack both waxy cuticle and stomates, in this respect differing from adult aerial leaves (Keeley 1990). These juvenile leaves optimize photosynthesis in the aquatic

environment and maximize growth while vernal pools are still inundated, thus lengthening the vernal pool-growing season.

LEG Reproduction

Legenere flowers and sets seeds during the dry-down phase of the vernal pool hydrologic cycle, sometimes while shallow water or inundated soil remains in the deepest parts of the pool basin (Dittes pers. obs.). Flowering and fruit maturation occurs from April through June (CNPS 2010; CDFG 2010), and likely varies by vernal pool depth/ponding duration and conditions of the season. Although pollination and breeding experiments have not been carried out for legenere, the reduced white flowers and flowers without corollas suggest a self-pollinating breeding system. Oswald (1994) has observed completely cleistogamous plants (flowers never open) in the Northern Sacramento Valley, which further indicates self-compatibility. Plants typically produce from several to 10 or more fruit, with each fruit containing up to 20 small smooth brown seeds (Holland 1983).

LEG Dispersal

Short-distance seed dispersal in legenere appears to be naturally limited by the mature fruit capsule, which only partially opens at its apex. Seeds can remain in the mature capsule after disintegration of the mother plant, potentially being transported by flowing water during the following fall-winter inundation phase (Holland 1983). Seed dispersal is naturally limited in a suite of other vernal pool plant species. This adaptive trait is thought to represent an adaptation to spatially unpredictable and limited vernal pool habitat (Griggs 1974, 1980; Zedler 1990).

Evidence of long-distance dispersal and colonization exists in the overall geographic distribution of this species in northern California. Natural dispersal of legenere seeds likely occurs via flowing water, transport on feet and feathers of waterfowl, and in mud on hooves and legs of livestock. As with other vernal pool species, natural dispersal of seeds was likely a more frequent event when there were many more vernal pools, more pool interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming native ungulates (Griggs 1980).

LEG Seed Dormancy

Seed dormancy and a stored soil seed bank is indicated by observation of multi-year periods with insufficient precipitation where legenere plants were absent, followed by reappearance during following favorable-hydrology growing seasons (Holland 1983; CDFG 2010). Seed longevity and seed abundance in the soil has not been investigated. The presence of a persistent soil seed bank provides insurance against localized extirpation resulting from the unpredictable occurrence and duration of appropriate growing conditions. If total seed crop failure occurs in a given year or set of years (failure to germinate, loss to late season flooding or

fire, excessive grazing by livestock or grasshopper herbivory), additional stored seeds are available for another year's effort.

LEG Population Genetics

Population genetics of legenere have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. In general, self-pollinating species tend to exhibit low levels of intrapopulation variation and a high degree of between population divergences. Elam (1996) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon. Given the limited number of occurrences in the Planning Area and the scattered geographical distribution, all intra-pool legenere populations should be considered unique, and important genetic entities.

LEG Habitat Requirements and Ecology

LEG Biogeography and Landform Relations

Legenere is strictly associated with the vernal pool-type hydrologic cycle. Over its geographic range, this species is found in several vernal pool physiographic/edaphic settings, including northern basalt, northern claypan, northern hardpan, northern volcanic ashflow, and northern volcanic mudflow vernal pools (Holland 1983). In Sacramento County, legenere is associated with vernal pools located on various geologic surfaces, including the Laguna, Mehrten, Riverbank, Undifferentiated Surficial Alluvial Deposit and South Fork Gravels. For this reason, it is more likely that presence of wetland habitat with suitable vernal pool-type hydrology is a more important factor in determining the geographical distribution of this species than is geologic surface or soils. All well-developed vernal pools, regardless of landform association, should be considered potentially suitable habitat for legenere.

LEG Hydrology Relations

Legenere is a strict endemic of the vernal pool hydrologic cycle. This species grows in well-developed vernal pools and playa lakes, as well as along the seasonally fluctuating margins of more permanent water bodies (small lakes, ponds, stock ponds), and basins within seasonal drainages (Holland 1983; CDFG 2010). Legenere has been reported to inhabit vernal wetlands ranging in size from 40 square feet to 100 acres (Holland 1983). Topographical position within pools and associated plant species indicate tolerance of, or preference for, the more extreme (longer-duration) inundation regimes encountered in vernal wetlands. It is interesting to note however, that in the larger/deeper pools encountered by Holland (1983), legenere was reported as not inhabiting basin positions deeper than eight inches ponding depth.

LEG Biological Community Relations

Floristic associations provide further indication of preference for more extreme vernal pool hydrological cycles. Legenere most frequently co-occurs in micro-sites with smooth goldfields (*Lasthenia glaberrima*) and common spikerush (*Eleocharis macrostachya*) (CDFG 2010). Both are typically associated with well-developed large or deep pools with longer periods of inundation, as well as with vernal marshes, permanent marsh edges and the seasonally fluctuating margins of stockponds. Most rare plant species found with legenere are also inhabitants of pools with longer duration inundation, including slender Orcutt grass (*Orcuttia tenuis*), Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), and Sanford's arrowhead (*Sagittaria sanfordi*). Other associates indicative of well-developed vernal pool hydrology include three-sepaled buttercup (*Ranunculus bonariensis* var. *trisepalus*), coyote thistle (*Eryngium castrense*, *E. vaseyi*), bractless hedge-hyssop (*Gratiola ebracteata*), downingias (*Downingia bicornuta*, *D. cuspidata, D. ornatissima*), flowering quillwort (*Lilaea scilloides*), and American pillwort (*Pilularia americana*).

Other vernal pool endemics reported as occurring with legenere include common inhabitants of shallower and/or smaller to medium-size vernal pools with shorter duration ponding, or the slopes and edges of larger or deeper pools. These species include Fremont's goldfields (*Lasthenia fremontii*), white-headed navarretia (*Navarretia leucocephala*), stalked popcorn-flower (*Plagiobothrys stipitatus*), bracted popcorn-flower (*P. bracteatus*), wooly marbles (*Psilocarphus brevissimus*), dwarf downingia (*Downingia pusilla*), annual hairgrass (*Deschampsia danthonioides*), and Douglas' meadowfoam (*Limnanthes douglasii*).

LEG Non-Native Weed Relations

Hydrological stresses associated with vernal pools exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian wild rye (*Lolium multiflorum*), and Mediterranean barley (*Hordeum marimum* ssp. *gussoneanum*), two non-native facultative wetland species, typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types and the margins of larger/deeper ones as well. Some suggest that built-up thatch from Italian wild rye, Mediterranean barley, Medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species as well by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2002).

Since legenere occupies medium to larger or deeper vernal pools, it may not be particularly susceptible to the effects of excessive growth of Italian wild rye and Mediterranean barley and thatch build-up, as with the more deeply-adapted Orcuttiae grasses and Bogg's Lake hedge-hyssop.

Weedy hydrophytic species presently reported as growing with legenere include mannagrass (*Glyceria occidentalis declinata*) and lippia (*Phyla nodiflora*). Although not-yet reported to co-inhabit vernal pools with legenere, other non-native weedy hydrophytes may present future problems. These species include swamp pricklegrass (*Crypsis schoenoides*), field bindweed (*Convolvulus arvensis*), common unicorn plant (*Probiscidea louisianica*), Bermuda grass (*Cynodon dactylon*), and paradox canary grass (*Phalaris paradoxa*). Cocklebur (*Xanthium strumarium*), a native species, can also become weedy and dominate vernal pools (Schlising pers. comm.; Unger pers. comm.).

LEG Livestock Grazing Relations

In general, appropriately timed dry-pasture livestock grazing regimes are thought to be compatible with the persistence of vernal pool vegetation. Robins and Vollmer (2002) provide a review of information pertaining to livestock grazing in vernal pool ecosystems.

Livestock grazing is reported as a threat at a number of populations (CDFG 2010), however many extant populations of legenere inhabit long-operating cattle ranches. Persistence in un-irrigated pasture systems indicates tolerance for at least some level of grazing. In most cases, timing of livestock grazing is likely more important than stocking rates in affecting persistence of legenere, as it is for the Orcuttiae grasses (Stone et al. 1988). During the period when pools are inundated and upland forage is still green and attractive, cattle tend to not congregate in pools, and trampling and grazing pressures to vernal pool plant species in their seedling or juvenile aquatic phase are minimized. As the upland forage cures and the vernal pools are in their flowering and seed-producing terrestrial phase, moist pools become more attractive to livestock and grazing and trampling pressures are increased. Excessive trampling and grazing during this period may negatively affect legenere, and other vernal pool species. Grazing in the summer and fall months, after seeds have set and plants have died likely has little negative effect on legenere.

It should be noted however, of all vernal pool rarities, legenere is the only one with a decumbent or sprawling habit, and it tends to intermingle with a comparatively succulent mass of intertwined smooth goldfields (*Lasthenia glaberrima*) stems. This growth habit, combined with typically low population numbers may make legenere somewhat more susceptible to inappropriately timed livestock grazing. For most other vernal pool annuals, small stature and high plant densities ensure that in all but extreme cases, a portion of every year's cohort escapes destruction, matures, and sets seed.

LEG Disturbance Response

With exception to persistence of some populations within operating ranches, little is known about the potential response of legenere to other disturbances. One wetland in Sacramento

County, observed to support up to 1,000 to 10,000 plants in 1991 (CNDDB occurrence # 33), has been "…disked annually for firebreak" (CDFG 2010). Another "large vernal pool" in Tehama County, "ripped and filled in Fall of 1994," was observed to support an estimated 1,000 legenere plants in 1995 (CDFG 2010).

Populations of several other rare vernal pool species, including Orcuttiae grasses and dwarf downingia, as well as more common species, may persist despite periodic disking of their resident pools over decades (Hoover 1941; Crampton 1959; Stone et al. 1988; Ahart pers. comm.; Kelsey pers. comm.; Dittes pers. obs.; CDFG 2010). It is exceedingly important to note that in these cases, disking is not so deep as to significantly affect the subtending impermeable layer or the vernal pool hydrological cycle. In addition, the disking is performed in the late summer or fall months in preparation for dry land winter grain crops, so vernal pool plants have set seed and dried. If this disking occurs earlier in the growing season, before seeds are mature, over consecutive years population extirpation is probable through exhaustion of the soil seed bank.

LEG Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for legenere are identified in Table G-3.4-1 and have been derived from input from local species experts.

Table G-3.4-1. Habitat Elements for Legenere

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

LEG Species Distribution and Population Trends

LEG Species Distribution

Legenere was first collected in 1890 from Solano County, California. Since that time, 61 occurrences have been recorded in the California Natural Diversity Data Base (CNDDB) (CDFG 2010), ranging from Santa Clara County in the south to southern Shasta County at the northern edge of the Great Central Valley. Legenere occurrences are distributed among four of the Geographic Sub-regions of the California Floristic Province, as described by Hickman (1993), including the San Joaquin Valley, Sacramento Valley, Inner Coast Range and Cascade Range Foothills. Elevations of legenere occurrences range from one to 880 meters (three to 2,887 feet) (CNPS 2010).

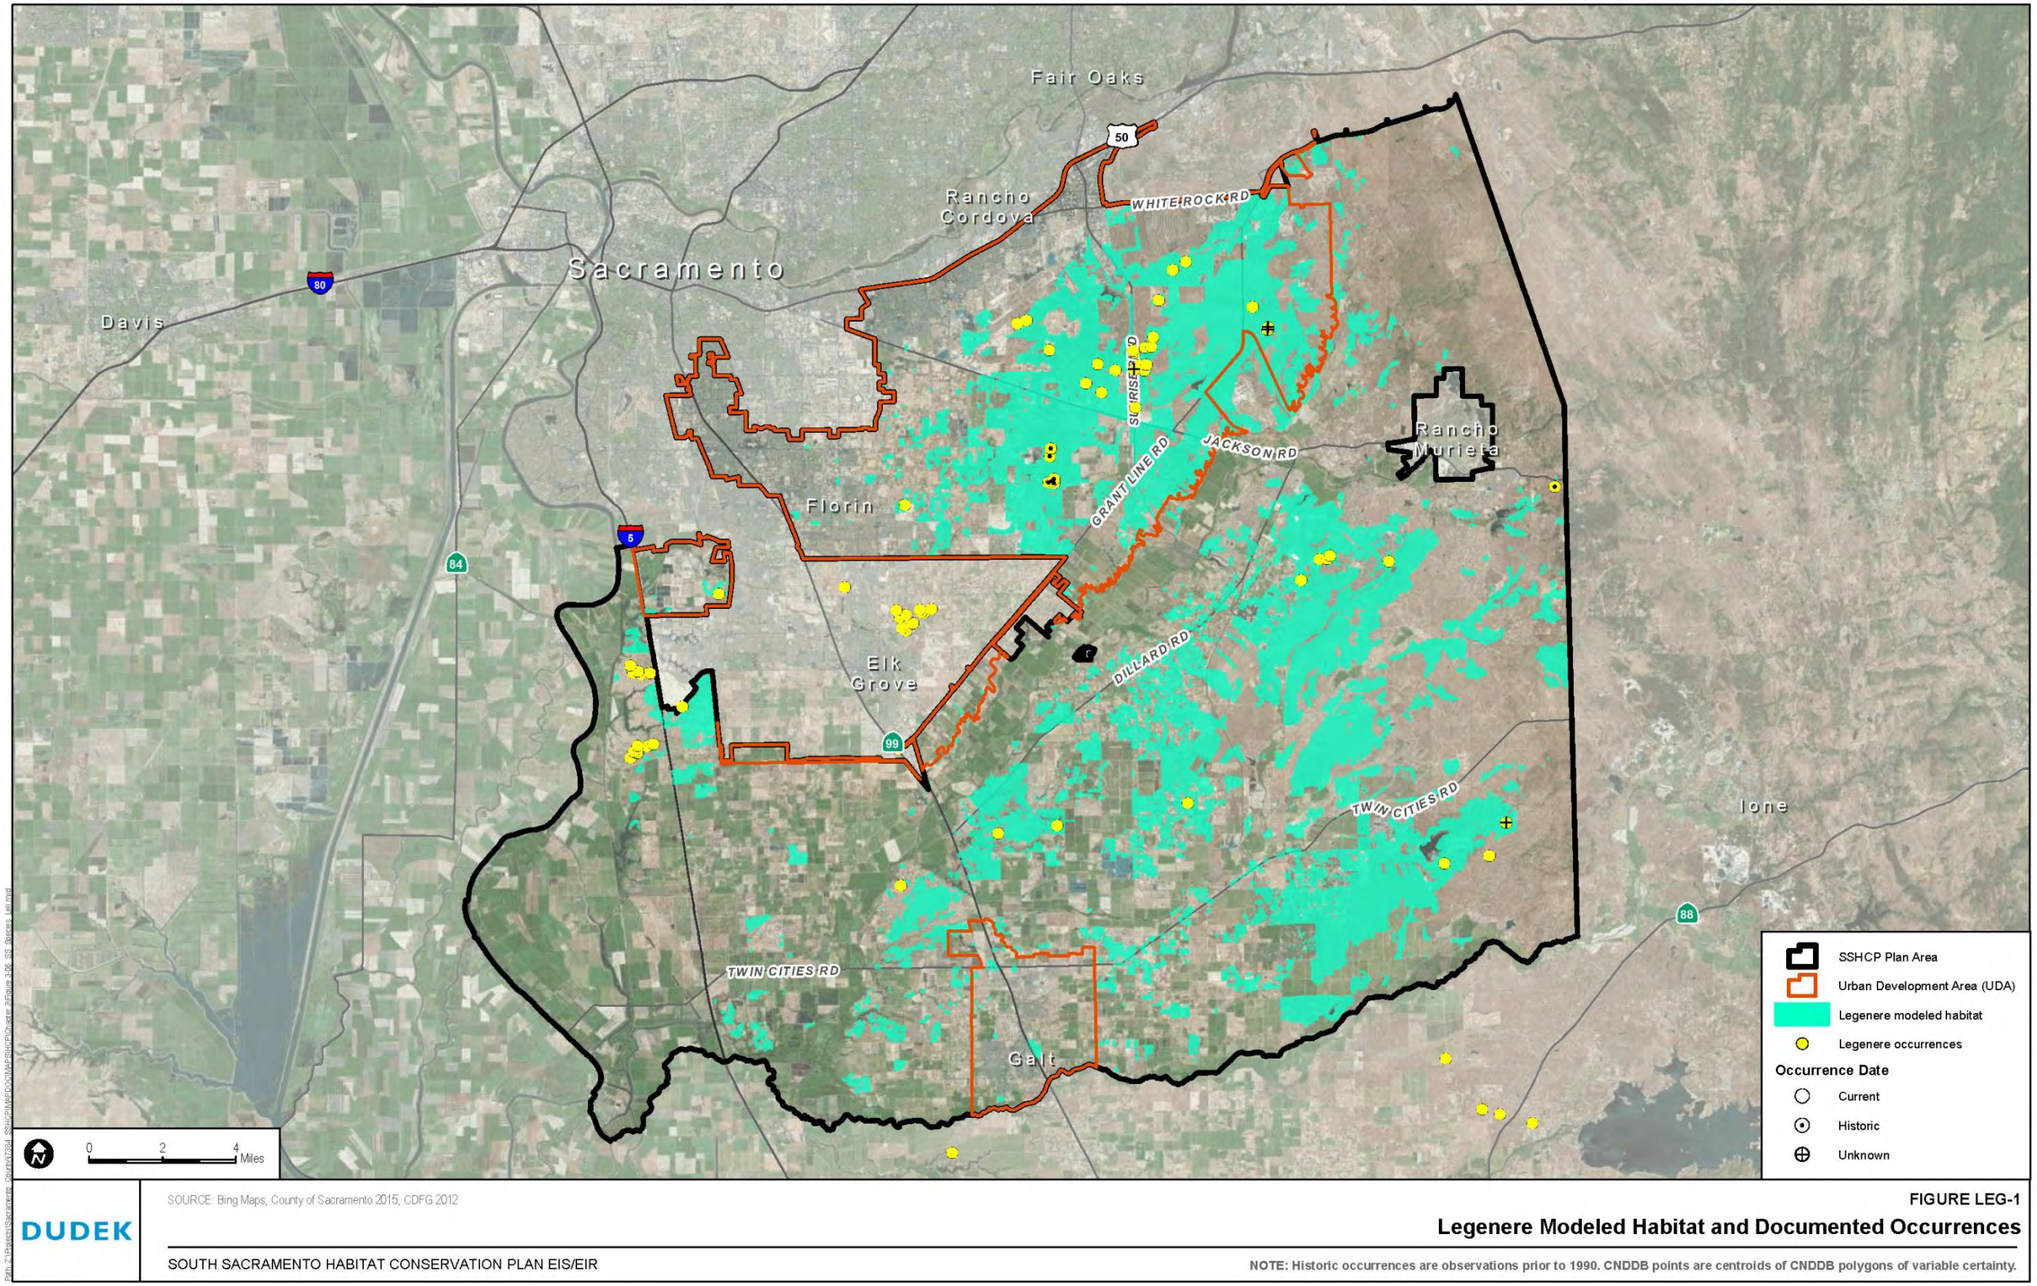
Sacramento County has the largest number of legenere occurrences with 23 of the 61 occurrences (38 percent) represented. Solano County has the second largest number with 12 occurrences (~20 percent), followed by Tehama County with five occurrences reported (~eight percent). The remaining 21 occurrences are found in Lake, Placer, Yuba, Sonoma, Alameda, Napa, Santa Clara, Shasta, San Mateo, San Joaquin and Stanislaus Counties which each have three or fewer occurrences (CDFG 2010).

Legenere's comparatively wide geographic and elevation distribution may partially reflect comparatively broad habitat requirements, or preference for a more commonly occurring vernal pool hydro-period. It may also reflect a higher propensity for seed dispersal by waterfowl, or even a different "biogeographic legacy" (e.g., timeline of evolution and geographic distribution of ancestral taxon).

LEG Central Valley Distribution

The Central Valley supports 52 (85 percent) of the 61 recorded legenere occurrences. The two southernmost occurrences, one of which is extirpated, are located in the Central Valley in northern San Joaquin County, approximately three miles southeast of the City of Galt. The next occurrence to the north is in southern Sacramento County, located approximately 7.5 miles away, just south of the Cosumnes River. An additional 22 occurrences are recorded from Sacramento County, these being widely distributed from near Interstate 5 near the western edge of the county, to the vicinity of Arkansas Creek along the eastern county line, to just northeast of Rio Linda, near the county's northern boundary (CDFG 2010).

Another population center, comprised of 12 clustered occurrences is located approximately 15 miles to the west in Solano County. A gap of approximately 12 miles exists between the northernmost Sacramento County occurrence and the two closely situated occurrences in Placer County. Another two occurrences are located approximately 19 miles further north of the Placer County occurrences in southwest Yuba County. A distance of approximately 70 miles



separates the southernmost of the two Tehama County occurrences from the Yuba County occurrences to the south. In Tehama County, the southern most of the two occurrences is located between Corning and Black Butte Lake in southern Tehama County, and the other is located approximately 15 miles to the northeast, west of the Sacramento River near Gerber. The northernmost Central Valley legenere population is comprised of a single occurrence southeast of Redding at the Stillwater Plains (CDFG 2010). Although suitable habitat exists in Butte County, legenere has not yet been encountered there.

LEG Distribution within the Planning Area

Of the 23 CNDDB legenere occurrences presently known in Sacramento County, 21 are located within the Planning Area (Figure LEG-1). The two outlying occurrences, one of which is extirpated, are located near the northern Sacramento County line, in the vicinity of Rio Linda (CNDDB occurrences #32 and #33). Of the 21 extant occurrences in the Planning Area, 15 are located within the UDA, and six are outside (CDFG 2010). One additional legenere occurrence not yet recorded in the CNDDB is located within the UDA (within the Sunrise-Douglas Mitigation Bank).

Within the UDA, the western-most CNDDB occurrence, located within the 2,465-acre Beach Lake Mitigation Site on the south side of Laguna Creek, is comprised of an unspecified number of vernal pools (CNDDB occurrence #41). Another occurrence is located approximately 3.5 miles to the east on private land, northeast of the intersection of State Highway 99 and Sheldon Road. This occurrence (CNDDB occurrence #31) is comprised of an unspecified number of occupied vernal pools as well (CNDDB 2010). A distance of less than two miles separates occurrence #31 from its nearest neighbor (CNDDB occurrence #27), located northwest of the intersection of Waterman and Bond Roads. Occurrence #27, comprised of five occupied natural pools and five occupied created pools, is located on private land (CDFG 2010). Another occurrence, supporting three colonies, is located on private land, approximately 0.75 miles to the east, northeast of the intersection of Waterman Road and Bond Road (CNDDB occurrence #30). Two occurrences, situated within 0.75 mile of each other, are located on the 320-acre Gene Andel Park, approximately five miles northeast of CNDDB occurrence #30. One of these (CNDDB occurrence #28) is comprised of four occupied vernal pools; the other (CNDDB occurrence #29), located approximately 1.3 miles to the north, is comprised of two colonies associated with vernally wet depressions along a seasonal drainage (CDFG 2010).

Figure LEG-1 Legenere Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

Four CNDDB occurrences are located three to four miles to the north of occurrence #29, in association with Mather Air Force Base (AFB); all are near the southern boundary, north of Kiefer Blvd. The westernmost of these occurrences (CNDDB occurrence #44), is comprised of four occupied vernal pools. The next occurrence to the southeast, located approximately one-mile distant within the 700-acre Mather Regional Park, is comprised of two occupied vernal pools (CNDDB occurrence #45). The two easternmost of the four Mather AFB occurrences, each support one occupied vernal pool (CNDDB occurrences #46 and #47) (CDFG 2010).

An additional occurrence, not yet registered in the CNDDB, is located east of Mather Field, northeast of the intersection of Sunrise Boulevard and Kiefer Boulevard. This occurrence, comprised of 12 occupied vernal pools, is included within the 400-acre Sunrise-Douglas Mitigation Bank (Sugnet and Associates 1998). Another occurrence, not yet registered in the CNDDB, is located within the UDA to the east (Cordova Hills Survey *date unknown*) and another occurrence is located outside the UDA in the southeastern portion of the Planning Area at Howard Ranch (TNC *date unknown*).

In Sacramento County, nine of the 23 legenere occurrences (39 percent) are associated with River Bank Formation. This Formation consists of alluvial deposits associated with the Sacramento, American and Cosumnes Rivers. Eight other legenere occurrences (40 percent) are associated with Redding and Red Bluff/Redding soils of the Laguna Formation. This geological landform is comprised of remnant old-terrace alluvial deposits of ancestral river channels and pediment gravels, which were deposited during the early Pleistocene, between 600,000 and 1,500,000 years ago. Laguna Formation and associated soils are strongly associated with the distribution of vernal pools. It is significant to note that owing to the diminutive size of the species, its ability to inter-mingle with more common species, and the area of unsurveyed or partially surveyed area of Riverbank and Laguna Formation, other occurrences are likely to be present in Sacramento County. In addition, well-developed vernal pools on landforms other than Riverbank and Laguna could provide suitable habitat. The modeled habitat of the species in the Planning Area is discussed in Section G-4 of this Appendix.

LEG Population Levels and Trends

Of the 61 documented CNDDB occurrences, six are now reported as “extirpated” (10 percent), including one occurrence in each of Sacramento County (CNNDB occurrence #32), Placer County (Occurrence CNDDB #14), and Sonoma County (occurrence #8). An occurrence on the San Joaquin and Stanislaus County line (CNDDB occurrence #4) is reported as extirpated, as well as two occurrences in Solano County (occurrence CNDDB #2 and #3). A single occurrence in Lake County (occurrence CNDDB #9) is reported as “possibly extirpated” (CDFG 2010).

Population trends are listed as unknown from all occurrences statewide, with the exception of one occurrence in Placer County (decreasing) and one occurrence in Lake County listed as possibly extirpated (CDFG 2010). Population trends for all extant legenere occurrences in Sacramento County are reported as unknown. In all but three cases, only one estimate for population numbers is recorded (Table G-3.4-2). Botanists making second visits to the other three sites did not observe any legenere plants during 1993 (CNNDB occurrence #5) and 1997 (CNNDB occurrences #46 and #47) (CDFG 2010).

Table G-3.4-2. Legenere Population Estimates for Sacramento County

CNDDB Occurrence #	Occurrence # of pools observed	Range of population estimates
5	Streambed	1976: Locally common 1983: none
12	Large vernal pool (> 1 Acre)	1983: 1000+
13	Vernal pool (~ 1000 sq. ft.)	1983: 100
21	Vernal pool Marsh	1991: >4100
22	Large vernal marsh	1991: 15
27	5 vernal pools and 5 created depressions	1991: 1000's
28	4 vernal pools	1988: <100
29	Ephemeral drainage	1988: <100
30	Seasonal wetland vernal pool	1991: 300+
31	Vernal pools	1993: 2500+
32	Artificial seasonal pond	1991: 150 1997: Site extirpated by subdivision
33	Seasonal wetland	1991: 1000-10,000 1997: none (too late for surveys?)
40	Vernal pool	1995: 50
41	Vernal pools	1995: 300
42	Vernal pools	1995: Unknown
44	4 vernal pools	1997: Several hundred
45	2 vernal pools	1997: Several hundred
46	1 deep vernal pool	1993: 1000 1997: none
47	1 vernal pool and swale	1993: 500 1997: none
50	Stock pond	2000: ?
60	Vernal pools	2002: thousands
62	Vernal pool	2002: ~1,000
63	Vernal pool	2003: 300-500

Source: CDFG 2010.

It should be noted that legenere is an inconspicuous and relatively ephemeral species that easily escapes the notice of botanists; it lacks showy flowers, and it most frequently grows

clambering and mixed with the stems of more common and superficially similar species. Given these considerations and the amount of unsurveyed or partially surveyed suitable habitat in the Planning Area, additional occurrences may have escaped notice during past surveys, and more populations likely remain to be discovered.

It is impossible to determine the number of historically occurring legenere populations lost or the acreage of suitable habitat lost to historic agricultural land-use conversions, since so much had happened before these species first received attention. Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978; Jones and Stokes 1990), however owing to habitat specificity (restriction to), only a subset of the vernal pool habitat lost within the natural range of the species likely provided suitable habitat for legenere.

There has been no comprehensive effort to monitor all populations of legenere. In summary, the following population estimates for the Sacramento County occurrences have been recorded (CDFG 2010). Observations, monitoring and research conducted on other rare vernal pool species indicate that abundance of individuals within populations may vary greatly between species, between populations within species, and within populations through years (Griggs and Jain 1983; Holland 1987; Alexander and Schlising 1997; CDFG 2010). For Orcuttiae grasses and other species, this extreme population variability is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). Fluctuations of similar magnitude are also recorded for hairy Orcutt grass (*Orcuttia pilosa*), Hoover's spurge (*Chamaesyce hooveri*), and Greene's tuctoria (*Tuctoria greenei*) at the Vina Plains Preserve in Tehama County (Alexander and Schlising 1997).

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given legenere population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another aspect of population demography is the quantity and age of stored seed in the soil profile. Undoubtedly, the number of stored seeds in the soil profile has bearing on how many plants can be produced in a given favorable year.

LEG Threats to the Species

Potential direct threats to legenere include loss of vernal pool habitat to agricultural or urban/industrial land-use conversions; construction and maintenance of firebreaks, roads, and utility corridors; inappropriate livestock grazing regimes (later spring/summer rotations); feral pigs, recreational target shooting, grassland fires; recreational vehicles; equestrian and pedestrian traffic; and refuse dumping (CDFG 2010).

Potential Indirect threats to legenere include hydrological alteration of sub-watersheds by surrounding developments and land uses; shifts in competitive interactions (hydrology-mediated or invasive weeds); windblown refuse accumulation; point and non-point source water pollution; air pollution, and global climate change.

LEG Data Gaps and Conservation Implications

With exception to observations of field workers (Holland 1983; Platenkamp 1998; Preston pers. comm.; CDFG 2010), legenere has received limited research attention. Detailed studies have not been conducted regarding the biology, ecology, potential for cross pollination, population genetics, habitat relationships, population dynamics, trends or threats associated with the species. Pertinent data gaps, implications for conservation, and operating assumptions include the following.

LEG Unknown Number of Undiscovered Populations

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Planning Area and elsewhere within the range of the species. In the Planning Area, discovery of new populations of legenere may occur on the large dry-land ranchlands, public quasi-public lands and vernal pool-grassland preserves already established in the eastern portion of the County.

LEG Unknown Relationship between Landform/Soil Chemistry and Bio-Geographic Distribution

In Sacramento County, legenere is associated primarily with the Riverbank and Laguna Formations, although it also occurs on Mehrten, Undifferentiated Surfucial Alluvial Deposits, and South Fork Gravels as well. Elsewhere within its range, legenere is associated with northern basalt flow, northern claypan, northern hardpan, northern volcanic ashflow, and northern volcanic mudflow vernal pool settings. Soil properties, including chemistry, likely vary substantially among these edaphic settings.

The exact nature of the relationship of Landform to species distribution is unknown. It is probable that functioning vernal pools with well-developed hydrology, regardless of landform, soil series and soil pH (except extremes) may provide suitable habitat for this species. In the Planning Area, vernal pools are most frequent and best developed on the Laguna Formation.

LEG Unknown Pollination Ecology

In general, plants with reduced flowers tend to be self-pollinators. In addition to plants producing flowers with no petals at all (Holland 1983; Mason 1957), Oswald (1994) mentions cleistogamous flowers present in northern California legenere populations. Pollination and

breeding studies have not been conducted, so the potential for outcrossing and potential pollinator relationships are unknown.

LEG What Constitutes Population Vigor, and How to Measure?

Population vigorand population dynamics, including year-to-year variability in abundance, has not been described in detail for any of the occurrences in Sacramento County, or elsewhere. The majority of CNDDB occurrences do not have population estimates recorded for single year observations. Where given, estimates range from 15 plants to 10,000 individuals, although most vernal pools are reported to support fewer than 1,000 individuals. At several sites, observations made over multiple years indicate that legenere populations can vary between years, with low numbers present during years with sub-optimal hydrology (CDFG 2010). Other rare vernal pool species have been shown to be variable in population abundance from year-to-year (Holland 1987; Griggs pers. comm. 2003), and causative factors contributing to year-to-year population fluctuations in rare species may be difficult to identify (Alexander and Schlising 1997).

Population vigor will be difficult to assess for this cryptic species, based on number of individuals present over short intervals of time. Trends occurring over longer periods may occur that are not discernable, and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

LEG Specific Hydrological Requirements of Legenere

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting legenere populations in the Planning Area (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate).

The general lack of numerical hydrological data limits the ability to precisely monitor or assess hydrological suitability of legenere -vernal pool habitat within established preserves. Similarly, assessment of potentially suitable legenere habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing legenere populations are established, assessed and monitored over time, a more quantifiable definition of suitable legenere-vernal pool hydrology will emerge based on the new information.

LEG Existing Hydrological Trend of Pools and Existing Indirect Effects

Extant legenere populations in the Planning Area may have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

Existing legenere habitat conditions may not be pristine, so if trends in vigor or habitat quality become apparent during over time, it may be difficult to attribute trend to any specific management activity.

LEG Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations are complex and may vary substantially by geography (Holland and Dains 1990).

Proposed preserve designs may not afford complete protection to the hydrological systems that support legenere and other species assemblages dependent on them.

LEG Definition of Appropriate Scale Legenere-Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective legenere-vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale vernal pool preserve that includes rare plant populations at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et al. 1998).

LEG Determination of an Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the legenere-vernal pool preserves, primarily for upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with legenere-occupied pools, although grazing and monitoring in similar systems have been addressed (Barry 1998; TNC 2000; Griggs 2002; Robins and Vollmar 2002). It is important to note that legenere does persist though, in historically and contemporary operating livestock ranches and United States Forest Service (USFS) and Bureau of Land Management (BLM) grazing allotments. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems. Since legenere occupies medium to large-size vernal pools, management of Italian wild rye and Mediterranean barley around the margins of vernal pools, and Medusa-head grass in uplands should be monitored and managed, but not primarily for the needs of legenere specifically.

Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

LEG Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in vernal pools include western mannagrass and lippia. Others that may become problematic in the future include swamp pricklegrass, Bermuda grass, common spikerush, field bindweed, paradox canary grass, hairy hawkbit, cocklebur, and cattails. None of these species are reported to co-inhabit legenere-occupied vernal pools in Sacramento County. Any of these and others now unknown may appear and/or change in abundance in legenere -occupied pools over time. Italian wild rye and Mediterranean barley, two common non-native inhabitants of shallow vernal pools and vernal pool margins, might be of management concern to legenere if they are allowed to completely dominate the vernal pool margins and adjacent uplands. Potential competitive interactions with these species may affect the vigor of legenere populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect legenere populations.

LEG Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to combine to design preserves for multi-species conservation. Within Sacramento County, legenere has been reported as sharing vernal pools and wetlands with other rare plant species, including slender Orcutt grass, Bogg's Lake hedge-hyssop, and Sanford's arrowhead. Many of these pool complexes supporting rare species also provide habitat for rare invertebrates, amphibians, mammals, and bird species as well.

Management for multiple species maximizes the effectiveness of habitat conservation and requires coordinated monitoring and actions. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime between July 1st and April 1st may be compatible with or even benefit some legenere-associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

LEG Genetic Considerations (Spatial and Temporal Variation, Seed Bank, Drift, Bottlenecks)

Population genetics for legenere are completely unknown. For an overview of genetic considerations of vernal pool plant species, see Elam (1998). Current limitations in our understanding of legenere population genetics have little immediate conservation implication, given the relatively few number of legenere occurrences in the Planning Area.

LEG Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, the existence and potential role of a dormant soil seed bank in population dynamics is indicated by the observation of multiple-year periods during which plants were absent, followed by reappearance during a following favorable hydrologic season. Beyond observations though, there have been no empirical studies addressing the presence of a soil seed bank, seed dormancy or longevity for legenere. From the perspective of conservation, knowledge of site-specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

LEG Inoculation

Since there are few populations of legenere in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied legenere habitat, create meta-population structure at extant occurrences where single pools may support the species, and help ensure existence should any natural populations become compromised. Dispersal into, and colonization of re-established or established or enhanced seasonal wetlands and vernal pools, irrigation ditches, trenches next to railroad tracks has been documented (CDFG 2010). Legenere appears to be a self-compatible species, which is a pre-adaptation for colonization.

LEG Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter, ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant legenere occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of legenere, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect legenere and other native plant species in the future.

LEG Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall

patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology.

It is likely that given the expected global climate trends, a vigor response of some kind could be expected for legenere populations within the study period of this EIS/EIR, or at some time beyond.

PINCUSHION NAVARRETIA (PINA)

Pincushion Navarretia (PINA)

(Navarretia myersii)

Status USFWS: None

Status CDFW: None

Status CNPS: 1B.1

PINA Listing Status

Pincushion navarretia *(Navarretia myersii)* is considered to be rare, threatened or endangered throughout its range, thus qualifying its designation as a list 1B.1 species by the California Native Plant Society (CNPS 2010). I

t has been assigned an R-E-D Code of 3-3-3, meaning it is distributed in one to several highly restricted occurrences, endangered throughout its range, and entirely restricted to California.

Being a CNPS List 1B.1 plant species, pincushion navarretia meets the California Department of Fish and Wildlife's (CDFW's) definition of a special plant though it has no formal protection status by the California Department of Fish and Wildlife (CDFW) or United States Fish and Wildlife Service (USFWS).

PINA Life History and Ecology

PINA Species Description and Life History

Pincushion navarretia, a strict vernal pool endemic, is an annual in the phlox family (Polemoniaceae). This distinctive species grows very low with aggregations attaining a mat-like

appearance. The typically low-growing stems can reach up to two centimeters in height. Long thread-like leaves reaching from four to eight centimeters in length radiate from the base of the inflorescence. The inflorescence is comprised of five to 60, long (1.2 to 2.1 centimeters), tubular, sessile (stalkless) white flowers (Day 1993). These sessile flowers, long flower tubes and low-growing stems are features that most readily distinguish pincushion navarretia from the co-occurring and much more common white-headed navarretia (*N. leucocephala* ssp. *leucocephala*).

Interestingly, pincushion navarretia specimens collected from the northern edge of its range (Sacramento and Amador Counties) possess slightly shorter flower tubes, and in Sacramento County, more lobing of the inflorescence bracts, than do specimens collected from the type locality in Merced County. Plants from these northern localities are considered to be morphologic and geographic intermediates between typical *N. myersii* ssp. *myersii* and the closely related and even more rare Small pincushion navarretia (*N. myersii* ssp. *deminuta* P.S Allen and Day), which only occurs in the Coast Ranges to the northeast (Day 1995).

Pincushion navarretia, and the genus in general, has received little attention from biologists or ecologists. Pincushion navarretia was included in an investigation of evolution of adaptive morphological and life history traits of vernal pool species, with the genus *Navarretia* used as a model (Spencer and Reiseberg 1998). Pincushion navarretia was determined to be one of the more highly adapted of the vernal pool specialists in the group. Other than this single study and basic taxonomic and biogeographic treatments, pincushion navarretia remains mostly unstudied.

Since all vernal pool plant species share similar environmental selective pressures, they likely also share similar adaptive traits. For this reason, studies addressing the life history and ecology of other more common vernal pool plant species may provide some insight into the life history and ecology of pincushion navarretia.

Pincushion navarretia shares the annual growth habit with the vast majority of other endemic vernal pool plants. This adaptive trait confers to populations avoidance of the regular and extreme seasonal drought that characterizes vernal pool habitat and the Mediterranean Climate (Griggs and Jain 1983; Holland 1987; Stone et al. 1988; Zedler 1990).

The specific timing of the germination of pincushion navarretia seeds relative to the timing of the vernal pool inundation cycle has not been studied or described. In general, a given vernal pool species may germinate either during the wetting phase or the inundation-phase of the vernal pool cycle (Keeley and Zedler 1998). Seeds of the more common and related white-headed navarettia germinate under water in pool basins or on saturated soil at pool margins in the late fall and winter months, after the soil profile is saturated and vernal pools have filled (Crampton 1959; Dittes pers. obs.).

Germination requirements and optima for pincushion navarretia have not been investigated. It has been shown however, that seeds readily germinate in the laboratory by cold-stratifying imbibed seeds at two to four degrees Celsius in the dark for two weeks and then subjecting them to a cycle of 16 hours of light at 21 degrees Celsius and eight hours of dark at 15 degrees Celsius (Spencer and Rieseberg 1998). Unlike Orcuttiae grasses, symbiosis with an aquatic fungus does not appear necessary to break seed dormancy in the lab. Seed dormancy and required environmental cues for in-situ germination may exist, but are presently unknown.

One of the challenges posed to vernal pool plants is the need to photosynthesize and grow while submersed, and then transition into a terrestrial growth phase. pincushion navarretia and some other vernal pool species exhibit a juvenile isoetid growth form defined by production of cylindrical, air-filled, erect/floating leaves while submersed. These leaves facilitate light exposure and gas exchange, thus lengthening the growing season by maximizing growth while vernal pools are still inundated. This juvenile morphology contrasts with that of "adult" plants, or those producing growth during the dry-down or terrestrial phase of the vernal pool cycle. In their study of adaptive traits of vernal pool navarretias, Spencer and Rieseberg (1998) found that pincushion navarretia was the only one possessing an "unambiguous" isoetid growth form. The others were found to exhibit an inducible isoetid growth form, likely indicating a less strict requirement for, or lower tolerance of more severe vernal pool inundation regimes.

Pincushion navarretia flowers and sets seeds during the terrestrial phase of the vernal pool hydrologic cycle, typically in May (CNPS 2010), although populations in eastern Merced County were fully flowering by April 15th (Dittes and Guardino 2001). The large flowers, long flower tubes, and exerted stamens and stigmas indicate an outcrossing breeding strategy, as do a high proportion of pollen grains per flower, a large pollen-ovule ratio, and a comparatively wide corolla limb (Spencer and Rieseberg 1998).

Considering the unusually long white flowers, a specific co-evolved insect pollinator of pincushion navarretia may exist, although this has not been investigated. The existence of pollinator guilds involving co-evolved native solitary bees has been reported as occurring with a variety of vernal pool plant species (Thorp 1990, 1996). Although pollinators of Navarretia have not been investigated specifically, native solitary bees have been frequently observed visiting the closely related White-Headed Navarretia (Dittes pers. obs.). Fecundity and variation in seed production have not been investigated in pincushion navarretia.

As with many other vernal pool species, seed dispersal is naturally limited, in the case of pincushion navarretia, by an indehiscent fruit capsule that is forced open only after the fiberous seed coats absorb water and expand (Spencer and Rieseberg 1998). Limited seed dispersal in vernal pool species is thought to represent an adaptation to spatially unpredictable and limited vernal pool habitat (Griggs 1974, 1980). Natural dispersal of seeds, however limited, likely

occurs via flowing water, transport on feet and feathers of waterfowl, and in mud on hooves and legs of livestock. As with all other vernal pool species, natural dispersal of seeds was likely a more frequent event when there were many more vernal pools, more pool interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming ungulates (Griggs 1980).

The existence of a dormant soil seed bank is unknown for pincushion navarretia. The presence of a persistent soil seed bank provides insurance against localized extirpation resulting from the unpredictable occurrence and duration of appropriate growing conditions. If total seed crop failure occurs in a given year or set of years (failure to germinate, loss to late season flooding or fire, excessive grazing by livestock or grasshopper herbivory), additional stored seeds are available for another year's effort.

The population biology and genetics of pincushion navarretia have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. Elam (1996) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon. Given the highly limited number of occurrences and the scattered geographical distribution, all intra-pool pincushion navarretia populations should be considered unique, and important genetic entities.

PINA Habitat Requirements and Ecology

It is generally held that many of the endemic vernal pool plant species are relatively recent evolutionary derivations of more common and widespread upland progenitors (Stebbins 1976; Stone 1990; Raven and Axlerod 1978; Thorne 1984), including pincushion navarretia (Spencer and Rieseberg 1998). These neoendemic vernal pool species are thought to have evolved from terrestrial habitat into seasonally aquatic vernal pool habitat made available as the Mediterranean Climate developed and the inland Tertiary-age Sea dried.

Most of the pincushion navarretia occurrences in eastern Merced County are associated with the ancient, weathered alluvial terraces comprising the Valley Springs and Ione Geologic Formations (Dittes and Guardino 2001). A small number of occurrences are also found in vernal pools on the North Merced Gravels Formation. In Sacramento County, pincushion navarretia is associated primarily with the Ione and Laguna Formations

Pincushion navarretia is a strict vernal pool endemic. It is of importance to conservation however, that in contrast to the "deeply-adapted" vernal pool grasses of the Orcuttiae Tribe, pincushion navarretia occupies more commonly occurring, smaller and/or shallower vernal pools with comparatively more "flashy" hydrology. In a survey involving 19 occupied vernal pools in eastern Merced County, pincushion navarretia was documented as occurring in small to medium size vernal pools that range from 16 to 283 square meters (0.004 to 0.07 acres) in

area and from 12.7 to 25.4 centimeters (five to 10 inches) in depth (Dittes and Guardino 2001). At the Phoenix Field Ecological Reserve in Sacramento County (CNDDB occurrence #3) pincushion navarretia is reported to inhabit the margins of "the more shallow, dry pools" in the complex (CDFG 2010). Vernal pool dimensions (or reference to size) are not given for any of the other CNDDB occurrences.

Floristic associations provide further indication of preference for less extreme (more typical) vernal pool hydrological cycles than the Orcuttiae grasses. In contrast to the latter, pincushion navarretia grows in the same hydro-topographical position as more commonly occurring vernal pool associates, while Common Spikerush (*Eleocharis macrostachya*, an indicator of longer duration inundation) is lacking. Pincushion navarretia grows mixed together with Fremont's goldfields (*Lasthenia fremontii*), wooly marbles (*Psilocarphus* spp.), annual hairgrass (*Deschampsia danthonoides*), stipitate popcorn-flower (*Plagiobothrys stipitatus*), double-horned downingia (*Downingia bicornuta*), bluestars (*Brodiaea minor*), toad rush (*Juncus bufomius*), capitate rush (*Juncus capitatus*), quillwort (*Isoetes howellii*), coyote thistle (*Eryngium* spp.), Sacramento Valley pogogyne (*Pogogyne zizyphoroides*), long-beaked stork's-bill (*Erodium botrys*), and succulent owl's clover (*Castilleja campestris* ssp. *succulenta*). Most of these species are commonly occurring vernal pool species that inhabit small to medium size vernal pools and swales, and the slopes and margins of larger or deeper pools that support Orcuttiae grasses and common spikerush.

Hydrological stresses associated with vernal pools exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian wild rye and Mediterranean barley, two non-native facultative wetland species, typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types. Some suggest that built-up thatch from Italian wild rye, Mediterranean barley, Medusa-head grass, and other non-native upland species may indirectly affect vernal pool species as well by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2001).

Since pincushion navarretia occupies the smaller to medium size, "more typical" vernal pool types and the margins of larger and/or deeper pools, it may be more susceptible to the effects of excessive growth of Italian wild rye and Mediterranean barley and thatch buildup than the Orcuttiae grasses, or the more deeply-adapted legenere (*Legenere limosa*).

Although none are specifically reported to co-inhabit vernal pools with pincushion navarretia, several non-native weedy hydrophytes may present future problems. Mannagrass (*Glyceria declinata*), an aggressive weed of irrigated agriculture and degraded vernal pools, has already been reported as a potential problem at vernal pools in the region. Additional species to consider include rosy lippia (*Phyla nodiflora* var. *rosea*), field bindweed (*Convolvulus arvensis*),

common unicorn plant (*Probiscidea louisianica*), swamp pricklegrass (*Crypsis schoenoides*), crabgrass (*Cynodon dactylon*) and paradox canary grass (*Phalaris paradoxa*). Cocklebur (*Xanthium strumarium*), another native species, can also dominate vernal pools (Schlising pers. comm.; Unger pers. comm.).

Specific interactions between livestock grazing and pincushion navarretia are largely unknown. In general, appropriately timed dry-pasture livestock grazing regimes are thought to be compatible with the development and persistence of vernal pool vegetation. Robins and Vollmer (2001) provide a review of information pertaining to livestock grazing in vernal pool ecosystems.

All populations of pincushion navarretia located in eastern Merced County inhabit long-operating cattle ranches, so persistence indicates tolerance for at least some level of grazing. Observations made along fence-lines in the region indicate however, that sheep grazing may be responsible at least in part, for absence of pincushion navarretia and the co-occurring rare succulent owl's-clover in some areas (Dittes and Guardino 2001). Sheep exert a somewhat different selective pressure in vernal pools owing to very close cropping of vegetation and a tendancy to "nest" in pool basins during the terrestrial phase (Kelsey pers. comm.).

Timing of livestock grazing is likely more important than stocking rates in affecting persistence of pincushion navarretia. By limiting grazing to the period when pools are inundated and upland forage is still green and attractive, cattle tend to not congregate in pools and trampling and grazing pressures to vernal pool plant species in their seedling or juvenile aquatic phase are minimized. Once the upland forage cures and the vernal pools are in their flowering and seed-producing terrestrial phase, moist pools become more attractive to livestock and grazing and trampling pressures are increased. Grazing in the summer and fall months, after seeds have set and plants have died likely has little effect on pincushion navarretia.

Although responses to disturbance have not been described for pincushion navarretia, other pertinent examples exist. As an illustration of the role of timing in response of vernal pool species to potential disturbances, Hoover (1941) and Crampton (1959) have reported Orcuttieae grass populations being completely disked in dry-farmed grain fields in the late fall, without apparent detriment to the Orcuttieae populations the following growing season. It has been noted that the same disking performed during the late spring or summer growing periods may completely deplete the soil seed bank if performed over successive years (Stone et al. 1988). Similarly, a small vernal pool located in the middle of a winter-wheat field in eastern Merced County persists and continues to support the rare dwarf downingia (*Downingia pusilla*), despite annual disking and planting over decades (Kelsey pers. comm.; Dittes pers. obs.). It is very important to note that in these cases the disking is not disrupting the water-retaining capacity and hydrological cycle of the respective vernal pools. This is not always the case with disking.

PINA Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for pincushion navarretia are identified in Table G-3.5-1 and have been derived from input from local species experts.

Table G-3.5-1. Habitat Elements of Pincushion Navarretia

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

PINA Species Distribution and Population Trends

PINA Range Wide Distribution

Presently, pincushion navarretia is recorded from 14 CNDDB occurrences distributed along a narrow swath of the Great Central Valley, from Placer County in the north to Merced County in the south (CDFG 2010). These occurrences are all situated at sites ranging from 65 to 1,082 feet in elevation (CNPS 2010), and all lie within either the Sacramento Valley or San Joaquin Valley Subregions of the Great Valley Region of the California Floristic Province (Hickman 1993).

PINA Central Valley Distribution

The northernmost occurrence of pincushion navarretia is located near the City of Lincoln in Placer County. Six CNDDB occurrences are located in eastern Sacramento County, three in Amador County (one of these is shared with Sacramento County), one in Calaveras County, one in Placer County and four in Merced County (CDFG 2010).

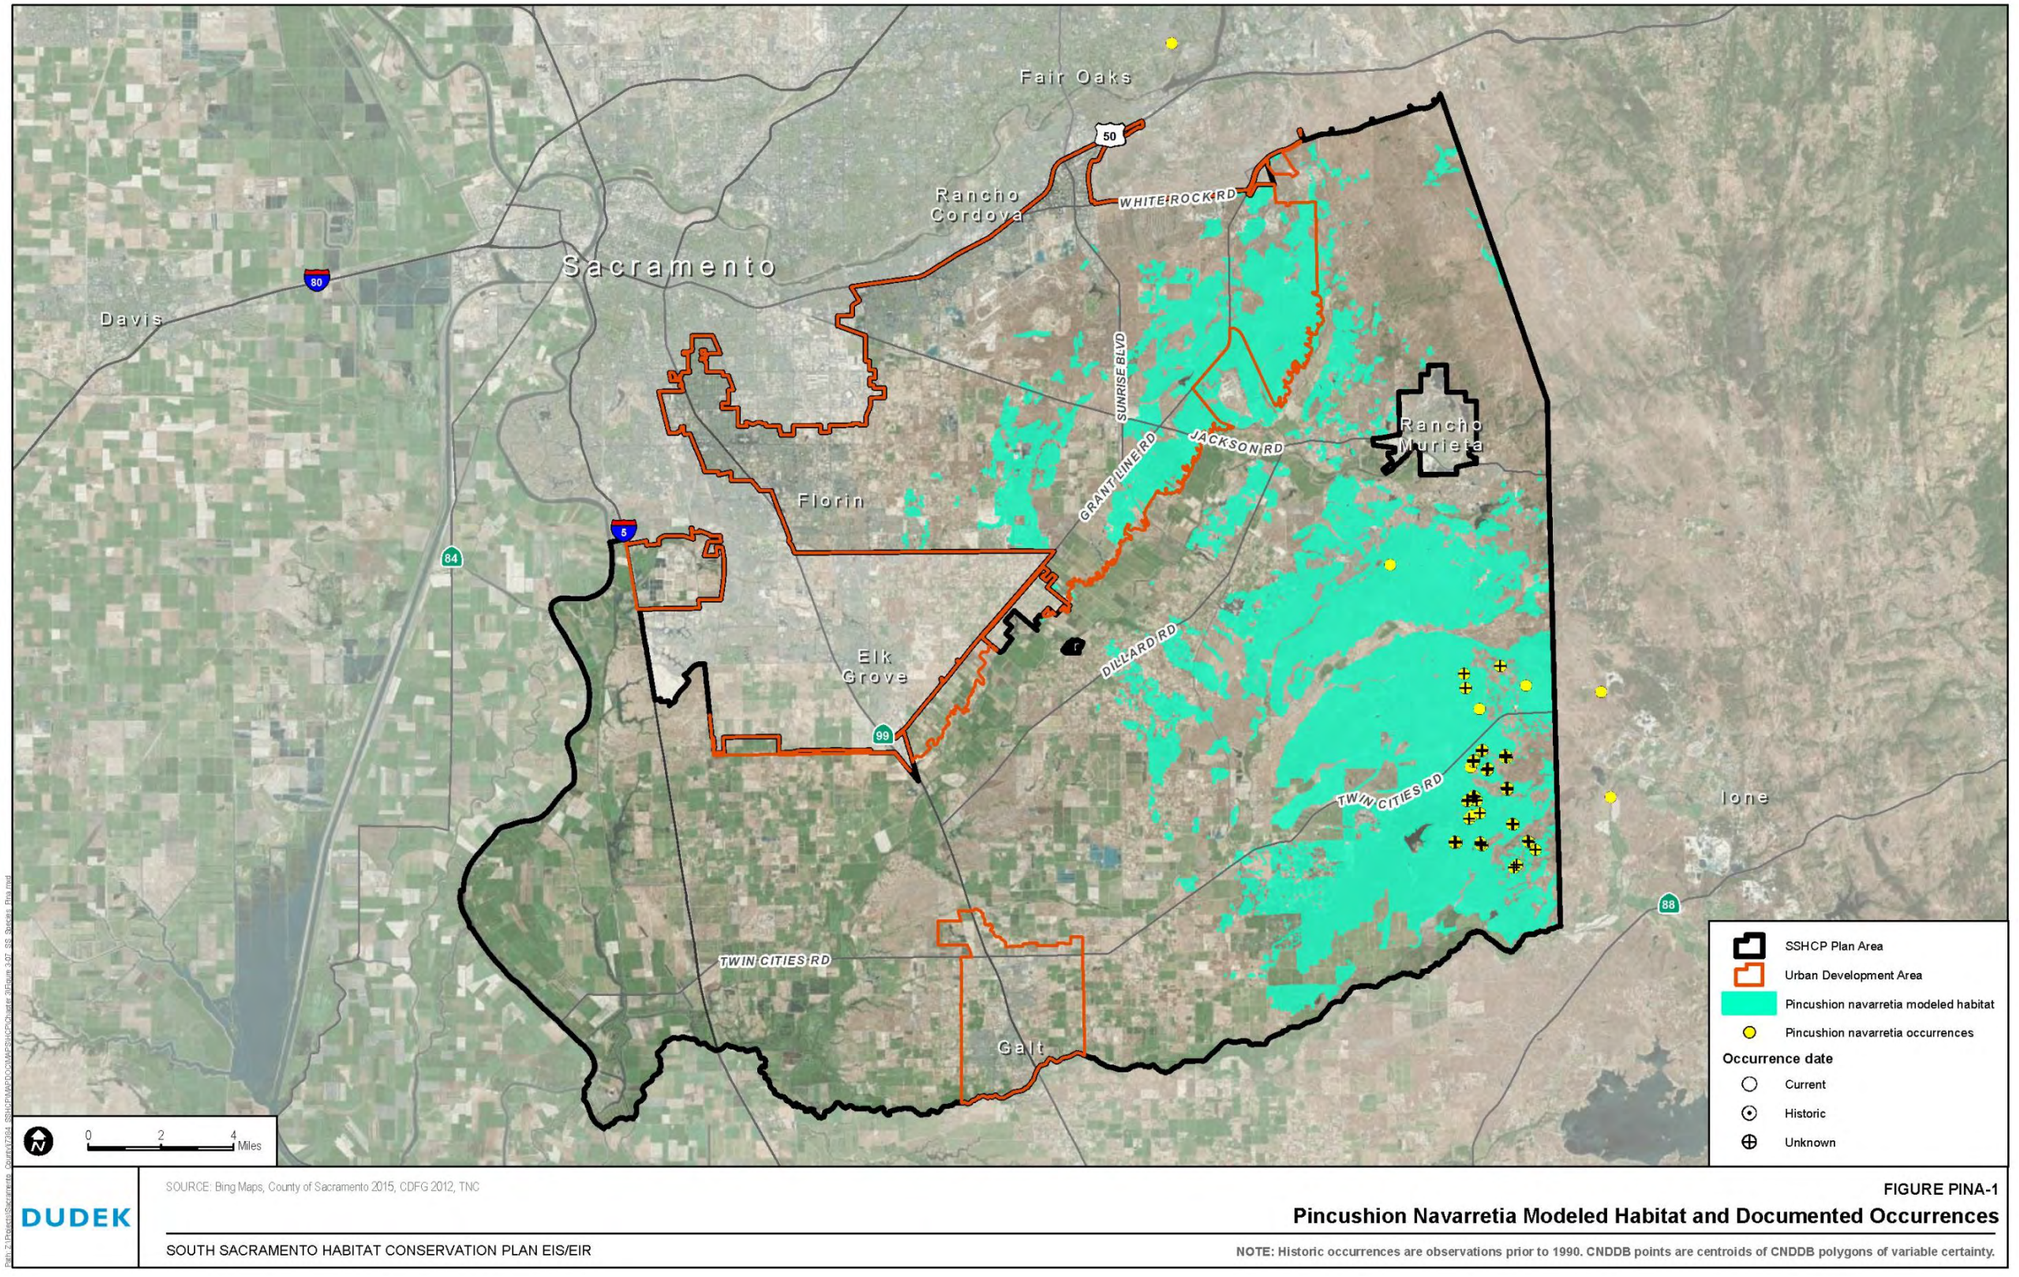
PINA Distribution within the Planning Area

Currently, of the six documented CNDDB occurrences of pincushion navarretia recorded from Sacramento County, five are included within the Planning Area (CNDDB #7-10 and #16) (Figure PINA-1). These five are located outside of the UDA in the southeast corner of the County. Most of these occurrences are on the 13,000-acre Howard Ranch property. The Howard Ranch is managed by The Nature Conservancy (TNC) as part of the Cosumnes River Watershed Project. The remaining Sacramento County Occurrence (CNDDB occurrence #3) is located outside of the Planning Area, just north of the American River at the Phoenix Field Ecological Reserve.

It is important to note that owing to its small stature, preference for small to medium-sized vernal pools and the area of remaining unsurveyed or partially surveyed habitat, moderate to high potential exists for discovery of additional populations within the Planning Area.

Table G-3.5-2 shows the soil series, geological formation and landform associations for each known occurrence in Sacramento County. Generally, pincushion navarretia is associated with old terrace remnant alluvial deposits of ancestral river channels and pediment gravels, which were deposited during the early Pleistocene between 600,000 and 1,500,000 years ago (confirm). Though the distribution of the taxon is extremely disjunct, the modeled habitat of the taxon in the Planning Area is discussed in Section G-4 of this Appendix.

Table G-3.5-2. Extant CNDDB Occurrence Numbers, Distribution, Associated Soil Series and Landform Formations For Pincushion Navarretia In Eastern Sacramento County



CNDDB Occurrence #	Quadrangle	Soil Series[a]	Geological Formation and Landform
3	Folsom	Red Bluff-Redding	Laguna Formation
7	Carbondale	Amador-Gillender	Valley Springs Formation
8	Carbondale	Amador-Gillender	Valley Springs Formation
9	Goose Creek	Corning	Laguna Formation
10	Goose Creek	Hadselville-Pentz	Modesto Formation

[a] Soil series information based on what USDA soil survey type occurs at the CNDDB species location (USDA 1993)

PINA Population Levels and Trends

Of the 15 documented occurrences presumed extant, one in Amador County (CNDDB occurrence #2) has not been observed since 1941; the Calaveras County population (CNDDB occurrence #13) has not been observed since 1957, and the Placer County population (CNDDB occurrence #12) has not been observed since 1971. The exact locations and status of these occurrences are unknown. The remaining 12 CNDDB occurrences presumed extant are also given a trend assessment of unknown (CDFG 2010).

Figure PINA-1 Pincushion Navarretia Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

It is impossible to determine the number of historically occurring pincushion navarretia populations or the acreage of suitable habitat lost to historic agricultural and urban land-use conversions, since so much had happened before these species first received attention. Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978); however, owing to habitat specificity, only a subset of the vernal pool habitat lost within the natural range of the species may have provided suitable habitat for pincushion navarretia. Effects of historic livestock grazing combined with drought and habitat alterations relating to development of non-native annual grassland are unknown as well.

There has been no comprehensive effort to monitor any of the known populations of pincushion navarretia. Numbers of individuals have not been recorded for any of the populations and year-to-year population dynamics are unknown (Table G-3.5-3).

Table G-3.5-3. Population Estimates of CNDDB Occurrences

CNDDB #	# of Pools Observed	Range of Population Estimates
3	Unknown	1994: 1000 plants
7	Unknown	2005: 1000's
8	Unknown	Unknown
9	Unknown	Unknown
10	Unknown	Unknown

Studies involving other vernal pool plant rarities, including Orcuttiae grasses and Hoover's Spurge have demonstrated marked fluctuation in numbers of individuals within populations between years (Griggs 1983; Holland 1987; Alexander and Schlising 1997). This extreme population variability is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). It is not known however, if pincushion navarretia exhibits a similar between-year pattern.

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given pincushion navarretia population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another critical aspect of population demography is the presence and nature of the soil seed bank, which is unknown for pincushion navarretia.

PINA Threats to the Species

Potential threats to pincushion navarretia include loss of vernal pool habitat to agricultural or urban/industrial land-use conversions, hydrological alteration of sub-watersheds and associated vernal pool habitat, shifts in competitive interactions (hydrological mediated or invasive weeds), inappropriate livestock grazing regimes (later spring/summer rotations, sheep vs. cattle), recreational vehicle use, equestrian and pedestrian traffic, refuse dumping, windblown refuse accumulation, air pollution and global climate change.

Irrigation runoff and invasive plants are listed as a threat at one occurrence (CNDDB occurrence #3) (CDFG 2010). Although no threats are listed for the remaining 12 occurrences, all are located on operating cattle ranches and are subject to potentially inappropriate livestock grazing regimes.

PINA Data Gaps and Conservation Implications

Despite its distinctive appearance and extreme rarity, pincushion navarretia has received little research attention from botanists or ecologists. Aside from general observations of field workers provided in the CNDDB and the study of vernal pool adaptive traits in the genus *Navarretia* (Spencer and Rieseberg 1998), nothing else exists regarding the biology, ecology, pollinators, breeding system, population genetics, habitat relationships, population levels, trends or threats associated with this taxon. Pertinent data gaps, implications for conservation, and operating assumptions include:

PINA Unknown Number of Undiscovered Populations

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Planning Area and elsewhere within the range of the species. In the Planning Area, discovery of new populations may occur on the large dry-land ranchlands, public quasi-public lands and vernal pool-grassland preserves already established in the eastern portion of the County.

PINA Unknown Relationship between Landform/Soil Chemistry and Bio-Geographic Distribution

Pincushion navarretia has a geographic association with old alluvial terraces possessing acidic soils primarily of the Ione, and to a lesser extent, Red Bluff Families (Arroyo Seco and Laguna Geological Formations). The exact nature of this relationship is however, unknown. It is unknown if soil pH or other edaphic factors influence pincushion navarretia distribution and population vigor. It is possible that the presence of functioning vernal pools, regardless of landform, soil series and soil pH can provide suitable habitat.

PINA Unknown Pollination Ecology

Pincushion navarretia possesses the longest flowers of any of the species in the genus. Floral morphology generally reflects breeding systems and pollinator relationships. It may be expected that the very long flower tubes select for a particular pollinator, perhaps even a specialized co-evolved species. Bumble-bee flies (family Bombylidae), butterflies, and moths all have feeding apparatus long enough to reach potential nectar rewards located at the base of the floral tube. Since the stigma and anthers are exerted though, it may also be possible that solitary bees, small beetles, or some insect with less specialized mouthparts collects the pollen from the exerted stamens for use and incidentally spreads it to the exerted stigmas of nearby flowers.

PINA What Constitutes Population Vigor, and How to Measure?

Population vigor and population dynamics, including year-to-year variability in abundance, have not been studied for pincushion navarretia. The existence of a dormant soil seed bank, a critical contributor to population stability in some other vernal pool species, is unknown for pincushion navarretia as well. Other rare vernal pool species have been shown to be highly variable in abundance from year-to-year (Holland 1987; Griggs pers. comm. 2003), and causative factors contributing to year-to-year population fluctuations may be difficult to identify (Alexander and Schlising 1997).

Trends may occur that are not discernable and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

PINA Specific Hydrological Requirements of Pincushion Navarretia

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting pincushion navarretia populations (e.g., timing of rainfall, depth of ponding, duration of ponding, and soil dry down rate).

The general lack of numerical hydrological data limits the ability to precisely monitor and/or assess hydrological suitability of pincushion navarretia -vernal pool habitat within established preserves. Similarly, assessment of potentially suitable pincushion navarretia habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing pincushion navarretia populations are established, assessed and monitored over time, a more quantifiable definition of suitable pincushion navarretia -vernal pool hydrology will emerge based on the new information.

PINA Existing Hydrological Trend of Pools and Existing Indirect Effects

Extant pincushion navarretia populations may have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

Existing pincushion navarretia conditions may not be pristine, so if trends in vigor or habitat quality become apparent over time, it may be difficult to attribute trend to any specific management activity.

PINA Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by geography (Holland and Dains 1990). Proposed preserve designs may not afford complete protection to the hydrological systems that support pincushion navarretia and other species assemblages dependent on them.

PINA Definition of Appropriate Scale pincushion navarretia -Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective pincushion navarretia -vernal pool preserves. It is a paradigm of conservation biology that “bigger is better” for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale vernal pool preserve that includes pincushion navarretia at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et. al. 1998).

PINA Determination of an Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the pincushion navarretia -vernal pool preserves, for upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with pincushion navarretia-occupied pools, although grazing and monitoring in similar systems have been addressed (Barry 1998; TNC 2000; Griggs 2002; Robins and Vollmar 2002). It is important to note that pincushion navarretia does persist though, in historically and contemporary operating livestock ranches. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems. Since pincushion navarretia occupied small to medium size vernal pools,

management of Italian Rye and Mediterranean Barley around the margins of vernal pools, and Medusa-head grass in uplands should be of particular management concern.

Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

PINA Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in vernal pools include western mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, field bindweed, lippia, paradox canary grass, hairy hawkbit, cocklebur and cattails. None of these are reported to coinhabit pincushion navarretia -occupied vernal pools in Sacramento County. Any of these and others now unknown may appear or change in abundance in pincushion navarretia -occupied pools over time. Italian wild rye and Mediterranean barley, two common non-native inhabitants of shallow vernal pools and vernal pool margins, might be of management concern to pincushion navarretia, owing to the latter's preference for small to medium size vernal pools.

Potential competitive interactions with these species may affect the vigor of pincushion navarretia populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect pincushion navarretia populations.

PINA Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to combine design preserves for multi-species conservation. Suitability of pincushion navarretia habitat for supporting other rare plant species has not been specifically addressed, although natural populations of the rare Sacramento Orcutt grass (Orcuttia viscida), legenere (*Legenere limosa*), and succulent owl's-clover (*Castilleja campestris* ssp. *succulenta*) are documented as sharing vernal pools with it. Many of these pool complexes also may provide habitat for rare invertebrates, amphibians, mammals, and bird species as well. Management for multiple species maximizes the effectiveness of habitat conservation and requires coordinated monitoring and actions. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime between November 1st and April 15th may be compatible with or even benefit some pincushion navarretia -associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

PINA Genetic Variation (Spatial and Temporal [Seed Bank], Genetic Drift, Genetic Bottlenecks)

Population genetics for pincushion navarretia are completely unknown. Current limitations in our understanding of pincushion navarretia population genetics have little immediate conservation implication, given the extreme rarity of pincushion navarretia.

PINA Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, the existence and potential role of a dormant soil seed bank in population dynamics is completely unknown for pincushion navarretia. There have been no studies addressing the presence of a soil seed bank, seed dormancy or longevity. From the perspective of conservation, knowledge of site specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

PINA Inoculation

Since there are so few natural populations of pincushion navarretia in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied pincushion navarretia habitat, create meta-population structure at extant occurrences where single pools may support the species, and ensure existence should any natural populations become compromised.

PINA Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter. ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant pincushion navarretia occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of pincushion navarretia, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect pincushion navarretia and other native plant species.

PINA Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology. It is likely that given the expected global climate trends, a vigor response of some kind could be expected for pincushion navarretia populations within the study period of this EIS/EIR, or at some time beyond.

SLENDER ORCUTT GRASS (SLOG)

Slender Orcutt Grass (SLOG)

(Orcuttia tenuis)

Status USFWS: Threatened

Status CDFW: Endangered

Status CNPS: List 1B.

Joe Molter, BLM

SLOG Listing Status

Slender Orcutt grass (*Orcuttia tenuis*) was first listed as state Endangered by the California Department of Fish and Wildlife (CDFW) under the California Endangered Species Act in 1988 (Stone et al. 1988), and on March 26, 1997 the species received Listing as Threatened under the Federal Endangered Species Act by the United States Fish and Wildlife Service (USFWS) (USFWS 1997). The California Native Plant Society (CNPS) includes slender Orcutt grass as a CNPS List 1B.1 species and has assigned an R-E-D Code of 2-3-3, meaning it is distributed in a limited

number of occurrences, occasionally more if each occurrence is small, it is endangered throughout its range, and found only in California (CNPS 2010).

SLOG Life History and Ecology

SLOG Species Description and Life History

Slender Orcutt grass is a member of the distinctive *Orcuttieae* Tribe of the grass family (Poaceae), a group of nine vernal pool species endemic to California and northern Baja California. The Orcutt grasses have been long recognized by botanists as highly evolved, ecologically unusual and naturally restricted (Hoover 1941; Crampton 1959; Reeder 1965, 1980, 1982).

As with other members of the tribe, slender Orcutt grass is a relatively small-stature annual species. Its five to 15 centimeter-long, sparsely hairy-sticky stems are weakly tufted and mostly erect. Like the stems and inflorescences, the 1-2 mm wide, one to five centimeters-long leaves are sparsely hairy and covered with a sticky, highly aromatic exudate. Small scale-bracted flowers (florets) are arranged in erect, two-ranked, flattened spikelets that are usually separated from each other along the exserted terminal five to 10 centimeter-long spikes (Hickman 1993). Often, the flowering stems branch from the upper nodes, with each branch terminating in a single spike-like inflorescence (Stone et al. 1988).

Slender Orcutt grass is most readily distinguished from its closest relative hairy Orcutt grass (*O. pilosa*) on the basis of the stem branching mostly from the upper nodes, the spikelets being evenly spaced rather than congested along the inflorescence axis, and being only sparsely hairy (Reeder 1982; Hickman 1993). Other than the arrangement of spikelets, slender Orcutt grass is similar to hairy Orcutt grass with respect to floral characteristics. Both have similar-sized irregularly toothed glumes and equally five-toothed lemmas, also of similar size. Although morphologically similar, specific status of slender Orcutt grass is further substantiated by a chromosome number of 2n=26, versus 2n=30 for hairy Orcutt grass (Reeder 1982).

All Orcutt grasses are very highly evolved and uniquely adapted members of the endemic vernal pool flora. Their anatomy and physiology (Keeley 1981, 1990, 1998), morphology, and life history traits (Crampton 1959; Griggs 1974, 1976, 1980, 1981) are highly adapted to the stressful, more extreme portions of the vernal pool niche. Some adaptive traits (physiology, anatomy, morphological-distinct life history stages) confer ability of individuals to survive the varied stresses of a single hydrological season, while others (e.g., annual habit, precise germination cues, stored soil seed bank, indeterminate flowering, dispersal-limiting traits) confer population stability through time in the context of year-to-year hydrological uncertainties that characterize the Mediterranean climate (Griggs 1980; Stone et al. 1988).

Evolution of the annual growth habit is a key adaptation of slender Orcutt grass to vernal pool habitat, as is the case with almost all other vernal pool plants (Griggs and Jain 1983; Holland 1987). The annual growth habit allows populations to persist through the regular and extreme summer drought that is characteristic of California's vernal pool landscape (Stone et al. 1988).

Slender Orcutt grass seeds germinate during the fall or winter months, generally 2-4 weeks after standing water has been present in the vernal pool (Griggs 1980). Germination can continue after cessation of winter rains and as the shallow water at the pool margins begins to warm and recede (Griggs 1974; Holland 1987; Stone et al. 1988). A requirement of cold stratification followed by increasingly warm fluctuating diurnal temperatures and the presence of a symbiotic aquatic fungus (*Alternaria* sp., *Curvilaria* sp.) that has been determined necessary for Orcutt grass seed germination (Griggs 1980, 1981; Keeley 1988). Sensitivity to these environmental cues ensures germination only during years with hydrological conditions favorable for plants to complete their entire life cycle (Griggs 1980, 1981; Stone et al. 1988).

Slender Orcutt grass is thought to be one of the least specifically adapted of the genus with regard to hydrology and habitat breadth (Stone et al. 1988). It has been observed to be more likely than other Orcutt grasses to germinate during years of marginal precipitation, although seedling mortality can be high during such years (Griggs 1981).

Members of the genus *Orcuttia* develop long (approximately ten centimeters), thin (one to two millimeters-wide) juvenile leaves that float on the water surface when seeds germinate under shallow water or when seeds become submersed shortly after germination (Hoover 1941; Griggs 1974, 1980, 1981; Reeder 1982). By facilitating light exposure and atmospheric gas exchange for photosynthesis while submersed, these amphibious juvenile leaves maximize vegetative growth before vernal pool dry-down (Griggs 1981; Stone et al. 1988; Keeley 1990).

Orcutt grass plants are able to produce most of their aboveground vegetative growth, as well as flowers and seed as the vernal pools dry down in late spring and early to mid-summer (Crampton 1959). Vegetative and phenological demographics appear to be largely determined by pool dry-down rate (Griggs 1974, 1980; Stone et al. 1988). Thus, mature fruiting plants in drying soil above the waterline and submersed seedlings further toward the center can occur simultaneously in a single pool.

Indeterminate growth of new stems and spikelets provides for prolonged productivity as seasonally available water allows (Griggs 1974, 1980). This habit may result in smaller plants with fewer flowers and seeds maturing earlier in the season at the pool margins, and later maturing, larger, more fecund plants towards the pool center. This morphological and phenological plasticity confers an adaptive advantage in the context of extreme seasonal

fluctuations and the unpredictable year-to-year variability of the Mediterranean Climate (Griggs 1980; Griggs and Jain 1983; Stone et al. 1988).

Since Orcutt grasses mature in a terrestrial setting during the hotter, more xeric late spring and summer months, possession of the C_4 photosynthetic pathway and Krantz Anatomy (Griggs 1980; Keeley 1990, 1998) are important adaptive traits. This photosynthetic pathway allows plants to exchange atmospheric gasses with increased efficiency and concomitant reduction in water loss to evaporative transpiration. This permits the extended period of vegetative growth and reproduction of Orcutt grasses into the hot arid summer months after most other vernal pool associates have completely desiccated (Griggs 1980; Stone et al. 1988).

All Orcutt grasses possess an aromatic sticky glandular exudate on the stems, leaves and inflorescences. This trait is thought to be advantageous both as an anti-desiccation (Hoover 1941; Crampton 1959) and anti-herbivory adaptation (Griggs 1974, 1980). Grasshoppers can exert significant herbivory pressures late in the season although it has not been noted for slender Orcutt grass specifically.

Slender Orcutt grass plants flower and set seed as the margins and basin of the vernal pools dry from May through October (CNPS 2010). Detailed pollination and breeding experiments have not been conducted on this species. Like most other grasses, Orcutt grasses are thought to be primarily wind-pollinated out-breeders as indicated by protogynous floral maturation, strongly exserted anthers and measured patterns of genetic variation (Griggs 1980; Griggs and Jain 1983; Stone et al. 1988). In one instance, native solitary bees of the family Halictidae were observed collecting pollen from one of its relatives, slender Orcutt grass (Griggs 1974).

Seed production of Orcutt grass plants is known to vary greatly between individuals along moisture gradients within single pools, among populations between pools, and within pools between years (Griggs 1980; Griggs and Jain 1983). Fully mature slender Orcutt grass individuals can produce from 11 to over 164 seeds per plant, with an average of 58 seeds estimated. Seed set in Orcutt grasses appears uncertain and dependent on precise synchrony of appropriate environmental conditions and phenological development (Stone et al. 1988).

After the growing season, the mature slender Orcutt grass seeds are held tightly within maternal floral structures (lemma and pelea) on the inflorescence until the mechanical action of wind, heavy rain and winter inundation shatter the inflorescences and release the mature florets. This lack of dispersal is thought to be an adaptation to the sparsely scattered distribution of suitable large vernal pools (Griggs 1974, 1980). It is an advantage for a large proportion of the seed crop to remain within the available large-pool habitat, rather than chance loss to unsuitable uplands. Even though dispersal is naturally limited, Orcutt grass colonization of pools was probably a more frequently occurring event in the historic past when

there were likely more populations, many more pools, more pool interconnectivity, exceedingly larger waterfowl migrations, and unfenced roaming ungulates (Griggs 1980). Of the Genus *Orcuttia*, slender Orcutt grass exhibits the greatest propensity for colonizing newly available habitat, most likely the result of seed transport by livestock (Stone et al. 1988).

Not all *Orcuttia* seeds germinate every year, resulting in the buildup of a dormant soil seed bank (Griggs 1974, 1980, 1981). The soil seed bank is a critical adaptive barrier against local extinction events that could otherwise result from the unpredictable occurrence and duration of favorable growing conditions (Stone et al. 1988). In a study of five slender Orcutt grass populations, 14 seeds were found dormant in the soil for every 1 growing plant present (Griggs 1980; Griggs and Jain 1983). Between-population and between-year variation in soil seed bank density and the duration of seed viability in the soil is unknown. The soil seed bank also may contribute to overall genetic diversity of populations, as seeds stored over multiple years produced under varying growth conditions may harbor adaptive allelic combinations that are infrequently expressed or selected.

Studies of seed weight and allozyme electrophoresis indicate that Orcutt grasses possess low levels of gene flow between populations, and high levels of gene flow within (Griggs 1980, 1984; Griggs and Jain 1983). This is to be expected given the highly insular distribution and seasonally dynamic nature of vernal pool habitat (Stone et al, 1988). These studies also revealed very high levels of genetic diversity within the seed families of individual plants, with almost 50 percent of each species' genetic variation represented in samples from one plant. In addition, approximately 80 to 90 percent of the total genetic diversity of each species was represented in each population (Griggs 1980, 1984; Griggs and Jain 1983). It should be noted that this study was limited to assaying seven enzyme systems from two populations of slender Orcutt grass.

SLOG Habitat Requirements and Ecology

Like all grasses in the genus *Orcuttia*, slender Orcutt grass is strictly adapted to the vernal pool hydrological cycle. The tribe is thought to be a relatively ancient evolutionary group (Griggs 1981; Reeder 1982), descendant from a perennial ancestor related to the Chlorideae Tribe (Keeley 1998). The ancestral entity is thought to have inhabited the marshy margins of the Tertiary-age sea formerly covering the Great Central Valley (Axelrod 1973; Raven and Axelrod 1978). The evolving Orcuttieae lineage adapted to the increasing seasonal stresses as the Mediterranean climate developed and the inland water body receded.

Interestingly and of potential significance to conservation, slender Orcutt grass appears to be the least specific of the genus *Orcuttia* with regard to niche breadth and habitat specificity. This is indicated by occupation of a wider range of vernal pool sizes and vernal wetland types, occurrence over a greater geographical area and landform types, a larger number of occurrences,

and a marked tendency to colonize newly available habitats (where seed sources are available), including constructed stock-ponds and hydrology-enhanced vernal pools (Stone et al. 1988).

Over its geographic range, slender Orcutt grass is associated with a number of distinct physiographic/edaphic settings (Stone et al. 1988). In eastern Sacramento County (southernmost populations) and on the Stillwater and Millville Plains of Shasta County, slender Orcutt grass is associated with vernal pools located on ancient weathered alluvial terraces with soils of the Redding and related Series (Stone et al. 1988). Soils of the Redding series tend to be strongly acidic (indication of age and weathering) and are generally gravelly with cobble. These soils also typically possess a shallow, water-impermeable iron-silica hardpan that favors the development of vernal pools (SCS 1993). In Tehama County, slender Orcutt grass occurs in vernal pools associated with cemented hardpan of the Tuscan, Toomes and related Series, as well as in more shallow volcanic soils and in volcanic bedrock depressions (Stone et al. 1988; CDFG 2010). The montane Occurrences of Lassen and Shasta Counties are also associated with volcanic soils, but in addition to mudflow and bedrock substrates, wetlands formed on large clay flats also support the species.

Orcutt grasses are strongly adapted to the more extreme hydrological cycles encountered in the spectrum of vernal pool types, e.g., they are typically associated with larger or deeper vernal pools that tend to possess more extreme regimes of inundation (Crampton 1959; Griggs 1974). Of the members of the genus *Orcuttia*, slender Orcutt grass tends to occupy the widest range of vernal pool sizes and types (Stone et al. 1988). Vernal pools occupied by slender Orcutt grass documented prior to 1988 range in size from 840 square meters to 45 hectares at Boggs Lake, and among the 39 pools measured, the median pool size was found to be 6,500 square meters (Stone et al. 1988). Upslope watershed area (Area of Drainage) associated with occupied pools was reported by Stone et al. (1988) to range from 0.4 to 1,145 acres among the known occurrences. It should be noted that a number of occurrences have been discovered since 1988.

Vernal pool hydrology has not been precisely defined for any of the Orcutt grasses. In general, ponding must be of sufficient duration and under the appropriate seasonal temperature regime to release the seeds from dormancy through decomposition of maternal floral structures in the presence of a symbiotic aquatic fungus (Griggs 1980; Griggs and Jain 1983; Keeley 1988). The depth or duration of pool inundation are not only critical for germination, but are likely strong determinants excluding other less specialized, but obligate vernal pool species from the barren micro-sites located in the deeper parts of pools that are inhabited by Orcutt grass species.

Ponding cannot be so excessive though, as to foster the recruitment and proliferation of native perennial marsh species, in particular common spikerush (*Eleocharis macrostachya*) (Crampton 1959; Stone et al. 1988; CDFG 2010) and cattail (*Typha* spp.). Common spikerush, a potentially aggressive rhizomatous species, is usually only found in the deepest portions of the more well

developed natural vernal pools. In such cases where it co-occurs with slender Orcutt grass, the latter grows mostly in barren areas lacking the spikerush, or at topographical positions just above the spikerush zone (Stone et al. 1988). Prolonged duration of ponding resulting from placement of berms, construction of road surfaces, or other alterations in the vicinity of natural pools has been cited as potential impacts at a number of slender Orcutt grass occurrences (CDFG 2010).

In the Sacramento Valley, slender Orcutt grass occurs in pools with other vernal pool endemics, including stalked popcorn-flower (*Plagiobothrys stipitatus*), common spikerush, coyote thistle (*Eryngium castrense*), white-headed navarretia (*Navarretia leucocephala*), water shamrock (*Marsilea vestida*), dwarf wooly marbles (*Psilocarphus brevissimus*), downingia (*Downingia* spp.), California damasonium (*Damasonium californicum*), vernal pool foxtail (*Alopecurus saccatus*), annual hairgrass (*Deschampsia danthonioides*), doveweed (*Eremocarpus setigerus*), smooth spike-primrose (*Epilobium pygmaeum*), Fitch's spikeweed (*Hemizonia fitchii*), Fremont's Goldfields (*Lasthenia fremontii*), and rabbitsfoot grass (*Polypogon monspeliensis*) (Stone et al. 1988; CDFG 2010). Many of these other vernal pool species however, do not appear to tolerate the hydrologic extremes of prime Orcutt grass habitat. They complete their lifecycle earlier in the season, and are therefore confined to the shallower margins or slopes of the deeper pools that support Orcutt grasses (Crampton 1959; Stone et al. 1988).

Hydrological stresses associated with vernal pools, and Orcutt grass pools specifically, exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian rye grass (*Lolium multiflorum*) and Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), are two non-native facultative wetland species that typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types. They cannot however, tolerate the more extreme inundation regimes of deeper Orcutt pools. Thatch build-up from Italian rye grass, Mediterranean barley, medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2002).

Although none are specifically reported to co-inhabit vernal pools with slender Orcutt grass "weedy species" are mentioned as a threat at several of the occurrences (CDFG 2010). Several non-native weedy hydrophytes may present future problems within the deeper portions of occupied Orcutt grass pools through competitive exclusion (as with common spikerush). Mannagrass (*Glyceria occidentalis*), an aggressive weed of irrigated agriculture and degraded vernal pools, has already been reported as a potential problem at several of the known related Sacramento Orcutt grass (*Orcuttia viscida*) populations. Additional species to consider include rosy lippia (*Phyla nodiflora* var. *rosea*), field bindweed (*Convolvulus arvensis*), common unicorn plant (*Probiscidea louisianica*), swamp pricklegrass (*Crypsis schoenoides*), Bermuda grass (*Cynodon dactylon*) and paradox canary grass (*Phalaris paradoxa*). Cocklebur (*Xanthium*

strumarium), another native species, can also dominate portions of Orcutt grass-type pools (Schlising, Unger pers. comm.).

Appropriately timed dry-pasture livestock grazing regimes are generally thought to be compatible with Orcutt grass populations, and may even enhance habitat in situations where Common Spikerush may otherwise predominate (Stone et al. 1988; CDFG 2010). By grazing from late fall, into early to mid-spring months, livestock are generally kept from the occupied portions of Orcutt grass pools by standing water, inundated soil and attraction to abundant green forage in the uplands. Most problems with livestock grazing arise from later spring and summer grazing regimes, when the Orcutt grass pools have dried and flowering and fruiting plants are exposed and vulnerable to trampling and cropping (Stone et al. 1988). In addition, during the later season when the upland forage has dried, the moist bottoms of vernal pools become highly attractive and may suffer increased trampling and hoof-pocking (Dittes pers. obs).

As an example of the role of timing in response to potential disturbances, Hoover (1941) and Crampton (1959) have reported Orcuttieae populations being completely disked in dry-farmed grain fields in the late fall, without apparent detriment to the Orcuttieae populations the following growing season. It has been noted that the same disking performed during the late spring or summer growing periods may completely deplete the soil seed bank and extirpate the population if performed over successive years (Stone et al. 1988).

SLOG Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for Sacramento Orcutt grass are identified in Table G-3.6-1 and have been derived from the USFWS's list of primary constituent elements in the final rule designating critical habitat for the species (USFWS 2005) as well as input from local species experts.

Table G-3.6-1. Habitat Elements for Slender Orcutt Grass

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

SLOG Species Distribution and Population Trends

SLOG Species Distribution

Slender Orcutt grass is distributed in the Sacramento Valley from eastern Sacramento County in the south, to the vicinity of Redding in Shasta County to the north. The species also occupies the adjacent Cascade Range Foothills in the region north and northeast of Red Bluff, as well as sites in the Pit River Drainage, located northeast of the Sacramento Valley. Another concentration of occurrences is located in the montane region of northern Plumas, western Lassen and eastern Shasta Counties, extending from the vicinity of Lake Almanor, north to the plateau region east and northeast of Lassen Peak. Two disjunct populations, comprising the westernmost occurrences, are located in the Inner Coast Range region of Lake County. Slender Orcutt grass is among the most widespread of the Orcuttiae grasses and exhibits the widest range in elevations (85 to 5,760 feet).

Slender Orcutt grass occurrences are distributed among five of the Geographic Subregions of the California Floristic Province, as described by Hickman (1993); the Sacramento Valley (Sacramento, Butte and Tehama Counties), Inner Coastal Range (Lake County), Cascade Range Foothill (Tehama County), High Cascade Range (Tehama, Shasta, Siskiyou, Plumas and Lassen Counties), and the non-Warner Mountain Subregion of the Modoc Plateau Region (Modoc County) (CNPS 2010).

This comparatively wide distribution may partially reflect the previously mentioned observations of Stone et al. (1988) regarding its comparatively broad habitat requirements relative to some of the other Orcutt grasses (e.g., Sacramento Orcutt grass). It may also reflect a different propensity for seed dispersal by waterfowl, or perhaps even a different “biogeographic legacy” (e.g., timeline of evolution and geographic distribution of ancestral taxon).

SLOG Central Valley Distribution

In the Central Valley, slender Orcutt grass occurs among five population centers. The southernmost of these, comprising three CNNDB occurrences and one yet to be recorded occurrence, is located in eastern Sacramento County. The next population center, comprised of two occurrences, is located approximately 65 miles to the north in southern Butte County. The next population center to the north, comprised of 30 occurrences, is located in Tehama County (CDFG 2010).

A large portion of the extant slender Orcutt grass occurrences are distributed among the remaining two Central Valley population centers. The northernmost, extends from the Stillwater Plains near Redding, to the Millville Plains in the vicinity of Cottonwood and Anderson to the south. The remaining Central Valley population center is located at slightly higher

elevations in the Cascade Range Foothills of Tehama County, north and northeast of Red Bluff in the vicinity of Manton, Dales Lake, Dales, and Hog Lake Plateau.

SLOG Distribution within the Planning Area

Currently, there are three recorded CNDDB occurrences of slender Orcutt grass presently known within the Planning Area (Figure SLOG-1), and one occurrence that is not yet registered with the CNDDB (Witham pers. comm.). One of these (CNDDB occurrence #16) is situated on the alluvial terrace at the northern edge of Laguna Creek, southeast of the intersection of Gerber and Excelsior Roads. This occurrence, comprised of a single occupied natural vernal pool, is situated within a proposed 300-acre habitat preserve (Klotz Property). This occurrence is located within the Planning Area as well as within the Sacramento UDA. The second slender Orcutt grass occurrence within the Planning Area is located just south of the Klotz property and is also located on a property that is proposed for a preserve (occurrence #90).

The third slender Orcutt grass occurrence located within the Planning Area is situated on the terrace landscape to the east of Mather Field, between Douglas Road and Kiefer Boulevard (CNDDB occurrence #71). This occurrence, comprised of one occupied natural vernal pool, is also located within the UDA. This occurrence is not currently protected, but is proposed for inclusion within a 20-acre vernal pool mitigation preserve (Radmacher pers. comm., 2003)

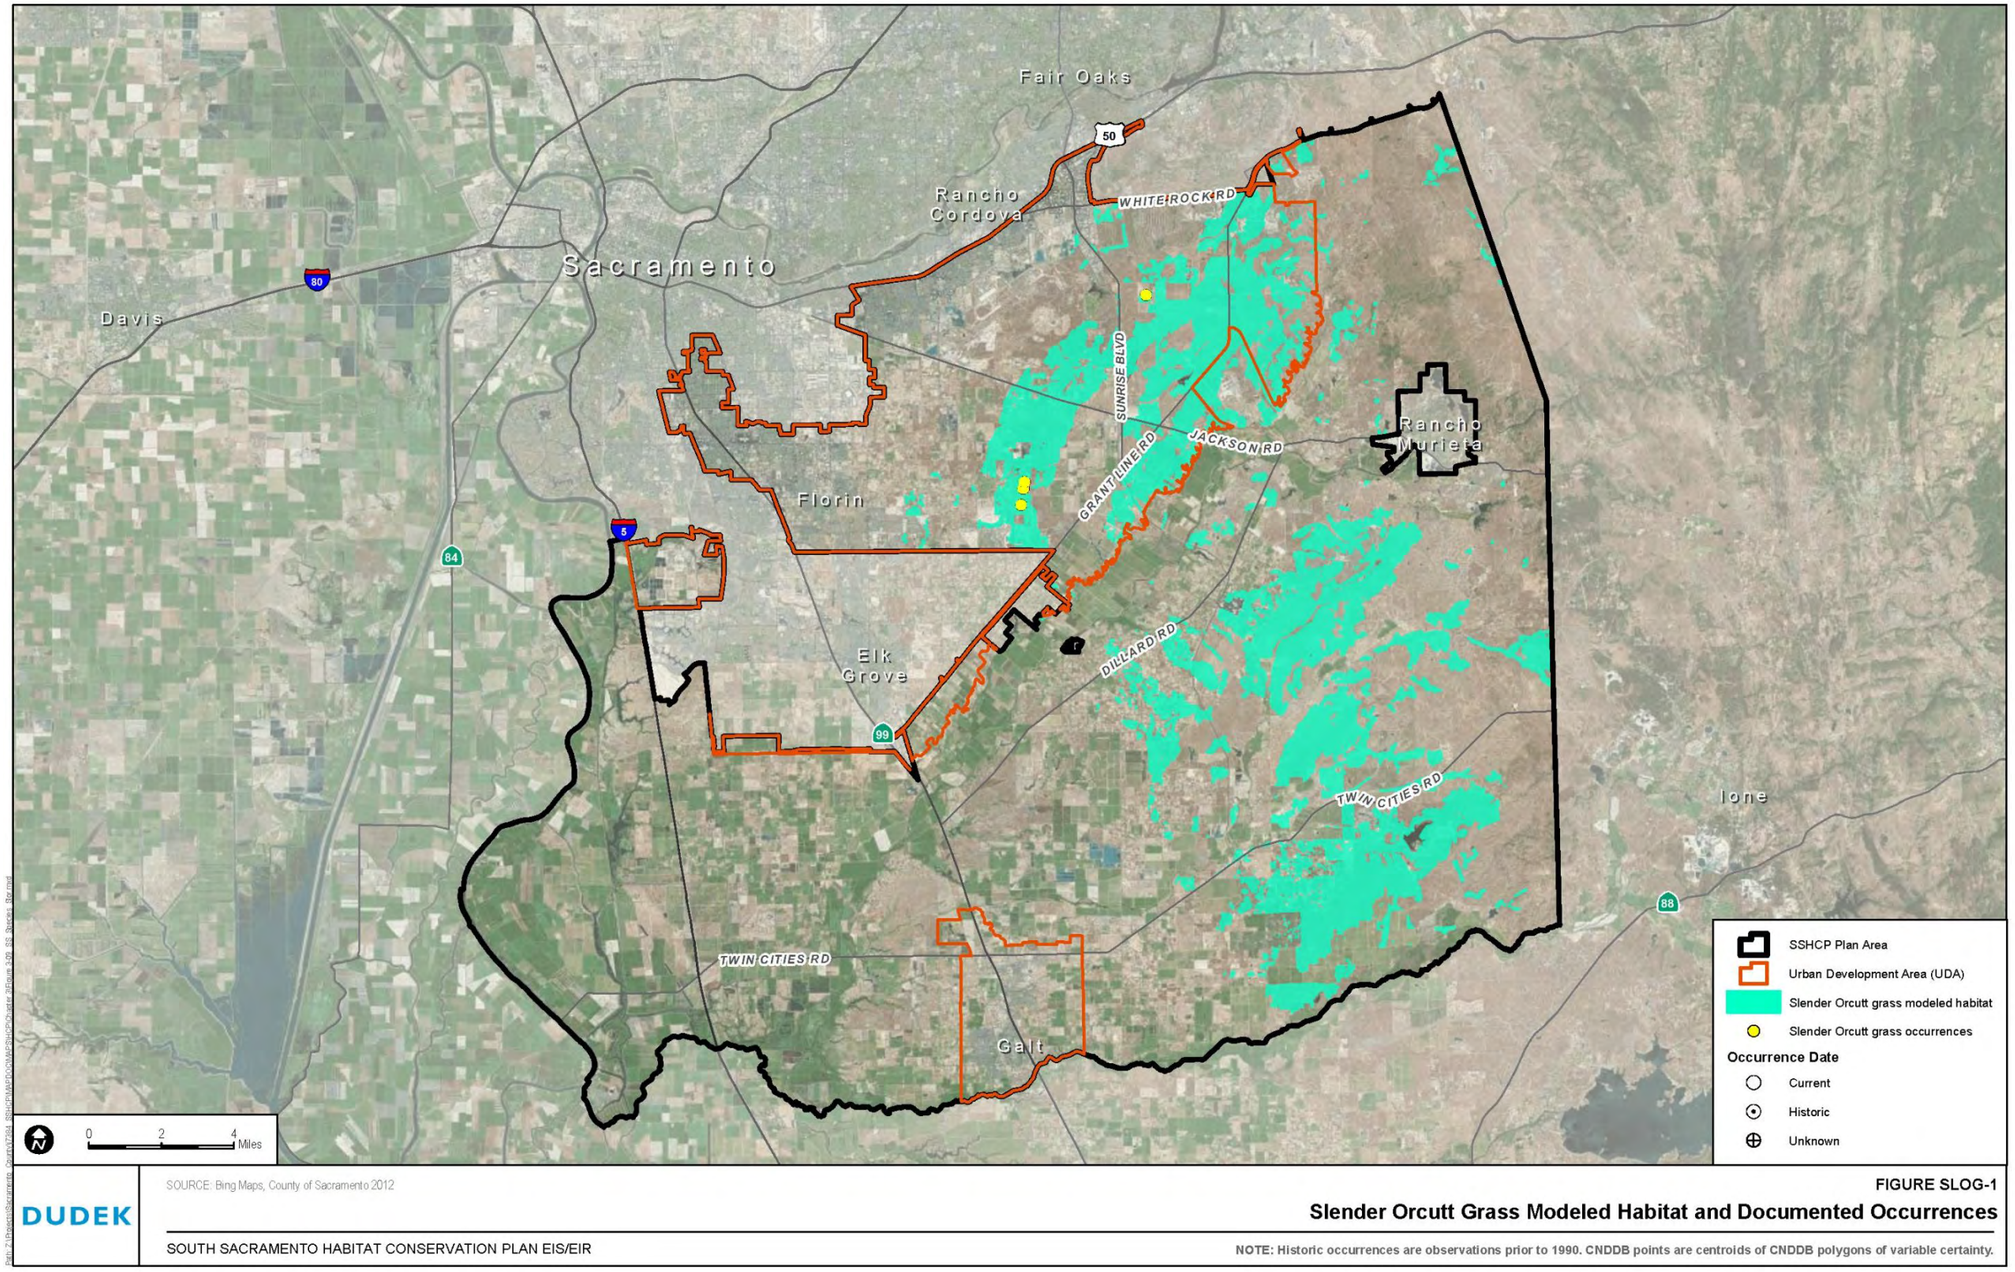
A fourth occurrence not yet reported in the CNDDB is located at the Unico Radio Facility on the south side of White Rock Road. This occurrence is within the Planning Area as well as within the UDA (Radmacher pers. comm. 2003).

In Sacramento County, slender Orcutt grass is associated with the Laguna Formation. This geological landform is comprised of remnant old-terrace alluvial deposits of ancestral river channels and pediment gravels, which were deposited during the early Pleistocene, between 600,000 and 1,500,000 years ago. Though the distribution of the species is extremely disjunct, the modeled habitat of the species in the Planning Area is discussed in Section G-4 of this Appendix.

SLOG Population Levels and Trends

Alice Eastwood collected the type collection for slender Orcutt grass in Shasta County in 1912. Since then, a total of 90 occurrences have been recorded (CDFG 2010), including 31 in Tehama County, 24 in Shasta County, a shared occurrence in Shasta and Tehama counties, five in Lassen County, 18 in Modoc County, four in Plumas County, three in Sacramento County and two occurrences in each of Siskiyou, Butte, and Lake counties. It should be noted that an additional population not yet recorded in the CNDDB is known from Sacramento County (CDFG 2010).

Of the 90 documented CNDDB occurrences, one is possibly extirpated from Shasta County and the shared Shasta/Tehama County occurrence is possibly extirpated. In addition, downward population trends have been reported for six populations in Shasta County, two in Tehama County, and one in Plumas County. Of the 90 known occurrences, only two have been classified as "stable." The population trends for the remaining 79 occurrences are classified as "unknown." By 1991, the CDFG stated that the trend for slender Orcutt grass is one of decline (USFWS 1997).



It is impossible to determine the number of historically occurring slender Orcutt grass populations or the acreage of suitable habitat lost to historic agricultural land-use conversions, since so much had happened before these species first received attention (Stone et al. 1988). Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978, Jones & Stokes 1990), however owing to habitat specificity (restriction to), only a subset of the vernal pool habitat lost within the natural range of the species likely provided suitable habitat for slender Orcutt grass (Stone et al. 1988). Concerns over loss of Orcutt grass populations and habitat were expressed beginning with some of the earliest investigators (Hoover 1941; Crampton 1959, 1976; Griggs 1974).

There has been no comprehensive effort to monitor all populations of slender Orcutt grass. Various monitoring projects have been conducted by BLM, USFS, and CDFW. Stone et al. (1988) also provided estimates of populations at all Occurrences visited in 1986 and 1987.

Research conducted at other sites and on other Orcuttiae species indicate that abundance of individuals within Orcutt grass populations varies greatly between species, between populations within species, and within populations through years (Griggs and Jain 1983). This extreme population variability is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). Fluctuations of similar magnitude are also recorded for hairy Orcutt grass (*Orcuttia pilosa*), slender Orcutt grass (*Orcuttia tenuis*), and Greene's tuctoria (*Tuctoria greenei*) at the Vina Plains Preserve in Tehama County (Alexander and Schlising 1997).

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given Orcutt grass population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another aspect of population demography is the quantity and age of stored seed in the soil profile. Undoubtedly, the number of stored seeds in the soil profile has bearing on how many plants can be produced in a given favorable year.

Figure SLOG-1 Slender Orcutt Grass Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

SLOG Threats to the Species

Potential direct threats to slender Orcutt grass include loss of vernal pool habitat to agricultural or urban/industrial land-use conversions, construction and maintenance of firebreaks, roads, and utility corridors, timber harvest activities (in montane occurrences), inappropriate livestock grazing regimes (later spring/summer rotations), grassland fires, recreational vehicles, equestrian and pedestrian traffic, and refuse dumping.

Potential Indirect threats to slender Orcutt grass include hydrological alteration of sub-watersheds by surrounding developments and land uses, shifts in competitive interactions (hydrology-mediated or invasive weeds), windblown refuse accumulation, point and non-point source water pollution, air pollution, and global climate change.

The proposed Klotz Preserve encompasses approximately 300 acres of vernal pool habitat supporting one CNDDB Occurrence of slender Orcutt grass (CNDDB Occurrence #16). The proposed Were preserve encompasses approximately 160 acres of vernal pool habitat supporting one CNDDB Occurrence of slender Orcutt grass (CNDDB Occurrence #90) The other Sacramento County CNDDB Occurrence (CNDDB Occurrence #71) is currently unprotected, but is planned for inclusion within a proposed 20-acre vernal pool preserve. The fourth slender Orcutt grass occurrence known in Sacramento County, located at the Unica Radio Facility Site, is currently unprotected.

The USFWS has designated critical habitat areas for slender Orcutt grass that encompasses all of the known occurrences and a large portion of the remaining potentially suitable habitat.

SLOG Data Gaps and Conservation Implications

Grasses of the Tribe Orcuttieae, including slender Orcutt grass, are among the most studied and best known of all vernal pool plant species and vernal pool species assemblages. As previously discussed, researchers have variously addressed taxonomy and biogeography, biology, ecology, breeding system, population genetics, habitat relationships, population levels, trends and threats. Even with the attention of researchers and relatively extensive body of information, data gaps with varying implications for conservation remain including:

SLOG What Constitutes Population Vigor, and How to Measure?

A good measure of Orcutt grass population vigor is difficult to define, given the highly variable year-to-year abundance within populations (Holland 1987; Griggs pers. comm. 2003). The contribution of the stored soil seed bank to population numbers and population genetic diversity is an important, but currently unknown factor as well. Furthermore, even if a trend at

the population level is discerned, causative factors contributing to year-to-year population fluctuations may be very difficult to identify (Alexander and Schlising 1997).

Trends may occur that are not discernable and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

SLOG Specific Hydrological Requirements of Slender Orcutt Grass

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting slender Orcutt grass populations (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate). At the same time, It is also important to note that slender Orcutt grass is cited as one of the more broadly adapted species of the genus, inhabiting a wider array of vernal pool sizes and types, and one of the most likely to germinate during years with marginal precipitation (Holland 1987; Griggs pers. comm.).

The general lack of numerical hydrological data limits the ability to precisely monitor or assess hydrological suitability of slender Orcutt grass-vernal pool habitat within established preserves. Similarly, assessment of potentially suitable slender Orcutt grass habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing slender Orcutt grass populations are established, assessed and monitored over time, a more quantifiable definition of suitable slender Orcutt grass-vernal pool hydrology may be developed.

SLOG Existing Hydrological Trend of Pools and Existing Indirect Effects

Several slender Orcutt grass populations throughout the state have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

Existing slender Orcutt grass conditions are not pristine, so if trends in vigor or habitat quality become apparent over time, it may be difficult to attribute trend to any specific management activity.

SLOG Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by geography (Holland and Dains 1990). The geo-hydrologic investigation of Hanes and Stromberg (1998), conducted at a single site over three years in

eastern Sacramento County, addresses aspects of vernal pool hydrology that are important to consider in formulation of hydrological buffers (e.g., relationship between pool basin hydrology and surrounding upland soil profile).

Proposed preserve designs may not afford complete protection to the hydrological systems that support slender Orcutt grass and other species assemblages dependent on them without more information on appropriate scale hydrologic buffers.

SLOG Definition of Appropriate Scale Slender Orcutt Grass-Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective slender Orcutt grass-vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale Sacramento Orcutt grass pool preserve at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et al. 1998).

Proposed preserve designs may not afford complete protection to the ecosystems that slender Orcutt grass and other species assemblages depend on without more information on appropriate scale of preserve area.

SLOG Determination of an Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the slender Orcutt grass-vernal pool preserves, primarily for upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with slender Orcutt grass-occupied pools, although grazing and monitoring in similar systems have been addressed (Barry 1998, TNC 2000; Griggs 2002; Robins and Vollmar 2002; Burmester pers. comm.). It is important to note that slender Orcutt grass and other members of the Orcuttiae tribe do persist though, in historically and contemporary operating livestock ranches. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems.

. Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

With regard to compatible grazing regimes, timing of grazing appears far more important than stocking rate, grazing intensity, or duration of rotation in annual grassland pasture systems that support Orcutt grass-occupied vernal pools (Stone et al. 1988; Griggs 2000; Griggs pers. comm.). During the inundated period of the vernal pool cycle (generally late fall through mid-to late spring), germinating seed and establishing aquatic-phase seedlings are afforded protection from trampling and grazing by a general aversion of cattle to standing water, as well as

attractive forage in uplands. Even if some cattle congregate at the edge or meander into or across the pools while inundated, germinating seeds in the deeper portions of the pools are unaffected, the vast majority of the pool substrate escapes trampling and nothing is eaten.

Conversely, grazing during the dry-down period or terrestrial phase, when plants are flowering and setting seed can be detrimental to the season's flowering effort and seed crop (generally mid-to late spring through the summer and early fall months). Given multiple years of improperly timed grazing and seed loss (both from standing crop and exhaustion of soil seed bank), populations may decline in vigor and may even be extirpated.

SLOG Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in Orcuttiae-occupied vernal pools include western mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, field bindweed, Lippia (*Phyla nodiflora*), paradox canary grass, cocklebur, and cattails. Of these, common spikerush presently co-inhabit slender Orcutt grass-occupied vernal pools in Sacramento County. Any of these and others now unknown may appear or change in abundance in slender Orcutt grass-occupied pools over time.

Potential competitive interactions with these species may affect the vigor of slender Orcutt grass populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect slender Orcutt grass populations.

SLOG Unknown Relationship Between Landform/Soil Chemistry And Bio-Geographic Distribution

In Sacramento County, slender Orcutt grass has a geographic association with old alluvial terraces possessing soils primarily of the Redding Family (Laguna Geological Formation). Occurrences in Tehama, Lassen and Modoc Counties are associated with other landforms and soils as well. The exact nature of this relationship to landform and soil is however, unknown. Given the relatively wide distribution of this species though, it is unlikely that soil pH or other parameter of soil chemistry strongly influences slender Orcutt grass distribution and population vigor. It is more likely that large or deep vernal pools, regardless of landform, soil series and soil pH may provide suitable habitat.

From the perspective of slender Orcutt grass conservation, this uncertainty has bearing on the definition of potentially suitable habitat, which guides surveys and establishment of habitat preserves.

SLOG Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to design preserves for multi-species conservation. Suitability of slender Orcutt grass habitat for supporting other rare plant species has not been specifically addressed, although natural populations of the rare pincushion navarretia (*Navarretia myersii* ssp. *myersii*), Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), and legenere (*Legenere limosa*) are documented as sharing specific vernal pools with slender Orcutt grass. Many of these pool complexes also may provide habitat for rare invertebrates, amphibians, mammals and bird species as well.

Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime between November 1st and May 1st may benefit slender Orcutt grass-associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

SLOG Genetic Considerations (Spatial and Temporal Variation, Seed Bank, Drift, Bottlenecks)

It has been determined that *Orcuttia* populations are genetically isolated as well as diverse, the latter both within and between pools (populations), and within the "seed family" of a single reproductive plant. In addition, there is a high degree of localized adaptation and strong intra-pool selective pressures (Griggs 1980; Griggs and Jain 1983). However, investigations of slender Orcutt grass population genetics have been limited to measures of seed size and weight (genetically fixed traits) within and among populations, and electrophoretic study of seven enzyme systems in only two populations. These analyses represent a very small portion of the genome and allow limited interpretation of patterns of genetic diversity and limited inference as to uniqueness of a given population. Another potentially important consideration is that there has been no assessment of the "genetic memory" potentially associated with stored seeds in the soil seed bank. Elam (1996) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon.

SLOG Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, it appears that slender Orcutt grass populations depend on a substantial reserve of dormant seed stored in the soil as a buffer against single year and multiple-year cycles of unfavorable hydrological conditions. This population parameter has only been measured in a few pools during one growing season (Griggs 1980). There have been no other studies addressing spatial or temporal variability of seed abundance in the soil seed bank or longevity of dormant seeds.

From the perspective of conservation, knowledge of site-specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

SLOG Inoculation

Since there are so few natural populations of slender Orcutt grass in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied slender Orcutt grass habitat, create meta-population structure at extant occurrences where single pools now support the species, and ensure existence should any natural populations become compromised.

In addition to complete protection and enhancement of natural populations, it has been suggested that experimental inoculations may be desirable for Orcuttieae conservation (Griggs and Jain 1983; Griggs pers. comm.). The experimental establishment of a Sacramento Orcutt grass population at Phoenix Field (CNDDB occurrence #15), now 25 years-old, provides some indication of the probable success of inoculating suitable habitat and creating self-sustaining populations. However, not all experimental inoculations attempted during the research of Griggs were “successful.” (Griggs pers. comm.). Inoculations of slender Orcutt grass planted in Tehama County into re-established or established pools have had marginal success due to excessive ponding and competitive exclusion from Cattails. These Occurrences (CNDDB Occurrence # 72, #73 and #74) are rank as “poor” and the current population trends are “unknown.” The population genetics and long-term viability of artificially inoculated population for Orcutt grasses are unknown.

SLOG Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter, ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant slender Orcutt grass occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of slender Orcutt grass, if existing air quality can be maintained. If however, California’s human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect slender Orcutt grass and other native plant species.

If air pollution becomes such a problem that slender Orcutt grass is affected, few management options will exist to change conditions for this species.

SLOG Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology.

It is likely that given the expected global climate trends, a vigor response of some kind could be expected for slender Orcutt grass populations within the EIS/EIR Study Period, or at some time beyond.

SLOG Unknown Number of Undiscovered Populations

Additional unsurveyed potentially suitable habitat exists within the Planning Area, principally on the larger private dry-land ranches that harbor well-developed vernal pools and vernal pool complexes. Authorities generally consider slender Orcutt grass as one of the more completely understood species with regard to distribution and frequency (Stone, Taylor, Macdonald, Griggs, 2002 pers. comm.), owing primarily to typical association with only the best developed of vernal pools and seemingly natural restricted range; however, it is also acknowledged that a limited number of additional populations could be yet discovered as the remaining large tracts become surveyed.

It is very unlikely however, that enough populations remain to be discovered to justify a future change in the conservation status of slender Orcutt grass (Stone, Taylor, Witham, Griggs pers. comm.).

It is assumed that most, but perhaps not all extant populations of slender Orcutt grass are already known. It is further assumed that since there are so few natural populations and the probability of finding a substantial number more is low, that all populations yet discovered are of great conservation importance and should receive the same protection and management.

SACRAMENTO ORCUTT GRASS (SAOG)

Sacramento Orcutt Grass (SAOG)

(Orcuttia tenuis)

Status USFWS: Endangered

Status CDFW: Endangered

Status CNPS: 1B.1

SAOG Listing Status

Sacramento Orcutt grass (*Orcuttia viscida*), also commonly called sticky Orcutt grass, was first listed as state Endangered by the California Department of Fish and Wildlife (CDFW) under the California Endangered Species Act in 1988 (Stone et al. 1988), and on March 26, 1997 the species received listing by the United States Fish and Wildlife Service (USFWS) as Endangered under the Federal Endangered Species Act (USFWS 1997). The California Native Plant Society

(CNPS) includes Sacramento Orcutt grass as a CNPS List 1B.1 species and has assigned an R-E-D Code of 3-3-3, meaning it is distributed in several highly restricted occurrences, or present in such small numbers that it is seldom found and reported, it is endangered throughout its range, and found only in California (CNPS 2010).

SAOG Life History and Ecology

SAOG Species Description and Life History

Sacramento Orcutt grass is a member of the distinctive Orcuttieae Tribe of the grass family (Poaceae), a group of nine vernal pool species endemic to California and northern Baja California. The Orcutt grasses have been long recognized by botanists as highly evolved, ecologically unusual and naturally restricted (Hoover 1941; Crampton 1959; Reeder 1965, 1980, 1982).

As with other members of the tribe, Sacramento Orcutt grass is a relatively small-stature annual species. Its three to 10 centimeter-long, densely hairy-sticky stems are tufted and mostly erect to spreading with age. Like the stems and inflorescences, the two to four millimeter-wide leaves are also hairy and densely covered with a sticky, highly aromatic exudate. Small scale-bracted flowers (florets) are arranged in dense two-ranked, flattened spikelets that are more or less overlapping and clustered together into exserted terminal three to five centimeter-long spikes (Hickman 1993).

Sacramento Orcutt grass is most readily distinguished from its closest relatives California Orcutt grass (*O. californica)* and San Joaquin Valley Orcutt grass (*O. inaequalis*) on the basis of having five unequal lemma lobes with the central lobe being the longest, the large lemma size (six to seven millimeter), lemma awn length (greater than one millimeter), and comparatively long fruit ($\pm$ 2.5 millimeter) (Hickman 1993). These morphological characters were first used to circumscribe the taxon as *O. californica* var. *viscida* (Hoover 1941). Subsequent study of morphology, chromosome number, and seed protein composition justified elevation of both varieties *O. tenuis* and *O*. *inaequalis* to specific rank (Reeder 1980, 1982).

All Orcutt grasses are very highly evolved and uniquely adapted members of the endemic vernal pool flora. Their anatomy and physiology (Keeley 1981, 1990, 1998), morphology, and life history traits (Crampton 1959; Griggs 1974, 1980, 1981) are highly adapted to the stressful, more extreme portions of the vernal pool niche. Some adaptive traits (physiology, anatomy, morphological-distinct life history stages) confer ability of individuals to survive the varied stresses of a single hydrological season, while others (e.g., annual habit, precise germination cues, stored soil seed bank, indeterminate flowering, dispersal-limiting traits) confer population stability through time in the context of year-to-year hydrological uncertainties that characterize the prevailing Mediterranean Climate (Griggs 1980; Stone et al. 1988).

Evolution of the annual growth habit is a key adaptation of Sacramento Orcutt grass to vernal pool habitat, as is the case with almost all other vernal pool plants (Griggs and Jain 1983; Holland 1987). The annual growth habit allows populations to persist through the regular and extreme summer drought that is characteristic of California's vernal pool landscape (Stone et al. 1988).

Sacramento Orcutt grass seeds germinate during the later spring months after cessation of winter rains and as the shallow water at the pool margins begins to warm and recede (Griggs 1974; Holland 1987; Stone et al. 1988). A requirement of cold stratification followed by increasingly warm fluctuating diurnal temperatures and the presence of a symbiotic aquatic fungus that has been determined necessary for Orcutt grass seed germination (Griggs 1980, 1981; Keeley 1988). Sensitivity to these environmental cues ensures germination only during years with hydrological conditions favorable for plants to complete their entire life cycle (Griggs 1980, 1981; Stone et al. 1988).

Sacramento Orcutt grass is thought to be the most specifically adapted of the genus with regard to suitable hydrology (Stone et al. 1988). It has been observed to be the least likely to germinate during years of marginal precipitation (Holland 1987). During a 14 year-long observation period at one population (CNDDB Occurrence #15), it was determined that Sacramento Orcutt grass numbers peaked in years when heavy rains (greater than 40 centimeters [15.7 inches]) occurred in the period from November through April and vernal pools remained inundated longer than usual (Holland 1987).

Members of the genus *Orcuttia* develop long (approximately 10 centimeters), thin (one to two millimeters-wide) juvenile leaves that float on the water surface when seeds germinate under shallow water or when seeds become submersed shortly after germination (Hoover 1941; Griggs 1974, 1980, 1981; Reeder 1982). By facilitating light exposure and atmospheric gas exchange for photosynthesis while submersed, these amphibious juvenile leaves maximize vegetative growth before vernal pool dry-down (Griggs 1981; Stone et al. 1988; Keeley 1990).

Orcutt grass plants are able to produce most of their above-ground vegetative growth, as well as flowers and seed as the vernal pools dry down in late spring and early to mid-summer (Crampton 1959). Vegetative and phenological demographics appear to be largely determined by pool dry-down rate (Griggs 1974, 1980; Stone et al. 1988). Thus, mature fruiting plants in drying soil above the waterline and submersed seedlings further toward the center can occur simultaneously in a single pool.

Indeterminate growth of new stems and spikelets provides for prolonged productivity as seasonally available water allows (Griggs 1974, 1980). This habit may result in smaller plants with fewer flowers and seeds maturing earlier in the season at the pool margins, and later maturing, larger, more fecund plants towards the pool center. This morphological and

phenological plasticity confers an adaptive advantage in the context of extreme seasonal fluctuations and the unpredictable year-to-year variability of the Mediterranean Climate (Griggs 1980; Griggs and Jain 1983; Stone et al. 1988).

Since Orcutt grasses mature in a terrestrial setting during the hotter, more xeric late spring and summer months, possession of the C_4 photosynthetic pathway and Krantz Anatomy (Griggs 1980; Keeley 1990, 1998) are important adaptive traits. This photosynthetic pathway allows plants to exchange atmospheric gasses with increased efficiency and concomitant reduction in water loss to evaporative transpiration. This permits the extended period of vegetative growth and reproduction of Orcutt grasses into the hot arid summer months after most other vernal pool associates have completely desiccated (Griggs 1980; Stone et al. 1988).

All Orcutt grasses possess an aromatic sticky glandular exudate on the stems, leaves and inflorescences. This trait, particularly well developed in Sacramento Orcutt grass, is thought to be advantageous both as an anti-desiccation (Hoover 1941; Crampton 1959) and anti-herbivory adaptation (Griggs 1974, 1980). Grasshoppers can exert significant herbivory pressures late in the season although it has not been noted for Sacramento Orcutt grass specifically.

Sacramento Orcutt grass plants flower and set seed as the margins and basin of the vernal pools dry from April through July (CNPS 2010). Detailed pollination and breeding experiments have not been conducted on this species. Like most other grasses, Orcutt grasses are thought to be primarily wind-pollinated out-breeders as indicated by protogynous floral maturation, strongly exserted anthers and measured patterns of genetic variation (Griggs 1980; Griggs and Jain 1983; Stone et al. 1988). In one instance, native solitary bees of the family Halictidae were observed collecting pollen from Sacramento Orcutt grass plants (Griggs 1974).

Seed production of Orcutt grass plants is known to vary greatly between individuals along moisture gradients within single pools, among populations between pools, and within pools between years (Griggs 1980; Griggs and Jain 1983). Fully mature Sacramento Orcutt grass individuals can produce from 0 to over 600 seeds per plant. Seed set in Orcutt grasses appears uncertain and dependent on precise synchrony of appropriate environmental conditions and phenological development (Stone et al. 1988).

After the growing season, the mature Sacramento Orcutt grass seeds are held tightly within maternal floral structures (lemma and pelea) on the inflorescence until the mechanical action of wind, heavy rain and winter inundation shatter the inflorescences and release the mature florets. This lack of dispersal is thought to be an adaptation to the very sparsely scattered distribution of suitable large vernal pools (Griggs 1974, 1980). It is an advantage for a large proportion of the seed crop to remain within the available large-pool habitat, rather than chance loss to unsuitable uplands. Even though dispersal is naturally limited, Orcutt grass

colonization of pools was probably a more frequently occurring event in the historic past when there were likely more populations, many more pools, more pool interconnectivity, exceedingly larger waterfowl migrations, and unfenced roaming ungulates (Griggs 1980).

Not all *Orcuttia* seeds germinate every year, resulting in the buildup of a dormant soil seed bank (Griggs 1974, 1980, 1981). The soil seed bank is a critical adaptive barrier against local extinction events that could otherwise result from the unpredictable occurrence and duration of favorable growing conditions (Stone et al. 1988). In a study of one Sacramento Orcutt grass population, 44 seeds were found dormant in the soil for every one growing plant present (Griggs 1980; Griggs and Jain 1983). Between-population and between-year variation in soil seed bank density and the duration of seed viability in the soil is unknown. The soil seed bank also may contribute to overall genetic diversity of populations, as seeds stored over multiple years produced under varying growth conditions may harbor adaptive allelic combinations that are infrequently expressed or selected for.

Studies of seed weight and allozyme electrophoresis indicate that Orcutt grasses possess low levels of gene flow between populations, and high levels of gene flow within (Griggs 1980, 1984; Griggs and Jain 1983). This is to be expected given the highly insular distribution and seasonally dynamic nature of vernal pool habitat (Stone et al, 1988). These studies also revealed very high levels of genetic diversity within the seed families of individual plants, with almost 50 percent of each species' genetic variation represented in samples from one plant. In addition, approximately 80 to 90 percent of the total genetic diversity of each species was represented in each population (Griggs 1980, 1984; Griggs and Jain 1983). It should be noted that this study was limited to assaying four enzyme systems from two populations of Sacramento Orcutt grass.

SAOG Habitat Requirements and Ecology

Like all grasses in the genus *Orcuttia*, Sacramento Orcutt grass is strictly adapted to habitats possessing vernal pool-type hydrology. The tribe is thought to be a relatively ancient evolutionary group (Griggs 1981; Reeder 1982), descendant from a perennial ancestor related to the Chlorideae Tribe (Keeley 1998). The ancestral entity is thought to have inhabited the marshy margins of the Tertiary-age sea formerly covering the Great Central Valley (Axelrod 1973; Raven and Axelrod 1978). The evolving Orcuttieae lineage adapted to the increasing seasonal stresses as the Mediterranean climate developed and the inland water body receded.

Interestingly and of potential significance to conservation, Sacramento Orcutt grass appears to be the most specific of the genus *Orcuttia* with regard to niche breadth, as indicated by restriction to the largest of pools (Stone et al. 1988), comparatively poor seed germination

during marginal hydrologic-seasons (Stone et al. 1988; Holland 1987), and highly limited geographic distribution.

Sacramento Orcutt grass is restricted to the older and more weathered high terrace alluvial landform that comprises the Laguna Geologic Formation (SCS 1993). Soils associated with Sacramento Orcutt grass vernal pools include the Red Bluff-Redding Complex (0 to 5 percent slopes), Redding Gravelly Loam (0 to 8 percent slopes), Corning Complex (0 to 8 percent slopes), and Xerarents-Urban Land San Joaquin Complex (0 to 5 percent slopes). These soils tend to be strongly acidic, an indication of age and weathering (SCS 1993). In addition to being acidic, these soils are gravelly with cobble, and in many places, they possess a shallow, water-impermeable iron-silica hardpan that favors the development of vernal pools (SCS 1993).

Natural restriction of Sacramento Orcutt grass to these alluvial terrace landforms and associated soil series may reflect the propensity of these soils and landforms to develop suitably large vernal pools with appropriate hydrological regimes. Holland and Dains (1990) have shown how landform and soil relate to hydrological characteristics of vernal pools, and how these factors may influence floristic composition. This distribution may also reflect on the biogeography of an old geological surface that has remained exposed and relatively undisturbed over geological time, away from lower elevation, more recent alluvial depositions.

Orcutt grasses are strongly adapted to the more extreme hydrological cycles encountered in the spectrum of vernal pool types (e.g., they are typically associated with larger or deeper vernal pools that tend to possess more extreme regimes of inundation) (Crampton 1959; Griggs 1974). Of the members of the genus *Orcuttia*, Sacramento Orcutt grass tends to occupy the larger, more hydrologic-extreme pools. Vernal pools occupied by Sacramento Orcutt grass documented prior to 1988 range in size from 100 square meters (~120 square yards) to 10 hectares (~25 acres), and among the 10 pools measured, the median pool size was found to be 2,800 square meters (~3,349 square yards) (Stone et al. 1988). Upslope watershed area (Area of Drainage) associated with occupied pools was reported by Stone et al. (1988) to range from 0.5 to 123 acres among the known occurrences.

Since 1988, additional smaller pools within one of the pool complexes located east of Mather Air Force Base were found to support this species (CNDDB Occurrence #6) (CDFG 2010). Even though Sacramento Orcutt grass can be found in smaller pools (as measured by surface area), it is important to consider that even these are relatively deep, exhibit characteristics of well-developed vernal pool hydrology (Preston 2002 pers. comm.), and are situated in relatively close proximity to more typical, large pools within the 123-acre drainage area reported by Stone et al. (1988).

Vernal pool hydrology has not been precisely defined for any of the Orcutt grasses. In general, ponding must be of sufficient duration and under the appropriate seasonal temperature regime to release the seeds from dormancy through decomposition of maternal floral structures in the presence of a symbiotic aquatic fungus (Griggs 1980; Griggs and Jain 1983; Keeley 1988). The depth or duration of pool inundation are also likely factors excluding other less specialized, but obligate, vernal pool species from the barren micro-sites located in the deeper parts of pools that are inhabited by Sacramento Orcutt grass.

Ponding cannot be so excessive though, as to foster the recruitment and proliferation of native perennial marsh species, in particular common spikerush (*Eleocharis macrostachya*) (Crampton 1959; Stone et al. 1988; CDFG 2010). This potentially aggressive rhizomatous species is usually only found in the deepest portions of the more well developed natural vernal pools. In such cases where it co-occurs with Sacramento Orcutt grass, the latter grows mostly in barren areas lacking the spikerush (Stone et al. 1988). Prolonged duration of ponding resulting from placement of berms, construction of road surfaces, or urban development in the vicinity of natural pools appears to have resulted in increase vigor of common spikerush with concomitant loss of Sacramento Orcutt grass vigor in three pools in the complex east of Grant Line Road (CNDDB Occurrence #6) (Jones and Stokes 1990, 1998). Hydrological alteration and proliferation of common spikerush may also have negatively affected Sacramento Orcutt grass habitat at two Phoenix Field occurrences (CNDDB Occurrences #5 and 15) and the occurrence immediately east of Mather Air Force Base (CNDDB Occurrence #17; Preston pers. comm.).

Sacramento Orcutt grass occurs in pools with other vernal pool endemics, including Howell's quillwort (*Isoetes howelii*), coyote thistle (*Eryngium castrense*), dwarf wooly marbles (*Psilocarphus brevissimus*), flowering quillwort (*Lilaea scilloides*), stalked popcorn-flower (*Plagiobothrys stipitatus*), common spikerush, pincushion navarretia (*Navarretia myersii* ssp. *myersii*), Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), legenere (*Legenere limosa*), white-headed navarretia (*Navarretia leucocephala*), double-horned downingia (*Downingia bicornuta*), goldfields (*Lasthenia* spp.) and hairy pepperwort (*Marsilea vestida*) (CDFG 2010). Many of these other vernal pool species however, do not appear to tolerate the hydrologic extremes of prime Sacramento Orcutt grass habitat. They complete their life cycle earlier in the season, and are therefore confined to the shallower margins or slopes of the deeper pools that support Sacramento Orcutt grass (Crampton 1959; Stone et al. 1988).

Hydrological stresses associated with vernal pools, and Orcutt grass pools specifically, exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian wild rye (*Lolium multiflorum*) and Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*) are two non-native facultative wetland species that typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types. They cannot however, tolerate the more extreme

inundation regimes of deeper Orcutt pools. Thatch build-up from Italian rye grass, Mediterranean barley, Medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmer 2001)

Several non-native weedy hydrophytes may however, present problems within the deeper portions of occupied Orcutt pools through competitive exclusion (as with common spikerush). Mannagrass (*Glyceria occidentalis*), an aggressive weed of irrigated agriculture and degraded vernal pools has already been reported as a potential problem at two of the known Sacramento Orcutt grass populations (CNDDB Occurrences #16 and #17). Although not recorded from any Sacramento Orcutt grass populations, other non-native aggressive species that can become problematic in deeper Orcutt grass-type vernal pools include rosy Lippia (*Phyla nodiflora* var. *rosea*), field bindweed (*Convolvulus arvensis*), swamp pricklegrass (*Crypsis schoenoides*), Bermuda grass (*Cynodon dactylon*) and paradox canary grass (*Phalaris paradoxa*) (Dittes pers. obs.). Cocklebur (*Xanthium strumarium*), another native species, can also come to dominate portions of Orcutt grass-type pools (Schlising, Unger pers. comm.).

Appropriately timed dry-pasture livestock grazing regimes are generally thought to be compatible with Orcutt grass populations, and may even enhance habitat in situations where Common spikerush may otherwise predominate (Stone et al. 1988; CDFG 2010). By grazing from late fall, into early to mid-spring months, livestock are generally kept from the occupied portions of Orcutt grass pools by standing water, inundated soil and attraction to abundant green forage in the uplands. Most problems with livestock grazing arise from later spring and summer grazing regimes, when the Orcutt grass pools have dried and flowering and fruiting plants are exposed and vulnerable to trampling and cropping (Stone et al. 1988). In addition, during the later season when the upland forage has dried, the moist bottoms of vernal pools become highly attractive and may suffer increased trampling and hoof-pocking (Dittes pers. obs).

As an example of the role of timing in relation to potential disturbance response, Hoover (1941) and Crampton (1959) have reported Orcuttieae populations being completely disked in dry-farmed grain fields in the late fall, without apparent detriment to the populations the following growing season. It has been noted that the same disking performed during the late spring or summer growing periods may completely deplete the soil seed bank and extirpate the population if performed over successive years (Stone et al. 1988).

SAOG Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for Sacramento Orcutt grass are identified in Table G-3.7-1 and have been derived from the USFWS's list of primary constituent elements in

the final rule designating critical habitat for the species (USFWS 2005) as well as input from local species experts.

Table G-3.7-1. Habitat Elements for Sacramento Orcutt Grass

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

SAOG Species Distribution and Population Trends

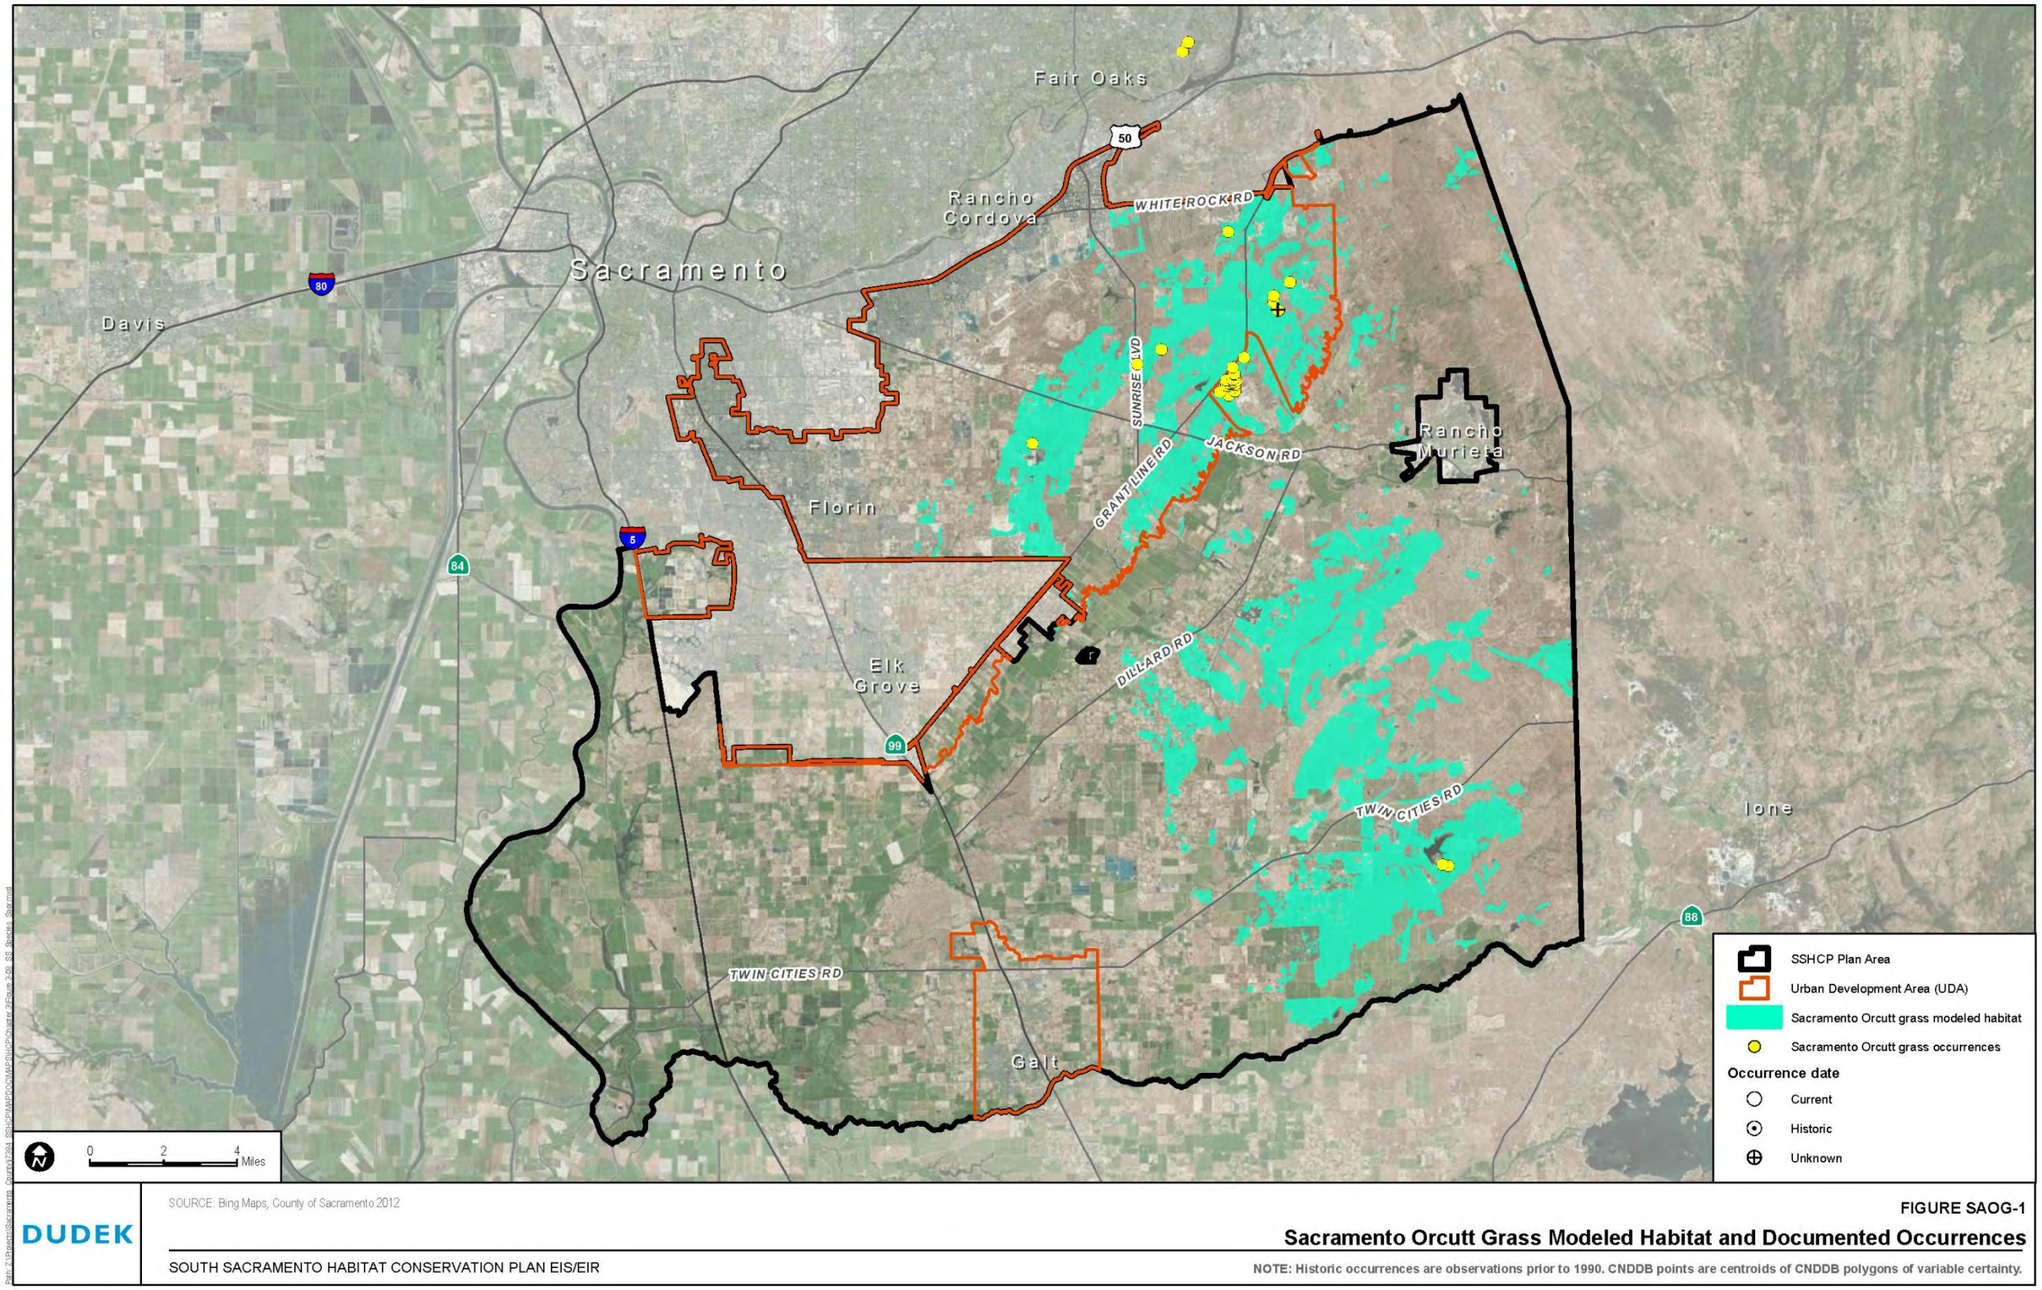
SAOG Species Distribution

Sacramento Orcutt grass occurs only in southeastern Sacramento County near the juncture of the Sierra Nevada foothills and eastern edge of the Sacramento Valley, qualifying it as the most geographically restricted member of the genus *Orcuttia*. There are no historic records or collections of this species made outside of this area (Stone et al. 1988; CDFG 2010). This distinction may partially reflect the previously mentioned observations of Holland (1987) and Stone et al. (1988) regarding its relatively high level of ecological specialization and comparatively narrow habitat requirements. This distribution also may reflect the fact that the largest, most hydrological stable pools located at lower topographical positions in the Central Valley were the first to have been lost to agriculture in the latter 19th and early 20th centuries, before the pioneering collections of Hoover and Crampton were made.

SAOG Central Valley Distribution

Sacramento Orcutt grass occurs within a narrow swath of remnant high terraces that lay near the juncture of the Northern Sierra Nevada Foothill and Sacramento Valley Biogeographic Provinces (Hickman 1993), between 110 and 270 feet in elevation (CDFG 2010). The recorded range of the species extends in a narrow band of habitat from the terrace just north of the American River in the vicinity of Orangevale, south approximately 26 miles to the vicinity of Rancho Seco Lake on the Arroyo Seco Mesa.

Nine extant (and one extinct) CNDDB occurrences are recorded from within this narrow north-to-south oriented band (CDFG 2010). These ten CNDDB occurrences are clustered among three geographically defined regions, hereafter referred to as the northernmost, central, and southernmost population centers (CDFG 2010).



The northernmost of the three Sacramento Orcutt grass population centers, located on the alluvial terrace north of the American River, is comprised of three CNDDB occurrences. The northernmost occurrence, located near Orangevale, is extinct (CNDDB occurrence #4). One occurrence, comprised of one occupied vernal pool, is located further south at Phoenix Field (CNDDB occurrence #5). An artificially introduced population is located in a single vernal pool at nearby Phoenix Park (CNDDB occurrence # 15). It has been suggested that since the Phoenix Park Occurrence has established from seed derived from the Phoenix Field occurrence, the two are best considered as one genetic population. The northernmost population center (CNDDB occurrences #4, #5, and #15) is located outside of the Planning Area.

SAOG Distribution within the Planning Area

The central population center is located on the terrace landscape east of Mather Air Force Base in the vicinity of the Laguna Creek watershed. As measured by the number of CNDDB occurrences, number of occupied pools and past estimates of the number of individuals, this population center comprises the core of the species' currently known distribution (CDFG 2010; Stone pers. comm. 2002). Within an area spanning approximately seven miles by four miles, six CNDDB occurrences are known. This central Sacramento Orcutt grass population center lies within the Planning Area, however four of the occurrences are included within the UDA (CNDDB occurrences #17, #18, #19 and #20) and two occurrences are in the Keifer Landfill area outside of the UDA (CNDDB occurrences #1 and #6) (Figure SAOG-1).

The southernmost population center, comprised of just one occurrence (CNDDB occurrence #16), is located approximately three miles north of the Sacramento-San Joaquin County Line near Rancho Seco Lake. This population is located approximately 14 miles south of the next nearest population. This southernmost site is located within the Planning Area, but outside of the Sacramento UDA. The distribution of the species is extremely disjunct. The modeled habitat of the species in the Planning Area is discussed in Section G-4 of this Appendix.

INTENTIONALLY LEFT BLANK

SAOG Population Levels and Trends

It is impossible to determine the number of historically occurring Sacramento Orcutt grass populations or the acreage of suitable habitat lost to historic agricultural land-use conversions, since so much had happened before these species first received attention (Stone *et. al*. 1988). Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978). Owing to habitat specificity (restriction to largest pools), only a subset of the vernal pool habitat lost within the natural range of the species likely provided suitable habitat for Sacramento Orcutt grass (Stone et al. 1988). Concerns over loss of Orcutt grass populations and habitat were expressed beginning with some of the earlier investigators (Hoover 1941; Crampton 1959, 1976; Griggs 1974).

The first collections of Sacramento Orcutt grass were made by Hoover in 1941. At that time, much habitat had already been lost, including some of the larger, lower terrace pools that occupied sites most favorable to agricultural development. Since 1941, a total of only 30 occupied vernal pools have been recorded, two of which (CNDDB occurrence #4 and portion of CNDDB occurrence # 6) were extirpated by 1988 (Stone et al. 1988, CDFG 2010). By 1991, the USFWS stated that the trend for Sacramento Orcutt Grass is one of rapid decline (USFWS 1997).

There has been no comprehensive effort to monitor all populations of Sacramento Orcutt grass. Informal monitoring projects have been conducted by the CDFW at the Phoenix Field Ecological Preserve, by Holland at the Phoenix Park Vernal Pool Preserve, and by Jones and Stokes at the Kiefer Landfill sites (Preston pers. comm.). Stone et al. (1988) also provided estimates of populations at all occurrences visited in 1986 and 1987. Population estimates recorded for Sacramento Orcutt Grass are summarized in Table G-3.7-2.

Table G-3.7-2. Sacramento Orcutt Grass Population Estimates for Eastern Sacramento County

CNDDB Occurrence #	Occurrence # of pools observed	Range of population estimates
1	1	1986-87: "numerous" 1995: 400,000 1998: 138,000
5	1	1986: >200,000 1994-96: >100,000 1997: 9,500
6	6-19	1990: "thousands" 1995: >1,000,000 1998: 129,000
15	1	1978: (0) pool seeded 1985: >1,000 1986: >10,000 1991: >1,000 1995: ~ 100,000 1996: 35 1997: 1,000
16	1	1986: ~500 1987:200 1993: < 20 (M. Gause) 1995: 300

20	Unknown	Unknown

Source: CDFG 2010; Stone et al. 1988

These data, and research of others, indicate that abundance within Orcutt grass populations varies greatly between populations, and within populations from year to year (Griggs and Jain 1983; Holland 1987). This extreme population variability is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). Fluctuations of similar magnitude are also recorded for hairy Orcutt grass (*Orcuttia pilosa*), slender Orcutt grass (*Orcuttia tenuis*), and Greene's tuctoria (*Tuctoria greenei*) at the Vina Plains Preserve in Tehama County (Alexander and Schlising 1997).

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given Orcutt grass population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another aspect of population demography is

the quantity and age of stored seed in the soil profile. Undoubtedly, the number of stored seeds in the soil profile has bearing on how many plants can be produced in a given favorable year.

SAOG Threats to the Species

Potential direct threats to Sacramento Orcutt grass include loss of vernal pool habitat to agricultural or urban/industrial land-use conversions, construction and maintenance of firebreaks, roads, and utility corridors, inappropriate livestock grazing regimes (later spring/summer rotations), grassland fires, recreational vehicles, equestrian and pedestrian traffic, and refuse dumping.

Potential Indirect threats to Sacramento Orcutt grass include hydrological alteration of sub-watersheds by surrounding developments and land uses, shifts in competitive interactions (hydrology-mediated or invasive weeds), windblown refuse accumulation, point and non-point source water pollution, air pollution, and global climate change.

Preserves currently established or in the process of becoming established that include Sacramento Orcutt grass are the Sunrise-Douglas Mitigation Bank and the Kiefer Landfill Wetland Preserve. The Sunrise-Douglas preserve encompasses approximately 480 acres of vernal pool annual grassland habitat supporting two CNDDB occurrences (CNDDB occurrence #17 and #18). The proposed Kiefer Wetland Preserve will encompass two CNDDB occurrences (CNDDB occurrence #1 and #6), encompassing 19 occupied pools, and an undetermined number of acres of annual grassland vernal pool habitat. The remaining Sacramento Orcutt Grass Occurrences in the Planning Area (CNDDB occurrences #16, #19 and #20) remain unprotected.

The USFWS has designated critical habitat areas for Sacramento Orcutt grass that encompasses all of the known 0ccurrences and a large portion of the remaining potentially suitable habitat.

SAOG Data Gaps and Conservation Implications

Grasses of the Tribe Orcuttieae, including Sacramento Orcutt grass, are among the most studied and best known of all vernal pool plant species and vernal pool species assemblages. As previously discussed, researchers have variously addressed taxonomy and biogeography, biology, ecology, breeding system, population genetics, habitat relationships, population levels, trends and threats. Even with the attention of researchers and relatively extensive body of information, data gaps with varying implications for conservation remain including:

SAOG What Constitutes Population Vigor, and How to Measure?

A good measure of Orcutt grass population vigor is difficult to define, given the highly variable year-to-year abundance within populations (Holland 1987; Griggs pers. comm. 2003). The contribution

of the stored soil seed bank to population numbers and population genetic diversity is an important, but currently unknown factor as well. Furthermore, even if a trend at the population level is discerned, causative factors contributing to year-to-year population fluctuations may be very difficult to identify (Alexander and Schlising 1997). Therefore, trends may occur that are not discernable and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

SAOG Specific Hydrological Requirements of Sacramento Orcutt Grass

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting Sacramento Orcutt Grass populations (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate). At the same time, It is also important to note that Sacramento Orcutt Grass is cited as one of the more specifically adapted species of the genus, inhabiting the more well-developed of vernal pools, and one of the least likely to germinate during years with marginal precipitation (Holland 1987; Griggs pers. comm.). The general lack of numerical hydrological data limits the ability to precisely monitor or assess hydrological suitability of Sacramento Orcutt Grass-vernal pool habitat within established preserves. Similarly, assessment of potentially suitable Sacramento Orcutt grass habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing Sacramento Orcutt grass populations are established, assessed and monitored over time, a more quantifiable definition of suitable Sacramento Orcutt grass -vernal pool hydrology may be developed.

SAOG Existing Hydrological Trend of Pools and Existing Indirect Effects

Most of the Sacramento Orcutt grass populations have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds. Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown. Existing Sacramento Orcutt grass conditions for are not pristine, so if trends in vigor or habitat quality become apparent over time, it may be difficult to attribute trend to any specific management activity.

SAOG Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by geography (Holland and Dains 1990). The geo-hydrologic investigation of Hanes and Stromberg (1998), conducted at a single site over three years in eastern Sacramento County, addresses aspects of vernal pool hydrology that are important to

consider in formulation of hydrological buffers (e.g., relationship between pool basin hydrology and surrounding upland soil profile).

Proposed preserve designs may not afford complete protection to the hydrological systems that support Sacramento Orcutt grass and other species assemblages dependent on them without more information on appropriate scale hydrologic buffers.

SAOG Definition of Appropriate Scale Sacramento Orcutt Grass -Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective Sacramento Orcutt grass -vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale Sacramento Orcutt grass -vernal pool preserve at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et al. 1998). Proposed preserve designs may not afford complete protection to the ecosystems that Sacramento Orcutt grass and other species assemblages depend on without more information on appropriate scale of preserve area.

SAOG Determination of an Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the Sacramento Orcutt grass -vernal pool preserves, primarily for upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with Sacramento Orcutt grass -occupied pools; although grazing and monitoring in similar systems have been addressed (Barry 1998; TNC 2000; Griggs 2002; Robins and Vollmar 2002; Burmester pers. comm.). It is important to note that Sacramento Orcutt grass and other members of the Orcuttiae tribe do persist though, in historically and contemporary operating livestock ranches. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems.

Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

With regard to compatible grazing regimes, timing of grazing appears far more important than stocking rate, grazing intensity, or duration of rotation in annual grassland pasture systems that support Orcutt grass-occupied vernal pools (Stone et al. 1988; Griggs 2000; Griggs pers. comm.). During the inundated period of the vernal pool cycle (generally late fall through mid-to late spring), germinating seed and establishing aquatic-phase seedlings are afforded protection from trampling and grazing by a general aversion of cattle to standing water, as well as attractive forage in uplands. Even if some cattle congregate at the edge or meander into or

across the pools while inundated, germinating seeds in the deeper portions of the pools are unaffected, the vast majority of the pool substrate escapes trampling and nothing is eaten.

Conversely, grazing during the dry-down period or terrestrial phase, when plants are flowering and setting seed can be detrimental to the season's flowering effort and seed crop (generally mid-to late spring through the summer and early fall months). Given multiple years of improperly timed grazing and seed loss (both from standing crop and exhaustion of soil seed bank), populations may decline in vigor and may even be extirpated.

SAOG Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in Orcuttiae-occupied vernal pools include western mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, field bindweed, lippia, paradox canary grass and cocklebur. Of these, western mannagrass and common spikerush presently co-inhabit Sacramento Orcutt grass -occupied vernal pools. Any of these, as well as currently unknown, species may appear or change in abundance in Sacramento Orcutt grass -occupied pools over time.

Potential competitive interactions with these species may affect the vigor of Sacramento Orcutt grass populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect Sacramento Orcutt grass populations

SAOG Unknown Relationship Between Landform/Soil Chemistry and Bio-Geographic Distribution

As previously mentioned, Sacramento Orcutt Grass has a strong geographic association with old alluvial terraces possessing soils primarily of the Redding, and to a lesser extent, Red Bluff Families (Laguna Geological Formation). This association has proven useful in predicting the location of new populations, as indicated by the southernmost discovery on Llano Seco Mesa (Stone 2002 pers. comm.). The exact nature of this relationship is however unknown. Does pH or some other factor influence Orcutt grass population vigor, or do soil associations with tendency to develop and support large vernal pools/hydrology, regardless of landform and soil pH, provide suitable habitat? From the perspective of Sacramento Orcutt grass conservation, this uncertainty has bearing on the definition of potentially suitable habitat, which guides surveys and establishment of habitat preserves.

SAOG Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to design preserves for multi-species conservation. Suitability of Sacramento Orcutt grass habitat for supporting other rare plant species has not been specifically addressed,

although natural populations of the rare pincushion navarretia, Bogg's-Lake hedge hyssop, and legenere are documented as sharing specific vernal pools with Sacramento Orcutt grass. Many of these pool complexes also may provide habitat for rare invertebrates, amphibians, mammals, and bird species as well. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime between November 1st and May 1st may benefit Sacramento Orcutt grass -associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

SAOG Genetic Considerations (Spatial and Temporal Variation, Seed Bank, Drift, Bottlenecks)

It has been determined that *Orcuttia* populations are genetically isolated as well as diverse, the latter both within and between pools (populations), and within the "seed family" of a single reproductive plant. In addition, there is a high degree of localized adaptation and strong intra-pool selective pressures (Griggs 1980; Griggs and Jain 1983). However, investigations of Sacramento Orcutt grass population genetics have been limited to measures of seed size and weight (genetically fixed traits) within and among populations, and electrophoretic study of four enzyme systems in only two populations. These analyses represent a very small portion of the genome and allow limited interpretation of patterns of genetic diversity and limited inference as to uniqueness of a given population. Another potentially important consideration is that there has been no assessment of the "genetic memory" potentially associated with stored seeds in the soil seed bank. Elam (1996) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon.

Current limitations in our understanding of Sacramento Orcutt grass population genetics have little immediate conservation implication, , however; ifinoculation of pools is proposed for any alternatives analyzed in this EIS/EIR, or as part of the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005), appropriate measures will be developed to ensure that seed collection, seed treatment and pool inoculation methods are consistent with what we know and do not know about Sacramento Orcutt grass ecology and population genetics.

SAOG Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, it appears that Sacramento Orcutt Grass populations depend on a substantial reserve of dormant seed stored in the soil as a buffer against single year and multiple-year cycles of unfavorable hydrological conditions. This population parameter has only been measured in a few pools during one growing season (Griggs 1980). There have been no other studies addressing spatial or temporal variability of seed abundance in the soil seed bank

or longevity of dormant seeds. From the perspective of conservation, knowledge of site-specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

SAOG Inoculation

Since there are so few natural populations of Sacramento Orcutt Grass, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved, but unoccupied Sacramento Orcutt grass habitat, create meta-population structure at extant occurrences where single pools now support the species, and ensure existence should any natural populations become compromised.

In addition to complete protection and enhancement of natural populations, it has been suggested that experimental inoculations may be desirable for Orcuttieae conservation (Griggs and Jain 1983; Griggs pers. comm.). The experimental establishment of one population at Phoenix Field (CNDDB occurrence #15), now 25 years-old, provides some indication of the probably success of inoculating suitable habitat and creating self-sustaining populations. However, not all experimental inoculations attempted during the research of Griggs were "successful" (Griggs pers. comm.), and the population genetics and long-term viability of the inoculated population are unknown.

SAOG Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter. ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant Sacramento Orcutt grass occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of Sacramento Orcutt grass, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively effect Sacramento Orcutt grass and other native plant species. If air pollution becomes such a problem that Sacramento Orcutt grass is affected, few management options will exist to change conditions for this species.

SAOG Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature

over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology. It is likely that given the expected global climate trends, a vigor response of some kind could be expected for Sacramento Orcutt grass populations within the 50-year study period of the EIS/EIR or at some time beyond.

SAOG Unknown Number of Undiscovered Populations

Additional unsurveyed potentially suitable habitat exists within the Planning Area, principally on the larger private dry-land ranches that harbor well-developed vernal pools and vernal pool complexes. Authorities generally consider Sacramento Orcutt grass as one of the more completely understood species with regard to distribution and frequency (Stone, Taylor, Macdonald, Griggs, 2002 pers. comm.), owing primarily to typical association with only the most developed vernal pools and seemingly natural restricted range. However, it is also acknowledged that a limited number of additional populations could be yet discovered as the remaining large tracts become surveyed. It is very unlikely however, that enough populations remain to be discovered to justify a future change in the conservation status of Sacramento Orcutt grass (Stone, Taylor, Witham, Griggs pers. comm.).

SANFORD'S ARROWHEAD (SAAR)

Sanford's Arrowhead (SAAR)

(Sagittaria sanfordii Green)

Status USFWS: None

Status CDFW: None

Status CNPS: List 1B.2

© 2007 Wendy Fisher

SAAR Listing Status

Sanford's Arrowhead (*Sagittaria sanfordii*), an obligate wetland species, is considered to be rare, threatened or endangered throughout its range, thus qualifying its designation as a list 1B.2 species by California Native Plant Society (CNPS 2010). It has been assigned an R-E-D Code of 2-2-3, meaning it is distributed in a limited number of occurrences, occasionally more if each occurrence is small, it is endangered in a portion of its range, and entirely restricted to California.

Being a CNPS List 1B.2 plant species, Sanford's Arrowhead meets the definitions of Section 1901, Chapter 10 (Native Plant Protection Act) or Sections 2062 and 2067 of the California Endangered Species Act (CESA) of the California Department of Fish and Wildlife (CDFW) Code, and is eligible for state listing. It is mandatory that all CNPS 1B species be fully considered during preparation of environmental documents relating to California Environmental Quality Act (CEQA) (CNPS 2010). Owing to its relatively limited geographic range and ongoing and potential future threats, Sanford's Arrowhead may become a candidate for future agency listing.

SAAR Life History and Ecology

SAAR Species Description and Life History

SAAR Physical Description

Sanford's Arrowhead is a perennial member of the water plantain family (*Alismataceae*). This emergent marsh species possesses a thin elongate underground stem (rhizome) that produces small [8-15 millimeters (0.3-0.6 inches) –wide] spherical tubers (corms) at their apices. New plants (clones), comprised of a cluster of leaves and one to several inflorescence stalks, grow from these tubers at the onset of the growing season. Emergent leaves possess sheathing stalks

and range from two to ten decimeters (~8-39 inches) in length. The leaves are completely linear and three-angled, or they may possess a narrowly elliptic to lanceolate blade that ranges from five to 15 centimeters (~2-5.9 inches) in length (Mason 1957; Hickman 1993). Plants tend to grow in colonial patches.

The inflorescence is comprised of a naked stem bearing several whorled-series of flowers near the apex. The lowermost inflorescence whorls are typically comprised of three female flowers and the upper whorls are comprised entirely of male flowers. Both male and female flowers possess three white roundish petals with entire margins, as well as three small green narrowly triangular sepals. The petals are deciduous, and as the fruits mature, the flower stalks elongate to two to three centimeters (0.8-1.2 inches) and curve downward relative to the inflorescence axis. Fruits are arranged in dense ovoid head-like clusters, and from a distance superficially resemble green berries. Individual fruit are narrowly flattened side-to-side and possess a small lateral beak at the apex (Mason 1957). Initially, the emergent inflorescence stalk is erect and shorter than the leaves. As the fruits mature the entire inflorescence may recline and float on the surface of the water.

Sanford's Arrowhead is distinguished from its close relatives on the basis of its emergent leaves being narrowly linear to narrow-ovate or lanceolate, in contrast to the sagittate (arrowhead-shaped) leaves of the other Arrowhead species. In addition, only in Sanford's Arrowhead do the stalks of the maturing fruit thicken and curve downward relative to the inflorescence axis; the others possess stalks that remain un-thickened and curved upward (Hickman 1993).

Other than basic taxonomic and biogeographic treatments (Mason 1957; Hickman 1993), Sanford's Arrowhead is mostly unstudied. Existing biological and ecological information is derived mostly from observations of field botanists, primarily as a result of land management and agency-related resource surveys (Gause and Burmester pers. comms.).

Other species in the genus *Sagittaria*, have been variously studied with respect to breeding systems and reproduction (Wooten 1971; Kaul 1985; Delesalle and Muenchow 1992; Muenchow and Blum 1994; Muenchow 1998; Sarkissian et al. 2001; Huang 2003), dispersal and population dynamics (Gordon 1996), seed germination (Keddy and Constabel 1986; Gordon 1996; Leck 1996), seedling-hydrology relations (Keddy and Ellis 1985; Delesalle and Blum 1994), fish and wildlife interactions (Gruenhagen and Fredirickson 1990; Hohman et al. 1990; Muenchow and Delesalle 1992; Gough and Grace 1998; Evers et al. 1998), competitive interactions and community relations (Shaffer et al. 1992), and population genetics and rare plant conservation (Newberry 1991; Edwards and Sharitz 2000). Where applicable, information derived from studies of related Sagittaria species is referenced here for Sanford's Arrowhead.

SAAR Ecological Life Cycle

Sanford's Arrowhead shares the perennial clonal growth habit with the vast majority of other endemic emergent marsh plants. Thin elongate rhizomes produce ovoid tubers (corms) at their tips that allow the plant to persist within the submersed substrate through the dormant winter season. New plants (clones) are produced from these tubers at the onset of favorable growing conditions (Mason 1957). Observations have also been made of a Sanford's Arrowhead colony reappearing with vigor following a year during which the habitat failed to flood and aerial leaves and stems were completely absent (Gause pers. comm.). The ability of this colony to withstand at least one year of unfavorable hydrologic conditions and then reappear with vigor is likely attributable to the dormant rhizome and associated tubers/corms.

SAAR Seed Germination

Seed longevity, after-ripening, dormancy characteristics, germination requirements and optima for Sanford's Arrowhead have not been investigated. Similarly, no observations have been recorded or are otherwise available relating to seed ecology, germination or seedling growth in the field. Many marsh species exhibit soil-seed banking as a dynamic of their population ecology. This trait is unknown for Sanford's Arrowhead.

SAAR Vegetative Growth

Little is known regarding the dynamics of vegetative growth of Sanford's Arrowhead (e.g., growth rates, rhizome elongation rate or rhizome length, time to reproduction, clone longevity, physiological adaptations, etc.). Sanford's Arrowhead colonies have been observed to persist in a vegetative state throughout the year, without significant seasonal dieback of leaves (Gause pers. comm.).

SAAR Reproduction

Like many perennial marsh species, Sanford's Arrowhead reproduces asexually by dispersal of fragmented rhizomes and tubers, as well as sexually, via flowering and seed production. The relative contributions of asexual and sexual reproduction to population dynamics (e.g., dispersal, colonization, population growth and maintenance) likely vary by the type of aquatic system (isolated and static versus interconnected and flowing), and the nature of seasonal disturbances (flood, scour, trampling, waterfowl foraging, dredging and other ditch maintenance, etc.).

Sanford's Arrowhead flowers from May through October. As previously mentioned, this species has separate male and female flowers within a single inflorescence. Although pollination and breeding experiments have not been carried out for Sanford's Arrowhead specifically, the separate male and female flowers and well-developed petals suggest an out-crossing breeding

system. Pollination ecology of Sanford's Arrowhead has not been investigated. For two other Sagittaria species, principal flower visitors appeared to be generalist bees as well as assorted wasps and flies (Muenchow and Delesalle 1994). Fecundity has not been addressed for Sanford's Arrowhead.

SAAR Dispersal

Many perennial marsh species exhibit a comparatively wide geographic range and low morphologic variability (Mason 1957). This may reflect high dispersal potential associated with interconnected watercourses and with actions of migratory waterfowl. Waterfowl, muskrats, beavers and other wildlife readily consume all parts of some Sagittaria species, including seeds and tubers (Mason 1957). In addition, floodwaters likely disperse mature fruits and seeds, as well as fragmented rhizomes and associated tubers.

Evidence of long-distance dispersal and colonization exists in the overall geographic distribution of Sanford's Arrowhead in California, with disjunct northern and southern populations in Del Norte and Orange Counties, respectively. As with other wetland species, natural dispersal of seeds was likely a more frequent event when there were many more wetland acres, more interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming native ungulates.

SAAR Seed Dormancy

Seed dormancy and stored soil seed banks are characteristics shared by many perennial marsh species. These traits however have not been investigated for Sanford's Arrowhead specifically. In perennial marsh species, the presence of a persistent soil seed bank may facilitate recolonization following prolonged periods of drought. A soil seed bank also ensures germination within barren topographic-hydrologic positions made newly available as water levels recede within drought-affected basins. Perenniating tubers/corms and rhizomes may buffer colonies against at least one year of drought; dormant seeds in the soil profile may further assure persistence over longer periods. Recruitment from persistent seed banks may also contribute over time to genetic diversity of populations that are potentially dominated by clones arising through high rates of vegetative reproduction (Edwards and Sharitz 2000).

SAAR Population Genetics

Population genetics of Sanford's Arrowhead have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. Given the limited number of occurrences in the Planning Area and the widely scattered geographical distribution, all Sanford Arrowhead occurrences should be considered unique, and important genetic entities.

SAAR Habitat Requirements and Ecology

SAAR Biogeography and Landform Relations

Sanford's Arrowhead is strictly associated with freshwater marsh hydrology. Since this topographic-hydrologic setting occurs on nearly all landforms supporting rivers, creeks, lakes, ponds and irrigation channels, strong correlations with landforms should not be expected. In addition to numerous Central Valley settings, Sanford's Arrowhead is also recorded from marsh habitats in Orange and Ventura Counties of southern California and from the coastal region of Del Norte County. Sanford's Arrowhead also occurs on the Tuscan Volcanic Formation in the Cascade Range Foothills. Modeled habitat for Sanford's arrowhead is discussed in Section G-4 of this Appendix.

SAAR Hydrology Relations

As previously noted, Sanford's Arrowhead is strictly associated with hydrologic systems supporting emergent marsh vegetation. These include the margins of rivers, streams, ponds, reservoirs, irrigation and drainage canals and ditches, and stock-ponds. This species is reported to inhabit the cracks in concrete-lined irrigation/drainage ditches as well. Sanford's Arrowhead is also reported to occur in several seasonal wetlands with sufficient hydrology for persistence of emergent marsh species. As with other perennial marsh species, Sanford's Arrowhead likely inhabits specific zones defined by depth of ponding. Water depths are reported for only three of the 68 occurrences reported in CNDDB in 2010 (CDFG 2010); these range from four inches to two feet in depth (CDFG 2010). Observations made by some indicate preference for the relatively shallow margins o f deeper marsh systems (Gause pers. comm.).

SAAR Biological Community Relations

Plant species reported as occurring with Sanford's Arrowhead include regionally common emergent marsh species, as well as non-emergent wetland species more typically associated with marsh edges, saturated soil and even disturbed irrigated pastures. At one occurrence, Sanford's Arrowhead is reported as co-occurring with species more typically associated with vernal pools, including the rare legenere (*Legenere limosa*) and dwarf downingia (*Downingia pusilla*) (CDFG 2010).

Regionally common emergent marsh species associated with Sanford's Arrowhead include cattail (*Typha* spp.), other arrowheads (*Sagittaria latifolia*, *S. montevidensis, S. rigida*), water plantain (*Alisma plantago-aquatica*), tule (*Scirpus acutus*), yellow or Montevido waterweed (*Ludwigia peploides* ssp. *peploides* or *L.p.* ssp. *montevidensis*, respectively), parrot's-feather (*Myriophyllum aquaticum*), and willow-weed (*Polygonum lapathifolium*).

Co-occurring non-emergent wetland species more typically associated with the margins of permanent marshes, and/or with seasonal marshes, include various umbrella sedges (*Cyperus difformis, C. eragrostis, Cyperus* sp.), lady's-thumb (*Polygonum persicaria*) and assorted native bearded spangletop (*Leptochloa fascicularis*), and non-native perennial grasses barnyard grass (*Echinochloa crus-galli*, purple love grass (*Eragrostis diffusa*), dallisgrass (*Paspalum dilatatum*), Johnsongrass (*Sorghum halepense*) and bristlegrass (*Setaria* sp.). Willow (*Salix* spp.) is reported to share habitat with Sanford's Arrowhead as well (CDFG 2010).

SAAR Non-Native Weed Relations

Many of the previously mentioned emergent marsh associates, native and non-native alike, can be aggressive competitors. This trait results from vigorous lateral vegetative growth, either underground via rhizomes or stolons, with branching and elongating stems in the water column, or sprawling clambering aerial stems. Some floating species can completely cover the surface of water and mud as well such as mosquito fern (*Azolla* spp.), duckweed (*Lemma* spp.), water hyacinth (*Eichornia crassipes*), young mannagrass (*Glyceria* spp.), and others. Unlike terrestrial habitats, water availability is not a limiting factor for emergent marsh species. Rather, competition between species for available rooting substrate and light impose limits on population establishment, growth and persistence.

As mentioned previously, some of the commonly reported species associated with Sanford's Arrowhead are non-native perennial grasses, many of which are relatively aggressive weeds of marsh edges, irrigation ditches, irrigated pastures, rice fields and seasonal wetlands. In addition, other aggressively weedy wetland species in the region may present competitive problems with Sanford's Arrowhead, including other arrowheads (*Sagittaria* spp.), water plantains (*Alisma* spp., *Damasonium* spp.), water pepperweeds (*Polygonum* spp.), water hyacinth, water-nymph (*Najas* spp.), burhead (*Echinodorus berteroi*), water-milfoil (*Myriophyllum* spp.), waterweeds (*Elodea* spp., *Hydrilla verticillata, Ottelia alismoides*), Brazilian waterweed (*Egeria densa*), pondweed (*Potamogeton* spp.), purple loosestrife (*Lythrum salicaria*), and others.

The perennial marsh wetland habitat is highly productive, with much potential for intense interspecies competitive interactions. Many of the component species, including Sanford's Arrowhead, can be aggressive spreaders by rhizomes, stolons, or by dispersal of fragments/propagules. Ability for rapid lateral overtopping growth is the norm in this habitat. Sanford's Arrowhead is reported to be weedy and troublesome at the Rancho Cordova Golf Course ponds (CDFG 2010); however, other information on competitive interactions is lacking.

SAAR Livestock Grazing Relations

Interactions of livestock grazing with Sanford's Arrowhead have not been specifically addressed. As with other species though, interactions likely vary according to a variety of site-specific factors and timing. For example, marsh habitats located within irrigated pastures are likely to receive less grazing and trampling pressure than would the same habitat if it were located within a non-irrigated upland annual grassland setting. Within non-irrigated upland pastures, grazing and trampling pressures within the marshy shallows probably vary by season, with relatively little tendency of livestock to enter the marshy shallows during late winter to mid-spring months when forage and water is abundant and an increased pressure from livestock as the weather dries and warms into the summer months (Dittes pers. obs.). The capacity of colonies to recover from grazing and trampling is not known; however many rhizomatous perennial marsh species have the marked capacity to re-sprout after fragmentation of rhizome mats.

Among all of the CNDDB occurrences, livestock grazing is reported as a potential threat at only two (CNDDB occurrence # 14 and 15) (CDFG 2002). Nutrient loading, algae blooms and eutrophication associated with runoff from irrigated and overstocked pastures may potentially negatively affect some aquatic plant species, including Sanford's Arrowhead.

SAAR Disturbance Response

Owing to high vegetative productivity, rhizomatous or stoloniferous spread, subterranean tubers, and seed production, many emergent marsh species are well-adapted to, and may even benefit from periodic disturbances. In the absence of disturbances and a limiting deep-water edge, some marsh habitats may diminish in emergent species diversity, and may eventually transition into semi-terrestrial and terrestrial habitat. It is likely that in addition to basin topography, periodic disturbances (sediment scour and deposition) associated with seasonal flood events are an important determinant in the succession and species composition of any given marsh, as well as the meta-population dynamics of a given emergent marsh species. These dynamics are unknown as they relate to Sanford's Arrowhead.

The foraging activities of ducks and other waterfowl have been cited as loosening the rhizome tubers of Sagittaria, thus facilitating dispersal and potential colonization events. One mention of significant foraging of Sanford's Arrowhead by ducks is given in Tehama County (CDFG 2002). All parts of some Sagittaria species are edible for waterfowl, and dispersal is facilitated by wildlife breaking off tubers and perhaps spreading seeds while foraging (Mason 1954).

SAAR Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for Sanford' Arrowhead are identified in Table G-3.8-1 and have been derived from input from local species experts.

Table G-3.8-1. Habitat Elements for Sanford's Arrowhead

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Freshwater marsh, open water, streams/creeks.	Strictly associated with hydrologic systems supporting emergent marsh vegetation, including the margins of rivers, streams, ponds, reservoirs, irrigation and drainage canals and ditches, and stock-ponds. Sanford's Arrowhead is also reported to occur in several seasonal wetlands with sufficient hydrology for persistence of emergent marsh species. As with other perennial marsh species, Sanford's Arrowhead likely inhabits specific zones defined by depth of ponding; however, additional information is needed to determine depth requirements.

SAAR Species Distribution and Population Trends

SAAR Species Distribution

Sanford's Arrowhead is distributed from Orange and Ventura Counties in southern California to Butte and Tehama Counties at the northern edge of the Great Central Valley. A disjunct population occurs in the most northwestern part of the state near Crescent City in Del Norte County (CNPS 2010).

Sanford's Arrowhead occurrences are distributed among six of the Geographic Sub-regions of the California Floristic Province, as described by Hickman (1993), including the San Joaquin Valley, Sacramento Valley, Cascade Range Foothills, Outer North Coast Range, Western Transverse Range, and South Coast. Sanford's Arrowhead ranges from sea level to 2,132 feet above mean sea level (CNPS 2010).

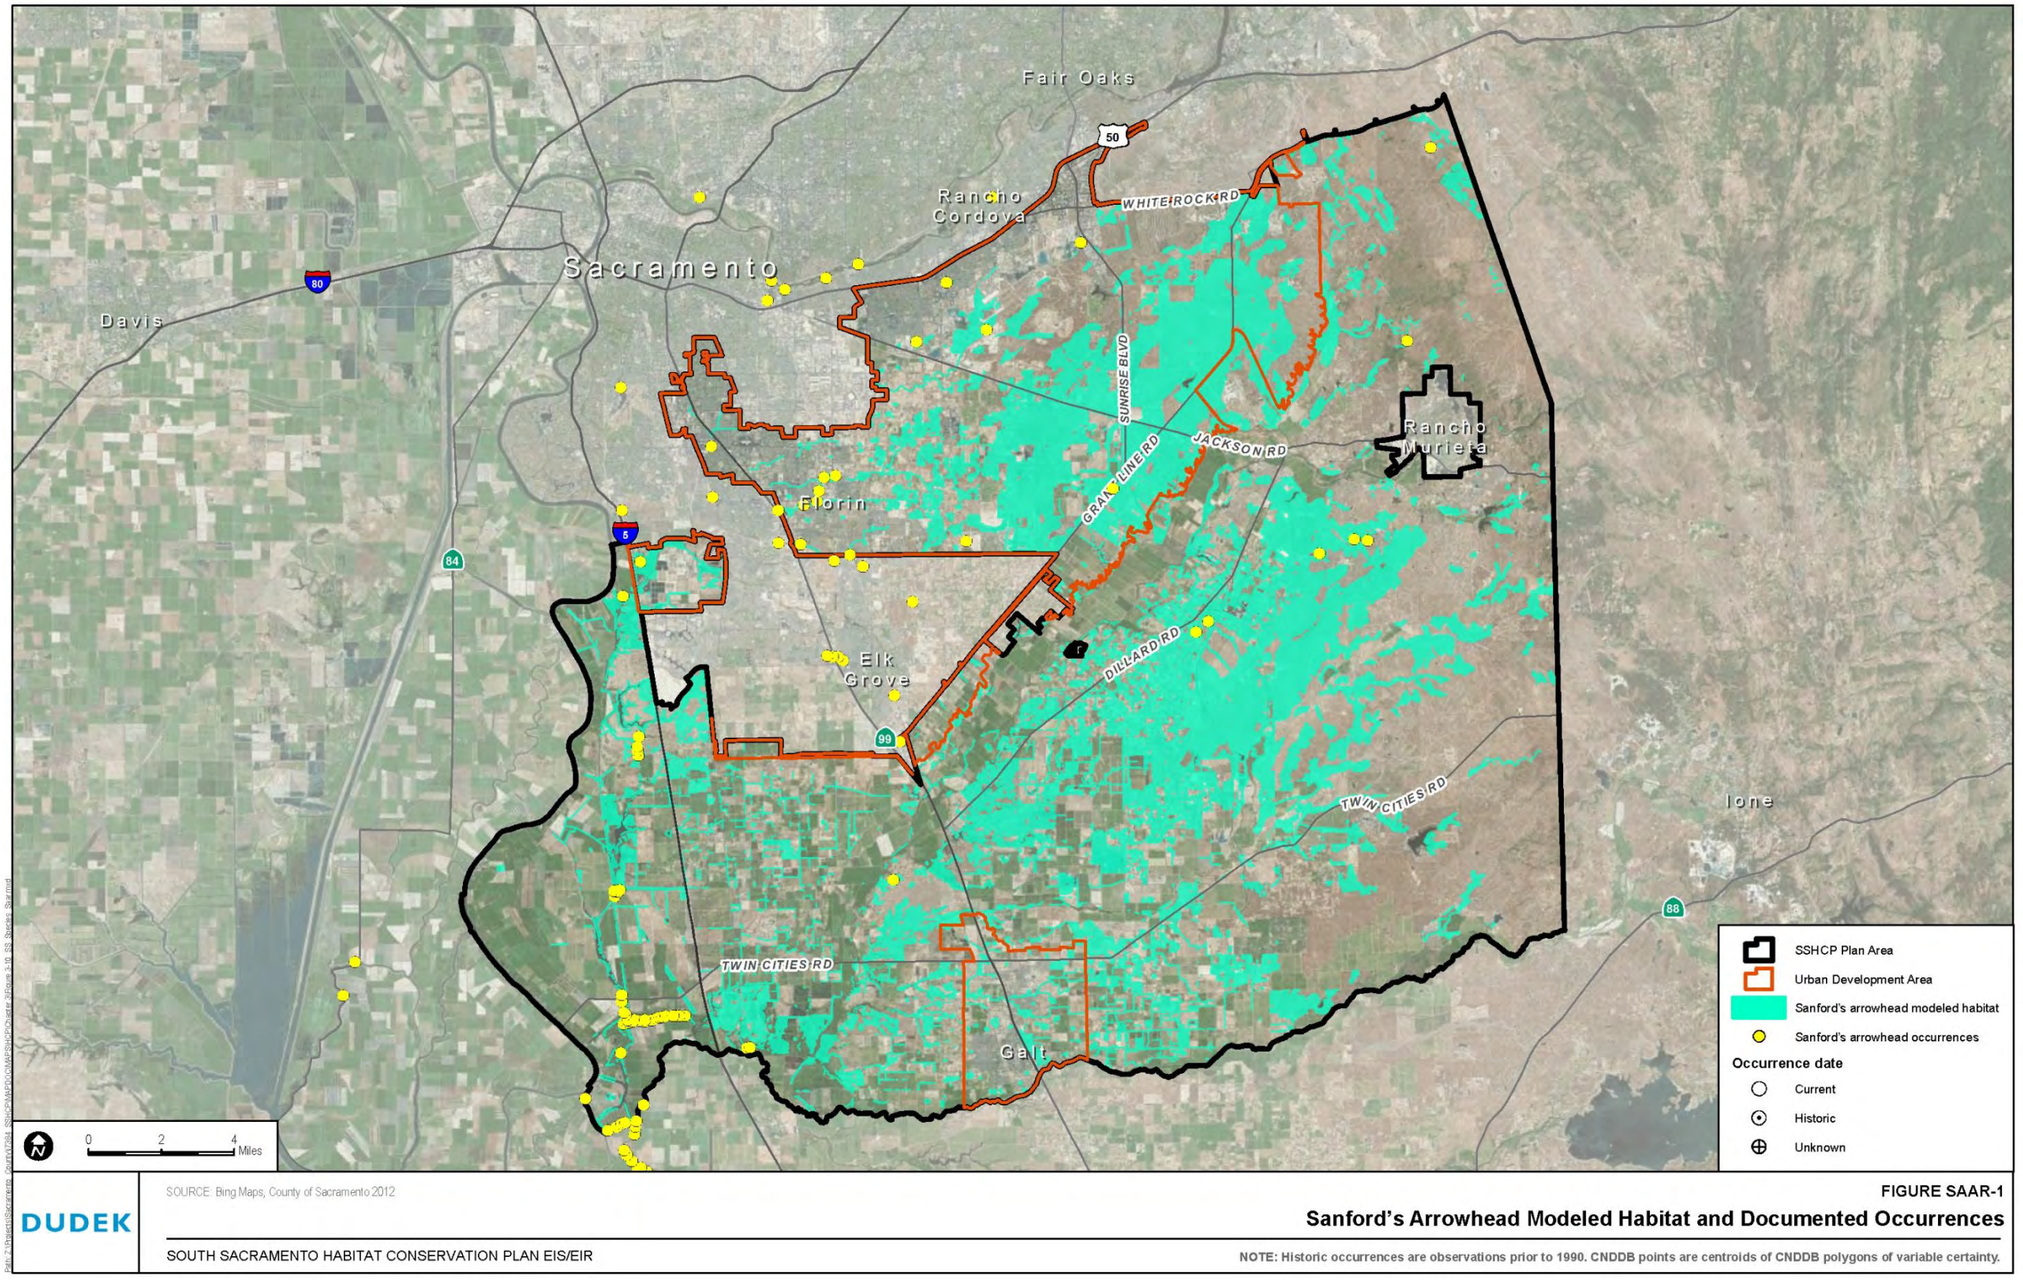
Sacramento County has the largest number of Sanford Arrowhead occurrences with 40 of the 68 occurrences (59%) represented (CDFG 2010). Calflora reports 86 records within California, 10 of which are within Sacramento County (Calflora 2010). Fresno County has the second largest number with eight occurrences (12%), followed by Butte and Merced Counties each having five occurrences reported (7% each) (CDFG 2010). Of the remaining 10 occurrences, San Joaquin and Tehama each have three (4% each), Del Norte, El Dorado, Madera, Mariposa, Orange, Placer, Shasta, and Ventura Counties each support one occurrence (<2% each) (CDFG 2010).

SAAR Central Valley Distribution

The Central Valley supports the majority of Sanford's Arrowhead occurrences. The northernmost Central Valley occurrences are located approximately 28 miles apart from each other in east-central and southern Butte County (CDFG 2002). Forty occurrences are located in Sacramento County (CDFG 2010). Another 15 Occurrences are distributed in the Central Valley along an arc of approximately 65 miles, extending from central Merced to northern Madera counties (CDFG 2002).

SAAR Distribution within the Planning Area

Of the 40 total (32 extant) Sanford's Arrowhead CNDDB occurrences presently recorded from Sacramento County, 23 occurrences (58%) are located within the Planning Area, 15 of which are located within the Urban Development Area (UDA) (Figure SAAR-1) (CDFG 2010). Figure SAAR-1 shows occurrence records within and adjacent to the Planning Area from the CNDDB (CDFG 2010), with one additional occurrence recorded by Wetland Research Associates (2004).



Occurrences of Sanford's Arrowhead in Sacramento County have been documented in the following Landform Formations: Basin deposits, lower and middle units in the Riverbank Formation, stream channel deposits, Turlock Lake Formation, and upper unit Modesto Formation/Alluvial deposits (CDFG 2002).

SAAR Population Levels and Trends

Of the 68 documented CNDDB Sanford's Arrowhead occurrences, one (CNDDB occurrence #2) located in Ventura County, is now reported as "extirpated." Another eight occurrences located in Sacramento County are reported as possibly extirpated (CDFG 2010). It is important to note though, that of the remaining 59 occurrences presumed extant, 11 have not been observed since between 1940 and 1958, even though the habitats were resurveyed in 1980 (CDFG 2002; none of these are in Sacramento County). One occurrence observed in 1975 was resurveyed in 1993 with no plants found (CDFG 2002). Twenty CNDDB occurrences are historic; they have not been observed in the last 20 years (CDFG 2010). Population trends are listed as unknown for all Sanford's Arrowhead Occurrences statewide.

It should be noted that Sanford's Arrowhead is a relatively cryptic emergent marsh species, the habitats are not easily surveyed, and much unsurveyed habitat is associated with agricultural and urbanized areas, neither of which are frequented by botanists. For these reasons, additional as-yet undiscovered Sanford's Arrowhead occurrences should be expected within the Planning Area.

Figure SAAR-1 Sanford's Arrowhead Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

It is impossible to determine the number of historically occurring Sanford's Arrowhead lost or the acreage of suitable habitat lost to historic agricultural land-use conversions, since so much had happened before this species first received attention. The Great Central Valley marsh system once extended from the southern edge of the Tulare Lake Basin in the southern San Joaquin Valley, almost interrupted, to the Sacramento River basin of Butte and Tehama counties in the north. Early explorers write about the extensive Tule Marsh that impeded east-west travel at most of these latitudes within the Great Central Valley. Mason reports of a 100-acre population of Sanford's Arrowhead observed in 1912 from near Tracy that by 1954 was gone and the habitat entirely under cultivation (Mason 1954). It has been estimated that by 1978 only 4% of California's pre-settlement Central Valley wetlands remained (Airola and Messick 1987 as cited by Snyder 1994). Loss of Sanford's Arrowhead populations and habitat since pre-settlement times is incalculable and without doubt, substantial.

There has been no comprehensive effort to monitor any populations of Sanford's Arrowhead over years, so variations in abundance and other population dynamics are unknown.

Observations, monitoring and research conducted on other perennial marsh species indicate that abundance of individuals within populations can vary greatly between years, with some species exhibiting even transitory behavior (Mason 1957). Furthermore, successional changes can be relatively rapid in marshes, and if a deep-water edge is not available to impede spread, and if disturbances do not remove accumulated biomass, transition into terrestrial or semi-terrestrial habitats may result. Owing to these dynamics, long-term management and monitoring of Sanford's Arrowhead and other aquatic and emergent marsh species pose unique challenges.

SAAR Threats to the Species

Potential direct threats to Sanford's Arrowhead include: loss of emergent marsh habitat owing to agricultural and urban land-use conversion, irrigation and drainage ditch maintenance, flood control activities, road widening and maintenance, inappropriate livestock grazing regimes, recreational vehicles, bicycle traffic, and refuse dumping (CDFG 2010).

Potential indirect threats to Sanford's Arrowhead include: hydrological alteration of sub-watersheds by surrounding developments and land uses; shifts in competitive interactions (hydrology-mediated or invasive non-native and weedy native species); sedimentation; windblown refuse accumulation; herbicides, nutrient loading and other point and non-point source water pollution; recreational boat waves; foraging damage by wildlife; ecological succession, air pollution, and global climate change.

Note that of the 32 occurrences presumed extant in Sacramento County (CDFG 2010), none are included within established preserves, and at least 15 are habitants of artificial or otherwise

maintained irrigation, drainage, or flood control conveyances (CDFG 2002). Only 10 appear to be associated with relatively natural wetland systems (CDFG 2002).

With regard to the remaining 27 presumed extant CNNDB occurrences outside of Sacramento County, only two are encompassed within established preserves; one of these is associated with a stockpond at The Nature Conservancy's (TNC) Vina Plains Preserve in Tehama County (CNDDB occurrence # 33), and another is located on Bureau of Land Management (BLM) land at Hog Lake, Tehama County (CNDDB occurrence # 34). Of the 19 remaining occurrences, eight are associated with irrigation/drainage canals, two are in man-made reservoirs, one is located in a groundwater recharge basin, and one is associated with a stockpond (CDFG 2002). Of the remaining seven occurrences, three do not have habitat notes included (CDFG 2002). In summary, of the 27 presumed extant occurrences outside of Sacramento County (CDFG 2010), only four are associated with presumably "natural" hydrological features (CDFG 2002).

SAAR Data Gaps

It is significant to note that Sanford's Arrowhead is difficult to survey for, and it can be difficult to see when growing with other emergent marsh species. Furthermore, since it occurs in association with a variety of water body-types, including irrigation and drainage ditches and canals (habitats seldom surveyed), other occurrences are likely to be present within Sacramento County. All marsh habitats, regardless of landform association, should be considered as potentially suitable habitat for Sanford's Arrowhead. It is likely that as additional surveys are conducted, new occurrences/populations will be discovered within the Planning Area. It is impossible however, to predict the number of future discoveries in Sacramento County or elsewhere.

With exception to observations of field workers (CDFG 2010), Sanford's Arrowhead has received limited research attention. Detailed studies have not been conducted regarding the biology, ecology, breeding system, population genetics, habitat-hydrology relationships, population dynamics, trends or threats. Investigations have been conducted on the biology and ecology of other Arrowhead species, including the sometimes co-occurring wide-leaved arrowhead or tule potato (*Sagittaria latifolia*). Pertinent data gaps for Sanford's Arrowhead specifically, along with implications for conservation, and operating assumptions include:

SAAR Unknown Number of Undiscovered Occurrences

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Planning Area and elsewhere within the range of the species. In the Planning Area, discovery of new populations of Sanford's Arrowhead may occur anywhere that emergent marsh habitat is present, including natural drainages, created irrigation/drainage conveyances, reservoir and lake margins

and stockponds. Potential habitat is also present within channelized natural, and artificially excavated drainages within urbanized areas. In these situations, Sanford's Arrowhead can colonize reaches that are concrete-lined; here inhabiting cracks or rooting on accumulated sediments.

SAAR Unknown Relationship between Landform/Soil Chemistry and Bio-Geographic Distribution

In the 2002 CNDDB in Sacramento County, 11 of the 28 Sanford's Arrowhead occurrences are associated with Lower and Middle Units of the River Bank Formation. Another four occurrences are associated with Stream Channel Deposits, three are associated with the Turlock Formation, two with the Upper Unit Modesto Formation, and one occurrence is associated with each of the Quaternary Fanglomerate (Qfa) and Basin Deposits (CDFG 2002). The nature of relationship of landform to Sanford's Arrowhead is likely attributable to factors affecting the development and persistence of emergent marsh habit. Recent alluvial deposits are associated with active watercourses.

SAAR Unknown Breeding System and Pollination Ecology

Pollination and breeding studies have not been conducted for Sanford's Arrowhead and specific pollinator relationships are unknown. It may be important to note that the flowers of Sanford's Arrowhead closely resemble those found in other Sagittaria species, as well as those in other genera of the family Alismataceae (*Alisma, Damasonium, Echinodorus*). Separate male and female flowers and relatively large flower petals suggest an outcrossing breeding strategy, although self-compatibility has been demonstrated for other species of Sagittaria (Muenchow and Delesalle 1994).

An investigation of pollination ecology involving the common arrowheads (*Sagittaria latifolia* and *S. australis*) in Colorado revealed that flower visitors there are principally generalist bees of the genera *Bombus, Lasioglossum, Ceratina and Augochlora*, as well as assorted flies and wasps (Muenchow and Delesalle 1994).

SAAR Specific Hydrological Requirements of SAAR

Numerical data do not exist regarding specific hydrological parameters associated with emergent marsh habitats supporting Sanford's Arrowhead populations in the Planning Area, or elsewhere (e.g., maximum and minimum inundation tolerances; optimal ponding depth; response to water level fluctuations; tolerance of dry-down/desiccation; wave action and other water current relationships, etc.).

SAAR Interactions with Non-Native Weeds (and Aggressive Natives) and Weed Management Activities

Non-native weeds, or aggressive native species reported as occurring in emergent marsh habitats with Sanford's Arrowhead are listed in Section 2.2. All of these and others not-yet known may become problematic in Sanford's Arrowhead-occupied emergent marsh preserves owing to aggressive lateral growth and strong competitive abilities. Other aquatic weeds not yet known from the region or even from North America may become problematic following potential future introductions. Interactions between Sanford's Arrowhead and associated emergent marsh species are unknown.

SAAR Interactions with Non-Native and Native Wildlife Species and Wildlife Management Activities

Wildlife interactions with Sanford's Arrowhead are mostly unknown. One reference is made of waterfowl heavily utilizing a Sanford's Arrowhead population (CDFG 2010). Other Sagittaria species are well documented with regard to food utilization by waterfowl (Mason 1957). In addition to waterfowl, muskrats likely utilize all parts of Sagittaria plants as well. Grazing of seedlings or young vegetation by crayfish is not known, but is likely. Other aquatic pest invertebrate and fish species not-yet known from the region, but which could become established if introduced, could threaten Sanford's Arrowhead emergent marsh habitats in the future (e.g. Asian mitten crab, jumping carp, etc.).

SAAR Genetic Considerations (Spatial and Temporal Variation, Seed Bank, Drift, Bottlenecks)

Population genetics for Sanford's Arrowhead are completely unknown.

SAAR Seed Longevity and Dynamics of Stored Soil Seed Bank

There have been no empirical studies addressing the presence of a soil seed bank, seed dormancy or longevity for Sanford's Arrowhead.

Since there are few populations of Sanford's Arrowhead in Sacramento County that are not threatened, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable emergent marsh habitat and increasing the number of naturally self-sustaining populations. In addition, so much Sanford's Arrowhead habitat within the Planning Area is not protected and is subject to potential impacts resulting from routine maintenance (irrigation and drainage channels).

Any additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied emergent marsh habitat, create meta-population structure at extant occurrences where single colonies may support the species, and help ensure existence should any natural populations become compromised. Dispersal into, and colonization of artificially created or enhanced irrigation ditches, excavations next to railroad tracks and artificial ponds has been documented (CDFG 2010). Sanford's Arrowhead has been successfully transplanted elsewhere in Sacramento County by the U.S. Army Corp of Engineers (USACE) (Burmester pers. comm.). The common tule potato and many other clonal emergent marsh species are readily transplantable where suitable marsh habitat exists.

SAAR Water Quality

Sanford's Arrowhead occupies habitats that are particularly subject to a variety of types of point and non-point-source water pollutants. Specific examples include sediment transport in storm-water runoff; myriad hydrocarbons from road, highway and rooftop surfaces; nutrient runoff from dairies and stockyards; fertilizer runoff from golf courses, residential landscaping and agricultural areas; herbicide runoff from roadside and highway shoulder maintenance activities; chemical and material spills from road and highway surfaces industrial areas and construction sites; myriad rain-borne air pollutants; recreational watercraft, and others. In addition, the relationship between Sanford's Arrowhead and relationships to basic physical properties of water are unknown as well, including turbidity, conductivity, pH, Biological Oxygen Demand (BOD), and others. Interestingly, the common tule potato, and several other emergent marsh species have been investigated and variously utilized in small-scale non-conventional wastewater treatment systems.

SAAR Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide, etc.)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter, ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to emergent marsh vegetation. Assuming that extant Sanford's Arrowhead occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of Sanford's Arrowhead, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect Sanford's Arrowhead and other native plant species in the future.

SAAR Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology.

SAAR Existing Hydrological Trend of Emergent Marshes and Existing Indirect Effects

Extant Sanford's Arrowhead populations in the Planning Area have undoubtedly experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete consideration and management/protection at the level of watershed, or precise hydrological monitoring and accurate modeling on a wetland complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

MID-VALLEY FAIRY SHRIMP (MVFS)

Mid-Valley Fairy Shrimp (MVFS)

(Branchinecta mesovallensis)

Status USFWS: None

Status CDFW: None

MVFS Listing Status

The mid-valley fairy shrimp meets the requirements as a "rare, threatened or endangered species" under the California Environmental Quality Act (CEQA); however, they have no formal State or Federal protected species status. Mid-valley fairy shrimp was petitioned for endangered status under the Federal Endangered Species Act (USFWS 2003), but rejected for listing (USFWS 2004)

MVFS Life History and Ecology

MVFS Species Description and Life History

The mid-valley fairy shrimp is a typical Branchinecta anostracan. The female's second antennae are smooth, and there are no cephalic ridges or cornices. The female's thoracic surface has two paired dorsolateral projections on the fifth to seventh segments, and a pair of single dorsolateral conical projections on the fourth segment. The brood pouch is pyriform (Eriksen and Belk 1999; Belk and Fugate 2000; Rogers 2002c). The basal fourth of the male mid-valley fairy shrimp's second antennal proximal segment bears an anteriomedial pulvillus, but otherwise is smooth (Eriksen and Belk 1999; Belk and Fugate 2000). The distal segment of the male second antennae is flattened laterally, with the bilobed apex bent medially. This bilobed apex is asymmetrical: the anterior lobe is larger than the posterior. Live animals are typically off-white to grey, although the brood pouch may be green or yellow (Rogers pers. obs.). Depending upon the rapidity of development, mature animals may vary in length from three to 38 millimeters (Rogers pers. obs.). Animals may shrink as much as 11 to 32 percent upon preservation (Rogers 2002b).

Anostracans like the mid-valley fairy shrimp are a component of the zooplanktonic community within episodic, ephemeral aquatic habitats and can occur in densities as high as 200 per liter of water (Rogers pers. obs.). The vast majority of fairy shrimp are omnivorous, indiscriminately

filtering particles from the water column, including bacteria, unicellular algae, and micrometazoa (Eriksen and Belk 1999). Fairy shrimp will attempt to consume whatever material they can fit into their feeding groove, and do not discriminate based upon taste as do some other crustacean groups (Eriksen and Belk 1999). Mid-valley fairy shrimp will also rasp periphyton from sticks, stems and slender leaves (Rogers pers. obs.).

During the dry phase of their habitat, the anostracans survive as diapausing cysts (resting eggs) in and on the substrate (Sars 1896, 1898; Eriksen and Belk 1999; Rogers and Fugate 2001). When the habitat inundates from seasonal rainfall, some of the cysts hatch, and the nauplii (early larval form of anostraca) swim into the upper water column (Eriksen and Belk 1999). These larval forms are typically indistinguishable between species.

The maturation rates of the animal vary extensively depending upon temperature, and habitat type (Helm 1998; Eriksen and Belk 1999; Rogers *In review*), and the mid-valley fairy shrimp can reach maturity in as little as four days (Rogers *In review*; Rogers pers. obs.). In the genus Branchinecta, the brood pouch is truncate and as wide as the thoracic genital segments. However, when oocytes are present in the lateral pouches, the brood pouch is wider than the genital segments, forming an amplexial groove, and males can amplex the female successfully. If the oocytes are not present in the lateral pouches the female is sometimes able to wriggle out of the male's grasp (Rogers 2002b). Males approach the females from beneath to amplex. Amplexus is sustained for a second or two, as mating is rapid and the female is released immediately afterwards (Rogers 2002b). The female typically sheds her cysts as the shell forms over the fertilized oocyte (Murugan et al. 1996) and the cysts fall to the substrate.

The cysts lay dormant in the substrate until the pool dries and re-inundates during the subsequent rains. Beyond inundation of the habitat, the specific cues for hatching are unknown although temperature (Hall 1959; Belk 1977; Al-Tikrity and Grainger 1990; Belk and Nelson 1995; Helm 1998; Eriksen and Belk 1999; Rogers *In review*) and conductivity (Anderson 1958; Bowen et al. 1988; Broch 1969, 1988; Brown and Carpelan 1971; Brown 1972) are believed to play a large role. The mid-valley fairy shrimp is typically univoltine (i.e., one generation per year); however, animals of different ages may be present if a pool partially inundates allowing some cysts to hatch, and then later increases in volume, hydrating cysts that were further up-slope (Rogers pers. obs.).

Planktonic crustaceans are important in the food web, as they represent a high fat, high protein resource for migratory waterfowl. Mallard (*Anas platyrhynchos*), green-winged teal (*A. carolinensis*), bufflehead (*Bucephala albeola*), greater yellowlegs (*Tringa melanoleuca*), and killdeer (*Charadrius vociferus*) all forage actively in Central Valley vernal pools on the invertebrate and amphibian fauna during the winter months (Proctor 1964; Horne1966; Mellors, 1975; Silveira 1996; Dumont and Negrea 2002).

Predator consumption of fairy shrimp cysts aids in distributing populations of fairy shrimp. Predators (e.g., birds, amphibians) expel viable cysts in their excrement, often at locations other than where they were consumed (Proctor 1964; Wissinger et al. 1999). If conditions are suitable, these transported cysts may hatch at the new location and potentially establish a new population. Cysts are also transported by wind, and in mud carried on the feet of animals, including livestock that may wade through the habitat (Rogers in prep). This type of dispersal aids ephemeral pool crustaceans to exploit a wide variety of ephemeral habitats (Rogers 2000).

Being prey items of birds, mid-valley fairy shrimp are an intermediate host for avian cestodes (Rogers *In review*). Anostracans that are hosting a cestode tend to be bright pink in color. The change in color is due to the presence of cestode cysticercoides. The parasitic tapeworm castrates the host, which causes the host animal to accumulate lipids (probably linked to carotenoid pigments) that would otherwise be expended by the host during reproduction (Amat et al. 1991).

No specific bacterial, viral or protozoan diseases have been reported for the mid-valley fairy shrimp. Occasionally, specimens with black markings or lesions will appear in collections. These black markings, sometimes referred to as 'black disease', are actually evidence of the normal immune response of all crustacea to any bacteria, where any foreign bacteria is infused with melanin to lethal levels (Bang 1983). Branchiopod crustaceans are commonly found with phoretic ciliate protozoan colonies around the mouth and posterioventral portions of the head, which are abandoned with the exuvia by the crustacean with each molt.

Mid-valley fairy shrimp commonly co-occur with the California fairy shrimp (*Linderiella occidentalis* Dodds, 1923) (Eriksen and Belk 1999; Rogers *In review*). This species has also been reported co-occurring with the vernal pool fairy shrimp (*Branchinecta lynchi* Eng, Belk and Eriksen 1990) on three occasions, where the mid-valley fairy shrimp was probably washed into the vernal pool fairy shrimp habitat by abnormally high rainfall (Eriksen and Belk 1999). Other species of Branchinecta (*B. lindahli* Packard, 1883, *B. coloradensis* Packard, 1874, *B. mackini* Dexter, 1956, *B. lynchi*, *B. conservatio* Eng, Belk and Eriksen, 1990) occur within the range of the vernal pool fairy shrimp, but are typically found in different, although similar, vernal pool habitats (Rogers *In review*).

MVFS Habitat Requirements and Ecology

This species is entirely dependent upon the aquatic environment provided by vernal pool wetland ecosystems. The mid-valley fairy shrimp depends upon the presence of water in the winter and early spring and the absence of water during the summer. These specific vernal pool wetlands are dependent upon intact sub-watersheds, and the surrounding uplands that support

those watersheds. Vernal pool habitat is a component of the larger grassland ecosystem of the California Great Central Valley.

The mid-valley fairy shrimp needs the cold winter waters to hatch and grow in, typically appearing after the first frosts, and the dry summers to dry the resting cysts and prevent them from being attacked by fungi. Habitats supporting the mid-valley fairy shrimp are typically in Central Valley California floristic provinces below 300 meters in elevation. Typical habitat for mid-valley fairy shrimp in California includes vernal pools and seasonally ponded areas within vernal swales (Eng et al. 1990). Vernal pools that support these fairy shrimp are often grass or mud-bottomed, with clear to tea-colored water, and are often in basalt flow depression pools in grasslands (Eriksen and Belk 1999).

Mid-valley fairy shrimp have been found in habitats ranging from 0.001 to 0.5 acre in area, and typically utilizes habitats shorter in duration than is used by congeners (Eriksen and Belk 1999; Rogers pers. obs.).

Various physiochemical factors have been examined in laboratory experiments and existing mid-valley fairy shrimp habitats including alkalinity, total dissolved solids (TDS), and pH (Rogers *In review*). The importance of many of these parameters has recently been called into question with evidence that type and amount of dissolved salts may be a more important habitat requirement (Rogers *In review*). Considering the daily fluctuations in pH of a given habitat, this is to be expected. During the daylight hours, the hydrophytes are photosynthesizing, removing the CO_2 (from HCO_3) from the water, and raising the pH. During the night, the hydrophytes are respiring, increasing the CO_2 (and thereby, the HCO_3) in the water lowering the pH. If there is rainfall, the distilled precipitation will lower the pH, as will winds that cause surface action. When the habitats are drying and losing volume through evaporation, the pH, alkalinity, TDS, and electrical conductivity will increase, just as they decrease when the pools inundate or reinundate (Rogers *In review*).

Some vernal pools need a certain amount of grazing. Vernal pools that have all grazing removed become overgrown with native and exotic plants that generate deep thatch layers on the pool substrate, unless some other disturbance (i.e., weed control programs, vehicular use of pools, fire fuels control) prevents thatch deposition. As this thatch layer decomposes, it also oxidizes the water, which can suffocate gill-breathing invertebrates (Rogers 1998). Therefore, moderate grazing may be a necessary habitat component. Conversely, excessive livestock grazing can be detrimental to mid-valley fairy shrimp. Over-grazing tends to result in a large amount of manure in vernal pools. The organic waste reduces the dissolved oxygen in the water, leaving the gill-breathing invertebrates like the mid-valley fairy shrimp without oxygen (Rogers 1998, pers. obs,). It is important not to alter grazing regimes in conservation areas until the importance of grazing to those particular systems are assessed.

Common wetland plant species that co-occur with mid-valley fairy shrimp generally need the same hydrological conditions. Therefore, the presence of these plant species within a potential habitat would imply a greater potential for a population of these shrimp to be present. These plants may include: coyote thistle (*Eryngium* spp.), downingia (*Downingia* spp.), goldfields (*Lasthenia* spp.), wooly-marbles (*Psilocarphus* spp.), hair grass (*Deschampsia* spp.), and toad rush (*Juncus bufonius*).

Similarly, pools that are dominated by vernal pool plant species that require short inundation periods may have hydrology that cannot support shrimp species. These plants may include Mediterranean barley (*Hordeum marinum* ssp, *gussoneanum*) and Italian rye grass (*Lolium multiflorum*).

Conversely, wetland habitats that support plant species that need water year round cannot support special-status shrimp species because the shrimp's cysts must dry out before they can hatch (Eriksen and Belk 1999), or if they remain wet or moist through the warmer summer months, the cysts will fungus (Rogers pers. obs.). These plants include cattails (*Typha* spp.), willow (*Salix* spp.), Fremont's cottonwood (*Populus fremontii*), duckweed (*Lemna* spp.), nut grass (*Cyperus* spp.), Baltic rush (*Juncus balticus*), and bulrush (*Schenoplectus* spp.).

Fairy shrimp are a component of a larger invertebrate community structure (Rogers 1998). This invertebrate community includes mostly planktonic crustacea dependent upon temporary wetlands including copepods, cladocerans, and ostracodes, as well as flatworms, and a suite of insect species, including: vernal pool haliplid beetle (*Apterliplus parvulus*), Scimitar backswimmers (*Buenoa scimitra*), Ricksecker's hydrochara (*Hydrochara rickseckeri*), and many others (Rogers 1998). These habitats are usually low in opportunistic species like mosquitoes and chironomid midges in the genus *Chironomus* (Rogers 1998).

Therefore, potential special-status shrimp habitat is defined as vernal pools and seasonal wetlands of sufficient size (depth and area) and seasonality that may also support specific vegetation and invertebrate community structure that indicate the potential for ponding for a sufficient duration to allow special-status shrimp species to complete their life cycles and to maintain water temperatures conducive to special-status shrimp species.

Optimal mid-valley fairy shrimp habitat tends to be small, with an abbreviated hydroperiod, neutral to slightly alkaline, clear vernal pools, low in dissolved salts, dominated with vernal pool plants, and sustains a complex vernal pool invertebrate community (Eriksen and Belk 1999; Rogers pers. obs., 1998, *In review*).

MVFS Habitat Elements

Habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The habitat elements for Vernal Pool Fairy Shrimp are identified in Table G-3.9-1 and are largely based on the habitat elements for mid-valley fairy shrimp.

Table G-3.9-1. Habitat Elements for Mid-Valley Fairy Shrimp

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by mounds and swales, and depressions within a matrix of surrounding uplands that result in complexes of continuously, or intermittently, flowing surface water in the swales connecting the pools providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water for a minimum of 18 days, in all but the driest years; thereby providing adequate water for incubation, maturation, and reproduction.

MVFS Species Distribution and Population Trends

There are more than 40 species of *Branchinecta* world-wide (Belk and Brtek 1995, 1997; Rogers and Fugate 2001; Belk and Rogers 2002) distributed throughout the Holarctic and Neotropical regions, with one species ranging into the Antarctic. The mid-valley fairy shrimp is endemic to California (Eriksen and Belk 1999; Belk and Fugate 2000).

Habitat occupied by fairy shrimp tends to exist on level open ground. This geomorphic setting tends to be the most desirable for agricultural, urban or industrial development. As a result, the grassland plateaus and floor of the Great Central Valley has been broadly converted by human use. Consequently, an unknown amount of vernal pool habitat has been lost, and an unknown number of mid-valley fairy shrimp occurrences as well, although there have been attempts to calculate the lost acreages (Holland 1978, 1988, 1998; Bauder and McMillan 1988). Due to current pressures of the increasing human populations in California, more mid-valley fairy shrimp habitat will and is being encroached upon and impacted throughout the species range.

MVFS Range Wide Distribution

The earliest collections of the mid-valley fairy shrimp were made by Clyde Eriksen in the late 1960's at Mather Air Force Base. Eriksen collected the mid-valley fairy shrimp with specimens of the vernal pool tadpole shrimp, *Lepidurus packardi*. The mid-valley fairy shrimp was not recognized as a new species until Anne Huber collected material from south of Mather Field

and sent the specimens to Mike Fugate for identification. Fugate sent the material on to Denton Belk, who identified them as an undescribed species.

The mid-valley fairy shrimp is found in California from southern Sacramento County, west to Solano and Contra Costa Counties, and along the east side of the Central Valley south to Fresno County (Eriksen and Belk 1999). The entire range of this species is within the Central Valley.

MVFS Central Valley Distribution

The mid-valley fairy shrimp is endemic to California Central Valley grassland vernal pools (Belk and Fugate 2000). Known occurrences include: scattered occurrences from Mather Field area of Sacramento, south through Galt from Sacramento County; Jepson Prairie, Travis Air Force Base and Vacaville areas in Solano County: from Lodi north to the county border in San Joaquin County; the Byron Airport in Contra Costa County; the Virgina Smith Trust (Haystack Mountain) and Arena Plains National Wildlife Reserve in Merced County; one location in central Madera County; and one in northern Fresno County (Erickson and Belk 1999; Belk and Fugate 2000; Rogers in prep.).

MVFS Distribution within the Planning Area

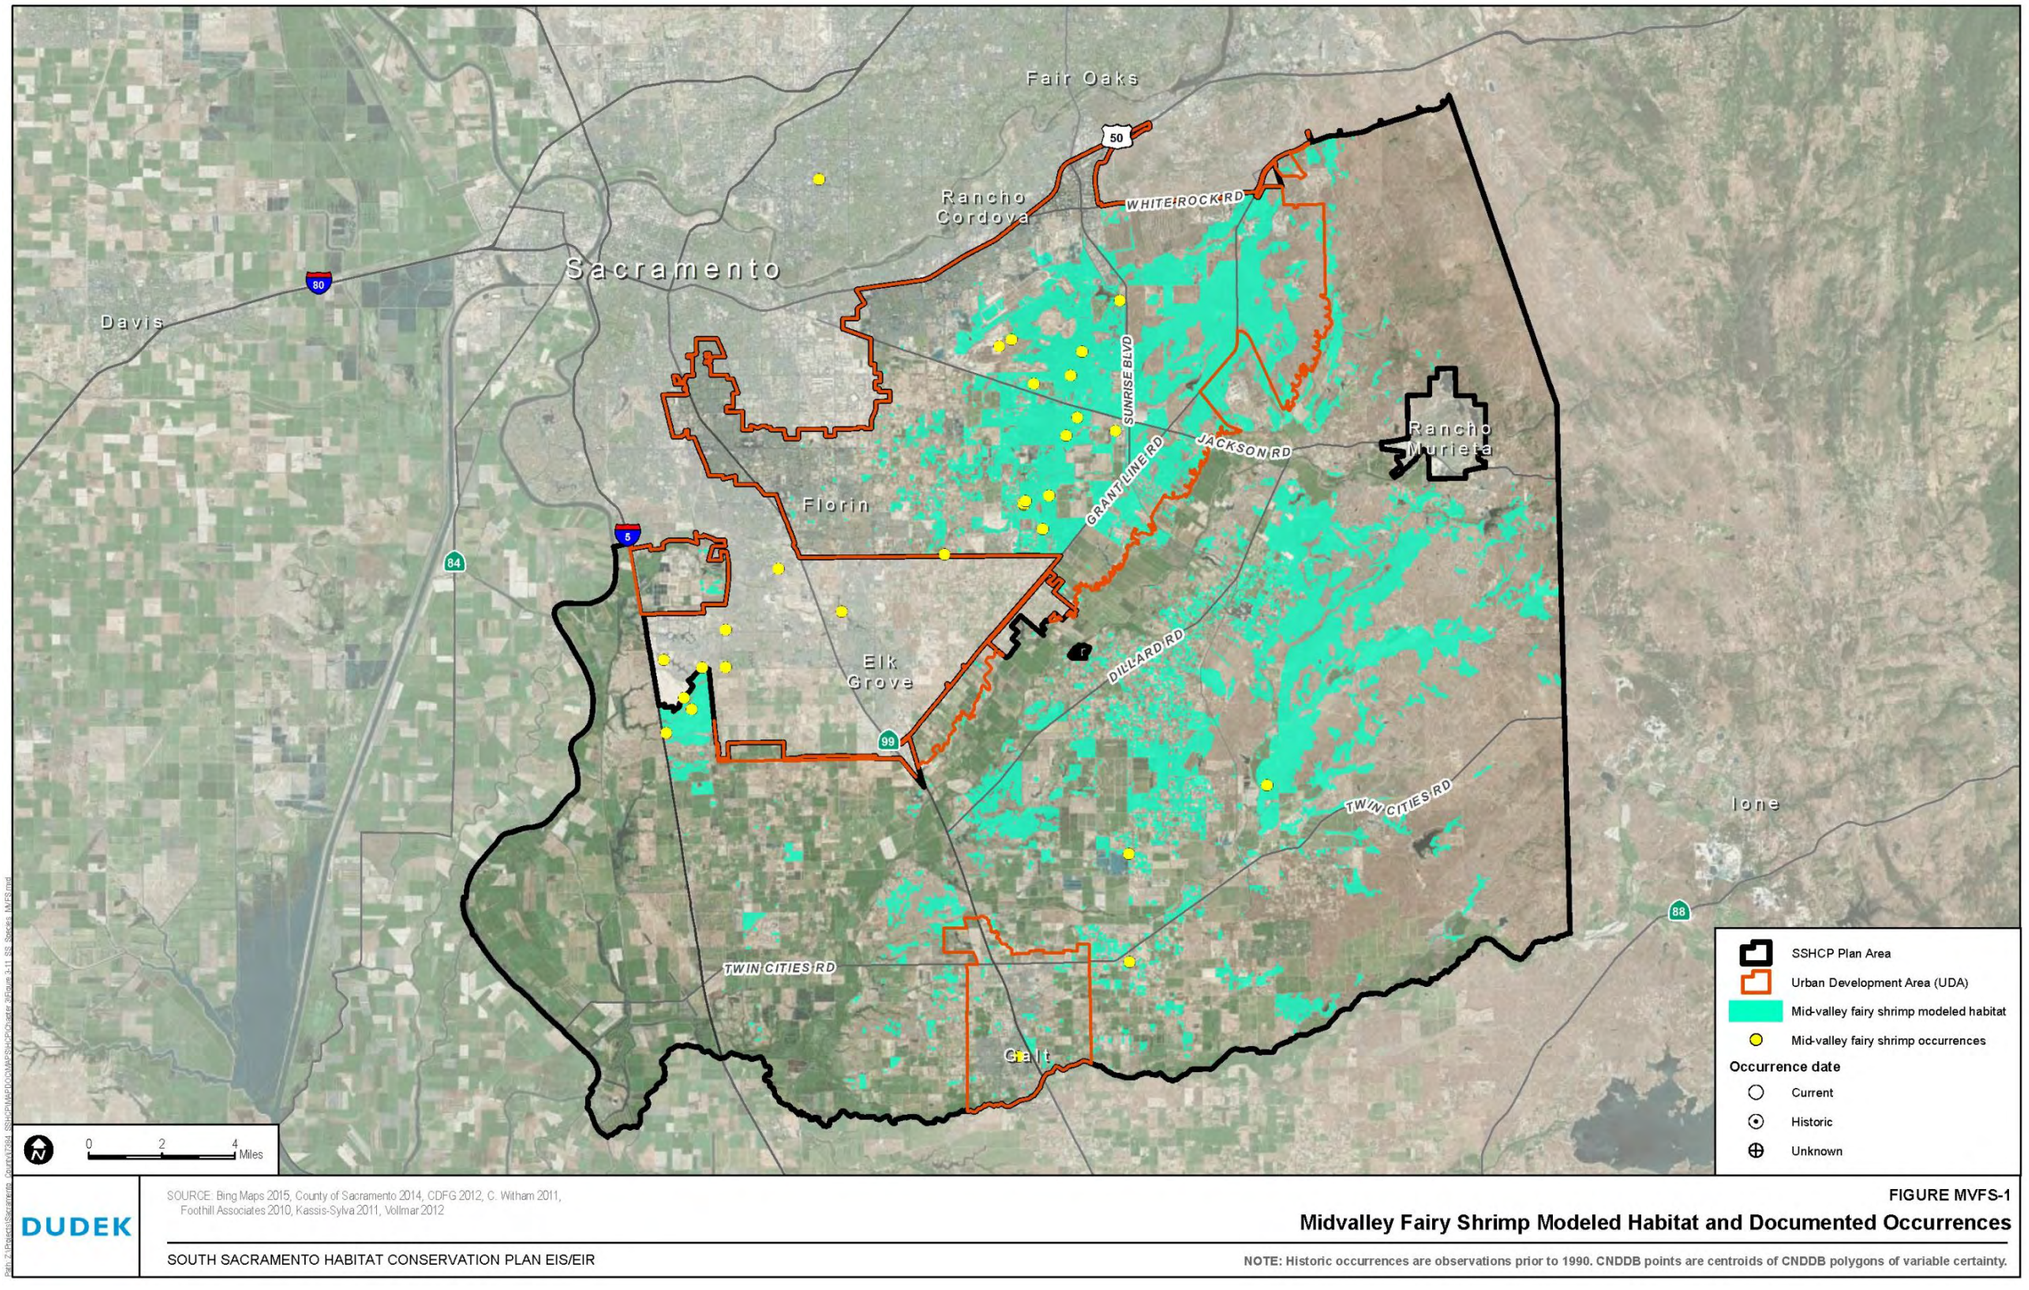
The mid-valley fairy shrimp was first officially reported from the Planning Area in the species' original description (Belk and Fugate 2000). Specimens were collected from Mather Air Force Base as early as 1967 by Dr. Clyde Eriksen (Eriksen, pers. comm.). Numerous surveys related to development projects have been conducted within and adjacent to the Planning Area (USFWS records; CDFG 2010), but the area has not been thoroughly surveyed for mid-valley fairy shrimp, and the total extent of potential habitat is unknown. Figure MVFS-1 illustrates the known recorded occurrences of mid-valley fairy shrimp within and adjacent to the Planning Area. The modeled habitat of the species in the Planning Area is discussed in Section G-4 of this Appendix.

MVFS Population Levels and Trends

An unknown amount of vernal pool habitat has been lost and with it, an unknown number of mid-valley fairy shrimp occurrences. Attempts have been made to calculate lost vernal pool acreages (Holland 1978, 1988, 1998; Bauder and McMillan 1988). Due to current pressures of the increasing human populations in California, more mid-valley fairy shrimp habitat will and is being encroached upon and impacted throughout the species' range.

Adequate determination of remaining mid-valley fairy shrimp occurrences throughout the animal's range as well as population trends is difficult. Eriksen and Belk (1999) present a map of localities for the mid-valley fairy shrimp with less than 30 localities represented, with the greatest density of occurrences in southern Sacramento County.

The California Natural Diversity Data Base (CNDDB) vernal pool crustacean records (CDFG 2010) may be somewhat misleading, due to the inconsistency of the data presented. Some records refer to individual pools, while others refer to pool complexes, and others still refer to groups of complexes. Additionally, the CNDDB does is not updated when a particular site or population is extirpated. Because of issues such as these, it is difficult to determine what actually constitutes a "population" or "occurrence" in any attempt at impact analysis.



In addition, survey maps and records tend to show where vernal pool crustaceans are, and do not emphasize where they are not. Compounding these difficulties, records are typically a reflection of where surveys have been conducted, rather than a delineation of special-status shrimp distribution. Therefore, it is difficult to establish existing conditions for this species across the entire species range, as well as within the Planning Area. None of this is to say that vernal pool crustaceans are not threatened, endangered, or should not be protected. The issue is that where a paucity of adequate data exists, consistent data reporting would help prevent ambiguous interpretation or mischaracterization of species conservation needs.

MVFS Threats to the Species

As described previously, the greatest threat to vernal pool invertebrates is the elimination, loss, or modification of their habitat by development. The filling of vernal pools or modification of the watershed that supports those pools either eliminates the habitat or disrupts the pool ecosystem to where it is overcome by opportunistic invertebrate species and invasive, opportunistic and non-native plants, that out compete the obligatory vernal pool species (Rogers 1998).

Excessive livestock grazing in vernal pool terrain can be detrimental to vernal pool invertebrate communities. Over grazing tends to result in large amounts of manure in vernal pools. The organic waste reduces the dissolve oxygen in the water during decomposition, leaving gill-breathing invertebrates without oxygen (Rogers 1998, pers. obs,). Conversely, vernal pool grasslands are disturbance systems, and need a certain amount of grazing. Vernal pools that have all grazing removed may become overgrown with native (i.e.; Eleocharis sp., Eryngium sp.) and exotic plants (i.e.; Glyceria sp. Lolium multiflorum) that generate deep thatch layers on the pool substrate. As this thatch layer decomposes, it also reduces the dissolved oxygen in the water, which can suffocate gill-breathing invertebrates (Rogers 1998). Both lack of and excessive grazing cause an increase in organic matter in the habitat that eliminates the natural vernal pool invertebrate community, and promotes opportunistic and invasive species, that outcompete the obligatory vernal pool species (Rogers 1998). Therefore, moderate grazing, or other disturbance may be a necessary habitat suitability component, and the removal of grazing or excessive grazing are threats to the mid-valley fairy shrimp.

Figure MVFS-1 Midvalley Fairy Shrimp Modeled Habitat and Documented Occurrences

INTENTIONALLY LEFT BLANK

Damage to the watershed that supports vernal pools and vernal pool complexes will impact vernal pool invertebrate communities. Elimination of the watershed will not allow the pools to pond properly and will curtail the movement of nutrients into the pool from overland flow (Rogers 1998). Road run-off entering the watershed and conveyed to occupied habitat through the watershed may carry petroleum by-product residue or sediment from vehicles or paving or road maintenance activities. Furthermore, pesticide, herbicide, fertilizer, and sediment run-off from agricultural activities that may enter the watershed and be conveyed to occupied habitat, and may be injurious to vernal pool invertebrates. Ground disturbance from development activities may loosen soil that that may enter the watershed and be conveyed to occupied habitat as sediment.

Non-native invasive species are a threat to vernal pool invertebrate communities. There is concern that Bullfrogs (Rana catesbeiana) may feed upon federally protected vernal pool crustaceans (Balfour and Morey 1999). Manna grass and Italian rye grass are both exotic plants that occur in vernal pools. These species tend to produce heavy thatch and eventually organic loads upon decomposition, which reduce available oxygen in the water (Rogers 1998). In addition, people may introduce the non-discriminating predatory mosquitofish (Gambusia affinis) into vernal pools to control perceived local mosquito problems (Rogers pers. obs.).

Habitat fragmentation is a threat to vernal pool invertebrates in that the development surrounding small pool complexes may prevent waterfowl or shorebirds from feeding at the pools, thereby preventing genetic flow between occupied habitats. Furthermore, small pool complexes surrounded by development will not be buffered against the run-off from developed areas, and concomitant changes in the watershed hydrology.

Additional threats to the vernal pool invertebrate community structure include off-road vehicle use of vernal pool habitat for recreational “mud-bogging,” conversion of vernal pools into deep stock tanks that do not dry during the summer, and draining of vernal pools.

MVFS Data Gaps and Conservation Implications

Restoration and creation of mid-valley fairy shrimp habitat has been demonstrated to be feasible (Rogers 1998). Specific habitat parameters for this and other vernal pool invertebrate species are still poorly understood. For example, there appears to be a need by this species to have a minimum pool volume and a minimum pool surface area within a given habitat to be occupied. Since this species has been found in a wide variety of natural and re-established or established vernal pool habitats, it is likely that it is in some respects an opportunist, as most temporary water fauna must be.
