APPENDIX D
Re-establishment and Establishment Guidelines

1 INTRODUCTION

The United States Army Corps of Engineers (USACE) and the US Environmental Protection Agency (EPA) define restoration as, "the manipulation of the physical, chemical, or biological characteristics of a site with the goal of returning natural/ historic functions to a former or degraded aquatic resource" (USACE and EPA 2008). Restoration includes both rehabilitation, which repairs natural/historic functions to a degraded aquatic resource, and re-establishment, which returns natural/historic functions to a former aquatic resource. Establishment (i.e., creation) is defined as, "the manipulation of the physical, chemical, or biological characteristics present to develop an aquatic resource that did not previously exist at an upland site." Re-establishing is always preferable to establishment because the likelihood of success is far greater where some aquatic resource characteristics are already present or were historically present. Additionally, because the establishment of wetland and other waters on upland and/or deepwater sites will result in a net decrease in upland and/or deepwater habitat, this should only occur when there are no existing or available sites with re-establishment opportunities. Even highly degraded and disturbed re-establishment sites are preferable to establishment sites. Nevertheless, it is expected that a portion of mitigation acreage under the South Sacramento Habitat Conservation Plan (SSHCP) will occur as wetland and other waters establishment due to a lack of available restoration sites outside the Urban Development Area (UDA).

This appendix explains the SSHCP protocols for establishment and restoration of wetlands and other water ecosystems. These protocols are based on the USACE's Mitigation Guidelines for the Clean Water Act (CWA) 404 Program and the United States Environmental Protection Agency's (EPA) *Principles for Ecological Restoration of Aquatic Resources* (EPA 2000). They are meant to provide applicants with a basic outline for planning, designing, implementing, and managing restoration or establishment projects. In so doing, the protocols are meant to ensure that wetland projects will be viable in perpetuity, and will adequately compensate for impacted habitat. This section will also provide standards that are specific to each of the 10 aquatic resources land cover types, including restoration and establishment methods, monitoring requirements, criteria against which success will be measured, and remedial steps for projects that do not meet the basic success criteria. It is recognized that ecosystem restoration and establishment is an evolving science, and that this document represents current understandings and expectations in the field. Therefore, the application of these protocols will allow adjustments in an adaptive manner to reflect the best available science of wetland and stream establishment and re-establishment, monitoring, and performance standards that can improve the long-term viability of restoration and establishment projects.

APPENDIX D (Continued)

The following methodology describes the process by which determinations were made regarding the potential for establishment and re-establishment acreage amounts to occur within the Plan Area.

Assumptions

Irrigated pasture and croplands are considered the only habitats where removal of the current land use and re-establishment of topography may result in re-established wetlands. Irrigated pasture is considered particularly suitable for re-establishment of wetlands because the hardpan is likely intact. Croplands, depending on the crop, may also retain the hardpan. Both land uses occur where wetlands may have historically occurred.

Orchards and vineyards are not suitable for wetland restoration because the lands have been deep-ripped to support the agricultural uses.

Valley grasslands may be suitable for establishment of wetlands, but only outside of 250 feet of an existing wetland feature so as not to create any indirect effects to the wetland per U.S. Fish and Wildlife Service (USFWS) protocol.

Only land in the Plan Area is considered for re-establishment or establishment.

It is assumed that parcels 20 acres in size or less will be too expensive to acquire and too small to support successful re-establishment or establishment.

It is assumed that existing preserves will not be suitable for re-establishment or establishment as this may risk damaging protected resources and easements may prohibit re-establishment or establishment.

Based on California Department of Fish and Wildlife recommendations, it is assumed that between 15% and 30% of land that is assumed to be suitable habitat will be available for acquisition.

Up to 8% of a site can be re-established or established with wetlands. This is based on the density of wetlands found in Valley Grassland cover type throughout the Plan Area. Wetlands include vernal pools, swales, seasonal wetlands, freshwater marsh, streams and open water. Wetland density within the Plan Area was derived from the acreage of wetlands within the Valley Grassland cover type as this is the only upland cover type that is reflective of historic natural conditions. All other upland cover types have been heavily modified.

Methodology

Identify all Cropland, Irrigated Pasture, and Valley Grassland cover types in the SSHCP Plan Area. This forms the “base map.”

APPENDIX D (Continued)

Using the parcel layer, remove all parcels from the base map that are less than 20 acres in size.

Using the existing preserve layer, remove all parcels from the base map that are already protected.

Using a buffer file, remove all lands from the base map that are within 250 feet of a vernal pool, swale, and stream/creek (VPIH) land cover type.

Calculate range of how many Cropland, Irrigated Pasture, and Valley Grassland acres are available for potential re-establishment or establishment, assuming 15% to 30% of the base map can be acquired.

Calculate range of how many wetland acres can be re-established or established based on 8% density.

Conclusions

The base map sums to 210,509 acres.

After removing lots smaller than 20 acres in size and already preserved lands, the map sums to approximately 135,455 acres.

After removing areas within 250 feet of existing VPIH land covers, the map sums to approximately 85,690 acres.

It is estimated that further investigation into the historical agricultural practices on some of the potential re-establishment or establishment sites will reveal past deep-ripping. Sites that have been deep-ripped will not have an intact perched aquafer, which is necessary to support most wetland cover types. There are some questions as to whether or not the perched aquifer in soils that have been deep-ripped can be repaired. Orchards and vineyards are not considered suitable candidates for re-establishment or establishment because deep-ripping has typically occurred where they were established. It is also understood that acquiring potential re-establishment or establishment sites is dependent on a willing buyer and willing seller agreement. Therefore, it is not probable that all identified potential wetland re-establishment or establishment sites can be acquired for re-establishment or establishment. It is estimated that between 15% and 30% of potential re-establishment or establishment sites will be successfully negotiated for acquisition and will be capable of supporting re-establishment or establishment efforts. Therefore, it is assumed that between 12,854 and 25,707 acres may be available for wetland re-establishment or establishment.

Wetland re-establishment and establishment guidelines set forth in this study limit the percent of land that can be re-established and established to 8% of the site. The remaining 92% is required as upland

APPENDIX D (Continued)

habitat, which supports the hydrology of the wetland. Therefore, it is estimated that between 1,028 and 2,057 acres of wetlands can be re-established or established within the Plan Area.

The SSHCP impacts analysis forecasts that approximately 1,200 acres of wetlands will be impacted. Because we assume that the Plan Area can provide between 1,028 and 2,057 acres of wetland re-establishment and establishment, the re-establishment/establishment ratio under the SSHCP is set at 1:1.

APPENDIX D (Continued)

2 GUIDELINES

The restoration and establishment process has several stages: site selection, site evaluation, project design, project implementation, project monitoring, and project management. General protocols for each of these stages are as follows:

2.1 Site Selection

The National Resource Council (NRC) stipulates that "site selection for wetland conservation and mitigation should be conducted on a watershed scale in order to maintain wetland diversity, connectivity, and appropriate proportions of upland and wetland systems needed to enhance the long-term stability of the wetland and riparian systems" (NRC 2001). Protected upstream and upland areas provide a safeguard against the negative edge effects of future development. Therefore, restoration and establishment sites that are contiguous to existing preserves or lands protected by conservation easements will have priority over wetland restoration or establishment sites outside of a comprehensive preserve system. All restoration and establishment sites must be under permanent conservation easement or have preserve status.

Consideration will be given to a site's position within the watershed, its function within the watershed, and the potential impacts of restoration or establishment on existing proximate wetland and other aquatic resource habitats within the same watershed. Restoration or establishment sites that can benefit the watershed in which they are situated will have priority over those with little to no impact; sites with no potential impact on the watershed in which they are situated will have priority over those with potential negative impacts. Sites with potential negative impacts to the watershed or nearby habitat will be avoided.

Wetlands and other waters that have retained functional hydrodynamics or degraded and former wetlands whose hydrodynamics can be re-established through passive restoration tend to be more fiscally and environmentally sustainable than those where functional hydrodynamics must be engineered or created. Active hydrodynamic restoration methods, like grading and excavation can severely damage the substrate and encourage the spread of invasive plant species. "Hard" engineering solutions, such as irrigation and pumping systems, are costly and cannot readily adapt to seasonal and annual fluctuations in rainfall and water level. Hence, restoration and establishment sites that do not require active intervention to remediate wetland or other waters hydrodynamics will have priority over other sites. No restoration or establishment projects that use irrigation as a primary or long-term water source are permitted.

Soil type and permeability are also important considerations, as they dictate a site's ability to retain water and support vegetation. Highly permeable soils are not likely to retain enough water to function as a wetland or other water ecosystem, except where water tables or water inflow

APPENDIX D (Continued)

rates are high. Factors such as soils pH, nutrient content, climate, parent material, relief, organisms, and the overriding influence hydrologic regime, will influence whether wetland-appropriate vegetation struggles or thrives. Therefore, restoration and establishment sites with soil types known to support wetland hydrology and vegetation will have priority over other sites.

Additionally, restoration and establishment site selection will consider the potential effects of habitat restoration on nearby County airport operations. Pursuant to Title 33 of the Code of Federal Regulations (CFR) Section 332.3, compensatory mitigation projects should not be located where they will increase risks to aviation by attracting wildlife to areas where aircraft–wildlife strikes may occur (e.g., near airports). Thus, those sites that are less likely to increase wildlife hazard attractants within a County airport's approach and departure airspace will be given priority over other sites.

Lastly, because a central goal of mitigation is to offset unavoidable adverse impacts to wetlands, streams, and other aquatic resources to maintain a diverse assortment of wetland types, functions, landscape settings, and geomorphic settings, sites that have unique or rare topographical, geomorphic, vegetative, biotic, or functional characteristics will have priority over other sites.

In summary, the Implementing Entity will prioritize restoration and establishment sites that:

- Are contiguous to existing preserves or lands under conservation easements;
- Can withstand re-establishment or establishment projects without adverse impacts to the watershed or habitat in which they are situated;
- Do not require active intervention to remediate wetland or other waters' hydrodynamics;
- Have appropriate soil types, composition, and permeability;
- Do not attract wildlife within the approach and departure airspace of County airports, and
- Have unique or rare characteristics.

Once a restoration or establishment site is selected, a reference site will be identified. Reference sites should be in-kind and as proximate to the restoration or restoration site as possible. The site being mitigated for can be used as the reference site if it is reasonably proximate and similar to the restoration or establishment site, and if it has not been destroyed prior to the start of the restoration or establishment project. Reference sites should not be chosen randomly, but rather so that collectively they represent the diversity of species and plant communities that exist on the sites that are going to be destroyed.

APPENDIX D (Continued)

2.2 Site Evaluation

Once the restoration or establishment site and the reference site are selected, an interdisciplinary team of experts will survey the site. This team will include the Implementing Entity and at least one Monitoring Biologist (MB). The MB will be a professional botanist, biologist, or restoration ecologist familiar with California flora and fauna, and experienced with wetland or other waters re-establishment or establishment projects; alternatively, the MB can be a firm specializing in the re-establishment or establishment of wetlands and other waters. This person or firm will be contracted to perform the baseline evaluation (in addition to the monitoring responsibilities detailed in Section 2.5).

The baseline evaluation will actually consist of two surveys: one in wet season (January to February) and one in the flowering period (March through May). Each survey should note the following, using either metrics on or descriptions of:

- Topography and slope;
- Water quality (turbidity, nutrient levels, presence of toxins, etc.);
- Subsurface water flow rate, direction, depth, and duration;
- Surface water flow rate, direction, depth, and duration;
- Soil/substrate type, permeability, moisture levels, and erosion;
- Dominant vegetation type, location, density, and elevation;
- Presence and location of invasive species;
- Presence and location of listed species;
- Aquatic function (if any);
- Historical and current uses of the site; and
- Historical and current uses of neighboring land that may affect the project outcome.

Surveys of plant and animal species specific to particular wetland or other water types may need to occur within a more specific time frame or multiple times over the course of the survey period for the results to be accurate and reliable. These particular survey requirements will be detailed within the restoration and establishment guidelines of each wetland and other water type.

The reference site should be surveyed at the same time and using the same methods and metrics as the restoration or establishment site.

APPENDIX D (Continued)

2.3 Project Design

Project design depends upon the desired outcome of each project. The overarching goal for all mitigation projects under the SSHCP is an ecosystem strategy approach to re-establish or establish sustainable and functioning ecosystems that match the characteristics and functions of the ecosystems they replace within a system of conservation areas and reserves so that species dispersal mechanisms remain functional. However, depending on project-specific constraints and opportunities, this may be too broad or constraining. Therefore, the Implementing Entity and MB will use the baseline evaluation findings to set project-specific goals and to design the project with the aim of meeting those goals. As part of the project design, the team will also generate an implementation plan that describes how the design will be implemented. Lastly, the team will generate a monitoring and management plan, which will include project-specific outcomes, criteria against which progress toward meeting those objectives can be measured, and the monitoring methods that will be used to measure those criteria.

In general, passive restoration design is preferable to active restoration, as it is less invasive and the result is self-sustaining. Passive restoration involves removing the source of degradation (e.g., cattle grazing, culverts, etc.) and allowing natural process to gradually return the site to a functioning wetland or other water ecosystem. However, passive restoration design will not meet the goals of every restoration project, especially on severely degraded sites, and passive designs cannot be used for establishment projects. Therefore, it is expected that some projects will utilize active restoration and establishment project designs.

The USACE South Pacific Division's *Final 2015 Regional Compensatory Mitigation and Monitoring Guidelines* (USACE 2015) recommend the following considerations for mitigation planning: A mitigation plan for wetland compensatory mitigation projects should consider the NRC's operational guidelines for restoring ecologically self-sustaining wetlands (NRC 2001). This succinct document provides some useful guidelines on factors to consider in planning wetland compensatory mitigation. In addition, examination of existing compensatory mitigation sites has provided information that can be used to ensure the success of proposed compensatory mitigation sites. In general, compensatory mitigation sites should be designed with the following in mind.

General Design Recommendations for Compensatory Mitigation

- Ensure an adequate buffer subject to minimal or no human disturbance is established and protected adjacent to any aquatic resources in the compensatory mitigation site.
- Integrate macro- and micro-topographic features to create a diversity of hydrologic and geomorphic conditions, plant communities, and animal habitat.

APPENDIX D (Continued)

- Design the compensatory mitigation project to mimic a local reference site of similar class and landscape position that provides the desired habitat features and functionality.
- Incorporate mitigation plantings of species native to the local area.
- Avoid or minimize impacts to special-status species and other biological resources.

Design Recommendations for Wetland Compensatory Mitigation

- Select compensatory mitigation sites with natural, self-sustaining sources of hydrology (surface water, groundwater, and precipitation). The use of engineered structures such as pumps, water control structures, or diversions is strongly discouraged. Securing water rights and/or understanding the risks of existing or future water diversions are critical elements.

Design Recommendations for Stream Compensatory Mitigation

- Ensure the main channel through the compensatory mitigation site is free to migrate laterally over its active and terrace floodplain.
- Ensure channel geometry (plan, profile, and cross-section) of the compensatory mitigation site is appropriate for the watershed location and physical/hydrological condition.
- Use local, native materials as fill material to the extent practicable.
- Use bioengineering techniques to the extent practicable.
- Establish/restore and protect riparian areas next to the stream channel.

Additionally, project designs must address the three fundamental components of wetland ecosystems: hydrology, substrate, and vegetation. According to the NRC's Committee on the Characterization of Wetlands (NRC 1995):

> The states of the three factors that characterize wetlands are… recurrent, sustained saturation (the hydrological criterion), physical and chemical conditions in the substrate that reflect recurrent, sustained saturation (the substrate criterion), and the presence of organisms that are specifically adapted to recurrent and sustained saturation of the substrate (the biologic criterion).

2.3.1 Hydrology

The project design should describe how topography and hydrology of the site will be altered (if at all) to re-establish or establish the appropriate hydrodynamics and hydroperiod for the wetland or other water ecosystem. The design should also explain what aquatic function is expected to result from this change.

APPENDIX D (Continued)

This component of the project design should utilize natural hydrologic patterns whenever possible, and avoid depending on hard engineering to achieve the desired hydrology. Soft engineering is always preferable to hard engineering, as it is more natural and self-sustaining, requires minimal maintenance, and is more cost-effective. As explained in Section 2.1, grading, excavation, pumping, and irrigation are undesirable and should be avoided. Irrigation is never acceptable as a primary or long-term water source.

2.3.2 Substrate

The project design should describe how (if at all) the soil or substrate will be amended or translocated to re-establish or establish the appropriate level of saturation and nutrient/organic matter content for the wetland or other water ecosystem. The project design should utilize existing soil and substrate whenever appropriate for the wetland or other water type being re-established or established. To avoid the spread of invasive species, soil and/or substrate translocated from off site should be sourced from sites free of invasive species.

2.3.3 Vegetation

The project design should describe how (if at all) the site will be vegetated or revegetated. Substrate, plants, and seeds collected from the site can be used to revegetate and repopulate the site after hydrology is re-established or established. When no native seed bank exists, site-suitable plant species should be procured from as local a source as possible. Off-site plant, seed, and substrate collection should come from local sites free of invasive species. Commercial seeds for native plants can be substituted if no local seed banks are available. Project designs, especially active designs, should use variation to allow for adaptive management. When designs include excavation or grading, they should provide appropriately heterogeneous topography. When designs include revegetation, they should create varying plant elevations and emergence levels. Such variations enable flexibility in case of extreme weather events and other unpredictable factors that can affect the project.

In summary, the Implementing Entity will design restoration and establishment projects that:

- Are based on foreseeable constraints and information derived from the baseline evaluation;
- Strive to meet project-specific goals, outcomes, and success criteria;
- Specify monitoring frequency and management protocols;
- Are passive, whenever possible;
- Address the water, substrate, and biota that compose the wetland or other water type;

- Utilize existing hydrological patterns, topography, soil, substrate, native vegetation, and/or local seed banks, whenever possible; and
- Create variation to allow for experimentation and adaptive management.

2.4 Implementation

The implementation plan must provide a timeline for the project implementation, and must describe all avoidance and minimization measures that the Implementing Entity will take during implementation of the project. These measures are described in detail in Chapter 7 Conservation Strategy of the SSHCP.

2.4.1 Timing

Implementation will occur either before or after the breeding and aestivation seasons of species present at the restoration or establishment site. The Implementing Entity will also time the implementation so that revegetation occurs during the appropriate growing season. If the planned implementation season arrives with unexpectedly poor conditions (e.g., drought, flood, etc.) the Implementing Entity will postpone project implementation until better conditions emerge, up to one calendar year or 18 months.

2.4.2 Avoidance and Minimization

Prior to entering the restoration or establishment site all boots, tools, truck tires, truck beds, and any other equipment should be washed and disinfected to limit the spread of invasive species and disease. If invasive species are already present at the re-establishment or establishment site prior to implementation, and the project design involves eradicating such species, the Implementing Entity will use mowing, hand weeding, and other natural methods to do so. Herbicides and pesticides will be avoided.

When the project design involves excavation or grading, the Implementing Entity will salvage appropriate native soils, substrate, and plant materials from the re-establishment or establishment site, whenever possible. Seeds with viable embryos should be collected by hand, with scissors, or with clippers, and stored under cool and dry conditions. Substrate should be harvested using a hammer or backhoe to loosen blocks that are at least 6 inches deep, and stored on greenhouse flats wrapped in damp fabric.

All tools should be removed from the site after implementation, except those needed for monitoring purposes.

APPENDIX D (Continued)

2.5 Monitoring

A monitoring schedule will be developed as part of the project design process (see Section 2.3). Monitoring should occur with the highest frequency during and immediately after implementation. These surveys should include the same metrics and descriptions as the baseline evaluation.

Long-term monitoring should include an annual Biological Inspection, and more detailed quantitative and qualitative surveys every 5 years. The Biological Inspection will consist of one or more walk-through surveys that note:

- Hydrology;
- Vegetation composition;
- Presence and location of invasive species;
- Wildlife presence; and
- Condition of habitat features, including changes and/or pending needs.

Surveys should include photo documentation where useful. Summary reports of monitoring results should be submitted to the Implementing Agency by the end of each monitoring year.

The Monitoring Biologist (MB) is responsible for all near- and long-term monitoring of the re-establishment or establishment site. Ideally, the same MB will perform both the baseline evaluation (detailed in Section 2.2) and project monitoring for the duration of the monitoring period. However, a change of the MB can be made in consultation with the Implementing Agency, and with the Implementing Entity's approval at the time of change. The exiting MB will give a tour and introduction of the site to the entering MB.

Duties of the MB include, but are not limited to:

- Monitoring site function, hydrology, and erosion control;
- Monitoring water quality;
- An annual Biological Inspection of the site; collecting data and preparing reports based on this Inspection;
- Monitoring presence, vigor, location, and density of vegetation and biota;
- Evaluating the accumulation of thatch and recommending removal, when necessary;
- Evaluating the presence of newly introduced, non-native, or exotic plant species, and recommending removal, when necessary;

APPENDIX D (Continued)

- Recommending allowable activities on the site, e.g. educational activities, tours, grazing, etc.; and
- Recommending remedial or corrective actions, to be implemented by the Implementing Entity.

2.6 Management

The Implementing Entity is responsible for the near- and long-term management and maintenance of the restoration or establishment site. Long-term management is necessary to ensure that the restoration or establishment project is viable as a wetland or other water habitat in perpetuity. The Implementing Entity's management duties will include, but not be limited to:

- Maintaining fencing and signage;
- Coordinating trash removal;
- Removing thatch and dead vegetative matter to reduce fire hazard;
- Removing and/or managing exotic and invasive plant species, when necessary;
- Coordinating grazing schedules, when applicable;
- Coordinating the annual Biological Inspection by the MB;
- Reviewing monitoring data and performing general inspections; and
- Implementing remedial or corrective action when necessary.

The Implementing Entity will coordinate with the MB to determine when and where remedial or corrective action is necessary and feasible.

Final Environmental Impact Statement and Environmental Impact Report for the South Sacramento Habitat Conservation Plan

February 2018

Abstract

This document evaluates the environmental consequences of approving incidental take permits under the federal and state Endangered Species Acts and implementing new urban development and associated infrastructure projects within southern Sacramento County, California, pursuant to a proposed Habitat Conservation Plan. Net benefits to most biological resources and aquatic resources are expected, compared to conventional project-by-project authorization processes. The proposed project and other action-alternatives would have minor impacts to other resources, none of which are significant.

16-1 Census Tracts in the Planning Area and Identification of Minority and Low-Income Populations 16-7

TABLES

ES-1 Summary of Impacts and Mitigation ES-11
ES-2 Summary of Impacts to Special-Status Species, Including Covered Species ES-28
2-1 Maximum Losses of Natural Land Categories Under the No Action/ No Project Alternative 2-38
2-2 Minimum Acres of New Preserves Under the No Action/No Project Alternative 2-39
2-3 Covered Activities Included in Each Action Alternative Studied in the EIS/EIR 2-50
2-4 Maximum Direct Impacts (Loss) of Natural Lands Under the Proposed Action/ Proposed Project Alternative 2-54
2-5 Planning Area Special-Status Species Included as Covered Species 2-55
2-6 Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative 2-60
2-7 Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy 2-77
2-8 Minimum Preservation of Natural Land Categories Under the Proposed Action/ Proposed Project Alternative 2-116
2-9 Local Planning Documents and Time Horizons Relevant to the Permit Term 2-127
2-10 Maximum Loss of Natural Land Categories Under the Reduced Permit Term Alternative 2-133
2-11 Minimum Acres of New Preserves Under the Reduced Permit Term Alternative 2-141
3-1 Similar NEPA and CEQA Terms 3-1
4-1 Acreage of Sacramento County, Galt, and Rancho Cordova within the EIS/EIR Planning Area 4-15
4-2 Existing Land Use Designations within the Planning Area 4-30
4-3 Changes to Existing Land Use Designations under the No Action/No Project Alternative 4-39
4-4 Changes to Existing Land Use Designations under the Proposed Action/ Proposed Project Alternative 4-46
4-5 Changes in Existing Land Use Designation under the Reduced Permit Term Alternative 4-53
6-1 Important Farmland Mapping Categories 6-2

6-2 Important Farmland within the Planning Area 6-10
6-3 Impacts on Important Farmland Expected Under the No Action/No Project Alternative 6-16
6-4 Impacts on Important Farmland Expected Under the Proposed Action/ Proposed Project Alternative 6-23
6-5 Impacts on Important Farmland due to Covered Activities under the Reduced Permit Term Alternative 6-28
7-1 Watersheds and Sub-Watersheds of the Planning Area 7-33
7-2 2010 CWA Section 303(d) Pollutants and Sources for the Planning Area 7-38
8-1a Total Acres of Each Land Cover Within the Planning Area 8-17
8-1b Acres of Each Natural Land Cover Already Preserved Within the Planning Area 8-18
8-2 Existing Vernal-Pool Ecosystem Land Covers in the Planning Area 8-30
8-3 Acres of Essential Connectivity Areas (ECAs) Within the Planning Area 8-32
8-4 Acres of Direct Impacts to Each Natural Land Cover Under the No Action/ No Project Alternative 8-41
8-5 Expected Mitigation for Natural Land Cover Impacts Under the No Action/ No Project Alternative 8-43
8-6 Direct and Indirect Effects on the Vernal Pool Ecosystem Land Covers Expected Under the No Action/No Project Alternative 8-46
8-7 Estimated Amounts of Vernal Pool Ecosystem Mitigation Implemented Under the No Action/No Project Alternative 8-46
8-8 Expected Direct Impacts to Natural Land Covers – Proposed Action/Proposed Project Alternative 8-66
8-9 Natural Land Cover Mitigation under the Proposed Action/ Proposed Project Alternative 8-67
8-10 Direct and Indirect Effects on the Vernal Pool Ecosystem under the Proposed Action/Proposed Project Alternative 8-68
8-11 Expected Mitigation for Vernal Pool Ecosystem impacts Under the Proposed Action/Proposed Project Alternative 8-70
8-12 Expected Direct Impacts to Natural Land Covers – Reduced Permit Term Alternative 8-99
8-13 Natural Land Cover Mitigation under the Reduced Permit Term Alternative 8-100
8-14 Direct and Indirect Effects on the Vernal Pool Ecosystem – Reduced Permit Term Alternative 8-101
8-15 Expected Mitigation for Vernal Pool Ecosystem Impacts Under the Reduced Permit Term Alternative 8-103
9-1 South Sacramento Habitat Conservation Plan Covered Species 9-10
9-2 Other Special-Status Plant Species Analyzed in Chapter 9 9-12
9-3 Other Special-Status Wildlife Species Analyzed in Chapter 9 9-14
9-4 Direct/Indirect Impacts and Conservation of Vernal Pool Invertebrate and Plant Modeled Habitat under the No Action/No Project Alternative 9-27

9-5 Effects and Modeled Habitat Conservation for Valley Elderberry Longhorn Beetle under the No Action/No Project Alternative 9-30
9-6 Direct Effects and Modeled Habitat Conservation for California Tiger Salamander under the No Action/No Project Alternative 9-33
9-7 Direct Effects and Preservation of Western Spadefoot Modeled Habitat Under the No Action/No Project Alternative 9-37
9-8 Direct Effects and Conservation of Giant Garter Snake Modeled Habitat Under the No Action/No Project Alternative 9-41
9-9 Direct Effects and of Modeled Habitat for Western Pond Turtle Under the No Action/No Project Alternative 9-44
9-10 Direct Effects and Conservation of Cooper's Hawk Modeled Habitat under the No Action/No Project Alternative 9-48
9-11 Direct Effects and Conservation of Tricolored Blackbird Modeled Habitat Under the No Action/No Project Alternative 9-51
9-12 Direct Loss and Conservation of Western Burrowing Owl Modeled Habitat under the No Action/No Project Alternative 9-54
9-13 Direct Effects and Preservation of Ferruginous Hawk Modeled Habitat Under the No Action/No Project Alternative 9-57
9-14 Direct Effects and Conservation of Swainson's Hawk Modeled Habitat under the No Action/No Project Alternative 9-60
9-15 Direct Effects and Conservation for Northern Harrier Modeled Habitat Under the No Action/No Project Alternative 9-63
9-16 Direct Effects and Conservation of White-Tailed Kite Modeled Habitat Under the No Action/No Project Alternative 9-66
9-17 Direct Effects and of Modeled Habitat for Greater Sandhill Crane Under the No Action/No Project Alternative 9-70
9-18 Direct Effects and Conservation of Modeled Habitat for Loggerhead Shrike Under the No Action/No Project Alternative 9-74
9-19 Direct Effects and Conservation of Modeled Habitat for Western Red Bat Under the No Action/No Project Alternative 9-82

SSHCP EIS/EIR EXECUTIVE SUMMARY

ES.1 INTRODUCTION

This document is the joint Environmental Impact Statement (EIS) and Environmental Impact Report (EIR) for the proposed South Sacramento Habitat Conservation Plan (SSHCP), prepared pursuant to both the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). The U.S. Fish and Wildlife Service (USFWS) is the lead agency under NEPA and Sacramento County is the lead agency under CEQA for this joint SSHCP EIS and EIR (SSHCP EIS/EIR). Cooperating agencies are U.S. Army Corps of Engineers (USACE), U.S. Environmental Protection Agency (USEPA), and California Department of Fish and Wildlife (CDFW).

The SSHCP EIS/EIR evaluates the potential environmental impacts from issuing federal and state endangered-species take permits, and the implementation of a long-term HCP in south Sacramento County. Five local government organizations in south Sacramento County—the Permit Applicants[1]—have applied for incidental take[2] permits (ITPs) from the USFWS under Section 10(a)(1)(B) of the federal Endangered Species Act (ESA) and from the CDFW under Section 2835 of the California Fish and Game Code.

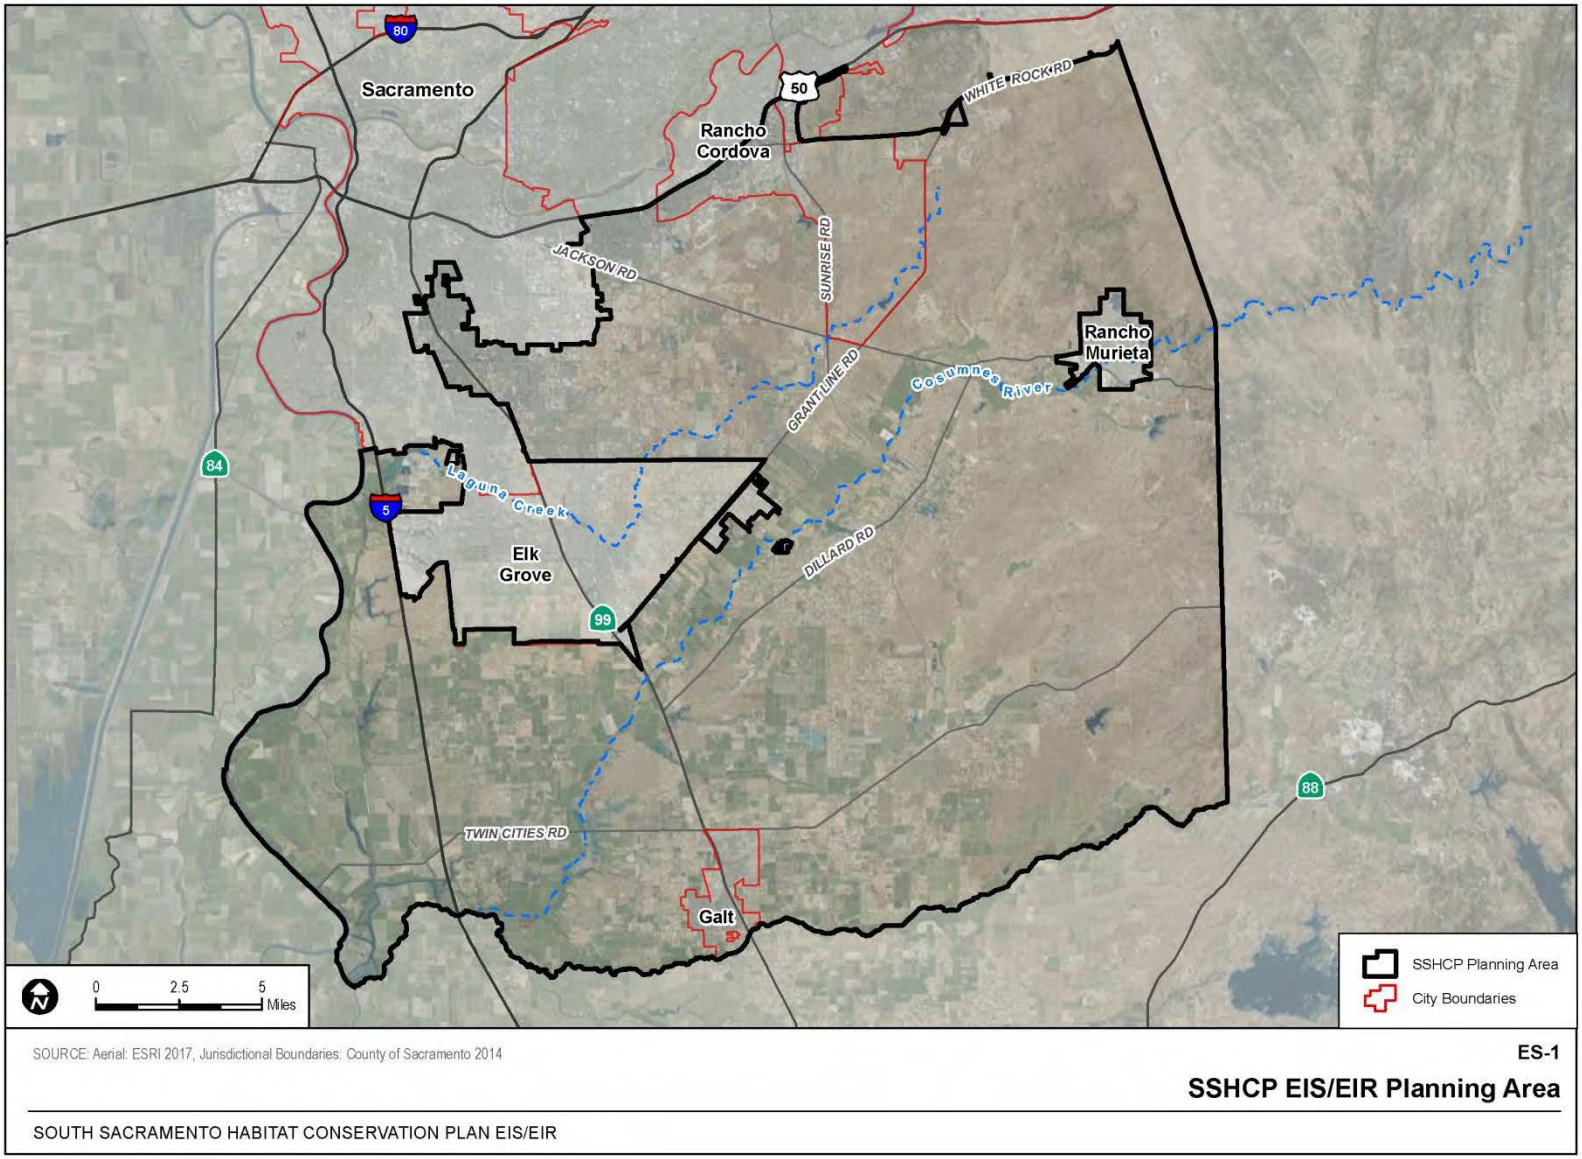
The ITPs issued by the USFWS and CDFW would authorize incidental take of 28 native plant and animal species (Covered Species). Incidental take of these Covered Species would be authorized for defined categories of future activities (Covered Activities), including the planned urban development and associated transportation and infrastructure projects that are anticipated by the Permit Applicants within the Planning Area[3] (Figure ES-1) during the next 50 years. The issuance of ITPs would address and satisfy future regulatory compliance needs of the Plan Permittees and would result in the establishment of a relatively large and interconnected Preserve System in the Planning Area.

As a required component of these ITP applications, the Permit Applicants have prepared the SSHCP, which is an HCP under ESA Section 10. The SSHCP identifies where future projects and activities would likely impact listed species, natural communities, and aquatic resources, and presents a comprehensive regional strategy for the avoidance, minimization, and mitigation of

[1] The Permit Applicants are Sacramento County, Galt, Rancho Cordova, the Sacramento County Water Agency (SCWA), and the Capital Southeast Connector Joint Powers Authority (Connector JPA). Each of these Permit Applicants is a lead agency for CEQA review of the SSHCP EIS/EIR. In addition, the future South Sacramento Conservation Agency (the SSHCP Implementing Entity) will become a Permit Applicant.

[2] Incidental take is generally defined as direct or indirect harm to a species, including habitat loss, which is incidental to an otherwise lawful activity (e.g., land development, improvements to public infrastructure).

[3] The EIS/EIR Planning Area encompasses approximately 317,655 acres within south Sacramento County, and has the same boundaries as the SSHCP Planning Area. The EIS/EIR Planning Area includes Galt and Galt's sphere of influence, and the portion of Rancho Cordova that is located south of U.S. Highway 50. The geographical boundaries of the Planning Area are U.S. Highway 50 and White Rock Road to the north, the Sacramento River levee and County Road J11 (Walnut Grove-Thornton Road) to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and the San Joaquin County to the south.



those impacts. SSHCP is accompanied by an Aquatic Resources Program (ARP), which proposes a locally based program for projects that impact aquatic resources to obtain permits under Section 404 of the Clean Water Act (CWA 404). The SSHCP also identifies future Covered Activity impacts to aquatic resources of the Planning Area, and provides a strategy to maximize the avoidance, minimization, and compensatory mitigation of aquatic resource impacts. (see Chapter 2 for a detailed description of the Proposed Action/Proposed Project Alternative and other alternatives considered).This EIS/EIR evaluates the potential impacts of ITP issuance by the USFWS and CDFW; approval and execution of an Implementing Agreement (IA) for the SSHCP; approval and implementation of the SSHCP by Sacramento County and the other Permit Applicants; approval and implementation by USACE of a multilevel CWA Section 404 permitting program for future SSHCP Covered Activity projects and activities; and approval and implementation of the SSHCP ARP by the Permit Applicants, as further discussed in EIS/EIR Section 1.5 (see Chapter 2 for a detailed description of all project alternatives).

The purpose of the EIS component of this joint EIS/EIR is to inform USFWS decision makers and the public of the effects on the human environment that would result from issuance of the ITPs to these local and state entities and from implementation of the proposed SSHCP or an alternative HCP within south Sacramento County. The USFWS will use the EIS/EIR to comply with NEPA for their issuance of ITPs to the Permit Applicants. The purpose of the EIR component of this joint EIS/EIR is to inform Permit Applicant decision makers and the public of the anticipated significant environmental impacts of the proposed project (the SSHCP), measures to mitigate any significant impacts, and reasonable alternatives that could reduce any significant environmental impacts of the proposed project to a less-than-significant level. The EIR will be used by the Permit Applicants to approve the SSHCP in compliance with CEQA.

ES.2 EIS/EIR PLANNING AREA

The Planning Area encompasses approximately 317,655 acres within south Sacramento County, as shown in Figure ES-1. The boundary of the Planning Area was defined by the Permit Applicants using both jurisdictional and ecological factors, and is the area where future projects and activities, conservation actions, and associated incidental take of species would occur under the EIS/EIR alternatives.

Figure ES-1 SSHCP EIS/EIR Planning Area

INTENTIONALLY LEFT BLANK

The Planning Area includes Galt and Galt's sphere of influence, and the portion of Rancho Cordova that is located south of U.S. Highway 50. The geographical boundaries of the Planning Area are U.S. Highway 50 and White Rock Road to the north, the Sacramento River levee and County Road J11 (Walnut Grove-Thornton Road) to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and the San Joaquin County line to the south.

The portions of the Planning Area where future urban-development projects would occur are also discussed as the Urban Development Area (UDA). Sacramento County has previously adopted an Urban Service Boundary (USB) to demarcate the ultimate extent to which the County would provide future urban services, such as sanitary sewer and water supply. Therefore, the portion of the Sacramento County USB that is within the Planning Area is within the UDA. Likewise, the portion of Rancho Cordova's sphere of influences that is within the USB is also part of the Planning Area's UDA. The Planning Area's UDA also includes all lands within Galt and within Galt's sphere of influence (see Figure ES-1). Approximately 67,618 acres of the Planning Area are also within the UDA.

ES.3 ALTERNATIVES CONSIDERED AND ALTERNATIVES EVALUATED

Underlying needs and problems that are currently present within the Planning Area include the large loss of natural land covers and natural communities, including grazing lands and croplands, from urban development and other human activities. The corresponding loss of suitable habitat for native plant and animal species within the Planning Area has led to a desire for a coordinated plan for protecting or conserving the best remaining natural communities in the Planning Area, including aquatic resources, and a desire to streamline the project review and permitting processes for future development projects and activities.

The lead agencies evaluated a range of reasonable project alternatives for an HCP in south Sacramento County to address these underlying needs and problems. Ideas for potential alternatives came from a variety of sources, including the SSHCP development process, the public scoping process under CEQA and NEPA, and input from the lead and cooperating agencies. In addition to the No Action/No Project Alternative, which must be analyzed, two action alternatives were carried forward for detailed analysis in the EIS/EIR because they are practicable, include provisions to reduce impacts, address the existing issues and underlying needs present in the Planning Area, and will achieve the purposes and objectives presented in Section 1.3:

- Alternative 1: No Action/No Project
- Alternative 2: Proposed Action/Proposed Project
- Alternative 3: Reduced Permit Term

Each of these alternatives would occur within the same Planning Area (Figure ES-1).

Alternative 1—No Action/No Project

Under the No Action/No Project Alternative, an HCP for south Sacramento County would not be approved or implemented, and ITPs would not be issued to the Permit Applicants for species impacts from future development projects and activities within the Planning Area. Also, the Permit Applicants would not implement a local ARP or approve associated local aquatic resource protection ordinances. Therefore, the USACE would not develop a CWA 404 permitting strategy for future development projects and activities. In addition, the CDFW would not develop a streamlined permit strategy for streambed impacts of future development projects and activities, and the CDFW would not issue a Master Streambed Alteration Agreement to the Permit Applicants.

Therefore, the No Action/No Project Alternative would continue the conventional project-by-project regulatory reviews in which individual project developers apply for necessary project permits with multiple state and federal resource agencies, and with permit application review proceeding without a systematic, comprehensive process. Individual projects/actions in the Planning Area that require authorization under CWA 404 would continue to obtain USACE authorization through existing types of CWA 404 authorizations, and would continue to comply with requirements for providing compensatory mitigation.

The No Action/No Project Alternative assumes that all lands zoned or ultimately planned/contemplated for urban development in adopted General Plans that are not already currently developed would eventually become developed over the next 50 years.[4] In association with the expected future urban development, the public infrastructure systems, such as water, wastewater, recycled water, stormwater, flood control, solid waste, and utility systems, as well as transportation systems, would be expanded or improved, as described in several local and regional infrastructure agency master plans and/or capital improvement programs.

The vast majority of urban development under the No Action/No Project Alternative would occur within the UDA described in Section ES.2. However, the No Action/No Project Alternative also assumes that it will become increasingly more difficult for new projects to obtain authorizations under ESA or CWA within the area now designated as the Mather Core Recovery Area (MCRA) by the USACE.[5] Consequently, No Action/No Project Alternative also assumes that

[4] Full buildout means all currently undeveloped lands that are zoned for, or are ultimately planned/contemplated for, future urban development (in the adopted general plans of the Permit Applicants) would become developed. However, full buildout will include some open space and conservation lands within the areas planned for urban development. This includes all lands within the Sacramento County USB that are within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), and all lands within Galt's city limits and within Galt's sphere of influence.

[5] The MCRA was defined in the 2005 *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon.* Portland, Oregon: USFWS, Region 1.

not all urban development allowed under current zoning could be accommodated within the MCRA, and approximately 1,900 acres of future development could be "displaced" to locations outside the current USB for Sacramento County.

Alternative 2—Proposed Action/Proposed Project

The Proposed Action/Proposed Project (the SSHCP) is a regional, comprehensive plan that establishes a framework for Permit Applicants to comply with state and federal endangered species regulations and with aquatic resource regulations, while accommodating future land use and development included in the general plans of Sacramento County, Galt, and Rancho Cordova.

The SSHCP identifies Covered Activities, which are specific types of projects and activities within the Planning Area that may result in the take of SSHCP Covered Species or loss of aquatic resources. SSHCP Covered Activities implemented within the UDA would include, but are not limited to:

- Activities and projects related to urban development and associated infrastructure, including buildout of the USB as described for the No Action/No Project Alternative.
- The Capital Southeast Connector Project and other planned transportation projects;
- Planned water and wastewater development projects; and
- Maintenance of stream channels in the UDA, such as vegetation and sediment removal.

The SSHCP Conservation Strategy is designed to allow streamlining of Covered Activity compliance with the federal ESA, the California Endangered Species Act (CESA), CWA, Fish and Game Code, and other applicable environmental regulations. The SSHCP Conservation Strategy identifies Biological Goals for Planning Area land covers, natural communities, aquatic resources, and Covered Species, including specific measurable Biological Objectives to achieve each Biological Goal. The SSHCP's Conservation Strategy would include habitat restoration, enhancement and management actions, and adaptive management and monitoring activities. The SSHCP Conservation Strategy would establish and implement a consolidated and interconnected Preserve System in the Planning Area that would preserve ecologically important resources using a landscape or watershed perspective. The SSHCP includes a preserve monitoring and management program and an adaptive management plan.

The Permit Applicants are requesting ESA and CESA ITPs with 50-year permit terms. Under the Proposed Action/Proposed Project Alternative, federal and state ITPs would be issued to the Permit Applicants by the USFWS and CDFW, and the USACE would develop and approve a multilevel CWA 404 permit strategy for the Permit Applicants.

Alternative 3—Reduced Permit Term

This alternative also includes a regional HCP for south Sacramento County, including an ARP; the issuance of 30-year ITPs by USFWS and CDFW; and development of a 30-year multi-level CWA permit

strategy by the USACE for HCP Covered Activities. However, the ITPs and the expedited CWA permit strategy would end at year 30, which generally coincides with the durations of the adopted General Plans and reasonably foreseeable master plan projects for the local jurisdictions. Under the Reduced Permit Term Alternative, the Permit Applicants would implement the same categories of Covered Activities, and request ESA and CESA take coverage for the same Covered Species. Urban development would occur within the UDA (described in Section ES.2), with the only development Covered Activities outside the UDA being road and pipeline infrastructure projects.

The Reduced Permit Term Alternative would implement an HCP Conservation Strategy during the 30-year permit term, which would include the same Biological Goals for the Planning Area as the Proposed Action/Proposed Project Alternative. The Reduced Permit Term Alternative would implement the same Avoidance and Minimization Measures (AMMs) as the Proposed Action/Proposed Project Alternative and would provide additional avoidance measures not included in the No Action/No Project Alternative.

However, the acres of natural land covers, species habitats, and aquatic resources preserved under each of the Measurable Objectives would be less under the Reduced Permit Term Alternative's Conservation Strategy because less urban development would occur during the 30-year permit term of the Reduced Permit Term Alternative, so fewer development fees would be collected to acquire lands for a Preserve System.

ES.4 KNOWN ISSUES OR CONTROVERSY

NEPA regulations and the CEQA Guidelines require the Executive Summary to identify issues raised by agencies and the public. Chapter 1 presents an overview of the EIS/EIR public scoping process. Generally, the issues of concern raised during the 2008 and 2013 public scoping processes included the following:

- The proper geographic scope of the SSHCP and EIS/EIR, such as considering effects in adjacent areas or addressing Elk Grove's sphere of influence.
- Effects of SSHCP implementation on agriculture, including grazing.
- Regulatory topics, such as consistency with USACE mitigation regulations and the potential role of mitigation banks.
- Compliance with air quality regulations and the potential effects of air quality on Covered Species and human health.
- Consistency with planning efforts in the Sacramento/San Joaquin Delta.
- Coordination with the activities and planning of local jurisdictions, agencies, and land management organizations that are not Permit Applicants.
- Adequacy of funding for implementation of the Conservation Strategy.

- Which Covered Activities should be included in the alternatives, and what locations are available for Preserves.
- The analysis of cumulative impacts.
- Use of best-available science and data, such as recent research on tricolored blackbird (*Agelaius tricolor*).
- Questions and suggestions regarding the funding, selection, acquisition, location, and management of Preserve System lands.
- Integration of mosquito and vector control with SSHCP implementation and Preserve System management.
- Integration of the SSHCP with issues of water supply and new urban development.

EIS and EIR summary sections are also required to identify areas of controversy known to the lead agencies. The term "controversy" is defined as circumstances where a substantial dispute exists as to the environmental consequences of an action, and does not refer to the existing of opposition to an action where the environmental effects are relatively undisputed (43 CFR 46.30). A potential area of controversy may be the amount of new urban development that would occur within the MCRA under each alternative evaluated, because each alternative would remove more suitable species habitat within the MCRA than is provided by the species-specific recovery criteria presented in the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005).[6]

ES.5 SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Tables ES-1, Summary of Impacts and Mitigation, and ES-2, Summary of Impacts to Special-Status Species, Including Covered Species, briefly describe and compare the adverse and beneficial impacts of each alternative evaluated in the SSHCP EIS/EIR, including potential impacts to environmental resources identified during scoping, and potential impacts to other resources analyzed in the EIS/EIR. When comparing the two action alternatives to the No Action/No Project Alternative baseline condition, most of the impacts were determined to be ***Minor Beneficial*** effects or determined to have **No Impact**. Examples of impacts that differed the most between alternatives include the following:

- Impacts to Vernal Pool ecosystem and Valley Grassland land covers under "Natural Land Cover Habitats, and Associated Plant and Animal Communities" (Table ES-1); and

[6] U.S. Fish and Wildlife Service. 2005. *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon*. Approved December 15, 2005. U.S. Fish and Wildlife Service, Region 1. Portland, Oregon. Available at: https://www.fws.gov/sacramento/es/Recovery-Planning/Vernal-Pool/es_recovery_vernal-pool-recovery.htm.

- Impacts to 11 Vernal Pool species, western spadefoot (*Spea hammondii)*, western pond turtle (*Actinemys marmorata)*, several bird species, and several non-covered plant species under "Special-Status Species Including HCP Covered Species" (Table ES-2).

Based on the analysis in Chapters 4 through 16 and as summarized in Tables ES-1 and ES-2, the Proposed Action/Proposed Project Alternative was identified as the Environmentally Preferable Alternative and Environmentally Superior Alternative. Discussions of each of the identified impacts and any mitigation measures, including pertinent support data, can be found in the resource-topic chapters of the EIS/EIR, Chapters 4 through 16.

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
LAND USE						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • displace urban development outside the Urban Services Boundary (USB), inconsistent with the Sacramento Area Council of Governments (SACOG's) Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) and other regional plans, as well as the smart growth policies of the County and Rancho Cordova's adopted General Plans; • place mitigation preserves in areas that would eventually be surrounded by urban development, potentially resulting in conflicts with existing and planned land uses, but management and monitoring activities on new preserves are not expected to be intensive relative to existing conditions, and management and monitoring activities would not result in incompatibility with adjacent land uses or inconsistencies with any applicable planning document; and • potentially increase safety hazards associated with wildlife strikes on aircraft due to wetland re-establishment and establishment within proximity to airports.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • avoid inconsistencies with existing land use plans; • minimize potential conflicts of preserve management and monitoring activities by siting compatible uses near preserves and by providing a coordinated way to minimize incompatibilities with existing or planned land uses, or conflicts with existing plans; and • improve compatibility with airports and minimize potential airport safety hazards by implementing a planning process that coordinates wetlands re-establishment/ establishment with airport planning staff.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • avoid inconsistencies with existing land use plans by avoiding urban development outside the UDA; • minimize potential conflicts of preserve management and monitoring activities by siting compatible uses near preserves and by providing a coordinated way to minimize incompatibilities with existing or planned land uses, or conflicts with existing plans during years 1–30 of the EIS/EIR study period; and • improve compatibility with airports and minimize potential airport safety hazards by implementing a planning process during years 1-30 of the EIS/EIR study period that coordinates wetlands re-establishment/ establishment with airport planning staff.	Minor Beneficial Effect	None required
Cumulative Effects						
Under the No Action/No Project Alternative, approximately 1,900 acres of planned urban development would be shifted or displaced to areas outside the current UDA, probably to areas south of the Elk Grove SOI , or areas near Rancho Murieta. This displaced development of the No Action/No Project Alternative would add to the land use impacts of reasonably foreseeable development in the Elk Grove SOI and Rancho Murieta areas. Because the No Action/No Project Alternative would add to the existing land use plan conflicts of past and present activities, and the reasonably foreseeable future projects, the No Action/No Project Alternative would substantially contribute to the existing significant cumulative impact to land use from past, present and reasonably foreseeable projects present in the Study Area.	Because the Proposed Action/Proposed Project would not conflict with any existing land use plans, the Proposed Action/Proposed Project would have a smaller incremental contribution to the Planning Area's cumulative conflicts with existing land use plans.	Minor Beneficial Cumulative Effect	None required	Because the Reduced Permit Term Alternative would result in less development outside the UDA than the No Action/No Project Alternative, it would have a smaller cumulative contribution to conflicts with existing land use plans.	Minor Beneficial Cumulative Effect	None required
SOILS, GEOLOGY AND MINERAL RESOURCES						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • not substantially increase development on expansive soils, asbestos-containing soils, or areas prone to landslide, as these are not present in the UDA; and • preclude or substantially inhibit the extraction of any mineral resources present within lands that are developed or used for mitigation preserves.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • result in reduced potential for adverse effects from erosion and landslide from development activities and preserve system establishment and establishment; • result in a slightly reduced risk of exposure to naturally occurring asbestos; • result in a slightly more removal of access to important mineral resource s by new urban development or associated infrastructure; and	Minor Beneficial Effect to geological resources, soils, and exposure to geological hazards Less Than Significant Adverse Effect to	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in reduced potential for adverse effects from erosion and landslide from development activities and preserve system establishment; • result in a slightly reduced risk of exposure to naturally occurring asbestos; • result in a slightly more removal of access to important mineral resources by new urban development or associated infrastructure; and	Minor Beneficial Effect to geological resources, soils, and exposure to geological hazards Less Than Significant Adverse Effect to	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
	• result in similar potential for removal of access to important mineral resources by new preserves.	mineral resources access		• result in a similar potential for removal of access to important mineral resources from new preserves.	mineral resources access	
Cumulative Effects						
Projects and activities included in the No Action/No Project Alternative would not have an adverse effect on geology and soils or human exposure to naturally occurring asbestos because of the combination of geologic and soils conditions in the Planning Area and because future projects would comply with applicable regulations and policies. The No Action/No Project Alternative, when considered together with past, present, and reasonably foreseeable other projects, could limit access to aggregate resources that are outside the mapped MRZ-2 significant mineral deposits.	The incremental effects of the Proposed Action/Proposed Project Alternative would have a minor beneficial impact to geology and soils and risk of exposure to naturally occurring asbestos when compared to the incremental effects of the No Action/No Project Alternative baseline condition. Incremental effects of the Proposed Action/Proposed Project Alternative would have a less than significant impact to access to mineral resources when compared to the incremental effects of the No Action/No Project Alternative baseline condition.	Minor Beneficial Cumulative Impact to geology and soils and risk of exposure to naturally occurring asbestos Less than Significant Cumulative Impact to access to mineral resources	None required	The incremental effects of Reduced Permit Term Alternative would have a minor beneficial impact to geology and soils and risk of exposure to naturally occurring asbestos when compared to the incremental effects of the No Action/No Project Alternative baseline condition. Incremental effects of the Reduced Permit Term Alternative would have a less than significant impact to access to mineral resources when compared to the incremental effects of the No Action/No Project Alternative baseline condition.	Minor Beneficial Cumulative Impact to geology and soils and risk of exposure to naturally occurring asbestos Less than Significant Cumulative Impact to access to mineral resources	None required
AGRICULTURE						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in conversion of approximately 32,205 acres of Important Farmland to non-agricultural uses; • result in new land uses that conflict with 4,767 acres of land that have existing Williamson Act contracts; and • result in incompatible uses near existing agricultural uses by displacing 1,900 acres of new urban development to locations outside the UDA.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • result in conversion of approximately 1,100 less acres of Important Farmland to non-agricultural uses; • result in new land uses that conflict with 32 more acres of land that have existing Williamson Act contracts; • result in fewer incompatible uses near existing agricultural uses by not displacing 1,900 acres of new urban development to locations outside the UDA; and • result in fewer incompatible uses near existing agricultural by implementing an AMM that emphasizes placement of compatible uses adjacent to cropland preserves.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in conversion of approximately 1,720 less acres of Important Farmland to non-agricultural uses; • result in land uses that conflict with 133 more acres of land with existing Williamson Act contracts; and • result in fewer incompatible uses near existing agricultural uses by not displacing development outside the UDA and by implementing an AMM during the 30-year permit term that emphasizes placement of compatible uses adjacent to cropland preserves.	Minor Beneficial Effect	None required
Cumulative Effects						
The cumulative effects of planned urban growth on existing Important Farmlands would result in a cumulatively significant and unavoidable adverse impact on agriculture resources. Under the No Action/No Project Alternative, approximately 1,900 acres of planned urban development is expected to be shifted or displaced to locations outside the UDA. Among the areas that are expected to receive this urban development are south of the Elk Grove SOI and near Rancho Murieta. These components of the No Action/No Project Alternative would further increase conflicts with land use plans, and further make a cumulatively considerable (i.e., significant) contribution to the cumulatively significant and unavoidable adverse impacts to agriculture that was identified in the General Plan EIRs for Sacramento County, Galt, and Rancho Cordova.	Because the Proposed Action/Proposed Project Alternative would not result in urban development shifted or displaced to outside the UDA, and would result in more preservation of Important Farmlands and grazing lands as compared to the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative's incremental contribution to cumulative impacts on agriculture resources would be less than that described for the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required	Because the Reduced Permit Term Alternative would avoid urban development outside the UDA and increase preservation of Important Farmlands and grazing lands as compared to the No Action/No Project Alternative, the Reduced Permit Term Alternative's contribution to cumulative impacts on agriculture would also be less than that described for the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required

Table ES-1. Summary of Impacts and Mitigation

Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
HYDROLOGY AND WATER QUALITY						
Direct and Indirect Effects – Groundwater Hydrology						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in increased groundwater demand for new urban development; and • result in increased impervious surfaces from development, with associated adverse effects to groundwater recharge.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • result in groundwater demand that is consistent with the groundwater demand of the No Action/No Project ; • result in impervious surfaces from development and associated effects to groundwater recharge are consistent with the adverse effect of the No Action/No Project Alternative; • result in greater protection of groundwater recharge from larger and more contiguous preserves; • result in greater protection of groundwater recharge along streams and other waterways from required setbacks and larger setback between new development and natural waterways; and • implement a regional Conservation Strategy that has protection of watersheds and related ecosystem functions (including groundwater recharge) as one of the guiding principles.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in consistent groundwater use; • result in consistent adverse effects to groundwater recharge due to impervious surfaces from development; • result in greater protection of groundwater recharge areas from preserve establishment inside the UDA; and • result in a Conservation Strategy that has protection of watersheds and related ecosystem functions (including groundwater recharge) as one of the guiding principles inside the UDA.	Minor Beneficial Effect	None required
Cumulative Effects - Groundwater Hydrology						
The combination of past, present, and reasonably foreseeable future projects would combine with the No Action/No Project Alternative groundwater use leading to adverse cumulative effects and exceedance of the sustainable yields of the groundwater basins, groundwater level reductions affecting increased pumping energy use, occurrence of dry wells, or land subsidence.	Implementation of the SSHCP Conservation Strategy, including the SSHCP AMMs, the SSHCP ARP, and the interconnected SSHCP Preserve System is expected to result in more consistent and frequent conservation of groundwater recharge compared to the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required	The implementation of an HCP Conservation Strategy, including AMMs, an ARP, and the interconnected Preserve System during the 30-year permit term under the Reduced Permit Term Alternative would result in better conservation of groundwater recharge inside the UDA compared to the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required
Direct and Indirect Effects – Surface Water Hydrology and Flooding						
As compared to the Existing Condition, the No Action/No Project Alternative would: • not substantially increase the existing rate or amount of surface runoff in a manner that would cause flooding or exceed stormwater system capacity; and • not place residences within a flood hazard area, or expose people or structures to a significant risk involving flooding.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • provide greater setbacks of new development from streams, creeks, and minor tributaries, which would maintain existing hydrologic functions of UDA streams and floodplains, and retain more of the stream's floodplain to provide better flood storage and flood flow; • provide greater protection of surface waters in each Planning Area HUC watersheds by consolidating project avoidance and mitigation requirement into contiguous and interconnected preserves. Provide greater avoidance and protection of aquatic resources within the UDA, including in the MCRA portion of the UDA. Assembles a large contiguous Landscape Preserve in the southeast portion of the Planning Area, totaling between 33,500 to 34,000 acres; • require implementation of additional AMMs to avoid or minimize surface hydrologic resources, and requires consistent implementation of surface hydrology AMMs during	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • provide greater setbacks of new development from streams, creeks, and minor tributaries, which would maintain existing hydrologic functions of UDA streams and floodplains, and retain more of the stream's floodplain to provide better flood storage and flood flow; • result in greater and more consistent avoidance of adverse effects to surface hydrology conditions because of overlapping and new AMMs. Requires implementation of additional AMMs to avoid or minimize surface hydrologic resources, and requires consistent implementation of surface hydrology AMMs during all ground disturbing Covered Activities and would provide greater management of indirect impacts of urbanization, such as intrusion from domestic animals and informal trails; and • result in a Conservation Strategy that has protection of watersheds and related ecosystem functions as one of the	Minor Beneficial Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
	all ground disturbing Covered Activities; • result in better management of avoided aquatic resources and aquatic habitat to minimize indirect impacts of adjacent urbanization, and to maintain values and aquatic functions on preserved lands in perpetuity; and • implement a regional Conservation Strategy that has protection of watersheds and related ecosystem functions as one of the guiding principles, while balancing regional housing and development needs.			guiding principles.		
Cumulative Effects - Surface Water Hydrology and Flooding						
Projects and activities included in the No Action/No Project Alternative with potential to affect surface hydrologic conditions are conversion of agricultural and undeveloped lands to new urban development. New urban development projects under the No Action/No Project Alternative would be required to adequately address stormwater runoff and flooding issues. Incremental effects of the No Action/No Project Alternative are individually limited, and would not make a cumulatively considerable contribution.	The implementation of the SSHCP Conservation Strategy, including the interconnected SSHCP Preserve System, the Covered Activity AMMs, and the ARP, would result in larger areas of watershed preservation, consistent and more frequent implementation of AMMs, and require larger setbacks and more conservation of natural waterways compared to the No Action/No Project Alternative. Incremental effects of the Proposed Action/Proposed Project are individually limited, and would not make a cumulatively considerable contribution.	Minor Beneficial Cumulative Effect	None required	The implementation of an HCP Conservation Strategy, including Covered Activity AMMs, and interconnected Preserve System, and an ARP during the 30-year permit term of the Reduced Permit Term Alternative would result in larger areas of watershed preservation, consistent and more frequent implementation of AMMs, and require larger setbacks and more conservation of natural waterways in the UDA when compared to the No Action/No Project Alternative. Consequently, the incremental effects of the Reduced Permit Term Alternative would have a minor beneficial impact to surface hydrology, stormwater runoff, and flooding conditions when compared to the incremental effects of the No Action/No Project Alternative baseline condition. Incremental effects of Reduced Permit Term Alternative are individually limited, and would not make a cumulatively considerable contribution.	Minor Beneficial Cumulative Effect	None required
Direct and Indirect Effects – Surface Water Quality and Groundwater Quality						
As compared to the Existing Condition, the No Action/No Project Alternative would: • not alter the course of local waterways in a manner that results in substantial erosion or sedimentation or result in substantial new sources of pollutants in urban runoff; • not result in migration of contaminants from the lower aquifers, or migration of the contaminant plumes at the groundwater cleanup sites in Sacramento County; • not result in degradation of groundwater quality; • not result in substantially increased levels of contaminants in stormwater runoff from the post-construction activities, cause impairment of the beneficial uses of receiving waters or areas that provide water quality benefit, or cause substantial harm to the biological integrity of the waterways by the discharge of stormwater; and • not substantially increase discharge of stormwater from material storage areas, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • have smaller direct and indirect impacts to surface water quality and to ground water quality; • provide a Conservation Strategy that has protection of watersheds and related ecosystem functions (including water quality) as one of the guiding principles; • provide larger contiguous preserves that would provide better protection to existing surface water quality; and • provide greater setbacks between new development and streams, creeks, and minor tributaries, and provide setbacks between new development and preserves to reduce al direct and indirect water quality effects of new urban development on surface water quality. , better improve or maintain existing water quality through processes such as filtration and/or trapping of contaminants such as sediment or toxicants and prevention of erosion, and would facilitate greater groundwater recharge along creeks and streams.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in smaller direct and indirect impacts to surface water quality and ground water quality; • provide larger contiguous preserves that would provide better protection to existing surface water quality inside the UDA; • provide greater setbacks between new development and streams, creeks, and minor tributaries, and provide setbacks between new development and preserves to reduce all direct and indirect water quality effects of new urban development on surface water quality to better improve or maintain existing water quality through processes such as filtration and/or trapping of contaminants such as sediment or toxicants and prevention of erosion; and • facilitate greater groundwater recharge along creeks and streams.	Minor Beneficial Effect	None required

AGENDA ITEM 11.1

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
Cumulative Effects - Surface Water Quality and Groundwater Quality						
The existing water treatment infrastructure has capacity to accommodate additional wastewater inflows expected from all future planned development in the Planning Area, including the full build-out of the UDA by 2065 assumed under the No Action/No Project Alternative. Therefore, the incremental effects of additional surface water in the Planning Area that would occur under the No Action/No Project Alternative would be individually limited, and would not make a considerable contribution to the downstream significant cumulative Delta water quality impact.	Implementation of the SSHCP Conservation Strategy, including the SSHCP AMMs, the interconnected SSHCP Preserve System and the ARP, are expected to result in greater protection of surface water quality and groundwater quality compared to the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required	The implementation of the Conservation Strategy during the 30-year permit term under the Reduced Permit Term Alternative, including AMMs, the ARP, and the interconnected Preserve System, are expected to result in greater protection of surface water quality and groundwater quality compared to the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required
NATURAL LAND COVER HABITATS, AND ASSOCIATED PLANT AND ANIMAL COMMUNITIES						
Direct and Indirect Effects – Vernal Pool Ecosystem						
As compared to the Existing Condition, the No Action/No Project Alternative would: • directly and indirectly impact approximately 17,949 acres of vernal pool ecosystem, which is approximately 17.4 % of the total 103,210 acres of existing vernal pool ecosystem within the Planning Area; • directly and indirectly impact 9,783 acres of the Mather Core Recovery Area's Vernal Pool Ecosystem, or approximately 54% of what exists in the Mather Core Recovery Area; • preserve approximately 10,406 acres of existing Vernal Pool Ecosystem within the Planning Area as mitigation for projects and activities; • re-establish and/or establish approximately 562 acres of vernal pools and swales on mitigation preserves to mitigate direct impacts (loss) of 562 acres of vernal pools and swales; and • preserve approximately 4,550 acres of the existing 18,117 acres of Vernal Pool Ecosystem within the Mather Core Area.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • directly and indirectly impact 690 fewer total acres of the Planning Area's total vernal pool ecosystem and the associated vernal pool plant and animal communities; • directly and indirectly impact 1,283 fewer acres of the Mather Core Area's vernal pool ecosystem and the associated vernal pool plant and animal communities; • require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects of development projects and activities on the vernal pool ecosystem; • preserve approximately 7,340 more acres of Vernal Pool Ecosystem in the Planning Area; • result in interconnected and more contiguous preserves of vernal pool ecosystem within the Planning Area; and • preserve 934 more acres of the Mather Core Area's vernal pool ecosystem and the associated vernal pool plant and animal communities.	Significant Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • directly and indirectly impact 1,147 more acres of vernal pool ecosystem and associated vernal pool plant and animal communities; • directly and indirectly impact 254 more acres of the Mather Core Area's vernal pool ecosystem and the associated vernal pool plant and animal communities; • require Covered Activities to implement better AMMs to reduce and minimize indirect effects of development projects and activities on the vernal pool ecosystem during the 30-year permit term; • preserve approximately 4,896 more acres of Vernal Pool Ecosystem in the Planning Area, and approximately 2/3 of the preserved Vernal Pool Ecosystem acres would be within an interconnected preserve system established during the 30-year permit term; • establish preserves during the 30-year permit term that would be more interconnected and more contiguous than the preserves established under the No Action/No Project Alternative; and • preserve approximately 1,193 acres less of the Mather Core Area's vernal pool ecosystem and the associated vernal pool plant and animal communities.	Less than Significant Adverse	None required
Cumulative Effects – Vernal Pool Ecosystem						
The incremental effects of the No Action/No Project Alternative would have direct and indirect impacts that would result in an estimated loss of 17,949 acres or approximately 17.4 % of the 103,210 acres of existing vernal pool ecosystem within the Planning Area. Project mitigation under the No Action/No Project Alternative would include an estimated 10,406 acres of preservation and 579 acres of vernal pool habitat re-establishment/establishment within the Planning area. Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to vernal pool ecosystem, when considered together with the significant impacts to vernal pool ecosystem from past, current, and foreseeable future	Overall, the Proposed Action/Proposed Project Alternative would make a slightly smaller contribution to Study Area cumulative effects on the vernal pool ecosystem, when compared to the No Action/No Project Alternative. However, at the scale of Vernal Pool Ecosystem impacts throughout the Study Area, the 690-acre difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different.	No Cumulative Effect	None required	The incremental effects of the Reduced Permit Term Alternative would directly and indirectly impact 19,096 acres vernal pool ecosystem within the Planning Area, which is 1,147 acres more than the total direct and indirect impact expected under the No Action/No Project Alternative. Overall, the Reduced Permit Term Alternative would make a slightly larger contribution to Study Area cumulative effects on the vernal pool ecosystem, when compared to the No Action/No Project Alternative. However, at the scale of Vernal Pool Ecosystem impacts throughout the Study Area, the 1,147-acre difference in impacts under the Reduced Permit Term	No Cumulative Effect	None required

Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
projects and activities in the Study Area, would be a significant cumulative effect				Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different.		
Direct and Indirect Effects – Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, Open Water						
As compared to the Existing Condition, the No Action/No Project Alternative would: • directly impact 583 acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers and associated plant and animal communities, approximately 5.5% of the existing 10,676 acres of the land covers within the Planning Area; • preserve approximately 24 acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers within the Planning Area; and • re-establish or establish 291 acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers within the Planning Area.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • directly impact 79 fewer acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers and associated plant and animal communities; • require Covered Activity activities and project to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, Open Water natural communities, such as larger setbacks between new development and streams and creeks; • preserve 480 more acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water; • re-establish or establish 213 more acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers within the Planning Area; and • result in more interconnected and contiguous preserves of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers within the Planning Area.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • directly impact 48 fewer acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers and associated plant and animal communities; • require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs to better avoid and minimize indirect effects to Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water natural communities, such as larger setbacks between new development and streams and creeks; • preserve 311 more acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water; • re-establish or establish 128 more acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers within the Planning Area; and • result in more interconnected and more contiguous preserves of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers within the Planning Area.	Minor Beneficial Effect	None required
Cumulative Effects – Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, Open Water						
The incremental impacts of the No Action/No Project Alternative would result in the direct loss of 583 acres, or approximately 5.5 % of the existing Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers and associated natural communities within the Planning Area. Project mitigation for impacts to Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water would continue to be implemented on a project-by-project basis. Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water, when considered together with the significant impacts to Valley Grassland from past, current, and foreseeable future projects and activities in the Study Area, would be a significant cumulative effect.	Overall, the Proposed Action/Proposed Project Alternative would make a slightly smaller incremental contribution the cumulative loss of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water in the Study Area, when compared to the No Action/No Project Alternative. However, at the scale of impacts to these aquatic resources throughout the Study Area, the 79-acre difference in direct impacts, the 480-acre difference in preservation, and the 213-acre difference in re-establishment of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers under the Proposed Action/Proposed Project Alternative when compared to impacts under the No Action/No Project Alternative is not discernibly different.	No Cumulative Effect	None required	Overall, the Reduced Permit Term Alternative would make a slightly smaller contribution the cumulative loss of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water in the Study Area, when compared to the No Action/No Project Alternative. However, at the scale of impacts to these aquatic resources throughout the Study Area, the 535-acre difference in direct impacts, the 311-acre difference in preservation, and the 128-acre difference in re-establishment of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers under the Reduced Permit Term Alternative is not discernibly different from the impacts expected under the No Action/No Project Alternative.	No Cumulative Effect	None required
Direct and Indirect Effects – Riparian Land Covers (Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland)						
As compared to the Existing Condition, the No Action/No Project Alternative would: • directly impact (remove) 554 acres of riparian land covers and their associated natural community within the Planning Area, approximately 7% of the existing 7,951 acres of riparian land covers and riparian plant and animal natural communities present in the Planning Area; and • re-establish or establish 256 acres of Mixed Riparian Woodland and 298 acres of Mixed Riparian Scrub land covers.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • directly impact 37 more acres of Riparian land covers and associated plant and animal communities; • require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Riparian land covers such as larger setbacks between new development and streams and creeks; • preserve 964 acres more of Riparian land covers (Mixed	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • directly impact 56 more acres of Riparian land covers and associated plant and animal communities; • require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs, to better avoid and minimize indirect effects to Riparian land covers and natural communities, such as larger setbacks between new	Minor Beneficial Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
	Riparian Woodland and Mixed Riparian Scrub); • re-establish or establish 37 acres more of Riparian land covers (Mixed Riparian Woodland and Mixed Riparian Scrub) within the Planning Area; and • result in more interconnected and contiguous preserves of Riparian land covers within the Planning Area, which would reduce habitat fragmentation effects on the plant and animal community.			development and streams and creeks; • preserve 696 more acres of Riparian land covers; • re-establish or establish 55 more acres of Riparian land covers within the Planning Area; • result in more interconnected and more contiguous preserves of Riparian land covers within the Planning Area.		
Cumulative Effects – Riparian Land Covers (Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland)						
The incremental impacts of the No Action/No Project Alternative would result in the direct loss of 554 acres, or approximately 7 % of the existing Riparian land covers within the Planning Area. However, the regulatory environment under the No Action/No Project is expected to require projects to re-establish or establish 554 acres of riparian land covers which, over time, are expected to re-establish the wildlife habitat and plant and animal natural community of the directly impacted riparian land covers. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. Therefore, the incremental impacts of the No Action/No Project Alternative on Riparian land covers, when considered together with the significant impacts to riparian land covers from past and current human activities and the reasonably foreseeable future project within the Study Area, would result in a less than significant cumulative effect.	The incremental impacts of Proposed Action/Proposed Project Alternative would make a slightly similar contribution the cumulative loss of Riparian land covers in the Study Area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of cumulative impacts to riparian resources throughout the Study Area, the 37-acre difference in direct impacts, the 964 acre difference in Riparian preservation, and the 37-acre difference in re-establishment of Riparian land covers is not discernibly different from the impacts expected under the No Action/No Project Alternative.	No Cumulative Effect	None required	Overall, the impacts of Reduced Permit Term Alternative would make a similar contribution the cumulative loss of Riparian land covers in the Study Area, when compared to the No Action/No Project Alternative. In addition, at the scale of cumulative impacts to riparian resources throughout the Study Area, the 56-acre difference in direct impacts, and the 693 acre difference in Riparian preservation, and the 55-acre difference in re-establishment of Riparian land covers is not discernibly different when compared to impacts expected under the No Action/No Project Alternative.	No Cumulative Effect	None required
Direct and Indirect Effects – Valley Grassland						
As compared to the Existing Condition, the No Action/No Project Alternative would: • remove a total of 23,429 acres of Valley Grassland natural community, approximately 17.3% of the existing Valley Grassland within the Planning Area; and • preserve approximately 11,806 acres of Valley Grassland land cover within the Planning Area, which includes the 8,690 acres of Valley Grassland that would be preserved within the Vernal Pool Ecosystem.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • directly impact(remove) 1,415 fewer acres of Valley Grassland land cover and the associated plant and animal communities; • require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Valley Grasslands; • preserve 10,208 acres more Valley Grassland within a large SSHCP Preserve System; and • result in more interconnected and contiguous preserves of Valley Grassland within the Planning Area, which would reduce habitat fragmentation effects on the Valley Grassland plant and animal community.	Significant Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • directly impact 242 more acres of Valley Grassland land covers and associated plant and animal communities; • require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs, to better avoid and minimize indirect effects to Valley Grassland natural communities, such as larger setbacks between new development and preserved land covers, and larger setbacks between new development and streams and creeks; • preserve 6,783 more acres of Valley Grassland land cover; and • result in more interconnected and more contiguous preserves of Valley Grasslands within the Planning Area.	Less than Significant Adverse Effect	None Required
Cumulative Effects – Valley Grassland						
The incremental impact of the No Action/No Project Alternative would result in the direct loss of 23,429 acres of Valley Grassland (21,797 acres in the UDA and 1,632 acres outside the UDA), which would remove approximately 17.3% of the existing Valley Grassland acres within the Planning Area.	The incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution to the cumulative loss of Valley Grassland in the Study Area, when compared to the incremental impact of the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required.	At the scale of impacts to Valley Grassland throughout the Study Area, the 242-acre difference in direct impacts and the 6,783-acre difference in Valley Grassland preservation under the Reduced Permit Term Alternative is not discernibly different from the	No Cumulative Effect	None required.

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to Valley Grassland, when considered together with the significant impacts to Valley Grassland from past, current, and foreseeable future projects and activities in the Study Area, would be a significant cumulative effect.				impacts expected under the No Action/No Project Alternative.		
Direct and Indirect Effects – Blue Oak Woodland and Blue Oak Savanna						
As compared to the Existing Condition, the No Action/No Project Alternative would: • directly impact (remove) 140 acres of Blue Oak Woodland and Blue Oak Savanna land covers and their associated natural communities , approximately 1% of the existing 14,769 acres of combined Blue Oak Woodland and Blue Oak Savanna existing in the Planning Area; and • preserve approximately 70 acres of Blue Oak Woodland and/or Blue Oak Savanna and re-establish or establish approximately 70 acres of Blue Oak Woodland and/or Blue Oak Savanna.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • directly impact 93 acres less Blue Oak Woodland and Blue Oak Savanna and associated plant and animal communities; • require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Blue Oak Woodland and Blue Oak Savanna; • preserve an acreage of Blue Oak Woodland and Blue Oak Savanna in the Planning Area (47 acres) equal to the expected impacts to Blue Oak Woodland and Blue Oak Savanna. By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna preservation in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres); • re-establish and/or establish an acreage of Blue Oak Woodland and Blue Oak Savanna in the Planning Area (47 acres) equal to the expected impacts to Blue Oak Woodland and Blue Oak Savanna to provide no net loss of oak woodlands within the Planning Area. By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna re-establishment or establishment in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres); and • result in more interconnected and contiguous preserves of Blue Oak Woodland and Blue Oak Savanna within the Planning Area, which would reduce habitat fragmentation effects on the Blue Oak Woodland and Blue Oak Savanna plant and animal community.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • directly impact 93 acres less Blue Oak Woodland and Blue Oak Savanna and their associated plant and animal communities; • require Covered Activity projects and activities implemented during the 30-year permit term to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Blue Oak Woodland and Blue Oak Savanna; • preserve an acreage of Blue Oak Woodland and Blue Oak Savanna in the Planning Area (46 acres) that would nearly equal acres of expected impacts to Blue Oak Woodland and Blue Oak Savanna (47 acres). By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna preservation in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres); • re-establish and/or establish an acreage of Blue Oak Woodland and Blue Oak Savanna in the Planning Area (46 acres) that would nearly equal the acres of expected impacts to Blue Oak Woodland and Blue Oak Savanna (47 acres). By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna re-establishment or establishment in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres); and • result in more interconnected and contiguous preserves of Blue Oak Woodland and Blue Oak Savanna within the Planning Area, which would reduce habitat fragmentation effects on the Blue Oak Woodland and Blue Oak Savanna plant and animal community	Minor Beneficial Effect	None required
Cumulative Effects – Blue Oak Woodland and Blue Oak Savanna						
The No Action/No Project Alternative is anticipated to preserve 70 acres and to re-establish 70 acres of Blue Oak Woodland and Blue Oak Savanna, which together is equivalent to the 140 acres expected to be directly impacted (lost) under the No Action/No Project Alternative. Therefore, only 70 acres or approximately 0.5% of the Blue Oak Woodland and Blue Oak Savanna within the Planning Area would be directly impacted (lost), and the past and current impacts to Blue Oak Woodland and Blue Oak Savanna within most of the Study Area have been relatively small. Therefore, the	The incremental impacts of the Proposed Action/Proposed Project Alternative would make a slightly smaller contribution to the cumulative loss of Blue Oak Woodland and Blue Oak Savanna in the Study Area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to Blue Oak Woodland and Blue Oak Savanna throughout the Study Area, the difference in direct impacts and the difference in preservation and re-establishment or establishment of Blue Oak	No Cumulative Effect	None required	Overall, the incremental impacts of the Reduced Permit Term Alternative would make a slightly smaller contribution the cumulative loss of Blue Oak Woodland and Blue Oak Savanna in the Study Area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to Blue Oak Woodland and Blue Oak Savanna throughout the Study Area, the difference in direct impacts and the difference in preservation and re-establishment or establishment of Blue Oak	No Cumulative Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
incremental impact of the No Action/No Project Alternative on Blue Oak Woodland and Blue Oak Savanna, when considered together with the impacts of past, current, and reasonably foreseeable projects, would result in a less than significant cumulative effect.	Woodland and Blue Oak Savanna land covers is not discernibly different.			Woodland and Blue Oak Savanna land covers is not discernibly different.		
Direct and Indirect Effects – Farmland (Croplands and Irrigated Pasture-Grassland)						
As compared to the Existing Condition, the No Action/No Project Alternative would: • directly remove up to approximately 8,484 acres of existing Cropland and Irrigated Pasture-Grassland land covers and their associated plant and animal communities, which is approximately 12.5% of the total existing of these land covers in the Planning Area; and • preserve approximately 7,615 acres of similar resource-category farmland to mitigate direct impacts to Cropland and Irrigated Pasture-Grassland land covers.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • directly impact (remove) 450 fewer acres of Croplands and Irrigated Pasture-Grasslands land cover and the their plant and animal communities; • require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Croplands and Irrigated Pasture-Grasslands; • preserve 2,081 acres more Croplands and Irrigated Pasture-Grasslands (or a similar quality farmland land cover) within a large SSHCP Preserve System; and • result in more contiguous preserves and an interconnected Preserve System in that includes Croplands and Irrigated Pasture-Grasslands within the Planning Area, and which would reduce habitat fragmentation effects on native wildlife in the Planning Area.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • directly impact 354 fewer acres of Cropland and Irrigated Pasture-Grassland land covers and associated wildlife communities; • require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs, to better avoid and minimize indirect effects to Cropland and Irrigated Pasture-Grassland; • preserve 326 more acres of Cropland and Irrigated Pasture-Grassland land covers; • preserve higher quality farmland during the 30-year permit term by mitigating impact to any farmland land cover with the higher quality Cropland or Irrigated Pasture-Grassland; • result in more contiguous and interconnected and preserves of Cropland and Irrigated Pasture-Grassland farmland within a larger Preserve System; and • result in management of Cropland and Irrigated Pasture-Grassland within the Preserve System on a regional basis, and under a comprehensive preserve management program.	Minor Beneficial Effect	None required
Cumulative Effects – Farmland (Croplands and Irrigated Pasture-Grassland)						
The incremental loss of 8,484 acres of Cropland and Irrigated Pasture-Grasslands under the No Action/No Project Alternative would be a significant cumulative effect when considered together with the acres of Cropland and Irrigated Pasture Grassland lost from past and present human activities and the other foreseeable future projects in the Study Area.	The incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution the cumulative loss of Cropland and Irrigated Pasture-Grassland in the Study Area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to Cropland and Irrigated Pasture-Grassland throughout the Study Area, the 450-acre difference in direct impacts and the 2,081-acres difference in the permanent preservation of Cropland and Irrigated Pasture-Grassland land covers is not discernibly different between the Proposed Action/ Proposed Project Alternative and the No Action/No Project Alternative.	No Cumulative Effect	None required	At the scale of impacts to Cropland and Irrigated Pasture-Grassland throughout the Study Area, the 354-acre difference in direct impacts and the 326-acre difference in Cropland and Irrigated Pasture-Grassland preservation under the Reduced Permit Term Alternative is not discernibly different from the impacts expected under the No Action/No Project Alternative.	No Cumulative Effect	None required
Direct and Indirect Effects – Farmland (Orchards/Vineyards)						
As compared to the Existing Condition, the No Action/No Project Alternative would: • directly impact approximately 1,745 acres of existing Orchard and Vineyard land covers and associated plant and animal communities, which is approximately 5.7% of the existing 30,367 acres of Orchard and Vineyard land covers in the Planning Area; and • preserve approximately 1,566 acres of similar quality farmland, which	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • directly impact (remove) 63 fewer acres of Orchards and Vineyards land cover and the their plant and animal communities; • require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • directly impact 119 acres less of Orchards and Vineyards land covers and associated wildlife communities; • require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs, to better avoid and minimize	Minor Beneficial Effect	None required

AGENDA ITEM 11.1

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
equals approximately 90% of the acres of Orchard and Vineyard lost.	indirect effects to Orchards and Vineyards land covers; • preserve 515 acres more farmland, and would preserve farmland within a large SSHCP Preserve System; • mitigate impacts to Orchard and Vineyard land covers by preserving equal acres of Croplands and Irrigated Pasture land covers, which provide much higher quality habitat for the native wildlife community that uses farmland in the Planning Area; and • preserve farmland in larger preserves within an interconnected Preserve System, which would reduce habitat fragmentation effects on native wildlife in the Planning Area.			indirect effects to Orchards and Vineyards; • preserve higher quality farmland during the 30-year permit term by mitigating impact to Orchards and Vineyards with higher quality Cropland or Irrigated Pasture-Grassland; • preserve 381 less acres of Orchards and Vineyards over the 50-year EIS/EIR Study Period; • result in farmland preserves that are more contiguous, more interconnected, and within a larger Preserve System; and • result in management of preserved farmlands on a regional basis within the Preserve System, and under a comprehensive preserve management program.		
Cumulative Effects – Farmland (Orchards/Vineyards)						
Projects and activities implemented under the No Action/No Project Alternative are estimated to result in the direct loss of approximately 1,745 acres of existing Orchard and Vineyard. The regulatory environment of would require the preservation of approximately 1,566 acres of farmland of a similar category, which would permanently preserve those acres of farmland, but would still result in a net loss of 1,745 acres of farmland in the Planning Area. In addition, mitigation for impacts to farmland would continue to occur on a project by project basis, and would likely result of a pattern of farmland preserves that are geographically fragmented. Therefore, the incremental loss of Orchard and Vineyard under the No Action/No Project Alternative, when combined with the effects of past and current projects and the effects of the foreseeable future actions in the Study Area, would likely result in a less than significant cumulative effect to Orchard and Vineyard land covers.	The incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution the cumulative loss of farmland in the Study Area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to farmland throughout the Study Area, the 63-acre difference in direct impacts to Orchard and Vineyard land covers and the 515-acres difference in the preservation of farmland land covers is not discernibly different between the Proposed Action/ Proposed Project Alternative and the No Action/No Project Alternative.	No Cumulative Effect	None required	At the scale of impacts to Orchards and Vineyard throughout the Study Area, the 119-acre difference in direct impacts and the 381-acre difference in Orchards and Vineyard preservation under the Reduced Permit Term Alternative is not discernibly different from the impacts expected under the No Action/No Project Alternative.	No Cumulative Effect	None required
Direct and Indirect Effects – Wildlife Movement Corridors						
As compared to the Existing Condition, the No Action/No Project Alternative would: • impact the extreme northern most portion of the Coyote Creek; • directly and indirectly impact existing wildlife movement and dispersal along Laguna Creek corridor due to planned urban development, and associated human activities and recreation along creeks and streams within the UDA; and • impact Bear Slough-Browns Creek ECAs and the Coyote Creek- Dry Creek ECAs through some rural transportation projects.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • provide a coordinated, interconnected Preserve System designed to provide connectivity between existing preserves and new preserves established under the Proposed Action/Proposed Project; • require new development project to incorporate AMMs that would avoid or minimize effects on riparian corridors used for wildlife movement; • require new development projects inside the UDA and related roadway projects outside the UDA to incorporate wildlife crossing structures at specific locations; and • not result in displaced development outside the UDA, to locations that have a greater potential to affect designated wildlife movement corridors.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • provide a coordinated, interconnected Preserve System designed to provide connectivity between existing preserves and new preserves established under the Reduced Permit Term Alternative; • require new development projects implemented during the 30-year permit term to incorporate AMMs that would avoid or minimize effects on riparian corridors used for wildlife movement; • require new development projects inside the UDA and related roadway projects outside the UDA implemented during the 30-year permit term to incorporate wildlife crossing structures at specific locations; • not result in displaced development outside the UDA, to locations that have a greater potential to affect designated wildlife movement corridors.	Minor Beneficial Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
Cumulative Effects — Wildlife Movement Corridors						
the incremental loss and degradation of wildlife movement and corridors under the No Action/No Project Alternative would be a significant cumulative effect when considered together with the impacts to wildlife movement from by past and current human activities and the foreseeable other projects in the Study Area.	The incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution the cumulative loss of wildlife movement and dispersal in the Study Area, when compared to the incremental impact of the No Action/No Project Alternative. However, at the scale of wildlife movement throughout the Study Area, the difference in movement under the Proposed Action/Proposed Project Alternative when compared to impacts under the No Action/No Project Alternative is not discernibly different.	No Cumulative Effect	None required	The incremental impacts of the Reduced Permit Term Alternative would make a smaller contribution the cumulative loss of wildlife movement and dispersal in the Study Area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of wildlife movement throughout the Study Area, the difference in impacts to wildlife movement under the Reduced Permit Term Alternative when compared to expected impacts to wildlife movement under the No Action/No Project Alternative, is not discernibly different.	No Cumulative Effect	None required
SPECIAL-STATUS SPECIES INCLUDING HCP COVERED SPECIES						
Direct and Indirect Effects

Cumulative Effects						
Refer to Table ES-2 for impact significance for each analyzed species.						
AQUATIC RESOURCES						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in the loss of 821 acres of wetland waters; • result in the loss of 359 other waters; • result in the loss of 427 acres of Riparian land cover types; • in total, result in the loss of 1,607 acres of aquatic resources; and • preserve 1,740 acres of aquatic resources.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • result in the loss of 855 acres of wetland waters, which is 34 more acres than the 821-acre loss anticipated under the No Action/No Project Alternative; • result in the loss of 294 other waters, which is 65 acres less than the 359-acre loss anticipated under the No Action/No Project Alternative; • result in the loss of 464 acres of Riparian land cover types, which is 37 acres more than the 427 acres expected under the No Action/No Project Alternative; • in total, result in the loss of 1,613 acres of aquatic resources, which is 5 acres greater loss of aquatic resources compared to the 1,607-acre loss of the No Action/No Project Alternative; • preserve 2,738 acres of aquatic resources, which is greater by 998 acres compared 1,740 acres under the No Action/No Project Alternative; • require AMMs such as increased Stream Setbacks that would be more protective to aquatic resources relative to the No Action/No project Alternative; • implement the SSHCP and ARP resulting in a greater area of aquatic resources protections and management than the No Action/No Project Alternative; and • improve aquatic resource abundance, diversity, and condition within the Planning Area over that expected under the No Action/No Project Alternative.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in the loss of 931 acres of wetland waters, which is 110 more acres than the 821-acre loss anticipated under the No Action/No Project Alternative; • result in the loss of 315 other waters, which is 44 acres less than the 359-acre loss anticipated under the No Action/No Project Alternative; • result in the loss of 485 acres of Riparian land cover types, which is 55 acres more than the 427 acres expected under the No Action/No Project Alternative; • in total, result in the loss of 1,728 acres of aquatic resources, which is 121 acres greater loss of aquatic resources compared to the No Action/No Project Alternative; • preserve 2,778 acres of aquatic resources, which is greater by 1,038 acres compared 1,740 acres under No Action/No Project Alternative; • require AMMs such as increased Stream Setbacks that would be more protective to aquatic resources relative to the No Action/No project Alternative. However, once the permit term has expired (Years 31–50 of the 50-year EIS/EIR Study Period) projects would be subject to the Avoidance and Minimization Measures of the No Action/Project alternative (which do not include, for example, the expectation of required Stream Setbacks); • implement the SSHCP and ARP for the first 30 years of the study period, and result in a greater area of aquatic resources preserved than the No Action/No Project Alternative; and	Minor Beneficial Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
				• improve aquatic resource abundance, diversity, and condition within the Planning Area over that expected under the No Action/No Project Alternative.		
Cumulative Effects						
Many of the foreseeable other projects and actions would not result in additional losses of aquatic resource functions and services from the study area because they would comply with existing regulatory requirements to avoid and minimize impacts to aquatic resources and to provide compensatory mitigation for unavoidable impacts. However, the foreseeable rural residential developments, the agricultural activities on private lands, and other future activities are likely to result in additional losses and additional adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period	Implementation of the SSHCP Conservation Strategy, including the SSHCP AMMs, the SSHCP ARP, and the interconnected SSHCP Preserve System is expected to result in more consistent and frequent conservation of aquatic resources compared to the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required	Implementation of the SSHCP Conservation Strategy, including the SSHCP AMMs, the SSHCP ARP, and the interconnected SSHCP Preserve System during the first 30 years of the study period is expected to result in more consistent and frequent conservation of aquatic resources compared to the No Action/No Project Alternative.	Minor Beneficial Cumulative Effect	None required
PALEONTOLOGICAL, CULTURAL, AND HISTORICAL RESOURCES						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in damage to cultural resources from construction in areas where cultural resources are present; • result in damage or destruction to historic resources, including structures and sites; and • potentially impact human remains due to ground disturbance during construction.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • not result in disturbance of up to 1,900 acres outside the UDA identified as "moderate" or "high" cultural resource sensitivity by Sacramento County; • provide additional setback preserves along stream, creeks, and riparian areas, which generally have the highest sensitivity for cultural resources in the Planning Area; and • result in similar effects to existing historical resources and paleontological resources.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • not result in disturbance of up to 1,900 acres outside the UDA identified as "moderate" or "high" cultural resource sensitivity by Sacramento County; • provide 30-years of additional protections for stream, creeks, and riparian areas, which generally have the highest sensitivity for cultural resources in the Planning Area; and • result in similar effects on historical resources and paleontological resources.	Minor Beneficial Effect	None required
Cumulative Effects						
Although the policies in the Sacramento County General Plan (Sacramento County 2011) and Rancho Cordova General Plan (Rancho Cordova 2013) are designed to minimize protect impacts to paleontological and cultural resources, additional losses of paleontological and cultural resources would result from the new urban development projects, activities, and actions included in the No Action/No Project Alternative. Therefore, the direct and indirect impacts of the No Action/No Project Alternative would further increase the significant loss of cultural and paleontological resources that already exists in the study area.	Compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would include less development outside the current Sacramento County USB boundary, where cultural resource sensitivity is higher. The Proposed Action/Proposed Project would also include stream setbacks on streams, creeks, and first and second order tributaries to those streams and creeks. Because stream/creek and riparian areas have greater cultural resource sensitivity, these setbacks would reduce the potential for impacts to cultural resources.	Minor Beneficial Cumulative Effect	None required	Compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would not displace or shift urban development outside the current Sacramento County USB boundary where cultural resource sensitivity is moderate or high. The Reduced Permit Term Alternative would also include 30 -years of additional setbacks between new urban development and UDA streams, creeks, and first and second order tributaries to those streams and creeks. Because stream/creek and riparian areas have greater cultural resource sensitivity, the 30 -years of larger and more numerous setbacks are expected to reduce impacts to cultural resources.	Minor Beneficial Cumulative Effect	None required
PUBLIC SERVICES AND FACILITIES						
Direct and Indirect Effects - Law Enforcement, Fire Protection, and Emergency Services						
As compared to the Existing Condition, the No Action/No Project Alternative would: • increase the potential for adverse physical impacts associated with the provision of law enforcement services, fire protection, or emergency services to meet demands of urban development outside the UDA; • increase demand for law enforcement, fire protection, or emergency	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • reduce the potential for adverse physical impacts associated with the provision of law enforcement services, fire protection, or emergency services to meet demands of urban development outside the UDA;	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • reduce the potential for adverse physical impacts associated with the provision of law enforcement services, fire protection, or emergency services to meet demands of urban development outside the UDA;	Minor Beneficial Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
services by displacing urban development to areas remote from existing concentrations of law enforcement services, fire protection, or emergency services; • not change demand for local fire departments or CAL FIRE beyond current levels as a result of preserve management activities; and • not impede delivery of fire, police, and emergency services to preserve areas by improving coordination with local and state service providers.	• reduce demand for law enforcement, fire protection, or emergency services by not resulting in urban development remote from existing concentrations of law enforcement services, fire protection, or emergency services; • not change demand for local fire departments or CAL FIRE beyond current levels as a result of preserve management activities; and • not impede delivery of fire, police, and emergency services to preserve areas by improving coordination with local and state service providers.			• reduce demand for law enforcement, fire protection, or emergency services by not resulting in urban development remote from existing concentrations of law enforcement services, fire protection, or emergency services; • not change demand for local fire departments or CAL FIRE beyond current levels as a result of preserve management activities; and • not impede delivery of fire, police, and emergency services to preserve areas by improving coordination with local and state service providers.		
Cumulative Effects - Law Enforcement, Fire Protection, and Emergency Services						
Development under the No Action/No Project Alternative would include additional demand for police and fire services after the time frame evaluated in General Plan EIRs of the Cities of Rancho Cordova and Galt and the County of Sacramento, ranging from 15 to 35 additional years. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. However, existing funding mechanisms for law enforcement, fire protection, and emergency services would ensure that the new development would also provide new funding for these services.	The Proposed Action/Proposed Project would not include urban development outside the UDA where law enforcement, fire protection, and emergency services are less available. The Proposed Action/Proposed Project would also improve coordination between Preserve Managers and local or state service providers. Therefore, the Proposed Action/Proposed Project would have a smaller incremental contribution to impacts on demand for new facilities or law enforcement services, fire protection, or emergency services as compared to the No Action/No Project alternative.	Minor Beneficial Cumulative Effect	None required	The Reduced Permit Term Alternative would not include urban development outside the UDA where law enforcement, fire protection, and emergency services are less available. The Reduced Permit Term Alternative would also improve coordination between Preserve Managers and local or state service providers and therefore would have a smaller incremental contribution to impacts on demand for new facilities of law enforcement services, fire protection, or emergency services as compared to the No Action/No Project alternative.	Minor Beneficial Cumulative Effect	None required
Direct and Indirect Effects - Water and Wastewater Services						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in impacts from expanding water and wastewater infrastructure to serve urban development urban development outside the UDA; • continue the potential for existing aquatic resources or future preserves to conflict with planned infrastructure development; and • increase the severity of the significant and unavoidable impacts to potable water supply and wastewater treatment identified previously for Sacramento County, Rancho Cordova, and Galt.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • reduce the impacts from expanding water and wastewater infrastructure to serve urban development urban development outside the UDA; • reduce the potential for existing aquatic resources or future preserves to conflict with planned infrastructure development; and • result in similar impacts on adequacy of water supply for full buildout of the project.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • reduce the impacts from expanding water and wastewater infrastructure to serve urban development urban development outside the UDA; • reduce the potential for existing aquatic resources or future preserves to conflict with planned infrastructure development; and • result in similar impacts on adequacy of water supply for full buildout of the project.	Minor Beneficial Effect	None required
Cumulative Effects - Water and Wastewater Services						
Cumulative effects on water and wastewater services not evaluated in the General Plan EIRs of the Cities of Rancho Cordova and Galt and the County of Sacramento would include the additional increment of growth in the Planning Area after the end of their study periods, which range from 15 to 35 years of additional growth and development. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. The additional demand for water and wastewater infrastructure outside the UDA from these projects would be offset through payment of fees by project developers and by rate increases passed on to residents of the Planning Area.	The Proposed Action/Proposed Project would not include urban development outside the UDA where water and wastewater infrastructure are less available, and would have a smaller incremental contribution to impacts on demand for new water or wastewater facilities as compared to the No Action/No Project alternative.	Minor Beneficial Cumulative Effect	None required	The Reduced Permit Term Alternative would not include urban development outside the UDA where water and wastewater infrastructure are less available, and would have a smaller incremental contribution to impacts on demand for new water or wastewater facilities as compared to the No Action/No Project alternative.	Minor Beneficial Cumulative Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
Direct and Indirect Effects - Solid Waste Disposal						
As compared to the Existing Condition, the No Action/No Project Alternative would: • be serviced by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs; and • not result in a demand for solid waste disposal services that cannot be met by existing or reasonably foreseeable future service capacity.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • be serviced by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs; and • result in the same demand for solid waste disposal services.	No Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • be serviced by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs; and • result in the same demand for solid waste disposal services.	No Effect	None required
Cumulative Effects - Solid Waste Disposal						
Cumulative effects to solid waste disposal under the No Action/No Project alternative that were not evaluated in the General Plan EIRs of the Cities of Rancho Cordova and Galt and the County of Sacramento would include the additional increment of growth in the Planning Area after the end of their study periods, which range from 15 to 35 years of additional growth and development. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. The additional demand for solid waste disposal from these projects would be offset through payment of fees by project developers and by rate increases passed on to residents of the Planning Area.	The urban development under the Proposed Action/Proposed Project would accommodate the same population increase as the No Action/No Project Alternative, and would generate approximately the same amount of solid waste.	No Cumulative Effect	None required	The urban development under the Reduced Permit Term Alternative would accommodate the same population increase as the No Action/No Project Alternative and would generate approximately the same amount of solid waste.	No Cumulative Effect	None required
Direct and Indirect Effects - Parks and Recreational Facilities						
As compared to the Existing Condition, the No Action/No Project Alternative would: • increase the potential for substantial adverse physical impacts associated with the provision of park and recreation services outside the UDA; and • allow for development of trails planned in the Sacramento County, Galt, or Rancho Cordova General Plan.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • reduce the potential for substantial adverse physical impacts associated with the provision of park and recreation services outside the UDA, or result in substantial physical deterioration of an existing facility due to increased use; and • allow for development of trails planned in the Sacramento County, Galt, or Rancho Cordova General Plan.	No Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • not result in substantial adverse physical impacts associated with the provision of park and recreation services, or result in substantial physical deterioration of an existing facility due to increased use; and • allow for development of trails planned in the Sacramento County, Galt, or Rancho Cordova General Plan.	No Effect	None required
Cumulative Effects - Parks and Recreational Facilities						
Under the No Action/No Project Alternative, parks and recreational facilities would continue to be developed along with urban development in the cumulative impacts study area, maintaining a similar per capita availability of parks and recreational facilities despite increases in population. This would also be the case for reasonably foreseeable other projects.	Urban development under the Proposed Action/Proposed Project would also increase the Planning Area population and result in increased demand for parks and recreational facilities, but this new urban development would generate fees and taxes to pay for additional parks and recreational facilities. The Proposed Action/Proposed Project Alternative would provide limited park and recreational facility benefits by providing nature trails in some preserves, designed consistent with AMMs NATURE TRAIL-1 through NATURE TRAIL-5.	No Cumulative Effect	None required	Urban development under the Reduced Permit Term Alternative would also increase the Planning Area population and result in increased demand for parks and recreational facilities, but as with the past, present, and reasonably foreseeable future projects, this new urban development would generate fees and taxes to pay for additional parks and recreational facilities. The Reduced Permit Term Alternative would provide limited park and recreational facility benefits by providing nature trails in some preserves established during the 30-year permit term, designed in a manner consistent with AMMs NATURE TRAIL-1 through NATURE TRAIL-5. Additional trails would likely be constructed within preserves that are established as mitigation for project impacts in years 31–50 of the EIS/EIR study period.	No Cumulative Effect	None required
Direct and Indirect Effects - Energy						
As compared to the Existing Condition, the No Action/No Project Alternative would: • increase the potential for impacts associated with building new electric	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • reduce the potential for impacts associated with building new	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • reduce the potential for impacts associated with building new	Minor Beneficial Effect	None required

Table ES-1. Summary of Impacts and Mitigation

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
or natural gas infrastructure to meet demands of urban development outside the UDA; • increase the potential for urban development patterns to conflict with regional energy infrastructure plans; and • increase demand for electricity and natural gas service because of increased urban development within the Planning Area.	electric or natural gas infrastructure to meet demands of urban development outside the UDA; • reduce the potential for urban development patterns to conflict with regional energy infrastructure plans; and • result in similar demand for electricity and natural gas service because total amounts of urban development within the Planning Area would be similar.			electric or natural gas infrastructure to meet demands of urban development outside the UDA; • reduce the potential for urban development patterns to conflict with regional energy infrastructure plans; and • result in similar demand for electricity and natural gas service because total amounts of urban development within the Planning Area would be similar.		
Cumulative Effects - Energy						
Cumulative effects to energy not evaluated in the General Plan EIRs of Rancho Cordova, Galt and the Sacramento County would include the additional increment of growth in the Planning Area after the end of their study periods, which range from 15 to 35 years of additional growth and development. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. The additional demand for energy infrastructure outside the UDA from these projects would be offset by rate increases passed on to residents of the Planning Area.	Additional development from urban development under the Proposed Action/Proposed Project would offset its impacts similarly to the No Action/No Project Alternative, through payment of usage fees. Because the Proposed Action/Proposed Project would include an Aquatic Resources Plan and expedited permitting process for aquatic resources, proponents constructing or expanding energy infrastructure would be less likely to have to develop alternative routes to avoid wetlands and waters. Generally, development of utility infrastructure within the Preserve System could occur as long as those projects complied with SSHCP AMMs.	No Cumulative Effect	None required	Additional development from urban development under the Reduced Permit Term Alternative would offset its impacts similarly to the No Action/No Project Alternative, through payment of usage fees. Because the Proposed Action/Proposed Project would include an Aquatic Resources Plan and expedited permitting process for aquatic resources, proponents constructing or expanding energy infrastructure would be less likely to have to develop alternative routes to avoid wetlands and waters. Generally, development of utility infrastructure within the Preserve System could occur as long as those projects complied with SSHCP AMMs.	No Cumulative Effect	None required
Direct and Indirect Effects - Mosquito Abatement						
As compared to the Existing Condition, the No Action/No Project Alternative would: • potentially create more new breeding areas for mosquitos; and • potentially restrict mosquito abatement activities within preserves.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • potentially create more new breeding areas for mosquitos, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health; and • potentially restrict mosquito abatement activities within preserves, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health.	Less Than Significant Adverse Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • potentially create more new breeding areas for mosquitos, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health; and • potentially restrict mosquito abatement activities within preserves, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health.	Less Than Significant Adverse Effect	None required
Cumulative Effects - Mosquito Abatement						
Existing patterns of development have resulted in avoidance of wetlands, establishment of on-site preserves, and on-site wetland establishment projects, which expose residents and employees to potential mosquito hazards. The lead agencies anticipate that avoidance of wetlands, establishment of on-site preserves, and wetland establishment projects would continue to be a common mitigation strategy under the No Action/No Project Alternative. However, funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so any additional demand for mosquito abatement would be met.	The Proposed Action/Proposed Project would contribute to cumulative impacts on mosquito abatement by establishing new aquatic resources and potentially making it more difficult to conduct mosquito abatement activities on preserves. However, the Preserve System would be carefully monitored and managed to avoid the aquatic resource conditions conducive to mosquito breeding. Further, funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so additional demand for mosquito abatement would be met.	Less Than Significant Adverse Cumulative Effect	None required	The Reduced Permit Term Alternative would contribute to cumulative impacts on mosquito abatement by establishing new aquatic resources and potentially making it more difficult to conduct mosquito abatement activities on preserves. However, the conceptual preserve system would be carefully monitored and managed to avoid the aquatic resource conditions conducive to mosquito breeding. Further, funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so additional demand for mosquito abatement would be met.	Less Than Significant Adverse Cumulative Effect	None required
TRAFFIC AND CIRCULATION						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would:	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:	Minor Beneficial Effect	None required

No Action/No Project Alternative	Proposed Action/Proposed Project Alternative			Reduced Permit Term Alternative		
Impact	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*	*Impact*	*CEQA/NEPA Significance*	*Mitigation Measures*
• increase vehicle trips, demand on transit to serve outlying areas, and overall demand on the local and regional transportation system by resulting in displacement and shifting of urban development outside the UDA; • increase potential conflicts with future planned roadways, extensions of existing roadways, and roadway widening and improvements that are planned in the Sacramento County, Galt, and Rancho Cordova General Plan Circulation Elements; • result in a minimal amount of additional vehicle trips for management and monitoring of mitigation preserves; and • result in a minimal amount of additional heavy vehicle trips for habitat re-establishment/ establishment on mitigation preserves.	• reduce vehicle trips, demand on transit to serve outlying areas, and overall demand on the local and regional transportation system by not resulting in displacement and shifting of urban development outside the UDA; • reduce potential conflicts with future planned roadways, extensions of existing roadways, and roadway widening and improvements that are planned in the Sacramento County, Galt, and Rancho Cordova General Plan Circulation Elements; • result in a minimal amount of additional vehicle trips for preserve system management and monitoring; and • result in a minimal amount of additional heavy vehicle trips for preserve system habitat re-establishment/establishment.			• reduce vehicle trips, demand on transit to serve outlying areas, and overall demand on the local and regional transportation system by not resulting in displacement and shifting of urban development outside the UDA; • reduce potential conflicts with future planned roadways, extensions of existing roadways, and roadway widening and improvements that are planned in the Sacramento County, Galt, and Rancho Cordova General Plan Circulation Elements; • result in a minimal amount of additional vehicle trips for preserve system management and monitoring; and • result in a minimal amount of additional heavy vehicle trips for preserve system habitat re-establishment/establishment.		
Cumulative Effects						
The future traffic impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative impacts of the No Action/No Project Alternative on existing and future traffic and circulation are identical to the direct and indirect impacts.	The future traffic impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative impacts of the Proposed Project/Proposed Action on existing and future traffic and circulation are identical to the direct and indirect impacts	N/A	None required	The future traffic impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative impacts of the Reduced Permit Term Alternative on existing and future traffic and circulation are identical to the direct and indirect impacts	N/A	None required
AIR QUALITY						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in increased mobile-source criteria pollutant, TAC, and odor emissions, and dust emissions from construction of urban development; • result in increased CO emissions during construction of urban development; • result in increased mobile-source criteria pollutant emissions from operation of urban development; • result in increased emissions of criteria pollutants, TACs, and odors from stationary and area wide sources associated with operation of urban development; • result in increased CO emissions during the operation of urban development; • result in increased exposure of sensitive receptors to mobile source TACs and odors from operation of urban development; • result in increased mobile source emissions from operation of mitigation preserves; and • result in increased exposure of sensitive receptors to TACs, odors, and CO from operation of mitigation preserves.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • result in reduced mobile-source criteria pollutant, TAC, and odor emissions, and dust emissions from construction of urban development and preserve establishment; • result in similar CO emissions during construction of urban development and preserve establishment; • result in reduced mobile-source criteria pollutant emissions from operation of urban development; • result in similar emissions of criteria pollutants, TACs, and odors from stationary and area wide sources associated with operation of urban development; • result in similar CO emissions during the operation of urban development; • result in similar exposure of sensitive receptors to mobile source TACs and odors from operation of urban development; • result in reduced mobile source emissions from preserve system operation; and • result in similar exposure of sensitive receptors to TACs, odors, and CO from preserve system operation.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in reduced mobile-source criteria pollutant, TAC, and odor emissions, and dust emissions from construction of urban development and preserve establishment; • result in similar CO emissions and concentrations during construction of urban development and preserve establishment; • result in reduced mobile-source criteria pollutant emissions from operation of urban development; • result in similar emissions of criteria pollutants, TACs, and odors from stationary and area wide sources associated with operation of urban development; • result in similar CO emissions during the operation of urban development; • result in similar exposure of sensitive receptors to mobile source TACs and odors from operation of urban development; • result in reduced mobile source emissions from preserve system operation; and • result in similar exposure of sensitive receptors to TACs, odors, and CO from preserve system operation.	Minor Beneficial Effect	None required
Cumulative Effects						
The construction, stationary, and mobile source air emissions from these foreseeable other projects were generally included in the analysis of cumulative air emissions impacts incorporated from the General Plan EIRs. These General Plan EIRs identified significant and unavoidable air quality impacts from	Various elements of the Proposed Action/Proposed Project Alternative would reduce emissions of criteria pollutants compared to the No Action/No Project Alternative, including more effective emission reductions from implementation of AMMs and the lack of	Minor Beneficial Cumulative Effect	None required	Various elements of the Reduced Permit Term Alternative would reduce emissions of criteria pollutants compared to the No Action/No Project Alternative, including more effective emission reductions from implementation of AMMs and the lack of urban development being	Minor Beneficial Cumulative Effect	None required

emissions of criteria pollutants during construction and operation. Consequently, the combination of past, present, and reasonably foreseeable future projects would result in continued significant adverse cumulative air quality effects, with the SVAB likely remaining in non-attainment for ozone, PM10, and PM2.5. As discussed above, the direct and indirect impacts of No Action/No Project Alternative would adversely affect existing air quality through the emissions of criteria pollutants.	urban development being shifted or displaced outside the USB, thereby reducing VMT. The reduced emissions result in the minor beneficial effects identified above, and the Proposed Action/Proposed Project Alternative would make a smaller incremental contribution to any cumulative air quality impacts when compared to the incremental effects of the No Action/No Project Alternative.			shifted or displaced outside the USB, thereby reducing VMT. The reduced emissions result in the minor beneficial effects identified above, and the Reduced Permit Term Alternative would make a smaller incremental contribution to any cumulative air quality impacts when compared to the incremental effects of the No Action/No Project Alternative.		
GREENHOUSE GASES AND CLIMATE CHANGE						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in increased GHG emissions from construction of urban development; • result in increased GHG emissions from mitigation preserve construction/establishment; • result in increased GHG emissions from operations of urban development; • result in increased GHG emissions from the loss of carbon-sequestering terrestrial land covers; and • result in little difference in GHG emissions resulting from mitigation preserve management.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • result in a net reduction in GHG emissions from construction of urban development; • result in net reduction in GHG emissions from preserve system construction/establishment; • result in a net reduction in GHG emissions from operations of urban development; • result in a net reduction in GHG emissions from the loss of carbon-sequestering terrestrial land covers; • result in little difference in GHG emissions from preserve system management; and • result in a preserve system that is more resilient to climate change.	Minor Beneficial Effect	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in a net reduction in GHG emissions from construction of urban development; • result in a net reduction in GHG emissions resulting from operations of urban development; • result in a negligible difference in GHG emissions from the loss of carbon-sequestering terrestrial land covers; • result in little difference in GHG emissions from preserve system construction/ establishment; • result in little difference in GHG emissions from preserve system management; and • result in a preserve system that is more resilient to climate change.	Minor Beneficial Effect	None required
Cumulative Effects						
The GHG emission impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative GHG emission impacts of the No Action/No Project Alternative are identical to the direct and indirect impacts.	The GHG emission impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative GHG emission impacts of the Proposed Action/Proposed Project Alternative are identical to the direct and indirect impacts.	N/A	None required	The GHG emission impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative GHG emission impacts of the Reduced Permit Term Alternative are identical to the direct and indirect impacts.	N/A	None required
POPULATION AND HOUSING, SOCIOECONOMICS, AND ENVIRONMENTAL JUSTICE						
Direct and Indirect Effects						
As compared to the Existing Condition, the No Action/No Project Alternative would: • result in conversion of grazing land and farmland to developed land uses, reducing agricultural employment. • not impede meeting current or future residential development needs. • not result in a substantial displacement of housing units or people; and • positively affect low –income and minority populations through establishment of preserves in the UDA.	As compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would: • result in similar population and housing impacts; • result in similar socioeconomic impacts; and • result in similar environmental justice impacts.	No Impact	None required	As compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would: • result in similar population and housing impacts; • result in similar socioeconomic impacts; and • result in similar environmental justice impacts.	Minor Beneficial Effect	None required
Cumulative Effects						
The No Action/No Project Alternative, when considered with past, present, and other reasonably foreseeable projects would result in greater opportunities to live and/or work near quality transit, provide for more access to parks and higher education, and would not displace housing, businesses, or populations.	The incremental direct and indirect effects on population and housing, socioeconomics, and environmental justice under the Proposed Action/Proposed Project Alternative are similar to the incremental effects of the No Action/No Project Alternative.	No Cumulative Impact	None required	The incremental direct and indirect effects on population and housing, socioeconomics, and environmental justice under the Reduced Permit Term Alternative are similar to the incremental effects of the No Action/No Project Alternative.	No Cumulative Impact	None required

CHAPTER 1 – INTRODUCTION/PURPOSE AND NEED

This joint Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) (EIS/EIR) evaluates the impacts associated with implementing all elements of the South Sacramento Habitat Conservation Plan (SSHCP or Plan) and issuing an associated Endangered Species Act Incidental Take Permit (ESA ITP) and California Endangered Species Act Incidental Take Permit (CESA ITP).

One purpose of this joint EIS/EIR is to inform decision makers and the public of the effects on the human environment of the approval of the SSHCP, issuance of ITPs to local entities, and the future implementation of the SSHCP. This joint EIS/EIR also provides measures to mitigate impacts and presents reasonable alternatives that could reduce the significant environmental impacts of the proposed action to a less-than-significant level.

This EIS/EIR was prepared pursuant to the National Environmental Policy Act of 1969 (NEPA) (42 United States Code [U.S.C.] 4321–4347 et seq.), the California Environmental Quality Act (CEQA) (California Public Resources Code, Section 21000 et seq.), the regulations for implementing NEPA (40 Code of Federal Regulations [CFR] Parts 1500–1508 and 43 CFR Part 46), and the Guidelines for Implementing CEQA (CEQA Guidelines) (Section 15000 et seq.).

The U.S. Fish and Wildlife Service (USFWS) is the lead agency under NEPA, and Sacramento County (the County) is the lead agency under CEQA in the preparation of this joint EIS/EIR.

The Draft EIS/EIR and Draft SSHCP were released for concurrent public reviews on June 2, 2017, when the USFWS published a Notice of Availability (NOA) for both documents (82 FR 25612), and the County published an NOA for the Draft EIS/EIR with the California State Clearinghouse (control number 2003-0637). Separately, the U.S. Army Corps of Engineers (USACE) released their draft Clean Water Act (CWA) Permitting Strategy for the SSHCP.

Pursuant to ESA Section 10 policy, the USFWS provided a minimum 90-day public review and comment period for both draft documents, which ended on September 5, 2017. A total of 26 comment letters were received on the Draft EIS/EIR, the Draft SSHCP, and the CWA Permitting Strategy. During the 90-day comment period, the lead agencies and the SSHCP Plan Partners jointly conducted three public meetings in Wilton, Rancho Cordova, and Galt, to provide additional opportunities for the public to provide comments on the Draft SSHCP and the Draft EIS/EIR (see NOAs for locations). A total of two comment letters were submitted at these public meetings. An additional 24 comment letters were submitted to the lead agencies during the 90-day public comment period.

The lead agencies prepared responses to comments on the Draft EIS/EIR, and the Plan Partners prepared responses to comments on the Draft SSHCP in collaboration with the USFWS (see Final EIS/EIR Chapter 19). The USACE prepared the responses to comments on their Public Notice (Chapter 19). If a response to a comment on the Draft SSHCP resulted in

changes to the Final SSHCP, those changes were carried into the project description of the Proposed Action/Proposed Project Alternative in the Final EIS/EIR. Likewise, if the response to comments on the USACE Public Notice resulted in changes to the proposed CWA Permit Strategy, those changes were copied into relevant sections of the Final SSHCP, and into the description of the Proposed Action/Proposed Project Alternative in the Final EIS/EIR, as needed. Using this process, the Proposed Action/Proposed Project Alternative that is described and studied in the Final EIS/EIR is consistent with the Final SSHCP. Overall, the environmental impacts of the Proposed Action/Proposed Project Alternative remained similar relative to the impacts described in the Draft EIS/EIR, because the scope of changes to the Proposed Action/Proposed Project Alternative was minimal.

Substantive changes in the Final EIS/EIR are clearly marked. Changes from the Draft EIS/EIR resulting in added text are shown with bold underline. Changes from the Draft EIS/EIR resulting in deleted text are shown with ~~strikethrough~~.

1.1 SSHCP OVERVIEW

The following local agencies are jointly applying for species ITPs from the state and federal Wildlife Agencies (USFWS and California Department of Fish and Wildlife [CDFW]):

- Sacramento County
- The City of Galt
- The City of Rancho Cordova
- The Sacramento County Water Agency (SCWA)
- The Capital Southeast Connector Joint Powers Authority (Connector JPA)
- The future South Sacramento Conservation Agency (SSHCP Implementing Entity).

These six entities are the Permit Applicants. Together, they are applying for an ITP from the USFWS, pursuant to Section 10(a)(1)(B) of the ESA, and for an ITP from the CDFW, pursuant to Section 2081 of the California Fish and Game Code. The ITPs would authorize take[1] of certain

[1] "Take" is defined in the ESA as harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting or attempting to engage in any such conduct. "Harass" is defined by the USFWS as an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns (which include, but are not limited to, breeding feeding, or sheltering). "Harm" in the definition of take is further defined by USFWS to mean an act which actually kills or injures wildlife; such acts may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavior patterns, including breeding feeding, or sheltering (50 CFR 17.3).

"Take" is defined in Section 86 of the California Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill" a threatened or endangered species. Under CESA (which is

state-listed species, certain federally listed species, and other SSHCP Covered Species during the course of implementing otherwise lawful SSHCP Covered Activities that are described in Chapter 2, Alternatives, Including the Proposed Action/Proposed Project. The Permit Applicants are seeking ITPs with a 50-year permit term; however, this EIS/EIR also analyzes an action alternative with a shorter permit term.

The future SSHCP Implementing Entity would be a joint exercise of powers authority (JPA) called the South Sacramento Conservation Agency. This SSHCP Implementing Entity would be composed of a JPA Governing Board (JPA Board), an Implementation Commission, and an executive director and staff to help with day-to-day implementation of the SSHCP. The Implementing Entity would also be a permittee on the state and federal ITPs.

As a required component of the application for an ITP, the Permit Applicants have prepared the SSHCP, a habitat conservation plan (HCP) under Section 10 of the ESA. The SSHCP is intended to support the issuance of both the ESA and the CESA ITPs by providing a long-term conservation plan to minimize impacts to and permanently conserve the native species and all natural communities of the Planning Area, while allowing for planned future urban development and other Covered Activities that comply with local policies and regulations. The SSHCP identifies where future Covered Activities would likely impact Covered Species, natural communities, and aquatic resources, and presents a comprehensive regional strategy for the avoidance, minimization, and mitigation of those impacts.

The Permit Applicants have also prepared the SSHCP Aquatic Resources Plan (the ARP) to accompany the SSHCP, which proposes a locally based program for permitting future SSHCP Covered Activities that impact aquatic resources. The proposed SSHCP identifies future Covered Activity impacts to aquatic resources in the Planning Area, and provides a strategy to maximize the avoidance, minimization, and compensatory mitigation of aquatic resource impacts.

The three Land Use Authority Permit Applicants (i.e., Sacramento County, Galt, and Rancho Cordova) are using the SSHCP and the ARP to request that the USACE develop a (CWA Section 404 permit~~ting~~ strategy for future SSHCP Covered Activities that discharge dredged or fill material to wetlands and other waters of the United States. The Land Use Authority Permit Applicants are also requesting the Central Valley Regional Water Quality Control Board (RWQCB) develop a parallel multilevel CWA Section 401 permitting process for obtaining water quality certifications

included within the California Fish and Game Code), an endangered species is "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range." A threatened species is "a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts."

for future SSHCP Covered Activities, and a process for issuing reports of waste discharge under the California Porter-Cologne Water Quality Control Act (Porter-Cologne). In addition, the three Land Use Authority Permit Applicants (i.e., Sacramento County, Galt, and Rancho Cordova) are requesting that the CDFW develop a Master Streambed Alteration Agreement for future SSHCP Covered Activities (see Section 1.5, Decisions to be Made).

1.1.1 Geographic Scope of the EIS/EIR Planning Area

The Permit Applicants began the HCP planning process by identifying the areas where planned future growth and development may occur, and where future growth and development may affect state and federally protected species. The Planning Area is defined as the area in which all SSHCP Covered Activities (projects and activities) and all SSHCP habitat conservation actions, projects, and activities would be implemented, and where all associated incidental take of species would occur. The boundary of the Planning Area was defined by the Permit Applicants using both jurisdictional and ecological factors.

The Planning Area encompasses approximately 317,655 acres within south Sacramento County, as shown on Figure 1-1, South Sacramento Habitat Conservation Plan Area. The Planning Area includes Galt and Galt's sphere of influence, and the portion of Rancho Cordova that is located south of U.S. Highway 50. The geographical boundaries of the Planning Area are U.S. Highway 50 and White Rock Road to the north, the Sacramento River levee and County Road J11 (Walnut Grove-Thornton Road) to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and with the San Joaquin County to the south.

The Planning Area excludes the northern portion of Sacramento County, the portion of Rancho Cordova located north of U.S. Highway 50, the City of Sacramento, Elk Grove, Folsom, sovereign lands of the Miwok Tribe, and the Sacramento County community of Rancho Murieta (see Figure 1-1).

The SSHCP refers to the portion of the Planning Area where future urban development Covered Activities[2] would occur as the "Urban Development Area" (the UDA). Sacramento County has previously adopted an Urban Service Boundary (USB) to demarcate the ultimate extent to which the County would provide future urban services, such as sanitary sewer and water supply. Consequently, the portion of Sacramento County USB that is within the Planning Area is part of the SSHCP's UDA. The portion of the Rancho Cordova's sphere of influence that is within

[2] Covered Activities are future activities and projects over which an ITP permit applicant would have jurisdiction or another form of control, are likely to result in species incidental take, and are reasonably certain to occur over the proposed term of the ITP (USFWS and NOAA 2016). The SSHCP Covered Activities primarily consist of new urban development in the UDA, rural transportation projects and water recycling infrastructure outside the UDA, and management actions on future habitat preserves.

the boundaries of the Planning Area is also part of the UDA. The UDA also includes all lands within Galt and within Galt's sphere of influence (Figure 1-1). Approximately 67,618 acres within the Planning Area are also within the UDA.

The boundaries of the Planning Area also define the Planning Area used in this EIS/EIR. The EIS/EIR uses the term "Planning Area" because, as identified previously, the EIS/EIR evaluates alternatives to the proposed SSHCP. As described in Chapter 2, Section 2.1, Approach to Developing Alternatives, the lead agencies considered alternatives that might have smaller or different Planning Area boundaries. For these reasons, the term "Planning Area" is used in the EIS/EIR and indicates the geographic area for which the EIS/EIR provides analysis. The term "UDA" and the boundaries of the UDA are also used in the definition of the EIS/EIR Planning Area.

1.2 OVERVIEW OF NEPA AND CEQA

1.2.1 NEPA

NEPA requires federal agencies to conduct an environmental review before undertaking any discretionary actions, including any activities they implement, manage, permit, or fund. The NEPA process is intended to help federal officials make decisions that are based on an understanding of the environmental consequences of their decision, and to take actions that protect, restore, and enhance the environment. NEPA requires all federal agencies to solicit and to consider public input and comments on the environmental implications of their proposed actions through the preparation of appropriate documents. All federal agencies must use a systematic and interdisciplinary approach when preparing NEPA documents to ensure the integrated use of the natural and social sciences in planning and in all decision making that may have an impact on the human environment. The Office of the President's Council on Environmental Quality (the CEQ) has prepared NEPA regulations and guidance documents that federal agencies must follow (40 CFR Parts 1500–1508).

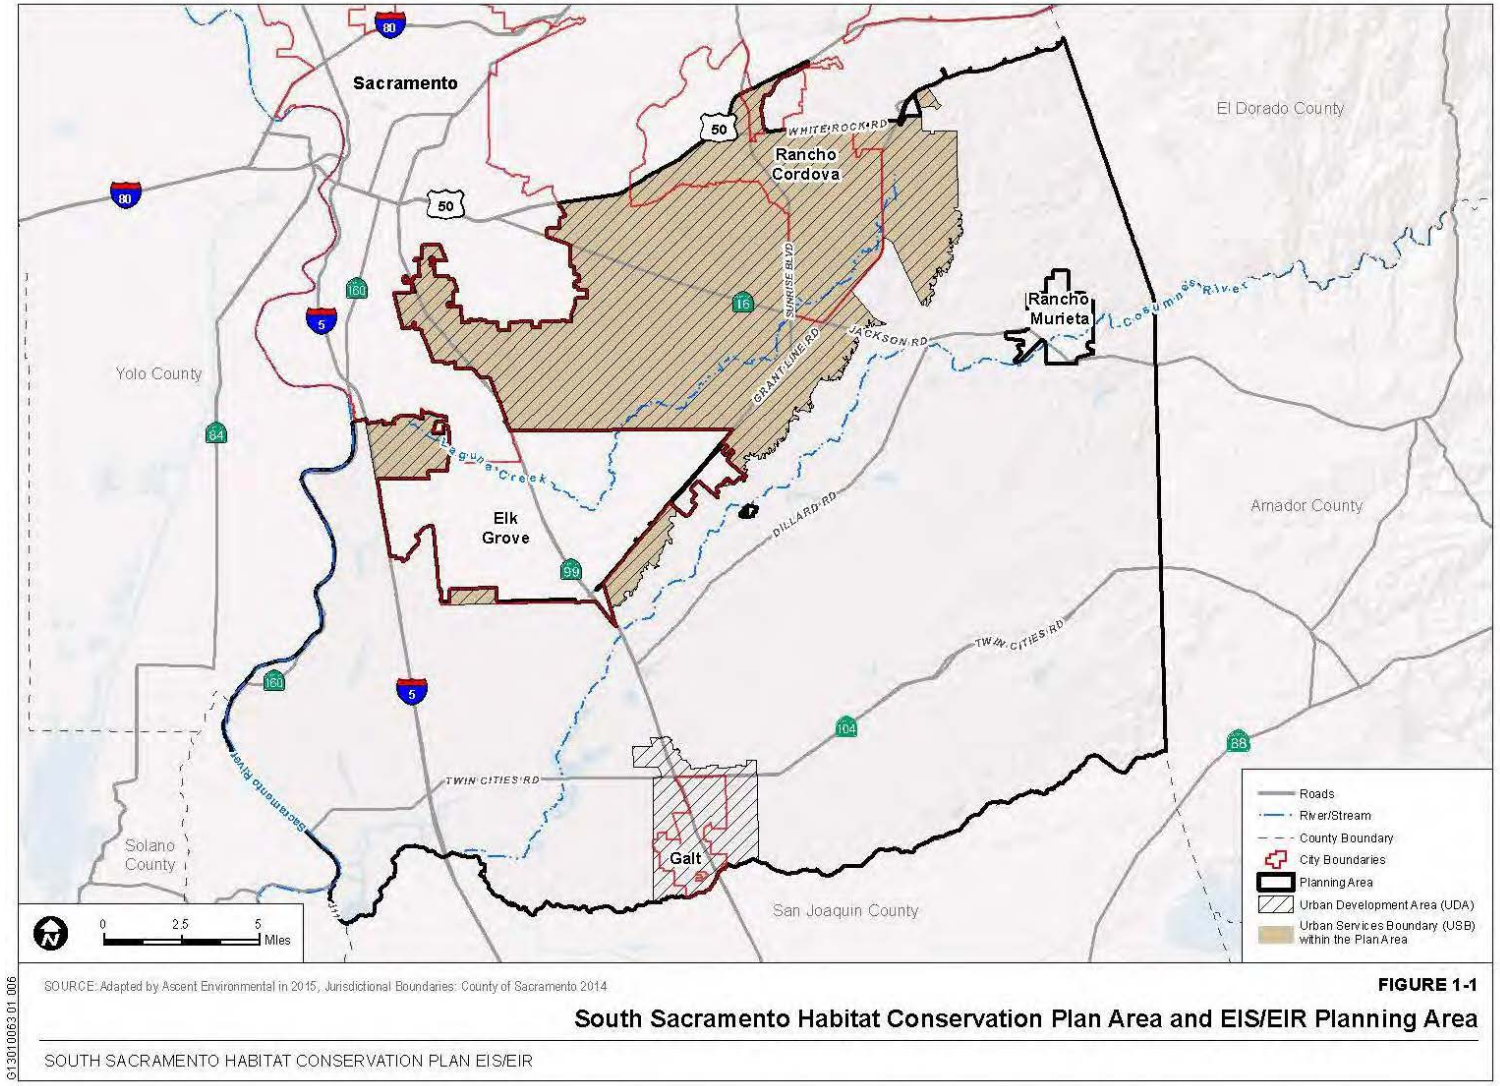
The USFWS, as the lead federal lead agency preparing this document, has determined that the issuance of an ITP to the Permit Applicants under Section 10 of the ESA would constitute a discretionary federal action likely to result in a significant effect on the human environment, and, thus, the preparation of an EIS is warranted.

Upon request of the lead agency, other federal agencies that have jurisdiction by law shall be a Cooperating Agency in the preparation of an EIS. Other federal, state, tribal, or local agencies that have special expertise with respect to an environmental issue analyzed in the EIS may be a Cooperating Agency in the preparation of an EIS. The Cooperating Agencies participate in the NEPA process at the earliest possible time; identify issues to be addressed in the EIS; collect and/or assemble necessary resource data; analyze data; develop alternatives; evaluate

alternatives; and estimate effects of implementing each alternative (40 CFR 1501.6; 43 CFR 46.230). A federal cooperating agency may adopt the EIS of a lead agency without recirculating when, after an independent review of the statement, the cooperating agency concludes that its suggestions and comments have been satisfied (40 CFR 1506.3[c]).

The USACE, the U.S. Environmental Protection Agency (EPA), and the CDFW have agreed to be Cooperating Agencies in the preparation of this EIS/EIR because of their jurisdiction by law and because of their special expertise on the environmental issues analyzed in this EIS/EIR.

1.2.2 CEQA



CEQA requires state and local agencies to evaluate the environmental implications of their actions and aims to prevent significant environmental impacts of those actions by requiring agencies, when feasible, to avoid significant environmental impacts or reduce them through the adoption of feasible mitigation measures. Like NEPA, CEQA requires all agencies to consider and publicly disclose the environmental implications of their proposed actions through the preparation of appropriate documents. CEQA requires that the state or local lead agency prepare an EIR when the lead agency determines that a project may have a significant effect on the environment. CEQA applies to all discretionary activities proposed to be carried out or approved by California public agencies. Sacramento County is the CEQA lead agency preparing this document and has determined that an EIR must be prepared for the proposed project because implementation of the SSHCP may result in a significant effect on the environment.

In addition to lead agencies, CEQA responsible agencies and CEQA trustee agencies have roles in the environmental review process. A responsible agency under CEQA is a state or local public agency other than the CEQA lead agency that has discretionary approval over all or a part of the project (CEQA Guidelines, Section 15381). A CEQA trustee agency is a state agency that has jurisdiction by law over natural resources affected by a project that are held in trust for the people of California (CEQA Guidelines, 15386).

All of the Permit Applicants are either a CEQA lead agency (Sacramento County) or CEQA responsible agencies (Galt, Rancho Cordova, SCWA, and the Connector JPA), and all Permit Applicants are responsible for discretionary approvals of the SSHCP and would be responsible for the future implementation of the SSHCP.

CDFW is a responsible agency under CEQA because it would approve the SSHCP and would issue a CESA ITP for the state-listed SSHCP Covered Species. In addition, as discussed in Section 1.5.6, the Permit Applicants are requesting that the CDFW develop and approve a programmatic Streambed Alteration Agreement for all future SSHCP Covered Activity projects and activities.

Figure 1-1 South Sacramento Habitat Conservation Plan Area

INTENTIONALLY LEFT BLANK

CDFW is also a trustee agency under CEQA because it has jurisdiction by law over natural resources that would be affected by the operational SSHCP, including the fish and wildlife the state-designated natural communities present in the Planning Area, state-designated rare or endangered native plants, game refuges, and ecological reserves.

The RWQCB is a CEQA responsible agency because it would take action on any associated water quality certifications and/or waste discharge requirements.

Other trustee agencies include the California State Lands Commission with regard to state-owned "sovereign" lands, such as the beds of navigable waters and state school lands, and the California State Department of Parks and Recreation with regard to units of the State Park System.

1.2.3 Joint Documentation

USFWS is a federal governmental agency within the U.S. Department of the Interior. The CEQ NEPA regulations (40 CFR 1506.2), the Department of the Interior NEPA regulations (43 CFR 46.440), and the Department of the Interior Manual (516 DM 4.18), require federal agencies to eliminate duplication between NEPA requirements and state or local environmental requirements by preparing joint documents when possible. Similarly, CEQA and the CEQA Guidelines strongly encourage state and local agencies to prepare a combined EIS/EIR that satisfies both NEPA and CEQA (California Public Resources Code, Section 21083.6; CEQA Guidelines, Section 15222). Given these regulations and guidance, and the efficiencies, cost savings, and other benefits associated with intra-agency collaboration on a joint NEPA/CEQA document, the lead agencies are preparing this joint EIS/EIR.

Although there are many requirements of CEQA and NEPA that are the same or are similar, there are some important terminology differences between the two laws. Table 3-1 in Chapter 3 lists the most common terms under each law and correlates them to terms of the opposite law that are used in a similar manner.

1.3 PURPOSE, NEED, AND OBJECTIVES

NEPA regulations require that each EIS briefly describe the underlying purpose and need to which the lead agency is responding in proposing the alternatives, including the proposed action (40 CFR 1502.13). The "need "for lead agency action refers to an underlying problem or opportunity to which an agency is responding. Often a need is described as a condition requiring relief (i.e., the presence of something not wanted), or is described as the lack of something requisite, desirable, or useful (i.e., the lack of something wanted). The "purpose" refers to a goal or objective that the lead agency is trying to achieve and should be stated, to the extent possible, in terms of desired outcomes (43 CFR 46.420). Often a purpose is described as a goal or an end to be attained. Similarly, CEQA requires an EIR to contain a statement of the

"objectives" sought by the proposed project. The CEQA statement of objectives should include the underlying purpose of the project (CEQA Guidelines, Section 15124[b]).

Identifying the needs, purposes, and objectives of the project and action help the lead agencies develop and determine the range of alternatives to be analyzed, and they provide a basis for the selection of an alternative by the lead agency decision makers (43 CFR 46.420; CEQA Guidelines, Section 15124[b]).

1.3.1 Background Information

Land Cover Conversion, Native Species, and Aquatic Resources

Current habitat conditions in the Planning Area reflect a history of human modification of the pre-European settlement natural landscape. After the founding of Sacramento County in 1850, through the first half of the twentieth century, a dominant human activity in the western part of the Planning Area was the conversion of natural land covers to agricultural row crops (cropland), with a corresponding loss of suitable habitat for many Planning Area native plant and wildlife species. The eastern part of the Planning Area was used primarily for grazing cattle during this period, and cattle grazing continues to dominate this part of the Planning Area. Grazing of natural grasslands does not remove the natural landscape and has little direct effect on aquatic resources, allowing natural grassland ecosystem functions, including vernal pools and vernal pool complexes, to continue.

Sacramento County experienced a rapid increase in population in the 1940s, with a corresponding expansion of urban and suburban development in the Cities of Sacramento, Folsom, and Galt. A second wave of new development occurred between 1950 and 1960 when Sacramento County's population grew by 81%, leading to new urban and suburban development in the south (Florin) and the east (Rancho Cordova), and additional expansions of Sacramento, Folsom, and Galt. The 1960s to 1980s saw moderate but steady increases in population growth, with a corresponding expansion of urban development and urban infrastructure (improved roadways, sewer/water lines, utilities, etc.) farther into the undeveloped southern and eastern portions of the County.

An additional expansion of urban development occurred in the Planning Area between 1997 and 2007. In 1988, approximately 137,000 acres or 41% of the Planning Area was cropland, 156,000 acres or 46% was grazing land, and 18,000 acres or 6% of the Planning Area was developed (DOC 2016). By 2014, the Planning Area had become 37% cropland, 42% grazing land, and 9% developed lands—a decrease of 12,000 acres of cropland, a decrease of 16,000 acres of grazing land, and an approximate 11,000-acre increase in developed land over this 26-year period (DOC 2016). New growth and development is expected to continue in the

south part of Sacramento County, with the rate of new development largely dependent on economic and market conditions.

During each period of rapid urban development, more and more of the pre-European settlement natural land covers and aquatic resources of the Planning Area were converted to urbanized land covers, which typically provide no suitable habitat for native plant or animal species. Urban development in Sacramento County has resulted in an especially high loss of the natural grassland landscapes that support critically endangered vernal-pool habitats (Witham et al. 2014; Witham et al 2005; Holland 2009; Holland and Vollmar 2009). A study of projects in the Planning Area that obtained CWA permits between 1979 and January 2013 found that during this 34-year time period, 991 acres of wetlands and other waters of the United States (i.e., vernal pools, marshes, other wetlands, streams, creeks, and other aquatic resources) were filled (lost) (USACE 2014; see EIS/EIR Appendix A). Most losses of the Planning Area aquatic resources authorized by CWA permits between 1979 and 2013 occurred inside the UDA (829 acres), and 162 acres of loss occurred outside the UDA. Therefore, streams, creaks, and other water bodies inside the UDA have experienced great direct losses, and the waters that remain in the UDA are now exposed to adverse effects from close proximity to development, such as decreased water quality resulting from urban runoff, changes in hydrologic regime, and reductions in habitat quality.

The losses of vernal pools and other natural land covers described previously for Sacramento County also occurred in most of the California Central Valley. Therefore, many of the Planning Area's native plant and animal species have had sufficient declines across their range to warrant listing under the ESA or CESA. For example, the valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) was listed as endangered by the USFWS in 1980; the Swainson's hawk (*Buteo swainsoni*) was listed as threatened by CDFW in 1983; the giant garter snake (*Thamnophis gigas*) was listed as threated by CDFW in 1984 and by the USFWS in 1993; greater sandhill crane (*Antigone canadensis tabida*) was listed as threatened by CDFW in 1983, tricolored blackbird (*Agelaius tricolor*) was emergency-listed as threatened by CDFW in 2014 and is being considered for formal threatened or endangered status. Many plant and crustacean species that live only in vernal pools were listed due to the extensive loss of vernal pool habitat over the entire Central Valley, including in the Planning Area (USFWS 2005). The vernal pool tadpole shrimp (*Lepidurus packardi*) and vernal pool fairy shrimp (*Branchinecta lynchi*) were listed as endangered and threatened respectively by USFWS in 1994; slender Orcutt grass (*Orcuttia tenuis*) and Sacramento Orcutt grass (*Orcuttia viscida*), a plant found only in Sacramento County, were listed as threatened and endangered respectively by the USFWS in 1997 and both were listed as endangered by CDFW in 1979; the plant Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), was listed as endangered by CDFW in 1978; and the California tiger salamander (*Ambystoma californiense*) was listed as threatened by USFWS in

2003 and threatened by CDFW in 2010. Suitable habitat for these listed species, and most native plant and animal species, would continue to be lost in the future by new urban development in the Planning Area.

Sacramento County is projected to experience an increase in population from 1,475,381 in 2015 to 2,153,833 by 2060, representing a growth of 678,452 persons (46%) over the next 45-year period (DOF 2015). A large portion of this population growth is expected to occur in southern Sacramento County, within the Planning Area. This expected Planning Area population growth will require new housing, new economic development (businesses), and new supporting infrastructure, such as roads and utilities. To meet the future housing demand of this increasing population, an estimated 245,816 new housing units will be needed in Sacramento County by 2060 (DOF 2015b). If agricultural land in Sacramento County is converted to new urban development at the same rate as in the past (about 0.1 acre per person[3]), then approximately 68,000 acres of existing grazing land and cropland would become urbanized between 2014 and 2060.

The Planning Area local jurisdictions must balance the needs to provide for population growth and associated urban development with the need to continue agricultural production in Sacramento County and the need to protect the native plant and wildlife species and associated terrestrial and aquatic natural communities of Sacramento County.

The Existing Environmental Regulatory Processes

The Planning Area land-use jurisdictions (Sacramento County, Galt, and Rancho Cordova) anticipate that landowners and individuals will continue to request approval of new urban development projects until all remaining undeveloped lands within the UDA have been developed. The land-use jurisdictions also anticipate a continued need to provide new transportation, utility, and other infrastructure facilities inside the UDA, and in the rural areas outside the UDA, to accommodate the anticipated Sacramento County population growth.

In the past, "leapfrog development" has occurred in the Planning Area, where new development is placed in a location distant from existing development. This leapfrog development has resulted in greater costs to local land-use jurisdictions to connect the leapfrog development to existing utility infrastructure; greater vehicle miles travelled since leapfrog development residents must drive farther to reach jobs and services, causing increased adverse traffic and air quality effects; and new urban/agriculture or urban/wildland interfaces, increasing the potential for conflicts between these land uses. The USB, which provides a

[3] This number was derived by dividing the 180,248 acres of urbanized land (DOC 2015) by 1,433,510 residents of Sacramento County in 2012 (DOF 2015b).

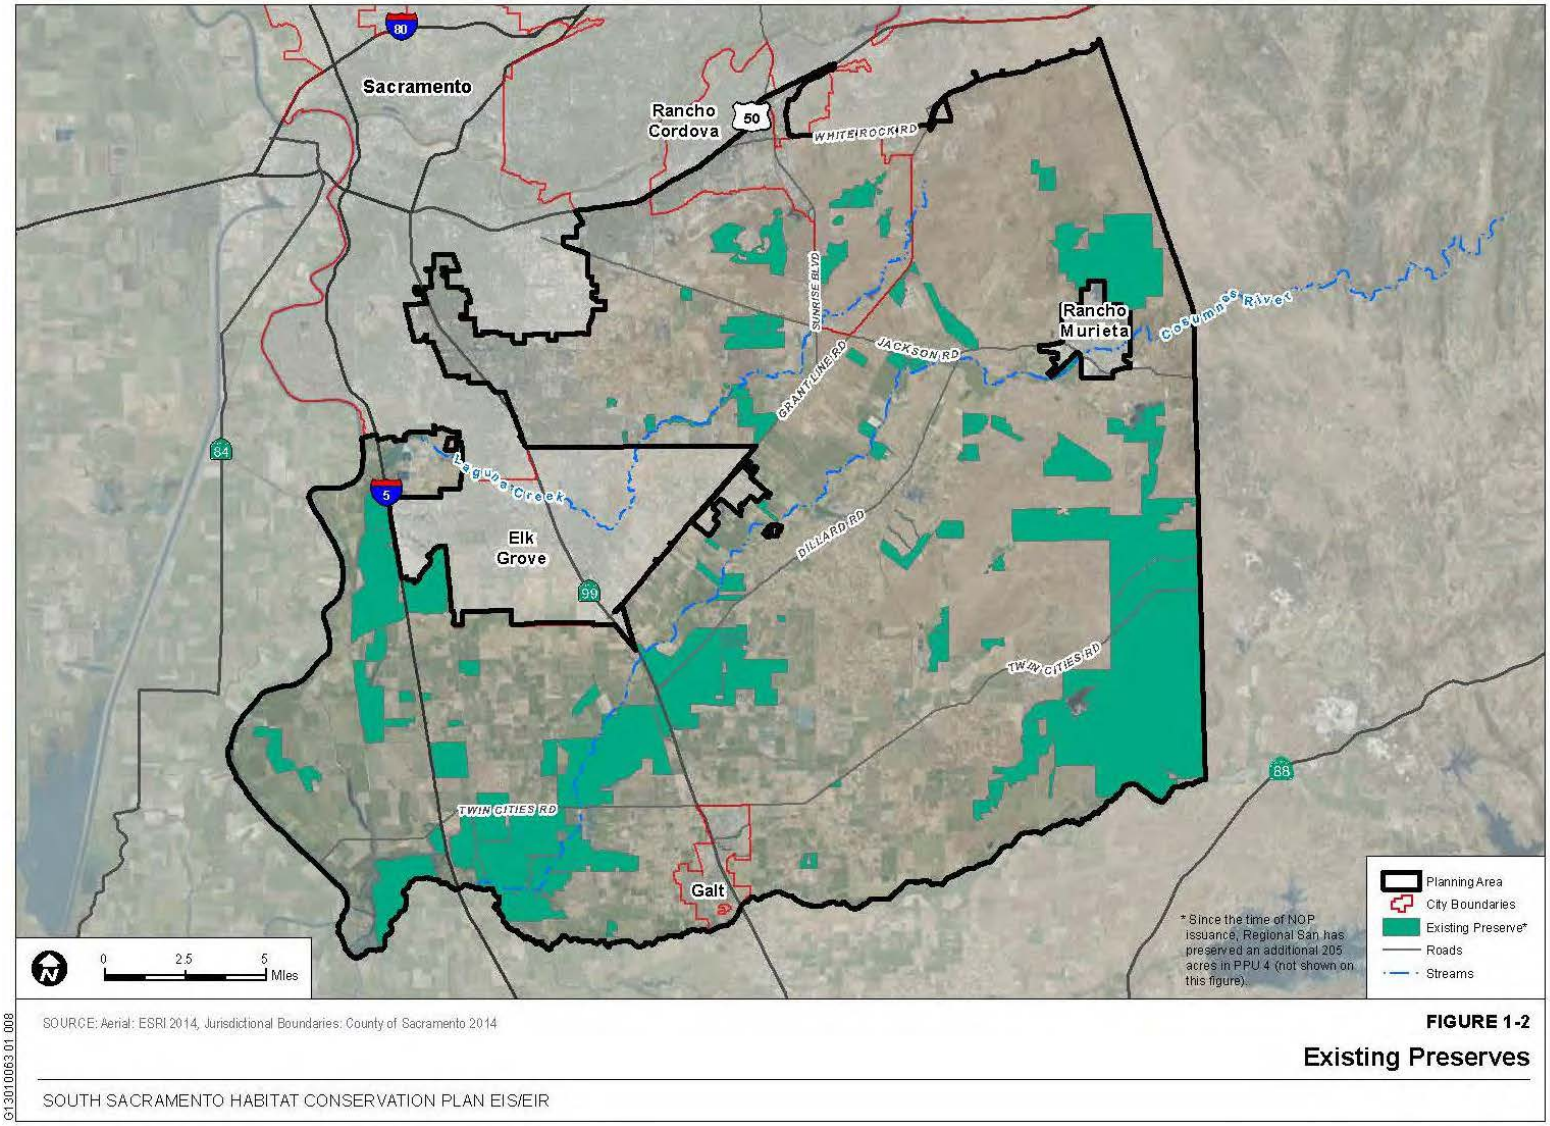
geographic limit to where Sacramento County urban services would be delivered, was established, in part, as a mechanism to reduce leapfrog development. The Planning Area land-use jurisdictions seek to develop and promote further mechanisms to encourage an orderly pattern of development extending out from the existing developed areas, focusing development within the UDA and discouraging future leapfrog development.

Currently, urban development projects coordinate with and seek approvals from multiple federal and state agencies for each individual project. This often results in a process that is lengthy, complex, and costly. Common local, state, and federal agency approval efforts include:

- Preparing a biological assessment for the project and consulting with the USFWS under the ESA and/or CDFW under CESA when there are potential effects to threatened or endangered species
- Conducting a wetland delineation and obtaining permits from USACE under Section 404 of the CWA for discharges of dredged and/or fill material into wetlands and other waters of the United States
- Obtaining authorization from the RWQCB under Section 401 of the CWA to support the CWA 404 permit from USACE
- Obtaining authorization from CDFW for modification to a river, stream, or creek through a Streambed Alteration Agreement pursuant to Section 1600 of the California Fish and Game Code.

To obtain all necessary agency approvals, an individual project proponent typically must consult and coordinate with several regulatory agencies, including those identified in the bullet list above, as well as the local land-use authority jurisdiction. Application packages for each agency differ, and similar data may need to be compiled and presented in a different manner for each agency, increasing the time and labor expended by project proponents. A consolidation of permit applications, or increased consistency across separate permit applications, would increase the efficiency of the existing permitting processes.

As project proponents proceed through the different agency approval processes, mitigation requirements of the different laws and statues may also differ or conflict. (For example, aquatic resources [under the jurisdiction of the CWA 404] may also provide habitat for ESA and/or CESA listed species, and mitigation requirements under each law may differ or conflict.) One law may promote avoidance and preservation of resources on the project site, while another law may promote establishment of resource preserves outside the project site. Considerable time and effort may be expended by project proponents and by agency personnel to coordinate and develop a single acceptable project-mitigation approach that is suitable for all project regulatory approvals.



If a project design changes to meet the requirements of one environmental law, the applicant may have to reinitiate discussions with every the other regulatory agency through an iterative and lengthy process to find a project design that meets all regulatory requirements, including the requirements of the local land-use authority's development policies and goals. In many instances, project changes are implemented to comply with one set of regulatory requirements, resulting in the need to coordinate the changes with the other regulatory agencies and potentially triggering recirculation of completed project-level CEQA or NEPA documents, if the project is sufficiently altered.

The current regulatory review process is series of project-by-project individual permitting efforts. Mitigation to compensate for project effects is determined separately for each project, which has resulted in a number of scattered and relatively small-sized preserves located within the project site, or located off-site. Past development projects would often preserve the greatest acres of aquatic resources in the smallest area of a project site to maximize the available area of development and concurrently minimize mitigation costs. Projects often chose mitigation sites with little consideration to the quality of the species habitat in the preserved areas, or the adverse indirect effects of surrounding the preserve with new development, including habitat fragmentation and permanent isolation of preserved populations from other populations of the same species. Where mitigation preserves are isolated and have little connectivity to other areas of remaining natural habitat, the movement and dispersal of wildlife and dispersal of plant seed and propagules decrease as habitat isolation increases. Many of the existing preserves, particularly in the UDA portion of the planning area, are now surrounded by urban development and are isolated from other areas of natural habitat (see Figure 1-2, Existing Preserves).

Similarly, mitigation sites preserved outside of a project site (i.e., were "off site") were often selected by the project proponent based on factors such as existing ownership by the project proponent or the ability to acquire the land at a lower cost, and site selection often did not give high priority to maximizing species habitat values or maintaining habitat connectivity.

Another concern with smaller or isolated preserves is that they may provide habitat for only part of a species' life history needs. As new development occurs around the preserve, eliminating nearby habitat needed for other parts of the life history, the species may no longer use the preserve. For example, the loss of foraging habitat around a preserve may make the nesting or breeding habitat protected in the preserve no longer viable.

Figure 1-2 Existing Preserves

INTENTIONALLY LEFT BLANK

Another outcome of the existing project-by-project review process is that mitigation preserves within the Planning Area are currently monitored and managed by several different entities and organizations, with a range in the quality of monitoring and habitat management. In some cases, required obligations or performance standards have not been met over the long term.

At present, the local land-use jurisdictions do not have a single coordinated plan for protecting or conserving the best of the remaining natural communities, the largest populations of native species, or the existing functions and benefits of the remaining aquatic resources in the Planning Area. If there were a mechanism to define which natural areas are of the highest preservation priority in the Planning Area, as well as high priority within important ecological subdivisions of the Planning Area (such as individual watersheds), then the mitigation efforts of each individual project would be better able to conserve Planning Area native species and their habitats, including species listed under the ESA and CESA, and maintain the existing physical, chemical, and biological functions and services of wetlands in the Planning Area.

A streamlined project review and permitting process that more efficiently integrates the multiple regulatory approval processes could reduce expenditures of the project proponents, the local land-use jurisdictions, and the regulatory agencies. Currently, regulatory agency staff must expend significant time and agency resources to respond to large numbers of individual approvals or permit applications submitted on a project-by-project basis. A streamlined project review and permitting process could also increase regulatory certainty for project proponents and increase agency project review efficiency, support identification of the most environmentally protective project alternatives, and allow more predictability of project budgets and schedules.

In addition, Sacramento County, Rancho Cordova, and Galt want new urban development to include “sound land use” planning principles, which include consolidating development to promote walkable neighborhoods and promote use of mass transit, and support the efficient provision of utilities and infrastructure. A streamlined and integrated project review and permitting process could help the local land-use jurisdictions achieve these principles.

Conclusion

The background information presented above summarizes the needs and goals of the parties involved in the ITP permit application, and also identify underlying problems and opportunities within this Planning Area to which the lead agencies wish to respond. The lead agencies considered the background information presented in Section 1.3.1, as well as the public interest, as they identified the broad purposes and needs and identified the detailed objectives listed in Sections 1.3.2 and 1.3.3.

1.3.2 Purpose and Need Statement

In response to receiving a request for authorization of species incidental take that is expected to result from future housing construction, other new urban development, and new supporting infrastructure within the Planning Area, the USFWS proposes to issue an ITP to the Permit Applicants. A purpose of that proposed federal action is to comprehensively protect and conserve multiple ESA and CESA listed species and other native species; to conserve, enhance, and restore the habitats and ecosystems upon which these native species depend, including aquatic resources and aquatic habitats; and to ensure the long-term survival of these species for the continuing benefit of the American people in Sacramento County, California.

In proposing alternative conservation plans, the lead agencies seek to accommodate the population growth and associated planned housing, economic development, and infrastructure expected within the Planning Area, using a streamlined environmental permitting process, while maintaining the existing richness of native plant and animal species in the south Sacramento County Planning Area and the natural ecosystems and agricultural lands on which these species depend.

1.3.3 Objectives

The following 18 objectives were identified to meet the above-stated purposes and needs:

1. Include an interconnected preserve system throughout the Planning Area that is large enough to maintain in perpetuity each type of natural community that is native to the Planning Area, maintain in perpetuity each type of native plant and animal species present within the Planning Area, and maintain in perpetuity or expand the existing distribution of each native animal and plant species within the Planning Area.
2. Locate preserves in areas that maximize protection of native plant and animal species and the ecosystems on which they depend.
3. Locate preserves in areas that maximize the protection of intact watersheds and watershed functions.
4. Protect large, contiguous blocks of species habitat. Provide habitat linkages between preserves that are wide enough to allow dispersal of individual native animals and plants and allow genetic exchange between species populations.
5. Protect sufficient cropland and irrigated pasture to provide important foraging habitat on which some native animal species now depend (e.g., Swainson's hawk, white-tailed kite).
6. Preserve adequate roosting and foraging habitat for the greater sandhill crane in the area between the existing Stone Lakes National Wildlife Refuge and the existing

Cosumnes River Preserve, to maintain or increase the population of greater sandhill crane over-wintering within the Planning Area.

7. Protect the long-term viability of ranching and farming operations in the Planning Area (consistent with other objectives).
8. Protect all currently documented occurrences and any newly discovered occurrences of Sacramento Orcutt grass, slender Orcutt grass, and Ahart's dwarf rush in the Planning Area.
9. Avoid or minimize impacts to state and federally listed species and their habitats, to the maximum extent practicable.
10. Avoid or minimize impacts to the existing physical, chemical, and biological functions and services of wetlands and streams in the Planning Area to the maximum extent practicable.
11. Achieve no net loss of the existing functions and services of aquatic resources in the Planning Area. Methods used to achieve no net loss may include the re-establishment and establishment of vernal pools and other aquatic land cover types.
12. Include a long-term preserve monitoring and habitat management program sufficient to maintain or improve habitats of targeted native plant and animal species in perpetuity.
13. Support the development and implementation of streamlined aquatic resource permitting programs under CWA 404, CWA 401, Porter-Cologne, and Section 1600 of the California Fish and Game Code (Streambed Alteration Agreements) by the federal and state agencies with responsibility for implementing those statutes within the Planning Area.
14. Facilitate the recovery of federally listed species, and provide sufficient preservation of federally designated recovery areas within the Planning Area.
15. Include adequate amount of urban development with associated fees to meet Objectives 1 through 14. In addition, the associated mitigation-fee structure must be practicable, with fees that are analogous to fees collected under other Northern California permitted HCPs that have similar species habitats and similar impacts.
16. Allow an adequate amount of urban development within the currently adopted spheres of influence for Rancho Cordova and Galt, and the currently adopted USB for Sacramento County, to discourage expansion beyond these boundaries and maintain the sound land use planning principles these boundaries encourage (e.g., preventing sprawl outside the USB and leap-frog development; consolidating development to support the efficient provision of utilities and infrastructure; promoting compact mixed-use development that supports viable transit and walkable areas; creating communities with a variety of housing types that support different income levels and socioeconomic conditions; and maintaining compliance with air quality laws and regulations that influence or are influenced by land use decisions such as Assembly Bill 32, Senate Bill 375, and the Clean Air Act).

17. Include as Covered Activities the SSHCP Permit Applicant's transportation, utility, and other infrastructure activities and projects as described in the approved master plans of the SSHCP Permit Applicants (Sacramento County, Galt, Rancho Cordova, SCWA, and Connector JPA).
18. Rely on willing sellers for the purchase of land or easements when establishing habitat preserves; do not include condemnation or eminent domain to meet the project needs, purposes, and objectives.

1.4 EIS/EIR SCOPE AND CONTENT

Under NEPA, the "scope" of an environmental document is defined as the range of actions, the range of alternatives, and the impacts to be considered (40 CFR 1508.25). Actions include any connected actions, any cumulative actions, or any similar actions. The types of impacts must include the direct, indirect, and cumulative impact of all alternatives considered (40 CFR 1508.25). Under CEQA, when soliciting input on the scope of an EIR, the lead agency is seeking information on significant environmental issues to be addressed in the EIR, reasonable alternatives, and mitigation measures (CEQA Guidelines, Section 15082[b]). Under both NEPA and CEQA, the process of gathering input from the public, agencies, and interested parties on the scope of an environmental document prior to its preparation is referred to as "scoping" or the "scoping process."

The scope and content of this EIS/EIR was shaped by the CEQ regulations for implementing NEPA, the requirements for an EIR provided in the CEQA statute and CEQA Guidelines, public and agency comments received during the EIS/EIR scoping process (described further in Sections 1.4.1 and 1.4.2), input from the Cooperating Agencies, input from the interdisciplinary EIS/EIR preparers, and the independent judgment of the lead agencies. Environmental resource topics that were considered for analysis in the EIS/EIR were guided, in part, by the initial study checklist that is provided in Appendix G of the CEQA Guidelines, which was adjusted as part of the scoping process.

The process and outcome for the selection of alternatives/actions is described in Chapter 2. Environmental Impacts and any associated mitigation measures are described within each environmental resource chapter of this EIS/EIR. See Chapter 3, Section 3.2, Resource Topics Evaluated in the Remaining Chapters, for a list of EIS/EIR resource chapters.

1.4.1 Summary of EIS/EIR Scoping Process

Scoping is the process used to determine the content (scope) of an EIS and/or EIR. The scoping process is used to help lead agencies identify the range of actions, alternative actions, potential impacts, mitigation measures, and the significant issues deserving of study in an EIS or EIR.

Scoping also helps lead agencies identify and eliminate from detailed study the issues that are not relevant or that have been analyzed in prior environmental documents or studies, thereby deemphasizing insignificant issues and narrowing the scope of the EIS or EIR (40 CFR 1501.1[d]; 40 CFR 1501.7; 43 CFR 46.235; CEQA Guidelines, Section 15082).

The scoping process includes internal scoping of lead agency interdisciplinary staff experts and external scoping of the public and other agencies. Lead agencies also use scoping to engage state, local, and tribal governments and the public in the early identification of concerns and information relevant to the preparation of the EIS/EIR (43 CFR 46.435).

Tools used to determine the scope of this EIS/EIR included publication of the Notice of Intent (NOI) and Notice of Preparation (NOP) pursuant to NEPA and CEQA, respectively; informal stakeholder and interagency meetings; public scoping meetings; and public workshops.

Public scoping processes for the SSHCP EIS/EIR occurred in 2008 and again in 2013. Elements of each scoping process are briefly summarized below. More detailed scoping summary reports that include copies of the NOIs and NOPs, public scoping meeting materials, and the scoping comments received during the 2008 and 2013 scoping processes are provided in EIS/EIR Appendix B.

Public Scoping Notices and Meetings

In 2008, the scoping process began on June 10 with the publication of the NOI in the Federal Register (pursuant to NEPA) and submittal of the NOP to the State Clearinghouse (pursuant to CEQA). NOPs (and often NOIs for joint NEPA/CEQA documents) are provided to the State Clearinghouse as part of the CEQA review process, and the Clearinghouse distributes the NOPs to various California state agencies. The NOI and NOP notified the public and agencies of the SSHCP; the intent to prepare an EIS/EIR; and the time, date, and location of public scoping meetings. The public was also invited to participate in the scoping process through a variety of media, including e-mail and hard-copy mailers. Display ads of the meeting announcement were also published in the Sacramento Bee (July 1, 2008), Grapevine (July 4, 2008), Galt Herald (July 2, 2008), and River Valley Times (July 2, 2008). In addition, the Elk Grove sent a meeting announcement attached to each resident's utility bill informing them of the scoping meetings.

USFWS, as the NEPA lead agency, and Sacramento County, as the CEQA lead agency, held four joint public scoping meetings on the following dates and times:

- July 8, 2008, from 6:30 p.m. to 8:30 p.m. in Galt
- July 11, 2008, from 10 a.m. to 12:00 p.m. in Sacramento
- July 15, 2008, from 6:30 p.m. to 8:30 p.m. in Rancho Cordova
- July 16, 2008, from 6:30 p.m. to 8:30 p.m. in Elk Grove.

For the four meetings, a total of 79 people signed in as meeting participants. Each meeting began with a brief presentation, followed by an open house-style forum where informational poster boards were available for review and staff from the lead and cooperating agencies were available to answer questions.

In 2013, the draft SSHCP had been further refined, some conditions had changed, and sufficient time had elapsed that the lead agencies felt that a second public scoping process was warranted. Public scoping began on October 28, 2013, with an NOP provided to the State Clearinghouse (pursuant to CEQA) and on November 4, 2013, with the publication of a NOI in the Federal Register (pursuant to NEPA). The NOI and NOP notified the public and agencies of the SSHCP; the intent to prepare an EIS/EIR; the circumstances for initiating the second scoping process; and the time, date, and location of public scoping meetings. The NOI or NOP were mailed to over 200 recipients in and around Sacramento County, including non-profit groups, media outlets, stakeholders, and local and state agencies. A news release for the NOI was also sent to six media outlets and was also available for review on the USFWS's website. The NOP was also posted on a project website developed specifically for the SSHCP.

USFWS, as the NEPA lead agency, and Sacramento County, as the CEQA lead agency, held two joint public scoping meetings on the following dates and times:

- November 20, 2013, from 6:30 p.m. to 8:30 p.m. in Galt
- November 21, 2013, from 2:00 p.m. to 4:00 p.m. in Sacramento.

For the two meetings, a total of 29 people signed in as meeting participants. Each meeting included a brief presentation and an open house forum where informational poster boards were available for review and staff from the lead agencies were available to answer questions.

In 2008 and 2013, the lead agencies also contacted the Native American Heritage Commission (NAHC) to obtain a list of tribes, individuals, and organizations that may have knowledge of heritage lands or other resources of interest that could potentially be affected by implementation of an HCP in the Planning Area. The 2008 and 2013 NOIs and NOPs (EIS/EIR Appendix B) were sent to the NAHC through the standard distribution to state agencies via the California State Clearinghouse, and sent directly to the tribal contacts provided by the NAHC at that time. At the time of this writing, no comments on the NOI and NOP or requests for further consultation were received.

The most recent list received in 2015 from the NAHC provided 19 tribal contacts for south Sacramento County. Copies of the draft EIS/EIR will be mailed directly to the tribal contacts provided by the NAHC. USFWS is conducting outreach to federally recognized tribes in the Planning Area during the EIS/EIR process. This process will be completed and tribal input

considered before the USFWS prepares their Record of Decision. In addition, compliance with Section 106 of the National Historic Preservation Act (NHPA 106) may require USFWS to consult with the State Historic Preservation Officer.

1.4.2 Significant Issues Identified in Public Scoping

During the 2008 scoping process, a total of approximately 80 comment letters, including emails, from individuals, businesses, organizations, and agencies were received. The primary issues identified in these comments include the following:

- The proper geographic scope of the SSHCP and EIS/EIR, such as considering effects in adjacent areas and addressing the Elk Grove sphere of influence
- Effects of plan implementation on agriculture, including grazing
- Regulatory topics such as consistency with USACE mitigation regulations and the potential role of mitigation banks.

During the 2013 scoping process, a total of 84 comments were received via letters, e-mails, written comments provided at scoping meetings, and oral comments provided at scoping meetings and via telephone. The primary issues identified in these comments include the following:

- Compliance with air quality regulations and the potential effects of air quality on Covered Species and human health
- Consistency of the SSHCP with planning efforts in the Sacramento/San Joaquin Delta
- Coordination of the SSHCP with the activities and planning of local jurisdictions, agencies, and land management organizations that are not SSHCP Permit Applicants
- Adequacy of funding for SSHCP implementation
- Consideration of alternatives related to inclusion of Covered Activities and locations available for preserves
- Projects and activities to include in the analysis of cumulative impacts, such as infrastructure impact from the proposed Cordova Hills project and potential development associated with the Elk Grove sphere of influence
- The placement of grazing lands in land cover classifications (agricultural or annual grassland)
- Use of best available science and data, such as recent research on tri-colored blackbird
- Questions and suggestions regarding the funding, selection, acquisition, location, and management of preserve system lands
- Integration of mosquito and vector control with SSHCP implementation and preserve system management

- Integration of the SSHCP with issues of water supply and water rights.

All of the 2008 and 2013 scoping comments were considered by the lead agencies during the development and preparation of the EIS/EIR. However, scoping comments did not identify areas of potential impacts or environmental analyses that were not already anticipated for inclusion in the EIS/EIR by the lead agencies (see Chapter 2, Section 3.2 for a list of resource chapters included in this EIS/EIR). Scoping comments related to potential EIS/EIR alternatives deserving of study are discussed further in Chapter 2.

1.5 DECISIONS TO BE MADE

Implementation of the SSHCP would require permits and approvals from the lead agencies as well as public agencies other than the lead agencies. This section describes the uses of this EIS/EIR by the lead agencies as well as the cooperating and responsible agencies. This section also satisfies the requirements of 40 CFR 1502.25 stating that a Draft EIS shall list all federal permits, licenses, and other entitlements that must be obtained in implementing the proposal.

1.5.1 U.S. Fish and Wildlife Service

USFWS would use the EIS/EIR to comply with NEPA for their issuance of ITPs to the Permit Applicants. As the lead agency under NEPA, USFWS must make a determination whether the EIS/EIR scope and impact analysis is adequate to provide NEPA compliance for its decision whether to issue an ESA Section 10(a)(1)(B) ITP for SSHCP Covered Species. In addition, it must select a preferred EIS/EIR alternative. If USFWS decides to issue the ITP, it would also decide to sign the SSHCP Implementing Agreement. The purpose of an HCP Implementing Agreement, when used, is to ensure that each permittee and all other parties understand their roles and responsibilities under the HCP, ESA ITP, and CESA ITP, and to provide remedies should any party fail to fulfill its obligations (USFWS and NOAA 2016).

ESA Section 10(a)(2)(B) requires that specific permit issuance criteria be met before USFWS may issue ITPs, and the USFWS must decide if those criteria would be met before selecting the EIS/EIR Alternative.

Permit Issuance Criteria

The issuance criteria for an ITP are contained in ESA Section 10(a)(2)(B) and the implementing regulations for ESA (50 CFR 17.22(b)(2) and 50 CFR 17.32[b][2]). These issuance criteria are listed below.

1. All taking of covered species must be incidental to otherwise lawful activities.
2. The applicant will, to the maximum extent practicable, minimize and mitigate the impacts of such taking.

3. The applicant will ensure adequate funding for the HCP.
4. The applicant will provide procedures to deal with changed circumstances, including adequate funding to address such changes.
5. The taking will not appreciably reduce the likelihood of survival and recovery of the species in the wild.
6. The applicant will ensure that other measures that USFWS may require will be provided.
7. The USFWS has received assurances that the HCP will be implemented by the applicants.

An applicant must prepare and submit to USFWS for approval an HCP containing the mandatory elements of Section 10(a)(2)(A) before an ITP can be issued. Accordingly, the HCP must specify the following information.

1. The impact that will likely result from the taking.
2. What steps the applicant will take to monitor, minimize, and mitigate such impacts; the funding available to implement such steps; and the procedures to be used to deal with unforeseen circumstances.
3. What alternative actions to such taking the applicant considered and the reasons why such alternatives are not proposed to be used.
4. Such other measures that USFWS may require as being necessary or appropriate for the purposes of the plan.

The determination as to whether the criteria have been met would be described in USFWS's permit decision package, which includes a Biological Opinion prepared pursuant to Section 7 of ESA, an appropriate final NEPA document, and ESA Findings prepared pursuant to ESA Section 10. These documents are produced and the permit decision package compiled after the NEPA process is completed. The permit decision package would contain the rationale behind USFWS's decision to either approve or deny a Section 10(a)(1)(B) permit application.

USFWS may decide to issue the ITP, which would contain standard permit terms and conditions, and may also contain additional permit terms and conditions appropriate for the operational SSHCP. Alternatively, USFWS may deny the ITP application. Permit denial regulations are explained in 50 CFR 13.21(b).

ESA Section 7

Issuance of an ITP is a federal action, which is subject to Section 7 of ESA. ESA Section 7(a)(2) requires all federal agencies consult with USFWS to ensure that any action "authorized, permitted, funded, or carried out" by any such agency "is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the

destruction or adverse modification" of Critical Habitat. The USFWS Sacramento Field Office would conduct an internal Section 7 consultation with the USFWS Region 8 office concerning its decision to issue ITPs to the SSHCP Permit Applicants. The results of this internal consultation would be documented in a Biological Opinion, which would be prepared by the USFWS Sacramento Field Office after completion of the NEPA process. Although the provisions of ESA Section 7 and ESA Section 10 are similar, Section 7 and its regulations also require an analysis of the HCP's direct and indirect effects, a jeopardy analysis for federally listed plants, and effects on Critical Habitat.

NEPA

Issuance of an ITP is a federal action, which is also subject to NEPA. As discussed in Section 1.2.1, USFWS has determined that issuance of ITPs for the SSHCP, a large regional HCP, is a major federal action likely to result in a significant effect on the environment, and therefore, the preparation of an EIS is warranted. The ESA Section 10's Five-Point Policy (USFWS and NOAA 2000) also requires preparation of an EIS for large regional HCPs. The USFWS's NEPA process would culminate in the preparation of a Record of Decision (ROD), a NEPA document which would document USFWS's final decision on the alternatives analyzed in this joint EIS/EIR.

The USFWS ROD would state the USFWS decision, identify all alternatives considered by the USFWS in reaching that decision~~, and identify the alternative considered to be environmentally preferable by the USFWS~~, **identify the environmentally preferable alternative (see Section 17.7), and identify the USFWS's preferred alternative.** The ROD must discuss preferences among alternatives based on relevant factors including the agency's statutory mission, economic, and technical considerations, and would identify and discuss considerations that were balanced by the USFWS in making its decision and how those considerations entered into the decision. The ROD would state whether all practicable means to avoid or minimize environmental harm from the alternative selected have been adopted, and the ROD would require a monitoring and enforcement program be adopted for conservation preserves and any additional mitigation measures.

1.5.2 Sacramento County

The EIS/EIR would be used by the five Permit Applicants to approve the SSHCP in compliance with CEQA. As discussed in Section 1.2.2, Sacramento County is the lead agency under CEQA and would be the first of the Permit Applicants to make a decision to certify that the EIS/EIR impact analysis is adequate to provide CEQA compliance for its decision to approve the SSHCP (or other action alternative). As the lead agency under CEQA, Sacramento County may also need to make Findings of Fact and Statements of Overriding Considerations pursuant to CEQA if one or more significant effects associated with approval of the SSHCP are identified. The County

would also file a Notice of Determination (NOD) upon adopting the SSHCP. In addition, Sacramento County would sign the SSHCP Implementing Agreement.

Once the SSHCP is adopted, as a Permit Applicant with land use authority, Sacramento County would use the information and analysis in the EIS/EIR to support future decisions related to the SSHCP, such as approval of a local SSHCP implementation ordinance or an implementation resolution. The ordinance or resolution would enable the County to enforce the requirements and commitments of the adopted SSHCP.

Sacramento County **and other Land-use Authority Permit Applicants** would also use the information and analysis in the EIS/EIR, as well as additional CEQA documentation if required, in making a decision to approve an aquatic resource protection ordinance that would enable Sacramento County **and other Land-use Authority Permit Applicants** to implement the requirements and commitments of the ARP, ~~including~~ **consistent with** the ~~requirements of a~~ **USACE's proposed issuance of a** CWA 404 programmatic general permit (PGP) ~~to be implemented by Sacramento County and the other Land-use Authority Permit Applicants~~.

As discussed in Section 1.1, each SSHCP Permit Applicant with land use authority is also requesting a Master Streambed Alteration Permit from CDFW for future SSHCP Covered Activities and is requesting a programmatic CWA 401 permit strategy from the RWQCB for future SSHCP Covered Activities (see Sections 1.5.4, 1.5.6, and 1.5.7 regarding these proposed Covered Activity permit strategies).

In addition, the County would use the information and analysis in the EIS/EIR in its decision to create the South Sacramento Conservation Agency, a new Joint Powers Authority that would function as the SSHCP Implementing Entity, as discussed previously in Section 1.1 and in Section 2.3.7.

1.5.3 Other Permit Applicants

Galt and Rancho Cordova. As discussed in Section 1.2.2, each Permit Applicant is a responsible agency under CEQA and would be required to consider the EIS/EIR and make findings, pursuant to CEQA. Galt and Rancho Cordova would use the information and analysis in the EIS/EIR to aid in their decision to adopt the SSHCP (i.e., approve the proposed Plan) and to sign the SSHCP Implementing Agreement. ~~T~~ Galt and Rancho Cordova would each file an NOD upon adopting the SSHCP.

Once the SSHCP is adopted, as Permit Applicants with land use authority, Galt and the Rancho Cordova would use the information and analysis in the EIS/EIR to support future decisions related to the SSHCP, such as approval of their SSHCP implementation ordinance or an

implementation resolution. The respective ordinances or resolutions would enable each city to enforce the requirements and commitments of the adopted SSHCP.

Each of these jurisdictions would also use the information and analysis in the EIS/EIR in making a decision to approve an aquatic resource protection ordinance that would enable each City to implement the requirements and commitments of the ARP, ~~including~~ **consistent with the** requirements of **the Corps' proposed** CWA 404 PGP~~s to be implemented by Rancho Cordova, the Galt, and Sacramento County~~.

As discussed in Section 1.1, each SSHCP Permit Applicant with land use authority is also requesting a Master Streambed Alteration Permit from CDFW for future SSHCP Covered Activities, and is requesting a programmatic CWA 401 permit strategy from the RWQCB for future SSHCP Covered Activities (see Sections 1.5.4, 1.5.6, and 1.5.7 regarding these permit strategies).

In addition, Rancho Cordova and Galt would use the information and analysis in the EIS/EIR in their decision to create the South Sacramento Conservation Agency, a new Joint Powers Authority that would function as the SSHCP Implementing Entity, as discussed previously in Section 1.1 and in Section 2.3.7.

SCWA and the Connector JPA. As Permit Applicants, the SCWA and the Connector JPA are responsible agencies under CEQA and would be required to consider the EIS/EIR and make findings pursuant to CEQA. The SCWA and the Connector JPA would use the information and analysis in the EIS/EIR to aid in their decision whether to adopt the SSHCP, and to decide to sign the SSHCP Implementing Agreement. The SCWA and the Connector JPA would each file an NOD upon adopting the SSHCP.

The SCWA and the Connector JPA do not have authority to approve land-use decisions, and therefore do not need to make decisions related to adoption of an implementing ordinance/resolution, adopting an aquatic resource protection ordinance, or creation of the SSHCP Implementing Entity. As discussed in Section 1.1, the SCWA and the Connector JPA are requesting ITPs only for Covered Activity projects and activities that they directly implement.

1.5.4 U.S. Army Corps of Engineers

The USACE would use the information and analysis in the EIS/EIR in its decision making on a multilevel CWA Section 404 permitting program for future SSHCP Covered Activity projects and activities that discharge dredged or fill material to wetlands and other waters of the United States (see USACE 2015). The proposed multilevel CWA 404 **permit** strategy would draw upon the content of the SSHCP, the ARP, and aquatic resource protection ordinances that would be implemented by the Land-use Authority Permit Applicants (see Section 1.1).

A primary goal of ARP implementation is to achieve an overall no net loss of aquatic resource functions and services in accordance with the USACE and EPA's 2008 Compensatory Mitigation Rule, *33 C.F.R. Parts 325 and 332, Compensatory Mitigation for Losses of Aquatic Resources: Final Rule* (Mitigation Rule). The draft ARP discusses and explains the proposed regional SSHCP Preserve System (and other elements of the SSHCP Conservation Strategy) in terms of a unified watershed strategy for improving the protection and management of Planning Area aquatic resources, and the ARP provides an evaluation of aquatic resources within the Planning Area. The proposed USACE's multilevel CWA 404 permit strategy being developed consists of:

- A PGP, founded on a local aquatic resources protection program and designed to reduce duplication with that program, for future Covered Activities with minimal individual and cumulative effects on aquatic resources. The PGP would be implemented by the three land-use authority Permit Applicants (i.e., Sacramento County, Galt, and Rancho Cordova).
- A regional general permit (RGP), if needed, for future Covered Activities with minimal individual and cumulative effects on aquatic resources that do not ~~fall under~~ **qualify for** the PGP.
- A procedure for issuing Letters of Permission (LOPs) for future Covered Activities with more than minimal effects, but less-than-significant effects, on the human environment, including aquatic resources.
- An abbreviated process for issuing standard permits (SPs) for other Covered Activity impacts that do not qualify for the PGP, RGP, or the LOP procedure.

Each of these permit approaches is summarized in the USACE white paper, *CWA 404 Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan* (EIS/EIR Appendix C), which contains the draft CWA 404 permit instruments (e.g., PGP) and procedures (e.g., LOP).

NEPA

As a cooperating agency on the SSHCP EIS/EIR, the USACE participated in the SSHCP EIS/EIR scoping processes discussed in Section 1.4. The USACE provided information to the lead agencies, and provided input on the sections of the EIS/EIR that concern the topics and issues that the USACE has both special expertise and jurisdiction by law, pursuant to NEPA regulations for cooperating agencies (40 CFR 1501.6; 43 CFR 46.230).

The USACE anticipates that the SSHCP NEPA process will be sufficient to comply with its regulatory mandates necessary to implement a CWA 404 permit strategy, including NEPA; its implementing regulations under 33 CFR Parts 320–332; and EPA's 404(b)(1) Guidelines for the alternatives considered in the SSHCP NEPA process. If the USACE determines that the EIS/EIR NEPA process was not sufficient to develop a permitting strategy, or if there are

substantial changes in the baseline conditions, additional NEPA documentation may be determined by the USACE to be required. As part of its compliance documentation with EPA's 404(b)(1) Guidelines, the USACE will also consider additional information outside of the purview of the NEPA process.

The USACE intends to complete a ROD that would document the agency's decision regarding the CWA 404 permit strategy and bases thereof, including a discussion of alternatives considered and evaluation of the environmental consequences. Findings would be documented in the ROD with regard to all applicable CWA 404 regulations and other applicable laws, including a discussion of public interest review factors considered and the USACE public interest determination (33 CFR 320.4[a]), and a determination of compliance with the Section 404(b)(1) Guidelines (40 CFR 230).

ESA Section 7

The USACE Sacramento District would request one consultation with the USFWS under ESA Section 7 that provides a single Biological Opinion for species take expected in association with all future SSHCP Covered Activities that would utilize the above-described CWA 404 permit strategy. This comprehensive Section 7 consultation would involve a review of all USACE actions under the proposed multilevel CWA permitting strategy for future SSHCP Covered Activities, and would be conducted simultaneously with the development of the SSHCP to assist the USFWS in assessing overall effects on individual species, groups of species, and ecosystems from multiple actions implemented by several parties under the HCP.

~~The USACE and the USFWS would complete this comprehensive and ecosystem-based consultation before the USACE decision to approve or deny the proposed multilevel CWA 404 permitting program.~~

As the final EIS/EIR was prepared, the USFWS continued to coordinate with USACE to discuss the most efficient approach to achieving ESA section 7 compliance for the Corps' section 404 CWA permit strategy for future SSHCP covered activities. This approach will be described and documented prior to the Service's completion of the Record of Decision and issuance of the SSHCP ITP. The intent of USFWS is to provide the Corps with one biological opinion that will reflect compliance with ESA section 7(a)(2) for section 404 CWA permitting of SSHCP Covered Activities, and preclude the need for project-level consultations on individual SSHCP Covered Activities.

NHPA Section 106

Projects and activities authorized by the USACE under CWA 404 must comply with Section 106 of NHPA 106. The NHPA protects cultural resources that are listed or are eligible to be listed on

the National Register of Historic Places. To meet the NHPA 106 requirements for CWA 404 permits for future SSHCP Covered Activities, the USACE may develop a Programmatic Agreement with the State Historic Preservation Office specifically to address NHPA 106 consultations on future SSHCP Covered Activities authorized under CWA 404. If this were to occur, as part of developing a Programmatic Agreement, the USACE would consult with regional Native American tribal contacts, and it may consider establishing a Memorandum of Understanding (MOU) with Native American tribes concerning future coordination and the protection of cultural resources.

1.5.5 U.S. Environmental Protection Agency

Among the roles and responsibilities of the EPA is to review and comment on CWA Section 404 permit applications. The EPA ~~determines appropriateness of~~ **maintains oversight on** CWA 404 permit actions and ~~determines~~ **confirms** consistency of ~~a~~ CWA 404 permit action**s** with **the regulations and policies of** the CWA Section 404 program. ~~If the USACE decides to issue a 404 permit, the EPA may object to the issuance of a permit as part of its review and comment role.~~ Under Section 404(q) of the CWA, and pursuant to a Memorandum of Agreement (MOA) between the ~~s~~**S**ecretary of the Army and the **EPA** ~~a~~**A**dministrator ~~of the EPA~~, if EPA objects to issuance of a Section 404 permit, it may initiate a process where the permit decision is elevated to higher levels of review within USACE and the Department of the Army. If resolution cannot be achieved, EPA may ultimately initiate a "veto" action pursuant to Section 404(q) of the CWA. Section 404(q) requires the following:

> Not later than the one-hundred-eightieth day after the date of enactment of this subsection, the Secretary shall enter into agreements with the Administrator, the Secretaries of the Departments of Agriculture, Commerce, Interior, and Transportation, and the heads of other appropriate Federal agencies to minimize, to the maximum extent practicable, duplication, needless paperwork, and delays in the issuance of permits under this section. Such agreements shall be developed to assure that, to the maximum extent practicable, a decision with respect to an application for a permit under subsection (a) of this section will be made not later than the ninetieth day after the date the notice of such application is published under subsection (a) of this section..

As a result, the Department of the Army entered into MOAs with the EPA, USFWS, and National Marine Fisheries Service related to procedures for elevating policy decisions or permit decision. If a permit decision is elevated to the ~~a~~**A**ssistant ~~s~~**S**ecretary of the Army for ~~c~~**C**ivil ~~w~~**W**orks (ASA-CW) by EPA, USFWS, and National Marine Fisheries Service, ASA-CW will either (1) inform the district engineer to proceed with final action, (2) inform the district engineer to proceed with final action in accordance with case-specific policy guidance, or (3) make a final permit decision in accordance

with 33 CFR 325.8. There isn't a negotiation or resolution process with the agency requesting the elevation under the Section 404(q) MOA. Section 404(c) states the following:

> The Administrator is authorized to prohibit the specification (including the withdrawal of specification) of any defined area as a disposal site, and he is authorized to deny or restrict the use of any defined area for specification (including the withdrawal of specification) as a disposal site, whenever he determines, after notice and opportunity for public hearings, that the discharge of such materials into such area will have an unacceptable adverse effect on municipal water supplies, shellfish beds and fishery areas (including spawning and breeding areas), wildlife, or recreational areas. Before making such determination, the Administrator shall consult with the Secretary. The Administrator shall set forth in writing and make public his findings and his reasons for making any determination under this subsection.

Therefore, under Section 404(c), EPA has the authority to veto permit actions. There is no requirement that EPA go through the process identified in the 404(q) MOA before going through the veto process. Therefore, EPA could veto a permit whether or not it elevated it under Section 404(q).

The EPA ~~would~~ **is** review**ing and commenting on** the USACE's proposed multilevel CWA 404 permit strategy for future SSHCP Covered Activities, including the proposed PGP permit action and **potentially** proposed RGP permit action**, as a Cooperating Agency on this EIS/EIR, and via review of the USACE's public noticing of the draft CWA 404 permit strategy**. If the USACE decide~~d~~**s** to approve and implement the proposed CWA 404 permit strategy ~~for future SSHCP Covered Activities~~, the EPA would **retain its normal** review ~~and determine appropriateness of any~~ **and comment responsibilities in regard to** future abbreviated LOPs or SP~~s~~ **applications** ~~issued~~ for ~~individual~~ SSHCP Covered Activities. ~~During these reviews, the EPA would use the information and programmatic analysis of Planning Area aquatic resources, species habitat, water quality, and hydrology impacts presented in the SSHCP EIS/EIR to the same extent that the USACE used that information and analysis for their decision to issue the PGP, RGP, LOP, and SP permits for SSHCP Covered Activities.~~

EPA also has comment authority under Section 309 of the Clean Air Act and under NEPA Section 102. The EPA would rate the draft SSHCP EIS/EIR and determine if the document is adequate, provides insufficient information, or is inadequate. In addition, EPA would rate the environmental impacts associated with the draft SSHCP EIS/EIR preferred action, with ratings on a scale from a lack of objections, environmental objections, to environmentally unsatisfactory. The rating system would provide a basis upon which EPA would make recommendations to the federal lead agency for improving the draft EIS/EIR.

1.5.6 California Department of Fish and Wildlife

CDFW participated in the preparation of the EIS/EIR as both a CEQA responsible agency and a CEQA trustee agency. The EIS/EIR would serve as the CEQA document that analyzes the regulatory permits issued by CDFW for the SSHCP. As a responsible agency under CEQA, CDFW would be required to consider the EIR for two CDFW decisions, as discussed below.

CESA Species Incidental Take Permit

CDFW would use the EIS/EIR and the SSHCP document in deciding whether to issue a CESA ITP under Section 2081 of the California Fish and Game Code for the incidental take of the SSHCP Covered Species that are listed as threatened or endangered under CESA (see Table 2-5 in Chapter 2).

CDFW would determine whether the information and analysis in the EIS/EIR is adequate to provide CEQA compliance for their CESA permit decision. CDFW would make the appropriate Findings pursuant to CEQA. CDFW would file a CEQA NOD, which would state that it has considered the EIS/EIR and would announce that CDFW has issued the CESA ITP for the SSHCP.

California Fish and Game Code Section 1600 Streambed Alteration Agreement

Section 1600 of the California Fish and Game Code requires that a Lake or Streambed Alteration Application be submitted to the CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." CDFW reviews the proposed actions and, if necessary, submits to the applicant a proposal for avoidance and minimization measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and the project applicant is called a Lake or Streambed Alteration Agreement.

Covered Activities that require a Streambed Alteration Agreement may also require a CWA Section 404 permit from the USACE. In these instances, the conditions of the CWA Section 404 permit and the Streambed Alteration Agreement may overlap. The Land-use Authority Permit Applicants (Sacramento County, Rancho Cordova, and Galt) are requesting CDFW to enter into a Master Streambed Alternation Agreement (MSAA) or a Long-term Streambed Alternation Permit (LTLSA) to address future Covered Activities occurring within stream zones (defined under Section 1602 of the California Fish and Game Code). The MSAA or LTLSA would be valid for 12 years and would be eligible for a one-time extension for a maximum period of 17 years. For the amount of time remaining under the 50-year SSHCP term following the expiration of the MSAA or LTLSA extension, Sacramento County, Rancho Cordova, and Galt would enter into a new MSAA or LTLSA agreement that would build upon the first agreement.

Under the proposed MSAA or the LTLSA, the Implementing Entity and the CDFW would develop an MOU to expedite CDFW reviews of future Covered Activities. The MOU would describe the Covered Activity permitting framework agreement between CDFW and the Implementing Entity, which is expected to include standardized procedures for Covered Activity avoidance, minimization, and compensatory mitigation requirements for impacts within a stream zone. Under the MOU, CDFW would allow Covered Activity project-proponents to submit a request for verification to the local Land Use Authority Permit Applicants or to the Implementing Entity (whoever has jurisdiction), and the Land Use Permit Applicant or Implementing Entity would act as a "clearinghouse" for the notification forms and would conduct an initial screening process to verify the project's consistency with the SSHCP, the ARP, and the aquatic protection ordinances. The Land Use Permit Applicant or the Implementing Entity would then submit the notification forms to CDFW, who would review the Covered Activity projects under the MOU agreement. Under the MOU, CDFW would collect a fee for each streambed alternation notification submitted by the Implementing Entity, and CDFW would determine whether to use the MSAA (or LTLSA), or to issue an individual Lake or Streambed Alternation Agreement (LSA) for a Covered Activity project.

CDFW would decide whether to develop an MSAA or LTLSA under California Fish and Game Code Section 1600 with the three land-use authority Permit Applicants for future SSHCP Covered Activities. CDFW would consider the information and analysis in the EIS/EIR and make the appropriate Findings of Fact pursuant to CEQA on that decision. CDFW would file a CEQA NOD, which would state that it has considered the EIS/EIR and would announce that it has issued the MSAA or LTLSA.

1.5.7 Central Valley Regional Water Quality Control Board

As a responsible agency under CEQA, the Central Valley RWQCB would determine whether the information and analysis in this EIS/EIR is adequate to provide CEQA compliance for its discretionary decisions associated with the SSHCP.

Assuming the information and analysis of the proposed RWQCB decisions is adequate in the EIS/EIR, the RWQCB would make the appropriate Findings pursuant to CEQA and would file an NOD, which would state that it has considered the EIS/EIR in its decision to approve a programmatic CWA 401 permit strategy for future SSHCP Covered Activities. The RWQCB would use the NOD to disclose this decision.

Programmatic CWA Section 401 Water Quality Certification

Section 401 of the CWA requires any applicant for a federal license or permit conducting an activity that may result in a discharge of a pollutant into wetlands and other waters of the

United States to obtain a certification indicating that the discharge would comply with the state's applicable effluent limitations and water quality standards. In California, the RWQCB administers CWA Section 401 requirements.

Parallel to the USACE's proposed multilevel CWA 404 permit~~ting~~ strategy, the RWQCB has an opportunity to increase the efficiency of their CWA 401 permitting processes for future SSHCP Covered Activities, while improving the protection and management of aquatic resources in the Planning Area. The SSHCP, the ARP, and the aquatic resource protection ordinances could facilitate the Central Valley RWQCB's development of these water quality certification strategies. The SSHCP Conservation Strategy provides aquatic resource avoidance, minimization, and mitigation measures that are consistent with the CWA Sections 404 and 401 implementing regulations and Porter-Cologne.

As discussed in Section 1.1, the SSHCP Permit Applicants are requesting that the RWQCB develop a programmatic Section 401 Water Quality Certification for future Covered Activities that qualify for the USACE's proposed CWA 404 PGP or **(potential)** RGP processes (see Section 1.5.4). As with the USACE's proposed CWA 404 General Permits (PGPs and **[potential]** RGPs), the programmatic 401 Water Quality Certification would authorize those SSHCP activities that cause no more than minimal individual and cumulative adverse impacts to aquatic resources within the Planning Area.

In addition, the RWQCB could adopt a more efficient Water Quality Certification process for the individual Covered Activities that would ~~fall under~~ **qualify for** the USACE's proposed CWA 404 abbreviated LOP ~~process~~ **procedure and/**or ~~the proposed CWA 404~~ abbreviated SP process (see Section 1.5.4).

RWQCB would use the information and analysis in the EIS/EIR when deciding whether to develop and approve (1) a programmatic Section 401 Water Quality Certification program for future Covered Activities with minimal individual and cumulative effects on aquatic resources that would ~~fall under~~ **qualify for** the proposed CWA 404 PGP or **(potential)** RGP ~~processes~~; and (2) when deciding whether to develop a more efficient and shorter process for issuing individual Water Quality Certifications to future Covered Activities that require a CWA 404 LOP or a SP under the USACE's proposed multilevel CWA 404 permit ~~permitting processes~~ **strategy**.

Programmatic Porter-Cologne Act Compliance

Porter-Cologne is California's primary statute governing water quality and water pollution issues with respect to both surface waters and groundwater. Porter-Cologne grants the State Water Resources Control Board and the RWQCBs power to protect water quality, including authority to adopt plans and policies, to regulate discharges of waste to surface and

groundwater, to regulate waste disposal sites, and to require cleanup of discharges of hazardous materials and other pollutants. Projects that require a CWA Section 401 water quality certification, a CWA Section 404 permit, and/or a Streambed Alteration Agreement may also require a Report of Waste Discharge for wetlands and others waters of the state under the Porter-Cologne Act.

The SSHCP Permit Applicants are requesting that the programmatic CWA 401 Water Quality Certification also satisfy the Report of Waste Discharge requirements under Porter-Cologne when future Covered Activities impact wetlands and other waters of the state. In addition, the SSHCP Permit Applicants are requesting that the RWQCB also adopt a more efficient Waste Discharge Requirement approach for the Covered Activities that do not qualify for the programmatic 401 Water Quality Certification.

RWQCB would also use the information and analysis in the EIS/EIR in deciding whether it would develop a program to issue a Report of Waste Discharge to three land-use authority Permit Applicants (Sacramento County, Rancho Cordova, and Galt) under Porter-Cologne. The Report of Waste Discharge would authorize discharges to surface waters applicable to all, or a subset, of future SSHCP Covered Activities.

RWQCB would make the appropriate Findings pursuant to CEQA and would file an NOD, which would state that it has considered the EIS/EIR for their approval decision, and inform the public that it has developed and approved a multilevel CWA 401 permitting program and Report of Waste Discharge.

1.6 FUTURE USES OF THE FINAL EIS/EIR DOCUMENT

Because many of the SSHCP's Covered Species live part or all of their lives in water bodies, the SSHCP would conserve wetland and stream habitats that are also subject to regulation under Sections 404 and 401 of the CWA, Porter-Cologne, and California Fish and Game Code Section 1600 et eq., pursuant to California's Lake and Streambed Alteration Program. Consequently, the aquatic resources addressed in the SSHCP include those regulated by the USACE, State Water Resources Control Board, Central Valley RWQCB, and CDFW, as well as local zoning and aquatic resource ordinances. Therefore, as discussed in Section 1.5, in addition to seeking ITPs from the USFWS and the CDFW, the SSHCP Permit Applicants are also seeking concurrent and parallel authorizations from other federal and state aquatic-resource regulatory agencies.

This section discusses how the information and analysis presented in the final SSHCP EIS/EIR would be used in the future by federal and state regulatory agencies to enact more efficient permitting processes for future SSHCP Covered Activity projects and activities implemented by third-parties or implemented by the Permit Applicants. These efficiencies would save time and

money for the regulatory agencies and the regulated public, and would facilitate better decision-making processes at the landscape level and at the project level.

1.6.1 U.S. Army Corps of Engineers Future Uses of the EIS/EIR

As described in Section 1.5.4, the USACE Sacramento District will rely on the EIS/EIR to support the agency's decision-making on development and implementation of a complementary CWA 404 permit~~ting~~ strategy that would align with a USFWS-permitted SSHCP (see USACE 2015 and EIS/EIR Appendix C).

As discussed previously, the ARP provides for a multidisciplinary, comprehensive, and programmatic approach to attain permit authorizations for future Covered Activity projects with impacts to the aquatic resources that are regulated by different agencies. This complementary multilevel strategy for permitting future SSHCP Covered Activities would rely upon use of the regional SSHCP Preserve System as one part of a unified watershed strategy for aquatic resource mitigation. This coordinated permitting and mitigation approach is expected to improve aquatic resources protection on a regional scale while providing a balanced approach and a robust strategy for the avoidance, minimization, and compensatory mitigation of aquatic resources.

The SSHCP and the ARP offer opportunities to integrate local land-use planning with regional aquatic-resource protection. The SSHCP and the ARP are expected to increase permitting efficiencies of similar state and federal permits, and to provide greater regulatory certainty for the Land Use Authority Permit Applicants and their third-party project proponents, as discussed in Section 1.6.4. This multidisciplinary permitting approach would include a logical permit-review progression that uses the proposed multilevel CWA 404 permit~~ting~~ strategy. As discussed in Section 1.5.4, the proposed CWA 404 permit~~ting~~ strategy is expected to include multiple permit instruments and/or processes, including a General Permit(s) (PGP, **potential** RGP), and abbreviated LOP **procedure** and **abbreviated** SP process~~es~~.

As discussed in Section 1.5.4, the USACE would request a single ESA Section 7 consultation with the USFWS that would provide ESA compliance for all future Covered Activities authorized by the USACE under the PGP or **(potential)** RGP process(es), and under the abbreviated LOP **procedure** and **abbreviated** SP process~~es~~. With a single Biological Opinion in place that addresses all USACE permit actions for future SSHCP Covered Activities, the current project-by-project "individual" Section 7 consultations between the USACE and USFWS is anticipated, for the most part, to be unnecessary.

Furthermore, as discussed in Section 1.5.4, the USACE may develop a Programmatic Agreement with the State Historic Preservation Office to address NHPA 106 consultations on future SSHCP Covered Activities that are authorized under CWA 404.

The USACE anticipates using the SSHCP EIS/EIR as a programmatic NEPA document during its future CWA 404 permit reviews of SSHCP Covered Activities. The SSHCP EIS/EIR provides a regional-scale, comprehensive, and programmatic analysis of expected impacts to aquatic resources, species habitat, water quality, and hydrology from all planned urban development over a 50-year study period. The USACE anticipates using, to the maximum extent feasible, the 50-year programmatic analyses provided in the EIS/EIR to address NEPA compliance required for the CWA 404 permits issued under each level of the proposed multilevel CWA 404 permit~~ting~~ strategy.

1.6.2 Regional Water Quality Control Board future uses of the EIS/EIR

As discussed in Section 1.5.7, the Central Valley RWQCB would develop a CWA 401 water quality certification strategy for future SSHCP Covered Activities that obtain a CWA 404 permit under the USACE's proposed multilevel CWA 404 permit~~ting~~ strategy for future SSHCP Covered Activities.

The SSHCP EIS/EIR provides a regional-scale and programmatic analysis of impacts to water quality and hydrology expected from implementation of new urban development over a 50-year period. The RWQCB would use the SSHCP EIS/EIR to address CEQA compliance for future CWA 401 permits issued to future Covered Activity projects that obtain a CWA 404 permit under each level of the proposed multilevel CWA 404 permit~~ting~~ strategy.

A programmatic CWA Section 401 Water Quality Certification could be used for the Covered Activity projects that ~~fall under~~ **qualify for** the USACE's proposed PGP or **(potential)** RGP (see Section 1.5.4). If a Covered Activity project qualifies for the USACE's PGP, and the RWQCB has issued a programmatic Section 401 Water Quality Certification for the PGP, the Covered Activity project would already be certified under CWA 401. The proposed programmatic 401 Water Quality Certification would also satisfy the Report of Waste Discharge requirements for Porter-Cologne. In addition, the programmatic Section 401 Water Quality Certification may potentially cover (all or in part) some larger Covered Activity projects that would ~~fall under~~ **qualify for** the USACE's abbreviated LOP ~~process~~ **procedure**, or ~~fall under~~ **qualify for** the abbreviated SP process.

Any Covered Activity project authorized under the proposed CWA Section 401 Water Quality Certification strategy must satisfy the RWQCB's water quality anti-degradation policy, to demonstrate that water quality standards would be maintained in the Planning Area. Covered Activities would demonstrate this by complying with all avoidance, minimization, and mitigation

requirements of the SSHCP. The local Land Use Authority Permit Applicant or the Implementing Entity (whoever has jurisdiction) would review the Covered Activity to assure all measures required by the SSHCP and ARP are met.

The local Land Use Authority Permit Applicant, or the Implementing Entity (whoever has jurisdiction), would evaluate each Covered Activity project submittal. Based on the CWA 404 permit process under which the Covered Activity would likely be processed, the local Land Use Authority Permit Applicant (or the Implementing Entity) would determine the appropriate means through which the project would apply for the associated CWA 401 Water Quality Certification. This initial Land Use Authority Permit Applicant (or the Implementing Entity) screening (vetting) before submittal to the RWQCB is anticipated to result in more efficient and streamlined RWQCB review process of individual CWA 401 Water Quality Certification applications.

This more efficient CWA 401 Water Quality Certification process would save time and costs compared to the current project-by-project permitting process, and would allow the RWQCB to consider individual project impacts from a watershed perspective. The SSHCP's comprehensive and balanced approach to aquatic resource impacts and aquatic resource conservation would provide a greater level of landscape-scale and watershed-scale protection of water quality than is possible under the conventional project-by-project permitting approach under the CWA 404 and CWA 401.

1.6.3 California Department of Fish and Wildlife Future Uses

As discussed in Section 1.5.4, the Permit Applicants are requesting an MSAA or LTLSA from the CDFW for future SSHCP Covered Activities occurring within a stream zone.

The SSHCP and ARP describes procedures for avoidance, minimization, and describes compensatory mitigation requirements for future Covered Activities occurring within a stream zone. Because each Covered Activity would comply with standardized requirements set forth in the SSHCP and ARP, the CDFW would be able to quicken its permitting process using the MOU procedure described in Section 1.5.6.

CDFW would use the SSHCP EIS/EIR to satisfy CEQA requirements for its decision to issue the MSAA or LTLSA, and would use the EIS/EIR for future decisions in individual LSAs issued for some Covered Activity projects. The proposed MOU would enable CDFW to quicken its LSA permitting process for Covered Activity urban development projects that comply with all SSHCP requirements. The CEQA lead agency would be able to incorporate regional, comprehensive, and programmatic analysis of aquatic resources, species habitat, natural communities, water quality, and hydrology from the SSHCP EIS/EIR, which would greatly quicken CDFW review timeline.

The Land Use Authority Permit Applicants would establish a review process to assist CDFW in the efficient processing of individual CWA 401 certifications for proposed Covered Activity projects and activities. Under this process, the Land Use Authority Permit Applicants (or the SSHCP Implementing Entity) would act as the initial "clearinghouse" for project LSA permit applications, in the same manner they would for the CWA 404 permit application reviews. The Land Use Authority Permit Applicant (or the Implementing Entity, as applicable) would screen individual Covered Activity applications to ensure that the proposed project complies with all requirements of the SSHCP and ARP, and the Land Use Authority Permit Applicant would notify the CDFW (pursuant to Section 1600 of the California Fish and Game Code), and would seek an individual LSA or would seek to append the Covered Activity project to an MSAA or LTLSA.

1.6.4 The SSHCP Permit Applicants (Future SSHCP Permittees) Future Uses of the EIS/EIR

In most cases, an individual Covered Activity project or activity would trigger CEQA and require preparation of a CEQA document that analyzes the proposed project or activity. All six of the SSHCP Permit Applicants (the future SSHCP Permittees) could use the final SSHCP EIS/EIR to simplify and streamline preparation of individual project CEQA documents for future Covered Activity projects that they directly implement over the proposed 50-year term of the SSHCP. The SSHCP Permit Applicant would be the CEQA lead agency in the preparation of CEQA documents for Covered Activity projects that they directly implement. The SSHCP EIS/EIR provides regional-scale comprehensive analyses of environmental impacts of all planned urban development within the Planning Area over a 50-year period. The SSHCP Permit Applicants (CEQA lead agencies) would use the analyses presented in the final SSHCP EIS/EIR to simplify and streamline preparation of future CEQA documents for individual Covered Activity projects, especially the comprehensive analyses of impacts to native plant and animal species, natural communities, aquatic resources, water quality, and hydrology.

The three local Land Use Authority Permit Applicants (Sacramento County, Galt, and Rancho Cordova) would also have the ability to extend the species incidental take coverage provided by the SSHCP ITPs to the Covered Activities implemented by third-party project proponents under their jurisdiction. The SSHCP term "third-party project proponents" refers to individuals or organizations that implement a SSHCP Covered Activity under the jurisdiction of a Land Use Authority Permit Applicant (i.e., Sacramento County, Galt, or Rancho Cordova). An example would be a developer (the third-party project proponent) who proposes a development project that is consistent with the requirements of an SSHCP urban development Covered Activity, and the proposed project's approvals or entitlements are subject to the jurisdiction of Sacramento County (a Land-use Authority Permit Applicant). Third-party project proponent uses of the Final EIS/EIR are discussed in Section 1.6.5.

Similarly, the SSHCP Implementing Entity would have the ability to extend incidental take coverage provided by the SSHCP ITPs to "Participating Special Entities" that implement a Covered Activity project under the oversight of the SSHCP Implementing Entity. SSHCP Participating Special Entities are third-party entities that are not under the jurisdiction of a Land Use Authority Permittee. Participating Special Entities might include school districts, reclamation districts, irrigation or water districts, utilities, or other organizations that are not subject to the regulatory authority of a local jurisdiction.

1.6.5 Third-Party Project Proponent Future Uses of the Final EIS/EIR

Because Land Use Authority Permit Applicants (Sacramento County, Galt, and Rancho Cordova) and the SSHCP Implementing Entity have the ability to extend the incidental take coverage provided by the SSHCP ITPs to Covered Activities implemented by third-party project proponents, the third-party project proponents implementing a Covered Activity would not need to prepare ESA Biological Assessment documents, would not need to apply for a CESA take permit, and would avoid the multiple negotiations and multiple project reviews that are currently required for project ESA and CESA compliance under the conventional project-by-project review process. Similarly, third-party project proponents implementing a Covered Activity that impacts wetlands and other waters of the United States or state, for the most part, would not need to apply for individual permits or approvals from each of aquatic resource regulatory agencies that have participated in the development of the SSHCP and the ARP (i.e., USACE and RWQCB under CWA 404 and CWA 401, and CDFW under California Fish and Game Code Section 1600 Lake and Streambed Alteration Program). For the relatively few number of large urban development Covered Activities that would still need a Letter of Permission or Standard Permit under CWA 404 and an individual CWA 401 permit, or an individual California Fish and Game Code Section 1600 Streambed Alteration permit, the process, effort, and time required to obtain those permits would be substantially simplified, abbreviated, and streamlined, relative to the current project-by-project review.

The SSHCP and the ARP provide third-party project proponents with pre-negotiated project-level biological and aquatic-resource Avoidance and Minimization Measures that can be incorporated early into the proposed project's design. Where project impacts are unavoidable, the SSHCP and the ARP permits and authorizations provide third-party project proponents with pre-determined mitigation requirements, which are standardized and are predictable in advance. In addition, the SSHCP and ARP permits and authorizations would provide pre-negotiated mitigation monitoring requirements and methodologies.

Because the final SSHCP EIS/EIR provides a comprehensive and regional-scale analysis of biological resource and aquatic resource impacts from implementation of future urban development planned for the next 50-year period, the effort and cost of preparing future

project-level CEQA documents and project-level NEPA documents could be reduced relative to project CEQA and NEPA documents prepared under the current project-by-project review process. Project-level CEQA and NEPA documents can reference and use the EIS/EIR's regional-scale and 50-year comprehensive and programmatic analysis of future Covered Activity impacts to native plant and animal species, natural communities, aquatic resources, water quality, hydrology, and other environmental resources natural resources, as well as the EIS/EIR's cumulative analysis of impacts to wetlands and other waters in the region.

This incorporation of information and analysis from the SSHCP EIS/EIR is expected to produce better project-level CEQA and NEPA documents and would save third-party project proponents time and reduce costs associated with the preparation of each project-level CEQA or NEPA document. Although the CEQA and NEPA lead agencies determine the scope and the conclusions of a development project's CEQA and/or NEPA document, in most cases the project proponent funds the document preparation.

Compared to the existing, conventional project-by-project CWA permit process, the proposed multilevel CWA 404 permit strategy for future Covered Activities would increase the efficiency of the CWA permitting process; provide for more systematic regional protection of Planning Area aquatic resources; balance the impacts to and conservation of aquatic resources at a regional-scale and at project-scale; and provide a coordinated approach for providing regional avoidance, minimization, and compensation for unavoidable impacts to aquatic resources. With a single, comprehensive ESA Section 7 consultation Biological Opinion that addresses all future Covered Activities authorized under the proposed CWA 404 permit strategy (see Section 1.5.4 and EIS/EIR Appendix C), the conventional project-by-project Section 7 consultations between the USACE and the USFWS for each project CWA permit would, for the most part, be unnecessary. The proposed multilevel CWA 404 permit strategy ~~permitting process~~, envisioned CWA 401 Certification process, and ~~envisioned~~ **potential** programmatic NHPA 106 agreement would be more efficient and would save time and costs, when compared to the conventional project-by-project permitting processes.

Under the proposed multilevel CWA 404 permit strategy ~~for future Covered Activities~~, most future Covered Activity projects requiring a CWA permit could be authorized **under the local programs implemented** by the jurisdictional Land-use Authority Permit Applicant**s** ~~under the~~**, in that most activities would be anticipated to meet the terms and conditions of the USACE's** proposed PGP ~~and would not require the~~**. Thus,** third-party project proponent**s would be most likely to receive a local permit under the ARP and local ordinances, rather than** to seek authorization directly from the USACE ~~or prepare a CWA 404 permit application~~.

As discussed in Section 1.5.4, and in EIS/EIR Appendix C, the **USACE's proposed** abbreviated LOP **procedure** and **abbreviated** SP process for CWA 404 permits would ~~likely~~ be needed for

only a small portion of the larger-scale urban development Covered Activity projects in the Planning Area. The SSHCP, ARP, and the regional, programmatic, and comprehensive analysis of aquatic resources in the Final SSHCP EIS/EIR, would identify appropriate and adequate aquatic resource impact Avoidance and Minimization Measures to assist in compliance with the 404(b)(1) guidelines. The envisioned abbreviated LOP **procedure** and **abbreviated** SP process~~es~~ would ~~largely~~ fulfill (in advance) the requirements of a separate off-site alternatives analysis, so an off-site alternatives analysis would not be required for the assessment of the Least Environmentally Damaging Practicable Alternative, ~~and in the case of SPs,~~ alleviat~~e~~**ing** the necessity of preparing **often** ~~a~~ rigorous off-site alternatives analysis. Therefore, the alternatives analysis necessary under the abbreviated LOP **procedure** and **abbreviated** SP process~~es~~ could be limited to identifying particular Avoidance and Minimization Measures from the SSHCP that are appropriate to apply to the project-site. In addition, the abbreviated LOP **procedure** and **abbreviated** SP process~~es~~ would provide the third-party project proponents with greater regulatory certainty.

NEPA requirements for future Covered Activity projects requiring permits under the abbreviated SP process ~~may be satisfied with a smaller Environmental Assessment-level of review, rather than the EIS-level of review that is typical under the current project-by-project CWA permit process.~~ **would realize greater efficiencies.** ~~Even~~ ~~f~~**F**or future Covered Activity urban development projects proposing potentially significant effects on the human environment~~ and requiring the~~**, for which the Corps determines requires** preparation of an EIS, the ~~proposed~~ SP **abbreviated** process would be ~~greatly abbreviated by relying on the regional, programmatic, and comprehensive analysis in the EIS/EIR.~~ **reduced in terms of process, information requirements, and timing. Please refer to *Appendix* C for additional description of the SP abbreviated process.**

Therefore, the proposed abbreviated LOP **procedure** and **abbreviated** SP process~~es~~ would save project proponents time and costs and would increase regulatory certainty in comparison to the conventional project-by-project processes.

Project Proposals Seeking CWA 401 Water Quality Certification

A parallel permitting process is anticipated for CWA 401 Certification of Covered Activity project proposals, including the potential use of all (or portions) of a programmatic Section 401 Certification. This more efficient CWA 401 Certification process would save project proponents time and costs when compared to the conventional project-by-project permitting process. The envisioned parallel multilevel process for Covered Activity 401 Water Quality Certification would allow greater environmental benefits at the watershed and regional scale.

Project Proposals Seeking a CDFW 1600 Streambed Alteration Agreement

A streamlined permitting process is envisioned for obtaining Streambed Alteration Agreements for Covered Activity project proposals. The Implementing Entity would evaluate the project submittal subnotification forms and conduct the initial screening process to verify project consistency with the SSHCP and the ARP regulatory permitting framework. Once approved by the Implementing Entity, the subnotification forms would then be submitted to CDFW for review and verification. The Final SSHCP EIS/EIR would provide CEQA compliance for these Streambed Alteration Agreements.

INTENTIONALLY LEFT BLANK

CHAPTER 2 – ALTERNATIVES, INCLUDING THE PROPOSED ACTION/PROPOSED PROJECT

This chapter presents detailed descriptions of the proposed South Sacramento Habitat Conservation Plan (SSHCP or Plan) for south Sacramento County (the Proposed Action/Proposed Project), the Reduced Permit Term Alternative HCP, and the No Action/No Project Alternative. This chapter also summarizes the approach used to consider and select the alternatives studied in detail, and discusses the alternatives that were considered but are not studied in detail.

The Environmental Impact Study/Environmental Impact Report (EIS/EIR) alternatives accommodate all planned future projects and activities in the Planning Area (Section 1.1.1), as described in the adopted General Plans of Sacramento County and Galt and Rancho Cordova, and the *Capital SouthEast Connector Project EIR* (Section 2.2.1 and Section 3.4).

2.1 APPROACH TO DEVELOPING ALTERNATIVES

2.1.1 Regulatory Framework for Developing Alternatives

National Environmental Policy Act and California Environmental Quality Act

The National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA) require that an EIS/EIR evaluate a reasonable range of alternatives to a proposed action, including a no-action alternative. While there is no clear rule for determining a reasonable range, NEPA and CEQA provide guidance that can be used to determine alternatives for consideration in an EIS/EIR.

NEPA regulations identify the alternatives as the “heart” of an EIS (40 CFR 1502.14). Each EIS must devote substantial treatment to each alternative, and present alternatives in comparative form to sharply define the issues and provide a clear basis for choice among options by the decision makers and the public (40 CFR 1502.14). The term “range of alternatives” refers to the alternatives discussed in an environmental document (CEQ 1981, Question 1a). The range of alternatives discussed must include all reasonable alternatives. Reasonable alternatives are those that are both technically and economically practical and feasible and meet the stated purposes and needs of the proposed action (43 CFR 46.420(b); CEQ 1981, Question 2a). The term “range of alternatives” includes other alternatives that were eliminated from detailed study, with a brief discussion of the reasons for eliminating them (40 CFR 1502.14(a); 43 CFR 46.420(c)). What constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case (CEQ 1981, Question 1b). The stated purpose and need for action and the “significant issues” identified during the scoping process will determine the range of alternatives and provide a basis for the selection of an alternative in the decision (43 CFR 43.415[b]; 43 CFR 46.420 [a][2]).

The range of alternatives under CEQA is governed by the rule of reason (14 CCR 15126.6[f]). Alternatives under CEQA must meet most of the basic project objectives, but avoid or substantially lessen any of the significant effects of the proposed project, and must be potentially feasible. In determining whether alternatives are feasible, lead agencies are guided by the following general definition of feasibility found in CEQA Guidelines, Section 15364 (14 CCR 15364): "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." In accordance with CEQA Guidelines, Section 15126.6(f), the lead agency should consider site suitability, economic viability, availability of infrastructure, general plan consistency, other regulatory limitations, jurisdictional boundaries, and the proponent's control over alternative sites in determining the range of feasible alternatives to be evaluated in an EIR. An EIR must briefly describe the rationale for selection and rejection of alternatives and the information that the lead agency relied upon in making the selection. It should also identify any alternatives that were considered by the lead agency but were rejected as infeasible during the scoping process, and briefly explain the reason for their exclusion (14 CCR 15126.6[c]).

A no-action alternative is required to be considered in an EIS, and a no project alternative is required to be considered in an EIR. A no action/no project alternative allows decision makers to compare the impacts of approving the project (or an alternative) to the expected future conditions if no project or alternative is approved and the activity would not take place.

NEPA regulations require an EIS to include a no-action alternative (40 CFR 1502.14). Where a new project or activity is proposed for implementation, the no-action alternative means "no project," and the no-action alternative looks at the effects of not approving the action under consideration (43 CFR 46.30[1]; 43 CFR 46.30[2]; CEQ 1981, Question 3). The no-action alternative describes the likely future conditions without the project and may also include predictable actions by other persons or entities in addition to the federal agency involved.

Under CEQA, an EIR is required to analyze the no project alternative. CEQA Guidelines Section 15126.6(e)(2) (14 CCR 15126.6[e][2]) indicates that the no project analysis shall discuss the baseline existing conditions at the time of the Notice of Preparation is published, as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services.

Clean Water Act

Consideration of alternatives is also required under the Section 404 of the Clean Water Act (CWA 404). Activities that would result in the discharge of dredged or fill material into wetlands and other waters of the United States **may** require authorization from the U.S. Army Corps of

Engineers (USACE) under CWA 404 **(e.g., exempt activities do not require authorization)**. Projects subject to permitting under the CWA 404 must comply with Section 404(b)(1) guidelines (40 CFR, Part 230) for discharge of dredged or fill material into wetlands and other waters of the United States. Section 404(b)(1) guidelines require that:

> except as provided under Section 404(b)(2), no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences.

The guidelines (40 CFR, Part 230) consider an alternative practicable "if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes." Practicable alternatives under the guidelines (40 CFR, Part 230) assume that "alternatives that do not involve special aquatic sites are available, unless clearly demonstrated otherwise." The guidelines (40 CFR, Part 230) also assume that "all practicable alternatives to the proposed discharge which do not involve a discharge into a special aquatic site are presumed to have less adverse impact on the aquatic ecosystem, unless clearly demonstrated otherwise."

Per the USACE's NEPA implementing regulations (33 CFR 325, Appendix B(9)(b)(5)), the alternatives analysis conducted in an EIS should be thorough enough to use for both the public interest review and the Section 404(b)(1) guidelines, where applicable**; however, on a case-by-case basis, additional information may be necessary. As discussed in Section 1.5.4, as part of its compliance documentation with EPA's 404(b)(1) Guidelines, the USACE will also consider additional information outside the purview of the NEPA process for this project.** Under the USACE public interest review, for activities in which there are unresolved conflicts as to resource use, USACE must evaluate the practicability of using reasonable alternative locations and methods to accomplish the objective of the proposed structure or work (33 CFR 320.4(a)(2)(ii)). As explained in Section 2.1.1, under the Section 404(b)(1) Guidelines, USACE must evaluate the practicability of alternatives in light of the overall project purpose (40 CFR 230.10(a)).

The Plan Permittees are seeking a Section 404 programmatic general permit from the USACE that would apply to the majority of SSHCP Covered Activities requiring CWA 404 authorization. If issued, the programmatic general permit would streamline the CWA 404 permitting process for certain activities covered under the SSHCP that would result in the discharge of dredged or fill material into wetlands and other waters of the United States. As discussed in greater detail in Chapter 1 of this document, other components of a CWA 404 permit strategy coordinated with the SSHCP may include the USACE's issuance of a regional general permit, Letter of Permission procedures, and an abbreviated standard permit process. As it applies to discussing the alternatives

analysis, as part of the ~~evaluation to issue~~ **decision making on issuing** programmatic general permits or regional general permits under CWA 404, USACE must ~~follow~~ **ensure compliance with** the U.S. Environmental Protection Agency's (EPA's) Section 404(b)(1) Guidelines ~~, which in part require that USACE document that the Covered Activities would result in no more than minimal individual and cumulative adverse effects on wetlands and other waters of the United States and that the permitted action is the least environmentally damaging practicable alternative~~.

2.1.2 How the SSHCP Development Process Has Considered Alternatives

The SSHCP has been developed through an iterative process that first began in 1992. Since that time, a range of conservation plan concepts were vetted by the proposed Permit Applicants; by several stakeholder committees; and representatives of the U.S. Fish and Wildlife (USFWS), California Department of Fish and Wildlife (CDFW), USACE, EPA, and the Regional Water Quality Control Board (RWQCB). The Proposed Action/Proposed Project Alternative is the end result of this process. The chronology of SSHCP development is briefly described in the following text.

1992–2006

In 1992, the EPA funded a USACE watershed study to assess the water resource needs of river basins and watersheds in south Sacramento County, including needs relating to ecosystem protection and restoration, flood risk management, watershed protection, water supply, and drought preparedness. In 1993, USFWS and CDFW proposed shifting from a watershed study to a more comprehensive regional resource protection plan, such as an HCP. After an initial assessment confirmed that an HCP in south Sacramento County would be politically, economically, and biologically feasible, further work was conducted to identify possible strategies and economic constraints.

In 1995, an SSHCP Steering Committee was formed to provide public stakeholder input into the development of the program. As initially constituted, this committee consisted of an equal number of members representing the regulatory, agricultural, development, and environmental stakeholders, as well as federal, state, and Sacramento County agency representatives.

In September 1996, the Steering Committee began to meet regularly to provide input regarding the goals and principles that it felt should guide the development of the SSHCP. The Steering Committee also formed two subcommittees to address biological and economic issues and identified members for these stakeholder subcommittees. Experts with local knowledge participated as science advisors to develop background information and baseline data about the Planning Area. In the late 1990s, funding was insufficient to make substantial progress, and work on the SSHCP halted.

In 2002, work began again on the SSHCP, which provides the foundation for the current Plan. Following the incorporation of the City of Elk Grove in 2000 and the City of Rancho Cordova in 2003, the local agencies with land use authority (Sacramento County and the Galt, Rancho Cordova, and Elk Grove) established[1] a strong collaboration to complete the SSHCP process successfully. A committee consisting of the land use authority Permit Applicants—the Local Agency Working Group—was established to consider each jurisdiction's interests in the Plan.

2006–2011

By late 2006, a Preliminary Administrative Draft SSHCP was completed and released to stakeholders for input. The Conservation Strategy of this preliminary plan considered all vernal pools within the Planning Area to have the same habitat value. The Conservation Strategy associated with this assumption is described in Section 2.1.5 as a potential alternative (i.e., "Preserve 50% of all Vernal Pools in the Planning Area"). However, just before the release of the 2006 Preliminary Draft SSHCP, the USFWS released the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (Vernal Pool Recovery Plan) (USFWS 2005). The information in the Vernal Pool Recovery Plan prompted the Permit Applicants and stakeholder groups to change the focus of the SSHCP and to place greater conservation value on the vernal pools and other aquatic habitats located within the two vernal pool Core Recovery Areas now designated within the Planning Area (USFWS 2005). Those vernal pool Core Recovery Areas included the Mather Core Recovery Area (MCRA), located almost entirely within the Urban Services Boundary (USB), and the Cosumnes/Rancho Seco Core Recovery Area, located outside the USB in the southeastern portion of the Planning Area (Figure 1-1). The Vernal Pool Recovery Plan established targets for preservation of vernal pool species occurrences and habitat in each vernal pool Core Recovery Area for each species in the Vernal Pool Recovery Plan. The targets established by the Vernal Pool Recovery Plan form the basis of the alternative "Recovery Plan Alternative (Preserve 95% of the Vernal Pools in the MCRA)" that is discussed in Section 2.1.5.

In addition to the information provided by the Vernal Pool Recovery Plan, new information on vernal pool tadpole shrimp (*Lepidurus packardi*) became available (USFWS 2008), which showed much higher densities of vernal pool tadpole shrimp within the MRCA than within any other part of that species' range, including the south part of the Planning Area and the Cosumnes/Rancho Seco Core Recovery Area.

During this period, the previously mentioned Local Agency Working Group evaluated comments and recommendations received from the Steering Committee, the stakeholder subcommittees, and the public. Scientific data on the ecology of the Planning Area was

[1] Note that in the context of this Plan, the word "establish" is synonymous with "create."

updated. Through this process, the list of Covered Species was revised several times after the 2006 Preliminary Draft SSHCP. By 2010, 10 native species had been removed from the 2006 list of Covered Species. Certain native species were removed for one or more of the following three general reasons:

1. New information about the status of the species over the species' range indicated the species is unlikely to be listed under the federal Endangered Species Act (ESA) or the California Endangered Species Act (CESA) during the proposed permit term.
2. The Plan preparers, Wildlife Agencies, and local species experts were not able to identify areas of breeding, feeding, or sheltering habitat for the species within the Planning Area.
3. The Permit Applicants, the stakeholder groups, and the Wildlife Agencies determined that the species could not be adversely impacted by any of the proposed Covered Activities.

The following native species were considered but removed from the list of SSHCP Covered Species in 2006:

- American peregrine falcon (*Falco peregrinus anatum*)
- Bald eagle (*Haliaeetus leucocephalus*)
- Golden eagle (*Aquila chrysaetos*)
- Long-eared owl (*Asio otus*)
- Merlin (*Falco columbarius*)
- Sharp-shinned hawk (*Accipiter striatus*)
- Short-eared owl (*Asio flammeus)*
- White-faced ibis (*Plegadis chihi*)
- Yellow-breasted chat (*Icteria virens*)
- Ringtail (*Bassariscus astutus*).

Although the Permit Applicants no longer sought incidental take authorization for these species, the Permit Applicants and stakeholder groups recognized that these native species would directly and indirectly benefit from the SSHCP Conservation Strategy.

For the 2010 Administrative Draft SSHCP, the Permit Applicants and stakeholder groups expanded the western boundary of the Planning Area to include agricultural lands located west of Interstate (I-) 5, which would allow the Plan to consider alternative ways to conserve Swainson's hawk (*Buteo swainsoni*) foraging habitat.

The regulatory agencies (USFWS, CDFW, USACE, EPA, and RWQCB) developed a map in 2011 that identified all important aquatic resources and Vernal Pool habitat remaining inside and adjacent to the designated MCRA. This map of aquatic resource conservation was informally called the "blue

line map" but is labeled as the "2011 Agency Conceptual Design" in the maps prepared around that time. This map identified 76% of remaining vernal pools in the MCRA for preservation but did not take into account the feasibility of acquiring these parcels. The 2011 Agency Conceptual Design map formed the basis of an alternative discussed further in Section 2.1.5.

A subsequent map ("2011 USFWS Most-Essential Habitat") was prepared by USFWS staff to identify areas where the most valuable vernal pool species habitat should be preserved in the MCRA, and identified preservation of 49% of Vernal Pool ecosystem landscape that remained in the MCRA in 2011. The 2011 USFWS Most-Essential Habitat map formed the basis of the alternative "Preserve 49% of the Vernal Pools within the MCRA" that is discussed in Section 2.1.5.

2012–Present

From 2012 to the present, several modifications were made to the SSHCP to further refine the document's impacts analysis and to enhance the SSHCP Conservation Strategy. In early 2012, the SSHCP Plan Partners, the regulatory agencies, and a select group of local experts with specific knowledge of SSHCP Covered Species held several meetings to discuss how the SSHCP Conservation Strategy could be crafted to maximize preservation of the Vernal Pool ecosystem within the Urban Development Area (UDA)[2]. The meetings resulted in tentative points of agreement that set the foundation for the SSHCP Conservation Strategy as it is currently described in the SSHCP. The main points of agreement are summarized as follows:

- The approach to conservation within the UDA will be a hybrid approach with the combination of hardline preserves being delineated where preserves could be negotiated with landowners coupled with a criteria-based approach where preserves could not be negotiated with willing landowners at that time.
- Hardline preserves will be shown for five projects (Arboretum, Sun Creek, Cordova Hills, Excelsior Estates [now known as Jackson Township], and New Bridge).
- Criteria are established for three zones within or adjacent to the MCRA. ("Adjacent" is defined as within 1 mile of the existing MCRA boundary.)

[2] As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where new urban development projects or activities could occur under the No Action/No Project Alternative, or where new urban development Covered Activities could occur under the two action alternatives. Therefore, the term "UDA" means all lands within the Sacramento County USB boundary that are also within the Planning Area (this includes lands within the Rancho Cordova city limits that are within the Planning Area); and all lands within Galt's city limits and within the City of Galt's sphere of influence (see Section1.1.1 and Figure 1-1).

- In order to meet regulatory agency concerns that the combined hardline preserve and criteria do not provide sufficient acquisition to mitigate for anticipated take, the Plan will specify that an additional 500 "flexible" acres will be acquired within or adjacent to the MCRA.
- The large Landscape-level preserve outside of the UDA is increased from 10,000 acres to 10,500 acres.
- An ordinance will be drafted and issued concurrently with the Draft EIS/EIR to provide assurances that incompatible practices do not irreparably harm potential resources (particularly Vernal Pool landscapes).

In addition to determining an acceptable approach to conservation within the MCRA because of its importance in the conservation of vernal pool tadpole shrimp, Sacramento Orcutt grass (*Orcuttia viscida*), and slender Orcutt grass (*Orcuttia tenuis*), the Plan Partners and the regulatory agencies also made several adjustments to SSHCP Land Cover Type Classifications. These modifications improved the baseline map that is used to calculate impacts that will result from the implementation of Covered Activities and is used to guide preservation of Covered Species habitat. The changes to the Land Cover Type Classifications include the following:

Low-Density Development Land Cover Type

Initial mapping underrepresented the acres of upland habitats (e.g., Valley Grassland) in areas characterized by small parcels (less than 5 acres in size). Specifically, many backyard areas within agricultural-residential development were mapped as grassland, and a number of larger fields were mapped as Low-Density Development. To correct these errors, all Low-Density Development cover types were reviewed against aerial photos and were adjusted to reflect the correct cover type.

Vernal Swale Land Cover Type

The Vernal Swale land cover type was removed as an SSHCP land use classification. Any feature that was classified as a Vernal Swale was reclassified as a Swale.

Vernal Impoundment Land Cover Type

The Vernal Impoundment land cover type was removed as an SSHCP land use classification. Vernal impoundments outside of the UDA were reclassified as Vernal Pool. Within the UDA, most vernal impoundments were reclassified as Vernal Pool, and some were reclassified as other Seasonal Wetland cover types, where appropriate.

Seasonal Impoundment Land Cover Type

The Seasonal Impoundment land cover type was removed as an SSHCP land use classification. Seasonal impoundments outside of the UDA were reclassified as Seasonal Wetland. Within the

UDA, seasonal impoundments outside of the MCRA were reclassified as Seasonal Wetland or Open Water. Within the MCRA, most seasonal impoundments were reclassified as Vernal Pool.

Stream/Creek (VPIH) Land Cover Type

The Stream/Creek Vernal Pool Invertebrate Habitat (VPIH) land use classification was created to capture VPIH that occurs within stream or creek channels.

During the winter of 2014, the Plan Permittees and the regulatory agencies developed a Vernal Pool watershed map that was prepared to help plan preserves to reduce the indirect impacts to Vernal Pool features covered under the SSHCP. The map is also used to calculate indirect impacts that will result from the implementation of a Covered Activity. The models are specifically designed for the portion of the Southeastern Sacramento Valley Vernal Pool Region (Keeler-Wolf et al. 1998; USFWS 2005) that is located in south Sacramento County.

Final adjustments were made to the Planning Area that included the removal of the Aerojet property and the removal of the City of Elk Grove to accommodate their requests to be dropped from the Plan. These modifications necessitated major adjustments to the Plan, including a new impacts analysis and adjustments to the Conservation Strategy. In addition to the changes mentioned previously, the Plan Partners also made some minor adjustments to the placement of infrastructure within the Planning Area to reduce impacts to Covered Species habitat. These adjustments included the minor realignment of roadways, water supply lines, and sewer lines.

2.1.3 Alternatives Considered

The lead agencies evaluated a range of reasonable project alternatives for an HCP in south Sacramento County. Ideas for potential alternatives came from a variety of sources, including the SSHCP development process, the public scoping process under CEQA and NEPA, and input from the lead and cooperating agencies. The following categories of potential alternatives were considered by the lead agencies. All alternatives considered were different types of conservation plans that varied in the ways described below:

- **Different permit terms**[3]—For example, include a 30-year permit term consistent with the term of the adopted General Plans, or include a longer term consistent with other development scenarios, such as the expected 50-year period needed for "full buildout[4]"

[3] The permit term is the time period in which incidental take associated with all Covered Activities is authorized by the Incidental Take Permits (ITPs), and the time period in which assembly of the Preserve System and all other aspects of the Conservation Strategy must be successfully completed.

[4] "Full buildout" means all currently undeveloped lands that are zoned for, or are ultimately planned/ contemplated for, future urban development (in the adopted general plans of the Permit Applicants) would become developed. Full buildout will include some open space and conservation lands within the areas planned for urban development.

of Sacramento County's approved USB and the other components of the UDA as described in Section 1.1.1.

- **Different Covered Species**—For example, include only species currently listed as threatened or endangered under ESA or CESA, or also include all or some unlisted species that may become listed during the permit term, or also include other species of local concern.
- **Different Planning Area boundary**—Smaller, larger, or differently shaped Planning Area. For example, the Planning Area size could include all undeveloped lands within south Sacramento County, or limit the size of the Planning Area to include only undeveloped lands within Sacramento County's approved USB, or include undeveloped lands within the Elk Grove sphere of influence (SOI), or also include undeveloped lands west of I-5.
- **Different types of Covered Activities**—In addition to covering future urban development and associated infrastructure activities, consider covering other types of activities that are under the jurisdiction of a Permit Applicant, such as the operation and maintenance of their existing facilities within the Planning Area.
- **Different amounts or frequency of Covered Activities**—For example, include greater or smaller amounts of new urban development within each Permit Applicant's jurisdiction.
- **Different Conservation Strategy elements**—Consider different types, locations, total amounts, or frequency of implementing certain conservation measures. For example, include different amounts or different locations of avoidance/preservation of vernal pools and other aquatic resources.

2.1.4 Alternative Formulation and Screening

Project alternatives were identified and screened using three tiers of criteria. Potential alternatives that met the screening criteria in the first tier were carried forward to the second tier, and then those that met the screening criteria in the second tier were carried over to the third tier. Only the alternatives that met the criteria for all three tiers were carried forward in this EIS/EIR for detailed study. EIS/EIR Appendix E contains a detailed description of how and why alternatives were screened from further analysis.

As discussed in Section 2.1.1, NEPA regulations and CEQA Guidelines require that the EIS/EIR include action alternatives that satisfy the following three criteria:

1. Achieves the stated purposes, needs, and objectives
2. Addresses one or more of the significant issues identified during scoping; avoids or substantially lessens potentially significant impacts
3. Is feasible, practicable, and reasonable

Alternatives in the EIS/EIR were screened using the three previously listed criteria, which are described in greater detail below. Alternatives that met those three criteria were then evaluated to be consistent with the guidance in the CWA Section 404(b)(1) Guidelines.

1. Purpose, Needs, and Objectives – First Tier Screening Criteria

The first tier criteria asked if the alternative would achieve the stated purposes, needs, and objectives. A purpose of the proposed federal action is to comprehensively protect and conserve multiple ESA- and CESA-listed species and other native species; to conserve, enhance, and restore the habitats and ecosystems upon which these native species depend, including aquatic resources and aquatic habitats; and to ensure the long-term survival of these species for the continuing benefit of the American people in Sacramento County, California. This purpose and need statement is supported by a list of underlying objectives identified by the lead agencies for the project. Potential alternatives were evaluated through the first tier screening criteria using the following question:

- Would the alternative meet Objectives 1–14 listed in Section 1.3.3?

To advance to the second tier, the answer to most or all of these questions had to be "yes" or "possibly." If the answer to the questions was "no" or "not likely," the alternative was screened out at that point.

2. Significant Issues and Impacts – Second Tier Screening Criteria

The second tier criteria considered whether the potential alternative addresses one or more of the significant issues identified during internal scoping and public scoping and whether the alternative would avoid or substantially lessen any significant adverse environmental effects (see Section 1.4.2). Potential alternatives that advanced to the second tier of screening were evaluated using the following question:

- Would the potential alternative address one or more significant issues related to the proposed action, and would the potential alternative avoid or substantially lessen any of the significant adverse environmental effects of the proposed project?

If the answer to the question was "yes," "possibly," or "unknown," the potential alternative was carried forward for third tier screening. If the answer was "no" or "not likely," then the potential alternative was not carried forward for detailed study in the EIS/EIR.

3. Feasible, Practicable, and Reasonable – Third Tier Screening Criteria

The third tier criteria focused on CEQA's concept of feasibility and NEPA's principle of reasonableness. As discussed in Sections 2.1.1 and 2.1.4, alternatives evaluated in an EIR should be

feasible. CEQA defines a "feasible" alternative as capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. Under NEPA, reasonable alternatives are technically and economically capable of being accomplished in a successful manner and within a reasonable period of time, taking into account environmental, social, legal, technological, and economic factors.

Therefore, under both CEQA and NEPA, the screening of alternatives can consider economic and social factors, as well as legal and technical feasibility. Project Objectives 15–18 identify planning and development criteria that must be met for an alternative to be considered feasible, practicable, and reasonable. Potential alternatives were evaluated through the third tier screening criteria using the following question:

- Would the alternative meet Objectives 15–18 listed in Section 1.3.3?

If all answers to whether an alternative would achieve all of the third tier screening criteria were "yes" or "possibly," the potential alternative is described in this EIS/EIR. If the answers to any of these questions were "no" or "not likely," the potential alternative was rejected for detailed study, and was not considered further.

Criteria to Determine Compliance of Alternatives with the 404(b)(1) Guidelines

In addition to the previously described CEQA and NEPA considerations, alternatives to adverse effects on the aquatic ecosystem must be evaluated by USACE pursuant with the requirements of the Section 404(b)(1) Guidelines. The alternatives analysis conducted in an EIS should be thorough enough to use for both the public interest review and the Section 404(b)(1) guidelines, where applicable**; however, on a case-by-case basis, additional information may be necessary. As discussed in Section 1.5.4, as part of its compliance documentation with EPA's 404(b)(1) Guidelines, the USACE will also consider additional information outside the purview of the NEPA process for this project**. ~~Under the USACE public interest review, for activities where there are unresolved conflicts as to resource use, USACE must evaluate the practicability of using reasonable alternative locations and methods to accomplish the objective of the proposed structure or work (33 CFR 320.4(a)(2)(ii)).~~ As explained in Section 2.1.1, under the Section 404(b)(1) Guidelines, USACE must evaluate the practicability of alternatives in light of the overall project purpose (40 CFR 230.10(a)). Under the Section 404(b)(1) Guidelines, USACE must evaluate the following to determine if each alternative is practicable:

- Availability
- Overall project purpose
- Costs
- Logistics
- Existing technology

- Adverse effects on the aquatic ecosystem
- Other significant adverse environmental consequences.

If the answers to the seven questions below were "not likely" or "unknown," the potential alternative is considered in this EIS/EIR. If the answers to any of these seven questions were "likely" or "yes," the potential alternative failed the screening, and consequently, is not considered in detail in this EIS/EIR. The seven questions are as follows:

1. Would the marginal costs of the potential alternative be so substantial that a reasonably prudent public agency would not proceed with the alternative?
2. Would the marginal costs of the potential alternative be so substantial that it would be impractical to proceed with the alternative?
3. Would the potential alternative take so long to implement, compared with the proposed action, that it would not meet the project purpose or objectives within an acceptable time frame?
4. Would the potential alternative require technology or physical components that are clearly technically infeasible based on currently available science and engineering for the scope of the potential alternative?
5. Would construction, operation, and/or maintenance of the potential alternative violate any federal, state, or local statutes or regulations?
6. Would the potential alternative involve an outcome that is clearly undesirable from a policy standpoint in that the outcome could not reflect a reasonable balancing of relevant economic, environmental, social, and technological factors?
7. Would the potential alternative involve an increase in adverse effects to the aquatic ecosystem?

2.1.5 Alternatives Considered and Not Carried Forward for Detailed Analysis

As discussed in Section 2.1.2, a conservation plan for southern Sacramento County has been under development in some form for approximately 20 years. During this time, many alternatives that considered different Planning Area boundaries, protection of different natural resources, different Covered Species, different conservation strategies, and other elements have been considered.

The SSHCP is the culmination of countless revisions and requests from stakeholders and regulators. The alternatives carried forward for detailed analysis include a comprehensive Conservation Strategy that endeavors to strike the balance of preservation, avoidance, minimization, and mitigation to reach economically feasible, beneficial outcomes. The NEPA process and identification of alternatives for the SSHCP has been ongoing with the formulation of

the SSHCP for over a decade. Several alternatives are described in Section 2.1.3. Many of these alternatives were not carried forward because they were not feasible or did not meet the project objectives. Over time, numerous USFWS-, CDFW-, and USACE-recommended avoidance measures were incorporated into the proposed action, and earlier SSHCP versions (alternatives) were not carried forward in favor of an alternative with less adverse impacts than some of the earlier iterations of the SSHCP. For example, over time the currently proposed Stream Setbacks, the protection of micro-watersheds, [5] and different types of utility and road realignments that avoid impacts to species and aquatic resources were added.

The lead agencies screened all potential alternatives following the process outlined in Section 2.1.4. The following sub-sections describe the alternatives considered and not carried forward based on one of the screening criteria outlined previously. These alternatives are organized into two groups: those that were proposed during the multiyear development of the SSHCP, and those that were suggested by commenters during the public scoping of the EIS/EIR (see Section 1.4). EIS/EIR Appendix E presents three tables that provide information regarding the reasons an alternative was not carried forward for detailed study in the EIS/EIR.

All Habitat Preservation and Project Mitigation is Located Outside of the USB

To allow development on all remaining undeveloped lands within Sacramento County's USB boundary, this alternative proposed all species habitat and aquatic resource avoidance, mitigation, and conservation would be located outside of the USB boundary. This was a primary component of the initial Conservation Strategy proposed by the Permit Applicants during the early period of SSHCP preparation (see Section 2.1.2). Under this potential alternative, approximately 28,000 acres of new development and associated infrastructure could occur inside the USB boundary, and all of the more than 30,000 acres of required habitat preservation would occur in the Planning Area outside the USB compared to the proposed action, which includes over 6,900 acres of habitat preservation inside the USB and over 27,500 acres outside the USB (Table 2-8) and assumes the remaining natural land covers within the USB would eventually be urbanized (approximately 33,500 acres; Table 2-4).

This alternative failed the first screening criteria because it would not achieve many of the purposes and objectives identified in Section 1.3.3. Objectives 1, 2, 3, 10, and 11 for maintaining the functions of aquatic resources in the Planning Area would not be achieved. This alternative would not allow for establishment of habitat linkages between new preserves in the USB and existing preserves outside the USB, conflicting with Objective 4. This alternative would not protect occurrences of narrowly distributed plant species such as Sacramento Orcutt grass and

[5] Refer to EIS/EIR Appendix D for AMM STREAM-1, AMM STREAM-2, AMM STREAM-3, AMM UTILITY-1, AMM UTILITY-2, and AMM UTILITY-4.

slender Orcutt grass that are known to occur within the USB, conflicting with Objective 8. Impacts to state and federally listed species and their habitats and impacts to aquatic resources would not be avoided to the maximum extent practicable, conflicting with Objectives 9 and 10. This alternative would not achieve Objective 14 because it would not preserve any of the MCRA, an area necessary for the recovery of 12 Planning Area species (USFWS 2005) and an especially important part of the endangered vernal pool tadpole shrimp range (USFWS 2007a). In addition, limiting preserves to the areas outside the USB would not satisfy the purpose and need to maintain the existing native species richness and natural communities in the Planning Area. For these reasons, this alternative was not carried forward for detailed analysis.

Preserve 50% of All Vernal Pools in the Planning Area

This alternative was considered by the Permit Applicants early in the initial period of SSHCP preparation (prior to the publication of the Vernal Pool Recovery Plan (USFWS 2005)) and would preserve a minimum of 50% of the vernal pools (wetted acres) remaining within the Planning Area at that time within new and existing preserves. This alternative would result in only 285 acres of new Vernal Pool preservation in the Planning Area compared to the proposed action, which would result in almost 1,000 acres of new Vernal Pool preservation and almost 400 acres of re-establishment (Table 8-9) in the Planning Area. The proposed action would preserve approximately 89% (Table 8-8) of the vernal pools within the Planning Area within new and existing preserves. The level of habitat preservation provided by this "Preserve 50%" alternative could not achieve several of the stated purposes and objectives (see Section 1.3). For example, this alternative would not provide sufficient preservation of vernal pools to maintain the existing distribution of native animal and plant species in the Planning Area, and therefore, it would not achieve Objective 1 (Section 1.3). This alternative would not provide sufficient preservation of Vernal Pool habitat to maximize protection of native plant and animal species or their ecosystems, which would not achieve Objective 2. This alternative would also not achieve Objective 3 because it would not provide large blocks of interconnected species habitat. This alternative would not achieve Objective 9 because it would not provide sufficient Vernal Pool preservation to avoid or minimize impacts to state and federally listed species and their habitats to the maximum extent practicable. This alternative may not achieve Objective 11 because it would make it less likely that the project could achieve no net loss of watershed function. In addition, it would not achieve Objective 14 because it would not provide sufficient preservation in the vernal pool Core Recovery Areas that are now designated within the Planning Area (USFWS 2005). For these reasons, this alternative would not achieve the stated purposes and objectives for a conservation plan implemented in south Sacramento County. Therefore, this alternative failed the first screening criteria and was not carried forward for detailed analysis.

Maximize Protection of Vernal Pool Wetted Acres in the MCRA Alternative

This alternative was derived from recovery criteria for the vernal pool tadpole shrimp in the MCRA (USFWS 2005) to maximize protection of Vernal Pool wetted acres within the MCRA. It was thought that vernal pool tadpole shrimp would be a good umbrella species for the purpose of developing potential conservation scenarios for the MCRA because vernal pool tadpole shrimp are distributed in vernal pools throughout the MCRA and co-occur in vernal pools or complexes with other listed or rare species in the MCRA. For the purposes of developing maps for potential conservation scenarios, the Vernal Pool Recovery Plan's criterion of 95% of suitable habitat was equated to wetted acres.

Urban development within Sacramento County continued from 2005 to the present, and projects meeting the regulatory requirements of CWA 404 and ESA received local and federal permits years subsequent to 2005. Due to development that has occurred since initial conception of this alternative, this alternative is no longer feasible based on existing conditions and was not carried forward for detailed analysis.

Preserve 76% of the Total Acreage of the MCRA

In 2011, regulatory agencies participating in the SSHCP planning process worked together to delineate a map of important aquatic resources and Vernal Pool habitat remaining in the MCRA (described in Section 2.1.2 as the "blue line map" or "2011 Agency Conceptual Design"). The Conservation Strategy depicted on this map would preserve 76% of the approximately 24,245-acre MCRA.

The large amount of Vernal Pool ecosystem preservation within the MCRA boundary would limit planned urban development within the USB, which overlaps with the MCRA (County of Sacramento 2011; City of Rancho Cordova 2006). This would shift development pressure to other areas that are currently unplanned for growth, since the development planned within the MCRA/USB occurs simultaneously with other regional planned development. For this reason, restrictions in the MCRA/USB would move development pressure to rural areas that are currently outside the USB and/or adjacent cities. These rural areas are typically large agricultural parcels that often support high-quality aquatic resources and species habitat because the inventory of properties with less constraint have been largely developed or are currently planned for development within the USB and adjacent cities. Therefore, this alternative would not achieve Objective 1 and Objective 5, which require protection of enough habitat to conserve every Planning Area Covered Species, including Swainson's hawk and white-tailed kite (*Elanus leucurus*) foraging habitat.

The 76% requirement for Vernal Pool landscape preservation within the MCRA/USB would reduce the available development fees to pay for acquisition of Cropland and Irrigated Pasture-Grassland in the SSHCP Preserve System or would increase fees. Typically, the land prices within the USB are greater than outside the USB, and the 2011 Agency Conceptual Design map did not consider the cost of acquiring a large percentage of lands within the USB for permanent habitat preservation. Analysis by the Permit Applicants determined that it would be economically infeasible for the SSHCP to acquire all parcels needed to achieve the Conservation Strategy mapped in the 2011 Agency Conceptual Design. Under this alternative, the development fees would be higher than fees charged by other HCPs, thus not achieving Objective 15. This alternative would not meet Objective 16 because it would limit urban development in the USB and potentially result in expansion outside currently adopted SOIs for Galt and Rancho Cordova and the Sacramento County USB. Objective 16 discourages expansion beyond these boundaries to maintain sound land use planning principles (e.g., consolidate development within USB and cities to support the efficient provision of utilities and infrastructure; support viable transit; and maintain compliance with land use and air quality regulations such as Assembly Bill 32, Senate Bill 375, and the Clean Air Act).This alternative may also require exercising of eminent domain to acquire some parcels within the MCRA, which is not consistent with Objective 18.

Because this alternative would not achieve several purposes and objectives (Section 1.3.3), this alternative failed the third screening criteria and was not carried forward for detailed analysis.

Preserve 49% of the Total Acreage of the MCRA

As described in Section 2.1.2, the USFWS developed a MCRA Conservation Strategy map in 2011 called the "2011 USFWS Most-Essential Habitat." This Conservation Strategy map identified the most valuable Vernal Pool habitat within the MCRA. The acreage of the "most-essential" Vernal Pool habitat was calculated to be 49% of the MCRA, or 11,880 acres of Vernal Pool ecosystem, which included preserving approximately 342 wetted acres of vernal pools in the MCRA. This amount of habitat preservation in the MCRA would not accommodate housing needs of the projected population growth in the Planning Area (see background discussion in Section 1.3 for information on projected population growth). Therefore, this potential alternative is not consistent with Objective 16, which requires the SSHCP to accommodate population growth and associated housing, economic development, and infrastructure within the currently adopted USB and SOIs of Galt and Rancho Cordova. In addition, this alternative would not achieve Objective 16 since it would lead to more development outside the USB, which would require the extension of utilities and infrastructure outside the USB; would lead to more urban sprawl with more vehicle trips; and would not promote compact mixed-use development that supports viable transit and walkable areas. The extension of utilities and additional transportation infrastructure

required by potential new development outside the USB would also conflict with Objective 17, which requires that master plans already approved by Sacramento County, Galt, Rancho Cordova, and Sacramento County Water Agency (SCWA) to be included as Covered Activities in any alternative analyzed in detail. These master plans focus on provision of new services to development within the USB and Galt's and Rancho Cordova's SOIs. Because this alternative would not achieve Objectives 16 or 17, it failed the third screening criteria and was not carried forward for detailed analysis.

Remove Lands Outside USB From the Planning Area Boundary

Under this potential alternative, the size of the Planning Area would be smaller. The new Planning Area would include the portion of the current Planning Area that is located within Sacramento County's USB and would exclude the areas of south Sacramento County that are outside the USB boundary. This alternative was identified during the scoping process for the EIS/EIR.

Under this potential alternative, the Planning Area covered by the SSHCP permits would not include the area of south Sacramento County that is outside the USB boundary. Therefore, the Planning Area would be limited to approximately 86,480 acres. Approximately 35,570 acres of that potential 86,480-acre Planning Area are already one of the "developed" land cover types (see Table 8-1), and 10,585 acres are already Cropland, Irrigated Pasture-Grassland, Vineyard, or Orchard. Constraining the Planning Area to the USB boundary would not allow the SSHCP Conservation Strategy to establish large preserves of Vernal Pool ecosystem in the area south of the USB and would prevent the SSHCP from achieving many identified needs, purposes, and objectives (Section 1.3). For example, this alternative could not maintain in perpetuity each type of natural community present in south Sacramento County, as is required by Objective 1. This alternative would not protect large, contiguous blocks of species habitat, as required by Objective 4, and would not allow for full implementation of the existing transportation, utility, and other infrastructure master plans outside the USB, as required by Objective 15. Finally, because this alternative would require all preserves to be established inside the USB, the alternative would not allow sufficient urban development within the currently adopted SOIs for Galt and Rancho Cordova and currently adopted USB for Sacramento County, as required by Objectives 16 and 17. Because this alternative would not achieve several objectives, this alternative was not carried forward for detailed analysis.

Remove Lands West of I-5 from the Planning Area Boundary

Under this potential alternative, the size of the Planning Area would be smaller. The western border of the Planning Area boundary would stop at I-5, and the Planning Area would not include lands west of I-5. This alternative was identified during the scoping process for the EIS/EIR.

This alternative would establish all SSHCP Preserves in the Planning Area located east of I-5 and would not preserve Swainson's hawk foraging habitat or other natural land covers west of I-5 because portions of this area are thought to be at risk from flooding and future sea level rise. However, recent species habitat mapping indicates that the Planning Area west of I-5 (in and around Stone Lakes National Wildlife Refuge [NWR]) provides key roosting habitat for greater sandhill crane (*Grus canadensis tabida*) (USFWS 2007b). Establishment of new SSHCP Preserves west of I-5 could provide substantial benefit to the local greater sandhill crane wintering population by enlarging the roosting areas within Stone Lakes NWR and by preserving linkages to existing foraging habitat along the Cosumnes River corridor. This alternative would not achieve Objective 6, which requires establishment of such greater sandhill crane habitat linkages. Alternatives that preserve habitat only east of I-5 could also prevent the establishment of preserves that are consistent with Objective 2, which directs that preserves be located in areas that maximize protection of native plant and animal species and the ecosystems on which they depend.

In addition, this alternative would not achieve Objective 5 because preserved Cropland and Irrigated Pasture-Grassland would not be sufficient to provide adequate amount of foraging habitat for Swainson's hawk and white-tailed kite. There may not be sufficient willing sellers in the lands east of I-5 that would sell land or conservation easements at an appropriate price to meet all SSHCP habitat preservation objectives, and this alternative may not be able to offset the effects of Covered Activities on Swainson's hawk and on other bird Covered Species.

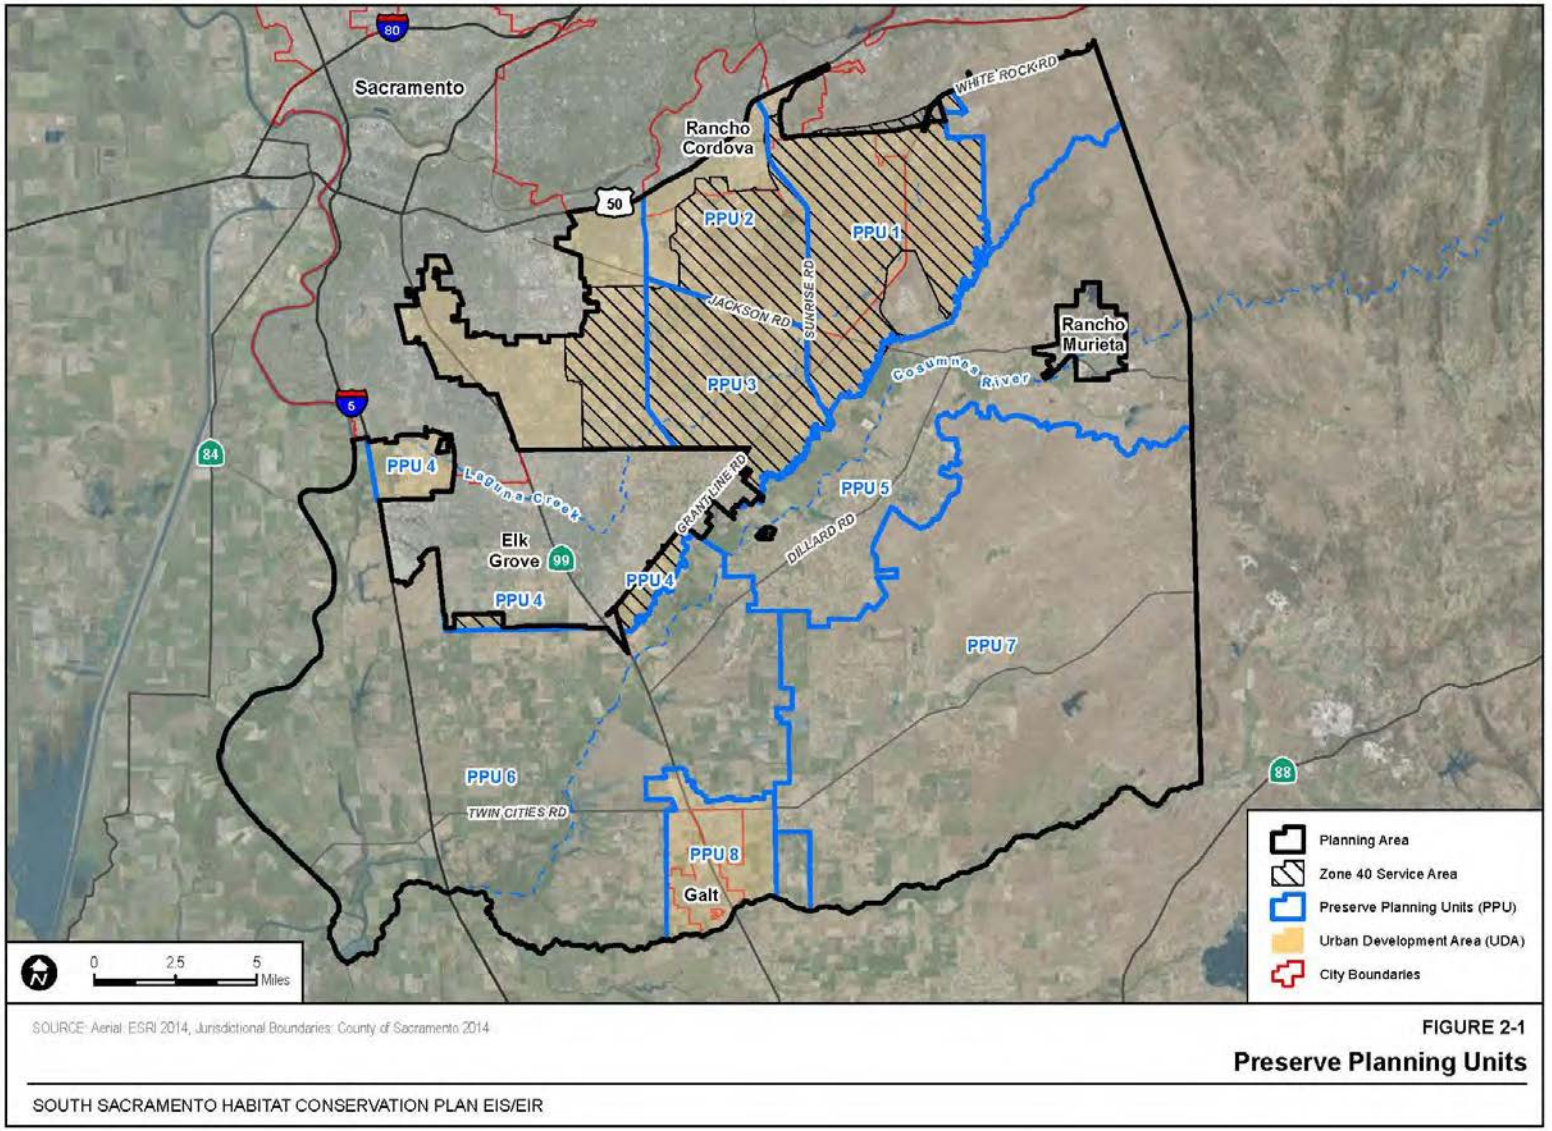
For these reasons, this alternative would not achieve several of the purposes and objectives listed in Section 1.3.3 and failed the first screening criteria. Therefore, this alternative was not carried forward for detailed analysis.

Reduce Impacts to the Highest-Quality Swainson's Hawk Habitat

This alternative would preserve most of the existing Cropland and Irrigated Pasture-Grassland within Preserve Planning Units (PPUs[6]) 4 and 6 of the Planning Area (Figure 2-1, Preserve Planning Units) to reduce impacts to important Swainson's hawk foraging and nesting habitat. This alternative was suggested at public scoping meetings (Section 1.4), and at those times, the entire SOI for the City of Elk Grove was still included in the Planning Area for the SSHCP. Future urban development in that SOI was expected to result in substantial loss of existing habitat, especially for Swainson's hawk and other special status species that use the Croplands and Irrigated

[6] To assist with development of an adequate SSHCP Conservation Strategy, the Permit Applicants divided the Planning Area into eight Preserve Planning Units (PPUs) that encompass areas where important Covered Species resources are present and where habitat preservation would occur (see Figure 1-1 in the SSHCP document). These eight SSHCP PPUs are geographic subdivisions of the Plan Area and were delineated to ensure that adequate Biological Goals and Measurable Objectives would be developed for biological resources in all parts of the Plan Area, including the location and implementation of the SSHCP Preserve System.

Pasture-Grassland that are currently present in much of the Elk Grove SOI. When Elk Grove withdrew from the SSHCP planning effort in 2014, all of the lands that are in Elk Grove's jurisdiction were also removed from the Planning Area. The removal of the current Elk Grove SOI boundaries from the Planning Area greatly reduced the acres of planned new urban development and loss of quality Swainson's hawk habitat requested in the SSHCP's Incidental Take Permits (ITPs). As a result, the alternative would no longer avoid or substantially lessen environmental effects of the proposed project, and it would not address a significant issue related to the proposed action; therefore, the alternative failed the second screening criteria, and analysis of this alternative was not carried forward subsequent to the participation of Elk Grove in the SSHCP.



2.1.6 Alternatives Carried Forward for Detailed Analysis

The following two EIS/EIR Action Alternatives were carried forward for detailed analysis in the EIS/EIR because they are practicable, include provisions to reduce impacts, address the existing issues and underlying needs present in the Planning Area, and will achieve the purposes and objectives presented in Section 1.3:

- **Proposed Action/Proposed Project Alternative (Section 2.3).** The Permit Applicants (future Plan Permittees) would implement categories of Covered Activities and a Conservation Strategy over a 50-year permit term. This is described in the SSHCP document that was prepared by the Permit Applicants and will be included in the ESA and CESA incidental-take permit application packages submitted to the USFWS and CDFW.
- **Reduced Permit Term Alternative (Section 2.4).** The Permit Applicants would implement the same categories of HCP Covered Activities as in the proposed SSHCP but over a shorter 30-year incidental-take permit term. The Permit Applicants would implement a similar HCP Conservation Strategy, but this strategy would result in a smaller, less comprehensive preserve system in the Planning Area (relative to the interconnect SSHCP Preserve System described in the Conservation Strategy of the Proposed Action/Proposed Project Alternative).

In addition to the two Action Alternatives studied in this EIS/EIR (i.e., the Proposed Action/Proposed Project Alternative and the Reduced Permit Term Alternative), a No Action/No Project Alternative is studied in detail. As discussed in Section 2.1.1, a No Action/No Project Alternative must be included in any EIS or EIR.

Figure 2-1 Preserve Planning Units

INTENTIONALLY LEFT BLANK

2.2 NO ACTION/NO PROJECT ALTERNATIVE

Under the No Action/No Project Alternative, the SSHCP would not be approved or implemented, and no comprehensive ESA and CESA ITPs would be issued to the Permit Applicants for species impacts resulting from future development projects and activities within the Planning Area.

Also, the local agencies (that are Land Use Authority Permittees under the SSHCP) would not implement a local Aquatic Resources Program (ARP) and associated local aquatic resource protection ordinances. Thus, there would be no local-level aquatic resources permitting program. In addition, the USACE would not develop a strategy for permitting these future projects and activities under CWA 404. Finally, the CDFW would not develop a streamlined permit strategy for the future development projects and activities, and the CDFW would not issue a Master Streambed Alteration Agreement (MSAA) to the Permit Applicants.

Under the No Action/No Project Alternative, project proponents (including local agencies and individual private developers) would continue to apply directly to the resource agencies for permits for species take under the ESA and CESA, as well as for CWA 404 authorizations for projects proposing to discharge dredged or fill material into wetlands and other waters of the United States, and for 401 and CDFW MSAA authorizations. Therefore, the No Action/No Project Alternative would continue the conventional project-by-project project regulatory reviews in which individual project developers apply for necessary project permits independently with each of the resource agencies with application review proceeding in a less systematic, comprehensive fashion.

2.2.1 Future Projects/Activities Likely Under the No Action/ No Project Alternative

The types of future projects and activities expected in the Planning Area under the No Action/No Project Alternative are described in the following text.

Future Urban Development

All lands within the Sacramento County USB are zoned or ultimately planned for urban development, as described in the adopted *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011, 2014a). Similarly, all lands within Galt and the Galt SOI, as well all lands within the Rancho Cordova SOI are zoned or ultimately planned for urban development, as described in those adopted General Plans (Galt 2009; Rancho Cordova 2006) (Figure 1-1).

Five Urban Development Master Plans (Arboretum, Cordova Hills, Jackson Township, NewBridge, and SunCreek) for large urban development projects are currently under preparation or have recently been approved in the UDA. These five Urban Development Master Plans were designed

to comply with SSHCP requirements and include preserves that would likely be similar in size, acreage, and location under the No Action/No Project Alternative.

The No Action/No Project Alternative assumes that all lands zoned or ultimately planned/contemplated for urban development in these five adopted General Plans that are not already currently developed would eventually become developed, which the EIS/EIR terms "full buildout." The Permit Applicants expect full buildout to occur over a 50-year period.

Although all lands within the Sacramento County USB are zoned or ultimately planned for urban development (County of Sacramento 2011, 2014a), not all of the land inside Sacramento County USB has specific urban land use designations at this time.

Full buildout would continue and include some on-site project avoidance of natural land covers[7] through both designated preserves and open space within the boundaries of the urban development projects. Other preserves would continue to be outside the UDA as off-site mitigation for private and public projects inside and outside the UDA.

Expansion, Improvement, Maintenance, and Operation of Public Infrastructure Systems

In association with the expected future urban development, the public infrastructure systems such as water, wastewater, recycled water, stormwater, flood control, solid waste, and utility systems, as well as transportation systems, would be expanded or improved, as described in several local and regional infrastructure agency master plans and/or capital improvement programs (Sacramento Area Sewer District 2010, 2014; Regional San 2000, 2015; SCWA 2005).

Although it is not included in these regional infrastructure plans or capital improvement programs, the South Sacramento County Agriculture and Habitat Lands Recycled Water Project (Regional San 2015) is also assumed to proceed under the No Action/No Project Alternative. This project would include new pumping and water transmission pipelines in the UDA and water distribution pipelines outside the UDA.

The SCWA and the Sacramento Area Flood Control Agency would continue to separately construct water pipeline, pumping station, and flood control infrastructure maintenance and improvements that are not identified in their master plans or capital improvement projects. These miscellaneous minor improvements or maintenance efforts would serve individual

[7] Natural land covers are those SSHCP land cover types that provide habitat for Covered Species and include Blue Oak Savanna, Blue Oak Woodland, Cropland, Freshwater Marsh, Irrigated Pasture-Grassland, Mine Tailings Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland, Open Water, Orchard, Seasonal Wetland, Stream/Creek, Stream/Creek (VPIH), Swale, Valley Grassland, Vernal Pool, and Vineyard, as discussed in Table 8-1.

development projects or address newly discovered system vulnerabilities. All of the new and existing public infrastructure facilities would be operated and maintained.

Road Improvements

Existing roadways would continue to be expanded and improved in the Planning Area, as discussed in the adopted General Plans. The majority of this expansion and improvement would be within the UDA to serve the transportation needs of new development and increased population. However, roads outside the UDA would also be improved to facilitate transportation between developed areas as follows:

- Road improvements described in the Sacramento County General Plan Circulation Element and associated Transportation Plan map (Sacramento County 2014b)
- Road improvements in the City of Rancho Cordova as directed by the *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (City of Rancho Cordova 2006) and Capital Improvement Plan[8] (Rancho Cordova 2013)
- Road improvements in the City of Galt and its SOI as directed by the *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009)
- Minor roads in the Planning Area that are not specifically identified for expansion or improvement in adopted General Plans of Sacramento County or Galt or Ranch Cordova to serve new and existing development

2.2.2 Expected Regulatory Environment Under the No Action/ No Project Alternative

Permitting and Local Entitlement Process

The No Action/No Project Alternative assumes that new projects and activities would seek entitlements and permits as they do now, following the conventional project-by-project review process. For the local land use agencies (i.e., Sacramento County, Galt, or Rancho Cordova), this process includes the review of building permits, grading permits, and use permits, as well as parcel maps, subdivision maps, specific plans, and master plans. Depending on the project details, some projects would be subject to CEQA review. In addition, individual projects would continue

[8] Capital Improvement Plans or Capital Improvement Programs, commonly referred to as CIPs, are short-range plans (typically over a 5–10 year horizon) that identify capital projects that an organization or public agency expects to develop. The definition of a capital projects can vary, but they generally include all long-lived infrastructure such as water facilities, sewers, streets, parks, and buildings, along with equipment. Utility providers often prepare and maintain utility master plans that are similar to CIPs.

to comply with any applicable policies contained in the adopted General Plans of Sacramento County, Galt, and Rancho Cordova.

Future Project Compliance with ESA and CESA

Under the No Action/No Project Alternative, projects subject to CEQA review would continue to reviewed individually by the CDFW under the conventional project-by-project review process, and projects with the potential to result in the direct take any state-listed species would be required to apply for an individual CESA incidental take permit under Section 2081(b) of the California Fish and Game Code. Similarly, the No Action/No Project Alternative would continue the existing project-by-project ESA-compliance process currently used by development projects and activities within the Planning Area. Currently, the most common way for development projects and activities in this Planning Area to receive their ESA clearance is through an ESA Section 7 consultation initiated by a federal agency, such as USACE, that is making a permit-issuance decision or another discretionary federal decision about the proposed project or activity. For example, **for** projects or activities that ~~could result in the direct fill or discharge to waters of the US must obtain~~ **require** USACE authorization under Section 404 of the Clean Water Act (CWA 404), ~~and~~ the USACE must ensure that the~~ir authorization~~ **permit** decision complies with the ESA. Therefore, the USACE consults with the USFWS and/or the National Marine Fisheries Service (NMFS) on the potential impacts of their permit or authorization decision on federally listed species and designated Critical Habitat. As part of this ESA Section 7 consultation, the USFWS (or NMFS) typically prepares an ESA Section 7 Biological Opinion document, which identifies any species-impact avoidance and minimization requirements, as well as any habitat preservation requirements needed to compensate for the project impacts on federally listed species. The USACE will incorporate the terms, conditions, and requirements of the ESA Section 7 Biological Opinion into the project's CWA 404 permit authorization as a special condition. If the USFWS determines during ESA Section 7 consultation, that the project is likely to jeopardize the continued existence of a federal species, or that the project is likely to result in the destruction or adverse modification of Critical Habitat, that project could not proceed without modifications. However, many of the future projects and activities within the UDA would continue to be implemented without obtaining USACE authorization under CWA 404, and therefore would not be reviewed under ESA Section 7. These projects may continue to receive building permits from Sacramento County, City of Galt, or City of Rancho Cordova for construction in or near habitat for federally listed species, but if the project does not ~~cause~~ **result in a** direct ~~fill or~~ discharge **of dredged or fill material** into waters of the U.S., the project would not be required to request CWA 404 authorization from the USACE. Projects and activities that do not request a CWA 404 authorization are not likely to be reviewed under the ESA, and therefore, the project would not mitigate or compensate impacts to listed species. Especially, indirect impacts to species and species habitat that occur later in time are often unmitigated within the UDA, such as indirect

impacts that result from altered surface and subsurface hydrology (which changes vernal pool inundation regimes), unseasonal landscaping irrigation and nuisance flows in to vernal pool habitat, increased invasive plant species, species disturbance and mortality by domestic dogs and cats, human recreation, increased trash, and increased wildfire frequency. These Planning Area unmitigated indirect impacts generally occur when the aquatic resource and species habitat is located on an adjacent parcel with a different owner, and the aquatic resources are not shown to be part of the pending project when it is reviewed by the local land-use authority (e.g., Sacramento County, Galt, or Rancho Cordova), or there is no CEQA nexus, or no CWA 404 permit or NEPA is required.

As part of the individual project ESA and CESA consultations, USFWS or CDFW are expected to continue requiring projects to implement impact Avoidance and Minimization Measures (AMMs), which may include species surveys conducted using ~~USACE~~ **USFWS** or CDFW protocols, species specific construction timing restrictions (i.e., construction windows), equipment use restrictions, addition of buffers[9] or setbacks to the project design, as well as other project-specific impact avoidance measures.

Currently, USFWS works with individual project proponents to include a "buffer" between the project's footprint and any adjacent species occurrence or species habitat that could be indirectly affected by the project or activity. The width of the buffer/setback needed to effectively avoid or minimize project impacts to species is determined through project-by-project consultations with the USFWS and CDFW, and is based on site-specific conditions.

As a result of each individual consultation with the USFWS and CDFW, different types of ESA and CESA compensation or mitigation would continue to be required by individual projects to offset unavoided project impacts to listed species under the No Action/No Project Alternative:

- The project proponent avoids and permanently preserves species habitat at the project site (i.e., on site preserves), and provides an endowment and a management plan to maintain species habitat on those preserves;
- The project proponent purchases existing habitat in off-site areas, puts a conservation easement on the property, and provides an endowment and a management plan to maintain species habitat on those preserves by a third party (i.e., are "turn-key" preserves);
- In certain cases, the project proponent would be allowed to offset species impacts by purchasing credits at a USFWS or CDFW approved habitat conservation bank;
- or a combination of some or all of the above.

[9] A buffer is the linear distance that a development footprint must be located away from the edge of a natural resource, such as species occurrence, an aquatic resource, or natural lands.

One of the Core Recovery Areas identified in the Vernal Pool Recovery Plan (USFWS 2005) is the MCRA. It is located largely inside Sacramento County's USB and is approximately 24,245 acres in size (Figure 1-2). Species populations and habitat present for which the MCRA is necessary for the recovery of species listed under the ESA, including the Sacramento Orcutt grass, slender Orcutt grass, vernal pool tadpole shrimp, and vernal pool fairy shrimp (*Branchinecta lynchi*), as well as Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), legenere (*Legenere limosa*), mid-valley fairy shrimp (*Branchinecta mesovallensis*), and western spadefoot (*Spea hammondii*). Recovery Criteria are identified for each of these species in the 2005 Vernal Pool Recovery Plan. The MCRA is designated as a Zone 1 Core Recovery Area (USFWS 2005). Protection of habitat and species occurrences in Zone 1 Core Recovery Areas would support metapopulation dynamics, provide for reintroduction or introduction sites, protect known and undiscovered populations, and prevent the extinction or irreversible decline of several listed species, often including a narrowly endemic species.

The USFWS has tracked loss of habitat for Vernal Pool species within the MCRA since the Vernal Pool Recovery Plan was adopted (Holland 2009). Further, the vernal pool tadpole shrimp, vernal pool fairy shrimp, Sacramento Orcutt grass, and slender Orcutt grass are becoming increasingly imperiled across their range (USFWS 2007b, 2007c, 2008, 2009). The MCRA includes population occurrences and high-quality habitat for each of these species, including the highest densities and largest populations of vernal pool tadpole shrimp present within the species' range (USFWS 2007b). Due to these factors and a need to protect habitat and species population in the MCRA for recovery of Vernal Pool species, the USFWS Sacramento office prioritizes preservation of vernal pools within the MCRA over preservation of vernal pools elsewhere for projects that impact vernal pools within the MCRA.

Therefore, over the next 50 years, the USFWS is expected to require new development projects and activities to provide increasingly greater amounts of compensation for impacts to federal and state-listed species within the MCRA, due to the ongoing and projected level of demand for urban development land use in the MCRA, and corresponding decline in habitat conservation opportunities. Therefore, it would be increasingly difficult for individual project proponents to protect large blocks of suitable habitat when project mitigation (habitat preservation or compensatory mitigation) is a result of set-asides, and/or land acquisition and purchase. Likewise, conservation banks and mitigation banks are typically not economical to establish in areas targeted for urban development where land prices are high, such as the MCRA. Zone 40 is an existing special benefit zone created by the SCWA and established in 1985 and expanded in 2005. Zone 40 is mostly located within Sacramento County's USB, and includes portions of Rancho Cordova and Elk Grove (Figure 2-1). Approximately 21,936 acres of the total 24,245-acre MCRA is within Zone 40 portion of the UDA. A portion of the Zone 40 water supply is provided through the

Freeport Regional Water Project, which diverts surface water from the Sacramento River and conveys it to a treatment plant located within Zone 40.

A 2004 Memorandum of Agreement (MOA) (Sacramento County et al. 2004) was signed between the USFWS, Sacramento County, SCWA, and Regional San to ensure implementation of all conservation commitments and all terms and conditions associated with two USFWS Biological Opinions related to delivery of water to Zone 40 (USFWS 1999a, 2004). The MOA (Sacramento County et al. 2004) states that proposed new residential or commercial development projects within Zone 40 that will use water delivered by the SCWA through the Freeport Regional Water Project will first complete ESA consultation (informal or formal consultation, Section 10 or Section 7) with the USFWS before receiving any project approvals or entitlements from a local land use jurisdiction (e.g., Sacramento County or Rancho Cordova). The MOA requirements were a condition for the Freeport Regional Water Project construction permits. The 2004 MOA identifies conservation measures that the U.S. Bureau of Reclamation, the San Juan Water District, Sacramento County, SCWA, and the City of Folsom will implement to avoid or to mitigate the indirect impacts of delivering Freeport Regional Water Project water to new urban growth within Zone 40 (County of Sacramento et al. 2004). One MOA conservation measure is to expedite the completion of a regional HCP that would include regional conservation measures that could mitigate the indirect effects of providing Freeport Regional Water Project water to the new development planned within the Zone 40 area. However, until a regional HCP is approved, the MOA states that the SCWA will not provide new service[10] from Freeport Regional Water Project facilities to any new building, development project, or new facility until the project proponent has complied with the ESA (Sacramento County et al. 2004). To assure this, Sacramento County and Folsom agreed to withhold all discretionary project approvals (e.g., grading permits and tentative/final map) for new projects intended to receive new service that could result in take of ESA-listed species until the project shows that is has complied with the ESA.

At the time of EIS/EIR preparation, the development projects proposed in the Zone 40 service area have demonstrated to Sacramento County that each proposed development project would have adequate groundwater supply without using surface water delivered by the Freeport Regional Water Project facilities. Therefore, the Zone 40 proposed development projects have obtained or are in the process of obtaining entitlements from Sacramento County (or from other local land use authority) based on the assumed water availability from other sources. Thus, there is no precedent to determine how much ESA mitigation will be required to offset the indirect

[10] For the purpose of this MOA "new service" means service that was not in existence and would not exist absent the Freeport Regional Water Project.

impacts of Freeport Regional Water Project water deliveries to individual new urban development project within Zone 40.

However, because future development projects within Zone 40 must comply with the federal ESA before local land use authorities provide entitlements and discretionary project approvals, the lead agencies assume that the USFWS would begin to have earlier input on project designs within Zone 40. This earlier ESA avoidance and minimization input from the USFWS is expected to result in more effective on-site avoidance and minimization of species impacts under the No Action/No Project Alternative compared to the existing conditions, where projects were sometimes too far along in design to feasibly add the maximum avoidance or preservation species habitats, including vernal pools.

Future Project Compliance with Section 404 of the Clean Water Act

Aquatic resources regulated by CWA 404 often provide habitat for species listed under the CESA and ESA. As discussed above, prior to making a decision on a project's CWA 404 authorization, the USACE must assure that their authorization decision complies with the ESA by consulting with the USFWS (and/or NMFS) under ESA Section 7.

In addition, the USACE must assure that ~~their~~ CWA 404 authorizations comply with Section 106 of the National Historic Preservation Act (NHPA 106). The National Historic Preservation Act protects cultural resources that are listed or are eligible to be listed on the National Register of Historic Places. Therefore, the USACE would continue to consult with the State Historic Preservation Office under NHPA 106, as needed for individual projects that receive CWA 404 authorizations.

Proponents for i~~I~~ndividual projects or activities in the Planning Area that may result in fill or discharge to waters of the U.S. would continue to request CWA 404 authorization from the USACE. The USACE evaluates two types of permits under CWA 404: General Permits (nationwide, regional, and programmatic) and Individual Permits (Letters of Permission and Standard Permits). Under existing regulatory conditions, each project or activity applies individually to USACE for a CWA 404 authorization. For future projects or activities with minimal individual and cumulative environmental impacts, projects would continue to apply for CWA 404 General Permits (nationwide permits, or regional general permits). Projects or activities that result in impacts to aquatic resources that exceed the limits for use of a nationwide permit, do not meet the terms and conditions of a ~~nationwide~~ **general** permit, or are determined to have more than minimal impacts, would continue to require individual permits (standard permits or letters of permission). ~~CWA 404 applications for standard permits would continue to require additional analyses and procedures, and therefore would continue to add time, complexity, and uncertainty to the project schedule and budget.~~

For **proposed** discharges of dredged or fill material authorized under CWA 404, adverse impacts to waters of the U.S (WOUS) must be avoided and minimized to the extent practicable. For unavoidable adverse impacts, compensatory mitigation ~~is~~ **may be** required to replace the loss of functions and services of those wetlands and other waters. In 2008, the USACE and the U.S. Environmental Protection Agency (USEPA) jointly issued regulations for compensatory mitigation titled *Compensatory Mitigation for Losses of Aquatic Resources: Final Rule, 33 CFR Parts 325 and 332* (USACE and USEPA 2008). The term "compensatory mitigation" refers to the restoration, re-establishment establishment, enhancement, and/or preservation of wetlands, streams, or other waters specifically for the purpose of offsetting loss of waters of the US caused by authorized discharges of dredged or fill material.

To determine the amount of CWA 404 compensatory mitigation that is required, the USACE would continue to refer to the 2008 Compensatory Mitigation Rule and use the USACE South Pacific Division's *Standard Operating Procedure for Determination of Mitigation Ratios* (2013) (or compensatory mitigation standards that are in use at the time of the project's CWA 404 permit application review). The amount of compensatory mitigation would continue to be sufficient to replace lost aquatic resource functions and services, to the extent practicable. In cases where functional or condition assessments or other suitable metrics are not used to determine loss of functions and services, a minimum one-to-one acreage or one-to-one linear foot compensation ratio (i.e., a 1:1 mitigation ratio) required by the 2008 Compensatory Mitigation Rule would be ~~used~~ **assumed to be required**.

~~In addition to setting minimum compensatory mitigation amounts, t~~**T**he 2008 Mitigation Rule establishes equivalent standards for types of compensatory mitigation ~~projects~~ **(33 CFR Part 332.2(b))**. The three ~~types of~~ **general options for** compensatory mitigation ~~projects~~ are: ~~use of~~ mitigation bank~~s~~ **credits**, ~~use of~~ in-lieu fee program~~s~~ ~~or~~ **credits**, **and** permittee-responsible mitigation ~~projects~~. Use of mitigation bank~~s~~ **credits** and use of in-lieu fee program~~s~~ **credits** are the preferred forms of CWA 404 compensatory mitigation under the 2008 Mitigation Rule, as they usually involve consolidating compensatory mitigation projects in ecologically appropriate locations using a watershed approach, they consolidate resources~~, and they provide financial planning and scientific expertise (which often is not practical for permittee-responsible mitigation projects)~~, they reduce temporal losses of functions, and they reduce uncertainty over mitigation project success. The 2008 Mitigation Rule would continue to require the USACE to consider compensatory mitigation options in the following order: 1) credits from a mitigation bank; 2) credits from an in-lieu fee program; 3) permittee-responsible mitigation under a watershed approach; 4) permittee-responsible mitigation through on-site and in-kind mitigation and; 5) permittee-responsible mitigation through off-site and/or out-of-kind mitigation.

In the 2011 Record of Decision (ROD) prepared by the USACE for the Sunridge Specific Plan EIS (SPK-2009-00511; USACE 2011), the USACE made a finding that, recognizing a significant cumulative loss of Vernal Pool wetlands within the MCRA, for any future unavoidable impacts to Vernal Pool wetlands within the MCRA, compensatory mitigation shall be:

1. Based on a method for assessing the functions of all wetlands and other waters of the U.S. on the project site;
2. Accomplished at a ratio of greater than 1:1, after considering direct and indirect impacts, temporal loss and difficulties creating vernal pool wetlands; and
3. Located within the MCRA, unless determined impracticable or inappropriate by the Corps.

Because these USACE findings are part of the existing regulatory environment, the above findings are expected to continue under the No Action/No Project Alternative. Therefore, the descriptions of the No Action/No Project Alternative presented in Sections 2.2.3 and 2.2.4 and the No Action/No Project Alternative impact analyses presented in Chapters 4–18 assume that future CWA 404 compensatory mitigation required for vernal pool losses inside the MCRA would be located inside or adjacent to the MCRA boundary. (However, it should be noted that the Sunridge Specific Plan ROD (USACE 2011) requirements apply only to vernal pools and not to other types of waters and aquatic resources, and that finding No. 3 of the Sunridge ROD provides the USACE some flexibility in judgment).

Therefore, as Vernal Pool wetlands within the MCRA continue to be lost, even if compensatory mitigation for lost Vernal Pool wetlands occurs within the MCRA, the USACE could recommend denial of one or more future CWA 404 applications, or the EPA could use their project veto authority under CWA Section 404(c). (It is also noted for clarity that, as part of the CWA 404 program's procedures, the USACE or EPA could make these decisions for other CWA 404 permit applications in other parts of the Planning Area for reasons involving availability of appropriate compensatory mitigation or based on other justifications relating to compliance with CWA 404 regulations).

Future Project Compliance with CWA 401 and Porter-Cologne Water Quality Control Act Project Compliance

Under CWA 401, projects and activities that require authorization of a federal license or permit that may result in the discharge of a pollutant into wetlands and other waters of the United States must also obtain a CWA 401 water quality certification from the state in which the discharge would originate. In California, the EPA has delegated the authority to grant water quality certifications to the State Water Resources Control Board (SWRCB), which are typically processed by the RWQCBs with local jurisdiction. A water quality certification

requires the project or activity to evaluate its potential impacts and implement appropriate measures to protect water quality and to comply with regulatory water quality standards.

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) is California's primary statute governing water quality and water pollution issues with respect to surface water and groundwater. The Porter-Cologne Act grants the SWRCB and the RWQCBs power to protect water quality. The Porter-Cologne Act grants the SWRCB and the RWQCBs authority to adopt plans and policies, to regulate discharges of waste to surface and groundwater, to regulate waste disposal sites, and to require cleanup of discharges of hazardous materials and other pollutants.

The RWQCBs' jurisdiction includes wetlands and other waters of the United States, as well as areas that meet the definition of wetlands and other "waters of the state." Wetlands and other waters of the state are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. The RWQCBs have the discretion to take jurisdiction over areas not federally protected under CWA 404, provided the areas meet the definition of wetlands and other "waters of the state."

Each project or activity would apply separately to the Central Valley RWQCB for a CWA 401 water quality certification under the No Action/No Project Alternative. The certification would declare that the discharge will comply with applicable provisions of the CWA 401, including water quality standards set by the state pursuant to the Porter-Cologne Act. California's water quality standards specify the designated use of a stream or lake (e.g., for water supply or recreation), pollutant limits necessary to protect the designated use (in the form of numeric or narrative criteria), and policies to ensure that existing water uses will not be degraded by pollutant discharges.

Summary of ESA, CWA 404, and CESA Compliance under the No Action/ No Project Alternative

Project compliance with state and federal laws that pertain to the special-status species and aquatic resources would continue to be achieved through individual consultations and individual permit applications. This individual project-by-project permitting process would continue to result in a project-by-project compensation, including compensatory mitigation for impacts to aquatic resources regulated by CWA 404. While CWA 404 mitigation is often accomplished using conservation and mitigation bank credits (e.g., the 2008 Federal Mitigation Rule puts mitigation banks at the top of its compensatory mitigation hierarchy), there would not likely be as much opportunity for regional coordination of compensatory mitigation as there would be with a regional HCP.

Each project proponent would continue to initiate individual consultations or permit applications with the different regulatory agencies, which currently requires substantial agency time and effort, can delay project implementation, and can add cost to the project.

ESA and CESA violations and unauthorized activities under CWA 404 and/or 401 may not be identified in a timely fashion (or at all) on some projects, particularly at project sites that are not subject to CEQA, such as a building permit for a commercial structure on a parcel with the appropriate commercial zoning. In some cases, these are large lots that may contain wetlands or other habitat for state and/or federally listed species; however, not all impacts to habitat would be identified consistent with ESA, CESA, or CWA requirements. For example, impacts are more likely overlooked on projects that are not subject to CEQA because the potential environmental impacts would not be identified in an Initial Study or EIR, and the proponent may not have the expertise to identify biological resources or understand the regulations, and the project impacts to species or habitat is beyond the purview of the regulators reviewing the building plans.

The cost and time required to obtain individual CWA 404 and ESA authorizations under the No Action/No Project scenario would result in some projects avoiding the requirement to obtain ESA and CWA 404 authorizations by designing the project footprint to avoid direct impact to existing aquatic resources and/or species habitat. For example a subdivision may have an undeveloped remainder lot that contains on-site wetlands. Over time, the avoided aquatic resources would likely be indirectly impacted from the nearby urban developments. This would continue to result in unpermitted (and therefore unmitigated) direct and indirect impacts under the No Action/No Project Alternative.

Future Project Compliance with California Fish and Game Code/Section 1600 Compliance

The No Action/No Project Alternative would continue the existing project-by-project permitting process for Lake and Streambed Alteration Agreements (LSA) under California Fish and Game Code Section 1600. Each project proponent would submit to the CDFW a Streambed Alteration Application for “any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake” (California Fish and Game Code, Section 1602). CDFW would review the proposed project, and if necessary, provide the applicant with a list of suggested measures, which can include development setbacks from the lake or stream, to protect affected fish and wildlife resources. The final proposal would be mutually agreed upon by CDFW and the applicant. This project-by-project process would continue to require project proponents to engage in back-and-forth discussions with CDFW, adding time and expense to their project.

Future Project Compliance with Local Environmental Policies Compliance

Existing natural resource policies that are included in the Sacramento County Code, the Sacramento County General Plan (Sacramento County 2011) and the General Plans for Galt (2009) and Rancho Cordova (2006) would continue to be applied to new projects and activities implemented under the No Action/No Project Alternative.

Sacramento County's existing Swainson's Hawk Ordinance would remain in effect under the No Action/No Project Alternative and would apply to projects and activities implemented both within the USB and outside the USB. This ordinance would continue to provide opportunities for future projects and activities implemented under the No Action/No Project Alternative (Section 2.2.2) to mitigate impacts to Swainson's hawk in two ways: (1) by payment of a fee, or (2) through dedication of conservation land. For projects affecting more than 40 acres of Swainson's hawk habitat, payment of a fee would not be an option. Although any dedicated lands used for Swainson's hawk mitigation must be approved by Sacramento County and CDFW, the Swainson's Hawk Ordinance does not require that the dedicated lands be high-quality habitat or be connected to other preserved lands. Therefore, under the No Action/No Project Alternative, Swainson's hawk mitigation would continue to be uncoordinated and implemented on a project-by-project basis, and would not necessarily be located on high-quality Swainson's hawk habitat.

Sacramento County's General Plan policy encouraging new development to be setback from streams and creeks in the Planning Area (General Plan Policy CO-115) would continue under the No Action/No Project Alternative future condition. This policy suggests 100-foot-wide setbacks, measured from the top of the stream bank to the adjacent development or agricultural activities, and includes two supplemental 50-foot setbacks added to the 100-foot setback. However, setbacks are suggested rather than required under this policy. Project stream setback requirements will continue to be imposed by Sacramento County through individual project CEQA process as mitigation for potential project impacts, and would continue to vary widely from the suggested setbacks listed in Policy CO-115.

2.2.3 Loss of Natural Lands Under the No Action/No Project Alternative

The majority of existing natural lands would be removed in the UDA as a result of new urban development and associated infrastructure envisioned in the adopted Sacramento County General Plan, adopted Rancho Cordova General Plan, and adopted Galt General Plan, as discussed in Section 2.2.1. Natural lands include all land except Aqueducts, Disturbed Land,[11] Low- and High-Density Development, Major Roads, Mine Tailings, and Recreation/Landscaped areas.

[11] The disturbed land cover type is defined as open space areas that have been subject to previous or ongoing disturbances such as along roadsides, trails, and parking lots. Scraped or graded land, gravel mining, and waste

The lead agencies assumed that the No Action/No Project Alternative would include the full buildout over of the UDA[12] the next 50 years, with the exception of approximately 1,900 acres of natural lands now located within the MCRA, as discussed in the following text.

The lead agencies reviewed assumptions about current and expected future regulatory requirements for the MCRA, as described in Section 2.2.2. Based on those future regulatory requirements, the lead agencies estimated approximately how much undeveloped land currently remaining inside the MCRA could reasonably be developed if the Vernal Pool wetland ESA and CESA mitigation requirements for that development also occur within the MCRA, as discussed above in Section2.2.2. The lead agencies also estimated the number of acres of each natural land cover within the MCRA that would be developed under different species and wetland mitigation scenarios over a 50-year period.

Professional judgement was used in modeling conceptual mitigation scenarios under the regulatory environment of the No Action/No Project Alternative described in 2.2.2.The lead agencies considered the requirements for ESA and CWA 404 mitigation that have occurred within Sacramento County since the designation of the MCRA in 2005 (USFWS 2005) and the best available scientific information on the status of the species and aquatic resources in the MCRA.

Using these trends in requirements and best available information, the lead agencies estimated minimum and maximum amounts of development and resultant preserves for ESA and CWA 404 mitigation.

The amounts of resource avoidance and preservation required by the expected regulatory setting in Section 2.2.2 restricts the amount of currently undeveloped land within the UDA that can be built out under the under the No Action/No Project Alternative.

Five large Urban Development Master Plans (Arboretum, Cordova Hills, Jackson Township, NewBridge, and SunCreek) are currently proposed within the UDA. These five Urban Development Master Plans were designed to comply with SSHCP requirements, including the establishment of large on-site preserves ranging in size from 100 to 600 acres. It is likely that preserves for the Urban Development Master Plans would be of similar size and location

disposal sites are included in this land cover type. Disturbed land cover type is vegetated with diverse weedy flora. These areas are of special concern as they tend to harbor and facilitate the spread of invasive plant species. Vascular plant species associated with the disturbed land cover typically include Johnson grass, Canadian horseweed (*Conyza canadensis*), milk thistle, yellow-star thistle (*Centaurea solstitialis*), stinkwort (*Dittrichia graveolens*), and field bindweed (*Convolvulus arvensis*).

[12] "Full Buildout" of the UDA means all currently undeveloped lands that are zoned for, or are ultimately planned/contemplated for future urban development in the adopted general plans of the Permit Applicants would become developed. Full buildout of the UDA will includes some open space and conservation lands within the areas of new urban development.

established under the No Action/No Project Alternative. In some cases, even larger preserves may be required in association with CWA 404 authorizations and associated ESA approvals for these Urban Development Master Plans if there is no comprehensive regional habitat conservation plan. For this reason, one or more of these Urban Development Master Plans may not be developed as proposed due to its inability to acquire adequate land for mitigation.

Instead, the master planned areas may be developed in a manner that avoids CWA 404 permitting requirements by designing the project to be located 50 feet or more outside the existing aquatic resources. Although, the USFWS may expect there to be direct and/or indirect impacts from development this close to aquatic resources, which might support listed species, the development community often does not consult with the USFWS and/or obtain ITPs because the habitat is not on the property owned by the developer and/or they argue that there is no take of species. Consequently, the remaining aquatic resources would not be protected by conservation easements; therefore, there is a potential for impacts to occur that would not happen on a managed preserve, which is fenced and maintained. Typical activities that occur on unmanaged vacant land include spread of invasive plants; illegal dumping; off-road motor vehicle use; and informal trails for runners, hikers, equestrians, BMX, and mountain bike riders. These uses can ultimately result in the unmitigated loss of habitat on natural lands.

If the Urban Development Master Plans are developed with larger preserves than currently proposed, the result would be less urban development within the MCRA/UDA. Under the maximum mitigation scenario modeled by the lead agencies, expected new urban development in the MCRA would occur within a matrix of avoided vernal pools and wetlands and would be less dense than typical urban development; however, the anticipated population growth over the next 50 years and associated housing and development needs would not change (Section 1.2.1). Therefore, the No Action/No Project Alternative assumes that up to 1,900 acres of additional new development would occur in locations outside the current USB. Sacramento County planners identified the following list of four locations outside the USB that would undergo development pressure under the maximum mitigation scenario:

1. Northeast portion of the Planning Area, south of White Rock Road
2. North-central portion of the Planning Area, south of Kammerer Road
3. Rancho Murieta expanding to the west or northwest
4. South-central portion of the Planning Area, expanding the rural towns of Wilton and Herald

In addition, natural lands would be removed outside the UDA as a result of recycled-water pipeline projects, planned road expansions, road widening, intersection improvements, and bridge-crossing improvements. The EIS/EIR assumes that pipeline and road projects outside

the UDA that would be Covered Activities under the Proposed Action/Proposed Project Alternative (Section 2.3.3) would occur under the No Action/No Project Alternative. These road and pipeline projects are described in the adopted General Plans (Sacramento County 2011; Rancho Cordova 2006; Galt 2009) or in other regional planning documents (Connector JPA 2012; Regional San 2015).

For the same reasons described previously for future urban development in the MCRA under the No Action/No Project Alternative, the lead agencies assumed that planned expansions or extensions of roadway improvement projects inside the MCRA may not receive necessary ESA or CWA 404 authorizations, and permit approvals and entitlements if they are unable to avoid vernal pools and other wetlands. If roadway alignments cannot be revised to avoid Vernal Pool or other wetlands, segments of roadways may not be expanded or extended as envisioned by the Circulation Elements of the Sacramento County General Plan and City of Rancho Cordova's General Plan.

Under the scenario of maximum new development in the UDA, of the existing 272,596 acres of natural land covers present within the Planning Area, a maximum of approximately 35,532 acres could be removed by new projects and activities implemented under the No Action/No Project Alternative (Table 2-1). See Chapter 8 and Table 8.4 for more detailed discussion for losses of natural land cover types. Approximately half, or 17,091 acres, of the natural lands lost to new development are expected to be annual grasslands that support vernal pools and swales (i.e., the Vernal Pool ecosystem).

Table 2-1. Maximum Losses of Natural Land Categories Under the No Action/No Project Alternative

Land Cover Category[1]	Maximum Acres Lost		
	Inside UDA (acres)	*Outside UDA (acres)[5, 6]*	*Planning Area Total (acres)*
All natural land covers[2]	32,426	3,106	35,532
Vernal Pool Ecosystem[3] land covers	17,135	553	17,688
Wetland land covers[4] and other water land covers	1,062	118	1,180

1 The rows in the table are not additive because the land cover categories include some overlapping land cover types (e.g., Vernal Pool is included in "all natural land covers," "Vernal Pool Ecosystem land covers," and "wetland land covers and other water land covers."

2 Planning Area land cover types were defined by the SSHCP preparers during development of the SSHCP. To allow for better comparison of impacts between the EIS/EIS alternatives, the EIS/EIR uses these same land covers and definitions in discussions of all alternatives. The natural land covers include Blue Oak Savanna, Blue Oak Woodland, Cropland, Freshwater Marsh, Irrigated Pasture-Grassland, Mine Tailings Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland, Open Water, Orchard, Seasonal Wetland, Stream/Creek, Stream/Creek (VPIH), Swale, Valley Grassland, Vernal Pool, and Vineyard, as discussed in Table 8-1.

3 Vernal Pool Ecosystem includes three aquatic land cover types (Vernal Pool, Swale, and Stream/Creek (VPIH)) and hydrologically connected Valley Grassland.

4 Wetland land covers and other water land covers include the following aquatic land cover types: Freshwater Marsh, Seasonal Wetland, Open Water, Stream/Creek, Vernal Pool, Swale, and Stream/Creek (VPIH).

5 Under certain future development scenarios (see Section 2.2.3), some of the road and infrastructure projects planned within the MCRA may not occur because lead agencies do not anticipate the impacts to wetlands could be mitigated within the MCRA, as required by the assumptions made for the future regulatory environment of the No Action/No Project Alternative. However, Table 2-1 depicts the maximum development/maximum scenario and includes all potential road and infrastructure.

6 Acres of natural land cover types lost outside the UDA includes the effects of the "displaced development" described in Section 2.2.2.

2.2.4 Preservation of Natural Lands Under the No Action/ No Project Alternative

New preserves established as mitigation for impact**s** to CWA 404 aquatic resources and ESA and CESA threatened and endangered species will continue to be established under the No Action/No Project Alternative to offset impacts of new urban development. This project mitigation would continue to be implemented on a project-by-project~~s~~ basis, and is expected to result in uncoordinated preservation of some species habitats and some natural communities under the No Action/No Project Alternative.

The acres of future habitat preservation for the No Action/No Project Alternative (Table 2-2) were calculated based on the future regulatory environment assumptions described in Section 2.2.2 for new projects in the Planning Area. Table 2-2 presents the No Action/No Project scenario with the highest feasible acres of development in the UDA and the lowest feasible mitigation acres in the UDA, to assure that all potential impacts of the future No Action/No Project Alternative are considered.

As discussed in Section 2.2.2, some of the project mitigation identified in Table 2-2 as required habitat preservation might be provided by projects purchasing credits in existing or new Conservation Banks.

Table 2-2. Minimum Acres of New Preserves Under the No Action/No Project Alternative

Land Cover Category[1]	Preserved Land (acres)		
	Inside UDA (acres)	*Outside UDA (acres)*	*Planning Area Total (acres)*
All natural land covers[2]	6,814	16,616	23,430
Vernal pool ecosystem[3] land covers	5,065	5,341	10,406
Wetland land covers[4] and other water land covers	546	1,753	2,299

1 The rows in the table are not additive because the land cover categories include some overlapping land cover types (e.g., Vernal Pool is included in "all natural land covers," "Vernal Pool Ecosystem land covers," and "wetland land covers and other water land covers."

2 Planning Area land cover types were defined by the SSHCP preparers during development of the SSHCP. To allow for better comparison of impacts between the EIS/EIS alternatives, the EIS/EIR uses these same land covers and definitions in discussions of all alternatives. The natural land covers include Blue Oak Savanna, Blue Oak Woodland, Cropland, Freshwater Marsh, Irrigated Pasture-Grassland, Mine Tailings Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland, Open Water, Orchard, Seasonal Wetland, Stream/Creek, Stream/Creek (VPIH), Swale, Valley Grassland, Vernal Pool, and Vineyard, as discussed in Table 8-1.

3 Vernal Pool Ecosystem includes three aquatic land cover types (Vernal Pool, Swale, and Stream/Creek (VPIH)) and hydrologically connected Valley Grassland.

4 Wetland land covers and other water land covers include the following aquatic land cover types: Freshwater Marsh, Seasonal Wetland, Open Water, Stream/Creek, Vernal Pool, Swale, and Stream/Creek (VPIH).

In addition to the acres of new preserve identified in Table 2-2, additional acreage of Vernal Pool ecosystem would be avoided by new urban development in the UDA because the lead agencies assume, for purposes of this EIS/EIR, that it may be difficult for new projects to obtain authorizations under ESA or CWA 404 that would allow impacts to these land cover types,

particularly within the MCRA (see also Section 2.2.2). This additional avoided land is not quantified as preserved land because we assume it would not be developed, and it will not be managed, monitored, or protected in perpetuity like a preserve would. It is possible over time that the UDA adjacent development would encroach upon these avoided areas, and activities that do not require local permits, such as gardens, trails, and small outbuildings, might be built within the avoidance areas.

Preserves established for project compensatory mitigation would continue to be established individually under the project-by-project regulatory environment of the No Action/No Project Alternative (Section 2.2.2). Mitigation and conservation banks would continue to be established and credits would be made available for individual projects to mitigate impacts; however, sometimes these banks are geographically distant from the impact, which is of concern for ESA, and, as of the writing of this document, no mitigations credits are available in the MCRA. Locations and sizes of new mitigation preserves would not be coordinated, and new UDA preserves are expected to become surrounded by new urban development in a geographically fragmented pattern, as the buildout of the UDA continues over time (Section 2.2.2). These scattered and isolated new and existing mitigation preserve sites may not maintain hydrologic connectivity and may not be connected by habitat that allows wildlife movement between the preserves. In addition, there would be no comprehensive management and monitoring program of the individual preserves to ensure successful species conservation at a regional scale or at a landscape scale.

The five large Urban Development Master Plans (Arboretum, Cordova Hills, Jackson Township, NewBridge, and SunCreek) may establish similar large, 100- to 600-acre preserves under the No Action/No Project Alternative. However, the individual project preserves are expected to be managed by various entities rather than being managed under one comprehensive, over-arching management plan. For example, weed abatement would not be implemented on a large scale to prevent weed seeds from being transferred back and forth between preserves. Preserve maintenance would not be coordinated, and several individuals would make in efficient repairs as needed. Knowledge and information would not be shared between preserve managers for adaptive management purposes, so mistakes that were identified on one preserve would not be avoided on all other preserves in the Planning Area.

Furthermore, the project-by-project mitigation process that is expected to continue under the No Action/No Project Alternative would continue to provide only incidental conservation benefits for native species that are not already state- or federally listed as threatened or endangered, even those native species that are known to be rare or a species of concern or have other special-species status. Individual project ESA consultations and CESA permit applications would continue to address only federal and state-listed species, limiting the number of species that would benefit from the project's avoidance and preservation of natural land covers.

2.2.5 Preserve Management and Monitoring Under the No Action/No Project Alternative

Under the No Action/No Project Alternative, preserves established as compensation for impacts to ESA/CESA species, or to ~~avoid impacts from discharge of dredged or fill material into wetlands and other waters of the United States,~~ **minimize adverse effects to waters of the U.S., or, in certain circumstances, compensate for the unavoidable loss of waters of the U.S.,** would be managed and monitored according to the requirements of the individual regulatory agencies, under the existing project-by-project review process. Preserve management and monitoring requirements would vary for each individual preserve, but the requirements would be similar to those in place for the ESA or CWA 404 preserves already established in the Planning Area.

Typical preserve management actions related to management and monitoring of preserves under the No Action/No Project Alternative could include but are not limited to**:**

- Vegetation management, including grazing within vernal pool ecosystem preserves;
- Relocation of special-status species;
- Collection and relocation of inocula soil from vernal pools that will be lost to re-established or established vernal pools;
- Collection of seeds and from plants that will be lost;
- Demolition or removal of existing structures on new preserve lands;
- Maintaining access roads;
- Control of non-native species;
- Wildfire management;
- Hazardous materials remediation on new preserve lands;
- Repair of existing fences and other land management facilities; and
- Operations related to water delivery for cattle and other animals used for managing grassland habitats.

Management of preserves could also require creating new dirt and paved roads (including bridges), drilling new wells for livestock water, and installing new fences. Typical preserve monitoring efforts under the No Action/No Project Alternative could include but not be limited to conducting surveys for special-status species and other natural resources within the preserve on a regular basis.

2.3 PROPOSED ACTION/PROPOSED PROJECT

Under the Proposed Action/Proposed Project Alternative, the six Permit Applicants (the future Plan Permittees) would implement the SSHCP over a 50-year period. If USFWS determines that

the proposed SSHCP meets all ESA Section 10 permit issuance criteria, a federal ITP would be issued to the six Permit Applicants by the USFWS for take of Covered Species by future Covered Activities. CDFW would issue a CESA ITP to the six Permit Applicants for take of state-listed Covered Species by future Covered Activities.

The proposed SSHCP is a comprehensive regional plan for conserving wildlife habitat and natural communities, including aquatic resources, in the Planning Area while accommodating the planned future land use and development described the approved General Plans of the Permit Applicants (see Section 2.2.1). The SSHCP is intended to establish and implement a regional program to conserve ecologically important resources in the Planning Area.

The SSHCP would to conserve 28 species of native plants and wildlife in the Planning Area, including 11 that are listed as threatened or endangered under the federal ESA, the CESA, or both. In addition, because so many of the Covered Species live part or all of their lives in water bodies, the SSHCP also helps to protect wetland and stream habitats that are subject to regulation under the federal CWA, the California Fish and Game Code, and California's Porter-Cologne Act.

A summary of the Proposed Action/Proposed Project Alternative is presented in the following text, including a description of the proposed action's Covered Activities, the Covered Species, the Conservation Strategy for the Planning Area, the monitoring program, and the ARP.

2.3.1 Expected Regulatory Environment Under the Proposed Action/Proposed Project

When compared to the future regulatory environment expected under the No Action/No Project Alternative (Section 2.2.2), the future regulatory environment of the Proposed Action/Proposed Project Alternative would differ as described in the following text.

Project Permitting and Local Entitlement Process

The six Permit Applicants (future Plan Permittees) or their third-party project proponents would pay development fees in order to use the SSHCP ITPs. The project development fees would be provided to the Land Use Authority Permittee with jurisdiction over the project site or to the SSHCP Implementing Entity.

The development fees paid by each Covered Activity would be used by the SSHCP Implementing Entity to fund the SSHCP Conservation Strategy.

Project ESA and CESA Compliance

Under the Proposed Action/Proposed Project Alternative, individual Covered Activity projects and activities that comply with the SSHCP would also comply with the ESA and CESA incidental take permits. Third party project proponents implementing a SSHCP Covered Activity project would pay "development fees" to the local Land Use Authority Permittee (i.e., Sacramento County, Galt, or Rancho Cordova), or to the SSHCP Implementing Entity , whoever has jurisdiction over the project site.

The SSHCP Conservation Strategy (see Section 2.3.5 below) provides a regional plan for conserving native species, natural communities, and aquatic resources in the Planning Area. The SSHCP Conservation Strategy was developed by the Permit Applicants and the regulatory agencies to both evaluate and prioritize the regional importance of the existing species habitat and existing aquatic resources in the Planning Area. Therefore, the importance (or lack of importance) of specific Planning Area locations and parcels to the conservation of listed species and ecosystem functions and service on a landscape and watershed basis has already been evaluated by the USFWS, CDFW, and USACE during the development of the SSHCP. In addition, activities and projects implemented under the Proposed Action/Proposed Project Alternative would be less likely to result in unmitigated ESA and CESA impacts due to lack of technical expertise or regulatory oversight, as described in Section 2.2.2 for the No Action/No Project Alternative.

The SSHCP would provide real streamlining for project proponents by significantly reducing the timeline for obtaining local approvals and entitlements, ESA and CESA authorizations, and CWA 404 authorizations. ~~The regulatory environment of the Proposed Action/Proposed Project SSHCP would eliminate the need for project-level consultations with the USFWS under ESAand with CDFW under CESA.~~ **It is also anticipated that project-level consultation with CDFW under CESA would be reduced or eliminated for Covered Species and Covered Activities**. The SSHCP Conservation Strategy would provide individual projects with appropriate impact avoidance and minimization measures, which can be incorporated into the design and implementation of individual projects. Implementation of the SSHCP Conservation Strategy would provide the correct type and amounts of mitigation (in the form of habitat protection, establishment, or re-establishment) for the impacts of individual Covered Activities. The SSHCP Conservation Strategy, rather than an individual project proponent, assumes responsibility for locating and procuring high-quality mitigation sites, establishing conservation easements, and preparing and implementing preserve management and monitoring plans.

The ~~Reduced Permit Term Alternative's~~ SSHCP Conservation Strategy would address cumulative impacts to vernal pool~~s~~ species within the MCRA. ~~Cumulative impacts within the MCRA as defined~~

~~in the Sunridge ROD (see Section 2.2.2) would be addressed through implementation of the SSHCP Conservation Strategy (described below in Section 2.3.5).~~

An approved and permitted SSHCP would meet the 2004 Zone 40 MOU (see Section 2.2.2) requirement for Sacramento County to prepare a regional HCP that addresses the indirect effects of the operational Freeport Regional Water Project and the indirect effect of the Zone 40 water delivery contracts. Therefore, new urban development Covered Activity projects implemented inside Zone 40 seeking entitlements from a local jurisdiction would be able to rely upon the Freeport Regional Water Project as the project's water source, without first obtaining project-level ESA approvals from the USFWS.

Project CWA 404 Compliance

Under the existing regulatory conditions, the USACE cannot authorize a proposed project under CWA 404 until the proposed project is in compliance with the ESA (see Section 2.2.2). Under the Proposed Action/Proposed Project, each Covered Activity that meets the requirements of the SSHCP would be in compliance with the ESA, and any incidental take of federally listed species would be covered by the SSHCP ESA incidental take permits. Therefore, **it is envisioned that in most cases,** the USACE would not be required to ~~intimate~~ **initiate** ESA Section 7 consultation with the USFWS before authorizing a proposed project that is a SSHCP Covered Activity. **There could be exceptions to this process, for example, if some time over the SSHCP permit term USACE authorized a Covered Activity that affected a threatened or endangered species that was not an SSHCP Covered Species.** As stated in Section 1.1, the SSHCP Permit Applicants used the SSHCP Conservation Strategy to prepare a local Aquatic Resources Program (ARP) which proposes a locally based program for permitting future SSHCP Covered Activities that impact aquatic resources, including wetlands and other waters. The Proposed Action/Proposed Project Alternatives includes the implementation of the ARP by the Permit Applicants and associated local aquatic resource protection ordinances.

The ARP relies on (and is consistent with) the SSHCP Conservation Strategy for aquatic habitats, including (1) Covered Activity implementation consistent with the ARP, (2) Covered Activity implementation of SSHCP AMMs that avoid and minimize direct and indirect adverse impacts to Planning Area aquatic resources to the extent practicable, (3) a landscape and watershed based cumulative analysis of expected impacts to wetlands and other waters over the next 50 years, and (4) the avoidance of wetlands and other waters, the minimization of impacts to wetlands and other waters, and the compensatory mitigation of wetlands and other waters planned on landscape and watershed basis, through the Planning Area.

~~As discussed in Section 2.2.2, the existing approach to permitting under CWA 404 provides the regulatory agencies little opportunity to evaluate individual project impacts or proposed~~

~~mitigation within a regional or a watershed scale; thus, the wetland regulatory agencies often have difficulty determining if projects are adequately mitigating for aquatic resource impacts. Under the Proposed Action/Proposed Project Alternative, implementation of the SSHCP Conservation Strategy and the ARP's measures to avoid and minimize impacts to aquatic resources, the Proposed Action/Proposed Project would assure CWA 404 compensatory mitigation for unavoidable impacts to aquatic resources is considered from a watershed-based perspective, and would systematically prioritize compensatory mitigation projects based on anticipated impacts to aquatic resources, considering both watershed- and function-based factors.~~

As discussed in Section 2.2.2, the existing approach to permitting under CWA 404 provides the regulatory agencies little opportunity to evaluate individual project impacts or proposed mitigation within a regional or a watershed scale. Under the Proposed Action/Proposed Project Alternative, implementation of the SSHCP Conservation Strategy and the ARP's mitigation approach (avoidance, minimization, and compensation) would be assumed to assure CWA 404 mitigation (avoidance, minimization, and compensation) is considered from a watershed-based perspective. These provisions, combined with a proposed in-lieu fee program (ILF); as discussed further below), would also systematically prioritize compensatory mitigation projects based on anticipated impacts to aquatic resources, considering both watershed- and function-based factors.

As discussed in EIS/EIR Chapter 10 and in Section 6 of the ARP document (see EIS/EIR Appendix I), the predicted future watershed conditions resulting from implementation of the SSHCP Conservation Strategy and the ARP would maintain or improve the overall aquatic resource abundance, diversity, and condition within the Planning Area. There would not be a net loss of aquatic resources in terms of acreage under the Proposed Action/Proposed Project, and the amount of high-condition resources within the Planning Area would be increased under the Proposed Action/Proposed Project, relative to the existing conditions.

The SSHCP Conservation Strategy and the ARP would provide compensatory mitigation for unavoidable impacts to aquatic resources (i.e., would provide aquatic resource re-establishment or establishment) that conforms to the minimum 1:1 compensatory mitigation ratios required by the 2008 Compensatory Mitigation Rule (see Section 2.2.2 above). Pursuant to the 2008 Compensatory Mitigation rule, the Permit Applicants are requesting the establishment of an in-lieu fee (ILF) program that would work in conjunction with the SSHCP's Covered Activity fee structure. The Permit Applicants (future Plan Permittees) would then be responsible for the CWA 404 compensatory mitigation requirements associated with the Covered Activity projects. The Permit Applicants would submit an ILF program proposal to the USACE and Interagency Review Team (a term described in the 2008 Compensatory Mitigation Rule) for review and processing. As of the writing of this EIS/EIR, the Permit Applicants have already submitted a draft ILF prospectus (in

accordance with 33 CFR 332.8[d][3]) and have received comments from the regulatory agencies that would potentially comprise the ILF's Interagency Review Team.

Under the Proposed Action/Proposed Project Alternative, the USACE has evaluated the Permit Applicants' proposed ARP (see EIS/EIR Appendix I), inclusive of its implementation guidance (as articulated in both the ARP and draft ARP ordinance), and has developed a draft Section 404 CWA permit strategy (see EIS/EIR Appendix C) for the future SSHCP Covered Activities (refer to Section 1.5.2), which is consistent with the USACE's regulations and guidance regarding CWA 404 permit development and issuance criteria.

Project Compliance with Porter Cologne Water Quality Control Act and CWA 401

As discussed above in Section 2.2.2, under CWA 401, and the Porter-Cologne Act projects and activities in California that require authorization of a federal license or permit for the discharge of a pollutant into wetlands and other waters must also obtain a CWA 401 water quality certification from the RWQCB with local jurisdiction

The ARP (see Appendix I) would facilitate the Central Valley RWQCB's development of water quality certification strategies for future SSHCP Covered Activities, in conjunction with USACE's development of a CWA 404 permit~~ting~~ strategy for future Covered Activities (see Appendix C).

Parallel to the USACE's CWA 404 permit~~ting~~ strategy, the RWQCB would have opportunities to increase the efficiency of their CWA 404 permitting processes while improving the protection and management of aquatic resources in the Planning Area. The RWQCB could issue a programmatic CWA 401 water quality certification for the USACE's general permit(s) and could adopt a more efficient water quality certification approach for Covered Activity projects associated with USACE's Letter of Permission and standard permit processes. The RWQCB could also adopt a more efficient waste discharge requirement approach for wetlands and other waters of the state.

California Fish and Game Code Section 1602 Master Lake or Streambed Alteration Agreement

The ARP and SSHCP address future impacts and provides for the conservation of streams and riparian habitat and other water bodies in the Planning Area that are regulated by CDFW. Under the Proposed Action/Proposed Project Alternative, CDFW would work with the land use authority Permit Applicants (Sacramento County, Galt, and Rancho Cordova) to streamline the process used to authorize Covered Activity projects and activities that affect the bed and bank of streams, ponds, and lakes under Section 1602 of the California Fish and Game Code, as discussed in Section 1.5.3.

In the streamlined process, the Land Use Authority Permittee Applicant or the SSHCP Implementing Entity may act as a "clearinghouse" for the notification forms, and would conduct an initial screening process to verify the project's consistency with the SSHCP and ARP, and the aquatic protection ordinances. The Land Use Permit Applicant or the SSHCP Implementing Entity may then submit the Lake or Streambed Alteration (LSA) notification forms to CDFW on the behalf of their third-party project proponents. This would remove the need for project developers to coordinate with CDFW for Section 1600 permits. Prior to processing an LSA Notification, CDFW must collect the fee for each LSA Notification submitted by the SSHCP Implementing Entity or by an individual third-party project proponent. CDFW is solely responsible for determining whether a LSA Agreement is required.

It would also expedite the Section 1600 permitting process because CDFW would have pre-determined that consistency with the regional HCP and ARP satisfies the requirements for a Streambed Alteration Agreement.

Master LSA Agreements and LSA Agreements for Routine Maintenance may be issued individually to the three Land Use Authority Permit Applicants and plan participants for future SSHCP Covered Activities. Prior to issuing any LSA Agreement to an SSHCP Permit Applicant or participant, CDFW will consider the information and analysis in this EIS/EIR, and any additional CEQA information provided at the time of individual project 's CEQA review to make the appropriate Findings of Fact pursuant to CEQA on the decision, and would file a CEQA Notice of Determination.

Local Environmental Policies

The existing Sacramento County Swainson's Hawk Ordinance, discussed in Section 2.2.2, only applies to portions of Sacramento County that are not included in an approved HCP that includes Swainson's hawk as a Covered Species. Therefore, under the Proposed Action/Proposed Project Alternative, the Swainson's Hawk Ordinance would no longer be available as an option for Covered Activity projects to mitigate impacts to Swainson's hawk.

2.3.2 Permit Term Under the Proposed Action/Proposed Project Alternative

The Permit Applicants (Section 1.1) are requesting ESA and CESA ITPs with 50-year permit terms. The Permit Applicants (future Plan Permittees) are requesting this permit term to accommodate all of the planned buildout of the UDA (see Section 2.2.1), as the rural transportation improvement projects and new recycled water conveyance infrastructure located planned outside the UDA, including the Capital Southeast Connector project (refer to Section 2.3.3).The requested term of the ITPs will also provide adequate time for the future SSHCP Implementing Entity (Section 2.3.7) to purchase all lands and easements needed to achieve all parts of the

SSHCP Conservation Strategy, including each SSHCP Biological Goal and the SSHCP Measurable Objectives that implement each Biological Goal.

2.3.3 Covered Activities and Loss of Natural Land Covers Under the Proposed Action/Proposed Project Alternative

SSHCP Covered Activity categories, listed in Table 2-3, include the development, operation, and maintenance of new urban development structures, public facilities, and utilities that are anticipated in the Planning Area by the Permit Applicants and for which incidental take authorization is requested by the Permit Applicants from the Wildlife Agencies (USFWS and CDFW). The SSHCP Conservation Strategy will provide avoidance, minimization, and compensation for impacts to SSHCP Covered Species, habitats, and aquatic resources that would result from implementation of all SSHCP Covered Activities.

SSHCP Covered Activities implemented within the UDA would include activities and projects related to urban development and associated infrastructure on all lands zoned or ultimately planned/contemplated for urban development in adopted General Plans of Sacramento County, Galt, and Rancho Cordova. Covered Activities would also include the Capital Southeast Connector Project and other transportation, water, and wastewater development projects in the UDA. In-stream maintenance in the UDA, including vegetation and sediment removal, would also be a Covered Activity.

Five large Urban Development Master Plans (Arboretum, Cordova Hills, Jackson Township, NewBridge, and SunCreek) are proposed by third-party project proponents within the UDA (Figure 5-4). These Urban Development Master Plans meet the definition of an Urban Development Covered Activity, and the Plan Permittees anticipate that builders purchasing large lots from the Urban Development Master Plan developer will use the SSHCP incidental take permits to obtain project-level authorization under the ESA and CESA ,and to expedite their individual project CWA authorizations. These five Urban Development Master Plans were designed to comply with all SSHCP requirements, including compliance with the SSHCP AMMs listed in this chapter.

Urban development Covered Activities (Table 2-3) would not occur outside of the UDA boundary. Covered Activities allowed outside the UDA are limited to planned infrastructure projects such as roadway improvements and widening, intersection improvements, construction of new recycled water pipelines, and maintenance of existing wastewater projects that provide sewer service to existing communities outside of the UDA.

The SSHCP Covered Activities would be implemented by the Plan Permittees or could be implemented by third parties (e.g., project proponents or private developers) that are subject to the jurisdiction and oversight of a Plan Permittee.

SSHCP Covered Activities would also include implementation of the SSHCP Conservation Strategy (Section 2.3.5), including management and monitoring of the proposed SSHCP Preserve System, and the re-establishment/establishment of aquatic resources within SSHCP Preserves located inside and outside the UDA.

Table 2-3 includes a list and a general description of the SSHCP Covered Activities. See Chapter 5 of the SSHCP document for further information about each of the SSHCP Covered Activities.

Table 2-3. Covered Activities Included in Each Action Alternative Studied in the EIS/EIR[1]

Covered Activity Categories[2]	Description
Urban Development Covered Activities Inside the UDA	
Residential, Commercial, and Industrial Structures	Construction, use, and maintenance of urban, suburban, and agricultural housing, retail centers, office buildings, factories, warehouses, and associated infrastructure. Also includes public service and cultural facilities such as new police and fire stations, convention centers, theaters, museums, hospitals, schools, colleges, libraries, and parking lots. Maintenance activities include the inspection, cleaning, rehabilitation, repair, and/or replacement of buildings, structures, and facilities.
Urban Park and Recreation Facilities	Construction and maintenance of recreational facilities such as regional parks, neighborhood parks, sports fields and facilities, indoor/outdoor sports complexes, recreation trails, community trails, playgrounds, golf courses, campgrounds, nature centers, racetracks, and associated infrastructure, including roads, bridges, restrooms, and parking areas.
Urban Water Supply Facilities	Construction and installation of new potable and recycled water supply facilities (e.g., pumping stations; water treatment facilities; storage facilities; reclamation facilities; and groundwater wells, valves, gates, weirs, and pipelines), extension of existing water pipelines, and removal and maintenance of existing water supply facilities.
Public and Private Utilities	Construction, replacement, augmentation, and maintenance of electric transmission utilities including underground and aboveground electric transmission and distribution lines, substations, access road maintenance, telecommunications lines, natural gas distribution pipelines, and urban solar energy projects. Other energy-generating projects within the UDA may also be determined to be Covered Activities, provided they meet the criteria established for Covered Activities not specifically described in the SSHCP.
Solid Waste Management Facilities	Construction, operation, maintenance, and decommissioning of new transfer stations and operation of new recycling stations within the UDA. Operation and maintenance of existing groundwater extraction and monitoring wells at Kiefer Landfill, as well as the expansion and decommissioning of existing landfills. This Covered Activity would not include operation of landfills.
Wastewater Facilities	Construction, installation, operation, and maintenance of all wastewater facilities in the UDA (e.g., sewage force mains, pumping stations, access facilities, treatment facilities, pipelines, recharge ponds, pipelines, and storage facilities) and all activities that support the provision of wastewater services including collection, diversion, delivery, distribution, conveyance, storage, treatment, and discharge. The extension, removal, replacement, abandonment, and maintenance of existing facilities/pipelines are also included, as are recharge ponds, groundwater wells, and operation and maintenance of existing wastewater projects in the rural communities of Walnut Grove and Courtland outside of the UDA.
Urban Transportation	Construction, realignment, widening, extension, abandonment, and removal of public and private transportation infrastructure (e.g., roadways, railroads, culverts, bridges, bike paths, street lights, roadside drainage, intersections/interchanges, sidewalks, and traffic signals), as well as other activities necessary to implement adopted transportation or capital improvement plans of the Permit Applicants. In-stream activities for transportation improvements including bridges, culverts, or other stream-crossing facility construction, replacement, and repair.

AGENDA ITEM 11.1

4063

Table 2-3. Covered Activities Included in Each Action Alternative Studied in the EIS/EIR[1]

Covered Activity Categories[2]	Description
Flood Control and Stormwater Management in the UDA	All activities that support flood control as described in water drainage, capital improvement, flood control, and storm drain master plans for Sacramento County and Galt and Rancho Cordova. Construction of new facilities and maintenance of new and existing facilities. Stormwater abatement and treatment facilities could include detention basins, stormwater channels, pumping stations, and natural or realigned stream channels. Operations and maintenance activities including vegetation control, silt/sedimentation removal, erosion control, and stream bank stabilization projects.
Stream Channel Modification	The permanent deepening, widening, and rerouting of existing stream channels during urban development, including that associated with construction of water supply, wastewater, and urban transportation infrastructure.
Master Plans Known at the Time of the SSHCP Preparation	Urban development associated with five development projects within the UDA (Arboretum, Cordova Hills Specific Plan, Jackson Township Master Plan, NewBridge Specific Plan, and SunCreek Specific Plan) that were preparing land use plans during SSHCP preparation. These five master plans were designed to comply with SSHCP requirements, including compliance with the Covered Activity descriptions and the SSHCP AMMs.
Capital Southeast Connector	Construction, operation, and maintenance of the Capital Southeast Connector, including but not limited to initial vegetation clearing, grading of the project footprint, pouring of concrete or asphalt, excavation, staging of equipment and materials, compacting soil, and landscaping, as well as operation and maintenance. During construction it may be necessary to temporarily divert stream channels using appropriate measures to avoid or minimize impacts to stream habitat.
Mather Airport Master Plan Development Projects	Development projects at Mather Airport including the maintenance, replacement, and improvements of existing airfields (runway extensions, new taxiways, and aprons) and construction of new airfields, aircraft facilities (aircraft storage facilities, aircraft maintenance facilitates, and jet fuel storage and dispensary facilities), and commercial facilities.
Mining Covered Activities in the UDA	
Mining Projects	Mining activities including surface extraction of rock or mineral resources and construction of associated infrastructure, buildings, and facilities (e.g., surface mining pits, processing sites, and access roads), and construction and operation of detention basins. A total of five surface mines (500 acres) are anticipated to occur within the UDA. The reclamation of previously mined land is also included as a Covered Activity.
Covered Activities Allowed in UDA Preserve Setbacks	
Trails	Construction, operation, and maintenance of paved bike/pedestrian trails may be sited within a Preserve Setback under certain conditions.
Low-velocity Bio-Retention Swales	Construction, operation, and maintenance of a bio-retention swale next to trails designed to hold and remove rainwater runoff from trails, which may be sited within a Preserve Setback under certain conditions.
Fencing	Installation of post and cable, split rail, or other open fencing adjacent to trails within the setback areas, which may be sited within a Preserve Setback under certain conditions.

AGENDA ITEM 11.1

4064

Table 2-3. Covered Activities Included in Each Action Alternative Studied in the EIS/EIR[1]

Covered Activity Categories[2]	Description
Interpretive Signs and Kiosks	Construction, operation, and maintenance of safety and directional signs and kiosks intended to educate trail users about the benefits of the preserve and the importance of the setback to the resources that they are protecting.
Fire Breaks	Construction and maintenance of fire breaks, including shallow tilling or scraping vegetation if required by local fire regulations.
Benches, Shade Structures, and Shade Trees	Installation of benches, shade structures, and trash receptacles along trails if on the outer edge of the trail farthest from the preserve, which may be sited within a Preserve Setback under certain conditions.
Covered Activities Allowed in UDA Stream Setbacks	
Trails	Construction and maintenance of permeable or semi-permeable hiking trails, paved trails, and their associated infrastructure.
Low-Velocity Bio-Retention Swales	Construction, operation, and maintenance of small linear features (swales) located on one or both sides of allowed trails
Crossings Perpendicular to the Stream	New roads, bike/pedestrian trails, railroads, sewer/water pipelines, and public utility transmission lines that cross perpendicular to streams.
Stream Bank Stabilization Projects	Construction of in-stream structures for erosion control and bank stabilization.
Fencing	Installation of post and cable, split rail, or other open fencing along trails to keep users on the trail and out of the Stream Setbacks.
Benches, Shade Structures, and Shade Trees	Installation of benches, shade structures, and trash receptacles along trails if located on the outer edge of the trail farthest from the creek.
Interpretive Signs and Kiosks	Construction, operation, and maintenance of signs and kiosks.
Riparian Re-Establishment or Establishment	Actions associated with re-establishment or establishment of riparian vegetation.
Outfalls	Construction and operation of outfall structures that allow the discharge of stormwater into streams from adjacent urban areas.
Flood Control Structures and Stormwater Management	Construction of detention basins, bio-retention swales, and water quality facilities that are designed to be compatible with the habitat and wildlife values of the adjacent stream corridor.
Septic Systems	Existing subsurface sewage disposal systems. Note: The operation, maintenance, or replacement of entitled or currently existing subsurface sewage disposal systems are not Covered Activities.
Nonconforming Structures	Existing nonconforming structures and nonconforming uses of land subject to specific requirements (see Chapter 5 of the SSHCP).
Rural Transportation Project Covered Activities (Outside the UDA)	
General Activities	Transportation projects consistent with the Circulation Element of Sacramento County General Plan. Construction, operation, and maintenance of roadways are Covered Activities. See Chapter 5 of the SSHCP for a complete list of roadway projects.
Rural Collector Road Improvements (two-lane rural roads)	Roadway widening, increase of shoulder width, and drainage improvements.
Arterial Road Improvements (four-lane roadways)	Roadway widening.
Road Realignment Projects	Rerouting/constructing existing roadways to facilitate more direct or new road connections.

AGENDA ITEM 11.1

4065

Table 2-3. Covered Activities Included in Each Action Alternative Studied in the EIS/EIR[1]

Covered Activity Categories[2]	Description
Road Interchange Projects	Construction of four planned interchange projects.
Recycled Water Project Covered Activities (Outside the UDA)	
Sacramento County Agriculture and Habitat Lands Recycled Water Project (South County Agricultural Program)	Construction and maintenance of facilities (e.g., pumping stations, pipelines, recycled water facilities, groundwater recharge facilities) associated with the South County Agricultural and Habitat Lands Recycled Water Project, plus a small section of pipeline that would provide recycled water to the existing Bartley-Cavanaugh Golf Course.
Covered Activities within SSHCP Preserves	
Preserve Management and Monitoring	Construction, maintenance, and use of facilities needed for preserve management and monitoring, including but not limited to roads, bridges, culverts, fences, gates, wells, stock tanks, and stock ponds.
Habitat Enhancement, Re-Establishment, and Establishment	Enhancement actions including but not limited to improvement of the hydrologic regime of a site to benefit a Covered Species, and vegetation management activities include installing perching poles and bat houses or other nesting/roosting improvements. Habitat re-establishment and establishment actions including but not limited to earth moving; regrading or recontouring of a site; restoring the past hydrologic regime or creating a hydrologic regime; and seeding or planting herbaceous vegetation, trees, shrubs, grasses, or other vegetation.
Species Surveys, Monitoring, Research, and Adaptive Management Activities	Species surveys conducted on preserve lands and on properties identified for potential acquisition, intensive management of habitat for research (e.g., new grazing regimes, controlled burns, cycling crop harvests), and other actions associated with adaptive management activities.
Water Supply for Livestock	New wells and associated infrastructure to provide water for livestock that are used to manage grassland vegetation as part of a preserve's management plan.
Groundwater Monitoring and Extraction Wells	Monitoring of existing and construction of new extraction wells for testing and treating existing contaminated groundwater on Kiefer Landfill Buffer lands.
Pesticide Use for Land Management	Pesticide use if part of an approved Preserve Management Plan (PMP) (e.g., exotic plant or exotic animal control). Only when necessary, pesticide use is allowed (1) within SSHCP Preserves, (2) within Preserve Setbacks, and (3) within road rights-of-way that border preserves.
Detention Basins	In limited situations, stormwater detention basins would be allowed on certain Linkage Preserves.
Low-Impact Nature Trails	Construction, maintenance, and improvement of a limited number of unpaved, low-impact nature trails within the Preserve System. Improvements include removal of upland vegetation, minor grading, directional and educational signs, and benches.

1 The Action Alternatives studied in this EIS/EIR are: 1) The Proposed Action/Proposed Project Alternative (the SSHCP), and 2) the Reduced Permit Term Alternative HCP.

2 Additional details of each Covered Activity category are presented in Chapter 5 of the Draft South Sacramento Habitat Conservation Plan document.

Removal of Natural Lands under the Proposed Action/Proposed Project Alternative

Natural land covers in the Planning Area (see Table 8-1a) would be directly or indirectly impacted by the Covered Activities implemented under the Proposed Action/Proposed Project Alternative.

As with the No Action/No Project Alternative, the Lead Agencies assume that the Proposed Action/Proposed Project Alternative would include the full build out of the UDA over the 50-year permit term. Under the Proposed Action/Proposed Project Alternative, all natural land covers currently present within the UDA will be removed by new urban development except the following:

- Natural lands within existing preserves in the UDA (see Table 8-1b)
- Natural lands within the UDA proposed for inclusion in the SSHCP Preserve System (see Section 2.3.5)
- Natural lands within the UDA expected to be inside minimum 50-foot-wide Preserve Setbacks (see Section 2.3.5)
- Natural lands within the UDA expected to be inside 25-foot wide to 150-foot-wide Stream Setbacks (see Section 2.3.5)

The maximum acres of Planning Area natural land cover directly impacted (removed) under the Proposed Action/Proposed Project Alternative is presented in Table 2-4. For all EIS/EIR Alternatives, direct impacts were calculated using the GIS methodology described in Section 3.6.5.

Table 2-4. Maximum Direct Impacts (Loss) of Natural Lands Under the Proposed Action/Proposed Project Alternative

Land Cover Category[1]	Maximum Acres Lost		
	Inside UDA (acres)	*Outside UDA (acres)*	*All Planning Area (acres)**
All natural land covers[2]	32,059	1,438	33,497
Vernal Pool Ecosystem[3] land covers	16,797	321	17,118
Aquatic resources[4]	1,076	73	1,149

1 The table columns are not additive because the land cover categories include some overlapping land cover types (e.g., Vernal Pool is included in "all natural land covers," "Vernal Pool Ecosystem land covers," and "aquatic resources."

2 Planning Area land cover types are defined in the SSHCP document (Chapter 3). To allow for better comparison of impacts between the EIS/EIS alternatives, the EIS/EIR uses the SSHCP land cover types in discussions of all EIS/EIR alternatives. The SSHCP "natural" land covers include Blue Oak Savanna, Blue Oak Woodland, Cropland, Freshwater Marsh, Irrigated Pasture-Grassland, Mine Tailings Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland, Open Water, Orchard, Seasonal Wetland, Stream/Creek, Stream/Creek (VPIH), Swale, Valley Grassland, Vernal Pool, and Vineyard, as discussed in Table 8-1 of the EIS/EIR.

3 Vernal Pool Ecosystem is defined by the SSHCP to include three aquatic land cover types (Vernal Pool, Swale, and Stream/Creek (VPIH) and hydrologically connected adjacent Valley Grassland.

4 Aquatic resources include the following SSHCP aquatic land cover types: Freshwater Marsh, Seasonal Wetland, Open Water, Stream/Creek, Vernal Pool, Swale, and Stream/Creek (VPIH).

2.3.4 Covered Species Under the Proposed Action/Proposed Project Alternative

Covered species are species that would be listed on the CESA or ESA ITPs issued by the Wildlife Agencies (CDFW and USFWS), and would be conserved in the Planning Area by the proposed SSHCP Conservation Strategy. The SSHCP proposes 28 special-status species for take coverage under ESA ITP and 8 state-listed species for take coverage under the CESA ITP (Table 2-5).

Table 2-5. Planning Area Special-Status Species Included as Covered Species

Scientific Name Common Name	Protection Status		
	Federal	*State*	*California Native Plant Society*

Status Definitions
Federal:
E= Listed as endangered under the ESA
T= Listed as threatened under the ESA
*= Species has designated ESA Critical Habitat located within the Planning Area
— = No ESA listing
BCC = Bird of Conservation Concern
State:
E = Listed as endangered under CESA
T = Listed as threatened under CESA
** = Under consideration for listing by CDFW as of September 14, 2015
CFP = Fully protected under the California Fish and Game Code
CSC = California species of special concern
WL = CDFW Watch List
— = No CESA or other state status
California Native Plant Society California Rare Plant Rank
1B = Rare, threatened, or endangered in California and elsewhere
2 = Rare, threatened, or endangered in California but more common elsewhere
California Native Plant Society California Rare Plant Rank Threat Ranks
0.1 = Seriously threatened in California (high degree/immediacy of threat)
0.2 = Fairly threatened in California (moderate degree/immediacy of threat)

2.3.5 Conservation Strategy under the Proposed Action/Proposed Project Alternative

The Conservation Strategy for the Proposed Action/Proposed Project Alternative includes implementation of AMMs (see Table 2-6 and EIS/EIR Appendix D) during construction and implementation of Covered Activities, achievement of the stated Biological Goals for the Planning Area, and each Measurable Objectives, including the assembly of an interconnected SSHCP Preserve System based on those Measurable Objectives, and a Preserve System Monitoring and Management Program.

Impact Avoidance and Minimization Measures (AMMs)

The SSHCP AMMs also provide new avoidance and minimization measures that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to surface water quality and groundwater quality, compared to the effects of the No Action/No Project Alternative.

Under the Proposed Action/Proposed Project Alternative, all Covered Activities (projects and activities) must incorporate or apply specific SSHCP AMMs during implementation of the Covered Activity (see EIS/EIR Appendix D). The SSHCP AMMS are intended to avoid or minimize direct and indirect impacts of the Covered Activities to Covered Species and Covered Species habitats, including aquatic resources. The SSHCP AMMs include measures to avoid species occurrences and habitat through project design, or through the timing of activities avoid times when a Covered Species could be present, including breeding periods. The SSHCP AMMs may also avoid or minimize the potential for take by reducing effects on Covered Species and other native species by altering construction plans or activities (e.g., modifying construction footprints, covering open trenches, using materials to reduce runoff from construction sites) or by modifying design elements of projects to reduce long term operational effects (e.g., noise, lighting, urban runoff). Many of the SSHCP AMMs also avoid or minimize impacts to wetlands and other waters to a greater extent, including several measures that would require new development to be set back a greater distance from the tops of stream and creek banks.

The SSHCP AMMs include some of the AMMs that projects are required to implement under the existing regulatory conditions (see Section 2.2.2). For example, AMM BMP1 through AMM BMP11 of the Proposed Action/Proposed Project Alternative would be similar to the construction best management practices that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes process for annual review of the effectiveness of each SSHCP AMM, and

a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the SSHCP would result these AMMs being implemented more frequently and consistently at all ground-disturbing activities, than would occur under the No Action/No Project Alternative. The SSHCP AMMs also provide new avoidance and minimization measures that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to species, species habitat and aquatic resources, compared to the effects of the No Action/No Project Alternative.

AMMs similar to those in the species-specific SSHCP AMMs may be required on a project-by-project basis under the No Action/No Project Alternative if required as a condition of the approval of the project entitlements or a permit (e.g., CWA, California Fish and Game Code Section 1600). However, under the Proposed Action/Proposed Project Alternative, there will be more consistent application of AMMs, which will inform the initial design of Covered Activities, so projects will not be delayed due to imposing unexpected AMMs that could require redesign. In addition, more consistent application of AMMs is expected because they would be implemented under the SSHCP comprehensive plan with a process for tracking implementation and effectiveness, rather than implemented under various statutes, regulations, and guidelines, with variability of their application and interpretation.

In addition, since AMMs will be known in advance and incorporated earlier in the design of projects, it is reasonable to assume that there will be greater application of AMMs than under the No Action/No Project Alternative. For example, the AMMs to minimize impacts to streams and creeks (AMMs STREAM-1 through Stream 5) must be applied to all Covered Activities where a stream or creek is located within a project footprint. These AMMs would be critical to the design of a project, such as a rezone and subdivision, because the AMMs require setbacks from streams that are 25–150 feet wide. Because project proponents will be aware of these measures early in the planning process, the setbacks can be accommodated more readily in the overall project plan, including the density and designation of land use zones coupled with economic considerations. In comparison, under the No Action/No Project Alternative, large setbacks can be economically infeasible at the permit stage in cases where zoning has already been approved, because the value of land changes with the zoning. Land approved for RD-5 zoning may be valued at one million dollars an acre compared to the same land zoned Ag-80 may be valued at 50,000 dollars per acre.

Table 2-6 compares SSHCP AMMs avoidance measures expected under the No Action/No Project Alternative. The comparisons are categorized as follows:

- New
- Similar

- More frequently applied.

AMMs are considered "new" if they were not identified in the No Action/No Project Alternative regulatory environment, and although the AMM may be an individual permit condition or condition of approval for an individual project, it is considered to be "new." AMMs are considered to be "similar" if they were identified in the No Action/No Project Alternative regulatory environment and their application would be "similar" to the application under Proposed Action/Proposed Project Alternative scenario. AMMs are considered to be "more frequently applied" if they were identified in some form in the No Action/No Project Alternative regulatory environment, and they are considered to be "more frequently applied" under SSHCP. Explanations of why AMMs would be "more frequently applied" under the Proposed Action/Proposed Project Alternative scenario are discussed previously and listed below:

- Increased knowledge of existing habitat
- Increased early coordination
- Applied more consistently by regulatory programs
- Applied to a greater variety of actions
- Reduced cost.

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
Condition 1		
Condition 1. Avoid and minimize urban development impacts to watershed hydrology and water quality. This condition will require Best Management Practices (BMPs) and low-impact development (LID) AMMs. The LID AMMs apply to all UDA Covered Activities that occur at the parcel, subdivision, or master plan scale.	National Pollutant Discharge Elimination System MS4 Design Measures. Sacramento and South Placer Regions (Stormwater Manual) Guidelines and requirements to reduce urban runoff from new development and redevelopment projects within the region (SSQP 2007).	The SSHCP AMMs are based on existing MS4 permit requirements.
LID-1 (Stormwater Quality) Enforce site design stormwater management.	See description for Condition 1.	*Similar.*
LID-2 (Groundwater Recharge) Consider groundwater recharge when siting preserves.	See description for Condition 1.	*More frequently applied.* Because SSHCP Preserves would be established by the Implementing Entity, the EIS/EIR assumes that increased attention would be paid to groundwater recharge when preserve locations are selected for acquisition.
LID-3 (Natural Site Features) Incorporate natural aquatic features into project design.	See description for Condition 1.	*Similar.*
Condition 2.		
Condition 2. Avoid and minimize urban development direct and indirect impacts to existing preserves and SSHCP Preserves. Applies to all UDA Covered Activities that border an existing preserve or planned SSHCP Preserve.	Most of the AMMs under Condition 2 are not codified in any existing regulations, but they could be required during project-by-project permitting or as design guidelines in specific plans.	—
EDGE-1 (Compatible Land Uses) Locate compatible land uses with less intensive human activity next to preserves.	None.	*New.*
EDGE-2 (Single-Loaded Streets) Streets adjacent to preserves should be single loaded (i.e., only be developed on one side so the preserve is visible from the street).	None.	*New.*

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
EDGE-3 (Preserve Setbacks) Set minimum 50-foot-wide setback outward from the boundary of any existing preserve or planned SSHCP Preserve.	None.	*New.*
EDGE-3a (Setback Recreational Trails) Set maximum 16-foot-wide trail on the side nearest development, with open fencing between setback and trail.	None.	*New.*
EDGE-3b (Setback Firebreaks) Set minimum legal firebreak width within Preserve Setbacks using trail as firebreak if possible.	None.	*New.*
EDGE-3c (Setback Shade Trees and Landscaping) Locate non-invasive, drought-tolerant landscaping between trail and adjacent urban development.	None.	*New.*
EDGE-4 (Locate Stormwater Control Outside Preserves) Direct urban stormwater away from preserve.	None.	*New.* Although MS4 requirements address stormwater control, they do not direct developers to avoid sending stormwater to preserves.
EDGE-5 (Stormwater Control in Preserve Setbacks) Locate within setback nearest development.	None.	*New.*
EDGE-6 (Detention Basins in Linkage Preserves) Design to minimize effects on species.	None.	*New.*
EDGE-7 (Hardpan/Duripan Protection) Avoid disruption or seal.	None.	*New.*
EDGE-8 (Outdoor Lighting) Direct lighting away from preserves.	Sacramento County Zoning Code offers some protection from light and glare for the night sky and residential uses.	*More frequently applied.* Under the SSHCP, outdoor lighting requirements would be applied to any Covered Activity that could direct light onto an existing or new preserve. This would be in addition to the requirements of Sacramento County's Zoning Code.

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
EDGE-9 (Livestock Access to Preserves) Design pick-up delivery facilities to be available and safe and not alter preserve habitat significantly.	Transportation improvement standards require safe ingress and egress.	*More frequently applied.* Under the AMM, focus would be on access for trucks with trailers and routes for such vehicles onto the preserve.
EDGE-10 (Prevent Invasive Species Spread)	Sacramento County Zoning Code restricts use of invasive plants in required landscape plans.	*More frequently applied.* Under the SSHCP, this AMM would be applied to all Covered Activities and not just those that are required to prepare landscape plans.
Condition 3. Implement Construction BMPs		
BMP-1 (Construction Fencing)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-2 (Erosion Control)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-3 (Equipment Storage and Fueling)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-4 (Erodible Materials)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-5 (Dust Control)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.* However, the limitation on using surface water would apply less frequently (e.g., stock ponds could conceivably be used as a water source for dust control).
BMP-6 (Construction Lighting)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-7 (Biological Monitor)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*

AGENDA ITEM 11.1

4075

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
BMP-8 (Training of Construction Staff)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-9 (Soil Compaction)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-10 (Revegetation)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.*
BMP-11 (Speed Limit)	Generally required as a standard BMP by local land use authorities as part of a discretionary permit (grading or building permit).	*Similar.* However, a 10-mile-per-hour speed limit on dirt roads might not always be applied.
Condition 4. Avoid and Minimize Impacts that May Result from the Implementation of Covered Transportation Projects		
ROAD-1 (Road Project Location)	Potentially required as part of ESA, CESA, or CWA permitting or consultation. Although road projects do take into account avoidance of impacts to species, wetlands, and waters, avoidance is not always held to the standard of "maximum extent practicable."	*More frequently applied.* Covered activity road projects would be held to a higher standard of avoidance than under existing regulatory conditions.
ROAD-2 (Wildlife Crossing Structures)	Potentially required as part of ESA or CESA permitting.	*More frequently applied.* Covered activity road projects would be held to a higher standard for wildlife connectivity than under existing regulatory conditions.
ROAD-3 (Roadside Pesticide Use)	The State Department of Pesticide Regulation requires full reporting of pesticide use along roadways. Use is reported monthly to agricultural commissioners who report to the state.	*More frequently applied.* Under the SSHCP, permittees will be responsible for ensuring that pesticide application along roadsides is in compliance with the AMM rather than relying on reporting that may not be consistent. Posting of signs for sensitive areas would also occur more frequently under the SSHCP.
Condition 5. Avoid and Minimize Impacts that Result from Public Use of Low-Impact Nature Trails in Preserves		
NATURE TRAIL-1 (Nature Trail Plan)	None.	*New.*
NATURE TRAIL- 2 (Nature Trail Protection of Duripan)	None.	*New.*
NATURE TRAIL- 3 (Nature Trail Location)	None.	*New.*

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
NATURE TRAIL- 4 (Biological Studies Prior to Nature Trail Design)	None.	*New.*
NATURE TRAIL- 5 (Monitoring of Nature Trail Impacts)	None.	*New.*
Condition 6. Avoid and Minimize Impacts to Existing Vernal Pools when Re-Establishing or Establishing Vernal Pool Wetlands		
RE-ESTABLISHMENT/ ESTABLISHMENT -1 (Vernal Pool)	Existing ESA, CESA, and CWA regulations put oversight for design and construction of re-established/established vernal pools under the responsibility of the USFWS, CDFW, and USACE.	*More frequently applied.* By listing the requirements for a Vernal Pool re-establishment/establishment site in the AMM, the SSHCP would result in increased certainty of methods and results when compared to the existing condition.
RE-ESTABLISHMENT/ ESTABLISHMENT -2 (Vernal Pool Inocula Bank)	None	*New.*
Condition 7. Avoid and Minimize Impacts to Streams and Creeks		
STREAM -1 (Laguna Creek Wildlife Movement Corridor)	None. However, some specific plans or flood control plans may establish setbacks along this reach.	*New.*
STREAM-2 (UDA Stream Setbacks)	None. However, some specific plans or flood control plans may establish setbacks along streams in the UDA.	*New.*
STREAM-3 (Minor Tributaries to UDA Streams)	None. However, some specific plans or flood control plans may establish setbacks along minor tributaries.	*New.*
STREAM-4 (Minimize Effects from Temporary Channel Re-Routing)	Projects would need to receive permits under California Fish and Game Code Section 1600. These would identify requirements to minimize effects on habitat and species in streams and creeks when the channel is temporarily rerouted.	*Similar.* The requirements of this SSHCP AMM would generally be the same as those required under a California Fish and Game Code Section 1600 permit.
STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening)	Projects would need to receive permits under California Fish and Game Code Section 1600. These would identify requirements to minimize effects on habitat and species in streams and creeks when the channel is temporarily rerouted.	*Similar.* The requirements of the SSHCP AMM would be generally the same as those required under a California Fish and Game Code Section 1600 permit.

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
Condition 8. Avoid and Minimize Impacts from Utility and Utility Maintenance Covered Activities		
UTILITY-1 (Avian Collision Avoidance)	Consultation with USFWS and CDFW, as well as adherence to the Avian Power Line Interaction Committee guidelines, are optional on utility projects unless a requirement is made by a local land use authority on a discretionary permit or in association with an ESA or CESA ITPs.	*New.*
UTILITY-2 (Utility Maintenance on Preserves)	Vernal pools receive protection through species avoidance or mitigation under CESA and ESA. However, these protections are not uniformly or consistently applied.	*More frequently applied.* This AMM would be implemented on any SSHCP Preserve.
UTILITY-3 (Trenchless Construction Methods)	Vernal pools receive protection through species avoidance or mitigation under CESA and ESA. However, these protections are not uniformly or consistently applied.	*More frequently applied.* This AMM would be implemented on any SSHCP Preserve.
UTILITY-4 (Siting of Entry and Exit Location)	Vernal pools and riparian woodland receive protection through species avoidance or mitigation under CESA and ESA. However, these protections are not uniformly or consistently applied.	*More frequently applied.* This AMM would be implemented on any SSHCP Preserve.
Condition 9. Avoid and Minimize Impacts that Might Result from Removing or Breaching Levees to Establish or Re-Establish Riparian Habitat		
LEVEE-1 (Preparation of Hydrologic Analysis)	CWA 404 regulations require consideration of flow alterations and related potential indirect impacts, such as effects of flows to downstream properties. Adherence to these regulations necessitates preparation of a hydrologic analysis.	*Similar.*
General Covered Species AMMs		
SPECIES-1 (Litter Removal Program)	None. Similar measures can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
SPECIES-2 (No Pets in Construction Areas)	None. Similar measures can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*

AGENDA ITEM 11.1

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
SPECIES-3 (Take Report)	None. Similar measures can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
SPECIES-4 (Post-Construction Compliance Report)	None. Similar measures can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
Sacramento or Slender Orcutt Grass		
ORCUTT-1 (Orcutt Grass Surveys)	Federal ESA protections would be used; however, surveys would only be conducted for this species if the project is a discretionary action that would prompt Sacramento County or City of Sacramento to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
ORCUTT-2 (Orcutt Grass Protection)	Federal ESA protections would be used; however, this species would only receive protection if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
California Tiger Salamander		
CTS-1 (California Tiger Salamander Daily Construction Schedule)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
CTS-2 (California Tiger Salamander Exclusion Fencing)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
CTS-3 (California Tiger Salamander Monitoring)	Federal ESA protections would be used; however, this species would only receive monitoring if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
CTS-4 (Avoid California Tiger Salamander Entrapment)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
CTS-5 (California Tiger Salamander Encounter Protocol)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
CTS-7 (Rodent Control)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
Western Spadefoot		
WS-1 (Western Spadefoot Work Window)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WS-2 (Western Spadefoot Exclusion Fencing)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WS-3 (Western Spadefoot Monitoring)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*

AGENDA ITEM 11.1

4080

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
WS-4 (Avoid Western Spadefoot Entrapment)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WS-5 (Erosion Control Materials in Western Spadefoot Habitat)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WS-6 (Western Spadefoot Encounter Protocol)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
Giant Garter Snake		
GGS-1 (Giant Garter Snake Surveys)	Federal ESA protections would be used; however, this species would only receive surveys if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
GGS-2 (Giant Garter Snake Work Window)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
GGS-3 (Giant Garter Snake Monitoring)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
GGS-4 (Giant Garter Snake Habitat Dewatering and Exclusion)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
GGS-5 (Avoid Giant Garter Snake Entrapment)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
GGS-6 (Erosion Control Materials in Giant Garter Snake Habitat)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
GGS-7 (Giant Garter Snake Encounter Protocol)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS.	*More frequently applied.* Instead of applying only on discretionary actions, this AMM would apply to any project that would like to use the SSHCP for species coverage.
GGS-8 (Giant Garter Snake Post-Construction Restoration)	Federal ESA protections would be used; however, this species would only receive those protections if the project is a discretionary action that would prompt Sacramento County or city to consult with USFWS. Restoration can also be required under project-by-project permitting efforts by local land use authorities or as part of a California Fish and Game Code Section 1600 or CWA 401/404 permit, but requirements for restorations on projects are not regular or predictable.	*More frequently applied.* Rather than occurring only potentially on projects requiring local land use authority discretionary permits or that obtain a California Fish and Game Code Section 1600 permit or CWA 401/404 permit, this AMM would be applied to any Covered Activity.
Western Pond Turtle		
WPT-1 (Western Pond Turtle Surveys)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WPT-2 (Western Pond Turtle Work Window)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
WPT-3 (Western Pond Turtle Monitoring)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WPT-5 (Avoid Western Pond Turtle Entrapment)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WPT-8 (Western Pond Turtle Encounter Protocol)	There is no formal protection under ESA or CESA for this species. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*New.*
WPT-9 (Western Pond Turtle Post-Construction Restoration)	There is no formal protection under ESA or CESA for this species. Restoration can be required under project-by-project permitting efforts by local land use authorities or as part of a California Fish and Game Code Section 1600 or CWA 401/404 permit, but requirements for restorations on projects are not regular or predictable.	*More frequently applied.* Rather than occurring only potentially on projects that obtain a California Fish and Game Code Section 1600 permit or CWA 401/404 permit, this AMM would be applied to any Covered Activity.

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
Tricolored Blackbird		
TCB-1 (Tricolored Blackbird Surveys)	This species is currently protected under CESA as a candidate for listing and also receives some protection under the Migratory Bird Treaty Act (MBTA). Future listing is uncertain, so required protections may not persist.	*More frequently applied.* Regardless of the listing decision by the Fish and Game Commission, this AMM would be applied to any Covered Activity.
TCB-2 (Tricolored Blackbird Pre-Construction Surveys)	This species is currently protected under CESA as a candidate for listing and also receives some protection under MBTA. Future listing is uncertain, so required protections may not persist.	*More frequently applied.* Regardless of the listing decision by the Fish and Game Commission, this AMM would be applied to any Covered Activity.
TCB-3 (Tricolored Blackbird Nest Buffer)	This species is currently protected under CESA as a candidate for listing and also receives some protection under MBTA. Future listing is uncertain, so required protections may not persist.	*More frequently applied.* Regardless of the listing decision by the Fish and Game Commission, this AMM would be applied to any Covered Activity.
TCB-4 (Tricolored Blackbird Nest Buffer Monitoring)	This species is currently protected under CESA as a candidate for listing and also receives some protection under MBTA. Future listing is uncertain, so required protections may not persist.	*More frequently applied.* Regardless of the listing decision by the Fish and Game Commission, this AMM would be applied to any Covered Activity.
TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	This species is currently protected under CESA as a candidate for listing and also receives some protection under MBTA. Future listing is uncertain, so required protections may not persist.	*More frequently applied.* Regardless of the listing decision by the Fish and Game Commission, this AMM would be applied to any Covered Activity.
Swainson's Hawk		
SWHA-1 (Swainson's Hawk Surveys)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
SWHA-2 (Swainson's Hawk Pre-Construction Surveys)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
SWHA-3 (Swainson's Hawk Nest Buffer)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.

Table 2-6. Comparison of AMMs Under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative

Proposed Action/Proposed Project Alternative Measure	No Action/No Project Alternative Regulatory Environment	Conclusion of SSHCP AMM Comparison with No Action/No Project Alternative Regulatory Environment
SWHA-4 (Swainson's Hawk Nest Buffer Monitoring)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
Greater Sandhill Crane		
GSC-1 (Greater Sandhill Crane Surveys)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
GSC-2 (Greater Sandhill Crane Pre-Construction Surveys)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
GSC-3 (Greater Sandhill Crane Roosting Buffer)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
GSC-4 (Greater Sandhill Crane Visual Barrier)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
GSC-5 (Greater Sandhill Crane Roosting Buffer Monitoring)	This species is formally protected under CESA and MBTA.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
Western Burrowing Owl		
WBO-1 (Western Burrowing Owl Surveys)	This species is formally protected under MBTA. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
WBO-2 (Western Burrowing Owl Pre-Construction Surveys)	This species is formally protected under MBTA. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.
WBO-3 (Burrowing Owl Avoidance)	This species is formally protected under MBTA. Protections can be required under project-by-project permitting efforts by local land use authorities but are not regular or predictable.	*More frequently applied.* Instead of potentially being applied only on discretionary actions, this AMM would be applied consistently to any project that would like to use the SSHCP for species coverage.

AGENDA ITEM 11.1

4087

The SSHCP Biological Goals and Their Associated Measurable Objectives and Conservation Actions

Biological Goals provide the broad guiding principles of any HCP Conservation Strategy and must be included in all regional HCPs (USFWS and NMFS 2000). The SSHCP Conservation Strategy is guided by the following five Biological Goals:

- **Biological Goal 1:** Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Planning Area.

  The intent of Biological Goal 1 is to maintain the existing heterogeneity of natural land covers (and their associated geologic formations and landforms) present within the Planning Area, minimize habitat fragmentation, and maintain landscape ecosystem functions by establishing a system of large and interconnected preserves.
- **Biological Goal 2:** Maintain or improve physical, chemical, and biological functions of aquatic resources within the Planning Area.

  The intent of Biological Goal 2 is to avoid or minimize impacts of future Covered Activities on Planning Area aquatic resources and to ensure no net loss of aquatic resources and aquatic functions by preserving existing aquatic resources and by re-establishing or establishing aquatic resources within the Planning Area.
- **Biological Goal 3:** Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.

  The intent of Biological Goal 3 is to ensure that adequate acreage of each natural land cover remains in the Planning Area to provide necessary breeding, foraging, and/or sheltering habitat for the Covered Species and other Planning Area native species that are associated with that land cover type.
- **Biological Goal 4:** Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Planning Area.

  Biological Goal 4 provides appropriate management and monitoring of lands preserved by the SSHCP to ensure that natural communities remain functional in perpetuity for the benefit of Covered Species and other Planning Area native species.
- **Biological Goal 5:** Maintain or expand the existing distribution of each Covered Species within the Planning Area.

  The intent of Biological Goal 5 is to ensure that each Covered Species persists within the Planning Area in perpetuity, and that unoccupied but suitable habitat for each Covered Species is preserved or re-established to provide for future Covered Species population growth and dispersal.

Biological Goals are often "stepped down" to smaller, more understandable and directly Measurable Objectives. Measurable Objectives are a condition to be met or a change to be achieved relative to the existing condition (USFWS and NMFS 2000). Each Measurable Objective should include all of the following: a species or habitat indicator, a location, an action, a quantity/state, and the timeframe needed to achieve the objective. Therefore, Measurable Objectives are quantitative and clearly state a desired result, as shown in Table 2-7. A Biological Goal is achieved by collectively implementing its Measurable Objectives (USFWS and NMFS 2000). For each Measurable Objective, the SSHCP also provides conservation actions that specify how the Measurable Objective would be achieved (Table 2-7). Additional information about the SSHCP Biological Goals, Measurable Objectives, and conservation actions is presented in the SSHCP (Chapter 7).

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Biological Goal 1: Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Planning Area.	
Objective L1. Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or establishes 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment, at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the conservation actions in this table.	**Conservation Action L1.1**. The minimum land acquisition required under the SSHCP for natural land cover types is 33,796 acres. Additional minimum land acquisition requirements will apply to some conservation analysis zones and for aquatic land cover types, as described in this table. Actual acquisition of some land cover types will likely be greater than the combined minimum requirements because parcel boundaries typically do not follow ecological boundaries, and the boundaries of acquired parcels will include land cover types that are not specified by acquisition requirements (e.g., minor roads, aqueducts). In addition, qualitative requirements for habitat connectivity or preservation of plant occurrences could require additional acreage. All SSHCP land acquisitions must be accomplished by Year 45 of the permit term to ensure that all preserve lands have at least 5 years to be managed, enhanced, and monitored according to the terms of the SSHCP. This time period will enable the Permitting Agencies to closely monitor the final land acquisitions to ensure that the Implementing Entity will complete the land acquisition strategy and achieve the final Biological Goals and Measurable Objectives. Management of these lands, however, will occur in perpetuity. Refer to objectives under Biological Goal 3 for minimum preservation and re-establishment/establishment requirements for individual SSHCP natural land cover types. Re-establishment/establishment requirements are separate and distinct from preservation requirements and cannot overlap.
Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (Minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10.)	**Conservation Action L2.1.** The Implementing Entity will acquire lands to link SSHCP Preserves and existing preserves in the Planning Area via Linkage Preserves. Linkage Preserves will have a minimum width of 600 feet. The Implementing Entity will select Linkage Preserve sites considering the following criteria: • Connects SSHCP Preserves together or connects SSHCP Preserve to existing preserves. • Provides known connectivity for Covered Species and other native terrestrial species. • Includes Covered Species modeled habitat.
Biological Goal 2: Maintain or improve physical, chemical, and biological functions of aquatic resources within the Planning Area.	
Objective W1. Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves). The Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.	**Conservation Action W1.1.** Implement Stream Setback requirements in the UDA pursuant to Table 5-1 of the SSHCP.

AGENDA ITEM 11.1

4090

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective W2. Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (LID and ROAD AMMs) • Implement ground disturbance AMM BMPs and ROAD AMMs	**Conservation Action W2.1.** Each Urban Development Covered Activity will implement LID AMMs in accordance with Section 5.4.
	Conservation Action W2.2. Each ground-disturbing Covered Activity will implement BMP measures (see Section 5.4).
	Conservation Action W2.3. Each urban development road construction and rural transportation Covered Activity will implement ROAD and BMP measures for road siting, design, pre-construction, construction, post-construction, and maintenance requirements (see Section 5.4).
Objective W3. Ensure Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams, as described in AMMs STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.	**Conservation Action W3.1.** Implement AMMs STREAM-1, STREAM-2, STREAM-3, and STREAM-4.
Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, VP4, SW1, FWM1, SC1, OW1, and RIP1).	**Conservation Action W4.1.** The Implementing Entity will select preserve sites for Valley Grassland within the Vernal Pool ecosystem considering the following criteria: • Known to include herbaceous native plant species. • Includes Covered Species modeled habitat. • Located adjacent to currently preserved lands. • Located on parcels 20 acres or greater and/or occurring within a larger open space area.
	Conservation Action W4.2. The Implementing Entity will select preserve sites for Vernal Pool and Swale habitat considering the following criteria: • Includes Covered Species modeled habitat. • Has naturally occurring high densities of vernal pools. • Has heterogeneity in vernal pool size, depth, and density. • Contains large or deep vernal pools. • Located adjacent to currently preserved lands. • Contains a soil type that is not currently preserved in the Planning Area or is underrepresented in the Preserve System. Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Can be managed to enhance or restore natural Vernal Pool ecosystem processes.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
	Conservation Action W4.3. The Implementing Entity will select preserve sites for Seasonal Wetland and Stream/Creek (VPIH) habitat considering the following criteria: • Links preserved vernal pools. • Includes Covered Species modeled habitat. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas.
	Conservation Action W4.4. The Implementing Entity will select preserve sites for Freshwater Marsh considering the following criteria: • Includes Covered Species modeled habitat. • Can be managed to enhance or restore natural Freshwater Marsh ecosystem processes.
	Conservation Action W4.5. The Implementing Entity will select preserve sites for Stream/Creek considering the following criteria: • Located in modeled habitat for aquatic Covered Species (particularly giant garter snake and western pond turtle). • Is in proximity to the mouth of the Stream/Creek to benefit giant garter snake and western pond turtle. • Located adjacent to an existing preserve. • Has water present during early spring through mid-fall (April through October). • Can be managed to enhance or restore natural Stream/Creek ecosystem processes.
	Conservation Action W4.6. The Implementing Entity will select preserve sites for Open Water considering the following criteria: • Includes Covered Species modeled habitat. • Can be managed to enhance or restore natural Open Water ecosystem processes.
	Conservation Action W4.7. The Implementing Entity will select preserve sites for riparian land cover types considering the following criteria: • Includes Covered Species modeled habitat. • Located within 3 miles of foraging habitat for bird Covered Species that use riparian habitat for nesting and/or roosting. • Closed canopy consisting of multiple vegetation layers and includes mature trees. • Is large, relatively unfragmented, and connected to Valley Grassland and agriculture areas. • Can be managed to enhance or restore riparian land cover type ecosystem processes.
Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with conservation actions listed in this table (see Objectives VP2, VP5, SW2, FWM2, OW2, and RIP2).	Refer to Conservation Actions VP2.1, VP 5.1, SW2.1, FWM2.1, OW2.1, and RIP2.1.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective W6. Ensure Covered Activities will avoid a minimum of 20% of first and second order tributaries to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek in the UDA.	**Conservation Action W6.1**. Required avoidance will comply with the requirements of AMM STREAM-3.
Objective W7. Ensure that, when re-establishing/establishing vernal pools, swales, and Freshwater Marsh, a minimum of 50 acres of Vernal Pool, 30 acres of Swale, and 50 acres of Freshwater Marsh re-establishment/establishment occur within the Morrison Creek Watershed.	Refer to Conservation Actions VP2.1, VP5.1, and FWM2.1.
Biological Goal 3: Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	
Aquatic	
Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action VG1.1.** Prioritize selection of preserve sites for Valley Grassland prioritized based on the following criteria: • Located in Vernal Pool ecosystem. • Known to support native herbaceous plants in uplands. • Located adjacent to currently preserved lands. • Located on parcels 20 acres or greater and/or occurring within larger open space area. • Management could enhance natural ecosystem processes of the Vernal Pool landscape.
Objective VP1a. Preserve a minimum of 966 acres of vernal pool in the Planning Area.	**Conservation Action VP1a.1.** Prioritize selection of preserve sites for vernal pools based on the following criteria: • Includes modeled habitat for Vernal Pool Covered Species. • Includes ecosystem functions of the uplands, micro-watersheds, and perched aquifer surrounding the vernal pools that are undisturbed. • Located adjacent to currently preserved lands. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Can be managed to maintain natural Vernal Pool ecosystem processes. • Has available water for grazing animals on preserves. • Depending on what is already preserved in the Planning Area, prioritize either naturally occurring high-density Vernal Pool complexes or more isolated pools to ensure heterogeneity of spatial patterns and connectivity. Depending on what is already preserved in the Planning Area, prioritize preservation of pools with each of the different landforms, geologic formations, floristic assemblages, and vernal pool sizes/depths.

AGENDA ITEM 11.1

4093

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective VP1b. Impacts to vernal pool within or adjacent to (within 1 mile of) the MCRA and Cosumnes/Rancho-Seco Core Recovery Area will be mitigated within or adjacent to (within 1 mile of) the MCRA and/or Cosumnes/Rancho-Seco Core Recovery Area.	**Conservation Action VP1b.1.** Prioritize selection of preserve sites for vernal pools in Core Recovery Areas based on the following criteria: • Is within the MCRA or Cosumnes/Rancho-Seco Recovery Area. • If not within the Core Recovery Areas, is within 1 mile of one of the two Core Recovery Areas. • Includes modeled habitat for Vernal Pool Covered Species. • Ecosystem functions of the uplands, micro-watersheds, and perched aquifer surrounding the vernal pools are undisturbed. • Adjacent to currently preserved lands. • On parcels 20 acres or greater and/or occurs in larger, open space areas. • Can be managed to maintain natural Vernal Pool ecosystem processes. • Depending on what is already preserved in the Plan Area, prioritize either naturally occurring high-density vernal pool complexes or more isolated pools to ensure heterogeneity of spatial patterns and connectivity. • Depending on what is already preserved in the Plan Area, prioritize preservation of pools with each of the different landforms, geologic formations, floristic assemblages, and vernal pool sizes/depths. Has available water for grazing animals on preserves
Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the MCRA.	**Conservation Action VP2.1**. Implement Vernal Pool re-establishment and establishment consistent with the requirements of AMMs RE-ESTABLISHMENT/ESTABLISHMENT-1 and -2. Adhere to specific protocols, described in detail in the ARP, and outlined in Title 33 of the Code of Federal Regulation, Part 325, Sections 332.4(c)(2) through (c)(14), of the USACE's Mitigation Rule.
Objective VP3. Preserve a minimum of 278 acres of Swale. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action VP3.1.** Prioritize selection of preserve sites for Swale or Stream/Creeks (VPIH) based on the following criteria: • Located in Vernal Pool ecosystem. • Links existing preserved Vernal Pool areas. • Includes Covered Species modeled habitat. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas.
Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action VP4.1.** Prioritize selection of preserve sites for Swale or Stream/Creek (VPIH) based on the following criteria: • Located in Vernal Pool ecosystem. • Has Swale preservation preferred over preservation of Stream/Creek (VPIH). • Links existing preserved Vernal Pool areas. • Includes Covered Species modeled habitat.

AGENDA ITEM 11.1

4094

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
	• Located on parcels 20 acres or greater and/or occurs in larger, open space areas.
Objective VP5. Re-establish and/or establish a minimum of 256 acres of Swale or Vernal Pool for impacts to the Swale and Stream/Creek (VPIH) land covers. Re-establishment and/or establishment will occur in accordance with the conservation actions in this table.	**Conservation Action VP5.1.** Prioritize selection of re-establishment/establishment sites for Swale based on the following criteria: • Located in Vernal Pool ecosystem. • Links existing preserved Vernal Pool areas. • Includes Covered Species modeled habitat. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas.
Objective VP6. Re-establish and/or establish a minimum of 300 acres of functional Vernal Pool ecosystem within or adjacent to (within 1 mile of) the MCRA.	Refer to Conservation Action VP2.1.
Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action SW1.1.** Prioritize selection of preserve sites for Seasonal Wetland based on the following criteria: • Includes Covered Species modeled habitat. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas, to the maximum extent feasible.
Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the conservation actions in this table.	**Conservation Action SW2.1.** Prioritize selection of re-establishment and/or establishment sites for Seasonal Wetland based on the following criteria: • Links existing preserved areas of Seasonal Wetland or other aquatic land cover types that provide modeled species habitat. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas, to the maximum extent feasible. • Supports soils and topography modeled for re-establishing and/or establishing Seasonal Wetland.
Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action FWM1.1.** Prioritize selection of preserve sites for Freshwater Marsh based on the following criteria: • Includes Covered Species modeled habitat. • Currently exhibits hydrology sufficient to support perennial Freshwater Marsh habitat. • Currently supports emergent vegetation such as tules and cattails.
Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the conservation	**Conservation Action FWM2.1**. Prioritize selection of re-establishment and/or establishment sites for Freshwater Marsh based on the following criteria: • Has historically supported Freshwater Marsh habitat. • Has soils and topography consistent with the Freshwater Marsh land cover type modeled for re-establishment and/or establishment of Freshwater Marsh.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
actions in this table.	• Links existing preserve areas of Freshwater Marsh other aquatic land cover types that provide modeled species habitat. • After re-establishment and/or establishment, would provide Covered Species modeled habitat. • Has hydrology sufficient to support perennial Freshwater Marsh habitat or a water source to re-establish historical hydrology of the site.
Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action SC1.1.** Prioritize selection of preserve sites for Stream/Creek based on the following criteria: • Has potential to support Covered Species (particularly giant garter snake and western pond turtle). • Proximity to the mouth of the Stream/Creek. • Adjacent to an existing preserve. • Water present during early spring through mid-fall (April through October). • Management can be used to enhance natural stream and creek ecosystem processes.
Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with the conservation actions in this table.	**Conservation Action SC2.1.** Prioritize selection of re-establishment and/or establishment sites for Stream/Creek based on the following criteria: • Has potential to support Covered Species (particularly giant garter snake and western pond turtle). • Links existing preserve areas of aquatic land cover types that provide modeled species habitat. • Proximity to the mouth of the Stream/Creek. • Adjacent to an existing preserve. • Water present during early spring through mid-fall (April through October). • Management can be used to enhance natural stream and creek ecosystem processes.
Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by the Technical Advisory Committee (TAC)). The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action OW1.1.** Prioritize selection of preserve sites for Open Water based on the following criteria: • Includes Covered Species modeled habitat. Links existing preserved land cover types that provide modeled species habitat. • Management can be used to enhance or restore natural ecosystem processes.
Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment	**Conservation Action OW2.1.** Prioritize selection of re-establishment and/or establishment sites for Open Water based on the following criteria: • Links existing preserve areas of aquatic land cover that provide Covered Species modeled habitat. • Management can be used to enhance or restore natural ecosystem processes.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
will occur in accordance with the conservation actions in this table.	
Objective RIP1. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailings Riparian Woodland land cover type. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action RIP1.1.** Prioritize selection of preserve sites for Mixed Riparian Woodland or Mixed Riparian Scrub based on the following criteria: • Includes Covered Species modeled habitat. • Located within 3 miles of foraging habitat for Covered Species that use riparian habitat for nesting and/or roosting. • Has closed canopy consisting of multiple vegetation layers and includes mature trees. • Is large, relatively unfragmented, and connected to Valley Grassland and agriculture areas. • Management can be used to enhance or restore natural ecosystem processes.
Objective RIP2. Re-establish and/or establish a minimum of 591 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailings Riparian Woodland land cover type. Re-establishment and/or establishment will occur in accordance with the conservation actions in this table.	**Conservation Action RIP2.1.** Prioritize selection of re-establishment and/or establishment sites for Mixed Riparian Woodland or Mixed Riparian Scrub based on the following criteria: • Potential re-establishment/establishment sites will fill gaps between existing Mixed Riparian Woodland or Mixed Riparian Scrub land cover sites, or establish a link between existing Riparian Woodland or Mixed Riparian Scrub land cover sites. • Includes Covered Species modeled habitat. • Located within 3 miles of foraging habitat for Covered Species that use riparian habitat for nesting and/or roosting. • Closed canopy consisting of multiple vegetation layers, including mature trees. • Large, unfragmented, and connected to Valley Grassland and agriculture areas. • Management can be used to enhance or restore natural ecosystem processes. • Re-establishment sites will be located along existing riparian corridors where habitat likely existed in the past, such as areas along the Cosumnes River, Deer Creek, South Laguna Creek, Willow Slough, North Badger Creek, South Badger Creek, Deadman's Gulch, or Skunk Creek. • Re-establishment will avoid locations preserved or restored for giant garter snake. • Establishment of riparian communities will avoid locations that historically did not support riparian vegetation. • Establishment of riparian communities will avoid any existing Vernal Pool landscapes. • Re-establishment will use the historical signature of riparian communities and aim to restore the historical conditions. • Re-establishment and establishment sites will be located within an SSHCP Preserve. • Re-establishment and establishment sites will support soils and topography modeled for re-establishment and/or establishment of riparian communities. • Re-established and established riparian communities will be designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Terrestrial	
Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action BOW1.1.** Prioritize selection of preserve sites for Blue Oak Woodland/Savanna that expand on or link to the Deer Creek Hills Preserve to the maximum extent feasible.
Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the conservation actions in this table.	**Conservation Action BOW2.1**. Prioritize selection of re-establishment/establishment sites for Blue Oak Woodland/Savanna that will expand the existing Deer Creek Hills Preserve to the maximum extent feasible or will establish a habitat link between an SSHCP Preserve and the existing Deer Creek Hills Preserve. Any potential re-establishment/establishment sites will fill gaps between existing preserved mixed Blue Oak Woodland or Blue Oak Savanna land covers or would link existing preserved Blue Oak Woodland or Blue Oak Savanna land covers. Re-establishment is preferred over establishment.
Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	**Conservation Action AG1.1.** The Implementing Entity will select preserve sites with existing agriculture land covers considering certain criteria, including the following: • Contains margins that support suitable nesting trees and/or could support plantings of additional trees and shrubs for future use as nesting or perching habitat and/or habitat for prey. • Contains soils identified in the soil survey of Sacramento County as highly productive. • Has an existing irrigation system that is engineered to provide for crop production. • Supports high prey densities for avian Covered Species or is capable of supporting crops that support high prey densities. • Management can be used to enhance or restore natural ecosystem processes.
Biological Goal 4: Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Planning Area.	
Objective HAB1. Develop PMPs for the benefit of Covered Species.	**Conservation Action HAB1.1.** Prepare a PMP for each preserve within 1 year of acquisition. The PMPs will identify preserve-specific preservation objectives for Covered Species and habitats and will be consistent with the Preserve System Management Program.
Objective HAB2. Assess whether SSHCP Preserves are being managed and maintained for the benefit of Covered Species.	**Conservation Action HAB2.1.** Individual PMPs will be reviewed periodically (e.g., every 3–5 years) after development in coordination with the Preserve System Management Program. If preserve sites are not meeting habitat success standards as determined by the TAC, modifications, such as remedial actions (e.g., adaptive management) or other additional preservation actions (e.g., adding acreage), will be implemented.

AGENDA ITEM 11.1

4098

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective HAB3. Record management history for preserve parcels as they are obtained. Consider management history when developing an initial PMP.	**Conservation Action HAB3.1.** The Implementing Entity will interview individuals, to the maximum extent feasible, that have been involved in management of acquired parcels. This could include landowners, property managers, ranch managers, and any others with management responsibility. For parcels that are part of a group (e.g., a ranch), separate reports for each parcel do not need to be prepared, but any variation in management treatment between the component parcels should be noted. To the maximum extent feasible, interviews will be audio or video recorded and summarized in a memorandum. Those memoranda will be reviewed, and any relevant information should be included as appendices in the initial and individual PMP. Preserve Managers will not change the management approach from existing management without a sound scientific basis for the change.
Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Planning Area. The program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Planning Area, including training of road crews to identify and report weeds.	**Conservation Action HAB4.1**. Include invasive plant and wildlife control strategies in all PMPs. These strategies may include site-specific grazing regimes, controlled burning protocols, and mowing/mechanical maintenance guidelines consistent with native plant re-establishment needs, invasive plant and wildlife removal, and consideration of endemic plant and wildlife species population needs.
Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter).	**Conservation Action HAB5.1.** Include in PMPs a requirement to regularly monitor noise and light intensity, frequency and quantity of trash, qualitative hydrology changes, and other issues along a transect from the boundary toward the interior. Preserve Managers will include this information in annual reports, noting any changes in these attributes over time. Quantitative monitoring for edge effects will occur on the same preserves hosting permanent plots for vernal pool plants and invertebrate species, and will be timed to allow for correlational analysis between edge effects and species presence or abundance over the long term.
Objective HAB6. Collect weather data throughout Sacramento County to assist in developing status and trends and tracking climate change and data.	**Conservation Action HAB6.1.** During assembly of the SSHCP Preserve System, install weather stations at selected preserves for fine-scale monitoring of climate trends and combine with data from existing weather stations to provide a comprehensive weather dataset. Preserves will be selected to receive weather stations based on gaps in geographic coverage of existing weather stations in Sacramento County.
Objective HAB7. Monitor vegetation biomass within grassland land covers.	**Conservation Action HAB7.1.** During assembly of Flexible Preserves (Valley Grassland, Blue Oak Savanna), measure vegetation biomass. Measurement will be by releve, residual dry matter, or similar technique. The technique selected will be used consistently across preserves on an annual basis at the end of the growing season (i.e., September or October).
Objective AG2. Of the 9,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as corn, alfalfa, or wheat) preferred by tricolored blackbird (*Agelaius tricolor*), greater sandhill crane, and the covered raptor species. The	**Conservation Action AG2.1**. Maintain a minimum of 2,000 acres as food plots that are planted with crops that are preferred by avian Covered Species as foraging habitat such as corn, alfalfa, or wheat. Food plots will be distributed throughout PPUs 4, 5, or 6 at a minimum of 10 different locations, none of which will be less than 20 acres.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The preserves will be assembled in accordance with the conservation actions in this table and in accordance with Section 7.5.	
Objective AG3. Maintain or increase raptor prey availability and improve raptor foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species.	**Conservation Action AG3.1.** Plant 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other small prey (e.g., amphibians, reptiles) within and on the borders of Cropland Preserves within PPUs 4, 5, and/or 6 to increase prey availability for covered avian species. In total, 100 linear feet of hedgerow will be planted each year until 5,000 linear feet is established within the Planning Area. Planting of hedgerows can be delayed for up to 5 years after issuance of permits to allow time to acquire preserves where hedgerows can be planted. At least 1,000 feet must be planted within 10 years after issuance of permits. Acceptable hedgerow plants include native trees, shrubs, and grasses, as approved by the TAC. Hedgerows must grow to be at least 5 feet in width and must be located on upland areas not prone to inundation from normal irrigation practices. Hedgerows that fail to establish or succumb to disease or other causes will be replaced within 1 year of removal or failure. Providing refuge habitat for prey species adjacent to agricultural settings will allow areas that have been harvested or with temporarily reduced or eliminated populations of prey to re-establish more quickly.
Objective RIP5. Monitor the groundwater table as it relates to status and trends for riparian habitat.	**Conservation Action RIP5.1.** During assembly of the SSHCP Preserve System, identify parcels that have existing water wells. To the maximum extent feasible, obtain history of depth to the groundwater table from property owners or managers. During assembly of the SSHCP Preserve System, take a reading of depth to groundwater at each existing well. Repeat measurement annually at a consistent time of year to allow comparison between years, and monitor any groundwater depletion or recharge.
	Conservation Action RIP5.2. During assembly of the SSHCP Preserve System, ensure availability of water for grazing animals on preserves, Cropland Preserves, and habitat restoration.
Biological Goal 5: Maintain or expand the existing distribution of each Covered Species within the Planning Area.	
Plant Covered Species	
Objective VPP1. Protect one currently documented unpreserved occurrence of Ahart's dwarf rush in the Planning Area. Prior to take of any occurrence of Ahart's dwarf rush, protect six currently unpreserved[13] and "biologically equivalent	**Conservation Action VPP1.1.** Conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when Ahart's dwarf rush is observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of Ahart's dwarf rush, identify one unprotected occurrence of the species and protect the occurrence within a new preserve.

[13] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Planning Area.

AGENDA ITEM 11.1

4100

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
or superior" (as defined by the TAC) occurrences of Ahart's dwarf rush within the Planning Area. After six currently unpreserved occurrences are protected, prior to take of an occurrence of Ahart's dwarf rush, protect one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of Ahart's dwarf rush within the Planning Area.	
Objective VPP2. Prior to take of any occurrence of Boggs Lake hedge-hyssop, protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Boggs Lake hedge-hyssop within the Planning Area.	**Conservation Action VPP2.1**. Conduct surveys in modeled habitat (and suitable habitat identified by the approved biologist at the time of the survey) during the appropriate time of year when Boggs Lake hedge-hyssop is observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of Boggs Lake hedge-hyssop, identify one unprotected occurrence of the species and protect the occurrence within a new preserve.
Objective VPP3. Prior to take of any occurrence of dwarf downingia, protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrence of dwarf downingia within the Planning Area.	**Conservation Action VPP3.1.** Conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when dwarf downingia is observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of dwarf downingia, identify one unprotected occurrence of the species and protect the occurrence within a new preserve.
Objective VPP4. Protect and maintain in perpetuity a minimum of 14 occurrences of legenere within the SSHCP Preserve System. Legenere occurrences will be preserved in accordance with the conservation actions described in this table. Prior to take of any occurrence of legenere, one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of legenere will be preserved and maintained within the Planning Area.	**Conservation Action VPP4.1.** Preserve and maintain in perpetuity at least 14 occurrences of legenere within the SSHCP Preserve System. Conduct surveys in modeled habitat (and suitable habitat identified by the approved biologist at the time of the survey) during the appropriate time of year when legenere is observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of legenere, identify one unprotected occurrence of the species and protect within the occurrence a new preserve.

AGENDA ITEM 11.1

4101

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective VPP5. Prior to take of any occurrence of pincushion navarretia, protect one currently unpreserved[14] and "biologically equivalent or superior" (as defined by the TAC) occurrence of pincushion navarretia within the Planning Area.	**Conservation Action VPP5.1.** Conduct surveys in modeled habitat (and suitable habitat identified by the approved biologist at the time of the survey) during the appropriate time of year when pincushion navarretia is observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of pincushion navarretia, identify one unprotected occurrence of the species and protect the occurrence within a new preserve.
Objective VPP6. Protect and maintain in perpetuity all known currently unprotected occurrences of Sacramento Orcutt grass in the Planning Area to preserve existing distribution and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.	**Conservation Action VPP6.1.** Preserve and maintain in perpetuity all known occurrences of Sacramento Orcutt grass in the Planning Area. Prior to proposed disturbance of a site associated with a Covered Activity, conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when Sacramento Orcutt grass is observable. Over the permit term, all plant surveys will comply with CDFW's most recent survey protocols for sensitive plants. If a species is found, the project proponent will protect the occurrence within a minimum satellite-sized preserve that encloses the entire Vernal Pool watershed. Surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If, after the first year, or any 5-year interval thereafter, Sacramento Orcutt grass is not persisting, the preservation effort will be deemed to have failed. Remediation (e.g., re-establishment at another location) must occur within 1 year after efforts are deemed unsuccessful.
Objective VPP7. Protect and maintain in perpetuity all known currently unprotected occurrences of slender Orcutt grass in the Planning Area to preserve existing distribution and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.	**Conservation Action VPP7.1.** Preserve and maintain in perpetuity all known occurrences of slender Orcutt grass in the Planning Area. Prior to the proposed disturbance of a site associated with a Covered Activity, conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when slender Orcutt grass is observable. Over the permit term, all plant surveys will comply with CDFW's most recent survey protocols for sensitive plants. If the species is found, the project proponent will protect the occurrence within a minimum satellite-sized preserve that encloses the entire Vernal Pool micro-watershed. Surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If, after the first year, or any 5-year interval thereafter, slender Orcutt grass is not persisting, the preservation effort will be deemed to have failed. Remediation (e.g., re-establishment at another location) must occur within 1 year after efforts are deemed unsuccessful.
Objective SA1. Prior to take of an occurrence of Sanford's arrowhead, protect one currently unpreserved[15] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Sanford's arrowhead within the Planning Area.	**Conservation Action SA1.1.** Conduct surveys in modeled habitat (and suitable habitat identified by the approved biologist at the time of the survey) during the appropriate time of year when Sanford's arrowhead are observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of Sanford's arrowhead, identify one unprotected occurrence of the species and protect within a new preserve.

[14] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Planning Area.

[15] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Planning Area.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective SA2. During re-establishment and/or establishment of Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek, translocate impacted Sanford's arrowhead from other sites.	**Conservation Action SA1.2.** The Implementing Entity will select translocation sites for Sanford's arrowhead in emergent marsh vegetation, including the margins of rivers, streams, ponds, reservoirs, irrigation and drainage canals, ditches, stock-ponds, and Freshwater Marsh, considering certain criteria, including the following: • Known to support Sanford's arrowhead. • Proposed for re-establishment/establishment. • Can be re-established to support Sanford's arrowhead populations and natural ecosystem processes.
Aquatic Animal Covered Species	
Objective VPI1. Protect and maintain in perpetuity 1,270 acres of vernal pool tadpole shrimp modeled aquatic habitat within the Planning Area to preserve existing distribution.	**Conservation Action VPI1.1.** The Implementing Entity will select preserve sites containing modeled habitat for vernal pool invertebrates considering certain criteria, including the following: • Includes vernal pool complexes with known occurrences of covered vernal pool invertebrates. • Represents diversity of vernal pool depth, size, density, geologic formations, and soil types within the Planning Area. • Includes vernal pool habitats embedded in Valley Grassland within Vernal Wetland Acre/Density Index Category 1–3 land analysis units that provide high-quality Vernal Pool habitat. • Located adjacency of other suitable habitat. • Has modeled habitat within the USFWS Core Recovery Areas and Critical Habitat for vernal pool invertebrate species.
	Conservation Action VPI1.2. Preserve a minimum of 90% of the watershed of each preserved Vernal Pool and maintain a minimum 50-foot setback outside the preserve boundary.
Objective VPI2. Protect and maintain in perpetuity 1,270 acres of vernal pool fairy shrimp modeled aquatic habitat within the Planning Area to preserve existing distribution.	See Conservation Actions VPI1.1 and VPI1.2.
Objective VPI3. Protect and maintain in perpetuity 1,059 acres of mid-valley fairy shrimp modeled aquatic habitat within the Planning Area to preserve existing distribution.	See Conservation Actions VPI1.1 and VPI1.2.
Objective VPI4. Protect and maintain in perpetuity 1,245 acres of Ricksecker's water scavenger beetle modeled aquatic habitat within the Planning Area to preserve existing distribution.	See Conservation Actions VPI1.1 and VPI1.2.

AGENDA ITEM 11.1

4103

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective VPI5. Ensure that, during implementation of Objective VP2, re-established or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/ establishment in accordance with the conservation actions in this table.	**Conservation Action VPI5.1:** Implement Vernal Pool re-establishment and establishment consistent with the requirements of AMMs RE-ESTABLISHMENT/ESTABLISHMENT-1 and -2.
Objective CTS1. Preserve at least five occupied California tiger salamander breeding ponds.	**Conservation Action CTS1.1**. The Implementing Entity will select breeding ponds for preservation considering certain criteria, including the following: • Located within USFWS Critical Habitat. • Has surveys that indicate active use of breeding pond within each of prior 3 years. • Has breeding ponds that can sustain inundation for a minimum of 70 days during an average rainfall year. • Has surrounding uplands that no more than 0.5 mile away containing Blue Oak Savanna, Blue Oak Woodland, and Valley Grassland with adequate burrows and refugia sites. • Has no predatory fish and American bullfrog (*Rana catesbeiana)* on site.
Objective CTS2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for California tiger salamander is preserved. Minimum preservation will total 141 acres of aquatic habitat and 1,677 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within California tiger salamander Critical Habitat occurs within California tiger salamander Critical Habitat (see Objectives BOW1, VP1, SW1, and VG1).	**Conservation Action CTS2.1.** Preserve California tiger salamander aquatic habitat (Vernal Pool and Seasonal Wetland). The Implementing Entity will select preserve sites considering certain criteria, including the following: • Located in modeled habitat within USFWS Critical Habitat. • Contains modeled wetlands and surrounding uplands no more than 0.5 mile from aquatic habitat. • Has wetlands that must be able to sustain inundation for a minimum of 70 days during an average rainfall year. • Has permanent impoundments that are appropriate as long as predatory fish and bullfrogs are absent.
	Conservation Action CTS2.2. Preserve California tiger salamander upland habitat (Blue Oak Woodland, Blue Oak Savanna, and Valley Grassland). The Implementing Entity will select preserve sites considering certain criteria, including the following: • Located in modeled habitat within USFWS Critical Habitat. • Contains Blue Oak Savanna, Blue Oak Woodland, and Valley Grassland no more than 0.5 mile from known breeding pond. • Contains burrows that are dry during the summer and fall months in open grassland or under isolated oaks. • Supports fossorial mammals to create upland burrows. • Located within 1.5 miles of Vernal Pool and Seasonal Wetland that are considered aquatic habitat.
	Conservation Action CTS2.3. Preserve California tiger salamander aquatic or upland habitat at a ratio of 1 acre for every 1 acre that is lost (1:1) within PPU 7. Conduct surveys after the first year and every 5 years thereafter to monitor the occupancy of the habitat.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective CTS3. Rural transportation project Covered Activities within California tiger salamander modeled habitat will be designed to allow California tiger salamander movement across the roadway area.	**Conservation Action CTS3.1**. The Implementing Entity will retain an approved biologist to prepare targeted species mobility studies to determine if California tiger salamander mobility between breeding ponds or between breeding ponds and upland refugia will be affected by rural transportation Covered Activities within California tiger salamander modeled habitat. Data relevant to determining California tiger salamander movement must be collected for at least 3 years, and the study will be updated through new data collection and consultation with USFWS and CDFW every 10 years. The mobility study methodology will be prepared in consultation with USFWS and CDFW and will need approval from USFWS and CDFW prior to implementation. The data will be used by the project proponent to select the most appropriate design requirements to maintain and facilitate California tiger salamander movement. Modeled habitat near each of the following roadways will be the subject of targeted species mobility studies for California tiger salamander: • Twin Cities Road east of State Route 99 • Ione Road within PPU 7 • Clay Station Road from Dillard Road south to Sacramento County line with San Joaquin County (Planning Area boundary) After construction is complete, California tiger salamander movement across and along the road will be monitored to assess how their movement changed in response to the project and if additional design considerations will be used as future projects are implemented along the roadway.
Objective WS1. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for western spadefoot is preserved. Minimum preservation will total 1,531 acres of aquatic habitat and 22,044 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within the MCRA or Cosumnes/Rancho Seco Core Recovery Area occurs within the Core Recovery Areas (see Objectives BOW1, VP1, VP3, SW1, SC1, OW1, and VG1).	**Conservation Action WS1.1.** The Implementing Entity will select preserve sites for aquatic and adjacent upland habitat considering certain criteria, including the following: • Habitat is located in the MCRA or Cosumnes/Rancho-Seco Core Recovery Areas. • Aquatic habitat will include temporary pools and drainages. • Aquatic habitat will include quiet streams that form following winter or spring rains. • Upland habitat should surround aquatic breeding sites. • Upland habitat will include friable soils suitable for burrow creation. • Upland habitat will include soils maintaining some degree of moisture. • Aquatic and upland habitat is located away from areas that are subject to vibrations that simulate rainfall, such as roadways with heavy traffic.
Objective WS2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic habitat for western spadefoot is re-established and/or	**Conservation Action WS2.1.** The Implementing Entity will select re-establishment and establishment sites considering certain criteria, including the following: • Habitat is located in the MCRA or Cosumnes/Rancho-Seco Core Recovery Areas. • Aquatic habitat will include temporary pools and drainages.

AGENDA ITEM 11.1

4105

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
established. Minimum re-establishment and/or establishment will total 906 acres of aquatic habitat. Ensure that mitigation for modeled high-value habitat impacted within the MCRA or Cosumnes/Rancho Seco Core Recovery Area occurs within the Core Recovery Areas (see Objectives VP2, SW2, and OW2).	• Habitat will include quiet streams that form following winter or spring rains. • Habitat will include upland habitat available no more than 500 feet away from preserved aquatic habitat. • Habitat will include friable soils suitable for burrow creation. • Habitat will include soils that maintain some degree of moisture. • Site links existing natural land covers that provide Covered Species modeled habitat. • Habitat is located away from areas that are subject to vibrations that simulate rainfall, such as roadways with heavy traffic. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment/establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective GGS1. During assembly of the SSHCP Preserve System, ensure that modeled habitats for giant garter snake are preserved along the following creeks (or other creeks that are determined by the TAC to provide similar giant garter snake habitat value): • Lower Laguna Creek, mainly between Twin Cities Road (State Route 104) and Miess Road • Skunk Creek, which flows into the Cosumnes River northwest of the City of Galt • Willow Creek and tributaries of Badger Creek, which are to the north of the lower Laguna Creek and west of the Folsom South Canal • Badger Marsh Mitigation for impacts to modeled habitats for giant garter snake that occur along Badger Creek and Stone Lakes will occur along these drainages.	**Conservation Action GGS1.1.** The Implementing Entity will select preserve sites for aquatic modeled habitat considering certain criteria, including the following: • Stream/Creek, Freshwater Marsh, Open Water, and Seasonal Wetland located entirely inside or within 0.25 mile of the following reaches: o A prominent drainageway on the Elliot mitigation site, which links to Stone Lakes NWR and is wet year-round. o Drainage canals south of Elk Grove, which have a past occurrence and link to Stone Lakes NWR; the perennial segments of these canals are suitable habitat. o Badger Creek and all other creeks that drain into the marsh at the Cosumnes River Preserve, which are likely high-quality habitat due to proximity and connectivity to a significant population of giant garter snakes; the perennial segments of these creeks are suitable habitat. o The perennial segments of Laguna Creek (south) and tributaries are suitable habitat due to presence of Freshwater Marsh habitat and proximity to known documented occurrences. o The perennial segments of drainages and canals leading from the Cosumnes River Preserve, including Deadman's Gulch, which provides suitable habitat. • Contains adequate water during the snake's active season (early spring through mid-fall) to provide food and cover. • Emergent, herbaceous wetland vegetation for escape cover and foraging habitat during the active season. • Grassy banks and openings in waterside vegetation for basking.
	Conservation Action GGS1.2. The Implementing Entity will select preserve sites with stream reaches that contain upland modeled habitat within 200 feet of the stream, including Mixed Riparian Scrub and Valley Grassland, considering the following criteria: • Contains a stream reach at least 600 feet in length. • Located near foraging and breeding habitat.

AGENDA ITEM 11.1
4106

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Minimum preservation will total 170 acres of giant garter snake high-value aquatic habitat and 2,323 acres of giant garter snake high-value upland habitat (see Objectives AG1, FWM1, SW1, SC1, OW1, RIP1, and VG1).	• Supports higher elevation uplands for cover. • Provides refuge from flood waters during the species' dormant season in the winter. • Contains upland habitat that can link isolated and disjunct giant garter snake aquatic habitat. • Contains a minimum 300-foot setback on at least one side of stream reaches.
Objective GGS2. During assembly of the SSHCP Preserve System, ensure that modeled habitats for giant garter snake are re-established and/or established along the following creeks (or other creeks that are determined by the TAC to provide similar habitat value): • Lower Laguna Creek, mainly between Twin Cities Road (State Route 104) and Miess Road • Skunk Creek, which flows into the Cosumnes River northwest of the City of Galt • Several creeks north of Lower Laguna Creek and west of the Folsom South Canal— Willow Creek and tributaries of Badger Creek • Badger Marsh Mitigation for impacts to modeled habitats for giant garter snake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum re-establishment and/or establishment will total 170 acres of high-value aquatic habitat and 134 acres of high-value upland habitat (see Objectives SW2, OW2, and RIP2).	**Conservation Action GGS2.1**. The Implementing Entity will select re-establishment and establishment sites for aquatic habitat that include Freshwater Marsh, Open Water, Stream/Creek, and Seasonal Wetland considering the following criteria: • Contains a supply of perennial water that can maintain emergent vegetation. • Located near (within 250 meters) the mouth of streams/creeks that is near potential upland habitat and adjacent to existing modeled upland habitat. • Can link isolated and disjunct giant garter snake habitat. • Includes re-established sites located along those portions of a stream corridor that have been identified as preserves for giant garter snake that provide upland habitat modeled for aestivation and/or basking at intervals no greater than 600 feet. Giant garter snake habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled habitat defined by the following criteria: • Located in intervals along the stream channel that are no closer to one another than 300 feet. • Are at least 0.2 acre at any given location along the stream channel but not to exceed 1 acre. • Provides perennial aquatic habitat. • Provides emergent vegetation (i.e., tules and/or cattails). • Provides grassy banks and openings in the waterside vegetation (e.g., bulrush, cattails, waterweed, or other floating vegetation). • Supports soils and topography modeled for re-establishing target habitat. • Designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat. • Provides a minimum 300-foot setback on at least one side of re-established stream reaches. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment or establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment/establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
	Conservation Action GGS2.2. The Implementing Entity will select re-establishment or establishment sites for aquatic habitat that include Mixed Riparian Scrub and Valley Grassland considering the following criteria: • Directly connects to (and within 0.25 mile of) aquatic habitat. • Includes higher elevation uplands to provide refuge from flood waters during the species' dormant season in the winter.

AGENDA ITEM 11.1

4107

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
	• Can link isolated and disjunct giant garter snake habitat. • Located along those portions of a stream corridor that have been identified as preserves for giant garter snake that provide upland habitat modeled for aestivation and/or nesting. Giant garter snake habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled habitat defined by the following criteria: • Supports soils and topography modeled for restoring target habitat. • Designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the re-established or established habitat is not meeting re-establishment or establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment or establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective GGS3. Plan Permittees will conduct a study to establish hydrologic baseline conditions along Badger Creek to identify what level of hydrology is necessary to support giant garter snake and to acquire a water source to maintain the minimum level of hydrology during the summer months when agricultural runoff may wane.	**Conservation Action GGS3.1.** Measure hydrologic parameters (e.g., flow rate, temperature) within Badger Creek in locations known to be occupied by giant garter snake. Three monthly hydrologic measurements will be made during the dry season of an average or better rainfall year. Each recording will occur over a full week to identify any regular interruptions in flow or changes in conditions due to diversions or inflows.
	Conservation Action GGS3.2. Acquire water rights adequate to maintain baseline dry season flows within Badger Creek, as determined during measurements obtained pursuant to Conservation Action GGS3.1.
Objective WPT1. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for western pond turtle is preserved. Minimum preservation will total 315.35 acres of aquatic habitat and 10,971 acres of upland habitat (see Objectives FWM1, OW1, RIP1, VG1, BOW1, and SC1).	**Conservation Action WPT1.1.** The Implementing Entity will select preserve sites for aquatic habitat, including Freshwater Marsh, Open Water, and Stream/Creek considering the following criteria: • Contains slow-moving or quiet water with emergent aquatic vegetation and deep pools with undercut banks for refugia. • Contains basking sites such as rocks, logs, matted floating vegetation, terrestrial islands within the aquatic habitat, and human-made debris. • Will allow a minimum 300-foot setback on at least one side of the stream reaches that are preserved for western pond turtle. • Located where a stream reach is at least 600 feet in length.
	Conservation Action WPT1.2. The Implementing Entity will select preserve sites for upland habitat, including Blue Oak Savanna, Blue Oak Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland considering the following criteria: • Allows for a 400-foot setback along both sides of the stream reaches identified for western pond turtle outside of the UDA. • Allows for a 300-foot corridor along each side of North Laguna Creek to the maximum extent feasible, as measured from the ordinary high water mark of the creek, with a minimum stream corridor width of 600 feet plus the width of the creek,

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
	with additional setbacks as defined by local government ordinances. In segments of Laguna Creek where a 300-foot corridor on one side of the creek is not possible due to existing development and constraints, 300 feet may be used as an average for a defined length of the creek. However, the corridor on either side of Laguna Creek will be a minimum of the mapped Federal Emergency Management Agency 100-year floodplain of 2014.
Objective WPT2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic habitat for western pond turtle is re-established and/or established. Minimum re-establishment and/or establishment will total 315 acres of aquatic habitat (see Objectives RIP2, FWM2, and OW2).	**Conservation Action WPT2.1**. The Implementing Entity will select re-establishment and/or establishment sites for foraging and breeding habitat that includes Freshwater Marsh, Open Water, and Stream/Creek considering the following criteria: • Contains slow-moving or quiet water with emergent aquatic vegetation and deep pools with undercut banks for refugia. • Contains or has high potential to create basking sites such as rocks, logs, matted floating vegetation, terrestrial islands within the aquatic habitat, and human-made debris. Western pond turtle aquatic habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled habitat, defined by the following criteria: • Located in intervals along the stream channel that are no closer to one another than 300 feet. • Includes re-establishment or establishment sites within modeled habitat area at least 600 feet in length. • Contains at least 0.2 acre at any given location along the stream channel but will not exceed 1 acre. • Provides perennial aquatic habitat. • Provides emergent vegetation (i.e., tules and/or cattails). • Provides grassy banks and openings in the waterside vegetation (e.g., bulrush, cattails, waterweed, or other floating vegetation). • Supports soils and topography modeled for restoring target habitat. • Designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat. • Provides a minimum 300-foot setback on at least one side of restored stream reaches. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment/establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Terrestrial Invertebrate Covered Species	
Objective VELB1. Relocate or replace each impacted elderberry shrub (*Sambucus* spp.) according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (1999b). Mitigation will occur in locations that are not inundated for 2 continuous weeks, as determined by the TAC.	**Conservation Action VELB1.1**. Implement the following measures to avoid or minimize impacts to occupied valley elderberry longhorn beetle habitat: • Conduct protocol-level surveys for valley elderberry longhorn beetle if elderberry shrubs are located within 100 feet of construction activities. • Avoid direct impacts to occupied elderberry shrubs defined as shrubs within 20 feet of construction. • Avoid indirect impacts of occupied elderberry shrubs defined as shrubs between 20 and 100 feet of construction. • Compensate for direct loss of elderberry shrubs according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (1999b).

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
	• Conduct surveys after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards of 60% survivorship of occupied shrubs, the effort will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective VELB2. During implementation of riparian habitat re-establishment and/or establishment, strategically include elderberry shrub in the planting palette (see Objective RIP2).	**Conservation Action VELB2.1.** In riparian habitat re-establishment and establishment sites that include modeled habitat for valley elderberry longhorn beetle (i.e., Mixed Riparian Woodland and Mixed Riparian Scrub or Valley Grassland with elderberry shrubs along a riparian corridor), include elderberry shrubs in plantings to create habitat characteristics associated with valley elderberry longhorn beetle occupancy. These characteristics include density of elderberry shrubs, shrub size, number of stems, and range of branch sizes (Talley et al. 2007).
Bird Covered Species	
Objective CH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 974 acres of modeled foraging and nesting habitat for Cooper's hawk is preserved in accordance with the conservation actions described in this table (see Objectives RIP1 and BOW1).	**Conservation Action CH1.1.** The Implementing Entity will select preserve sites for nesting and foraging habitat considering certain criteria, including the following: • Includes Blue Oak Woodland characterized by dense canopy closure (typically stands consisting of at least six trees with sparse ground cover). • Includes stands with trees approximately 26 to 49 feet high and 8 to 20 inches in diameter at breast height. • Has proximity to foraging habitat with dense prey populations. • Located outside of the UDA.
Objective CH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 601 acres of modeled foraging and nesting habitat for Cooper's hawk is re-established and/or established (see Objective RIP2).	**Conservation Action CH2.1.** Refer to Conservation Action RIP2.1. The Implementing Entity will select re-establishment or establishment sites for modeled foraging and nesting habitat considering certain criteria, including the following: • Located near known nesting territories. • Connects disjunct segments of riparian habitats. • Has proximity to modeled foraging areas with abundant prey populations. Cooper's hawk Mixed Riparian Woodland and Mixed Riparian Scrub habitat establishment and re-establishment will occur only where a non-modeled land cover is converted to Mixed Riparian Woodland and Mixed Riparian Scrub. Re-establishment or establishment criteria for modeled Cooper's hawk habitat will also include the following: • Trees will be planted to encourage dense canopy closure of the mature stand. • Planting of 10 acorns for each tree to establish oak trees will occur. • Survivorship of at least six trees pursuant to stand will occur. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the established or re-established habitat is not meeting re-establishment or establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment or establishment efforts must occur within 1 year after efforts are deemed unsuccessful.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective CH3. During assembly of the SSHCP Preserve System, ensure that a minimum of 38 acres of modeled foraging habitat for Cooper's hawk is preserved in accordance with the conservation actions described in this table (see Objectives RIP1 and BOW1).	**Conservation Action CH3.1**. The Implementing Entity will select preserve sites for foraging habitat aquatic modeled habitat considering certain criteria, including the following: • Includes Blue Oak Savannah containing trees approximately 26 to 49 feet high and 8 to 20 inches in diameter at breast height. • Includes presence of dense prey populations. • Located outside of the UDA.
Objective FH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 25,881 acres of modeled foraging habitat for ferruginous hawk is preserved, including 19,625 acres in PPUs 5 and/or 7 (see Objectives AG1, VG1, VP1, VP3, and SW1).	**Conservation Action FH1.1**. The Implementing Entity will select preserve sites for foraging habitat considering certain criteria, including the following: • Known to already support populations of prey species, including rabbits, ground squirrels, and pocket gophers. • Includes moderate to dense vegetative cover (particularly grasses). • Includes topographic variation with shorter vegetation.
Objective FH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for ferruginous hawk is re-established and/or established (see Objectives VP2 and SW2).	**Conservation Action FH2.1.** The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Includes moderate to dense vegetative cover (particularly grasses). • Includes topographic variation with shorter vegetation.
Objective SH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 31,033 acres of modeled foraging habitat for Swainson's hawk is preserved (see Objectives AG1, AG2, SW1, VP1, VP3, and VG1). Ensure that mitigation for high-value modeled habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8.	**Conservation Action SH1.1.** The Implementing Entity will select preserve sites that include foraging habitat considering certain criteria, including the following: • Includes presence of irrigation systems that are engineered to provide for alfalfa production. • Includes agricultural lands that have existing trees or could support plantings of additional trees for future use as Swainson's hawk nest trees. • Located within 3 miles of active nest sites, where the record of the nest site is not older than 5 years, unless confirmed to be currently active by new surveys. • Has proximity to large, contiguous area of open space that provides foraging habitat. • Has proximity to stream riparian corridors containing large trees that potentially provide nesting habitat. Preserves can include sites supporting Vineyard and Orchard as long as vines and trees are removed within 2 years of acquisition.
Objective SH2. At least 2,000 acres of Cropland habitat within high-value habitat within PPUs 4, 6, and 8 will be preserved in fee title to ensure that intensive	**Conservation Action SH2.1.** Preserve 2,000 acres (1:1 ratio) of Cropland habitat within 2 miles of at least two active nesting sites in fee title to ensure that intensive management actions can be taken that may be infeasible on preserve easement lands. Land held in fee title will be restricted to growing fields or row crops. Fee title lands must maintain, at a minimum, an average of 50% of their crop cover type in alfalfa over a period of 5 years. Other crop types or land covers may be substituted for alfalfa if a

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
management actions can be taken. Land held in fee title will be restricted to growing field or row crops. Fee title lands must maintain, at a minimum, an average of 50% of their crop cover-type in alfalfa. Other crop types or land covers may be substituted for alfalfa if the TAC determines that such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa.	Swainson's hawk expert determines that such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa.
Objective SH3. During assembly of the SSHCP Preserve System, ensure a minimum of 746 acres of modeled nesting habitat for Swainson's hawk is preserved (see Objective RIP1).	**Conservation Action SH3.1.** The Implementing Entity will select preserve sites that contain modeled nesting habitat considering certain criteria, including the following: Presently supports nesting activity. Located within or near (preferably within 4.2 miles) productive foraging habitat such as Prime Farmland, Statewide Farmland (most productive), and current agriculture land cover types (i.e., alfalfa; other crop types or land covers may be substituted for alfalfa if the TAC determines that such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa). Support large mature trees (e.g., taller than 50 feet) that are preferred nesting sites. Located in rural areas unlikely to be affected by high levels of human activities.
Objective SH4. During assembly of the SSHCP Preserve System, ensure that a minimum of 373 acres of modeled riparian nesting habitat for Swainson's hawk is re-established and/or established. Ensure that mitigation for modeled nesting habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8 (see Objective RIP2).	**Conservation Action SH4.1**. Re-establish or establish riparian habitat along stream or river channels near known nesting territories. Establishment and re-establishment will target areas that connect disjunct segments of riparian habitat to the maximum extent feasible. Surveys will be conducted periodically for 10 years to monitor success, including habitat quality and use by nesting Swainson's hawk. During the first year, established or re-established habitat will be monitored monthly, with more frequent monitoring during summer months or periods of drought to ensure that new plantings are kept moist. During the second and third years, habitat will be monitored quarterly. For the remainder of the monitoring period, restoration habitat will be monitored every 6 months. If there are extended periods of drought within the monitoring period, or if established or re-established habitat becomes flooded for an extended period during the monitoring period, the habitat will be monitored more frequently to assess the impacts of and remediate for these extreme weather conditions. If, after 10 years, the established or re-established habitat is not meeting re-establishment or establishment criteria standards in terms of modeled habitat quality, the efforts will be deemed to have failed. Absence of nesting Swainson's hawks over the 10-year period will not be a criterion for failure as long as the riparian habitat has otherwise achieved the re-establishment or establishment standards. If, at any time during the monitoring period, restored habitat is declining beyond remediation, dying, or dead, efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective SH5. For each of the 36 known nesting trees within the UDA, plant 10 trees	**Conservation Action SH5.1**. Plant nesting trees on properties protected by the SSHCP and within proximity to protected foraging habitat. Tree species will be selected based on known suitability as nesting habitat for Swainson's hawk. To minimize temporal

AGENDA ITEM 11.1
4112

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
that are modeled for Swainson's hawk nesting within SSHCP Preserves. Plant nesting trees on properties protected by the SSHCP within PPUs 4, 6, and 8, and near protected foraging habitat. Tree species will be selected based on known suitability as nesting habitat for Swainson's hawk, and the planted trees must be maintained and/or replaced in perpetuity.	loss, a mix of tree species will be planted at each site to include fast- and slow-growing species. Trees that are acceptable for planting include Fremont's cottonwood (*Populus fremontii*), valley oak (*Quercus lobata*), blue oak (*Q. douglasii*), interior live oak (*Q. wislizenii*), western sycamore (*Platanus racemosa*), red willow (*Salix laevigata*), and Northern California black walnut (*Juglans hindsii*). Clusters of five trees must be established and maintained for every 40 acres of agricultural Cropland preserved and must include at least two different species, one of which must be a fast-maturing tree such as Fremont's cottonwood or red willow. Trees will be placed at the edges of agricultural fields. To help ensure survivorship, acorns will be used to establish oak trees, and at least 10 acorns will be planted for each required tree (i.e., if a cluster is to be composed of two cottonwoods and three valley oaks, then 30 valley oak acorns must be planted).
Objective SH6. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for Swainson's hawk is re-established and/or established (see Objective RIP2).	**Conservation Action SH6.1.** The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Includes presence of irrigation systems that are engineered to provide for alfalfa production. • Includes agricultural lands that could support plantings of additional trees for future use as Swainson's hawk nest trees. • Located within 3 miles of active nest sites where the record of the nest site is not older than 5 years, unless confirmed to be currently active by new surveys. • Has proximity to large, contiguous area of open space that provides foraging habitat. • Has proximity to stream riparian corridors containing large trees that potentially provide nesting habitat.
Objective WK1. During assembly of the SSHCP Preserve System, ensure that a minimum of 31,205 acres of modeled foraging habitat for white-tailed kite is preserved (see Objectives VG1, AG1, RIP1, SW1, VP1, VP3, and BOW1).	**Conservation Action WK1.1.** The Implementing Entity will select preserve sites for foraging habitat considering certain criteria, including the following: • Includes agricultural lands that support perennial crops (e.g., alfalfa) rather than annual crops. • Known to be used by white-tailed kite for foraging. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective WK2. During assembly of the SSHCP Preserve System, ensure that a minimum of 974 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is preserved (see Objectives RIP1 and BOW1).	**Conservation Action WK2.1.** The Implementing Entity will select preserve sites for nesting habitat, including Blue Oak Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub, considering certain criteria, including the following: • Includes large, unfragmented patches connected to grassland and agriculture areas known to support high prey densities. • Includes closed canopy consisting of multiple vegetation layers, including mature trees. • Known to support nesting white-tailed kite. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective WK3. During assembly of the SSHCP Preserve System, ensure a minimum of 767 acres of modeled foraging habitat for white-tailed kite is re-established and/or established (see Objectives VP2, RIP2, and SW2).	**Conservation Action WK3.1.** Implement Conservation Actions VP2.1, RIP2.1, and SW2.1. Foraging habitat re-establishment or establishment will involve establishing habitat, including vegetation structure modeled for voles (*Microtus californicus*) where the species historically occurred but no longer exists due to loss of or changes in ecological factors. White-tailed kite foraging habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled habitat.
	Conservation Action WK3.2. Re-establish or establish nesting habitat in areas that have a range of riparian plant assemblages that include large trees such as cottonwood and valley oak, as well as an understory of Mixed Riparian Scrub. The Implementing Entity will select re-establishment/establishment sites for nesting habitat considering certain criteria, including the following: • Located along existing riparian corridors where nesting habitat likely existed in the past, such as along the Cosumnes River and Deer Creek. • Located within a new or existing preserve or habitat corridor. Created riparian woodland areas must be able to support a wide variety of species. • Located in areas within at least 0.5 mile of modeled foraging habitat. • Supports soil and topography modeled for restoring target habitat. • Located at least 500 feet from urban land uses, including structures and roads. • Includes avoidance of locations that historically did not support riparian woodland. • Includes avoidance of locations within the existing Vernal Pool landscape. Surveys will be conducted after 1 year and every 5 years thereafter to monitor prey abundance. If, after the first year or any 5-year interval thereafter, the re-established habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective WK4. During assembly of the SSHCP Preserve System, ensure that a minimum of 601 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is re-established and/or established (see Objective RIP2).	See Conservation Action WK2.1.
Objective NH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,245 acres of modeled foraging habitat for northern harrier is preserved (see Objectives VG1, AG1, VP1, VP3, FWM1, and SW1).	**Conservation Action NH1.1**. The Implementing Entity will select preserve sites for foraging habitat considering certain criteria, including the following: • Includes open habitats with dense, tall (12 to 38 inches) vegetation. • Known to support high prey densities (small mammals). • On parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially support other Covered Species. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective NH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 30,048 acres of modeled nesting/foraging habitat for northern harrier is preserved (see Objectives VG1 and AG1).	**Conservation Action NH2.1.** The Implementing Entity will select preserve sites for nesting/foraging habitat considering the following criteria: • Includes open habitats with dense, tall (12 to 38 inches) vegetation. • Includes wet or moist sites for nesting. • Known to support high prey densities (small mammals). • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially supports other Covered Species. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective NH3. During assembly of the SSHCP Preserve System, ensure that a minimum of 856 acres of modeled foraging habitat for northern harrier is re-established and/or established (see Objectives VP2, FWM2, and SW2).	**Conservation Action NH3.1.** The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Has historically contained intact foraging habitat. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Could potentially support other Covered Species. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective BO1. Preserve seven occupied western burrowing owl sites (commensurate with 20% of the estimated number of sites within the UDA as of 2014), preserve at least 200 acres of land surrounding each occupied burrow site, and maintain modeled habitat for western burrowing owl within 0.4 mile of breeding sites.	**Conservation Action BO1.1.** The Implementing Entity will select preserve sites that include nesting habitat land cover types considering certain criteria, including the following: • Known to support breeding burrowing owls. • Located within 3 miles of a known nesting site or modeled nesting habitat. • Known to support high rodent populations during the breeding season. • Expands upon or links already preserved lands and will not be bisected by new roadways or incur impacts from any other infrastructure developments. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Potentially support other Covered Species. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
	Conservation Action BO1.2. Preserve modeled nesting habitat within PPUs 4, 6, and/or 8.

AGENDA ITEM 11.1

4115

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective BO2. For each burrowing owl or burrowing owl pair passively excluded, protect 200 acres of modeled habitat for western burrowing owl and establish a ground squirrel (*Spermophilus (Otospermophilus) beecheyi*) colony and augment with artificial burrows as appropriate (determined by TAC). Artificial burrows will be established at appropriate locations throughout the Preserve System pursuant to CDFW (California Department of Fish and Game 2012 guidelines) or as otherwise determined by the TAC.	**Conservation Action BO2.1.** Select preserve sites in areas with known species occurrences and that contain modeled habitat. Manage these locations to maintain the following: o Open, well-drained terrain with low risk of flooding. o Short, sparse vegetation. o Underground burrows or burrow facsimiles. o Modeled foraging habitat within 0.4 mile of breeding sites. o Enhanced foraging habitat quality through the following: ▪ Promoting fossorial mammal populations in areas that are modeled foraging habitat. ▪ Providing sentinel posts or mounds near burrows.
Objective LS1. During assembly of the SSHCP Preserve System, ensure that a minimum of 9,152 acres of modeled foraging habitat for loggerhead shrike is preserved (see Objectives VG1, AG1, SW1, VP1, and VP3).	**Conservation Action LS1.1.** The Implementing Entity will select preserve sites for foraging habitat considering certain criteria, including the following: • Are open with sparse vegetation for foraging. • Available hunting perches with an open view. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Known to support loggerhead shrike and other Covered Species. • Linked or adjacent to currently preserved lands. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective LS2. During assembly of the SSHCP Preserve System, ensure that a minimum of 22,014 acres of modeled nesting/foraging habitat for loggerhead shrike is preserved (see Objectives VG1 and RIP1).	**Conservation Action LS2.1**. The Implementing Entity will select preserve sites for nesting/foraging habitat considering certain criteria, including the following: • Are open with sparse vegetation for foraging interspersed with scattered or isolated low trees or large shrubs for nest sites. • Available hunting perches with an open view. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Known to support loggerhead shrike and other Covered Species. • Linked or adjacent to currently preserved lands. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective LS3. During assembly of the SSHCP Preserve System, ensure that a minimum of 592 acres of modeled nesting	**Conservation Action LS3.1.** The Implementing Entity will select re-establishment/establishment sites for nesting habitat considering certain criteria, including the following: • Possess or can be planted with scattered or isolated low trees or large shrubs for nest sites.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
habitat for loggerhead shrike is re-established and/or established (see Objective RIP2).	• Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Has potential to support loggerhead shrike and other Covered Species after re-establishment and/or establishment. • Linked or adjacent to currently preserved lands. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Loggerhead shrike habitat re-establishment will only occur where habitat historically occurred but no longer exists due to loss of or changes in ecological factors.
Objective LS4. During assembly of the SSHCP Preserve System, ensure that a minimum of 965 acres of modeled nesting habitat for loggerhead shrike is preserved (see Objective RIP2).	See Conservation Action LS2.1.
Objective LS5. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for loggerhead shrike is re-established and/or established (see Objective SW2).	**Conservation Action LS5.1.** The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Has potential to support loggerhead shrike and other Covered Species after re-establishment and/or establishment. • Linked or adjacent to currently preserved lands. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Loggerhead shrike habitat re-establishment will only occur where habitat historically occurred but no longer exists due to loss of or changes in ecological factors.
Objective GS1. During assembly of the SSHCP Preserve System, ensure that a minimum of 257 acres of modeled roosting or roosting/foraging habitat for greater sandhill crane is preserved. Roosting habitat will be preserved and maintained within PPUs 4, 6, and 8, with a minimum of 75% within PPU 6 (see Objectives VP1, SW1, and FWM1).	**Conservation Action GS1.1.** The Implementing Entity will select preserve sites for roosting habitat considering certain criteria, including the following: • Includes known roost sites. • Located within 2 miles of modeled foraging habitat outside the UDA. • Includes 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially supports other Covered Species or where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species. • Located at least 1,000 feet from disturbances such as roads or other operations that may disturb roosting. • Free of fences and power lines. • Has Seasonal Wetland present from September to mid-March. • Supports natural drainage inflows or water delivery mimics natural hydrologic cycles.

AGENDA ITEM 11.1

4117

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective GS2. During assembly of the SSHCP Preserve System, ensure that a minimum of 7,751 acres of modeled foraging habitat for greater sandhill crane is preserved (see Objectives AG1, AG2, and VG1).	**Conservation Action GS2.1**. The Implementing Entity will select preserve sites for foraging habitat considering certain criteria, including the following: • Includes modeled foraging habitat located within 2 miles of known roost sites or modeled roosting habitat outside the UDA. • Located on parcels 20 acres or greater and/or that occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially supports other Covered Species or where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species. • Free of fences and power lines. • Contains available sources of "grit," including gravel and dirt roads or rocky uplands.
Objective GS3. During assembly of the SSHCP Preserve System, ensure that a minimum of 184 acres of modeled roosting habitat or roosting/foraging habitat for greater sandhill crane is established and/or re-established. Re-establish two new roost sites (minimum of 90 acres of Freshwater Marsh/Seasonal Wetland complex each) every 2 miles in the gap between the Cosumnes population and the Stone Lakes' population or other strategic locations if that gap is closed by another HCP or conservation project (see Objectives VP2, SW2, and FWM2).	**Conservation Action GS3.1.** Implement conservation actions for Objectives SW2 and FWM2. Select re-establishment or establishment sites outside the UDA based on the same criteria used for preservation sites in Conservation Actions GS1.1 and GS2.1. Habitat re-establishment and establishment will only occur where it replaces low-quality foraging or roosting habitat, including the following features: • Replacement of unmodeled agriculture uses such as orchards and vineyards with habitats supporting high prey abundance (e.g., vole), including Grassland, suitable Croplands, Irrigated Pasture-Grassland, and Wet Meadow. • Removal of physical structures that can cause collisions during takeoff and flying, including fences, distribution lines, and other built structures. • Removal of human disturbances from otherwise modeled foraging and roosting habitat. • Establishment of suitable hydrologic regimes at roosting sites. • Grit sources near foraging areas.
Objective GS4. Create a visual screen of woody vegetation near human disturbances such as buildings, bridges, and paved roads from permanent roosting habitat within PPU 6. Screens should be located as appropriate to not interfere with habitat usage by greater sandhill crane.	**Conservation Action GS4.1**. Plant visual screens of woody vegetation in known and potential roosting sites within PPU 6 where there are nearby human disturbances, including roads, bridges, and dwellings.
Objective GS5. As part of the 2,000 acres preserved under Objective AG2, establish and maintain 10 food plots in strategic	**Conservation Action GS5.1**. Maintain the 200 acres among the 10 food plots as Irrigated Pasture-Grassland or planted with crops preferred by greater sandhill crane as foraging habitat. Crops may include alfalfa, corn, wheat, or rice. The 10 food plots will be distributed throughout PPU 6 at a minimum of five locations, each at least 20 acres in size. Food plots must be within 1.5 miles

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
locations totaling a minimum of 200 acres within an agricultural setting for greater sandhill crane foraging habitat within PPU 6. Maintain the 200 acres among the 10 food plots as Irrigated Pasture-Grassland or planted with crops preferred by greater sandhill crane as foraging habitat. Crops may include alfalfa, corn, wheat, or rice. Strategic placement of food plots will include locations for food plots in upland areas above the floodplain.	of Irrigated Pasture-Grassland or other pasture and within 2 miles of known roosting sites. Crops must not be harvested or removed until March.
Objective GS6. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,000 acres of high-value modeled foraging habitat for greater sandhill crane outside the 100-year floodplain is preserved (see Objectives VP1, SW1, and FWM1).	**Conservation Action GS6.1.** The Implementing Entity will select preserve sites for high-value foraging habitat outside the 100-year floodplain considering certain criteria, including the following: • Include modeled high-value foraging habitat that is located outside the 100-year floodplain. • Located within 2 miles of known roost sites or modeled roosting habitat outside the UDA. • Located on parcels 20 acres or greater and/or that occurs in larger, open space areas. • Is recorded as supporting greater sandhill crane foraging during previous flood events. • Linked or adjacent to currently preserved lands. • Potentially supports other Covered Species or where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species. • Free of fences and power lines. • Contains available sources of "grit," including gravel and dirt roads or rocky uplands.
Objective TB1. During assembly of the SSHCP Preserve System, ensure that a minimum of 4,149 acres of modeled foraging habitat for tricolored blackbird is preserved (see Objectives AG1, AG2, FWM1, VG1, VP1, VP3, OW1, and SW1).	**Conservation Action TB1.1.** The Implementing Entity will select preserve sites for foraging habitat considering certain criteria, including the following: • Expands on or links already preserved lands and is not bisected by new roadways or incurs impacts from any other infrastructure developments. • Located within 1 mile of a known nesting site or modeled nesting habitat (Note: Intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat). • Contains vegetation with a potential for high insect populations during the breeding season (April through July). • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract tricolored blackbird.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective TB2. During assembly of the SSHCP Preserve System, ensure that a minimum of 27,532 acres of modeled nesting/foraging habitat for tricolored blackbird is preserved, including a minimum of 402 acres of Freshwater Marsh and Seasonal Wetland (see Objectives AG1, AG2, VG1, FWM1, and SW1).	**Conservation Action TB2.1.** The Implementing Entity will select preserve sites for aquatic nesting/foraging habitat, including Seasonal Wetland and Freshwater Marsh land cover types considering certain criteria, including the following: • Has nesting substrate (e.g., tules, cattails) in an extensive area (minimum 2 acres) to accommodate large tricolored blackbird colonies. • Known to currently or historically support a tricolored blackbird colony. • Located within 3 miles of a known foraging site or modeled foraging habitat (Note: Intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat). • Includes Open Water (e.g., canal, lakeshore, or farm pond) within 1,640 feet of nesting substrate to provide a water source for nestlings. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Management for tricolored blackbird will include maintaining young, lush growth of emergent wetland (cattails or tules).
	Conservation Action TB2.2. The Implementing Entity will select preserve sites for upland nesting/foraging habitat, including Cropland, Valley Seasonal Wetland, and Freshwater Marsh land cover types considering certain criteria, including the following: • Has upland nesting substrate (e.g., Himalayan blackberry (*Rubus armeniacus*) thickets) in an extensive area (minimum 2 acres) to accommodate large tricolored blackbird colonies. • Known to currently or historically support a tricolored blackbird colony. • Located within 3 miles of a known foraging site or modeled foraging habitat (note: intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat). • Includes pen water (e.g., canal, lakeshore, or farm pond) within 1,640 feet of nesting substrate to provide a water source for nestlings. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Management for tricolored blackbird will include maintaining young, lush growth of emergent wetland (cattails or tules).
Objective TB3. During assembly of the SSHCP Preserve System, ensure that a minimum of 917 acres of modeled foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2, SW2, OW2, and VP2).	**Conservation Action TB3.1.** Implement Conservation Actions FWM2.1, SW2.1, OW2.1, and VP2.1. The Implementing Entity will select re-establishment/establishment sites for aquatic modeled habitat considering certain criteria, including the following: • Occurs within 1,000 feet of a nesting colony that is occupied at the time of re-establishment/establishment or that was recorded as an occupied nesting colony at any time since 2008. Sources for occupied nesting colonies are the California Natural Diversity Database, Tricolored Blackbird Portal, eBird, or other data sources approved by the Wildlife Agencies. • Includes all or a mix of Irrigated Pasture-Grassland, Cropland, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, Open Water, and/or Valley Grassland, preferably situated within a mosaic of foraging habitat (as opposed to on

AGENDA ITEM 11.1

4120

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
	the edge of foraging habitat) and providing adequate insect prey. Tricolored blackbird habitat establishment/re-establishment will occur only where currently non-modeled habitat is converted to modeled habitat (e.g., conversion of a current non-wetland to a wetland). Modeled nesting substrate includes flooded, thorny, spiny, or "visually" but not actually spiny vegetation. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the established or re-established habitat is not meeting re-establishment or establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment or establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective TB4. During assembly of the SSHCP Preserve System, ensure that a minimum of 232 acres of modeled nesting/foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2 and SW2).	**Conservation Action TB4.1.** The Implementing Entity will select re-establishment/establishment sites for nesting/foraging habitat, including Valley Grassland, Seasonal Wetland, and Freshwater Marsh land cover types considering certain criteria, including the following: • Known to historically support a tricolored blackbird colony. • Located within 1 mile of a known foraging site or SSHCP land cover type that provides modeled nesting and foraging habitat (Valley Grassland, Freshwater Marsh, Seasonal Wetland (Section 3.4.5)). Intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat. • Includes Open Water (e.g., canal, lakeshore, or stock pond) to provide water for nestlings within 1,640 feet of area where upland nesting substrate can be re-established and/or established. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Management for tricolored blackbird will include maintaining young, lush growth of emergent wetland (cattails or tules) or for upland sites, blackberry bushes or other suitable spiny bushes.
Objective TB5. Provide mitigation for loss of any tricolored blackbird nesting colony site that is occupied at the time of Covered Activity implementation or was recorded as an occupied nesting colony at any time since 2008. Sources for occupied nesting colonies are the California Natural Diversity Database, Tricolored Blackbird Portal, eBird, or other data sources approved by the Wildlife Agencies. Minimum mitigation is to protect one extant unprotected occurrence of a nesting colony prior to take of one nesting	**Conservation Action TB5.1.** Protect at least one extant unprotected occurrence of a nesting colony prior to take of one nesting colony of tricolored blackbird. Each of the extant occurrences preserved will meet the following criteria: • Has supported a minimum of 200 individual tricolored blackbirds during one or both of the survey years preceding the project application. • Includes protected nesting substrate (including wetlands that are flooded March to July, and thorny, spiny, or "visually" but not actually spiny vegetation). • Includes open, accessible water within 1,640 feet of the nesting substrate. • Located within 1 mile of at least 500 acres of a known foraging site or SSHCP land cover type that provides modeled nesting and foraging habitat (Valley Grassland, some Cropland, Freshwater Marsh, Seasonal Wetland (Section 3.4.5)). This requirement targets lands with adequate insect forage. Intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
colony of tricolored blackbird. Ensure that at least five extant tricolored blackbird colonies that were occupied in recent years are maintained and managed within the SSHCP Preserve System.	One or more of the three elements (nesting substrate, access to Open Water as a water source for nestlings, and modeled foraging habitat) may be provided through re-establishment or establishment through Conservation Action TB3.1. If re-establishment is included, surveys will be conducted the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective TB6. Conduct an experimental study to identify management actions to protect tricolored blackbird colonies (e.g., coarse netting to reduce nest predation or impact of pesticides).	**Conservation Action TB6.1.** Select one or more existing tricolored blackbird colonies as experimental populations. If a large colony is available, test several potential feasible management actions within that one colony. If results of experimental treatments indicate a measurable and biologically significant decrease in nest predation or increased fledgling success and that treatments are feasible, include these management actions within PMPs for preserves that include historic or current tricolored blackbird colonies.
Objective TB7. Ensure that at least one large tricolored blackbird colony (i.e., one that has historically (from 1950 onward) supported a minimum of 1,500 individuals) is protected.	**Conservation Action TB7.1.** Each of the large colonies preserved will meet the following criteria: • Has supported a minimum of 1,500 individual tricolored blackbirds during a survey year since 1950. • Includes a protected nesting substrate (including flooded, thorny, spiny, or "visually" but not actually spiny vegetation). • Includes open accessible water to provide a water source for nestlings within 1,640 feet of the nesting substrate. • Includes at least 500 acres of modeled foraging habitat (that may include any combination of irrigated pasture alfalfa, Vernal Pool, Valley Grassland, Seasonal Wetland, Swale, and Freshwater Marsh) providing adequate insect prey within a 1-mile radius of the nesting colony. One or more of the three elements (nesting substrate, access to Open Water, and modeled foraging habitat) may be provided through re-establishment or establishment through Conservation Action TB3.1. If re-establishment is included, surveys will be conducted the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective TB8. For any tricolored blackbird nesting colony that is removed by a Covered Activity, re-establish and/or establish three new colonies within SSHCP Preserves. Re-established and/or established colonies can be in aquatic (Freshwater Marsh, Seasonal Wetland) or upland (Annual Grassland) habitat types, and must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands that provide adequate	**Conservation Action TB8.1**. When re-establishing and/or establishing aquatic nesting colony sites, the Implementing Entity will consider the following in their design: • Avoid management of properties for fall and winter waterfowl habitat. Maintain flooded marshes from spring into July through irrigation or impoundment (8–12 inches standing water through spring). As necessary, use graywater or recycled water sources for spring irrigation. • Plant mixture of cattails and tules (cattails more abundant) in Seasonal Wetland and Freshwater Marshes if absent. Manage the wetlands for large patches of cattails (at least 100 feet in width) spaced away from the shoreline. Refresh cattails by mowing/disking or burning, not less than every 3 years in fall and winter. • Protect the colony site from encroachment by trees or high shrubs to eliminate perching sites for avian nest predators. • Select sites for re-establishment/establishment of aquatic nesting habitat that must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands. Agricultural operations or grasslands should ideally be

AGENDA ITEM 11.1

4122

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
foraging opportunities.	protected in SSHCP Preserves, but if not, must be free from pesticide use so that insect populations are not reduced. • Encourage cattle grazing near suitable breeding colony sites if possible. Grazing increases insect abundance and the short grass increases tricolored blackbird access to insects. As an alternative to cattle grazing, conduct prescribed burns every 5 years. The preferred grass height to maintain by grazing is less than15 inches. • Near the aquatic nesting colony site, promote insect production in early spring through irrigation or other methods. Preferred insect prey include grasshoppers and caterpillars, but aquatic insect larvae can also provide food. • Tules or cattails will be cut down or removed after each season to allow for growth of new tules and cattails.
	Conservation Action TB8.2. When re-establishing and/or establishing upland nesting colony sites, the Implementing Entity will consider the following in their design: • Provide native spiny, thorny, thick substrate such as California blackberry (*Rubus ursinus*), prickly lettuce (*Lactuca serriola*), nettles (*Urtica dioica*), California rose (*Rosa californica*), sandbar willow (*Salix exigua*), and mugwort (*Artemisia douglasiana*). • Protect existing patches of non-native Himalayan blackberry and milk thistle (*Silybum marianum*) patches and allow planting in select areas. These provide superior upland habitat compared to native species as they are more thick and spiny. • Protect the colony site from encroachment by trees or high shrubs to eliminate perching sites for avian nest predators. Patches should remain in the open to avoid predator access from trees and shrubs. • Target establishment of high-density patches with height of 4 to 10 feet in existing pastureland and rangeland. Irrigating in March–April can help increase the height and density of the plants if the winter has been dry. • Do not prune or mow patches until after the nesting season. • Select sites for re-establishment/establishment of upland nesting habitat that must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands. Agricultural operations or grasslands should ideally be protected in SSHCP Preserves, but if not, must be free from pesticide use so that insect populations are not reduced. • Ensure a water source is available within 1,500 feet of a target upland colony site throughout the breeding season. Water sources can include ponds, marshes, canals, stock ponds, and streams.
Mammal Covered Species	
Objective AB1. During assembly of the SSHCP Preserve System, ensure that a minimum of 23,171 acres of modeled habitat for American badger is preserved (see Objectives BOW1, VG1, VP1, VP3, and SW1).	**Conservation Action AB1.1.** The Implementing Entity will select preserve sites for modeled habitat considering certain criteria, including the following: • Includes large areas (e.g., relatively undisturbed by human activity). • Supports friable soils. • Known to support high prey densities, particularly ground squirrels and pocket gophers. • Located where management can be used to enhance or re-establish natural ecosystem processes.

AGENDA ITEM 11.1

4123

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective AB2. During Preserve Assembly, ensure that a minimum of 767 acres of modeled habitat for American badger is re-established and/or established (see Objectives VP2 and SW2).	**Conservation Action AB2.1.** The Implementing Entity will select re-establishment/establishment sites for modeled habitat considering certain criteria, including the following: • Includes arge areas (e.g., relatively undisturbed by human activity). • Supports friable soils. • Known to support high prey densities, particularly ground squirrels and pocket gophers. • Located where management can be used to enhance or re-establish natural ecosystem processes.
Objective WR1. During Preserve Assembly, ensure that a minimum of 23,910 acres of modeled foraging habitat for western red bat is preserved (see Objectives BOW1, RIP1, AG1, VG1, VP1, VP3, SW1, OW1, FWM1, and SC1)**.**	**Conservation Action WR1.1.** The Implementing Entity will select preserve sites for foraging habitat considering certain criteria, including the following: • Includes foraging areas known to be used by western red bats. • Located within 2–3 miles of permanent water. • Includes areas known or having potential to support high insect prey densities. • Includes few or no human disturbances. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absent of or few habitat-fragmenting features, including roads and other infrastructure. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.
Objective WR2. During assembly of the SSHCP Preserve System, ensure that a minimum of 841 acres of modeled roosting/foraging habitat for western red bat is preserved (see Objectives BOW1 and RIP1).	**Conservation Action WR2.1**. The Implementing Entity will select preserve sites for roosting/foraging habitat considering certain criteria, including the following: • Includes active roosting sites, especially maternity sites (note that buildings, bridges, and other built structures may be used for roosting). • Located within 2–3 miles of foraging habitat and permanent water. • Includes foraging areas known to be used by western red bat. • Includes areas known or having potential to support high insect prey densities. • Includes few or no human disturbances. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absent of or few habitat-fragmenting features, including roads and other infrastructure. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.

Table 2-7. Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy

Measurable Objectives	Conservation Actions
Objective WR3. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,317 acres of modeled foraging habitat for western red bat is re-established and/or established (see Objectives VP2, SW2, OW2, FWM2, and RIP2).	**Conservation Action WR3.1.** The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Includes areas known or having potential to support high insect prey densities. • Located within 2–3 miles of permanent water. • Includes few or no human disturbances. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absent of or few habitat-fragmenting features, including roads and other infrastructure. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.
Objective WR4. During assembly of the SSHCP Preserve System, ensure that a minimum of 450 acres of modeled roosting/foraging habitat for western red bat is re-established and/or established (see Objective RIP2).	**Conservation Action WR4.1.** The Implementing Entity will select re-establishment/establishment sites for roosting/foraging habitat considering certain criteria, including the following: • Includes areas known or having potential to support high insect prey densities. • Located within 2–3 miles of foraging habitat and permanent water. • Includes few or no human disturbances. • Located on parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absent of or few habitat-fragmenting features, including roads and other infrastructure. • Located where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.

Notes:

[1] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Planning Area.

.

SSHCP Preserve System

The Biological Goals and Measurable Objectives of the Proposed Action/Proposed Project Alternative (SSHCP) require the assembly, monitoring, and management of an interconnected SSHCP Preserve System of at least 36,282 acres to conserve species and natural communities currently present within each Planning Area PPU. The SSHCP Preserve System would be incrementally assembled during the 50-year permit term by the SSHCP acquisition of land in fee title and through acquisition of conservation easements.

The SSHCP Preserve System described in the Proposed Action/Proposed Project Alternative includes the following preserve categories:

- **Landscape Preserve:** This category includes preserves that are at least 10,500 acres in size and that contain extensive areas of contiguous natural land covers where natural ecological functions can continue to operate, typically without extensive land management activities. Because existing development has already fragmented much of the remaining habitat within the UDA, the one Landscape Preserve would be located outside the UDA.
- **Core Preserve:** This category includes preserves that are at least 800 acres in size and contain extensive areas of contiguous habitat. The conceptual preserve system would include three Core Preserves in the UDA.
- **Minor Preserve:** This category includes preserves that are between 250 and 800 acres in size that contain populations that are important to the viability of a Covered Species have unusually high biological diversity, and/or have a high concentration of sensitive biological resources. Minor Preserves would be required to connect to existing preserves and/or to the new SSHCP Core Preserves via Linkage Preserves. The conceptual preserve system includes eight Minor Preserves, three of which are located within the UDA.
- **Satellite Preserve:** This category includes preserves that are smaller than Core and Minor Preserves (i.e., less than 250 acres) but contain populations that are important to the viability of a Covered Species in the Planning Area or have a particularly high concentration of sensitive biological resources. Satellite Preserves may not have the biological diversity of Core and Minor Preserves and may or may not be connected to other preserves by habitat linkages due to other planning constraints such as existing development. The conceptual preserve system would include 10 Satellite Preserves, and all but a portion of one would be located in the UDA.
- **Linkage Preserve:** This category includes preserves that are generally more linear-shaped landscape features that connect large habitat blocks (e.g., Core and Minor Preserves) and are designed to provide for dispersal and movement of species between preserve areas and hydrologic connectivity/water quality. These Linkage Preserves would follow stream channels, where possible, to maintain hydrologic connectivity and wildlife movement. The final width and length of each Linkage Preserves would depend on several factors,

including habitat types in the linkage, the ecological function (or functions) the linkage is designed to serve (e.g., overland wildlife movement, drainage), and adjacent land uses. However, the minimum width of any Linkage Preserves is 600 feet. The Preserve System would include 11 Linkage Preserves, most of which would be in the UDA.

- **Wildlife Movement Corridor:** There would be a minimum of two Wildlife Movement Corridor Preserves. The Laguna Creek Wildlife Movement Corridor Preserve is an important landscape feature in PPUs 1 and 3 in the Planning Area, and preservation of habitat along this corridor would be an important way the Preserve System would maintain wildlife movement and habitat for resident wildlife, preserving riparian habitat and maintaining hydrologic connections between preserves inside the UDA. Outside the UDA, the Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve would serve a similar function traversing east to west through PPU 5 and connecting to the Cosumnes River floodplain in PPU 6.
- **Cropland Preserve:** This category includes preserves consisting of existing agricultural lands, mostly located in PPU 6, and have been identified as uniquely important foraging and roosting habitat in the Planning Area for some Covered Species, including Swainson's hawk, white-tailed kite (*Elanus leucurus*), and greater sandhill crane. Cropland Preserves could be any acreage or shape. The Preserve System would include approximately 6,500 acres of Cropland Preserve, most of which would be in the outside the UDA in PPU 6.

In addition to these seven main preserve categories, 500 acres of Flexible Preserve would be added to other SSHCP Preserves or existing preserves in the Planning Area. Flexible Preserves could be of any SSHCP Preserve size category (e.g., Core, Minor, Satellite, Linkage) but must be within 1 mile of the MCRA in PPUs 1, 2, or 3 and adjacent to an SSHCP Preserve or existing preserve. The 500 acres of Flexible Preserve is primarily intended to preserve existing vernal pool ecosystem, but Flexible Preserve could also be used to preserve areas that previously supported vernal pools that can be used for Vernal Pool re-establishment/establishment.

Setbacks

The SSHCP includes two types of setbacks between new urban development and existing natural resources. The first type is a Stream Setback, in which the footprint of a new UDA development project must be set back a certain number of feet from the top of the bank of streams and creeks, as stated in AMMs STREAM-1, STREAM-2, and STREAM-3.

The second type of setback is a Preserve Setback, which is required by AMM EDGE-1, EDGE-2, EDGE-3, under which the footprint of new UDA must be no closer than 50 feet from the boundary of existing and SSHCP Preserves. Preserve Setbacks are required for most Covered Activities in the UDA (refer to Section 2.3.3).

AMM EDGE-3 would provide a Preserve Setback by requiring all UDA development projects and activities be permanently "set back" at least 50 feet outward from the boundary of any existing or conceptual preserve. The lead agencies estimate that approximately 625 acres of habitat will be protected from development of urban structures within Preserve Setback along 105 linear miles of existing and potential preserve boundaries. The natural land covers within the minimum 50-foot-wide Preserve Setbacks would remain in its natural state and function as a transition area between new urban development and the natural resources of the preserves. However, a limited number of specific Covered Activities could be allowed within SSHCP Preserve Setbacks, as described in Table 2-3 in Section 2.3.3.

AMM STREAM-1 and STREAM-2 require that project developers or the Implementing Entity design of Covered Activity shall establish Stream Setbacks surrounding particular streams in the UDA. Stream Setbacks at least 100 feet wide measured from the top of the bank would be established on both sides of the following UDA streams, creeks, and drainages: Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Sun Creek, and the Paseo Central drainage. A Stream Setback of at least 150 feet wide measured from the top of the bank would be established on both sides of Laguna Creek. The primary purpose of a Stream Setback is to minimize indirect effects of adjacent urban development Covered Activities on Planning Area waterway hydrologic functions, including water quality, and to avoid or reduce associated adverse effects on Covered Species aquatic habitats. Finally, under AMM STREAM-3, a 12.5-foot setback would be established from each side of the top of the bank along avoided first- and second-order tributaries to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Sun Creek, Laguna Creek, and the Paseo Central drainage.

Expected Preserve System Under the Proposed Action/Proposed Project Alternative

Implementation of the SSHCP Conservation Strategy over the 50-year permit term would result in a Preserve System totaling a minimum of 36,282 acres of new preservation, which would then be managed in perpetuity. A project alternative that was not carried forward subsequent to the release of the Notice of Preparation and Notice of Intent anticipated a larger preserve area (50,310 acres). The preserve size was scaled back (along with the UDA) when the City of Elk Grove and Aerojet properties opted out of participation in the SSHCP. Table 2-8 presents a scenario for a conceptual preserve system developed for the SSHCP totaling 36,282 acres of natural land covers. This Preserve System would preserve approximately 18,388 acres of vernal pool ecosystem in the Planning Area, or 51% of the Preserve System.

Table 2-8. Minimum Preservation of Natural Land Categories Under the Proposed Action/ Proposed Project Alternative

Land Cover Category[1]	Preserved Land (acres)		
	Inside UDA (acres)	*Outside UDA (acres)*	*Total (acres)*
All natural land covers[2]	7,030	27,465	34,495
Vernal pool ecosystem[3] land covers	5,618	12,125	17,743
Wetland land covers[4] and other water land covers	605	1,169	1,774

1 The rows in the table are not additive because the land cover categories include some overlapping land cover types (e.g., Vernal Pool is included in "all natural land covers," "Vernal Pool Ecosystem land covers," and "wetland land covers and other water land covers."

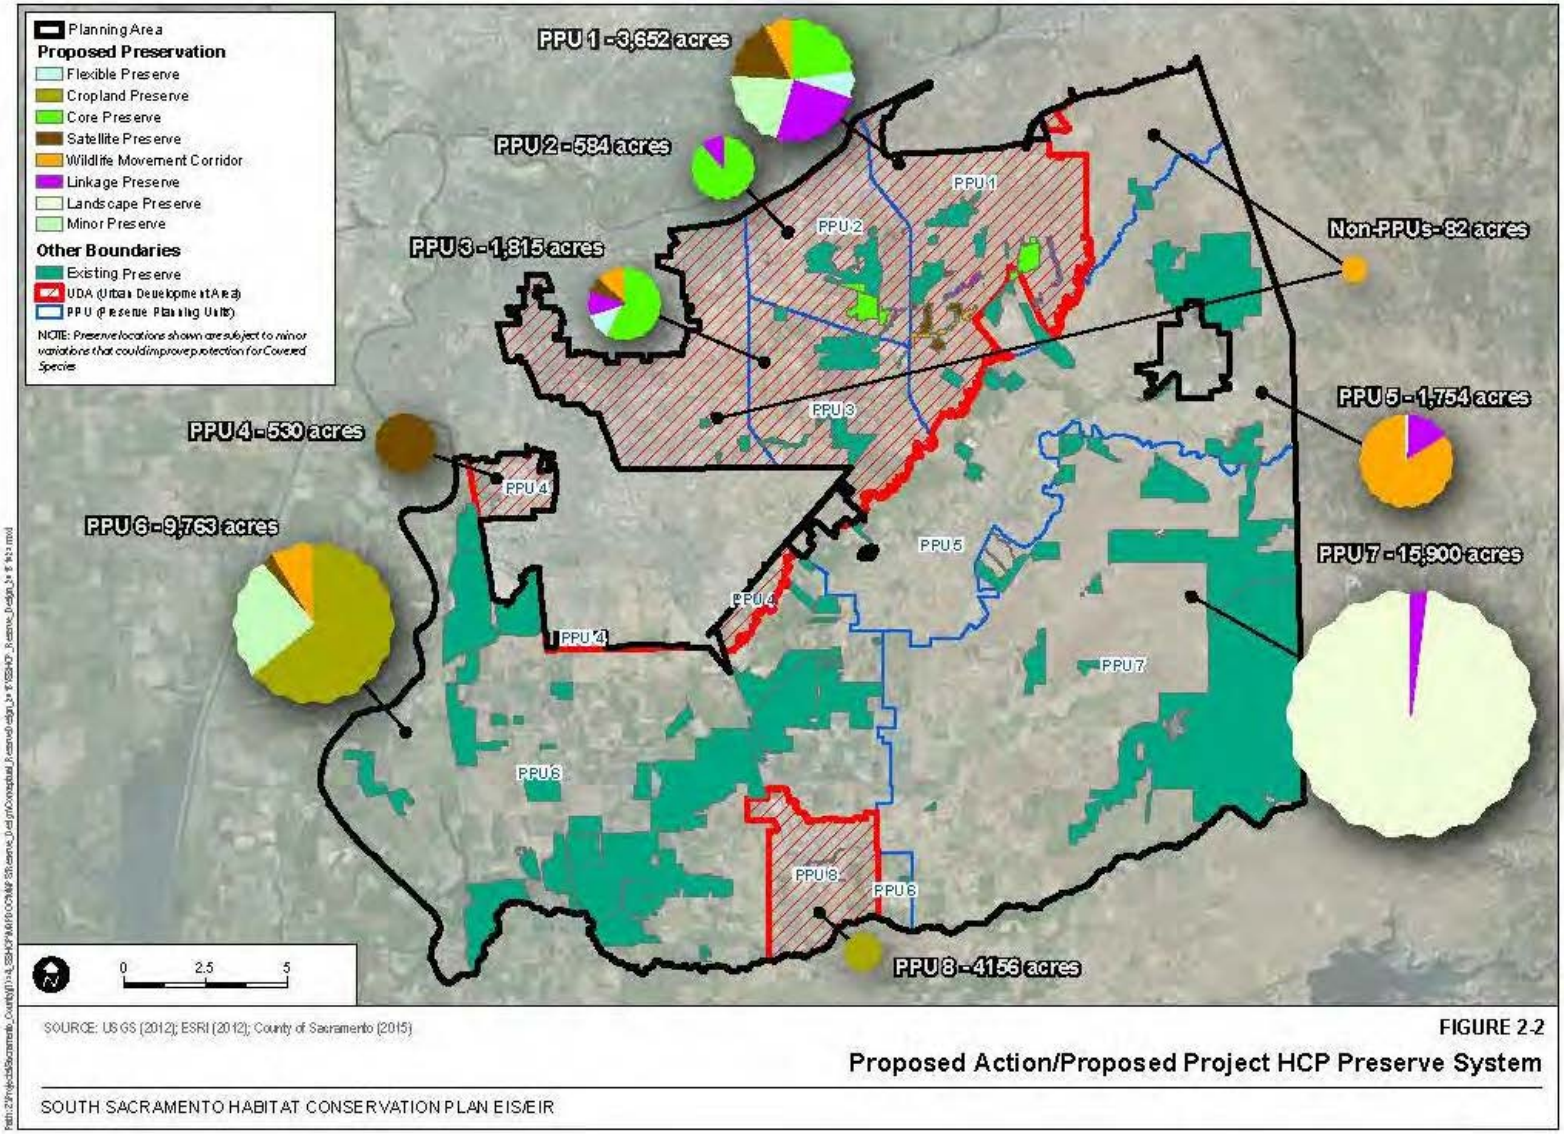
2 Planning Area land cover types were defined by the SSHCP preparers during development of the SSHCP. To allow for better comparison of impacts between the EIS/EIS alternatives, the EIS/EIR uses these same land cover types in discussions of all alternatives. The natural land covers include Blue Oak Savanna, Blue Oak Woodland, Cropland, Freshwater Marsh, Irrigated Pasture-Grassland, Mine Tailings Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland, Open Water, Orchard, Seasonal Wetland, Stream/Creek, Stream/Creek (VPIH), Swale, Valley Grassland, Vernal Pool, and Vineyard, as discussed in Table 8-1.

3 The Vernal Pool Ecosystem includes three aquatic land cover types (Vernal Pool, Swale, and Stream/Creek (VPIH)) and hydrologically connected Valley Grassland.

4 Wetland land covers include the following aquatic land cover types: Freshwater Marsh, Seasonal Wetland, Open Water, Stream/Creek, Vernal Pool, Swale, and Stream/Creek (VPIH).

To assist with development of an adequate SSHCP Conservation Strategy, the Plan Area was further divided into eight Preserve Planning Units (PPUs) that encompass areas where important Covered Species resources are present and where habitat preservation would occur (see Figure 2-1). These eight SSHCP PPUs are geographic subdivisions of the Plan Area and were delineated to ensure that adequate Biological Goals for the SSHCP would be developed for biological resources in all parts of the Plan Area, including the location and implementation of the Preserve System.

PPUs 1–3 cover roughly the eastern half of the UDA. PPUs 4–7 cover most of the Planning Area outside the UDA. PPU 8 covers the City of Galt and Galt's SOI. The western portion of the UDA and a small area outside of the UDA in the extreme northeastern portion of the Planning Area are not within PPUs. Although geopolitical or physical landmarks were used to delineate some PPU boundaries, this was done for ease of mapping and to make locating PPU boundaries in the field easier. The PPUs capture specific habitat or agricultural land cover types or areas identified as being important for a specific suite of species. For instance, the Biological Goals and Measurable Objectives (Table 2-7) describe specific requirements for species habitat preservation and aquatic resource re-establishment and establishment in PPUs.



The Proposed Action/Proposed Project Alternative would preserve important corridors for wildlife movement through the Planning Area, the Laguna Creek Wildlife Movement Corridor Preserve and the Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve. These corridors connect across multiple PPUs. The Laguna Creek Wildlife Movement Corridor Preserve would include approximately 520 acres inside the UDA. Approximately 4 miles and 440 acres of the Laguna Creek Wildlife Movement Corridor Preserve would be within PPUs 1 and 3, and the

remaining approximately 1 mile and 82 acres would be in the portion of the UDA that was not included in a PPU. The Laguna Creek Wildlife Movement Corridor Preserve would provide habitat, connectivity, and wildlife movement between the new Core Preserve in PPU 1 and the Core Preserves in PPU 3. The Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve would preserve an extensive area surrounding Deer Creek and the Cosumnes River across PPU 5 from Rancho Murieta southeast to the broader Cosumnes River floodplain in PPU 6. Both of the Wildlife Movement Corridor Preserves would, in addition to facilitating plant and wildlife habitat functions, preserve riparian habitat and maintain hydrologic connections between conceptual preserve areas.

The final spatial configuration of the conceptual preserve system is not known at this time because it would be assembled over time and **would** rely on purchasing lands or easements from buyers who are willing to sell at the time. However, a description of the conceptual preserve is provided in the following text based on the SSHCP Biological Goals and Measurable Objectives and conservation actions specified for each Planning Area PPU. Figure 2-2 displays the conceptual preserve system elements for each Planning Area PPU.

INTENTIONALLY LEFT BLANK

Figure 2-2 Proposed Action/Proposed Project HCP Preserve System

INTENTIONALLY LEFT BLANK

Inside the UDA, existing development has fragmented much of the remaining natural land covers, and planned urban development places further constraints on the possible locations and sizes for preserves. Therefore, the Conservation Strategy in the UDA identifies the highest-quality natural land covers remaining and establishes Linkage Preserves to connect those natural land covers to other new or existing preserves. Three minimum 800-acre Core Preserves would be established inside the UDA. Preserves in the UDA would be well connected. New Linkage Preserves would ensure that habitat connectivity is maintained between the three Core Preserves, three Minor Preserves, nine Satellite Preserves, several existing preserves, and the Laguna Creek Wildlife Movement Corridor Preserve. The locations for some preserves in the UDA were known at the time of SSHCP preparation, and those are shown on Figure 2-2 as "Proposed Preservation." The following text describes the proposed preservation areas:

PPU 1: PP1 is the easternmost portion of the UDA and includes approximately 15,800 acres of the MCRA. New preserves in PPU 1 would include one Core Preserve of approximately 840 acres, three Minor Preserves totaling approximately 785 acres, and seven Satellite Preserves totaling approximately 600 acres. These preserves would be located to enclose intact Vernal Pool ecosystem and known occurrences of rare plants such as Sacramento Orcutt grass and slender Orcutt grass. At least seven new Linkage Preserves totaling approximately 920 acres would also be established in PPU 1 and would connect the new Core, Minor, and Satellite Preserves to each other and to existing preserves.

The conceptual preserve design for PPU 1 would maintain habitat connectivity with the Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve inside PPU 1 and 3 and provide connectivity in the UDA to existing preserves both within and south of the UDA. This connectivity in PPU 1 would be accomplished by portions of a Minor Preserve and a Core Preserve that are mostly located in the UDA portion of PPU 1.

PPU 2: PP2 is an important portion of the MCRA, and is adjacent to the existing Mather Preserve. New preserves in PPU 2 are one Core Preserve of approximately 520 acres as shown on Figure 2-2, and two Linkage Preserves that would connect the new Core Preserve to existing preserves located to the east and south, including a connection across Jackson Highway between PPUs 1 and 3. The new Core Preserve in PPU 2 would preserve the intact Vernal Pool ecosystem and abut the existing Mather Preserve to the north.

PPU 3: PP3 preserves would be acquired to preserve existing high-quality habitat that is present between two large existing preserves (Figure 2-2). This is done to maintain landscape functions of the remaining Vernal Pool ecosystem; capture known occurrences of rare plants such as Sacramento Orcutt grass and slender Orcutt grass; and maintain north–south wildlife movement between Jackson Highway, Laguna Creek, and Calvine

Road in PPU 3. PPU 3 would establish a 1,050-acre Core Preserve. Two Satellite Preserves that would provide connectivity between existing preserves and the Laguna Creek Wildlife Movement Corridor would also be located in PPU 3, and a single Linkage Preserve would connect the new preserves in PPU 3 from Grant Line Road through an area surrounded by a large-lot agricultural residential development to the Cosumnes River/Deer Creek Wildlife Movement Corridor.

PPU 4: PPU 4 is a small area west of Elk Grove and northeast of the Stone Lakes NWR. The goal of PPU 4 would be to augment the existing Stone Lakes NWR. PPU 4 would include preserves totaling approximately 530 acres composed primarily of Valley Grassland that connects to the refuge. Although the total size of this preserve would typically make it a Minor Preserve, it was classified by the Permit Applicants as a Satellite Preserve because it would be fragmented by existing development in the area.

Flexible Preserve: At least 500 acres of Flexible Preserves would be established next to other preserves within the conceptual preserve system or to existing preserves inside the UDA. The purpose of the Flexible Preserve category is to assure that the operational Preserve System is providing the species conservation benefits of functions of the Vernal Pool ecosystem within the MCRA, as anticipated by the Permit Applicants at the time of SSHCP preparation. Flexible Preserve acres would be adjacent to existing or new preserves and must be within the MCRA or located within 1 mile of the MCRA.

Outside the UDA, land is largely undeveloped and composed of large parcels under the existing conditions. This condition would allow the SSHCP Conservation Strategy to assemble larger preserves, such as a more than 10,000-acre Landscape Preserve in PPU 7. The undeveloped nature of the area outside the UDA would also allow the Conservation Strategy to identify areas in PPU 6 for Cropland Preserves in the southwest of the Planning Area that would protect existing agricultural habitat for species such as Swainson's hawk and greater sandhill crane.

PPU 5: PPU 5 is outside the UDA in the west-central part of the Planning Area. Approximately 1,691 acres in PPU 5 would be preserved under the Proposed Action/Proposed Project Alternative. The preserve design focus in PPU 5 would be to provide habitat linkages among preserves both outside and inside the UDA, primarily along the Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve. Approximately 1,500 acres would be preserved in PPU 5 along the Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve, an expanse of Valley Grassland, Riparian, Stream/Creek, and Cropland land cover types enclosing the Cosumnes River that extends for 16 miles in PPU 5 and ranges in width from approximately 500 feet to 1 mile. The Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve in PPU 5 would be

connected to the Laguna Creek Wildlife Movement Corridor Preserve to the northwest in PPU 3 by a wide 260-acre Linkage Preserve.

PPU 6: PPU 6 is outside the UDA in the southwest part of Planning Area. Approximately 9,750 acres would be preserved in PPU 6, and the preserve design focus in PPU 6 would be to preserve existing agricultural lands that provide habitat for the broad-ranging Swainson's hawk, greater sandhill crane, and white-tailed kite. Approximately 8,500 acres of Cropland Preserve in PPU 6 would be established under the Proposed Action/Proposed Project Alternative. Other natural land covers could also be preserved in each Cropland Preserve, but these would be preserved and managed primarily for the benefit of Covered Species that forage in the row crop or irrigated pastures, and would generally be adjacent to existing agricultural fields. Smaller acreages of Riparian, Vernal Pool, and other aquatic land covers would also be preserved in PPU 6. These smaller areas would be managed differently than the Cropland Preserves and would likely be the sites of Vernal Pool re-establishment and/or establishment through conversion of Irrigated Pasture-Grassland or Valley Grassland. Most of these smaller preserves would fill gaps near existing preserves or between existing preserves and conceptual SSHCP Preserves. Approximately 4 miles and 800 acres of the Cosumnes River/Deer Creek Wildlife Movement Corridor would be preserved within PPU 6, connecting to the Cosumnes River/Deer Creek Wildlife Movement Corridor described previously in PPU 5. In PPU 6, the Cosumnes River/Deer Creek Wildlife Movement Corridor would include mostly Mixed Riparian Woodland and agricultural lands.

PPU 7: PPU 7 is located outside the UDA in the southeastern portion of the Planning Area and was delineated to encompass large areas of the Vernal Pool ecosystem in the Cosumnes/Rancho Seco Core Recovery Area. Approximately 15,900 acres would be preserved in PPU 7, including a Landscape Preserve of at least 10,500 acres and 300 acres of Linkage Preserve that would connect the Landscape Preserve to the Cosumnes River/Deer Creek Corridor in PPU 5. The preserve design focus in PPU 7 would be to preserve natural land covers in a large Landscape Preserve. SSHCP Preserves in PPU 7 would target Vernal Pool and Valley Grassland in areas that are adjacent to or near existing preserves, such as the 12,500-acre Chance Ranch.

PPU 8: New habitat preservation in this PPU would include 415 acres of Cropland Preserve located in the northwest of the PPU and in the south of the PPU along Dry Creek. This Cropland Preserve would focus on preserving high-value Swainson's hawk foraging habitat and a greater sandhill crane roosting pond.

2.3.6 SSHCP Preserve Management and Monitoring Programs

The Proposed Action/Proposed Project Alternative would include two separate programs for monitoring and tracking implementation of the SSHCP and the SSHCP Conservation Strategy, including progress toward achieving each SSHCP Biological Goal and Measurable Objective. The two programs are described as follows:

Permit Compliance and AMM Effectiveness Monitoring Program

The first SSHCP monitoring program, the Permit Compliance and AMM Effectiveness Monitoring Program, would track compliance with the Covered Activities and acres of impacts, acres of conservation required by each Measurable Objective, and any other permit term and condition. This program would include the following components:

- **HCP Compliance Monitoring:** HCP Compliance Monitoring would track the status of Covered Activity implementation and Measurable Objective implementation and document that all requirements of the SSHCP and the ITPs are being met.
- **AMM Compliance Monitoring:** AMM Compliance Monitoring would ensure required AMMs are implemented at Covered Activity project sites and implemented correctly. In this way, AMM Compliance Monitoring would ensure that adverse effects of Covered Activities on Covered Species and natural land cover types that provide habitat for Covered Species (including aquatic resources) will not exceed the impacts assumed during the development of the SSHCP.
- **AMM Effectiveness Monitoring:** The effectiveness of AMMs in avoiding or reducing adverse effects of Covered Activities would be tracked through AMM Effectiveness Monitoring. The results of AMM Effectiveness Monitoring would be used to adaptively modify or change AMMs if AMMs are not avoiding or minimizing impacts to Covered Species as anticipated. The adaptive modification of AMMs over the permit term assures that the maximum adverse effects of the SSHCP will not exceed the amounts analyzed by this EIS/EIR.

Preserve System Management and Monitoring Program

The Preserve System Management and Monitoring Program would monitor effectiveness of the SSHCP Preserve System (described in Section 2.3.5) and operational Conservation Strategy to ensure that it is achieving the expected conservation of Covered Species within the Planning Area.

The Preserve System Management and Monitoring Program would also link preserve monitoring results to decisions about adaptive land management action on preserves to improve both management and monitoring for the benefit of Covered Species.

The Proposed Action/Proposed Project Alternative would include a program to manage the Preserve System, described in Section 2.3.5, and to monitor the effectiveness of the land management activities implemented on each individual preserve in the Preserve System.

The Preserve System Management and Monitoring Program would integrate the monitoring results into an adaptive management process to have one cohesive program where monitoring would inform changes in management actions and continually improve Covered Species habitat on each preserve.

The Preserve System Management and Monitoring Program document would provide a single framework document from which the SSHCP Implementing Entity (Section 2.3.7) would develop a separate individual Preserve Management Plan (PMP) for each SSHCP Preserve. The Preserve System Management and Monitoring Program document would be developed by the Implementing Entity within 18 months of permit issuance.

The Preserve System Management and Monitoring Program framework document would include the following:

- A template to be used by the Implementing Entity to prepare initial PMPs for new preserves. Initial PMPs would address immediate short-term management needs such as trash removal, fence repair, and invasive species control.
- A template to be used by each Preserve Manager (Section 2.3.7) to prepare individual PMPs. Each individual PMP would include a "decision tree" for using preserve monitoring data and other data to adjust preserve management actions.
- A comprehensive management and monitoring "toolbox" to be used by the Preserve Manager to prepare and then implement an individual PMP for each preserve in the larger Preserve System. The toolbox would include a set of adaptive management methods that can be used by preserve staff on preserves. The Preserve System Management and Monitoring Program would also provide protocols for routine preserve management actions and activities that could be required for any SSHCP Preserve, including regular patrols, trash removal, fence/gate installation and repairs, and other maintenance activities.

2.3.7 SSHCP and ARP Implementation

Implementation of the SSHCP and ARP would protect ecological diversity and aquatic resource function in Southern Sacramento County, while allowing planned urban growth and development in accordance with approved General Plans and applicable laws.

Responsibility for implementing the permitted SSHCP would jointly rest with all Permit Applicants. SSHCP implementation would be directed by the SSHCP Implementing Entity, a Joint Powers Authority composed of the Sacramento County, Galt, and Rancho Cordova (the Land Use Authority Applicants).

The Implementing Entity would be composed of a Joint Powers Authority Governing Board, an Implementation Committee, and an Executive Director and staff, such as Preserve Managers, to help with day-to-day implementation of the Plan. Refer to Chapter 9.3 of the SSHCP document for further details on the proposed Implementing Entity structure and the responsibilities of each Implementing Entity element.

The ARP would be implemented by the Permit Applicants in conjunction with the SSHCP, for the purpose of improving the protection and management of Planning Area aquatic resources. The SSHCP Conservation Strategy and the ARP assure a watershed-level approach to aquatic resources ~~and~~**,** with a better evaluation of cumulative impacts to aquatic resources. The ARP would be implemented locally**, and would** use the comprehensive, landscape, and project-level Conservation Strategy for aquatic resources, as described in Appendix I.

In the event that circumstances change during implementation of the SSHCP, the SSHCP has identified changed circumstances that are reasonably foreseeable, and provides planned responses to address the changed circumstances, as required by the ESA Section 10 incidental take permit issuance criteria (40 CFR 17.22(b)). SSHCP changed circumstances include floods, drought, changes in water availability, wildfire, invasive species, covered species disease, long-term changes in precipitation and temperature, new species listing, and new designation of Critical Habitat. The planned responses to these events, if needed, would be Covered Activities by the SSHCP. Examples of planned responses include inspections of affected conservation lands within a specific time from the end of the event (e.g., 30 days); evaluation of the extent of the damage; purchasing of additional water supplies, if necessary, to maintain crops supporting habitat functions; and habitat restoration and enhanced recovery of affected habitat area.

2.4 REDUCED PERMIT TERM ALTERNATIVE

The Reduced Permit Term Alternative was carried forward for detailed study because, within the Planning Area, the General Plan durations range from 16 years to more than 30 years (Table 2-9). The lead agencies determined that the underlying needs in the Planning Area and the purposes and objectives of implementing a Habitat Conservation Plan in south Sacramento County could generally be achieved within incidental-take permit terms shorter than the term that requested under the Proposed Action/Proposed Project Alternative. A 30-year permit term is analyzed because that term generally coincides with the durations of the adopted General Plans and other

local planning documents of the Permit Applicants, including most reasonably foreseeable master plan projects in those jurisdictions (see Section 2.1).

Table 2-9. Local Planning Documents and Time Horizons Relevant to the Permit Term

Document	Date Produced	Projection/Time Horizon	Plan Duration
2030 Galt General Plan: Policy Document	2009	2030	16 years
City of Rancho Cordova General Plan	2006	2030/2050	16–36 years
Sacramento County General Plan of 2005–2030	1993; updated 2011	2030	16 years
County of Sacramento General Plan USB	1993	At least until 2060	46 years

Sources: City of Galt 2009; City of Rancho Cordova 2006; County of Sacramento 2011.

As with the Proposed Action/Proposed Project Alternative, this alternative consists of issuance of ITPs by USFWS and CDFW for species take resulting from Covered Activities; the implementation of a HCP Conservation Strategy for the Planning Area by the Permit Applicants, including an ARP; and the development of a CWA 404 permit strategy by the USACE for future Covered Activities that result in fill or discharge to waters of the U.S. However, the term of ITPs and the use of the CWA 404 permit strategy would end after 30 years.

Under the Reduced Permit Term Alternative, the Permit Applicants (future Plan Permittees) would implement the same types or categories of Covered Activities that are discussed in Section 2.3.3. Under the Reduced Permit Term Alternative, the Permit Applicants would request ESA and CESA take coverage for the same Covered Species as listed in Section 2.3.4.

2.4.1 Expected Regulatory Environment under the Reduced Permit Term Alternative

Under the Reduced Permit Term Alternative, a HCP that includes an ARP would allow expedited CESA, ESA, and CWA 404 permitting process**es** for HCP Covered Activities, as was described above for the Proposed Action/Proposed Project Alternative in Section 2.3.1. The implementation of the regional HCP, including implementation of HCP Covered Activities under the ITPs would occur over a 30-year permit term.

The regulatory environment under Reduced Permit Term Alternative would be different from the regulatory environment expected under the No Action/No Project Alternative described in Section 2.2.2. During the 30-year permit term, the Covered Activity permitting and entitlement process would be similar to the process described for the Proposed Action/Proposed Project in Section 2.3.1.

Federal ESA and CESA Compliance

Under the Reduced Permit Term Alternative, an ESA ITP would be issued to the Permit Applicants (the future Plan Permittees) by the USFWS, and a CESA ITP would be issued to the Permit Applicants by the CDFW.

Individual Covered Activity projects and activities that comply with the SSHCP would also comply with the ESA and CESA incidental take permits. Third party project proponents implementing a SSHCP Covered Activity project would pay "development fees" to the local Land Use Authority Permittee (i.e., Sacramento County, Galt, or Rancho Cordova), or to the SSHCP Implementing Entity , whoever has jurisdiction over the project site.

Under the Reduced Permit Term Alternative, the regional HCP would include a Conservation Strategy that provides a regional plan for conserving native species, natural communities, and aquatic resources in the Planning Area. Because the HCP Conservation Strategy was developed by the Permit Applicants and the regulatory agencies, it evaluates and prioritizes the regional importance of the existing species habitat and existing aquatic resources in the Planning Area.

Therefore, the importance (or lack of importance) of a specific Planning Area location or parcel to the conservation of listed species, ecosystem functions, and aquatic resources of the region would have already been determined by USFWS, CDFW, and USACE during the development of the HCP, as described above in Section 2.3.1 for the Proposed Action/Proposed Project Alternative.

Therefore, each project proponent would not need to spend time or money preparing draft and final ESA biological assessment documents, because the ESA consultation on the project's impacts would have been done when the Biological Opinion was prepared for the regional HCP and the ITP was issued.

Further, each Covered Activity that meets the requirements of the SSHCP would be in compliance with the ESA, and any incidental take of federally listed species or impacts to Critical Habitat by the Covered Activity would be covered by the SSHCP ESA incidental take permits. Therefore, **it is envisioned that in most cases,** the USACE would not be required to initiate ESA Section 7 consultation with the USFWS before providing CWA 404 authorizations to a proposed project that is a SSHCP Covered Activity. Similarly, for CESA, a project proponent would not need to consult individually with CDFW, apply for a project-specific species permit from CDFW, negotiate project avoidance measures with CDFW, or negotiate type or amounts of species mitigation with CDFW. These elements of the Reduced Permit Term Alternative would substantially reduce the timeline for the proposed project.

The Reduced Permit Term Alternative's Conservation Strategy would address cumulative impacts to vernal pool~~s~~ **species** within the MCRA. ~~Cumulative impacts within the MCRA~~

~~identified in the Sunridge ROD (see Section 2.2.2) would be are addressed through implementation of the Reduced Permit Term Alternative Conservation Strategy (described below in Section 2.4.5).~~

The Reduced Permit Term Alternative HCP would meet Sacramento County's obligations in the 2004 Zone 40 MOU to prepare a regional HCP that addresses the indirect effects of the operational Freeport Regional Water Project and the Zone 40 water delivery contracts. Therefore, new urban development projects inside Zone 40 that are seek entitlements from a local jurisdiction would be able to rely on the Freeport Regional Water Project as the project's water source, without first obtaining project-level ESA approvals from the USFWS.

CWA 404 Compliance

During the 30-year permit term, Covered Activity compliance with CWA 404 would be similar to the process described in Section 2.3.1 for the Proposed Action/Proposed Project Alternative. Each Covered Activity that meets the requirements of the HCP would be in compliance with the ESA, and any incidental take of federally listed species would be covered by the 30-year ESA incidental take permit. Therefore, **it is envisioned that in most cases** during the 30-year permit term, the USACE would not be required to initiate ESA Section 7 consultation with the USFWS before authorizing a Covered Activity project under CWA 404. This will shorten project timelines and reduce project costs, as was described for the Proposed Action/Proposed Project Alternative.

Under the Reduced Permit Term Alternative, the Permit Applicants would also use the HCP Conservation Strategy to prepare a local Aquatic Resources Program (ARP) which proposes a locally based 30-year program for permitting future HCP Covered Activities that impact aquatic resources, including wetlands and other waters. The HCP Conservation Strategy and the ARP would provide compensatory mitigation (e.g., re-establishment or establishment) for unavoidable impacts to aquatic resources, which provides to the minimum 1:1 compensatory mitigation ratios required by the 2008 Compensatory Mitigation Rule. Pursuant to the 2008 Compensatory Mitigation rule, the Permit Applicants would request the establishment of a 30-year in-lieu fee (ILF) program that would work in conjunction with the HCP's Covered Activity fee structure. The Permit Applicants would then be responsible for the CWA 404 compensatory mitigation requirements of the Covered Activity projects and activities.

Because the HCP Conservation Strategy~~, and the~~ ARP, **and proposed In Lieu Fee program** will allow the USACE and RWQCB the ability to evaluate~~individual project impacts, and evaluate~~ proposed locations for compensatory mitigation using a watershed and regional-scale approach, wetland regulatory agencies would be better able to ~~determine if individual projects are adequately mitigating~~ **plan for adequate compensatory mitigation** for aquatic resource impacts in ecologically

appropriate locations, as was described for the Conservation Strategy of the Proposed Action/Proposed Project Alternative.

Because the ARP would discuss and explain the regional HCP Preserve System (and other elements of the HCP Conservation Strategy) in terms of a unified watershed strategy for improving the protection and management of Planning Area aquatic resources, the ARP allows the USACE to develop a multilevel CWA 404 permit~~ting~~ strategy for the future HCP Covered Activities (similar to the Proposed Action/Proposed Project Alternative). Under the HCP and ARP, the USACE compensatory mitigation decisions can be based on the well-planned regional perspective for compensatory mitigation that is outlined in the Reduced Permit Term HCP and ARP documents.

The HCP and ARP would integrate avoidance, minimization, and compensatory mitigation into a comprehensive uniform regional strategy that would preserve more of the MCRA than would occur under the No Action/No Project Alternative. Aquatic resource compensatory mitigation strategy outlined in the HCP and the ARP would be predictable, and would provide 1:1 mitigation of direct impacts of the Covered Activities

The HCP AMMs implemented during the 30-year permit term would provide equal or stronger AMMs when compared to avoidance measures required by individual projects on a project-by-project basis under the No Action/No Project Alternative.

Project Compliance with Porter Cologne Water Quality Control Act and CWA 401

As discussed above in Section 2.2.2, under CWA 401 and the Porter-Cologne Act, projects and activities in California that require authorization, a federal license, or a permit for the discharge of a pollutant into wetlands and other waters must also obtain a CWA 401 water quality certification from the RWQCB with local jurisdiction.

The HCP and ARP would facilitate the Central Valley RWQCB's development of water quality certification strategies for future SSHCP Covered Activities, in conjunction with USACE's development of a CWA 404 permit~~ting~~ strategy for future Covered Activities (see Appendix C).

Parallel to the USACE's CWA 404 permit~~ting~~ strategy, the RWQCB would have opportunities to increase the efficiency of their CWA 404 permitting processes while improving the protection and management of aquatic resources in the Planning Area. The RWQCB could issue a programmatic CWA 401 water quality certification for the USACE's general permit(s) and could adopt a more efficient water quality certification approach for Covered Activity projects associated with USACE's Letter of Permission and standard permit processes. The RWQCB could also adopt a more efficient waste discharge requirement approach for wetlands and other waters of the state.

California Fish and Game Code Section 1600 Master Streambed Alteration Agreement

The ARP and HCP address future impacts and provides for the conservation of streams and riparian habitat and other water bodies in the Planning Area that are regulated by CDFW. Under the Proposed Action/Proposed Project Alternative, CDFW would work with the land use authority Permit Applicants (Sacramento County, Galt, and Rancho Cordova) to develop a 30-year process to streamline authorization of Covered Activity projects and activities that affect the bed and bank of streams, ponds, and lakes under Section 1602 of the California Fish and Game Code, as discussed in Section 1.5.3.

In the streamlined process, the Land Use Authority Permittee Applicant or the SSHCP Implementing Entity may act as a "clearinghouse" for the notification forms, and would conduct an initial screening process to verify the project's consistency with the SSHCP and ARP, and the aquatic protection ordinances. Under the MSAA or Long-Term Streambed Alteration Agreement scenario, an expedited process of review with CDFW would allow each Covered Activity project proponent to submit a request for verification to the local Land Use Authority Permittees or Implementing Entity, whoever has jurisdiction, who would verify project consistency with the regional HCP and ARP.

The local Land Use Authority Permit Applicant or the HCP Implementing Entity would then submit appropriate paperwork to CDFW, who would review and approve the activity requests under the MSAA or Long-Term Streambed Alteration Agreement. This would remove the need for project developers to coordinate with CDFW for Section 1600 permits. It would also expedite the Section 1600 permitting process because CDFW would have pre-determined that consistency with the regional HCP and ARP satisfies the requirements for a Streambed Alteration Agreement.

Prior to processing a Lake or Streambed Alteration (LSA) Notification, CDFW must collect the fee for each LSA Notification submitted by the SSHCP Implementing Entity or by an individual third-party project proponent. CDFW is solely responsible for determining whether a LSA Agreement is required.

Local Environmental Policies

The existing County Swainson's Hawk Ordinance, discussed in Section 2.2.2, only applies to portions of Sacramento County that are not included in an approved HCP that includes Swainson's hawk as a Covered Species. Therefore, under the Proposed Action/Proposed Project Alternative, the Swainson's Hawk Ordinance would no longer be available as an option for projects to mitigate impacts to Swainson's hawk.

2.4.2 Permit Term Under the Reduced Permit Term Alternative

Within the Planning Area, the General Plan durations range from 16 years to more than 30 years (Table 2-9). The five master plan projects and the Capital Southeast Connector Project are expected to be completed within a 30-year time period. The HCP permit term of 30 years, which coincides with planned development and local General Plans. This permit term is considered by some permitting agencies to be more desirable because uncertainties increased under the longer 50-year permit term. Based on these reasons and the General Plan durations listed in Table 2-9, the lead agencies determined that a 30-year Reduced Permit Term Alternative should be analyzed in this EIS/EIR to inform and support future decisions related to the most appropriate term for the SSHCP. The 30-year permit term would provide adequate time for the HCP Implementing Entity to purchase lands and easements needed for the HCP Preserve System within the USB and monitor wetland re-establishment/establishment performance.

2.4.3 Covered Activities/Projects Under the Reduced Permit Term Alternative

The types or categories of Covered Activities for the Reduced Permit Term Alternative would be the same as described under the Proposed Action/Proposed Project Alternative in Section 2.3.1. Similarly, most of the Covered Activities would implement new urban development, which would be constructed and operated inside the UDA portions of the Planning Area only. In the portion of the Planning Area located outside the UDA, Covered Activities would consist of the same limited number of roadway and recycled water infrastructure projects that are described for the Proposed Action/Proposed Project Alternative in Section 2.3.2.

Removal of Natural Land Covers During the 30-Year Permit Term

As discussed in Section 2.2.2, there are five known master plan developments currently proposed within the MCRA portion of the UDA: Cordova Hills, Arboretum, Jackson Township, NewBridge, and Suncreek. Sacramento County and Rancho Cordova expect these five master plan developments to be completed within the next 30-years. Approximately 5,600 acres of the 24,245-acre MCRA would have new development during the 30-year permit term.

Outside the UDA, the road and pipeline projects described as Covered Activities under the Proposed Action/Proposed Project Alternative, including the Capital Southeast Connector Project, would be completed during the 30-year permit term, pursuant to Sacramento County General Plan Circulation Element and facilities master plans.

The 30 years of construction or implementation of the urban development Covered Activities within the UDA described previously and the other types of regional HCP Covered Activities

expected outside the UDA in the next 30 years would remove a total of approximately 19,275 acres of natural lands in the Planning Area under the Reduced Permit Term Alternative (Table 2-10).

Table 2-10. Maximum Loss of Natural Land Categories Under the Reduced Permit Term Alternative

Land Cover Category[1]	Maximum Acres Lost		
	Inside UDA (acres)	*Outside UDA (acres)*	*Planning Area Total (acres)*
All natural land covers[2]	17,831	1,444	19,275
Vernal pool ecosystem[3] land covers	9,968	322	10,290
Wetland land covers[4] and other water land covers	674	74	748

1 The rows in the table are not additive because the land cover categories include some overlapping land cover types (e.g., Vernal Pool is included in "all natural land covers," "Vernal Pool ecosystem land covers," and "wetland land covers and other water land covers."

2 Planning Area land cover types were defined by the SSHCP preparers during development of the SSHCP. To allow for better comparison of impacts between the EIS/EIS alternatives, the EIS/EIR uses these same land covers and definitions in discussions of all alternatives. The natural land covers include Blue Oak Savanna, Blue Oak Woodland, Cropland, Freshwater Marsh, Irrigated Pasture-Grassland, Mine Tailings Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland, Open Water, Orchard, Seasonal Wetland, Stream/Creek, Stream/Creek (VPIH), Swale, Valley Grassland, Vernal Pool, and Vineyard, as discussed in Table 8-1.

3 Vernal Pool Ecosystem includes three aquatic land cover types (Vernal Pool, Swale, and Stream/Creek (VPIH)) and hydrologically connected Valley Grassland.

4 Wetland land covers include the following aquatic land cover types regulated under the CWA: Freshwater Marsh, Seasonal Wetland, Open Water, Stream/Creek, Vernal Pool, Swale, and Stream/Creek (VPIH).

The Reduced Permit Term Alternative (i.e., 30-year permit) is 60% of the time frame compared to the 50-year permit term of the Proposed Action/Proposed Project Alternative. Coincidentally, the area[16] projected to be urbanized within the UDA during the 30-year term constitutes approximately 58%–60% of full buildout of the UDA. Therefore, approximately 60% of the development acres assumed in the full buildout scenario would be permitted via the Reduced Permit Term Alternative.

The Reduced Permit Term Alternative would directly impact approximately 1,741 acres of aquatic resources within the UDA and 115 acres of aquatic resources outside the UDA (Table 8-12), which is 122 acres less than direct impacts to aquatic resources under the No Action/No Project Alternative (Table 8-4).

2.4.4 Covered Species Under the Reduced Permit Term Alternative

The Reduced Permit Term Alternative would include the same 28 Covered Species as for the Proposed Action/Proposed Project Alternative (see Table 2-5 for lists of Covered Species). The Reduced Permit Term Alternative, through the implementation of the an HCP Conservation Strategy during the 30-year permit term, including the Biological Goals and Measurable Objectives, implementation of the AMMs, and the ARP would provide additional avoidance

16 This area includes the Five Master Plans, County UPA, Rancho Cordova SOI, and Galt SOI.

measures not included in the No Action/No Project Alternative, which are expected to lessen the potential adverse effects to Covered Species relative to the No Action/No Project Alternative.

2.4.5 Conservation Strategy Under the Reduced Permit Term Alternative

The Reduced Permit Term Alternative includes a 30-year Conservation Strategy, which would include similar Biological Goals for the Planning Area as the Proposed Action/Proposed Project SSHCP. The Biological Goals for the Planning Area under the Reduced Permit Term Alternative would provide the same guiding principles as those identified for the Proposed Action/Proposed Project Alternative in Section 2.3.5, including the permanent conservation of each Covered Species within the Planning Area and the conservation of watershed ecosystem functions (including groundwater recharge) as some of the guiding principles.

However, the Reduced Permit Term Alternative would establish a smaller and less interconnected HCP Preserve System in the Planning Area, but would include a comprehensive preserve management program for those preserves. Active management of the preserve system established during the 30-year permit term of the Reduced Permit Term Alternative combined with 30 years of AMMs and particularly greater setbacks along streams, creeks, and minor tributaries will limit indirect impacts from urbanization, such as spread of invasive plants, establishment of informal trails, and use by people and domestic animals. AMM EDGE-1 requires compatible land uses included in the Covered Activities (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) to be located in areas immediately adjacent to existing or conceptual preserve boundaries. The compatible land uses established during the 30-year permit term will provide buffering of preserves from potential indirect effects of adjacent urban development during the permit term and beyond.

The Reduced Permit Term Alternative would also require each Covered Activity to implement the same resource-impact avoidance and minimization measures (AMMs) that the Proposed Action/Proposed Project Alternative requires. The implementation of these AMMs (see Table 2-6) would reduce direct and indirect impacts of the Covered Activities implemented during the 30-year permit term, when compared to the direct and indirect impacts of the No Action/No Project Alternative.

The Reduced Permit Term Alternative would also require the Permit Applicants to review of AMM effectiveness annually for the 30-year permit term and provide a process to make adaptive changes of any AMM that is not effective at avoiding impacts to aquatic resources or species. This additional layer of oversight of AMM implementation and oversight of AMM effectiveness under the Reduced Permit Term Alternative increases avoidance and minimization of impacts, when compared to the impacts of the No Action/No Project Alternative.

However, less new urban development would occur during the 30-year permit term of the Reduced Permit Term Alternative, and fewer development fees would be collected; thus, fewer financial resources would be available to the HCP to establish a HCP Preserve System within the Planning Area. Therefore, the acres preserved under the Measurable Objectives for Biological Goal No. 3 (to preserve and re-establish/establish natural land covers that provide Covered Species habitat) and Biological Goal No. 4 (to maintain or improve the habitat value of natural land covers that are preserved under Goal 3)) would be less under the Reduced Permit Term Alternative when compared to the Proposed Action/Proposed Project Alternative.

For each Measurable Objective, the SSHCP also provides Conservation Actions that specify how the Measurable Objective would be achieved (Table 2-7).The categories HCP Conservation Actions that would implement each Measurable Objectives in Table 2-7 would be the same for the Reduced Permit Term Alternative. However, Conservation Actions AG2.1, AG3.1, SH2.1, and GS5.1 would match the acreages that would be preserved under the Reduced Permit Term Alternative Measureable Objectives.

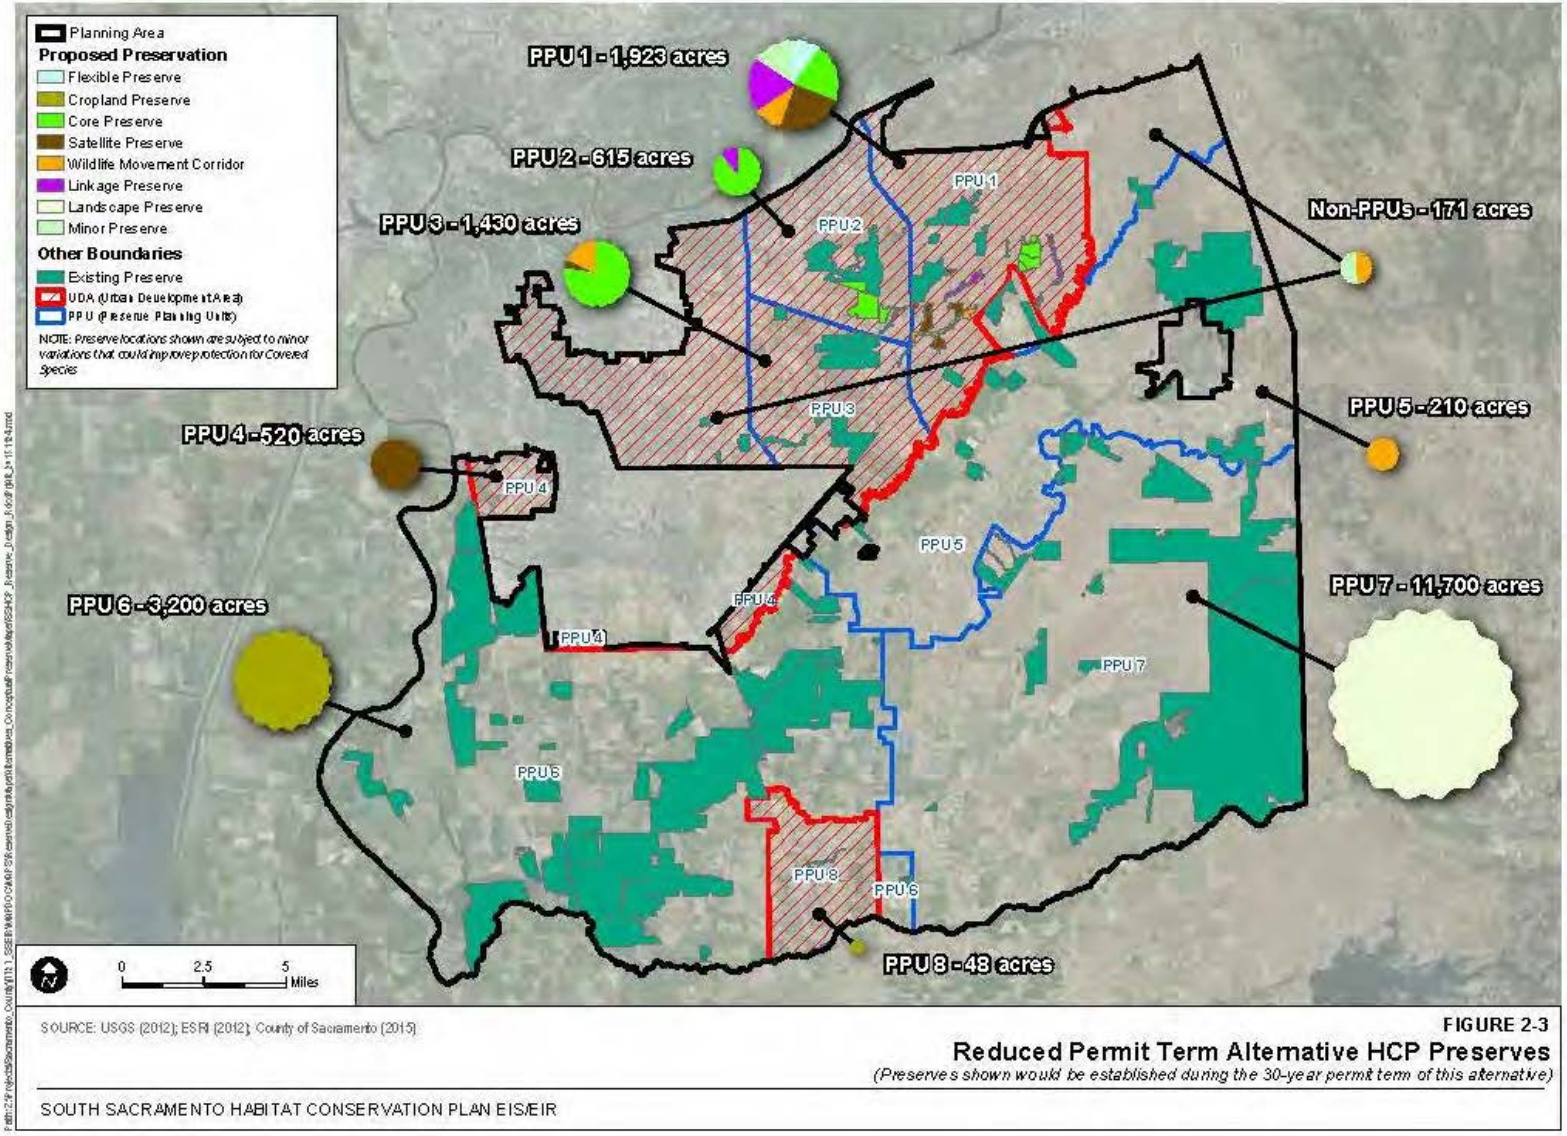
Under the Reduced Permit Term Alternative, the Permit Applicants would also use the HCP Conservation Strategy to prepare an Aquatic Resources Plan, as described for the Proposed Action/Proposed Project Alternative.

Expected HCP Preserve System under the Reduced Permit Term Alternative

As compared to the on-site avoidance and preserves that would result from the project-by-project regulatory review expected under the No Action/No Project Alternative, the 30-year term of the Reduced Permit Term Alternative HCP would assemble a more interconnected Preserve System both within and outside the UDA, and that features a larger minimum preserve size and greater habitat connectivity to existing preserves and between new preserves (Figure 2-3).

The Reduced Permit Term Alternative HCP Preserves would total approximately 20,044 acres of natural lands (compared to the approximately 23,430 acres preserved under the No Action/No Project Alternative, and the 34,495 acres of natural lands that would be preserved under the Proposed Action/Proposed Project Alternative). The Reduced Permit Term Alternative would preserve 4,752 acres of natural lands in the UDA (compared to the 7,030 acres preserved in the UDA under the Proposed Action/Proposed Project Alternative and the 6,814 acres preserved under the No Action/No Project Alternative). It should be noted that this comparison of acreages compares preserves established over 30-year period in the Reduced Permit Term Alternative with those established over 50 years in the No Action/No Project Alternative and the Proposed Action/Proposed Project Alternative.

As shown on Figure 2-3, many of the Reduced Permit Term Alternative HCP Preserves in the UDA would be similar in size, location, and connectivity to the UDA preserves described for the conceptual preserve system of the Proposed Action/Proposed Project Alternative (Section 2.3.5).



However, less urban development would occur under the Reduced Permit Term Alternative HCP over a 30-year permit term compared to the Proposed Action/Proposed Project Alternative 50-year permit term. As a result, development fees collected will also be less under the Reduced Permit Term Alternative than under the Proposed Action/Proposed Project Alternative.

Under the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative, most of the Preserve System established inside the UDA would be associated with the development of the five large Master Plans discussed in Sections 2.3.3 and 2.3.4. Therefore, the Preserve System established inside the UDA under the Reduced Permit Term Alternative is expected to be very similar to the Preserve System established inside the UDA under the Proposed Action/Proposed Project Alternative.

However, the shorter duration of Reduced Permit Term Alternative and the lower amount of urban development and associated development fees collected by the Reduced Permit Term Alternative HCP would not allow the HCP's Implementing Entity to establish as many acres of new preserves in the Planning Area as would occur under the Proposed Action/Proposed Project Alternative's 50-year permit term, and relatively few new preserves are expected to be established outside the UDA under the Reduced Permit Term Alternative.

As further described in the Reduced Permit Term Alternative's conceptual preserve system description, the shorter duration of Reduced Permit Term Alternative and the lower amount of development fees collected would not allow the Implementing Entity to acquire as much preserve land as under the Proposed Action/Proposed Project Alternative.

Figure 2-3 Reduced Permit Term Alternative HCP Preserves

INTENTIONALLY LEFT BLANK

As noted in Section 2.3.5, the Laguna Creek Wildlife Movement Corridor is a major part of the conceptual preserve system inside the UDA and would provide habitat, connectivity, and wildlife movement between the new Core Preserve in PPU 1 and the Core Preserves in PPU 3. The Laguna Creek Wildlife Movement Corridor would include approximately 520 acres inside the UDA. Approximately 4 miles and 440 acres of the Laguna Creek Wildlife Movement Corridor would be within PPUs 1 and 3, and the remaining approximately 1 mile and 82 acres would be in the portion of the Planning Area that was not included in a PPU (refer to Section 2.3.5). The following text summarizes the PPUs:

PPU 1 is the easternmost portion of the UDA and includes approximately 15,800 acres of the MCRA. New preserves in PPU 1 would include one Core Preserve of approximately 359 acres, three Minor Preserves totaling approximately 271 acres, and seven Satellite Preserves totaling approximately 434 acres. These Preserves would enclose intact Vernal Pool ecosystem and known occurrences of rare plants such as Sacramento Orcutt grass and slender Orcutt grass. At least seven new Linkage Preserves totaling approximately 353 acres would also be established in PPU 1 and would connect the new Core, Minor, and Satellite Preserves to each other and to existing preserves. The small portion of PPU 1 outside the UDA would have no new preserves under the Reduced Permit Term Alternative.

The conceptual preserve design for PPU 1 would maintain habitat connectivity with the Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve inside PPUs 1 and 3 and provide connectivity in the UDA to existing preserves within and south of the UDA. This connectivity in PPU 1 would be accomplished by an approximately 85-acre Flexible Preserve and portions of a Minor Preserve and a Core Preserve that are mostly located in the UDA portion of PPU 1.

PPU 2 is an important portion of the MCRA and is adjacent to the existing Mather Preserve. New preserves in PPU 2 are one Core Preserve of approximately 520 acres, as shown on Figure 2-3, and two Linkage Preserves that would connect the new Core Preserve to existing preserves located to the east and south, including across Jackson Highway between PPUs 1 and 3. The new Core Preserve in PPU 2 would preserve intact Vernal Pool ecosystem and abut the existing Mather Preserve to the north.

PPU 3 preserves would acquire existing, high-quality habitat present between two large existing preserves (Figure 2-3) to maintain landscape functions of the remaining Vernal Pool ecosystem; capture known occurrences of rare plants such as Sacramento Orcutt grass and slender Orcutt grass; and maintain north–south wildlife movement between Jackson Highway, Laguna Creek, and Calvine Road in PPU 3. PPU 3 would establish a

1,025-acre Core Preserve. One Satellite Preserve would provide connectivity between existing preserves and the new Core Preserve.

PPU 4 is a small area west of Elk Grove and northeast of the Stone Lakes NWR. The goal within PPU 4 would be to augment the existing Stone Lakes NWR. PPU 4 would include one preserve totaling approximately 530 acres and composed primarily of Valley Grassland that connects to the Refuge. Although the total size of this preserve would typically make it a Minor Preserve; however, it was classified by the Permit Applicants as a Satellite Preserve because it would be fragmented by existing development in the area.

Flexible Preserve: At least 170 acres of Flexible Preserve would be established next to other preserves within the conceptual preserve system or to existing preserves inside the UDA. The purpose of the Flexible Preserve category is to assure that the operational Preserve System is providing the species conservation benefits of functions of the Vernal Pool ecosystem within the MCRA as anticipated by the Permit Applicants at the time of SSHCP preparation. Flexible Preserve acres would be located adjacent to existing or new preserves and must be within the MCRA or located within 1 mile of the MCRA.

PPU 5 is outside the UDA in the west-central part of the Planning Area. Under the Reduced Permit Term Alternative, new preserves in PPU 5 would be limited to approximately 210 acres of natural land covers along the Cosumnes River/Deer Creek Wildlife Movement Corridor. Most of the Cosumnes River/Deer Creek Wildlife Movement Corridor that would be preserved under the Proposed Action/Proposed Project Alternative would not be preserved under the Reduced Permit Term Alternative.

PPU 6 is outside the UDA in the southwestern part of Planning Area. Approximately 3,200 acres would be preserved in PPU 6 under the Reduced Permit Term Alternative, all of which would be Cropland Preserves. The preserve design focus for these Cropland Preserves would be to preserve existing agricultural lands that provide habitat for the broad-ranging Swainson's hawk, greater sandhill crane, and white-tailed kite. Other natural land covers could also be preserved in each Cropland Preserve, but these would be preserved and managed primarily for the benefit of Covered Species that forage in the row crop or irrigated pastures, and would generally be adjacent to existing agricultural fields.

PPU 7 is located outside the UDA in the southeastern portion of the Planning Area and was delineated to encompass large areas of the Vernal Pool ecosystem in the Cosumnes/Rancho Seco Core Recovery Area. Approximately 11,700 acres would be preserved in PPU 7. The preserve design focus in PPU 7 would be to preserve natural land covers in a large Landscape Preserve. SSHCP Preserves in PPU 7 would target Vernal Pool

and Valley Grassland in areas that are adjacent to or near existing preserves, such as the 12,500-acre Chance Ranch.

PPU 8: New habitat preservation in this PPU would include 48 acres of Cropland Preserve located at the southern edge of the Planning Area just outside Galt, along Dry Creek. This Cropland Preserve would focus on preserving high-value Swainson's hawk foraging habitat and a greater sandhill crane roosting pond.

Given the assumptions for development and preservation described previously, the lead agencies developed a Conservation Strategy for the Reduced Permit Term Alternative. This scenario provides a reasonable estimate of habitat preservation likely to occur, but is only one of many potential ways that development and preservation could proceed under this alternative. Table 2-11 provides a summary of the potential Preserve System by land cover type inside and outside of the UDA for the Reduced Permit Term Alternative.

Table 2-11. Minimum Acres of New Preserves Under the Reduced Permit Term Alternative

Land Cover Category[1]	Preserved Land (acres)		
	Inside UDA (acres)	*Outside UDA (acres)*	*Total (acres)*
All natural land covers[2]	4,752	15,293	20,044
Vernal pool ecosystem[3] land covers	3,674	7,042	10,716
Wetland land covers[4] and other water land covers	404	770	1,174

1 The rows in the table are not additive because the land cover categories include some overlapping land cover types (e.g., Vernal Pool is included in "all natural land covers," "Vernal Pool Ecosystem land covers," and "wetland land covers and other water land covers."

2 Planning Area land cover types were defined by the SSHCP preparers during development of the SSHCP. To allow for better comparison of impacts between the EIS/EIS alternatives, the EIS/EIR uses these land cover definitions in discussions of all alternatives. The natural land covers include Blue Oak Savanna, Blue Oak Woodland, Cropland, Freshwater Marsh, Irrigated Pasture-Grassland, Mine Tailings Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland, Open Water, Orchard, Seasonal Wetland, Stream/Creek, Stream/Creek (VPIH), Swale, Valley Grassland, Vernal Pool, and Vineyard, as discussed in Table 8-1.

3 Vernal Pool Ecosystem includes three aquatic land cover types (Vernal Pool, Swale, and Stream/Creek (VPIH)) and hydrologically connected Valley Grassland.

4 Wetland land covers include the following aquatic land cover types: Freshwater Marsh, Seasonal Wetland, Open Water, Stream/Creek, Vernal Pool, Swale, and Stream/Creek (VPIH).

2.4.6 Preserve Management and Monitoring Programs under the Reduced Permit Term Alternative

The Reduced Permit Term Alternative would include the Compliance and AMM Effectiveness Monitoring Program and the Preserve System Management and Monitoring Program described in Section 2.3.6 for the Proposed Action/Proposed Project Alternative. As with the Proposed Action/Proposed Project Alternative, management and monitoring of preserves would continue in perpetuity after the end of the permit period.

2.4.7 HCP Implementation

Implementation of the Reduced Permit Term Alternative would occur over a 30-year permit term. The responsibilities of the Permit Applicants (future Plan Permittees) and the proposed structure and organization of the HCP Implementing Entity would be the same as described for the Proposed Action/Proposed Project Alternative above in Section 2.3.7.

CHAPTER 3 – INTRODUCTION TO CHAPTERS 4 THROUGH 17

The National Environmental Policy Act (NEPA) regulations and the California Environmental Quality Act (CEQA) Guidelines identify required content for Environmental Impact Statement (EIS) and Environmental Impact Report (EIR) documents (40 CFR 1502.10; CEQA Guidelines Sections 15120–15132). However, the format and organization of a NEPA or CEQA document is not mandated by these regulations and guidelines. Chapter 3 explains the format and organization of required EIS and EIR content that will be presented in Chapters 4 through 17.

Chapter 3 also provides a single location for the EIS/EIR to present terms, definitions, and concepts that will be used in the remaining EIS/EIR chapters. Chapters 4 through 17 refer to information presented in Chapter 3 to avoid duplication or repetition of the same information in each of the EIS/EIR resource impact analyses presented in Chapters 4 through 17.

Specific concepts presented in Chapter 3 include discussions of the approach taken, the information used, and general assumptions that will be made to estimate the direct, indirect, and cumulative impacts of each EIS/EIR alternative on the separate resource topics addressed in Chapters 4 through 17.

3.1 NEPA AND CEQA TERMS

As described in Chapters 1 and 2, NEPA and CEQA require analysis of potential environmental effects of proposed actions (and alternatives to those actions) before government agency approval. While many concepts are common to NEPA and CEQA, there are differences between the two in terminology, some of the required content, and certain elements of the impact analyses. Table 3-1 compares NEPA and CEQA terms that will be used in the remaining EIS/EIR chapters.

Table 3-1. Similar NEPA and CEQA Terms

NEPA Term	CEQA Term
Lead Agency	Lead Agency
Cooperating Agency	Responsible Agency Trustee Agency
Environmental Impact Statement (EIS)	Environmental Impact Report (EIR)
Notice of Intent (NOI)	Notice of Preparation (NOP)
Environmental Impact Statement (EIS)	Environmental Impact Report (EIR)

Environmental Consequences	Environmental Impacts
Environmentally Preferred Alternative	Environmentally Superior Alternative
Notice of Availability (NOA)	Notice of Availability (NOA) Notice of Completion (NOC)
Record of Decision (ROD)	Findings of Fact and Statement of Overriding Considerations/Project Approval Notice of Determination (NOD)

3.2 RESOURCE TOPICS EVALUATED IN THE REMAINING CHAPTERS

Using the scoping processes discussed in Section 1.4, the lead agencies identified the following resource areas as deserving of study in this EIS/EIR. Required content and analysis for each of these resource topics will be presented together, in a single EIS/EIR chapter:

- **Chapter 4—*Land Use*** analyzes effects of each alternative on existing and planned land use conditions, consistency with applicable planning documents, and compatibility with existing and planned land uses. This chapter also includes a land use compatibility analysis of airports in the Planning Area.
- **Chapter 5—*Soils, Geology, and Mineral Resources*** analyzes effects of each alternative on geology, soils, and mineral resources within the Planning Area. Issues addressed include existing geologic and soil conditions, seismic and soils-related hazards (e.g., earthquake, landslide, erosion), accessibility of important mineral resources, and the potential for unsafe human exposure to naturally occurring asbestos.
- **Chapter 6—*Agriculture*** analyzes effects on agricultural resources and agricultural activities within the Planning Area.
- **Chapter 7—*Hydrology and Water Quality*** analyzes effects of each alternative on hydrology and water quality conditions within the Planning Area. The analysis focuses on potential short- and long-term effects of implementing each alternative on drainage, runoff, and pollutant discharges.
- **Chapter 8—*Natural Land Cover Habitat Types, and Associated Plant and Animal Communities*** analyzes effects of each alternative on land cover types, including sensitive natural communities, and the common plant and animal species that use them.
- **Chapter 9—*Special-Status Species, Including HCP Covered Species*** analyzes effects of each alternative on special-status terrestrial and aquatic species occurring in the Planning Area, including the 28 species specifically addressed in the South Sacramento Habitat Conservation Plan (SSHCP) (the SSHCP Covered Species).
- **Chapter 10—*Aquatic Resources*** analyzes effects of each alternative on wetlands and other types of aquatic resources within the Planning Area. The analysis focuses on impacts to aquatic resources that might be jurisdictional under Section 404 of the Clean Water Act (CWA 404); aquatic resources that might be jurisdictional under CWA 401 and/or state of California regulations; and aquatic resources (including riparian areas, lakes, or streambeds) that are jurisdictional or might be jurisdictional under section 1600 of the California Fish and Game Code.
- **Chapter 11—*Paleontological, Cultural, and Historical Resources*** analyzes effects of the alternatives on paleontological, cultural, and historical resources within the Planning Area. For this EIS/EIR, cultural resources include tribal resources.

- **Chapter 12—*Public Services and Facilities*** analyzes effects of each alternative on public services and facilities within the Planning Area. Services and facilities assessed include fire protection, law enforcement, water supply, wastewater treatment, solid waste (landfill capacity), parks and recreation, energy services (natural gas and electricity), and mosquito abatement.
- **Chapter 13—*Traffic and Circulation*** analyzes effects of each alternative on traffic and circulation within the Planning Area. The analysis focuses on impacts to transportation systems that support the movement of goods and people. These systems include roads and freeways that support motorized vehicles; railways; public transit; and non-motorized travel, including bicycles and pedestrians.
- **Chapter 14—*Air Quality*** analyzes effects of each alternative on air quality within the Planning Area. General topics addressed include existing air quality conditions and construction and operational air emissions. Air quality impacts are evaluated for emissions of criteria air pollutants, fugitive dust, toxic air contaminants, and odors.
- **Chapter 15—*Greenhouse Gases and Climate Change*** analyzes effects of each alternative on global climate change, as well as impacts of global climate change on each alternative.
- **Chapter 16—*Population and Housing, Socioeconomics, and Environmental Justice*** analyzes effects of each alternative on population and housing, socioeconomics, and environmental justice within the Planning Area. Included in this chapter is the regulatory setting for population and housing, socioeconomics, and environmental justice, which identifies the laws and policies that govern the decision-making processes of relevant federal, state, and local agencies with a role in implementing the alternatives. This chapter provides an overview of social and economic conditions, demographics, and the characteristics of minority and low-income populations in the Planning Area that are relevant for analysis of environmental justice effects.
- **Chapter 17—*Other Required Analysis for CEQA and NEPA*** identifies significant effects that cannot be avoided, potentially significant effects that could be avoided, and effects found not to be significant; discusses the relationship between short-term uses of the environment and enhancement of long-term productivity; identifies irreversible and irretrievable commitments of resources, as well as significant irreversible environmental changes; discusses growth inducement and related effects; and discusses compliance with relevant executive orders. In addition, the list of EIS/EIR preparers that is required by NEPA regulation and the CEQA Guidelines is presented as EIS/EIR Chapter 18.

Although aesthetic resources and noise are included on the CEQA Guidelines Appendix G Environmental Checklist Form, these issues were not identified during the EIS/EIR internal scoping or the public scoping processes (see Section 1.4) as significant environmental issues deserving of study (40 CFR 1500.4(g)). In addition, the effects of the two EIS/EIR action

alternatives described in Sections 2.3 and 2.4 on aesthetic resources and on noise are anticipated to be essentially the same as anticipated future changes in aesthetics and noise that would occur under the No Action condition (i.e., the future conditions in south Sacramento County if an HCP is not permitted or implemented). Therefore, relative to the expected No Action future conditions, the EIS/EIR action alternatives would not have an effect on future noise or future aesthetic resources (see Initial Study Checklist in Appendix F). Therefore, to help narrow the scope of this EIS/EIR and concentrate on the issues that are truly significant to the decisions in question (pursuant to 40 CFR 15001.1, 40 CFR 1501.1(d), 40 CFR 1501.7(a)(3), and CEQA Guidelines Section 15063(c)(3)), noise and aesthetic resources are not studied further in this EIS/EIR.

3.3 FORMAT AND CONTENT OF CHAPTERS 4 THROUGH 16

Some of the EIS content required by NEPA regulation 40 CFR 1502.10 and some EIR content required by CEQA Guidelines Sections 15120–15132 were presented in EIS/EIR Chapter 1, including a description of the project location, the purpose and need for action and a statement of project objectives, and identification of the decision(s) to be made.

Required descriptions of the alternatives analyzed, including descriptions of the No Action/No Project Alternative and the Proposed Action/Proposed Project Alternative, were presented in EIS/EIR Chapter 2. Chapter 2 also provided brief discussions of the alternatives that were eliminated from detailed study and the reasons for their elimination. NEPA regulations and the CEQA guidelines also require EISs and EIRs to describe the existing environmental conditions present in the vicinity of the proposed project and the alternatives (i.e., the Affected Environment/Environmental Setting), and also require EISs and EIRs to describe and analyze the environmental impacts of the proposed project and each alternative (i.e., the Environmental Consequences/Environmental Impacts). The SSHCP EIS/EIR organizes that content by resource topic as listed in Section 3.2. In this manner, the existing conditions of an environmental resource as well as the potential impacts on that environmental resource will be presented together in one EIS/EIR chapter.

The resource-topic chapters (Chapters 4 through 16) are organized into two primary sections: the Affected Environment/Environmental Setting section and the Environmental Consequences/Environmental Impacts section:

- **Affected Environment/Environmental Setting**
    - ***Regulatory Framework***
    - ***Existing Conditions***

- **Environmental Consequences/Environmental Impacts**
    - ***Methodology for Assessing Impacts of Each Alternative*** on the chapter's resource topic
        - Study Area (if different than the Planning Area)
        - Impact Methodology
        - Significance Criteria and Thresholds of Significance
    - ***No Action/No Project Alternative***
        - Direct and Indirect Effects of the Alternative
        - Cumulative Effects Analysis of the No Action/No Project Alternative
    - ***Proposed Action/Proposed Project Alternative***
        - Direct and Indirect Effects of the Proposed Action/Proposed Project
        - Significance of Direct and Indirect Effects
        - Cumulative Effects of the Proposed Action/Project Alternative
    - ***Reduced Permit Term Alternative***
        - Direct and Indirect Effects of the Alternative
        - Significance of Direct and Indirect Effects
        - Cumulative Effects of the Reduced Permit Term Alternative

3.4 PREVIOUS PLANNING AREA ENVIRONMENTAL REVIEWS

Under certain circumstances, NEPA and CEQA regulations allow information or analysis previously presented in another document to be incorporated by reference into an EIS or EIR. If the analysis and assumptions used in the referenced document are determined by the lead agencies to be appropriate for the EIS/EIR analysis, a brief summary or description of the incorporated information or analysis will be provided, including pertinent page numbers and other relevant identifying information, pursuant to 40 CFR 1502.21, 43 CFR 46.135, and CEQA Guidelines, Section 15150(c).

The sections titled "Environmental Consequences/Environmental Impacts" in Chapters 4 through 16 may incorporate by reference certain information or analysis available from previous environmental documents. Three of these previous documents are the EIRs prepared for the Sacramento County, City of Galt, and City of Rancho Cordova General Plans, which identify policies and land use priorities to guide future development in those jurisdictions. The Sacramento County, Galt, and Rancho Cordova General Plans were updated relatively recently, and those jurisdictions overlap with the EIS/EIR Planning Area, although both the Sacramento County and the Rancho Cordova General Plans include lands that are outside the EIS/EIR Planning Area boundary. The General Plans provide a broad outline of future land use patterns within the

Planning Area. In addition, within the Galt and Rancho Cordova city limits and within Sacramento County's Urban Policy Area (UPA),[1] urban land use designations and intensities are identified.

The urban development Covered Activities that are included in the Proposed Action/Proposed Project Alternative and also included in the Reduced Permit Term Alternative (Sections 2.3 and 2.4) are consistent with future urban development patterns, infrastructure, and other elements described in the three General Plans. The planned future urban development, infrastructure, and the other elements described in the three adopted General Plans were also closely considered by the lead agencies when identifying and describing the No Action/No Project Alternative's activities, projects, and the expected future condition of the Planning Area (Section 2.2).

3.4.1 Sacramento County General Plan

The *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011) includes goals and policies that help ensure that future population growth in the County will have adequate housing, employment, public services, and other necessities (Sacramento County 2011, p. 12). As part of the Sacramento County General Plan, the County adopted two growth boundaries to create a logical progression of urban development—the Urban Services Boundary (USB) and the UPA. The USB indicates the ultimate boundary of the urban area in the unincorporated County, while the UPA defines the area within the USB expected to receive urban levels of public infrastructure and services within the General Plan's 25-year planning period.

Several elements of the Sacramento County General Plan were developed in a manner that anticipated the approval and implementation of an HCP in south Sacramento County (see Sacramento County 2011, Land Use Element, pp. 36, 136–137; Open Space Element, pp. 4, 17, 18; Agricultural Element, p. 9; Conservation Element, pp. 20, 35, 37, 38, 41, 45, 47, 57, 68).

The Sacramento County General Plan Land Use Element policies give priority to residential development on vacant or underutilized sites within existing urban areas that have infrastructure available, support completion of existing planned communities located within the current UPA, and support infill development within the UPA (Policies LU-4 through LU-11). The Land Use Element also contains policies allowing urban development within new growth areas that are contiguous to but outside the existing UPA (Policy LU-3). New growth areas outside the existing UPA can only be developed if the County first approves a specific plan, a comprehensive plan, or other master plan for the new growth areas (Sacramento County 2011,

[1] The Urban Policy Area (UPA) defines the area expected to receive urban levels of public infrastructure and services within the planning horizon by providing the geographic basis for the provision of urban services and infrastructure to the unincorporated County (Sacramento County 2011b).

Land Use Element, p. 35). The Sacramento County General Plan also introduced a new process by which the County would consider requests to expand the UPA; it requires any UPA expansion to meet a series of "smart growth" performance criteria (Sacramento County 2011, Land Use Element Policies LU-119 and LU-120). Although all of the land located between the current UPA boundary and the USB boundary is expected to be developed in the future, the current Sacramento County General Plan does not assign specific land use designations or development density targets to this area.

The *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR) (Sacramento County 2010) analyzed the effects of population growth and urban development that could occur under the General Plan over 25 years. The EIR considered several different alternatives, which included (or excluded) various potential new growth areas for urban development. Ultimately, the County adopted a General Plan that did not include any new growth areas, but instead included policies directing how such areas could be developed following a master planning process; the adopted General Plan most closely resembled the Mixed Use Alternative analyzed in the General Plan EIR. One of the other EIR alternatives, the original staff proposal, included new growth areas within the SSHCP's Urban Development Area (UDA). The inclusion of these new growth areas, primarily within the Jackson Highway corridor (see also Section 3.7.2 regarding proposed future development within the Jackson Highway Corridor), makes this original staff proposal alternative more closely resemble the development scenario assumed by the SSHCP than does the adopted alternative. For this reason, this EIS/EIR utilizes the General Plan EIR analyses associated with the original staff proposal rather than the analyses associated with the Mixed Use Alternative when citing the Sacramento County General Plan EIR. However, the analysis in the General Plan EIR included nearly 300,000 additional acres of Sacramento County that are not included in the SSHCP EIS/EIR Planning Area. Therefore, the significance conclusions presented in the Sacramento County General Plan EIR include impacts from development outside the EIS/EIR Planning Area.

3.4.2 Galt General Plan

The *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009a) contains statements of goals, policies, standards, implementation programs, and quantified objectives that constitute the formal policy of Galt about future land use, development, and environmental quality in Galt and its sphere of influence (SOI) through the year 2030. The Galt General Plan covers an area beyond its current SOI to an area north of Twin Cities Road, which the Galt expects would be annexed to it if needed for development.

The *Final Environmental Impact Report for the 2030 Galt General Plan* (Galt General Plan EIR) (Galt 2009b) analyzed the effects of expected population growth and urban development under the Galt General Plan over 20 years to the year 2030. The Galt General Plan EIR assumed full

buildout[2] within the existing City boundaries (Figure 1-1) by 2030, and assumed that locations of future development would conform to the "Preferred Land Use Diagram" included in the General Plan (Galt 2009b, p. LU-5). The EIR also assumed that a proposed SOI expansion would be approved by the Sacramento Local Agency Formation Commission.

The proposed Galt SOI is within the SSHCP EIS/EIR Planning Area and is part of the UDA,[3] as shown on Figure 1-1.

3.4.3 Rancho Cordova General Plan

The *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2006a) is the only general plan adopted by Rancho Cordova since Rancho Cordova was incorporated as a new city in 2003. The Rancho Cordova General Plan provides policies to plan for new urban growth over a 20-year period ending in 2030. Similar to the Sacramento County General Plan, the Rancho Cordova General Plan includes a land use map and multiple "elements," each of which includes goals and policies that guide future development, infrastructure, and conservation (Rancho Cordova 2006a). The Rancho Cordova General Plan provides projections for development by 2030, and full buildout of the development allowed by the General Plan within Rancho Cordova and its approved SOI by the year 2050.

The *City of Rancho Cordova General Plan Final Environmental Impact Report* (Rancho Cordova General Plan EIR) (Rancho Cordova 2006b) evaluated effects of the new urban development planned in the City of Rancho Cordova between the year 2006 and 2030, including development of the City's approved SOI. In addition, the Rancho Cordova General Plan EIR also evaluated full buildout of the Rancho Cordova city boundary and full buildout of Rancho Cordova's approved SOI, but did not identify a year when that full buildout would occur.

The study area for the Rancho Cordova General Plan EIR included areas outside the EIS/EIR Planning Area, including the portion of the City north of Highway 50 and the land owned by Aerojet northeast of the Planning Area (see EIS/EIR Planning Area discussion in Section 1.1.1). Therefore, the significance conclusions presented in the Rancho Cordova General Plan EIR include impacts from development outside the EIS/EIR Planning Area.

---

2 "Full Buildout" means all currently undeveloped lands that are zoned for or are ultimately planned/contemplated for future urban development (in the adopted General Plans of the Permit Applicants) would become developed. Full buildout will include some open space and conservation lands within the areas planned for urban development.

3 As discussed in Section1.1.1, the UDA is an area that includes the portion of the Sacramento County Urban Services Boundary (USB) that is located within the EIS/EIR Planning Area, the portion of the incorporated City of Rancho Cordova that is located within the EIS/EIR Planning Area, and all the City of Galt and Galt's Sphere of Influence (SOI) (see Figure 1-1).

3.4.4 Sacramento Area Council of Governments Metropolitan Transportation Plan and Sustainable Communities Strategy

The Sacramento Area Council of Governments (SACOG) Metropolitan Transportation Plan (MTP) is a 20-year regional plan for transportation projects, such as bikeway, road, sidewalk, and transit projects in the six-county region of Sacramento, Yuba, Sutter, Yolo, Placer, and El Dorado Counties. Any transportation projects in the six-county region using federal and state funding must be included in the MTP. Since the adoption of Senate Bill 375 in 2008, each Metropolitan Planning Organization, including SACOG, is also required to include a Sustainable Communities Strategy (SCS) as part of its regional transportation plan. The SCS must demonstrate how development patterns and transportation network, policies, and programs can work together to achieve greenhouse gas emission reduction targets set by the California Air Resources Board for cars and light trucks, if there is a feasible way to do so. The SACOG MTP/SCS was adopted on February 18, 2016 (SACOG 2016a).

The *Final Environmental Impact Report for the 2016 Metropolitan Transportation Plan/Sustainable Communities Strategy* (MTP/SCS EIR) (SACOG 2016b) evaluated effects associated with implementation of the MTP/SCS over a 6,036-square-mile plan area. The study area for the MTP/SCS EIR includes the six-county region described above, and the analysis and conclusions reached by the MTP/SCS EIR are based on development and population growth across a much larger area than the EIS/EIR Planning Area.

3.4.5 Capital Southeast Connector

The Capital Southeast Connector is a proposed 35-mile multimodal transportation roadway extending from Interstate 5, south of Elk Grove, northeast through the UDA, to U.S. Highway 50 in El Dorado County. The Capital Southeast Connector will link existing communities in Sacramento and El Dorado Counties, including Elk Grove, Rancho Cordova, Folsom, and El Dorado Hills. Much of the project footprint of the Capital Southeast Connector (26.5 miles) is within the Planning Area.

Generally, the Capital Southeast Connector includes the following project segments:

- A four-lane expressway segment from the Interstate 5/Hood-Franklin Road Interchange easterly along an extension of Kammerer Road to the existing Kammerer Road/ Bruceville Road intersection
- A four- to six-lane thoroughfare segment east of the Kammerer Road/Bruceville Road intersection along Kammerer Road, and then northeast on Grant Line Road to its intersection with Bond Road (note: this road segment is within the UDA)

- A four-lane limited access rural thoroughfare along Grant Line Road from the intersection of Bond Road, northeasterly to the intersection of Calvine Road (note: this road segment is within the UDA)
- A four- to six-lane expressway segment on Grant Line Road from its intersection with Calvine Road, northeasterly to the intersection of White Rock Road, and then on White Rock Road from its intersection with Grant Line Road easterly to the Sacramento County–El Dorado County Line
- A four- to six-lane thoroughfare segment on White Rock Road from the Sacramento County–El Dorado County line northeasterly to the intersection with the U.S. Highway 50 interchange at Silva Valley Parkway (note: this segment and interchange are outside of the Planning Area, so are not SSHCP Covered Activities and are not covered by the SSHCP permits).

The construction and future operation of the 26.5-mile portion of the Capital Southeast Connector located within the Planning Area is a Covered Activity of the two EIS/EIR action alternatives (see Sections 2.3 and 2.4).

The *Capital Southeast Connector Project Final Program Environmental Impact Report* (Connector EIR) (Connector JPA 2012) analyzed effects associated with the selection of a maximum 1,000-foot-wide general alignment along the 35-mile corridor between Interstate 5 in Elk Grove and U.S. Highway 50 in El Dorado County. Project design guidelines were included as assumptions to help define the general scope of the project and estimate potential impacts of the project in the Program EIR, but the document was not intended to provide environmental clearance for full project design, and subsequent project-level analyses will be completed in the future. As described previously, the study area for the Connector EIR included areas outside the EIS/EIR Planning Area; therefore, the significance conclusions presented in the Connector EIR include impacts from project development outside the EIS/EIR Planning Area.

3.5 CONTENTS OF THE AFFECTED ENVIRONMENT/ ENVIRONMENTAL SETTING SECTIONS OF CHAPTERS 4 THROUGH 16

NEPA regulations require that each EIS describe the Affected Environment, defined as the existing environment of the area to be affected by the alternatives under consideration (40 CFR 1502.15). Similarly, under CEQA, each EIR is required to describe the existing Environmental Setting and the physical environmental conditions in the vicinity of the project (from both a local and regional perspective), as it exists at the time the Notice of Preparation (NOP) is published (CEQA Guidelines, Section 15125). As discussed in Section 1.4.1, the NOP for this EIS/EIR was published in 2013.

NEPA regulations and CEQA Guidelines both require the description of the existing environmental conditions be no longer than is necessary to understand and describe the effects of the proposed action/proposed project and the alternatives.

The Affected Environment/Environmental Setting sections of Chapters 4–16 (see preliminary discussion in Section 3.3) include a description of the existing regulatory environment typical in the Planning Area for proposed projects that could affect that resource topic. The Affected Environment/Environmental Setting sections identify the Planning Area's existing laws, regulations, and local policies that apply to that resource topic. Any environmental analyses, studies, or surveys of the resource topic that would be required by the existing Regulatory Framework are explained in this section. In addition, relevant permits, licenses, and other entitlements that must be obtained to implement the alternatives are presented in this section of Chapters 4–16, as required by NEPA regulation 40 CFR 1502.25.

The Affected Environment/Environmental Setting sections also describes the existing physical environmental conditions of that resource within the EIS/EIR Planning Area, and existing conditions within the EIS/EIR study area of that resource topic, if the study area of the resource topic is larger than the EIS/EIR Planning Area (see study area discussion in Section 3.6.2).

3.6 CONTENTS OF ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACT SECTIONS IN CHAPTERS 4 THROUGH 16

As outlined in Section 3.3, the potential environmental impacts of implementing the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative, and the Reduced Permit Term Alternative are presented in separate subsections of each resource-topic chapter (Chapters 4 through 16).

In Chapters 4 through 16, the level of detail used when describing environmental impacts for each resource-topic varies in proportion to their significance, meaning that severe impacts are described in more detail than less consequential impacts, as required by 40 CFR 1502.2(b) and by CEQA Guidelines, Section 15126.2(a). This is intended to help decision makers and the public focus on each alternative's key effects. CEQA requires that an EIR be prepared with a sufficient degree of analysis to provide decision makers with information that enables them to make a decision that intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project under CEQA need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible (CEQA Guidelines, Section 15151).

The analysis of the proposed action and each alternative must include an analysis of the direct, indirect, and cumulative effects of the proposed action or alternative, as well as analysis of the effects of any appropriate mitigation measures and best management practices (43 CFR 46.130a). Under NEPA regulations, those mitigation measures and best management practices can be analyzed either as elements of the alternatives or in a separate discussion of mitigation (43 CFR 46.130a). Because mitigation, conservation, minimization, and avoidance measures are key components of the SSHCP, each of the Environmental Consequences/Environmental Impact sections of Chapters 4–16 concurrently analyze both the adverse impacts of the alternative and the beneficial impacts of the mitigation, conservation, minimization, and avoidance measures that are also included in the description of the alternative (see Section 2.2, 2.3, and 2.4). Under CEQA, an EIR is required to distinguish between the measures that are proposed by project proponents to be included in the project and other mitigation measures that the lead agency determines could reasonably be expected to reduce significant adverse impacts; the EIR is required to identify mitigation measures for each significant environmental effect identified (CEQA Guidelines, Section 15126.4).

Therefore, this EIS/EIR will recommend additional mitigation measures, as appropriate, when an impact determination finds that a significantly adverse effect would result from an action alternative (see additional discussion of impact significance in Section 3.8).

3.6.1 EIS/EIR Environmental Baseline

Under NEPA, the impacts of the proposed action and each alternative are usually discussed and evaluated in comparison to the expected future conditions that would occur without an action/project (CEQ 1981, Question #3; 43 CFR 46.4.15[b][1]). The future conditions without the action/project are the same future environmental conditions described for the No Action Alternative. Therefore, the expected future condition for each of the resource areas studied in this EIS/EIR (see Section 3.2) is described in the No Action/No Project Alternative sections of Chapters 4–16 (see Section 3.3). As indicated in those sections, the expected No Action/No Project's future conditions are always described and discussed relative to the existing conditions of that resource topic.

Under CEQA, the impacts of the proposed project and each alternative are usually described relative to the existing environmental conditions at the time the NOP is issued (CEQA Guidelines, Section 15125(a)). The existing environmental condition of the resources in the Planning Area at the time of NOP issuance are presented in the Affected Environment/ Environmental Setting sections of Chapters 4–16.

However, under both NEPA regulations and the CEQA Guidelines, lead agencies have discretion in some situations to use a different baseline for describing and assessing environmental effects

of a proposed project and alternatives. As discussed previously, the CEQA baseline for describing impacts and assessing significance of project impacts is normally the environmental setting (the existing conditions) at the time an NOP is issued (CEQA Guidelines, Section 15125[a]). However, CEQA case law has clarified that in some situations, this typical approach may not be appropriate. In the 2013 California Supreme Court decision, *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority*, the court clarified that lead agencies preparing EIRs have the discretion to use a future-condition baseline when a comparison to the existing conditions would be misleading or uninformative. That court decision noted the following points: (1) that a CEQA analysis needs to "employ a realistic baseline that will give the public and decision makers the most accurate picture practically possible of the project's likely impacts;" (2) "CEQA imposes no 'uniform, inflexible rule for determination of the existing conditions baseline,' instead leaving to a sound exercise of agency discretion the exact method of measuring the existing environmental conditions upon which the project will operate;" and (3) a lead agency may "omit an analysis of impacts on existing conditions when inclusion of such an analysis would detract from an EIR's effectiveness as an informational document, either because an analysis based on existing conditions would be uninformative or because it would be misleading to decision makers and the public" (*Neighbors for Smart Rail v. Exposition Metro Authority* [2013] 57 Cal.4th 439, 507). Also, the court indicated that "nothing in CEQA law precludes an agency from considering both types of baseline—existing and future conditions—in its primary analysis of the project's significant adverse effects."

For this EIS/EIR, the lead agencies determined that using the existing condition as the baseline to describe and determine the significance of each action alternative's expected impacts would be misleading. This determination was made because the two action alternatives include, as Covered Activities, future urban development and infrastructure projects that are also reasonably expected to occur under the No Action/No Project Alternative. Although the details of this future development are not completely known at this time, it is anticipated that new urban development under all of the EIS/EIR alternatives would accommodate the same population and development growth, and that this urban growth would occur in areas where public infrastructure and services are planned for the 50-year EIS/EIR study period (i.e., within the spheres of influence for the Cities of Galt and Rancho Cordova and within Sacramento County's USB). As a result, the types of new urban development and associated infrastructure would be the same, and the general locations and the acres of new urban development would be very similar for all alternatives. Therefore, using existing conditions as the baseline for describing the effects of each action alternative and for determining the significance of those effects would misrepresent the impacts of the action alternative because that development would occur whether or not an HCP is approved and implemented in south Sacramento County.

Further, the future urban development and infrastructure Covered Activity projects and activities are not part of the "project" under CEQA that is subject to approval by the CEQA lead agency and by the other HCP Permit Applicants (see Section 1.5), are not part of the "project" under CEQA that would be subject to permitting by the California Department of Fish and Wildlife (CDFW) (see Section 1.5), and are not part of the "action" under NEPA that would be subject to permitting by the U.S. Fish and Wildlife Service (USFWS) (see Section 1.5). The EIS/EIR "project" (under CEQA) and "action" (under NEPA) consists of the approval and implementation of the HCP, SSHCP Aquatic Resources Plan (ARP), and issuance of associated take permits, but not the actual construction of or the discretionary entitlements of urban development projects and activities. Thus, the future environmental impacts of new urban development in the Planning Area would not result from the decisions to be made about the Proposed Action/Proposed Project (Section 1.5). For these reasons, the EIS/EIR basis of comparison (the EIS/EIR baseline) for describing the environmental impacts of each action alternative is the future condition of the Planning Area expected to occur under the No Action/No Project Alternative.

3.6.2 Geographic Study Area of Resource Topics Analyzed in Chapters 4 through 16

For most of the resource topics analyzed in Chapters 4–16, the geographic study area for direct, indirect, and cumulative effects of each alternative is the same as the Planning Area boundary (see Section 1.1.1). However, for some resource areas, the study area is larger than the Planning Area because the effects of the Proposed Action/Proposed Project would act synergistically with impacts in the larger area to affect the resource. For example, for EIS/EIR Chapter 14, Air Quality, the impact study area for that resource topic consists of the Sacramento Valley Air Basin because emissions generated in the Planning Area are distributed throughout that air basin. In Chapter 8, Natural Land Cover Habitat Types, and Associated Plant and Animal Communities, the study area for impacts to the vernal-pool land cover and the vernal-pool ecosystem considers cumulative impacts to those aquatic resources within the boundary of the Southeastern Sacramento Valley Vernal Pool Region (Keeler-Wolf et al. 1998; USFWS 2005), which extend beyond the EIS/EIR Planning Area to include other portions of Sacramento County, and portions of Placer, Yuba, San Joaquin, Calaveras, Amador, and Eldorado Counties. For Chapter 9, Special-Status Species, Including HCP Covered Species, the study area for cumulative impacts varies depending on the species because some species have very limited ranges, while others have extensive ranges.

When the study area for a resource topic is different from the Planning Area boundary, the section titled "Methodology for Assessing Impacts of Each Alternative" (see Section 3.3) defines the study area and provides a reasonable explanation for the geographic area used in the cumulative analysis (CEQA Guidelines, Section 15120 [b][3]).

3.6.3 EIS/EIR Study Period

The Proposed Action/Proposed Project requests a 50-year Incidental Take Permit (ITP) permit term (see Section 2.4.1). During the proposed 50-year permit term, all Covered Activities would be constructed, the entire SSHCP Preserve System would be established, and the other parts of the proposed Conservation Strategy would be completed. Therefore, a 50-year EIS/EIR study period is reasonable for the Proposed Action/Proposed Project because that period will cover the amount of time anticipated by the Permit Applicants for full build-out of the UDA to occur, and the amount of time anticipated for assembly of the interconnected SSHCP Preserve System and implementation of the proposed SSHCP Conservation Strategy.

To allow for a coequal analysis of all EIS/EIR alternatives, as required by NEPA regulation (40 CFR 1502.14), the EIS/EIR also uses the same 50-year analysis study period to evaluate the No Action/No Project Alternative and to evaluate the Reduced Permit Term Alternative.

3.6.4 Addressing Incomplete or Unavailable Information in Chapters 4 through 16

CEQA recognizes that drafting an EIR necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to determine and disclose all that it reasonably can (CEQA Guidelines, Section 15144). The courts have looked not for perfection but for adequacy, completeness, and a good-faith effort at full disclosure (CEQA Guidelines, Section 15151).

Likewise, NEPA regulations direct that when a lead agency is evaluating a reasonably foreseeable effect in an EIS and there is incomplete or unavailable information, the EIS shall always be clear that such information is lacking (40 CFR 1502.22). Further, if information relevant to a reasonably foreseeable adverse impact cannot be obtained because the means to obtain it are not known, or the costs of obtaining the information are exorbitant, the EIS shall: (1) state that such information is incomplete or is unavailable; (2) state why the missing information is relevant to evaluating the foreseeable adverse impact; (3) summarize the existing information and credible scientific evidence which is relevant to evaluating the reasonably foreseeable adverse impact; and (4) the lead agency's evaluation of the foreseeable adverse impact with incomplete or unavailable information shall be based upon theoretical approaches or methods that are generally accepted in the scientific community (40 CFR 1502.22(b)).

The description of the three EIS/EIR alternatives in Chapter 2, including the types, amounts, locations, and timing of future development forecasted in the Planning Area under each alternative, was based on information obtained from three primary sources: (1) the adopted

General Plans (see Section 3.4); (2) the Master Plan development applications currently being processed by the local land use authorities (see Section 2.2.1 and Table 2-3), and (3) the professional judgment of the planning departments of Sacramento County, Galt, and Rancho Cordova. These sources of information provide the best available information about the types, amounts, locations, and timing of future development expected in the Planning Area under each of the three EIS/EIR alternatives, and they provide the foundation for the impact analysis of each EIS/EIR alternative presented in Chapters 4 through 16.

However, information about the precise amounts, specific locations, and actual timing of future development projects under each EIS/EIR alternative over the 50-year EIS/EIR study period is incomplete. Furthermore, current forecasts of Planning Area economic conditions, population trends, and other factors that stimulate and drive urban development have some uncertainty, so the future population growth and economic conditions over the next 50 years may be different from the current predictions. In addition, as discussed in Section 2.2.2 for the No Action/No Project Alternative, there is also some uncertainty about future regulatory requirements for new development projects within parts of the UDA and how those requirements may affect species habitat and aquatic resource avoidance, minimization, and preservation over the next 50 years.

The EIS/EIR identifies where specific information about the future conditions of an EIS/EIR alternative is incomplete or unavailable at this time. The EIS/EIR then explains how any incomplete or unavailable information was addressed by the lead agencies to forecast the likely future conditions under an EIS/EIR alternative and to determine the environmental impacts of each EIS/EIR alternative.

3.6.5 GIS Methodology Used in Chapters 4 through 16 to Estimate Direct Impacts of Each EIS/EIR Alternative

Direct impacts are effects caused by the action or project and occur at the same time and place as the action or project (40 CFR 1508.8; CEQA Guideline, Section15358). Direct impacts are also discussed as primary impacts under CEQA.

Chapters 4–16 estimate the permanent direct effects of each EIS/EIR alternative using geographical information system (GIS) technology. GIS is a computer and software system designed to collect, store, manage, present, analyze, and manipulate spatial or geographically referenced data (i.e., information or data identified by its location). GIS spatial data represents locations of real objects (such as roads, land use, elevation, vegetation, and waterways) as points, lines, and polygons.

The majority of natural-resource spatial data used by the SSHCP EIS/EIR came from aerial photographs of the Planning Area that were digitized or scanned by the Permit Applicants to

produce digital data sets. Existing spatial data from other sources was also used, including spatial data from the CDFW Natural Diversity Database to locate species survey data and known species occurrences within the Planning Area, maps of streams and creeks from the National Hydrological Dataset, state maps of important farmland, and other publicly available geographic datasets. GIS can be used to combine several spatial datasets to create a new output vector dataset (or new map overlay), which is visually similar to stacking several paper maps of the same area. The new map overlay can be similar to a mathematical Venn diagram of overlays for the same area—for example, a union overlay combines geographic features into a single new output; an intersect overlay defines the area where inputs overlap, and a symmetric difference overlay defines an output that includes the total of both inputs, except for the overlapping areas.

The impact analysis in this EIS/EIR included use of GIS digital map overlays of the planned new urban development and infrastructure footprints expected under the each alternative. The GIS map overlay of urban development projects and activities expected under each EIS/EIR alternative (described in Sections 2.2, 2.3, and 2.4) includes UDA Master Plan development projects and infrastructure projects that are currently in the planning process (see Table 2-9), and the other anticipated urban development and infrastructure discussed in the adopted General Plans (see Section 3.4), including the road and utility infrastructure projects that are planned by Capital Southeast Connector JPA and the Sacramento Regional County Sanitation District.

The EIS/EIR then used GIS technology to compare the spatial data overlay of planned urban development for each EIS/EIR alternative to the spatial data overlays of existing resources for this Planning Area.

Where the GIS comparison of the map overlays showed an intersection or overlap between the alternative's planned-development footprint and an existing environmental resource, the Environmental Consequences/Environmental Impact analysis assumes that the environmental resources present within the area of overlap would be removed, and new urban development would occur in that area. GIS was used to quantify these acres of overlap, and the Environmental Consequences/Environmental Impact analysis analyzed those acres of existing land cover or natural resource as permanently impacted and removed (lost).

The GIS software can make precise calculations. However, the map overlay of the new urban development expected under each alternative included many assumptions about the specific locations, types, timing, quantity, and total area of future urban development and associated infrastructure. As discussed in Section 3.6.4, the assumptions made by the lead agencies to develop the data overlay of each EIS/EIR alternative were based on information from the General Plans described in Section 3.4, on information in the Master Plan development applications currently being processed by the local land use authorities, and on the professional judgment of the planning departments of Sacramento County, Galt, and Rancho Cordova. As

further discussed in Section 3.6.7, these sources of information provide the best available information about the types, amounts, locations, and timing of future urban development in the Planning Area. Use of the best available scientific and commercial information during the preparation of the EIS/EIR is discussed in Section 3.6.7.

3.6.6 Methodology Used in Chapters 4–16 to Estimate Indirect Impacts of EIS/EIR Alternatives

NEPA defines indirect impacts as effects of the action that occur later in time, or are farther removed in distance, but are still reasonably foreseeable (40 CFR 1508.8). Similarly, CEQA describes indirect effects as those that are caused by a project but occur later in time or at some distance from the project site, but are still reasonably foreseeable. Indirect impacts are also referred to as secondary effects under CEQA (CEQA Guidelines, Section 15064[d]). CEQA further states that "An indirect physical change in the environment is a physical change in the environment which is not immediately related to the project, but which is caused indirectly by the project. If a direct physical change in the environment in turn causes another change in the environment, then the other change is an indirect change in the environment" (CEQA Guidelines, Section 15064 [d][2]).

New urban development and associated new infrastructure are known to produce environmental stressors that can permanently impact existing environmental resources over time and/or can permanently impact environmental resources that are located outside the development project site. As discussed below, these stressors result from urban development's physical changes to existing landscapes and watersheds, removal or changes to existing vegetation, the construction and long-term maintenance of buildings and infrastructure, new or increased human activities of all types, and increased vehicle traffic.

Each EIS/EIR resource chapter (Chapters 4–16) identifies the environmental stressors of the EIS/EIR alternatives that could indirectly impact the resources analyzed in that chapter. For most resources studied in Chapters 4–16, the exact location and the exact quantity or intensity of the future indirect effects that would be caused by those environmental stressors cannot be accurately quantified at this time. Therefore, most indirect impacts of each EIS/EIR alternative are described and analyzed qualitatively in Chapters 4–16. Discussions of the duration, general locations, expected extent, and relative intensity of the indirect effects of each EIS/EIR alternative on the chapter's resource topic are included in each qualitative indirect impact analyses presented in Chapters 4–16.

However, to prepare the Endangered Species Act (ESA) incidental take permit (see Section 1.1), the USFWS must evaluate the total acres of vernal-pool species habitat within the Planning Area that would be permanently impacted, including all indirectly impacted acres. Therefore,

the Environmental Consequences/Environmental Impact sections of Chapter 8 and Chapter 9 also quantify acres of indirect impacts to three aquatic land cover types that provide aquatic habitat for vernal-pool species (i.e., vernal pool, swale, and the stream/creek land cover types). As detailed in Sections 8.2.1 and 9.2.1, the Permit Applicants used LIDAR technology to create digital maps of individual vernal pool microwatersheds from aerial photo data, and then quantified the indirect impacts of each action alternative on vernal pools, swales, and stream/creeks land covers using GIS methodology, as described in Section 3.6.4.

Known environmental stressors of new urban development could result in the following indirect impacts to existing environmental resources.

Hydrologic Alterations. As new development occurs, increased runoff from new impermeable surfaces (e.g., roads, parking lots) and from irrigated landscapes (e.g., yards, sports fields, golf courses) can occur. Urban runoff from developed areas has the potential to add water to the natural hydrologic system and can change the existing hydrographs of creeks, streams, and waterways in the project site and in the surrounding region. Constructing barriers such as berms or raised beds, which are often built to support roadways and railroad tracks, changes hydrology by blocking waterways and creating impoundments where water can collect. These kinds of impoundments can also alter and degrade downgradient waters by fragmenting the local watershed, resulting in premature drying of downstream aquatic resources and can lead to permanent loss of aquatic habitat. Urban development in a part of a watershed may alter the hydrology of the remaining aquatic resources. Long-term effects on water quality caused by runoff from new impermeable surfaces potentially include pollution from petroleum products, fertilizers, pesticides and herbicides, soil erosion, increased turbidity, and increased sedimentation. Soil erosion and chemical and toxic compound pollution (e.g., fuel, oil, lubricants, paints, release agents, and other materials) also affect water quality and aquatic habitats.

Pollution. New urban development increases the potential for point and non-point source pollutants to enter the natural landscape through both surface and subterranean water flows, through windblown trash accumulation, through windblown dispersion of chemicals, and through illegal dumping of industrial and household trash and garden waste in natural areas. Pesticides, herbicides, and fertilizers can enter adjacent landscapes through runoff from irrigated landscapes or from storm events. Contaminants from automobile traffic that collect on roadways, parking lots, and driveways, and enter natural landscapes during storm events include oil, gas, brake dust, and other automobile fluids. Roadway materials, vehicle leaks, and spills in a development also contaminate adjacent or downstream aquatic resources and aquatic and semiaquatic habitats, including riparian habitat. Illegal dumping of unwanted items such as trash, tires, and appliances in natural or open space areas directly crush vegetation and restrict photosynthesis by blocking the sun. Discarded electronics (i.e., e-waste) can introduce various toxic chemicals into the environment, including heavy metals that may leach into soil,

groundwater, and surface waterways. These waste materials may also disrupt natural hydrology by forming obstructions and blocking flows and may create habitat for pest species such as non-native rats.

New urban development and associated increased presence of humans and vehicle use also typically increases air pollution. One effect of air pollution is increased nitrogen deposition (N-deposition), which, in turn, facilitates the growth of non-native plant species and degrades existing habitats of native plant and wildlife species. Future development in the Planning Area will likely increase local sources of nitrogenous air pollutants, primarily due to traffic and new demand for electricity generation.

Pesticides, fertilizers, fungicides, herbicides, and rodenticides used in developed areas may directly affect adjacent or downstream vegetation communities and habitat quality, be directly toxic to species or indirectly toxic to species through prey vectors, or reduce prey abundance. These substances may penetrate open spaces through urban runoff from residential and commercial landscape areas and golf courses, overspray, wind, direct applications in interface areas, soil penetration, and wildlife vectors. Pesticides, for example, can act in several ways—the original pesticide can be toxic, its decomposed elements can be even more toxic, and it can "bioaccumulate," whereby the contaminant concentrates further in each successive link of the food chain, thus reaching higher concentrations at higher levels of the food chain. Fertilizers, as discussed previously, can enter wetland and riparian systems and cause eutrophication (excessive nutrients in water bodies) and result in large algae blooms and can enhance growth of non-native aquatic weeds.

Increased Human Activity and Recreation. These stressors indirectly affect open spaces from increased foot, equestrian, bicycle, and off-road vehicle traffic (including unauthorized uses), and can result in trampled vegetation, compacted soils, impaired hydrology, invasive plant and animal introduction and facilitation, and increased trash and debris. Increases in human activity along the interface of open spaces and new urban development may result in trampling of vegetation and compaction of soils. Trampling of vegetation and compaction of soils can decrease the rate of rainfall interception and evapotranspiration, soil moisture, water penetration pathways, surface flows, and erosion. Recreational off-road vehicle use in particular, especially during the wet season, can create large ruts in natural land covers, damage soil profiles, reduce native vegetative cover, and promote invasion by non-native plants. Off-leash pets may harass and kill wildlife and introduce disease and parasites (e.g., from fecal material). Human and pet presence or activity can alter wildlife behavior and can cause wildlife to permanently avoid suitable habitat areas or abandon occupied nesting/breeding sites. Accidental and intentional wildfire ignitions may also increase from human recreation.

Altered Fire Regimes. Urbanization and changed land uses (e.g., changes in grazing patterns of an open space) can alter natural wildfire regimes by increasing the frequency and intensity of fires, but also change tactical approaches for fighting wildfires. In most cases, wildfires in new urban development are quickly suppressed for public safety and to protect property, but in some cases, wildfires become uncontrollable and catastrophic, in part because past wildfire suppression in increasingly urbanized areas has resulted in much greater fuel loads in open space areas than occurred under pre-development conditions. Altered wildfire regimes, and particularly increased incidence of fires in urbanizing areas, are a result of human activities at the open space–urban interface, including accidental ignitions from sparks from equipment (e.g., mowers striking rocks), cigarettes, children playing with matches, and intentional arson ignitions. However, wildfires may also be ignited by downed or arcing from new power lines, or from cars starting fires along new roadsides.

Traffic and Vehicle Collisions. New roadways and increased capacity of improved roadways can increase the risk of vehicle collisions where wildlife use or attempt to cross roadways, impact current traffic patterns, increase emissions, and affect air quality of the surrounding region.

Invasive Plants and Animals. New development, including new roadways, new utility corridors, and other infrastructure, can increase numbers and promote movement and dispersal of invasive, non-native plant and wildlife species, ultimately changing ecological functions in open spaces and reducing numbers and diversity of native species. As development and infrastructure encroach into natural landscapes, newly disturbed areas and/or the interface between developed areas and native habitats provide an opportunity for invasive plant species to establish and eventually invade natural habitat settings, degrading habitat and potentially expatriating native plant species. Increases in non-native invasive plant species can alter ecosystem processes, such as nutrient cycling, hydrologic cycles, frequencies of wildfires, and erosion and sediment deposition. Invasive plants further interfere in ecosystem functions by outcompeting and displacing native plants and wildlife, providing refuge for non-native animals, and hybridizing with native species.

Mesopredators. An indirect consequence of habitat fragmentation by new development and isolation of habitat by new development is an increase in abundance of urban-adapted or urban-tolerant mesopredators, such as raccoons, skunks, opossums, and foxes (*Urocyon cinereoargenteus*, *Vulpes* spp.). Non-native mesopredators may also include free-roaming stray and feral cats and dogs, which can have the same effects as wild mesopredators. These mesopredator species can outcompete smaller native species for available resources and increase predation rates on the smaller native species, thus reducing the distribution and populations of vulnerable native species in the region.

Aboveground Utilities. New power lines, transmission towers, and utility poles can also cause collisions, entanglements, and electrocution of bats and large birds, especially raptors. Other potential indirect effects associated with operation and maintenance and repair of utility transmission lines are similar to short-term construction-related effects, including hydrologic and water quality alterations, soil erosion, chemical and toxic compounds pollution, dust, noise, vibration, lighting, increased human activity, temporary fencing, accidental clearing, trampling, grading, oak tree root effects, and trash and other debris.

Disease. The increased human and associated pet population can increase the risk of disease transmission to native wildlife. For example, free-ranging domestic cats and dogs can transmit new diseases to wild animals.

Lighting. New lighting may affect wildlife orientation/disorientation and attraction/repulsion, reproduction, and communication at the behavioral and population ecology level, and competition and predation at the community ecology level. Ecological light pollution from new development can include increased ambient light and direct glare from sky glare, lighted buildings, streetlights, and security lights would generally be chronic.

Microclimate Changes. New urban development may introduce microclimate changes at the open space–urban edge, such as alterations in wind, solar radiation and light exposure, and water. Increased wind exposure at the open space–urban interface may result in direct physical damage to natural vegetation (e.g., windpruning and/or loosening of bark) or increase evapotranspiration, reduce humidity, and increase desiccation of plants that require adequate soil moisture for regeneration. Increased wind may also increase dust levels and seed transport, potentially interfering with photosynthesis and introducing non-native species. Alterations in solar radiation and light exposure can have numerous effects on adjacent natural habitats. Daytime temperatures can be higher and nighttime temperatures lower than areas within intact natural vegetation patches, resulting in greater temperature ranges of the soil and increased chance of frost. Soil nutrient cycling, soil moisture retention, invertebrate communities, and predator/prey relations also may be affected by altered soil temperatures. Temperature alterations may also occur in aquatic habitats that exceed species' (e.g., fish, amphibians, or crustaceans) tolerances. Hydrologic alterations and related effects from new development include changes in the rates of rainfall interception and evapotranspiration; changes in soil moisture, water penetration pathways, surface flows, subsurface flows, and soil erosion; movement of salts, nutrients, and pesticides; and habitat alterations for ground-dwelling species.

Habitat Fragmentation and Isolation. New urban development often fragments existing natural lands that provide habitat for native plants and animals. Habitat fragmentation and isolation of plant and wildlife populations, including effects on wildlife movement and dispersal as well as effects on plant pollinators and seed dispersal, may cause extinction of local

populations. At the larger landscape scale, change in regional abundance and distribution of habitat may change the migration and habitat use patterns of some wildlife species, which in turn alters multiple landscape-scale ecological functions. Fragmentation also decreases the functional size of conserved habitat patches. As remaining habitat areas diminish in size, the ratio of vulnerable edge to preserved interior area increases. Increased edge effects heighten species' vulnerability to stochastic disturbances, pollution, and invasion by non-native plant and animal species.

3.6.7 Specific Assumptions Used in the Environmental Impact Analysis of Each EIS/EIR Alternative

The EIS/EIR presents information and assumptions specific to the impact analysis of individual EIS/EIR alternatives here in Chapter 3 to avoid repeating the same information in each resource topic chapter's Environmental Consequences/Environmental Impact analysis for that alternative.

3.6.7.1 Analysis of the No Action/No Project Alternative

As discussed in Section 2.2.2, the No Action/No Project Alternative assumes up to approximately 1,900 acres of new development might be displaced from the current USB and would occur within five areas outside the existing USB (Section 2.2.2). The potential impact of the development displaced to areas outside the USB was estimated based on the existing land cover types present within those five areas.

The No Action/No Project Alternative uses GIS map layers (discussed in Section 3.6.4) to determine the acres of existing land cover types present within these five areas. The No Action/No Project Alternative assumes that the 1,900 acres of new development displaced to these five areas would impact land cover types at the same proportion that those land covers currently exist in those areas. For example, if the five potential displaced development areas currently consist of 40% grassland, then the EIS/EIR analysis assumed 40% of the approximately 1,900 acres of displaced development, or 760 acres, would occur on that existing land cover type.

3.6.7.2 Analysis of the Reduced Permit Term Alternative, After the End of the Permit Term (Years 31–50)

As described in Section 2.4, the Reduced Permit Term Alternative would have a 30-year permit term for the ITPs and expedited CWA permit strategy, during which time the SSHCP would be implemented and the various Covered Activities would be constructed. However, this EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3); this study period extends beyond the end of the permit term for this alternative. Therefore, the analysis of the Reduced Permit Term Alternative also considers the period of time (Years 31–50)

following the end of the permit term. This section describes assumptions specific to this post-permit period of time for the Reduced Permit Term Alternative.

To determine the environmental impacts of the Reduced Permit Term Alternative in Chapters 4–16, the lead agencies assume that at the end of the alternative's proposed 30-year HCP permit term, the existing project-by-project CWA permit process, and the related ESA Section 7 consultation processes (described in Section 2.2.2) would resume again for any additional projects and activities implemented after the end of the 30-year permit term. As discussed in Section 2.2.2, the impact analysis for the Reduced Permit Term Alternative assumes that each new development project implemented after year 30 would again seek individual project-by-project regulatory approvals from multiple local, state, and federal agencies, and there would not be a coordinated approach to designing new preserves or a plan to connect new preserves to existing preserves.

The impact analyses for the Reduced Permit Term Alternative assumes that after the end of the alternative's 30-year permit term, additional urban development would occur inside the UDA, causing full buildout of the UDA by the end of the EIS/EIR's 50-year study period. However, development within the Mather Core Recovery Area (MCRA) portion of the UDA would be limited by the availability of vernal pool resources within the MCRA to serve as mitigation for development impacts because the regulatory environment in years 31–50 of the Reduced Permit Term Alternatives would presumably be similar to the regulatory environment described for the No Project Alternative in Sections 2.2.2 and 2.2.3.

Of the 23,500 acres of the MCRA located within the UDA, approximately 1,300 acres are already developed and approximately 4,600 acres are in existing established preserves. As discussed in Section 2.4, approximately 6,700 acres of the MCRA are expected to be impacted by new urban development during this alternative's 30-year permit term, and approximately 3,800 acres of permanent preserves established within the MCRA during this alternative's 30-year permit term. This would leave approximately 7,100 acres of the MCRA still available for potential future development at year 30.

Based on the Reduced Permit Term Alternative's assumptions for ESA and CWA regulatory requirements in the MCRA for years 31–50 (which are the same regulatory assumptions as for the No Action/No Project Alternative—see Section 2.2.2), the lead agencies estimated how much undeveloped land remaining inside the MCRA (and the rest of the UDA) at year 30 would reasonably be developed by the Reduced Permit Term Alternative in years 31–50 of the EIS/EIR 50-year study period.

Some speculation and assumptions were necessary to estimate acres of future mitigation that could be implemented under the expected MCRA regulatory environment of years 31–50 of the

Reduced Permit Term Alternative. The lead agencies made those assumptions by considering the trends in ESA and CWA mitigation that have occurred within Sacramento County since the designation of the MCRA in 2005 (USFWS 2005), and used the best available scientific information on the status of the species and aquatic resources in the MCRA and elsewhere in the UDA. The lead agencies concluded that further urban development of the MCRA in years 31–50 would be restricted primarily to areas of the MCRA where development could occur without causing direct impacts to vernal pools, largely through the use of on-site avoidance areas and/or on-site preserves.

As with the No Project Alternative (see Section 2.2.3), it is not possible to determine with accuracy a complete picture of possible future urban development and mitigation that would occur in the UDA during years 31–50 of the Reduced Permit Term Alternative. This is because of the incomplete information on individual development projects in the Planning Area over the next 50 years and uncertainty regarding economic conditions and population trends that drive urban development over such a long time. In addition, as discussed in Section 2.2.2 for the No Action/No Project Alternative, there is also uncertainty about future regulatory requirements for new urban development and future increases in avoidance, minimization, and preservation of aquatic resources and species habitats within the UDA over the next 50 years.

3.7 CUMULATIVE EFFECTS ANALYSIS IN RESOURCE CHAPTERS 4 THROUGH 16

NEPA regulations define a cumulative effect as the impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time (40 CFR 1508.7; 43 CFR 46.115). Similarly, CEQA cumulative impacts are defined as “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts” (CEQA Guidelines, Section 15355). Under CEQA, the lead agency must consider whether the cumulative impact is significant, and whether a project’s incremental effect, although individually limited, is cumulatively considerable. “Cumulatively considerable” means that the incremental effect of an individual project is significant when viewed in connection with the effects of the past projects, the effects of other current projects, and the effects of probable future projects (CEQA Guidelines, Section 15064[h][1]).

As outlined in Section 3.3, the Environmental Consequences/ Environmental Impact analysis of each EIS/EIR Alternative first presents the direct and indirect effects of the alternative on that chapter’s resource topic. Then, those incremental direct and indirect impacts are considered

together with the impact of past, present, and probable (reasonably foreseeable) "other" future projects and activities in a cumulative analysis.

Each cumulative analysis presented in Chapters 4–16 first reviews the effects of all past and present actions on the resource topic analyzed in that chapter. In most chapters, the Existing Condition description presented in the Affected Environment/Environmental Setting section of the chapter(see Section 3.3) has already provided a thorough and adequate description of the impacts of all past and current actions within the chapter's study area. Each cumulative effects analysis then discusses additional impacts that would result from the reasonably foreseeable projects and activities within the chapter's study area, including those described in Section 3.7.2. The cumulative analysis adds the incremental direct and indirect effects expected from the alternative to the aggregate effects of all past and present actions and the reasonably foreseeable future actions.

As stated in CEQA Guidelines Section 15130(b)(1), the following elements are necessary to an adequate discussion of significant cumulative impacts:

A. A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency.
B. A summary of projections contained in an adopted local, regional, or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

Previously approved land use documents, including general plans, specific plans, regional transportation plans, plans for the reduction of greenhouse gas emissions, and local coastal plans, may be used in cumulative impact analysis. A pertinent discussion of cumulative impacts contained in one or more previously certified EIRs may be incorporated by reference (CEQA Guidelines, Section 15130[d]).

The analysis of cumulative impacts is evaluated at a level of detail sufficient for the lead agencies to use as a reasonable basis for decision making in selecting between the alternatives.

3.7.1 Past and Present Actions in the Planning Area

To minimize repetition of information in Chapters 4–16, this section provides a brief summary of these past and ongoing present actions that are relevant to cumulative impact analyses of the EIS/EIR alternatives.

3.7.1.1 Past and Present Agriculture and Urban Development

As described in Section 1.3.1, past development and conversion of natural lands in the Planning Area included the conversion of natural lands to farmland, the subsequent conversion of farmland to urban and rural development, and direct conversion of natural lands in to urban and rural developments.

Urban development in the Planning Area intensified in the 1940s and again between 1950 and 1960, with new growth occurring primarily near the City of Sacramento and in smaller cities such as Folsom, Galt, and Isleton. Urban development continued at a moderate rate between 1960 and 1990, resulting in an expansion of urban land use patterns and infrastructure into the southern and eastern portions of Sacramento County. Development slowed in the early 1990s, picked up again in the early 2000s, and softened or slowed considerably from 2007 to 2012. Since 2012, development activity has again intensified in the Planning Area. In total, urban development comprises approximately 54,000 acres of the Planning Area.

In the eastern portion of the Planning Area, existing agricultural activities primarily consist of ranching and grazing. Livestock grazing of native annual grassland landscapes has altered plant species composition of the grasslands, but has had little effect on the ecology of the grassland landscapes or wildlife species. Appropriately managed grazing and rangeland is compatible with the habitat needs of many species, including vernal pool species.

The central portion of the Planning Area supports more irrigated pasture relative to the eastern portion of the Planning Area, while the southwestern portion of the Planning Area supports more vineyards and croplands. In total, these farming and related activities currently comprise approximately 100,000 acres of the Planning Area (not counting non-irrigated natural grasslands that are often used for grazing).

Croplands in the Planning Area are an altered landscape that retains little of the historical (pre-European settlement) conditions. Formerly consisting of extensive open grasslands, wetlands, broad riparian systems, and oak woodlands, the conversion to cropland has removed most of the historical native communities. The development of row crops, orchards, and vineyards has reduced or eliminated habitat for many native species (especially native plant species) whose habitat requirements are not compatible with these crops.

In addition, the land disturbances associated with past farming practices have contributed to sedimentation of waterways in the Planning Area, and past and current use of fertilizers and pesticides (including rodenticides) have also have contributed to existing water quality issues, which may have directly and indirectly contributed to past aquatic species mortality.

However, while generally supporting less diversity of wildlife compared to most natural landscapes, some cropland types continue to support wildlife and can provide essential breeding, foraging, or roosting habitat for several resident and migrant wildlife species. Although farming has resulted in substantial changes to the historical landscapes in the Planning Area, some cropland provides essential habitat by native wildlife species, including giant garter snake (*Thamnophis gigas*) using agricultural ditches; western pond turtle (*Actinemys marmorata*) using agricultural ditches and canals; Swainson's hawk (*Buteo swainsoni*) foraging in hay, grain, and row crops; burrowing owl (*Athene cunicularia*) using various agricultural types that include ground squirrel (*Sciuridae*) burrows; white-tailed kite (*Elanus leucurus*) foraging in hay and grain; and tricolored blackbird (*Agelaius tricolor*) foraging in hay and grain fields.

Farming and grazing are expected to continue in and around portions of the Planning Area currently used for agriculture (Sacramento County 2011; Rancho Cordova 2006a; Galt 2009a). Farmlands are subject to continuing changes in crop types depending on various factors, including, local, national, and global economic conditions.

3.7.1.2 Past and Present Infrastructure Development and Operation

The agricultural and urban development described in Section 3.7.1.1 has been accompanied by infrastructure to support these land development uses. Some of the major infrastructure constructed and operated in the Planning Area is described below.

Water Supply. Most of the water supply for existing urban development in the Planning Area is sourced from groundwater wells, with a limited amount of surface water used. Groundwater is pumped by individual users and by Planning Area water districts from two groundwater basins that underlay the Planning Area: the Central Area basin and the South (Galt) Area basin. The Central Basin is managed by the Sacramento Central Groundwater Authority, which has also adopted a management plan, consistent with the Sacramento Water Forum objectives, that addresses groundwater decline and quality in the Central Basin. Some of the water purveyors located within the Central Basin rely entirely on groundwater pumping, and some purveyors' production wells have been affected by groundwater decline and contamination.

The surface water supply used by existing urban development in the Planning Area is diverted from the Sacramento River west of the Planning Area and from the American River north of the Planning Area.

A recently constructed and operating major surface water project in the Planning Area is the Freeport Regional Water Project, which includes the following components constructed in the Planning Area between 2007 and 2011:

- Vineyard Surface Water Treatment Plant, a water treatment plant located in central Sacramento County on an 80-acre parcel at the northeast corner of Florin and Knox Roads, and 1 mile east of Bradshaw Road, with existing capacity to treat up to 50 million gallons of drinking water per day and future capacity to treat up to 100 million gallons per day
- A terminal facility located at the point of delivery to the Folsom South Canal
- A canal pumping plant located at the Folsom South Canal terminus
- A series of settling basins
- Four underground pipelines carrying the water from the intake facility to the Vineyard Surface Water Treatment Plant and (via the Folsom South Canal) to the Mokelumne Aqueducts outside the Planning Area.

Surface waters are also diverted from the American River into the Folsom South Canal, a 26.7-mile-long concrete-lined canal that traverses the Planning Area from north to south. The Folsom South Canal, part of the larger Central Valley Project, is used to supply water for irrigation and municipal and industrial use in Sacramento and San Joaquin Counties. With a bottom width of 34 feet and maximum water depth of 17.8 feet, the Folsom South Canal presents a substantial barrier to east–west movement and dispersal of native terrestrial wildlife species in the Planning Area.

Flood Control. Within the UDA, many of the streams have small levees constructed adjacent to the channels, and these streams primarily converge into the Morrison Creek channel near the Sacramento River. Outside the UDA, many streams also have levees constructed adjacent to their channels, and most of these streams converge with the Cosumnes River, which eventually flows into the Mokelumne River. The South County Streams Group Project is a federally authorized flood control project implemented by the U.S. Army Corps of Engineers, Central Valley Flood Protection Board, and Sacramento Area Flood Control Agency for lower Morrison Creek and its principal tributaries (i.e., Florin Creek, Elder Creek, and Unionhouse Creek); the project consists of levee improvements starting south of the town of Freeport, running easterly along the southern edge of the urbanized area, and extending up four creeks. The easternmost portion of improvements planned for Florin Creek and Morrison Creek (east of Highway 99) are within the Planning Area.

Morrison Creek conveys flow to the low-lying Beach/Stones Lake Basin adjacent to the Sacramento River levee, where during wet weather events, most excess flow is pumped into the Sacramento River and some flows drain further south into Snodgrass Slough and to the Mokelumne River.

South of the Morrison Creek system (in the Planning Area outside the USB), important floodplain areas include Deer Creek, Cosumnes River, Laguna Creek (which conveys much of the drainage from the City of Galt), and Dry Creek. These streams are all contained by constructed levees that are managed by local reclamation districts.

Two major dams upstream of the Planning Area allow for storage of upstream runoff for release during the summer season in and downstream of the Planning Area. These dams are Folsom Dam and Nimbus Dam on the American River, both outside the Planning Area to the northeast. The Cosumnes River is unique in that it is the only west-slope Sierra river that does not have a dam constructed on the main-stem of the river.

Urban Wastewater. The large majority of municipal wastewater generated in the UDA is collected and conveyed to the Sacramento Regional Wastewater Treatment Plant (SRWTP) operated by the Sacramento Regional County Sanitation District (Regional San). The SRWTP provides service for 1.4 million people located within the Cities of Sacramento, West Sacramento, Rancho Cordova, Citrus Heights, Elk Grove, and Folsom; unincorporated areas of Sacramento County; and the communities of Courtland and Walnut Grove. The SRWTP currently treats approximately 141 million gallons per day of inflow and produces secondary treated effluent that is discharged to the Sacramento River near the town of Freeport. As a result of permit requirements adopted by the Central Valley Regional Water Quality Control Board in 2010, and subsequent amendments, Regional San is underway with construction of treatment process improvements at the SRWTP for improved contaminant removal performance, including additional nutrient removal (i.e., ammonia and nitrate reduction) and tertiary filtration on a seasonal basis during the dry season to increase pathogen removal (Regional San 2014). Construction of the new SRWTP is scheduled to be completed in 2023.

Also in the Planning Area, the City of Galt wastewater treatment plant currently produces about 2.3 million gallons per day of tertiary treated effluent and discharges to Laguna Creek, which flows to the lower Cosumnes River.

Roadways. Interstate 5 and State Route 99 are two existing major highways running north–south in the western part of the Planning Area. U.S. Highway 50, serving east–west traffic, is located on the northern edge of the Planning Area. State Route 16 (Jackson Road) and State Route 104 (Twin Cities Road) cross the southern part of the Planning Area and provide east–west traffic connectivity.

Other major roadways existing within the Planning Area are four-lane thoroughfares or heavily used two-lane arterial roads, including Folsom Boulevard, White Rock Road, Gerber Road, Kiefer Boulevard, Scott Road, Ione Road, Excelsior Road, Bradshaw Road, Vineyard Road, Elk Grove-Florin Road, South Watt Avenue, French Road, Power Inn Road, Stockton Boulevard, Florin Road, Jackson Highway, Grant Line Road, Calvine Road, Wilton Road, Dillard Road, Clay Station Road, Hood-Franklin Road, Bruceville Road, Franklin Boulevard, and Twin Cities Road .

Within the City of Galt, existing major roadways include a section of Twin Cities Road (State Route 104), Walnut Avenue, Elm Avenue, Simmerhorn Road, Boessow Road (C Street), A Street, New Hope Road, Lincoln Way, and Carillion Boulevard.

Within the portion of the City of Rancho Cordova located within the Planning Area, existing major streets include Sunrise Boulevard, White Rock Road, International Drive/Mather Field Road, Douglas Road, Grant Line Road, Zinfandel Drive, Rancho Cordova Parkway/Jaeger Road, Folsom Boulevard, Nike Road, and Bradshaw Road.

Airports. Two public-use airports are located within the Planning Area—Mather Airport and Franklin Field. Mather Airport, which was formerly the Mather Air Force Base, is located in the UDA portion of the Planning Area and is adjacent to the City of Rancho Cordova. The airport was first constructed in the early 1900s and is currently owned and operated by Sacramento County. Redevelopment activities on the former base property have included airport-related, commercial, and industrial uses (Sacramento County 2010). Mather Airport is surrounded to the north and west by residential and commercial development and to the south and east by undeveloped land and agricultural operations with applications in to the County of Sacramento for master-planned communities. Since its conversion from a military airfield to a public/commercial facility, non-military flights have increased at this facility, specifically air cargo. During 2012, Mather Airport supported 79,786 flight operations, including cargo, general aviation, air taxi, and military. Over the 5 years from 2008 to 2012, an average of 79,535 flight operations occurred annually (FAA 2013). The *Mather Airport Master Plan* update for the continued operation and maintenance of the airport was adopted by the Board of Supervisors in August 2014 (Sacramento County 2014).

Franklin Field is located in southern Sacramento County approximately 1 mile northeast of the intersection of Twin Cities Road and Franklin Boulevard (see Figure 4-4). Franklin Field is currently a public-use airport owned and operated by the County of Sacramento, and was the site of bomber training during World War II. Franklin Field is surrounded by agricultural operations, including row crops and grazing lands. The facility is considered an uncontrolled airport since it does not have an air traffic control tower or personnel. There were approximately 36,000 operations in 2008 at Franklin Field, including flight training. The Airport

Master Plan Working Paper anticipates that operations at this airport will increase over time, reaching approximately 64,000 operations by 2027 (Sacramento County Airport System 2008).

3.7.1.3 Past and Present Mining Operations in the Planning Area

As mentioned in Section 1.3.1, gold has been mined in Sacramento County since 1849 by various lode and placer methods such as hydraulic mining, drift mining, drag-line dredging, and bucket-line dredging. The vast majority of gold recovered in Sacramento County has been from large placer operations. Dredging operations in Sacramento County began in 1899 in the vicinity of Folsom, located northeast of the Planning Area. The Folsom Dredge Field is one of the most extensive historic dredging operations in California. When combined with other dredged and hydraulically mined areas in Sacramento County, an estimated total area of 54.4 square miles was disturbed by placer mining operations in north-central and northeastern Sacramento County, including large areas within the Planning Area. As of 1999, an estimated 80% of these dredged areas Countywide had been reclaimed for other land uses (Division of Mines and Geology 1999). Those remnants that remain in the Planning Area typically support minimal vegetation, but may include bands of the Mine Tailing Riparian land cover type interspersed among or between mounds of dredge spoiling (see Chapter 8 for discussion of Planning Area land cover types).

All of the currently permitted mining operations in unincorporated Sacramento County are located within the Planning Area. Aggregate mining occurs both inside and outside the UDA, with 24 permitted aggregate mines, 21 of which are currently active. Additionally, one application for an additional aggregate mine is being processed by the County. Clay is currently being surface mined in four locations within the County, including along the Cosumnes River, topsoil is currently mined near the Cosumnes River, and there is one existing pumice pit.

The lead agencies anticipate mining in existing permitted locations would continue in the Planning Area inside and outside the UDA for the next 20 to 50 years. Therefore, the impacts of mines in those locations are considered by this EIS/EIR cumulative analysis to be a continuation of present conditions.

3.7.1.4 Past and Present Preservation of Natural Lands in the Planning Area

The Planning Area includes several established existing preserves both inside and outside of the UDA. Existing preserves within the Planning Area total approximately 64,500 acres and include a national wildlife refuge, large and small nature preserves, lands under conservation easements as well as conservation bank lands, and individual mitigation sites preserved in perpetuity by past projects that were authorized or permitted under the CWA, ESA, California Endangered Species Act (CESA), and/or local environmental regulations. Of the approximately

64,500 acres of existing preserves, approximately 3,170 acres are inside the UDA and about 61,330 acres are outside the UDA.

Inside the UDA, most existing preserves occur near the Sacramento Valley Vernal Pool Prairie Preserve, in an area located south of Jackson Highway between Excelsior and Eagles Nest roads and north of Grant Line Road. These include lands under conservation easement or owned by the Sacramento Valley Conservancy, two mitigation banks (Arroyo Seco and Bryte Ranch), and several mitigation sites established by past projects or activities. Other sites with permanent conservation easements are more scattered inside the UDA, including at locations along northern Laguna Creek, locations within the City of Rancho Cordova, and at the Keifer Landfill Bufferlands. In addition, the 2,650 acres of preserved lands at the Sacramento Regional County Sanitation District Bufferlands, located in the western part of the UDA, have "termed" conservation easements, meaning those acres are currently preserved, but might not be preserved in perpetuity. In addition, the ~~2,650~~**2,150** acres of preserved lands at the ~~Sacramento Regional County Sanitation District~~ **Regional San** Bufferlands, located in the western part of the UDA, have "termed" conservation easements, meaning those acres are currently preserved, but might not be preserved in perpetuity.

Outside of the UDA, relatively large areas have been preserved in the Planning Area west of Interstate 5, within the Cosumnes River floodplain, and in the eastern part of the Planning Area outside the UDA. Existing preserves larger than 500 acres include the Stone Lakes National Wildlife Refuge, Deer Creek Hills, Chance Ranch, Borden Ranch, Snyder Preserve, Clay Station Conservation Bank, Laguna Terrace Conservation Bank, Gill Ranch Conservation Bank, Elliot mitigation site, Delta Meadows, Sacramento Municipal Utilities District mitigation bank, and the Cosumnes River Preserve. Smaller conservation sites are distributed within the Cosumnes River and Deer Creek corridor, eastern Sacramento County grasslands, and agricultural lands west of State Route 99. In addition to these relatively large preserves, several smaller mitigation and conservation banks have been authorized by the USFWS and/or U.S. Army Corps of Engineers in the Planning Area outside the UDA.

3.7.2 Reasonably Foreseeable Other Actions

Reasonably foreseeable future "other actions" are actions that would affect the environment in the future, and are not activities that would occur as part of the proposed action and other action alternatives (CEQ 1997). The planned development and infrastructure described in the adopted General Plans and other documents presented in Section 3.4, including the expected "full build-out" of the UDA, are reasonably foreseeable within this Planning Area. However, those future development projects and activities are Covered Activities under the two EIS/EIR action alternatives, and the No Action/No Project Alternative includes similar future urban development projects and activities. Therefore, the EIS/EIR list of reasonably foreseeable future

"other" actions in or near the Planning Area is limited to foreseeable new projects or activities not included as part of the descriptions of the No Action/No Project Alternative (Section 2.2) or the description of the two action alternatives (Sections 2.3 and 2.4).

For this EIS/EIR, reasonably foreseeable future other actions were identified based on information extracted from existing environmental documents, and investigation of future project plans by other state and federal agencies and private entities (CEQA Guidelines, Section 15130[a][1]).

3.7.2.1 Other Urban Development by Elk Grove and by Rancho Murieta

Urban development is expected to continue adjacent to the EIS/EIR Planning Area within the existing boundaries of the community of Rancho Murieta and the City of Elk Grove (Figure 1-1). Although these communities are outside the current Planning Area boundary, past, present, and new urban development in these locations would be included in the cumulative impact study area for several resource topics analyzed in Chapters 4–16, including hydrology, water quality, natural communities, species habitat, wetlands and waters, transportation, air quality, and climate change.

"Rancho Murieta North" was originally proposed in 2014, and an EIR for that new development project is under preparation (Sacramento County 2015). The project would be located on approximately 770 acres, which is most of the remaining land within the Rancho Murieta Planned Development, as approved in 1969. The entire Rancho Murieta Planned Development is outside the EIS/EIR Planning Area. The Rancho Murieta North project would include approximately 300 acres of new residential development, 430 acres of Park/Recreation/Open Space, and 40 acres of General Commercial land uses.

It is reasonably foreseeable that the City of Elk Grove will eventually annex land south and southwest of their current SOI boundary. As of the writing of this EIS/EIR, landowners south of the current Elk Grove city boundary have submitted a proposal to the Local Agency Formation Commission to expand the Elk Grove SOI that includes approximately 1,150 acres of land currently under County jurisdiction (LAFCO 2016). This proposed SOI expansion is located south of Kammerer Road and west of Highway 99, outside the UDA but within the Planning Area. New urban development is proposed for the majority of that approximately 1,150-acre area.

Additionally, the City of Elk Grove has submitted a proposal to LAFCO to simultaneously expand its SOI and annex approximately 560 acres of land southeast of its current boundary (LAFCO 2016). This proposed 560-acre expansion is located within the UDA portion of the Planning Area south of Grantline Road and east of the Union Pacific Railroad tracks, and is currently under County jurisdiction. Under the City of Elk Grove's proposal, this land is intended to be used for public uses, including a large soccer complex.

3.7.2.2 Other Future Rural Residential Development

Low-density rural development would continue to occur outside the UDA within the approximately 19,600 acres of designated Agriculture Residential areas in Sacramento County, consistent with the County's General Plan (Sacramento County 2011). Within areas designated as Agricultural Residential by the Sacramento County General Plan, construction of new residential structures may occur, along with associated grading, landscaping, and accessory structures.

3.7.2.3 Future Agricultural Conversion

Changes in farmland and other agricultural land uses are not proposed as Covered Activities but are reasonably expected to occur in the future in areas outside the UDA that are zoned for agricultural uses. It is not possible, however, to predict how crop types or agricultural uses may change over the 50-year permit term. Nonetheless, some conversion of rangeland that supports Valley Grasslands and Vernal Pool Ecosystem to a more intensively managed agricultural use (such as cropland, vineyards, or orchards) would be expected over the 50-year study period. This conversion of rangeland to orchards or vineyards would include "deep-ripping" of soils, which would remove the existing soil structure that forms the perched aquifer and supports the ecology of the Vernal Pool Ecosystem. Changes to more intensively managed agricultural uses would result in the types of effects similar to those discussed in Section 3.7.1.1 and Appendix G. Grading or construction of new structures to support future changes in agricultural use, such as barns, corrals, and fences, would also be expected in areas zoned for agricultural uses.

3.7.2.4 California High-Speed Rail

Construction of a high-speed train through the Planning Area is a reasonably foreseeable project that could occur within the next 50 years (California High Speed Rail Authority and Federal Railroad Administration 2005; California High Speed Rail Authority 2013). The Federal Railroad Administration and the California High-Speed Rail Authority have adopted a state-wide program EIR/EIS (California High Speed Rail Authority and Federal Railroad Administration 2005), which studied various alignment options for the train system. The exact alignment within Sacramento County is not yet determined, but up to 35 linear miles of the Merced to Sacramento segment of the high-speed rail line could bisect the Planning Area (California High Speed Rail Authority 2013). The standard width of the high-speed rail line's right-of-way would be 600 feet, but the right-of-way width would be substantially wider in locations where the rail line crosses existing roadways. Existing roadways will be elevated and bridges installed where the rail line would cross, requiring rights-of-way of up to 900 feet wide to allow construction of the new roadway embankments and bridge footings (DiGegoria, pers. comm. 2016).

3.7.2.5 Wilton Rancheria Casino

The Miwok tribe is proposing to develop a casino resort at one of two sites in Sacramento County (BIA 2015). As of June 2016, the tribe's preferred site is within the City of Elk Grove outside the Planning Area, but another potential location is on a 282-acre site in the City of Galt SOI. If the Galt SOI site were selected, the casino resort would cover approximately 76 acres of the 282-acre parcel and would include a 12-story hotel tower, convention center, spa, restaurants, and a 110,000-square-foot gambling floor. The project could generate the equivalent of 1,750 full-time jobs and host up to 14,000 patrons per day, according to the Draft EIS prepared for the federal Bureau of Indian Affairs (BIA 2015).

3.7.2.6 California WaterFix

The California WaterFix project (CDWR and USBOR 2015) is a proposed water conveyance facility with three new intakes on the Sacramento River at the western edge of the Planning Area and dual tunnels to convey water to existing state and federal pumping plants located in San Joaquin County. Approximately 12 miles of the proposed pipeline route would be located within the southwestern portion of the Planning Area. California WaterFix was previously part of the Bay Delta Conservation Plan, but the project no longer includes mitigation or conservation activities through an HCP. Instead, the project proponent, the California Department of Water Resources, proposes to mitigate construction and future direct and indirect operation impacts of the California WaterFix project by restoring approximately 2,300 acres of habitat and preserving up to 13,300 acres of habitat in the Delta. The locations of the habitat restoration and preservation associated with California Waterfix are not certain, but most are expected to be located outside the western boundary of the EIS/EIR Planning Area within the legal boundary of the Sacramento-San Joaquin River Delta. However, some California WaterFix project restoration or preservation actions might occur in the southwest part of the EIS/EIR Planning Area in the small portion of the Cosumnes River floodplain that overlaps with the legal boundary of the Sacramento-San Joaquin River Delta (CDWR and USBOR 2015).

3.7.2.7 Preservation of Natural Lands in the Planning Area (Not Project Mitigation)

Other entities are expected to continue to preserve lands within the Planning Area. The existing Stone Lakes National Wildlife Refuge has an 18,000-acre planning boundary that is located in the western part of the Planning Area outside the USB (USFWS 2007). At the time of EIS/EIR preparation, Stone Lakes National Wildlife Refuge has preserved 6,420 acres through fee-title acquisitions and conservation easements. Although there are no official projections about how quickly the refuge would be able to acquire land, the No Action/No Project Alternative assumes that by the end of the 50-year study period, the entire 18,000-acre refuge planning area would

be acquired and preserved by the Stone Lakes National Wildlife Refuge. This addition to Stone Lakes National Wildlife Refuge would provide an additional 11,580 acres of habitat preservation compared to the existing condition.

The Draft EIS/EIR assumes that Stone Lakes National Wildlife Refuge (NWR) would enroll properties at the same rate that it has since its creation. Since the adoption of the approximately 18,000-acre refuge boundary in 1992, Stone Lakes NWR has enrolled 6,550 acres. That amounts to an average rate of acquisition of 262 acres per year. Extending that same rate of acquisition over the proposed 50-year permit term of the SSHCP, Stone Lakes NWR would acquire an additional 13,100 acres. That amount would more than complete the approximately 18,000-acre approved refuge boundary.

The existing Cosumnes River Preserve is located in the south part of the Planning Area, outside the USB. The Cosumnes River Preserve currently preserves approximately 46,000 acres of blue oak woodlands, valley grassland, vernal pool, freshwater marsh, and cropland along the Cosumnes River or in the floodplain of the Cosumnes River. The *Cosumnes River Preserve Management Plan* (Cosumnes River Preserve 2008) describes plans to acquire an additional 5,450 acres of riparian habitat that is currently unprotected along the Cosumnes River by 2028.

Other nongovernmental organizations, such as the Sacramento Valley Conservancy, Audubon Society, and others have previously preserved approximately 13,900 acres in the Planning Area under the existing conditions. The No Action/No Project Alternative assumes that these organizations will continue to preserve lands in the Planning Area, specifically the areas identified on the "Twenty-First Century Open Space Vision" map (Sacramento Valley Conservancy 2014).

There are eight approved mitigation or conservation banks in the Planning Area totaling 5,320 acres. Additional mitigation or conservation banks may be established in the Planning Area during the study period, but specific acreages are not known.

3.7.2.8 Proposed Urban Development in the Planning Area That is Not Included in the EIS/EIR Alternatives

Several properties within the UDA have already obtained local entitlements and have obtained, or are close to obtaining, individual CESA, ESA, and CWA authorizations from the USFWS, CDFW, and U.S. Army Corps of Engineers. These properties include those in the Rio Del Oro Specific Plan area and those in the Mather Field Specific Plan area. Therefore, while these properties are located within the EIS/EIR Planning Area, they are not included in the EIS/EIR impact analyses because future projects and activities within these areas will not obtain their ESA, CESA, or CWA authorizations through the proposed SSHCP or one of the other EIS/EIR alternatives. However, future impacts on these properties will be included in the cumulative impact analysis of each EIS/EIR alternative.

3.8 SIGNIFICANCE OF IMPACTS THAT ARE PRESENTED IN CHAPTERS 4 THROUGH 16

3.8.1 Significance Thresholds

NEPA regulations require that the determination of significance consider both context and intensity of the impacts (40 CFR 1508.27). "Context" means that the significance of an impact must be analyzed in several contexts, including the affected region, locality, affected interests, and society as a whole. "Intensity" refers to the severity of the impact and must consider: (1) both beneficial and adverse effects; (2) the degree to which the action affects public health and safety; (3) unique characteristics of the area, including cultural resources, parks, farmland, wetlands and critical areas; (4) if the effects are likely to be controversial; (5) if there are any unique or unknown risks; (6) if the action is precedent setting; (7) if the action is related to other actions or are cumulatively significant; (8) the degree that the action affects districts, highways, structures, objects eligible for the National Register of Historic Places, or cause loss of scientific, cultural, or historical resources; (9) the degree to which the action affects endangered or threatened species or their critical habitat; and (10) whether the action threatens a violation of federal, state, or local laws or requirements imposed to protect the environment (40 CFR 1508.27).

Under CEQA, a significant impact on the environment is defined as a "substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by a project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance" (CEQA Guidelines, Section 15382). As provided under CEQA Guidelines Section 15143, and consistent with NEPA regulation 40 CFR 1508.7, each determination of significance will consider the context, intensity or severity of the impact, and probability of occurrence. An economic or social change by itself shall not be considered a significant effect on the environment, but a social or economic change related to a physical change may be considered in determining whether the physical change is significant (CEQA Guidelines, Section 15382). In general, an EIR should define the thresholds of significance and explain the criteria used to judge whether an impact is above or below that threshold (CEQA Guidelines, Section 15064[f]).

A "threshold of significance" is an identifiable quantitative, qualitative, or performance level of a particular environmental effect. Determining whether a project may have significant effect on the environment calls for careful judgement on the part of the lead agencies. The decision should be based to the extent possible on the best available scientific and factual data. However, a single ironclad definition of "significant effect" is not possible because the significance of an effect may vary with setting (CEQA Guidelines, Section 15064[b]). In determining the significance of the environmental effects, the lead agency shall consider direct

and indirect physical changes in the environment that may be caused by the project. Tools for determining the threshold of significance include the CEQA mandatory findings of significance (CEQA Guidelines, Section 15065), Appendix G of the CEQA Guidelines (the model Initial Study Checklist), agency regulatory standards, consultations with other agencies, and a lead agency's specific thresholds of significance.

As outlined in Section 3.3, the Environmental Consequences/Environmental Impact sections of Chapters 4–16 include a Methodology subsection, which explains the criteria considered and identifies the thresholds of significance used to determine the significance of impacts to the resource topics evaluated in that chapter. The criteria used and the thresholds for determining the significance of impacts on each resource topic are based on Appendix G of the CEQA Guidelines, and on the resource-specific sources described in the Methodology section. Some of the Appendix G thresholds were modified where appropriate to meet the circumstances of that resource topic within this Planning Area.

3.8.2 Impact Findings and Mitigation of Significant Impacts

As discussed in Section 1.1, one purpose of an EIS is to provide a full and fair discussion of the environmental impacts, and to inform decision makers and the public of reasonable alternatives (40 CFR 1502.1). Under CEQA, however, the significance of each impact disclosed in an EIR must be determined. CEQA further requires that, whenever possible, agency decision makers must adopt feasible mitigation to avoid or substantially lessen any significant impact (California Public Resources Code, Section 21002).

The impact analyses presented in Chapters 4–16 compare the impacts of each alternative to the thresholds of significance established for that resource topic. As required by CEQA, if an impact meets or crosses a threshold of significance, the EIS/EIR must identify feasible mitigation measures, which could minimize the significant adverse impact. An EIR must also identify those significant environmental effects that can be mitigated but not reduced to a level of insignificance (CEQA Guidelines, Section 15126.2[b]). Therefore, the Environmental Consequences/Environmental Impact analyses in Chapters 4–16 first present a statement of each impact's significance, before considering any additional mitigation measures that might be added by the EIS/EIR. If an impact is found to be significant, then a second statement of each impact's significance is presented after the analysis considers the additional mitigation measures added by the EIS/EIR.

Although NEPA regulations do not require lead agencies to reduce EIS significant impacts to a less-than-significant level, the practice to include feasible mitigation whenever possible to reduce a significant impact is consistent with NEPA's definition of mitigation (40 CFR 1508.20) and is consistent with NEPA regulations requiring agencies to include appropriate mitigation

measures not already included in the description of the proposed action or an alternative (43 CFR 1502.14[f]), and the requirement that the Environmental Consequences section of an EIS must discuss means to mitigate adverse environmental impacts (40 CFR 1502.16[h]).

As discussed in Section 3.6.1, the baseline (the basis of comparison) used in this EIS/EIR to describe and evaluate the significance of each environmental impact of the action alternatives is the No Action/No Project Alternative (i.e., the expected future condition of the Planning Area without an HCP implemented in south Sacramento County).

The potential impact findings used in this EIS/EIR are defined below.

- ***No Impact/Effect*.** This impact would cause no discernible adverse or beneficial change in the physical environment of the chapter's resource topic.
- ***Less Than Significant Adverse Effect.*** This impact would cause a discernible, but not substantial, adverse change in the physical environment of the chapter's resource topic.
- ***Significant Adverse Effect*.** This impact would cause a substantial, or potentially substantial, adverse change in the physical condition of the chapter's resource topic within the area affected. Therefore, the EIS/EIR would identify additional mitigation measures, if feasible, to reduce the adverse impact to less than significant. Impacts are determined to be significant based on the criteria and thresholds of significance identified for that resource topic. Significant impacts fall into two categories: (1) those adverse impacts for which there is feasible mitigation available that would avoid or reduce the environmental impacts to less-than-significant levels, and (2) those adverse impacts for which there is either no feasible mitigation available or for which, even with implementation of feasible mitigation measures, there would remain a significant adverse impact on the environment. Those impacts that cannot be reduced to a less-than-significant level by mitigation are identified as significant and unavoidable adverse effects**.**
- ***Significant and Unavoidable Adverse Effect*.** This impact would cause a substantial adverse change in the environment of the chapter's resource topic and cannot be avoided or mitigated to a less-than-significant level if the action is implemented. Even when the impact finding remains significantly adverse after the application of mitigation measures, the project proponent is still obligated to incorporate all feasible measures to reduce the severity of the impact.
- ***Minor Beneficial Effect*.** The impact would result in a discernible improvement of the chapter's resource topic, when compared to the environmental conditions of the baseline (see Section 3.6.1).
- ***Significant Beneficial Effect*.** The impact would result in a substantial or significant improvement of the chapter's resource topic when compared to the environmental conditions of the baseline (see Section 3.6.1).

CHAPTER 4 – LAND USE

This chapter presents the potential impacts of each Environmental Impact Statement/Environmental Impact Report (EIS/EIR) alternative on existing and planned land use conditions, consistency with applicable planning documents, and compatibility with existing and planned land uses.

This chapter also includes a land use compatibility analysis of Franklin Field and Mather Airport, which are within the Planning Area, and the Sacramento Executive, Rancho Murieta, and Eagle's Nest Airports, which are located outside of but within the vicinity of the Planning Area.

The land use compatibility analysis evaluates the potential for airport safety concerns associated with the implementation of an alternative's activities or projects within any of the adopted airport Comprehensive Land Use Plans (CLUPs).

4.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

This section describes the regulatory and physical environmental setting for land use planning and existing land uses within the Planning Area.

4.1.1 Regulatory Framework

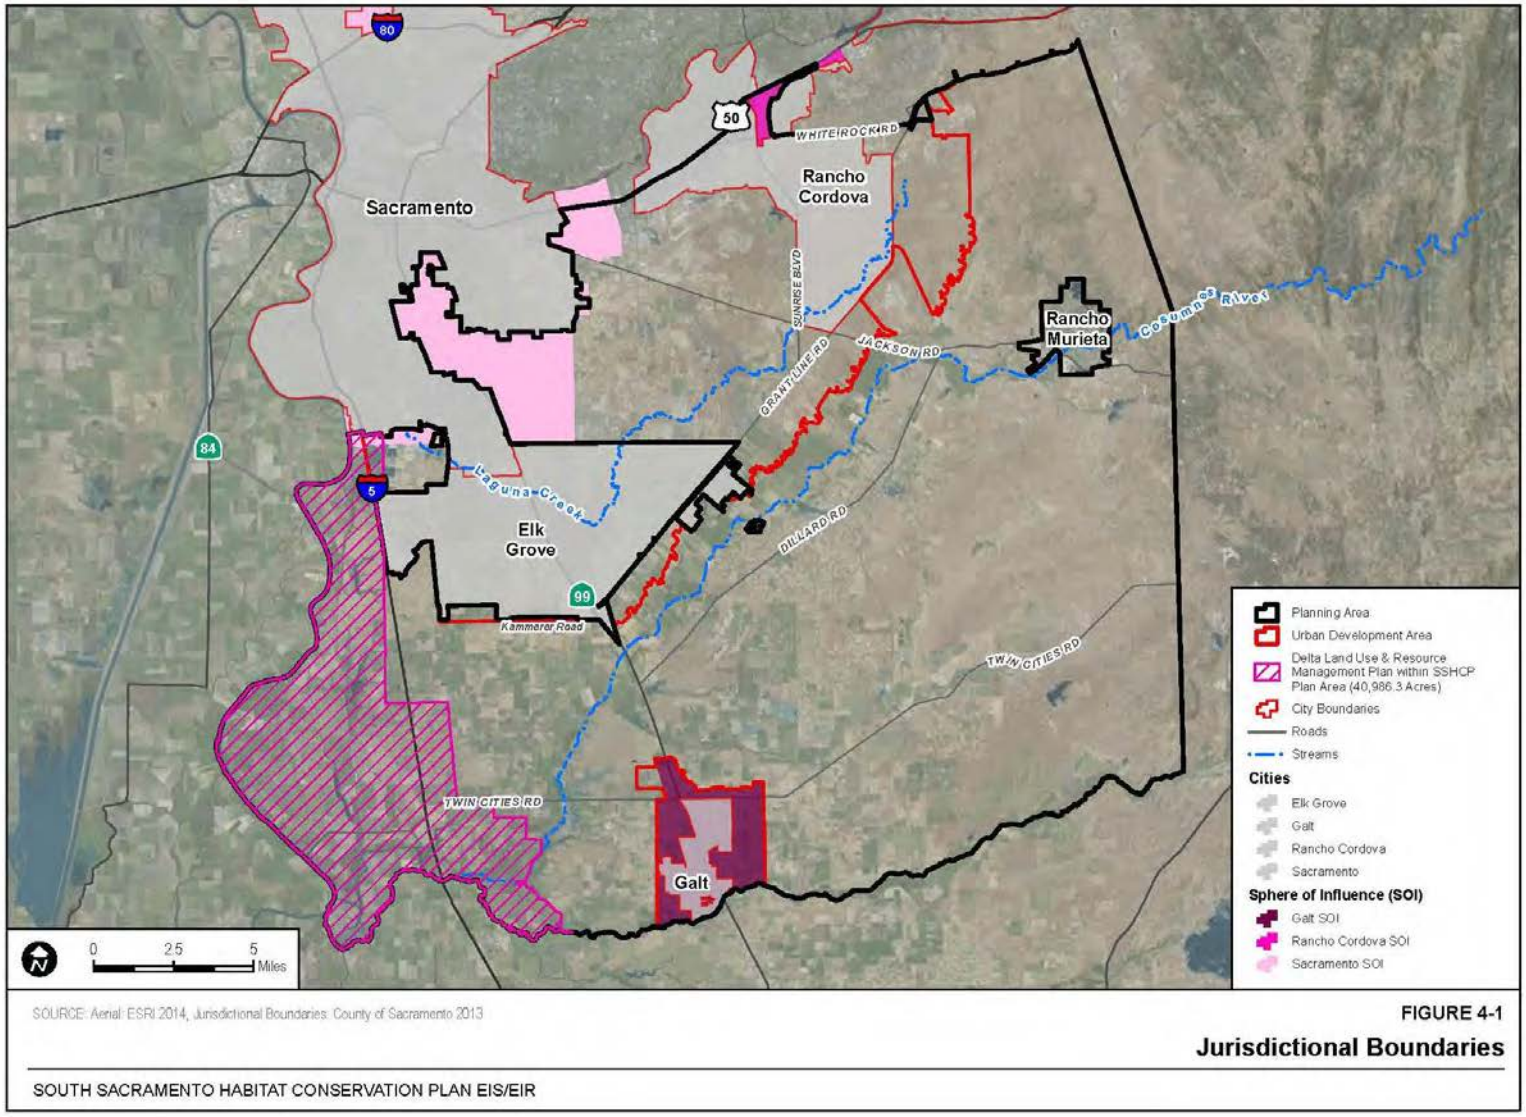
This section includes a summary of applicable federal, state, and local regulations, policies, and the planning documents for those agencies that have land use authority or are involved with land use decisions within the Planning Area. Pursuant to 40 Code of Federal Regulations (CFR) 1502.25, these applicable policies and plans helped to determine the appropriate scope of analysis included in Chapter 4. There are no tribal plans available that pertain to land use in the Planning Area; therefore, tribal plans are not discussed.

4.1.1.1 Federal Regulations and Policies

Wildlife Hazard Mitigation Program, Hazardous Wildlife Attractants

The Federal Aviation Administration (FAA) issued an Advisory Circular titled "Hazardous Wildlife Attractants on or Near Airports" (FAA 2007). The FAA released this Advisory Circular as part of its Wildlife Hazard Mitigation Program. The FAA recommends the guidance in this Advisory Circular for land use planners and developers of projects, facilities, and activities on or near airports. The FAA requires airports that receive federal grant-in-aid assistance to follow this guidance. Three of the airports within the Planning Area (Mather Airport and Franklin Field) or nearby (Sacramento Executive Airport) receive federal grant-in-aid assistance and are therefore subject to these guidelines (FAA 2007).

This Advisory Circular recommends that local planning efforts evaluate the potential for hazardous wildlife attractants on or near airports since wildlife–aircraft collisions are a serious economic and public safety issue and jeopardize future airport expansions. The Advisory Circular provides guidance to assess and address development projects and land use planning near airports with respect to their potential to attract wildlife or increase airport wildlife hazards.[1] Land uses that could attract hazardous wildlife include aquatic resources, agricultural activities, landfills, public parks, and landscaping (FAA 2007). The Advisory Circular recommends that hazardous wildlife attractants be located no closer than 5,000 feet at airports that serve piston-powered aircraft, 10,000 feet between airports that serve turbine-powered aircraft, and 5 miles from airports when the attractant could cause hazardous wildlife movement into or across the approach or departure airspace. The Advisory Circular also contains multiple recommendations on how to minimize hazardous wildlife attractants, such as rapid stormwater detention basin drainage, steep-sided, narrow ponds, and elimination of vegetation (FAA 2007).



4.1.1.2 State Regulations and Policies

Delta Protection Act and the Land Use and Resource Management Plan for the Primary Zone of the Delta

The islands, marshes, waterways, and lands located at the confluence of the Sacramento River and the San Joaquin River, including the Suisun Marsh, were defined as "the Delta" in 1959 with the passage of the Delta Protection Act (CDWR 1993). The Delta is a network of inland channels and inland "islands" that cover approximately 738,000 acres. The Delta Protection Act ~~identifies a Primary Zone of approximately 500,000 acres where a comprehensive resource management plan, the Delta Plan (Delta Stewardship Council 2013), is applied (see the discussion under the heading "Delta Reform Act of 2009 and the Delta Plan" below).~~ **, originally enacted in 1992, established the Delta Protection Commission and designated the Land Use and Resource Management Plan as a comprehensive resource management plan for the approximately 500,000-acre Primary Zone.** The southwestern-most portion of the Planning Area in Preserve Planning Unit (PPU) 6, totaling approximately 32,000 acres west of Interstate 5, is within the Primary Zone (Figure 4-1). An additional approximately 9,000-acre portion of PPU 6 east of Interstate 5 is within the Delta Secondary Zone. The Secondary Zone is defined by the Delta Protection Act as being within the legal Delta, but is subject to the land use authority of a local government. The Delta Protection Commission comments on projects in the Secondary Zone that have the potential to impact the Primary Zone, but does not have jurisdiction over projects in the Secondary Zone.

[1] Wildlife hazards include airplane collisions with birds (e.g., seagulls, owls, ducks, geese, crows) and mammals (e.g., deer, coyotes).

Figure 4-1 Jurisdictional Boundaries

INTENTIONALLY LEFT BLANK

The Delta Protection Commission prepared the *Land Use and Resource Management Plan for the Primary Zone of the Delta* (Land Use and Resource Management Plan), which was last updated in 2010 (Delta Protection Commission 2010). The Land Use and Resource Management Plan includes policies for development of land within the Primary Zone of the Delta. Within 180 days of the Delta Protection Commission's adopting, updating, or changing the Land Use and Resource Management Plan, local governments must submit amendments to their general plans that make them consistent with the Land Use and Resource Management Plan. Applicable policies from the Land Use and Resource Management Plan are identified below (Delta Protection Commission 2010).

> **Policy P-2:** Local government general plans, as defined in Government Code Section 65300 et seq., and zoning codes shall continue to promote and facilitate agriculture and agriculturally-supporting commercial and industrial uses as the primary land uses in the Primary Zone; recreation and natural resources land uses shall be supported in appropriate locations and where conflicts with agricultural land uses or other beneficial uses can be minimized.
>
> **Policy P-3:** New non-agriculturally oriented residential, recreational, commercial, habitat, restoration, or industrial development shall ensure that appropriate buffer areas are provided by those proposing new development to prevent conflicts between any proposed use and existing adjacent agricultural parcels. Buffers shall adequately protect integrity of land for existing and future agricultural uses and shall not include uses that conflict with agricultural operations on adjacent agricultural lands. Appropriate buffer setbacks shall be determined in consultation with local Agricultural Commissioners, and shall be based on applicable general plan policies and criteria included in Right-to-Farm Ordinances adopted by local jurisdictions.
>
> **Policy P-8:** Local government policies regarding mitigation of adverse environmental impacts under the California Environmental Quality Act may allow mitigation beyond county boundaries, if acceptable to reviewing fish and wildlife agencies and with approval of the recipient jurisdiction, for example in approved mitigation banks or in the case of agricultural loss to mitigation.[2] Mitigation in the Primary Zone for loss of agricultural lands in the Secondary Zone may be appropriate if the mitigation program

[2] This portion of Policy P-2 conflicts with the South Sacramento Habitat Conservation Plan (SSHCP) proposed requirements that Covered Activity mitigation occur within the Planning Area (see EIS/EIR Proposed Action/Proposed Project Alternative description in Section 2.3.5). However, the remainder of Policy P-8 remains applicable to all alternatives analyzed in the EIS/EIR, so Policy P-8 has been retained as part of the regulatory environment considered by the lead agencies when determining the scope of the analysis in Chapter 4, pursuant to 40 CFR 1502.25(b).

supports continued farming in the Primary Zone. California Government Code Section 51256.3 (Assembly Bill 797) specifically allows an agricultural conservation easement located within the Primary or Secondary Zone of the Delta to be related to Williamson Act contract rescissions in any other portion of the secondary zone without respect to County boundary limitations.

Delta Reform Act of 2009 and the Delta Plan

The Delta Reform Act created the Delta Stewardship Council and directed the council to complete the Delta Plan (Delta Stewardship Council 2013). The Delta Plan includes land use policies that encourage the location of new development in areas within the Delta where existing infrastructure is available and land is designated for development (Delta Stewardship Council 2013). Local governments whose jurisdiction falls within the legal boundary of the Delta and Suisun Marsh must certify to the council that certain agency decisions—such as approval of a development project or land use policy—are consistent with the Delta Plan. Individuals who disagree with that certification may file an appeal with the council, and if the appeal is upheld, the project or policy must be revised to enable a new certification to be granted.

Approximately 41,000 acres within the southwestern portion of the Planning Area falls within the Primary Zone or Secondary Zone of the Delta Plan (Delta Stewardship Council 2013).

Relevant policies from the Delta Plan (Delta Stewardship Council 2013) include the following:

Locate New Urban Development Wisely

a. New residential, commercial, and industrial development must be limited to the following areas, as shown in Appendix 6 and Appendix 7 [of the Delta Plan]:
   (1) Areas that city or county general plans as of May 16, 2013, designate for residential, commercial, and industrial development in cities or their spheres of influence;
   (4) The unincorporated Delta towns of Clarksburg, Courtland, Hood, Locke, Ryde, and Walnut Grove.
b. Notwithstanding subsection (a), new residential, commercial, and industrial development is permitted outside the areas described in subsection (a) if it is consistent with the land uses designated in county general plans as of May 16, 2013, and is otherwise consistent with this element of the Delta Plan.
c. For purposes of Water Code section 85057.5(a)(3) and section 5001(j)(1)(E), this policy covers proposed actions that involve new residential, commercial, and industrial development that is not located within the areas described in subsection (a).

d. This policy is not intended in any way to alter the concurrent authority of the Delta Protection Commission to separately regulate development in the Delta's Primary Zone.

Respect Local Land Use When Siting Water or Flood Facilities or Restoring Habitats

a. Water management facilities, ecosystem restoration, and flood management infrastructure must be sited to avoid or reduce conflicts with existing uses or those uses described or depicted in city and county general plans for their jurisdictions or spheres of influence when feasible, considering comments from local agencies and the Delta Protection Commission. Plans for ecosystem restoration must consider sites on existing public lands, when feasible and consistent with a project's purpose, before privately owned sites are purchased. Measures to mitigate conflicts with adjacent uses may include, but are not limited to, buffers to prevent adverse effects on adjacent farmland.
b. For purposes of Water Code section 85057.5(a)(3) and section 5001(j)(1)(E) of this Chapter [of the Delta Plan], this policy covers proposed actions that involve the siting of water management facilities, ecosystem restoration, and flood management infrastructure.

ER P3. Protect Opportunities to Restore Habitat

a. Within the priority habitat restoration areas depicted in Appendix 5 of the Delta Plan, significant adverse impacts to the opportunity to restore habitat as described in section 5006, must be avoided or mitigated.

b. Impacts referenced in subsection (a) will be deemed to be avoided or mitigated if the project is designed and implemented so that it will not preclude or otherwise interfere with the ability to restore habitat as described in section 5006.

c. Impacts referenced in subsection (a) shall be mitigated to a point where the impacts have no significant effect on the opportunity to restore habitat as described in section 5006. Mitigation shall be determined, in consultation with the California Department of Fish and Wildlife, considering the size of the area impacted by the covered action and the type and value of habitat that could be restored on that area, taking into account existing and proposed restoration plans, landscape attributes, the elevation map shown in Appendix 4, and other relevant information about habitat restoration opportunities of the area.

d. **For purposes of Water Code section 85057.5(a)(3) and section 5001(j)(1)(E) of this Chapter, this policy covers proposed actions in the priority habitat restoration areas depicted in Appendix 5 of the Delta Plan. It does not cover proposed actions outside those areas.**

Delta Plan Policy G P1. Delta Plan Policy G P1 requires that actions not exempt from CEQA and subject to Delta Plan regulations must include applicable feasible mitigation measures consistent with those identified in the Delta Plan EIR or substitute mitigation measures that are equally or more effective. Delta Plan Policy G P1 also states that actions subject to Delta Plan regulations must document use of the best available science as relevant to the purpose and nature of the project. Finally, Delta Plan Policy G P1 requires that ecosystem restoration and water management covered actions include adequate provisions for continued implementation of adaptive management, appropriate to the scope of the action. This requirement is satisfied through A) the development of an adaptive management plan that is consistent with the framework described in Appendix 1B of the Delta Plan, and B) documentation of adequate resources to implement the proposed adaptive management plan.

Delta Plan Policies DP P1 and DP P2. Delta Plan Policy DP P1 states that new residential, commercial or industrial development is permitted outside the urban boundaries only if it is consistent with the land use designated in the relevant county general plan. It is intended to strengthen existing Delta communities while protecting farmland and open space, providing land for ecosystem restoration needs, and reducing flood risk. Delta Plan Policy DP P2 states that plans for ecosystem restoration must be sited to avoid or reduce conflicts with existing uses when feasible.

Delta Plan Policy ER P2. Delta Plan Policy ER P2 states that habitat restoration must be consistent with Appendix 3 of the Delta Plan regulations and that restoration will occur at appropriate elevations.

Delta Plan Policy ER R2. This policy states, for the Cosumnes-Mokelumne Confluence: "Allow these unregulated and minimally regulated rivers to flood over their banks during winter and spring frequently and regularly to create seasonal floodplains and riparian habitats that grade into tidal marsh and shallow subtidal habitats."

Delta Plan Policy ER P3. This policy requires that, within the priority habitat restoration areas depicted in Appendix 5 of the Delta Plan, significant adverse impacts to the opportunity to restore habitat must be avoided or mitigated. Much of the overlap between the Legal Delta and the SSHCP Plan Area includes the Cosumnes-Mokelumne Confluence PHRA.

Delta Plan Policies RR P2, RR P3, and RR P4. Policy RR P2 requires flood protection for residential development in rural areas. Policy RR P3 restricts encroachment in floodways. Policy RR P4 restricts encroachment in floodplains, including the Cosumnes-Mokelumne Confluence. Policy RR P4 specifically states that "no encroachment shall be allowed or constructed unless it can be demonstrated by appropriate analysis that the encroachment will not have a significant impact on floodplain values and functions."

Delta Plan Policy ER P5. Policy ER P5 calls for avoiding introductions and habitat improvements for invasive nonnative species or mitigating these potential impacts in a manner that appropriately protects the ecosystem. Analysis on this matter should address both nonnative wildlife species as well as terrestrial and aquatic weeds. To the maximum extent practicable, design of habitat restoration and creation actions should avoid or minimize effects that would lead to the establishment of nonnative invasive species populations on site before relying on mitigation measures. In the event that mitigation is warranted, those mitigation and minimization measures should be equally or more effective than the Delta Plan mitigation measure 4-1.

4.1.1.3 Regional Regulations and Policies

Metropolitan Transportation Plan/Sustainable Communities Strategy

The Sacramento Area Council of Governments (SACOG) is an association that includes the Counties of El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba, as well as 22 cities, including two of the South Sacramento Habitat Conservation Plan (SSHCP) Permit Applicants (the City of Galt and the City of Rancho Cordova). As a metropolitan transportation organization, SACOG is required to prepare a long-range transportation plan for all modes of transportation—including public transit, automobile, bicycles, and pedestrians—every 4 years for the six-county area. SACOG is also required to integrate land use, housing, and transportation strategies into a Sustainable Communities Strategy (SCS) that achieves the California Air Resources Board emissions reduction targets for greenhouse gases.

The *Metropolitan Transportation Plan/Sustainable Communities Strategy 2036* (the 2036 MTP/SCS) (SACOG 2016) was prepared to establish regional access and to identify mobility goals; identify present and future transportation needs, deficiencies, and constraints within the transportation system; analyze potential solutions; estimate available funding; propose investments; and achieve regional targets for reducing greenhouse gas emissions. The 2036 MTP/SCS plan does not present requirements for urban development within the Planning Area; rather, it forms the foundation for regional transportation investments, as described in the *Regional Housing Needs Plan 2013–2021* (SACOG 2012), and provides regional compliance with federal air quality and state greenhouse gas emissions requirements.

Sacramento Region Blueprint Transportation and Land Use Plan

In recognizing future regional environmental effects of continuing the historical pattern of growth in the six-county area—including loss of habitat, agricultural land, and open space, as well as an increase in traffic congestion and pollution— SACOG initiated preparation of the *Sacramento Region Blueprint Transportation and Land Use Plan* in 2002 to identify the region's housing/employment needs through year 2050, and to propose different scenarios for future urban development to accommodate those housing/employment needs. SACOG identified a "base-case" representing development trends at that time and projecting development trends out to year 2050. Alternative future urban development strategies were developed, each implementing differing levels of "smart growth" strategies. After extensive outreach and public involvement, the SACOG Board of Directors adopted the preferred blueprint scenario in December 2004 (SACOG 2004). The preferred blueprint scenario represents a balanced approach that emphasizes infill and revitalization, and relies on smart growth principles to encourage development at higher densities, while offering a wide choice of housing options (SACOG 2004).

Recent SACOG documents, such as the 2036 MTP/SCS (SACOG 2016) described previously, use the preferred blueprint scenario as the land use basis for future transportation investments.

4.1.1.4 Local Regulations, Policies, and Plans

Land uses in the Planning Area are governed by the general plans and other local plans and policies of Sacramento County, Galt, and Rancho Cordova. The general plans of these three jurisdictions guide the location and type of land use by establishing each community's planning goals, objectives, and policies.

Land uses in the Planning Area are also influenced by the 2036 MTP/SCS and by the Airport Land Use Compatibility Plans of each public-use airport located in or adjacent to the Planning Area.

Sacramento County General Plan

The Land Use Element of the adopted *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011) identifies a goal of establishing "an orderly pattern of land use that concentrates urban development, enhances community character and identity through the creation and maintenance of neighborhoods, is functionally linked with transit, promotes public health, and protects Sacramento County's natural, environmental and agricultural resources" (Sacramento County 2011, p. 17).

The Land Use Element also establishes Sacramento County's growth boundary system, which it describes as the "backbone of Sacramento County's urban planning philosophy" (Sacramento County 2011, p. 18). Sacramento County has two growth boundary designations: the Urban Service Boundary (USB), which indicates the ultimate boundary of the urban area in the

unincorporated county and the Urban Policy Area, which identifies the areas where urban development will occur through the year 2030. Please see Chapter 1 for a detailed description of these plan boundaries. While the USB is intended to be a permanent boundary, the Urban Policy Area is adjusted incrementally as needed to ensure that Sacramento County can accommodate anticipated growth throughout the 25-year planning cycle. The area between the two lines is reserved for future urbanization.

As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, the term "UDA" means all lands within Sacramento County's USB boundary that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within Galt's sphere of influence (SOI) (see Figure 1-1).

The Sacramento County General Plan and the current County Urban Policy Area boundary assume that most growth in the unincorporated areas of Sacramento County would occur east of the City of Sacramento, north of the City of Elk Grove, and southwest of the City of Rancho Cordova. In addition, expansion of the Urban Policy Area to create several new communities within the Mather Core Recovery Area (MCRA) (USFWS 2005) was anticipated in the General Plan, which notes that stringent criteria for expanding the Urban Policy Area would require such proposals to demonstrate "high quality design and the creation of complete communities that offer a range of housing, employment, commercial uses, transportation choices and community amenities" (Sacramento 2011, Executive Summary, p. 3).

The Sacramento County General Plan Land Use Element establishes an objective of allowing "Limited agricultural–residential land use expansion outside the USB that does not compromise objectives for protecting prime agricultural lands and open space, and avoids groundwater overdraft and contamination" (Sacramento County 2011, p. 72).

Policies relevant to this EIS/EIR from Sacramento County's Land Use Element include the following (Sacramento County 2011):

> **Policy LU-2:** The County shall maintain an Urban Service Boundary that defines the long-range plans (beyond twenty-five years) for urbanization and extension of public infrastructure and services, and defines important areas for protecting as open space and agriculture.
>
> **Policy LU-15:** Planning and development of new growth areas should be consistent with Sacramento County-adopted Habitat Conservation Plans and other efforts to preserve and protect natural resources.

Policy LU-120: The County shall only consider approval of a proposed Urban Policy Area expansion and/or Master Plan outside of the existing Urban Policy Area if the Board finds that the proposed project is planned and will be built in a manner that meets specific standards such as density, jobs-housing balance, financing, mix of uses, etc., specified in the policy (note: this is a summary of this policy. See pages 124 through 135 of the Land Use Element).

Policy LU-122: The Urban Policy Area is intended to provide an adequate supply of developable land sufficient to accommodate projected growth. The Urban Policy Area shall also include additional preserve lands to ensure an appropriate supply of open space. It is the policy and intent of the County to evaluate the Urban Policy Area at a minimum of five-year intervals, to determine if an expansion is needed to maintain a constant adequate supply of land.

- Guidelines to be considered by the Board in determining the expansion of the Urban Policy Area include:
- Buildout rates by type of use, unit type and density for the previous 5-year period.
- Infill trends and opportunities.
- Population and job growth projections as reflected by a minimum of three independent sources.
- Evidence that the infrastructure capacity and service availability exist or can be extended to the property.
- Evidence that the proposed expansion is consistent with Sacramento County adopted Habitat Conservation Plan goals and objectives, or where such a draft or adopted Plan does not exist, evidence that important natural resources lands, agricultural lands, and open space lands will be protected and integrated into a cohesive and interconnected network of open space within the Urban Policy Area.

Policy LU-127: The County shall not expand the Urban Service Boundary unless:

- There is inadequate vacant land within the USB to accommodate the projected 25-year demand for urban uses; and
- The proposal calling for such expansion can satisfy the requirements of a master water plan as contained in the Conservation Element; and
- The proposal calling for such expansion can satisfy the requirements of the Sacramento County Air Quality Attainment Plan; and
- The area of expansion does not incorporate open space areas for which previously secured open space easements would need to be relinquished; and

- The area of expansion does not include the development of important natural resource areas, aquifer recharge lands or prime agricultural lands;
- The area of expansion does not preclude implementation of a Sacramento County-adopted Habitat Conservation Plan; OR
- The Board approves such expansion by a 4/5ths vote based upon a finding that the expansion would provide extraordinary environmental, social or economic benefits and opportunities to the County.

Galt General Plan

The *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009) Land Use Element establishes a goal of expanding the City of Galt "as necessary in an orderly pattern consistent with economic, social, and environmental needs" (Galt 2009). Several policies include requirements to protect habitat and open space, including areas proposed for development within the Galt's SOI. Galt General Plan policies relevant to this EIS/EIR include the following (Galt 2009):

> **Policy LU-1.10:** The City shall coordinate habitat preservation efforts with Sacramento County to maintain critical species habitat preservation zoning on open space north of the Planning Area[3] and within the proposed South Sacramento County Habitat Conservation Plan. The City shall continue to mitigate impacts on special habitats and endangered species in consultation with applicable Federal and State agencies prior to adoption of the South Sacramento County Habitat Conservation Plan.
>
> **Policy LU-9.1:** The City should participate in regional efforts to establish a permanent agriculture, open space, and wildlife habitat greenbelt between the northern boundary of the Planning Area and the City of Elk Grove.

Rancho Cordova General Plan

The Land Use Element in the *Rancho Cordova General Plan* (Rancho Cordova 2006a) focuses on development of the predominantly urban land uses anticipated within Rancho Cordova's limits, with a vision of creating a "series of walkable neighborhoods, villages, and districts, each with a center of activity that promotes interactions between residents, employees, and visitors." The Rancho Cordova General Plan also recognizes the need to preserve natural resources as an important community feature. It establishes Rancho Cordova's goals of achieving a "balanced

[3] The Galt General Plan uses "Planning Area" to describe the geographic area that will be directly addressed by the General Plan, and typically encompasses the city limits and potentially annexable land within its SOI (Galt 2009, p. 3).

and integrated land use pattern" and participating in the "decision-making on land-use, circulation, and park issues outside the City limits that have an impact on the City" (Rancho Cordova 2006a). Other elements of the Rancho Cordova General Plan do include relevant policies, as noted below.

The Rancho Cordova General Plan Natural Resources Element identifies the Rancho Cordova's specific goals and policies intended to position Rancho Cordova as "a leader in natural resource conservation, managing natural resources to ensure long-term sustainability while evaluating new opportunities and techniques in conservation" (Rancho Cordova 2006a). The Natural Resources Element contains goals related to protecting and preserving diverse wildlife and plant habitat and natural aquatic resources and several supporting policies. Those policies that relate to land use and are relevant to this EIS/EIR are as follows (Rancho Cordova 2006a):

> **Policy NR.1.2:** Conserve Swainson's hawk habitat consistent with State policies and Department of Fish and Wildlife guidelines.
>
> **Policy NR.1.6:** Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.

Airport Plans and Guidelines

Three of the public airports located within the Planning Area (Mather Airport, Franklin Field, and Sacramento Executive Airport) have adopted a CLUP. An airport CLUP addresses airport noise, land use compatibility, and safety. The Rancho Murieta Airport and Eagle's Nest Airport (which is located within Amador County, immediately adjacent to the eastern edge of the Planning Area) do not have adopted CLUPs; similar guidance is provided through the *Airport Land Use Commission Policy Plan* (Airport Land Use Commission 1992) and the *California Airport Land Use Planning Handbook* (Airport Handbook) (State of California Department of Transportation 2011). Each of the airport land use plans define compatible and incompatible land uses within three airport safety zones: the "Clear Zone," "Approach–Departure Zone," and "Overflight Zone."[4] Figures 4-3 through 4-7 depict each of the airports and include the limits of the airport, Overflight Zones, and 5-mile radii. There are multiple factors that are included in the airport land use plans that provide direction on compatible land uses adjacent to or nearby airports. Given the nature of the SSHCP as a conservation-planning tool, these airport land use compatibility analyses focus on the presence of or increase/decrease of natural areas that may attract wildlife, either on the

[4] The "Clear Zone" is near the end of the runway and carries the most restrictions in terms of compatible land uses. The "Approach–Departure Zone" is located under the takeoff and landing slopes and is slightly less restrictive than the "Clear Zone" but more restrictive than the "Overflight Zone." The "Overflight Zone" is the area under the air traffic pattern and is the least restrictive (SACOG 1997, p. 30). The "Overflight Zone" roughly corresponds to the "Airport Operations Area," as defined in FAA Advisory Circular 150/5200-33B.

ground or in flight, or result in microclimatic conditions that may affect navigation. In all of the airport land use plans, open space and natural areas, including natural water areas, are compatible only if they do not result in the possibility that a water area may cause ground fog, a wildlife strike hazard from species such as deer or geese that are attracted to grazing opportunities, or a bird–aircraft collision hazard. These plans allow existing incompatible land uses to continue; however, no existing incompatible land use may be changed to another incompatible land use except by a 4/5 majority vote of the County Board of Supervisors.

4.1.2 Existing Conditions

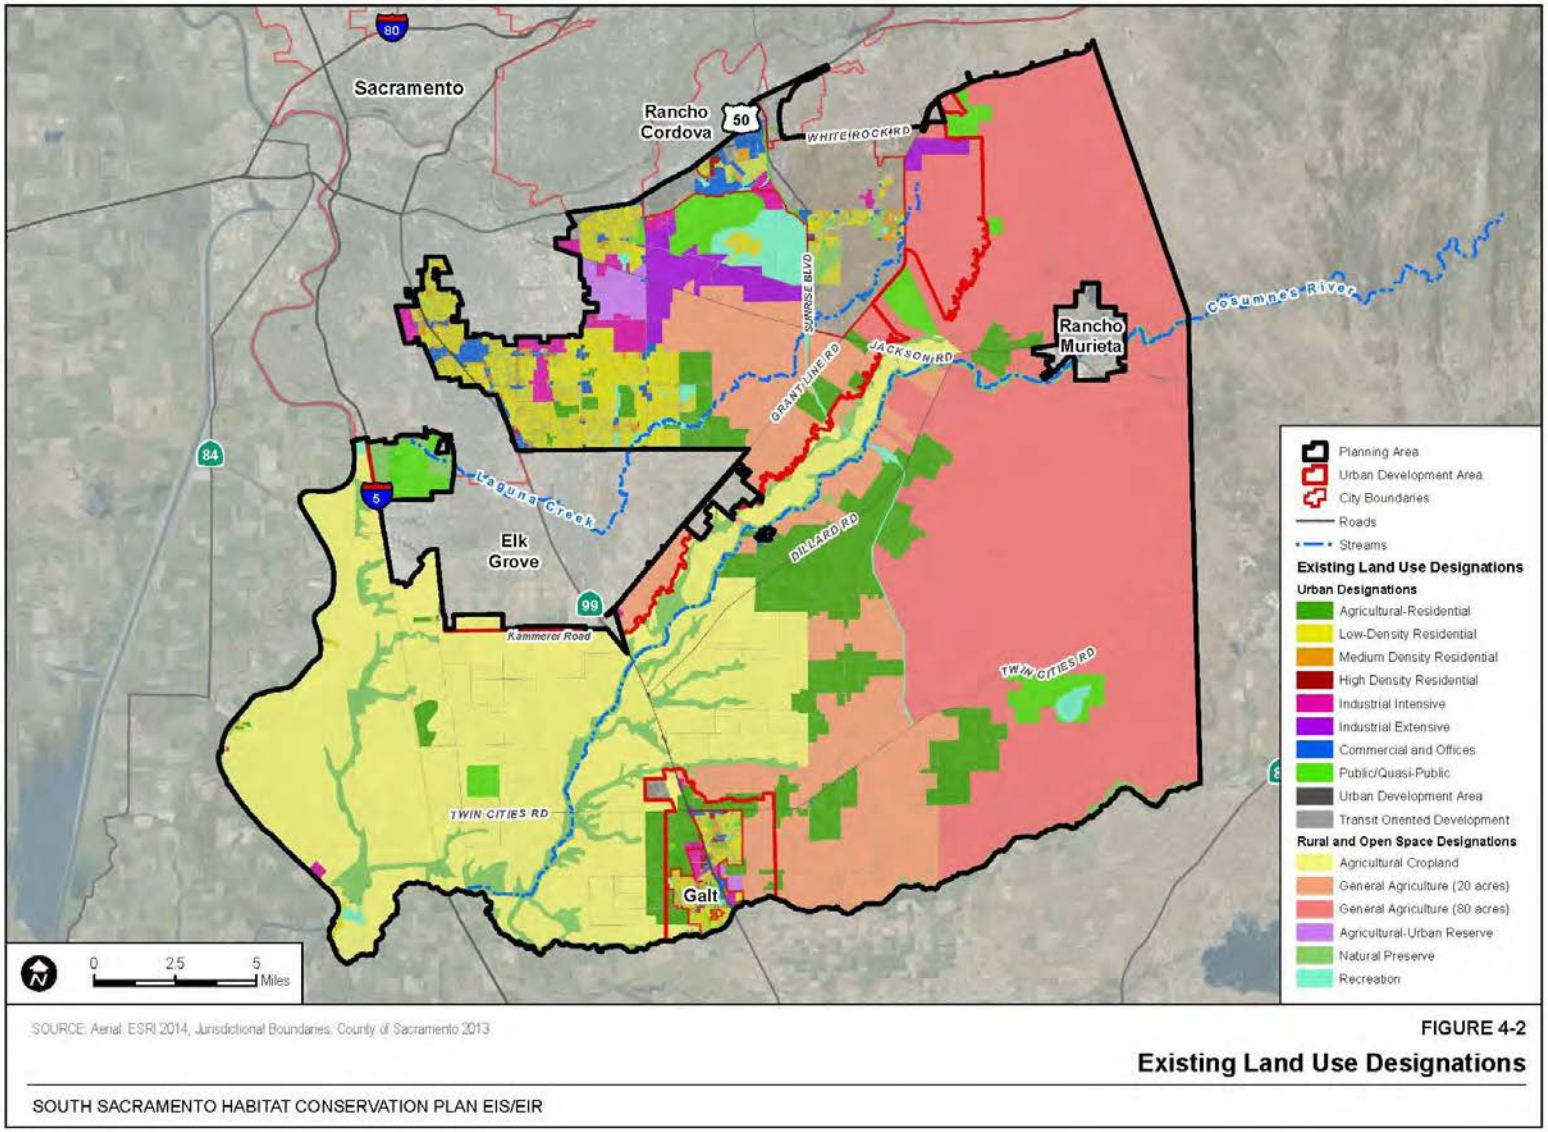


Figure 4-1 illustrates the city and county jurisdictional boundaries, including the SOI for each city, within the EIS/EIR Planning Area. Table 4-1 identifies the acreage of the Planning Area within Sacramento County, Galt, and Rancho Cordova.

Table 4-1. Acreage of Sacramento County, Galt, and Rancho Cordova within the EIS/EIR Planning Area

Jurisdiction	Acreage within the Planning Area
Sacramento County (unincorporated)	307,142
City of Galt	2,009
City of Rancho Cordova	8,504
Total Acres in the Planning Area	**317,655**

4.1.2.1 Past and Current Land Use in the Planning Area

Sacramento County was formed in 1850 as one of the original 27 counties of the State of California. As discussed in Sections 1.3.1 and 3.7.1, Sacramento County has a strong agricultural history. Agriculture and grazing lands dominated the landscape throughout the early twentieth century. Urbanization increased in the 1940s and again between 1950 and 1960, with new growth occurring primarily near the City of Sacramento and in smaller cities such as Folsom, Galt, and Isleton. Growth continued at a moderate rate between 1960 and 1990, resulting in an expansion of urban land use patterns and infrastructure into the southern and eastern portions of Sacramento County. Development slowed in the early 1990s, picked up again in the early 2000s, and softened or slowed considerably from 2007 to 2009. Approximately 46,000 people lived in the Sacramento metropolitan region in 1900. The population in Sacramento County reached one million between 1980 and 1990, and in 2010 the population was 1.4 million (Sacramento County 2011).

Sacramento County covers approximately 990 square miles and includes seven incorporated cities—Sacramento, Elk Grove, Citrus Heights, Folsom, Galt, Isleton, and Rancho Cordova—and many other unincorporated communities. Communities within the Planning Area, located primarily in the central and western portions of the unincorporated County, typically include land designated for agricultural uses with minimum parcel sizes of 20, 40, or 80 acres. These communities include Alta Mesa, Clay Station, Herald, Point Pleasant, Sloughhouse, and Wilton. These six Planning Area communities are located outside of the UDA, in the southern and eastern portions of the Planning Area, where the Sacramento County General Plan provides for continuation of the historically agricultural-based land use patterns (Sacramento County 2011). Although it is not included in the Planning Area, the unincorporated community of Rancho Murieta is also located in the southeastern portion of Sacramento County outside the UDA (Figure 4-2).

Unincorporated areas of Sacramento County located within the UDA include Florin, Rosemont, Mather, and Vineyard. These areas include existing residential, commercial, and industrial development. The Sacramento County General Plan land use diagram (Sacramento County 2011) indicates that a majority of new urban (residential, commercial, and industrial) land uses would be located north of Elk Grove and east of Sacramento (residential and commercial), while new industrial land uses would be located south of Mather Airport.

4.1.2.2 Land Use Designations in the Planning Area

Table 4-2 provides a summary of the existing land use designations in the Planning Area, also depicted on Figure 4-2. The existing land uses were compiled from the Rancho Cordova, City of Galt, and Sacramento County General Plan land use maps (Sacramento County 2011; Galt 2009; Rancho Cordova 2006a). However, specific land use designations for each Planning Area local jurisdiction were somewhat different. To create a uniform list of Planning Area land use

designations, the EIS/EIR assigned the land use designations used in each general plan to one of the 18 land use designations listed in Table 4-2.

Table 4-2. Existing Land Use Designations within the Planning Area

Land Use Designation[1]	Acres	% of Total Planning Area (approximate)
Agricultural Cropland	82,279	25.9
Agricultural Residential	24,926	7.8
Agricultural Urban Reserve	1,907	0.6
General Agriculture (20 Acres)	38,720	12.2
General Agriculture (80 Acres)	106,692	33.6
Total Agriculture	*254,524*	*80.1*
Low Density Residential	6,263	2.0
Medium Density Residential	687	0.2
High Density Residential	223	0.1
Commercial and Offices	2,272	0.7
Industrial Extensive	4,362	1.4
Industrial Intensive	3,408	1.1
Specific Plan Area	7,008	2.2
Transit Oriented Development	70	0.0
Misc. Urban Development Area[2]	72	0.0
Total Urban	*24,365*	*7.7*
Natural Preserve	18,556	5.8
Public/Quasi-Public	8,896	2.8
Recreation	3,328	1.0
Rights-of-Way[3]	7,986	2.5
Planning Area TOTAL	**317,655**	**100**

1 Land use designations used in Chapter 4 are closely based on the land use designations in Sacramento County 2011.
2 The Misc. Urban Development Area designation is included to capture the entirety of the Planning Area.
3 The "rights-of-way" designation represents areas of roadways, utility corridors, and other areas where a local land use authority has granted rights-of-way, and no land use designation was retained.

SACOG predicts that the region will continue to experience strong growth over the EIS/EIR 50-year study period discussed in Section 3.6.3 (SACOG 2004). SACOG has forecasted that Sacramento County will see an increase in population from 1,223,499 in 2000 to 1,695,498 by 2025 and over 2 million by 2050 (SACOG 2005, 2009, as cited in Sacramento County et al. 2017). The six-county Sacramento region is predicted to see an increase in population from 1,886,165 in 2000 to 2,814,254 in 2025. A large portion of this growth is expected to occur within the Planning Area in southern and eastern Sacramento County (Sacramento County et al. 2017). The general planning processes conducted by Sacramento County, Galt, and Rancho Cordova have taken into account these regional population estimates and have laid out land use frameworks to accommodate this projected population increases. As indicated in Table 4-2, generally, the land use designations for Sacramento County, Galt, and Rancho Cordova include

agriculture (including different parcel sizes and land use intensities), urban development (including different residential densities, commercial, and industrial uses), natural preserve, public or quasi-public, and recreational.

4.1.2.3 Airports

There are two public-use airports located within the Planning Area (Mather Airport and Franklin Field) and another three (Sacramento Executive, Rancho Murieta, and Eagle's Nest) located outside of the Planning Area, but within the project vicinity. In addition, there are several private airports within the Planning Area. Private airports are not part of the national air transportation network and serve private individuals, including agricultural spraying operators. Private airports in the Planning Area vary in size from single dirt airstrips to paved runways with hangars. Private airports in the Planning Area include Boeckmann Ranch Airport, Bottimore Ranch Airport, Flying B Ranch Airport, Flying R Airport, Lucchetti Ranch Airport, Mosier Airport, Mustang Airport, Sky Way Estates Airport, and Van Vleck Airport. All of the private airports are located outside of the UDA.

Mather Airport

Mather Airport, which was formerly the Mather Air Force Base, is located in the UDA portion of unincorporated Sacramento County, adjacent to Rancho Cordova (Figure 4-3). The airport is owned and operated by Sacramento County. Current redevelopment activities on the former base property include airport-related, commercial, and industrial uses (Sacramento County 2010). Mather Airport is bordered to the north and west by residential and commercial development and to the south and east by undeveloped land and agricultural operations.

Water bodies and other land uses that attract birds near Mather Airport include Mather Lake, located in Mather Regional Park approximately 2 miles east of the airport. The American River also flows approximately 3 miles northwest of the airport. Several smaller water bodies are present within Mather Airport's airport safety zone (which includes the Clear, Approach–Departure, and Overflight Zones), as are extensive areas of vernal pools. Within the airport's 5-mile separation zone are additional seasonally wet vernal pool areas to the east and south; the American River to the northwest (as noted above); and other open water/aquatic resources to the west, south, and east, including Laguna Creek. In addition, another bird attractant is the 1,084-acre Kiefer Landfill, located approximately 4.5 miles southeast of the airport.

Since its conversion from a military airfield to a public/commercial facility, non-military operations have increased at this facility, specifically air cargo, as have issues relative to local

development. During 2012, Mather Airport, a controlled airport,[5] supported 79,786 flight operations, including cargo, general aviation, air taxi, and military. Over the 5 years from 2008 to 2012, an average of 79,535 flight operations occurred annually (FAA 2013a). The Mather Airport CLUP (SACOG 1997), as noted above, defines compatible and incompatible land uses within three airport safety zones: Clear Zone, Approach–Departure Zone, and Overflight Zone.[6] Open space and natural areas, including natural water areas, are compatible in all three zones only if they do not result in a possibility that a water area may cause a wildlife hazard. The Mather Airport Master Plan update was adopted by the Board of Supervisors in August 2014.

Franklin Field

Franklin Field is located outside the UDA, in southern Sacramento County, approximately 1 mile northeast of the intersection of Twin Cities Road and Franklin Boulevard (see Figure 4-4). Franklin Field is currently a public-use airport owned and operated by Sacramento County.

Franklin Field is surrounded by agricultural land uses, including row crops and grazing lands. Existing drainage canals separate many of the agricultural fields, and similar canals elsewhere in the Planning Area provide habitat and resources for birds and other wildlife. Stone Lakes National Wildlife Refuge is located less than 5 miles northwest of Franklin Field and contains over 11,000 acres of publicly owned land that comprises freshwater sloughs, wetlands, vernal pools, riparian forest, and grasslands (USFWS 2013). Additional sloughs are located to the east and south of Franklin Field, which ultimately drain into the San Pablo Bay west of Vallejo. Several smaller water bodies are located within Franklin Field's airport safety zone (which includes the Clear, Approach–Departure, and Overflight Zones), as described previously. Within the 5-mile separation zone are additional vernal pool areas to the north and east; streams and drainages along the eastern and western portions of the 5-mile separation zone; the Cosumnes River along the east and south; Stones Lakes National Wildlife Refuge to the west (as noted previously); and other open water/aquatic resources, including freshwater marshes to the south and west.

Franklin Field is considered an uncontrolled airport since it does not have an air traffic control tower or personnel. There were approximately 36,000 operations in 2008 at Franklin Field, including flight training. The Airport Master Plan Working Paper anticipates that operations at this airport will increase over time, reaching approximately 64,000 operations by 2027 (Sacramento County Airport System 2008). Currently, Franklin Field has prepared a CLUP, which was amended in 1992 (SACOG 1992). The Franklin Field CLUP (SACOG 1992), as noted in Section 4.1.1, defines compatible and incompatible land uses within the following same three airport

[5] A controlled airport is an airport that has an operating airport traffic control tower. An uncontrolled airport does not include a traffic control tower.

[6] See footnote 4 for a definition of each zone.

safety zones as the Mather Airport CLUP: Clear Zone, Approach–Departure Zone, and Overflight Zone. Open space and natural areas, including natural water areas, are compatible in all three zones only if they do not result in a possibility that a water area may cause a wildlife hazard.

Sacramento Executive Airport

Sacramento Executive Airport is a controlled general aviation airport located in the City of Sacramento on Freeport Boulevard, outside of but within the vicinity of the Planning Area (Figure 4-5). Over 30 businesses operate at this airport, offering a wide variety of aviation-related services, including a full-service fixed-base operator, flight schools, aircraft maintenance, avionics, and aerial photography (Sacramento County 2010).

Sacramento Executive Airport is completely surrounded by urban development, including residential and commercial land uses. Reichmuth Park is located approximately 1 mile west of the runway, and Bing Maloney golf course is adjacent to the southern edge of the airport. Neither Reichmuth Park nor Bing Maloney golf course contains any water bodies. The Sacramento River is approximately 1.5 miles west of the airport at its closest point. Few aquatic resources are present within the Sacramento Executive Airport's safety zone (which includes the Clear, Approach–Departure, and Overflight Zones). Within the 5-mile separation zone are the Sacramento River and the Sacramento River Deep Water Ship Channel, which are located to the west, and other open water/aquatic resources, including Laguna Creek to the south.

Although Sacramento Executive Airport is located outside of the Planning Area, its area of influence extends into the Planning Area.[7] This airport is approximately 540 acres, and much of it is already developed or in a Clear (Safety) Zone. During 2012, Sacramento Executive Airport supported 88,619 flight operations, including air carrier, air taxi, general aviation, and military. Over the 5 years from 2008 to 2012, an average of 91,784 flight operations occurred annually (FAA 2013b). Sacramento Executive Airport has a CLUP that was amended in 1999 (SACOG 1999). The Sacramento Executive Airport CLUP (SACOG 1999), as noted previously, defines compatible and incompatible land uses within the same three airport safety zones as the Mather Airport CLUP: Clear Zone, Approach–Departure Zone, and Overflight Zone. Open space and natural areas, including natural water areas, are compatible only if they do not result in a possibility that a water area may cause a wildlife hazard.

[7] "Area of Influence" is defined as the airport planning boundaries where height, noise, or safety restrictions are imposed. Height standards for defining obstructions to air navigation are established by the FAA and are defined in Federal Aviation Regulation, Part 77, Objects Affecting Navigable Airspace. Noise restrictions are governed by California Administrative Code, Title 21, Subchapter 6. Airport safety areas are determined by the Airport Land Use Commission. The total area encompassed by these three sets of boundaries is referred to as the "Airport Area of Influence" (SACOG 1999, p. 8).

Rancho Murieta Airport

Rancho Murieta Airport is an uncontrolled airport located approximately 1 mile west of the business district of Rancho Murieta in eastern Sacramento County. The community of Rancho Murieta, including the Rancho Murieta Airport, is excluded from the Planning Area (Figure 4-6). Although this airport is not within the Planning Area, its area of influence extends into the Planning Area. The Rancho Murieta Airport is approximately 76 acres and has been active since 1970.

The airport is predominantly surrounded by residential development or agriculture to the north, east, and west. An existing riparian preserve is located adjacent to and south of the airport as part of the Cosumnes River. Thus, the Cosumnes River, as well as other open water/aquatic resources located to the south and northwest, is a major riparian resource within the Rancho Murieta airport safety zone (which includes the Clear, Approach–Departure, and Overflight Zones). Within the 5-mile separation zone are other creeks, including the continuation of the Cosumnes River, which passes in an east–west direction; vernal pools located in all directions around the airport; and other open water/aquatic resources that are located to the southeast, west, and northwest.

Rancho Murieta Airport has two relatively short runways, which are approximately 3,800 feet long (FAA 2013c), and can only accommodate smaller aircraft. It has no control tower. On average, there are 73 aircraft operations daily (based on data for the 12-month period ending December 2015) (AirNav.Com 2016a). There is no CLUP for this airport, but instead the Airport Land Use Commission Policy Plan (Airport Land Use Commission 1992) governs activity at this facility. This plan, as noted in Section 4.1.1, defines compatible and incompatible land uses within the same three airport safety zones as the Mather Airport CLUP: Clear Zone, Approach–Departure Zone, and Overflight Zone. Open space and natural areas, including natural water areas, are compatible only within all three zones if they do not result in a possibility that a water area may cause a wildlife hazard.

Eagle's Nest Airport

Eagle's Nest Airport is an uncontrolled private airport located approximately 1 mile east of the Planning Area, in the town of Ione in Amador County (Figure 4-7). It has been open since 1988 and covers approximately 600 acres. Low-density commercial and residential land uses composed of grasslands, oak woodlands, and scattered vernal pools are located in proximity and to the west and south of the airport. Willow Creek is approximately 1 mile south of the southern end of the runway. Thus, vernal pools and Willow Creek are aquatic resources within the Eagle's Nest airport safety zone (which includes the Clear, Approach–Departure, and Overflight Zones). Within the 5-mile separation zone are other creeks, including the Cosumnes River to the north; vernal pools located generally in the north, west, and south; and other open water/aquatic resources to the northwest of the airport.

Eagle's Nest Airport has a single 4,000-foot-long runway and is used by smaller aircraft. It has no control tower and averages 21 aircraft operations per week (AirNav.Com 2016b). The lead agencies could not confirm if a CLUP was adopted for this airport but assumes the airport is operating in compliance with the Airport Land Use Commission Policy Plan (Airport Land Use Commission 1992). This plan, as noted previously, defines compatible and incompatible land uses within the same three airport safety zones as the Mather Airport CLUP: Clear Zone, Approach–Departure Zone, and Overflight Zone. Open space and natural areas, including natural water areas, are compatible within all three zones only if they do not result in a possibility that a water area may cause a wildlife hazard.

Airport Hazards

There are many hazards associated with airports that are applicable in regional land use planning. Location of new urban development must be planned in the context of airport height restrictions, noise compatibility, and wildlife hazard considerations. Given the fact that the SSHCP is a conservation planning document, the focus of this analysis is on wildlife hazards.

Birds frequently use airports and surrounding habitats because there is open space, food resources, perches, and often ponds or other aquatic resources. The use of aquatic resources by wildlife in the vicinity of airports depends greatly on the species that are present and their behaviors. Some species are resident year-round, while others are only present during migration in the spring or fall or during summer months. Species that present the greatest wildlife-strike hazard for aircraft include waterfowl and gulls, raptors, blackbirds, and other passerines (Blackwell et al. 2008).

Wildlife collisions with airplanes have increased in frequency as air traffic has increased, with approximately 11,520 wildlife collisions reported in California since 1999 (FAA 2013d). Birds are a management concern for airports, airlines, the military, and wildlife managers. Wildlife strikes on aircraft result in annual damage costs of at least $400 million, the loss of human life, and the deaths of at least 65,000 birds (Sodhi 2002; Blackwell et al. 2008). There has been a marked increase in the incidence of avian strikes in recent decades, which may be attributable to larger, wider-bodied aircraft that are quieter, which makes evasion by birds more difficult (Sodhi 2002).

Therefore, the FAA regulates the management of wildlife attractants within air operation areas to reduce the risk of wildlife collisions. Most (66%) of bird strikes that damaged aircraft occurred less than 500 feet from the ground and within 1.5 miles of the airfield. Almost all (95%) of bird strikes occur within 3,280 feet from the ground and within 11.5 miles of the airfield (Dolbeer 2006). Analysis of this data indicates that the collisions that occur within 1.5 miles of the airfield likely result from birds that reside in the immediate vicinity of the airport.

Although it is not required by regulations or policies, the FAA Office of Airports encourages general aviation airports to conduct wildlife hazard assessments to determine what, if any, measures are needed to reduce wildlife hazards to aircraft. As part of these wildlife hazard assessments, airports would identify potential wildlife attractants within a 5-mile radius of the airport and develop measures to reduce any threats posed to aircraft by the attractant, such as issuing notices to airmen regarding the hazard or changing approach and departure paths to avoid the attractant. This can also include collaborating with the owner or proponent of the attractant to notify the airport when potentially hazardous wildlife, especially migratory waterfowl, are present at off-site locations. The FAA supports general aviation airports by making Airport Improvement Program grants available to conduct a wildlife hazards assessment.

The risk of wildlife strikes is generally increased by the presence of aquatic resources near airports, which attract large waterfowl such as ducks and geese. Waterfowl populations in managed wetlands in Central Valley flood basins can reach extremely dense concentrations, with thousands of large waterfowl covering an area of just a few acres (Silveira 1998). By contrast, vernal pools are generally relatively small, often isolated, wetlands that support only small numbers of waterfowl, shorebirds, and other water birds and only for a short period of time because vernal pools dry quickly. Often, only a single bird or pair of birds is observed at an inundated vernal pool (Silveira 1998). Vernal pools with a large surface area are reported to receive greater waterfowl use than smaller pools (Baker et al. 1992, as cited in Silveira 1998), which may be related to the large pools' longer inundation period.

4.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

4.2.1 Methodology for Assessing Impacts of Each Alternative on Land Use

The change in land use conditions anticipated under each alternative is evaluated and compared to the existing and planned land uses within the Planning Area. Impacts are identified where the actions or projects associated with an EIS/EIR alternative would be incompatible with an existing land use or would conflict with an adopted land use plan.

Potential ways the alternatives could affect land use would be by introducing uses that would be incompatible and/or inconsistent with applicable land use plans, goals, and policies. This includes assessing safety hazards of airports by assessing potential conflicts between proposed activities, including lands proposed for preservation, existing land uses, and goals and policies contained in airport planning documents.

The future projects and activities expected under each EIS/EIR alternative are described in Chapter 2. As discussed in Sections 3.6.5, the EIS/EIR impact methodology uses geographic information system (GIS) datasets that were prepared using the best available information about the amounts and locations of ground disturbance from the future projects and activities

expected under each alternative. The impact analyses presented in Sections 4.2.2, 4.2.3, and 4.2.4 are described using the Planning Area land use designations listed in Table 4-1. The analysis of each alternative also incorporates by reference certain impact analyses from the planning documents listed in Section 3.4. In accordance with NEPA regulation 43 CFR 46.135(b), where a prior analysis is incorporated, the source document, including pertinent page numbers, is cited, and the analysis is briefly described. The study period used in the Chapter 4 impact analyses is described in Section 3.6.3.

In addition, a land use compatibility analysis was also performed for each EIS/EIR alternative to identify potential incompatible uses near airports. The primary consideration was locations of aquatic land covers, which tend to be most attractive for large-bodied birds, including gulls and waterfowl, and which can also cause formation of ground fog. Using GIS, the Overflight Zones for each airport were compared to the potential locations of future preserves. The Overflight Zones identify a 10,000-foot radius from the center of each end of primary surface runways and incorporate the Clear Zone and Approach–Departure Zone. The GIS analysis then evaluated changes to any aquatic land covers within those preserves that would be potentially attractive to birds, resulting in an incompatible use within the aircraft separation zones.

The cumulative analysis of impacts from each EIS/EIR alternative was evaluated using the methodology generally described in Section 3.7. The Sacramento County, Galt, and Rancho Cordova General Plan EIRs (Sacramento County 2010; Galt 2008; Rancho Cordova 2006b) evaluated the cumulative effects of the future urban development planned by that jurisdiction. (However, the Sacramento County General Plan (2011) did not analyze new development outside the current Urban Policy Area boundary but instead established policies for how such future development could be considered.) Where the cumulative impact analysis and assumptions used in a general plan EIR document was determined by the lead agencies to be appropriate for use in the impact analyses of an EIS/EIR alternative, a brief summary or description of the incorporated analysis is provided. As discussed in Section 3.4, the three General Plan EIRs used different study periods ending in 2030 (Galt 2008), 2030 (Rancho Cordova 2006b), and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur within Galt, Rancho Cordova, and Sacramento County in the years after their General Plan EIR study period ends but before this EIS/EIR's study period ends in 2065. Consequently, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Therefore, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of all urban development activities and projects that are included in the description of each EIS/EIR alternative.

The study area used in Chapter 4 for the cumulative analysis of each EIS/EIR alternative on land use is the EIS/EIR Planning Area plus lands within the City of Elk Grove, the City of Elk Grove's SOI, and the community of Rancho Murieta (see Figure 1-1).

Determination of Impact Significance

As discussed in Section 3.8.1, the criteria used to evaluate the significance of each alternative's impacts on land use are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and on typical thresholds used to evaluate land use effects and incompatibilities in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse impact would occur if the alternative would:

1. Conflict with any applicable adopted land use plan, policy or regulation of a federal, state or local agency with jurisdiction over the project (including but not limited to a general plan, specific plan or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect;
2. Physically disrupt or divide an established community;
3. Result in a safety hazard for people residing or working in the vicinity of an airport/airstrip;
4. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks; or
5. Displace substantial amount of existing housing, necessitating the construction of replacement housing elsewhere.

Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) does not provide suggested criteria for determining a beneficial effect. The following criteria and thresholds were developed by the lead agencies:

A beneficial effect to land use would occur if the alternative would:

1. Reduce existing conflicts with an applicable adopted land use plan, policy, or regulation of a federal, state, or local agency with jurisdiction over the project (including but not limited to a general plan, specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect;
2. Reduce physical disruption or division of an established community;
3. Reduce a safety hazard for people residing or working in the vicinity of an airport/airstrip;
4. Reduce changes in air traffic patterns, including either an increase in traffic levels or a change in location that reduces substantial safety risks; or

5. Reduce displacement of existing housing, necessitating less construction of replacement housing elsewhere.

4.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2.

4.2.2.1 Direct and Indirect Effects of the Alternative

Anticipated changes to the existing land use designations within the Planning Area are shown in Table 4-3.

Table 4-3. Changes to Existing Land Use Designations under the No Action/No Project Alternative

Land Use Designation	Existing Land Use Designations in Planning Area (acres)	Existing % of Planning Area	Land Use Designations Removed from Development (acres)	New Land Use Designations in Planning Area (acres)	New % of Planning Area
Agricultural Cropland	82,279	25.9	2,263	80,016	25.19

Notes:

1 Urban (future) represents the total area of projected urban development under the No Action/No Project Alternative. The land use designation of these areas after development is not known at this time.

2 The "rights-of-way" designation represents areas of roadways, utility corridors, and other areas where a local land use authority has granted rights-of-way, and no land use designation was retained.

3 Table columns may not total precisely due to rounding.

As described in Section 2.2.2, the urban development expected under the No Action/No Project Alternative (Table 4-3) would occur under the General Plans of Sacramento County, Rancho Cordova, and Galt. The General Plan EIRs, described in Sections 3.4.1, 3.4.2, and 3.4.3, analyzed the compatibility of land uses and consistency with general plan policies within Sacramento County, Galt, and Rancho Cordova. The land use analyses from each of these General Plan EIRs provide the foundation of the impact analysis for the No Action/No Project Alternative. The relevant land use impact analyses from each General Plan EIR are summarized and incorporated by reference below.

The impact analyses presented in the *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR) (Sacramento County 2010) determined the following within Sacramento County:

- Proposed future land uses would not conflict with existing adjacent land use plans or programs or divide an existing community resulting in a less-than-significant impact (Sacramento County 2010, pp. 3-22 to 3-66).
- General plan policies for expansion of the UPA would conflict with some smart growth principles, and the physical effects of the policy conflicts could result in significant impacts related to loss of open space and development outside of the urban environment (Sacramento County 2010, pp. 3-22 to 3-66).
- Displacement of housing due to roadway expansions would result in a less-than-significant impact (Sacramento County 2010, pp. 3-22 to 3-66).
- Compliance with the airport CLUPs would ensure airport safety impacts would be less than significant (Sacramento County 2010, pp. 3-22 to 3-66).
- Planned urban growth within the Jackson Highway Corridor[8] would conflict with "smart growth principles" that direct development towards existing urbanized areas and away from open space, and this urban growth would result in a significant and unavoidable impact to existing land use policy (Sacramento County 2010, pp. 3-22 to 3-66).

The impact analysis presented in the *City of Galt General Plan Update: 2030 Final EIR* (Galt General Plan EIR) (Galt 2008) determined the following within the City of Galt SOI:

- Planned Urban development described in the Galt General Plan (Galt 2009) would not physically divide an established community, or conflict with an adopted land use plan

[8] As described further in Section 3.4.1, the proposed project analyzed within the Sacramento County General Plan EIR assumed development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by the County. However, the County is currently processing Master Plans in the Jackson Highway Corridor, so the referenced conclusions from the proposed project analysis are relevant to the No Action/No Project Alternative.

including a habitat conservation plan, resulting in a less-than-significant impact (Galt 2008, pp. 4-1 to 4-9).

- Planned Urban development along Highway 99 would be located within one mile of Mustang Airport which could result in a land use conflict. The addition of a new policy requiring using the Caltrans Airport Land Use Planning Handbook when reviewing projects within a mile of the airport would reduce impacts to less than significant (Galt 2008, pp. 4-1 to 4-9).

The Galt General Plan EIR did not address displacement of existing housing that would necessitate the construction of replacement housing elsewhere.

The impact analysis presented in the *City of Rancho Cordova General Plan Final EIR* (Rancho Cordova General Plan EIR) (Rancho Cordova 2006b), determined the following within Rancho Cordova:

- New urban development would not divide an established community, conflict with a habitat conservation plan, or result in incompatible land uses based on compliance with general plan land use policies resulting in a less-than-significant impact (Rancho Cordova 2006b, pp. 4.1-1 to 4.1-62).
- Conflicts with other land use plans, policies and regulations would occur with the Mather Airport CLUP, Sacramento County General Plan, and the Mather Field Specific Plan resulting in a significant and unavoidable impact (Rancho Cordova 2006b, pp. 4.1-1 to 4.1-62).
- New urban development would not result in the displacement of existing housing resulting in a less-than-significant impact (Rancho Cordova 2006b, p. 4.3-14).

The 50-year study period for this EIS/EIR ends in 2065, which is after the study periods of the three previously referenced General Plan EIRs. Consequently, additional urban development not analyzed in the three General Plan EIRs would occur between the end of the three General Plan EIRs' analysis periods and the end of the EIS/EIR's study period. This additional development would include the displacement or shifting of 1,900 acres of urban development outside the UDA under the No Action/No Project Alternative (as described in Section 2.2.3) and would result in longer or increased vehicle trips, an increase in air pollutants (Chapter 14), and a potential loss of agricultural land (Chapter 6). Because the No Action/No Project Alternative would be inconsistent with regional transportation plans (Chapter 13) and result in extension of development beyond the existing USB, the No Action/No Project Alternative is inconsistent with the 2036 MTP/SCS (SACOG 2016). Similarly, because the *Sacramento Region Blueprint Transportation and Land Use Plan* (SACOG 2004) emphasizes infill and other revitalization and relies on smart growth principles, the shift or displacement of 1,900 acres of new development to locations beyond the current USB would also conflict with the *Sacramento Region Blueprint Transportation and Land Use Plan*.

Development outside the current UDA would also be inconsistent with Sacramento County and Rancho Cordova's adopted general plans, specifically smart growth policies discussed in Section 4.1.1. For example, Sacramento County's Policy LU-122 (Sacramento County 2011) specifically states the "Urban Policy Area is intended to provide an adequate supply of developable land sufficient to accommodate projected growth," and Sacramento County will "evaluate the UPA at a minimum of five-year intervals, to determine if an expansion is needed to maintain a constant adequate supply of land." Policy LU-127 states that Sacramento County shall not expand the USB unless specific conditions are met or that Sacramento County finds the expansion "would provide extraordinary environmental, social or economic benefits and opportunities to the County" (Sacramento County 2011, pp. 132, 134). The intent of these policies is to ensure any expansion of the UPA or USB is done thoughtfully to avoid inconsistencies with potential impacts to adjacent areas. An inconsistency with smart growth policies would contribute further to the already significant, unavoidable impacts described in the Sacramento County and Rancho Cordova General Plan EIRs discussed previously.

Consistency with the Delta Plan was not analyzed as part of the EIRs for the General Plans of Sacramento County, Galt, and Rancho Cordova. Based on a review of the Delta Plan screening criteria[9] (Delta Stewardship Council 2014) that local land use authorities would use to make this determination and the fact that most new development under the No Action/No Project Alternative would be located outside the southwestern portion of the Planning Area that is within the Primary or Secondary Zones of the Delta Plan, few of the projects and activities implemented under the No Action/No Project Alternative would be subject to Delta Plan consistency. However, urban development outside the UDA could potentially conflict with Policy P-3 that requires buffers between urban development and agricultural operations. This would be a less-than-significant, adverse impact to consistency with adopted plans and policies.

As explained in Section 2.2, under the No Action/No Project Alternative, mitigation for impacts to listed species or existing aquatic resources from new urban development would continue to include avoidance and compensation, including establishment of on-site or off-site preserves. As discussed in Section 2.2.5, management of mitigation preserves and mitigation banks could continue to include a variety of habitat management activities, such as livestock transportation for grazing management, fence repair, and visits by preserve managers for maintenance and monitoring. Many of these preserves established under the No Action/No Project Alternative would be located in the UDA and would eventually be

[9] The screening criteria for this determination are available here: http://deltacouncil.ca.gov/sites/default/files/2014/11/2014-11-25-Covered-Actions-Checklist.pdf

surrounded by urban development. With that proximity to development, preserve management and monitoring activities could result in conflicts with existing and planned land uses. However, under the No Action/No Project Alternative management and monitoring activities on new preserves are not expected to be intensive relative to existing conditions, and management and monitoring activities would not result in incompatibility with adjacent land uses or inconsistencies with any applicable planning document. Therefore, mitigation preserves established under the No Action/No Project Alternative would not be incompatible with adjacent land uses or with any of the planning documents discussed in Section 4.1.1. Consequently, the No Action/No Project Alternative preserves would result in a less-than-significant impact to adjacent land uses and would not be inconsistent with existing planning documents. Agricultural compatibility is analyzed in Section 6.2.2.

Preserves established as mitigation under the No Action/No Project Alternative would not be located within any established community, and the Preserve System would not require physically changing or altering an existing developed area or adding a new population. Therefore, the No Action/No Project Alternative would not disrupt an established community or displace existing housing and would have ***No Impact*** on any established community or existing housing.

Depending on the location, establishment of new on-site or off-site mitigation preserves could contribute to potential safety hazards associated with wildlife strikes on aircraft. In general, the airports within or adjacent to the Planning Area, including Sacramento Executive, Mather, Franklin Field, Rancho Murieta, and Eagle's Nest, are located near urban development, undeveloped lands, and agricultural areas. The urban development that would occur under the No Action/No Project Alternative could eliminate some aquatic resources that currently attract hazardous wildlife, and re-established or established aquatic resources could create new hazardous wildlife attractants. As stated in Section 2.2.2, re-establishment and/or establishment to mitigate for impacts to aquatic resources under the Clean Water Act, Section 404, would typically occur at a 1:1 ratio; therefore, there would be no net change in wetlands acres in the Planning Area from activities and projects authorized under Clean Water Act, Section 404. Aquatic resources could be re-established or established in open space areas within the Overflight Zone to replace those wetlands lost due to development; however, the CLUPs and the Airport Land Use Commission Policy Plan note that open space and natural areas, including natural water areas, are compatible within all the airport safety zones only if the mitigation area does not cause a wildlife hazard (Airport Land Use Commission 1992; State of California Department of Transportation 2011). Therefore, the Clean Water Act, Section 404, compensatory mitigation for project impacts under the No Action/No Project Alternative could increase aquatic resources within existing airport safety zone areas, potentially creating an incompatible use due to increased wildlife hazards. Based

on the FAA's recent interest in projects near airports, the EIS/EIR assumes that local land use authorities in the Planning Area will continue to consider potential wildlife hazards when evaluating proposed projects in their jurisdictions, including wetland establishment and/or re-establishment. However, that oversight by local land use authorities would only occur if the project is subject to CEQA review. Otherwise, the project would likely proceed without consideration to wildlife hazards.

In summary, aquatic resources re-establishment and establishment mitigation expected under the No Action/No Project Alternative could potentially increase the safety hazards associated with wildlife strikes on aircraft if the location of re-established or established aquatic resources creates a greater risk of wildlife strike than the existing aquatic resources that are removed by the new development. However, it is equally likely that new aquatic resource locations will be farther away from airport safety zones. Therefore, the No Action/No Project Alternative would have a less-than-significant impact on airport safety.

4.2.2.2 Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and 4.1.2.1, past and present agricultural operations; urban development; development of agricultural-residential neighborhoods and other rural development; mining operations; and construction of energy, water conveyance, flood control, and transportation infrastructure projects, such as facilities owned and managed by the California Department of Transportation and the Department of Water Resources, have altered land use throughout the study area. These past and present alterations have resulted in the existing conditions of land use described in Section 4.1.2.

The types of reasonably foreseeable future other projects, activities, and actions, described in Section 3.7.2, are similar to the types of past and present actions that occurred in the study area. The reasonably foreseeable future other actions in the study area (see Section 3.7.2 and 4.1.2.1) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in Elk Grove and Rancho Murieta, master planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued development of cultivated agricultural lands, expansion of existing preserves, and development of major infrastructure projects such as the California High-Speed Rail and the California WaterFix (see Section 3.7.2 for details of these projects). Some of these foreseeable "other" future actions are consistent with the existing land use plans discussed in Section 4.1.1.4; however, the buildout of the Elk Grove's future SOI expansion and development north of Rancho Murieta would affect the existing land use designations in the Planning Area outside the UDA. These other foreseeable developments would conflict with Sacramento County General Plan (Sacramento County 2011), the 2036 MTP/SCS (SACOG

2016), and the *Sacramento Region Blueprint Transportation and Land Use Plan* (SACOG 2004), which prioritize locating new development within the existing USB. These inconsistencies of past, present, and reasonably foreseeable future other projects and activities with existing land use plans would be a cumulatively significant adverse impact.

In addition, as discussed in Section 4.2.2, under the No Action/No Project Alternative, approximately 1,900 acres of planned urban development would be shifted or displaced to areas outside the current UDA, which would probably be to areas south of the Elk Grove SOI or areas near Rancho Murieta. This displaced development of the No Action/No Project Alternative would add to the land use impacts of reasonably foreseeable development in the Elk Grove SOI and Rancho Murieta areas. Because the No Action/No Project Alternative would add to the existing land use plan conflicts of past and present activities and the reasonably foreseeable future projects, the No Action/No Project Alternative would substantially contribute to the existing significant cumulative impact to land use from past, present, and reasonably foreseeable projects present in the study area.

4.2.3 Proposed Action/Proposed Project

The Proposed Action/Proposed Project Alternative is described in Section 2.3.

4.2.3.1 Direct and Indirect Effects of the Alternative

Under the Proposed Action/Proposed Project Alternative, approval, issuance of Incidental Take Permits, and implementation of the SSHCP would occur as described in Section 2.3.

As shown in Table 4-4, under the Proposed Action/Proposed Project Alternative, approximately 19.2% of the Planning Area (34,852 acres) would be developed with urban uses during the 50-year study period.

Table 4-4. Changes to Existing Land Use Designations under the Proposed Action/ Proposed Project Alternative

Land Use Designation	Existing Land Use Designations in Planning Area (acres)	Existing % of Planning Area	Land Use Designations Removed from Development (acres)	New Land Use Designations in Planning Area (acres)	New % of Planning Area

Low Density Residential	6,263	2.0%	3,191	3,071	1.0%
Medium Density Residential	687	0.2%	160	527	0.2%
High Density Residential	223	0.1%	17	206	0.1%
Commercial – Office	2,272	0.7%	528	1,745	0.5%
Industrial Extensive	4,362	1.4%	1,414	2,949	0.9%
Industrial Intensive	3,408	1.1%	1,219	2,190	0.7%
Specific Plan Area	7,008	2.2%	3,420	3,589	1.1%
Other Mixed Use Development	142	0.0%	44	98	0.02%
Urban (Future)[1]	*0*	*0.0%*	*0*	34,852	11.0%
Total Urban	*24,365*	*7.7%*	*9,993*	*49,227*	*19.1%*
Natural Preserve	18,556	5.8%	555	18,001	5.7%
Public/Quasi-Public	8,896	2.8%	1,856	7,040	2.2%
Recreation	3,328	1.0%	457	2,871	0.9%%
Rights-of-Way[2]	7,986	2.5%	1,792	6,192	2.0%
TOTAL[3]	**317,655**	**100.0%**	**34,852**	**317,655**	**100.0%**

Notes:

1 Urban (future) represents the total area of projected urban development under the Proposed Action/Proposed Project Alternative, which would be located primarily within the UDA. The land use designation of these areas after development is not known at this time.

2 The "rights-of-way" designation represents areas of roadways, utility corridors, and other areas where a local land use authority has granted rights-of-way, and no land use designation was retained.

3 Table columns may not total precisely due to rounding.

The Covered Activities of the Proposed Action/Proposed Project Alternative include the same types of urban development projects and activities that are discussed under the No Action/No Project Alternative. However, under the Proposed Action/Proposed Project Alternative, 1,900 acres of urban development would not be "displaced" outside of the UDA. The Proposed Action/Proposed Project Alternative would not result in urban development replacing agricultural lands outside the UDA, and therefore, would not result in the inconsistencies with existing general plans that are described for the No Action/No Project Alternative in Section 4.2.2.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected and coordinated SSHCP Preserve System. Within the UDA, the locations of some individual preserves of the future SSHCP Preserve System are already known because they are proposed as part of pending projects. Both inside and outside of the UDA, other preserves needed to complete the Preserve System would be acquired by following certain criteria to preserve existing habitat for Covered Species, including preservation of currently undeveloped lands that support vernal pools. Although the Proposed Action/Proposed Project Alternative does not identify the specific locations of lands that would be acquired for the Preserve System, it is anticipated that preserves would be located on undeveloped or agricultural lands with high quality habitats or special-status species populations or on lands natural land that connect existing preserve areas. Such potential preserve sites would be non-urbanized and typically outside of established communities, and therefore, it is not anticipated that the establishment of new preserves under the Proposed Action/Proposed Project Alternative would affect established communities.

However, the Proposed Action/Proposed Project Alternative would allow for more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented consistently with the Sacramento County General Plan and the Rancho Cordova General Plan without urban development shifting or being displaced to locations outside the current USB.

The Proposed Action/Proposed Project Alternative has been designed to complement and help implement the goals and policies of the Sacramento County General Plan and of ordinances adopted for the protection of resources, as discussed in Section 4.1.1.4. The Proposed Action/Proposed Project Alternative provides a means to implement several of the policies in the Land Use Elements of the Sacramento County General Plan, Rancho Cordova General Plan, and Galt General Plan, contributing to consistency with these plans. These include, but are not limited to, Sacramento County General Plan Policy CO-58 (Sacramento County 2011), which ensures no net loss of wetlands, riparian woodlands, and oak woodlands, and Sacramento County General Plan Policy CO-65 (Sacramento County 2011), which requires the creation of a network of preserves linked by wildlife movement corridors (see Section 4.1.1.4). The Sacramento County General Plan (Sacramento County 2011) also includes numerous conservation and open space policies to ensure resources and habitat are identified and protected as development occurs and specifically supports the goals and objectives of the SSHCP.

The Galt General Plan (Galt 2008) and the Rancho Cordova General Plan (Rancho Cordova 2006a) include policies designed to protect species habitat and aquatic resources as Galt and Rancho Cordova continue to develop, and the Proposed Action/Proposed Project

Alternative would be consistent with those policies. Specifically, the Galt General Plan (Galt 2008) includes Policy LU-1.10, which requires working with Sacramento County to coordinate habitat preservation efforts, and Policy LU-9.1, which states that Galt will participate in establishing a permanent agriculture, open space, and wildlife habitat greenbelt between Galt and Elk Grove. The Rancho Cordova General Plan (Rancho Cordova 2006a) includes several policies to conserve natural resources within Rancho Cordova and specifically supports the goals and objectives of the SSHCP. Rancho Cordova General Plan Policy NR.1.1 requires the protection of rare, threatened, and endangered species and their habitats in compliance with federal and state law; Rancho Cordova General Plan Policy NR.1.6 requires participation in the development of an HCP; and Rancho Cordova General Plan Policy NR.2.1 requires "no net loss" of wetlands consistent with current federal and state aquatic resource regulations (discussed in Section 4.1.1.4) (Rancho Cordova 2006a).

As discussed in Section 4.1.1, approximately 41,000 acres within the southwestern portion of the Planning Area falls within the Primary Zone of the Delta Plan. The Proposed Action/Proposed Project Alternative's stated biological goals (Section 2.3) are consistent with the Delta Plan policies for restoring, protecting, and enhancing the Delta ecosystem and water supply (Section 4.1.1). Therefore, the Proposed Action/Proposed Project Alternative would be less likely to result in inconsistencies with the Delta Plan, relative to the No Action/No Project Alternative. Because projected urban development described under the adopted general plans would be accommodated within the existing UDA, the Proposed Action/Proposed Project Alternative would result in fewer potential conflicts with existing general plans than under the No Action/No Project Alternative, in which approximately 1,900 acres of planned urban development could be shifted or displaced to areas outside the current USB (see Section 4.4.4).

Further, the Proposed Action/Proposed Project Alternative would implement more of the natural resource protections included in the Sacramento County General Plan (Sacramento County 2011), the Delta Plan (Delta Stewardship Council 2013), and the Land Use and Resource Management Plan for the Primary Zone of the Delta (Delta Protection Commission 2010) compared to the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial*** effect to land use plan compatibility compared to the land use plan compatibility expected under the No Action/No Project Alternative.

As indicated in Section 2.3.5, the Proposed Action/Proposed Project Alternative includes a large, interconnected Preserve System and a comprehensive preserve management program. Most preserve land management activities would maintain existing land uses (e.g., grazing, agriculture), with only minor modifications to enhance quality of species habitat. As with the No Action/No Project Alternative, preserve management under the Proposed Action/Proposed Project Alternative would also include a variety of habitat management activities, including transportation of sheep, goats, or cattle for grazing management; fence repair; wildlife or vegetation surveys; and visits by preserve managers for maintenance and monitoring (Table 2-3, Section 2.3.6). Similar to the No

Action/No Project Alternative, preserves located inside the UDA would eventually be surrounded by urban development. With that proximity to development, preserve management and monitoring have potential to conflict with existing and planned land uses. However, a preserve management plan would be prepared for each SSHCP preserve located inside the UDA, which would avoid or minimize preserve activities potential effects on surrounding areas. The preserve management plan would provide a coordinated way to minimize incompatibilities with existing or planned land uses or conflicts with existing land use plans. Avoidance and Minimization Measure (AMM) EDGE-1 would prioritize compatible adjacent uses next to SSHCP preserves. The Proposed Action/Proposed Project Alternative would include an interconnected Preserve System, which includes larger core preserves (rather than the often smaller and more isolated preserves that would be established without a coordinated process under the No Action/No Project Alternative) (see Section 2.3.5). The Proposed Action/Proposed Project Alternative preserve design would reduce conflicts between urban uses and open space/wildlife uses when compared to the conflicts expected under the No Action/No Project Alternative. Therefore, there would be either no difference to or a minor benefit to (i.e., reduction in) land use impacts from preserve activities under the Proposed Action/Proposed Project Alternative when compared to land use impacts expected under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative preserve system would have a ***Minor Beneficial*** effect on land use plan compatibility relative to the land use plan compatibility of the No Action/No Project Alternative. Agricultural compatibility is analyzed in Section 6.2.3.

The interconnected Preserve System would not be located within any established community, and the Preserve System would not require physically changing or altering an existing developed area or adding a new population. Therefore, the Proposed Action/Proposed Project Alternative would have ***No Impact*** on disrupting an established community or displacing existing housing compared to the No Action/No Project Alternative baseline condition.

The Proposed Action/Proposed Project Alternative includes acquisition, monitoring, and management of a Preserve System. The Preserve System would create habitat to support a variety of natural land covers and species habitats in the Planning Area. The creation or establishment of new aquatic habitats or the re-establishment of aquatic habitats could contribute to the potential for airport safety hazards (e.g., wildlife strikes) to occur. An analysis is provided below that addresses this potential safety concern for airports within or adjacent to the Planning Area (see Figures 4-3 through 4-7 and the existing condition of each Planning Area airport presented in Section 4.1.2).

Aquatic habitat is a focus of the airport wildlife hazard assessment because it has potential to attract water birds that are considered hazardous to aircraft. The assessments include evaluation of the potential for collisions by birds with aircraft above the Planning Area and elsewhere as a result of synergistic effects between new and existing aquatic resources or other wildlife attractants.

As indicated in EIS/EIR Chapters 8 and 10, the Proposed Action/Proposed Project Alternative would prioritize re-establishment/establishment of vernal pools in the MCRA rather than freshwater marsh or open water aquatic resources. As discussed in Section 4.1.2.3, vernal pools hold water for only a few weeks or months and for much shorter periods than freshwater marsh, seasonal wetlands, and other aquatic resources, and thus, attract water birds for less time per year than other wetland types. Therefore, wildlife attractants near Mather Field in the MCRA may be reduced under the Proposed Action/Proposed Project Alternative compared to the No Action/No Project Alternative baseline condition.

Further, AMM AIRPORT-1 indicates that, prior to any re-establishment or establishment of wetlands that would result in a net increase in area of freshwater marsh or open water in the Preserve System or a substantial increase in the proximity of open water or freshwater marsh to airports, an approved biologist must evaluate the proposed establishment/re-establishment activity and the types of wildlife that it will attract (including types/quantities of birds or other wildlife), and provide recommendations on how to reduce wildlife hazards, if feasible. Therefore, AMM AIRPORT-1 would further reduce potential impacts on aircraft hazards and improve the coordination between aquatic resource re-establishment/establishment projects and the Sacramento County Department of Airports.

The Preserve System of the Proposed Action/Proposed Project Alternative would not re-establish or establish aquatic resources within the safety zones of Sacramento Executive Airport. Thus, there would not be an increased risk of wildlife strike hazards at Sacramento Executive Airport compared to the No Action/No Project Alternative baseline condition.

The Proposed Action/Proposed Project Alternative could result in additional preserves being established within the Overflight Zones or 5-mile separation zones for other airports within or adjacent to the Planning Area. Aquatic resources, especially vernal pools, would be re-established and/or established within the Preserve System. The CLUPs and FAA's latest Advisory Circular note that open space and natural areas, including natural wetland areas, are compatible within all the airport safety zones only if wetland areas or preserves do not cause a wildlife hazard. Relative to freshwater marsh or open water wetland, vernal pools rarely hold water, and thus, are only occasionally used by water birds (Silveira 1998). During preserve planning, the planning for re-establishment or establishment of aquatic resources would comply with the policies and regulations of the relevant airport safety zone (see Sections 4.1.1.1, 4.1.1.4, and 4.1.2.1). The Proposed Action/Proposed Project Alternative's adherence to wildlife hazard policies in the CLUPs or FAA Advisory Circular would ensure that established or re-established aquatic resources do not result in wildlife hazards at any Planning Area airport. Potential increases in wildlife strike hazards at these airports would also be reduced through the planning process described for AMM AIRPORT-1 in Chapter 5 of the SSHCP document (EIS/EIR Appendix D).

In addition to wildlife strike hazard, aquatic resources located within the Overflight Zone and/or 5-mile separation zone can generate ground fog. The analysis for the potential of ground fog creation is based on the elevation of the water area, the distance from the runway, and the prevailing winds. AMM AIRPORT-1 in the SSHCP (Appendix D) would ensure that the design of preserve areas, including wetlands, takes into consideration the potential for ground fog creation.

The Proposed Action/Proposed Project Alternative would result in less potential for inconsistencies with the adopted airport CLUPs and other relevant policies relative to inconsistencies expected under the No Action/No Project Alternative condition. The Proposed Action/Proposed Project Alternative would also not increase the risk of wildlife strike hazards at the airports in the Planning Area compared to the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on airport safety when compared to airport safety under the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Impacts

Compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would include the following actions:

- Avoid inconsistencies with existing land use plans
- Minimize potential conflicts of preserve management and monitoring activities by siting compatible uses near preserves and by providing a coordinated way to minimize incompatibilities with existing or planned land uses or conflicts with existing plans
- Improve compatibility with airports and minimize potential airport safety hazards by implementing a planning process that coordinates wetlands re-establishment/establishment with airport planning staff

Therefore, when considering the totality of direct and indirect effects discussed previously, the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects to land use when compared to the No Action/No Project Alternative baseline condition.

4.2.3.2 Cumulative Effects of the Proposed Action/Proposed Project Alternative

As described in Sections 3.7.1 and 4.1.2.1, past and present human activities in the Planning Area converted much of the historically undeveloped lands to agricultural use, and then some of that agricultural use has been converted to developed land. These and other past and present human activities are reflected in the acres of existing land use described in Table 4-2.

The types of reasonably foreseeable future other projects, activities, and actions described in Section 3.7.2 are similar to the types of past and present actions that occurred in the Planning

Area. These foreseeable "other" projects, activities, and actions include new urban development within the City of Elk Grove and within Rancho Murieta, master planned developments in the UDA named "Rio Del Oro" (3,828 acres) and "Mather South" (885 acres) further rural residential development outside the UDA, continued urban development on cultivated agricultural lands, expansion of existing preserves, and development of major infrastructure projects such as the California High-Speed Rail and the California WaterFix.

Two of the reasonably foreseeable future projects described in Section 3.7, the buildout of the City of Elk Grove's future SOI expansion and new development north of Rancho Murieta, would ultimately affect the planned land uses outside the UDA. These two foreseeable other projects would conflict with the Sacramento County General Plan (Sacramento County 2011), the 2036 MTP/SCS (SACOG 2016), and the *Sacramento Region Blueprint Transportation and Land Use Plan* (SACOG 2004), which are all land use planning documents that prioritize new urban development within the existing USB. The types and amounts of urban development Covered Activities (including associated transportation and recycled water Covered Activities) described under the Proposed Action/Proposed Project Alternative (Section 2.3.3) are very similar to the planned urban development described within the General Plans for Sacramento County, Galt, and Rancho Cordova. The changes in land use designations to allow the urban development and infrastructure Covered Activities of the Proposed Action/Proposed Project Alternative would be consistent with the 2036 MTP/SCS, the *Sacramento Region Blueprint Transportation and Land Use Plan*, and the Delta Plan because they would confine urban development to the UDA. Further, the changes in land use designations under the Proposed Action/Proposed Project Alternative to allow urban development and infrastructure Covered Activities are consistent with the Sacramento County, Galt, and Rancho Cordova General Plan land use policies that encourage development projects to evaluate conservation to minimize or avoid impacts to biological resources.

As identified in Section 4.2.2, the incremental impacts of the No Action/No Project Alternative on existing land use designations, when considered together with changes to land use designations resulting from past, present, and reasonably foreseeable projects and activities in the cumulative study area, would have a significant adverse cumulative effect on land use by conflicting with up to six existing land use plans. As discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the two action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Because the Proposed Action/Proposed Project Alternative would not conflict with any existing land use plans, the Proposed Action/Proposed Project Alternative would have a smaller incremental contribution to the Planning Area's cumulative conflicts with existing land use plans. Therefore, the Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect when compared to the No Action/No Project Alternative baseline condition.

4.2.4 Reduced Permit Term Alternative

The Reduced Permit Term Alternative is described in Section 2.4.

4.2.4.1 Direct and Indirect Effects of the Alternative

As described in Section 2.4, the Reduced Permit Term Alternative would include similar types of new urban development as the No Action/No Project Alternative (Section 4.2.2) and the Proposed Action/Proposed Project Alternative (Section 4.2.3).

As shown in Table 4-5, under the Reduced Permit Term Alternative, approximately 16.2% of the Planning Area (37,398 acres) would be developed with urban uses by the end of the 50-year study period.

Table 4-5. Changes in Existing Land Use Designation under the Reduced Permit Term Alternative

Land Use Designation	Existing Land Use Designations in Planning Area (acres)	Existing % of Planning Area	Land Use Designations Removed from Development (acres)	New Land Use Designations in Planning Area (acres)	New % of Planning Area
Agricultural Cropland	82,279	25.9	1,667	80,612	25.4
Agricultural Residential	24,926	7.8	3,232	21,694	6.8
Agricultural Urban Reserve	1,907	0.6	845	1,062	0.3
General Agriculture (20 Acres)	38,720	12.2	9,811	28,909	9.1
General Agriculture (80 Acres)	106,692	33.6	6,476	100,216	31.6
Total Agriculture	*254,524*	*80.1*	*22,031*	*232,493*	*73.2*
Low Density Residential	6,263	2.0	3,166	3,097	1.0
Medium Density Residential	687	0.2	160	527	0.2
High Density Residential	223	0.1	17	206	0.06
Commercial – Office	2,272	0.7	528	1,744	0.6
Industrial Extensive	4,362	1.4	1,752	2,609	0.8
Industrial Intensive	3,408	1.1	1,219	2,189	0.7
Specific Plan Area	7,008	2.2	3,524	3,484	0.1
Other Mixed Use Development	142	0.0	44	98	0.03
Urban (Future)	**0**	**0**	**0**	37,398	11.8
Total Urban[1]	*24,365*	*7.7*	*10,412*	*51,351*	*16.2*
Natural Preserve	18,556	5.8	552	18,004	5.7
Public/Quasi-Public	8,896	2.8	1,867	7,030	2.2
Recreation	3,328	1.0	475	2,853	0.9
Rights-of-Way[2]	7,986	2.5	2,061	5,925	1.9
TOTAL[3]	**317,655**	**100.0**	**37,398**	**317,655**	**100.0**

Note: The GIS mapping exercise conducted for the Reduced Permit Term Alternative was focused on identifying the areas of development impacts to natural land covers and did not include all potential redevelopment of existing developed land covers.

1 Urban (future) represents the total area of projected urban development under the Proposed Action/Proposed Project Alternative, which would be located primarily within the UDA .The land use designation of these areas after development is not known at this time.

2 The "rights-of-way" designation represents areas of roadways, utility corridors, and other areas where a local land use authority has granted rights-of-way, and no land use designation was retained.

3 Tables may not total precisely due to rounding.

Under the Reduced Permit Term Alternative, new urban development would occur inside the UDA, as directed by the General Plans of Sacramento County, Rancho Cordova, and Galt, and no new urban development would "shift" or be displaced to areas outside the UDA. The Reduced Permit Term Alternative would result in only 210 acres of less direct impact to natural land covers than the No Action/No Project Alternative. However, 896 acres more of direct impacts to natural land covers would occur in the MCRA portion of the UDA, and 597 acres more of direct impacts to natural land covers would occur in the UDA outside the MCRA when compared to the direct impacts of the No Action/No Project Alternative. Compared to the No Action/No Project Alternative, 406 fewer acres of lands with agricultural land use designations would be changed to urban development under the Reduced Permit Term Alternative (Table 4-5). By avoiding a shift or a displacement of new development to areas outside the UDA, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on compatibility with existing land use plans when compared to the No Action/No Project Alternative baseline condition.

As with the No Action/No Project Alternative, preserve management activities under the Reduced Permit Term Alternative would include grazing management, fence repair, trash removal, mowing and/or vegetation removal to control thatch and invasive species, and visits by preserve managers for maintenance and monitoring. These activities would neither conflict with applicable land use policies from Sacramento County or Galt and Rancho Cordova nor would they physically divide an existing community or displace residents. However, the preserve system established during the 30-year Reduced Permit Term Alternative would have more intensive management and monitoring than the preserves established during the same period of the No Action/No Project Alternative. Many of the preserves under the Reduced Permit Term Alternative would be located in the UDA and thus, would be near urban development. The management and monitoring of these preserves could result in some conflicts with existing or planned land uses. However, a preserve management plan would be prepared for each preserve and would take into account how preserve activities affect surrounding areas. That preserve management plan would provide a coordinated way to minimize incompatibilities with existing or planned land uses or conflicts with existing plans. AMM EDGE-1 would prioritize compatible adjacent uses next to preserves established during the 30-year permit term. Overall, there would be either no difference or a minor benefit in land use impacts from preserve activities when compared to the No Action/No Project Alternative. Therefore, the preserve system would have a ***Minor Beneficial*** effect on land use plan compatibility compared to the No Action/No Project Alternative baseline condition. Agricultural compatibility is analyzed in Section 6.2.4.

Potential impacts on wildlife strike hazard to aircraft would be essentially the same for years 1–30 as for the Proposed Action/Proposed Project Alternative (Section 4.2.3). Effects on aircraft strike hazard would be reduced through implementation of AMM AIRPORT-1, which

would ensure coordination between airport planners and the entities siting wetland re-establishment/establishment projects. From years 31–50, the potential impacts would be essentially the same as for the No Action/No Project Alternative (Section 4.2.2). Because of the enhancement coordination with airport planners during the 30-year permit term, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on wildlife strike hazard compared to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Impacts

Compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would include the following actions:

- Avoid inconsistencies with existing land use plans by avoiding urban development outside the UDA
- Minimize potential conflicts of preserve management and monitoring activities by siting compatible uses near preserves and by providing a coordinated way to minimize incompatibilities with existing or planned land uses or conflicts with existing plans during years 1–30 of the EIS/EIR study period
- Improve compatibility with airports and minimize potential airport safety hazards by implementing a planning process during years 1–30 of the EIS/EIR study period that coordinates wetlands re-establishment/establishment with airport planning staff

Therefore, when considering the totality of direct and indirect effects discussed previously, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to land use compared to the No Action/No Project Alternative baseline condition.

4.2.4.2 Cumulative Effects of the Alternative

As described in the No Action/No Project Alternative, the Planning Area has transitioned from undeveloped land to agriculture to developed land, and this transition is reflected in the land use designations described in Table 4-2. The adopted General Plans of Sacramento County, Galt, and Rancho Cordova have attempted to minimize the adverse effects of future urban development land use changes (e.g., increased traffic, increased loss of agricultural lands) through zoning and land use designations that minimize incompatible land uses (Section 4.1.1).

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area, including additional urban development in Elk Grove and Rancho Murieta, master planned development at Rio Del Oro and Mather South, further rural residential development outside the UDA, continued development of

cultivated agricultural lands, expansion of existing preserves, and development of major infrastructure projects such as the California High-Speed Rail and the California WaterFix.

The buildout of the City of Elk Grove's future SOI expansion and the development north of Rancho Murieta, which are reasonably foreseeable future projects in Section 3.7, would affect the ultimate land use mixture outside the UDA. These developments would conflict with the Sacramento County General Plan, MTP/SCS, and the *Sacramento Region Blueprint Transportation and Land Use Plan*, which prioritize development within the existing USB.

Urban development (including transportation and recycled water Covered Activities) described under the Reduced Permit Term Alternative is very similar to urban development included within the General Plans of Sacramento County, Galt, and Rancho Cordova General Plans and would be consistent with the 2036 MTP/SCS, the *Sacramento Region Blueprint Transportation and Land Use Plan*, and the Delta Plan, which provide frameworks for coordinated land use planning. Further, the Reduced Permit Term Alternative is consistent with the Sacramento County, Galt, and Rancho Cordova General Plan land use policies that encourage development projects to evaluate conservation to minimize or avoid impacts to biological resources.

As identified in Section 4.2.2, the land use changes outside the UDA under the No Action/No Project Alternative, when considered together with land use changes resulting from past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on land use by conflicting with existing land use plans. The Proposed Action/Proposed Project Alternative has been designed to complement and help implement the goals and policies of the Sacramento County General Plan and of ordinances adopted for the protection of resources, as discussed in Section 4.1.1.4 and other chapters of this EIS/EIR.

However, this EIS/EIR evaluates the impacts of the No Action/No Project Alternative relative to the existing conditions but evaluates the impacts of the two action alternatives relative to the future conditions expected under the No Action/No Project Alternative (see Section 3.6.1). Because the Reduced Permit Term Alternative would result in less development outside the UDA than the No Action/No Project Alternative, it would have a smaller cumulative contribution to conflicts with existing land use plans. Therefore, the Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect when compared to the No Action/No Project Alternative baseline condition.

CHAPTER 5 – SOILS, GEOLOGY, AND MINERAL RESOURCES

This chapter presents the existing conditions and the potential effects of each Environmental Impact Statement/Environmental Impact Report (EIS/EIR) alternative on geology, soils, and mineral resources. Issues analyzed include existing geology and geologic conditions; soil conditions; seismic and soils hazards from earthquake, landslide, and erosion; important mineral resources; and naturally occurring asbestos. However, paleontological resources, the potential occurrence of which is closely related to geologic features, are addressed in EIS/EIR Chapter 11, Paleontological, Cultural, and Historical Resources.

Geology and geologic conditions are the result of processes occurring over millions of years involving large-scale changes in physical landforms such as the formation of the Sierra Nevada or the filling of valleys from erosion. The effects of past geologic process are reflected in an area's topography, the types of deep underlying soil or rock present, and conditions such as the presence or absence of seismic faults. The analysis of soils includes conditions near the ground surface, typically no deeper than 10 feet. Processes that develop soils, such as erosion of surrounding rock material and inputs of organic material from vegetation, usually occur within a timescale of tens of thousands of years. Environmental impact documents analyze geology and soils because they are related to issues such as earthquake risk, erosion potential, and naturally occurring health hazards such as naturally occurring asbestos. These types of issues can be important factors in a project's siting, design, and implementation.

Mineral resources are marketable materials that are extracted from the earth, such as precious metals, petroleum products such as natural gas and oil, and sand and gravel used for construction. Environmental impact documents analyze mineral resources because a project or activity, such as placing housing over a gravel deposit suitable for construction aggregate, can limit or prevent future access to these resources.

5.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

As discussed in Chapter 3, Section 3.5, Contents of the Affected Environment/Environmental Setting Sections of Chapters 4 through 16, this section describes the existing regulatory conditions and the existing physical conditions of the geology, soils, and mineral resources within the Planning Area, and the existing conditions of hazards related to earthquakes, landslides and erosion, and naturally occurring asbestos.

5.1.1 Regulatory Framework

There are several federal, state, and local agency requirements that apply to soils, geological resources, and/or mineral resources within the Planning Area. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, issuance of permits permitting, or implementation of the alternatives analyzed in

this EIS/EIR. This section also identifies any relevant federal permits or other entitlements that must be obtained prior to implementing the alternatives. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 5.2, Environmental Consequences/Environmental Impacts (40 CFR 1502.25).

5.1.1.1 Federal

International Building Code

The design and construction of engineered facilities in California must comply with the requirements of the International Building Code (International Code Council 2014) and the adoptions to that code adopted by the State of California (see California Building Standards Code below).

Clean Water Act

The federal Clean Water Act (CWA) is discussed in detail in Chapters 7 and 10. However, because CWA Sections 401 and 402 are directly relevant to grading activities, it is also discussed here in Chapter 5.

Under CWA Section 401, projects and activities that may result in the discharge of a pollutant into wetlands and other waters of the United States and require authorization by federal license or federal permit must first obtain a CWA Section 401 water quality certification from the state in which the discharge would originate. In California, the U.S. Environmental Protection Agency has delegated the authority to grant water quality certifications to the State Water Resources Control Board, which are typically processed by the Regional Water Quality Control Boards with local jurisdiction. A water quality certification requires the project or activity to evaluate its potential impacts and implement appropriate measures to protect water quality and comply with regulatory water quality standards.

Under CWA Section 402 (CWA 402), the National Pollutant Discharge Elimination System (NPDES) program regulates the discharge of waste into wetlands and other waters of the United States. The NPDES permit regulations apply to broad categories of discharges, including point-source municipal wastewater discharges and nonpoint-source stormwater runoff. NPDES permits typically identify the following:

- Effluent and receiving-water limits on allowable concentrations and/or mass emissions of pollutants contained in the discharge
- Prohibitions on discharges not specifically allowed under the permit

- Provisions that describe required actions by the discharger, including industrial pretreatment, pollution prevention, self-monitoring, and other activities

The California State Water Resources Control Board administers the NPDES permit program in California. Projects that disturb 1 or more acres of soil must obtain coverage under the state's NPDES General Permit for Discharges of Storm Water Associated with Construction Activity. A stormwater pollution prevention plan must be developed and implemented that provides specific construction-related best management practices (BMPs) to prevent soil erosion and loss of topsoil. The required components and BMPs commonly included in a stormwater pollution prevention plan are described in greater detail in Chapter 7, Hydrology and Water Quality.

5.1.1.2 State

California Building Code

The California Building Code (CBC) (24 CCR) is based on the International Building Code. The International Building Code Seismic Zone Map of the United States places the Planning Area within Seismic Hazard Zone III, which corresponds to an area that may experience damage due to earthquakes having moderate intensities of V or more on the Modified Mercalli Scale, which corresponds to maximum momentum magnitudes of 4.9 or greater. The CBC has been modified for California conditions with more detailed and/or more stringent regulations. Specific minimum seismic safety and structural design requirements are set forth in Chapter 16 of the CBC. The CBC identifies seismic factors that must be considered in a structural design. For example, Chapter 18 of the CBC regulates the excavation of foundations and retaining walls, while Chapter 18A regulates construction on unstable soils, such as expansive soils and areas subject to liquefaction. Appendix J of the CBC regulates grading activities, including drainage and erosion control.

Alquist-Priolo Earthquake Fault Zoning Act

The intent of the Alquist-Priolo Earthquake Fault Zoning Act (California Public Resources Code, Section 2621–2630) is to reduce the risk to life and property from surface fault rupture during earthquakes by regulating construction in active fault corridors and prohibiting the location of most types of structures intended for human occupancy across the traces of active faults in California. The act defines criteria for identifying active faults, giving legal support to terms such as active and inactive, and establishing[1] a process for reviewing building proposals in Earthquake Fault Zones. Before a project can be permitted in a designated Alquist-Priolo Earthquake Fault Zone, cities and counties must require a geologic investigation to demonstrate

[1] Note that in the context of this Plan, the word "establish" is synonymous with "create."

that proposed buildings would not be constructed across active faults. However, no Alquist-Priolo Zones are mapped within the Planning Area (CGS 2017).

Seismic Hazards Mapping Act

The intent of the Seismic Hazards Mapping Act (PRC Section 2690–2699.6) is to reduce damage resulting from earthquakes in California. While the Alquist-Priolo Act addresses surface fault rupture, the Seismic Hazards Mapping Act addresses other earthquake-related hazards, including strong ground shaking, liquefaction, and seismically induced landslides. The act's provisions are similar in concept to those of the Alquist-Priolo Act: the state is charged with identifying and mapping areas at risk of strong ground shaking, liquefaction, landslides, and other corollary hazards, and cities and counties are required to regulate development within mapped Seismic Hazard Zones. Seismic Hazard Zones must incorporate standards specified by California Geological Survey (CGS) Special Publication 117a, *Guidelines for Evaluating and Mitigating Seismic Hazards* (CGS 2008). However, no Seismic Hazard Zones are mapped in the Planning Area.

Surface Mining and Reclamation Act

The State of California Surface Mining and Reclamation Act (SMARA) (California Public Resources Code Sections 2710–2719), is the primary regulation governing mining operations and mine reclamation. Its purposes are to ensure that adverse environmental effects are prevented or minimized; mined lands are reclaimed to a useable condition; production and conservation of minerals are encouraged while giving consideration to recreational, ecological, and aesthetic values; and residual hazards to public health and safety are eliminated. Local agencies are responsible for ensuring compliance with SMARA requirements for mine operation and reclamation.

SMARA mandates that the Mineral Resources Project, which is administered by the CGS and provides objective geologic expertise and information about California's diverse non-fuel mineral resources, classify lands throughout the state that contain regionally significant mineral resources (California Public Resources Code, Division 2, Chapter 9, Section 2710 et seq.). Through the SMARA Mineral Land Classification Project, the State Geologist identifies and maps mineral resources of the state (not including oil and gas) to show where economically significant mineral deposits occur and where they are likely to occur based upon the best available scientific data (CDOC 2007).

Mineral resources classified under the Mineral Land Classification Project include metals; industrial minerals; and construction aggregate, which includes sand, gravel, and crushed stone. Special emphasis has been given to construction aggregate because it is the state's most important mineral commodity in terms of tonnage, value, and societal infrastructure. Local

agencies are required to use the classification information when developing local land use plans and when making land use decisions (CDOC 2007).

SMARA also requires the State Geologist to classify lands within California based on mineral resource availability. The State Geologist is responsible for classifying lands subject to urban development by Mineral Resource Zones (MRZs) according to the presence or absence of significant sand, gravel, stone, or other deposits of value that may be suitable for mining. The process is based solely on underlying geology without regard to existing land use or land ownership. The primary goal of mineral land classification is to ensure that local government decision makers recognize and consider the mineral potential of the land before making land use decisions that could preclude mining.

The CGS has established the following MRZ classification system to denote both the location and significance of key extractive resources:

- **MRZ-1** – Areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence
- **MRZ-2** – Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists
- **MRZ-3** – Areas containing mineral deposits, the significance of which cannot be evaluated from existing data
- **MRZ-4** – Areas where available information is inadequate for assignment to any other MRZ zone

Asbestos Airborne Toxic Control Measure (for Construction, Grading, Quarrying, and Surface Mining Operations

The California Air Resources Board has adopted an Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations (17 CCR 93105). This statewide regulation requires use of control measures to minimize emissions of asbestos-laden dust. The Asbestos Airborne Toxic Control Measure applies to any size construction project although there are more stringent mitigation requirements for projects that exceed 1 acre. Naturally occurring asbestos is known to be present in eastern Sacramento County (CDOC 2006). In the Planning Area, the Sacramento Metropolitan Air Quality Management District has regulatory authority to ensure compliance with the Asbestos Airborne Toxic Control Measure.

5.1.1.3 Local

Sacramento County

Sacramento County 2030 General Plan

The *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011) Safety Element includes goals, objectives, and policies related to seismic and geologic hazards; the Agricultural Element includes goals, objectives, and policies that address the conservation of soil resources; and the Conservation Element addresses extraction of mineral resources. Applicable goals and policies include the following:

Goal: Minimize the loss of life, injury, and property damage due to seismic and geological hazards.

Policy SA-1: The County shall require geotechnical reports and impose the appropriate mitigation measures for new development located in seismic and geologically sensitive areas.

Policy SA-3: The County shall support efforts by Federal, State, and other local jurisdictions to investigate local seismic and geological hazards and support those programs that effectively mitigate these hazards.

Policy SA-4: The County shall prohibit development on ground surfaces which exceed 40 percent in slope, such as the bluff areas along the American River. Development shall be set back from these slopes at a distance established by the Zoning Code.

Goal: Protect important farmlands from conversion and encroachment and conserve agricultural resources.

Policy AG-28: The County shall actively encourage conservation of soil resources.

Goal: Mineral resources protected for economic extraction with minimal adverse impacts.

Policy CO-38: Sewer interceptor and trunk alignments shall be routed to avoid areas planned for aggregate resource mining to the extent practical. Where such alignments are impractical, they shall be designed to minimize aggregate resources which would be precluded from mining, and make reasonable attempt to preserve the future use of mined areas for flood control or recharge purposes.

Policy CO-39: Surface mining operations shall be subject to appropriate mitigation measures and shall avoid creating any significant nuisances, hazards, and adverse

environmental impacts, unless the Board of Supervisors makes the findings to override as required by [the California Environmental Quality Act] CEQA Guidelines Section 15091.

Policy CO-41: Surface mining shall not be allowed without adequate plans for reclamation of mined areas. Reclamation plans should be based on a plan for post-mining land use that is consistent with the land use strategies of the General Plan.

Policy CO-44: Due to the predicted shortages of aggregates in Sacramento County, mining of mineral resources within the Urban Services Boundary (USB) is encouraged, where consistent with Habitat Conservation Plans or other County initiated conservation programs and where such mining does not preclude successful completion of these plans, to avoid the potential loss of these mineral resources as a result of potential urban development. This policy is not intended to preclude mining outside the USB.

Sacramento County Land Grading and Erosion Control Ordinance

The Sacramento County Land Grading and Erosion Control Ordinance (Sacramento County Code, Chapter 16.44) was established to minimize damage to surrounding properties and public rights-of-way; limit degradation to the water quality of watercourses; and avoid disrupting drainage system flow during clearing, grubbing, grading, filling, and excavating activities. The ordinance establishes administrative procedures, minimum standards of review, and implementation and enforcement procedures for the control of erosion and sedimentation that are directly related to land grading activities.

Sacramento County NPDES Municipal Stormwater Permit Program

Stormwater discharges to the municipal separate storm sewer systems in Sacramento County and the Cities of Sacramento, Galt, Rancho Cordova, Elk Grove, Folsom, and Citrus Heights are regulated under an NPDES Municipal Stormwater Permit issued by the Central Valley Regional Water Quality Control Board (Order No. R5-2015-0023, NPDES No. CAS082597). This NPDES permit is renewed every 5 years, most recently in April 2015. Ground-disturbing projects or activities within these jurisdictions must implement required BMPs to avoid or reduce stormwater run-off, soil erosion, and the corresponding discharge of pollutants to downstream surface waters, to the maximum extent practicable. The Sacramento County NPDES permit is discussed in more detail in Chapter 7.

2030 Galt General Plan

The *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009a) contains goals and policies in the Safety and Seismic, Public Facilities and Services, and Conservation Elements to minimize risk from seismic and geologic hazards, limit erosion and siltation, and

express the community's priorities regarding mining activities. Applicable goals and policies include the following:

Goal SS-2: To minimize the loss of life, injury, hardships, and property damage due to seismic and geological hazards.

Policy SS-2.1: Geologic and Soils Information. The City of Galt shall require soils reports for new projects and use the information to determine appropriate permitting requirements.

Policy SS-2.2: Seismically-Engineered Public Structures. The City of Galt should ensure that all existing and future public structures, such as buildings and water storage tanks, are of sufficient construction to withstand seismically induced ground shaking and related geologic hazards.

Policy SS-2.3: Grading/Erosion Control. The City of Galt shall require grading and erosion control plans to be prepared by a qualified engineer or land surveyor.

Goal PSF-4: To collect and dispose of stormwater in a manner that protects the city's residents and property from the hazards of flooding, manage stormwater in a manner that is safe and environmentally sensitive, and enhances the environment.

Policy PFS-4.5: Grading During the Rainy Season. The City of Galt shall prohibit grading activities during the rainy season, unless adequately mitigated, to avoid sedimentation of storm drainage facilities.

Policy PFS-4.6: Erosion Control Plan. The City of Galt requires new development projects to prepare an erosion control plan.

Goal COS-4: To preserve and enhance open space lands to maintain the natural resources of the Galt area.

Policy COS-4.7: Mining Activities. The City of Galt shall prohibit mining activities in the City limits and strongly oppose mining activity proposals within the Galt General Plan Planning Area.

Rancho Cordova General Plan

The *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2006a) contains goals and policies in the Safety Element to minimize risk from seismic and geologic hazards and in the Natural Resources Element to address mineral extraction. Applicable goals and policies include the following:

Goal S.3: Reduce the Risk of Adverse Effects to Residents or Businesses as a Result of Geologic or Seismic Instability.

Policy S.3.1: Support efforts by federal, State, and local jurisdictions to investigate local seismic and geologic hazards and support those programs that effectively mitigate these hazards.

Policy S.3.2: Ensure that new structures are protected from damage caused by geologic and/or soil conditions to the greatest extent feasible.

Goal NR.6: Support the Environmentally Sensitive Extraction of Minerals and the Subsequent Reclamation of Mined Areas.

Policy NR.6.1: Ensure that the environmental effects of mining and reclamation on aquifers, streams, scenic views, and surrounding residential uses are prevented or minimized.

Policy NR.6.3: While mining activities are anticipated to be phased out within the City of Rancho Cordova, the City recognizes the right of these uses to continue and will require setbacks, buffers, screening, and other appropriate measures to allow for the continued operation of mining activities.

5.1.2 Planning Area Geologic Environment Existing Conditions

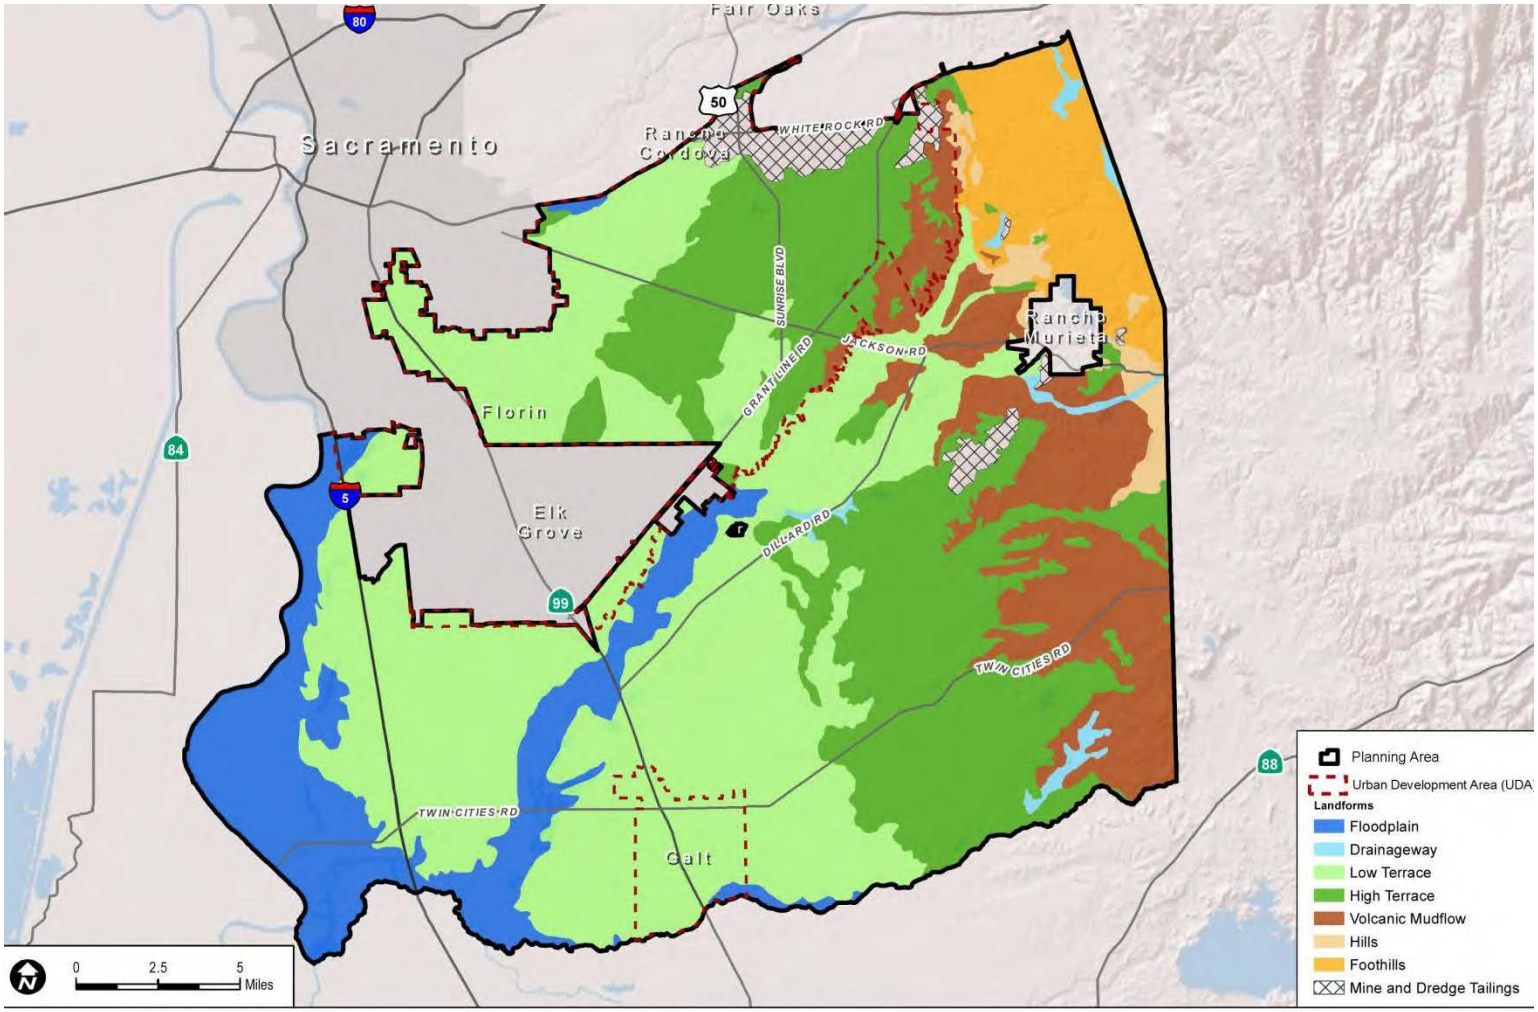
This section provides information on existing locations and condition of geologic resources, surface soils, and minerals in the Planning Area, as well as the existing geological hazards in the Planning Area.

Additional information about the interrelationships between Planning Area landforms, geologic formations, and associated soils is included to provide context for discussions and analysis of vernal pools and other aquatic resources that will be presented in subsequent chapters in this EIS/EIR, including Chapter 8 (Natural Land Cover Habitats, and Associated Plant and Animal Communities), Chapter 9 (Special-Status Species Including HCP Covered Species), and Chapter 10 (Aquatic Resources).

The present landscape of Sacramento County has been shaped over time by the ongoing processes of erosion and deposition. Material eroded from the ancestral Sierra Nevada, formed over 100 million years ago, was deposited in an ancient sea that once occupied the Sacramento Valley floor. The Sacramento Valley is the area of the Central Valley north of the Sacramento–San Joaquin River Delta that is drained by the Sacramento River. Approximately 10 million to 15 million years ago, tectonic uplifts altered the geomorphology of the Sierra Nevada. Glaciation, volcanism, and erosion followed the uplifting, adding layers of sediment to the Sacramento Valley floor. Under the present geologic conditions, the alteration of the local geomorphology

continues through stream erosion of the Sacramento Valley sediments and subsequent deposition in adjacent floodplains (Sacramento County 2011).

These past processes are evident in the topography of the Planning Area, which is generally flat in the central and western portions of the Planning Area, and transitions to rolling hills in the eastern portion approaching the Sierra Nevada foothills.



Planning Area Geomorphic Provinces. The Planning Area is located within portions of two distinct geomorphic provinces. A geomorphic province is an area that has a relatively consistent geologic origin and erosional/depositional history. The majority of the Planning Area lies within the Great Valley Province, which extends from Redding in the north to approximately Bakersfield in the south and is bounded by the coastal mountain ranges on the west and the Sierra Nevada to the east (CGS 2002). The Great Valley Province is generally flat and low-lying, consisting largely of alluvial and sedimentary deposits that have been eroded from the adjacent mountain ranges and that make up the Sacramento Valley floor. The eastern region of Sacramento County lies within the Sierra Nevada Province, and is differentiated from the Great Valley Province portion of the Planning Area by the presence of outcroppings of metamorphic rock strata, increasing elevations, and undulating topography (CGS 2002).

Planning Area Landforms. A landform is a geomorphological unit and is largely defined by its surface form and location in the landscape. As part of the terrain, a landform is an element of topography. Landforms are categorized by characteristic physical attributes such as elevation, slope, orientation, stratification, rock exposure, and soil type. The development of the existing landforms in the Planning Area took place during the Pleistocene (1.6 million to 10,000 years ago) and Holocene (10,000 to 200 years ago) Epochs.

The seven predominant landforms in the Planning Area are floodplain (low and high), drainageway, low terrace, high terrace, volcanic mudflow, hills, and foothills (Figure 5-1) (Jones and Stokes 1990; USDA 1993; Smith and Verrill 1998). These landforms are discussed below in order of their geographic placement on the landscape from the lowest elevation (newest surfaces) to highest elevation (oldest surfaces).

Figure 5-1 also identifies mine and dredge tailings, which is not a natural landform. These are human-formed features in Sacramento County that are composed almost entirely of rounded river rock that was excavated from ancient riverbeds during gold mining activities in the early 1900s through approximately 1960. The dredged rock, after being processed to extract the gold, was disposed of in large rows or piles at several locations in the Planning Area (Figure 5-1).

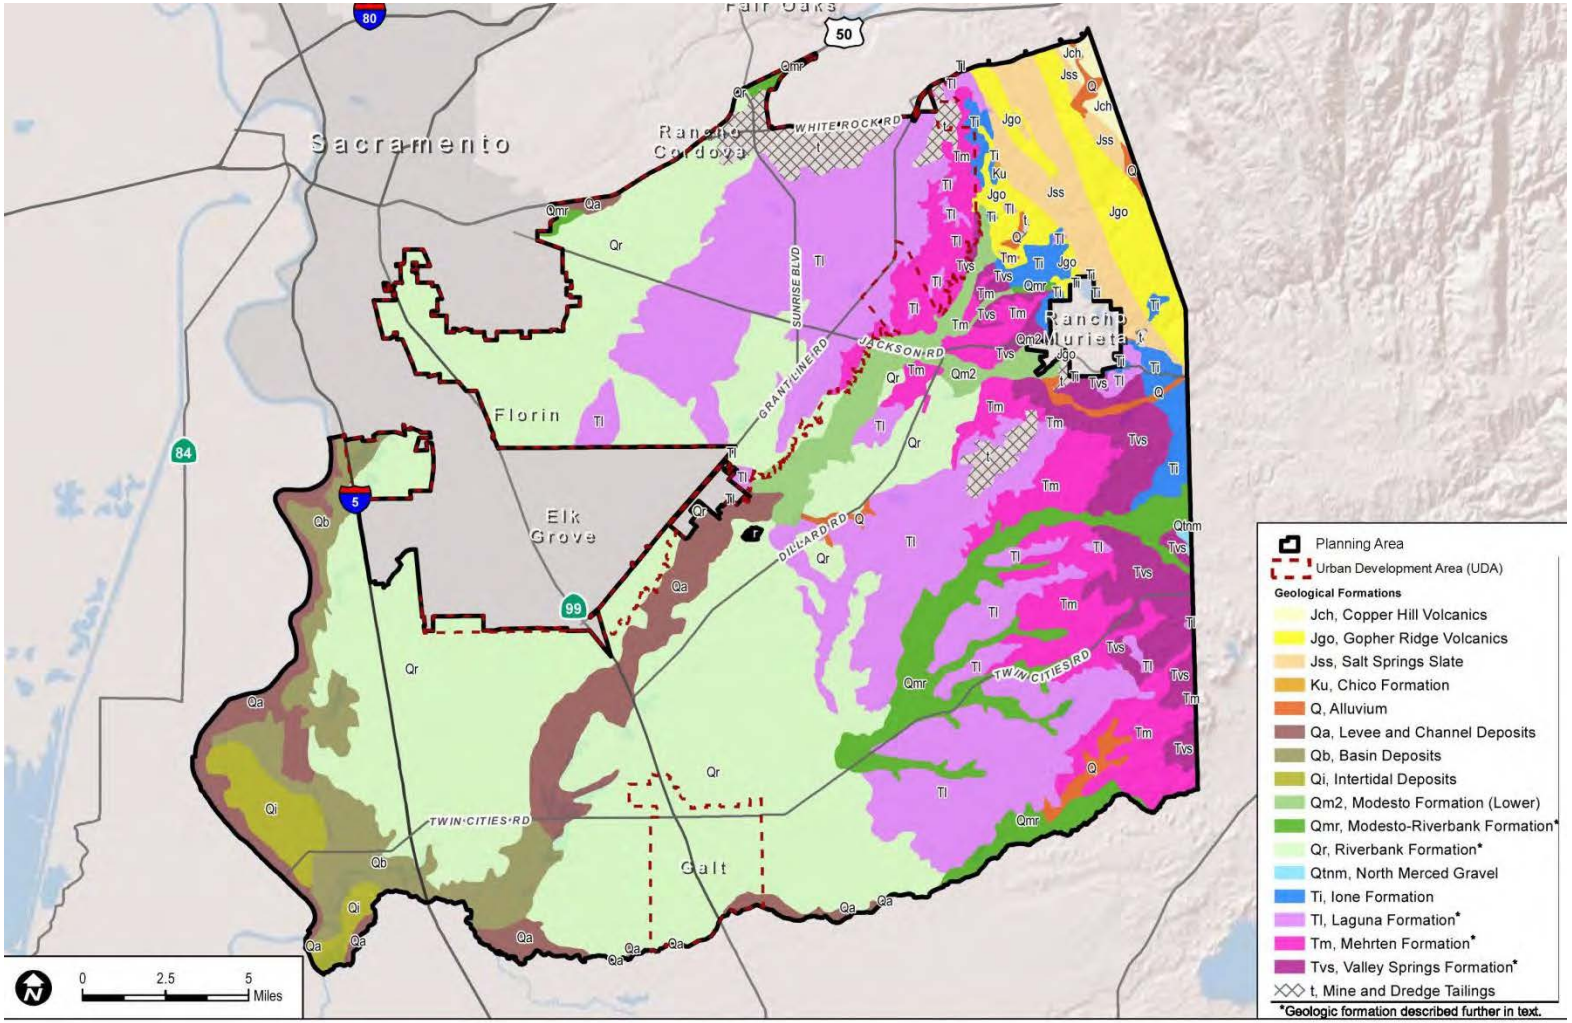
INTENTIONALLY LEFT BLANK

Planning Area Geologic Formations. Each of the seven geomorphological landforms in the Planning Area (discussed previously) also supports specific geologic surficial deposits (geological formations). A geologic formation is a geomorphic feature on the Earth's surface during an episode of landscape development. Geologic formations are differentiated by various criteria, including age, physical structure, layering of materials, compaction, texture, depositional history, geomorphology, and soil-profile development (Smith and Verrill 1998). The geologic formations described below are from the Geologic Map of the Sacramento Quadrangle prepared by the CGS (CGS 1981) (see Figure 5-2). Like Figure 5-1, Figure 5-2 also identifies areas of human-created mine and dredge tailings, which are not a natural geologic formation.

As discussed in the introduction to Section 5.1.2, Planning Area Geologic Environmental Existing Conditions, the locations and ecology of vernal pools are closely correlated to the geologic formation and soils. Of the 17 geologic formations found within the Planning Area, 15 contain vernal pools. Of the 15 Planning Area geologic formations that contain vernal pools, there are 5 primary geologic formations that support the majority of vernal pools remaining in the Planning Area: the Laguna, Riverbank, Modesto-Riverbank, Mehrten, and Valley Springs Formations. These five formations are each described in detail in Sections 5.1.2.2 to 5.1.2.5, beginning with Planning Area geologic formations with the most vernal pool acres to the geologic formations with the fewest vernal pool acres.

Planning Area Soils. Many different kinds of soils are found within the Planning Area with a wide range of characteristics, including depth to rock, the presence of hardpans, erodibility, clay content, and soil slopes. Soils in the Planning Area vary from very deep, nearly level alluvial soils to undulating shallow soils over restrictive duripans or clay-rich soil horizons to shallow hilly soils overlying bedrock. These soils also vary from well-drained to poorly drained mineral soils, and to a lesser extent, organic soils. Individual soil units are organized into map units called soil associations, which consist of soil units of the same texture and composition that occur in a geographic position (USDA 1993).

Planning Area soils series with support vernal pools are soils that include an impermeable layer. The impermeable soil layer can be formed of claypan, a cemented hardpan (duripan), rock, or a combination of these. Certain soil series in the Planning Area consistently coincide with the occurrence of vernal pools. Most of the soil series with vernal pools are strongly associated with a specific geologic formation, although some soil series may occur on two or more geologic formations. The six most prominent soil series within the Planning Area are discussed in Sections 5.1.2.2 to 5.1.2.5. The locations of these key Planning Area soil series are shown in Figure 5-3.



5.1.2.1 Floodplain Landform (Low and High Floodplains)

The youngest and lowest landform surface in the Planning Area is the low floodplains. This is an active surface with component landforms that include nearly level floodplains bordering the Sacramento, American, and Cosumnes Rivers; each river's tributaries; and the many smaller channels in the Planning Area. The low floodplains are frequently inundated unless they are protected by levees or upstream dams. The landscape is dynamic as new channels are formed and old channels become inactive. Alluvium moving downstream on the low floodplains in the Planning Area has buried older geomorphic surfaces. High floodplains are also an active surface but somewhat older than the low floodplains. Unless protected by human-made levees or upstream dams, all floodplains occasionally or frequently flood. The components of this surface include backswamps, which are the sections of floodplain where silts and clays settle out; the edges of backswamps; and natural levees and floodplains along the rivers and other channels. All of these surface components are nearly level (Jones and Stokes 1990; USDA 1993; Smith and Verrill 1998). Vernal pools are not found on the Floodplain Landform within the Planning Area.

5.1.2.2 Drainageway Landform and Geologic Formations

The drainageway landform is composed of relatively recent alluvial deposits at the base of toe slopes (i.e., depositional material at the base of a slope) and of stream terraces (i.e., deposits of old floodplain material oriented parallel to the stream) adjacent to floodplains and incised channels of active waterways, and occur on top of other older geologic formations. These are the second-youngest landform surfaces in the Planning Area and are present where active streams, creeks, and rivers traverse the other landforms found in the Planning Area. Consequently, vernal pools that formed on drainageway deposits are relatively young but are often associated with another older vernal pool type on the adjacent higher ground and terraces (terrace landforms are discussed below). In contrast to vernal pools found on the low terrace, high terrace, and mudflow landforms, the vernal pools found on the drainageway landform fill and drain relatively rapidly and may depend more on overland runoff and direct precipitation to maintain their hydrology (Jones and Stokes 1990). Soils above the restricting claypan or hardpan layers in these pool types may be too deep for perched water tables (i.e., an area of saturated soil near the ground surface and separated from deeper groundwater aquifers by an impermeable layer of rock, clay, or other material) to become exposed in shallow vernal pools. Additionally, the basins of these types of pools are often shallow, increasing susceptibility to evaporation, or slightly sloped, which encourages drainage.

INTENTIONALLY LEFT BLANK

Figure 5-3 Key Soil Series

INTENTIONALLY LEFT BLANK

Modesto-Riverbank Geologic Formation

The Modesto-Riverbank Formations (i.e., Modesto Formation (lower) and Modesto-Riverbank Formation) are dominantly andesitic, late- to middle-Pleistocene alluvium composed of gravel, sand, silt, and clay derived from deposition from various streams (CGS 1981). The Modesto-Riverbank Formations are generally confined to the southeastern portion of the Planning Area forming on either side of Laguna Creek (south) and its tributaries, and on either side of Dry Creek. Widths vary from approximately 0.25 mile wide along the tributaries of Laguna Creek (south) to about 1 mile wide along the main channel of Laguna Creek and Dry Creek. These formations extend west from the Planning Area's boundary with Amador County to a nondescript area east of Galt.

There are a number of soil series that are associated with the Modesto-Riverbank Formations, including, but not limited to, the Corning complex, Hicksville loam, Madera loam, Redding gravelly loam, and Tehama loam (CGS 1981).

The Modesto-Riverbank Formations cover the fifth largest area in the Planning Area, with a total of 14,688 acres, with 567 acres inside the Urban Development Area (UDA[2]) and 14,121 acres outside the UDA. It comprises nearly 5% of the total Planning Area.

The Modesto-Riverbank Formations encompass 5,272 or about 9% of the total number of vernal pools within the Planning Area. All 5,272 vernal pools occurring on this formation are outside of the UDA. The Modesto-Riverbank Formations rank fourth in importance in terms of total number of vernal pools. Approximately 11% (503 acres) of the total vernal pool acreage within the entire Planning Area occurs on the Modesto-Riverbank Formations. All 503 acres of Modesto-Riverbank formation vernal pools are found outside of the UDA.

5.1.2.3 Low Terrace Landform, Geologic Formations, and Soil Series

Low terraces (also referred to as "young terrace"), are of relatively recent geologic origin (Jones and Stokes 1990). They contain late Pleistocene-age (100,000 years ago) geomorphic surfaces that are underlain by older stream alluvium. Low terrace landforms occur on the broad, nearly level plain of alluvial deposits that make up the Sacramento Valley floor. Low terrace landforms are relatively young when compared to the high terrace or the mudflow landforms (Smith and

[2] As discussed in Section 1.1.1, Geographic Scope of the EIS/EIR Planning Area, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, the term "UDA" means all lands within Sacramento County's USB boundary that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within Galt's sphere of influence (see Figure 1-1).

Verrill 1998). Low terrace soils are younger and not as well developed when compared to high terrace landforms, but have been forming long enough to have undergone significant pedogenesis (soil forming processes), and claypans and duripans are common.

Vernal pools occur extensively in certain areas of the low terraces. Low terrace soils commonly form seasonal "perched aquifers" (the same as the perched water table identified previously in the description of the drainageway landform). Vernal pools found within the low terrace landforms do not exhibit the same richness of flora or specialized species when compared to vernal pools on high terrace landforms. Most young terrace sites have been plowed, graded, or heavily grazed because of the arable soils that are present and the proximity to reliable water. This and the relatively young age of the vernal pools may also account for the unspecialized flora in these pools in the Planning Area. Many low terrace pools are shallow or have poorly defined basins.

Riverbank Geologic Formation

The Riverbank Formation is located on the low (young) terrace landform. The Riverbank Formation was deposited on a plain of stream alluvium that has been partially dissected. The upper surface of this plain, in most places, represents the upper surface of the Riverbank Formation. The upper surface is characterized by a gently undulating surface. In the vicinity of Elk Grove, the Riverbank Formation is about 10 miles wide from west to east. To the east, it laps onto older materials composed of the Laguna Formation. To the west, it is in turn overlain by younger alluvial materials. The Riverbank Formation is generally confined to the central and western portions of the Planning Area and occurs on either side of the Cosumnes River.

The Riverbank Formation is the largest geologic formation in the Planning Area, with a total of 122,228 acres (35,401 acres inside the UDA and 86,827 acres outside the UDA). It comprises just over 38% of the total Planning Area (Figure 5-2). Although the Riverbank Formation dominates the Planning Area, large portions have been converted for agriculture or developed for urban uses because of the arable soils that are present and the proximity to reliable water. In addition, most undeveloped portions of the Riverbank Formation were plowed or leveled in the past. Consequently, young-terrace vernal pools are not as common in the Planning Area as the extent of the Riverbank Formation might suggest (Jones and Stokes 1990).

Soils with claypans and duripans are common in the Riverbank Formation, as are vernal pools (Smith and Verrill 1998). As discussed below, the San Joaquin soil series is most closely associated with the Riverbank Formation. Other associated soil series in the Planning Area include Redding, Red Bluff, and Corning.

The Riverbank Formation encompasses 12,367, or 20%, of the total number of vernal pools within the Planning Area, with 2,800 located inside the UDA and 9,567 outside the UDA. The Riverbank Formation ranks second in total number of Planning Area vernal pools.

Approximately 34% (1,533 acres) of the total vernal pool acres within the entire Planning Area occurs on the Riverbank Formation, with 289 acres of vernal pool within the UDA and 1,244 acres outside the UDA.

Soil Series

San Joaquin. The San Joaquin soil series is the most extensive vernal pool soil in the Planning Area. This soil series, as well as other soils with which it is geographically associated (e.g., Fiddyment, Galt, Madera, and Rocklin), developed in the Riverbank Formation on young (low) alluvial terraces along the eastern flank of the Central Valley (in the later Pleistocene, 100,000 to 200,000 years old). San Joaquin soils formed in old alluvium on hummocky topography. A cemented hardpan (duripan) typically 2 feet to 4 feet beneath the surface restricts roots and water percolation. The soil series consists of well-drained and moderately well-drained soils above the duripan that formed in alluvium derived from mixed but dominantly granitic rock sources. Seasonal perched aquifers form above the duripan. The San Joaquin series is found on undulating low terraces with slopes of 0% to 9%. Some areas have been leveled. San Joaquin soils account for approximately 17% of soils within Sacramento County, and San Joaquin soil complexes comprise an additional 8%, for a total of approximately 25% of Sacramento County. San Joaquin soils are the predominant soil series on the Riverbank Formation occurring on both the high floodplain and low terrace landforms in Sacramento County.

Vernal pools tend to form in mound-intermound areas and depressional features within the San Joaquin soil series. Together, the San Joaquin, Redding, and Corning soil series are the primary soils for northern hardpan vernal pools. However, there are several dozen additional soil series (but of more limited distribution) that share the cemented duripan, reddish color, and landscape position that characterize northern hardpan vernal pool soils (Solomeshch et al. 2007).

5.1.2.4 High Terrace Landform, Geologic Formations, and Soil Series

The high terrace landform (also referred to as “old terrace”) is restricted to the east side of the Central Valley (Smith and Verrill 1998; Jones and Stokes 1990; Reiner and Swenson 2000). The high terrace landform was laid down from 600,000 to over 1 million years ago in the mid- to early Pleistocene to late Pliocene (5 million years ago), and lies topographically above low terraces. In the Planning Area, high terraces are ancient deposits of the Pleistocene-era American River, which was located south of its present-day site (Jones and Stokes 1990). Very strong soil development has occurred in relatively flat areas on these terraces where the geomorphic

surfaces are very old. The most pronounced erosion-induced mound-depression microtopography and vernal pool landscapes are found on the high terraces. Similar to the low terrace landform, the soil-restrictive layers form perched aquifers in high terrace landform soils. The soils and vernal pools of the high terrace landform have essentially been developing for more than a half-million years. Consequently, the high terrace landform exhibits well-developed soils and floristically rich habitat. Vernal pools on high terrace landforms typically support more specialized species than vernal pools found within any other landform (Jones and Stokes 1990).

In the Planning Area, the high terrace landform supports the Laguna Formation and Arroyo Seco gravels. Little of the Arroyo Seco gravels have been farmed because irrigation water is lacking and many sites are not arable. Consequently, vernal pools are abundant on level surfaces. However, much of the Planning Area with Laguna Formation high-terrace pools was dryland farmed with wheat or oats for relatively short periods in the past. This activity appears to have had little effect on vernal pools in some areas, such as at the Sunrise-Douglas development area, while in other areas the plowing appears to have disrupted surface hydrology (Jones and Stokes 1990).

Laguna Geologic Formation

The Laguna Formation is located on the High Terrace Landform (Smith and Verrill 1998; Jones and Stokes 1990; Reiner and Swenson 2000). The Laguna Formation, ranging in age from late Miocene to early Pliocene, rests over the older Mehrten Formation (described below). The Laguna Formation is composed of interbedded alluvial gravel, sand, and silt deposited from ancient river channels draining from the Sierra Nevada range, including the Feather, Yuba, American, Cosumnes, and Merced Rivers (Helley and Harwood 1985).

The exposed Laguna Formation occurs in a band several miles wide running north to south along the eastern half of the Planning Area. The Laguna Formation is exposed in the eastern and central portions of the Planning Area. The formation's eastern outcrop extends northward from Dry Creek (southern boundary of the Planning Area), where its area of exposure is about 6 miles wide, to its northernmost exposure along Meiss Road. Its central outcrop extends northward from Deer Creek to its northernmost exposure along U.S. Route 50. The Redding soil series and Red Bluff-Redding complex are the characteristic soil series associated with the Laguna Formation north of the Cosumnes River (soils types are described further below). South of the Cosumnes River to the headwaters of Badger Creek, the Redding series and Red Bluff-Redding complex are the main soils, and they give way to Corning and Hadselville-Pentz complexes south of Badger Creek to Dry Creek at the Sacramento–San Joaquin County line.

The Laguna Formation is the second-most extensive geologic formation in the Planning Area, totaling 61,282 acres (23,608 acres are inside the UDA and 37,674 acres are outside the UDA). It comprises just over 19% of the total Planning Area.

The Laguna Formation ranks first in total number of Planning Area vernal pools. The Laguna Formation encompasses 26,684 vernal pools or 43% of the total number of vernal pools within the Planning Area. Of the 26,684 vernal pools occurring on this formation, 7,734 are located inside the UDA and 18,950 are outside the UDA.

The Laguna Formation supports a variety of vernal pool sizes and densities, including some of the greatest vernal pool densities and most of the very large vernal pools remaining within the Planning Area, primarily within the UDA portion of the Planning Area (Dittes et al. 2007). Dittes et al. 2007 also found significantly lower density of vernal pools, smaller sizes of individual vernal pools, and a different category of "vernal pool complexes" on Laguna Formation soils located outside of the UDA when compared to vernal pools on Laguna Formation soils inside the UDA. Approximately 34% (1,554 acres) of the total vernal pool acreage within the entire Planning Area occurs on the Laguna Formation: 603 acres within the UDA and 951 acres outside the UDA.

Soil Series

Red Bluff. The Red Bluff soil series consists of very deep, well-drained loamy mineral soils formed in high (older) terraces of the Laguna Formation. Red Bluff soils are dominant on high and intermediate terraces and have 0% to 9% slopes in elevations of 75 to 1,500 feet above mean sea level (amsl). Soil horizons nearest the surface may have maximum clay contents of 3% to 10%, and deeper soil horizons have clay content ranging from 27% to 60%. The restrictive layer in the Red Bluff series is claypan at a depth of approximately 35 inches (Jones and Stokes 1990). A high content of clay, reddish color, and a significant amount of iron and manganese staining distinguish these soils from other soils in the Planning Area. The soil between a depth of 7 and 21 inches is dry in all parts from June to October, and moist in some or all parts the rest of the year. Red Bluff soils are among the oldest soils in Sacramento County. Parent materials for Red Bluff soils are gravelly and cobbly alluvium from mixed sources and laid down by an ancestral channel of the American River. This parent material consists of rounded pebbles and cobbles including dark metamorphic, quartzitic, and volcanic rocks in a granitic sand matrix. These American River channel pebbles are approximately 600,000 years old, consequently, they are of mid-Pleistocene age. Soils on hills in the eastern part of Sacramento County also are estimated to be of mid-Pleistocene age.

Corning. Corning soils are gravelly loam formed from the Laguna Formation and Arroyo Seco gravels on high terraces and terrace remnant landforms. Corning soils are characterized by mound-intermound microrelief and on smooth terrace side slopes. They are very deep. They

are well drained on the mounds and moderately well drained in the intermound areas. Typically, the surface layer is gravelly fine sandy loam. The restrictive layer is a claypan at approximately 28 inches in depth (Jones and Stokes 1990). The substratum is stratified gravelly sandy clay loam and gravelly sandy loam. It formed in old valley fill from mixed sources. Typically, the surface layer is reddish-brown, yellowish-red, and red gravelly loam about 22 inches thick. The subsoil is red and dark red clay about 18 inches thick. The substratum to a depth of 60 inches is strong brown clay loam. Permeability is very slow. Surface runoff is slow or medium. The hazard of erosion is slight or moderate. After intense rainstorms, the soil is saturated for a short time. Slopes are 0% to 30%. Elevations are 75 to 1,300 feet amsl. Slopes are 0% to 30%. The soils formed in gravelly alluvium derived from mixed rock sources.

Redding. Redding and Corning soil series developed on older, higher alluvial terrace landforms of the Laguna Formation (Pliocene to early-Pleistocene age). The Corning soil series is described in the previous paragraph. The Redding soil series is a well-drained, gravelly loam mineral soil that is moderately deep over a hardpan and supports primarily annual grassland. It formed in gravelly old valley fill from mixed sources but primarily derives from the Laguna Formation. The hardpan occurs at a depth of 2 to 4 feet below surface level. The series is found on nearly level or dissected and undulating to hilly high terraces. Slopes are 0% to 30%.

Typically, the Redding series surface layer is strong brown gravelly loam about 7 inches thick. The upper part of the subsoil is yellowish-red loam and gravelly loam. The lower part is a claypan of reddish brown and yellowish-red gravelly clay about 8 inches thick, at about 20 inches depth with a weighted average clay content of 35% to 60%. Below this to a depth of 66 inches is a very gravelly hardpan that is strongly cemented with silica. Therefore, the Redding soil series restrictive layer is both a claypan and a hardpan. In some areas, the surface layer is gravelly sandy loam, loam, or sandy loam. The shrink–swell potential is high. Surface runoff is very slow or slow. The hazard of water erosion is slight to moderate. Permeability is very slow in the Redding soil. Water is perched above the claypan/hardpan for short periods after seasonal rainfall in winter and early spring. The soil between depths of 4 and 18 inches is usually dry all of the time from June until September or early October and is moist in some or all parts the rest of the year. Redding soils are on nearly level or dissected and undulating to hilly high terraces. Microrelief may be hummocky. Gravel and cobbles tend to concentrate in the intermound in hummocky areas. Vernal pools are common in areas with slopes of 0% to 3%. Elevations are 40 to 2,000 feet amsl. This soil is used as rangeland or for dryland crops such as wheat. Redding soils may provide wetland functions and services.

Redding soils account for approximately 6% of Sacramento County, predominantly in the eastern portion of Sacramento County. Redding soils are the predominant soil series occurring on the Laguna Formation on low and high terraces.

5.1.2.5 Volcanic Mudflow Landform Geologic Formations and Soil Series

The northern Sierra Nevada was once covered by extensive volcanic mudflows believed to have arisen east of the sierra crest. These ancient mudflow formations were exposed at the base of the Sierra Nevada foothills, and then overlain by a thin soil derived from alluvial material, colluvial material (a loose deposit of rock debris accumulated through the action of gravity at the base of a cliff or slope), and eroded elements of the parent mudflow parent material (Jones and Stokes 1990). The mudflow landform ranges in age from early Pleistocene to Oligocene (37 to 24 million years ago) (Smith and Verrill 1998; Jones and Stokes 1990). The mudflow formation exists today as low, nearly level to gently sloping ridges and fans along the eastern edge of the Planning Area. The mudflow formation is characterized by a thin, shallow layer of soil over impermeable bedrock.

In the Planning Area, areas of the mudflow landform support the Mehrten Formation and the Valley Springs Formation (see geologic formation discussion below). Valley Springs formed in the Oligocene, and Mehrten formed in the Miocene (10 to 25 million years ago) or Pliocene. Soils on the mudflow formation are shallow, extremely rocky, excessively drained by surface runoff and high water infiltration rates, and underlain by impervious mudflow that impedes the downward movement of water and upon which a perched aquifer periodically forms during the wet season (Jones and Stokes 1990).

Mehrten Geologic Formation

The Mehrten Formation consists of eroded, high-standing remnants of volcanic mudflow fans that were deposited during the Pliocene and Miocene and is located on the volcanic mudflow landform. Vernal pools tend to be located on the western edge of the Mehrten Formation in the Sacramento Valley because the eastern portion increases in slope, precluding development of soil processes that formed vernal pools (Smith and Verrill 1998). Vernal pools classified as Northern Volcanic Mudflow Vernal Pools (Sawyer and Keeler-Wolf 1995) are often found on Mehrten Formation soils. Several outcrops of the Mehrten Formation are exposed in a discontinuous band that runs north–south in the eastern portion of the Planning Area in a stratum that underlies the Laguna Formation and overlies the Valley Springs Formation. The exposed band of the Mehrten Formation extends from the south County boundary at Dry Creek, where it is about 4 miles wide, north to U.S. Route 50, where it is less than 1 mile wide.

In the Planning Area, the Mehrten Formation is characterized by the mound-intermound soil series and complexes such as Hadselville-Pentz, Red Bluff-Redding, Corning-Redding, and Pardee-Rancho Seco. The Corning-Redding and Red Bluff-Redding complexes are predominant north of the Cosumnes River, while the Hadselvill-Pentz and Pardee-Rancho Seco complexes are predominant south of the Cosumnes River.

The Mehrten Formation is the third largest of the exposed geologic formations in the Planning Area, with a total of 26,459 acres (3,863 acres inside the UDA and 22,596 acres outside the UDA). It comprises just over 8% of the total Planning Area.

The Mehrten Formation encompasses 10,275 vernal pools, or about 17% of the total number of vernal pools within the Planning Area, with 648 located inside the UDA and 9,627 outside the UDA. The exposed Mehrten Formation ranks third in total number of vernal pools in the Planning Area. In addition, approximately 11% (478 acres) of the total vernal pool acreage within the Planning Area occurs on the Mehrten Formation, with 32 acres of vernal pool in the UDA and 446 acres outside the UDA.

Valley Springs Geologic Formation

The Valley Springs Formation is also on the mudflow landform but is slightly older than the Mehrten Formation. The Valley Springs Formation is made up of eroded, high-standing remnants of rhyolitic (a fine-grained volcanic rock similar to granite) volcanic mudflow fans that were deposited 20–35 million years ago. Vernal pools tend to be located on the western edge of the formation in the Sacramento Valley because the eastern portion increases in slope, precluding soil processes that allow vernal pool development (Smith and Verrill 1998).

The Valley Springs Formation is exposed along the southeastern portion of the Planning Area from the southeastern corner along Dry Creek, northward to the headwaters of Carson Creek. The formation is generally exposed over an area from 1 to 2 miles in width. Its widest exposure is along Arkansas Creek, where it is exposed for about 4 miles from east of Ione Road, west to the Cosumnes River. There may be expansive clays present, especially in fine-grained material. The Amador-Gillender, Hadselville-Pentz, and Pardee-Rancho Seco soil complexes predominate on the Valley Springs Formation.

The Valley Springs Formation is the seventh largest geologic formation exposed in the Planning Area, with a total of 13,690 acres, 141 acres inside the UDA and 13,549 acres outside the UDA. It comprises just over 4% of the total Planning Area.

The Valley Springs Formation contains 4,139 vernal pools, or about 7% of the total number of vernal pools within the Planning Area. Of the 4,139 vernal pools occurring on this formation, 10 are located inside the UDA and 4,129 are outside the UDA. The Valley Springs Formation ranks fifth in importance in terms of total number of Planning Area vernal pools. Approximately 6% (265 acres) of the total vernal pool acreage within the Planning Area occurs on the Valley Springs Formation. With the exception of 0.16 acre, almost all of the vernal pool acreage on this formation occurs outside of the UDA.

Soil Series

Pentz. The Pentz soil series consists of shallow loamy, well-drained soils formed in material weathered from weakly consolidated basic andesitic tuffaceous sediments primarily from the Mehrten Formation on exposed, upturned edges of mudflow formations at the base of the Sierra Nevada foothills (Jones and Stokes 1990). Pentz soils form mound-intermound microrelief and are found on hills and on backslopes of hills. Pentz soils are on the mound position. Slopes are 2% to 50%. The restrictive layer is bedrock. Much of the soil is dry in most years from May 15 to October 15, is moist in all parts from December 1 to May 1, and moist in some parts the rest of the year. The weighted average clay content ranges from 10% to 20%. Coarse fragments are subrounded or rounded metamorphic rock, quartz, or quartzite. Content of coarse fragments is 0% to 35%, with 0% to 25% cobbles or stones. Organic matter in the upper 7 inches mixed is 1% to 3%. Pentz soils are on undulating to hilly hills and on steep backslopes of hills, with mound-intermound microrelief. The microrelief is most strongly expressed on slopes of less than 20%. Elevation is 110 to 600 feet amsl.

The Pentz soil is shallow and well drained. Typically, the surface layer is brown fine sandy loam about 9 inches thick. The subsoil also is brown fine sandy loam. It is about 7 inches thick. Weakly consolidated tuffaceous sandstone is at a depth of about 16 inches. In some areas, the surface layer is gravelly sandy loam, sandy loam, or loam. In other areas, a thin hardpan caps the bedrock. Permeability is moderately rapid in the Pentz soil. Runoff is medium. The hazard of water erosion is slight or moderate.

Hadselville. The Hadselville soil series consists of very shallow loamy, moderately well-drained intermound soils formed in material weathered from weakly consolidated basic andesitic tuffaceous sediments (compacted volcanic ash varying in size from fine sand to coarse gravel) primarily from the Mehrten Formation on exposed, upturned edges of mudflow formations at the base of the Sierra Nevada foothills (Jones and Stokes 1990). The Hadselville and Pentz soils (Pentz soils are described above) are on hills with a mound-intermound microrelief topography. Hadselville soils are in the intermound position, and slopes are 2% to 30%. Soil depth ranges from 4 to 10 inches. The restrictive layer is bedrock. The soil is dry at the bottom depth in most years for a period of 120 to 150 days from May 15 to October 1, moist in all parts for a period of 135 to 165 days from November 15 to April 15, and moist in some parts the rest of the year. Organic matter content ranges from 1% to 2% throughout the profile and is higher than the underlying material. Elevation is 110 to 350 feet amsl.

The Hadselville soil is very shallow and moderately well drained. Typically, the surface layer is grayish-brown sandy loam about 7 inches thick. Weakly consolidated tuffaceous sandstone is at a depth of about 7 inches. In some areas, the surface layer is gravelly sandy loam. In other

areas, a thin hardpan caps the bedrock. Permeability is moderately rapid in the Hadselville soil. Runoff is very slow or medium. The hazard of water erosion is slight or moderate.

5.1.2.6 Hill Landform

A hill landform has a raised surface above a surrounding level plain and is distinguished by its sloping sides and defined peak. Hill landforms can be formed through the geologic processes of faulting and erosion. Within the Planning Area, both processes likely played a role in the formation of the hill landform, which is associated with the Pliocene (5 million years ago) uplift of the Sierra Nevada mountains to the east of the Planning Area. These processes continue to shape the hill landform into present day. Within the Planning Area, the hill landform can be found in a narrow band immediately west of the foothills (Figure 5-1). As shown in Figure 5-2, the Ione Formation, an Eocene-age (55 to 33 million years ago) weathered sedimentary formation primarily comprises the hill landform in the Planning Area (Smith and Verrill 1998; Creely and Force 2007). Vernal pools are not found on the hill landform within the Planning Area.

5.1.2.7 Foothill Landform

The foothill landform is a surface defined by a gradual increase in elevation at the base of a mountain range. They form the transition zone between hills and higher elevation mountains. The foothill landform is associated with the Pliocene (5 million years ago) uplift of the Sierra Nevada mountains to the east of the Planning Area and is found along the far eastern margin of the Planning Area (Figure 5-1). Uplift from active geologic faults, erosion, and dissection by active stream channels draining the mountain range are the primary forces that shape this landform. Vernal pools are not found on the foothill landform. Within the Planning Area, the Copper Hill Volcanic, Gopher Ridge Volcanic, and Salt Springs Slate geologic formations are found on the foothill landform (Figure 5-2).

5.1.2.8 Existing Hazards

Soil Subsidence

Subsidence is the gradual settling or sinking of the Earth's surface with little or no horizontal motion. Lands in Sacramento County may be affected by five types of subsidence: compaction of unconsolidated soils by earthquake shaking, compaction by heavy structures, the erosion of peat soils, peat oxidation, and fluid withdrawal. As discussed below, the likelihood for substantial seismic activity in the Planning Area is low; thus, earthquake shaking is not a major source of subsidence. Subsidence in peat soils from heavy structures has not been an issue in the Planning Area. The pumping of water for residential, commercial, and agricultural uses from aquifers is the most common cause of subsidence in the Planning Area via the fluid

withdrawal mechanism. Known subsidence areas occur in the far western portions of Sacramento County, including the portion of the Planning Area west of Interstate (I)-5 (see Figure II-7 of the Sacramento County General Plan [Sacramento County 2011]). Although subsidence has caused substantial problems in portions of the Delta and in the San Joaquin Valley, it is not a major concern in the Planning Area.

Expansive Soils

Expansive soils contain shrink-swell clays that are capable of absorbing water. As water is absorbed, the clays increase in volume. This change in volume is capable of exerting enough force on subsurface portions of buildings and other structures to damage foundations and underground utilities. Damage can also occur as the soils dry and contract.

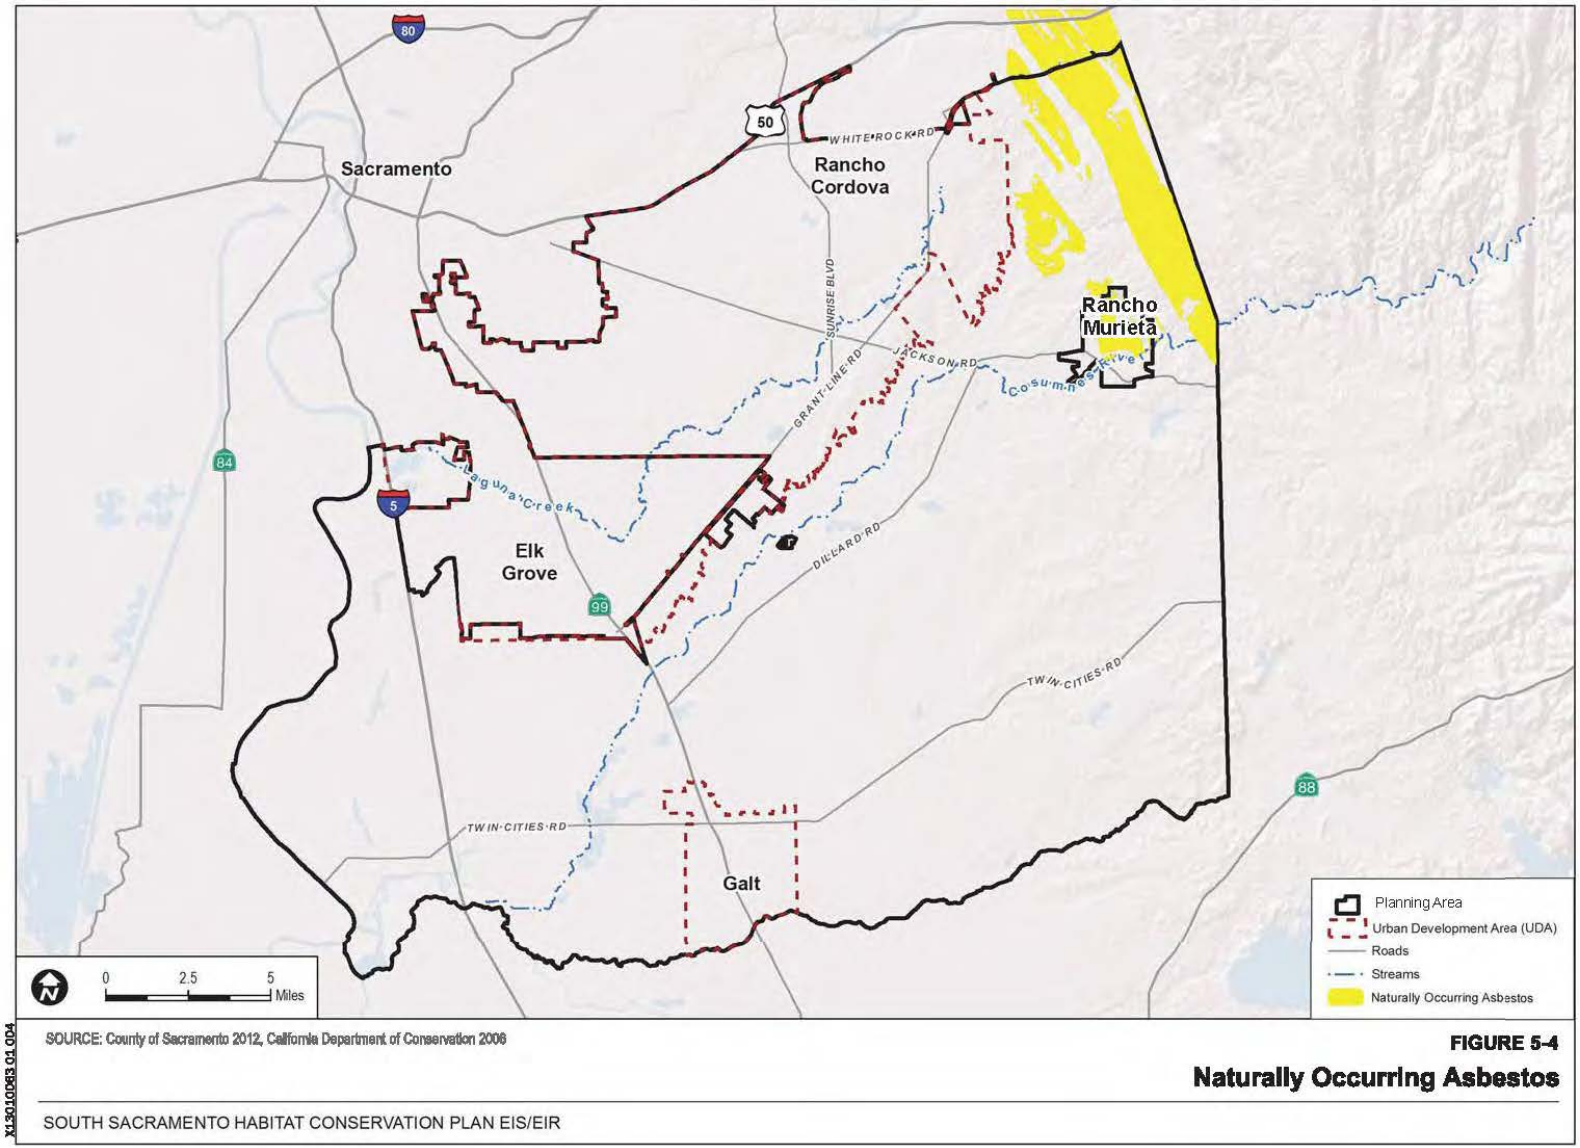
Expansive soils are associated with approximately one-third of all soil types in Sacramento County. However, in the Planning Area, only the Valley Springs Formation (Figure 5-2) is described as having the potential to contain expansive soils (Sacramento County 2010). Expansive soils are largely composed of clays, which greatly increase in volume when water is absorbed and shrink when dried. Expansive soils are primarily of concern for building foundations that may rise during the rainy season and fall during the dry season in response to the clay's action. If soil movement varies under different parts of the building, the result is that foundations crack, structural portions of the building are distorted, and doors and windows are warped so that they do not function properly (Sacramento County 2010).

Landslides

A landslide is the downhill movement of masses of earth material under the force of gravity. The factors contributing to landslide potential are steep slopes, unstable terrain, and proximity to earthquake faults. This process typically involves the surface soil and an upper portion of the underlying bedrock. As discussed above, expansive soils tend to shrink and swell in response to moisture content changes. When expansive soils are located on slopes, gravity tends to work the soil downslope during this shrinking and swelling process. Movement may be very rapid or so slow that a change of position can be noted only over a period of weeks or years (creep). The size of a landslide can range from several square feet to several square miles.

Almost all of the topography in the Planning Area is relatively flat and would not be subject to landslides. In the Planning Area, only a narrow strip along the eastern boundary of Sacramento County, east of Rancho Murieta and north of the Cosumnes River, is considered by the Sacramento County to have landslide potential (Sacramento County 2011). As identified above, expansive soils may contribute to landslide risk where they occur on slopes. Only the Valley Springs Formation has the potential to contain expansive soils, and occurrences of the Valley

Spring Formation (Figure 5-2) are south and west of landslide potential area identified by Sacramento County. This indicates that the locations of the Valley Springs Formation are not on steep enough slopes for the potential expansive soils to increase landslide risk.



Naturally Occurring Asbestos

Asbestos is a naturally occurring mineral that is classified as a known human carcinogen. In California, serpentinite and ultramafic rock (two specific rock types) may contain asbestos minerals, especially near fault zones. Asbestos can also be associated with other rock types in California, though much less frequently than serpentinite and/or ultramafic rock.

Asbestos poses a health risk only when it becomes friable, which means that it can be easily broken into tiny pieces, which can then be become airborne and then inhaled. All types of asbestos are hazardous and may cause lung disease and cancer. Asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading, and at quarry operations (broken or crushed serpentinite and ultramafic rocks) (Sacramento County 2010). All of these activities may have the effect of releasing potentially harmful asbestos into the air.

The Sacramento Metropolitan Air Quality Management District has determined that naturally occurring asbestos is present within areas of eastern Sacramento County (SMAQMD 2006). Sacramento Metropolitan Air Quality Management District commissioned the CGS to test for and map all areas of potential naturally occurring asbestos within eastern Sacramento County (CDOC 2006). The map depicts locations within eastern Sacramento County that are known to or likely to contain naturally occurring asbestos (Figure 5-4). Locations of naturally occurring asbestos in the Planning Area are associated with the foothill landform discussed in Section 5.1.2.7, Foothill Landform (Figure 5-2). Based on available California Department of Conservation information, the western and central portions of the Planning Area, including the UDA, are unlikely to contain naturally occurring asbestos (CDOC 2000) (Figure 5-4).

Figure 5-4 Naturally Occurring Asbestos

INTENTIONALLY LEFT BLANK

Geologic Hazards

Seismicity and Earthquake

The intensity of seismic shaking, or strong ground motion, during an earthquake is dependent on the distance and direction from the epicenter of the earthquake, the magnitude of the earthquake, and the geologic conditions of the surrounding area. Ground shaking could potentially result in the damage or collapse of buildings, levees, and other structures. Most earthquakes occur along faults, which are fractures or geological areas of weakness, along which rocks on one side have been displaced with respect to those on the other side. Most faults are the result of repeated displacement that may have taken place suddenly and/or by slow creep over many years.

No major active faults transect Sacramento County (CDOC 2013), and Sacramento County has experienced relatively little seismic activity. While it is possible for the Planning Area to be subject to seismic shaking, the probability for seismic shaking in the Planning Area is low (CGS 2008).

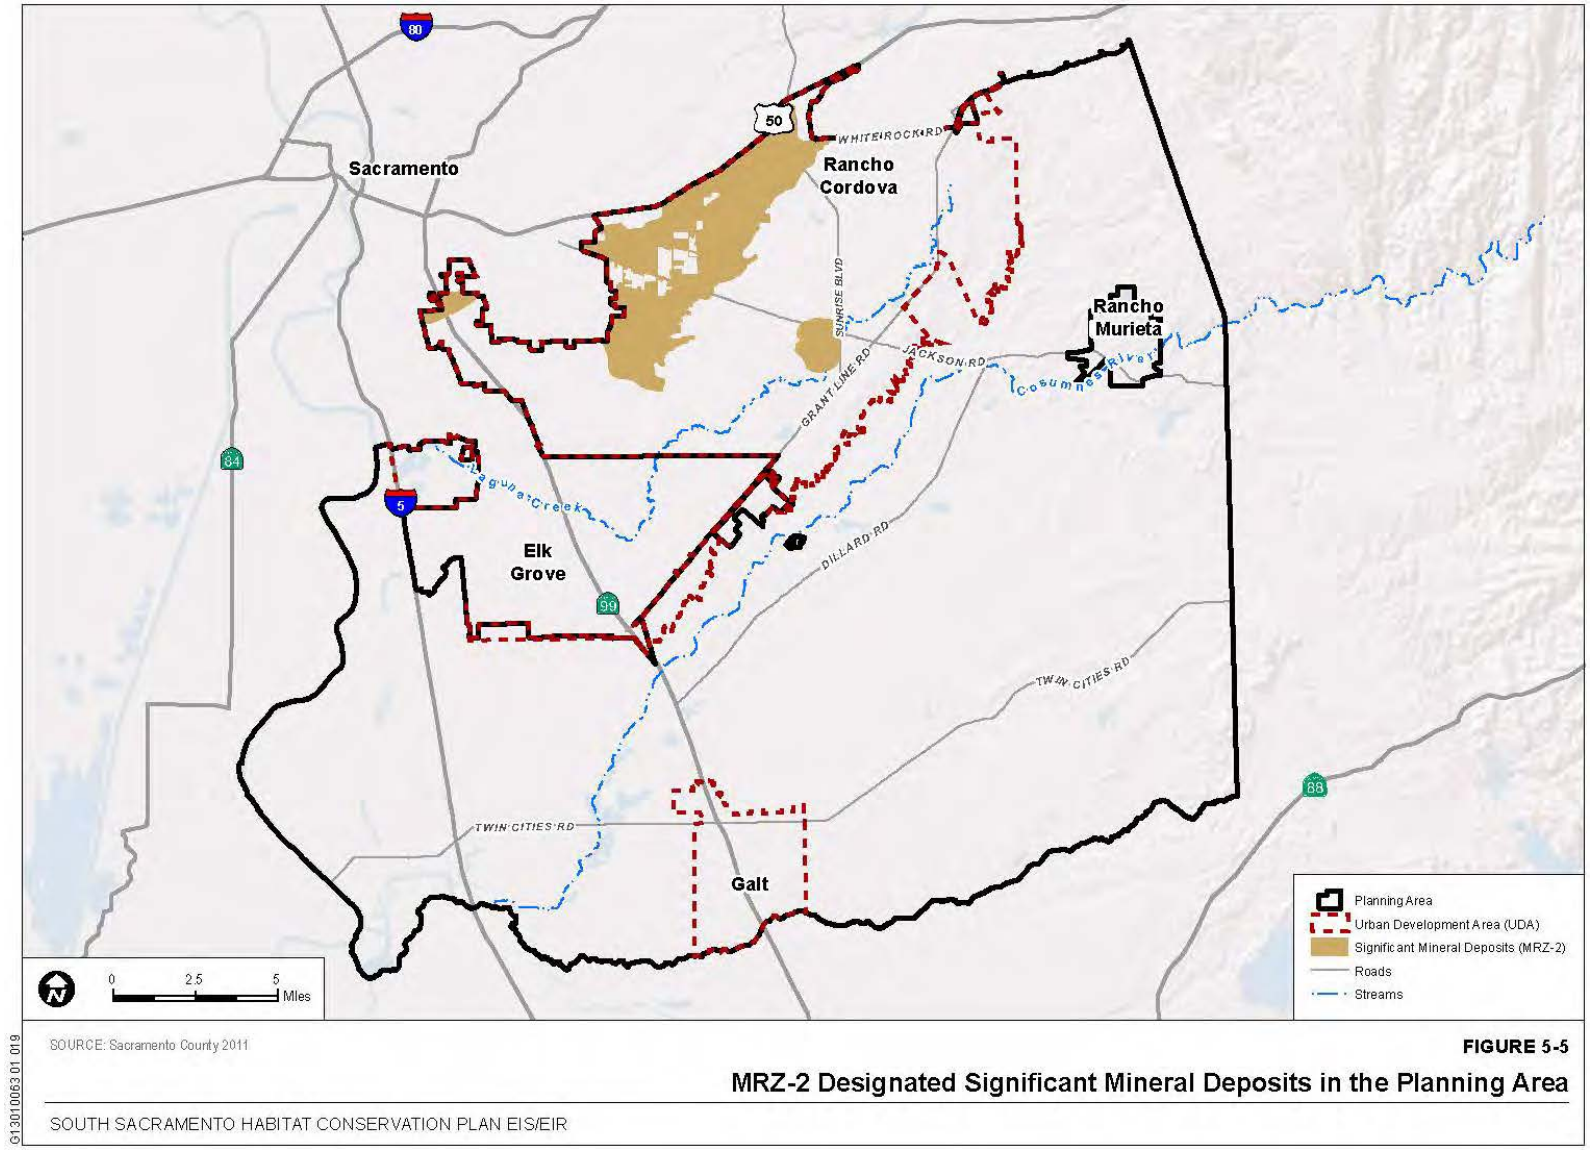
Soil Liquefaction

Soil liquefaction occurs when ground shaking from an earthquake causes a sediment layer saturated with groundwater to lose strength and take on the characteristics of a fluid. Factors determining the liquefaction potential are soil type, the level and duration of seismic ground motions, the type and consistency of soils, and the depth to groundwater. Loose sands and peat deposits are susceptible to liquefaction, while clayey silts and silty clays are generally stable under the influence of seismic ground shaking (CGS 2008). Liquefaction poses a hazard to engineered structures. The loss of soil strength can result in bearing capacity insufficient to support foundation loads, increased lateral pressure on retaining or basement walls, and slope instability. Sites underlain by relatively loose sandy soils and saturated deposits of fill combined with a shallow groundwater table, which typically are located in alluvial river valleys/basins and floodplains, are susceptible to liquefaction.

Sacramento County has two areas that may pose liquefaction problems: the downtown area of Sacramento and lands within the legal Delta (Sacramento County 2011). The Planning Area excludes Sacramento but includes a small portion of the legal Delta (see Section 4.1.1.2, State Regulations and Policies, and Figure 4-1). Approximately 40,986 acres of the Planning Area are within the legal Delta, and therefore, are subject to potential liquefaction. The legal Delta in the Planning Area is located west of I5, and an adjacent portion of the Cosumnes and Mokelumne River floodplain east of I-5 (in the southwestern portion of the Planning Area) (Figure 4-1). However, as stated in the preceding section, the Planning Area has very small seismic risk, and associated risk of soil liquefaction damage is also very small.

5.1.2.9 Existing Mineral Resources

As discussed in Section 5.1.1, Regulatory Framework, the State Mining and Geology Board has designated certain mineral deposits as being regionally significant to satisfy future needs. The California Geological Survey has designated the majority of the Planning Area as MRZ-3, i.e., areas containing mineral deposits, the significance of which cannot be evaluated from existing data.



A few areas located within the eastern and southwestern portions of the Planning Area are designated as MRZ-1—areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence.

Two primary locations within the UDA portion of the Planning Area are designated as MRZ-2 (Figure 5-5)—areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists. The larger area is located along the north–central boundary of the Planning Area, and a smaller area is located northwest of the intersection of Sunrise Boulevard and Grant Line Road. These are areas that are known to contain substantial aggregate resources. The primary mineral resource in the Planning Area that is currently in production is aggregate. As discussed in Section 3.7.1.3, Past and Present Mining Operations in the Planning Area, there are several active aggregate mining operations both inside and outside the UDA, with 24 permitted aggregate mines, 21 of which are currently active. Additionally, one application for an additional aggregate mine is being processed by Sacramento County. The presence of aggregate mines outside the UDA indicates that there are commercially viable aggregate resources in locations designated MRZ-3.

Clay is currently being surface mined in four locations within Sacramento County, including along the Cosumnes River. Topsoil is currently mined near the Cosumnes River, and there is one existing pumice pit.

Other known Planning Area mineral resources that have, or could, support commercial operations include gold, silver, lignite, natural gas, and petroleum (Sacramento County 2011).

5.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

5.2.1 Methodology for Assessing Impacts of Each Alternative on Soils, Geology, and Mineral Resources

This section describes and analyzes the potential impacts of each EIS/EIR alternative on the geologic conditions, soil conditions, and mineral resources, and geological hazards within the Planning Area. Potential ways that an EIS/EIR alternative could affect these resources include soil erosion or loss of access to important soil, geologic, or mineral resources. The impact analysis also evaluates whether an EIS/EIR alternative could affect human exposure to naturally occurring asbestos or to existing seismic and soils hazards (e.g., earthquake, landslide).

The projects and activities expected under each EIS/EIR alternative, including expected or conceptual preserves, are described in Chapter 2, Alternatives, Including the Proposed Action/Proposed Project. As discussed in Chapter 3, Section 3.6.5, GIS Methodology Used in Chapters 4–16 to Estimate Direct Impacts of Each EIS/EIR Alternative, the EIS/EIR impact methodology uses geographic information system (GIS) datasets that were prepared using the best available information about the amounts and locations of ground disturbance from future projects and activities expected under each alternative. GIS datasets of Planning Area soils, geology, and mineral resources, and datasets of geological hazards were prepared using existing studies and using best available state and local sources of information, summarized above in Sections 5.1.1 and 5.1.2. The GIS methodology was used to compare these datasets and to quantitatively estimate the direct impacts of each EIS/EIR alternative on the resources and hazards studied in Chapter 5.

As discussed in Section 5.1.2, the natural geologic conditions, landforms, and soils within the "mine and dredge tailings" areas shown on Figures 5-1, 5-2, and 5-3 have been substantially altered by past human activities. Therefore, potential impacts of the EIS/EIR alternatives on the "mine and dredge tailings" areas are not discussed in Section 5.2.2, No Action/No Project Alternative; Section 5.2.3, Proposed Action/Proposed Project Alternative; or Section 5.2.4, Reduced Permit Term Alternative.

The analysis of each EIS/EIR alternative in Section 5.2 assumes that new building and facility construction implemented under each alternative would comply with the applicable federal, state, and local regulations and policy requirements for structural design, construction techniques, and other aspects of the engineering and construction process, discussed previously in Section 5.1.1. The study period and the study area used in the Chapter 5 impact analyses are described in Section 3.6.2, Geographic Study Area of Resource Topics Analyzed in Chapters 4 Through 16, and Section 3.6.3, EIS/EIR Study Period. The lead agencies determined

that an appropriate geographic scale for evaluating the impacts of each EIS/EIR alternative on soils, geology, and mineral resources should include the entire Planning Area.

As discussed in Section 3.7, Cumulative Effects Analysis in Resource Chapters 4 through 16, the Chapter 5 cumulative analyses of impacts to soils, geology, and mineral resources will consider the effects of past and present urban development within in the Planning Area (see Existing Conditions in Section 5.1.2) and will consider future impacts expected from reasonably foreseeable "other" projects in the Planning Area (see Section 3.7). The cumulative analysis of each EIS/EIR alternative will then determine if the incremental impacts of the alternative on soils, geology, and mineral resources would be significant (i.e., cumulatively considerable).

However, adverse effects on geology and soils are generally site specific rather than regional in nature; therefore, the geologic effects of multiple projects over large distances typically do not interact. However, if multiple actions or projects are proposed in close proximity, they may combine cumulatively, such as if erosion generated by two adjacent projects creates a larger cumulative, downstream erosion impact.

Given the low seismic risk in the Planning Area, the site-specific nature of seismic impacts, and the fact that any new urban development occurring within the Planning Area would be subject to, at a minimum, uniform site development and construction standards consistent with the CBC, cumulative impacts resulting from seismic risks are not considered further in Sections 5.2.2, 5.2.3, or 5.2.4.

As discussed Section 3.4, Previous Planning Area Environmental Reviews, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Sacramento County 2010[3]; Galt 2009b; Rancho Cordova 2006b) analyzed direct and cumulative impacts of urban growth planned within each jurisdiction, including impacts to geological resources and hazards. When the impact analysis or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief summary or description of the incorporated information or analysis is provided in Sections 5.2.2, 5.2.3, and 5.2.4.

As discussed in Section 3.4, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b), 2030 (Rancho Cordova 2006b), and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur within Galt, Rancho Cordova, and

[3] As described further in Section 3.4.1, Sacramento County General Plan, the proposed project analyzed within the Sacramento County General Plan EIR assumed development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by Sacramento County. However, Sacramento County is currently processing land use entitlements in the Jackson Highway Corridor, so the referenced conclusions from the proposed project analysis are relevant to the No Action/No Project Alternative.

Sacramento County in the years after each General Plan EIR study period ends but before this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of all urban development activities and projects that are included in the description of each EIS/EIR alternative.

5.2.1.1 Determination of Impact Significance

As discussed in Section 3.8.1, Significance Thresholds, the criteria used to evaluate the significance of each alternative's impacts on soils, geology, and mineral resources are based on Appendix G of the CEQA Guidelines and on typical thresholds used to evaluate effects to soils, geology, and mineral resources in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse effect could occur if the alternative would:

1. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
   - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault,
   - Strong seismic ground shaking,
   - Seismic-related ground failure, including liquefaction, or
   - Landslides;
2. Result in substantial soil erosion or the loss of topsoil;
3. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the action/project, and potentially result in on or off-site landslide, lateral spreading, subsidence, liquefaction or collapse;
4. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property;
5. Result in unsafe exposure to naturally occurring asbestos;
6. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater; or
7. Result in the obstruction of access to, or the removal of mineral resources. In particular, for aggregate resources, obstruction to access or removal of mineral resources delineated on a local general plan, specific plan, or other land use plan.

Appendix G of the CEQA Guidelines does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial effect could occur if the alternative would:

1. Discernibly reduce compared to a baseline environmental condition, exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
   - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault;
   - Strong seismic ground shaking;
   - Seismic-related ground failure, including liquefaction;
   - Landslides; or
   - Unstable geologic units or soils that would become unstable and potentially result in landslide, lateral spreading, subsidence, liquefaction or collapse.
2. Discernibly reduce the potential for soil erosion or the loss of topsoil, or be discernibly more protective of topsoil, compared to a baseline environmental condition;
3. Discernibly reduce, compared to a baseline environmental condition, the amount of new urban development located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property;
4. Discernibly reduce or avoid unsafe exposure to naturally occurring asbestos compared to a baseline environmental condition;
5. Discernibly reduce, compared to a baseline environmental condition, the amount of new urban development located on soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater; or
6. Discernibly increase access to, or the removal of mineral resources, compared to a baseline environmental condition. In particular, for aggregate resources, increase access to or removal of mineral resources delineated on a local general plan, specific plan, or other land use plan.

The impact analysis for the three EIS/EIR alternatives will consider the context, intensity, and severity of potential impacts to each of these impact criteria and will present separate determinations of significance addressing each of these criteria.

5.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2, No Action/No Project Alternative, of Chapter 2.

5.2.2.1 Direct and Indirect Effects of the Alternative

Much of the estimated future urban development expected under the No Action/No Project Alternative (Section 2.2) is also described and analyzed in the Sacramento County General Plan, the Galt General Plan, and the Rancho Cordova General Plan (see Section 3.4 and Section 5.2.1, Methodology for Assessing Impacts of Each Alternative on Soils, Geology, and Mineral Resources).

As discussed in Section 5.2.1, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR) (Sacramento County 2010) determined that any impacts of planned future development on the existing geology and soil resources of Sacramento County would be less than significant because future projects would comply with applicable regulations and policies (Sacramento County 2010, pp. 13-24 to 13-36). However, the impact analysis presented in the Sacramento County General Plan EIR determined that future development would permanently obstruct access to existing mineral resources of Sacramento County, and this adverse impact would be significant and unavoidable (Sacramento County 2010, pp. 13-27 to 13-28). In addition, the EIR impact analysis determined that adverse impacts of future development in areas of Sacramento County with naturally occurring asbestos would be less than significant because all future development projects would comply with applicable regulations discussed on page 11-75 of the Sacramento County General Plan EIR (Sacramento County 2010).

The impact analysis presented in the *City of Rancho Cordova General Plan Final Environmental Impact Report* (Rancho Cordova General Plan EIR) (Rancho Cordova 2006b) similarly determined that impacts of future development to existing geology and soil resources would also be less than significant based on the combination of geologic and soils conditions in the Planning Area and because future projects would comply with applicable regulations and policies (Rancho Cordova 2006b, pp. 4.8-19 to 4.8-26). The impact analysis in the Rancho Cordova General Plan EIR also determined that impacts of future development on existing mineral resources would be significant and unavoidable because future development would permanently obstruct access to existing mineral resources (Rancho Cordova 2006b, pp. 4.8-26 to 4.8-27). The Rancho Cordova General Plan EIR does not analyze impacts resulting from future development in naturally occurring asbestos areas because soil types that could contain

naturally occurring asbestos are not found in the Planning Area. The impact analysis presented in the *City of Galt General Plan Update: 2030 Final EIR* (Galt General Plan EIR) (Galt 2009b), found that any adverse impacts from future development on the existing geology and soil resources, and on seismic hazards within Galt and the Galt sphere of influence (SOI) would be less than significant because future development projects would implement the general plan policies identified in the Galt General Plan EIR (Galt 2009b, pp. 8-24 to 8-25 and 10-13). The Galt General Plan EIR does not analyze impacts of future development on mineral resources as no mineral resources would be affected by General Plan Implementation or impacts resulting from exposure to naturally occurring asbestos because soil types that could contain naturally occurring asbestos are not found in the Planning Area.

As stated above in Section 5.2.1, the 50-year study period for this EIS/EIR extends to 2065, beyond the study periods for these three General Plans (to 2030 for Galt and Rancho Cordova and to 2050 for Sacramento County). The lead agencies anticipate that new urban development projects would continue to “build out" all of the UDA through the end of the EIS/EIR 50-year study period (2065). Therefore, additional urban development beyond that anticipated in the General Plans can be expected to occur within Galt, Rancho Cordova, and Sacramento County. The regulatory, geological, and soils conditions that support the less than significant impact conclusions for soils and geology in the three General Plan EIRs would continue to apply for buildout of the UDA. For example, as identified in Section 5.1.2.8, Existing Hazards, there are no locations that could contain expansive soils or naturally occurring asbestos in the UDA and no areas of landslide risk.

In addition, future development projects that would occur over the EIS/EIR 50-year study period but that were not explicitly addressed in the Galt, Rancho Cordova, or Sacramento County General Plan EIRs would comply with the General Plan regulations and policies for soils and geology (Section 5.1.1.3, Local). An example is the Capital Southeast Connector Project (see Section 3.4.5, Capital Southeast Connector), which was not originally contemplated in the Sacramento County General Plan (Sacramento County 2011), but is included in the project description for the No Action/No Project Alternative. The Capital SouthEast Connector Project EIR identified potentially significant adverse impacts in areas subject to liquefaction and erosion (Connector JPA 2012). However, the Capital Southeast Connector Project would implement site-specific mitigation to reduce these adverse impacts to less than significant (Connector JPA 2012, pp. 8-9 to 8-11). The significant and unavoidable adverse impacts of planned urban development on mineral resources identified in the Sacramento County and Rancho Cordova General Plan EIRs would also occur under the No Action/No Project Alternative. The additional urban development included in the No Action/No Project Alternative beyond that anticipated in the Rancho Cordova and Sacramento County General Plans, particularly any additional development in designated

MRZ-2 significant mineral deposits (Figure 5-5) would result in further potential for future development to permanently obstruct access to existing mineral resources.

Shifted or displaced development. As explained in Section 2.2.2, Expected Regulatory Environment Under the No Action/No Project Alternative, and Section 2.2.3, Loss of Natural Lands Under the No Action/No Project Alternative, the regulatory environment of the No Action/No Project Alternative is expected to restrict the ability of local jurisdictions to permit up to approximately 1,900 acres of urban development planned in the Mather Core Recovery Area (MCRA), and therefore, this future development could shift or be displaced to areas outside of Sacramento County's USB boundary. Sacramento County planners identified four locations outside the USB where this development may shift or be displaced: (1) in the northeast portion of the Planning Area, south of White Rock Road; (2) in the north-central portion of the Planning Area, south of Kammerer Road; (3) in the east-central portion of the Planning Area, expanding Rancho Murieta to the west or northwest; and (4) in the south-central portion of the Planning Area, expanding the rural towns of Wilton and Herald.

Locations No. 2 and 4 are in topographically flat areas, far from locations potentially containing expansive soils (Figure 5-2), naturally occurring asbestos (Figure 5-4), or significant mineral deposits (Figure 5-5). If any development is shifted or displaced to these locations, impacts from this development on soils, geology, and mineral resources would be less than significant based on the combination of physical conditions in these locations and because future projects would comply with applicable regulations and policies.

If any of the 1,900 acres of planned development is shifted or displaced from the MCRA to the northeast portion of the Planning Area outside the USB, Locations No. 1 and 3 identified above, new development in these areas would encounter steeper topography compared to land within the MCRA and, therefore, has a greater risk of causing erosion. Neither location intersects the Sacramento County identified landslide risk area, but portions of the area northwest of Rancho Murieta contains the Valley Spring Formation (Figure 5-2) that could contain expansive soils. However, this impact analysis of the No Action/No Project Alternative assumes that all future development projects would comply with applicable policies and regulations identified in the General Plans for Rancho Cordova and Sacramento County (see Section 5.1.1.3). Consequently, any adverse effects of new development on the existing geology, soils, risk of soil erosion, and risk of expansive soils would be less than significant, similar to the determinations made in the General Plan EIRs for Rancho Cordova and Sacramento County.

If development displaced from the MCRA is shifted to locations to the northeast portion of the Planning Area, Locations No. 1 and 3 identified above, that new development would also be more likely to encounter areas of natural occurring asbestos (Figure 5-4). However, risks to human health under the No Action/No Project Alternative would be less than significant

because future development projects implemented anywhere within Sacramento County must comply with applicable policies and regulations discussed in Section 5.1.1.3 and in the Sacramento County General Plan EIR (Sacramento County 2010 p. 11-75).

Any of the 1,900 acres development that would shift from the MCRA to areas outside Sacramento County USB boundary could also preclude or inhibit access to mineral resources under, or near where the shifted development occurs. However, there are no designated MRZ-2 significant mineral deposits (Figure 5-5) in the four potential locations for where development might be shifted or displaced outside the USB under the No Action/No Project Alternative (see Section 2.2.3 and Section 5.1.2). There are no designated MRZ-2 significant mineral deposits anywhere outside the USB. Therefore, the 1,900 acres of shifted or displaced development, or any other elements of the No Action/No Project Alternative outside the USB, would not add to the significant impacts to mineral resource access that were identified in the General Plan EIRs discussed above.

Project mitigation and conservation expected under the No Action/No Project Alternative are described in Section 2.2.2 Expected Regulatory Environment Under the No Action/No Project Alternative; Section 2.2.4, Preservation of Natural Lands Under the No Action/ No Project Alternative; and Section 2.2.5, Preserve Management and Monitoring Under the No Action/No Project Alternative. Purchasing of credits at an approved mitigation bank or through an established in-lieu fee program, or establishing on-site or off-site mitigation Preserves, would not result in activities that could increase seismic risk, landslide risk, erosion potential, unsafe exposure to naturally occurring asbestos, or other effects to geology and soils.

Furthermore, project compensatory-mitigation activities associated with the re-establishment or establishment of vernal pools and other aquatic resources on Preserves may require use of heavy equipment and grading or excavation of soil to depths up to 3 feet, which could increase potential for erosion to occur or could mobilize naturally occurring asbestos. However, re-establishment/establishment of vernal pools would occur only on specific soil types that form seasonal perched aquifers (see Chapter 8), which are not found on steep slopes. Therefore, vernal pool and other aquatic resources re-establishment and establishment activities would not occur on steep slopes that are susceptible to erosion and would be unlikely to disturb rock types containing naturally occurring asbestos found in the northeastern part of Sacramento County (Exhibit 5-4). In addition, where aquatic resources re-establishment and establishment activities are of sufficient size to require a County grading permit (over an acre of disturbance or over 300 cubic yards of soil are moved), implementation of existing policies and regulations related to construction would be required (see Section 5.1.1.3), which would prevent significant adverse effects resulting from erosion. If an aquatic resources re-establishment/establishment project were to be undertaken in an area that contains rock types containing naturally occurring asbestos, applicable regulations and policies to prevent hazardous exposure to

naturally occurring asbestos would be implemented. Therefore, the less than significant conclusion for adverse effects from erosion and from naturally occurring asbestos presented in the General Plan EIRs would not be changed by these mitigation activities. The less than significant conclusion for adverse effects from erosion and from naturally occurring asbestos from the General Plan EIRs remains applicable to the impacts from erosion and from naturally occurring asbestos expected under the No Action/No Project Alternative.

However, the establishment of on-site or off-site mitigation Preserves could preclude or substantially inhibit the extraction of any mineral resources present within the lands that are preserved. The impacts to mineral resources presented in the General Plan EIRs (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006b) included impacts from the various categories of open-space that would be required by the jurisdiction, including on-site parks, outdoor recreation areas, green belts, and any on-site mitigation Preserves. However, the impact analyses in the General Plan EIRs may not have considered impacts to mineral resources present at any off-site mitigation preserve sites. Although policies in the Sacramento County General Plan (Sacramento County 2011) and Rancho Cordova General Plan (Rancho Cordova 2006a) are designed to preserve access to mineral resources, and the location of future off-site preserves under the No Action/No Project Alternative may be reviewed by the applicable jurisdiction, there is the potential for future off-site mitigation preserves to be located in an area with mineral resources. This may result in some additional loss of access to mineral resources. Therefore, the significant and unavoidable adverse effects to mineral resources identified in the Sacramento County and the Rancho Cordova General Plan EIRs continues to be applicable to the mineral-resource impacts expected under the No Action/No Project Alternative.

5.2.2.2 Cumulative Effects of the No Action/No Project Alternative

The past and present urban development and associated infrastructure projects and human activities discussed in Section 3.7.1 have altered the EIS/EIR Planning Area geologic resources, including surface soils, landforms, and landscapes; altered access to important minerals resources; and have altered human exposure to naturally occurring asbestos and human exposure to soils hazards from earthquake, landslide, and erosion. These past and present alterations have resulted in the existing conditions of Planning Area described in Section 5.1.2. The effects of the past and present actions on soils and geology in the study area represent a less than significant adverse effect on the soils and geology within the study area. However, the effects of the past and present actions represent a significant adverse effect on access to important mineral resources in the study area. The past and present actions described in Section 3.7.1 have increased the potential for human exposure to naturally occurring asbestos, but various policies and regulations minimize the risk for exposure resulting in a less than significant adverse effect.

The types of future reasonably foreseeable "other" projects, activities, and actions, described in Section 3.7.2, Reasonably Foreseeable Other Actions, are similar to the types of past and present actions that occurred in the study area. The other reasonably foreseeable future actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in the Elk Grove SOI and in Rancho Murieta, development of the Wilton Rancheria Casino, master planned developments named Rio Del Oro and Mather South inside the UDA, further rural residential development outside the UDA, continued urban development of cultivated agricultural lands, major infrastructure projects such as California High-Speed Rail and California WaterFix, and expansion of the existing National Wild Refuge and the Cosumnes River Preserve (see Section 3.7.2 for details of these projects). Like the activities analyzed in the General Plan EIRs for Galt, Rancho Cordova, and Sacramento County, these reasonably foreseeable other projects would comply with applicable regulations and policies addressing geology and soils and human exposure to naturally occurring asbestos. Either through implementation of applicable regulations and policies, or because a future reasonably foreseeable other project does not affect a particular resource, for example, urban development in the Elk Grove SOI does not intersect any rock types that could contain natural occurring asbestos, the reasonably foreseeable other projects would not contribute to adverse effects on geology and soils or human exposure to naturally occurring asbestos. None of the future reasonably foreseeable other projects intersect areas mapped as MRZ-2 significant mineral deposits (Figure 5-5); however, the Rio Del Oro and Mather South master planned developments are very close to these designated deposits. As identified earlier in Section 5.1.2.9, Existing Mineral Resources, the presence of aggregate mines outside the UDA in the Planning Area indicates that there are commercially viable aggregate resources in locations designated MRZ-3. Therefore, these master planned developments, or other future reasonably foreseeable other projects, could limit access to aggregate resources that are outside the mapped MRZ-2 significant mineral deposits. Therefore, they may contribute to the significant adverse effect on access to mineral resources in the study area. As described above, projects and activities included in the No Action/No Project Alternative would not have an adverse effect on geology and soils or human exposure to naturally occurring asbestos because of the combination of geologic and soils conditions in the Planning Area and because future projects would comply with applicable regulations and policies. Therefore, when the incremental effects of the No Action/No Project Alternative are viewed in connection with the effects of the past, present, and reasonably foreseeable future other actions, the No Action/No Project Alternative would not cause, or make a considerable contribution, to a significant cumulative impact on geology and soils or human exposure to naturally occurring asbestos. The No Action/No Project Alternative would result in a ***Less Than Significant Adverse Cumulative*** effect to geology and soils or human exposure to naturally occurring asbestos.

As also described previously, the direct and indirect impacts of No Action/No Project Alternative would adversely affect access to mineral resources. Therefore, when the incremental effects of the No Action/No Project Alternative are viewed in connection with the effects of the past, present, and reasonably foreseeable future other actions, the No Action/No Project Alternative would make a considerable contribution, to a significant cumulative impact on access to mineral resources. The No Action/No Project Alternative would result in a ***Significant Adverse Cumulative*** effect to access to mineral resources.

5.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3, Proposed Action/Proposed Project.

5.2.3.1 Direct and Indirect Effects of the Alternative

As described in Section 2.3.3, Covered Activities and Loss of Natural Land Covers Under the Proposed Action/Proposed Project Alternative, the Proposed Action/Proposed Project Alternative Covered Activities include the same types of urban development as the No Action/No Project Alternative. Covered Activities under the Proposed Action/Proposed Project Alternative would result in urban development projects and activities on approximately 33,500 acres of natural landscapes in the Planning Area (Section 2.3.3). A large majority of this urban development, approximately 32,000 acres, would occur inside the UDA. The remaining roughly 1,500 acres of natural land covers removed outside the UDA would result, in large part, from various transportation and infrastructure projects. None of the urban development, transportation, or infrastructure projects inside or outside the UDA intersect landslide risk areas identified by Sacramento County (see Section 5.1.2.8) or locations that could contain naturally occurring asbestos (Figure 5-4). Projects and activities included in the Proposed Action/Proposed Project Alternative would comply with applicable regulations and policies to minimize erosion, seismic risk, and other geology and soils impacts. Some urban development in the UDA would occur over areas designated as MRZ-2 significant mineral deposits containing aggregate (Figure 5-5), preventing future access to the aggregate in these locations.

Under the Proposed Action/Proposed Project Alternative, there are approximately 2,000 fewer acres of new urban development projects on natural landscapes than the No Action/No Project Alternative. Therefore, there is less potential for urban development to expose native soils during construction and contribute to risks of erosion, although implementation of applicable regulations and policies under all alternatives substantially decreases the risk of harmful erosion.

The Proposed Action/Proposed Project Alternative includes urban development Covered Activities within the MCRA portion of the UDA to be implemented consistent with the approved

Sacramento County and Rancho Cordova General Plans without urban development shifting or being displaced to locations outside the UDA (Section 2.3.3). As a result, none of the new urban development of the Proposed Action/Proposed Project Alternative could occur in areas outside the UDA where there is naturally occurring asbestos, or where topography can increase the risk of erosion (Figures 5-3 and 5-4). The potential increased risks of erosion and human exposure to naturally occurring asbestos identified in Section 5.2.2.1, Direct and Indirect Effects of the Alternative, for the No Action/No Project Alternative, for the two potential displaced development locations in the northeast portion of the Planning Area, would not occur under the Proposed Action/Proposed Project Alternative.

The SSHCP includes Avoidance and Minimization Measures (AMMs) that would be included in all Covered Activity projects and activities implemented over the 50-year permit term (Table 2-6). SSHCP AMMs BMP-1, BMP-4, and BMP-9 would require development projects and activities s to implement BMPs that control erosion and erodible materials and implement soil compaction BMPs. As discussed above in Sections 5.1.1 and 5.2.2, the No Action/No Project Alternative's projects and activities would implement construction standard BMPs, which are similar to these SSHCP BMP AMMs. However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative includes processes for annual review of AMM effectiveness and a process for making adaptive changes to an AMM that is not effective at avoiding impacts to soils and geology. This additional layer of oversight of AMM implementation and AMM effectiveness under the Proposed Action/Proposed Project Alternative increases avoidance and minimization of impacts to geology and soils from construction activities. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to soils and geology, compared to the effects of the No Action/No Project Alternative.

Differences in the locations of development in the UDA between the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative are primarily within the MCRA. Only small portions of the MCRA intersect with lands designated as MRZ-2 significant mineral deposits. The increased amount of urban development in the MCRA under the Proposed Action/Proposed Project Alternative could result in a slight increase in development over designated MRZ-2 significant mineral deposits.

Preserves. As discussed in Section 2.3.5, Conservation Strategy Under the Proposed Action/Proposed Project Alternative, the Proposed Action/Proposed Project Alternative includes the establishment of an interconnected Preserve System in the Planning Area, and a comprehensive Preserve management program that would be implemented in perpetuity. The

Preserve System under the Proposed Action/Proposed Project Alternative would be more contiguous and more connected over the Planning Area than the project-by-project Preserves that would be established under the No Action/No Project Alternative.

However, the number, size, and configuration of future Preserves is not an important factor in determining the effects of any EIS/EIR alternative on geology and soils because most preserve activities have little to no potential to generate adverse effects to geological resources and soils.

Where aquatic resource re-establishment and establishment is undertaken on Preserves, if earth moving is required, there is increased potential for erosion. Also, if earth moving is conducted where rock types that contain naturally occurring asbestos occur, there could be an increased risk of human exposure to naturally occurring asbestos. However, as discussed in Section 5.2.2.1 for aquatic resources re-establishment and establishment under the No Action/No Project Alternative, it is highly unlikely that these activities would occur in locations with steep slopes susceptible to erosion, or where naturally occurring asbestos might be encountered. This would also apply to aquatic resource re-establishment and establishment under the Proposed Action/Proposed Project Alternative. Applicable policies and regulations that would minimize erosion and potential mobilization of naturally occurring asbestos would be enforced across all alternatives. However, under the Proposed Action/Proposed Project Alternative, SSHCP AMMs that call for implementation of BMPs that control erosion and erodible materials, and soil compaction BMPs would be applied to earth moving associated with aquatic resource re-establishment/establishment, potentially further lessening possible adverse effects from soil erosion.

The SSHCP Preserve System would preclude the extraction of any mineral resources located under the new Preserves. Therefore, there is the potential for the loss of access to mineral resources as a result of future Preserves. However, there are only very small areas considered for Preserves under the SSHCP that intersect with designated MRZ-2 significant mineral deposits (Figure 5-5). If any Preserves established under the Proposed Action/Proposed Project Alternative were located on designated MRZ-2 significant mineral deposits, the area affected would be minor. Because the precise locations of all Preserves is not known at this time, it cannot be determined whether the Proposed Action/Proposed Project Alternative would result in more or less acres of Preserves established over designated MRZ-2 significant mineral deposits compared to the No Action/No Project Alternative. However, given that there are limited locations suitable for Preserves in the MRZ-2 area due to past disturbance and development over much of the area, it is unlikely that there would be substantial differences between the two alternatives.

Therefore, because the Proposed Action/Proposed Project Alternative will not shift or displace development outside the USB, because fewer acres of natural landscapes would be developed,

and because the SSHCP AMMs provide additional mechanisms to minimize effects from soil erosion during ground-disturbing activities, the Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial*** effect on geology and soils and risks to human health from naturally occurring asbestos when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Increased urban development in the MCRA under the Proposed Action/Proposed Project Alternative compared to the No Action/No Project Alternative could result in a slight increase in development over designated MRZ-2 significant mineral deposits. The potential for Preserve lands to limit access to MRZ-2 significant mineral deposits would not be substantially different between the two alternatives. Therefore, the Proposed Action/Proposed Project Alternative would result in a ***Less Than Significant Adverse*** effect on access to mineral resources when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

5.2.3.2 Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would result in the following:

- Reduced potential for adverse effects from erosion and landslide from development activities and Preserve System establishment and establishment
- A slightly reduced risk of exposure to naturally occurring asbestos
- A slightly more removal of access to important mineral resources by new urban development or associated infrastructure
- Similar removal of access to important mineral resources by new Preserves

Therefore, after considering the significance of effects from the Proposed Action/Proposed Alternative on all of the geological resources impact-criteria, the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects to Planning Area geological resources, soils, and human exposure to geological hazards compared to the impacts that would occur under the No Action/No Project Alternative baseline condition. The Proposed Action/Proposed Project Alternative would result in a ***Less Than Significant Adverse*** effect to access to mineral resources when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

5.2.3.3 Cumulative Effects of the Alternative

The effect of past, present, and reasonably foreseeable future actions on soils, geology, and mineral resources were described above in Section 5.2.2. As discussed in Section 5.2.2, the

incremental effects of the No Action/No Project Alternative on geology and soils and exposure to naturally occurring asbestos were determined to be less than significant and not contribute to a significant adverse cumulative impact when viewed in connection with the effects of the past, present, and foreseeable other projects. The incremental effects of the No Action/No Project Alternative on access to mineral resources were determined to be significant and contribute to a significant adverse cumulative impact when viewed in connection with the effects of the past, present, and foreseeable other projects.

As discussed in Section 5.2.3.2, Significance of Direct and Indirect Effects, the Proposed Action/Proposed Project Alternative would result in reduced impacts to geology and soils (i.e., erosion potential and landslide risk) and reduced potential for exposure to naturally occurring asbestos compared to the No Action/No Project Alternative. Consequently, the incremental effects of the Proposed Action/Proposed Project Alternative would have a minor beneficial impact to geology and soils and risk of exposure to naturally occurring asbestos compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of Proposed Action/Proposed Project Alternative are individually limited and would not make a cumulatively considerable contribution to any adverse cumulative impact of the past, present, and reasonably foreseeable future projects. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect to geology and soils and risk of exposure to naturally occurring asbestos compared to the No Action/No Project Alternative baseline condition.

As described in Section 5.2.3.2, the effects of the Proposed Action/Proposed Project Alternative on access to mineral resources from urban development would be slightly more than those identified for the No Action/No Project Alternative. Effects from Preserve activities would be similar to those identified for the No Action/No Project Alternative. Consequently, the incremental effects of the Proposed Action/Proposed Project Alternative would have a less than significant impact to access to mineral resources when compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of Proposed Action/Proposed Project Alternative are individually limited and would not make a cumulatively considerable contribution to the significant adverse effect of the past, present, and reasonably foreseeable future projects when compared to the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative would result in a ***Less than Significant Cumulative*** effect to access to mineral resources compared to the No Action/No Project Alternative baseline condition.

5.2.4 Reduced Permit Term Alternative

As described in Section 2.3.3, the Reduced Permit Term Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative.

Under the Reduced Permit Term Alternative, the core of the Preserve System established inside the UDA would be associated with the development of five large land use entitlements, as discussed in Section 2.3.4, Covered Species Under the Proposed Action/Proposed Project Alternative, for the Reduced Permit Term Alternative, and also discussed in Section 2.3.3 for the Proposed Action/Proposed Project Alternative. Because the core of the Preserve System inside the UDA under both EIS/EIR action alternatives is associated with the same five large land use entitlements, approximately 70% of the UDA Preserves established under the Reduced Permit Term Alternative would have similar sizes, boundaries, and locations as the UDA Preserves established under the Proposed Action/Proposed Project Alternative. However, the shorter duration of the Reduced Permit Term Alternative—and the smaller amount of urban development and associated development fees collected by the Reduced Permit Term Alternative HCP—would not allow the SSHCP Implementing Entity to establish as many acres of new Preserves in the Planning Area as would occur under the Proposed Action/Proposed Project Alternative's 50-year permit term. Therefore, fewer new Preserves would be established under the Conservation Strategy of the Reduced Permit Term Alternative. This difference would be especially pronounced outside the UDA.

As described in Section 2.4, Reduced Permit Term Alternative, the federal Endangered Species Act and California Endangered Species Act Incidental Take Permits and the CWA permit strategy for SSHCP Covered Activities would be valid only during the 30-year permit term of the Reduced Permit Term Alternative HCP, and the Reduced Permit Term Alternative HCP's Conservation Strategy would be implemented only during this 30-year term. The urban development Covered Activities and Conservation Strategies associated with the five land use entitlements would be implemented inside the UDA during this 30-year period. However, the EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3), so the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, as described in Section 3.6.7.2, Analysis of the Reduced Permit Term Alternative, After the End of the Permit Term (Years 31–50), the EIS/EIR analysis of the Reduced Permit Term Alternative also considers future urban development that is not part of the project description of the Reduced Permit Term Alternative but is still expected to occur within the Planning Area after the end of the permit term (i.e., in Years 31–50 of the EIS/EIR study period).

As described in Section 3.6.7.2, Analysis of the Reduced Permit Term Alternative, After the End of the Permit Term (Years 31–50), project mitigation Preserves established after the end of the

30-year Reduced Permit Term Alternative would be established under a project-by-project process for obtaining individual authorizations under the CWA, federal Endangered Species Act, California Endangered Species Act, and Section 1600 of the California Fish and Game Code. Consequently, mitigation Preserves established in Years 31–50 of the EIS/EIR study period would not be established using a regional, landscape-based approach that balances new urban development with the need for conservation, as would be provided by an HCP. Therefore, much of the Preserve System inside the UDA would be very similar under the two action alternatives, but the Preserve System outside the UDA would be substantially different between the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, it is unlikely that mitigation Preserves established outside the UDA would be contiguous or would be interconnected, and it is unlikely that a large, contiguous 10,500-acre landscape-size Vernal Pool Preserve would be established in the southwestern portion of the Planning Area. Likewise, the No Action/No Project Alterative also would not result in contiguous, interconnected Preserves outside the UDA, and would not establish a 10,500-acre Vernal Pool Preserve in the Planning Area. In these ways, the new mitigation Preserves established outside the UDA under the Reduced Permit Term Alternative and the No Action/No Project Alternative would be similar.

5.2.4.1 Direct and Indirect Effects of the Alternative

As described in Section 2.4.4, Covered Species Under the Reduced Permit Term Alternative, the Reduced Permit Term Alternative would include similar types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative. Covered Activities under the Reduced Permit Term Alternative would result in urban development projects and activities on approximately 19,300 acres of natural landscapes in the Planning Area (Section 2.4.4). A large majority of this urban development, approximately 17,000 acres would occur inside the UDA. The remaining roughly 1,500 acres of natural land covers removed outside the UDA would result, in large part, from various transportation and infrastructure projects. None of the urban development, transportation, or infrastructure projects inside or outside the UDA intersect landslide risk areas identified by Sacramento County (see Section 5.1.2.8, Existing Hazards) or locations that could contain naturally occurring asbestos (Figure 5-4). Projects and activities included in the Proposed Action/Proposed Project Alternative would comply with applicable regulations and policies to minimize erosion, seismic risk, and other geology and soils impacts. Some urban development in the UDA would occur over areas designated as MRZ-2 significant mineral deposits containing aggregate (Figure 5-5), preventing future access to the aggregate in these locations. Under the Reduced Permit Term Alternative, there are approximately 18,500 fewer acres of new urban development projects on natural landscapes than the No Action/No Project Alternative. Therefore, there is less potential for urban development to expose native soils during construction and contribute to risks of

erosion, although implementation of applicable regulations and policies under all alternatives substantially decreases the risk of harmful erosion.

The Reduced Permit Term Alternative includes urban development Covered Activities within the MCRA without urban development shifting or being displaced to locations outside the UDA (Section 2.4.3, Covered Activities/Projects Under the Reduced Permit Term Alternative). As a result, none of the new urban development under the Reduced Permit Term Alternative would occur in areas outside the UDA where there is naturally occurring asbestos or where topography can increase the risk of erosion (Figures 5-3 and 5-4). The potential increased risks of erosion and human exposure to naturally occurring asbestos identified in Section 5.2.2.1 for the No Action/No Project Alternative for the two potential displaced development locations in the northeast portion of the Planning Area, would not occur under the Reduced Permit Term Alternative.

During the 30-year permit term under the Reduced Permit Term Alternative, AMMs like those included in the SSHCP would be included in all Covered Activity project and activities implemented within the Planning Area. As summarized in Table 2-6 in Chapter 2 of this EIS/EIR, AMMs BMP-1, BMP-4, and BMP-9 would require development projects and activities to implement BMPs that control erosion and erodible materials, and to implement soil compaction BMPs. As discussed above in Sections 5.1.1 and 5.2.2, the No Action/No Project Alternative's projects and activities would implement construction standard BMPs that are similar to these SSHCP BMP AMMs. However, implementation of the AMMs under the Reduced Permit Term Alternative would include additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM. The Reduced Permit Term Alternative would include processes for annual review of AMM effectiveness and for making adaptive changes to an AMM that is not effective at avoiding impacts to soils and geology. This additional layer of oversight of AMM implementation and AMM effectiveness during the 30-year permit term under the Reduced Permit Term Alternative increases avoidance and minimization of impacts to geology and soils from construction activities. The AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to soils and geology compared to the effects of the No Action/No Project Alternative.

Differences in the locations of development in the UDA between the Reduced Permit Term Alternative and the No Action/No Project Alternative are primarily within the MCRA. Only small portions of the MCRA intersect with lands designated as MRZ-2 significant mineral deposits. The increased amount of urban development in the MCRA under the Reduced Permit Term Alternative could result in a slight increase in development over designated MRZ-2 significant mineral deposits.

Preserves. The Reduced Permit Term Alternative includes an interconnected Preserve System established during the 30-year permit term and a comprehensive Preserve management program for those Preserves to be implemented in perpetuity. The Preserve System established during the 30-year permit term under the Reduced Permit Term Alternative would be consolidated and linked (similar to the Proposed Action/Proposed Project Alternative). As described in Section 2.4.5, Conservation Strategy Under the Reduced Permit Term Alternative, in Chapter 2, continued establishment of a coordinated Preserve management and monitoring program would cease after the end of the 30-year permit term. The interconnected Preserve System established during the permit term would remain intact, whereas future mitigation Preserves established during Years 31–50 of the EIS/EIR study period would not be established in as consolidated a manner and would resemble mitigation Preserve establishment patterns under the No Action/No Project Alternative. The resulting scenario would be such that a portion of Preserves would reflect a more interconnected Preserve System, although fewer acres as compared to the Proposed Action/Proposed Project Alternative, and a portion would reflect an establishment pattern like the No Action/No Project Alternative.

As described above for the Proposed Action/Proposed Project Alternative, the number, size, and configuration of future Preserves would not be an important factor in determining effects on geology and soils because most Preserve activities have little to no potential to generate adverse effects to geology and soils, and Preserves would be established consistent with applicable regulations (see Section 5.1.1) under all alternatives.

Where aquatic resource re-establishment and establishment is undertaken on Preserves, if earth moving is required, there is increased potential for erosion. Also, if earth moving is conducted where rock types that contain naturally occurring asbestos occur, there could be an increased risk of human exposure to naturally occurring asbestos. However, as discussed in Section 5.2.2.1, Direct and Indirect Effects of the Alternative, for aquatic resources re-establishment and establishment under the No Action/No Project Alternative, it is highly unlikely that these activities would occur in locations with steep slopes susceptible to erosion, or where naturally occurring asbestos might be encountered. This would also apply to aquatic resource re-establishment and establishment under the Reduced Permit Term Alternative. Applicable policies and regulations that would minimize erosion and potential mobilization of naturally occurring asbestos would be enforced across all alternatives. However, during the 30-year permit term under the Reduced Permit Term Alternative, AMMs that call for implementation of BMPs that control erosion and erodible materials, and soil compaction BMPs would be applied to earth moving associated with aquatic resource re-establishment/establishment, potentially further lessening possible adverse effects from soil erosion.

The Preserve System created as part of the Reduced Permit Term Alternative would preclude the extraction of any mineral resources located under the new Preserves. Therefore, there is

the potential for the loss of access to mineral resources as a result of future Preserves. However, there are only very small areas considered for Preserves under the Reduced Permit Term Alternative that intersect with designated MRZ-2 significant mineral deposits (Figure 5-5). If any Preserves established under the Reduced Permit Term Alternative were located on designated MRZ-2 significant mineral deposits, the area affected would be minor. Because the precise locations of all Preserves are not known at this time, it cannot be determined whether the Reduced Permit Term Alternative would result in more or less acres of Preserves established over designated MRZ-2 significant mineral deposits compared to the No Action/No Project Alternative. However, given that there are limited locations suitable for Preserves in the MRZ-2 area due to past disturbance and development over much of the area, it is unlikely that there would be substantial differences between the two alternatives.

Therefore, because the Reduced Permit Term Alternative will not shift or displace development outside the USB, because fewer acres of natural landscapes would be developed, and because implementation of AMMs during the 30-year permit term provides additional mechanisms to minimize effects from soil erosion during ground-disturbing activities, the Reduced Permit Term Alternative would result in a ***Minor Beneficial*** effect on geology and soils and risks to human health from naturally occurring asbestos when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Increased urban development in the MCRA under the Reduced Development Alternative compared to the No Action/No Project Alternative could result in a slight increase in development over designated MRZ-2 significant mineral deposits. The potential for Preserve lands to limit access to MRZ-2 significant mineral deposits would not be substantially different between the two alternatives. Therefore, the Reduced Permit Term Alternative would result in a ***Less Than Significant Adverse*** effect on access to mineral resources when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

5.2.4.2 Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would result in the following:

- Reduced potential for adverse effects from erosion and landslide from development activities and Preserve System establishment
- A slightly reduced risk of exposure to naturally occurring asbestos
- Slightly more removal of access to important mineral resources by new urban development or associated infrastructure
- A similar potential for removal of access to important mineral resources from new Preserves

Therefore, after considering the significance of effects from the Reduced Permit Term Alternative on all of the geological resources impact criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to Planning Area geological resources, soils, and human exposure to geological hazards compared to the impacts that would occur under the No Action/No Project Alternative baseline condition. The Reduced Permit Term Alternative would result in a ***Less Than Significant Adverse*** effect to access to mineral resources compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

5.2.4.3 Cumulative Effects of the Alternative

The effect of past, present, and reasonably foreseeable future actions on soils, geology, and mineral resources were described in Section 5.2.2. As discussed in Section 5.2.2, the incremental effects of the No Action/No Project Alternative on geology and soils and exposure to naturally occurring asbestos were determined to be less than significant and not contribute to a significant adverse cumulative effect when viewed in connection with the effects of the past, present, and foreseeable other projects. The incremental effects of the No Action/No Project Alternative on access to mineral resources were determined to be significant and contribute to a significant adverse cumulative effect when viewed in connection with the effects of the past, present, and foreseeable other projects.

As discussed in Section 5.2.4.2, the Reduced Permit Term Alternative would result in reduced impacts to geology and soils (i.e., erosion potential and landslide risk) and reduced potential for exposure to naturally occurring asbestos compared to the No Action/No Project Alternative. Consequently, the incremental effects of the Reduced Permit Term Alternative would have a minor beneficial effect to geology and soils and risk of exposure to naturally occurring asbestos compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of Reduced Permit Term Alternative are individually limited and would not make a cumulatively considerable contribution to any adverse cumulative impact of the past, present, and reasonably foreseeable future projects. The Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect to geology and soils and risk of exposure to naturally occurring asbestos compared to the No Action/No Project Alternative baseline condition.

As described in Section 5.2.4.2, the effects of the Reduced Permit Term Alternative on access to mineral resources from urban development would be slightly more than those identified for the No Action/No Project Alternative. Effects from Preserve activities would be similar to those identified for the No Action/No Project Alternative. Consequently, the incremental effects of the Reduced Permit Term Alternative would have a less than significant effect to access to mineral resources when compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of the Proposed Action/Proposed Project

Alternative are individually limited and would not make a cumulatively considerable contribution to the significant adverse effect of the past, present, and reasonably foreseeable future projects when compared to the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative would result in a ***Less than Significant Cumulative*** effect to access to mineral resources compared to the No Action/No Project Alternative baseline condition.

INTENTIONALLY LEFT BLANK

CHAPTER 6 – AGRICULTURE

This chapter presents the existing conditions and the potential environmental effects of each Environmental Impact Statement/Environmental Impact Report (EIS/EIR) alternative on the agricultural resources and agricultural activities within the Planning Area. The agricultural resources discussed and analyzed in this chapter include farmlands such as row crops, orchards, and vineyards and the Planning Area's natural grasslands that are used for grazing and other agricultural activities.

6.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

6.1.1 Regulatory Framework

This section includes a summary of applicable federal, state, and local regulations; policies for the agencies that have regulatory responsibilities for the protection of agricultural resources; and activities within the Planning Area. Pursuant to Title 40 of the Code of Federal Regulations, Section 1502.25, these applicable policies and plans helped to determine the appropriate scope of analysis included in Chapter 4, Land Use. This section discusses the basic responsibilities of these agencies, explains the relevant agency regulations, and describes the planning documents that are relative to the Planning Area.

6.1.1.1 Federal

Farmland Protection Policy Act of 1984

The Farmland Protection Policy Act requires federal agencies to consider how their activities or responsibilities that involve financing or assisting construction of improvement projects or acquiring, managing, or disposing federal land and facilities may affect farmland. Planned development or infrastructure projects must assess their potential effects on the loss or conversion of farmland.

The federal lead agency must consult with the U.S. Department of Agriculture's Natural Resources Conservation Service to complete a Land Evaluation and Site Assessment for the affected area. As part of the Land Evaluation and Site Assessment process, the federal lead agency is responsible for coordinating completion of the Farmland Conversion Impact Rating Form with the Natural Resources Conservation Service. A Land Evaluation and Site Assessment process may be required for some of projects, and if required, is prepared at the time an application for development is filed with the lead agency.

Safe Harbor Agreements

Private property owners can voluntarily enter into a Safe Harbor Agreement with the U.S. Fish and Wildlife Service and engage in activities that are beneficial to endangered species on their property. In turn, property owners are provided assurances that new land use restrictions will not be required on the property, even if the population of listed species on the subject property increases. The assurances are provided by the U.S. Fish and Wildlife Service through an Enhancement of Survival Permit issued to the property owner and under the authority of Section 10(a)(1)(A) of the federal

Endangered Species Act. This permit authorizes incidental take of species that may result from actions undertaken by the landowner under the Safe Harbor Agreement, provided that the landowner is following the provisions of said agreement by providing a net conservation benefit that contributes to the recovery of the subject Covered Species. The contribution toward recovery varies from case to case. The Safe Harbor Agreement does not have to provide permanent conservation for the enrolled property. Safe Harbor Agreements would be applicable for lands within the Planning Area where protected species or protected habitat are present.

6.1.1.2 State

Farmland Mapping and Monitoring Program (FMMP)

The State of California Department of Conservation Farmland Mapping and Monitoring Program (FMMP) produces maps and statistical data for use in analyzing impacts to agricultural resources in the state (CDOC 2013). The FMMP Important Farmland Maps include the defined mapping categories listed in Table 6-1.

Table 6-1. Important Farmland Mapping Categories

Category	Definition
Prime Farmland (P)	Farmland with the best combination of physical and chemical features able to sustain long-term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agricultural production at some time during the 4 years prior to the mapping date.
Farmland of Statewide Importance (S)	Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture. Land must have been used for irrigated agricultural production at some time during the 4 years prior to the mapping date.
Unique Farmland (U)	Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the 4 years prior to the mapping date.
Farmland of Local Importance (L)	Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.
Grazing Land (G)	Land on which the existing vegetation is suited to the grazing of livestock.
Urban and Built-Up Land (D)	Land occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. This land is used for residential, industrial, commercial, construction, institutional, and public administration uses; railroad and other transportation yards; cemeteries; airports; golf courses; sanitary landfills; sewage treatment; water control structures; and other developed purposes.
Other Land (X)	Land not included in any other mapping category. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry, or aquaculture facilities; strip mines; borrow pits; and water bodies smaller than 40 acres. Vacant and non-agricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land.
Water (W)	Perennial water bodies with an extent of at least 40 acres.

Source: CDOC 2013.

California Land Conservation Act (Williamson Act)

The California Land Conservation Act, commonly referred to as the Williamson Act, is the state's primary program for restricting the uses of agricultural and open space lands to farming and ranching. The Williamson Act is a voluntary program that offers reduced property taxes on lands that have been placed under a Williamson Act contract, which requires that the land remain available for agricultural use for a minimum of 10 years.

Land Use and Resource Management Plan for the Primary Zone of the Delta

Policies contained in the Agricultural chapter of the *Land Use and Resource Management Plan for the Primary Zone of the Delta* (Delta Protection Commission 2010) relevant to the EIS/EIR alternatives apply to the areas of the EIS/EIR Planning Area that are west of Interstate 5. Relevant policies include the following (Delta Protection Commission 2010):

> **Policy P-2:** Conversion of land to non-agriculturally-oriented uses should occur first where productivity and agricultural values are lowest.
>
> **Policy P-4:** Support agricultural programs that maintain economic viability and increase agricultural income in accordance with market demands, including but not limited to wildlife-friendly farming, conservation tillage and non-tillage.
>
> **Policy P-5:** Local governments shall encourage implementation of the necessary plans and ordinances to: maximize agricultural parcel size; reduce subdivision of agricultural lands; protect agriculture and related activities; protect agricultural land from conversion to non-agriculturally-oriented uses. An optimum package of regulatory and incentive programs could include: (1) an urban limit line; (2) minimum parcel size consistent with local agricultural practices and needs; (3) strict subdivision regulations regarding subdivision of agricultural lands to ensure that subdivided lands will continue to contain agriculturally-oriented land uses; (4) require adequate buffers between agricultural and non-agricultural land uses particularly residential development outside but adjacent to the Primary Zone; (5) an agriculture element of the general plan; (6) a Right-to-Farm ordinance; and (7) a conservation easement program.
>
> **Policy P-6:** Encourage acquisition of agricultural conservation easements from willing sellers as mitigation for projects within each county. Promote use of environmental mitigation in agricultural areas only when it is consistent and compatible with ongoing agricultural operations and when developed in appropriate locations designated on a countywide or Delta-wide habitat management plan.

Policy P-7: Encourage management of agricultural lands which maximize wildlife habitat seasonally and year-round, through techniques such as fall and winter flooding, leaving crop residue, creation of mosaic of small grains and flooded areas, wildlife friendly farming, controlling predators, controlling poaching, controlling public access, and others.

Policy P-8: Encourage the protection of agricultural areas, recreational resources and sensitive biological habitats, and the reclamation of those areas from the destruction caused by inundation.

California Right to Farm Act

The "Right to Farm Act" (California Civil Code Sections 3482.5, 3482.6, 3483, and 3484 collectively) is a statewide agricultural protection act. Similar to Sacramento County Code Chapter 14.05 (the Right to Farm Ordinance, discussed below), the Right to Farm Act helps protect agricultural operations, activities, facilities, etc. from nuisance complaints. Unlike the County Code, the Right to Farm Act has a broader sweep of protections with the intention of shielding agricultural processing activities, operations, and facilities, such as the processing of dairy products, the production of wine, the processing of meat and egg products, the drying of fruits and grains, the packing and cooling of fruits and vegetables, and the processing for wholesale and retail markets of agricultural products. The Planning Area has many of these processing facilities and operations. The Right to Farm Act prevails over contrary provisions of any city or county ordinance.

6.1.1.3 Local

Sacramento County General Plan

The *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011) includes an Agriculture Element, which identifies Sacramento County's overall agricultural goals of protecting the County's agricultural lands, maintaining the productivity of those lands, and promoting/supporting agricultural activities as an integral part of the Sacramento County economy. The Agriculture Element also includes specific Objectives and Implementation Measures to allow achievement of the stated goals.

The Sacramento County General Plan's Conservation Element (Sacramento County 2011) also contains goals and policies related to agriculture. Specifically, this element directs that preserves established[1] to protect ecological resources should be planned and managed to avoid conflicts with adjacent agricultural activities. It also directs that sensitive habitat areas on public lands should be protected from exposure to pesticides and other similar chemical applications.

[1] Note that in the context of this Plan, the word "establish" is synonymous with "create."

Finally, this element notes that ranching and grazing may be compatible activities with preserves established to protect and conserve vernal pool habitat and that native vegetative habitats should be protected from improper grazing activities on public lands.

The Sacramento County General Plan Agriculture Element contains the following policies relevant to agriculture in the Planning Area (Sacramento County 2011):

> **Policy AG-1:** The County shall protect Prime, Statewide Importance, Unique and Local Importance farmlands located outside of the [urban services boundary] USB from urban encroachment.
>
> **Policy AG-3:** The County shall permit agricultural uses on buffers, provided such uses are conducted in a manner compatible with urban uses. Buffers shall be used to separate farming practices incompatible with adjacent urban uses. Any homeowners' association or similar entity within the development shall assist in determining compatible use. Buffers shall not adversely conflict with agricultural uses on adjoining property.
>
> **Policy AG-5:** Projects resulting in the conversion of more than fifty (50) acres of farmland shall be mitigated within Sacramento County, except as specified in the following text, based on a 1:1 ratio, for the loss of the following farmland categories through the specific planning process or individual project entitlement requests to provide in-kind or similar resource value protection (such as easements for agricultural purposes):
>
> - Prime, Statewide Importance, Unique, Local Importance, and Grazing farmlands located outside the USB;
> - Prime, Statewide Importance, Unique, and Local Importance farmlands located inside the USB.
>
> The Board of Supervisors retains the authority to override impacts to Unique, Local, and Grazing farmlands, but not with respect to Prime and Statewide farmlands.
>
> However, if that land is also required to provide mitigation pursuant to a Sacramento County endorsed or approved Habitat Conservation Plan (HCP), then the Board of Supervisors may consider the mitigation land provided in accordance with the HCP as meeting the requirements of this section including land outside of Sacramento County.[2]

[2] Note: This policy is not tied to any maps contained in the Agriculture Element. Instead, the most current Important Farmland map from the Department of Conservation should be used to calculate mitigation.

Policy AG-10: The County shall balance the protection of Prime, Statewide Importance, Unique, and Local Importance farmlands and farmlands with intensive agricultural investments with the preservation of natural habitat so that the protection of farmland can also serve to protect habitat.

Policy AG-11: Cooperation shall be encouraged between landowners of Prime, Statewide Importance, Unique, and Local Importance farmlands or land with intensive agricultural investments and landowners of natural resource preserves, including mitigation banks, mitigation sites, and wildlife refuges, so that both habitat preservation and standard farming practices mutually benefit.

Policy AG-12: The County will cooperate with landowners of agriculturally zoned properties to promote the placing of natural preserve/mitigation amenities on land, such as trees and other biota enhancing improvement, by making sure amenities are assets to both the natural preserve/mitigation areas and agriculture practices.

Policy AG-13: Indemnification against property losses from recreational users should be provided to agricultural property owners adjacent to mitigation banks, environmental mitigation sites, wildlife refuges, or other natural resource preserves provided loss is proven to be a direct and exclusive result of new recreational access provided by the establishment of, and occurring through, such sites, and provide law enforcement access to such sites.

Policy AG-14: The County shall initiate intergovernmental agreements with state and federal wildlife management authorities in order to mitigate loss of Prime, Statewide Importance, Unique, and Local Importance farmlands or land with intensive agricultural investment due to natural habitat conversion.

Policy AG-15: The County shall pursue opportunities to create mitigation banks, environmental mitigation sites, wildlife refuges, or other natural resource preserves wherein substantial agricultural activities that are compatible with protection of high habitat values continue, but incompatible activities and conversion for development are precluded by conservation easements.

Policy AG-16: Maintain private ownership by coordinating with non-profit organizations to acquire conservation easements for preserving farmlands.

Policy AG-17: The establishment of conservation easements combining preservation of agricultural uses, habitat values, and open space on the same property should be encouraged where feasible.

Policy AG-19: Recreational trails shall be designed in cooperation with adjacent property owners to minimize adverse impacts on farming practices.

Policy AG-20: Public recreation trails adjacent to permanent agriculture shall be designed to provide appropriate vehicle access for law enforcement needs.

Policy AG-21: The County encourages the preservation of Prime, Statewide Importance, Unique, and Local Importance farmlands, including opposing any residential or commercial development for the Cosumnes River or Deer Creek riparian areas which are not compatible with agricultural uses.

Policy AG-22: If land within the Cosumnes River watershed is developed for non-agricultural purposes, the County should actively pursue easement dedication for equestrian trails and bikeways within such development as a condition of approval.

Policy AG-23: The County seeks to minimize agricultural/trail-user conflicts by recommending and seeking buffer zones between trails and nearby agricultural land and by locating trails away from the Cosumnes and Deer Creek riparian areas.

Policy AG-25: Outside the Urban Service Boundary, the County shall encourage landowners to enter into Williamson Act contracts or, as appropriate, to rescind Notices of Nonrenewal. Provide support to keep property in the Williamson Act by allowing agricultural-friendly land use practices that include additional economic incentives, and support replacing existing Williamson Act contracts with amended contracts that include agricultural-friendly land use practices.

Policy AG-28: The County shall actively encourage conservation of soil resources.

Sacramento County Code

The Sacramento County Code Chapter 14.05 (2016) establishes the County's "Right-to-Farm" ordinance, which states the right of landowners to continue agricultural activities in the vicinity of non-agricultural land uses. The ordinance prioritizes commercially productive agricultural land uses and protects these uses from potential issues of land use compatibility that may arise due to the development of non-agricultural land uses adjacent to existing agricultural land. The agricultural activity, operation, or facility must have been in operation for more than 3 years, not been declared a nuisance at the time it began, and operate consistently with accepted agricultural customs and standards in order to be protected under the ordinance.

Galt General Plan

The Conservation Element of the *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009a) identifies agricultural lands surrounding Galt as a valuable component of the City's open space resources, and establishes a goal of preserving and enhancing these lands. The policy included in the Galt General Plan that addresses agricultural lands includes the following (Galt 2009a):

> **Policy COS-4.1:** Prime Agricultural Land Preservation. The City shall work to preserve prime agricultural lands surrounding the Planning Area from future development by creating a clear and sensitive urban transition to minimize land use conflicts and protect long-term agriculture.

The Galt Municipal Code does not include a "Right-to-Farm" ordinance or other mechanism to protect agricultural uses if land use compatibility issues arise.

Rancho Cordova General Plan

Rancho Cordova has only a limited amount of agricultural land, and the *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2006a) recognizes that most areas that currently support agriculture within the City limits will be developed with urban and suburban uses. The Rancho Cordova General Plan includes policies and measures that recognize the right of existing agricultural uses to continue as long as the landowner/farmers desire, to minimize land use conflicts/impacts to urban and agricultural uses through the use of buffers and other similar methods, and to mitigate for the loss of farmland through the preservation of an equal amount of land that is of equal or higher agricultural value.

Applicable policies in the Rancho Cordova General Plan include the following (Rancho Cordova 2006a):

> **Policy LU.1.8:** While agricultural uses are anticipated to be phased out within the City limits, the City recognizes the right of these uses to continue as long as their individual owners/farmers desire.
>
> **Policy LU.1.9:** The City shall require development to protect 1 acre of existing farmland of equal or higher quality for each acre of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance that would be converted to non-agricultural uses. This protection may consist of the establishment of farmland conservation easements, farmland deed restrictions, or other appropriate farmland conservation in perpetuity, but may also be utilized for compatible wildlife conservation efforts. The farmland to be preserved shall be located within Sacramento County and must have adequate water

supply to support agricultural use. As part of the consideration of land areas proposed to be protected, the City shall consider the benefits of preserving farmlands in proximity to other protected lands.

Policy LU.1.10: The City shall ensure that the following standards are met regarding agricultural conservation easement content:

- Provisions of an accurate legal document that prohibits any activity that substantially impairs or diminishes the agricultural productivity of the land;
- Protection of any existing water rights necessary to maintain agricultural uses and retain such water rights for ongoing use on the agricultural land; and
- Interests in the agricultural land shall be held in trust by the City and/or an entity acceptable to the City, in perpetuity.

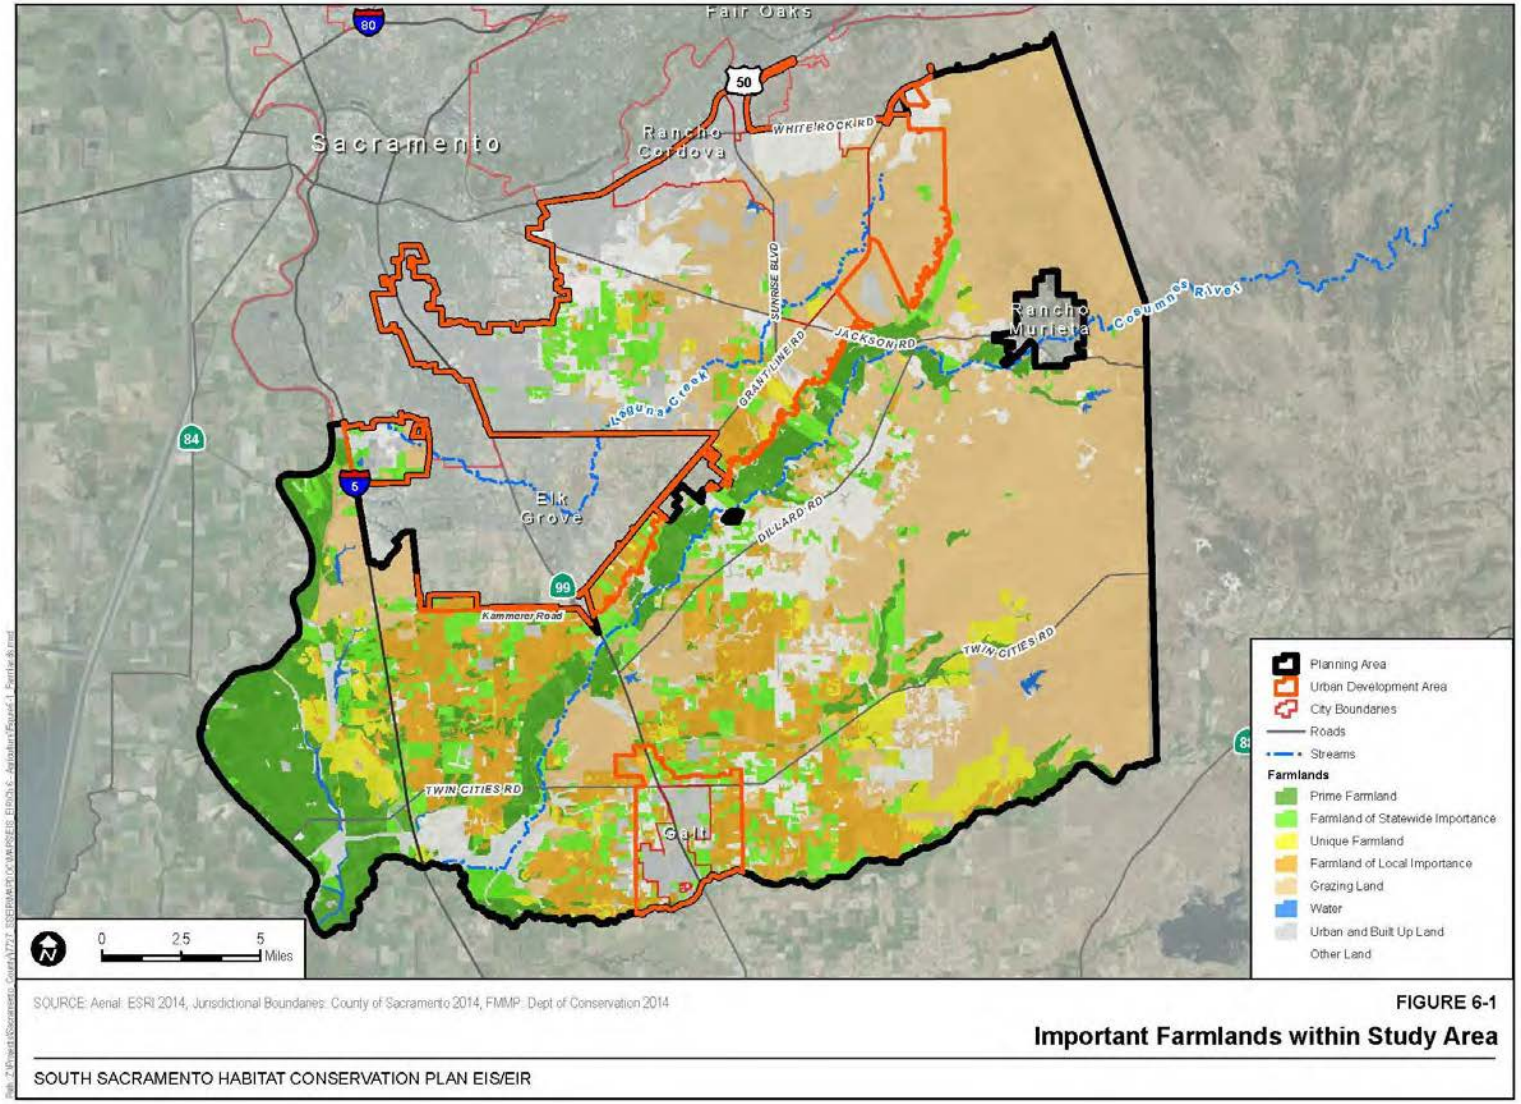
Rancho Cordova Municipal Code

The Rancho Cordova Municipal Code Chapter 14.05 (2016) establishes a "Right-to-Farm" ordinance protecting agricultural land uses in the vicinity of non-agricultural land uses. While agricultural production may generate noise, odor, dust, and other undesirable effects to adjacent non-agricultural land uses, the ordinance considers these effects acceptable in the furtherance of General Plan goals intended to preserve and enhance agricultural production. The agricultural activity, operation, or facility must have been in operation for more than 3 years, not been declared a nuisance at the time it began, and operate consistent with accepted agricultural customs and standards to be protected under the ordinance. Chapter 23.904 of the Rancho Cordova Municipal Code (2016) sets forth development and operating standards for agricultural activities to mitigate potential adverse effects of agricultural activities on adjacent and surrounding land uses.

6.1.2 Planning Area Agricultural Resources and Activities

This section describes the existing agricultural resources (farmland) and activities (i.e., active farming or grazing) that occur within the EIS/EIR Planning Area. In the eastern portion of the Planning Area, agricultural activities primarily consist of ranching and grazing. The central portion of the Planning Area supports more irrigated pasture and grassland. The southwestern portion of the Planning Area supports more vineyards and croplands and includes the Cosumnes River floodplain. Figure 6-1 shows the locations of Important Farmlands within the Planning Area.

6.1.2.1 Important Farmlands



According to current FMMP data (CDOC 2014), approximately 256,832 acres of the 317,655-acre Planning Area are considered Important Farmland (Table 6-2). As indicated on Figure 6-1, more than half of this Important Farmland is used for grazing lands and is not actively cultivated.

Table 6-2. Important Farmland within the Planning Area

Agricultural Land	Area of Each Farmland Type (acres)			
	Sacramento County	*Rancho Cordova*	*Galt*	*Total for Planning Area*
Prime Farmland	35,769	15	35	35,819
Unique Farmland	13,899	159	0.4	14,058
Farmland of Statewide Importance	39,653	22	248	39,923
Farmland of Local Importance	32,611	242	379	33,231
Grazing Land	128,858	4,867	76	133,801
Total	**250,790**	**5,305**	**737**	**256,832**

Source: CDOC 2014.

Figure 6-1 Important Farmlands within Study Area

AGENDA ITEM 11.1
4336

INTENTIONALLY LEFT BLANK

6.1.2.2 Types of Agricultural Activities

A variety of agricultural activities occur within the Planning Area, primarily outside the Urban Development Area (UDA).[3] In general, these activities include cultivation of row crops, irrigated pasture, fruit and nut orchards, and vineyards. Agricultural lands within the Planning Area can generally be described as follows:

- **Row and Field Crops:** Many row and field crops are concentrated in the portion of the Cosumnes River floodplain that is in the southwest of the Planning Area. Row and field crops include all non-orchard and non-vineyard agricultural crops, such as rice and other small grains, corn, tomatoes, melons, peppers, safflower, sunflower, and short-term perennial crops (e.g., asparagus, alfalfa).
- **Irrigated Pasture and Grasslands:** Irrigated pasture and grasslands occur in a scattered distribution generally in the central portion of the Planning Area. Irrigated pasture and grasslands includes hay production (wheat, oats, clovers, mixed grasses), seasonal summer pasture for livestock (primarily cattle), and year-round pasture for livestock (primarily cattle or horses). Seasonal pasture appears to be the most common use. Irrigated pasture and grasslands are typically seeded, cut/grazed, and reseeded on a regular basis on an approximately 5- to 7-year cycle before the fields are left fallow to rest and the cycle is started over again. Irrigated pasture and grasslands do not encompass dry grazing, as noted in the following text.
- **Fruit and Nut Orchards:** Orchards are scattered throughout the Planning Area, with the largest concentration along the western boundary. Fruit tree orchards include apples, cherries, pears, apricots, chestnuts, kiwi, nectarines, olives, peaches, and plums. Nut tree orchards include walnuts, almonds, pecans, pistachios, and chestnuts.
- **Vineyards:** Vineyards are located in many areas of the Planning Area, with concentrations north and south of Twin Cities Road in Preserve Planning Unit 7, west of Interstate 5 in Preserve Planning Unit 6, and near the UDA boundary southeast of Grant Line Road. In Sacramento County, vineyards are primarily established for wine grape production, with some minor table grape producers. Vineyards are primarily "clean cultivated," meaning no other vegetation is allowed to grow between the rows or on the edges of fields and irrigation ditches.

[3] As discussed in Section 1.1.1, Geographic Scope of the EIS/EIR Planning Area, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, UDA means all lands within Sacramento County's USB boundary that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within Galt's sphere of influence (SOI) (see Figure 1-1).

In addition to these agricultural lands, ranchers use extensive areas of non-irrigated valley grassland within the Planning Area for livestock grazing.

6.1.2.3 Williamson Act Lands

Approximately 139,890 acres within the Planning Area is currently under active Williamson Act contracts (CDOC 2016). Approximately 10,400 acres of these active contracts is identified for nonrenewal. Figure 6-2 shows lands under Williamson Act contracts that are in the Planning Area.

6.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

6.2.1 Methodology for Assessing Impacts of Each Alternative on Agricultural Resources

This section describes the potential impacts of the actions and projects associated with each EIS/EIR alternative on the agricultural resources and activities in the Planning Area. Potential ways that the EIS/EIR alternatives could affect agricultural resources or activities include converting agricultural lands designated as Important Farmland to a developed land cover type or limiting or eliminating the ability of active farming or grazing activities to continue.

As discussed in Section 3.6.4, Addressing Incomplete or Unavailable Information in Chapters 4 through 16, geographic information system methodology was used to quantitatively estimate the direct impacts of each EIS/EIR alternative on Important Farmland and on lands with Williamson Act contracts. Geographic information system datasets of future projects and activities expected under each EIS/EIR alternative were digitally overlaid (compared) to separate geographic information system datasets of FMMP of Important Farmlands and Williamson Act lands.

~~It is appropriate to consider impacts to certain environmental resources within the context of other impacts occurring in the surrounding landscape, community, or region (see Section 3.6.2, Geographic Study Area of Resource Topics Analyzed in Chapters 4 through 16).~~

The study area used to analyze direct and indirect effects of the alternatives on agriculture is the Planning Area. The lead agencies determined that an appropriate geographic scale for evaluating the **cumulative** impacts of each EIS/EIR alternative on agriculture lands and activities should include all agricultural resources and activities within the Sacramento Area Council of Government's six-county region (SACOG 2016), which includes all of Sacramento, Placer, El Dorado, Sutter, Yolo, and Yuba Counties.

As discussed in Section 3.7, Cumulative Effects Analysis in Resource Chapters 4 through 16, the Chapter 6 cumulative analyses of impacts to agriculture resources will consider (1) the effects of past and present urban development within in the Planning Area (see Existing Conditions in Section 6.1.2, Planning Area Agricultural Resources and Activities) and within the larger six-county study area, and (2) future impacts expected from other reasonably foreseeable projects in the Planning Area (see Section 3.7) and other reasonably foreseeable projects within the larger six-county study area. The cumulative analysis of each EIS/EIR alternative will then consider whether the incremental impacts of the alternative on agricultural resources and agricultural activities would be significant (i.e., would be cumulatively considerable).

As discussed in Section 3.4, Previous Planning Area Environmental Reviews, and Section 6.1.1.3, Local, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006b) analyzed direct and cumulative impacts of urban growth planned within their jurisdictions, including impacts to agricultural resources and agricultural activities. When the impact analyses or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief summary or description of the incorporated information or analysis is provided in Sections 6.2.2, No Action/No Project Alternative; 6.2.3, Proposed Action/Proposed Project Alterative; and 6.2.4, Reduced Permit Term Alternative.

As discussed in Section 3.8.1, Significance Thresholds, the criteria used to evaluate the significance of each alternative's impacts on agricultural resources and activities are based on the California Environmental Quality Act (CEQA) Guidelines (Appendix G) (14 CCR 15000 et seq.) and on typical thresholds used to evaluate agricultural impacts in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse impact could occur if the alternative would:

1. Convert more than 50 acres of Prime Farmland, Unique Farmland, Farmland of Statewide Importance, Farmland of Local Importance, Grazing Land, or areas containing prime soils to uses not conducive to agricultural production;
2. Conflict with an existing Williamson Act contract; or
3. Introduce incompatible uses in the vicinity of existing agricultural uses.

The CEQA Guidelines (Appendix G) (14 CCR 15000 et seq.) does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial impact could occur if the alternative would:

1. Restore more than 50 acres of agricultural production in areas containing prime soils;
2. Reduce or eliminate a conflict with an existing Williamson Act contract; or

3. Reduce or eliminate incompatible uses in the vicinity of existing agricultural uses.

The impact analysis for the three EIS/EIR alternatives will consider the context, intensity, and severity of potential impacts to each of these agricultural resource impact criteria and will present a separate determination of significance for each of these criteria.

6.2.2 No Action/No Project Alternative

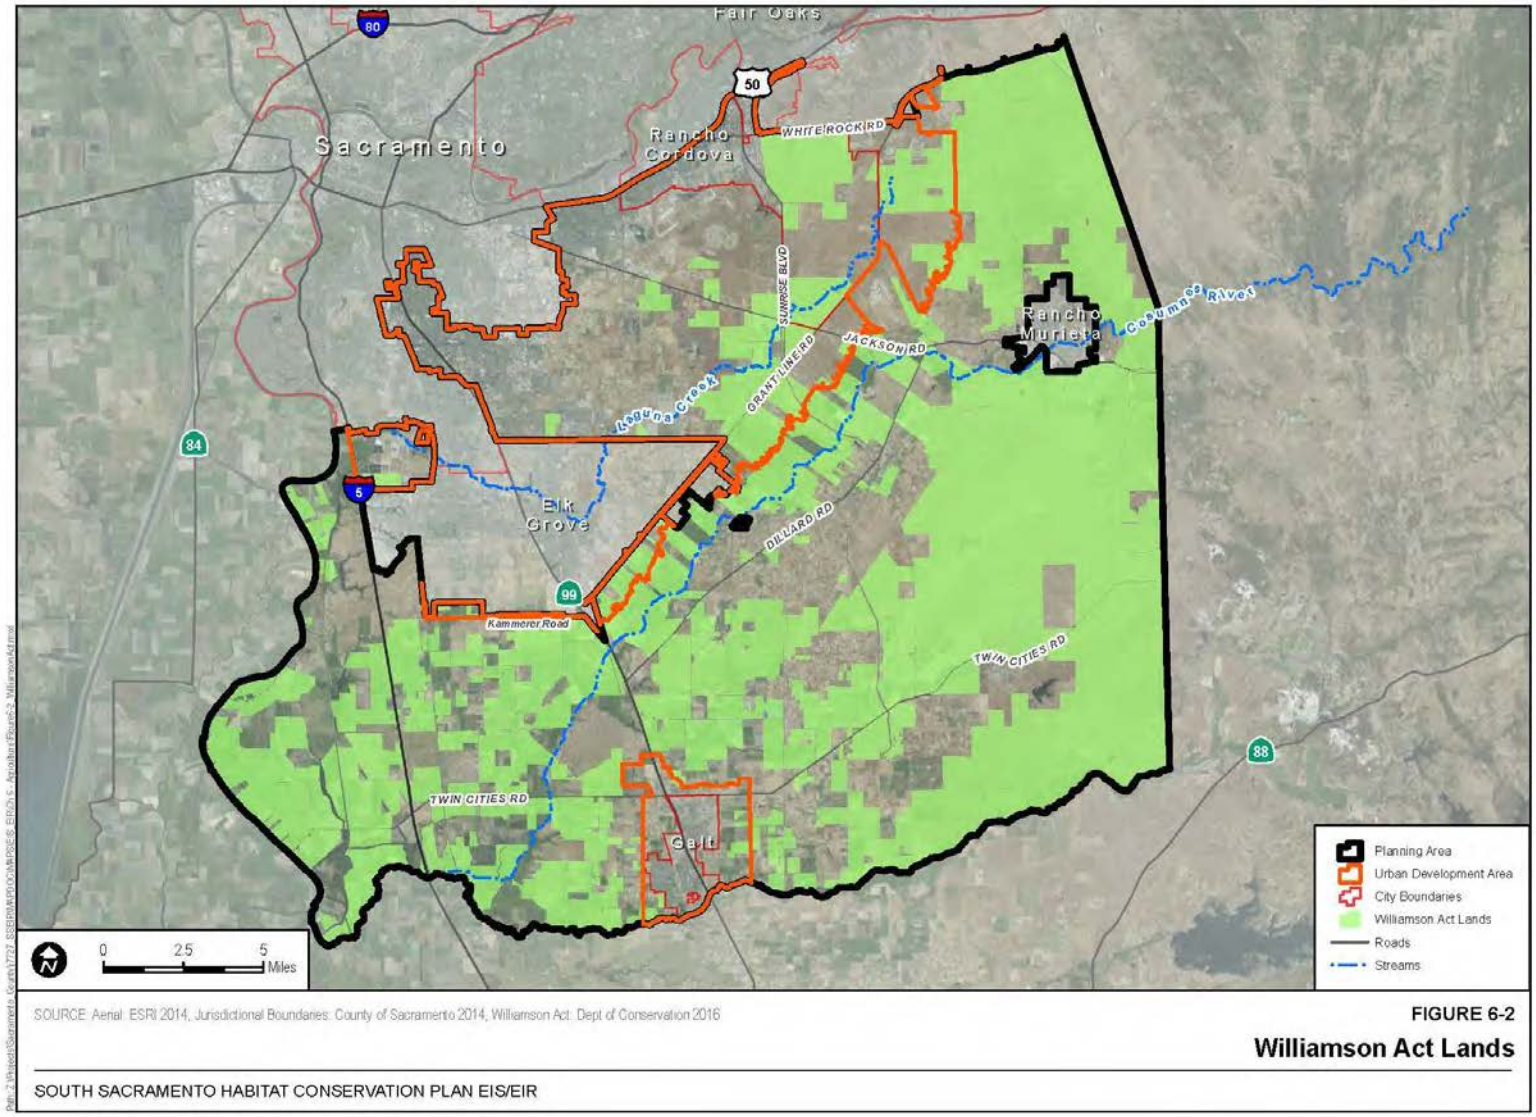
The No Action/No Project Alternative is described in Section 2.2, No Action/No Project Alternative.

6.2.2.1 Direct and Indirect Effects of the Alternative

Under the No Action/No Project Alternative, future urban development and associated infrastructure would convert approximately 30,570 acres of the approximately 256,832 acres of existing Important Farmland in the Planning Area to non-agricultural uses (Table 6-3). Nearly all of these impacts would be within the UDA. However, as explained in Section 2.2, approximately 1,900 acres of planned urban development would be shifted or displaced to locations outside the UDA under the No Action/No Project Alternative. Conversion (loss) of Important Farmland to a developed land cover type and conflicts between existing agricultural activities and new urban uses would occur on these 1,900 acres of "displaced" urban development.

Table 6-3. Impacts on Important Farmland Expected Under the No Action/No Project Alternative

Important Farmland Type	Existing Acres within Planning Area	Acres Removed from Agricultural Use Under This Alternative	New Total within Planning Area at the End of Study Period (acres)
Prime Farmland	35,819	398	35,421
Unique Farmland	14,058	742	13,316
Farmland of Statewide Importance	39,923	6,636	33,287
Farmland of Local Importance	33,231	7,165	26,066
Grazing Land[1]	133,801	17,264	116,537
Total	**256,832**	**32,205**	**224,627**



Source: CDOC 2014.

[1] The Sacramento County General Plan Policies (2011) do not require mitigation for impacts to Grazing Land within the USB according to Policy AG-5. However, these acres are still included in the impact total because they are mapped as Important Farmland.

The effects on agriculture of future urban development within Sacramento County, Galt, and Rancho Cordova were evaluated in the analysis of the General Plan EIRs discussed in Section 3.4 and Section 6.1.1, Federal (Sacramento County 2011; Galt 2009b; Rancho Cordova 2006b).

As discussed in Section 6.2.1, Methodology for Assessing Impacts of Each Alternative on Agricultural Resources, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

Figure 6-2 Williamson Act Lands

INTENTIONALLY LEFT BLANK

The impact analysis presented in the *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR) (Sacramento County 2010) determined the following within Sacramento County:

- Future development within Sacramento County would result in conversion of 8,645 acres of Important Farmland,[4] beyond the level than can be mitigated through in-kind mitigation; this would be a significant and unavoidable adverse impact (Sacramento County 2010, pp. 3-47 to 3-60)
- The encouragement of non-renewal of Williamson Act contracts is considered a significant adverse impact (Sacramento County 2010, pp. 3-47 to 3-60)

The Sacramento County General Plan EIR (Sacramento County 2010) did not address compatibility of designated land uses (e.g., residential) with adjacent agricultural uses.

The impact analysis presented in the *City of Galt General Plan Update: 2030 Final EIR* (Galt General Plan EIR) (Galt 2009b) determined the following within the Galt sphere of influence (SOI):

- Planned development consistent with the Galt General Plan would convert up to 3,200 acres of Important Farmland, a significant and unavoidable adverse impact (Galt 2009b, pp. 8-25 to 8-28)
- Impacts to any lands under Williamson Act contracts would be less than significant adverse; however, planned development in the Galt SOI would require annexation and re-zoning of parcels under Williamson Act contracts (Galt 2009b, pp. 8-25 to 8-28)
- Impacts associated with introducing incompatible land uses in the vicinity of existing agricultural uses would be less than significant adverse with implementation of the Galt General Plan policies that would protect agricultural uses and establish a green belt (Galt 2009b, pp. 8-25 to 8-28)

The impact analysis presented in the *City of Rancho Cordova General Plan Final Environmental Impact Report* (Rancho Cordova General Plan EIR) (Rancho Cordova 2006b) determined the following within Rancho Cordova:

- Conversion of most if not all of the Important Farmlands in the City due to planned development would result in a significant and unavoidable adverse impact (Rancho Cordova 2006b, pp. 4.2-17 to 4.2-24)

[4] As described further in Section 3.4.1, Sacramento County General Plan, the proposed project analyzed within the Sacramento County General Plan EIR assumed development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by the County. However, the County is currently processing land use entitlements in the Jackson Highway Corridor, so the referenced conclusions from the proposed project analysis are relevant to the No Action/No Project Alternative.

- Urban development would surround the one parcel in the City under a Williamson Act contracts, impeding the ability of the landowner to farm the land according to the Williamson Act contract and potentially violating the contract; this would result in a significant and unavoidable adverse impact (Rancho Cordova 2006b, pp. 4.2-17 to 4.2-24)
- Agriculture/urban interface conflicts such as farm equipment and vehicle conflicts on area roadways, potential trespassing and vandalism to active farmlands, and growth pressures on farmland near urban uses in the City would occur resulting in a significant and unavoidable adverse impact (Rancho Cordova 2006b, pp. 4.2-17 to 4.2-24)

As discussed in Section 3.4 and Section 6.1.3, Local, the three General Plan EIRs used different study periods ending in 2030 (Galt 2009b), in 2030 (Rancho Cordova 2006b), and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3, EIS/EIR Study Period). Therefore, additional urban development can be expected to occur within Galt, Rancho Cordova, and Sacramento County in the years after their General Plan EIR study periods end and when this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

The conversion of Important Farmlands to developed uses would contribute further to the already significant, unavoidable indirect adverse impacts to agricultural resources from new incompatible uses described in the environmental documents for the General Plans of Sacramento County, Galt, and Rancho Cordova. The description of the No Action/No Project Alternative (Section 2.2) assumes that project compliance with the existing General Plan policies, such as Sacramento County General Plan Policies AG-5 and AG-25 and Rancho Cordova General Plan Policy LU.1.9, as well as compliance with existing agricultural protection ordinances identified in Section 6.1.1, Regulatory Framework, would continue under the No Action/No Project Alternative, and these local policies and ordinances would reduce but not eliminate indirect impacts related to incompatible land uses.

As explained in Section 2.2.2, under the No Action/No Project Alternative, mitigation for impacts to listed species or aquatic resources from new urban development that cannot be avoided would continue to require avoidance, minimization, and compensatory mitigation. As discussed in Section 2.2.2, project Clean Water Act Section 404 compensatory mitigation and/or federal Endangered Species Act and California Endangered Species Act mitigation under the No Action/No Project Alternative could include purchase of credits in existing mitigation banks,

payment of in-lieu fees, and establishment of on-site or off-site preserves by the Permittees. High-priority locations for project mitigation preserves would include sites that have soils and hydrology that support vernal pools or that include riparian areas. These high-priority mitigation sites could contain Important Farmland or be under active Williamson Act contracts. However, mitigation preserves would not result in the loss of farmland or farming activities to developed uses, but instead, change how the land is used (e.g., fallow versus active farming). Therefore, including agricultural lands within mitigation preserves, including Important Farmland agricultural lands, would not require mitigation under existing Sacramento County, Galt, or Rancho Cordova policies. Potential impacts from allowing incompatible uses to be developed adjacent to existing agricultural lands would be mitigated, if necessary, through compliance with applicable Sacramento County, Galt, or Rancho Cordova General Plan policies.

On-site or off-site mitigation preservation could also include foraging habitat for species such as Swainson's hawk (*Buteo swainsoni*) or greater sandhill crane (*Grus canadensis*). As discussed in Chapter 9, Special-Status Species Including HCP Covered Species, habitat for these species includes open fields that contain row or field crops and grazing land. Species conservation easements on these agricultural lands may include restrictions that limit the type of crops grown or harvest times to ensure appropriate species habitat is preserved within the conservation easement. Conservation easements proposed on lands under existing Williamson Act contracts would be reviewed to ensure the terms of the contract do not conflict with the language of the conservation easement. Therefore, any limitation on types of crops and/or harvest times that are included in a new conservation easement would not result in significant adverse effects to Important Farmland or Williamson Act contracts.

Therefore, under the No Action/No Project Alternative, habitat re-establishment/establishment would not result in ***No Impact*** to agricultural operations.

6.2.2.2 Cumulative Effects of the No Action/No Project Alternative

As discussed in Section 3.7.1, Past and Present Actions in the Planning Area, and Section 6.2.1, past and present urban development and associated infrastructure project and activities in the EIS/EIR Planning Area have replaced much of the land historically used for agricultural production, especially within the UDA portion of the EIS/EIR Planning Area. Other developing areas within the study area (see Section 6.2.1) such as the Cities of Davis, El Dorado Hills, Yuba City, and Wheatland have also replaced formerly productive agricultural lands with urban development land covers.

Reasonably foreseeable future projects in the EIS/EIR Planning Area that could remove Important Farmland include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the Wilton Rancheria Casino, and construction of the

California High-Speed Rail and the California WaterFix projects (Section 3.7.2, Reasonably Foreseeable Other Actions). Outside the EIS/EIR Planning Area in the remainder of the study area, SACOG (2016) projects that urban development, rural residential development, and transportation projects have the potential to impact 2,466 acres of Prime Farmland, 746 acres of Unique Farmland, and 2,243 acres of Farmland of Statewide Importance for a combined potential impact to 5,455 acres of FMMP-designated farmland.

To address the loss of farmland, many state and local laws and requirements to protect farmland resources have been enacted (see Section 6.1.1). In Sacramento County, these requirements prescribe actions such as a 1:1 replacement for projects that convert more than 50 acres of Important Farmland and the encouragement to support the Williamson Act program to ensure a temporary protection of farmland resources. Based on Sacramento County General Plan Policy AG-5 (Sacramento County 2011), each conversion of less than 50 acres of Important Farmland as part of present and reasonably foreseeable actions would be considered a less-than-significant adverse impact not requiring mitigation. However, the cumulative effects of multiple conversions of less than 50 acres of Important Farmland would be cumulatively significant. Significant adverse cumulative effects from current and reasonably foreseeable future activities would be identified and mitigated according to General Plan policies. However, even with these policies in place, as indicated in the incorporated impact analysis from the General Plan EIRs for Sacramento County (2010), Galt (2009b), and Rancho Cordova (2006b), the cumulative effects of planned urban growth on existing Important Farmlands would result in a cumulatively significant and unavoidable adverse impact on agriculture resources.

Under the No Action/No Project Alternative, approximately 1,900 acres of planned urban development is expected to be shifted or displaced to locations outside the UDA. The areas expected to receive this urban development include south of the Elk Grove SOI and near Rancho Murieta. These components of the No Action/No Project Alternative would further increase conflicts with land use plans and make a cumulatively considerable (i.e., significant) contribution to the cumulatively significant and unavoidable adverse impact to agriculture that was identified in the General Plan EIRs for Sacramento County (2010), Galt (2009b), and Rancho Cordova (2006b). Therefore, the No Action/No Project Alternative would result in a significant and unavoidable adverse cumulative effect to agricultural resources and agricultural activities.

6.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3, Proposed Action/Proposed Project Alternative.

6.2.3.1 Direct and Indirect Effects of the Proposed Action/Proposed Project Alternative

Under the Proposed Action/Proposed Project Alternative, Covered Activity projects and activities would convert approximately 31,105 acres of the approximately 256,832 acres of Important Farmland in the Planning Area to non-agricultural uses (Table 6-4). As discussed in Section 2.3, nearly all of these effects would be within the UDA. Of the approximately 31,105 acres of Important Farmland that would be converted to a non-agricultural use under the Proposed Action/Proposed Project Alternative, approximately 4,799 acres are under an active Williamson Act contract.

The remainder of Important Farmland in the Planning Area, including approximately 225,727 acres outside the UDA, would not be adversely affected by the Proposed Action/Proposed Project Alternative, including 9,642 acres of Cropland and Irrigated Pasture-Grassland that would be conserved as part of the SSHCP Preserve System (see the following text).

Table 6-4. Impacts on Important Farmland Expected Under the Proposed Action/Proposed Project Alternative

Important Farmland Type	Existing Acres within Planning Area	Acres Removed from Agricultural Use Under this Alternative	New Total within Planning Area at End of Study Period (acres)
Prime Farmland	35,819	275	35,544
Unique Farmland	14,058	1,004	13,054
Farmland of Statewide Importance	39,923	6,049	33,874
Farmland of Local Importance	33,231	7,743	25,488
Grazing Land[1]	133,801	16,035	117,766
Total	**256,832**	**31,105**	**225,727**

Source: CDOC 2014.

[1] The Sacramento County General Plan (Sacramento County 2011) does not require mitigation for impacts to Grazing Land within the USB according to Policy AG-5. However, these acres are still included in the impact total because they are mapped as Important Farmlands.

As described in Section 2.3, the Proposed Action/Proposed Project Alternative would allow urban development Covered Activities within the Mather Core Recovery Area portion of the UDA to be implemented consistently with the approved Sacramento County and Rancho Cordova General Plans without urban development shifting or being displaced to locations outside the UDA. As a result, Important Farmland converted to urban uses outside the UDA would be less under the Proposed Action/Proposed Project Alternative than under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on agricultural resources and activities compared to the No Action/No Project Alternative baseline condition.

As indicated in Section 2.3, under the Proposed Action/Proposed Project Alternative, cropland conservation easements or preserves would be established to allow for continued agricultural production on areas that provide foraging and nesting habitat for several Covered Species, including Swainson's hawk, white-tailed kite (*Elanus leucurus*), and greater sandhill crane.

The Proposed Action/Proposed Project Alternative would preserve approximately 9,642 acres of Cropland and Irrigated Pasture-Grassland under conservation easements or in-fee titles from willing sellers (as part of the approximately 36,038 acres of natural land covers included within the Preserve System). The protected Cropland and Irrigated Pasture-Grassland would generally be located outside the UDA and west of State Route 99 in the Cosumnes River floodplain. ~~Avoidance and Minimization Measure (AMM) EDGE-1 would prioritize compatible adjacent uses next to SSHCP Preserves, such as parks, nature trails, roads, or other uses that would not convert or introduce incompatible land uses or conflict with any existing Williamson Act contracts.~~ Some of the land included within the Preserve System may include Important Farmland or land currently enrolled in a Williamson Act contract; however, establishment of preserves would not convert Important Farmland to developed uses or prevent farmers/ranchers from using their agricultural land for agricultural purposes. Therefore, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect to agriculture resources and agricultural activities relative to the No Action/No Project Alternative baseline condition. Further, under the Proposed Action/Proposed Project Alternative, the "Right-to-Farm" ordinances and General Plan policies enacted by Sacramento County and Rancho Cordova (described in Section 6.1.1) would also still apply and protect agricultural operations from indirect effects of urban development and incompatible uses.

Much, if not all, of the Cropland Preserves would include Important Farmland. That would also be true for many acres of other preserve types established under the Proposed Action/Proposed Project Alternative. Similarly, many of the areas protected under conservation easement or in fee-title preserves would be under a Williamson Act contract. Each Williamson Act contract is unique, and some may restrict the possible terms allowed for a conservation easement. If a conservation easement were proposed for land that is in a Williamson Act contract, the future Permittees would review the specifics of the Williamson Act contract to ensure that the establishment of a conservation easement is allowable.

Cropland Preserves would be established primarily by purchase of conservation easements from willing landowners. The conservation easement would identify the types of crops to provide habitat for Covered Species, timing for harvest, crop rotations, or other measures that benefit targeted Covered Species, as agreed to in the conservation easement purchase and as described in the SSHCP document. Active agricultural lands placed under a conservation easement would be kept in active agricultural use. Management plans would be developed

with landowners and would be periodically reviewed, which could provide landowners the opportunity to adaptively manage land management activities.

Of the Important Farmland included in the proposed SSHCP Preserve System, a substantial amount would be located on lands that the state's FMMP designates as Grazing Land (CDOC 2013, 2014). Generally, grazing on SSHCP Preserves would continue because grazing is beneficial for the Vernal Pool Ecosystem (see Chapter 8, Natural Land Cover Habitat Types and Associated Plant and Animal Communities). Existing grazing leases or licenses on the properties that become part of the SSHCP Preserve System would remain in effect, and the current grazing regimen would be continued until a Preserve Management Plan (Section 2.3.6, SSHCP Preserve Management and Monitoring Programs) is prepared. The Preserve Management Plan would specify the timing of grazing, how many animals can graze at one time, the duration of grazing, and how much vegetation should be present on a grazed area, and would be reviewed annually with the livestock operator. Therefore, establishment of preserves under the Proposed Action/Proposed Project Alternative would not convert Important Farmland to developed uses or prevent farmers/ranchers from using their agricultural land for agricultural purposes. A small amount of Cropland or Irrigated Pasture-Grassland may be converted to an aquatic resource land cover type from the re-establishment or establishment of Riparian Woodland, Vernal Pools, or Seasonal Wetlands under the Proposed Action/Proposed Project Alternative. Although these changes in land cover type are not considered agricultural conversion under the Sacramento County, Galt, or Rancho Cordova General Plans, under the Proposed Action/Proposed Project Alternative, the change in land cover would be mitigated as a loss of species habitat. Establishment of preserves under the Proposed Action/Proposed Project Alternative would have ***No Impact*** on agriculture, which is the same for preserves established under the No Action/No Project Alternative baseline condition.

Preservation, re-establishment/establishment, and management of species habitat may result in the expansion (colonization or increased numbers) of some Covered Species. The SSHCP includes a Good Neighbor Program (refer to Chapter 11 in the SSHCP document) that extends Incidental Take Permit coverage for willing participants on any agricultural lands within 0.5 mile of an SSHCP Preserve. Therefore, this would be a ***Minor Beneficial*** effect to agricultural activities relative to the No Action/No Project Alternative baseline condition.

6.2.3.2 Significance of Direct and Indirect Effects

Compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would result in the following:

- Conversion of approximately 1,100 fewer acres of Important Farmland to non-agricultural uses

- New land uses that conflict with 32 more acres of land that have existing Williamson Act contracts
- Fewer incompatible uses near existing agricultural uses by not displacing 1,900 acres of new urban development to locations outside the UDA
- Fewer incompatible uses near existing agricultural by implementing an AMM that emphasizes placement of compatible uses adjacent to Cropland Preserves

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative on all of the agricultural resource impact criteria, the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects to agriculture when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

6.2.3.3 Cumulative Effects of the Proposed Action/Proposed Project Alternative

As described in Sections 3.7, past and present urban development projects and activities have resulted in loss of Important Farmland in the study area. The EIRs prepared for the Sacramento County, Galt, and Rancho Cordova General Plans (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006b) concluded that development consistent with these plans would result in significant and unavoidable adverse cumulative impacts to Important Farmland.

Reasonably foreseeable future projects that could remove additional Important Farmland include expansion of the Rancho Murieta development, urban development in the Elk Grove SOI, development of the Wilton Rancheria Casino, and construction of the California High-Speed Rail and the California WaterFix projects. Outside the EIS/EIR Planning Area in the remainder of the study area, SACOG (2016) projects that urban development, rural residential development, and transportation projects have the potential to impact 2,466 acres of Prime Farmland, 746 acres of Unique Farmland, and 2,243 acres of Farmland of Statewide Importance for a combined potential impact to 5,455 acres of FMMP designated farmland.

Present and reasonably foreseeable other projects in the Planning Area would comply with policies of Sacramento County, Galt, and Rancho Cordova described in Section 6.1.1. Those policies are designed to protect agricultural resources and require agencies or project proponents to mitigate for the loss of Important Farmland, which would provide a mechanism to ensure that potential impacts associated with the loss of farmland are appropriately addressed. However, the loss of Important Farmland from past, present, and reasonably foreseeable future projects under the Proposed Action/Proposed Project Alternative would still be considered cumulatively significant adverse, which is the same as the cumulative impact analysis of the No Action/No Project Alternative.

Urban development under the Proposed Action/Proposed Project Alternative would contribute to cumulative impacts by converting 32,060 acres of natural land in the UDA, including areas with Important Farmland. Compared to the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative would not result in shifting or displacement of new development to areas located outside the UDA, such as south of the Elk Grove SOI where nearly all of the land is currently in agricultural production. In addition, the Proposed Action/Proposed Project Alternative would result in mitigation for all Covered Activity impacts to agricultural lands. Under the No Action/No Project Alternative, existing Sacramento County General Plan Policy AG-5 (Sacramento County 2011) only requires mitigation for loss of agricultural lands for projects converting more than 50 acres of Important Farmland. Therefore, urban development under the Proposed Action/Proposed Project Alternative would have a smaller incremental contribution to cumulative impacts on agriculture and agricultural activities than the No Action/No Project Alternative baseline condition.

Establishment and management of preserves under the Proposed Action/Proposed Project Alternative would not contribute substantially to cumulative effects on agriculture because any changes to existing agricultural operations within SSHCP Preserves would be minor and would not substantially change agricultural use of study area croplands. Further, compared to the No Action/No Project Alternative baseline conditions, the Proposed Action/Proposed Project Alternative would preserve 10,000 acres more of Valley Grassland outside the UDA in perpetuity, and these 10,000 acres would be kept available for grazing.

Because the Proposed Action/Proposed Project Alternative would not result in urban development shifted or displaced to outside the UDA, and would result in more preservation of Important Farmlands and grazing lands as compared to the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative's incremental contribution to cumulative impacts on agriculture resources would be less than that described for the No Action/No Project Alternative in Section 6.2.2.2, Cumulative Effects of the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial Cumulative*** effect on agriculture compared to the No Action/No Project Alternative baseline condition.

6.2.4 Reduced Permit Term Alternative

The Reduced Permit Term Alternative is described in Section 2.4, Reduced Permit Term Alternative. Section 6.2.4.1, Direct and Indirect Effects of the Alternative, presents separate determinations for each of the adverse and beneficial criterion (listed in Section 6.2.1). Section 6.2.4.2, Significance of Direct and Indirect Effects, weighs all of those separate determinations to present one "bottom-line" determination statement for the significance of the direct and indirect effects of the Reduced Permit Term Alternative on agriculture. Finally, Section 6.2.4.3,

Cumulative Effects of the Reduced Permit Term Alternative, describes the cumulative effects of past, present, and reasonably foreseeable other projects in the cumulative study area, and then considers the incremental contribution made by the Reduced Permit Term Alternative to those cumulative effects.

6.2.4.1 Direct and Indirect Effects of the Alternative

Under the Reduced Permit Term Alternative, Covered Activities would convert approximately 30,485 acres of the approximately 256,946 acres of Important Farmland in the Planning Area to non-agricultural uses (Table 6-5). Of the approximately 30,485 acres of Important Farmland that would be converted to a non-agricultural use under the Reduced Permit Term Alternative, approximately 4,900 acres are currently under an active Williamson Act contract.

The remainder of Important Farmland in the Planning Area, including acres of active cropland that would be conserved as part of the Preserve System established during the 30-year permit term, would not be adversely affected by the Reduced Permit Term Alternative.

Table 6-5. Impacts on Important Farmland due to Covered Activities under the Reduced Permit Term Alternative

Important Farmland Type	Existing Acres within Planning Area	Impacts on Each Farmland Type (acres)			New Total within Planning Area (acres)
		Years 1–30	*Years 31–50*	*Total*	
Prime Farmland	35,731	237	83	321	35,410
Unique	14,060	274	464	738	13,322
Farmland of Statewide Importance	39,998	1,280	4,746	6,027	33,971
Farmland of Local Importance	33,316	4,751	2,167	6,917	26,399
Grazing Land[1]	133,841	9,570	6,912	16,482	117,358
Total	**256,946**	**16,113**	**14,372**	**30,485**	**226,460**

Source: CDOC 2014.

1. The Sacramento County General Plan (Sacramento County 2011) does not require mitigation for impacts to Grazing Land in the USB according to Policy AG-5. However, these acres are still included in the impact total because they are mapped as Important Farmland.

Under the Reduced Permit Term Alternative, approximately 896 acres more of natural land covers within in the Mather Core Recovery Area would be directly impacted, and 597 acres more of direct impacts to natural land covers in the UDA outside the Mather Core Recovery Area compared to the No Action/No Project Alternative would occur. As described in Section 2.4, the Reduced Permit Term Alternative would allow urban development Covered Activities within the Mather Core Recovery Area portion of the UDA to be implemented consistent with the approved Sacramento County and Rancho Cordova General Plans, without urban development shifting or being displaced to locations outside the UDA. As a result, acres of Important Farmland

changed to urban development would be less under the Reduced Permit Term Alternative as compared to the No Action/No Project Alternative. Therefore, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on Important Farmland as compared to the impacts of the No Action/No Project Alternative baseline condition.

Under the Reduced Permit Term Alternative, the "Right-to-Farm" ordinances and General Plan policies enacted by Sacramento County and Rancho Cordova (described in Section 6.1.1) would apply and would protect agricultural operations from indirect effects of urban development during the EIS/EIR 50-year study period, including the 30-year permit term of the Reduced Permit Term Alternative. ~~Additional protections for agricultural operations would be provided by the Reduced Permit Term Alternative during the 30-year permit term by AMM EDGE-1, which would limit incompatible uses adjacent to Cropland Preserves~~. This would be ~~a ***Minor Beneficial impact***~~ ***No Impact*** to agricultural resources and agricultural activities relative to the No Action/No Project Alternative.

Much, if not all, of the Cropland Preserves would include Important Farmland. That would also be true for many acres of other preserve types established under the Reduced Permit Term Alternative. Similarly, many of the areas protected under conservation easement or in fee-title preserves would be under a Williamson Act contract. Each Williamson Act contract is unique, and some may restrict the possible terms allowed for a conservation easement. If a conservation easement were proposed for land that is in a Williamson Act contract, the future Permittees would review the specifics of the Williamson Act contract to ensure that the establishment of a conservation easement is allowable.

Of the Important Farmland included in the Reduced Permit Term Alternative's Preserve System, a substantial amount would be located on lands that the state's FMMP designates as Grazing Land (CDOC 2013, 2014). This would include the large landscape-scale preserve outside the UDA. Generally, grazing on SSHCP Preserves would continue because grazing is beneficial for the Vernal Pool Ecosystem (see Chapter 8). Existing grazing leases or licenses on the properties that receive conservation easements or are purchased in fee-title for SSHCP Preserves would remain in effect, and the current grazing regime would be continued until a management plan was prepared for the preserve. The Preserve Management Plan would specify the timing of grazing, how many animals can graze at one time, the duration of grazing, and how much vegetation should be present on a grazed area, and would be reviewed annually with the livestock operator. Therefore, establishment of preserves under the Reduced Permit Term Alternative would not convert Important Farmland to developed uses or prevent farmers/ranchers from using their agricultural land for agricultural purposes.

Cropland Preserves established during the 30-year permit term would be in large blocks to allow for continued agricultural production and would be protected through purchase of conservation

easements or fee-title purchases from willing sellers. Cropland Preserves established during the 30-year permit term (as part of the approximately 30,646 acres of natural land covers included within the Preserve System during the permit term) would include approximately 11,334 acres of row crops and Irrigated Pasture-Grassland. The Cropland Preserves would be almost entirely outside the UDA.

As outlined in Section 2.4.3, Covered Activities/Projects Under the Reduced Permit Term Alternative, after the 30-year permit term expires, mitigation preserves would continue to be established on a project-by-project basis as project mitigation for impacts to aquatic resources or listed species. It is expected that Cropland Preserves established after the end of the 30-year permit term (during Years 31–50 of the EIS/EIR 50-year study period) would comply with Sacramento County's Swainson's hawk ordinance to mitigate project effects on Swainson's hawk habitat. During Years 31–50 of the EIS/EIR 50-year study period, Sacramento County's agricultural protection ordinance (Section 6.1.2) would also continue to require that impacts to Important Farmland be mitigated by preserving Important Farmlands, preferably outside the USB boundary, when more than 50 acres are impacted by a project.

~~AMM EDGE-1 would prioritize compatible adjacent uses next to SSHCP Preserves, such as parks, nature trails, roads, or other uses that would not convert or introduce incompatible land uses or conflict with any existing Williamson Act contracts.~~ Some of the land included within the Preserve System may include important farmland or land currently enrolled in a Williamson Act contract; however, establishment of preserves would not convert Important Farmland to developed uses or prevent farmers/ranchers from using their agricultural land for agricultural purposes. Therefore, establishment of preserves under the Reduced Permit Term Alternative would have ***No Impact*** on agriculture compared to the No Action/No Project Alternative baseline condition.

Preservation, re-establishment/establishment, and management of species habitat may result in the expansion (colonization or increased numbers) of some Covered Species. As in the Proposed Action/Proposed Project Alternative, the Reduced Permit Term Alternative would include a Good Neighbor Program (refer to Chapter 11 in the SSHCP document) that extends Incidental Take Permit coverage for willing participants for any agricultural lands within 0.5 mile of an SSHCP Preserve. Therefore, this would be a ***Minor Beneficial*** effect to agricultural activities relative to the No Action/No Project Alternative baseline condition.

6.2.4.2 Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would result in the following:

- Conversion of approximately 1,720 fewer acres of Important Farmland to non-agricultural uses

- Land uses that conflict with 133 more acres of land with existing Williamson Act contracts
- Fewer incompatible uses near existing agricultural uses by not displacing development outside the UDA and by implementing an AMM during the 30-year permit term that emphasizes placement of compatible uses adjacent to Cropland Preserves

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on all of the agricultural resource impact criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to agriculture compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

6.2.4.3 Cumulative Effects of the Reduced Permit Term Alternative

As described in Section 3.7, past and present urban development projects and activities have resulted in loss of Important Farmland in the agricultural resource study area. The EIRs prepared for the Sacramento County, Galt, and Rancho Cordova General Plans *(*Sacramento County 2010, Galt 2009b, Rancho Cordova 2006b) concluded that current and future development consistent with these plans would result in significant and unavoidable adverse impacts to Important Farmland (Sacramento County 2010, pp. 3-47 to 3-60; Galt 2009b, pp. 8-25 to 8-28; Rancho Cordova 2006b, pp. 4.2-17 to 4.2-24).

Reasonably foreseeable future projects, not included in the description of this alternative, that could remove additional Important Farmland include expansion of the Rancho Murieta development, urban development in the Elk Grove SOI, development of the Wilton Rancheria Casino, and construction of the California High-Speed Rail and the California WaterFix projects (see Section 3.7.2). SACOG (2016) projects that outside the EIS/EIR Planning Area in the remainder of the study area, urban development, rural residential development, and transportation projects have the potential to impact 2,466 acres of Prime Farmland, 746 acres of Unique Farmland, and 2,243 acres of Farmland of Statewide Importance for a combined potential impact to 5,455 acres of FMMP-designated farmland.

To address the loss of farmland, many state and local laws and requirements to protect farmland resources have been enacted (see Section 6.1.1). For example, in Sacramento County, these requirements prescribe actions such as a 1:1 replacement for projects that convert more than 50 acres of Important Farmland and the encouragement to support the Williamson Act program to ensure a temporary protection of farmland resources. Based on the Sacramento County General Plan Policy AG-5 (2011), each conversion of less than 50 acres of Important Farmland as part of present and reasonably foreseeable actions would be considered a less-than-significant adverse impact not requiring mitigation. However, the cumulative effects of multiple conversions of less than 50 acres of Important Farmland would be cumulatively significant. Significant adverse cumulative effects from current and reasonably foreseeable

future activities would be identified and mitigated according to General Plan policies. However, even with these policies in place, the cumulative effects of past, present, and reasonably foreseeable other projects on existing Important Farmland would result in a cumulatively significant adverse impact on agriculture resources.

Urban development under the Reduced Permit Term Alternative would contribute to cumulative impacts by converting approximately 35,367 acres of natural land, including areas with Important Farmland. Compared with the No Action/No Project Alternative, the Reduced Permit Term Alternative would not result in shifting or displacement of development to areas located outside the UDA, such as south of the Elk Grove SOI where nearly all of the land is currently in agricultural production. In addition, the Reduced Permit Term Alternative would result in mitigation for any Covered Activity impacts to agricultural lands during the 30-year permit term. Under the No Action/No Project Alternative, existing Sacramento County General Plan Policy AG-5 (2011) only requires mitigation for loss of agricultural lands for projects converting more than 50 acres of Important Farmland. Therefore, urban development under the Reduced Permit Term Alternative would have a smaller incremental contribution to cumulative impacts on agriculture and agricultural activities than the No Action/No Project Alternative baseline condition.

Establishment and management of mitigation lands, preserves, and open space under the Reduced Permit Term Alternative would not contribute substantially to cumulative effects on agriculture because the minor restrictions on agricultural operations within SSHCP Cropland Preserves would not substantially change agricultural use of Planning Area croplands. Further, under the Reduced Permit Term Alternative, more than 22,014 acres of Valley Grassland outside the UDA would be preserved during the 30-year permit term in perpetuity and kept available for grazing in compliance with an approved Preserve Management Plan.

Because the Reduced Permit Term Alternative would avoid urban development outside the UDA and increase preservation of Important Farmland and grazing lands compared to the No Action/No Project Alternative, the Reduced Permit Term Alternative's contribution to cumulative impacts on agriculture would also be less than that described for the No Action/No Project Alternative. Thus, the Reduced Permit Term Alternative would have a ***Minor Beneficial Cumulative*** effect to agriculture compared to the cumulative impact analysis of the No Action/No Project Alternative baseline condition.

CHAPTER 7 – HYDROLOGY AND WATER QUALITY

Chapter 7 presents the existing conditions and analyzes the effects of each Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) alternative on groundwater hydrology, surface water hydrology, and the water quality of surface waters and groundwater.

The hydrology and water quality of the rivers, streams, creeks, and ephemeral drainages of the Planning Area are discussed and analyzed here in Chapter 7, but these land covers are also discussed and analyzed as natural habitat for native plants and animals in Chapter 8, Natural Land Cover Habitats and Associated Plant and Animal Communities, and in Chapter 10, Aquatic Resources, as aquatic resources regulated by the Clean Water Act, California Porter-Cologne Act, and by other federal, state, or local regulations and policies.

7.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

7.1.1 Regulatory Framework

Several federal, state, regional, and local agencies regulate project effects to hydrology and water quality within the Planning Area. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, permitting, or implementation of the alternatives analyzed in this EIS/EIR. This section also identifies any relevant federal permits or other entitlements that must be obtained before implementing the alternatives. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 7.2 (40 CFR 1502.25).

7.1.1.1 Federal and State

The federal and state regulations relevant to Planning Area project and activity effects on floodplain management and surface water quality are addressed together because the state is generally delegated authority to implement and enforce the federal regulations.

National Flood Insurance Program/Executive Order 11988 (Floodplain Management)

The Federal Emergency Management Agency (FEMA) is responsible for determining flood elevations based on available studies. Pursuant to the National Flood Insurance Program Final Rule, FEMA is also responsible for developing the Flood Insurance Rate Maps, which are used in the National Flood Insurance Program. The Flood Insurance Rate Maps denote the location of the federal 100-year flood area, 500-year flood area, and the base flood elevation. In a 100-year floodplain, there is a 1% chance of flooding in a given year, and in a 500-year floodplain, there is a 0.2% chance of flooding in a given year. If an area is within a 100-year floodplain, flood insurance is required by most mortgage companies. FEMA's existing 100-year floodplain map of the Planning Area is discussed below in Section 7.1.2. Under the National Flood Insurance Program, local land-use authority agencies typically cannot approve urban residential and

nonresidential development structures proposed within the regulatory floodplain (typically the 100-year floodplain), if that development is subject to, or results in, flood water over 1 foot in elevation. In addition, local land-use authority agencies cannot approve development in delineated floodways within the floodplain.

Executive Order 11988 (Carter 1977) applies to federally funded projects or activities and requires federal agencies to recognize the significant values of floodplains, avoid development within the 100-year floodplain where feasible, minimize and reduce flooding hazards, and consider the public benefits that would be realized from restoring and preserving floodplains.

State Plan of Flood Control

The Central Valley Flood Protection Act of 2008 (authorized by Senate Bill 5) directed the California Department of Water Resources (DWR) and the Central Valley Flood Protection Board to prepare a comprehensive flood protection plan for the California Central Valley. The resulting State Plan of Flood Control (DWR 2010) established a system-wide approach to improving flood management in the areas currently receiving some amount of flood protection from existing federal, state, and local flood control facilities. In addition, the State Plan of Flood Control provides recommended structural and nonstructural means for improving performance and eliminating the deficiencies of flood management facilities, while also addressing ecosystem and other water-related issues. The flood legislation also established the 200-year flood event (flood with a 1-in-200 chance of occurring in any year) as the minimum level of flood protection to be provided in urban and urbanizing areas. Additionally, cities and counties in the Central Valley must incorporate the data, policies, and implementation measures of the State Plan of Flood Control into their general plans (see discussion of Planning Area general plans in Section 3.4, Previous Planning Area Environmental Reviews). Development within designated floodways and floodplains must acquire an encroachment permit from the Central Valley Flood Protection Board.

Rivers and Harbor Act

The Rivers and Harbors Act addresses projects and activities in navigable waters and harbor and river improvements. Section 14 of the Rivers and Harbors Act (33 U.S.C. 408) provides that the secretary of the Army, on recommendation of the chief of engineers, may grant permission of the temporary or permanent occupation or alteration of any sea wall, bulkhead, jetty, dike, levee, wharf, pier, or other work built by the United States so long as the occupation or alteration is not injurious to the public interest and will not impair the usefulness of the project. This permission will be granted by an appropriate real estate instrument in accordance with existing real estate regulations. Reviews under 33 U.S.C. 408 are conducted by the U.S. Army

Corps of Engineers (USACE) Sacramento District's Flood Protection and Navigation Section. The USACE responses are provided to the Central Valley Flood Protection Board.

Clean Water Act

The Clean Water Act (CWA) is the federal statute addressing surface water quality; it does not address either groundwater or water quantity. It was enacted with the goal of restoring and maintaining "the chemical, physical, and biological integrity of the Nation's waters," which includes surface waters that are either navigable or connected to navigable water (33 U.S.C. 1251 et seq.). The CWA prohibits discharge of pollutants to surface waters from point and nonpoint sources unless authorized by appropriate permits. The law authorizes the U.S. Environmental Protection Agency (EPA) to set point-source effluent limitations for industry and publicly owned treatment works, and requires states (or U.S. EPA in the event of a state default) to set water quality standards for contaminants in surface waters. The provisions of the CWA are administered and regulated in the Planning Area primarily by the U.S. EPA, California EPA, USACE, and the State Water Resources Control Board (SWRCB).

Under CWA Section 303(d), states are required to develop lists of water bodies that would not attain water quality standards after implementation of required levels of treatment by point-source dischargers (municipalities and industries). CWA 303(d) requires that the state develop a total maximum daily load (TMDL) for each of the listed pollutants. The TMDL is the amount of loading that the water body can receive and still be in compliance with water quality objectives. The TMDL can also act as a plan to reduce loading of a specific pollutant from various sources to achieve compliance with water quality objectives. The TMDL prepared by the state must include an allocation of allowable loadings for point and nonpoint sources, with consideration of background loadings and a margin of safety to the allowable load.

Under CWA Section 402, the National Pollutant Discharge Elimination System (NPDES) program regulates the discharge of waste into waters of the United States. NPDES permit regulations apply to broad categories of discharges, including point-source municipal wastewater discharges and nonpoint-source stormwater runoff. NPDES permits typically identify the following:

- Effluent and receiving-water limits on allowable concentrations and/or mass emissions of pollutants contained in the discharge;
- Prohibitions on discharges not specifically allowed under the permit; and
- Provisions that describe required actions by the discharger, including industrial pretreatment, pollution prevention, self-monitoring, and other activities.

Under CWA Section 401, projects and activities that require federal authorization for the discharge of a pollutant into waters of the United States under CWA Section 404 must also obtain

a CWA Section 401 water quality certification from the state in which the discharge would originate. In California, U.S. EPA has delegated the authority to grant water quality certifications to the SWRCB, which are typically processed by the Regional Water Quality Control Boards with local jurisdiction. The Planning Area is located within the jurisdiction of the Central Valley Regional Water Quality Control Board (Central Valley RWQCB). A water quality certification requires the project or activity to evaluate its potential impacts and implement appropriate measures to protect water quality and comply with regulatory water quality standards. The issuance of CWA 404 authorizations by the USACE for the discharge of dredged and fill materials into waters of the United States is a typical federal action that requires CWA Section 401 water quality certification.

National Toxics Rule and California Toxics Rule

In 1992, pursuant to the CWA, the U.S. EPA promulgated the National Toxics Rule criteria to establish numeric criteria for priority toxic pollutants for California. At the time the National Toxics Rule was established, it provided water quality standards for 42 pollutants that were not covered under California's statewide water quality regulations. Additionally, a 1994 court order revoked California's statewide water quality control plan for priority pollutants. U.S. EPA subsequently developed and promulgated additional numeric water quality criteria for priority pollutants with the adoption of the California Toxics Rule (U.S. EPA 2000). The California Toxics Rule "carried forward" the promulgated criteria of the National Toxics Rule, thereby providing a single document listing California's fully adopted and applicable water quality criteria for 126 priority pollutants.

Porter–Cologne Water Quality Control Act

The Porter–Cologne Water Quality Control Act is the principal law regulating water quality in California; it also incorporates many provisions of the federal CWA. This act established the SWRCB and nine regions, each overseen by RWQCBs, for protection of the quality of the state's surface and groundwater supplies and enforcement of the CWA. Water quality control plans (i.e., "Basin Plans") for each region identify beneficial uses of water to be protected, and they establish water quality objectives necessary to support the designated beneficial uses of water resources. Basin Plans also contain implementing pollution control and resource management actions needed to maintain existing water quality conditions and bring water bodies into compliance with water quality objectives where impaired. Under the Porter–Cologne Water Quality Control Act, waste discharges that occur to water or land that have potential to affect water quality may be issued Waste Discharge Requirements by the Central Valley RWQCB, or they may be waived if the waste discharge does not significantly affect water quality.

The Planning Area is located within the jurisdiction of the Water Quality Control Plan for the Sacramento River and San Joaquin River Basins (Basin Plan) (CVRWQCB 2015a). The Basin Plan contains specific numeric water quality objectives for designated constituents of concern in surface water bodies. Constituents of concern generically refer to any type of physical property, chemical, or biological parameter in a water body (e.g., coliform bacteria, dissolved oxygen, pH, pesticides, electrical conductivity, total dissolved solids, temperature, turbidity, and trace elements) that may adversely affect a beneficial use (e.g., drinking water quality, industrial and agricultural water supplies, aquatic life, recreation). The Basin Plan includes numeric water quality objectives that apply basin-wide, as well as specific objectives applicable only in certain surface water bodies or portions of water bodies. Additionally, the Basin Plan contains narrative basin-wide surface water quality objectives that specify broad water quality goals and minimum acceptable water quality conditions.

Groundwater quality objectives specified in the Basin Plan (CVRWQCB 2015a) consist primarily of the statewide drinking water quality standards set forth in Title 22 of the California Code of Regulations. The Title 22 primary drinking water quality standards specify the maximum allowable concentrations for numerous constituents for the protection of human health (e.g., bacterial, inorganic compounds, trace metal, and organic parameters). Title 22 secondary drinking water standards are set for constituents of concern that pose nuisance, taste, or odor concerns (e.g., salinity, iron, manganese).

The state's antidegradation policy (SWRCB Resolution No. 68-16, Statement of Policy with Respect to Maintaining High Quality Waters in California) is designed to maintain high-quality waters in the state. The antidegradation policy requires protection of all existing beneficial uses that existed in 1968 at the time of the policy adoption, and it specifies that degradation of high-quality water is only permissible when it is demonstrated to the SWRCB that beneficial uses would not be unreasonably affected, and the highest quality water consistent with the maximum benefit to the state would be achieved.

California NPDES General Construction Stormwater Permit

The SWRCB adopted a statewide general NPDES permit for stormwater discharges associated with construction activity (Construction General Permit) in Order No. 2009-0009-DWQ (as amended by revised orders 2010-0014-DWQ and 2012-006-DWQ). The Construction General Permit applies to projects that involve soil disturbance of more than 1 acre, and includes specific requirements based on the "risk level" of erosion at the site. The risk level is dependent on the project's sediment runoff risk and risk to receiving water bodies. Obtaining coverage under the Construction General Permit requires filing of a Notice of Intent and preparing and implementing a stormwater pollution prevention plan, which specifies best management

practices (BMPs) to reduce or eliminate construction-related sediment and other pollutants in stormwater as well as non-stormwater discharges.

Central Valley RWQCB Irrigated Lands Regulatory Program

The Irrigated Lands Regulatory Program is administered by the Central Valley RWQCB to regulate discharges from irrigated agricultural lands. The Irrigated Lands Regulatory Program is relevant to the scope of the impact assessments presented in Section 7.2 because it addresses water quality for substantial areas of land that might contribute to waste discharges that contribute to surface and groundwater conditions. The Central Valley RWQCB issues Waste Discharge Requirements to "third party" organizations of growers, which are designed to protect surface water and groundwater quality.

The Sacramento Water Quality Coalition is an organization of commercial agricultural operators (including nurseries and managed wetlands) in the northern Sacramento Valley, including the Planning Area. The Sacramento Water Quality Coalition was issued Waste Discharge Requirements under the Irrigated Lands Regulatory Program (Order R5-2014-0030-R1) (CVRWQCB 2015b). The Waste Discharge Requirements include development and implementation of constituent-specific Surface Water/Groundwater Quality Management Plans when monitoring indicates exceedances of water quality objectives.

7.1.1.2 Regional

The Water Forum Agreement

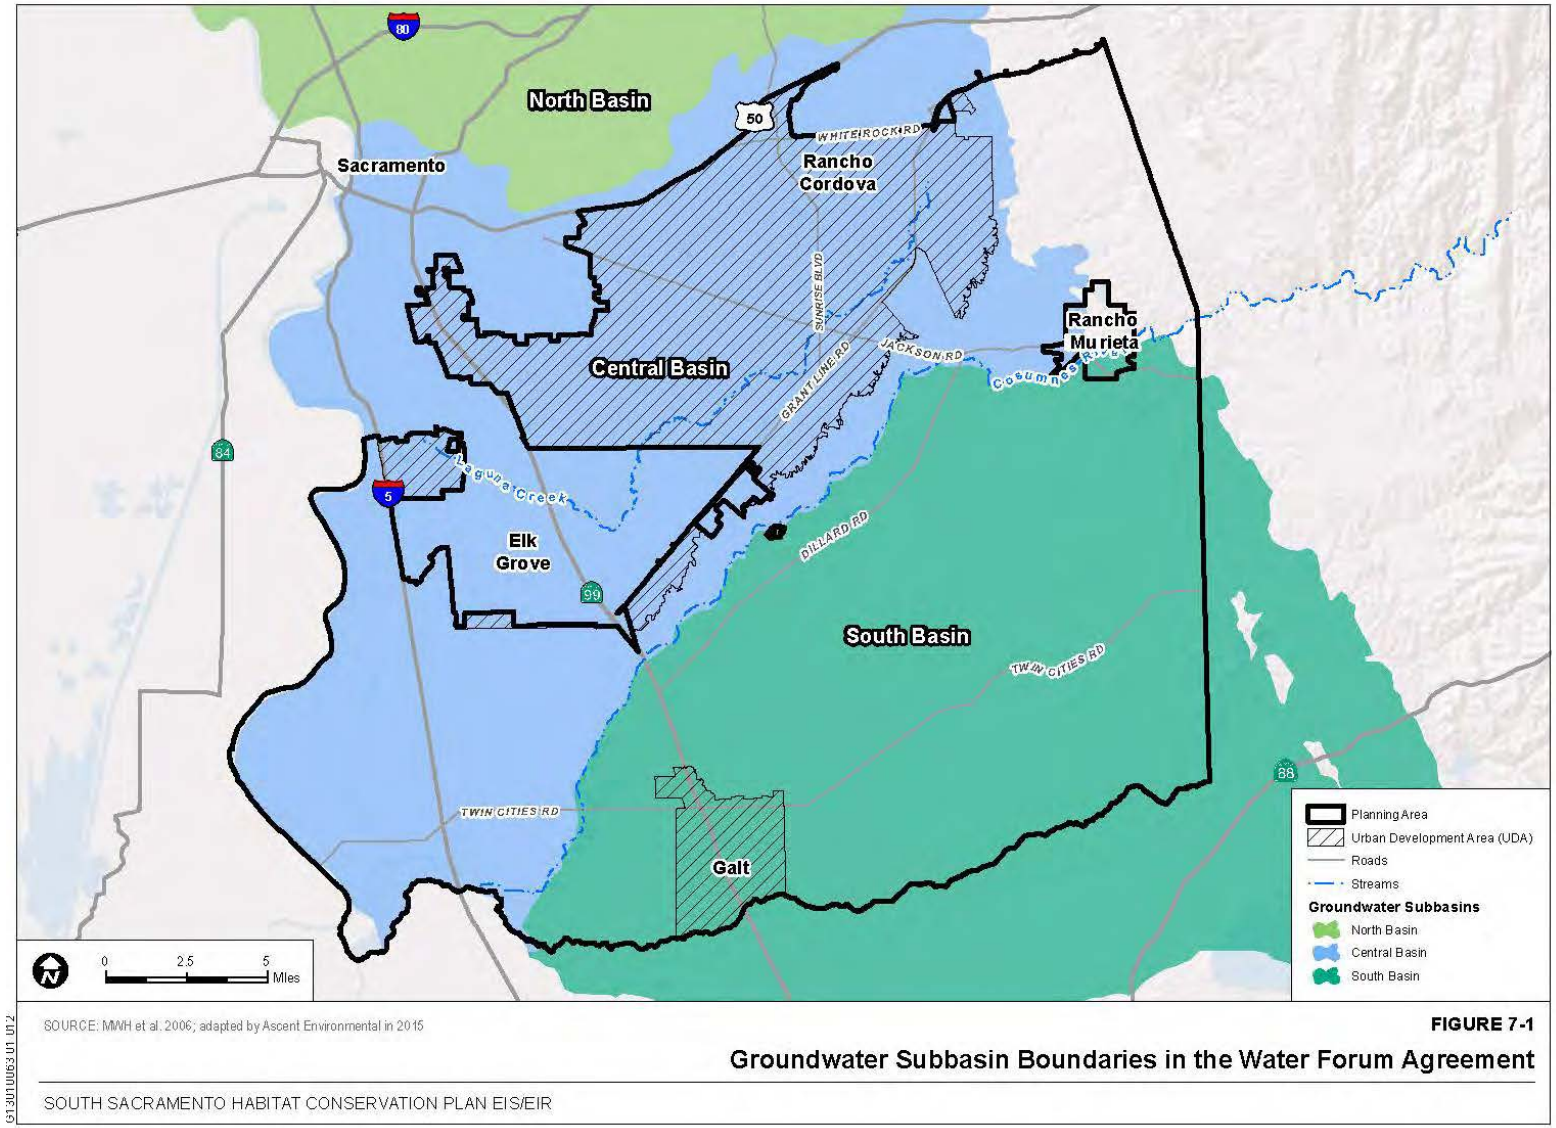
The Water Forum Agreement is an agreement established in 2000 among local governments, municipal water purveyors, agricultural water districts, businesses, and citizen groups in Sacramento County, western Placer County, and western El Dorado County. The purpose of the Water Forum Agreement is to facilitate these stakeholders' ability to provide for reliable and safe water supplies, economic health, and planned development through the year 2030 while preserving the fishery, wildlife, recreational, and aesthetic values of the Lower American River. The Water Forum Agreement includes seven elements addressing surface water diversions, groundwater management, dry-year water supplies, water conservation, and instream flow standards and habitat management for the Lower American River (Sacramento City-County Office of Metropolitan Water Planning 1999).

Management of available groundwater resources in response to the future municipal (including industrial) and agricultural demands for groundwater is a key component of the Water Forum Agreement (and the Water Forum successor efforts), which have resulted in active groundwater planning and management efforts in the Planning Area and surrounding communities. The safe yield of an aquifer refers to the amount of groundwater that can be

used without resulting in adverse effects, such as wells going dry, land subsidence, and groundwater quality degradation. The safe yields of the Central and South Groundwater Basins (Figure 7-1) were identified in the Water Forum Agreement as 273,000 acre-feet per year (AFY) and 115,000 AFY, respectively. The Sacramento Central Groundwater Authority was formed and developed a groundwater management plan for the Central Basin (MWH et al. 2006). The South Area Water Council developed a similar groundwater management plan for the South Basin (Robertson-Bryan Inc. and WRIME 2011).

Sacramento Region NPDES Municipal Stormwater Permit

Sacramento County and the Cities of Sacramento, Galt, Rancho Cordova, Elk Grove, Folsom, and Citrus Heights are co-permittees under a single NPDES Municipal Stormwater Permit for stormwater discharges to their separate municipal storm sewer systems (Central Valley RWQCB Order No. R5-2015-0023, NPDES No. CAS082597). This stormwater discharge NPDES permit is renewed every 5 years, most recently in April 2015. The seven jurisdictions formed the Sacramento Stormwater Quality Partnership to cooperatively implement a Stormwater Quality Improvement Plan (SQIP), which was last updated in 2009 (2009 SQIP) (Sacramento County et al. 2009). The stormwater discharge NPDES permit requires ground-disturbing projects and activities to implement BMPs that avoid or reduce stormwater runoff, soil erosion, and the discharge of pollutants to surface waters to the "maximum extent practicable," which is the performance standard specified in the CWA Section 402(p). Stormwater runoff from urbanized areas (i.e., also known as urban runoff) generally increases as development of additional impervious surfaces occur (e.g., pavement, roofs) that reduces infiltration of rainfall into the soil.



The 2009 SQIP describes the cooperatively implemented stormwater management actions of the Sacramento Stormwater Quality Partnership, as well as the individual stormwater agency programs. The 2009 SQIP addresses six minimum control elements: (1) public education and outreach, (2) public involvement and participation, (3) detection and elimination of illicit discharges, (4) construction stormwater control, (5) postconstruction stormwater control for new development and redevelopment, and (6) pollution prevention/good housekeeping for municipal operations. The 2009 SQIP identifies activities under each program element, performance standards, implementation schedule with milestones, and specific monitoring and assessment activities. The Sacramento Stormwater Quality Partnership develops and implements annual work plans, provides program management, identifies targeted pollutant reduction goals, and conducts commercial/industrial inspections public outreach, monitoring, effectiveness assessments, and reporting activities. The individual local jurisdictions also implement stormwater quality improvement activities, oversee construction of stormwater control facilities, conduct compliance activities, and review new development projects for planning and implementation of appropriate postconstruction stormwater controls.

Sacramento Stormwater Quality Partnership agencies implement construction site management program BMPs that avoid or minimize the amount of erosion, pollutant discharges, and urban runoff and off-site sedimentation resulting from individual development-project construction sites, which helps protect the water quality. Construction management is typically accomplished by each NPDES permittee through code enforcement at the planning and design review stages, ensuring project construction site compliance with the SWRCB's statewide NPDES Construction General Permit, and local enforcement of construction activities.

The Stormwater Quality Partnership has conducted planning and developed approaches and requirements for new development and significant redevelopment postconstruction stormwater control measures. The Sacramento Stormwater Quality Partnership jurisdictions have also prepared and adopted new development standards, developed improved guidance for design of source and treatment control measures specific to Sacramento conditions, added General Plan policies and actions for water quality and watershed protection, and conducted pollutant removal effectiveness studies of proprietary devices and control strategies. Stormwater quality design standards were first developed by the Sacramento Stormwater Quality Partnership in 2007, and most recently updated in the 2014 *Stormwater Quality Design Manual* (Sacramento Stormwater Quality Partnership 2014), which addresses stormwater runoff system hydrology and water quality design requirements for development and significant redevelopment projects.

Pursuant to its stormwater discharge NPDES permit, the Sacramento Stormwater Quality Partnership also developed a Hydromodification Management Plan in 2011 and updated it in October 2017, and it will be integrated into each NPDES permittee's development standards following approval by the Central Valley RWQCB. Hydromodification is defined in the NPDES permit as the "change in the natural watershed hydrologic processes and stormwater runoff characteristics (i.e., interception, infiltration, overland flow, interflow, and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport" (Sacramento Stormwater Quality Partnership 2017)). In terms of the regulatory responsibility of the NPDES permit, hydromodification is primarily concerned with the increases in the magnitude, frequency, volume, and duration of stormwater runoff as a result of urban development that typically increases the amount of impervious surfaces that prevent infiltration of rainfall into the soil and increases amounts of stormwater runoff. The Hydromodification Management Plan outlines stormwater facility design approaches to minimize the changes in stormwater runoff, which in turn better protects receiving streams from increased potential for erosion and other adverse impacts.

Figure 7-1. Groundwater Subbasin Boundaries in the Water Forum Agreement

AGENDA ITEM 11.1
4368

INTENTIONALLY LEFT BLANK

The Coordinated Monitoring Program (CMP), a joint effort of the Sacramento Regional County Sanitation District (Regional San) and the Sacramento Stormwater Quality Partnership, has conducted comprehensive monitoring to evaluate the effects of urban runoff on water quality in the American River and Sacramento River since 1991, and at selected urban tributary stream locations routinely since 2003 (including two locations in Laguna Creek within the Urban Development Area (UDA) portion of the Planning Area). The intent of the CMP is to provide compliance with the NPDES Municipal Stormwater Permit and high-quality data that can be used to support development and implementation of water quality policies and regulations for urban runoff in the Sacramento area. Although the CMP data includes areas extending beyond the Planning Area, the CMP data provides comprehensive information that is representative of ambient and seasonal water quality conditions in the Planning Area.

7.1.1.3 Local

Sacramento County 2030 General Plan

The Agriculture (AG), Circulation (CI), Safety (SA), and Conservation (CO) elements of the *Sacramento County General Plan of 2005*-2030 (Sacramento County General Plan) (Sacramento County 2011) specify goals and objectives for hydrology and water quality management and protection in the Planning Area. Applicable policies include the following:

> **Policy AG-29:** The County shall minimize flood risks to agricultural lands resulting from new urban developments.
>
> **Policy CI-65:** Incorporate Low Impact Design (LID) techniques to the greatest extent feasible to improve water quality, runoff and erosion control, infiltration, groundwater recharge, visual aesthetics, etc.
>
> **Policy SA-5:** A comprehensive drainage plan for major planning efforts shall be prepared for streams and their tributaries prior to any development within the 100-year floodplain defined by full watershed development without channel modifications.
>
> **Policy SA-10:** Fill within the 100-year floodplain of creeks outside of the Urban Service Boundary is permissible to accommodate structures (e.g., residential, commercial, accessory) and septic systems, and only when the Board of Supervisors finds that the fill will not impede water flows or stormwater runoff capacity. Such development shall not cause an increase in base flood elevation of the 100-year floodplain exceeding 0.10 feet, unless analysis clearly indicated that the physical and/or economic use of adjacent property within the floodplain would not be adversely affected. A permit is required if the fill is within the jurisdiction of the Central Valley Flood Protection Board.

Policy SA-14: The County shall require, when deemed to be physically or ecologically necessary, all new urban development and redevelopment projects to incorporate runoff control measures to minimize peak flows of runoff and/or assist in financing or otherwise implementing Comprehensive Drainage Plans.

Policy SA-16: Deny creation of parcels that do not have buildable areas outside the 100-year floodplain unless otherwise allowed in the Floodplain Management Ordinance.

Policy SA-17: For residential zoning, the area outside the 100-year floodplain must be contiguous or reasonably situated to provide buildable area for a residence and associated structures. Examples of structures include swimming pools, sheds, barns, detached garages, and other outbuildings that are normally associated with residential development. There may be exceptions (such as the Delta area) as allowed in the Floodplain Management Ordinance.

Policy SA-22: Areas within a 100-year floodplain shall not be upzoned to a more intensive use unless and until a Master Drainage Plan is prepared that identifies areas of the floodplain that may be developed.

Policy CO-7: Support the Water Forum Agreement Groundwater Management Element. Prior to approving any new development, a water supply plan shall be approved that demonstrates consistency with an adopted groundwater management plan.

Policy CO-8: Applicants proposing developments in areas with significant groundwater recharge characteristics shall evaluate the impact of said development on groundwater recharge and quality. This evaluation should recognize criteria defined in any broader Countywide determination and/or evaluation of groundwater recharge areas.

Policy CO-10: Support local watershed initiatives that enhance groundwater recharge.

Policy CO-11: Support local groundwater management efforts that are consistent with the Water Forum Agreement Groundwater Management Element.

Policy CO-12: Support groundwater recharge in surface mining reclamation plans where feasible.

Policy CO-22: Support water management practices that are responsive to the impacts of Global Climate Change such as groundwater banking and other water storage projects.

Policy CO-23: Development approval shall be subject to a finding regarding its impact on valuable water-supported ecosystems.

Policy CO-24: Comply with the Sacramento NPDES Municipal Stormwater Permit.

Policy CO-25: Support the preservation, restoration, and creation of riparian corridors, wetlands, and buffer zones.

Policy CO-26: Protect areas susceptible to erosion, natural water bodies, and natural drainage systems.

Policy CO-27: Support surface water quality monitoring programs that identify and address causes of water quality degradation.

Policy CO-28: Comply with other water quality regulations and NPDES permits as they apply to County projects or activities, such as the State's Construction General Permit and Aquatic Pesticides Permit.

Policy CO-29: Continue to support the County's participation in regional NPDES Municipal Permit compliance activities through collaborative efforts such as the Sacramento Stormwater Quality Partnership.

Policy CO-30: Require development projects to comply with the County's stormwater development/design standards, including hydromodification management and low impact development standards, established pursuant to the NPDES Municipal Permit.

Policy CO-31: Require property owners to maintain all required stormwater measures to ensure proper performance for the life of the project.

Policy CO-32: Support programs and activities conducted by watershed groups and citizen volunteers that help to ensure compliance with the NPDES Municipal Permit by increasing public awareness and encouraging stewardship of water resources.

Policy CO-88: Where removal of riparian habitat is necessary for channel maintenance, it will be planned and mitigated so as to minimize unavoidable impacts upon biological resources.

Policy CO-89: Protect, enhance and maintain riparian habitat in Sacramento County.

Policy CO-93: Discourage fill in the 100-year floodplain (Please also refer to CO-117).

Policy CO-94: Development within the 100-year floodplain and designated floodway of Sacramento streams, sloughs, creeks or rivers shall be:

- Consistent with policies to protect wetlands and riparian areas; and
- Limited to land uses that can support seasonal inundation.

Policy CO-95: Development within the 100-year floodplain should occur in concert with the development of the Floodplain Protection Zone (please refer to Land Uses Adjacent to Rivers and Streams for information on this Zone).

Policy CO-100: Encourage construction of structures for flood control and stormwater quality purposes using currently approved scientific methods to prevent erosion and stabilize the banks.

Policy CO-101: Stabilize the banks of rivers and streams in a manner that increases flood protection and increases riparian habitat functions.

Policy CO-105: Channel modification projects shall be considered for approval by the Board of Supervisors only after conducting a noticed public hearing examining the full range of alternatives, relative costs and benefits, and environmental, economic, and social benefits.

Policy CO-106: Realigned or modified channels should retain topographic diversity including maintaining meandering characteristics, varied berm width, naturalized side slope, and varied channel bottom elevation.

Policy CO-107: Maintain and protect natural function of channels in developed, newly developing, and rural areas.

Policy CO-109: Channel modifications should not prevent minimum water flows necessary to protect and enhance fish habitats, native riparian vegetation, water quality, or ground water recharge.

Policy CO-111: Channel modifications shall retain wetland and riparian vegetation whenever possible or otherwise recreate the natural channel consistent with the historical ecological integrity of the stream or river.

Policy CO-112: The use of concrete and impervious materials is discouraged where it is inconsistent with the existing adjacent watercourse and overall ecological function of the stream.

Policy CO-114: Protect stream corridors to enhance water quality, provide public amenities, maintain flood control objectives, preserve and enhance habitat, and offer recreational and educational opportunities.

Policy CO-115: Provide setbacks along stream corridors and stream channels to protect riparian habitat functions.

Policy CO-116: Encourage filter strips using appropriate native vegetation and substrate along riparian streambanks adjacent to irrigated croplands.

Policy CO-117: Public roads, parking, and associated fill slopes shall be located outside of the stream corridor, except at stream crossings and for purposes of extending or setting back levees. The construction of public roads and parking should utilize structural materials to facilitate permeability. Crossings shall be minimized and be aesthetically compatible with naturalistic values of the stream channel.

Policy CO-118: Development adjacent to waterways should protect the water conveyance of the system, while preserving and enhancing the riparian habitat and its function.

Policy CO-119: Preserve and enhance the Laguna Creek Parkway.

Policy CO-121: No grading, clearing, tree cutting, debris disposal or any other despoiling action shall be allowed in rivers and streams except for normal channel maintenance, restoration activities, and road crossings.

Policy CO-122: River and stream maintenance should allow natural vegetation in and along the channel to assist in removal of nutrients, pollutants, and sediment and to increase bank stabilization, while minimizing impacts on conveyance.

Policy CO-126: Prohibit obstruction or underground diversion of natural waterways.

Sacramento County Floodplain Management Ordinance, Improvement Standards, and Local Floodplain Management Plan

To participate in the National Flood Insurance Program, Sacramento County has adopted a Floodplain Management Ordinance that meets FEMA's standards and accompanying Improvement Standards, as well as the Local Floodplain Management Plan. The ordinance defines what types of development activities are allowed and how proposed development may be permitted with the intent of managing flooding to reduce damage to structures and infrastructure and to minimize the risk of human casualties. Land development activities within designated flood hazard areas (whether mapped by FEMA or a local floodplain management

agency) must obtain a Floodplain Management Permit from the Sacramento County Department of Water Resources. The Floodplain Management Ordinance specifies base flood elevation and flood proofing requirements for individual projects involving residential and nonresidential structures. For larger master plan development projects, stormwater runoff plans must be prepared to identify the existing base flood elevations and the post-project flood elevation conditions of the site, and pre- and post-project stormwater drainage channels and features, and assure that no adverse effects occur upstream or downstream of the site. Sacramento County imposes a policy of no net loss of floodplain storage volume as a result of development in the floodplains typical of the streams located in the Planning Area. Thus, development in flood hazard areas may need to offset any loss of floodwater storage space caused by placement of fill and structures in a floodplain by creating/excavating an equivalent volume of ground from below the base flood elevation. This can be accomplished by filling in the floodplain and compensating for the loss of flood storage by building a detention basin. Floodplain size is directly related to the overall health of a stream. Floodplains absorb and store floodwaters, reducing velocity and allow for the slow release to the stream. Floodplain trees and plants filter sediments and pollutants, and they help to anchor the riverbanks, preventing erosion and providing shade to reduce water temperatures.

Floodplains for many local water bodies and waterways are not mapped by FEMA because the focus of the FEMA Flood Insurance Rate Maps is to provide information for insurance programs. Some rural areas of the eastern part of Sacramento County with watersheds that are less than 1 square mile in size have not been mapped by FEMA. However, these local 100-year floodplains are still identified by Sacramento County and regulated by the provisions of the Sacramento County Floodplain Management Ordinance. Local floodplains in Sacramento County are typically mapped either in response to an area having flooding problems, or in response to a request by a property owner to make modifications to their parcel.

2030 Galt General Plan

The Conservation and Open Space (COS) and Public Facilities and Services (PFS) elements of *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009) include policies that address design and implementation of future urban development to manage flood control, stormwater runoff, and protection of water quality and biological resource values associated with riparian corridors and floodplains. Applicable policies include the following:

> **Policy COS-1.1:** Flood Control. The City shall require adequate natural floodway design to assure flood control in areas where stream channels have been modified and to foster stream enhancement, improved water quality, recreational opportunities, and groundwater recharge.

Policy COS-1.2: Flood Protection Ordinance. The City shall continue to implement the City's flood protection ordinance.

Policy COS-1.3: Inter-Agency Coordination. The City shall cooperate with FEMA, California Department of Water Resources, and other appropriate local, State, and Federal agencies to address local and regional flood issues.

Policy COS-1.4: Storm Flow Impacts. The City will continue to ensure, through the development review process, that future developments do not increase peak storm flows and do not cause flooding of downstream facilities and properties.

Policy COS-1.5: Water Quality Control Board Regulations Compliance. The City shall continue to comply with the Central Valley RWQCB's regulations concerning the operation of the City's wastewater treatment plant.

Policy COS-1.6: Underground Storage Tank Law Compliance. The City shall provide continued compliance with the Underground Storage Tank Law and all other laws relating to water quality.

Policy COS-1.7: Stormwater Quality Protection. The City shall, through the development review process, ensure compliance with federal and state stormwater quality standards and regulations.

Policy COS-1.8: Septic System Discouragement. The City shall protect groundwater resources by protesting urban development with septic systems in the unincorporated County on parcels less than 2 acres on the west side of the Planning Area and less than 5 acres on the north and east side of the Planning Area.

Policy COS-1.10: Ecological Features Retention. The City shall retain to the extent feasible the ecological features of the creeks, sloughs, and rivers in their natural state.

Policy COS-1.12: Best Management Practices. The City shall require all new development and redevelopment to implement BMPs to reduce pollutants to the maximum extent practicable. Additionally, the City shall require, as part of its Storm Water NPDES Permit and ordinances, to implement the Grading Plan, Erosion Control Plan, and Pollution Prevention Plan (SWPPP) during construction activities of any improvement plans, new development, and redevelopment projects for reducing pollutants to the maximum extent practicable.

Policy COS-1.14: Floodplain Dedication. The City should require property owners and developers to dedicate land within 100-year floodplains to the City, or other City-

designated entity for biological mitigation credit or similar purpose, when a development project is approved. In addition to the land requirement, the City should require public access adjacent to these areas, but outside the 100 year flood plain, via bicycle and pedestrian trails and related amenities with appropriate signage.

Policy COS-1.17: Floodplain Visual Accessibility. The City shall require visual accessibility to floodplains via direct, single frontage roadways, along the length of any particular stream and associated floodplain section being developed (on both sides).

Policy PFS-2.2: Groundwater Protection. The City should protect the groundwater basin from overdraft from city use of groundwater. To this end, the City shall study, working closely with other public and private entities as deemed appropriate, the safe yield[1] of the groundwater basin. Water management programs such as conjunctive use[2] and recharge programs should also be considered. The City should use this information to determine the most appropriate long-term water supply to serve Galt.

Policy PFS-2.3: Surface Water Protection. The City shall protect surface water resources, including rivers, creeks, streams, sloughs, and marshes, from development impacts.

Policy PFS-3.1: Treatment Facilities Safety. The City shall ensure that sewage treatment plant operations and sludge disposal do not result in a health or safety hazard to persons, wildlife, or livestock.

Policy PFS-3.4: Sewage Treatment. The City shall oppose urban development within the sphere of influence which is not sewered and shall oppose the use of "package treatment plants." Urban development should be considered as less than 2 acre parcels on the west side of the Planning Area and less than 5 acre parcels on the north and east side of the Planning Area.

Policy PFS-3.9: Expand Use of Reclaimed Water. The City shall encourage the use of tertiary treated wastewater for irrigation of agricultural lands, large landscaped areas, and recreation/open space areas within close proximity to the City's Waste Water Treatment Plant to help ensure ongoing compliance with Central Valley RWQCB requirements.

[1] Safe yield (also known as sustainable yield) is generally defined as the amount of groundwater that can be used from a groundwater basin (or specific aquifer) on a long-term annual average basis while maintaining a balance with the amount of groundwater (or aquifer) recharge from water sources.

[2] Conjunctive use is generally defined as the planned joint use of surface and groundwater to improve overall water supply reliability.

Policy PFS-4.3: Stormwater Quality. The City shall ensure compliance with federal and state clean water standards by continuing to monitor and enforce provisions to control non-point source and point source water pollution contained in the U.S. Environmental Protection Agency NPDES program.

Policy PFS-4.4: Project Design. The City should encourage project designs that minimize drainage concentrations and impervious surfaces.

Policy PFS-4.5: Grading During the Rainy Season. The City shall prohibit grading activities during the rainy season, unless adequately mitigated, to avoid sedimentation of storm drainage facilities.

Policy PFS-4.6: Erosion Control Plan. The City shall require new development projects to prepare an erosion control plan.

Policy PFS-4.7: Mitigating Stormwater Runoff. The City shall require projects that have significant impacts on the quantity and quality of surface water runoff to incorporate mitigation measures for impacts related to urban runoff.

Policy PFS-4.9: Detention Requirements. The City should require detention storage with measured release to ensure that the capacity of downstream creeks and sloughs would not be exceeded.

City of Galt Floodplain Management Regulations

Title 19 of Galt's Municipal Code establishes the City's requirements for floodplain management. It includes regulations to:

A. Restrict or prohibit uses which are dangerous to health, safety, and property due to water or erosion hazards, or which result in damaging increases in erosion or flood heights or velocities.
B. Require that uses vulnerable to floods, including facilities which serve such uses, be protected against flood damage at the time of initial construction.
C. Control the alteration of natural floodplains, stream channels, and natural protective barriers, which help accommodate or channel floodwaters.
D. Control filling, grading, dredging, and other development which may increase flood damage.
E. Prevent or regulate the construction of flood barriers which will unnaturally divert floodwaters or which may increase flood hazards in other areas.

Rancho Cordova General Plan

The Safety (S) Element of the *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2013) addresses flooding, stormwater runoff, and groundwater quality and establishes goals, policies, and actions related to supporting efforts to limit the potential for community flooding from the Cosumnes River or American River, discouraging new development in areas likely to flood, and preventing further groundwater contamination. The Natural Resources (NR) Element addresses current groundwater contamination issues associated with the Aerojet property, which is designated by the U.S. EPA as a Superfund site because the contamination has the potential to adversely affect human health and/or the environment. Applicable policies include the following:

> **Policy S.2.1:** Support and encourage efforts to limit and reduce the potential for community flooding from the Cosumnes or American Rivers.
>
> **Policy S.2.2:** Manage the risk of flooding by discouraging new development located in an area that is likely to flood.
>
> **Policy S.2.3:** Discourage the creation of new parcels when the presence of easements, floodplain, marsh, or riparian habitat, and/or other features would leave insufficient land to build and operate structures. This policy shall not apply to open space lots specifically created for dedication to the City or another appropriate party for habitat protection, flood control, drainage, or wetland maintenance.
>
> **Policy S.2.4:** Ensure that adequate drainage exists for both existing and new development.
>
> **Policy NR.3.2:** In general, the City will encourage the preservation of existing location, topography, and meandering alignment of natural creeks. The modification, re-creation, and realignment of creek corridors shall recreate the character of the natural creek corridor to the extent feasible, appropriate, and consistent with other City policies. Channelization and the use of concrete within creek corridors shall be discouraged, but is not prohibited.
>
> **Policy NR.3.3:** Encourage the creation of secondary flood control channels where the existing channel supports extensive riparian vegetation.
>
> **Policy NR.5.2:** Encourage the use of treated wastewater to irrigate parks, golf courses, and landscaping.
>
> **Policy NR.5.3:** Protect surface and ground water from major sources of pollution, including hazardous materials contamination and urban runoff.

Policy NR.5.4: Prevent contamination of the groundwater table and surface water, and remedy existing contamination to the extent practicable.

Policy NR.5.5: Minimize erosion to stream channels resulting from new development in urban areas consistent with State law.

Policy NR.5.7: Continue to cooperate and participate with the County, other cities, and the Regional Water Quality Control Board regarding compliance with the joint National Pollutant Discharge Elimination System Permit (NPDES No. CAS082597) or any subsequent permit and support water quality improvement projects in order to maintain compliance with regional, state, and federal water quality requirements.

Policy NR.5.8: The City shall require groundwater impact evaluations be conducted for the Grant Line West, Westborough, Aerojet, Glenborough, Mather and Jackson Planning Areas to determine whether urbanization of these areas would adversely impact groundwater remediation activities associated with Mather and Aerojet prior to the approval of large-scale development. Should an adverse impact be determined, a mitigation program shall be developed in consultation with applicable local, state, and federal agencies to ensure remediation activities are not impacted. This may include the provision of land areas for groundwater remediation facilities, installation/extension of necessary infrastructure, or other appropriate measures.

Local Stormwater Runoff, Grading, and Erosion Control Ordinances and Municipal Code Requirements

Sacramento County, Rancho Cordova, and Galt all include stormwater runoff, grading, and erosion control requirements within their municipal codes and ordinances. These ordinances serve to minimize adverse on-site and off-site effects of construction activities to degradation of the water quality, and the disruption of stormwater drainage caused by clearing, grubbing, grading, filling, and excavating land. The ordinances establish administrative procedures, minimum standards of review, and implementation and enforcement procedures for stormwater runoff, grading, and erosion control activities. The oversight of land development within the jurisdictions of these local agencies occurs during their project planning and reviews where they ensure project compliance with the ordinances, as well as with the construction-related plans and policies developed by the Sacramento Stormwater Quality Partnership to comply with their NPDES Municipal Stormwater Permit.

7.1.2 Existing Conditions

This section provides information on the existing conditions of groundwater hydrology; groundwater quality; surface water hydrology, including surface water runoff, urban runoff, and summer runoff; surface water quality; and municipal wastewater within the Planning Area.

7.1.2.1 Groundwater Hydrology Conditions

The Planning Area is entirely within the 20,000-square-mile Central Valley Aquifer[3] System, which stretches from north of Redding to south of Bakersfield. The Central Valley Aquifer System is categorized into three sub-regions by DWR, and the Planning Area overlies two of them—the Sacramento Valley Groundwater Basin and the San Joaquin Valley Groundwater Basin (DWR 2003). The Planning Area north of the Cosumnes River overlies the South American River groundwater sub-basin, and the Planning Area south of the Cosumnes River overlies the Cosumnes sub-basin of the San Joaquin Valley Basin. The groundwater sub-basins underlying the Planning Area were also further categorized for the Water Forum Agreement process (Section 7.1.1.2) based on a combination of hydrologic features and municipal or water agency boundaries. With minor exceptions, the Planning Area north of the Cosumnes River is within the Water Forum Agreement's Central Basin, and south of the Cosumnes is in the Water Forum Agreement's South Basin (see Figure 7-1).

The geology of the Sacramento and San Joaquin basins are defined by deposits of continental origin (alluvial deposits eroded from the ancestral Sierra Nevada Mountains and ancient mudflows believed to have arisen east of the Sierra crest) that extend to about 20,000 feet below ground surface and overlie older marine sediments (DWR 2003). The Planning Area includes an upper layer of relatively young and unconsolidated floodplain deposits and alluvium to a depth of about 100 feet. Underlying the floodplain deposits, much of the Planning Area is characterized by are unconsolidated and poorly consolidated alluvial deposits of the Riverbank, Modesto-Riverbank, Modesto, and Laguna geologic formations, which extend to a depth of about 300 feet near the Sacramento River, and slope upward to the eastern margin of the Planning Area where these sediments contact the bedrock of the Sierra Nevada foothills (see Figure 5-2). The Modesto-Riverbank/Riverbank/Laguna formations are important freshwater aquifers in the Planning Area for shallow domestic and agricultural water supply wells, consisting of interlaced layers of coarse deposits along with variable amounts of sand, silt, and clay. Underlying the alluvial Riverbank/Laguna/Modesto-Riverbank formations is the deeper Mehrten Formation, an ancient volcanic mudflow now exposed at the base of the Sierra Nevada foothills (see Section 5.1.2.5, Volcanic Mudflow Landform Geologic Formations and Soil

[3] An aquifer is generally defined as a groundwater bearing zone of the earth's crust.

Series). The Mehrten Formation also serves as an important freshwater aquifer for the Planning Area, primarily for larger municipal and agricultural water supply wells. The Mehrten Formation extends to a depth of about 2,000 feet near the Sacramento River, and is separated from the overlying alluvial formations by a discontinuous clay layer that restricts groundwater movement between the overlying alluvial aquifer and the Mehrten Formation aquifer.

Groundwater in the Central basin and South basin (Figure 7-1) is the primary source of water for municipal and agricultural uses in the Planning Area (Robertson-Bryan Inc. and WRIME 2011; SCWA 2004). Most domestic groundwater wells in the Planning Area pump from aquifers (i.e., groundwater-bearing zone of the earth's crust) within the alluvial formations and pump from depths less than 200 feet deep. However, large capacity agricultural and municipal water supply wells are typically installed into the Mehrten Formation and pumped from depths up to 600 feet or more.

With population growth, increased municipal and industrial water use, and the advent of intensive irrigated agricultural activities in the Planning Area beginning in the 1940s (see Section 1.3, Purpose, Need, and Objectives), the depth to the saturated zones of the alluvial aquifers (i.e., groundwater table or groundwater level) across the Planning Area decreased from the 1940s through about 1980, and then generally stabilized at that level in the succeeding 20 years, leading up to the development of the Water Forum Agreement in 2000 (Sacramento City-County Office of Metropolitan Water Planning 1999; RMC Inc. 2014). However, during the drought of 1987–1992, rate of aquifer recharged was low, and groundwater levels across the Central Basin declined about 15 feet on average (Sacramento City-County Office of Metropolitan Water Planning 1999). After the end of the drought in 1992 through about 2007, groundwater levels generally recovered to the previous mid-1980s level. Since about 2007, groundwater levels in some wells have declined from extensive use of groundwater (RMC Inc. 2014; Robertson-Bryan Inc. and WRIME 2011). The extensive use of groundwater has also resulted in a large cone of groundwater depression (i.e., an area of lower groundwater levels relative to groundwater level in the surrounding areas of the aquifer, resulting from groundwater pumping) located west of Elk Grove in the Central basin, and a similar cone of depression east of Galt in the South basin. There is currently no evidence of substantial or adverse land surface subsidence in the Central Basin or South Basin as a result of these lowered groundwater levels (RMC Inc. 2014; Robertson-Bryan Inc. and WRIME 2011).

As discussed in Section 7.1.1.2, the Water Forum Agreement (established in 2000) and the South Basin Groundwater Management Plan identified the safe yield of the Central Basin as 273,000 AFY, and the safe yield of the South Groundwater Basin as 115,000 AFY. Estimates of groundwater extraction from the Central Basin were about 233,000 AFY in 2011 and 253,000 AFY in 2012, averaging about 243,000 AFY per year (RMC Inc. 2014). Groundwater extraction in the South Basin was approximately 115,000 AFY each year from 2000 to 2004. However, in

general, groundwater use had been less than the sustainable yield target, over the longer time period of 1980 to 2004 (Robertson-Bryan and WRIME 2011).

Additionally, current climate changes and related uncertainty in future precipitation and runoff conditions in the Central Valley and upper watersheds of the Sierra Nevada mountains is expected to affect existing and future water supply conditions, including groundwater in the Planning Area and surrounding region. Hydrologic modeling of the Sacramento County region was conducted by the Regional Water Authority to evaluate future land uses anticipated to occur under the Galt, Rancho Cordova, and Sacramento County General Plans, using projected 2030 urban and agricultural water demands and estimated effects of future climate change (Regional Water Authority 2013). The modeling indicates that, in contrast to modeling results for the Water Forum Agreement and the Zone 40 Water Supply Master Plan EIR (described above), the average annual municipal demand would increase by about 4,000 AFY and available surface water supplies could be reduced by up to 33,000 AFY (including water delivery cutbacks imposed to meet drought-related state water conservation regulations), compared to modeled future conditions without climate change. The modeling assumes that groundwater pumping would be used to make up the shortfall, which would occur primarily to meet agricultural demands, resulting in average groundwater level reductions by up to about 20 feet in agricultural areas. Groundwater would be sufficient to meet future water demands in normal water years based on the water rights and contracts of all water purveyors. However, future water shortages in single and multiple dry-year scenarios could be a concern to the water purveyors for long-term groundwater availability.

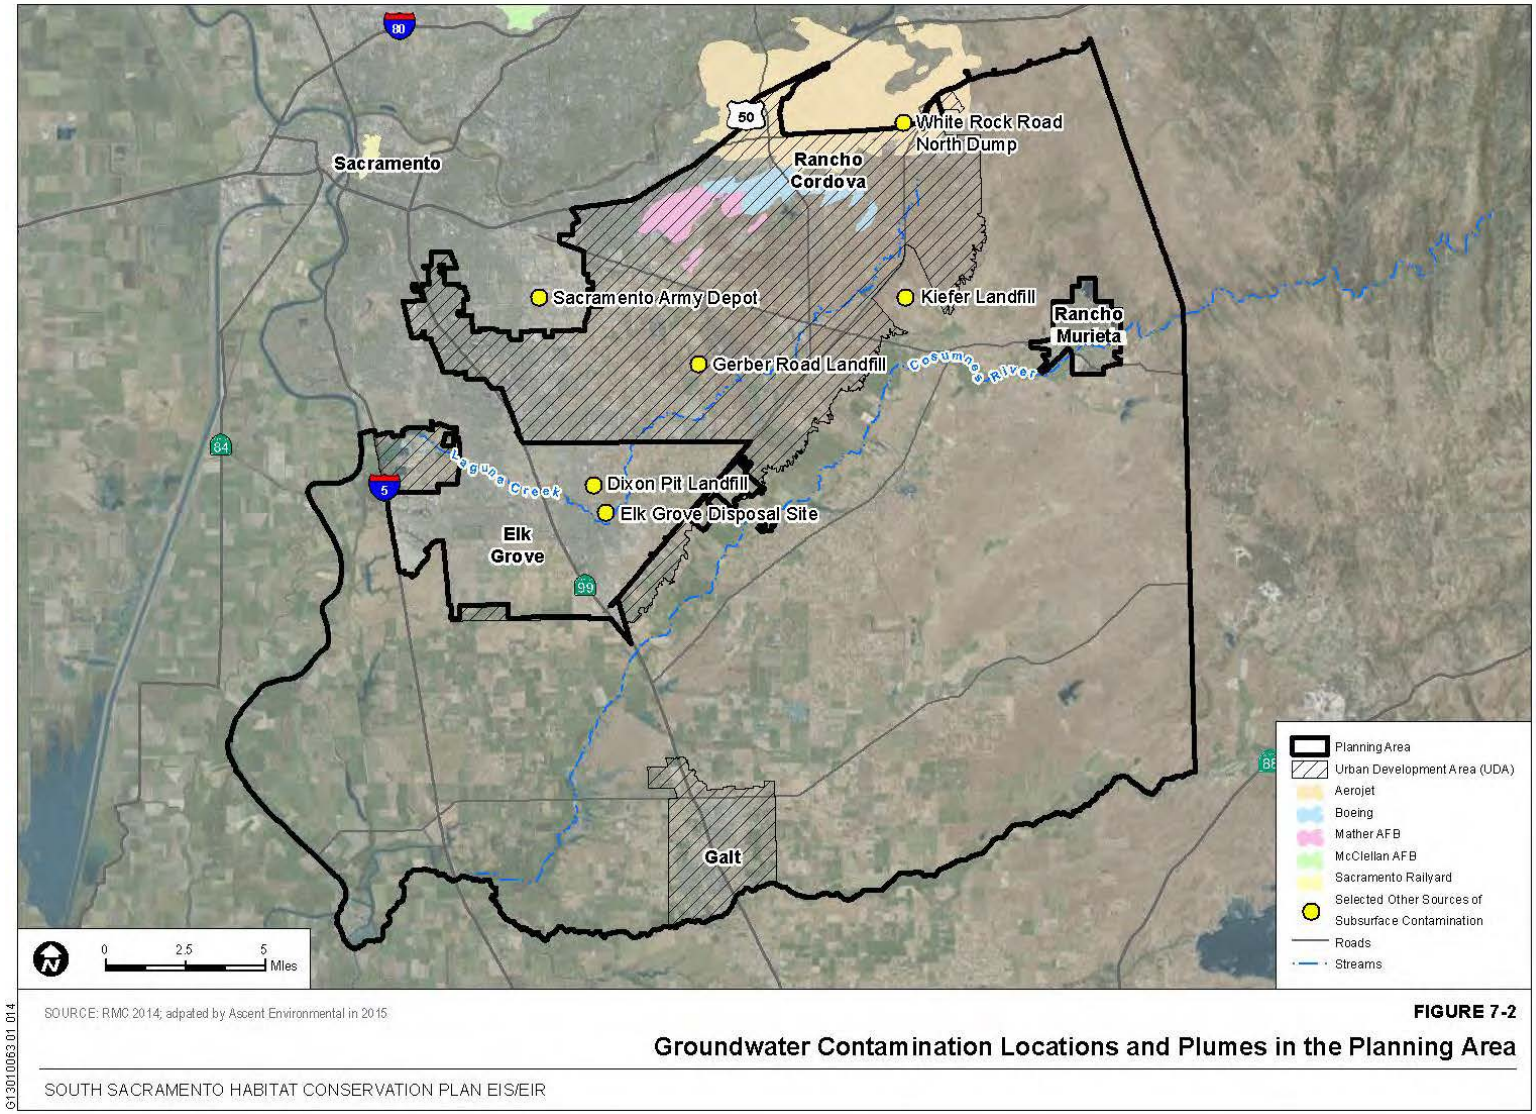
Additionally, current predictions for future climate change include warmer average air temperatures and somewhat less annual average precipitation over the long term in the Central Valley and in the Sierra Nevada Mountains, which contribute runoff to the streams in the Planning Area (i.e., primarily Deer Creek, Cosumnes River, and Dry Creek) (RMC Inc. 2015). However, the intensity and amount of rainfall during individual storm events is predicted to increase from climate change, and the amount of precipitation as snowfall in the Sierra Nevada Mountains east of the Planning Area will decrease. The combination of less snowfall, warmer temperatures currently expected to result in less Sierra Mountain snow fall in the winter, earlier Sierra Mountain snowmelt runoff in the spring, increased winter rainfall intensity in the Planning Area, and increased Sierra watershed areas exposed to rain rather than snow may result in increased downstream flood flows and flood volumes, including in the American River and Sacramento River that are adjacent to the Planning Area.

As discussed in Section 5.2.1, Methodology for Assessing Impacts of Each Alternative on Soils, Geology, and Mineral Resources, the Laguna, Riverbank, Modesto-Riverbank, Mehrten, and Valley Springs geologic formations include soils with an impermeable subsurface soil layer formed of cemented hardpan (duripan), claypan, rock, or a combination of these (Figure 5-2).

Winter rains saturate the upper soil layers, forming a seasonal perched aquifer that persists through the winter rainy season. This is an important category of groundwater in the analysis of the EIS/EIR alternatives because the Planning Area vernal pools and vernal pool ecosystems depend on the seasonal formation of the soil perched aquifer (see Section 8.1.2, Existing Conditions). However, the seasonal perched aquifers are not used for water supplies.

7.1.2.2 Groundwater Quality

Groundwater quality refers to the chemical and physical properties of groundwater, which affects the uses of the groundwater. Groundwater quality in the aquifers of the Planning Area's alluvial geologic- formations and groundwater quality in the deeper aquifer of the volcanic Mehrten Formation, with few exceptions, are suitable for municipal, industrial, and agricultural water supply uses, which are the main uses of groundwater in the Planning Area (Sacramento City-County Office of Metropolitan Water Planning 1999). Groundwater quality in the seasonal perched aquifers is not discussed in Chapter 7 because this groundwater is not used for water supplies.



Throughout the Planning Area, the large majority of constituents of concern regulated by Title 22 of the California Code of Regulations (Section 7.1.1.1) are present in groundwater at concentrations below drinking water standards. However, arsenic, which is a contaminant of concern for public health, is present in some locations of the geologic formation aquifers and the aquifer of the Mehrten Formation (RMC Inc. 2014). Galt has wellhead treatment systems installed on several of its municipal wells to remove arsenic (Galt 2009). Elevated levels of iron, manganese, and odor also are present in the Mehrten Formation groundwater at levels above the secondary drinking water quality standards for taste and odor (RMC Inc. 2014). Groundwater data collected by the Sacramento County Water Agency and Galt have shown that lower groundwater levels, such as the cones of groundwater depression in southern Sacramento County, may result in the migration of poorer-quality groundwater from the deeper Mehrten Formation to the overlying alluvial-formation aquifer, where it may increase manganese and arsenic (Sacramento County 2010).

Groundwater management actions implemented by municipal water purveyors to manage arsenic and manganese include well-head treatment systems, blending water sources with elevated and low concentrations to achieve compliance, or abandoning affected wells. Groundwater in the alluvial formation aquifers and the Mehrten Formation aquifer is typically low in total dissolved solids. Municipal water purveyors also manage total dissolved solids to achieve the Title 22 secondary drinking water standards for taste. Salinity intrusion from groundwater in the Delta does not occur in the Central Basin or in the South Basin (Figure 7-1) under the existing conditions (RMC Inc. 2014; Robertson-Bryan and WRIME 2011).

In addition to the naturally occurring groundwater constituents of concern (e.g., dissolved oxygen, pH, electrical conductivity, total dissolved solids, temperature, turbidity, and trace elements), there are six specific locations within or very near the UDA portion of the Planning Area where groundwater contamination has occurred as a result of past industrial activities. Substantial groundwater cleanup actions are being implemented to prevent or minimize movement of these contaminants, and prevent or minimize further degradation of groundwater quality (Figure 7-2). The U.S. EPA Superfund program was used at several of these locations to address cleanup activities for remediation of soil contamination and containment and treatment of contaminated groundwater. The groundwater contamination is known either by the company name associated with the industrial waste disposal activities or by geographical locations, as follows: Aerojet (property that also includes the White Rock Road-North Dump landfill), the former Mather Air Force Base (Mather AFB), and Boeing (property that also includes the Inactive Rancho Cordova Test Site) (Figure 7-2). The former Sacramento Army Depot is a federal Superfund cleanup site located outside of the Planning Area boundary but is shown on Figure 7-2 because it is nearby and within the same Central Groundwater Basin as the Planning Area. Figure 7-2 also shows the general footprint of the existing plumes of elevated contaminants in the groundwater near the Aerojet, Boeing, and Mather AFB locations, as mapped with groundwater data collected through 2007 (Sacramento Central Groundwater Authority 2014). The plumes of contamination spread in the groundwater as a result of contaminant diffusion, natural groundwater flow, and groundwater flow that is induced by local groundwater pumping.

The existing cleanup activities at the other soil and groundwater contamination locations in the Planning Area (Figure 7-2) have regulatory oversight provided by state agencies (Central Valley Regional Water Board and California Department of Toxic Substances Control). The existing cleanup activities at the active Kiefer Landfill and the inactive Gerber Road landfill contamination locations and are managed by the Sacramento County Department of Waste Management and Recycling. The Dixon Pit and Elk Grove landfills are locations of groundwater contamination located near the UDA portion of Planning Area in the Central Basin. The groundwater contaminants at these four landfill sites are a result of the solid waste disposal activities that occurred before federal and state regulations that now exclude disposal of hazardous waste in landfills, and they now require clay-lined or geotextile-lined landfill disposal areas and other measures that prevent percolation of contaminants to groundwater, prevent rainwater infiltration, and require the collection and treatment of landfill leachate.

Figure 7-2. Groundwater Contamination Locations and Plumes in the Planning Area

INTENTIONALLY LEFT BLANK

Of the six groundwater-contamination locations in or near the UDA, the most extensive areas of groundwater contamination are associated with the former Aerojet and Boeing operations (see Figure 7-2). Past rocket-development activities at these areas involved the surface discharge of rocket fuels and other waste products, which were carried by rainwater infiltration and percolation into the groundwater table. Groundwater constituents of concern discharged at the former Aerojet and Boeing operations include volatile organic carbon compounds, solvents (e.g., trichloroethylene, Freon, chloroform), and other compounds associated with rocket fuels (i.e., perchlorate and N-nitrosodimethylamine). Aerojet is currently monitoring groundwater quality and is operating numerous groundwater extraction wells and treatment systems that remove contaminants from the pumped groundwater. Aerojet discharges an average of 49.2 million gallons per day (mgd) of treated groundwater to the American River north of the Planning Area, and to multiple local streams in the UDA (e.g., Morrison Creek, Alder Creek, Buffalo Creek, and unnamed stormwater drainage channels) under an NPDES permit issued by the Central Valley RWQCB and last revised in December 2013 (Order R5-2013-0155).

Existing groundwater extraction wells and treatment systems are also operated in and around the Mather AFB property (Figure 7-2). Soil and groundwater contamination at Mather AFB occurred in association with past air base operations and maintenance activities, including waste pits, landfills, and leaking tanks that discharged petroleum oils and lubricants, solvents, and protective coatings. Groundwater extraction and treatment systems at Mather AFB primarily pump, treat, and reinject the treated water into the groundwater, but one system discharges approximately 0.5 mgd of treated water per day to Mather Lake (a man-made pond on the eastern side of the former base property). A recent annual monitoring report for the Mather AFB groundwater cleanup process indicates that the extraction wells are successfully stopping the spread of the contaminant plumes in the Central Basin (U.S. EPA 2015a).

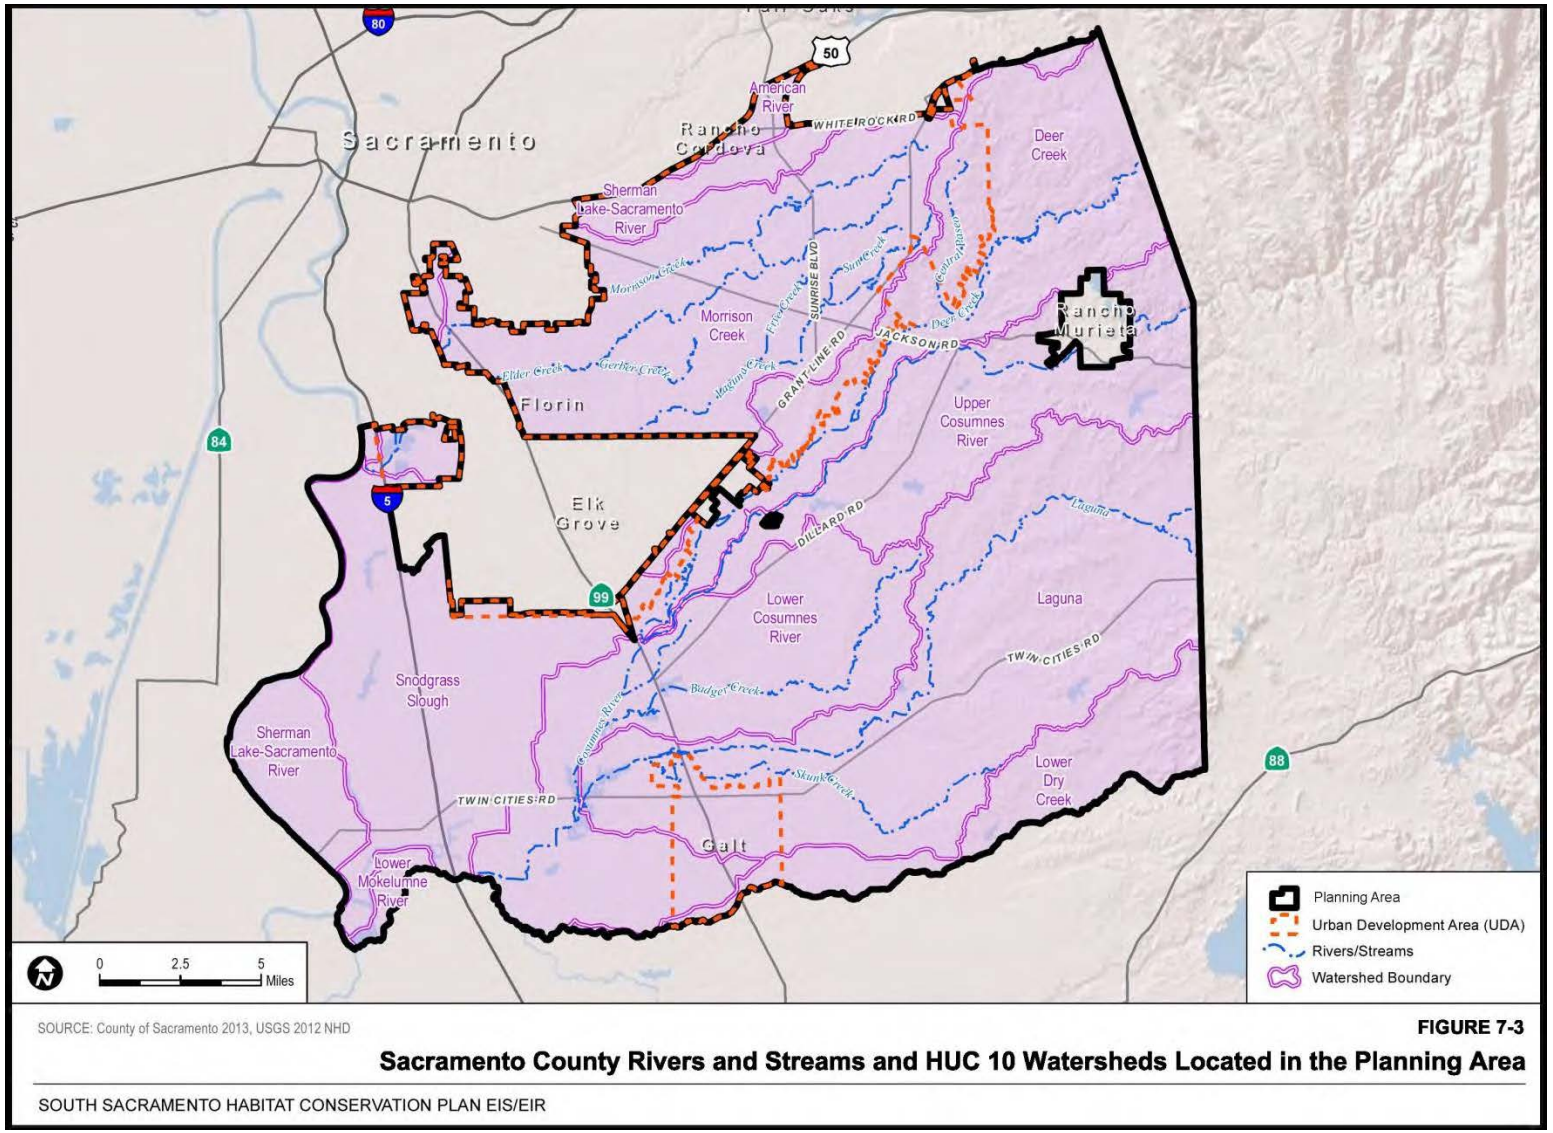
The other groundwater contamination locations and plumes shown in Figure 7-2 affect relatively small areas compared to the much larger and complex contaminant issues at the Aerojet and Mather AFB properties. Extraction wells and treatment activities at the Sacramento Army Depot were completed, and the site is not a concern for further groundwater contamination (U.S. EPA 2015b).

The Keifer Landfill site involves groundwater contamination with volatile organic compounds associated with a former unlined landfill disposal area. The existing Keifer Landfill groundwater cleanup activities include the pumping of groundwater by extraction wells, groundwater treatment, and discharge of approximately 1.0 mgd of treated water per day to Deer Creek under an NPDES permit issued to by the Central Valley RWQCB and last revised in Order R5-2013-0002.

Water quality information for seasonal perched groundwater in the Planning Area has not been studied. However, as discussed in Chapter 8, because of proximity to existing urban development, several areas of perched seasonal groundwater within the UDA are susceptible to water quality degradation from infiltration of surface contaminants carried by urban runoff sources within the watershed of the perched groundwater.

7.1.2.3 Surface Water Hydrology

This section describes the existing condition of surface streams in the Planning Area and their watersheds. As discussed further in Section 10.1.2, Existing Conditions of Aquatic Resources, watersheds in the United States are delineated using a hierarchical system, which divides the United States into 21 regions, 221 sub-regions, 378 hydrologic accounting units, and 2,264 cataloging units (USGS 2013). Each hydrologic unit is identified by a unique Hydrologic Unit Code (HUC) consisting of 2 to 12 digits, which define successively smaller units within the classification system (USGS and NRCS 2009; USGS and NRCS 2013).



At the 10-digit HUC level, the Planning Area includes a portion or the entirety of 10 different watersheds (Figure 7-3). The small, northernmost portion of the Planning Area is within the Lower American River watershed and drains north to the American River. The north (largest) UDA portion of the Planning Area is primarily located within the Morrison Creek Watershed, which drains west through the City Elk Grove to ~~Beech~~ **Beach** Lake and the Sacramento River.

Portions of three HUC 10 watersheds located in the southeastern and south-central portion of the Planning area (i.e. Sherman Lake-Sacramento River, Snodgrass Slough, and Lower Consumes River) are within the legal Delta. Snodgrass Slough, the lower reaches of the Cosumnes River, and the section of the Mokelumne River bordering the Planning Area are tidally influenced (Figure 7-3).

Table 7-1 shows the names of the 10 Planning Area HUC 10 watersheds and associated HUC 12 watershed (i.e., smaller sub-watersheds), which are named by the largest waterway within the watershed or sub-watershed. Table 7-1 also presents the total size of each HUC 12 sub-watershed and the acres of each HUC 12 sub-watershed within the Planning Area.

Many of the waterways occurring in the Planning Area's HUC 12 watersheds are typically ephemeral with periods of no streamflow during the dry summer months, or only intermittently flow in the dry summer months. However, some of these historically ephemeral or intermittent waterways now have some water flow throughout the year as a result of irrigation run-off from urbanized areas, and from the discharges discussed in Section 7.1.2.2 (e.g., groundwater treatment discharges to drainages and tributaries of Morrison Creek, Alder Creek, Buffalo Creek, Deer Creek, American River, and Mather Lake, as well as the Galt municipal wastewater discharges to the Cosumnes River).

INTENTIONALLY LEFT BLANK

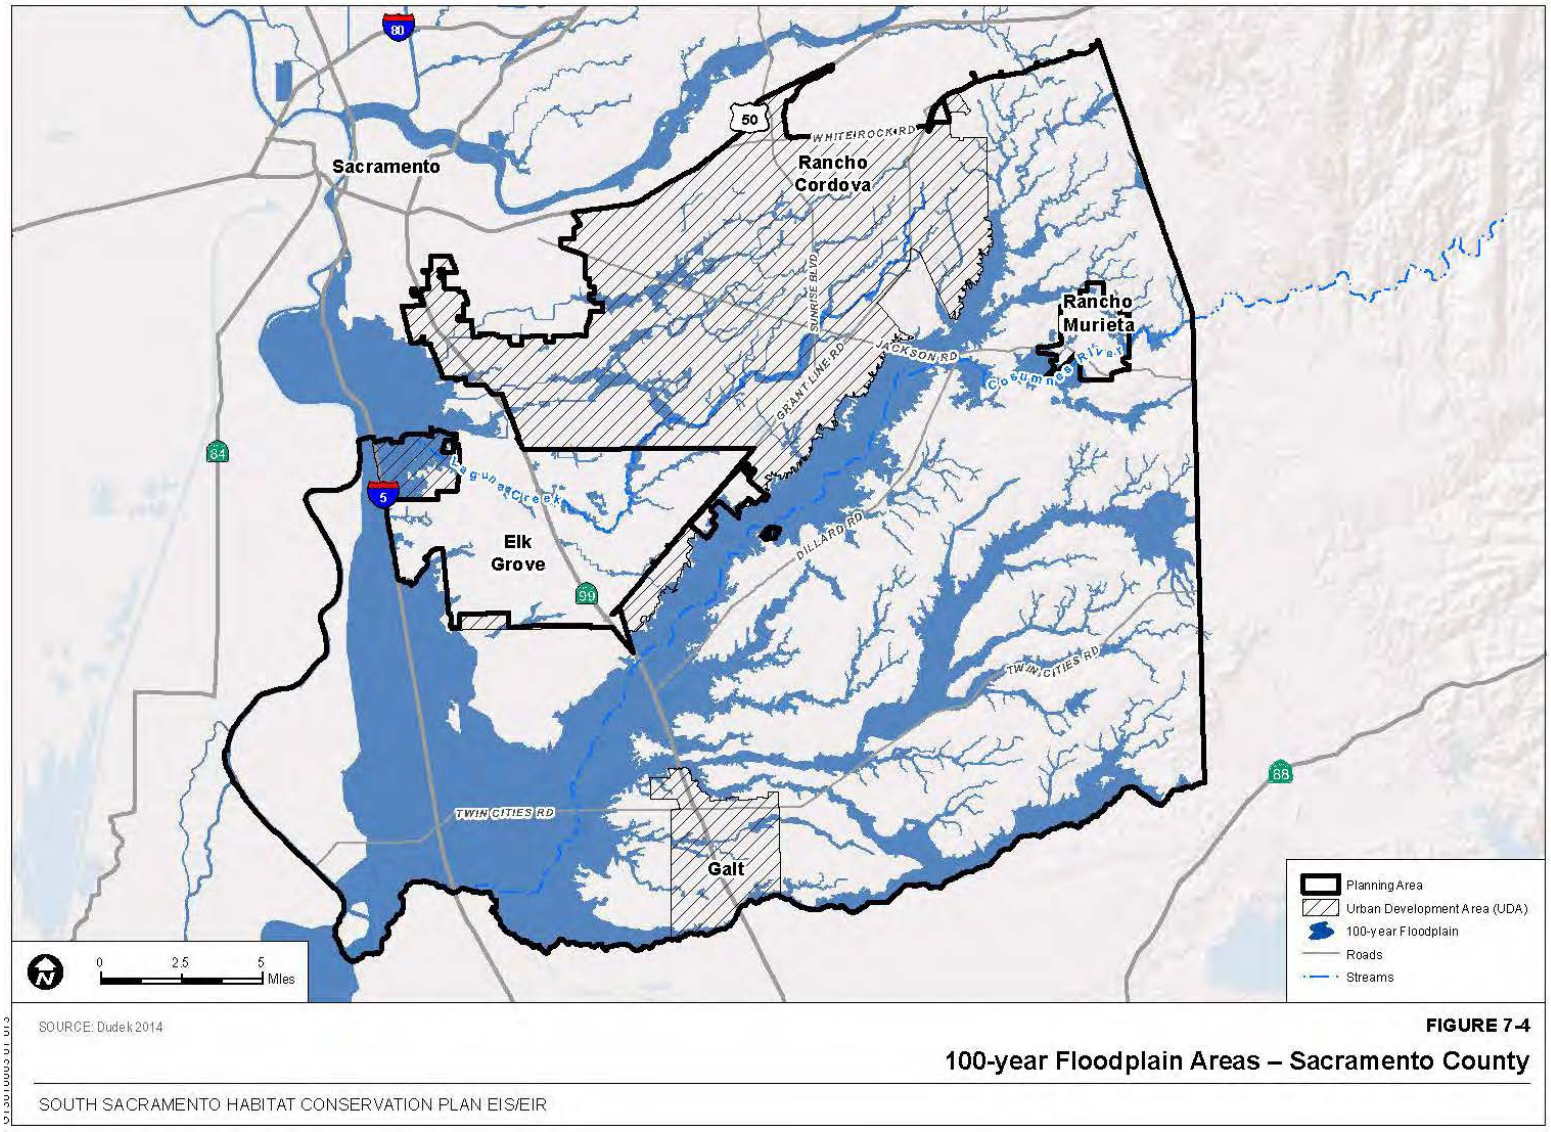
Table 7-1. Watersheds and Sub-Watersheds of the Planning Area

Watershed (HUC 10)	Sub-Watershed(s) (HUC 12)	Total Acres in Sub-Watershed	Acres of Sub-Watershed within the Planning Area	% of Sub-Watershed within the Planning Area
American River	Lower American River	30,063	3,158	11%
	Upper American River	35,358	8,929	25%
Deer Creek	Lower Deer Creek	29,043	28,741	99%
	Carson Creek	20,773	11,021	53%
	Upper Deer Creek	33,166	7,067	21%
Laguna[1]	Middle Laguna	26,128	26,128	100%
	Upper Laguna	13,883	5,925	43%
	Willow Creek	14,377	377	3%
	Lower Laguna	31,149	31,149	100%
	Hadselville Creek	12,612	11,756	93%
Lower Cosumnes River	Badger Creek	13,835	13,835	100%
	North Fork Badger Creek	10,985	10,985	100%
	Grizzly Slough–Cosumnes River	22,492	22,492	100%
Lower Dry Creek	Liberty Cemetery–Dry Creek	12,667	4,489	35%
	Loch Lane–Dry Creek	24,572	13,568	55%
Lower Mokelumne River	South Mokelumne River–Mokelumne River	26,802	293	1%
	Hog Slough	30,375	3	0%
	Murphy Creek–Mokelumne River	39,395	1,707	4%
Morrison Creek	Lower Morrison Creek	10,383	7,018	68%
	Elder Creek	14,038	12,917	92%
	Laguna Creek[1]	30,784	29,514	96%
	Upper Morrison Creek	27,583	20,894	76%
Sherman Lake–Sacramento River	Beaver Lake–Sacramento River	28,434	9,254	33%
Snodgrass Slough	Sacramento Drainage Canal	14,134	14,134	100%
	South Stone Lake–Snodgrass Slough	37,652	37,580	100%
Upper Cosumnes River	Town of Wilton–Cosumnes River	16,451	16,451	100%
	Arkansas Creek–Cosumnes River	22,405	15,581	70%
	Indian Creek–Cosumnes River	24,116	46	0%

Source: USGS and NRCS 2013

[1] There are two Laguna Creeks in the Planning Area. The first Laguna Creek crosses the UDA and is a tributary to Morrison Creek and the Sacramento River. The second Laguna Creek is larger, located in the south part of the Planning Area, and is a tributary to the Cosumnes River and the Mokelumne River.

As discussed in Section 7.1.1.1, FEMA designates and delineates 100-year floodplain areas. The FEMA-designated 100-year floodplain areas in the Planning Area are primarily adjacent to major rivers, streams, and creeks of the Planning Area (Figure 7-4). However, FEMA 100-year floodplain mapping may not include small rural watersheds that are less than 1 square mile in size.



Within the UDA portion of the Planning Area, many of the streams have levees adjacent to the channels and primarily converge into the Morrison Creek channel, which is also contained within levees to its confluence with the Sacramento River. The South County Streams program of the Sacramento Area Flood Control Agency involves planning, construction, and operation of floodplain management facilities for Morrison Creek and its principal tributaries (i.e., Florin Creek, Elder Creek, the first Laguna Creek,[4] and Unionhouse Creek) (Figure 7-3). The Sacramento Area Flood Control Agency's flood control facilities are mostly located in the lower reaches of these streams where the increased rates and volumes of channel flows during storm events combine to create potential flooding situations, which are then managed through appropriately sized levees, constructed channels, and pump stations to safely contain the flows. Morrison Creek conveys flow to the low-lying Beach Lake basin adjacent to the Sacramento River levee, where during wet weather events most excess flow is pumped into the Sacramento River near Clarksburg, but some flows drain south into Snodgrass Slough and to the Mokelumne River (Figure 7-3).

South of Morrison Creek in the Planning Area, floodplain areas include Deer Creek, Cosumnes River, Badger Creek, the second Laguna Creek,[4] Skunk Creek, and Dry Creek on the south border of Sacramento County and the Planning Area. Most stormwater runoff from Galt is conveyed into the second Laguna Creek (Figure 7-3).

The existing stormwater facilities within the UDA were designed consistent with County and City requirements to include sufficient capacity. Urban drainage systems present in Galt, Rancho Cordova, and Sacramento County have been designed to ensure that people or structures would not be exposed to significant adverse flood hazards. Community designs typically include stormwater detention basins, underground drainage infrastructure, culverts and bridges in waterways, modifications of stream channels, and construction of new drainage channels. Detention basins with properly sized outlet pipes are required by local jurisdictions to provide flood control to limit discharge to receiving waters to the same flow rates within the tributaries as the existing condition flow rates.

[4] There are two Laguna Creeks in the Planning Area. The first Laguna Creek crosses the UDA and is a tributary to Morrison Creek and the Sacramento River. The second Laguna Creek is larger, located in the south part of the Planning Area, and is a tributary to the Cosumnes River and the Mokelumne River.

Figure 7-4. 100-year Floodplain Areas – Sacramento County

INTENTIONALLY LEFT BLANK

Natural bank erosion typically occurs intermittently as waterways meander or shift within their floodplain, and is a normal part of all fluvial ecosystems. Periodic erosion of the stream bank maintains patches of young riparian vegetation throughout the stream system, which provides habitat required by many riparian plant and animal species. However, natural waterway meandering and associated bank erosion in the UDA and other locations of the Planning Area have been prevented or minimized to create stability for land uses that are located in proximity to the stream bank. Currently, setbacks between new urban development and the banks of a stream or other natural waterway are not required in most land use zones, provided there is no existing flood hazard. Typically, only minor setbacks were required by local jurisdictions during the land use planning processes of most development projects within the Planning Area. Many natural waterways in the UDA and in other locations of the Planning Area have been physically modified to remain a relatively narrow corridor, and natural waterway meandering and associated ecosystem processes no longer occur.

Most streams and other waterways that run through existing communities within the UDA are now surrounded by urban activities. During the land use planning process, stream corridors have been incorporated with recreational land uses such as trails, parks, and golf courses; other times, stream corridors are designated as narrow strips of open space with no required setbacks from buildings or streets.

Many Planning Area streams are armored with concrete or rock slope protection to prevent downcutting and bank erosion. Without adequate setbacks, natural waterways rarely remain in their natural state in urban areas, since the natural hydrology changes, and downcutting and bank erosion occurs. Bank erosion and downcutting can be accelerated if upstream areas are channelized, which can increase the speed of flows and result in accelerated downstream erosion. In addition, banks can erode more quickly when people and domestic animals access the streams for recreation such as fishing, picnics, swimming, and playing fetch with water-loving dogs. In time, tree roots that once stabilized the banks become exposed and erosion accelerates, causing the stream to widen or change course. If adequate setbacks from buildings and roads were not incorporated into an urban stream corridor, the solution was to shore up the banks with concrete or rock slope protection to keep the stream in the narrow designated area. The installation of erosion control has typically included the removal of vegetation. Therefore, adverse impacts to the natural hydrologic function of streams have occurred in urban areas even in cases where the natural streambed was originally avoided. This is particularly true in cases where there are no designated setbacks from urban uses, and/or there is no management of the stream corridor designed to prevent adverse impacts to the stream from encroaching human activity. Without adequate setbacks, adverse impacts to the natural hydrologic function of streams will continue to occur within the Planning Area.

7.1.2.4 Surface Water Quality

Water quality conditions of the Planning Area surface waters are affected by conditions in the watersheds, including weather and temperature, groundwater inputs, atmospheric deposition, animal wastes, urban contaminants and emissions, seasonal rainwater runoff, and climatic patterns (e.g., droughts). The principal sources of potential contaminant discharges to surface waters in the Planning Area are associated with human-related activities and include urban stormwater runoff, agricultural runoff, and municipal wastewater treatment plant discharges.

Four waterways in the Planning Area (Morrison Creek, Elder Creek, Deer Creek, and the lower Cosumnes River), as well as the lower Sacramento River immediately downstream of the Planning Area, do not meet CWA Section 303(d) water quality standards and are included in the SWRCB's current list impaired water bodies (SWRCB 2011). The constituents of concern include legacy organochlorine pesticides products (i.e., no longer sold in the United States but present in soil and very resistant to decay in the environment), and diazinon and chlorpyrifos, which were banned for residential use in California (Table 7-2). Mercury is also a legacy constituent of concern that was used for gold mining in the Sierra Nevada Mountains and is present in waterways outside the Planning Area, including the Sacramento River and the legal Delta (Table 7-2).

Information about the existing conditions for the constituents of concern and contaminant sources for surface waters in the Planning Area are discussed below.

Table 7-2. 2010 CWA Section 303(d) Pollutants and Sources for the Planning Area

Pollutant/Stressor	Listed Source
Morrison Creek	Diazinon, pentachlorophenol, pyrethroid pesticides, sediment toxicity
Elder Creek	Chlorpyrifos, diazinon, pyrethroid pesticides, sediment toxicity
Deer Creek	Iron
Cosumnes River (below Michigan Bar; partly in Delta Waterways, eastern portion)	Escherichia coli (E. coli), invasive species
Sacramento River (Knights Landing to Delta)	Chlordane, DDT, dieldrin, mercury, polychlorinated biphenyl compounds (PCBs), unknown toxicity
Sacramento River–San Joaquin River Delta	Chlorpyrifos, DDT, diazinon, electrical conductivity, Group A (organochlorine) pesticides, invasive species, mercury, PCBs, unknown toxicity

Source: SWRCB 2011

Urban Runoff

Urban stormwater runoff and irrigation runoff may contain a wide variety of potentially harmful constituents of concern that can adversely affect beneficial uses in receiving waters, including aquatic life, recreational opportunities (e.g., aesthetics, fishing, swimming), and human health. Constituents of concern include elevated temperature discharges, organic oxygen demanding

substances, petroleum hydrocarbons, pathogens, pesticides, and trace metals. Urban runoff can enter and affect water bodies, including rivers, streams, creeks, marshes, swales, and vernal pools.

Contaminants accumulate on the ground surface in urban environments during California's summer dry season. In the winter wet season, surface runoff during the initial rainfall mobilize and transport those contaminants as a "first flush" effect, which refers to the typically higher concentrations of contaminants during the initial stormwater runoff events of the wet season.

Urban development increases impervious surfaces, which increases the volume of stormwater runoff to centralized drainage systems and can result in increased rates and volumes of runoff to receiving waters. This change in the hydrologic condition relative to the pre-development hydrologic condition is hydromodification, a process that can increase erosion in receiving waterways and increase sedimentation in downstream water bodies. Changes in surface runoff (i.e., drainage of land, changes in flow paths), hydromodification, and resulting erosion and channel scour can lead to the loss of riparian and aquatic resources, and result in water quality changes such as increased stream temperatures and reduced natural contaminant removal processes (e.g., settling and deposition, bacterial decay). Hydromodification can also redirect water away from aquatic habitats such as vernal pools and other wetlands, resulting in drying and lower habitat quality.

The most recent 2013/2014 CMP annual monitoring report prepared by the Regional San and Sacramento Stormwater Quality Partnership organization evaluated water quality in samples collected during three wet-weather events and one dry-weather period (Larry Walker Associates 2014). Ambient and stormwater quality conditions are evaluated in the annual report for a wide range of constituents of concern, typically within categories of compounds that are indicative of background conditions, increased soil erosion, and urban and industrial sources (e.g., automotive petroleum products, pet wastes, pesticides, fertilizers). The CMP report indicates that concentrations of most constituents of concern in the American River and Sacramento River are below (i.e., consistent with) applicable water quality objectives for drinking water and for aquatic life protection as a result of typically low constituent concentrations (i.e., low mineral content, organic matter, toxic metals, organic compounds, and pesticides) (Larry Walker Associates 2014). However, seasonal wet weather water quality conditions can exhibit temporary occurrences of elevated turbidity, suspended solids, pathogen indicator bacteria, and trace metals (e.g., copper and lead) and common use pesticides. For urban tributary streams, the data for wet weather samples indicate frequent detection of elevated concentrations of copper, polycyclic aromatic hydrocarbon compounds, and E. coli bacteria relative to applicable water quality objectives (Larry Walker Associates 2014, 2013).

Additionally, the Sacramento Stormwater Quality Partnership prepared an effectiveness assessment report of the stormwater management program being implemented for the NPDES

Municipal Stormwater Permit (Sacramento Stormwater Quality Partnership 2013), which summarized the findings of a decade of CMP monitoring data for constituents of concern in urban runoff including the sources, fate and transport characteristics, and status and trends with respect to applicable regulatory water quality objectives, as follows:

- Exceedances of water quality standards in the American River and Sacramento River are rare to infrequent.
- Water quality exceedances observed in the American River and Sacramento River are generally not linked to urban stormwater runoff discharges or sources.
- Long-term trends of either increasing or decreasing concentrations of most constituents of concern in urban stormwater runoff are not discernible in older urban areas; however, aquatic toxicity in urban tributaries appears to have decreased significantly over the monitoring period.
- The concentrations of most constituents of concern in urban stormwater runoff from newer developments are lower than runoff from older urban areas, indicating that new development design standards are effective in minimizing constituent of concern discharges.
- Urban tributaries are no longer impaired by diazinon and chlorpyrifos.
- Investigations of actions to control contaminant sources from entering stormwater for a variety of constituents of concern indicate the following:
    - Sediment control BMPs will help reduce the discharges of copper, lead, zinc, mercury, pathogens, polycyclic aromatic hydrocarbons, and other sediment-bound pollutants.
    - Mercury-containing products such as fluorescent lamps are the largest source of mercury in urban runoff; however, mercury discharges are very minor compared to legacy sources of mercury already in the waterways.
    - Sources of bacterial pathogen indicators are difficult to quantify; however, wild animals are likely to constitute a significant, yet largely uncontrollable, source.
    - The major source of copper in urban watersheds is brake pad wear.
    - The major source of pesticides is legal application of insecticides by licensed pest control operators. Pesticides also are the most important and only consistent source of aquatic toxicity in urban runoff.

Agricultural Runoff

Potential water quality sources and constituents of concern in the Planning Area include drainage and wet weather stormwater runoff from areas of irrigated agricultural and pasture land. Constituents of concern include suspended sediment and turbidity associated with routine soil disturbances (e.g., tilling, grazing), organic matter, organic oxygen demanding substances,

fertilizer nutrients (e.g., nitrogen and phosphorus), pesticides, and pathogens. Agricultural runoff can enter and affect off-site water bodies, including rivers, streams, and wetlands.

Agricultural operators in the Sacramento Valley Water Quality Coalition fund a receiving water-quality monitoring program for compliance with the Waste Discharge Requirements issued under the Central Valley RWQCB's Irrigated Lands Regulatory Program (CVRWQCB 2015b). The receiving water quality monitoring program collects water samples at 35 stream sites to study potential water quality effects of agricultural activities, including sites in the lower Cosumnes River, the second Laguna Creek (tributary to Cosumnes River), and Dry Creek in the south part of the Planning Area (Figure 7-2). The Sacramento Valley Water Quality Coalition's monitoring program collects samples quarterly, or monthly during the primary agricultural growing season, and includes periodic monitoring of wet weather conditions at all 35 stream sites. Samples are evaluated for water column and sediment toxicity; physical and conventional parameters in water and sediment; organic carbon, pathogen indicator bacteria, nutrients, and trace metals in water; and pesticides in water and sediment.

Based on Sacramento Valley Water Quality Coalition's monitoring data collected from 2005 through 2013, there are no major water quality problems associated with agricultural discharges or managed wetlands discharges in the Sacramento River Basin (Larry Walker Associates 2015). The majority of observed concentrations that are elevated relative to a water quality objective have been with conventional non-toxic constituents of concern (i.e., conductivity, temperature, dissolved oxygen, E. coli, pH, and nutrients [total ammonia and nitrate]). The monitoring data also indicate that in many of these instances, the observed exceedances may be substantially affected by natural processes and sources in the area (e.g., hydrology, temperature, algae growth) rather than agricultural activity. Concentrations are less frequently elevated for constituents such as copper (or other metals), pesticides, aquatic toxicity, and sediment toxicity when observed. In the 2013/2014 annual data, analysis of 56 receiving water sample sites for pesticides (i.e., organophosphate, carbamate, organochlorine, benzophenyl, and pyrethroid) and a variety of herbicides resulted in detection of 14 different compounds (Larry Walker Associates 2015). Approximately 70% of the samples had no detections of pesticides, and 98% of all pesticide tests were below analytical detection limits. Exceedances of objectives for three registered pesticides (chlorpyrifos, diazinon, and malathion) and DDT (or a DDT breakdown product) was observed in six Sacramento Valley Water Quality Coalition monitoring samples. Statistically significant toxicity was not observed in any of the 330 water column samples evaluated from 17 sample sites in 2013/2014. However, sediment toxicity was observed in five samples from three sample sites based on the 10-day percent survival toxicity test for Hyallela species. Only two of the sediment samples exhibited statistically significant toxicity above the threshold established for the program (i.e., ≥20%

reduction compared to the control), and follow-on testing indicated the pyrethroid pesticide bifenthrin as likely contributing to the observed sediment toxicity.

The Sacramento Valley Water Quality Coalition also evaluates long-term trends that may indicate long-term water quality degradation. Based on an assessment of 624 sample site-parameter combinations, a total of 31 results (i.e., approximately 5% of the beginning number of evaluations) were determined to have significant trends suggesting potential for long-term degradation to be occurring. Most of the significant trends were for physical parameters (i.e., conductivity, dissolved oxygen, pH, temperature, total organic carbon, and total suspended solids). Some of the parameters with trends (i.e., higher conductivity and pH, and lower dissolved oxygen) corresponded to dry year types with lower streamflow and higher temperatures, indicating that the conditions are likely affected primarily by background weather and hydrology rather than agricultural activity.

Contaminants contributed from agricultural activity and runoff in the Planning Area (e.g., pesticides, suspended sediment, pathogens, and nutrients) can affect surface water and groundwater quality. As noted in Table 7-2, numerous streams in the Planning Area and the Delta are listed as impaired by several constituents originating from urban or agricultural runoff sources.

Municipal Wastewater

As discussed in Section 7.1.1.1, municipal wastewater discharges are regulated by the Central Valley RWQCB through the NPDES permit program to ensure that the discharges comply with applicable surface water quality standards designed to protect aquatic life, municipal water supply, and other beneficial uses. Relative to background river concentrations, municipal wastewater discharges may contain elevated levels of salinity, organic matter, trace metals, synthetic organic compounds, human pathogens, and unregulated or emerging constituents of concern (e.g., pharmaceuticals, personal care products, and endocrine-disrupting compounds).

The large majority of municipal and industrial wastewater generated in Planning Area is generated in the UDA, and is collected and conveyed westward through sanitary sewer systems to the Sacramento Regional Wastewater Treatment Plant operated by Regional San. The Sacramento Regional Wastewater Treatment Plant provides wastewater collection and treatment for 1.4 million people inside and outside the Planning Area, including people in the cities of Sacramento, West Sacramento, Rancho Cordova, Citrus Heights, Elk Grove, and Folsom; unincorporated areas of Sacramento County; and the communities of Courtland and Walnut Grove. The Sacramento Regional Wastewater Treatment Plant currently treats approximately 141 mgd of inflow and produces secondary treated effluent, which is discharged to the Sacramento River near the town of Freeport. As a result of permit requirements adopted by the Central Valley RWQCB in 2010 and subsequent amendments, the Regional San is currently

constructing treatment process improvements at the Sacramento Regional Wastewater Treatment Plant, including additional nutrient removal (i.e., ammonia and nitrate reduction) and tertiary filtration on a seasonal basis during the dry season to increase pathogen removal (Ascent Environmental Inc. 2014). Construction of facility improvements at the Sacramento Regional Wastewater Treatment Plant is scheduled to be completed in 2023.

Galt also owns and operates a wastewater treatment plant in the Planning Area. Galt's wastewater treatment plant complies with the Central Valley RWQCB's regulations concerning the operation of the City's wastewater treatment plant. The Galt wastewater treatment plant currently produces about 2.3 mgd of tertiary treated effluent per day, and it discharges that treated effluent to the Laguna Creek that is a tributary to the lower Cosumnes River (Figure 7-3).

Urban development in the Planning Area contributes to wastewater discharge from Galt and the Sacramento Regional Wastewater Treatment Plant that affects the downstream Sacramento River and the Delta water quality conditions. Additionally, Delta water quality is affected by the municipal water demands in the Planning Area that are served by Water Forum Agreement purveyors with surface water from the American River basin. Use of American River basin surface water, along with other water diversions from Central Valley rivers and the Delta, contribute to reduced flows in the Lower American River flow, lower Sacramento River, and Delta inflow. Existing Delta water quality conditions assessed in operations modeling for the California WaterFix EIR/EIS (USBR and DWR 2015) indicate that the western Delta in particular is affected by elevated salinity levels that adversely affect municipal and agricultural water supplies. The California WaterFix EIR/EIS also indicates that existing Delta water quality conditions are adversely affected by mercury, dissolved organic carbon, dissolved oxygen, selenium, and Microcystis algae.

7.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

7.2.1 Methodology for Assessing Impacts of Each Alternative on Hydrology and Water Quality

The Environmental Consequences/Environmental Impact section identifies the potential impacts of the actions and projects associated with each EIS/EIR alternative on the groundwater hydrology, surface water hydrology, and the water quality of surface waters and groundwater in the Planning Area. The Chapter 7 analysis for each EIS/EIR alternatives relies on existing planning documents that have projected regional water demand.

Potential ways that the EIS/EIR alternatives could impact surface waters and groundwater hydrology and water quality include direct and indirect impacts from construction and

operations related to new urban development in the UDA, and the related transportation projects and other infrastructure projects outside the UDA that are expected to occur under each EIS/EIR alternative.

The future projects and activities expected under each EIS/EIR alternative are described in Chapter 2, Alternatives, Including the Proposed Action/Proposed Project. As discussed in Section 3.6.5, GIS Methodology Used in Chapters 4–16 to Estimate Direct Impacts of Each EIS/EIR Alternative, the EIS/EIR impact methodology uses geographic information system (GIS) datasets that were prepared using the best available information about the amounts and locations of ground disturbance from the future projects and activities expected under each alternative.

As discussed in Section 3.4 and in Section 7.1.1.3, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Sacramento County 2010; Galt 2009; Rancho Cordova 2006a) analyzed direct and cumulative impacts of urban growth planned within their jurisdictions, including impacts to surface waters and groundwater hydrology and water quality. When the impact analysis or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief summary or description of the incorporated information or analysis is provided in Sections 7.2.2, 7.2.3, and 7.2.4.

However, as discussed in Section 3.4, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2008), in 2050 (Rancho Cordova 2006a), and 2030 (Sacramento County 2010), and the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3, EIS/EIR Study Period). As discussed in Section 3.4, the EIRs for Rancho Cordova General Plan and the Galt General Plan analyzed full buildout of those jurisdictions. However, additional urban development can be expected to occur within Sacramento County during the 35 years after the General Plan EIR study period ended, and before this EIS/EIR's study period ends in 2065. Consequently, the impact analyses and conclusions incorporated from the Sacramento County General Plan EIR may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative presented in Chapter 2. Therefore, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the three General Plan EIRs, along with the effects of all urban development activities and projects that are included in the description of each EIS/EIR alternative.

In addition to analysis and conclusions incorporated by reference from the three General Plan EIRs, relevant information and analysis of operations-related hydrologic effects and water quality effects of existing water and wastewater infrastructure projects in the Planning Area were incorporated into the analysis of the EIS/EIR alternatives from these final EIRs: *The Water Forum Proposal EIR* (Sacramento City-County Office of Metropolitan Water Planning 1999), *The 2002 Zone 40 Water Supply Master Plan EIR* (SCWA 2004), and *The Sacramento Regional County*

Sanitation District EchoWater Project EIR (Ascent Environmental Inc. 2014). In accordance with NEPA regulation 43 CFR 46.135(b), where a prior analysis is incorporated, the source document, including pertinent page numbers, is cited and the analysis is briefly described.

As discussed in Section 3.6.2, Geographic Study Area of Resource Topics Analyzed in Chapters 4 Through 16, it is appropriate to consider impacts to some environmental resources within the context of other impacts occurring to the resource within the surrounding landscape, community, or region. The General Plan EIRs and the three EIRs prepared for existing water and wastewater infrastructure projects in the Sacramento County region, by necessity, also addressed effects that would occur over a spatial area that extends beyond the Planning Area boundary. These local and regional hydrology and water quality effects are applicable to the cumulative impact analysis of each EIS/EIR alternative within the Planning Area because the local and regional changes to hydrology and water quality will occur as a result of the shared water resources and water/wastewater infrastructure among the municipal agencies in the urbanized areas of Sacramento County and western Placer and El Dorado Counties. In addition, the existing stormwater drainage and flood control facilities (i.e., levees, pump stations) discussed in Section 7.1.2.3 were developed based on watershed, level of development, watershed size, history, and trends in problem conditions. Several of the HUC 10 watershed boundaries discussed in Section 7.1.2 extend beyond the EIS/EIR Planning Area boundary (Figure 7-2). Consequently, the analysis of cumulative impacts to hydrology and water quality extends beyond the Planning Area. Accordingly, the lead agencies determined that an appropriate geographic scale for evaluating the impacts of each EIS/EIR alternative on surface water and water quality should include the Planning Area, the area of each HUC 10 watershed discussed in Section 7.1.2, the area of Sacramento County located outside the Planning Area, and the western portions of Placer and El Dorado Counties.

As discussed in Section 3.7, Cumulative Effects Analysis in Resource Chapters 4 through 16, the Chapter 7 cumulative analyses of impacts to surface waters and groundwater hydrology and water quality will consider the effects of past and present urban development within in the Planning Area (see existing conditions in Section 6.1.2, Planning Area Agricultural Resources and Activities) and within the larger study area, as well as impacts expected from reasonably foreseeable “other” projects in the Planning Area (see Section 3.7) and foreseeable “other” projects within the larger study area. The cumulative analysis of each EIS/EIR alternative will then consider whether the incremental impacts of the alternative on surface waters and groundwater hydrology and water quality would be significant (i.e., would be cumulatively considerable). The reasonably foreseeable “other” projects within the larger study area include the proposed Bay Delta Conservation Plan/California WaterFix EIR/EIS (USBR and DWR 2015).

The current effects and expected future effects of climate change were also considered in the analysis of cumulative impacts, using information presented in the American River Basin Integrated Regional Water Management Plan (Regional Water Authority 2013).

7.2.1.1 Determination of Impact Significance

As discussed in Section 3.8.1, Significance Thresholds, the criteria used to evaluate the significance of impacts expected from each EIS/EIR alternative on hydrology and water quality are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines, and on typical thresholds used to evaluate hydrology and water quality impact in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse impact would occur if the alternative would:

1. Result in a violation of any water quality standard or waste discharge requirement;
2. Substantially deplete groundwater supplies or substantially interfere with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted);
3. Substantially alter the existing drainage pattern of an area, including through the modification of the course of a stream or river in a manner that would result in substantial erosion, siltation, and/or environmental harm;
4. Substantially alter the existing drainage pattern of an area and/or substantially increase the rate or amount of stormwater runoff in a manner that would result in flooding on- or off-site;
5. Create or contribute runoff which would exceed the capacity of existing or planned stormwater drainage systems.
6. Create or contribute to runoff water which would provide substantial additional sources of polluted runoff. Additional sources of polluted runoff or other degradation of water quality would be considered substantial if it is not in compliance with an applicable NPDES permit, or there is a net increase in any other pollution source of a CWA 303d impaired waterway;
7. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map, or other flood hazard delineation map;
8. Place structures within a 100-year flood hazard area that would impede or redirect flood flows;
9. Expose people or structures to a substantial risk of loss, injury or death involving flooding; or

Appendix G of the CEQA Guidelines does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial impact could occur if the alternative would:

1. Discernibly reduce the consumption of groundwater or discernibly increase the potential for groundwater infiltration/recharge;
2. Discernibly reduce changes in existing drainage pattern of an area, including reducing modification of the course of a stream or river that would discernibly reduce or avoid erosion, siltation, and/or environmental harm;
3. Discernibly reduce changes to existing drainage pattern of an area or discernibly reduce the rate of stormwater runoff to avoid flooding on or off site;
4. Avoid or discernibly reduce runoff that would exceed the capacity of existing or planned stormwater drainage systems;
5. Avoid or discernibly reduce polluted runoff or discernibly Improve surface water quality; or
6. Discernibly improve groundwater quality.

The impact analysis for the three EIS/EIR alternatives will consider the context, intensity, and severity of potential impacts to each of these hydrology and water quality impact-criteria, and will present separate determinations of significance addressing each of these criteria.

7.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2, No Action/No Project Alternative.

7.2.2.1 Groundwater Hydrology Effects of the No Action/No Project Alternative

Direct and Indirect Effects of the Alternative

As discussed in Section 2.2.3, Loss of Natural Lands Under the No Action/No Project Alternative, new urban development would occur on approximately 32,424 acres of existing natural land covers within the portion of UDA located north of the Cosumnes River as well as the portion of the UDA in the Galt sphere of influence (SOI). This planned urban development would increase impervious surfaces (e.g., buildings, roads, and parking lots) within the Upper Morrison Creek, Lower Morrison Creek, Elder Creek, Laguna Creek, and the Beaver Lake–Sacramento River HUC 12 watersheds in the north-central part of the Planning Area, and increase impervious surfaces in a portion of the Lower Cosumnes River and the Laguna watersheds in the south-central portion of the Planning Area.

This development and increase in impervious surfaces is expected to reduce the amount of rainfall infiltration through the soil relative to existing rainfall infiltration rates in those

watersheds, and would reduce the existing rate of groundwater recharge in the UDA portion of the Central Basin. Additionally, population growth from the approximately 32,424 acres of new development under the No Action Alternative would increase municipal and industrial water demands, and much of that demand may be met by groundwater.

The potential indirect adverse hydrologic effects of concern associated with reduced recharge and increased groundwater use include reduced long-term groundwater availability, increased depth of groundwater pumping and power consumption, reduced well yields and wells going dry, and land subsidence.

The remainder of this assessment analyzes the effects of the No Action/No Project Alternative on groundwater hydrology groundwater modeling studies in the Planning Area (which include effects of changes to impervious surfaces and groundwater supply uses) and the General Plan EIRs.

Groundwater is, and would continue to be, a primary water source used for municipal, industrial, and agricultural water supply in the Planning Area over the EIS/EIR study period (RMC Inc. 2014; Robertson-Bryan and WRIME 2011). Future groundwater hydrology will primarily be affected by future municipal and industrial uses because agricultural land uses are not expected to increase.

Within the northern portion of the UDA (the portion of the UDA that is within the Urban Services Boundary of Sacramento County) (Figure 1-1), most of the future planned urban development included in the No Action/No Project Alternative is within Sacramento County's Zone 40 water supply system service area, with smaller areas of the UDA lying within water service areas of Sacramento, Golden State Water Company, and California American Water Company. The *2002 Zone 40 Water Supply Master Plan* (SCWA and MWH 2005) plans future water supply facilities for about 47,000 acres of the 86,000-acre Zone 40 service area, which is the area within the Planning Area, with the majority of future planned urban development. Groundwater modeling conducted for the Zone 40 Water Supply Master Plan (and more recent modeling for water resource management and planning in the Central Basin [RMC Inc. 2014]), along with groundwater modeling for the South Basin (Robertson-Bryan and WRIME 2011), provide the best available information for describing the effects of the future No Action/No Project Alternative on future groundwater hydrologic conditions in the Planning Area.

The Zone 40 system is designed for conjunctive use of both surface water and groundwater, with maximum surface water use and minimal use of groundwater during wet years, which allows groundwater table in the aquifer to recover. During drier years when surface water is insufficient for municipal and industrial water demands, groundwater is used to a greater extent.

Groundwater modeling results for Zone 40 indicate that for the future 2030 condition, average groundwater levels in the northern region of the Zone 40 area would decrease and eventually stabilize at lower levels (compared to the 2000 baseline conditions) as a result of increased municipal groundwater uses, and the existing groundwater extraction, treatment, and discharge operations at the Aerojet, Mather AFB, and Boeing Superfund sites in Zone 40 (SCWA 2004). However, the existing groundwater cone of depression near Elk Grove would diminish by 2030, with groundwater levels modeled to rise by about 10 feet compared to the 2000 baseline conditions. The groundwater modeling for Zone 40 considered municipal and agricultural water demands for the entire Central Basin (Figure 7-1), which are projected to increase to about 450,000 AFY by 2030 compared to a baseline demand of about 375,000 AFY in 2000 (SCWA 2004; MWH et al. 2006).

In the South Basin (Figure 7-1), new urban development in Galt is projected to result in increased groundwater use up to 9,900 AFY in 2030 compared to the current use of approximately 5,900 AFY (Carollo Engineers 2013). As discussed in Section 7.1.2.1, the portion of the Planning Area within the South Basin is dominated by rural agricultural lands, where the future groundwater demand and supply balance is expected to remain similar to existing conditions. However, the South Basin is expected to have an increase in the acreage of vineyards that will be irrigated with drip irrigation systems, which is expected to reduce groundwater use compared to most other types of irrigated agriculture (Robertson-Bryan Inc. and WRIME 2011). Groundwater modeling indicates that current groundwater use in the South Basin is currently approximately 114,800 AFY and will decrease by an estimated 1,200 AFY in the future and remain consistent with the South Basin sustainable groundwater yield target established in the Water Forum Agreement (Robertson-Bryan Inc. and WRIME 2011). The current groundwater levels in the cone of depression near Galt are expected to remain similar to the baseline 1996 groundwater levels existing at the time of the *Water Forum Proposal EIR* (Robertson-Bryan Inc. and WRIME 2011).

The effects of future planned urban development on the existing groundwater conditions within the Planning Area were also evaluated in the Sacramento County and Galt General Plan EIRs (Sacramento County 2011; Galt 2009) based on the modeling results presented above; however, no groundwater hydrology impacts were identified for Rancho Cordova's General Plan. The relevant impact analysis and conclusions are summarized below and incorporated by reference:

- Significant and unavoidable groundwater hydrology impacts could occur in the Central Basin due to additional urban development planned for the Jackson Highway Corridor New Growth Area, from the planned Grant Line East New Growth Area, and from the

planned Easton New Growth Area (Sacramento County 2010, p. 6-53, Chapter 65, Water Supply). The effects of the water demands to groundwater will be assessed prior to approval of those projects pursuant to Senate Bill 610 and Senate Bill 221, which require a determination that the groundwater is reasonably available to meet demand. The analysis will be included in the CEQA document for the development projects and considered prior to approval of the development. The future water demands and impervious surfaces of these development areas were not considered in the 2002 Zone 40 Water Supply Master Plan or associated groundwater modeling.

- Significant and unavoidable groundwater hydrology impacts could occur in the South Basin due to long-term use of groundwater to meet municipal water demands, and reduced groundwater recharge, that would result in a net deficit in the existing aquifer volume or a lowering of the existing local groundwater levels (Galt 2008, p. 8-3, Chapter 8, Natural Resources).

As discussed in Section 7.2.1, additional urban development can be expected to occur within Sacramento County during the 35 years after the end of the Sacramento County General Plan EIR study period in 2050, and before the end of this EIS/EIR's study period in 2065 (see Section 3.6.3). Therefore, impacts of the No Action/No Project Alternative on existing groundwater conditions would be nearly identical to the significant and unavoidable impacts to groundwater hydrology identified in the General Plan EIRs (Sacramento County 2011; Galt 2009) at 2050. The lead agencies anticipate that the No Action/No Project Alternative impacts to groundwater from additional urban development after 2030 would be similar in nature but potentially greater due to additional population and increased municipal water demand. Therefore, the additional impacts of the No Action/No Project Alternative would further contribute to the significant and unavoidable impacts identified in the General Plan EIRs.

In addition, as discussed in Section 2.2.2, up to approximately 1,900 acres of planned urban development could be shifted or displaced to one or more locations outside the current Sacramento County Urban Service Boundary (USB) boundary under the No Action/No Project Alternative. This change in location of impervious surfaces and municipal groundwater use that would occur from the displaced development also was not considered in the groundwater modeling used in the Sacramento County General Plan EIR. However, the total municipal and agricultural water demand expected in the Planning Area would not change because of the displaced development. The displaced development may result in slightly more future

[5] The Sacramento County General Plan EIR analyzed development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by Sacramento County. However, Sacramento County is currently processing Master Plans in the Jackson Highway Corridor, so the incorporated analysis and conclusions are relevant to the No Action/No Project Alternative.

groundwater use in the South Basin and slightly less groundwater use in the Central Basin. However, the 1,900 acres of displaced development is a relatively small area compared to the total size of the Planning Area. Therefore, the displacement of 1,900 acres of planned development to locations adjacent to the current Sacramento County USB boundary would not be expected to substantially change the conclusions presented in the General Plan EIRs. In addition, as discussed in Section 2.2.1, the South Sacramento County Agriculture and Habitat Lands Recycled Water Project (Regional Sanitation 2015) is also assumed to proceed under the No Action/No Project Alternative. This project would increase agriculture use of recycled water by approximately 50,000 AFY in the southwestern portion of the Planning Area outside the UDA, which is expected to reduce agricultural groundwater-pumping in that portion of the Central Basin by a similar amount (RMC Inc. 2015) (Figure 7-1). However, the Regional Water Authority's climate change modeling (Regional Water Authority 2013) used in the General Plan EIRs did not include the reduced groundwater pumping expected under this recycled water program. Therefore, the potential beneficial effects of the Recycled Water Project element of the No Action/No Project Alternative on the projected Central Basin groundwater levels, including the cone of groundwater depression located west of Elk Grove, are uncertain.

Establishment of preserves to mitigate development projects impacts under the Endangered Species Act (ESA), California Endangered Species Act (CESA), or CWA Section 404 would not be expected to directly or indirectly result in adverse changes to groundwater hydrologic conditions because groundwater use would not increase. In addition, the existing rainwater infiltration and associated groundwater recharge occurring at preserved lands would likely continue on those lands in perpetuity.

No Action/No Project Cumulative Effects on Groundwater Hydrology

As discussed in Section 3.7.1, Past and Present Actions in the Planning Area, past and present urban development, municipal use of groundwater, and irrigated agricultural uses of groundwater, have adversely impacted groundwater recharge and groundwater tables in the study area. These past and present alterations have resulted in the groundwater existing conditions described in Section 7.1.2.1. The past and present extensive use of municipal and agricultural water remain within the designated sustainable yields for the Central Basin and South Basin established by the Water Forum Agreement and the South Basin Groundwater Management Plan, which allows relatively lower groundwater levels compared to historical conditions, and existence of groundwater cones of depression. The types of future reasonably foreseeable "other" projects, activities, and actions, described in Section 3.7.2, Reasonably Foreseeable Other Actions, are similar to the types of past and present actions that occurred in the study area. The other reasonably foreseeable future actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in the Elk Grove SOI and in Rancho

Murieta, development of the Wilton Rancheria Casino, master planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued urban development of cultivated agricultural lands, major infrastructure projects such as California High-Speed Rail and the California WaterFix, and expansion of the existing National Wild Refuge and the Cosumnes River Preserve (see Section 3.7.2 for details of these projects). The water demands of these foreseeable other projects were generally included in the analysis of cumulative groundwater hydrology impacts incorporated from the General Plan EIRs. Hydrologic modeling of the entire Sacramento County region was conducted by the Regional Water Authority to evaluate future 2030 land uses anticipated to occur under the three General Plans, projected 2030 urban and agricultural water demands, and estimated effects of future climate change (Regional Water Authority 2013). The modeling assumes that groundwater would be used to make up the shortfall, which would occur primarily to meet agricultural demands, resulting in average groundwater level reductions by up to about 20 feet in agricultural areas. Groundwater would be sufficient to meet future water demands in normal water years based on the water rights and contracts of all water purveyors. However, future water shortages in single and multiple dry-year scenarios could be a concern for long-term groundwater availability. Consequently, the combination of past, present, and reasonably foreseeable future projects could result in groundwater use that may lead to significant cumulative effects to exceedance of the sustainable yields of the groundwater basins, groundwater level reductions affecting increased pumping energy use, occurrence of dry wells, or land subsidence.

The groundwater basins underlying the Planning Area are large and defined by the major hydrologic barriers of the American River to the north of the Central Basin, the Sacramento River to the west of the Central Basin, Dry Creek to the south of the South Basin, and the upgradient and bedrock formations of the Sierra Nevada Mountains to the east of these basins (Figure 7-1). Therefore, the existing/cumulative groundwater hydrology conditions in the Planning Area are generally localized to effects within these basins.

As discussed previously, the direct and indirect impacts of No Action/No Project Alternative would adversely affect existing groundwater conditions. However, the effects of future urban development/agricultural water demand in the Planning Area have been considered in the groundwater modeling studies of the Central and South Groundwater Basins. Therefore, the incremental contribution of the No Action/No Project Alternative effects would be significant and cumulatively considerable, when viewed in connection with the cumulative effects of the past projects, current projects, and probable other projects on the groundwater hydrology of the study area. The No Action/No Project Alternative's incremental effects are determined to be significant and cumulatively considerable, when viewed in connection with the significant cumulative impact of the past, present, and foreseeable other projects in the study area.

7.2.2.2 Surface Water Hydrology and Flooding Effects of the No Action/ No Project Alternative

Direct and Indirect Effects of the No Action/No Project Alternative

This impact analysis addresses the direct and indirect effects to surface hydrology, stormwater runoff, and flooding under the No Action/No Project Alternative. New urban development in the Planning Area would increase the amount of impervious surfaces in the UDA, and thus reduce the amount of rainfall infiltration into the soil, resulting in the potential for increased stormwater runoff, and in hydrologic changes to downstream or receiving waters.

Urban development stormwater facilities must be designed consistent with Sacramento County, Rancho Cordova, or Galt requirements (see Section 7.1.1) to include sufficient capacity. New development projects and activities under the No Action/No Project Alternative will not exceed the capacity of existing or planned urban stormwater drainage systems.

Designs for new master plan or specific plan developments would continue to include significant grading to moderate topographic changes in order to create level building areas, proper drainage, and adequate line of site for roads, which will continue to alter existing localized drainage conditions inside the UDA. New development projects and activities under the No Action/No Project Alternative would continue to include detention basins; underground drainage infrastructure; culverts and bridges in waterways; modifications of stream channels; construction of new drainage channels; and, often, encroachments into, or losses of, wetlands and other waters, riparian areas, and floodplains.

Detention basins with properly sized outlet pipes will be required to provide flood control and to slow discharges to receiving waters such that the receiving waters maintain the same flow rates within the tributaries as the pre-project condition flow rates. Therefore, the additional impervious surface area associated with build out of the UDA under the No Action/ No Project Alternative would not necessarily result in increased flooding or changes to the existing hydrology in UDA streams.

Under the No Action/No Project Alternative, setbacks between new urban development and the banks of a stream or other natural waterway will not be required in most Planning Area land use zones (see Chapter 4, Land Use), provided there is no existing flood hazard. At the most, only minor setbacks between new development and streambanks would be required by local jurisdictions during the land use planning processes of future development projects and activities within the Planning Area. Many of the remaining natural sections of streams and waterways in the UDA (Section 7.1.2.3) will be physically modified to remain a relatively narrow and stable corridor. Once stabilized, these streams and waterways will no longer meander over

time, reducing or eliminating many fluvial ecosystem processes currently present in these waterway sections.

Most remaining natural waterways within the UDA would become surrounded by urban activities under the No Action/No Project Alternative. During the local land use planning process, recreational land uses such as trails, parks, and golf courses stream corridors may be incorporated into these stream corridors. Most stream corridors would be narrow strips of open space with no required setbacks from buildings or streets.

Many natural waterways in the UDA may become armored with concrete or rock protection to prevent channel downcutting and bank erosion. Other natural waterways channels may be left in a natural state. The installation of erosion control would typically include removal of vegetation. Therefore, adverse impacts to the natural hydrologic and ecosystem functions of UDA streams may occur even in cases where the natural stream channel was originally avoided. In addition, newly urbanized stream channels and stream corridors would not be managed to prevent adverse impacts to the stream from encroaching human activity. Without adequate setbacks, adverse impacts to the natural hydrologic function of streams are expected to occur within the UDA under the No Action/No Project Alternative.

The effects on surface hydrology, stormwater runoff, and flooding from planned urban development within Sacramento County, Galt, and Rancho Cordova were evaluated in the analysis of the General Plan EIRs discussed in Section 3.4 and Section 7.2.1 (Sacramento County 2011; Galt 2009; Rancho Cordova 2006b). As discussed in Section 7.2.1, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative:

- The planned urban development described in the Sacramento County General Plan through the year 2030 would be implemented in compliance with Sacramento County's Floodplain Management Ordinance, Improvement Standards, and General Plan policies. Therefore, planned development would not substantially increase the existing rate or amount of surface runoff in a manner that would cause flooding or exceed stormwater system capacity, thus resulting in a less-than-significant impact (Sacramento County 2010, p. 7-25, Chapter 7, Hydrology and Water Quality).
- Planned urban development would be implemented in compliance with Sacramento County's Floodplain Management Ordinance, Improvement Standards, and Sacramento County General Plan policies would ensure that no residences are placed within a flood hazard area, and that people or structures would not be exposed to a significant risk involving flooding, thus resulting in a less than significant impact (Sacramento County 2010, p. 7-45, Chapter 7, Hydrology and Water Quality).

- The Galt General Plan EIR determined that housing construction within a 100-year flood hazard area, or other structures that could impede or redirect flood flows, is a less-than-significant impact. Galt, in accordance with its policies, would preserve floodplain areas, limit development in hazardous areas, and implement a Storm Drainage Master Plan and a Pavement Management Plan to ensure that adequate levels of stormwater drainage infrastructure are provided (Galt 2008, p. 6-27, Chapter 6, Public Facilities).
- The exposure of people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam, is a less-than-significant impact in the Galt General Plan EIR (Galt 2008, p. 6-28, Chapter 6, Public Facilities).
- The Rancho Cordova General Plan contains policies and action items that adequately address stormwater drainage and flooding issues from planned new urban development. Therefore, the increased impervious surfaces, altered drainage conditions, and altered stormwater runoff rates (which could result in flooding effects) of planned urban development, would result in a less-than-significant impact (Rancho Cordova 2006a, p. 4.9-41, Chapter 4.9, Hydrology and Water Quality).

As discussed in Section 3.4 and in Section 7.2.1, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009), in 2050 (Rancho Cordova 2006a), and 2030 (Sacramento County 2010)—and the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). The Galt and Rancho Cordova General Plan EIRs analyzed buildout of their jurisdictions. However, additional urban development would occur within Sacramento County after the 2030 end of the General Plan EIR study period, until the expected buildout of the UDA at end of this EIS/EIR's study period in 2065. Consequently, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of the additional urban development activities and projects included in the description of each EIS/EIR alternative. The lead agencies extrapolated that the impacts of the additional urban development in the latter part of the 50-year EIS/EIR study period, including potential increases to stormwater runoff, stream and drainage channel modifications, or additional encroachment in floodplains, would be similar to the impacts of urban development implemented in the early part of the EIS/EIR study period, which was analyzed in the General Plan EIRs. Because existing regulations related to flood control and stormwater management (see Section 7.1.1) would continue over the 50-year EIS/EIR study period of the No Action/No Project Alternative, the impacts of new urban development constructed in the latter part of the EIS/EIR study period would also result in ***Less Than Significant Adverse*** effects to stormwater runoff, stormwater system capacity, flooding, flood hazards, flood flows, drainage, and stream channels, as was identified in the General Plan EIRs for new development implemented in the early part of the EIS/EIR study period. Structures and the human environment would not be

exposed to undue risk of flooding; natural watersheds and streams would continue to be modified within the UDA to fit within designated areas of communities.

Additionally, as described in Section 2.2.2, up to approximately 1,900 acres of planned urban development could be shifted or displaced from inside the MCRA to one or more locations outside the current Sacramento County USB boundary under the No Action/No Project Alternative. This displacement of new urban development would also shift the location of impervious surfaces outside the current USB boundary. Consequently, stormwater runoff-related effects within the MCRA boundary could be reduced compared to the effects described in the General Plan EIRs. However, the impervious surfaces constructed in the areas of displaced development would be expected to result in similar effects to stormwater runoff, and similar changes to stormwater drainage infrastructure as described in the General Plan EIRs, and would not substantially change the types or severity of hydrology, stormwater runoff, or flooding effects identified and analyzed in the three General Plan EIRs (see bullets above). The displaced urban development assumed in the No Action/No Project Alternative would contribute to, but would not substantially change, the ***Less Than Significant Adverse*** effects on surface hydrology, stormwater runoff, and flooding identified in the three General Plan EIRs.

Establishment of preserves under the No Action/No Project Alternative to mitigate development project-impacts under ESA, CESA, or CWA Section 404 would not be expected to directly or indirectly result in adverse changes to surface hydrology, stormwater runoff, or flooding conditions because the amount of any increase in impervious surfaces, or alteration of surface drainage features or stormwater runoff conditions, would likely be minimal at any one site.

No Action/No Project Cumulative Effects on Surface Water Hydrology and Flooding

As discussed in Section 3.7.1 and in Section 7.1.2, past and present urban development projects and activities have constructed impervious surfaces, re-aligned channels, and constructed other encroachments (e.g., bridges, culverts). These past and present alterations have resulted in the existing surface water hydrology conditions in the Planning Area (see Section 7.1.2). The effects of the past and present actions on surface water hydrology in the Planning Area were described in Section7.2.2.2 and represent a significant adverse impact on the surface water hydrologic conditions within the study area.

The types of future reasonably foreseeable “other” projects, activities and actions, described in Section 3.7.2, are similar to the types of past and present actions that have occurred in the study area. The other reasonably foreseeable future actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in the Elk Grove SOI and in Rancho Murieta, development of the Wilton Rancheria Casino, master planned developments inside the UDA named Rio Del Oro

and Mather South, further rural residential development outside the UDA, continued urban development of cultivated agricultural lands, major infrastructure projects such as California High-Speed Rail and the California WaterFix, and expansion of the existing National Wild Refuge and the Cosumnes River Preserve (see Section 3.7.2 for details of these projects). These reasonably foreseeable other projects have potential to effect existing surface hydrology, stormwater runoff, and flooding conditions. Additionally, predictions for future climate change include increased winter rainfall intensity in the Planning Area and increased Sierra Mountain areas exposed to rain rather than snow, which may result in increased downstream flood flows and frequency of flood volumes. However, as described in Section 7.1.1.3, the General Plans contain policies and implementation programs that require new urban development to adequately address stormwater runoff and flooding issues, considering both current and future hydrologic conditions and current and future infrastructure conditions.

Projects and activities included in the No Action/No Project Alternative (see Section 2.2.1, Future Projects/Activities Likely Under the No Action/No Project Alternative) with potential to affect surface hydrologic conditions are conversion of agricultural and undeveloped lands to new urban development. As described above and in Section 7.1.1, new urban development projects under the No Action/No Project Alternative would be required to adequately address stormwater runoff and flooding issues. Therefore, when the incremental effects of the No Action/No Project Alternative are viewed in connection with the effects of the past, present, and reasonably foreseeable future other actions, the No Action/No Project Alternative would not cause, or make a considerable contribution to, the significant cumulative impact on surface hydrology, stormwater runoff, or flooding conditions of the study area. The No Action/No Project Alternative would result in a ***Less Than Significant Adverse Cumulative*** effect on groundwater hydrology.

7.2.2.3 Surface Water Quality and Groundwater Quality Effects of the No Action/No Project Alternative

Direct and Indirect Effects of the No Action/No Project Alternative

This section describes the expected indirect effects on surface water quality and groundwater quality under the No Action/No Project Alternative as discussed in Section 2.2.1. The planned urban development under the No Action/No Project Alternative includes construction activities with potential to result in temporary discharges to surface water or impacts to groundwater quality in the Planning Area. Urban development construction activities typically involve vegetation removal, grubbing and grading, excavation, and a variety of other construction activities that may result in exposure of disturbed sites to rainfall and stormwater runoff events. If not conducted with appropriate stormwater quality control measures, construction activities can result in soil erosion and/or runoff of contaminants such as suspended sediment,

petroleum hydrocarbons, and other construction materials (e.g., concrete, paints, and coatings) to off-site or downstream areas. Other contaminants discharged in construction site runoff may include toxic organic compounds in petroleum products and trace metals (e.g., copper, zinc).

Potential indirect water quality effects of new urban development and infrastructure after construction is completed could include increased urban stormwater runoff into receiving waters, increased municipal wastewater discharges from the Sacramento Regional Wastewater Treatment Plant to the Sacramento River, and increased municipal wastewater from Galt discharged into the Cosumnes River. Inside the UDA, planned urban development has potential to increase stormwater runoff that discharges of stormwater contaminants that may adversely affect surface water and groundwater quality. Urban stormwater runoff often includes contaminants such as potentially toxic compounds (e.g., petroleum hydrocarbons, household pesticides, and trace metals [copper]), oxygen-demanding substances, nutrients, pet wastes, and trash, which would adversely water quality of Planning Area receiving waters, primarily in the UDA where new urban development will occur. The effects of the future planned urban development and infrastructure on surface water and groundwater quality were evaluated in the three General Plan EIRs (Galt 2009; Rancho Cordova 2006b; and Sacramento County 2011). The relevant conclusions from each of these EIRs are summarized below:

- The future development impacts on urban runoff and impacts from new sources of pollutants is a less than significant impact because compliance with Sacramento County Stormwater Ordinance, implementation of low-impact development (LID) standards, and construction runoff control measures would ensure that new development would not alter the course of local waterways in a manner that results in substantial erosion or sedimentation or result in substantial new sources of pollutants in urban runoff (Sacramento County 2010, p. 7-56, Chapter 7, Hydrology and Water Quality).
- The potential for municipal water supply groundwater pumping to result in migration of contaminants from the lower aquifers, or migration of the contaminant plumes at the groundwater cleanup sites in Sacramento County, is a less than significant impact. Compliance with Title 22 drinking water quality requirements by water purveyors would ensure that any extracted groundwater for distribution is treated to the appropriate standard (Sacramento County 2010, p. 6-71, Chapter 6, Water Supply).
- The impacts of new urban development on changes in the volume of stormwater runoff or to cause increases in stream bank and channel erosion is a less than significant impact because Galt General Plan policies, programs, and mitigation measures will be implemented (Galt 2008, p. 6-22, Chapter 6, Public Facilities and Services). Galt's mitigation for any unavoidable impacts includes monitoring and enforcement provisions to control nonpoint and point source water pollution requirements of the NPDES

Municipal Stormwater Permit, as well as continued implementation of its Stormwater Management Plan in coordination with the Stormwater Quality Partnership agencies.

- The new urban development has potential to result in increased levels of contaminants in stormwater runoff from the postconstruction activities, cause impairment of the beneficial uses of receiving waters or areas that provide water quality benefit, or cause substantial harm to the biological integrity of the waterways by the discharge of stormwater is a less than significant impact with implementation of Galt's General Plan policies, programs, and mitigation measures described in the bullet above (Galt 2008, p. 6-26, Chapter 6, Public Facilities).
- The urban development to result in increased discharge of stormwater from material storage areas, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas is a less than significant impact with implementation of Galt's General Plan policies, programs, and mitigation measures described above in the first bullet (Galt 2008, p. 6-29, Chapter 6, Public Facilities).
- The potential for urban development to result in the discharge of polluted runoff that could cause harm to the biological integrity of waterways, exceed water quality standards, or otherwise substantially degrade surface water quality is a less than significant impact with implementation of Rancho Cordova's General Plan policies, programs, and mitigation measures (Rancho Cordova 2006a, p. 4.9-34, Chapter 4.9, Hydrology and Water Quality). In addition to the General Plan policies that generally address land use requirements and prevention/treatment provisions for stormwater and groundwater contamination, Rancho Cordova adopted mitigation measures to (a) continue coordination and implementation of the 2009 SQIP for the NPDES Municipal Stormwater Permit, and (b) require future land uses that utilize hazardous materials or generate hazardous wastes to provide adequate containment facilities to ensure that surface water and groundwater resources are protected.
- The potential for urban development to result in the degradation of groundwater quality is a less than significant impact with implementation of Rancho Cordova's General Plan policies, programs, and mitigation measures (Rancho Cordova 2006a, p. 4.9-39, Chapter 4.9, Hydrology and Water Quality). In addition to the General Plan policies that generally address measures to prevent groundwater contamination and require cleanup actions, Rancho Cordova's mitigation measure requires development project proponents to determine whether urbanization of these areas would adversely affect the Aerojet/Mather AFB groundwater remediation activities prior to Rancho Cordova's approval of large-scale development.

As discussed in Section 3.4 and Section 7.2.1, the Galt and Rancho Cordova General Plan EIRs analyzed buildout of their jurisdictions. However, additional urban development would occur within Sacramento County during the 35-year period after the end of the General Plan EIR study period (2030) and the buildout of the UDA expected at end of this EIS/EIR's study period in 2065. Consequently, the lead agencies considered the impact analysis and conclusions incorporated by reference from the General Plan EIRs, along with the effects of the additional urban development activities and projects included in the description of the No Action/No Project Alternative. The lead agencies extrapolated that the impacts of the additional urban development in the latter part of the 50-year EIS/EIR study period, including potential increases to nonpoint and point source waste discharges, and stormwater runoff effects would be similar to the impacts of urban development implemented in the early part of the EIS/EIR study period, which was analyzed in the General Plan EIRs. However, because existing regulations related to surface water quality and groundwater quality—including local ordinance requirements in the General Plans (Section 7.1.1.3), the NPDES Municipal Stormwater Permit provisions to minimize and avoid contaminant discharges, and the Central Valley RWQCB regulations for development of appropriate municipal wastewater treatment and disposal (Sections 7.1.1.2 and 7.1.1.3)—would continue over the 50-year EIS/EIR study period, the impacts of new urban development constructed in the latter part of the EIS/EIR study period would continue to result in ***Less Than Significant Adverse*** effects on surface water quality and groundwater quality, as was identified in the General Plan EIRs.

Additionally, as described in Section 2.2.2, Expected Regulatory Environment Under the No Action/No Project Alternative, up to approximately 1,900 acres of planned urban development could be shifted or displaced from inside the MCRA to one or more locations outside the current Sacramento County USB boundary under the No Action/No Project Alternative. This displacement of new urban development would also shift locations of potential discharges of contaminants from temporary construction activities and from long-term urban stormwater runoff to locations outside the current USB boundary. However, the approximately 1,900 acres of displaced development is relatively small compared to the total acres of planned new development analyzed in the General Plan EIRs, and the existing regulations related to surface water quality and groundwater quality (see Section 7.1.1) would also apply to urban development within areas of displaced development over the 50-year EIS/EIR study period.

The continued establishment of preserves under the No Action/No Project Alternative to mitigate development project impacts under ESA, CESA, or CWA Section 404 would not be expected to directly or indirectly result in adverse changes to surface water quality or groundwater. Projects that reestablish or establish aquatic resources on preserves would implement BMPs to avoid soil erosion or discharges of contaminants. Consequently, new

preserves and preserve activities would not be expected to exceed water quality objectives or degrade existing water quality.

Therefore, the No Action/No Project Alternative would not substantially change the types or severity of surface water and groundwater quality impacts identified in the General Plan EIRs. Consequently, the No Action/No Project Alternative would not change the less than significant surface water and groundwater quality impacts described in the General Plan EIR documents listed above.

No Action/No Project Cumulative Effects on Surface Water Quality and Groundwater Quality

As discussed in Sections 3.7.1 and 7.2.1, past and present urban development and associated infrastructure projects and activities in the EIS/EIR Planning Area have adversely altered water quality from agricultural and urban runoff with contaminants potentially harmful to aquatic life, human health, and harmful to recreational beneficial uses in surface water bodies (e.g., pesticides, petroleum products, trace metals, pathogens, nutrients, and suspended sediment) and groundwater quality for municipal uses. Urban development in the Planning Area has contributed to wastewater discharge from the Sacramento Regional Wastewater Treatment Plant to the Sacramento River and Delta. Contaminants have also been contributed from agricultural runoff in the Planning Area (e.g., pesticides, suspended sediment, pathogens, and nutrients). Additionally, downstream water quality is also affected by the municipal water demands in the Planning Area that are served by Water Forum Agreement purveyors with surface water from the American River basin. Use of American River basin surface water, along with other water diversions from Central Valley rivers and the Delta, contribute to reduced flows in the Lower American River flow, lower Sacramento River, and Delta inflow. These past and present alterations have resulted in the existing conditions of surface water quality and groundwater quality described above in Sections 7.1.2.2 and 7.1.2.4, and they represent a significant adverse impact on water quality in the study area.

The types of future reasonably foreseeable “other” projects, activities, and actions, described in Section 3.7.2, are similar to the types of past and present actions that occurred in the study area. The other reasonably foreseeable future actions in the study area (see Sections 3.7.2 and 4.1.2.1, Past and Current Land Use in the Planning Area) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in Elk Grove and Rancho Murieta, master planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued development of cultivated agricultural lands, and development of major infrastructure projects such as California High-Speed Rail and the California WaterFix (see Section 3.7.2 for details of these projects). These reasonably foreseeable other projects have potential to affect existing surface water quality and existing groundwater quality. However, these foreseeable projects and activities would be required

to meet the existing regulations and local policies for surface water quality and groundwater quality, as described in Section 7.1.1. Moreover, implementation of agricultural water quality monitoring and management programs for the Irrigated Lands Regulatory Program would be expected to result in improved water quality in ongoing agricultural drainage discharges in the Planning Area, compared to existing conditions.

Projects and activities included in the No Action/No Project Alternative (see Section 2.2.1) affecting surface water quality and groundwater quality would consist primarily of additional conversion of agricultural and undeveloped lands to urban development (and displaced development) and the related changes in urban and agricultural runoff of contaminants, as well as additional municipal water uses of groundwater and surface water supply sources in the Planning Area. As noted above, new urban development projects in the Planning Area (including development displaced to areas outside the existing USB) would be required to meet existing regulations and policies for water quality, including urban stormwater runoff controls and construction BMPs to meet stormwater quality regulatory requirements of the NPDES Municipal Stormwater Permit. Therefore, they are not expected to adverse contribute to the existing surface water quality or groundwater quality in the Planning Area. Additionally, as noted above, increased groundwater use in the Planning Area is not expected to adversely affect migration of contaminants from lower aquifers, or migration of the contaminant plumes at the groundwater cleanup sites in Sacramento County.

However, the additional municipal water uses projected by the Water Forum Agreement purveyors, including future development in the Planning Area, was considered in the recent modeling for the California WaterFix EIR/EIS (USBR and DWR 2015), which concluded that addition municipal water uses in the Central Valley and the WaterFix facilities operations will result in additional reductions to Delta inflow, and additional reductions in inflow from climate change will result in salinity intrusion in the western Delta. Consequently, the WaterFix EIR/EIS identifies that significant and unavoidable cumulative water quality effects are expected to continue to occur downstream from the Planning Area in the Delta for salinity parameters, mercury, dissolved organic carbon, selenium, and Microcystis algae (USBR and DWR 2015). However, the operational EchoWater Project will improve effluent water quality discharged from the Sacramento Regional Wastewater Treatment Plant to the Sacramento River for flows of up to 181 mgd, and the EchoWater Project has increased capacity to accommodate additional wastewater inflows expected from all future planned development in the Planning Area, including the full buildout of the UDA by 2065 assumed under the No Action/No Project Alternative. After the Regional San's EchoWater Project is fully operational, the contribution of the No Action/No Project Alternative to increased quantity of treated effluent and increased contaminant discharges to the downstream Sacramento River and Delta water quality were determined to be less than significant (Ascent Environmental 2014).

Therefore, the incremental effects of additional surface water in the Planning Area that would occur under the No Action/No Project Alternative would be individually limited and would not make a considerable contribution to the significant cumulative effect on downstream Delta water quality.

7.2.3 Proposed Action/Proposed Project Alternative

As described in Table 2-3 located in Section 2.3.3, Covered Activities and Loss of Natural Land Covers Under the Proposed Action/Proposed Project Alternative, the Proposed Action/Proposed Project Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative. As discussed in Section 2.3.3, the locations of UDA new urban development under the Proposed Action/Proposed Project Alternative would differ slightly, primarily related to the Conservation Strategy of the Proposed Action, which would consolidate project ESA, CESA, and CWA Section 404 into a managed interconnected South Sacramento Habitat Conservation Plan (SSHCP) Preserve System.

As discussed in Section 2.3.1, the Proposed Action/Proposed Project Alternative would allow urban development Covered Activities within the MCRA portion of the UDA to be implemented consistent with planned urban development described in the approved Sacramento County and Rancho Cordova General Plans, without urban development shifting or being displaced to locations outside the current USB boundary. Therefore, the Proposed Action/Proposed Project Alternative does not assume that approximately 1,900 acres of new urban development would be shifted or "displaced" to locations outside of the current USB boundary for Sacramento County.

As discussed in Section 2.3.5, Conservation Strategy under the Proposed Action/Proposed Project Alternative, and Table 2-6, one of the major benefits of the Proposed Action/Proposed Project Alternative to Planning Area hydrology and water quality compared to impacts expected under the No Action/No Project Alternative are the SSHCP Avoidance and Minimization Measures (AMMs) that will be implemented under each urban development Covered Activity project or activity, particularly the SSHCP AMMs related to Stream Setbacks (see Condition 7 AMMs, including STREAM-1, STREAM-2, and STREAM-3), which are described in EIS/EIR Appendix D).

7.2.3.1 Groundwater Hydrology Effects of the Proposed Action/ Proposed Project Alternative

Direct and Indirect Effects of the Alternative

The Proposed Action/Proposed Project Alternative includes full buildout of the UDA, without urban development Covered Activities occurring outside the UDA. Therefore, the potential for incidental changes in location of groundwater demand in the Central Basin and South Basin

identified for the No Action/No Project Alternative (Section 7.2.2.1) would not occur under the Proposed Action/Proposed Project Alternative. However, no significant impacts in groundwater use or groundwater recharge were identified for the No Action/No Project Alternative, including the effects of the displaced development.

The Proposed Action/Proposed Project Alternative includes a Conservation Strategy that has protection of watersheds and related ecosystem functions (including groundwater recharge) as one of the guiding principles. The SSHCP and Aquatic Resources Program (ARP) includes AMM LID-2, which requires the Implementing Entity to prioritize locations that are suitable for groundwater recharge incorporation when siting SSHCP Preserves containing Riparian, Open Water, or Freshwater Marsh SSHCP land cover types.

AMM LID-2 is not included in the No Action/No Project Alternative; therefore, there is a beneficial Impact associated with groundwater recharge under the Proposed Action/Proposed Project Alternative compared to the No Action/No Project Alternative baseline condition. The Proposed Action/Proposed Project Alternative provides greater preservation of aquatic resources and greater reestablishment and establishment of wetlands and other waters, and it provides greater management of preserved, reestablished, and establish aquatic resources relative to the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative would result in better surface water conditions relative to the No Action/No Project Alternative, which would also benefit groundwater recharge and groundwater hydrology, relative to the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- Result in groundwater demand that is consistent with the groundwater demand of the No Action/No Project Alternative.
- Result in impervious surfaces from development and associated effects to groundwater recharge consistent with the adverse effect of the No Action/No Project Alternative.
- Result in greater protection of groundwater recharge from larger and more contiguous preserves.
- Result in greater protection of groundwater recharge along streams and other waterways from required setbacks and larger setback between new development and natural waterways.
- Implement a regional Conservation Strategy that has protection of watersheds and related ecosystem functions (including groundwater recharge) as one of the guiding principles.

Therefore, after considering the impacts from the Proposed Action/Proposed Project Alternative on each of the impact criteria for groundwater hydrology, the Proposed Action/Proposed Project would result in ***Minor Beneficial*** effects on groundwater hydrology, when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Proposed Action/Proposed Project Cumulative Effects on Groundwater Hydrology

The effects of past, present, and reasonably foreseeable other projects on groundwater hydrology in the Planning Area are described in Section 7.2.2.1, and represent a significant adverse cumulative impact on the groundwater hydrologic conditions within the study area. As discussed in Section 7.2.2.1, the incremental effects of the No Action/No Project Alternative were determined to be significant and cumulatively considerable, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As described herein, implementation of the SSHCP Conservation Strategy, including the SSHCP AMMs, SSHCP ARP, and interconnected SSHCP Preserve System is expected to result in more consistent and frequent conservation of groundwater recharge compared to the No Action/No Project Alternative. Consequently, the incremental effects of Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on groundwater hydrology when compared to the incremental effects of the No Action/No Project Alternative baseline condition; therefore, the Proposed Action/Proposed Project does not result in a cumulatively considerable contribution to the significant adverse cumulative impacts on groundwater hydrology. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative Effect*** on groundwater hydrology compared to the No Action/No Project Alternative baseline condition.

7.2.3.2 Surface Water Hydrology and Flooding Effects of the Proposed Action/ Proposed Project Alternative

Direct and Indirect Effects of the Alternative

As described in Section 2.3.3, the Proposed Action/Proposed Project Alternative Covered Activities include the same types of urban development anticipated under the No Action/No Project Alternative. Under the Proposed Action/Proposed Project Alternative, the approval, issuance of Incidental Take Permits, and the implementation of the SSHCP would occur as described in Section 2.3, Proposed Action/Proposed Project. As described in Section 2.3.3, the Proposed Action/Proposed Project Alternative Covered Activities include the same types of urban development as those anticipated under the No Action/No Project Alternative. Approximately 32,059 acres of existing natural land covers would be converted to a developed land cover type inside the UDA, primarily within the Morrison Creek HUC 10 watershed.

Outside the UDA, associated infrastructure and transportation improvement projects outside would directly impact approximately 1,438 acres of natural land cover types, primarily in parts of Snodgrass Slough, Lower Cosumnes River, Upper Cosumnes River, and Laguna watersheds (Table 8-8 and Figure 7-3).

However, the Proposed Action/Project Alternative includes a Conservation Strategy that has protection of watersheds and their surface hydrologic functions as a guiding principle. SSHCP Biological Goal 2 would maintain or improve physical, chemical, and biological functions of aquatic resources within the Planning Area. As discussed in Section 2.3.5, Conservation Strategy under the Proposed Action/Proposed Project Alternative, the proposed SSHCP Conservation Strategy includes an interconnected and coordinated SSHCP Preserve System where further development of the watershed would not occur, and would include thousands of acres of surface waters (including vernal pool systems, seasonal wetlands, streams and creeks, riparian zones, marshes, and open water). The SSHCP Preserve System would be used by the ARP as part of a unified watershed strategy of avoidance, minimization, and compensatory mitigation for the Planning Area.

Inside the UDA and Morrison Creek watershed, approximately 7,030 acres of natural land covers would be permanently protected and managed (Table 8-9) through the designation of relatively large and contiguous Core, Minor, Satellite, and Linkage Preserves that would protect 605 acres of wetlands and other waters, as well as 74 acres of riparian land covers. In addition, one of the objectives of the Proposed Action/Proposed Project Alternative is to protect an additional 1,200 acres along the Laguna Creek Corridor located in the UDA. However, the majority of the total 34,495-acre SSHCP Preserve System (27,465 acres) will be located outside the UDA and would preserve agricultural lands and natural landscapes with natural intact sources of surface and sub-surface water influx and outflow.

The SSHCP Conservation Strategy outside the UDA within the Laguna Watershed would protect approximately 2,059 acres of surface waters by establishing a large Landscape Preserve on approximately 14,493 acres of contiguous preserves in the Laguna Creek watershed and portions of the Upper Cosumnes River Watershed to the north and the Lower Dry Creek to the south (Figure 7-3). This 14,493-acre SSHCP Landscape Preserve would will be located strategically to connect with and build upon the existing 12,500-acre Chance Ranch in the eastern part of the Laguna Watershed, resulting in a total contiguous Landscape preserve of between 33,500 and 34,000 acres in the southeastern portion of the Planning Area (Figure 7-3). In the southwestern portion of the Planning Area, approximately 610 acres of agricultural lands adjacent to the river and creek floodplains would be preserved in the Snodgrass Slough, Sherman Lake-Sacramento River, and Lower Consumes River Watersheds.

In addition to assembling a large network of interconnected preserves that preserve natural corridors and provide large blocks of contiguous habitat, the SSHCP Conservation Strategy includes AMMs that would be incorporated into the design of the SSHCP Covered Activities, or would be implemented during the construction and implementation of the SSHCP Covered Activities. These AMMs include requiring each development Covered Activity to incorporate LID design measures, implement BMPs during construction, comply with siting and design requirements, and provide setbacks between new urban development and existing streams and waterways (Stream and Preserve Setbacks) (see Table 2-6 and Appendix D). Additionally, the SSHCP ARP includes the same AMMs and mitigation requirements as the SSHCP Conservation Strategy. The proposed SSHCP Conservation Strategy and the ARP provide the following benefits to surface water resources and regional surface water functions:

a. Provides a regional approach to balance conservation of aquatic resources and new urban development within the Planning Area;
b. Avoids and minimizes impacts to aquatic resources to the greatest extent practicable;
c. Implements compensatory mitigation of aquatic resources at a landscape level to protect watersheds; and
d. Achieves an overall no net loss of aquatic resources functions and services.

The proposed SSHCP requires hydrologic resource AMMs (see Table 2-6 and Appendix D) be implemented during design, construction, and operation of urban development Covered Activities and projects within the Planning Area. For example, AMM LID-3 requires Covered Activities to incorporate avoidance of project-site natural aquatic features (such as creeks and streams) into the project design to retain natural hydrologic patterns and to retain habitat of aquatic Covered Species and other native species. Implementation of AMM LID-3 also preserves project site natural features to avoid or minimize adverse changes to existing surface hydrologic conditions.

AMM STREAM-1 would result in a minimum 300-foot-wide wildlife movement corridor along the northern Laguna Creek inside the UDA by requiring Covered Activities to be setback a minimum of 150 feet from the top of the bank on both sides of the creek. AMM STREAM-2 would require setbacks of 100 feet from the top of stream banks at Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Central Paseo, and Sun Creek in the UDA. AMM STREAM-3 would require a 25-foot setback of new urban development from the stream banks of all first- and second-order streams (minor tributaries) in the UDA. The primary objective of the Stream Setback AMMs is to reduce urban runoff and sediment and nutrient inputs from surface flows in new urban areas, to protect existing stream hydrology, and to protect water quality and habitat downstream. In addition, the Stream Setback AMMs would minimize physical modifications of stream channels, thereby reducing potential adverse changes to natural

hydrologic functions. As discussed in Section 7.2.2.2, there are no requirements for urban development projects to include these large setbacks under the No Action/No Project Alternative, except in areas that are zoned for open space. Existing regulations, including the Sacramento County Floodplain Management Ordinance, would continue to protect floodplains (see Section 7.1.1). However, as with the No Action/No Project Alternative, construction could still occur within an existing floodplain as long as the structure or facility does not cause or intensify flooding.

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project Alternative are similar to the standard BMP (e.g., erosion control measures) requirements that would be implemented during construction activities under the No Action/No Project Alternative. However, the Proposed Action/Proposed Project includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project includes process for annual review of AMM effectiveness, and adaptive changes of any AMMs that are not fully effective at avoiding impacts to aquatic resources or species. This additional layer of oversight of AMMs implementation and effectiveness under the Proposed Action/Proposed Project Alternative increases avoidance and minimization of impacts to surface water hydrology and aquatic resources from construction activities.

The SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative, including the Biological Goals and Measurable Objectives, the SSHCP AMMs, and the ARP, provide additional measures not included in the No Action/No Project Alternative that are expected to reduce adverse effects to surface hydrology in the UDA and Planning Area when compared to the impacts to surface hydrology resources that would occur under No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- Provide greater setbacks of new development from streams, creeks, and minor tributaries, which would maintain existing hydrologic functions of UDA streams and floodplains, and retain more of the stream's floodplain to provide better flood storage and flood flow.
- Provide greater protection of surface waters in each Planning Area HUC watershed by consolidating project avoidance and mitigation requirement into contiguous and interconnected preserves. Provide greater avoidance and protection of aquatic resources within the UDA, including in the MCRA portion of the UDA. Assemble a large

contiguous Landscape Preserve in the southeast portion of the Planning Area, totaling between 33,500 to 34,000 acres.

- Require implementation of additional AMMs to avoid or minimize surface hydrologic resources, and require consistent implementation of surface hydrology AMMs during all ground-disturbing Covered Activities.
- Result in better management of avoided aquatic resources and aquatic habitat to minimize indirect impacts of adjacent urbanization, and to maintain values and aquatic functions on preserved lands in perpetuity.
- Implement a regional Conservation Strategy that has protection of watersheds and related ecosystem functions as one of the guiding principles, while balancing regional housing and development needs.

Therefore, after considering the impacts from the Proposed Action/Proposed Project Alternative on all of the impact criteria for surface hydrology resources, the impacts of the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects to surface hydrologic resources when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects on Surface Water Hydrology and Flooding

The cumulative effect of past actions, present actions, and the reasonably foreseeable other actions on surface waters, stormwater runoff, and erosion in the study area were described in Section 7.2.2.2 and represent a significant adverse cumulative impact on the groundwater hydrologic conditions within the study area. As discussed in Section 7.2.2.2, because existing regulations related to flood control and stormwater management would continue over the 50-year EIS/EIR study period (see Section 7.1.1), the incremental effects of the No Action/No Project Alternative were determined to be individually limited and would result in a less than significant impacts to the existing surface hydrology, stormwater runoff, stormwater system capacity, flooding, flood hazards, flood flows, drainage, and stream channels, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed here in Section 7.2.3.2, the implementation of the SSHCP Conservation Strategy, including the interconnected SSHCP Preserve System, the Covered Activity AMMs, and the ARP, would result in larger areas of watershed preservation, consistent and more frequent implementation of AMMs, and would require larger setbacks and more conservation of natural waterways compared to the No Action/No Project Alternative. Consequently, the incremental effects of the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on surface hydrology, stormwater runoff, and flooding conditions when compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the

incremental effects of Proposed Action/Proposed Project are individually limited and would not make a cumulatively considerable contribution to the significant adverse impact of the past, present, and reasonably foreseeable future projects. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial*** cumulative effect to surface water hydrology and flooding compared to the No Action/No Project Alternative baseline condition.

7.2.3.3 Surface Water Quality and Groundwater Quality Effects of the Proposed Action/Proposed Project Alternative

Direct and Indirect Effects of the Alternative

Under the Proposed Action/Proposed Project Alternative, the approval, issuance of Incidental Take Permits, and implementation of the SSHCP would occur as described in Section 2.3. As described in Section 2.3, the Proposed Action/Proposed Project Covered Activities includes the same types of urban development as those anticipated under the No Action/No Project Alternative. As discussed in Chapter 8, approximately 32,059 acres of existing natural land covers would be converted to a developed land cover type by the urban development Covered Activities inside the UDA. Associated infrastructure and transportation improvement projects outside the UDA would directly impact approximately 1,438 acres of natural land cover types.

However, the Proposed Action/Project Alternative includes a Conservation Strategy that has protection of watersheds and their surface hydrologic functions as a guiding principle (SSHCP Biological Goal 2). As discussed in Section 2.3.5, the SSHCP Conservation Strategy includes an interconnected and coordinated SSHCP Preserve System that would preserve 7,030 acres of natural land covers inside the UDA and 27,465 acres outside the UDA. These preserve acres include thousands of acres of surface waters and areas of groundwater recharge.

The SSHCP Conservation strategy and the ARP would better minimize adverse water quality effects of urban development, compared to the No Action/No Project Alternative. The SSHCP requires each Covered Activity to implement SSHCP AMMs (see Table 2-6 and Appendix D). The AMMs for aquatic resources, particularly the establishment of setbacks at streams, creeks, and minor tributaries, combined with the active management of the large and interconnected SSHCP Preserve System, would limit indirect impacts to surface waters from new urban development such as spread of invasive plants, trespassing by people and domestic animals, and unauthorized trails. The AMM measures BMP-1 through BMP-4 and BMP-9 and BMP-10 require Covered Activities to implement construction BMPs to protect water quality through appropriate sediment and pollution control devices and practices.

The AMMs LID-1, LID-2, and LID-3 require the project design of urban development Covered Activities to incorporate avoidance of aquatic features such as creeks and streams, and to

design urban stormwater runoff management to avoid discharges of contaminants from completed development. As discussed in Section 7.2.3.2 for the Proposed Action/Proposed Project, the AMMs STREAM-1 through STREAM-5 requires setbacks between streams and new urban development. Stream setback widths required by these AMMs range from 25 to 150 feet from top of bank. As discussed in Section 7.2.2.2, the No Action/No Project Alternative has no requirements for all new urban development projects to include these large setbacks, except in areas that are zoned for open space. In addition, AMM EDGE-1 encourages new urban development Covered Activities to locate compatible land uses adjacent to new and existing SSHCP preserves, including parks, ball fields, detention basins, open space, and other land uses that have minimal ground disturbance. The soil surfaces in a compatible land use area may be re-contoured, but the soil restrictive layer will remain undamaged and most of the soil profile above the restrictive layer will remain intact. Therefore, AMM EDGE-1 places a larger buffer between deep construction grading and surface hydrology, maintains more of the seasonal perched aquifer, and maintains more of the microwatersheds of aquatic resources and species habitat present within a preserves. AMM EDGE-3 also requires setbacks between new UDA urban development and new or existing preserves, and these Preserve Setbacks are expected to contain aquatic resources. These stream and Preserve Setbacks requirements would reduce indirect impacts of operational urban developments on surface water quality and groundwater quality. In addition, the natural vegetation remaining within the setbacks acts to hold or settle out pollutants or silt rather than discharging to the stream or waterway. Setbacks help to maintain the natural floodplains of the stream or waterway, reducing erosion and sedimentation of streams. AMM EDGE-2 requires single-loaded streets adjacent to preserves, which provides a wider set back from human activities, allows more visibility of the preserve, and will reduce potential water quality impacts that would result from illegal dumping or trespassing with off-road vehicles. Therefore, both the stream and the Preserve Setback AMMs required under the Proposed Action/Proposed Project Alternative would reduce potential direct and indirect water quality effects of new urban development, better improve or maintain existing water quality through processes such as filtration and/or trapping of contaminants such as sediment or toxicants and prevention of erosion, and facilitate greater groundwater recharge along creeks and streams, when compared to compared to the effects expected under the No Action/No Project Alternative.

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project Alternative are similar to the construction best management practices that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, as well as annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This

additional oversight and guidance provided by the SSHCP would result in water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The SSHCP AMMs also provide new avoidance and minimization measures that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects on surface water quality and groundwater quality, compared to the effects of the No Action/No Project Alternative.

As discussed above in the analysis of surface waters, the Proposed Action/Proposed Project Alternative would also establish a watershed-based, interconnected, and coordinated Preserve System in the Planning Area, which would include a comprehensive preserve management program implemented in perpetuity. The more contiguous and more interconnected design of the regional SSHCP Preserve System, as well as the coordinated management of preserves in the SSHCP Preserve System, would provide greater benefits to water quality compared to the uncoordinated, smaller, and more scattered and isolated individual preserves of the No Action/No Project Alternative. The regional, watershed-based conservation provided by the SSHCP Preserve System, the SSHCP Conservation Plan, and the ARP would better protect upper watersheds, water quality of surface waters, and water quality of groundwater. The Proposed Action/Proposed Project Alternative would reduce adverse effects on surface water quality and groundwater quality relative to the effects of No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- Have smaller direct and indirect impacts to surface water quality and to groundwater quality.
- Provide a Conservation Strategy that has protection of watersheds and related ecosystem functions (including water quality) as one of the guiding principles.
- Provide larger contiguous preserves that would provide better protection to existing surface water quality.
- Provide greater setbacks between new development and streams, creeks, and minor tributaries, and provide setbacks between new development and preserves to reduce al direct and indirect water quality effects of new urban development on surface water quality. It would also improve or maintain existing water quality through processes such as filtration and/or trapping of contaminants such as sediment or toxicants and prevention of erosion, and it would facilitate greater groundwater recharge along creeks and streams.

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative on all of the surface water quality and groundwater quality related impact criteria, the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects on surface water quality and groundwater quality when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects on Surface Water Quality and Groundwater Quality

The effects of past, present, and reasonably foreseeable other projects on surface water quality and groundwater quality in the Planning Area were described in Section 7.2.2.3 and represent a significant adverse cumulative impact on the surface water quality and groundwater quality within the study area. As discussed in Section 7.2.2.3, the incremental effects of the No Action/No Project Alternative were determined not to be cumulatively considerable when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed herein, implementation of the Proposed Action/Proposed Project Alternative's Conservation Strategy, including the SSHCP AMMs, the interconnected SSHCP Preserve System, and the ARP are expected to result in greater protection of surface water quality and groundwater quality compared to the No Action/No Project Alternative. Consequently, the Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial*** cumulative effect to surface water quality and groundwater quality compared to the No Action/No Project Alternative baseline condition.

7.2.4 Reduced Permit Term Alternative

As described in Section 2.3.3, the Reduced Permit Term Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative.

Under both the Reduced Permit Term Alternative and Proposed Action/Proposed Project Alternative, most of the Preserve System established inside the UDA would be associated with the development of the five large Master Plans discussed in Sections 2.3.3 and 2.3.4. Therefore, the Preserve System established inside the UDA under the Reduce Permit Term Alternative is expected to be very similar to the Preserve System established inside the UDA under Proposed Action/Proposed Project Alternative.

However, the shorter duration of Reduced Permit Term Alternative and the lower amount of urban development and associated development fees collected by the Reduced Permit Term Alternative would not allow the HCP's Implementing Entity to establish as many acres of new preserves in the Planning Area as would occur under the Proposed Action/Proposed Project

Alternative's 50-year permit term. In addition, relatively few new preserves are expected to be established outside the UDA under the Reduced Permit Term Alternative.

As described in Section 3.6.7.2, Analysis of the Reduced Permit Term Alternative, After the End of the Permit Term (Years 31–50), the ESA and CESA Incidental Take Permits and the CWA permit strategy for future Covered Activities would be valid only during the 30-year permit term, and the Reduced Permit Term Alternative HCP would be implemented only during this 30-year term. The urban development Covered Activities and conservation actions associated with the five Master Plans would be implemented inside the UDA during this 30-year period. However, the EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3), and the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, the analysis of the Reduced Permit Term Alternative also considers urban development that is not part of the project description of the Reduced Permit Term Alternative, but is expected to occur within the Planning Area after the end of the permit term (i.e., in years 31–50 of the EIS/EIR study period).

Project mitigation preserves established after the end of the Reduced Permit Term Alternative 30-year permit term would be established following an individual project-by-project process for obtaining authorizations under the CWA, ESA, CESA, and Section 1600 of the California Fish and Game Code. Preserves established in years 31–50 of the EIS/EIR study period would not be established using a regional, watershed-based approach that balances new urban development with the need for conservation of groundwater hydrology, surface water hydrology, water quality of surface waters, and groundwater quality, as would be provided by the SSHCP Preserve System, the SSHCP Conservation Plan, and the ARP under the Proposed Action/Proposed Project Alternative. Therefore, it is unlikely that a landscape-level preserve would be established in the Planning Area under the Reduced Permit Term Alternative.

7.2.4.1 Groundwater Hydrology Effects of the Reduced Permit Term Alternative

Direct and Indirect Effects of the Alternative

As described in Section 2.4.4, Covered Species Under the Reduced Permit Term Alternative, the Reduced Permit Term Alternative would include similar types of new urban development and infrastructure as those anticipated under the No Action Alternative. Similar to the Proposed Action/Proposed Project Alternative, the displacement of planned urban development to areas outside of the County's existing USB expected under the No Action/No Project Alternative would not occur under the Reduced Permit Term Alternative. Therefore, the potential changes in location of groundwater use between the Central Basin and South Basin identified for the No Action/No Project Alternative would not occur under the Reduced Permit Term Alternative.

However, no significant changes in groundwater use or recharge associated with the displaced development were identified for the No Action/No Project Alternative.

As described in Section 2.4.5, Conservation Strategy Under the Reduced Permit Term Alternative, the Reduced Permit Term Alternative includes an interconnected Preserve System established during the 30-year permit term and a comprehensive preserve management program for those preserves. The establishment and management of this Preserve System during the 30-year permit term would include the same Conservation Strategy as the SSHCP, which includes the protection of watersheds and related ecosystem functions (including groundwater recharge) as one of the guiding principles. However, without a comprehensive regional HCP during years 31–50 of the 50-year EIS/EIR study period, preserves established after the end of the term would not implement AMMs for groundwater recharge, and would not include a comprehensive HCP management and Conservation Strategy.

Covered Activities implemented during the 30-year permit term would include AMMs. For example, AMM LID-2 requires the Implementing Entity to prioritize locations that are suitable for groundwater recharge incorporation when siting preserves for Riparian, Open Water, or Freshwater Marsh land cover types. However, without a comprehensive regional HCP for years 31–50 of the EIS/EIR study period, the preserves outside the UDA would not be subject to AMMs for groundwater recharge or for a comprehensive HCP management and Conservation Strategy.

During the 30-year permit term, the Reduced Permit Term Alternative provides for greater wetland preservation and would provide better management of preserves, relative to the No Action/No Project Alternative. This would provide a 30-year improvement in surface water conditions that would also benefit groundwater recharge and hydrology. Therefore, overall, the Reduced Permit Term Alternative results in a ***Minor Beneficial*** effect on groundwater recharge and hydrology inside the UDA when comparing the Reduce Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Result in consistent groundwater use.
- Result in consistent adverse effects to groundwater recharge due to impervious surfaces from development.
- Result in greater protection of groundwater recharge areas from preserve establishment inside the UDA.

- Result in a Conservation Strategy that has protection of watersheds and related ecosystem functions (including groundwater recharge) as one of the guiding principles inside the UDA.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on all of groundwater hydrology related impact criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to groundwater hydrology when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Reduced Permit Term Cumulative Effects of the Alternative on Groundwater Hydrology

The cumulative effect of past, present, and reasonably foreseeable future actions on groundwater hydrology for the No Action/No Project Alternative are described in Section 7.2.2. Effects of land use changes in the Planning Area that would occur from past, present, and reasonably foreseeable future projects would result in a significant adverse cumulative impact on groundwater hydrologic conditions.

The implementation of an HCP Conservation Strategy, including AMMs, an ARP, and the interconnected Preserve System during the 30-year permit term under the Reduced Permit Term Alternative would result in better conservation of groundwater recharge inside the UDA compared to the No Action/No Project Alternative. Consequently, the Reduced Permit Term Alternative has a ***Minor Beneficial*** effect on groundwater hydrology compared to the No Action/No Project Alternative baseline condition; therefore, it does not result in a considerable contribution to the adverse cumulative impacts to groundwater hydrology. The Proposed Action/Proposed Project Alternative results in a ***Minor Beneficial*** cumulative effect on groundwater hydrology compared to the No Action/No Project Alternative baseline condition.

7.2.4.2 Surface Hydrology, Stormwater Runoff, and Flooding Effects of the Reduced Permit Term Alternative

Direct and Indirect Effects of the Alternative

As described in Section 2.4.3, Covered Activities/Projects Under the Reduced Permit Term Alternative, the Reduced Permit Term Alternative Covered Activities include the same types of urban development as under the No Action/No Project Alternative. The Reduced Permit Term Alternative would directly impact approximately 1,741 acres of aquatic resources within the UDA and 115 acres of aquatic resources outside the UDA (Table 8-12), which is 122 acres less than direct impacts to aquatic resources under the No Action/No Project Alternative (Table 8-4).

As described in Section 2.4.5, the Reduced Permit Term Alternative includes a 30-year Conservation Strategy that would establish an interconnected and coordinated SSHCP Preserve System inside the UDA portion of the Planning Area, as well as a comprehensive preserve management program for those preserves. The establishment and management of this Preserve System during the 30-year permit term would include the same Conservation Strategy as the SSHCP, which includes the protection of watersheds and related ecosystem functions (including groundwater recharge) as one of the guiding principles. The Reduced Permit Term Alternative would include the same aquatic resource avoidance, minimization, and compensation measures that the Proposed Action/Proposed Project Alternative provides. These elements of the Reduced Permit Term Alternative would provide the following benefits to aquatic resources and regional aquatic function:

a. Provide a regional, balanced conservation and development approach for aquatic resources located within the Planning Area;
b. Minimize impacts to aquatic resources to the greatest extent practicable;
c. Implement compensatory mitigation at a landscape level to protect watersheds; and
d. Achieve an overall no net loss of aquatic resources functions and services.

Inside the UDA and Morrison Creek watershed, approximately 501 acres of natural land covers would be permanently protected and managed (Table 8-13) through the designation of relatively large and contiguous Core, Minor, Satellite, and Linkage Preserves that would protect 414 acres of wetlands and other waters, and 87 acres of riparian land covers. In addition, one of the objectives of the Proposed Action/Proposed Project Alternative is to permanently protect the Laguna Creek Corridor located in the UDA. However, the majority of the total 30,771-acre SSHCP Preserve System (25,936 acres) will be located outside the UDA, and would preserve agricultural lands and natural landscapes with natural intact sources of surface and sub-surface water influx and outflow.

During the 30-year permit term of the Reduced Permit Term Alternative, the implementation of several surface hydrology AMMs (see Table 2-6 of this EIS/EIR) during urban development Covered Activities within the UDA would better protect and benefit surface hydrology conditions relative to the impacts of the No Action/No Project Alternative. AMM LID-3 would require new urban development to incorporate preservation of a site's natural aquatic features (such as creeks and streams) into project design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species. Implementation of LID-3 would result in preservation of project site natural features, which would avoid or minimize adverse changes to existing surface hydrologic conditions inside the UDA.

AMM STREAM-1 results in a minimum 300-foot-wide wildlife movement corridor for Laguna Creek by requiring Covered Activities to be setback 150 feet from the top of the bank on both sides. AMM STREAM-2 requires setbacks of 100 feet from the stream banks of Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Central Paseo, and Sun Creek. STREAM-3 requires 25-foot setback from the stream banks of minor tributaries in the UDA. There are not requirements for large setback under the No Action/No Project Alternative except in areas that are zoned for open space or designated on a project-by-project basis. Existing regulations protect the floodplain; however, construction can still occur within an existing floodplain as long as it does not cause or intensify flooding. This can be accomplished by filling in the floodplain and compensating for the loss of flood storage by building a detention basin. AMMs STREAM-1, STREAM-2, and STREAM-3 would protect stream hydrology. Floodplains are related to the overall health of a stream. Floodplains absorb and store floodwaters, and they reduce velocity and allow for the slow release to the stream. Floodplain trees and plants filter sediments and pollutants, and they help to anchor the riverbanks preventing erosion and providing shade to reduce water temperatures. Stream setback requirements minimize physical modifications of stream channels, thereby reducing potential adverse changes to natural hydrologic functions inside the UDA. As discussed in Section 7.2.2.2, there are no requirements for urban development projects to include these large setbacks under the No Action/No Project Alternative, except in areas zoned for open space.

Active management of the Preserve System established during the 30-year permit term of the Reduced Permit Term Alternative, combined with 30 years of AMMs, particularly greater setbacks along streams, creeks, and minor tributaries will limit indirect impacts from urbanization such as spread of invasive plants, establishment of informal trails, and use by people and domestic animals. EDGE-1 requires compatible land uses included in the Covered Activities (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) to be located in areas immediately adjacent to existing or planned preserve boundaries. The compatible land use will provide additional buffering of preserves from potential indirect effects of adjacent urban development. The soil surfaces in a compatible land use area may be re-contoured, provided that the soil restrictive layer remains undamaged and most of the soil profile above the restrictive layer remains intact.

AMM BMP-1 through AMM BMP-11 of the Reduced Permit Term Alternative are similar to the standard best management practices (e.g., erosion control measures) requirements that would be implemented during construction activities under the No Action/No Project Alternative. However, the Reduced Permit Term Alternative includes 30 years of additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Reduced Permit Term Alternative includes process for annual review of AMM effectiveness for a 30-year period, as well as a process to make adaptive changes

of any AMM that is not fully effective at avoiding impacts to aquatic resources or species. This additional layer of oversight of AMMs implementation and effectiveness under the Reduced Permit Term Alternative increases avoidance and minimization of impacts to surface water hydrology and aquatic resources from construction activities.

Benefits resulting from permanent preserve establishment and management of preserves in perpetuity under the 30-year permit term of the Reduced Permit Term Alternative would not apply to any new preserves established during years 31–50 of the 50-year EIS/EIR study period, when the process for projects to establish mitigation preserves would be more similar to the No Action/No Project Alternative.

The Reduced Permit Term Alternative, through the implementation of an HCP Conservation Strategy during the 30-year permit term, including the Biological Goals and Objectives, implementation of the AMMs, and the ARP would provide additional surface water hydrology avoidance measures not included in the No Action/No Project Alternative, which are expected to lessen the potential adverse effects to surface hydrologic conditions relative to the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Provide greater setbacks of new development from streams, creeks, and minor tributaries, which would maintain existing hydrologic functions of UDA streams and floodplains, and retain more of the stream's floodplain to provide better flood storage and flood flow.
- Result in greater and more consistent avoidance of adverse effects on surface hydrology conditions because of overlapping and new AMMs. It would also require implementation of additional AMMs to avoid or minimize surface hydrologic resources, as well as consistent implementation of surface hydrology AMMs during all ground-disturbing Covered Activities. Moreover, it would provide greater management of indirect impacts of urbanization, such as intrusion from domestic animals and informal trails.
- Result in a Conservation Strategy that has protection of watersheds and related ecosystem functions as one of the guiding principles.

Therefore, after considering the of the Reduced Permit Term Alternative on each surface hydrology impact-criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to surface hydrologic resources, when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Reduced Permit Term Cumulative Effects on Surface Water Hydrology and Flooding

The cumulative effect of past actions, present actions, and the reasonably foreseeable other actions on surface waters, stormwater runoff, and erosion in the study area were described in Section 7.2.2.2, and represent a significant adverse cumulative impact on the groundwater hydrologic conditions within the study area. As discussed in Section 7.2.2.2, because existing regulations related to flood control and stormwater management would continue over the 50-year EIS/EIR study period (see Section 7.1.1), the incremental effects of the No Action/No Project Alternative were determined to be individually limited, and would result in a less than significant impacts to the existing surface hydrology, stormwater runoff, stormwater system capacity, flooding, flood hazards, flood flows, drainage, and stream channels, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed here in Section 7.2.4.2, implementation of an HCP Conservation Strategy, including Covered Activity AMMs, and interconnected Preserve System, and an ARP during the 30-year permit term of the Reduced Permit Term Alternative would result in larger areas of watershed preservation, consistent and more frequent implementation of AMMs, and require larger setbacks and more conservation of natural waterways in the UDA when compared to the No Action/No Project Alternative. Consequently, the incremental effects of the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect to surface hydrology, stormwater runoff, and flooding conditions when compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of Reduced Permit Term Alternative are individually limited and would not make a cumulatively considerable contribution to the significant adverse impact of the past, present, and reasonably foreseeable future projects. The Proposed Action/Proposed Project would result in a ***Minor Beneficial*** cumulative effect to surface water hydrology and flooding inside the UDA compared to the No Action/No Project Alternative baseline condition.

7.2.4.3 Surface Water Quality and Groundwater Quality Effect of the Reduced Permit Term Alternative

As described in Section 2.4.3, the Reduced Permit Term Alternative Covered Activities include the same types of urban development anticipated under the No Action/No Project Alternative.

The Reduced Permit Term Alternative, during the 30-year permit term, includes a Conservation Strategy that has protection of watersheds and their surface hydrologic functions as a guiding principle (Biological Goal 2). As discussed in Section 2.4.3, the Reduced Permit Term Alternative includes an interconnected and coordinated Preserve System and a 30-year implementation of an ARP that would better minimize adverse water quality effects of urban development compared to the No Action/No Project Alternative. The 30-year permit term would also require

each Covered Activity to implement AMMs (see Table 2-6 and Appendix D). The AMMs for aquatic resources, particularly the establishment of setbacks at streams, creeks, and minor tributaries, combined with the active management of the large and interconnected SSHCP Preserve System, would limit indirect impacts to surface waters from new urban development such as spread of invasive plants, trespassing by people and domestic animals, and unauthorized trails. AMMs BMP-1 through BMP-4 and BMPs 9 and 10 would require Covered Activities to implement construction BMPs to protect water quality through appropriate sediment and pollution control devices and practices.

AMMs LID-1, LID-2, and LID-3 require the project design of urban development Covered Activities to incorporate avoidance of aquatic features such as creeks and streams, and to design urban stormwater runoff management to avoid discharges of contaminants from completed development projects.

AMMs STREAM-1 through STREAM-5 require setbacks between streams and new urban development. Stream setback widths required by these AMMs range from 25 to 150 feet from top of bank. As discussed above in Section 7.2.2.2, the No Action/No Project Alternative has no requirements for all new urban development projects to include these large setbacks, except in areas that are zoned for open space. In addition, AMM EDGE-1 encourages new urban development Covered Activities to locate compatible land uses adjacent to new and existing preserves, including parks, ball fields, detention basins, open space, and other land uses that have minimal ground disturbance. The soil surfaces in a compatible land use area may be re-contoured, but the soil restrictive layer will remain undamaged and most of the soil profile above the restrictive layer will remain intact. Therefore, AMM EDGE-1 places a larger buffer between deep construction grading and the surface hydrology, maintains more of the seasonal perched aquifer, and maintains more of the microwatersheds of aquatic resources and species habitat present within a preserves. AMM EDGE-3 provides setbacks from preserves, which will likely contain aquatic resources. These stream and Preserve Setbacks would reduce indirect impacts of operational urban developments on surface water quality and groundwater quality. In addition, the natural vegetation remaining within the setbacks act to hold or settle out pollutants or silt rather than discharging to the stream or waterway. Setbacks help to maintain the natural floodplains of the stream or waterway, which reduces erosion and sedimentation of streams. AMM EDGE-2 requires single-loaded streets adjacent to preserves, which provides a wider setback from human activities, allows more visibility of the preserve, and will reduce potential water quality impacts that would result from illegal dumping or trespassing with off-road vehicles. Therefore, both the stream and the Preserve Setback AMMs required under the Reduced Permit Term Alternative would reduce potential direct and indirect water quality effects of new urban development, better improve or maintain existing water quality through processes such as filtration and/or trapping of contaminants

such as sediment or toxicants and prevention of erosion, and would facilitate greater groundwater recharge along creeks and streams, when compared to compared to the effects expected under the No Action/No Project Alternative.

AMM BMP-1 through AMM BMP-11 of the Reduced Permit Term Alternative would be similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, as well as annual reporting of the effectiveness of each AMM. The Reduced Permit Term Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM, and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the SSHCP would result in water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The SSHCP AMMs also provide new avoidance and minimization measures that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to surface water quality and groundwater quality, compared to the effects of the No Action/No Project Alternative.

The Reduced Permit Term Alternative, during the 30-year permit term, would also establish a watershed based interconnected Preserve System in the UDA, as well as a comprehensive preserve management program that is implemented in perpetuity. The more contiguous and more interconnected design of the Preserve System would be beneficial to water quality compared to the preservation that would provide greater benefits to water quality compared to the uncoordinated, smaller, and more scattered and isolated individual preserves of the No Action/No Project Alternative. The Reduced Permit Term would reduce adverse effects to surface water quality and groundwater quality relative to the effects of No Action/No Project Alternative.

Significance of Direct and Indirect Effects on Water Quality

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Result in smaller direct and indirect impacts to surface water quality and groundwater quality.
- Provide larger contiguous preserves that would provide better protection to existing surface water quality inside the UDA.
- Provide greater setbacks between new development and streams, creeks, and minor tributaries. It would also provide setbacks between new development and preserves

to reduce all direct and indirect water quality effects of new urban development on surface water quality to better improve or maintain existing water quality through processes such as filtration and/or trapping of contaminants such as sediment or toxicants and prevention of erosion.

- Facilitate greater groundwater recharge along creeks and streams.

Therefore, after considering the impacts from the Reduced Permit Term Alternative on all of surface water quality and groundwater quality impact criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to surface water and groundwater quality when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects on Surface Water Quality and Groundwater Quality

The effect of past, present, and reasonably foreseeable future actions on surface water quality and groundwater quality in the Planning Area were described in Section 7.2.2.3 and represent a significant adverse cumulative impact on the surface water quality and groundwater quality within the study area. As discussed in Section 7.2.2.3, the incremental effects of the No Action/No Project Alternative were determined to be significant and cumulatively considerable, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

Implementation of the Conservation Strategy during the 30-year permit term under the Reduced Permit Term Alternative, including AMMs, the ARP, and the interconnected Preserve System, are expected to result in greater protection of surface water quality and groundwater quality compared to the No Action/No Project Alternative. Consequently, the Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial*** cumulative effect to surface water quality and groundwater quality compared to the No Action/No Project Alternative baseline condition.

INTENTIONALLY LEFT BLANK

CHAPTER 8 – NATURAL LAND COVER HABITATS AND ASSOCIATED PLANT AND ANIMAL COMMUNITIES

This chapter presents the environmental effects of each Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) Alternative on the Planning Area natural land covers, including effects on the community of native plant and native animal species that that naturally co-occur within each land cover and use the land cover as habitat. As discussed in Section 8.1.2, Chapter 8 will use the same land cover classification system that is used in the South Sacramento Habitat Conservation Plan (SSHCP) document. Certain natural land covers analyzed in Chapter 8 are also classified by the State of California as "special-status natural communities."

Some of the species in the plant and animal communities that that live together in each land cover are protected or are otherwise considered to have special-status by a federal, state, or local environmental law, regulation, or policy. These "special status species" are e briefly mentioned in Chapter 8, but each is more fully analyzed in Chapter 9, Special-Status Species, Including HCP Covered Species, of this EIS/EIR.

Some of the natural land covers analyzed in Chapter 8 are also aquatic resources that are regulated by the federal Clean Water Act (CWA) and by the state's Porter-Cologne Water Quality Control Act. These aquatic land covers are analyzed in Chapter 8 as natural communities and species habitat. However, they are also analyzed separately in Chapter 10, Wetlands and Waters, in the context of the CWA and other statutes, regulations, and local policies that also regulate these land covers as aquatic resources.

8.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

8.1.1 Regulatory Framework

There are several federal, state, and local agency requirements that apply to the evaluation of natural communities and native species habitats. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, issuance of permits, or implementation of the alternatives analyzed in this EIS/EIR. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 8.2.

Federal Statutes and Regulations

Federal Endangered Species Act

As discussed in Section 9.1.1, the federal Endangered Species Act (ESA) and subsequent amendments provide for the conservation of federally endangered and threatened species, and species that are candidates for listing, and the habitat on which the species depend. The U.S.

Fish and Wildlife Service (USFWS) Sacramento Fish and Wildlife Office has jurisdiction over the federally listed plants, wildlife, and freshwater fish within the Planning Area.

Clean Water Act

CWA Section 404 regulates the discharge of dredged and fill materials into "waters of the United States," which are defined at 33 Code of Federal Regulations (CFR) 328.3 and at 40 CFR 230.3. CWA 404 permits must be issued by the U.S. Army Corps of Engineers (USACE) to projects and activities that discharge dredge or fill material into wetlands and other waters of the U.S. The USACE delineates and verifies waters of the United States, including wetlands at each project or activity site, through jurisdictional determinations (33 CFR 328.3, 40 CFR 230.3).

Projects or activities that result in discharge of dredge or fill into waters of the United States must obtain a permit from the USACE under Section 404. General permits include nationwide permits, regional general permits, or programmatic general permits. Individual permits include letters of permission or standard permits. General permits are issued by the USACE for categories of projects that are substantially similar in nature and have minimal environmental impacts, both individually and cumulatively. Individual permits are issued for projects that do not qualify for a general permit (i.e., that is expected to have more than a minimal adverse environmental impact).

Projects and activities must avoid and minimize direct impacts to waters of the United States, to the extent practicable. Aquatic resources are often avoided within on-site preserves. For unavoidable impacts, compensatory mitigation is required to replace the loss of waters of the United States functions. Compensatory mitigation includes re-establishment and establishment. **Re-establishment** is a form of environmental restoration in which there is manipulation of the physical, chemical, or biological characteristics of a site with the goal of returning the natural/historical functions to a former aquatic resource**. Establishment** is the manipulation of the physical, chemical, or biological characteristics of a site with the goal of developing a new aquatic resource where it did not previously exist. Pursuant to 40 CFR 230, the word "establish" is synonymous with "create" in this EIS/EIR.

In 2008, the USACE and the U.S. Environmental Protection Agency (EPA) jointly issued regulations for compensatory mitigation titled *Compensatory Mitigation for Losses of Aquatic Resources: Final Rule, 33 CFR Parts 325 and 332* (USACE and USEPA 2008)(2008 Compensatory Mitigation Rule). The term "compensatory mitigation" includes the restoration, re-establishment, establishment, enhancement, and/or preservation of wetlands, streams, or other aquatic resources specifically for the purpose of offsetting losses to these aquatic resources caused by authorized discharges of dredged or fill material into waters of the United States. The 2008 Compensatory Mitigation Rule seeks to improve the planning, implementation, and management

of wetland and stream compensatory mitigation projects by emphasizing a watershed approach in selecting compensatory mitigation project locations, requiring measurable and enforceable ecological performance standards with regular monitoring, and specifying the components of a complete compensatory mitigation plan.

If compensatory mitigation is required to offset unavoidable impacts to aquatic resources, the amount of compensatory mitigation must be sufficient to replace lost aquatic resource functions and services, to the extent practicable. In cases where functional or condition assessments or other suitable metrics are not used, a minimum 1-to-1 acreage or 1-to-1 linear foot compensation ratio must be used.

There are three forms of CWA 404 compensatory mitigation used within the Planning Area:

1. **Mitigation Bank:** A site, or suite of sites, where resources (e.g., wetlands, streams, riparian areas) are restored, established, enhanced, and/or preserved for the purpose of providing compensatory mitigation for impacts authorized by Department of the Army permits. In general, a mitigation bank sells compensatory mitigation credits to CWA 404 permittees whose obligation to provide compensatory mitigation is then transferred to the mitigation bank sponsor. The operation and use of a mitigation bank are governed by a mitigation banking instrument.
2. **In-Lieu Fee Program:** A program that conducts the restoration, establishment, enhancement, and/or preservation of aquatic resources through funds paid to a governmental agencies or nonprofit natural resources management entity by CWA 404 permittees to satisfy compensatory mitigation requirements for their USACE permits. Similar to a mitigation bank, an in-lieu fee program sells compensatory mitigation credits to permittees whose obligation to provide compensatory mitigation is then transferred to the in-lieu program sponsor. The operation and use of an in-lieu fee program are governed by an in-lieu fee program instrument.
3. **CWA Permittee-Responsible Mitigation:** An aquatic resource restoration, establishment, enhancement, and/or aquatic resource preservation activity undertaken by the CWA 404 permittee to provide compensatory mitigation: 1) permittee-responsible compensatory mitigation established under a watershed approach; 2) permittee-responsible compensatory mitigation through on-site and in-kind mitigation; and 3) permittee-responsible compensatory mitigation through off-site and/or out-of-kind mitigation.

CWA Section 401. To comply with Section 401 of the CWA, any project that receives permit under CWA Section 404 also needs to obtain a certification that the discharge will comply with the state's applicable effluent limitations and water quality standards. In California, the appropriate Regional Water Quality Control Board (RWQCB) administers CWA 401. The Central Valley RWQCB administers CWA 401 within the Planning Area.

State Statutes and Regulations

California Endangered Species Act

The California Endangered Species Act (CESA) (California Fish and Game Code, Section 2050 et seq.) prohibits the taking of species listed as threatened or endangered under the act, or candidates for listing, except as authorized by state law. Under CESA, "take" is defined as an activity that would directly or indirectly kill an individual of a species, but the CESA definition of take does not include "harm" or "harass," which is included in the ESA definition. As a result, the threshold for take is higher under CESA than under ESA.

Section 2081 of CESA states that take of an endangered, threatened, or candidate species may be authorized by the California Department of Fish and Wildlife (CDFW) if the impacts of the take are incidental to an otherwise lawful activity, are "minimized and fully mitigated," and do not "jeopardize the continued existence of [the] species." Any mitigation measures imposed under CESA must be measures "roughly proportional in extent to the impact of the authorized taking on the species."

Natural Community Conservation Planning Act

The Natural Communities Conservation Planning (NCCP) Act was established by the California Legislature, is directed by the Department of Fish and ~~Game~~ **Wildlife**, and is being implemented by the state, and public and private partnerships to protect habitat in California. The intent of the act is to promote long-term protection of plants, animals, and natural communities through landscape-level planning while still allowing compatible land use and local economic activity (California Fish and Game Code, Section 2800 et seq.; Morey and Ikeda 2001; Pollak 2001). As opposed to the single species interpretation of the federal ESA and CESA, this act aims at protecting many species using a regional ecosystem approach to habitat preservation. The Natural Communities Conservation Planning Act is designed to provide for conservation of ecosystems, including all of their components, whether they are rare or common, rather than a strategy of addressing impacts to rare taxa on a piecemeal, individual development project basis (Pollak 2001). By preserving larger areas of important habitat, it is hoped that common taxa will not become rare in the future (Lazar and Bjerke 2014).

Survey of California Vegetation

Natural communities have been considered part of the Natural Heritage conservation triad, along with plants and animals of conservation significance, since the state inception of the California Natural Heritage program in 1979 (CDFW 2016). In 2007, the State Legislature required CDFW to develop and maintain a vegetation mapping standard for the state (California Fish and Game Code Section 1940). This standard is manifested in the Survey of California Vegetation and implemented by the Vegetation Classification and Mapping Program (VegCAMP). VegCAMP focuses on

developing and maintaining maps and the classification of all vegetation and habitats in the state to support conservation and management decisions at the local, regional, and state levels. The California Natural Diversity Database (CNDDB) continues to include occurrences of rare natural communities despite the fact that funding for the natural communities part of the program was cut in the mid-1990s. Since that time, no new occurrences of natural communities have been added. However, the importance of maintaining the natural communities layer in the CNDDB has not diminished. Many of the 2,500+ individual occurrences of the 96 natural communities with occurrences in the CNDDB still have significance for conservation and their existence is considered in the California Environmental Quality Act (CEQA) environmental review process along with occurrences of plants and animals tracked by the CNDDB. Since 1999,CDFW's VegCAMP has undertaken the classification and mapping of vegetation throughout the state and also has assumed the role of standardizing vegetation nomenclature for California to comply with the National Vegetation Classification System standards. Many vegetation types included in the current list match well with existing CNDDB natural community elements, which were based on Holland (1986). However, there is a complex relationship between the CNDDB natural community elements and today's view of vegetation classification — in some cases, there is a one-to-one relationship, but in most there is a many-to-one or many-to-many relationship. Furthermore, in most cases no recent surveys have been made of the old CNDDB natural community occurrences to ascertain the proper identity based on today's National Vegetation Classification System classification standards. CDFW continues to refine the mapping and classification of the state's vegetation. This will take some time. In the meantime, CDFW continues to include all of the old CNDDB natural Community elements in the current Natural Communities List (CDFW 2016).

Section 1602 Streambed Alteration

All diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California that supports wildlife resources are subject to regulation by the CDFW under Sections 1600 et seq. of the California Fish and Game Code. Under Section 1602, it is unlawful for any person to substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by CDFW, or use any material from the streambeds, without first notifying CDFW of such activity and obtaining a Lake or Streambed Alteration Agreement authorizing such activity. "Stream" can be defined as a body of flowing water and the landform that conveys it, including water sources and adjoining landscape elements that are byproducts of and affected by interactions with flowing water without regard to size, duration or timing of flow.

Porter–Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act requires that each of the nine RWQCBs in California prepare and periodically update basin plans for water quality control. Each basin plan sets forth water quality standards for surface water and groundwater and actions to control nonpoint and

point sources of pollution to achieve and maintain these standards. Basin plans offer an opportunity to protect wetlands through the establishment of water quality objectives. The RWQCBs' jurisdiction includes waters of the United States and areas that meet the definition of "waters of the state." Waters of the state are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. The RWQCBs have the discretion to take jurisdiction over aquatic areas not federally protected under CWA Section 404 provided they meet the definition of "waters of the state." The Porter-Cologne Water Quality Control Act is discussed in more detail in Section 10.1.1 of this EIS/EIR.

Oak Woodland Protection

Section 21083.4 of the California Public Resources Code requires counties to determine if a project within their jurisdiction is expected to result in conversion of oak woodlands that would have a significant adverse effect on the environment. If the lead agency determines that a project would result in a significant adverse effect on oak woodlands, mitigation measures to reduce the significant adverse effect of converting oak woodlands to other land uses are required.

Protection for Common Bird Nests and Common Raptors

Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptor (e.g., hawks, owls, eagles, and falcons), including their nests or eggs. Section 3513 of the California Fish and Game Code codifies the federal Migratory Bird Treaty Act.

Local Regulations and Policies

Sacramento County General Plan of 2005–2030

The *Sacramento County General Plan* of 2005-2030 (Sacramento County General Plan)(Sacramento County 2011) Conservation Element includes goals, objectives, and over 100 policies related to the management and preservation of natural resources (policies CO-19 through CO-140 under Section V, Vegetation and Wildlife). The following is a summary of the policies relevant to the Planning Area natural communities (land covers) and their associated plant and animal species.

> **Policies CO-19 to CO-32:** Provide for a safe, reliable water supply while protecting the beneficial uses of waters for the State of California by protecting water quality and water-supported ecosystems through preservation, restoration, and creation of riparian and wetlands habitats and buffers to protect water quality from erosion.

Policies CO-58 through CO-63: Support the management and restoration of wetland and riparian habitat, native habitat, and special-status species habitat. The Sacramento County General Plan calls for no net loss of wetlands, riparian woodlands, and oak woodlands.

Policies CO-83 and CO-86: Establish and limit land uses in vernal pool habitat preserves.

Policies CO-88 through CO-92: Support protection and enhancement of riparian habitat and promote the increase of native woodlands and riparian scrub along select waterways.

Policies CO-93 through CO-95: Maintain the natural character of the 100-year floodplain by limiting fill and excavation.

Policies CO-96 through CO-101: Promote the maintenance of bank stabilization on river and waterways and riparian functionality.

Policies CO-102 through CO-104: Promote the conservation and protection of the Cosumnes River and Mokelumne River corridors.

Policies CO-114 through CO-124: Protect stream corridors from an action that would degrade water quality and require maintenance of vegetation to allow for high water quality.

Policies CO-138 through CO-140: Require the preservation and protection of non-oak trees occurring in riparian habitats, especially those trees used by Swainson's hawks (*Buteo swainsonii*), and the protection of native trees other than oaks from development. Policies CO-138 through CO-140 also require that the removal of native oaks be compensated through canopy replacement or replanting.

In addition to the Conservation Element, the General Plan Agricultural Element contains policies that protect certain agricultural land covers (AG-1 though AG-6), as discussed previously in Section 6.1.1.3:

Policy AG-1: The County shall protect Prime, Statewide Importance, Unique and Local Importance farmlands located outside of the USB [urban services boundary] from urban encroachment.

Policy AG-3: The County shall permit agricultural uses on buffers, provided such uses are conducted in a manner compatible with urban uses. Buffers shall be used to separate farming practices incompatible with adjacent urban uses. Any homeowners' association or similar entity within the development shall assist in determining compatible use. Buffers shall not adversely conflict with agricultural uses on adjoining property.

Policy AG-5: Projects resulting in the conversion of more than fifty (50) acres of farmland shall be mitigated within Sacramento County, except as specified in the paragraph below, based on a 1:1 ratio, for the loss of the following farmland categories through the specific planning process or individual project entitlement requests to provide in-kind or similar resource value protection (such as easements for agricultural purposes):

- Prime, Statewide Importance, Unique, Local Importance, and Grazing farmlands located outside the USB;
- Prime, Statewide Importance, Unique, and Local Importance farmlands located inside the USB.

The Board of Supervisors retains the authority to override impacts to Unique, Local, and Grazing farmlands, but not with respect to Prime and Statewide farmlands.

Sacramento County Swainson's Hawk Ordinance

Chapter 16.130 of Title 16 of the Sacramento County Code addresses the reduction in Swainson's hawk foraging habitat within unincorporated Sacramento County. Participating in the County's Swainson's Hawk Mitigation Program, which is voluntary, is one option for mitigating the loss of foraging habitat within unincorporated areas of the County. Under this program, mitigation for impacts less than 40 acres can be achieved by paying a mitigation fee or providing replacement habitat (title or easement to suitable Swainson's hawk mitigation lands on a per-acre basis); mitigation for impacts of 40 acres or greater can be achieved only by providing replacement habitat under this program.

Sacramento County Tree Ordinance and Tree Preservation Ordinance

The Sacramento County Tree Ordinance (Chapter 19.04 of Title 19 of the County Code) establishes guidelines for the planting, removal, and protection of public trees as well as specially protected trees such as heritage or landmark trees within Sacramento County. A public tree is defined by the ordinance as "a tree or shrub planted or maintained, or both, by the County on an easement, planting easement, street, county park or public premises." A heritage tree is defined by the ordinance as "a California oak tree growing on any land (in unincorporated area) of Sacramento County, including privately owned land, with a trunk sixty inches or greater in girth measured four and one-half feet above the ground." A landmark tree is defined by the ordinance as "an especially prominent or stately tree on any land (in the unincorporated area) in Sacramento County, including privately owned land." The disturbance of any public tree without a permit is prohibited and special protection of landmark and heritage trees is required.

The Sacramento County Tree Preservation Ordinance (Chapter 19.12 of Title 19 of the County Code) establishes measures to preserve and protect native oak trees within the designated urban area. A native oak tree is defined by the ordinance as any valley oak (*Quercus lobata*), interior live oak (*Q. wislizenii*), blue oak *(Q. douglasii*), or oracle oak *(Q. morehus*) having at least one trunk of 6 inches or more in diameter measured 4.5 feet above the ground, or a multi-trunked native oak tree having an aggregate diameter of 10 inches or more measured 4.5 feet above the ground. The ordinance prohibits native oak tree removal or ground-disturbance activities within the dripline of a native oak tree, without a tree permit, unless authorized as a condition of a discretionary project such as a subdivision map, rezone, or conditional use permit. The ordinance establishes decision criteria for ascertaining whether or not oak tree removal should be permitted, along with development control measures intended to mitigate damage to oak trees caused by land development. The ordinance also establishes a Tree Preservation Fund to be used for tree planting and preservation programs and public education programs regarding trees.

2030 Galt General Plan

The *2030 Galt General Plan* (Galt General Plan) (Galt 2009) includes goals and policies that encourage the protection of important habitats and commit the city to address the effects of urban development on these habitats. Applicable Policies in the Galt General Plan include the following:

> **Policy COS-2.1:** Sensitive Species Protection: The City should require minimization of impacts to protect mature trees, vernal pools, and any threatened endangered or other sensitive species when approving new development.
>
> **Policy COS-2.2:** Wetland and Riparian Communities Management: The City shall support the protection, restoration, expansion, and management of wetland and riparian plant communities for passive recreation, groundwater recharge, and wildlife habitat.
>
> **Policy COS-2.3:** Biologically Sensitive Area Development: The City should require new development in areas that are known to have particular value for biological resources to maximize preservation of sensitive vegetation and wildlife habitat.
>
> **Policy COS-2.4:** Federal, State, and Local Statutes Compliance: The City shall review development proposals in accordance with applicable Federal, State, and local statutes protecting special-status species and jurisdictional wetlands.
>
> **Policy COS-2.5:** Mitigation Measures Imposition: The City shall take into consideration mitigation standards and policies of resource and regulatory agencies with jurisdiction over biological resources (e.g., USFWS, CDFW, etc.).

Policy COS-2.6: Biological Surveys: On sites that have the potential to contain critical or sensitive habitats or special species, the City shall require the project applicant to have the site surveyed by a qualified biologist. A report on the findings of this survey shall be submitted to the City as part of the application process.

Policy COS-2.7: Regional Habitat Conservation Efforts Coordination: The City shall continue to coordinate efforts with Sacramento County to develop the South Sacramento Habitat Conservation Plan.

Policy COS-3.1: Riparian Protection: The City should require the protection of existing riparian vegetation along stream courses in the city.

Policy COS-3.2: Mature Tree and Woodland Preservation: The City shall encourage retention of mature trees and woodlands to the maximum extent possible.

Policy COS-4.1: Prime Agricultural Land Preservation. The City shall work to preserve prime agricultural lands surrounding the Planning Area from future development by creating a clear and sensitive urban transition to minimize land use conflicts and protect long-term agriculture.

Galt Tree Ordinances

Chapter 12.28 of the City of Galt Municipal Code requires written permission and approval for the cutting or removal of oak trees or public trees on public and private property unless certain provisions such as emergencies apply. A public tree is any tree with one-half or more of its trunk or branches on or above public land. An oak tree is defined as including, but not limited to, valley oak, interior live oak, blue oak, or oracle oak having at least one trunk of 6 inches in diameter measured 4 feet above the ground, or multi-trunks with an aggregate diameter of 8 inches or more measured 4 feet above ground. Minimum development control measures are suggested such as not disturbing the ground within the driplines of protected trees. Grading within the dripline of oak trees is not permitted unless specifically authorized. A tree preservation fund is established and is expected to be contributed to in lieu of a project planting replacement trees and is used for the planting, enhancement, maintenance and/or monitoring of trees on publicly owned property, easements, or rights-of-way. Specific details apply for ground disturbance within a protected tree's dripline.

Rancho Cordova General Plan

The *Rancho Cordova General Plan* (Rancho Cordova 2006) Natural Resources Element includes various goals and policies that encourage the protection of important habitats and guide mitigation for impacts to these habitats that cannot be avoided. There is also a policy that

functions much like tree ordinances adopted by other jurisdictions. Applicable policies in the General Plan include the following:

Policy NR.1.1: Protect rare, threatened, and endangered species and their habitats in accordance with State and federal law.

Policy NR.1.2: Conserve Swainson's hawk habitat consistent with State policies and Department of Fish and Game guidelines.

Policy NR.1.6: Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.

Policy NR.1.8: The City shall encourage creation of habitat preserves that are immediately adjacent to each other in order to provide interconnected open space areas for animal movement.

Policy NR.1.9: The City shall require that impacts to riparian habitats be mitigated at a no net loss of existing function and value based on field survey and analysis of the riparian habitat to be impacted. No net loss be accomplished by avoidance of the habitat, restoration of existing habitat, or creation of new habitat, or through some combination of the above.

Policy NR.1.10: The City shall avoid the placement of new roadways within habitat preserves to the maximum extent feasible.

Policy NR.1.11: In such cases where habitat preserves are crossed by a roadway, or where two adjacent preserves are separated by a roadway, the roadway shall be designed or updated with wildlife passable fencing separating the roadway from the preserve and/or shall incorporate design features that allow for the movement of wildlife across or beneath the road without causing a hazard for vehicles and pedestrians on the roadway.

Policy NR.2.1: Require mitigation that provides for "no net loss" of wetlands consistent with current State and federal policies.

Policy NR.2.2: Ensure that direct and indirect effects to wetland habitats are minimized by environmentally sensitive project siting and design, to the maximum extent feasible.

Policy NR.2.5: The City shall require that drainage improvements that discharge into areas of wetlands to be preserved are, to the maximum extent feasible, designed to

mimic the undeveloped surface water flow conditions of the area in terms of seasonality, volume, and flow velocity.

Policy NR.3.1: Coordinate with property owners and local interest groups, such as the Sacramento Urban Creeks Council, to restore, enhance, and preserve creeks in Rancho Cordova.

Policy NR.3.4: Encourage projects that contain wetland preserves or creeks, or are located adjacent to wetland preserves or creeks, to be designed for visibility and, as appropriate, access.

Policy NR.4.1: Conserve native oak and landmark tree resources for their historic, economic, aesthetic, educational, and environmental value.

Policy NR.4.4: Prior to the approval of any public or private development project in areas identified or assumed to contain trees, the City shall require that a determinate survey of trees species and size be performed. If any native oaks or other native trees six inches or more in diameter at breast height (dbh), multi-trunk native oaks or native trees of 10 inches or greater dbh, or non-native trees of 18 inches or greater dbh that have been determined by a certified arborist to be in good health are found to occur, such trees shall be avoided if feasible. If such trees cannot be avoided, the project applicant shall do one of the following:

- All such trees shall be replaced at an inch-for-inch ratio. A replacement tree planting plan shall be prepared by a certified arborist or licensed landscape architect and shall be submitted to the City of Rancho Cordova for approval prior to removal of trees; or
- The project applicant shall submit a mitigation plan that provides for complete mitigation of the removal of such trees in coordination with the City of Rancho Cordova. The mitigation plan shall be subject to the approval of the City.

If the City of Ranch Cordova adopts a tree preservation ordinance at any time in the future, any future development activities shall be subject to that ordinance instead.

Policy LU.1.9: The City shall require development to protect 1 acre of existing farmland of equal or higher quality for each acre of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance that would be converted to non-agricultural uses. This protection may consist of the establishment of farmland conservation easements, farmland deed restrictions, or other appropriate farmland conservation in perpetuity, but may also be utilized for compatible wildlife conservation efforts. The farmland to be

preserved shall be located within Sacramento County and must have adequate water supply to support agricultural use. As part of the consideration of land areas proposed to be protected, the City shall consider the benefits of preserving farmlands in proximity to other protected lands.

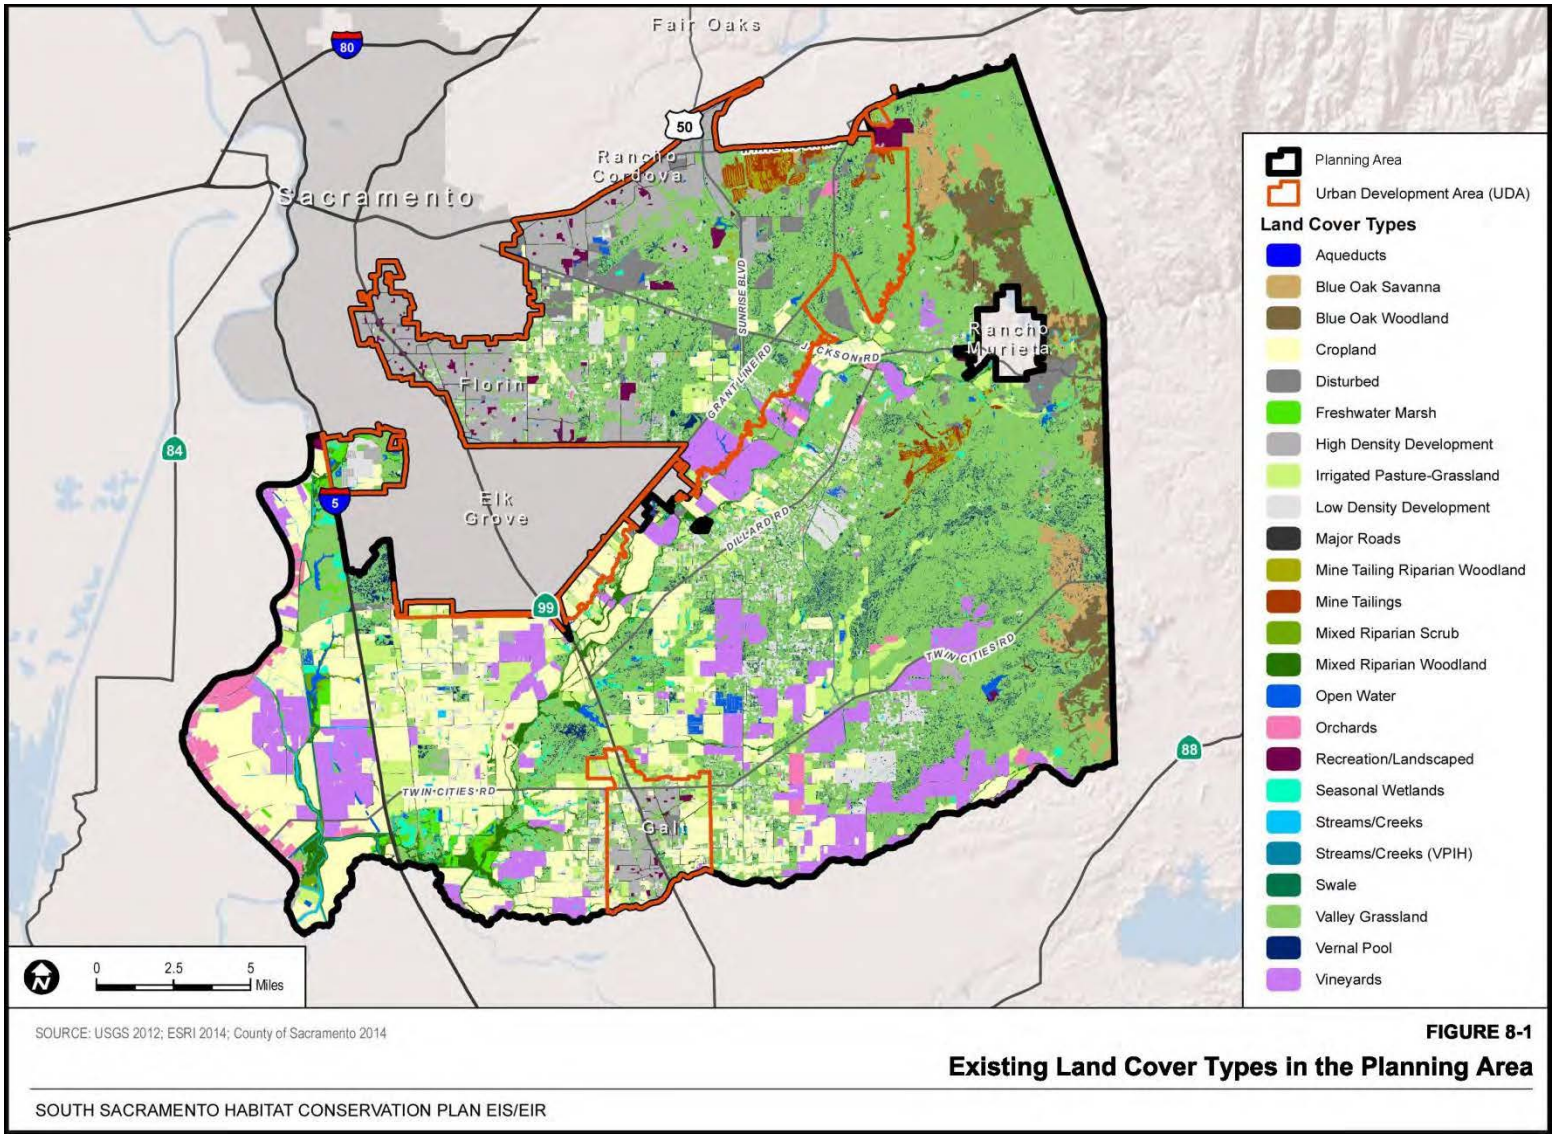
8.1.2 Existing Conditions

This section provides information on the existing condition of each Planning Area natural land cover, as well as the existing condition of the plant and wildlife community that occurs in each Planning Area land cover. A "community" is a naturally occurring group of organisms belonging to a number of different species that live together in the same habitat or same area and interact through trophic and spatial relationships; a community is typically characterized by reference to the dominant plant species that give the community structure (Allaby 2010, Lincoln et al. 1998).

The land cover classifications used in the EIS/EIR are the same Planning Area land covers defined in the Draft SSHCP document, which are a modified version of the natural communities described in CDFW's Manual of California Vegetation (Sawyer and Keeler-Wolf 1995). See the Draft SSHCP document Appendix E1 for a summary of the information and methodology used by the Permit Applicants to map existing SSHCP land covers within the Planning Area (Sacramento County et al. 2017).

Under the land cover classifications used in the SSHCP document, there are 17 "natural" land covers within the Planning Area. The natural land covers provide habitat for different communities of native plant and native wildlife species (see Section 8.1.2.1). Under the land cover classifications used in the SSHCP document, there are also eight "developed" land covers that were created by past and current human activities in the Planning Area (Table 8-1a). These eight developed land covers do not provide natural or important habitat for native plant and wildlife communities. Consequently, the developed land covers are not discussed further in Chapter 8, and any impacts from the EIS/EIR alternatives to areas of existing developed land covers are not analyzed in this chapter. However, because some of the Planning Area's special-status bird species occasionally use trees or other features within certain "developed" land covers, Chapter 9 will include some of the developed land covers in the analyses of the Planning Area's special-status species.

As discussed previously in Section 3.7.1, the Planning Area has been affected by past and current agriculture activities, urban development projects, infrastructure projects, and mining operations. These past and present activities have affected the existing distribution and existing conditions of the natural land covers and their associated natural communities that are present in the Planning Area (Figure 8-1).



8.1.2.1 Natural Land Covers

As discussed previously, there are 17 natural SSHCP land covers in the Planning Area, totaling approximately 272,596 acres (Table 8-1a). Each of the 17 natural land covers provide important habitat for an associated community of native plant and wildlife species.

The following section includes a brief description of each natural land cover, discusses the existing acres and general locations of each land cover within the Planning Area, and describes the general condition of each natural land cover in the Planning Area. Figure 8-1 shows the existing distribution of each natural land cover in the Planning Area, and Table 8-1a lists the acres of each natural land cover within the Planning Area.

Of the approximately 272,596 acres of natural land covers within the Planning Area, approximately 64,000 acres (approximately 19% of the Planning Area) are within existing preserves (Figure 1-2). The Planning Area's existing preserves include wildlife refuges, nature preserves, lands under conservation easements, open space, mitigation banks, and individual mitigation sites established by past projects. Table 8-1b, Existing Natural Land Covers Already Preserved within the Planning Area, lists the total acreage of each land cover within existing preserves.

Aquatic Land Covers

Vernal Pool Land Cover

Vernal pools are shallow surficial depressions that temporarily fill with water during winter and spring rains, but desiccate in the early dry summer months. As discussed in Appendix G-1, vernal pools occur as small poorly drained depressions in some Valley Grasslands and are perched above an impermeable or very slowly permeable soil horizon (Smith and Verrill 1998).

The hydrologic regime and seasonal inundation of a vernal pool is too short and unpredictable to support aquatic plant species, but is long enough to eliminate upland plant species. This characterizes vernal pools as ephemeral wetlands, and differentiates them from other aquatic ecosystems (Solomeshch and Holland 2007).

Most of California, including the Planning Area, has a Mediterranean climate that is characterized by hot, dry summers followed by a mild, wet winter. As discussed in Appendix G-1, soils in the Vernal Pool Ecosystems of the Planning Area typically become wetted in November and remain saturated during the winter and early spring, but dry by summer.

As discussed in Chapter 5, Planning Area vernal pools are located on several geological surfaces with soils that include a low-permeability layer such as a claypan, hardpan (e.g., silica-cemented duripans), a mudflow, or bedrock (Rains et al. 2006). Because vernal pools are associated with specific landforms, geologic formations, and soils (Smith and Verrill 1998), vernal pools tend to be clustered at the landscape scale, forming vernal pool complexes (Rains et al. 2006, USFWS 2006). A vernal pool's frequency of ponding, filling, draining, and ponding depth and ponding duration is primarily affected by characteristics of the vernal pool's watershed, including the underlying geology, the landform, the nature of the soil's water-restricting layer, and the soil depth above the soil's water-restricting layer. Vernal pool community structure (i.e., the type, number, and relative abundance of species) is largely determined by the vernal pool's physical makeup (e.g., size, depth, substrate, water chemistry) and the vernal pool's hydrology—the presence or absence of certain species and different patterns of species dominance can be indicative of physical and hydrologic differences among vernal pools (Holland and Jain 1988). Vernal pools in the Planning Area exhibit a variety of size, depth, soil, and water chemistry. Key physical parameters include pool drainage area, slope, soil type, soil structure and depth, pool size and depth, timing of the pool hydrologic cycle, and hydrologic interconnectivity. Most vernal pools in the Planning Area are broadly classified as Northern Hardpan vernal pools and Northern Volcanic Mudflow vernal pools (Jones and Stokes 1990, Sawyer and Keeler-Wolf 1995). In addition, a less specialized vernal pool type with generally lower species richness is found on Drainageway formation soils within the Planning Area. The vernal pools present in the Planning Area can be further classified by the presence or absence of certain dominant or less abundant vernal pool plant species (Sawyer and Keeler-Wolf 1995, Barbour et al. 2007, Sawyer et al. 2009).

Northern Volcanic Mudflow vernal pools occur on ancient mudflows called lahars. These pools are small, form in irregular depressions in gently sloping surfaces, and are often rocky and shallow. Water chemistry is mixo-saline, fresh (Sawyer and Keeler-Wolf 1995). As discussed in Chapter 5, Northern Volcanic Mudflow vernal pools are found on in the Planning Area on the Mehrten and Valley Springs formation in rocky soil series and complexes such as Hadselville-Pentz, Red Bluff-Redding, Corning-Redding, Amador-Gillender, and Pardee-Rancho Seco (Jones and Stokes 1990). Mudflow vernal pools in the Planning Area are hydrologically complex; in

some areas, vernal pools are in complex reticulated drainage networks with a high density of interconnected pools, swales, and ephemeral drainages (Jones and Stokes 1990). The seasonal hydrology of Northern Volcanic Mudflow vernal pools includes a perched water table (see Section 3.2.3), but the vernal pool hydrology is relatively "flashy" (i.e., pools fill and drain relatively rapidly). Northern Volcanic Mudflow vernal pools contain relatively rich flora that includes several vernal pool obligate species. The species richness and ecological complexity of Northern Volcanic Mudflow pools in the Planning Area exceed that of the Young-Terrace Northern Hardpan pools and the Drainageway vernal pools in the Planning Area. Possible explanations of the rich (less specialized) flora of Northern Volcanic Mudflow pools include the recent origin of the pools and their quickly changing or "flashy" hydrology. Mudflow pools fill and drain rapidly and are expected to be less stressful to most plant life than pools that remain flooded for extended periods, such as the Old-Terrace Northern Hardpan vernal pools (Jokerst 1990, Jones and Stokes 1990). Dominant plant species including California goldfields (*Lasthenia californica*), dwarf blennosperma (*Blennosperma nana*), round woollyheads (*Psilocarphus brevissimus*), two-crowned downingia (*Downingia bicornuta*), water pygmy (*Crassula aquatica*), and/or whiteflower navarretia (*Navarretia leucocephala*) are expected to be present with other herbs and grasses.

Northern Hardpan vernal pools form on alluvial terraces in old, acidic, nutrient-depleted soils with iron-silicate cemented soil layer (see Chapter 5). These soils often exhibit well-developed mound-intermound topography to form aggregations of pools and "mima mounds." Water chemistry is mixo-saline fresh (Sawyer and Keeler-Wolf 1995, USFWS 2005). Northern Hardpan vernal pools typically have a conductivity of 40 to 70 mhos per 1 centimeter, which is similar to oligotrophic high Sierra lakes (Keeley and Zedler 1998, Williamson et al. 2005). Water in hardpan vernal pools is not only low in dissolved salts, but also in dissolved nitrogen. For example, Rains et al. (2006) reported that, during the growing season, nitrate and phosphate concentrations were below detection limits (i.e., 0.006 milligrams per liter (mg/L) and 0.03 mg/L, respectively), and the amount of ammonium was negligible (0.1 mg/L). Within the Planning Area, Northern Hardpan vernal pools occur on the low (younger) terrace Riverbank Formation soil series (e.g., San Joaquin, Galt, Madera, Tehama), as well as on the high (older) terrace Laguna Formation and Arroyo Seco gravels (e.g. Corning, Redding, Red Bluff, Mokelumne soil series). Vernal pools occur extensively on both landforms types (Jones and Stokes 1990). Dominant plant species may include bladder clover (*Trifolium depauperatum*), coyote-thistle (*Eryngium vaseyi*), Fremont gold-fields (*Lasthenia fremontii*), dwarf downingia (*Downingia pusilla*), popcorn flower (*Cryptantha microstachys*), rose meadowfoam (*Limnanthes douglasii* ssp. *rosea*), and water pygmy (*Crassula aquatic)*.

High-Terrace Northern Hardpan vernal pools (e.g., on Corning and Redding soil series) are the most complex type of vernal pool in the Planning Area because of their rich and varied flora,

presence of special-status plant and invertebrate species, and complex hydrology, and because they often occur in areas with complex, highly convoluted interspersions of several soil types. Soils on high-terrace landform sites varies over short distances such that sites in proximity to each other is expected to have entirely different restricting layer types, depth, and vernal pool plant community. High-Terrace Northern Hardpan vernal pools are floristically rich and dominated by vernal pool obligate plant species (true "specialists") and typically support special-status vernal pool species. The tremendous age and the geographic location of High-Terrace Northern Hardpan pools may explain their rich and highly specialized flora (Jones and Stokes 1990). In addition, little of the high-terrace landform has been farmed in the Planning Area because irrigation water is lacking, and many sites are not arable. Some high-terrace vernal pool areas were dryland farmed in the past with wheat or oats; this type of farming appears to have had little effect on high-terrace vernal pools. However, on other formations, dryland farming has disrupted vernal pool surface hydrology. Consequently, High-Terrace Northern Hardpan vernal pools are relatively abundant in the Planning Area (Jones and Stokes 1990).

The Planning Area's **Low-Terrace Northern Hardpan vernal pools** (e.g., on San Joaquin soils) are of relatively recent geologic origin, which may explain their relatively unspecialized flora. The flora of Low-Terrace Northern Hardpan vernal pools often includes non-native plants, low species richness, scarcity of vernal pool obligate species, and low numbers of special-status plants. Most of the low terrace sites in the Planning Area have been plowed, graded, or heavily grazed because of their arable soils and proximity to reliable water; this may also account for their less specialized flora, relative to the flora of the High-Terrace Northern Hardpan pools. However, Low-Terrace Northern Hardpan vernal pools serve an important function as habitat for shorebirds, waterfowl, and raptors because of their location in the central portion of the valley along the Sacramento River (Jones and Stokes 1990; Silveira 1998).

Drainageway vernal pools are located on no particular Planning Area geologic formation, but formed on recent alluvial deposits that are adjacent to the incised channels of active watercourses. Consequently, Drainageway vernal pools are interspersed throughout the other three vernal pool types present in the Planning Area. Drainageway vernal pools fill and drain more rapidly than other Planning Area vernal pools, and are likely to depend more on overland runoff and direct precipitation to maintain their hydrology when compared to the other Planning Area vernal pool types (Jones and Stokes 1990).

All vernal pools support endemic plants and animals that are adapted to living under the extreme wet and dry annual hydrology of vernal pools. All vernal pool plant species live their entire lifecycle within 1 year, but have seeds that can remain dormant for many years. This allows vernal pool plant species to survive years of reduced winter rainfall and drought when pools partially fill with water or do not fill at all. Similarly, species of crustaceans, insects, and amphibians that occur in vernal pools are adapted to the extreme annual hydrology. Vernal

pools in the Central Valley and this Planning Area have historically supported four amphibian species: California tiger salamander (*Ambystoma californiense*), western spadefoot (*Spea hammondii*), western toad (*Anaxyrus boreas*), and the Pacific chorus frog (*Pseudacris regilla*) (Anderson 2013). However, recent estimates of the abundance and distribution of these amphibian species in the Sacramento Valley Vernal Pool Region indicate that most of these species are in steep decline or virtually extirpated from this region. Today, the Pacific chorus frog is often the most abundant, if not the only amphibian species, found within California's vernal pools (Anderson 2013). More than 22 species of freshwater crustaceans in occur in Planning Area vernal pools, including three species of fairy shrimp, six copepod species, several species of water fleas, several types of clam shrimp, seed shrimp, and tadpole shrimp (Poirier 2012), as well as flatworms, snails, insect larva, and aquatic beetles (Calderaro 2011).

Vernal pools were once widespread across the Central Valley and in this Planning Area. However, because of past agricultural and urban development in the Central Valley (see Section 3.7.1), much of the vernal pool landscape and its associated species, including vernal pool plants and vernal pool crustaceans, have disappeared from large portions of their historical range (Holland 2009; Witham et al. 2014; USACE 2014).

Vernal pools are also used by common or non-specialized wildlife species including migratory birds and resident insect species, including native bumblebees and other pollinators. In addition, upland wildlife species associated with the Valley Grasslands that surround vernal pools also forage in or disperse through vernal pools, especially when pools are dry (see the Valley Grassland and Vernal Pool Ecosystem discussions later in this section).

As discussed in Section 8.1.2.2, the Vernal Pool land covers in the Planning Area are hydrologically and ecologically connected to the Swale, Valley Grassland, and Stream/Creek (Vernal Pool Invertebrate Habitat (VPIH)) land covers, which are described below.

Swale Land Cover

In the Planning Area, Swales are shallow gently sloping narrow seasonal drainages found in flat to gently rolling Valley Grassland on soils with an impermeable layer, and are always in association with vernal pools. The movement of surface water between vernal pools can occur in a network of surface "swales" (Solomeshch and Holland 2007). As discussed in Appendix G-1, most Planning Area vernal pools begin to fill with water only after the soil becomes saturated from winter rainfall, and seasonal "perched aquifer" forms in the upper part of the soil profile (above the soil restrictive layer). After the soil becomes saturated and vernal pools fill, Swales may convey surface water during and after winter rainstorms. In this manner, swales function as conduits between vernal pools that provide movement of water and dispersal of vernal pool plant and animal propagules (e.g., pollen, seeds, cysts, eggs, and spores), and also function as

conduits for movement of juvenile and adult vernal pool vertebrate species, such as California tiger salamander and western spadefoot. Swales support many of the native plant species that are also found within vernal pools.

Generally, the Swale land cover provides intermittent habitat for portions of the life cycle of many of the vertebrate and crustacean species that occur in the vernal pool land cover, including Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii)*, dwarf downingia, pincushion navarretia (*Navarretia myersii*), mid-valley fairy shrimp (*Branchinecta mesovallensis*), vernal pool fairy shrimp (*Lepidurus packardi*), Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*), and western spadefoot. In addition to these special-status species, Swales also support more common vernal pool plant and animal species, and often support some plant species that are also found in the surrounding Valley Grasslands.

As indicated in Section 8.1.2.2, the Swale land cover is connected ecologically and hydrologically to Vernal Pools and the adjacent Valley Grassland upland, and many Swales also discharge to and are hydrologically connected with the Stream/Creek (VPIH)) land cover.

Stream/Creek (VPIH)

In this Planning Area, the Stream/Creek (VPIH) land cover consists of intermittent drainages which convey water only after rain events (i.e., are ephemeral) and are located within the Vernal Pool Ecosystem (see section 8.1.2.2). Unlike the Swale land cover, the Stream/Creek (VPIH) land cover is less likely to support plant species that also occur within vernal pools; the vegetation of the Stream/Creek (VPIH) land cover is usually dominated by Valley Grassland plant species. However, many vernal pool invertebrate crustaceans, including mid-valley fairy shrimp and vernal pool fairy shrimp, can be found within the Stream/Creek (VPIH) land cover, especially in places where water ponds between storm events. Dominant plant and wildlife species of the Stream/Creek (VPIH) land cover include species associated with Vernal Pools, Swales, and Valley Grasslands. As discussed in Section 8.1.2.2, the Stream/Creek (VPIH) land cover is only located in the Vernal Pool Ecosystem.

Valley Grassland Land Cover

The Valley Grassland land cover in the Planning Area is currently dominated by naturalized non-native annual grasses, but also includes some native and naturalized forbs (see Section 3.7.1). Non-native annual grasses that dominate this land cover include wild oats (*Avena fatua*), soft chess (*Bromus hordeaceus*), ripgut brome (*B. diandrus*), red brome (*B. madritensis* ssp. *rubens*), wild barley (*Hordeum* spp.), and foxtail fescue (*Vulpia myuros*). Common forbs of this land cover include broadleaf filaree (*Erodium botrys*), redstem filaree (*E. cicutarium*), turkey mullein (*Eremocarpus setigerus*), true clovers (*Trifolium* spp.), and bur clover (*Medicago polymorpha*)

(Kie 2005; Sawyer and Keeler-Wolf 1995). Native plant species comprise a small portion of the current annual grassland flora in the Sacramento Valley, including the Planning Area. For example, purple needlegrass (*Stipa pulchra*) can be found as the dominant grass (i.e., comprising greater than 20% cover) in small patches along ridgetops of low-lying hills in the eastern portion of Sacramento County.

Common native mammal species found in the Planning Area's valley grasslands community include mule deer (*Odocoileus hemionus*), as well as rodents such as California ground squirrels (*Otospermophilus beecheyi*), California pocket mice (*Chaetodipus californicus*), and black-tailed jack rabbits (*Lepus californicus*). Common predators include the coyote (*Canis latrans*) and western rattlesnakes (*Crotalus viridis*). Native bird species that utilize these open, grassy areas include horned lark (*Eremophila alpestris*), northern harrier (*Circus cyaneus*), and western meadowlark (*Sturnella neglecta*). Invertebrate populations also provide an abundant food source, such as pallid-winged grasshoppers (*Trimerotropis pallidipennis*) and devastator grasshopper (*Melanoplus devastator).*

As discussed in Section 8.1.2.2, approximately 97,349 acres of the total 135,152 acres of Valley Grassland present within the Planning Area (approximately 72%) (Table 8-2) are believed to be ecologically and hydrologically associated with Vernal Pools and Swales, and are a part of the Vernal Pool Ecosystem.

Stream/Creek Land Cover

The Stream/Creek land cover includes linear aquatic features such as rivers, streams, creeks, and drainages that are intermittent or perennial. Species expected to co-occur within the Stream/Creek land cover include predatory birds such as common mergansers (*Mergus merganser*) and belted kingfisher (*Megaceryle alcyon*), which feed on the smaller fish that reside in the perennial creeks such as smaller age class brown trout (*Salmo trutta*), bluegill (*Lepomis macrochirus*), and small mouth bass (*Micropterus dolomieu*). Other fish that reside in the perennial Stream/Creek land cover include common carp (*Cyprinus carpio*), Sacramento pikeminnows (*Ptychocheilus grandis*), and riffle sculpin (*Cottus gulosus*). Many of the terrestrial species that occur in the streams and creek community also use the adjacent Riparian land covers, as described below for the Riparian land cover's natural community. Aquatic invertebrates such as aquatic insects, insect larvae, crustaceans, and mollusks are also important elements of the natural community associated with this land cover.

Seasonal Wetland Land Cover

The Seasonal Wetland land cover includes ephemeral wetlands that pond during the winter rainy season and usually become dry by late summer or fall, but may pond water year-round in

some years. Many exist only because of man-made alterations of the landscape that caused water to pond longer or sometimes pond year round, for example, stock ponds that dry during the summer during most years are Seasonal Wetlands, whereas perennial stock ponds would be considered Open Water. Seasonal Wetlands support herbaceous hydrophytic plant species that may also occur in with perennial marshes and lakes. The Seasonal Wetland land cover occurs in isolated patches throughout this Planning Area, as well as on the edges of the Stream/Creek land cover, and edges of rivers, ponds, lakes, and reservoirs (Open Water land cover). Depending on water depth and duration, Seasonal Wetlands provide breeding habitat for a large number of amphibian species, including the California tiger salamander, western spadefoot, bullfrogs (*Bufo borealis)*, and Pacific treefrog (*Pseudacris regilla*). As with other seasonal and perennial waterbodies, the insects, crustaceans, mollusks (e.g., snails), and vegetation associated with this habitat provide important forage and habitat for migratory shorebirds and songbirds, as well as attracting upland wildlife such as mice, mule deer, coyote, raccoon (*Procyon lotor*), and striped skunk (*Mephitis mephitis*).

Freshwater Marsh Land Cover

Most of California's freshwater marshes occur in the Sacramento Valley and Sacramento–San Joaquin Delta regions. Therefore, the majority of Freshwater Marsh land cover in the Planning Area occurs along the perennial Cosumnes River and Deer Creek corridors. Freshwater marsh is also found on the margins of some streams and margins of the Open Water land covers.

Freshwater Marsh is typically dominated by perennial, herbaceous, hydrophytic plant species such as cattails (*Typha* spp.), tules (*Scirpus* spp.), and other emergent plant species, and is generally found along the edges of the Open Water land covers such as ponds, lakes, and rivers. Freshwater Marsh supports a diverse animal community. Prey species include insects, insect larvae, crustaceans, mollusks, birds, and mammals. For example, waterfowl feed on the abundant aquatic invertebrate populations associated with emergent Freshwater Marsh. The emergent vegetation also provides breeding habitat and shelter for red-winged blackbird (*Agelaius phoeniceus*). Swans, geese, and a variety of ducks visit the Freshwater Marshes for breeding, nesting, rearing young, and feeding. Muskrat (*Ondatra zibethicus*) use marsh plants for denning and feed on rushes, tule, cattails, crayfish, and snails.

Open Water Land Cover

Open Water land covers are perennial aquatic features, including natural or man-made ponds (e.g., stock ponds), lakes, and reservoirs. The Open Water community may include no vegetation, or may include rooted aquatic plants or non-rooted plants, such as algae, floating pondweeds, duckweeds, and other aquatic plants. The Open Water land cover is found throughout the Planning Area. Open Water features existing in the Planning Area are largely

unnamed, with the exception of Blodgett Reservoir inside the Urban Development Area (UDA[1]) and Rancho Seco Lake outside the UDA. Wastewater treatment facilities are classified in Table 8-1a as High-Density Development, though the treatment ponds themselves are classified as Open Water. Standing water found within the Recreation/Landscaped and High-Density Development land covers were mapped as part of the surrounding land cover.

Wildlife species of the Open Water community include warmwater fishes such as common carp, largemouth bass (*Micropterus salmoides*), goldfish (*Carassius auratus*), green sunfish (*Lepomis cyanellus)*, crayfish, ducks, geese, swans, and other migratory waterfowl. Aquatic invertebrates of the Open Water community (e.g., insects, insect larvae, crustaceans, and mollusks) act as prey for many of these species.

Riparian Land Covers

Riparian land covers are associated with Planning Area streams, creeks, or drainages and typically occur in the zone between the Active Stream Channel and Adjacent Upland land covers. The land cover classification system defines Riparian land covers by their associated trees and shrubs. The natural community of the Riparian land covers contains a great diversity of wildlife, including beaver (*Castor canadensis*), as well as providing foraging and sheltering habitat for species such as mule deer, and foraging and breeding habitat for many species of birds. The majority of the Planning Area wildlife species use the Riparian land covers as habitat for at least some portion of their life cycle.

In portions of the Planning Area that are already developed, riparian corridors are usually the only remaining natural land covers remaining for necessary breeding, nesting, denning, resting, sheltering, and foraging behaviors. The three categories of Riparian land covers are described below.

Mixed Riparian Woodland. The Mixed Riparian Woodland land cover is distinguishable by an open canopy layer dominated by tall Fremont cottonwood trees. Beneath this open layer, a moderately dense mid-canopy layer is composed of tree species such as Oregon ash (*Fraxinus latifolia*), Goodding's willow (*Salix gooddingii*), walnut (*Juglans* spp.), valley oak (*Quercus lobata*), and box elder (*Acer negundo*). In some areas, a subcanopy of dense riparian scrub

[1] As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where new urban development projects or activities could occur under the No Action/No Project Alternative, or where new urban development Covered Activities could occur under the two action alternatives. Therefore, the term "UDA" means all lands within the Sacramento County USB boundary that are also within the Planning Area (this includes lands within the Rancho Cordova city limits that are within the Planning Area) and all lands within Galt's city limits and within Galt's sphere of influence (see Section 1.1.1 and Figure 1-1).

dominated by willow species including arroyo willow (*S. lasiolepis*) and sandbar willow (*S. exigua*) is present.

Mixed Riparian Scrub. The Mixed Riparian Scrub land cover is interspersed with Mixed Riparian Woodlands in the floodplains of waterways throughout the Planning Area. This land cover often consists of an open-to-dense shrubby thicket dominated by a mixture of sandbar willow, arroyo willow, red willow (*S. laevigata*), and immature stands of Mixed Riparian Woodland tree species. Some of the more open canopy Mixed Riparian Scrub stands support an understory of native and non-native species, including wild rose (*Rosa californica*), wild grape (*Vitis californica*), perennial pepperweed (*Lepidium latifolium*), Himalayan blackberry (*Rubus discolor*), curly dock (*Rumex crispus*), and various non-native grasses.

Mine Tailing Riparian Woodland. The Mine Tailing Riparian Woodland land cover was defined by the SSHCP document for this Planning Area. It is distributed in a network of relatively narrow linear areas that naturally established in abandoned man-made mine tailing surface deposits within the Planning Area (see Figure 8-1). This land cover contains many of the same trees and the same native wildlife species commonly found in Mixed Riparian Woodland and Mixed Riparian Scrub land covers, described previously.

Terrestrial Land Covers

Blue Oak Woodland and Blue Oak Savanna Land Covers

Patches of Blue Oak Woodland and Blue Oak Savanna land covers are located in the eastern portion of the Planning Area near the Sacramento County border. Blue Oak Woodland and Blue Oak Savanna comprise approximately 5% of the Planning Area. Blue oaks are typically drought-tolerant, and unlike interior live oaks, are deciduous, dropping their leaves during periods of extreme moisture stress. This survival trait may explain the observed patterns of blue oak distribution, with blue oaks occupying drier, shallower, and more well-drained soils than interior live oaks or valley oaks (McDonald 1985, Sawyer and Keeler-Wolf 1995). In general, the SSHCP differentiates and maps Blue Oak Woodland land cover and Blue Oak Savanna by their tree-cover densities.

These woodlands and associated grasslands support a community of plants and animals that is similar to the community also found in the Valley Grassland land cover. Mule deer, woodpeckers, small rodents, and other species forage on the acorns produced each fall. Other species such as red fox (*Vulpes vulpes*) and gray fox (*Urocyon cinereoargenteus*), striped skunk, and coyote are attracted to the prey existing in these woodlands. The structure of the larger oak trees, which includes cavities, knots, and large limbs, provide nesting and roosting opportunities for many resident and migratory raptors and birds such as red-tailed hawk (*Buteo*

jamaicensis), western screech owl (*Megascops kennicottii*), great horned owl (*Bubo virginianus*), oak titmouse (*Baeolophus inornatus*), and western kingbird (*Tyrannus verticalis*).

Blue Oak Woodland. The Blue Oak Woodland land cover is distinguished by a blue oak-dominated overstory and an understory dominated by annual grasses. Blue Oak Woodland is distinguished from Blue Oak Savanna by the higher density of trees in the overstory canopy. Blue Oak Woodland is characterized by greater than 10% tree cover. Generally, Blue Oak Woodlands in the Planning Area have an open canopy, although the canopy could be nearly closed on better-quality sites.

Blue Oak Savanna. The Blue Oak Savanna land cover is characterized by grasslands with a very sparse tree canopy (less than 10% canopy cover) dominated mainly by blue oaks (USFS 1980, Sawyer and Keeler-Wolf 1995). Forbs and wildflowers typical of annual and perennial grasslands typically provide groundcover beneath the scattered trees.

Farmland Land Covers

There are four land covers associated with active farming operations: Cropland, Orchard, Vineyard, and Irrigated Pasture-Grassland. Agricultural activities also occur on the Valley Grassland and the Blue Oak Savanna land covers described above, including cattle grazing and ranching operations. However, the physical ecology, the biology, the plant and animal communities, and the extent of past disturbance in Croplands, Orchard, Vineyard, and Irrigated Pasture-Grasslands differ from those in Valley Grassland and Blue Oak Savanna. Therefore, Valley Grassland and Blue Oak Savanna are considered separately above, and not included here with farmlands.

Croplands, Vineyard, and Orchard provide food and habitat for insects, nesting/roosting opportunities for avian species, and protection for rodents and small mammals. Many of these bird and mammal species utilize these farmlands for foraging because small mammal prey are common in these land covers. Native terrestrial wildlife species associated with Planning Area farmlands include coyote, red fox, cottontail rabbits (*Sylvilagus audubonii*), deer mice (*Peromyscus maniculatus*), valley pocket gophers (*Thomomys bottae*), house mice (*Mus mus*), common bats species such as Yuma myotis (*Myotis yumanensis*), and western meadowlark (*Sturnella neglecta*), and red-winged blackbird.

Cropland (Row and Field Crops). The Cropland land cover includes all non-orchard and non-vineyard agricultural crops. Cropland includes annual row and field crops (e.g., small grains, corn, tomatoes, melons, peppers, safflower, sunflower) and short-term perennial crops (e.g., asparagus). Rice is a row crop grown in Sacramento County, but seldom in the Planning Area. However, small fields of rice have recently been planted on the existing Cosumnes River Preserve.

Irrigated Pasture–Grassland. The irrigated pasture–grassland land cover is defined as agricultural cropland in which a mix of perennial grasses and perennial legumes normally provide 100% ground cover. The Irrigated Pasture-Grassland land cover includes hay production (alfalfa, clovers, and mixed grasses), seasonal summer pasture for livestock (primarily cattle), and year-round pasture for livestock (primarily cattle or horses). The height of vegetation varies, according to season and livestock stocking levels, from a few inches to 2 or more feet on fertile soils before grazing. Alfalfa fields in the Planning Area are especially rich source of prey for hawks and other raptors, including Swainson's hawk, as well as greater sandhill crane. (Pasture on natural landscapes that are not irrigated and are used for ranching are discussed under the Valley Grassland natural land cover).

Orchard (Fruit and Nut Orchards). The Orchard land cover has limited habitat value for most native species, but habitat for western red bat (*Lasiurus blossevillii*) is used by raptor species for perching. Orchard crops in the Planning Area include apples, cherries, pears, almonds, walnuts, pistachios, apricots, chestnuts, kiwi, nectarines, olives, peaches, pecans, and plums.

Vineyard. Vineyards are composed of grape plants planted in rows, usually supported on wood and wire trellises. Vineyards are primarily "clean cultivated," meaning no other vegetation is allowed to grow between the rows or on the edges of fields and irrigation ditches, which provides habitat for a limited number of native plants and wildlife. However, some Planning Area vineyards use "environmentally friendly" management practices including bat boxes, raptor perches, and owl boxes to encourage presence of these species and reduce insect and predation damage.

8.1.2.2 The Vernal Pool Ecosystem in the Planning Area

As discussed above in Section 8.1.2.1 and in Appendix G, complexes of vernal pools occur within the Valley Grassland land cover of the Planning Area. Vernal pools within a complex are connected by the seasonal perched aquifer that forms between the soil surface and the sub-surface restricting layer, and are also connected by intermittingly flowing surface swales. Recent hydrological studies show that vernal pools do not simply fill from direct precipitation nor do they empty solely by evapo-transpiration. Instead, lateral subsurface flow imparts a high degree of connectivity among pools. Once the soils have become saturated, water moves laterally above the impervious horizon, moving from hillocks into pools and vice-versa, ultimately draining downslope within a single watershed to become late-season stream or riverine flow (Hanes et al. 1990, Hanes and Stromberg 1998, Rains et al. 2005). This perched aquifer slows or "buffers" changes to pool water volume and determine pool water chemistry (Hanes et al 1990; Barbour et al. 2007). See the longer discussion of Planning Area vernal pool hydrology and ecology presented in Appendix G-1.

The Vernal Pool and Swale land covers in this Planning Area cannot exist absent the adjacent uplands. Essential vernal pool ecology and functions (such as the seasonal hydrologic cycle, nutrient cycling, water chemistry, and food chain support) are closely tied to the surrounding Valley Grassland uplands. The SSHCP Permit Applicants have identified areas where the vernal-wetland land covers (i.e., Vernal Pool, Swale, and Stream/Creek (VPIH)) are ecologically and hydrologically connected with the adjacent Valley Grassland land cover. Of the total 135,152 acres of Valley Grassland within the Planning Area (Table 8-1a), approximately 97,349 acres are assumed to be hydrologically connected with vernal pools and swales (Table 8-2). Taken together, the Valley Grassland, Vernal Pool, Swale, and Stream/Creek (VPIH) land covers in these areas comprise the Vernal Pool Ecosystem. Existing acres of the Valley Grassland, Vernal Pool, Swale, and Stream/Creek (VPIH) land covers within the Vernal Pool Ecosystem are shown in Table 8-2.

Table 8-2. Existing Vernal-Pool Ecosystem Land Covers in the Planning Area

Land Cover	Existing Acres in Planning Area	Percentage of the 317,655-acre Planning Area
Aquatic Land Covers		
Vernal Pool*	4,536	1.4%
Swale*	1,252	0.4%
Stream/Creek (VPIH)*	73	0.02%
Terrestrial Covers		
Valley Grassland	97,349	30.7%
Total	**103,210**	**17.4%**

* Indicates land cover that is considered sensitive. Sensitive natural communities are those that receive specific recognition or legal protection under federal, state, or local laws or regulations; see Section 8.1.2.3.

Of the existing 103,210 acres of Vernal Pool Ecosystem within the Planning Area, approximately 18,117 acres of Vernal Pool Ecosystem are within the designated Mather Core Recovery Area (MCRA) (USFWS 2008), located almost entirely within the UDA. In addition, approximately 38,514 acres of Vernal Pool Ecosystem are within the designated Cosumnes/Rancho-Seco Core Recovery Area (C/RS) (USFWS 2008), located in the southeastern portion of the Planning Area.

8.1.2.3 Sensitive Natural Communities

Sensitive natural communities are those that receive specific recognition or legal protection under federal, state, or local laws or regulations. CDFW maintains a list of plant communities that are native to California (CDFG 2010). Within that list, CDFW has identified special-status natural communities, which are of limited distribution statewide or within a county or region and often vulnerable to environmental effects of projects. As discussed previously in Section 8.1.1, the Aquatic Resources land covers (including the Wetland and Other Waters land covers and the Riparian land covers), are also protected by the state under Fish and Game Code Sections 1600 to

1607. Land covers that are expected to be waters of the United States are considered by the EIS/EIR to be special-status and include the Wetland and Other Waters land covers. As discussed above in Section 8.1.1, the importance of protecting and preserving wetland and riparian natural communities is recognized in the Sacramento County, Rancho Cordova, and Galt General Plan policies. As discussed previously in Section 8.1.1, native oaks and oak woodlands are also provided varying levels of protection under state law and local regulations and policies.

The 11 Planning Area land covers that are discussed as sensitive natural communities in the EIS/EIR are Vernal Pool, Swale, Seasonal Wetland, Freshwater Marsh, Stream/Creek (VPIH), Stream/Creek, Open Water, Mixed Riparian Scrub, Mixed Riparian Woodland, Riparian Blue Oak Woodland, and Blue Oak Savannah.

8.1.2.4 Existing Wildlife Movement Corridors

The natural land covers within the Planning Area support local and regional movement and dispersal of wildlife, and are also important for species that use the Planning Area during their spring and fall migrations. The existing wildlife movement corridors are important to both resident and migratory species because they allow individual animals to travel between Planning Area feeding, sheltering, or breeding resources on a daily or seasonal basis. For example, one area may provide important foraging habitat in spring, while another provides forage in fall. Also, individuals or groups of a species may move on a daily basis between locations within the Planning Area that provide suitable nighttime cover and other locations for foraging. Existing corridors are wide and continuous between blocks of habitat and allow movement by native terrestrial species to occur with reduced risk of predation (e.g., cover is provided within the movement corridor) and reduced risk of adverse human interactions. For example, remaining riparian-woodland corridors along streams and creeks in UDA allow movement of wildlife through developed areas. In the Planning Area, riparian corridors exist along the Cosumnes River and Dry Creek outside the UDA, along Laguna Creek inside the UDA, and along many other smaller creeks and streams inside the UDA.

CDFW and the California Department of Transportation developed the California Essential Habitat Connectivity Project to map and assess important wildlife habitat linkages (Spencer et al. 2010). The goal of the Essential Habitat Connectivity Project was to identify large remaining blocks of intact habitat or natural landscape at a coarse spatial scale, and model linkages (Essential Connectivity Areas (ECAs)) between them that are important to maintain as movement corridors for wildlife. These corridors or ECAs are vital for maintaining native biodiversity within the remaining intact habitat of California, included in and connected by these corridors. This coarse-scale, statewide map was based primarily on the ecological integrity of vegetation communities over a very large region, rather than the specific movement and other life history requirements of particular species. Because of the connection of large, intact expanses of remaining habitat, these designated corridors provide migratory pathways and/or stopovers for many wildlife species.

Four designated ECAs are located within, or adjacent to, the Planning Area (Figure 8-2). There are a total of 119,992 acres of ECAs mapped within the Planning Area (Table 8-3), which is approximately 35% of the 317,655-acre Planning Area. These ECAs contain areas that vary in "permeability," which is defined as the lack of resistance to wildlife movement based in part on land cover type, existing roads, and terrain (Spencer et al. 2010). The 119,992 acres of ECAs within the Planning Area are comprised mostly of areas of intact natural land covers (see Table 8-3). However, areas of rural-residential development in south Sacramento County, which support more fragmented natural land covers, are also included within the boundary of certain ECAs (Figure 8-2). Some existing habitat preserves present in the Planning Area are within ECAs (e.g., Stone Lakes National Wildlife Area, the Cosumnes River Preserve, the Deer Creek Hills Oak Woodland Preserve, Rancho Seco Recreation Area, and Howard Ranch) (Figure 8-2).

The existing riparian corridor along Laguna Creek inside the UDA, and portions of the existing riparian corridor along the Cosumnes River outside the UDA, were not included in the ECAs. Regardless, these waterways continue to support relatively narrow but continuous riparian cover (Figure 8-1), and currently provide important east-west movement corridors for terrestrial wildlife.

Mule deer herds and other wildlife in the Planning Area utilize the relatively large and intact remaining blocks of habitat within the ECA and other corridors for movement, cover, and forage. The following summary of information on deer herds located within the Planning Area is adapted from CDFW data (2014a). Deer herds within the Planning Area are in the Motherlode Deer Management Unit, which includes the Sacramento Valley Deer Herd and the Placerville Deer Herd. These herds are located in deer zones A-North and D-5 according to the California Deer Zone Map (CDFW 2014a). The subspecies of deer in zone D-5 consists of the Columbian black-tailed deer (*Odocoileus hemionus columbianus*) and California mule deer (*Odocoileus hemionus californicus*). Deer in the western portion and lower elevations of zone D-5, which includes the majority of the Planning Area, are considered resident deer because they do not make long seasonal migrations. However, local movement within the Planning Area is important for accessing locations with suitable forage, cover, and fawning areas. Examples of the natural land covers within in the Planning area that are commonly utilized by deer include Blue Oak Woodland and Blue Oak Savanna, Valley Grassland, Seasonal Wetland, and Riparian land covers along watercourses, which provide cover and/or forage and also provide corridors for movement.

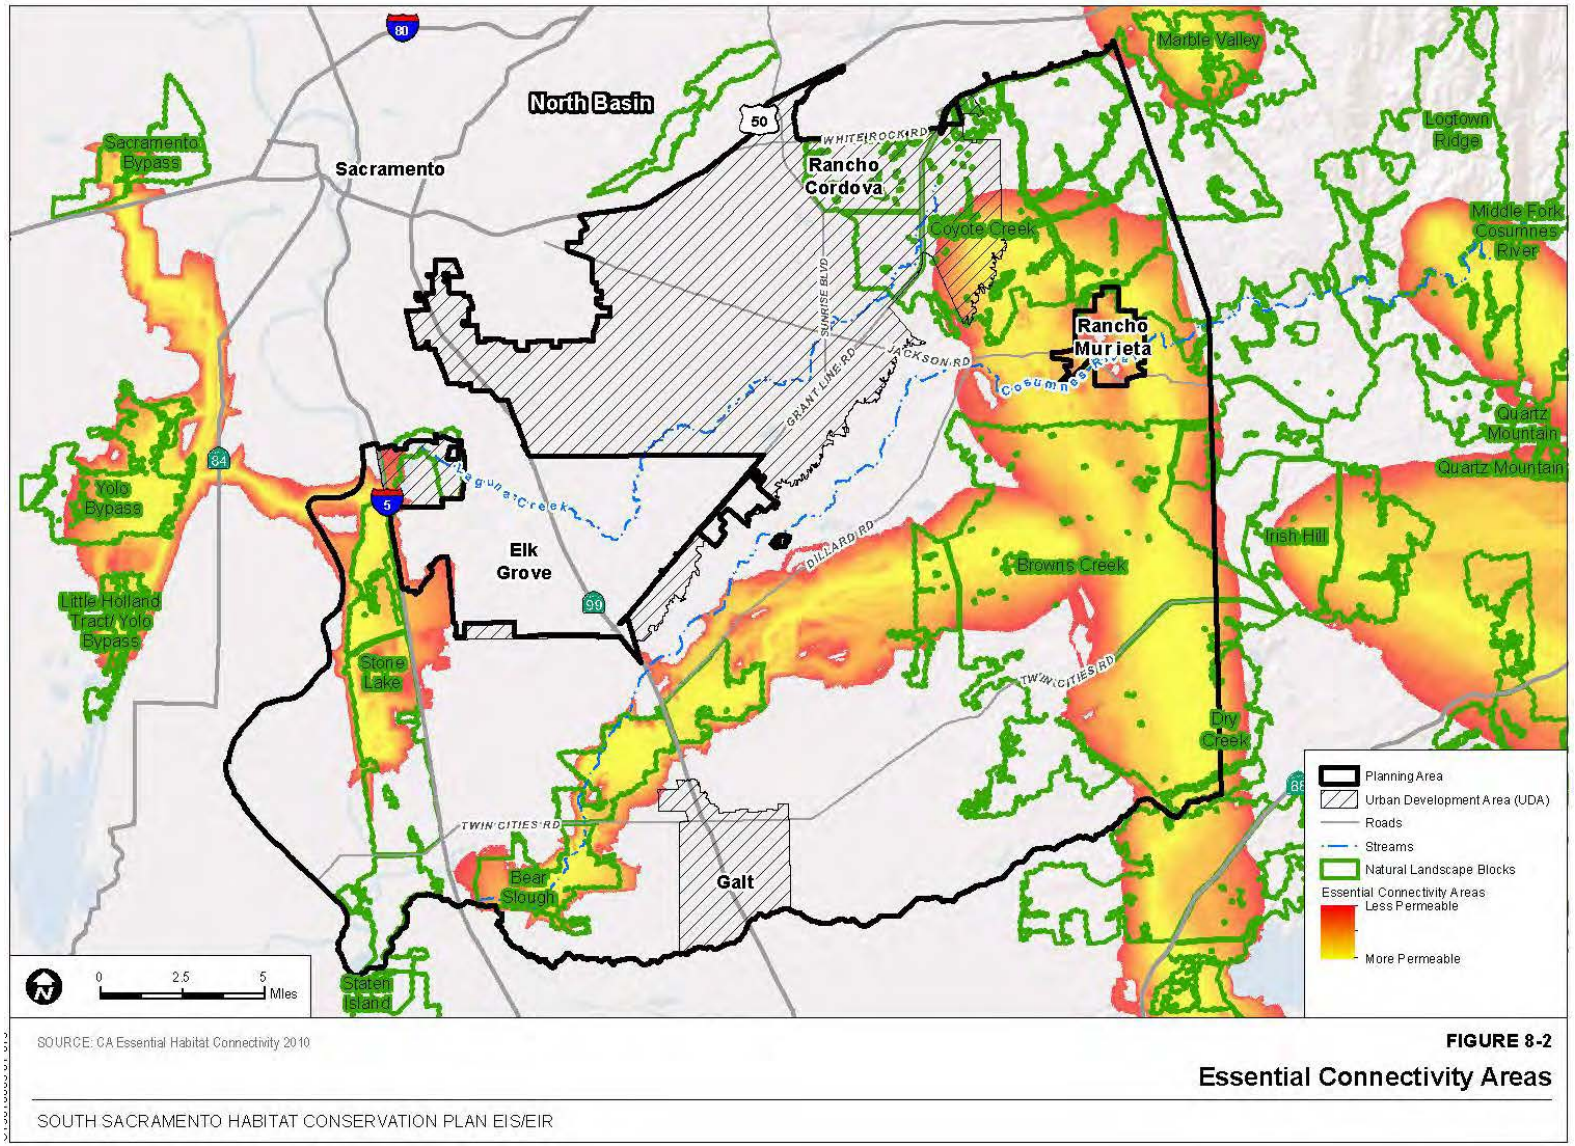

Table 8-3. Acres of Essential Connectivity Areas (ECAs) Within the Planning Area

Essential Connectivity Area	Total ECA Acres	Acres in Planning Area*	% in Planning Area
Stone Lake – Yolo Bypass	25,723	14,308	56
Bear Slough – Browns Creek	43,878	43,789	100
Marble Valley – Sawtooth Ridge	260,035	68	0.3
Duck Creek North Fork – Coyote Creek	126,166	64,196	51

Sources: Spencer et al. 2010; CDFW 2017.

* The ECAs overlap. Inconsistency between the total acres of ECAs in this table and the total ECA acreage in the text above is because of this overlap. .

Figure 8-2 Essential Connectivity Areas

AGENDA ITEM 11.1

4480

INTENTIONALLY LEFT BLANK

The Planning Area, like most of the California Central Valley, is located within the Pacific Flyway, which is identified by the USFWS, CDFW, and agencies to be a migratory pathway for waterfowl. The Pacific Flyway extends from the North Slope of Alaska south to Central and South America. Each year at least one billion birds migrate north and south along this corridor to reach nesting and wintering grounds depending on the season and the species. Birds that migrate through the Planning Area include waterbirds such as black-necked stilt (*Himantopus mexicanus*), American avocet (*Recurvirostra americana*), greater sandhill crane (*Grus canadensis tabida*), lesser sandhill crane (*Grus canadensis canadensis*), Ross' goose (*Chen rossii*), white-fronted goose (*Anser albifrons*), Canada goose (*Branta canadensis*), tundra swan (*Cygnus columbianus*), and numerous species of ducks and shorebirds. Within the Planning Area, the existing Wetland and Riparian natural land covers on the Stone Lakes National Wildlife Refuge, the existing Cosumnes River Preserve, and the ~~Sacramento Regional Sanitation District Buffer Lands~~ **Regional San Bufferlands** provide foraging and sheltering habitats for migratory water birds using the Pacific Flyway. Agricultural fields and pastures near these wetland areas provide foraging opportunities for many of these species. In addition to waterfowl and wading birds, natural land cover within the Planning Area supports migration of many raptor species, such as ferruginous hawk (*Buteo regalis*) and rough-legged hawk (*Buteo lagopus*), as well as song birds such as American goldfinch (*Spinus tristis*) and Wilson's warbler (*Cardellina pusilla*).

8.1.2.5 Wildlife Nursery Sites

Examples of native wildlife nursery sites include colonial bat maternity roosts, blue and great egret rookeries, and nest sites for other colonially nesting bird species. Known locations of nest and nursery sites from the CNDDB (CDFW 2014b) within the Planning Area consist of two bank swallow cavity congregations found on the bank of the Cosumnes River near Rancho Murieta, three black-crowned night heron (*Nycticorax nycticorax*) rookeries (at Fishhead Lake and ~~Nicholas~~ **Nicolaus** Pond within the UDA and along a tributary of Badger Creek outside the UDA), three double-crested cormorant (*Phalacrocorax auritus*) rookeries (one at Stone Lake and two in the UDA along lower Morrison Creek and at Black Crown Lake), and four great blue heron (*Ardea herodias*) and great egret (*Ardea alba*) rookeries (North Stone Lake, along the North Fork of Badger Creek, along lower Morrison Creek in the UDA, and along the Cosumnes River near Rancho Murieta). Riparian land cover within the Planning Area along creek and streams with mature riparian communities serve as nursery sites for these and other similar species. Although no CNDDB records were found for bat maternity roosts in the Planning Area, maternity roost for species such as Yuma myotis (*Myotis yumanensis*) and Brazilian free-tailed bats (*Tadarida brasiliensis*) are likely present in the Planning Area. These maternity roosts are found within old buildings, mines, caves, bridges, and large snags or cavities in woodlands (riparian and oak).

8.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

8.2.1 Methodology for Assessing Impacts of Each Alternative on Natural Land Covers and Natural Communities

This Environmental Consequences/Environmental Impact section describes the potential impacts of each EIS/EIR alternative on the Planning Area's natural land covers and the plant and animal natural communities associated with that land cover. Therefore, the analysis of impacts to a natural land cover includes analysis of vegetation, wildlife habitat, and native species, including common species, game species, and migratory species that use that land cover with in this Planning Area.

As discussed in Section 3.6.3, the EIS/EIR analyzes the potential impacts of each alternative over a relatively long 50-year study period. Consequently, Chapter 8 does not analyze temporary impacts on lands that are expected to become a permanent urban development later in the study period. This avoids "double counting" acres of temporary impacts and acres of permanent impacts on the same parcel or area of land.

As discussed in Section 8.1.2, some of the natural land covers contain more than one CDFW natural community. Where a land cover contains one or more natural communities identified as rare or "special status" by CDFW (CDFG 2010), then impacts to the entire land cover are included in the analysis of the sensitive natural community. As discussed in Section 8.1.2, the land covers within the Vernal Pool Ecosystem function together as a single ecosystem. Therefore, Chapter 8 analyzes impacts to Vernal Pool, Swale, Stream/Creek (VPIH), and Valley Grassland in the Vernal Pool Ecosystem together.

The future projects and activities expected under each EIS/EIR alternative are described in Chapter 2: they include the construction and future operation of new urban development inside the UDA and a smaller amount of related infrastructure projects outside the UDA. As discussed in Section 3.6.5, the EIS/EIR impact methodology uses geographic information system (GIS) datasets that were prepared using the best available information about the amounts and locations of future urban development projects and related activities expected under each EIS/EIR alternative.

New urban development and infrastructure activities under all EIS/EIR Alternatives (including ground disturbance and construction, the operation of new buildings and facilities, and increased human activity) will produce physical, chemical, and biotic "stressors" that can inhibit or constrain productivity of individual organisms, the productivity of a species population, and productivity at the natural community level or ecosystem level (Freedman 2015). Potential physical stressors likely to

result from new urban development include kinetic energy, such as blasting, use of heavy machinery, other noise, and trampling. Potential chemical stressors can include gasses (such as carbon dioxide, ozone, sulphur dioxide, etc.), metals (such as lead or mercury), different types of pesticides, or excessive nutrients. Potential biological stressors from new urban development can be natural in origin (such as herbivory, predation, or parasitism), or they can be anthropogenic, for example, when trees, habitat, or animals are harvested or removed. Anthropogenic biological stressors also can also be indirect, such as when an invasive non-native species or pathogen is introduced into a community. Environmental stressors can be from single disturbance events or can be chronic in their exposure. In addition, these different environmental stressors interact with each other to impact individuals in a species (Freedman 2015). Section 3.6 and Appendix G-1 summarize the types of environmental stressors expected from the types of projects and activities implemented under all EIS/EIR alternatives. Depending on the sensitivity of a natural community's plant and animal species to a given stressor, the natural land covers could be impacted to different extents.

The new urban development and infrastructure activities implemented under all EIS/EIR alternatives would directly impact Planning Area natural land covers and communities by permanently converting natural land covers to a developed land-cover type (Table 8-1a). This chapter quantifies the acres of each land cover expected to be directly impacted (lost) under each EIS/EIR alternative, and qualitatively describes and evaluates the corresponding direct loss of habitat and the plant and animal populations that occupied those acres.

As discussed in Section 3.6.6 and in Appendix G-1, the environmental stressors resulting from new urban development can also produce permanent indirect impacts that occur later in time or occur beyond the footprint of a project, such as later changes in the hydroperiod of an aquatic land cover or subsequent impacts to species populations after habitat become fragmented from new development. The indirect effects of each alternative on most of the Planning Area natural land covers (see Table 8-1a) will be described and analyzed qualitatively in this chapter by considering both the extent of the environmental stressors that would result from implementing alternative and the likely responses of each natural community and land cover to those environmental stressors, based on the best available biological information and agency expertise (see Section 3.6.6). However, expected indirect impacts to the three aquatic land covers that are within the Vernal Pool Ecosystem (i.e., Vernal Pools, Swales, and Stream/Creek (VPIH)) will be quantitatively described and analyzed in this chapter to provide analysis need for the agency decisions discussed in Section 1.5.

Vernal Pool Ecosystem Indirect Effects. Urban development activities within the watersheds of Vernal Pools, Swales, or Stream/Creek (VPIH) could indirectly change the existing hydrologic regime and ecology of those aquatic land covers over time. Vernal pool plant and animal species are especially vulnerable to indirect changes to the natural hydrologic regime of a Vernal Pool Ecosystem because both the timing of filling, water depth, and the period of inundation will dictate

whether the vernal pool's species will be able to germinate, survive, and reproduce (see discussion of Planning Area vernal pool hydrology and ecology presented in Appendix G). The EIS/EIR will estimate acres of indirectly impacted Vernal Pools, Swales, and Stream/Creek (VPIH) land covers using Light Detection and Ranging data (LIDAR data) available for the Planning Area. LIDAR images differ from aerial photography of land surfaces because they are created by using laser light to collect dense point-datasets of the land surfaces and produce highly accurate topographic and geospatial information about the land surface. This detailed LIDAR topographic data was used by the Permit Applicants to map the surface watershed-boundary of each vernal pool present within the UDA portion of the Planning Area (see Appendix E in the Draft SSHCP document for more information about use of LIDAR (Sacramento County et al. 2017)). As discussed in Sections 3.6.5 and 3.6.6, GIS technology and software was used to compare a GIS overlay of each vernal pool micro-watershed with a GIS overlay of future development and activities expected under that EIS/EIR alternative. GIS software programs were then used to quantify the area of overlap in each vernal pool watershed. Where future urban development intersected with 10% or more of an individual vernal pool watershed, the EIS/EIR assumes that the existing hydrologic regime of that individual vernal pool would permanently change over time (see discussion of Planning Area vernal pool hydrology in Appendix G-1). Changes to existing vernal pool hydrology would also change the existing ecology and habitat of the vernal pool and would permanently impact the natural community of native plant and animal species in the vernal pool. Therefore, the EIS/EIR quantified the acres of vernal pools with direct impacts to 10% or more of their microwatershed as acres of indirectly impacted Vernal Pool land cover. The LIDAR and GIS methodology used to estimate acres of indirectly impacted Vernal Pool, Swale, and Stream/Creek (VPIH) is explained further in Appendix E of the Draft SSHCP document (Sacramento County et al. 2017). This LIDAR data and GIS methodology was used to quantify indirect impacts under the 50-year permit term of the Proposed Action/Proposed Project Alternative and under the 30-year permit term of the Reduced Permit Term Alternative.

However, the computer analysis used to compare the LIDAR data of each vernal pool's microwatershed to the GIS overlay of planned urban development requires significant expertise, computer time, and resources. Consequently, it was not feasible for the EIS/EIR to use the LIDAR data to quantify potential indirect impacts of the No Action/No Project Alternative on the aquatic land covers within the Vernal Pool Ecosystem. In addition, it was not feasible for the EIS/EIR to also use the LIDAR data to quantify indirect impacts to the Vernal Pool Ecosystem that may occur after the end of the 30-year permit term in the latter part of the 50-year EIS/EIR study period (see Section 3.6.3 for discussion of the EIS/EIR study period). In the portions of the UDA where the LIDAR dataset and computer analysis could not be used to estimate vernal pool indirect effects of the No Action/No Project Alternative, or to estimate vernal pool indirect impacts of after the end of the Reduced Permit Term Alternative's 30-year permit, GIS methodology was used to delineate a 250-foot-wide zone around each Vernal Pool, Swale, or Stream/Creek (VPIH). Consistent with many ESA Section 7 consultations conducted within this Planning Area, any development activities within this 250-foot-wide zone were assumed to result in indirect impacts to the hydrology and ecology of the

Vernal Pool, Swale, or Stream/Creek (VPIH) land covers. GIS overlays of future development scenarios for these alternatives were compared to GIS overlays of the Vernal Pools, Swales, and Stream/Creek (VPIH). Where future development would occur inside the 250-foot-wide zone, the EIS/EIR quantified those Vernal Pools, Swales, or Stream/Creek (VPIH) as indirectly impacted. However, in the certain portions of the Planning Area where future new development under the No Action/No Project Alternative or after the 30-year term of the Reduced Permit Term Alternative was expected to be identical to the Proposed Action/Proposed Project Alternative, the results of the LIDAR analysis for those areas of the UDA were incorporated into to the impact analyses of the No Action/No Project Alternative and the impact analysis of the Reduced Permit Term Alternative.

As discussed in Section 3.6.3, the EIS/EIR analyzes the potential impacts of each alternative over a relatively long 50-year study period. Consequently, this chapter does not analyze temporary impacts on lands that are expected to become a permanent urban development later in the study period. This avoids "double counting" acres of temporary impacts and acres of permanent impacts on the same parcel or area of land.

study area. As discussed in Section 3.6.2, it is appropriate to consider incremental impacts to some environmental resources within the context of other impacts occurring to that resource within the surrounding landscape, community, or region. The lead agencies determined that an appropriate geographic scale for evaluating the incremental impacts resulting from each EIS/EIR alternative on most natural land covers and natural communities should extend beyond the boundary of the EIS/EIR Planning Area to consider impacts to the same land cover/natural community within the rest of Sacramento County, and within adjacent San Joaquin, Amador, Eldorado, Yolo, Solano, Sutter, and Placer Counties. However, incremental impacts to the Vernal Pool land cover and the Vernal Pool Ecosystem will consider cumulative impacts to those land covers within the Southeastern Sacramento Valley Vernal Pool Region, which includes most of Sacramento County and portions of San Joaquin, Calaveras, Amador, Eldorado, Placer, and Yuba Counties (Keeler-Wolf et al. 1998, USFWS 2005).

Determination of Impact Significance

Significance Criteria

As discussed in Section 3.8, the criteria used to evaluate the significance of each alternative's impacts on natural land covers and natural communities is based on CEQA Guidelines Appendix G (14 CCR 15000 et seq.) and on typical thresholds used to evaluate effects on these resources in recent EIRs prepared by the County. Based on these sources, a significant adverse impact would occur on a natural land cover and its associated plant and animal communities if the alternative would:

- Have a substantial adverse effect on any riparian or other special-status natural community identified in local or regional plans, policies, regulations, or by the U.S. Fish and Wildlife Service or California Department of Fish and Wildlife;

- Interfere substantially with the movement of any native resident or migratory wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a preservation policy or ordinance that protects a land cover such as oak woodland;
- Substantially reduce the habitat of a wildlife species within its range; or cause a native wildlife population to drop below self-sustaining levels; or threaten to eliminate the entirety of a plant or animal community.

Appendix G of the CEQA Guidelines does not provide suggested criteria for determining a beneficial effect. The following significance criteria and thresholds were developed by the lead agencies. A beneficial effect to land use would occur if the alternative would:

- Have a discernable beneficial effect on any riparian or other special-status natural community identified in local or regional plans, policies, regulations, or by the U.S. Fish and Wildlife Service or California Department of Fish and Wildlife;
- Have a discernable beneficial effect on the movement of any native resident or migratory wildlife species or with established native resident or migratory wildlife corridors, or improve the use of native wildlife nursery sites;
- Reduce conflicts with any local policies or ordinances protecting biological resources, such as a preservation policy or ordinance that protects a land cover such as oak woodland;
- Substantially improve the habitat of a wildlife species within its range; or cause the size of a native wildlife population to substantially increase; or protect the entirety of a plant or animal community.

8.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2 of Chapter 2.

The estimated direct loss of each natural land cover expected from the No Action/No Project Alternative future activities and projects are presented in Table 8-4 and are analyzed below. As discussed in Section 2.2.3 and Section 3.6.7, the No Action/No Project Alternative assumes that approximately 1,900 acres of new development would be “displaced” to areas outside the current USB boundary. The estimated acres of each natural land cover that would be directly impacted within these 1,900 acres were included in the Table 8-4 totals.

Table 8-4. Acres of Direct Impacts to Each Natural Land Cover Under the No Action/No Project Alternative

Land Cover	Direct Effects within UDA (acres)	Direct Effects outside UDA (acres))	Total Direct Impacts (acres)	Existing Acres in Planning Area	Percent of Existing Acres Directly Affected

* Indicates land cover that is considered sensitive. Sensitive natural communities are those that receive specific recognition or legal protection under federal, state, or local laws or regulations; see Section 8.1.2.3.

Table 8-5 presents the estimated acres of each natural land cover that would be preserved as mitigation by future projects and activities implemented under the No Action/No Project Alternative's expected regulatory environment (Section 2.2.2). Table 8-5 includes acres of

expected land cover preservation (i.e., impact avoidance) under ESA, CESA, and CWA, as well as acres of re-establishment and establishment of Aquatic land covers under CWA 404.

The re-establishment and establishment acres of aquatic resources presented Table 8-5 reflect the lead agency assumption that the requirements of 2008 Compensatory Mitigation Rule to be re-established or established to replace lost aquatic resource functions and services at a minimum one-to-one acreage or one-to-one linear foot compensation-ratio would continue under the No Action/No Project Alternative. Table 8-5 assumes that compensatory mitigation for direct impact to Vernal Pools and Swales would occur within the Planning Area. However, it is assumed compensatory mitigation for the other Aquatic land covers (Stream/Creek (VPIH), Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water) would continue to occur primarily by purchase of credits at an approved mitigation bank or an in-lieu fee program. However, several mitigation banks and in-lieu fee programs with service areas that overlap the Planning Area actually re-establish, establish, or enhance wetlands or other waters at locations outside the Planning Area. Therefore, Table 8-5 assumes that only one-half the necessary compensatory mitigation for direct impacts to Stream/Creek (VPIH), Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water would occur inside the Planning Area.

In addition, Table 8-5 assumes that required compensatory mitigation for direct impacts to the Mine Tailing Riparian land cover would be provided by re-establishing the higher quality Mixed Riparian Woodland or Mixed Riparian Scrub Riparian land covers. In addition, mitigation for direct loss of Farmland land cover could be met by the preservation of any Farmland land cover within a similar resource category (i.e., Prime farmland, Statewide Importance farmland, Unique Farmland, Local Importance farmland, and Grazing farmlands).

8.2.2.1 Vernal Pool Ecosystem (Valley Grassland, Vernal Pool, Swale, and Stream/ Creek [VPIH])

As discussed earlier in Section 8.1.2.2, The Vernal Pool Ecosystem in the Planning Area, this chapter consolidates the discussion and analysis of impacts to the four land covers within the

Vernal Pool Ecosystem because those land covers function together as a single ecosystem (also see Appendix G-1). As discussed in Section 8.2.1, indirect impacts to the Vernal Pool Ecosystem is described qualitatively for the Valley Grassland land cover, but is described both qualitatively and quantitatively for the Vernal Pool, Swale, and Stream/Creek (VPIH) land covers.

Direct and Indirect Effects of the Alternative

The loss of habitat from new development and related infrastructure under the No Action/No Project Alternative are estimated to result in direct impacts to approximately 17,688 acres of Vernal Pool Ecosystem, and result in indirect impacts to approximately 261 acres of Vernal Pool Ecosystem land covers and their associated plant and animal communities (Table 8-6). The total 17,949 acres of directly and indirectly impacted Vernal Pool Ecosystem is approximately 17.4% of the existing 103,210 acres of Vernal Pool Ecosystem land covers in the Planning Area.

The majority of the direct and indirect impacts to the Vernal Pool Ecosystem will occur inside the UDA, where most new urban development will occur (see Section 2.2). Future UDA urban development projects and activities under the No Action/No Project Alternative (see Section 2.2.1) would result in an estimated direct loss of 17,135 acres and the indirect loss of 261 acres of the Vernal Pool Ecosystem and the habitat that those acres provide for the vernal pool plant and animal communities (Table 8-6).

As discussed above in Section 8.1.2.2, most of the Mather Core Recovery Area (MCRA) is located inside the UDA. Of the approximately 18,117 existing acres of Vernal Pool Ecosystem within the MCRA, approximately 9,570 acres are expected to be directly impacted (removed), and an additional 213 acres are expected to be indirectly impacted (9,783 acres total, or approximately 54% of the MCRA's Vernal Pool Ecosystem).

As discussed in Section 2.2.1, rural transportation and water recycling projects that support the planned urban development are expected to occur outside the UDA. Projects and activities outside the UDA, including potential impacts from the estimated 1,900 acres of "displaced development" (see Section 2.2.3), are expected to directly impact (remove) 553 acres of existing Vernal Pool Ecosystem land covers outside the UDA (Table 8-6).

Of the approximate 38,514 acres of Vernal Pool Ecosystem within the C/RS, approximately 53 acres would be directly impacted, and 0.2 acre would be indirectly impacted by the rural transportation Covered Activities planned outside the UDA (0.14%).

The environmental stressors likely to result from the urban development projects and activities implemented under the No Action/No Project Alternative are described in Section 8.2.1, in Appendix G, and in Section 3.6.6. The following discussion qualitatively describes the expected indirect effects of the No Action/No Project Alternative's environmental stressors on the Planning Area's Vernal Pool Ecosystem plant and animal communities.

Most indirect effects of the No Action/No Project Alternative to the Vernal Pool Ecosystem are described qualitatively in Section 8.2.2. However, the indirect impact to the existing hydrology and ecology of Vernal Pools, Swales, and Stream/Creek (VPIH) land covers are qualitatively estimated. As discussed in Section 8.2.1, the plants and animals of the Vernal Pool Ecosystem are especially vulnerable to impacts of activities that alter the hydrology of the watershed that support the seasonal perched aquifer of a Vernal Pool Ecosystem. As presented in Table 8-6, urban development projects and activities under the No Action/No Project Alternative are expected to indirectly affect the existing hydrology and ecology of 261 acres of Vernal Pool Ecosystem land covers, in addition to the expected 17,688 total acres of direct impacts to the Vernal Pool Ecosystem (Table 8-6). Most of the 261 acres of indirect impact to the Vernal Pool Ecosystem land covers would occur inside the UDA where almost all new urban development activities would occur.

Because it would permanently add impermeable surfaces in the UDA, urban development is expected to result in increased urban runoff relative to existing conditions, especially during storm events. Such increases have potential to result in increased sediment loads in Stream/Creek (VPIH), and alterations of stream/creek hydrology (see Section 7.2.2). Also, additional new development may permanently increase the potential for exposure to chronic discharge of non-point source pollutants, such as grease, oil, fertilizers, and lawn pesticides, to Vernal Pool Ecosystems, potentially harming vernal pool crustaceans, other vernal pool animals, or altering plant community composition. However, project compliance with existing regulatory requirements (see Sections 8.1.1 and 7.1.1) is expected to avoid these indirect effects (see Sections 7.2.2.2 and 7.2.2.3).

New urban development inside the UDA under the No Action/No Project Alternative would also indirectly impact Vernal Pool Ecosystem land covers by increasing the presence of invasive plants through species escaping from new landscaping and disturbed areas, which are more easily colonized by invasive plants (see Appendix G-1). These invasive plants would impact Vernal Pool Ecosystems in the UDA by outcompeting native species and by using more water than native species, thereby shortening the vernal pool ponding period (see discussion of the vernal pool hydrologic cycle in Appendix G-1).

New urban development under the No Action/No Project Alternative is also expected to result in an increased wildfire frequency on vernal pools inside the UDA due to increased ignition sources related to human activities, and increases in invasive plant abundance, which generates more wildfire fuel than non-invasive plant species. Wildfire is a natural part of the ecology of the Vernal Pool Ecosystem's Vernal Pools, Swales, and Valley Grassland land covers, so additional low-intensity fires alone would not adversely impact the existing conditions of those land covers. However, increased fire frequency would require more intensive fire suppression activities to protect newly developed areas, including disking and bulldozing of emergency firebreaks and increased vehicle traffic and human activity (see Section 12.2.2), which are likely to directly and indirectly impact the Vernal Pool Ecosystem and its associated plant and animal communities.

Therefore, the quantified impacts to vernal pool species habitat and natural community (including direct and indirect loss) would total 17,949 acres, which is approximately 17.4% of the total 103,210 acres of existing Vernal Pool Ecosystem within the Planning Area (see Table 8-6).

Table 8-6. Direct and Indirect Effects on the Vernal Pool Ecosystem Land Covers Expected Under the No Action/No Project Alternative

Land Cover	Direct Impacts within the UDA (acres)	Direct Impacts Outside the UDA (acres)	Indirect Effects (acres)	Total Impacts (acres)	Existing Acres in 317,655-acre Planning Area	Percent of Existing Acres Directly or Indirectly Impacted
Valley Grassland (in Vernal Pool Ecosystem)	16,586	505	Described Qualitatively	17,091	97,349	17.6%
Vernal Pool	279	43	193	515	4,536	11.4%
Swale	235	5	61	301	1,252	24.0%
Stream/Creek (VPIH)	35	0	7	42	73	57.6%
Vernal Pool Ecosystem Total Impacts	**17,135**	**553**	**261**	**17,949**	**103,210**	**17.4%**

The regulatory environment under the No Action/No Project Alternative (see Section 2.2.2) would require urban development projects and activities that undergo environmental review under CEQA or the National Environmental Policy Act, and/or require ESA, CESA, or CWA regulatory authorization to avoid and minimize impacts to the maximum extent possible, and to provide compensatory mitigation for impacts the Vernal Pool Ecosystem that cannot be avoided. Mitigation provided by individual projects and activities are expected to preserve approximately 10,406 acres of existing Vernal Pool Ecosystem within the Planning Area. Approximately 562 acres of Vernal Pools and Swales would also be re-established or established (created) on these Preserves to mitigate direct impacts (loss) of 562 acres of Vernal Pools and Swales (Table 8-7).

Table 8-7. Estimated Amounts of Vernal Pool Ecosystem Mitigation Implemented Under the No Action/No Project Alternative

Land Cover	Preserved Land (acres)			Re-establishment & Establishment Acres In the Planning Area**
	Inside UDA	*Outside UDA*	*Total*	
Valley Grassland (in Vernal Pool Ecosystem)*	4,807	3,883	8,690	0
Vernal Pool*	164	866	1,030	322
Swale*	81	592	673	240
Stream/Creek (VPIH)*	13	0	13	17[a]
Total Vernal Pool Ecosystem Land Covers	**5,065**	**5,341**	**10,406**	**579**

* Indicates a land cover that is sensitive. Sensitive natural communities are those that receive specific recognition or legal protection under federal, state, or local laws or regulations; see Section 8.1.2.3.

** The re-establishment/establishment acres in this column are in addition to the preservation acres presented in the previous column.

[a] As discussed above, the Section 8.2.2 analysis assumes CWA 404 compensatory mitigation for this land cover would utilize mitigation banks or in-lieu-fee programs, resulting in approximately half of compensatory mitigation acres occurring outside the EIS/EIR Planning Area.

As discussed above in Section 8.1.2.2, most of the MCRA is located inside the UDA. Of the approximately 18,117 acres of Vernal Pool Ecosystem within the MCRA, 4,550 acres (24%) would be preserved by the Proposed Action/Proposed Project Alternative.

Cumulative Effects of the Alternative

A substantial amount of vernal pool habitat has been converted for human uses, in spite of federal regulations protecting wetlands. Vernal Pool Ecosystem loss occurs from direct destruction and modification of pools due to filling, grading, disking, leveling, paving, and other activities, as well as modification of surrounding uplands, which alters vernal pool watersheds and the supporting upland ecosystem. Remaining Vernal Pool Ecosystems have also become highly fragmented across the study area. Habitat fragmentation degrades the function and services of remaining Vernal Pool Ecosystems, and decreases the potential for vernal pool aquatic and upland species to persist over the long term.

The approximately 7 million acres of Central Valley Vernal Pool Ecosystem present in the 1800s have been significantly reduced, first by agricultural development and mineral extraction, and more recently by urban expansion (Holland 2009). Beginning around the mid-1800s, the primary loss of Vernal Pool Ecosystem was from conversion to agriculture and water conveyance and storage projects (Frayer et al. 1989; Kreissman 1991). Holland (1998) estimated approximately 967,600 acres of remaining vernal pool habitat in California, an 87% reduction in the original habitat acreage. Holland (2009) subsequently estimated that approximately 13% more of the vernal pool grassland identified in baseline mapping had been lost as of 2005.

In most instances, habitat losses have gone unmitigated, either proceeding without required authorization(s) such as a CWA 404 permit and associated Section 7(a)(2) consultation, or in instances where direct filling of waters of the United States have been avoided, thus not triggering the CWA permitting process or the CWA's Section 7 process. However, even in the instances of authorized activities, the mitigation measures typically required through regulatory authorization only serve to reduce the overall rate of habitat loss; a net loss of existing habitat remains (Holland 2009; Marty 2005). Based on observed loss rates, Holland (2009) estimated that Vernal Pool Ecosystem grasslands outside of preserves could be lost from the Central Valley by 2087.

The Southeastern Sacramento Valley Vernal Pool Region includes much of Sacramento County and Placer County, and portions of San Joaquin, Calaveras, Eldorado, and Yuba Counties. The Southeastern Sacramento Valley Vernal Pool Region includes two zone one core recovery areas (MCRA and C/RS in Sacramento County) and two zone two core areas (Beale and Western Placer County). Vernal Pool Ecosystem losses range from 0.9% to 8.84%. In 1998, Keeler-Wolf et al. estimated that the Southeastern Sacramento Valley Vernal Pool Region contains

approximately 15% of the remaining Vernal Pool Ecosystem California. Based on Holland (2009) mapping data, approximately 108,964 acres of Vernal Pool Ecosystem, or 12% of the total 2009 remaining Vernal Pool Ecosystem, is in the Southeastern Sacramento Valley Vernal Pool Region. This equates to an approximate 20% reduction in Vernal Pool Ecosystem within the Southeastern Sacramento Valley Vernal Pool Region from the early 1990s to 2005 (which is considerably higher than the cumulative total loss of 13% across the Central Valley of California). Rapid urbanization in Placer County accounts for much of the higher-than-average observed losses in the Southeastern Sacramento Valley Vernal Pool Region. From 1994 to 2005, 17,113 acres of Vernal Pool Ecosystem (35%) within Placer County was lost. In contrast, an estimated 6,598 acres, 12%, were lost in Sacramento County from 1993 to 2005, which is similar to the total proportion of vernal pool grassland loss estimated by Holland (2009) across the Central Valley in the same time period.

Losses in Sacramento County occurred primarily from 1993 to 2005, when a total of 6,598 acres of vernal pool grassland were lost at a rate of 1.5% per year, with 3,267 acres (12.6%) removed by new urban development; 2,193 acres (5.6%) removed by new vineyards and orchard; 416 acres (2.4%) removed by new agricultural-residential development; 420 acres (2.4%) removed by new plowed farmland; and 456 acres (2.3%) removed by new alfalfa, irrigated pasture, or other agricultural activities (Holland 2009). More recently, in 2010 approximately 1,000 acres of vernal pool grassland in southeastern Sacramento County, within the C/RS, were lost through conversion to vineyard and agriculture (Holland 2009).

As discussed in Section 3.7.1, the natural land covers and their associated plant and animal communities within the Planning Area have been fragmented and lost because of past development, especially within the UDA. These land cover losses have removed a significant amount of the historical pre-settlement acres of Vernal Pool Ecosystem in the study area, including the associated vernal pool plant and animal communities. In the MCRA, Holland (2009) identified approximately 13,543 acres of extant Vernal Pool Ecosystem in 2005. Approximately 1,434 acres of Vernal Pool Ecosystem (22% of habitat loss countywide), were lost in what is now the MCRA, primarily to urbanization (Holland 2009). An additional 315 acres of vernal pool grassland were lost in the first quarter of 2006 subsequent to the 2005 high-resolution imagery used by Holland (2009), for a total of 1,749 acres of Vernal Pool Ecosystem from the MCRA through March 2006. This is a 13% loss within the MCRA over the 8-year period, or 1.63% annually, similar to losses countywide. An additional 278 acres of vernal pool grassland (not mapped by Holland (2009)) were lost within the Sunrise Douglas (Sunridge) urban planning area concurrent or subsequent to the MCRA being designated. In total, 2,027 acres of Vernal Pool Ecosystem have been lost from the MCRA through 2006. It is worth noting that losses in the MCRA since its designation have already exceeded what is recommended by the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon, which is to protect 95% of suitable vernal pool branchiopod habitat in this Core Area.

However, a review of the USACE's CWA 404 project authorizations within the Planning Area between 1979 and 2013 indicated a small net gain of waters of the United States within individual projects authorized under CWA 404 (USACE 2014), although this gain was not determined individually for aquatic land covers within the Vernal Pool Ecosystem. Existing regulations and policies (Section 8.1.1) would reduce project impacts to Vernal Pool Ecosystem aquatic land covers primarily though avoidance (preservation) and secondarily though compensatory re-establishment/establishment (creation) of wetlands and other waters (see Sections 2.2.4 and 10.1.1). These CWA 404 requirements (for avoidance, minimization, and compensatory mitigation of aquatic resources) by projects and activities that are subject to CWA 404 permitting is expected to continue for the future projects and activities of the No Action/No Project Alternative, and for the "other" reasonably foreseeable future actions described in Section 3.7.2. As such, future actions subject to CWA 404 permitting would likely result in no net loss of Vernal Pool land cover acres from those projects. As discussed in Section 2.2.4 under the No Action/No Project Alternative, mitigation to compensate for future project and activity impacts to Vernal Pool Ecosystem land covers would continue to be undertaken primarily on a project-by-project basis, would likely continue to be geographically fragmented, and would not conserve Vernal Pool Ecosystems at a landscape scale.

The incremental effects of the No Action/No Project Alternative would have direct and indirect impacts that would result in an estimated loss of 17,949 acres or approximately 17.4 % of the 103,210 acres of existing Vernal Pool Ecosystem within the Planning Area. Project mitigation under the No Action/No Project Alternative would include an estimated 10,406 acres of preservation and 579 acres of vernal pool habitat re-establishment/establishment within the Planning area.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to Vernal Pool Ecosystem, when considered together with the significant impacts to Vernal Pool Ecosystem from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

8.2.2.2 Aquatic Land Covers (Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water)

As discussed in Section 8.1.2.1, the plant and animal communities associated with Aquatic land covers Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water differ in composition, but provide similar aquatic habitats, have similar ecology, and have similar susceptibility to the environmental stressors described in Appendix G-1. Therefore, Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural land covers are analyzed together in this chapter (see Section 8.2.1). As discussed in Section 8.1.2, Seasonal Wetland,

Freshwater Marsh, Stream/Creek, and Open Water communities are considered sensitive natural communities.

Direct and Indirect Effects of the Alternative

As discussed in Section 8.1.2.1, approximately 10,676 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities are present in the Planning Area (Table 8-1a).

Activities and development projects expected under the No Action/No Project Alternative (Section 2.2.1) are estimated to result in direct loss of approximately 583 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities. This total loss includes approximately 513 acres lost from new development within the UDA, and 70 acres lost from activities, projects, and displaced development outside of the UDA (Table 8-4). The estimated loss is approximately 5.5% of the existing 10,676 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water within the Planning Area.

The potential environmental stressors that are expected to result from the projects and activities implemented under the No Action/No Project alternative are described in Appendix G. The discussion below qualitatively describes the expected effects of the No Action/No Project's environmental stressors on the Planning Area's Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers and their plant and animal natural communities.

By permanently increasing the extent of impermeable surfaces, urban development in the UDA has potential to result in increased runoff relative to existing conditions, especially during storm events. Such increases could result in increased sediment loads in Seasonal Wetland, Freshwater Marsh, and Open Water land covers, and alter downstream hydrology in the Stream/Creek land cover in the UDA. Also, addition of new development is expected to permanently increase discharge of point and non-point source pollutants, such as grease, oil, fertilizers, and lawn pesticides, to Seasonal Wetland, Freshwater Marsh, Open Water, and flowing Stream/Creek land covers, relative to the existing conditions, potentially impacting the physical and biotic characteristics of the habitat and the associated natural community, including increases in sediments, chemical toxicity, and excessive nutrients. However, compliance with existing regulatory requirements (see Sections 8.1.1 and 7.1.1) is expected to avoid the indirect effects (see Sections 7.2.2.2 and 7.2.2.3).

The regulatory environment under the No Action/No Project Alternative would continue existing regulatory requirements for these four land covers (see Section 2.2.2 and Section 8.1.1), which would require urban development projects and activities that undergo environmental review under CEQA or the National Environmental Policy Act, and/or require

ESA, CESA, or CWA regulatory authorization to avoid and minimize impacts to the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers to the maximum extent possible, and to provide compensatory mitigation for losses of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers that cannot be avoided. This mitigation would be implemented on a project-by-project basis (see Section 2.2), and is expected to preserve approximately 24 acres and re-establish or establish 291 acres of these Aquatic Resource land covers within the Planning Area (Table 8-5).

Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and Section 8.1.2, past development in the Planning Area has removed a significant amount of the historical Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities within the study area, fragmenting much of the existing Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek that remains in the study area (see Section 8.1.2.1 above).

However, a review of the USACE's CWA 404 project authorizations within the Planning Area between 1979 and 2013 indicated a small net gain of waters of the United States within individual project sites authorized under CWA 404 (USACE 2014), although this gain was not determined individually for Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek. Existing regulations and policies (Section 8.1.1) would reduce individual project impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water Aquatic land covers primarily though avoidance (preservation) and secondarily though compensatory re-establishment/establishment (creation) of wetlands and other waters (see Section 2.2.4 and Section 8.1.1). The CWA 404 regulatory requirements (for avoidance, minimization, and compensatory mitigation) for projects and activities that are subject to CWA 404 permitting is expected to continue for the future projects and activities of the No Action/No Project Alternative, and for the "other" reasonably foreseeable future actions (described in Section 3.7.2). In addition, other regulations and policies described previously in Section 8.1.1, including Section 1600 of the California Fish and Game Code, would also minimize loss in acreage of Stream/creek in the Planning Area from the projects and activities that will occur under the No Action/No Project alternative, as well as for the "other" reasonably foreseeable future actions (described in Section 3.7.2).

The incremental impacts of the No Action/No Project Alternative would result in the direct loss of 583 acres, or approximately 5.5%, of the existing Seasonal Wetlands Freshwater Marsh, Stream/Creek, and Open Water land covers and associated natural communities within the Planning Area. Project mitigation for impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water would continue to be implemented on a project-by-project basis. Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to

Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water, when considered together with the significant impacts to Valley Grassland from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

8.2.2.3 Riparian Land Covers (Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland)

As discussed in Section 8.1.2.1, Planning Area Riparian land covers include Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland. The Riparian land covers are considered sensitive natural communities (Section 8.1.2.3). As discussed in Section 8.2.1, indirect impacts to the Riparian land covers are described qualitatively.

Direct and Indirect Effects of the Alternative

The new development and related infrastructure projects and activities expected under the No Action/No Project Alternative are estimated to directly impact (remove) 554 acres of Riparian land covers and their associated natural communities within the Planning Area (Table 8-4). The majority of this loss (approximately 509 acres) would be within the UDA, with an additional 45 acres from rural transportation projects associated with new urban development in the UDA, and the 1,900 acres of planned urban development expected to be displaced outside of the UDA (see Section 2.2.3). The estimated total of 554 acres lost represents approximately 7% of the existing 7,951 acres of Riparian land covers and riparian plant and animal natural communities present in the Planning Area.

The environmental stressors that may result from new urban development are discussed in Section 8.2.1 and in Appendix G-1. The following impact analysis qualitatively describes the expected indirect effects of the No Action/No Project Alternative's environmental stressors on the Riparian land covers and their plant and animal natural communities.

By permanently increasing the extent of impermeable surfaces, urban development in the UDA has potential to result in increased runoff relative to existing conditions, especially during storm events. Such increases could result in stream bank erosion, increased sediment loads downstream, and alterations of downstream hydrology, which could remove or physically damage the surrounding riparian habitat. Also, additional new development is expected to permanently increase the potential for long-term discharge of point and non-point source pollutants such as grease, oil, fertilizers, and lawn pesticides into streams and creeks, which would increase the quantity of pollutants within Riparian land covers and adversely affect the riparian plant and animal communities. However, compliance with existing regulatory requirements (see Sections 8.1.1 and 7.1.1) is expected to avoid the indirect effects (see the analysis in Sections 7.2.2.2 and 7.2.2.3).

The plant and animal communities associated with riparian land covers are also expected to be indirectly impacted from increased the presence of invasive plants, which colonize downstream Riparian land covers through the highly effective transport of plant parts, seeds, and other propagules in flowing water of streams and creeks associated with the Riparian land covers. Invasive plant species have potential to dominate the riparian communities where they become established, excluding native herbaceous and woody riparian vegetation and degrading habitat conditions for wildlife species of the riparian natural community that depend on that native riparian vegetation.

New urban development is also expected to result in an increased wildfire frequency in Riparian land covers inside the UDA due to increased potential for ignitions occurring from greater human presence and human activities. Should wildfires be of sufficient intensity to result in high levels of mortality to mature riparian vegetation, the Riparian land covers and associated natural community would be adversely affected for many years, until sufficient regrowth occurs to again support the natural plant and animal communities.

Development projects that undergo environmental review under NEPA or CEQA, or that require CDFW, CWA, or local authorizations, would be required to avoid and minimize impacts to riparian areas and to provide compensatory mitigation for direct impact impacts to Riparian land covers (see Section 8.1.1). Mitigation for riparian impacts would occur on a project-by-project basis, as required by separate regulatory agencies and local jurisdictions. The No Action/No Project Alternative is expected to re-establish or establish 256 acres of Mixed Riparian Woodland and 298 acres of Mixed Riparian Scrub land covers. As discussed in the introduction to Section 8.2.2, impacts to the Mine Tailing Riparian Woodland land cover are expected to be mitigated by re-establishment or establishment of Mixed Riparian Woodland or Mixed Riparian Scrub within the Planning Area. The re-establishment or establishment of 554 acres of Riparian land covers (Table 8-5) equals the expected direct loss of 554 acres of riparian land covers (Table 8-4).

Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and Section 8.1.2, past human activities in the study area have removed a significant amount of the Mixed Riparian Woodland and Mixed Riparian Scrub and their associated plant and animal communities once present in the study area. As discussed in Section 8.1.2.1 *Existing Conditions*, much of the riparian land covers remaining in the study area have been disturbed to different degrees, and have been indirectly affected by habitat fragmentation, change in stream hydrographs, and increased human disturbance in the study area.

In addition to the effects from past and current human activities, the reasonably foreseeable future activities expected within the Planning Area (Section 3.7) could result in loss of Riparian land covers, as well as indirect impacts to Riparian land covers (e.g., habitat fragmentation,

change in stream hydrographs, increased human disturbance). The types of future, reasonably foreseeable "other" projects, activities, and actions, described in Section 3.7.2, are similar to the types of past and present actions that occurred in the study area. The other reasonably foreseeable, future actions in the study area (see Sections 3.7.2 and 4.1.2.1) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in Elk Grove and Rancho Murieta, master-planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued development of cultivated agricultural lands, expansion of existing preserves, and development of major infrastructure projects, such as California High-Speed Rail and California WaterFix (see Section 3.7.2 for details about these projects). In addition, as discussed in Section 2.2.3, approximately 1,900 acres of planned urban development would be shifted or displaced to areas outside the current UDA under the No Action/No Project Alternative, probably to areas south of the Elk Grove sphere of influence or areas near Rancho Murieta.

The effects of past, present, and reasonably foreseeable other projects on the Riparian land covers in the study area are described in Section 8.2.2.1 and represent a significant adverse cumulative impact on the Riparian land covers within the study area. The incremental impacts of the No Action/No Project Alternative would result in the direct loss of 554 acres, or approximately 7%, of the existing Riparian land covers within the Planning Area. However, the regulatory environment under the No Action/No Project Alternative is expected to require projects to re-establish or establish 554 acres of Riparian land covers, which, over time, are expected to re-establish the wildlife habitat and plant and animal natural community of the directly impacted Riparian land covers. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation.

Therefore, the incremental impacts of the No Action/No Project Alternative on Riparian land covers, when considered together with the significant impacts to riparian land covers from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

8.2.2.4 Valley Grassland

As discussed in Section 8.1.2, approximately 135,152 acres of Valley Grassland are present in the Planning Area, including Valley Grassland that is present both inside and outside of the Vernal Pool Ecosystem (Table 8-1a), and including ranching and grazing agricultural lands. As discussed in Section 8.1.2, Valley Grassland provide habitat for large number of native wildlife species (e.g., small mammals, mule deer, western meadowlark, and red-winged blackbird; foraging for hawks and other raptors; and wintering sandhill cranes). The impacts to Valley

Grassland as a part of the Vernal Pool Ecosystem are also analyzed under impacts to the Vernal Pool Ecosystem (Section 8.2.2.1).

Direct and Indirect Effects of Alternative

Urban development projects and activities under the No Action/No Project Alternative (Section 2.2.2) are estimated to remove a total of 23,429 acres of Valley Grassland natural community within the Planning Area (Table 8-4). The majority of this loss would be within the UDA (approximately 21,797 acres) where most of the new urban development activities would occur. Approximately 1,632 acres of Valley Grassland would be impacted by planned infrastructure projects and activities located outside of the UDA and from the development expected to be displaced to areas outside the current USB boundaries under the No Action/No Project Alternative (Section 2.2.3).The estimated total loss of Valley Grassland would be approximately 17.3% of the existing Valley Grassland within the Planning Area (Section 8.1.2.1).

The environmental stressors resulting from new urban development can also produce permanent indirect impacts that occur later in time or occur beyond the project site (see Section 3.6.6 and Appendix G-1). The No Action/No Project Alternative would indirectly impact the plant and animal communities of the Valley Grassland land cover by resulting in habitat fragmentation, chronic ground vibration, chronic nighttime lighting, increased wildfire frequency, increased colonization by weedy plant species, and increased human activity, especially to the grasslands within the UDA.

The regulatory environment under the No Action/No Project Alternative (Section 8.1.1) would require mitigation for direct impacts to the Valley Grassland land cover and associated plant and animal communities for projects that undergo environmental review under CEQA. This mitigation would primarily occur as a result of mitigation requirements for loss of foraging habitat for associated special-status species, such as Swainson's hawk, and as a result of mitigation requirements for impacts to important farmland, including mitigation for loss of grazing land of more than 50 acres outside of the County of Sacramento's USB (also see the Section 8.2.2.1 analysis of Valley Grassland that is also located within the Vernal Pool Ecosystem).

The mitigation for impacts to Valley Grassland under the No Action/No Project Alternative would occur on a project-by-project basis and is anticipated to include preservation of approximately 11,806 acres of Valley Grassland land cover within the Planning Area, which includes the 8,690 acres of Valley Grassland that would be preserved within the Vernal Pool Ecosystem. This expected 11,806 acres of Valley Grassland preservation is roughly half the total 23,429 acres of the direct impacts (losses) to Valley Grassland land cover expected under the No Action/No Project Alternative.

Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and above in Section 8.1.2, Valley Grassland once covered the majority of the Planning Area, except along waterway riparian corridors and in areas of oak woodlands. However, much of the Valley Grassland has been lost from the study area, and remaining areas are often fragmented because of past and current human activities.

In addition to the effects from past and current human activities, the reasonably foreseeable future activities (Section 3.7) are expected to result in additional loss and fragmentation of Valley Grassland land cover in the study area. The types of future, reasonably foreseeable "other" projects, activities, and actions, described in Section 3.7.2, are similar to the types of past and present actions that occurred in the study area. The other reasonably foreseeable, future actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in Elk Grove and Rancho Murieta, master-planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued development of cultivated agricultural lands, expansion of existing preserves, and development of major infrastructure projects, such as California High-Speed Rail and California WaterFix (see Section 3.7.2 for details about these projects). In addition, as discussed in Section 2.2.3, approximately 1,900 acres of planned urban development would be shifted or displaced to areas outside the current UDA under the No Action/No Project Alternative, probably to areas south of the Elk Grove sphere of influence, or areas near Rancho Murieta that are currently dominated by Valley Grassland. The effects of past, present, and reasonably foreseeable other projects on Valley Grassland in the study area represent a significant adverse cumulative impact on the Valley Grassland within the study area.

The incremental impact of the No Action/No Project Alternative would result in the direct loss of 23,429 acres of Valley Grassland (21,797 acres in the UDA and 1,632 acres outside the UDA), which would remove approximately 17.3% of the existing Valley Grassland acres within the Planning Area. As under the existing conditions (Section 8.1.1), the regulatory environment of the No Action/No Project alternative would not require project mitigation to re-establish or establish Valley Grassland. However, project mitigation is expected to permanently preserve 11,806 acres of Valley Grassland, which is approximately half the amount of Valley Grassland that is expected to be directly impacted (lost) under the No Action/No Project Alternative. As discussed in Section 2.2.4, preserves of Valley Grassland would continue to be implemented on a project-by-project basis, and individual grassland preserves would likely be relatively small and geographically fragmented.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to Valley Grassland, when considered together with the significant impacts to Valley Grassland

from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

8.2.2.5 Blue Oak Woodland and Blue Oak Savanna

The Blue Oak Woodland land cover and the Blue Oak Savanna land cover are considered together because the plants and animals of both communities overlap considerably (see Section 8.1.2.1), and each land cover has the same regulatory requirements (Section 8.1.1). Blue Oak Woodland and Blue Oak Savanna land covers are sensitive natural communities (see discussion of individual land covers in Section 8.1.2). As discussed in Section 8.2.1, indirect impacts to the Blue Oak Woodland and Blue Oak Savanna land covers is described qualitatively.

Direct and Indirect Effects of the Alternative

The new development and related infrastructure projects and activities expected under the No Action/No Project Alternative are estimated to directly impact (remove) 140 acres of Blue Oak Woodland and Blue Oak Savanna land covers and their associated natural communities within the Planning Area (Table 8-4). The majority of these impacts (54 acres of Blue Oak Woodland and 84 acres of Blue Oak Savanna) would occur outside of the UDA where most of the existing Blue Oak Woodland and Blue Oak Savanna is present (Section 8.1.2.1). Relatively few acres of Blue Oak Woodland and Blue Oak Savanna exist within the UDA, and only 2 acres of Blue Oak Savanna would be impacted and no Blue Oak Woodland acres would be impacted within the UDA. The estimated total of 140 acres of direct impacts is approximately 1% of the existing 14,769 acres of combined Blue Oak Woodland and Blue Oak Savanna existing in the Planning Area (Table 8-1).

The environmental stressors that may result from new urban development are discussed in Section 8.2.1 and in Appendix G-1. The environmental stressors resulting from new urban development can also produce permanent indirect impacts that occur later in time or occur beyond the project site (Section 3.6.6). The No Action/No Project Alternative would indirectly impact the plant and animal communities of the Blue Oak Woodland and Blue Oak Savanna land covers by increasing habitat fragmentation, wildfire frequency, and colonization by weedy plant species.

Wildfire is a natural part of the Blue Oak Woodland and Blue Oak Savanna ecosystem, and low-intensity fires would likely burn under the oak canopy and not adversely Blue Oak Woodland and Blue Oak Savanna land covers or the associated plant and animal communities. However, with decades of fire suppression, the amount of fuel has built up to levels that would increase the intensity of wildfires. Should wildfires be of sufficient intensity to result in high levels of mortality to blue oaks, these land covers and associated plant and animal communities would be adversely affected for many years, until sufficient regrowth occurs to again support the natural plant and animal communities. New urban development is expected to result in an

increased wildfire frequency inside the UDA due to increased potential for ignitions associated with greater human presence and activities. However, because this increased risk of wildfire will occur primarily inside the UDA, there should be little or no harm to existing Blue Oak Woodland and Blue Oak Savanna land covers.

The regulatory environment under the No Action/No Project Alternative (Section 8.1.1) would require projects that undergo environmental review under CEQA or require approvals or entitlements from a local jurisdiction to provide compensatory mitigation for direct impacts (losses) of Blue Oak Woodland and Blue Oak Savanna trees and land covers. This mitigation would be implemented on a project-by-project basis and would be guided by the Oak Woodlands Conservation Act (Senate Bill 1334), and the oak tree compensation policies in the Conservation Element of the Sacramento County General Plan. Mitigation provided under the No Action/Project Alternative is estimated to preserve 70 acres of Blue Oak Woodland and/or Blue Oak Savanna and re-establish or establish approximately 70 acres of Blue Oak Woodland and/or Blue Oak Savanna. Because mitigation for impact to Blue Oak Woodland and Blue Oak Savanna would continue to be implemented on a project-by-project basis under the No Action/No Project Alternative (Section 2.2.4), preserves and compensatory mitigation sites would likely be geographically fragmented.

Cumulative Effects of the Alternative

As discussed in Section 8.1.2, the existing 14,769 acres of Blue Oak Woodland and Blue Oak Savanna natural communities within the Planning Area are located primarily outside the UDA, and are relatively undisturbed and unfragmented by past and current human activities. However, past residential development around Rancho Murieta has removed and fragmented some of the Blue Oak Woodland and Blue Oak Savanna natural communities in that location (Sacramento County 2011). Overall, past and current effects on Blue Oak Woodland and Blue Oak Savanna in the study area have been relatively small.

The reasonably foreseeable future activities (Section 3.7.3) could directly impact some existing Blue Oak Woodland and Blue Oak Savanna land covers in the study area, additional new urban development in Rancho Murieta, a master-planned development inside the UDA named Rio Del Oro, further rural residential developments outside the UDA, continued development of cultivated agricultural lands, and development of major infrastructure projects such as California High-Speed Rail (see Section 3.7.2 for details of these projects). In addition, as discussed in Section 2.2.3, approximately 1,900 acres of planned urban development would be shifted or displaced to areas outside the current UDA under the No Action/No Project Alternative, probably to areas south of the Elk Grove sphere of influence or areas near Rancho Murieta where Blue Oak Woodland and Blue Oak Savanna are present. The effects of past, present, and reasonably foreseeable other projects on Blue Oak Woodland and Blue Oak Savanna in the study area represent a significant adverse

cumulative impact on the Blue Oak Woodland and Blue Oak Savanna land covers within the study area. However, these foreseeable other projects and activities in the County would typically be required to preserve or re-establish any affected Blue Oak Woodlands under the no-net-loss policy for oak woodlands in the Conservation Element of the Sacramento County General Plan and the Sacramento County Tree Ordinance (Chapter 19.04 of Title 19 of the County Code). While the general plans of Galt and Rancho Cordova also contain tree protection policies (see Section 9.1.1), there is little if any Blue Oak Woodland or Blue Oak Savanna land covers within these jurisdictions.

The No Action/No Project Alternative is anticipated to preserve 70 acres and to re-establish 70 acres of Blue Oak Woodland and Blue Oak Savanna, which together is equivalent to the 140 acres expected to be directly impacted (lost) under the No Action/No Project Alternative. Therefore, only 70 acres or approximately 0.5% of the Blue Oak Woodland and Blue Oak Savanna within the Planning Area would be directly impacted (lost), and the past and current impacts to Blue Oak Woodland and Blue Oak Savanna within most of the study area have been relatively small. Therefore, the incremental impact of the No Action/No Project Alternative on Blue Oak Woodland and Blue Oak Savanna, when considered together with the impacts of past, current, and reasonably foreseeable projects, would result in a ***Less Than Significant Cumulative*** effect.

8.2.2.6 Farmland (Croplands and Irrigated Pasture-Grassland)

As discussed in Section 8.1.2, Cropland and Irrigated Pasture-Grassland are included in the Natural land cover category because they provide habitat for a native wildlife community (e.g., cottontail rabbits, other small mammals, mule deer, western meadowlark, red-winged blackbird; foraging for hawks and other raptors; and wintering sandhill cranes), and support some native trees and other native plants on the margins of fields or in hedgerows. There are approximately 67,820 acres of the Cropland and Irrigated Pasture-Grassland land covers in the Planning Area.

Direct and Indirect Effects of the Alternative

Future development projects and activities under the No Action/No Project Alternative are estimated to directly remove up to approximately 8,484 acres of existing Cropland and Irrigated Pasture-Grassland land covers and their associated plant and animal communities, which is approximately 12.5% of the total existing of these land covers in the Planning Area. Approximately 7,510 acres Cropland and Irrigated Pasture-Grassland are expected to be directly impacted (lost) in the UDA, where most new urban development activities would occur (Table 8-4). Approximately 974 acres would be directly impacted (lost) outside the UDA from infrastructure projects associated with new urban development and from the 1,900 acres of planned development expected to be displaced to areas outside the current Sacramento County USB boundary (see Section 2.2.3).

Environmental stressors associated with new urban development may cause indirect impacts later in time or beyond the project site (Section 3.6.6 and in Appendix G-1). Environmental stressors that could affect Cropland and Irrigated Pasture-Grassland native plant and animal communities include habitat fragmentation, increased wildfire frequency, increased colonization by weedy plant species, and increased human activity.

The regulatory environment under the No Action/No Project Alternative (Section 8.1.1) would require projects that undergo CEQA and projects that obtain local approvals or entitlements to provide mitigation for project impacts to Cropland and Irrigated Pasture-Grassland land covers. This mitigation would be implemented on a project-by-project basis and would be guided by the agricultural protection policies in the Sacramento County, Rancho Cordova, and Galt General Plans (see Section 8.1.1). Impacts to agricultural land covers, including Cropland and Irrigated Pasture-Grassland, could be mitigated by preserving any agricultural land cover of a similar resource category (e.g., Prime Farmland, Statewide Importance Farmland, Unique Farmland, or Local Importance Farmland).

The No Action/No Project Alternative would permanently preserve approximately 7,615 acres of similar resource-category farmland to mitigate direct impacts to Cropland and Irrigated Pasture-Grassland land covers (Table 8-5), which equals approximately 90% of the Cropland and Irrigated Pasture-Grassland acres lost (Table 8-4). However, a net loss of 7,510 acres of existing Cropland and Irrigated Pasture-Grasslands would still occur in the Planning Area.

Cumulative Effects of the Alternative

As discussed in Section 1.3.1, Section 3.7.1, and Section 8.1.2, past and current urban development within the study area has removed substantial amounts of Cropland and Irrigated Pasture-Grasslands since the 1920s. The other reasonably foreseeable, future actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in Elk Grove and Rancho Murieta, master-planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, expansion of existing preserves, additional conversions of Croplands and Irrigated Pasture to other Farmland land covers such as vineyards and orchards, and development of major infrastructure projects such as California High-Speed Rail and California WaterFix (see Section 3.7.2 for details about these projects). In addition, as discussed in Section 2.2.3, approximately 1,900 acres of planned urban development would be shifted or displaced to areas outside the current UDA under the No Action/No Project Alternative, probably to areas near Rancho Murieta or to areas south of the Elk Grove sphere of influence that currently support Cropland and Irrigated Pasture Grassland. These reasonably foreseeable “other” future actions are anticipated to result in additional loss of Cropland and Irrigated Pasture-Grasslands within the study area. As discussed in Section

8.1.1, current regulations will require these foreseeable other projects to provide some farmland preservation as mitigation for losses of farmland, but this mitigation would not replace the acres of lost farmland.

Projects and activities implemented under the No Action/No Project Alternative are estimated to result in the direct loss of approximately 8,484 acres of Cropland and Irrigated Pasture-Grassland, and the expected regulatory environment of the No Action/No Project (Section 2.2.2) would require the preservation of approximately 7,615 acres of similar quality farmland, which would permanently preserve farmland but would still result in a net loss of farmland in the Planning Area and study area. Mitigation for impacts to farmland would continue to occur on a project-by-project basis, and would likely result in a pattern of farmland preserves that are geographically fragmented.

Therefore, the incremental loss of 8,484 acres of Cropland and Irrigated Pasture-Grasslands under the No Action/No Project Alternative would be a ***Significant Cumulative*** effect when considered together with the acres of Cropland and Irrigated Pasture Grassland lost from past and present human activities and the other foreseeable future projects in the study area.

8.2.2.7 Farmland (Orchard/Vineyard)

As discussed in Section 8.1.2, Orchard and Vineyard are included in the Natural land cover category because they provide habitat for native wildlife (e.g., perching raptors, other native birds, roosting western red bats, small mammals). There are approximately 30,367 acres of Orchard and Vineyard land covers and their associated plant and animal communities in the Planning Area.

Direct and Indirect Effects of the Alternative

Future urban development projects and activities under the No Action/No Project Alternative are estimated to remove up to approximately 1,745 acres of existing Orchard and Vineyard land covers and associated plant and animal communities, which is approximately 5.7% of the existing 30,367 acres of Orchard and Vineyard land covers in the Planning Area. Approximately 1,546 acres Orchard and Vineyard are expected to be directly impacted (lost) in the UDA, where most new urban development activities would occur (Table 8-4). Approximately 199 acres would be directly impacted (lost) outside the UDA from infrastructure projects associated with new urban development and from the 1,900 acres of planned development expected to be displaced to areas outside the current Sacramento County USB boundary (see Section 2.2.3).

Environmental stressors associated with new urban development may cause indirect impacts later in time or beyond the project site (see Section 3.6.6 and Appendix G-1). Environmental stressors that could affect Orchard and Vineyard native plant and animal communities include

habitat fragmentation, increased wildfire frequency, increased colonization by weedy plant species, and increased human activity.

The regulatory environment under the No Action/No Project Alternative (Section 8.1.1) would require projects that undergo CEQA review and projects that obtain local approvals or entitlements to provide mitigation for project impacts to Orchard and Vineyard land covers. This mitigation would be implemented on a project-by-project basis and would be guided by the agricultural protection policies in the Sacramento County, Rancho Cordova, and Galt General Plans (see Section 8.1.1). Impacts to Agricultural land covers, including Orchard and Vineyard, could be mitigated by preserving any Farmland land cover of similar value (e.g., Prime Farmland, Statewide Importance Farmland, Unique Farmland, or Local Importance Farmland).

Approximately 1,566 acres of similar quality farmland would be preserved under the No Action/No Project Alternative, which equals approximately 90% of the acres of Orchard and Vineyard lost (Table 8-5).

Cumulative Effects of the Alternative

As summarized in Section 1.3.1, Section 3.7.1, and Section 8.1.2, past and current urban development has removed Orchard and Vineyard land covers. However, in recent years, Vineyard land covers have also been created in the Planning Area by the conversion of Annual Grassland, Cropland, Irrigated Pasture, or Orchard Agricultural lands into the Vineyard land cover.

The other reasonably foreseeable, future actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in Elk Grove and Rancho Murieta, master-planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, expansion of existing preserves, and development of major infrastructure projects such as California High-Speed Rail and California WaterFix (see Section 3.7.2 for details about these projects). In addition, as discussed in Section 2.2.3, approximately 1,900 acres of planned urban development would be shifted or displaced to areas outside the current USB under the No Action/No Project Alternative, probably to areas near Rancho Murieta or to areas south of the Elk Grove sphere of influence. These reasonably foreseeable "other" future actions are anticipated to directly impact additional Orchard and Vineyard land covers within the study area. As discussed in Section 8.1.1, current regulations will require many of these foreseeable other projects to mitigate losses of Orchard and Vineyard by preserving the same acres of a Farmland land cover that is of the same category (e.g., Prime Farmland, Statewide Importance Farmland, Unique Farmland or Local Importance). However, the foreseeable agricultural land conversions discussed in Section 3.7.2 are expected to create additional acres of vineyard within the Planning Area.

Projects and activities implemented under the No Action/No Project Alternative are estimated to result in the direct loss of approximately 1,745 acres of existing Orchard and Vineyard. The regulatory environment of the No Action/No Project (Section 2.2.2, Section 8.1.1) would require the preservation of approximately 1,566 acres of farmland of a similar category, which would permanently preserve those acres of farmland but would still result in a net loss of 1,745 acres of farmland in the Planning Area. In addition, mitigation for impacts to farmland would continue to occur on a project-by-project basis and would likely result in a pattern of farmland preserves that are geographically fragmented.

Therefore, the incremental loss of Orchard and Vineyard under the No Action/No Project Alternative, when combined with the effects of past and current projects and the effects of the foreseeable future actions in the study area, would likely result in a ***Less Than Significant Cumulative*** effect to Orchard and Vineyard land covers.

8.2.2.8 Wildlife Movement Corridors

Direct and Indirect Effects of the Alternative

As shown in Figure 8-2 and Table 8-3, there are four ECAs either partially or wholly within the Planning Area. As discussed in Section 2.2.1, the majority of planned urban development under the No Action/No Project Alternative would occur within in the UDA, but only the extreme northern most portion of the Coyote Creek ECA is in the UDA and could be impacted (Figure 8-2).

The expected locations of planned recycled water pipeline infrastructure located outside the UDA and south of Elk Grove are not within an ECA, and would have little or no impact on wildlife movement. However, some rural transportation projects outside the UDA would occur within the Bear Slough-Browns Creek ECAs and the Coyote Creek-Dry Creek ECAs. These rural transportation projects include road widening, which would likely reduce the ability of wildlife to move within the ECA. In addition, the 1,900 acres of new development displaced to areas outside the UDA (Section 2.2.1) could occur within the Coyote Creek-Dry Creek ECA north of Rancho Murieta, which would reduce the ability of wildlife to move in those ECAs.

As discussed in Section 8.1.2, Laguna Creek inside the UDA and the Cosumnes River outside the UDA currently have relatively narrow but continuous riparian cover for long distances and provide important east–west movement corridors for terrestrial wildlife in the Planning Area (Figure 8-1). Planned urban development, and associated human activities and recreation along creeks and streams within the UDA are expected to directly and indirectly affect the existing wildlife movement and dispersal along Laguna Creek corridor (see Section 8.1.2.4).

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2 and Section 8.1.1) would require new development projects that undergo CEQA to avoid substantial impacts to wildlife movement, but only if migration of a listed species could be affected.

However, new development projects that require authorizations under ESA, CESA, or CWA would be required to avoid and minimize impacts to wildlife movement corridors to the maximum extent possible. As discussed in Section 2.2.4 under the No Action/No Project Alternative, these avoidance and minimization measures (AMMs) would continue to be implemented on a project-by-project basis, resulting in mitigation that would likely be geographically fragmented and may not continue to provide wildlife movement through the Planning Area.

Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and Section 8.1.2, Natural land cover has been lost and fragmented as a result of past urban and suburban development within the Planning Area, which has reduced the ability for many wildlife species to move or disperse across the Planning Area and the larger study area.

The types of future, reasonably foreseeable "other" projects and actions, described in Section 3.7.2, are similar to the types of past and present actions that have occurred in the study area. The other reasonably foreseeable, future actions in the study area (see Sections 3.7.2 and 4.1.2.1) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in Elk Grove and Rancho Murieta, master-planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued development of cultivated agricultural lands, expansion of existing preserves, and development of major infrastructure projects such as California High-Speed Rail and California WaterFix (see Section 3.7.2 for details about these projects), and would continue to result in loss of Natural land covers. The foreseeable expansion of Rancho Murrieta could reduce the Coyote Creek ECA, and the additional low-density rural development expected within areas designated as Agricultural-Residential in the Sacramento County General Plan could impact movement in the Brown's Creek-Bear Slough ECA (Figure 8-2). If any of the foreseeable future infrastructure projects discussed in Section 3.7.2 would be located in a designated ECA or in another existing wildlife movement corridor, additional cumulative impacts to species movement could occur.

Therefore, the incremental loss and degradation of wildlife movement and corridors under the No Action/No Project Alternative would be a ***Significant Cumulative*** effect when considered together with the impacts to wildlife movement from by past and current human activities and the foreseeable other projects in the study area.

8.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3.3. As described in Section 2.3.3, the Proposed Action/Proposed Project Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project

Alternative. New urban development implemented under any EIS/EIR alternative could result in the same types of environmental stressors (see Appendix G). Both the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative include full buildout of the UDA.[2] However, the locations of new urban development in the UDA under the Proposed Action/Proposed Project Alternative are expected to differ slightly from the No Action/No Project Alternative, primarily because the Proposed Action/Proposed Project Alternative would consolidate the ESA, CESA, and CWA 404 mitigation requirements of future projects and activities (the SSHCP Covered Activities) to form a managed and interconnected SSHCP Preserve System (see Section 2.3.5). The interconnected network of Preserves in the SSHCP Preserve System would preserve and manage Natural land covers and their natural communities in perpetuity throughout the Planning Area.

In addition, the Proposed Action/Proposed Project Alternative would allow implementation of urban development within the MCRA portion of the UDA to be consistent with planned development described in the approved Sacramento County and Rancho Cordova General Plans, without approximately 19,000 acres of new urban development shifting or being displaced to locations outside the current USB boundary. Therefore, the Proposed Action/Proposed Project Alternative would have more urban development within the MCRA and within the UDA than under the No Action/No Project Alternative, because approximately 1,900 acres of new urban development would not shift or be displaced to locations outside of the current Sacramento County USB boundary.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative's Conservation Strategy also includes both landscape-level and project-level SSHCP impact AMMs (SSHCP AMMs), which would be incorporated into the design and or the implementation of each Covered Activity to avoid or minimize impacts to sensitive land covers and natural communities to the greatest extent practicable. The SSHCP AMMs include siting requirements, incorporation of low-impact development (LID) elements into project designs, incorporation of setback between waterways and new development (Stream Setbacks), incorporation of setbacks between preserved natural areas and new development (Preserve Setbacks), species-specific avoidance measures, and the use of best management practices (BMPs) during all ground-disturbing Covered Activities (see details of each SSHCP AMM in Appendix D).

Table 8-8 presents the direct impacts (loss) of each Natural land cover inside and outside the UDA under the Proposed Action/Proposed Project Alternative. Table 8-9 presents the acres of each Natural land cover expected to be preserved by the SSHCP Preserve System (see Section

[2] "Full buildout" of the UDA means all currently undeveloped lands that are zoned for, or are ultimately planned/contemplated for future urban development in the adopted general plans of the Permit Applicants would become developed. Full buildout of the UDA will include some open space and conservation lands within the areas of new urban development.

2.3.5). Table 8-8 also presents acres of each Natural land cover that would be re-established or established within the proposed SSHCP Preserve System.

Table 8-8. Expected Direct Impacts to Natural Land Covers – Proposed Action/Proposed Project Alternative

8.2.3.1 Vernal Pool Ecosystem (Valley Grassland, Vernal Pool, Swale, Stream/ Creek [VPIH])

As discussed in Section 8.1.2.2, this chapter discusses and analyzes impacts to the four land covers within the Vernal Pool Ecosystem together, because those land covers function together as a single ecosystem (also see Appendix G-1). As discussed in Section 8.2.1, indirect impacts to the Vernal Pool Ecosystem is described qualitatively for the Valley Grassland land cover, but is described both qualitatively and quantitatively for the Vernal Pool, Swale, and Stream/Creek (VPIH) land covers.

Direct and Indirect Effects of the Alternative

The Covered Activity projects and activities implemented under the Proposed Action/Proposed Project Alternative would directly impact approximately 17,118 acres of Vernal Pool Ecosystem (Table 8-10). This is 572 acres less than the anticipated 17,690 acres of Vernal Pool Ecosystem expected to be directly impacted under the No Action/No Project Alternative (Section 8.2.2).

Table 8-10. Direct and Indirect Effects on the Vernal Pool Ecosystem under the Proposed Action/Proposed Project Alternative

Land Cover	Direct Loss Within the UDA (acres)	Direct Loss Outside the UDA (acres	Indirect Effects (acres)	Total impacts (acres)	Total Existing in Planning Area (acres)	Percent of Existing impacted in Planning Area
Valley Grassland (in Vernal Pool Ecosystem)	16,187	286	Qualitative only	16,473	97,349	16.9%
Vernal Pool	355	34	95	484	4,536	10.7%
Swale	233	1	44	278	1,252	22.2%
Stream/Creek (VPIH)	22	0	4	26	73	35.6%
Grand Total	**16,797**	**321**	**143**	**17,261**	**103,210**	**16.7%**

As discussed in Section 8.1.2.5, most of the MCRA is located inside the UDA. Of the approximately 18,117 existing acres of Vernal Pool Ecosystem within the MCRA, approximately 8,387 acres are expected to be directly impacted (removed), and an additional 113 acres are expected to be indirectly impacted by the Proposed Action/Proposed Project Alternative (8,500 total). Of the approximate 38,514 acres of Vernal Pool Ecosystem within the C/RS, approximately 53 acres would be directly impacted, and 0.2 acre would be indirectly impacted by the rural transportation Covered Activities planned outside the UDA.

Specific SSHCP AMMs (see Section 2.2.2 and Appendix D) will minimize the direct and indirect impacts of the Covered Activities on the Aquatic land covers of the Vernal Pool Ecosystem. The SSHCP AMMs include limiting ground disturbance to the construction footprint; implementing erosion-control BMPs during ground disturbance and siting roads and utilities outside of sensitive areas (BMP-1, BMP-2, BMP-3, ROAD-1, and UTILITY-4); and implementing BMPs that control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training (BMP-8), and implement speed limits on the construction site (BMP-11). Indirect impacts to Stream/Creek and Vernal Pool water quality and hydrology would be minimized by AMM LID-1 through LID-3 and EDGE-4 through EDGE-7.

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project Alternative are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Proposed Action/Proposed Project Alternative would result in AMMs that are implemented more frequently and more consistently at all ground-disturbing activities, than the AMMs that would occur in new urban development projects under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to the Aquatic land covers of the Vernal Pool Ecosystem, compared to the effects of the No Action/No Project Alternative on the Vernal Pool Ecosystem.

Therefore, the environmental stressors that result from urban development (Appendix G) are expected to indirectly impact the hydrology, ecology, and species habitat within 143 acres of Vernal Pools, Swales, and Stream/Creek VPIH (Table 8-10), which is 118 acres less than the Vernal Pools, Swales, and Stream/Creek VPIH expected to be indirectly impacted under the No Action/No Project Alternative (Table 8-6).

The total 17,261 acres of directly and indirectly impacted Vernal Pool Ecosystem is approximately 16.7% of the existing 103,210 acres of Vernal Pool Ecosystem land covers in the Planning Area (Table 8-2 and Table 8-10). This expected total impact to the Vernal Pool Ecosystem under the Proposed Action/Proposed Project Alterative is 688 acres less than the total 17,949 acres of Vernal Pool Ecosystem impacts estimated for the No Action/No Project Alternative (Section 8.2.2).

The SSHCP Preserve System implemented under the Proposed Action/Proposed Project Alternative (Section 2.3.5) would preserve approximately 17,743 acres of Vernal Pool Ecosystem (Table 8-11). This would preserve 7,337 acres more than the 10,406 acres of Vernal Pool Ecosystem expected to be preserved under the No Action/No Project Alternative (Table 8-7). The Preserve System under the Proposed Action/Proposed Project Alternative would be designed to achieve the stated SSHCP Biological Goals and Measurable Objectives for the Planning Area's Vernal Pool Ecosystem (see Table 2-7). As discussed in Section 2.3.5, the individual Proposed Action/Proposed Project Alternative Preserves would be larger, contiguous, and interconnected, and would be consistently managed in perpetuity throughout the Planning Area. Consequently, each acre of Vernal Pool Ecosystem preserved under the Proposed

Action/Proposed Project Alternative would better maintain the existing habitat values and existing ecology of the Planning Area's Vernal Pool Ecosystems, when compared to the individual preserves that would be established on a project-by-project basis under the No Action/No Project Alternative.

As discussed in Section 8.1.2.2, most of the MCRA is located inside the UDA. Of the approximately 18,117 acres of Vernal Pool Ecosystem within the MCRA, 5,484 acres (30%) would be preserved by the Proposed Action/Proposed Project Alternative. Of the approximately 38,514 acres of Vernal Pool Ecosystem within the C/RS, approximately 15,294 acres (40%) would be preserved by the Proposed Action/Proposed Project Alternative.

Table 8-11. Expected Mitigation for Vernal Pool Ecosystem impacts Under the Proposed Action/Proposed Project Alternative

Land Cover	SSHCP Preserve System (acres)			Re-establishment/ Establishment (acres)
	Inside UDA	*Outside UDA*	*Total*	
Valley Grassland (in Vernal Pool Ecosystem)	5,289	11,184	16,473	0
Vernal Pool	210	756	966	389
Swale	93	185	278	256
Stream/Creek (VPIH)	26	0	26	0*
Total Vernal Pool Ecosystem Land Covers	**5,618**	**12,125**	**17,743**	**645**

* Compensatory mitigation for direct loss of 22 acres of Stream/Creek (VPIH) will be by re-establishment or establishment of Swale, which has been added to the 234 acres of compensatory mitigation for direct loss of Swale.

The SSHCP AMMs implemented under the Proposed Action/Proposed Project Alternative would be more effective at minimizing indirect impacts of new urban development on the existing hydrology and ecology of the Vernal Pool Ecosystem (see AMMs EDGE-1 through EDGE-10 and Appendix D) than the project-by-project impact AMMs that would be implemented for the No Action/No Project Alternative (Table 2-6).

Potential indirect impacts to the Vernal Pool Ecosystem from other environmental stressors, such as increased human activity and from habitat fragmentation (Appendix G), would also be minimized by the SSHCP AMMs, including EDGE-1 through EDGE-3, ROAD-1, ROAD-2 NATURE TRAIL-1 through NATURE TRAIL-4, STREAM-1 through STREAM-5, and UTILITY-2 through UTILITY-4. The potential for urban development to allow invasive species to more easily colonize SSHCP Preserves would be minimized by EDGE-10 and ROAD-3. In addition, when an SSHCP Preserve is located next to a new urban development, the development would include Preserve access-points designed to minimize impacts to the Vernal Pool Ecosystem that can be caused by the loading and unloading of livestock used to manage Valley Grasslands of preserved Vernal Pool Ecosystem (EDGE-9).

In addition to preserving 17,743-acres of Vernal Pool Ecosystem Aquatic land covers, the Proposed Action/Proposed Project Alternative would re-establish or establish 645 acres of Vernal Pool Ecosystem Aquatic land covers (Table 8-11) within the SSHCP Preserve System. Potential Impacts to existing vernal pools from the establishment of new vernal pools within an SSHCP Preserve would be minimized by SSHCP AMMs (see Re- establishment/Establishment AMMs described in Appendix D).

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- directly and indirectly impact 690 fewer total acres of the Planning Area's total Vernal Pool Ecosystem and the associated vernal pool plant and animal communities;
- directly and indirectly impact 1,283 fewer acres of the MCRA's Vernal Pool Ecosystem and the associated vernal pool plant and animal communities;
- require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects of development projects and activities on the Vernal Pool Ecosystem;
- preserve approximately 7,340 more acres of Vernal Pool Ecosystem in the Planning Area;
- result in interconnected and more contiguous Preserves of Vernal Pool Ecosystem within the Planning Area; and
- preserve 934 more acres of the MCRA's Vernal Pool Ecosystem and the associated vernal pool plant and animal communities.

Therefore, the Proposed Action/Proposed Project Alternative's incremental impact to the Vernal Pool Ecosystem and natural community is a ***Significant Beneficial*** effect, when compared to the No Action/No Project Alternative incremental impacts on vernal pools ecosystem and natural community.

Cumulative Effects on the Vernal Pool Ecosystem from the Propose Action/Proposed Project

The effects of past, present, and reasonably foreseeable other projects on the Vernal Pool Ecosystems in the study area were described in Section 8.2.2.1, and represent a significant adverse cumulative impact on the Vernal Pool Ecosystem within the study area. The incremental effects of the No Action/No Project Alternative, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area, were determined to be significant (see Section 8.2.2.1).

As discussed in this section, implementation of the SSHCP Conservation Strategy (including the SSHCP AMMs, the SSHCP Aquatic Resources Program, and the interconnected SSHCP Preserve System) is expected to result in larger areas of Vernal Pool Ecosystem preservation, more consistent and more frequent implementation of AMMs, and larger setbacks between new development in the UDA and preserved Vernal Pool Ecosystems within the UDA, when compared to the No Action/No Project Alternative. The incremental effects of the Proposed Action/Proposed Project Alternative would result in the direct and indirect loss of 17,261 acres of Vernal Pool Ecosystem within the Planning Area, which is 690 acres fewer than the loss under the No Action/No Project Alternative. Overall, the Proposed Action/Proposed Project Alternative would make a slightly smaller contribution to study area cumulative effects on the Vernal Pool Ecosystem, when compared to the No Action/No Project Alternative. However, at the scale of Vernal Pool Ecosystem impacts throughout the study area, the 690-acre difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. As discussed in Section 8.2.2.1, the impacts of the No Action/No Project Alternative on the Vernal Pool Ecosystem, when considered together with the impacts to Vernal Pool Ecosystem from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on the Vernal Pool Ecosystem. However, this EIS/EIR evaluates the future impacts of the two Action Alternatives relative to the future conditions expected under the No Action/No Project Alternative (see Section 3.6.1). Therefore, because the incremental effects of the Proposed Action/Proposed Project Alternative on the study area Vernal Pool Ecosystem is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative*** effect when compared to the No Action/No Project Alternative baseline condition.

8.2.3.2 Aquatic Land Covers (Seasonal Wetland, Freshwater Marsh, Stream/Creek, Open Water)

As discussed in Section 8.1.2.1, the plant and animal communities associated with Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water Aquatic land covers differ in composition but have similar ecological processes, aquatic habitats, and susceptibility to the environmental stressors of new urban development (described in Appendix G-1), and are analyzed together in this chapter. As discussed in Section 8.1.2.1, Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water communities are also considered “sensitive” natural communities.

Direct and Indirect Effects of the Proposed Action/Proposed Project Alternative

The acres of direct impacts from the Covered Activity projects and activities of the Proposed Action/Proposed Project Alternative on the Seasonal Wetland, Freshwater Marsh,

Stream/Creek, and Open Water land covers is approximately 504 acres (Table 8-8). This direct loss would be 79 acres less than the 583 acres of direct impact to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities that would be lost under the No Action/No Project Alternative.

Covered Activity projects and activities implemented under the Proposed Action/Proposed Project Alternative would implement the following SSHCP AMMs to avoid or minimize direct impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers by limiting ground disturbance to the construction footprint; implementing erosion-control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-2, BMP-3, ROAD-1, UTILITY-4); requiring construction BMPs that avoid and minimize impacts to water quality and limit stormwater and pollutant runoff (BMP-2), limit impacts of oil and fuel spills (BMP-3), limit deposit of erodible materials into waterways (BMP-4), control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training on litter control and other requirements of the SSHCP (BMP-8), restore temporarily disturbed areas (BMP-9), revegetate cut slopes (BMP-10), and implement speed limits on the construction site (BMP-11) (see Appendix D).

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project Alternative are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the SSHCP would result in AMMs that are implemented more frequently and more consistently at all ground-disturbing activities, than the AMMs that would occur in new urban development projects under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers, compared to the effects of the No Action/No Project Alternative on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers.

Other SSHCP AMMs would avoid and minimize indirect effects of SSHCP Covered Activities on water quality and hydrology of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water communities including AMM LID-1 through LID-3, and EDGE-4 through EDGE-6 (Appendix D). Potential impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water communities from increased human activity and from habitat fragmentation

would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2 NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project Alternative (Table 2-6), the SSHCP AMMs would better reduce indirect impacts on aquatic land covers. For example, STREAM-1 through STREAM-3 would require wider setbacks between natural waterways and new development, thereby providing greater protection of existing water quality and species habitats of Stream/Creek and other aquatic resources.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected SSHCP Preserve System within the Planning Area and a comprehensive SSHCP Preserve System management program to maintain and adaptively manage the SSHCP Preserve System in perpetuity. The Preserve System under the Proposed Action/Proposed Project Alternative would be more contiguous and maintain greater hydrologic connectivity than the project-by-project preserves that would be established under the No Action/No Project Alternative. The SSHCP Preserve system under the Proposed Action/Proposed Project Alternative would be designed to achieve the stated SSHCP Biological Goals and Measurable Objectives for the Planning Area's Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities (Table 2-7).

The Proposed Action/Proposed Project Alternative would impact approximately 504 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers (Table 8-8), but would mitigate these unavoidable impacts by preserving approximately 504 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area, and also by re-establishing or establishing an additional 504 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area (Table 8-9). By comparison, the No Action/No Project Alternative is expected to mitigate impact by re-establishing or establishing approximately 291-acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area, and would preserve only 24 acres of these land covers within the Planning Area (Table 8-5).

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- directly impact 79 fewer acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers and associated plant and animal communities;
- require Covered Activity activities and projects to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Seasonal

Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities, such as larger setbacks between new development and streams and creeks;

- preserve 480 more acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water;
- re-establish or establish 213 more acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area; and
- result in more interconnected and contiguous Preserves of Seasonal Wetlands, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area.

Therefore, the Proposed Action/Proposed Project Alternative's impact to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers would be a ***Minor Beneficial*** effect, when compared to the impacts of the No Action/No Project Alternative on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers of the Planning Area.

Cumulative Effects on Impacts to Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water Landcovers

The effects of past, present, and reasonably foreseeable other projects on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities within the study area were described in Section 8.2.2.2 and represent a significant adverse cumulative impact on Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water within the study area. As discussed in Section 8.2.2.2, the incremental effects of the No Action/No Project Alternative were determined to be significant when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed in this section, the incremental effects of the Proposed Action/Proposed Project Alternative would result in the loss of 504 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area, which is 79 acres less than the loss expected under the No Action/No Project Alternative.

Implementation of the SSHCP Conservation Strategy is expected to preserve 480 more acres and re-establish 213 more acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water within the Planning Area, and would result in consistent and more frequent implementation of AMMs, such as wider stream setbacks, that would reduce indirect impacts to remaining Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural land covers when compared to the No Action/No Project Alternative.

Overall, the Proposed Action/Proposed Project Alternative would make a slightly smaller incremental contribution to the cumulative loss of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water in the study area when compared to the No Action/No Project

Alternative. However, at the scale of impacts to these aquatic resources throughout the study area, the 79-acre difference in direct impacts, the 480-acre difference in preservation, and the 213-acre difference in re-establishment of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers under the Proposed Action/Proposed Project Alternative when compared to impacts under the No Action/No Project Alternative is not discernibly different.

As discussed in Section 8.2.2.2, the impacts of the No Action/No Project Alternative on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water resources. However, as discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Proposed Action/Proposed Project Alternative on the study area's Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative*** effect (when compared to the No Action/No Project Alternative baseline condition.

8.2.3.3 Riparian Land Covers (Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland)

As discussed in Section 8.1.2.1, the Planning Area's three Riparian land covers are Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland. The Riparian land covers are sensitive natural communities (Section 8.1.2.3).

Direct and Indirect Effects of the Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative would directly impact (remove) approximately 184 acres of Mixed Riparian Woodland, approximately 189 acres of Riparian Scrub, and approximately 218 acres of Mine Tailing Riparian Woodland, for a total of 591 acres of Riparian land cover directly impacted within the Planning Area (Table 8-8). This loss of Riparian land cover is 37 acres more than the No Action/No Project Alternative's expected loss of 554 acres.

Covered Activity projects and activities implemented under the Proposed Action/Proposed Project Alternative would implement the following SSHCP AMMs to avoid or minimize direct impacts to the Riparian land covers by limiting ground disturbance to the construction footprint, implementing erosion-control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-3, ROAD-1, and UTILITY-4), and by the implementation of AMMs requiring construction BMPs that avoid and minimize impacts to water quality and limit stormwater and pollutant runoff (BMP-2), limit impacts of oil and fuel spills (BMP-3), limit deposit of erodible

materials into waterways (BMP-4), control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training on litter control and other requirements of the SSHCP (BMP-8), restore temporarily disturbed areas (BMP-9), revegetate cut slopes (BMP-10), and implement speed limits on the construction site (BMP-11) (see Appendix D a description of each AMM).

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the SSHCP would result in AMMs that are implemented more frequently and more consistently at all ground-disturbing activities, than the AMMs that would occur in new urban development projects under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6).

Other SSHCP AMMs that would avoid and minimize indirect effects of SSHCP Covered Activities on water quality and hydrology of Riparian land covers include AMM LID-1 through LID-3, and EDGE-4 through EDGE-6 (Appendix D). Potential impacts to Riparian natural communities from increased human activity and from habitat fragmentation would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project alternative (Table 2-6), the SSHCP AMMs would better reduce indirect impacts on Riparian land covers. For example, STREAM-1 through STREAM-3 would require wider setbacks between natural waterways and new development, thereby providing greater protection of Riparian land covers adjacent to streams and creeks. The SSHCP AMMs implemented under the Proposed Action/Proposed Project Alternative would be more effective at minimizing indirect impacts of new urban development on Riparian land covers than the project-by-project impact AMMs that would be implemented for the No Action/No Project alternative (Table 2-6).

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected SSHCP Preserve System within the Planning Area and a comprehensive SSHCP Preserve System management program to maintain and adaptively manage the SSHCP Preserve System in perpetuity. The Preserve System under the Proposed Action/Proposed Project Alternative would be more contiguous and maintain greater connectivity between

riparian areas than the project-by-project Preserves that would be established under the No Action/No Project Alternative.

The SSHCP Preserve System under the Proposed Action/Proposed Project Alternative would be designed to achieve the stated SSHCP Biological Goals and Measurable Objectives for the Planning Area's Riparian land covers (Table 2-7). The SSHCP Conservation Strategy and the SSHCP Preserve System is expected to preserve approximately 964 acres of Riparian land covers, of which 74 acres are inside the UDA and 890 acres are outside the UDA (Table 8-9). By comparison, the No Action/No Project Alternative is not expected to preserve any Riparian land covers (Table 8-5). In addition to preserving 946 acres of Riparian land covers, the Proposed Action/Proposed Project Alternative would also re-establish or establish 591 acres of Mixed Riparian Woodland and Mixed Riparian Scrub within the SSHCP Preserve System (Table 8-9), an amount that equals the expected direct loss of 591 acres of Riparian land covers (Table 8-8). Because Mine Tailing Riparian Woodland land cover provides relatively low habitat value, functions, and services, impacts to the Mine Tailing Riparian Woodland land cover would be mitigated by preservation and by re-establishment of the higher quality, more natural Mixed Riparian Woodland or Mixed Riparian Scrub land covers.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- directly impact 37 more acres of Riparian land covers and associated plant and animal communities;
- require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Riparian land covers such as larger setbacks between new development and streams and creeks;
- preserve 964 acres more of Riparian land covers (Mixed Riparian Woodland and Mixed Riparian Scrub);
- re-establish or establish 37 acres more of Riparian land covers (Mixed Riparian Woodland and Mixed Riparian Scrub) within the Planning Area; and
- result in more interconnected and contiguous preserves of Riparian land covers within the Planning Area, which would reduce habitat fragmentation effects on the plant and animal communities.

Therefore, the Proposed Action/Proposed Project Alternative's impact to Riparian land covers and the associated plant and animal communities would be a ***Minor Beneficial*** effect, when

compared to the impacts of the No Action/No Project Alternative on Riparian land covers of the Planning Area.

Cumulative Effects of the Alternative

The effects of past, present, and reasonably foreseeable other projects on the Riparian land covers and natural communities within the study area were described in Section 8.2.2.3 and represent a significant adverse cumulative impact on the Riparian land covers within the study area. As discussed in Section 8.2.2.3, the incremental effects of the No Action/No Project Alternative were determined to have a less than significant cumulative adverse effect on riparian land covers in the study area, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed in this section, the Proposed Action/Proposed Project Alternative would result in the incremental loss of 591 acres of Riparian land covers within the Planning Area, which is 37 acres greater than the loss under the No Action/No Project Alternative.

However, the implementation of the SSHCP Conservation Strategy, including the SSHCP Preserve System, is expected to preserve 964 more acres and re-establish 37 more acres of Riparian land covers within the Planning Area, and would result in consistent and more frequent implementation of AMMs that would reduce indirect impacts to Riparian land covers when compared to the No Action/No Project Alternative.

Overall, the incremental impacts of Proposed Action/Proposed Project Alternative would make a slightly similar contribution to the cumulative loss of Riparian land covers in the study area when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of cumulative impacts to riparian resources throughout the study area, the 37-acre difference in direct impacts, the 964 acre difference in Riparian preservation, and the 37-acre difference in re-establishment of Riparian land covers is not discernibly different from the impacts expected under the No Action/No Project Alternative.

As discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Proposed Action/Proposed Project Alternative on the study area's Riparian land covers is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative*** effect when compared to the No Action/No Project Alternative baseline condition.

8.2.3.4 Valley Grassland

As discussed in Section 8.1.2, approximately 135,152 acres of Valley Grassland are present in the Planning Area, which includes Valley Grassland acres that are located both inside and outside of the Vernal Pool Ecosystem (Table 8-1), and Valley Grassland in ranching and grazing agricultural use. (The impacts to Valley Grassland as a part of the Vernal Pool Ecosystem are also analyzed under impacts to the Vernal Pool Ecosystem in Section 8.2.3.1.)

Direct and Indirect Effects of the Proposed Action/Proposed Project Alternative

New urban development and associated infrastructure projects implemented under the Proposed Action/Proposed Project Alternative would directly impact (remove) approximately 22,014 acres (16.3%) of the Planning Area's Valley Grasslands (Table 8-8). This loss of Valley Grassland is 1,415 acres less than the No Action/No Project Alternative expected loss of 23,429-acres of Valley Grassland.

Covered Activity projects and activities implemented under the Proposed Action/Proposed Project Alternative would implement SSHCP AMMs to avoid or minimize direct impacts to Valley Grassland, including limiting ground disturbance to the construction footprint, implementing erosion control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-3, ROAD-1, and UTILITY-4), and by implementing AMMs requiring construction BMPs that avoid and minimize stormwater and pollutant runoff (BMP-2), limit impacts of oil and fuel spills (BMP-3), limit deposit of erodible materials into waterways (BMP-4), control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training on litter control and other requirements of the SSHCP (BMP-8), restore temporarily disturbed areas (BMP-9), revegetate cut slopes (BMP-10), and implement speed limits on the construction site (BMP-11) (see Appendix D for a description of each AMM).

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts. This additional oversight and guidance provided by the SSHCP would result in AMMs that are implemented more frequently and more consistently at all ground-disturbing activities, than the AMMs that would occur in new urban development projects under the No Action/No

Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6).

Other SSHCP AMMs that would avoid and minimize indirect effects of SSHCP Covered Activities on Valley Grassland and the associated plant and animal communities include AMM LID-1 through LID-3, and EDGE-4 through EDGE-6 (Appendix D). Potential direct and indirect impacts to Valley Grassland plant and animal communities from increased human activity and from habitat fragmentation would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project alternative (Table 2-6), the SSHCP AMMs would better reduce indirect impacts on this land cover. For example, STREAM-1 through STREAM-3 would require wider setbacks between natural waterways and new development, thereby providing greater protection of all land covers adjacent to streams and creeks. The SSHCP AMMs implemented under the Proposed Action/Proposed Project Alternative would be more effective at minimizing indirect impacts of new urban development on Valley Grassland land cover than the project-by-project impact AMMs that would be implemented for the No Action/No Project Alternative (Table 2-6).

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected SSHCP Preserve System within the Planning Area and a comprehensive SSHCP Preserve System management program to maintain and adaptively manage the SSHCP Preserve System in perpetuity (Section 2.3.5). The SSHCP Preserve system would be designed to achieve the stated SSHCP Biological Goals and Measurable Objectives for the Planning Area's Valley Grasslands (Table 2-7). The SSHCP Preserve System would include approximately 22,014 acres of Valley Grassland and the associated plant and animal natural community (Table 8-9). This is 10,208 acres more Valley Grassland preserved than the 11,806 acres expected to be preserved under the No Action/No Project Alternative. The SSHCP Preserve System established under the Proposed Action/Proposed Project Alternative would also be more contiguous and maintain greater connectivity between preserves of Valley Grassland than the project-by-project mitigation preserves that would be established under the No Action/No Project Alternative.

Potential indirect effects of new urban development on Valley Grasslands within the SSHCP Preserve System would be avoided or minimized by other SSHCP AMMs required by the Proposed Action/Proposed Project Alternative. The effects of invasive weedy species would be minimized by EDGE-10 and ROAD-3, and the effects of expected increased wildfire frequency would be minimized by EDGE-3b (see Appendix D for a description of all SSHCP AMMs).

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- directly impact (remove) 1,415 fewer acres of Valley Grassland land cover and the associated plant and animal communities;
- require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Valley Grasslands;
- preserve 10,208 acres more Valley Grassland within a large SSHCP Preserve System; and
- result in more interconnected and contiguous preserves of Valley Grassland within the Planning Area, which would reduce habitat fragmentation effects on the Valley Grassland plant and animal communities.

Therefore, the Proposed Action/Proposed Project Alternative's impact to Valley Grassland land cover and the associated plant and animal communities would be a ***Significant Beneficial*** effect, when compared to the impacts of the No Action/No Project Alternative on Valley Grassland land covers of the Planning Area.

Cumulative Impacts to Valley Grassland from the Proposed Action/Proposed Project

The effects of past, present, and reasonably foreseeable other projects on the Valley Grassland natural community within the study area were described above in Section 8.2.2.4 and represent a significant adverse cumulative impact on the Valley Grassland within the study area. As discussed in Section 8.2.2.2, , the incremental direct and indirect impacts of No Action/No Project Alternative to Valley Grassland, when considered together with the significant impacts to Valley Grassland from past, current, and foreseeable future projects and activities in the study area, would be a significant cumulative effect.

As discussed here in Section 8.2.3.4, the Proposed Action/Proposed Project Alternative would result in the incremental loss of 22,014 acres of Valley Grassland and associated plant and animal communities within the Planning Area, which is 1,415 acres less than the loss expected under the No Action/No Project Alternative. Implementation of the SSHCP Conservation strategy is expected to preserve 10,208 acres more Valley Grassland within the Planning Area and would result in consistent and more frequent implementation of AMMs that would better avoid and minimize indirect impacts to the Valley Grassland natural community.

Overall, the incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution to the cumulative loss of Valley Grassland in the study area when compared to the incremental impact of the No Action/No Project Alternative.

As discussed in Section 8.2.2.4, the impacts of the No Action/No Project Alternative on Valley Grasslands, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on Valley Grassland. However, as discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the Proposed Action/Proposed Project Alternative has fewer impacts and preserves substantially more Valley Grassland than the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in a ***Minor Beneficial*** effect when compared to the No Action/No Project Alternative baseline condition.

8.2.3.5 Blue Oak Woodland and Blue Oak Savanna

The Blue Oak Woodland land cover and the Blue Oak Savanna land cover are considered together because the plants and animals of both communities overlap considerably (see Section 8.1.2.1), and each land cover has the same regulatory requirements (see Section 8.1.1). Blue Oak Woodland and Blue Oak Savanna land covers are sensitive natural communities (see discussion of individual land covers in Section 8.1.2). As discussed in Section 8.2.1, indirect impacts to the Blue Oak Woodland and Blue Oak Savanna land covers is described qualitatively.

Direct and Indirect Effects of the Proposed Action/Proposed Project Alternative

New urban development and associated infrastructure projects implemented under the Proposed Action/Proposed Project Alternative would directly impact (remove) approximately 9 acres of Blue Oak Savanna and approximately 38 acres of Blue Oak Savanna, for a combined loss of 47 acres (Table 8-8). This would be approximately 93 acres less than the 140 acres of Blue Oak Woodland and Blue Oak Savanna direct impacts expected under the No Action/No Project Alternative (Table 8-4).

Covered Activity projects and activities implemented under the Proposed Action/Proposed Project Alternative would implement relevant SSHCP AMMs to avoid or minimize direct impacts to Blue Oak Woodland and Blue Oak Savanna, including limiting ground disturbance to the construction footprint, implementing erosion-control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-3, ROAD-1, and UTILITY-4), and by implementation of AMMs requiring construction BMPs that avoid and minimize stormwater and pollutant runoff (BMP-2), limit impacts of oil and fuel spills (BMP-3), limit deposit of erodible materials into waterways (BMP-4), control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training on litter control and other requirements of the SSHCP (BMP-8), restore temporarily disturbed areas (BMP-9), revegetate cut slopes (BMP-10), and implement speed limits on the construction site (BMP-11) (see Appendix D for a description of each AMM).

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project Alternative are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts. This additional oversight and guidance provided by the SSHCP would result in AMMs that are implemented more frequently and more consistently at all ground-disturbing activities than the AMMs that would occur in new urban development projects under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6).

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected SSHCP Preserve System within the Planning Area and a comprehensive SSHCP Preserve System management program to maintain and adaptively manage the SSHCP Preserve System in perpetuity (Section 2.3.5). The SSHCP Preserve system would be designed to achieve the stated SSHCP biological goals and measurable objectives for the Planning Area's Blue Oak Woodland and Blue Oak Savanna (Table 2-7).

The Proposed Action/Proposed Project Alternative is expected to both preserve 47 acres of Blue Oak Woodland and Blue Oak Savanna and to re-establish or establish 47 acres of Blue Oak Woodland and Blue Oak Savanna within the Planning Area (Table 8-9), amounts that equal the expected direct impact (loss) of 47 acres within the Planning Area. In comparison, the 70 acres re-established/established under the No Action/No Project Alternative would replace only half of the acres of Blue Oak Woodland and Blue Oak Savanna lost under that alternative. In addition, the preservation and re-establishment of Blue Oak Woodland and Blue Oak Savanna under the Proposed Action/Proposed Project Alternative would occur in the SSHCP Preserve System, which would be more contiguous and maintain greater connectivity between Blue Oak Woodland and Blue Oak Savanna land covers than the project-by-project mitigation preserves that would be established under the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- directly impact 93 fewer acres of Blue Oak Woodland and Blue Oak Savanna and associated plant and animal communities;

- require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Blue Oak Woodland and Blue Oak Savanna;
- provide acres of Blue Oak Woodland and Blue Oak Savanna preservation in the Planning Area (47 acres) equal to the acres of expected impacts to Blue Oak Woodland and Blue Oak Savanna. By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna preservation in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres).
- the would provide acres of Blue Oak Woodland and Blue Oak Savanna re-establishment or establishment in the Planning Area (47 acres) equal to the acres of expected impacts to Blue Oak Woodland and Blue Oak Savanna to provide no net loss of oak woodlands within the Planning Area. By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna re-establishment or establishment in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres).
- result in more interconnected and contiguous Preserves of Blue Oak Woodland and Blue Oak Savanna within the Planning Area, which would reduce habitat fragmentation effects on the Blue Oak Woodland and Blue Oak Savanna plant and animal communities.

Therefore, the Proposed Action/Proposed Project Alternative's impacts to Blue Oak Woodland and Blue Oak Savanna and their associated plant and animal communities would be a ***Minor Beneficial*** effect, when compared to the impacts of the No Action/No Project Alternative on Blue Oak Woodland and Blue Oak Savanna land covers of the Planning Area.

Cumulative Impacts to Blue Oak Woodland and Blue Oak Savanna from the Proposed Action/Proposed Project

The effects of past, present, and reasonably foreseeable other projects on the Blue Oak Woodland and Blue Oak Savanna natural community within the study area were described in Section 8.2.2.5 and represent a significant adverse cumulative impact on Blue Oak Woodland and Blue Oak Savanna within the study area. As discussed in Section 8.2.2.5, the incremental direct and indirect impacts of the No Action/No Project Alternative to Blue Oak Woodland and Blue Oak Savanna, when considered together with the significant impacts to Blue Oak Woodland and Blue Oak Savanna from past, current, and foreseeable future projects and activities in the study area, would be a significant cumulative effect.

As discussed in this section, the Proposed Action/Proposed Project Alternative would result in the incremental loss of 47 acres of Blue Oak Woodland and Blue Oak Savannah and associated plant and animal communities within the Planning Area, which is 93 acres less than the loss of Blue Oak Woodland and Blue Oak Savannah expected under the No Action/No Project Alternative. The

implementation of the SSHCP Conservation Strategy in the Proposed Action/Proposed Project Alternative would preserve 47 acres of Blue Oak Woodland and Blue Oak Savanna, an amount equal to the acres of expected impacts. The No Action/No Project Alternative would also re-establish or establish 47 acres of Blue Oak Woodland and Blue Oak Savanna, an amount also equal to the acres of expected impacts. By comparison, the No Action/No Project Alternative would preserve 70 acres Blue Oak Woodland and Blue Oak Savanna and re-establish or establish 70 acres Blue Oak Woodland and Blue Oak Savanna, amounts that are only half of the expected 140 acres of impacts to Blue Oak Woodland and Blue Oak Savanna.

Overall, the incremental impacts of the Proposed Action/Proposed Project Alternative would make a slightly smaller contribution to the cumulative loss of Blue Oak Woodland and Blue Oak Savanna in the study area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to Blue Oak Woodland and Blue Oak Savanna throughout the study area, the difference in direct impacts and the difference in preservation and re-establishment or establishment of Blue Oak Woodland and Blue Oak Savanna land covers is not discernibly different.

As discussed in Section 8.2.2.5, the impacts of the No Action/No Project Alternative on Blue Oak Woodland and Blue Oak Savanna, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on Blue Oak Woodland and Blue Oak Savanna. However, as discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Proposed Action/Proposed Project Alternative on Blue Oak Woodland and Blue Oak Savanna are not discernibly different from the incremental effects of the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative would result in ***No Cumulative*** effect (when compared to the No Action/No Project Alternative baseline condition.

8.2.3.6 Farmland (Croplands/Irrigated Pasture-Grasslands)

As discussed in Section 8.1.2.1 above, Cropland and Irrigated Pasture-Grasslands are included in the Natural land cover category because they provide habitat for native wildlife (e.g., cottontail rabbits, mule deer, western meadowlark, and red-winged black bird). There are approximately 67,820 acres of Cropland and Irrigated Pasture-Grassland land covers and associated plant and animal communities in the Planning Area. As discussed in Section 8.1.2.1, pasture that is not irrigated and used for ranching and grazing is analyzed in the Valley Grassland land cover.

Direct and Indirect Effects of the Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is expected to directly impact (remove) approximately 8,034 acres of Cropland and Irrigated Pasture-Grasslands (Table 8-8). This is 450

acres less than the approximately 8,484 acres expected to be lost under the No Action/No Project Alternative.

Covered Activity projects and activities implemented under the Proposed Action/Proposed Project Alternative would implement SSHCP AMMs to avoid or minimize direct impacts to Cropland and Irrigated Pasture-Grasslands, including limiting ground disturbance to the construction footprint, implementing erosion control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-3, ROAD-1, and UTILITY-4), and by implementing AMMs requiring construction BMPs that avoid and minimize stormwater and pollutant runoff (BMP-2), limit impacts of oil and fuel spills (BMP-3), limit deposit of erodible materials into waterways (BMP-4), control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training on litter control and other requirements of the SSHCP (BMP-8), restore temporarily disturbed areas (BMP-9), revegetate cut slopes (BMP-10), and implement speed limits on the construction site (BMP-11) (see Appendix D for a description of each AMM).

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project Alternative are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts. This additional oversight and guidance provided by the SSHCP would result in AMMs that are implemented more frequently and more consistently at all ground-disturbing activities than the AMMs that would occur in new urban development projects under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6).

Other SSHCP AMMs that would avoid and minimize indirect effects of SSHCP Covered Activities on the native wildlife community in Cropland and Irrigated Pasture-Grassland include AMM LID-1 through LID-3, and EDGE-4 through EDGE-6 (see Appendix D). Potential direct and indirect impacts to Cropland and Irrigated Pasture-Grassland plant and animal communities from increased human activity and from habitat fragmentation would be minimized by AMMs EDGE-1 through EDGE-3, EDGE-8, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project Alternative (Table 2-6), the SSHCP AMMs would better reduce indirect impacts on these land covers. For example, STREAM-1 through STREAM-3 would require wider setbacks between natural waterways and new development, and wider setbacks between new Preserves and new development, thereby providing greater

protection of all adjacent land covers. The SSHCP AMMs implemented under the Proposed Action/Proposed Project Alternative would be more effective at minimizing indirect impacts on Croplands and Irrigated Pasture-Grasslands than the project-by-project impact AMMs that would be implemented of the No Action/No Project Alternative (Table 2-6).

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected SSHCP Preserve System within the Planning Area and a comprehensive SSHCP Preserve System management program to maintain and adaptively manage the SSHCP Preserve System in perpetuity (Section 2.3.5). The SSHCP Preserve system would be designed to achieve the stated SSHCP biological goals and measurable objectives for the natural communities that utilize Croplands and Irrigated Pasture-Grasslands, including the Planning Area's Swainson's hawk and wintering sandhill crane populations (Table 2-7).

Because the Orchard and Vineyard land covers provide relatively low habitat value for the native wildlife community that uses farmlands as habitat, the Proposed Action/Proposed Project Alternative would mitigate direct impacts to any Farmland land cover by preserving the same acreage of either Cropland or Irrigated Pasture-Grassland land covers. The SSHCP Preserve System would include approximately 9,696 acres of Croplands and Irrigated Pasture-Grasslands (Table 8-9). This would be 1,212 acres more than the 8,484 acres of farmland expected to be preserved under the No Action/No Project Alternative. The farmland Preserves of Cropland or Irrigated Pasture-Grassland established under the Proposed Action/Proposed Project Alternative would be more contiguous, maintain greater habitat connectivity between Preserves, and provide better habitat for native wildlife species than the farmland preserves established on a project by project basis under the No Action/No Project Alternative.

Potential indirect effects of new urban development on Cropland and Irrigated Pasture-Grassland Preserves within the SSHCP Preserve System would be avoided or minimized by other SSHCP AMMs required by the Proposed Action/Proposed Project Alternative. For example, the potential for increased invasive species would be minimized by EDGE-10 and ROAD- 3, and the effects of expected increased wildfire frequency would be minimized by EDGE-3b (see Appendix D for a description of all SSHCP AMMs).

The Preserve System implemented under the Proposed Action/Proposed Project Alternative (Section 2.3.5) would include approximately 9,696 acres of Cropland and Irrigated Pasture-Grassland (Table 8-9). This area is 2,081 acres more than the total 7,615 acres of Cropland and Irrigated Pasture-Grassland that could be preserved under the No Action/No Project Alternative (Table 8-5). In addition, as discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would preserve Cropland and Irrigated Pasture-Grassland within an interconnected SSHCP Preserve System throughout the Planning Area, and would include a comprehensive, in-perpetuity, preserve management program. In addition, the SSHCP Preserve System under the Proposed Action/Proposed Project Alternative would result in larger individual Preserves and

greater connectivity of Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- directly impact(remove) 450 fewer acres of Cropland and Irrigated Pasture-Grassland land cover and their plant and animal communities;
- require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Cropland and Irrigated Pasture-Grassland;
- preserve 2,081 acres more Cropland and Irrigated Pasture-Grassland (or a similar quality Farmland land cover) within a large SSHCP Preserve System; and
- result in more contiguous Preserves and an interconnected Preserve System that includes Cropland and Irrigated Pasture-Grassland within the Planning Area and which would reduce habitat fragmentation effects on native wildlife in the Planning Area.

Therefore, the Proposed Action/Proposed Project Alternative's impact to Cropland and Irrigated Pasture-Grassland land is a ***Minor Beneficial*** effect when compared to the No Action/No Project Alternative impacts on Cropland and Irrigated Pasture-Grassland land covers and farmland wildlife community.

Cumulative Impacts to Cropland and Irrigated Pasture-Grassland from the Proposed Action/Proposed Project Alternative

The effects of past, present, and reasonably foreseeable other projects on the Cropland and Irrigated Pasture-Grassland natural communities within the study area were described in Section 8.2.2.6. Also as discussed in Section 8.2.2.6, the incremental direct and indirect impacts of the No Action/No Project Alternative on Cropland and Irrigated Pasture-Grassland, when considered together with the impacts to Cropland and Irrigated Pasture-Grassland from past, current, and foreseeable future projects and activities in the study area, would result in a significant cumulative effect.

As discussed in this section, the Proposed Action/Proposed Project Alternative would result in the incremental loss of 8,034 acres of Cropland and Irrigated Pasture-Grassland and associated plant and animal communities within the Planning Area, which is 450 acres less than the loss expected under the No Action/No Project Alternative. The implementation of the SSHCP Conservation strategy is expected to preserve 2,081 more acres of Cropland and Irrigated Pasture-Grassland within the Planning Area within an interconnected SSHCP Preserve System and would result in consistent and more frequent implementation of AMMs that would better avoid and minimize

indirect impacts to the natural communities associated with Cropland and Irrigated Pasture-Grassland land covers.

Overall, the incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution to the cumulative loss of Cropland and Irrigated Pasture-Grassland in the study area when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to Cropland and Irrigated Pasture-Grassland throughout the study area, the 450-acre difference in direct impacts and the 2,081-acres difference in the permanent preservation of Cropland and Irrigated Pasture-Grassland land covers is not discernibly different between the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative.

As discussed in Section 8.2.2.6, the impacts of the No Action/No Project Alternative on Cropland and Irrigated Pasture-Grassland, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on Cropland and Irrigated Pasture-Grassland. However, as discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Proposed Action/Proposed Project Alternative on Cropland and Irrigated Pasture-Grassland are not discernibly different from the incremental effects of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative*** effect when compared to the No Action/No Project Alternative baseline condition.

8.2.3.7 Farmland (Orchard/Vineyard)

As discussed in Section 8.1.2, Orchard and Vineyard are included in the Natural land cover category because they provide habitat for native wildlife (e.g., small mammals, perching raptors, other native birds, roosting western red bats). There are approximately 30,367 acres of Orchard and Vineyard land covers and the associated plant and animal communities in the Planning Area.

Direct and Indirect Effects of the Alternative

The Proposed Action/Proposed Project Alternative is expected to directly impact (remove) approximately 1,662 acres of Orchard and Vineyard (Table 8-8). This loss is 63 acres less than the approximately 1,725 acres of Orchard and Vineyard estimated to be lost under the No Action/No Project Alternative.

Covered Activity projects and activities implemented under the Proposed Action/Proposed Project Alternative would implement SSHCP AMMs to avoid or minimize direct impacts to

Orchard and Vineyard, including limiting ground disturbance to the construction footprint, implementing erosion-control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-3, ROAD-1, and UTILITY-4), and by implementing AMMs requiring construction BMPs that avoid and minimize stormwater and pollutant runoff (BMP-2), limit impacts of oil and fuel spills (BMP-3), limit deposit of erodible materials into waterways (BMP-4), control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training on litter control and other requirements of the SSHCP (BMP-8), restore temporarily disturbed areas (BMP-9), revegetate cut slopes (BMP-10), and implement speed limits on the construction site (BMP-11) (see Appendix D for a description of each AMM).

AMM BMP-1 through AMM BMP-11 of the Proposed Action/Proposed Project are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts. This additional oversight and guidance provided by the SSHCP would result in AMMs that are implemented more frequently and more consistently at all ground-disturbing activities than the AMMs that would occur in new urban development projects under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6).

Other SSHCP AMMs that would avoid and minimize indirect effects of SSHCP Covered Activities on the native wildlife community in Orchard and Vineyard include AMM LID-1 through LID-3, and EDGE-4 through EDGE-6 (see Appendix D). Potential direct and indirect impacts to Orchard and Vineyard natural communities from increased human activity and from habitat fragmentation would be minimized by AMMs EDGE-1 through EDGE-3, EDGE-8, ROAD-1, ROAD-2 NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project Alternative (Table 2-6), the SSHCP AMMs would better reduce indirect impacts on these land covers. For example, STREAM-1 through STREAM-3 would require wider setbacks between natural waterways and new development, and wider setbacks between new Preserves and new development, thereby providing greater protection of all adjacent land covers. The SSHCP AMMs implemented under the Proposed Action/Proposed Project Alternative would be more effective at minimizing indirect impacts on Orchard and Vineyard than the project-by-project impact AMMs that would be implemented for the No Action/No Project Alternative (Table 2-6).

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected SSHCP Preserve System within the Planning Area and a comprehensive SSHCP Preserve System management program to maintain and adaptively manage the SSHCP Preserve System in perpetuity (Section 2.3.5). The SSHCP Preserve system would be designed to achieve the stated SSHCP Biological Goals and Measurable Objectives for the native species that utilize farmlands (Table 2-7). However, the SSHCP Preserve System would not preserve any acres of Orchard or Vineyard land covers. Because the Orchard and the Vineyard land covers provide relatively low habitat value for the native wildlife community that uses farmlands as habitat, the Proposed Action/Proposed Project Alternative would instead mitigate direct impacts to Orchards and Vineyards by preserving the same acreage of either Cropland or Irrigated Pasture-Grassland land covers (Table 8-9). Therefore, the 9,696 acres of farmland Preserves established under the Proposed Action/Proposed Project Alternative would be more contiguous, maintain greater habitat connectivity between Preserves, and provide better habitat for native wildlife species than the farmland preserves established on a project–by-project basis under the No Action/No Project Alternative. In addition, farmland Preserves established by the Proposed Action/Proposed Project Alternative would be operated to provide or improve habitat for target native species of concern. In addition, indirect effects of new urban development on farmland would be avoided or minimized by SSHCP AMMs. For example, the potential for increased invasive species would be minimized by EDGE-10 and ROAD-3, and the effects of expected increased wildfire frequency would be minimized by EDGE-3b (see Appendix D for a description of all SSHCP AMMs). The total 9,696 acres of Farmland land covers preserved under the Proposed Action/Proposed Project Alternative (Table 8-9) would equal the anticipated direct impact to Farmland land covers under Proposed Action/Proposed Project Alternative (Table 8-8), and this farmland preservation is 515 acres more than the 9,181-acres of farmlands preserved under the No Action/No Project Alternative (Table 8-5).

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- directly impact(remove) 63 fewer acres of Orchard and Vineyard land covers and their plant and animal communities;
- require Covered Activities to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Orchard and Vineyard land covers;
- preserve 515 acres more farmland and would preserve farmland within a large SSHCP Preserve System;
- mitigate impacts to Orchard and Vineyard land covers by preserving equal acres of Cropland and Irrigated Pasture-Grassland land covers, which provide much higher

quality habitat for the native wildlife community that uses farmland in the Planning Area; and

- preserve farmland in larger Preserves within an interconnected Preserve System, which would reduce habitat fragmentation effects on native wildlife in the Planning Area.

Therefore, the Proposed Action/Proposed Project Alternative's impacts to Orchard and Vineyard land covers and farmland wildlife community is a ***Minor Beneficial*** effect when compared to the No Action/No Project Alternative impacts on Orchard and Vineyard land covers and farmland wildlife community.

Cumulative Impacts to Orchards and Vineyards by the Proposed Action/ Proposed Project

The effects of past, present, and reasonably foreseeable other projects on the Orchard and Vineyard land covers within the study area were described in Section 8.2.2.7. Also as discussed in section 8.2.2.7, the incremental impacts of the No Action/No Project Alternative on Orchard and Vineyard land covers, when considered together with the impacts to Orchard and Vineyard from past, current, and foreseeable future projects and activities in the study area, would result in a less than significant cumulative effect to Orchard and Vineyard land covers.

As discussed here in Section 8.2.3.7, the Proposed Action/Proposed Project Alternative would result in the incremental loss of 1,662 acres of Orchard, Vineyard, and associated plant and animal communities within the Planning Area (Table 8-8), which is 63 acres less than the loss expected under the No Action/No Project Alternative (Table 8-4). The implementation of the SSHCP Conservation strategy is expected to preserve 515 more acres of farmland within a large interconnected Preserve System, would preserve farmland with much higher habitat value than the impacted Orchard and Vineyard land covers, and would result in consistent and more frequent implementation of AMMs that would better avoid and minimize indirect impacts to the farmland land covers and wildlife natural communities.

Overall, the incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution to the cumulative loss of farmland in the study area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to farmland throughout the study area, the 63-acre difference in direct impacts to Orchard and Vineyard land covers and the 515 acres difference in the preservation of farmland land covers is not discernibly different between the Proposed Action/ Proposed Project Alternative and the No Action/No Project Alternative.

As discussed in Section 8.2.2.6, the impacts of the No Action/No Project Alternative on Orchard and Vineyard land covers, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would have a less than

significant adverse cumulative effect on Orchard and Vineyard. However, as discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Proposed Action/Proposed Project Alternative on Orchard and Vineyard is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative*** effect when compared to the No Action/No Project baseline condition.

8.2.3.8 Wildlife Movement Corridors

Direct and Indirect Effects of the Alternative

As shown in Figure 8-2 and Table 8-3, there are four ECAs either partially or wholly within the Planning Area. The majority of development under the Proposed Action/Proposed Project Alternative would occur within in the UDA (see Section 2.3.3) and could only impact the extreme northern most portion of the Duck Creek North Fork - Coyote Creek ECA.

Outside the UDA, no recycled water pipeline Covered Activities would be located within an ECA. However, rural transportation Covered Activity projects are anticipated to occur within the Stone Lake – Yolo Bypass, Bear Slough – Browns Creek, and Duck Creek North Fork – Coyote Creek ECAs. These rural transportation projects include road-widening projects, which could reduce the ability of wildlife to move across these roadways and within these ECAs. The types of rural transportation Covered Activities included under the Proposed Action/Proposed Project Alternative are similar to the types of rural transportation projects included under the No Action/No Project Alternative; however, additional roadway development is expected under the No Action/No Project Alternative to serve the 1,900 acres of new urban development that is expected to be displaced outside of the existing USB boundary under the No Action Alternative (see Section 2.2.3).

Potential direct effects of future rural transportation Covered Activities under the Proposed Action/Proposed Project Alternative would occur from new or expanded roadways that would increase the size of existing movement barriers or create new barriers to terrestrial wildlife movement. However, all Covered Activities implemented under the Proposed Action/Proposed Project Alternative would incorporate SSHCP AMMs, which would reduce habitat fragmentation and also require roadway projects to incorporate structures that would allow native wildlife to cross under improved or new roadways. SSHCP AMMs that would help to maintain existing wildlife movement include EDGE-1 through EDGE-3, and ROAD-1 through ROAD-3. Several SSHCP AMMs (STREAM-1 through STREAM-5) would also require larger setbacks between existing waterways and new development relative to the No Action/No Project Alternative. These wider setbacks between new development in the UDA and existing waterways would allow continued wildlife movement in

these riparian corridors. The SSHCP AMMs would also reduce other environmental stressors associated with urban development (see Appendix G-1) to better avoid or minimize indirect impacts on wildlife movement, relative to the No Action/No Project Alternative.

In addition, the Proposed Action/Proposed Project Alternative would allow urban development within the MCRA portion of the UDA to be consistent with the planned development described in the approved Sacramento County and Rancho Cordova General Plans, without approximately 19,000 acres of new urban development being displaced to locations outside the current USB boundary (see Section 2.2.3). Because the Proposed Action/Proposed Project Alternative would not result in the displacement of planned urban development to locations outside of the UDA, the expected No Action/No Project Alternative impacts to the Duck Creek North Fork – Coyote Creek ECA would not occur under the Proposed Action/Proposed Project Alternative.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected 34,494-acre SSHCP Preserve System within the Planning Area (Table 8-9), and a comprehensive SSHCP Preserve System management program to maintain and adaptively manage the SSHCP Preserve System in perpetuity (Section 2.3.5). The SSHCP Preserve System would be designed to achieve the stated SSHCP Biological Goals and Measurable Objectives for wildlife movement, including maintaining wildlife movement and dispersal through the Planning Area, including inside the UDA and outside the UDA (Table 2-7).

Significance of Direct and Indirect Effects of the Alternative

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- provide a coordinated, interconnected Preserve System designed to provide connectivity between existing preserves and new Preserves established under the Proposed Action/Proposed Project Alternative;
- require new development project to incorporate AMMs that would avoid or minimize effects on riparian corridors used for wildlife movement;
- require new development projects inside the UDA and related roadway projects outside the UDA to incorporate wildlife crossing structures at specific locations; and
- not result in displaced development outside the UDA to locations that have a greater potential to affect designated wildlife movement corridors.

Therefore, the Proposed Action/Proposed Project Alternative's impact to wildlife movement corridors would be ***Minor Beneficial*** effect when compared to the No Action/No Project Alternative impacts on wildlife movement in the Planning Area.

Cumulative Impacts to Wildlife Movement from the Proposed Action/Proposed Project

The effects of past, present, and reasonably foreseeable other projects on wildlife movement in the study area were described above in Section 8.2.2.8 and represent a significant adverse cumulative impact on wildlife movement within the study area. As discussed in Section 8.2.2.8, the incremental direct and indirect impacts of No Action/No Project Alternative on existing wildlife movement and dispersal would be a significant cumulative effect, when considered together with the significant impacts to wildlife movement from past, current, and foreseeable future projects and activities in the study area.

As discussed in this section, the Proposed Action/Proposed Project Alternative would provide an interconnected Preserve System in the Planning Area, which would not occur under the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative would require wider setbacks between development and waterways, preserving wider riparian movement corridors when compared to the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would require roadway projects to include AMMs that would provide wildlife undercrossing at specific locations.

Overall, the incremental impacts of the Proposed Action/Proposed Project Alternative would make a smaller contribution to the cumulative loss of wildlife movement and dispersal in the study area, when compared to the incremental impact of the No Action/No Project Alternative. However, at the scale of wildlife movement throughout the study area, the difference in movement under the Proposed Action/Proposed Project Alternative when compared to impacts under the No Action/No Project Alternative is not discernibly different.

As discussed in Section 8.2.2.8, the impacts of the No Action/No Project Alternative on wildlife movement and dispersal, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect. However, as discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Proposed Action/Proposed Project Alternative on wildlife movement in the study area is not discernibly different from the incremental effects of the No Action/No Project Alternative on wildlife movement in the study area, the Proposed Action/Proposed Project Alternative would result in ***No Cumulative*** effect (when compared to the No Action/No Project baseline condition).

8.2.4 Reduced Permit Term Alternative

The Reduced Permit Term Alternative is described in Section 2.4. The Reduced Permit Term Alternative includes the same types of new urban development and infrastructure as those

anticipated under the No Action/No Project Alternative (see Section 2.4.3). New urban development implemented under any EIS/EIR alternative could result in the same types of environmental stressors (see Appendix G). The ESA and CESA incidental take permits and the CWA permit strategy for HCP Covered Activities would be valid only during the 30-year permit term of the Reduced Permit Term Alternative, and the Reduced Permit Term Alternative's Conservation Strategy would be implemented only during this 30-year term (see Section 2.4.1). The development of five large master plans within the UDA (see Sections 2.3.3 and 2.3.4) are expected to occur during the 30-year permit term. Under the Reduced Permit Term Alternative, the core of the SSHCP Preserve System inside the UDA would be associated with those five large master plans (see Sections 2.3.3 and 2.4.3). Because the core of the Preserve System inside the UDA under both EIS/EIR action alternatives is associated with the same five large master plans, approximately 70% of the UDA Preserves established under the Reduced Permit Term Alternative would have similar sizes, boundaries, and locations as the UDA Preserves established under the Proposed Action/Proposed Project Alternative. However, the shorter duration of the Reduced Permit Term Alternative—and the smaller amount of urban development and associated development fees collected under the Reduced Permit Term Alternative—would not allow the HCP's Implementing Entity to establish as many acres of new Preserves in the Planning Area as would occur under the Proposed Action/Proposed Project's 50-year permit term. Therefore, fewer new Preserves would be established under the Conservation Strategy of the Reduced Permit Term Alternative. This difference in acres of Natural land cover preservation would be especially pronounced outside the UDA.

This EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3), so the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, as described in Section 3.6.7.2, the EIS/EIR analysis of the Reduced Permit Term Alternative also considers future urban development that is not part of the project description of the Reduced Permit Term Alternative, but is still expected to occur within the Planning Area after the end of the permit term (i.e., in years 31–50 of the EIS/EIR Study Period). As described in Section 3.6.7.2, project mitigation Preserves established after the end of the 30-year Reduced Permit Term Alternative would be established under the existing project-by-project process for obtaining individual authorizations under CWA, ESA, CESA, and Section 1600 of the California Fish and Game Code. Consequently, mitigation Preserves established in years 31–50 of the EIS/EIR study period would not be established using a regional, landscape-based approach that balances the need for new urban development with the need for resource conservation, as would be provided by an HCP. Therefore, much of the Preserve System inside the UDA would be very similar under the two action alternatives, but the Preserve System outside the UDA would be substantially different between the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, it is unlikely that mitigation preserves established outside the

UDA would be contiguous or would be interconnected, and it is unlikely that a large, contiguous 10,500-acre landscape-size vernal pool Preserve would be established in the southwestern portion of the Planning Area. Likewise, the No Action/No Project Alterative also would not result in contiguous, interconnected preserves outside the UDA, and would not establish a 10,500-acre vernal-pool Preserve in the Planning Area. In these ways, the new mitigation Preserves established outside the UDA under the Reduced Permit Term Alternative and the No Action/No Project Alternative would be similar.

Table 8-12 presents the direct impacts (loss) of each natural land cover inside and outside the UDA expected under the Reduced Permit Term Alternative. Table 8-13 presents the acres of each natural land cover expected to be preserved under the Reduced Permit Term Alternative. Table 8-8 also presents acres of each Natural land cover that would be re-established or established under the Reduced Permit Term Alternative.

Table 8-12. Expected Direct Impacts to Natural Land Covers – Reduced Permit Term Alternative

* The re-establishment/establishment acres in this column are in addition to the preservation acres presented in the previous column.

* * Indicates a land cover type that is sensitive. Sensitive natural communities are those that receive specific recognition or legal protection under federal, state, or local laws or regulations.

8.2.4.1 Vernal Pool Ecosystem

As discussed in Section 8.1.2.2, impacts to the four land covers within the Vernal Pool Ecosystem land covers are discussed and analyzed together because they function together as a single ecosystem (also see discussion in Appendix G-1). Indirect impacts to the Vernal Pool Ecosystem is described qualitatively for the Valley Grassland land cover, but is described both

qualitatively and quantitatively for the Vernal Pool, Swale, and Stream/Creek (VPIH) land covers (see Section 8.2.1).

Direct and Indirect Effects of the Alternative

The Reduced Permit Term Alternative would directly impact approximately 18,825 acres of Vernal Pool Ecosystem (Table 8-14) over the EIS/EIR 50-year permit term. This is 1,135 acres more than the anticipated 17,690 acres of Vernal Pool Ecosystem expected to be directly impacted under the No Action/No Project Alternative over the EIS/EIR 50-year permit term (Table 8-6, Section 8.2.2).

Table 8-14. Direct and Indirect Effects on the Vernal Pool Ecosystem – Reduced Permit Term Alternative

Land Cover	Direct Loss Within the UDA (acres)	Direct Loss Outside the UDA (acres)	Indirect Effects (acres)	Total Impacts (acres)	Total Existing in 317,655-acre Planning Area	Percent of Existing Impacted in Planning Affected
Valley Grassland (in Vernal Pool Ecosystem)	17,828	286	Described Qualitatively	18,114	97,349	18.6%
Vernal Pool	379	34	186	599	4,536	13.2%
Swale	268	2	77	347	1,252	27.7%
Stream/Creek (VPIH)	28	0	8	36	73	49.3%
Vernal Pool Ecosystem Total Impacts	**18,503**	**322**	**271**	**19,096**	**103,210**	**18.5%**

As discussed in Section 8.1.2.5, most of the MCRA is located inside the UDA. Of the approximately 18,117 existing acres of Vernal Pool Ecosystem within the MCRA, approximately 9,800 acres are expected to be directly impacted (removed), and an additional 237 acres are expected to be indirectly impacted by the Reduced Permit Term Alternative, for a total of 10,037 acres (55% of the MCRA's Vernal Pool Ecosystem).

During the 30-year permit term, SSHCP Covered Activities implemented during the permit term would include relevant SSHCP AMMs to avoid or minimize direct and indirect impacts on the Vernal Pool Ecosystem (see Section 2.4.5). The SSHCP AMMs (see Appendix D) include limiting ground disturbance to the construction footprint, implementing erosion-control BMPs during any ground disturbance, and siting roads and utilities outside of sensitive areas (BMP-1, BMP-2, BMP-3, ROAD-1, and UTILITY-4); and implementing BMPs that control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training (BMP-8), and implement speed limits on the

construction site (BMP-11). Indirect impacts to Stream/Creek and Vernal Pool water quality and hydrology would be minimized by AMM LID-1 through LID-3 and EDGE-4 through EDGE-7.

AMM BMP-1 through AMM BMP-11 are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM implemented during the 30-year permit term. The Reduced Permit Term Alternative would also include annual review of the effectiveness of each SSHCP AMM implemented during the permit term and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Reduced Permit Term Alternative would result in BMPs and water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The AMMs implemented during the 30-year permit term also include new AMMs that would not occur under the No Action/No Project Alternative, and these new measures are expected to lessen the potential adverse effects to the Aquatic land covers of the Vernal Pool Ecosystem, compared to the effects of the No Action/No Project Alternative on the Vernal Pool Ecosystem.

Therefore, the environmental stressors that result from urban development (see Appendix G) are expected to indirectly impact the hydrology, ecology, and species habitat within 271 acres of Vernal Pools, Swales, and Stream/Creek (VPIH) (Table 8-14), which is 10 acres less than indirect impacts to Vernal Pools, Swales, and Stream/Creek (VPIH) expected under the No Action/No Project Alternative (Table 8-6).

The total 19,096 acres of directly and indirectly impacted Vernal Pool Ecosystem is approximately 18.5% of the existing 103,210 acres of Vernal Pool Ecosystem land covers in the Planning Area (Table 8-2, Table 8-14). This expected total impact to the Vernal Pool Ecosystem under the Reduced Permit Term Alternative is 1,147 acres more than the total 17,949 acres of Vernal Pool Ecosystem impacts estimated for the No Action/No Project Alternative (Table 8-6, Section 8.2.2).

The Reduced Permit Term Alternative is expected to preserve approximately 15,302 acres of Vernal Pool Ecosystem land covers over the EIS/EIR's 50-year study period (Table 8-15), which would include an expected 10,716 acres of Vernal Pool Ecosystem within the HCP Preserve System established during the 30-year permit term, and 4,590 acres preserved on a project-by-project basis as ESA mitigation (after the end of the permit term). The total acres of Vernal Pool Ecosystem preservation under the Reduced Permit Term Alternative is approximately 4,896 acres greater than the 10,406 acres of Vernal Pool Ecosystem preservation expected under the No Action/No Project Alternative. In addition, because the 10,716 acres preserved during the

first 30 years of the Reduced Permit Term Alternative would be within a more contiguous and interconnected HCP Preserve System, these acres of preserved Vernal Pool Ecosystem would better maintain the existing habitat values and existing ecology of the Vernal Pool Ecosystem, when compared the individual Preserves that would be established on a project-by-project basis under the No Action/No Project Alternative.

The SSHCP AMMs implemented during the 30-year permit would be more effective at minimizing indirect impacts of new urban development on the existing hydrology and ecology of the Vernal Pool Ecosystem (see AMMs EDGE -1 through EDGE-10 in Appendix D) than the project-by-project impact AMMs that would be implemented of the No Action/No Project Alternative.

Potential indirect impacts to the Vernal Pool Ecosystem from other environmental stressors, such as increased human activity and habitat fragmentation would be minimized during the 30-year permit term by EDGE-1 through EDGE-3, EDGE-8, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-4, STREAM-1 through STREAM-5, and UTILITY-2 through UTILITY-4. The potential for urban development to allow invasive species to more easily colonize SSHCP Preserves would be minimized by EDGE-10 and ROAD-3. In addition, when a Vernal Pool Ecosystem Preserve is located next to a new urban development during the permit term, the development would include Preserve access-points designed to minimize impacts to the Vernal Pool Ecosystem that can be caused by the loading and unloading of livestock used to manage Valley Grasslands of preserved Vernal Pool Ecosystem (EDGE-9).

In addition to preserving 15,302 acres of Vernal Pool Ecosystem aquatic land covers, the Reduced Permit Term Alternative would re-establish or establish 649 acres of Vernal Pool Ecosystem Aquatic land covers (Table 8-15). Potential Impacts to existing vernal pools from the establishment of new vernal pools within a preserved Vernal Pool Ecosystem would be minimized by AMMs (see RE-ESTABLISHMENT/ ESTABLISHMENT AMMs described in Appendix D).

Table 8-15. Expected Mitigation for Vernal Pool Ecosystem Impacts Under the Reduced Permit Term Alternative

Land Cover	Preserved Land (acres)			Re-establishment/ Establishment (acres)
	Inside UDA	*Outside UDA*	*Total*	
Valley Grassland (in Vernal Pool Ecosystem)	3,550	10,002	13,552	0
Vernal Pool	101	1,098	1,199	413
Swale	57	478	535	228
Stream/Creek (VPIH)	16	0	16	8
Total Vernal Pool Ecosystem	**3,724**	**11,578**	**15,302**	**649**

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- directly and indirectly impact 1,147 more acres of Vernal Pool Ecosystem and associated vernal pool plant and animal communities;
- directly and indirectly impact 254 more acres of the MCRA's Vernal Pool Ecosystem and the associated vernal pool plant and animal communities;
- implement better AMMs to reduce and minimize indirect effects of development projects and activities on the Vernal Pool Ecosystem during the 30-year permit term;
- preserve approximately 4,896 more acres of Vernal Pool Ecosystem in the Planning Area, and approximately two-thirds of the preserved Vernal Pool Ecosystem acres would be within an interconnected Preserve System established during the 30-year permit term;
- establish Preserves during the 30-year permit term that would be more interconnected and more contiguous than the Preserves established under the No Action/No Project Alternative; and
- preserve approximately 1,193 acres less of the MCRA's Vernal Pool Ecosystem and the associated vernal pool plant and animal communities.

Therefore, the Reduced Permit Term Alternative's incremental impact to the Vernal Pool Ecosystem and natural communities would be a ***Less Than Significant Adverse*** effect when compared to the No Action/No Project Alternative incremental impacts on the Vernal Pool Ecosystem and natural communities.

Cumulative Effects on the Vernal Pool Ecosystem from the Reduced Permit Term Alternative

The effects of past, present, and reasonably foreseeable other projects on the Vernal Pool Ecosystem within the study area were described in Section 8.2.2.1 and represent a significant adverse cumulative impact on the Vernal Pool Ecosystem within the study area. The incremental effects of the No Action/No Project Alternative, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area, were determined to be significant (see Section 8.2.2.1).

The incremental effects of the Reduced Permit Term Alternative would directly and indirectly impact 19,096 acres of Vernal Pool Ecosystem within the Planning Area, which is 1,147 acres more than the total direct and indirect impact expected under the No Action/No Project Alternative. Overall, the Reduced Permit Term Alternative would make a slightly larger contribution to study area cumulative effects on the Vernal Pool Ecosystem, when compared to

the No Action/No Project Alternative. However, at the scale of Vernal Pool Ecosystem impacts throughout the study area, the 1,147-acre difference in impacts under the Reduced Permit Term Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. As discussed in Section 8.2.2.1, the impacts of the No Action/No Project Alternative on the Vernal Pool Ecosystem, when considered together with the impacts to Vernal Pool Ecosystem from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on the Vernal Pool Ecosystem. However, this EIS/EIR evaluates the future impacts of the two action alternatives relative to the future conditions expected under the No Action/No Project Alternative (see Section 3.6.1). Therefore, because the incremental effects of the Reduced Permit Term Alternative on the study area Vernal Pool Ecosystem is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect when compared to the No Action/No Project baseline condition.

8.2.4.2 Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water

As discussed in Section 8.1.2.1, the plant and animal communities associated with Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water Natural land covers differ in composition, but provide similar aquatic habitats, have similar ecology, and have similar susceptibility to the environmental stressors described in Appendix G-1. Therefore, Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water Natural land covers are analyzed together in Chapter 8 (Section 8.2.1). As discussed in Section 8.1.2.1, Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water communities are also considered “sensitive” natural communities.

Direct and Indirect Effects of the Alternative

The acres of direct impacts under the Reduced Permit Term Alternative on natural communities of the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers would be approximately 535 acres (Table 8-12). This loss is 48 acres less than the loss of approximately 583 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers and associated plant and animal communities under the No Action/No Project Alternative.

All HCP Covered Activities implemented during the 30-year permit term would incorporate relevant SSHCP AMMs to avoid or minimize direct and indirect impacts on the Aquatic land covers, including the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water (see Section 2.4.5). The SSHCP AMMs (see Appendix D) include limiting ground disturbance to the construction footprint, implementing erosion-control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-2, ROAD-1, and UTILITY-4); and implementing BMPs

that control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training (BMP-8), and implement speed limits on the construction site (BMP-11). Indirect impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water water-quality and hydrology would be minimized by AMM LID-1 through LID-3, and EDGE-4 through EDGE-7.

AMM BMP-1 through AMM BMP-11 are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM implemented during the 30-year permit term. The Reduced Permit Term Alternative would also include annual review of the effectiveness of each SSHCP AMM implemented during the permit term and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Reduced Permit Term Alternative would result in BMPs and water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The AMMs implemented during the 30-year permit term also include new AMMs that would not occur under the No Action/No Project Alternative, and these new measures are expected to lessen the potential adverse effects to the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers compared to the effects of the No Action/No Project Alternative on these aquatic natural communities.

Other SSHCP AMMs that would avoid and minimize indirect effects of the SSHCP Covered Activities on water quality and hydrology of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water communities include AMM LID-1 through LID-3, and EDGE-4 through EDGE-6 (Appendix D). Potential impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water communities from increased human activity and from habitat fragmentation would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project Alternative (Table 2-6), the HCP AMMs would better reduce indirect impacts on aquatic land covers during the 30-year permit term. For example, STREAM-1 through STREAM-3 would require wider setbacks between natural waterways and new development, thereby providing greater protection of existing water quality and species habitats of Stream/Creek and other aquatic resources. Therefore, the environmental stressors that result from urban development (see Appendix G) implemented during the 30-year permit term are expected to be smaller in extent and result in fewer indirect impacts to the existing hydrology, ecology, and species habitat of Seasonal Wetland,

Freshwater Marsh, Stream/Creek, and Open Water land covers, when compared to the environmental stressors of new urban development implemented under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to preserve approximately 335 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers and associated plant and animal communities over the EIS/EIR's 50-year study period (Table 8-13). This is a larger area than the 24 acres estimated to be preserved under the No Action/No Project Alternative (Table 8-5). In addition, the acres preserved during the 30-year term of the Reduced Permit Term Alternative would be within a more contiguous and interconnected HCP Preserve System (see Section 2.4.4). Therefore, these preserved acres would better maintain the existing habitat values and existing ecology of the preserved Seasonal Wetland, Freshwater Marsh, Stream and Creek, and Open Water, when compared the individual Preserves that would be established on a project-by-project basis under the No Action/No Project Alternative.

In addition to preserving 335 acres of Seasonal Wetlands, Freshwater Marsh, Streams/Creeks, and Open Water land covers, the Reduced Permit Term Alternative would re-establish or establish 419 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area (Table 8-13). This is 128 acres more than the 291 acres re-establishment or establishment of these land covers expected in the Planning Area under the No Action/No Project Alternative (Table 8-5), primarily because compensatory mitigation for impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers during the 30-year permit term would occur at HCP Preserves or mitigation banks located within the Planning Area.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- directly impact 48 fewer acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers and associated plant and animal communities;
- would require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs to better avoid and minimize indirect effects to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities, such as larger setbacks between new development and streams and creeks;
- would preserve 311 more acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water;

- would re-establish or establish 128 more acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area; and
- would result in more interconnected and more contiguous Preserves of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area.

Therefore, the Reduced Permit Term Alternative's impact to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers would be **a Minor Beneficial** effect, when compared to the impacts of the No Action/No Project Alternative on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers of the Planning Area.

Cumulative Impacts to Seasonal Wetland, Freshwater Marsh, Streams and Creeks, and Open Water

The effects of past, present, and reasonably foreseeable other projects on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities within the study area were described in Section 8.2.2.2 and represent a significant adverse cumulative impact on the Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water within the study area. As discussed in Section 8.2.2.2, the incremental effects of the No Action/No Project were determined to be significant when viewed in connection with the effects of the past, current, and foreseeable other projects in the study area.

As discussed in this section, the incremental effects of the Reduced Permit Term Alternative would result in the direct loss of 535 acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers within the Planning Area, which is 48 acres less than the losses expected under the No Action/No Project Alternative.

In addition, as discussed previously, the SSHCP Conservation Strategy implemented during the 30-year permit term would require Covered Activities to incorporate AMMs, such as increased setbacks between waterways and new urban development. These additional AMMs would be consistently implemented and monitored, and would reduce the number and extent of environmental stressors that result from urban development to avoid or minimize indirect impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural land covers of the Planning Area, when compared to is the extent of indirect impacts anticipated under the No Action/No Project Alternative. The implementation of the Reduced Permit Term Alternative's Conservation Strategy is also expected to preserve 311 more acres and to re-establish 128 more acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water within the Planning Area, when compared to the No Action/No Project Alternative.

Overall, the Reduced Permit Term Alternative would make a slightly smaller contribution to the cumulative loss of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water in the study area when compared to the No Action/No Project Alternative. However, at the scale of impacts to these aquatic resources throughout the study area, the 535-acre difference in direct impacts, the 311-acre difference in preservation, and the 128-acre difference in re-establishment of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water land covers under the Reduced Permit Term Alternative is not discernibly different from the impacts expected under the No Action/No Project Alternative. As identified in Section 8.2.2.2, the incremental impacts to Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water from the No Action/No Project Alternative, when considered together with the acres of Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water impacted from past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on these land covers. As discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the two action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Reduced Permit Term Alternative on the study area's Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water natural communities is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect when compared to the future No Action/No Project Alternative condition.

8.2.4.3 Riparian Land Covers (Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland)

Planning Area Riparian land covers include Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland land covers. These riparian land covers are considered "sensitive natural communities" (see discussion of individual land covers in Section 8.1.2.3).

Direct and Indirect Effects of the Reduced Permit Term Alternative

The Reduced Permit Term Alternative is expected to directly impact (remove) 610 acres of Riparian land covers, which is 56 acres more than the loss of 554 acres of Riparian land covers expected under the No Action/No Project Alternative (Table 8-12).

All SSHCP Covered Activities implemented during the 30-year permit term of the Reduced Permit Term Alternative would incorporate relevant SSHCP AMMs to avoid or minimize direct and indirect impacts on the Riparian land covers and natural communities (see Section 2.4.5 and Appendix D).

The following AMMs would minimize direct impacts by limiting ground disturbance to the construction footprint; implementing erosion-control BMPs and siting roads and utilities outside of sensitive areas (BMP-1, BMP-2, ROAD-1, and UTILITY-4); and implementing BMPs

that control construction dust (BMP-5), limit construction lighting in adjacent natural habitats (BMP-6), require biological monitoring (BMP-7), require worker awareness training (BMP-8), and implement speed limits on the construction site (BMP-11).

AMM BMP-1 through AMM BMP-11 are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM implemented during the 30-year permit term. The Reduced Permit Term Alternative would also include annual review of the effectiveness of each SSHCP AMM implemented during the 30-year permit term and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Reduced Permit Term Alternative would result in BMPs and water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The AMMs implemented during the 30-year permit term also include new AMMs that would not occur under the No Action/No Project Alternative, and these new measures are expected to lessen the potential adverse effects to the Riparian Water land covers compared to the effects of the No Action/No Project Alternative.

Other AMMs which would avoid and minimize indirect effects of the Reduced Permit Term Alternative on water quality and hydrology of Riparian land covers include AMM LID-1 through LID-3, and EDGE-4 through EDGE-7 (Appendix D). Potential indirect impacts to Riparian land covers from increased human activity and from habitat fragmentation would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project Alternative (Table 2-6), the SSHCP AMMs would better reduce indirect impacts on Aquatic land covers during the 30-year permit term. For example, STREAM-1 through STREAM-3 would require wider setbacks between natural waterways and new development, thereby providing greater protection of existing water quality and species habitats of Riparian land covers and other aquatic resources. Therefore, the environmental stressors caused by new urban development (see Appendix G) are expected to be smaller in extent and would result in fewer indirect impacts to the existing hydrology, ecology, and species habitat the Riparian land covers, when compared to the environmental stressors of new urban development implemented under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to preserve approximately 696 acres of Riparian land covers and associated plant and animal communities over the EIS/EIR's 50-year study period (Table 8-13). By comparison, the No Action/No Project Alternative is not expected to

preserve any Riparian land covers (Table 8-5). In addition, the acres of Riparian land covers preserved during the 30-year term of the Reduced Permit Term Alternative would be within a contiguous and interconnected SSHCP Preserve System (see section 2.4.4), which would help to maintain the existing habitat values and existing ecology of the preserved Riparian land covers. In addition to preserving 696-acres of Riparian land covers, the Reduced Permit Term Alternative would re-establish or establish 609 acres of Riparian land covers within the Planning Area (Table 8-13). This is 55 acres more than the 554 acres of re-establishment or establishment of these land covers expected in the Planning Area under the No Action/No Project Alternative (Table 8-5).

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- directly impact 56 more acres of Riparian land covers and associated plant and animal communities;
- require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs, to better avoid and minimize indirect effects to Riparian land covers and natural communities, such as larger setbacks between new development and streams and creeks;
- preserve 696 more acres of Riparian land covers;
- re-establish or establish 55 more acres of Riparian land covers within the Planning Area; and
- result in more interconnected and more contiguous Preserves of Riparian land covers within the Planning Area.

Therefore, the Reduced Permit Term Alternative's impact to Riparian land covers and the associated plant and animal communities would be a ***Minor Beneficial*** effect, when compared to the impacts of the No Action/No Project Alternative on Riparian land covers of the Planning Area.

Cumulative Effects of the Alternative

The effects of past, present, and reasonably foreseeable other projects on the Riparian land covers and natural communities within the study area were described above in Section 8.2.2.3, and represent a significant adverse cumulative impact on the Riparian land covers within the study area. As discussed in Section 8.2.2.3, the incremental effects of the No Action/No Project Alternative were determined to have a less than significant cumulative adverse effect on riparian land covers in the study area when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As in this section 8.2.4.3, the incremental effects of the Reduced Permit Term Alternative would result in the loss of 610 acres of Riparian land covers within the Planning Area, which is 56 acres greater than the loss under the No Action/No Project Alternative. However, the Reduced Permit Term Alternative is expected to preserve 606 acres more and re-establish 55 more acres of Riparian land covers within the Planning Area, and would result in consistent and more frequent implementation of AMMs that would reduce indirect impacts to Riparian land covers when compared to the No Action/No Project Alternative.

Overall, the impacts of Reduced Permit Term Alternative would make a similar contribution to the cumulative loss of Riparian land covers in the study area, when compared to the No Action/No Project Alternative. In addition, at the scale of cumulative impacts to riparian resources throughout the study area, the 56-acre difference in direct impacts, the 693 acre difference in Riparian preservation, and the 55-acre difference in re-establishment of Riparian land covers is not discernibly different when compared to impacts expected under the No Action/No Project Alternative.

As discussed in Section 8.2.2.3, the incremental impacts of the No Action/No Project Alternative on the Riparian land covers, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would be less than significant, and the No Action/No Project Alternative would have a less than significant cumulative adverse effect on riparian land covers in the study area. As discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Reduced Permit Term Alternative on the study area's Riparian land covers and natural communities is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect (when compared to the No Action/No Project Alternative baseline condition.

8.2.4.4 Valley Grassland

As discussed in Section 8.1.2, approximately 135,152 acres of Valley Grassland are present in the Planning Area, which includes Valley Grassland acres that are located both inside and outside of the Vernal Pool Ecosystem (Table 8-1) and all Valley Grassland in ranching and grazing agricultural use. (The impacts to Valley Grassland as a part of the Vernal Pool Ecosystem are also analyzed under impacts to the Vernal Pool Ecosystem (Section 8.2.4.1).

Direct and Indirect Effects of the Reduced Permit Term Alternative

The Reduced Permit Term Alternative is expected to directly impact (remove) 23,671 acres of Valley Grassland (Table 8-12), which is 242 acres more than the loss of 23,429 acres of Valley Grassland expected under the No Action/No Project Alternative (Table 8-4).

All SSHCP Covered Activities implemented during the 30-year permit term of the Reduced Permit Term Alternative would incorporate relevant SSHCP AMMs, which would avoid or minimize direct and indirect impacts of the Covered Activities on the Valley Grassland natural community (see Section 2.4.5 and Appendix D).

AMMs that would minimize direct impacts include limiting ground disturbance to the construction footprint, implementing erosion control BMPs (BMP-1 through BMP-4), siting roads and utilities outside of sensitive areas include (ROAD-1, and UTILITY-4), controlling construction dust (BMP-5), limiting construction lighting adjacent natural habitats (BMP-6), requiring biological monitors (BMP-7), requiring worker awareness training (BMP-8), and implementing speed limits on the construction site (BMP-11).

AMM BMP-1 through AMM BMP-11 are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM implemented during the 30-year permit term. The Reduced Permit Term Alternative would also include annual review of the effectiveness of each SSHCP AMM implemented during the 30-year permit term, and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Reduced Permit Term Alternative would result in BMPs and water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The AMMs implemented during the 30-year permit term also include new AMMs that would not occur under the No Action/No Project Alternative, and these new measures are expected to lessen the potential adverse effects to the Valley Grasslands compared to the effects of the No Action/No Project Alternative.

Potential indirect impacts to Valley Grasslands from increased human activity and from habitat fragmentation would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project Alternative (Table 2-6), the SSHCP AMMs would reduce the extent of environmental stressors caused by new urban development (see Appendix G-1) and would result in fewer indirect impacts to the existing ecology and species habitat of Valley Grassland land covers, when compared to the new urban development implemented under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to preserve approximately 18,589 acres of Valley Grassland and associated plant and animal communities over the EIS/EIR's 50-year study period (Table 8-13), which is 6,783 acres more than the 11,806 acres of Valley Grassland

estimated to be preserved under the No Action/No Project Alternative (Table 8-5). In addition, the acres preserved during the 30-year term of the Reduced Permit Term Alternative would be within a more contiguous and interconnected SSHCP Preserve System (see section 2.4.4), which would better maintain the existing habitat values and existing ecology of the preserved Valley Grassland, when compared the individual Valley Grassland Preserves that would be established on a project-by-project basis under the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- directly impact 242 more acres of Valley Grassland land covers and associated plant and animal communities;
- require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs, to better avoid and minimize indirect effects to Valley Grassland natural communities, such as larger setbacks between new development and preserved land covers and larger setbacks between new development and streams and creeks;
- preserve 6,783 more acres of Valley Grassland land cover; and
- result in more interconnected and more contiguous Preserves of Valley Grasslands within the Planning Area.

Therefore, the Reduced Permit Term's impact to Valley Grassland and the associated plant and animal communities would be a ***Less Than Significant Adverse*** effect, when compared to the impacts of the No Action/No Project Alternative on Valley Grassland land covers of the Planning Area.

Cumulative Effects on Valley Grassland from the Reduced Permit Term Alternative

The effects of past, present, and reasonably foreseeable other projects on the Valley Grassland land covers and natural communities within the study area were described in Section 8.2.2.4 and represent a significant adverse cumulative impact on the Valley Grassland within the study area. As discussed in Section 8.2.2.4, the incremental effects of the No Action/No Project Alternative were determined to have a significant cumulative adverse impact on Valley Grassland in the study area, when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed here in Section 8.2.4.4, the incremental effects of the Reduced Permit Term Alternative would result in the loss of 23,671 acres of Valley Grassland within the Planning Area, which is 242 acres greater than the loss under the No Action/No Project Alternative.

In addition, as discussed previously, the SSHCP Conservation Strategy implemented during the 30-year permit term would require Covered Activities to incorporate additional AMMs, such as increased setbacks between Preserves and new urban development. These AMMs would be consistently implemented and monitored and would reduce the number and extent of environmental stressors that result from urban development to avoid or minimize indirect impacts to Valley Grassland natural communities when compared to the extent of indirect impacts anticipated under the No Action/No Project Alternative. The implementation of the Reduced Permit Term Alternative's Conservation Strategy is also expected to preserve 6,783 more acres of Valley Grassland in the Planning Area when compared to the No Action/No Project Alternative.

However, at the scale of impacts to Valley Grassland throughout the study area, the 242-acre difference in direct impacts and the 6,783-acre difference in Valley Grassland preservation under the Reduced Permit Term Alternative is not discernibly different from the impacts expected under the No Action/No Project Alternative. As identified in Section 8.2.2.4, the incremental impacts to Valley Grassland from the No Action/No Project Alternative would have a significant adverse cumulative effect on Valley Grassland when considered together with the Valley Grasslands impacted from past, present, and reasonably foreseeable projects and activities in the study area. As discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the two action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Reduced Permit Term Alternative on the study area's Valley Grassland is not discernibly different from the incremental effects of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect when compared to the future No Action/No Project Alternative condition.

8.2.4.5 Blue Oak Woodland and Blue Oak Savanna

The Blue Oak Woodland land cover and the Blue Oak Savanna land cover are considered together because the plants and animals of both communities overlap considerably (see Section 8.1.2.1), and each land cover has the same regulatory requirements (Section 8.1.1). Blue Oak Woodland and Blue Oak Savanna land covers are "sensitive natural communities" (see discussion of individual land covers in Section 8.1.2). As discussed in Section 8.2.1, indirect impacts to the Riparian land covers is described qualitatively.

Direct and Indirect Effects of the Alternative

The Reduced Permit Term Alternative is expected to directly impact (remove) 47 acres of Blue Oak Woodland and Blue Oak Savanna (Table 8-12), which is 93 acres less than the loss of 140 acres of Blue Oak Woodland and Blue Oak Savanna under the No Action/No Project Alternative (Table 8-4).

All SSHCP Covered Activities implemented during the 30-year permit term of the Reduced Permit Term Alternative would incorporate the relevant SSHCP AMMs (described in Appendix

D), which would avoid or minimize direct and indirect impacts of the Covered Activities on the Blue Oak Woodland and Blue Oak Savanna natural communities (see Section 2.4.5).

AMMs that would minimize direct impacts include limiting ground disturbance to the construction footprint, implementing erosion control BMPs (BMP-1 through BMP-4), siting roads and utilities outside of sensitive areas (ROAD-1, and UTILITY-4), controlling construction dust (BMP-5), limiting construction lighting adjacent natural habitats (BMP-6), requiring biological monitors (BMP-7), requiring worker awareness training (BMP-8), and implementing speed limits on the construction site (BMP-11).

AMM BMP-1 through AMM BMP-11 are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM implemented during the 30-year permit term. The Reduced Permit Term Alternative would also include annual review of the effectiveness of each SSHCP AMM implemented during the 30-year permit term and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Reduced Permit Term Alternative would result in BMPs and water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The AMMs implemented during the 30-year permit term also include new AMMs that would not occur under the No Action/No Project Alternative, and these new measures are expected to lessen the potential adverse effects to Blue Oak Woodland and Blue Oak Savanna natural communities compared to the effects of the No Action/No Project Alternative.

Potential indirect impacts to Blue Oak Woodland and Blue Oak Savanna from increased human activity and from habitat fragmentation would be minimized by AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5 and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project alternative (Table 2-6), the SSHCP AMMs would reduce the extent of environmental stressors caused by new urban development (see Appendix G-1) and would result in fewer indirect impacts to the existing ecology and species habitat of Blue Oak Woodland and Blue Oak Savanna Grassland land covers when compared to the impacts expected under the No Action/No Project Alternative.

As shown on Table 8-13, the Reduced Permit Term Alternative is expected to both preserve 46 acres of Blue Oak Woodland and Blue Oak Savanna and to re-establish or establish 46 acres of Blue Oak Woodland and Blue Oak Savanna within the Planning Area, which are amounts that nearly equal the expected acres of direct impact (loss) of 47 acres within the Planning Area (Table

8-12). In comparison, the 70 acres re-established/established under the No Action/No Project Alternative would replace only half of the acres of Blue Oak Woodland and Blue Oak Savanna lost under that alternative (Tables 4-4 and 8-5). In addition, the preservation and re-establishment of Blue Oak Woodland and Blue Oak Savanna would occur in the interconnected Preserve System established during the 30-year permit term, which would maintain greater connectivity between Blue Oak Woodland and Blue Oak Savanna land covers than the project-by-project mitigation preserves that would be established under the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- directly impact 93 acres less Blue Oak Woodland and Blue Oak Savanna and their associated plant and animal communities;
- require Covered Activity projects and activities implemented during the 30-year permit term to implement better and more consistently implemented AMMs to avoid and minimize indirect effects to Blue Oak Woodland and Blue Oak Savanna;
- preserve 46 acres of Blue Oak Woodland and Blue Oak Savanna in the Planning Area, which would nearly equal acres of expected impacts to Blue Oak Woodland and Blue Oak Savanna (47 acres). By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna preservation in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres).
- re-establish or establish 46 acres of Blue Oak Woodland and Blue Oak Savanna in the Planning Area, which would nearly equal the acres of expected impacts to Blue Oak Woodland and Blue Oak Savanna (47 acres). By comparison, the acreage of Blue Oak Woodland and Blue Oak Savanna re-establishment or establishment in the Planning Area under the No Action/No Project Alternative (70 acres) is only half of the expected impacts to Blue Oak Woodland and Blue Oak Savanna (140 acres).
- result in more interconnected and contiguous Preserves of Blue Oak Woodland and Blue Oak Savanna within the Planning Area, which would reduce habitat fragmentation effects on the Blue Oak Woodland and Blue Oak Savanna plant and animal communities.

Therefore, the Reduced Permit Term Alternative's impacts to Blue Oak Woodland and Blue Oak Savanna and their associated plant an animal communities would be **a *Minor Beneficial*** effect, when compared to the impacts of the No Action/No Project Alternative on Blue Oak Woodland and Blue Oak Savanna land covers of the Planning Area.

Cumulative Impacts to Blue Oak Woodland and Blue Oak Savanna from the Reduced Permit Term Alternative

The effects of past, present, and reasonably foreseeable other projects on the Blue Oak Woodland and Blue Oak Savanna land covers and natural communities within the study area were described in Section 8.2.2.5 and represent a significant adverse cumulative impact on the Blue Oak Woodland and Blue Oak Savanna within the study area. As discussed in Section 8.2.2.5, the incremental effects of the No Action/No Project Alternative were determined to have a significant cumulative adverse impact on Blue Oak Woodland and Blue Oak Savanna in the study area when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed in this section, the incremental effects of the Reduced Permit Term Alternative would result in the loss of 47 acres of Blue Oak Woodland and Blue Oak Savanna within the Planning Area, which is 93 acres less than the loss under the No Action/No Project Alternative. The Reduced Permit Term Alternative would preserve 46 acres of Blue Oak Woodland and Blue Oak Savanna, an amount nearly equal to the acres of expected impacts. The No Action/No Project Alternative would also re-establish/establish 46 acres of Blue Oak Woodland and Blue Oak Savanna, an amount also nearly equal to the acres of expected impacts. By comparison, the No Action/No Project Alternative would preserve 70 acres of Blue Oak Woodland and Blue Oak Savanna and re-establish or establish 70 acres Blue Oak Woodland and Blue Oak Savanna, which are each only half of the expected 140 acres of impacts to Blue Oak Woodland and Blue Oak Savanna.

Overall, the incremental impacts of the Reduced Permit Term Alternative would make a slightly smaller contribution to the cumulative loss of Blue Oak Woodland and Blue Oak Savanna in the study area, when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of impacts to Blue Oak Woodland and Blue Oak Savanna throughout the study area, the difference in direct impacts and the difference in preservation and re-establishment or establishment of Blue Oak Woodland and Blue Oak Savanna land covers is not discernibly different.

As discussed in Section 8.2.2.5, the impacts of the No Action/No Project Alternative on Blue Oak Woodland and Blue Oak Savanna, when considered together with the impacts from the past, present, and reasonably foreseeable projects and activities in the study area, would have a significant adverse cumulative effect on Blue Oak Woodland and Blue Oak Savanna. However, as discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Reduced Permit Term Alternative on Blue Oak Woodland and Blue Oak Savanna are not discernibly different from the incremental effects of the No

Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect (when compared to the No Action/No Project Alternative baseline condition.

8.2.4.6 Farmland (Cropland/Irrigated Pasture-Grassland)

As discussed in Section 8.1.2, Cropland and Irrigated Pasture-Grassland are included in the Natural land cover category because they provide habitat for a native wildlife community (e.g., cottontail rabbits, other small mammals, mule deer, western meadowlark, and red-winged black bird; foraging for hawks and other raptors; and wintering sandhill cranes), and support some native trees and other native plants on the margins of fields or in hedgerows. There are approximately 67,820 acres of the Cropland and Irrigated Pasture-Grassland land covers in the Planning Area.

Direct and Indirect Effects of the Alternative

The Reduced Permit Term Alternative is expected to directly impact (remove) 8,130 acres of Cropland and Irrigated Pasture-Grassland (Table 8-12), which is 354 acres less than the loss of 8,484 acres of Cropland and Irrigated Pasture-Grassland expected under the No Action/No Project Alternative (Table 8-4).

All SSHCP Covered Activities implemented during the 30-year permit term of the Reduced Permit Term Alternative would incorporate relevant SSHCP AMMs, which would avoid or minimize direct and indirect impacts of the Covered Activities on the Cropland and Irrigated Pasture-Grassland wildlife communities (see Section 2.4.5 and Appendix D).

AMMs that would minimize direct impacts include limiting ground disturbance to the construction footprint, implementing erosion control BMPs (BMP-1 through BMP-4), siting roads and utilities outside of sensitive areas include (ROAD-1, and UTILITY-4), controlling construction dust (BMP-5), limiting construction lighting adjacent natural habitats (BMP-6), requiring biological monitors (BMP-7), requiring worker awareness training (BMP-8), and implementing speed limits on the construction site (BMP-11).

AMM BMP-1 through AMM BMP-11 are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented, and annual reporting of the effectiveness of each AMM implemented during the 30-year permit term. The Reduced Permit Term Alternative would also include annual review of the effectiveness of each SSHCP AMM implemented during the 30-year permit term and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Reduced Permit Term Alternative would result in BMPs

and water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The AMMs implemented during the 30-year permit term also include new AMMs that would not occur under the No Action/No Project Alternative, and these new measures are expected to lessen the potential adverse effects to Cropland and Irrigated Pasture-Grassland compared to the effects of the No Action/No Project Alternative.

Potential indirect impacts to Cropland and Irrigated Pasture-Grassland from increased human activity and from habitat fragmentation would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project alternative (Table 2-6), the HCP AMMs would reduce the extent of environmental stressors caused by new urban development (see Appendix G-1) and would result in fewer indirect impacts to the existing ecology and species habitat of Cropland and Irrigated Pasture-Grassland when compared to the new urban development implemented under the No Action/No Project Alternative.

During the 30-year permit term, impacts to any Farmland land cover would be mitigated by preserving the Cropland or the Irrigated Pasture-Grassland land covers (which provide much higher quality foraging and roosting habitat for native raptor species, sandhill cranes, and other native wildlife species, when compared to other Farmland land covers). In comparison, the No Action/No Project Alternative would mitigate impacts to the Farmland land covers by preserving any "similar category" of farmland, as discussed in Section 8.2.2.6. The No Action/No Project alternative would preserve 7,615 acres of farmland during the EIS/EIR's 50-year study period. In comparison, the Reduced Permit Term Alternative would preserve approximately 7,941 acres of Cropland and Irrigated Pasture-Grassland, and also preserve approximately 1,185 acres of Orchard and Vineyard (Table 8-13).

Of the total 7,941 acres of Cropland and Irrigated Pasture-Grassland preserved over the 50-year study period of the Reduced Permit Term Alternative, approximately 5,559 acres (70%) would be preserved within a large and interconnected SSHCP Preserve System established during the 30-year permit term (see Section 2.4.4), and approximately 2,382 acres would be preserved on a project-by-project basis after the end of the permit term, as mitigation for individual projects and activities. Each acre of Cropland and Irrigated Pasture-Grassland preserved within the interconnected SSHCP Preserve System (see Section 2.4.4) would provide greater habitat value than the farmlands preserved under the No Action/No Project Alternative because of the Preserve System would provide higher habitat connectivity and include a comprehensive preserve management program that would manage the land covers to maintain existing farming operations and improve wildlife habitat.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- directly impact 354 fewer acres of Cropland and Irrigated Pasture-Grassland land covers and associated wildlife communities;
- require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs, to better avoid and minimize indirect effects to Cropland and Irrigated Pasture-Grassland;
- preserve 326 more acres of Cropland and Irrigated Pasture-Grassland land covers;
- preserve higher quality farmland during the 30-year permit term by mitigating impact to any Farmland land cover with the higher quality Cropland or Irrigated Pasture-Grassland;
- result in more contiguous and interconnected and Preserves of Cropland and Irrigated Pasture-Grassland farmland within a larger Preserve System; and
- manage Cropland and Irrigated Pasture-Grassland within the Preserve System on a regional basis and under a comprehensive preserve management program.

Therefore, the Reduced Permit Term Alternative's impact to Cropland and Irrigated Pasture-Grasslands and their associated native wildlife communities would be **a *Minor Beneficial*** effect, when compared to the impacts of the No Action/No Project Alternative on Cropland and Irrigated Pasture-Grassland land covers of the Planning Area.

Cumulative Analysis Impacts to Cropland and Irrigated Pasture-Grassland from the Reduced Permit Term Alternative

The effects of past, present, and reasonably foreseeable other projects on Cropland and Irrigated Pasture-Grassland within the study area were described above in Section 8.2.2.6, and represent a significant adverse cumulative impact on the Cropland and Irrigated Pasture-Grassland within the study area. As discussed in Section 8.2.2.6, the incremental effects of the No Action/No Project Alternative were determined to be a significant cumulative effect when viewed in connection with the effects of the past, present, and foreseeable other projects in the study area.

As discussed in this section, the incremental effects of the Reduced Permit Term Alternative would result in the direct loss of 8,130 acres of Cropland and Irrigated Pasture-Grassland within the Planning Area, which is 354 acres less than the expected loss of Cropland and Irrigated Pasture-Grassland under the No Action/No Project Alternative. In addition, as discussed previously, the HCP Conservation Strategy implemented during the 30-year permit term would

require Covered Activities to incorporate additional AMMs. These AMMs would be consistently implemented and monitored and would reduce the number and extent of environmental stressors that result from urban development to avoid or minimize indirect impacts to Cropland and Irrigated Pasture-Grassland natural communities, when compared to the extent of indirect impacts anticipated under the No Action/No Project Alternative. The implementation of the Reduced Permit Term Alternative is also expected to preserve 326 more acres of Cropland and Irrigated Pasture-Grassland when compared to the No Action/No Project Alternative. The Preserve System would also result in larger farmland Preserves and greater connectivity of farmland Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

However, at the scale of impacts to Cropland and Irrigated Pasture-Grassland throughout the study area, the 354-acre difference in direct impacts and the 326-acre difference in Cropland and Irrigated Pasture-Grassland preservation under the Reduced Permit Term Alternative is not discernibly different from the impacts expected under the No Action/No Project Alternative. As identified in Section 8.2.2.6, the incremental impacts to Cropland and Irrigated Pasture-Grassland from the No Action/No Project Alternative would have a significant adverse cumulative effect on Cropland and Irrigated Pasture-Grassland, when considered together with the Cropland and Irrigated Pasture-Grasslands impacted from past, present, and reasonably foreseeable projects and activities in the study area. As discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the two action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Reduced Permit Term Alternative on the study area's Cropland and Irrigated Pasture-Grasslands are not discernibly different from the incremental effects of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect when compared to the future No Action/No Project Alternative condition.

8.2.4.7 Farmland (Orchard/Vineyard)

As discussed in Section 8.1.2, Orchard and Vineyard are included in the natural land cover category because they provide habitat for native wildlife (e.g., small mammals, perching raptors, other native birds, and roosting western red bats). There are approximately 30,367 acres of Orchard and Vineyard land covers and the associated plant and animal communities in the Planning Area.

Direct and Indirect Effects of the Reduced Permit Term Alternative

The Reduced Permit Term Alternative is expected to directly impact (remove) approximately 1,685 acres of Orchard and Vineyard (Table 8-13). This loss is 119 acres more than the

approximately 1,566 acres of Orchard and Vineyard estimated to be lost under the No Action/No Project Alternative (Table 8-4).

All SSHCP Covered Activities implemented during the 30-year permit term of the Reduced Permit Term Alternative would incorporate relevant SSHCP AMMs, which would avoid or minimize direct and indirect impacts of the Covered Activities on the Orchard and Vineyard wildlife communities (see Section 2.4.5 and Appendix D).

AMMs that would minimize direct impacts include limiting ground disturbance to the construction footprint, implementing erosion control BMPs (BMP-1 through BMP-4), siting roads and utilities outside of sensitive areas (ROAD-1, and UTILITY-4), controlling construction dust (BMP-5), limiting construction lighting adjacent natural habitats (BMP-6), requiring biological monitors (BMP-7), requiring worker awareness training (BMP-8), and implementing speed limits on the construction site (BMP-11).

AMM BMP-1 through AMM BMP-11 are similar to the construction BMPs that would be implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM implemented during the 30-year permit term. The Reduced Permit Term Alternative would also include annual review of the effectiveness of each SSHCP AMM implemented during the 30-year permit term, and a process to make adaptive changes to any AMM that was not fully effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the Reduced Permit Term Alternative would result in BMPs and water quality AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The AMMs implemented during the 30-year permit term also include new AMMs that would not occur under the No Action/No Project Alternative, and these new measures are expected to lessen the potential adverse effects to the Orchard and Vineyard compared to the effects of the No Action/No Project Alternative.

Potential indirect impacts to Orchard and Vineyard from increased human activity and from habitat fragmentation would be minimized by the AMMs EDGE-1 through EDGE-3, EDGE-8, EDGE-10, ROAD-1, ROAD-2, NATURE TRAIL-1 through NATURE TRAIL-5, STREAM-1 through STREAM-5, and UTILITY-2 (see Appendix D for a description of AMMs). Relative to the AMMs implemented by individual projects under the No Action/No Project alternative (Table 2-6), the HCP AMMs would reduce the extent of environmental stressors caused by new urban development (see Appendix G-1) and would result in fewer indirect impacts to the existing ecology and species habitat of Orchard and Vineyard, when compared to the new urban development implemented under the No Action/No Project Alternative.

The Reduced Permit Term Alternative could preserve up to 1,185 acres of Orchard and Vineyard over the EIS/EIR's 50-year study period (Table 8-13), which is 381 acres less than the 1,566 acres of Orchard and Vineyard that could be preserved under the No Action/No Project Alternative (Table 8-5).

During the 30-year permit term of the Reduced Permit Term Alternative, impacts to any Farmland land cover, including Orchard and Vineyard, would be mitigated by preserving Cropland or Irrigated Pasture-Grassland land covers, which provide much higher quality habitat for native wildlife species than other Farmland land covers. In comparison, the No Action/No Project Alternative would mitigate impacts to Farmland land covers by preserving any "similar category" of farmland, as discussed in Section 8.2.2.6 (e.g., Prime Farmland, Statewide Importance Farmland, Unique Farmland, or Local Importance Farmland).

In addition, the acres preserved during the 30-year term of the Reduced Permit Term Alternative would be within a more contiguous and interconnected HCP Preserve System (see Section 2.4.4), which would better maintain the existing habitat values of the preserved Orchard and Vineyard when compared the individual farmland Preserves that would be established on a project-by-project basis under the No Action/No Project Alternative.

After the end of the 30-year permit term, mitigation for additional project impacts to Orchard and Vineyard during the 50-year EIS/EIR Study Period would again occur on a project-by-project basis and would mitigate impacts to Orchard and Vineyard by preserving acres of "similar category" farmland. Therefore, the preservation of 1,185-acres of Orchard and Vineyard expected under the Reduced Permit Term Alternative would occur after the end of the 30-year permit term.

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- directly impact 119 acres less of Orchard and Vineyard land covers and associated wildlife communities;
- require Covered Activity activities and projects implemented during the 30-year permit term to incorporate better and more consistently implemented AMMs to better avoid and minimize indirect effects to Orchard and Vineyard;
- preserve higher quality farmland during the 30-year permit term by mitigating impacts to Orchard and Vineyard with higher quality Cropland or Irrigated Pasture-Grassland.
- preserve 381 less acres of Orchard and Vineyard over the 50-year EIS/EIR study period;

- result in farmland Preserves that are more contiguous, more interconnected, and within a larger Preserve System; and
- manage preserved farmlands on a regional basis within the Preserve System and under a comprehensive preserve management program.

Therefore, the Reduced Permit Term's impact to Orchard and Vineyard and their associated native wildlife communities would be a ***Minor Beneficial*** effect when compared to the impacts of the No Action/No Project Alternative on Orchard and Vineyard land covers of the Planning Area.

Cumulative Impacts to Orchards and Vineyards from the Reduced Permit Term Alternative

The effects of past, present, and reasonably foreseeable other projects on Orchard and Vineyard within the study area were described in Section 8.2.2.7 and represent a significant adverse cumulative effect on Orchard and Vineyard within the study area. As discussed in Section 8.2.2.7, the incremental effects of the No Action/No Project on Orchard and Vineyard were determined to result in a less than significant cumulative effect when viewed in connection with the effects of the past, present, and foreseeable other projects in

As discussed here in Section 8.2.4.7, the incremental effects of the Reduced Permit Term Alternative would result in the direct loss of 1,685 acres of Orchard and Vineyard within the Planning Area, which is 119 acres greater than the loss under the No Action/No Project Alternative. In addition, as discussed above, the HCP Conservation Strategy implemented during the 30-year permit term would require Covered Activities to incorporate additional AMMs. These AMMs would be consistently implemented and monitored, and would reduce the number and extent of environmental stressors that result from urban development to avoid or minimize indirect impacts to Orchard and Vineyard, when compared to the extent of indirect impacts anticipated under the No Action/No Project Alternative. The implementation of the Reduced Permit Term Alternative is also expected to preserve 381 fewer acres of Orchard and Vineyard when compared to the No Action/No Project Alternative, because impacts to Orchard and Vineyard during the 30-year permit term would be mitigated by preserving other farmland land covers that provide better wildlife habitat (i.e., Cropland and Irrigated Pasture Grassland). The HCP Preserve System established during the 30-year permit term would result in larger farmland preserves, and greater connectivity of farmland preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

However, at the scale of impacts to Orchard and Vineyard throughout the study area, the 119-acre difference in direct impacts and the 381-acre difference in Orchard and Vineyard preservation under the Reduced Permit Term Alternative is not discernibly different from the impacts expected under the No Action/No Project Alternative. As identified in Section 8.2.2.7, the incremental impacts to Orchard and Vineyard from the No Action/No Project Alternative

have a significant adverse cumulative effect on Orchard and Vineyard, when considered together with the Orchard and Vineyard impacted from past, present, and reasonably foreseeable projects and activities in the study area. As discussed in Section 3.6.1, this EIS/EIR evaluates the future impacts of the two action alternatives relative to the future conditions expected under the No Action/No Project Alternative. Therefore, because the incremental effects of the Reduced Permit Term Alternative on the study area's Orchard and Vineyard are not discernibly different from the incremental effects of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect when compared to the future No Action/No Project Alternative condition.

8.2.4.8 Wildlife Movement Corridors

Direct and Indirect Effects of the Reduced Permit Term Alternative

As shown in Figure 8-2 and Table 8-2 above, there are four ECAs either partially or wholly within the Planning Area. The majority of development under the Reduced Permit Term Alternative would occur within in the UDA (see Section 2.4.3) and only impact the extreme northern most portion of the Duck Creek North Fork – Coyote Creek ECA.

Outside the UDA, no recycled water pipeline Covered Activities anticipated during the 30-year permit term would be located within an ECA. However, rural transportation Covered Activity projects during the 30-year permit term are anticipated to occur within the Stone Lake – Yolo Bypass, Bear Slough – Browns Creek, and Duck Creek North Fork – Coyote Creek ECAs. These rural transportation projects include road-widening projects, which could reduce the ability of wildlife to move across these roadways and within these ECAs. The types of rural transportation Covered Activities included under the Reduced Permit Term Alternative are similar to the types of rural transportation projects included under the No Action/No Project Alternative outside the UDA. However, additional roadway development is expected under the No Action/No Project Alternative to serve the 1,900-acres of new urban development that is expected to be displaced outside of the existing USB boundary under the No Action Alternative (see Section 2.2.3).

Potential direct effects of future rural transportation Covered Activities under the Reduced Permit Term Alternative would occur from the new or expanded roadways, which would increase the size of existing movement barriers or create new barriers to terrestrial wildlife movement. However, all Covered Activities implemented during the 30-year permit term of the Reduced Permit Term Alternative would incorporate SSHCP AMMs, which would reduce habitat fragmentation and also require roadway projects to incorporate structures that would allow native wildlife to cross under improved or new roadways. SSHCP AMMs implemented during the 30-year permit term would help to maintain existing wildlife movement, including AMMs EDGE-1 through EDGE-3, and ROAD-1 through ROAD-3 (See Appendix D).

Several SSHCP AMMs (STREAM-1 through STREAM-5) would also require larger setbacks between existing waterways and new development relative to the No Action/No Project Alternative. These wider setbacks between new development in the UDA and existing waterways would allow continued wildlife movement in the UDA's riparian corridors. The SSHCP AMMs implemented during the 30-year permit term would also reduce other environmental stressors associated with urban development (see Appendix G-1) to better avoid or minimize indirect impacts on wildlife movement, relative to the No Action/No Project Alternative.

In addition, the Reduced Permit Term Alternative would allow urban development within the MCRA portion of the UDA to be consistent with the planned development described in the approved Sacramento County and Rancho Cordova General Plans, without approximately 19,000 acres of new urban development being displaced to locations outside the current USB boundary (see Section 2.2.3). Because the Reduced Permit Term Alternative would not result in the displacement of planned urban development to locations outside of the UDA, the expected No Action/No Project impacts to the Duck Creek North Fork – Coyote Creek ECA would not occur under the Reduced Permit Term Alternative.

As discussed in Section 2.3.5, the Reduced Permit Term Alternative would include an interconnected 27,761-acre HCP Preserve System within the Planning Area (Table 8-13) and a comprehensive HCP Preserve System management program to maintain and adaptively manage the HCP Preserve System in perpetuity (Section 2.4.5). The HCP Preserve System would be designed to achieve the identified SSHCP Biological Goals and Measurable Objectives for wildlife movement, including maintaining wildlife movement and dispersal through the Planning Area, including inside the UDA and outside the UDA (Section 2.4.5, Table 2-7).

Significance of Direct and Indirect Effects

In summary, when compared to the expected No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- provide a coordinated, interconnected Preserve System designed to provide connectivity between existing preserves and new Preserves established under the Reduced Permit Term Alternative;
- require new development projects implemented during the 30-year permit term to incorporate AMMs that would avoid or minimize effects on riparian corridors used for wildlife movement;
- require new development projects inside the UDA and related roadway projects outside the UDA implemented during the 30-year permit term to incorporate wildlife crossing structures at specific locations; and

- not result in displaced development outside the UDA to locations that have a greater potential to affect designated wildlife movement corridors.

Therefore, the Reduced Permit Term Alternative's impact to wildlife movement corridors would be a ***Minor Beneficial*** effect when compared to the No Action/No Project Alternative impacts on wildlife movement in the Planning Area.

Cumulative Impacts to Wildlife Movement from the Reduced Permit Term Alternative

The effects of past, present, and reasonably foreseeable other projects on wildlife movement in the study area were described in Section 8.2.2.8 and represent a significant adverse cumulative impact on wildlife movement within the study area. As discussed in Section 8.2.2.8, the incremental direct and indirect impacts of the No Action/No Project Alternative on existing wildlife movement and dispersal would be a significant cumulative effect when considered together with the significant impacts to wildlife movement from past, current, and foreseeable future projects and activities in the study area.

As discussed here in Section 8.2.4.8, the Reduced Permit Term Alternative would provide an interconnected Preserve System in the Planning Area, which would not occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would require wider setbacks between development and waterways, preserving wider riparian movement corridors when compared to the No Action/No Project. In addition, the Reduced Permit Term Alternative would require roadway projects to include AMMs that would provide wildlife undercrossings at specific locations.

Overall, the incremental impacts of the Reduced Permit Term Alternative would make a smaller contribution to the cumulative loss of wildlife movement and dispersal in the study area when compared to the incremental impacts of the No Action/No Project Alternative. However, at the scale of wildlife movement throughout the study area, the difference in impacts to wildlife movement under the Reduced Permit Term Alternative when compared to expected impacts to wildlife movement under the No Action/No Project Alternative, is not discernibly different. Therefore, because the incremental effects of the Reduced Permit Term Alternative on wildlife movement in the study area is not discernibly different from the incremental effects of the No Action/No Project Alternative on wildlife movement in the study area, the Reduced Permit Term Alternative would result in ***No Cumulative*** effect when compared to the No Action/No Project Alternative baseline condition.

INTENTIONALLY LEFT BLANK

CHAPTER 9 – SPECIAL-STATUS SPECIES INCLUDING HCP COVERED SPECIES

This chapter presents the potential effects of each alternative on special-status species occurring in the Planning Area, including the 28 species specifically addressed in the Draft South Sacramento Habitat Conservation Plan (SSHCP) as "Covered Species."

Special-status species are plants and animals that are legally protected under state and/or federal law, or species that are considered sufficiently rare or unique that they are given special consideration by state and/or federal resource agencies or by recognized conservation organizations. See Appendix G for a discussion of the criteria used by the Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) to determine which Planning Area special-status species would be addressed in Chapter 9.

The SSHCP land cover types are referenced in this chapter to discuss Planning Area suitable habitat for individual special-status species. However, the existing conditions and potential impacts of each EIS/EIR alternative on each Planning Area land cover as a natural community were analyzed in Chapter 8 of this EIS/EIR.

9.1 ENVIRONMENTAL SETTING/AFFECTED ENVIRONMENT

9.1.1 Regulatory Framework

This section outlines the regulatory framework that would apply to potential impacts of the alternatives to special-status species, including Covered Species. The summaries of statutes, regulations, and policies that are provided below focus on information relevant to the scope of the impact analysis presented in this chapter. Pursuant to Title 40 of the Code of Federal Regulations (CFR), Section 1502.25 (40 CFR 1502.25), the applicable statutes, regulations, and policies helped to determine the appropriate scope of analysis included in Chapter 9.

9.1.1.1 Federal

Federal Endangered Species Act

The federal Endangered Species Act (ESA) provides a means whereby the ecosystems upon which endangered and threatened species depend may be conserved (16 USC 1531). The terms "conserve," "conserving," and "conservation" mean to use, and the use of all, methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to ESA are no longer necessary. The U.S. Fish and Wildlife Service (USFWS) has jurisdiction over plants, wildlife, and freshwater fish listed under ESA.

Section 9 of ESA prohibits any person from "taking" an endangered or threatened fish or wildlife species. Take, as defined by ESA, means "to harass, harm, pursue, hunt, shoot, wound, kill, trap,

capture, or collect or to attempt to engage in any such conduct" (Section 3(18)). Take of threatened species is also prohibited under Section 9 unless otherwise authorized by federal regulations. Additionally, Section 9 prohibits removing, cutting, and maliciously damaging or destroying plants listed under ESA on sites that are under federal jurisdiction.

Under federal regulations, "harm" is further defined by USFWS to include acts or habitat modification or degradation that create the likelihood of injury or actually result in death or injury to listed species by significantly disrupting normal behavior patterns or by impairing essential behavioral patterns, including but not limited to, breeding, feeding, or sheltering (50 CFR 17.3).

Incidental take of listed species may be authorized under Section 10 of ESA. Incidental take is species take that is "incidental to, and not the purpose of, the carrying out of an otherwise lawful activity" (50 CFR 17.3). Section 10 of ESA requires the issuance of an incidental take permit before any nonfederal action may be taken that would potentially harm, harass, injure, kill, capture, collect, or otherwise hurt (i.e., take) any individual of an endangered or threatened species. The permit requires preparation and implementation of a habitat conservation plan (HCP) that would minimize and mitigate the take of covered species to the maximum extent practicable.

Federal entities may receive authorization for take of a listed species through Section 7 of ESA if a determination is made (considering effects on the species and minimization and mitigation measures) that the action is not likely to jeopardize the continued existence of any species listed under ESA, or result in the destruction or adverse modification of the species' designated critical habitat.

Section 3 of ESA defines critical habitat as: (1) the specific areas within the geographical area occupied by a species at the time it is listed in accordance with the act, on which are found those physical or biological features, essential to the conservation of the species, and that may require special management considerations or protection; and (2) specific areas outside the geographical area occupied by a species at the time it is listed, upon a determination that such areas are essential for the conservation of the species. Critical habitat designations affect only federal agency actions or federally funded or permitted activities. Critical habitat designations do not affect activities by private landowners if there is no federal funding or authorization. Federal agencies are required to avoid destruction or adverse modification of designated critical habitat.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act makes it unlawful to pursue, hunt, take, capture, collect, kill or sell migratory birds, feathers, eggs, and nests. The statute does not discriminate between live or dead birds and also grants full protection to any bird parts, including feathers, eggs and nests. The current list of species protected by the Migratory Bird Treaty Act can be found in 50

CFR 10.13. The list includes nearly all migratory birds native to the United States. Over 800 species are currently on the list.

Executive Order 13186

Executive Order 13186 of 2001 assists compliance with the Migratory Bird Treaty Act by directing each federal agency taking actions that would have or would likely have a negative impact on migratory bird populations to work with USFWS to develop a memorandum of understanding to promote the conservation of migratory bird populations. Protocols developed under the memorandum of understanding must include the following agency responsibilities: (1) avoid and minimize, to the extent practicable, adverse impacts on migratory bird resources when conducting federal agency actions; (2) restore and enhance habitat of migratory birds, as practicable; and (3) prevent or abate the pollution or detrimental alteration of the environment for the benefit of migratory birds, as practicable.

9.1.1.2 State

California Endangered Species Act

The California Endangered Species Act (CESA) (California Fish and Game Code, Section 2050 et seq.) prohibits the taking of species listed as threatened or endangered under the act, or candidates for listing, except as authorized by state law. Under CESA, "take" is defined as an activity that would directly or indirectly kill an individual of a species, but the definition does not include "harm" or "harass," which is included in the ESA definition. As a result, the threshold for take is higher under CESA than under ESA.

CESA Section 2081 states that take of an endangered, threatened, or candidate species may be authorized by the California Department of Fish and Wildlife (CDFW) if the impacts of the take are incidental to an otherwise lawful activity, are "minimized and fully mitigated," and do not "jeopardize the continued existence of [the] species." Any mitigation measures imposed under CESA must be measures "roughly proportional in extent to the impact of the authorized taking on the species."

California Fully Protected Species

Fully protected species are addressed in Sections 3511, 4700, 5050, and 5515 of the California Fish and Game Code. These statutes prohibit take or possession of fully protected species and do not provide for authorization of incidental take unless a natural community conservation plan is prepared; therefore take is not authorized under the SSHCP.

Protection for Bird Nests and Raptors

Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptor (e.g., hawks, owls, eagles, and falcons), including their nests or eggs. Section 3513 of the California Fish and Game Code codifies the federal Migratory Bird Treaty Act, discussed previously.

California Native Plant Protection Act

The California Native Plant Protection Act provides protection to endangered and "rare" plant species, subspecies, and varieties of wild native plants in California. The California Native Plant Protection Act's definition of "endangered" and "rare" closely parallel the CESA definitions of "endangered" and "threatened" plant species.

Oak Woodlands Conservation Act

The Oak Woodlands Conservation Act (Senate Bill 1334), Section 21083.4 of the California Public Resources Code, requires counties to determine if a project within their jurisdiction may result in loss of oak woodlands that would have a significant adverse effect on the environment. If the lead agency determines that a project would result in a significant adverse effect on oak woodlands, mitigation measures to avoid or minimize the significant adverse effect of converting oak woodlands to other land uses are required.

9.1.1.3 Local

Sacramento County General Plan of 2005–2030

The *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011) Conservation Element includes goals, objectives, and over 100 policies related to the management and preservation of natural resources (policies CO-19 through CO-140 under Section V, Vegetation and Wildlife). The following is a summary of the policies relevant to special-status species. These policies either directly relate to special-status species or address habitats that are important to special-status species.

> **Policies CO-19 to CO-32:** Provide for a safe, reliable water supply while protecting beneficial uses by protecting water quality and water-supported ecosystems through preservation, restoration, and creation of riparian and wetlands habitats and buffers to protect water quality from erosion.

Policies CO-58 through CO-63: Support the management and restoration of wetland and riparian habitat, native habitat, and special-status species habitat. The general plan calls for no net loss of wetlands, riparian woodlands, and oak woodlands.

Policies CO-75 through 81: Support the preservation, enhancement, and restoration of special-status species habitat in Sacramento County to aid in the recovery of these species through maintenance of viable populations and wildlife corridors, managing vegetation on public lands to encourage native species, and controlling access and protecting sensitive habitat.

Policies CO-83 and CO-86: Establish and limit land uses in vernal pool habitat preserves.

Policies CO-88 through CO-92: Support protection and enhancement of riparian habitat and promote the increase of native woodlands and riparian scrub along select waterways.

Policies CO-96 through CO-101: Promote the maintenance of bank stabilization on river and waterways and riparian functionality.

Policies CO-102 through CO-104: Promote the conservation and protection of the Cosumnes River and Mokelumne River corridors.

Policies CO-114 through CO-124: Protect stream corridors from an action that would degrade water quality and require maintenance of vegetation to allow for high water quality.

Policies CO-138 through CO-140: Require the preservation and protection of heritage and landmark trees, especially those used by Swainson's hawks (*Buteo swainsoni*) in riparian areas, the protection of native trees other than oaks from development, and a no net loss of oak woodland canopy area. The section also requires compensation for removal of native oaks and native non-oaks, and provides mitigation measures for compensation.

Sacramento County Swainson's Hawk Ordinance

Chapter 16.130 of Title 16 of the Sacramento County Code addresses the reduction in Swainson's hawk foraging habitat within unincorporated Sacramento County (County). Participating in the County's Swainson's Hawk Mitigation Program, which is voluntary, is one option for mitigating the loss of foraging habitat within unincorporated areas of the County. Under this program, mitigation for impacts less than 40 acres can be achieved by paying a mitigation fee or providing replacement habitat (title or easement to suitable Swainson's hawk mitigation lands on a per-

acre basis); mitigation for impacts of 40 acres or greater can be achieved only by providing replacement habitat under this program.

Sacramento County Tree Preservation and Protection Ordinance

The Sacramento County Tree Preservation and Protection Ordinance, Chapter 19.12 of Title 19 of the Sacramento County Code, requires the protection of all native oak trees having a single trunk of 6 inches diameter at breast height (dbh) or greater, or with multiple trunks having an aggregate diameter of 10 inches dbh or greater. A native oak tree is defined by the ordinance as any of the following: valley oak (*Quercus lobata*), interior live oak (*Quercus wislizenii*), blue oak (*Quercus douglasii*), or oracle oak (*Quercus morehus*). The removal of any protected native oaks trees must be authorized through a removal permit. Grading is limited beneath oak trees within their dripline, and any protected oak trees damaged during construction would require mitigation as specified in the ordinance. Exceptions to this ordinance are provided within various categories of developed areas.

2030 Galt General Plan Policy Document

The *2030 Galt General Plan Policy Document* (Galt General Plan)(Galt 2009) Conservation Element includes goals and policies that encourage the protection of important habitats and commit the city to address the effects of urban development on these habitats. The following are policies relevant to special-status species. These policies either directly relate to special-status species or address habitats that are important to special-status species.

> **Policy COS-2.1:** Sensitive Species Protection: The City should require minimization of impacts to protect mature trees, vernal pools, and any threatened endangered or other sensitive species when approving new development.
>
> **Policy COS-2.2:** Wetland and Riparian Communities Management: The City shall support the protection, restoration, expansion, and management of wetland and riparian plant communities for passive recreation, groundwater recharge, and wildlife habitat.
>
> **Policy COS-2.3:** Biologically Sensitive Area Development: The City should require new development in areas that are known to have particular value for biological resources to maximize preservation of sensitive vegetation and wildlife habitat.
>
> **Policy COS-2.4:** Federal, State, and Local Statutes Compliance: The City shall review development proposals in accordance with applicable Federal, State, and local statutes protecting special-status species and jurisdictional wetlands.

Policy COS-2.5: Mitigation Measures Imposition: The City shall, in its role as lead agency, take into consideration mitigation standards and policies of resource and regulatory agencies with jurisdiction over biological resources (e.g., USFWS, CDFW, etc.).

Policy COS-2.6: Biological Surveys: On sites that have the potential to contain critical or sensitive habitats or special species, the City shall require the project applicant to have the site surveyed by a qualified biologist. A report on the findings of this survey shall be submitted to the City as part of the application process.

Policy COS-2.7: Regional Habitat Conservation Efforts Coordination: The City shall continue to coordinate efforts with Sacramento County to develop the South Sacramento Habitat Conservation Plan.

Galt Tree Ordinances

Chapter 12.28 of the Galt Municipal Code requires written permission and approval for the cutting or removal of oak trees or public trees on public and private property unless certain provisions such as emergencies apply. A public tree is any tree with one-half or more of its trunk or branches on or above public land. An oak tree is defined as including, but not limited to, valley oak, interior live oak, blue oak, or oracle oak having at least one trunk of 6 inches in diameter measured 4 feet above the ground, or multi-trunks with an aggregate diameter of 8 inches or more, measured 4 feet above ground. Minimum development control measures are suggested such as not disturbing the ground within the driplines of protected trees. Grading within the dripline of oak trees is not permitted unless specifically authorized. A tree preservation fund is established in lieu of replacement trees and could be used as mitigation for damage or removal of protected trees. Specific details apply for ground disturbance within a protected tree's dripline.

Rancho Cordova General Plan

The *Rancho Cordova General Plan* (Rancho Cordova 2006) Natural Resources Element includes various goals and policies relevant to special-status species, as well as a policy that functions much like tree ordinances adopted by other jurisdictions. The following are policies relevant to special-status species. These policies either directly relate to special-status species or address habitats that are important to special-status species.

Policy NR.1.1: Protect rare, threatened, and endangered species and their habitats in accordance with State and federal law.

Policy NR.1.2: Conserve Swainson's hawk habitat consistent with State policies and Department of Fish and Game guidelines.

Policy NR.1.6: Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.

Policy NR.1.8: The City shall encourage creation of habitat preserves that are immediately adjacent to each other in order to provide interconnected open space areas for animal movement.

Policy NR.1.9: The City shall require that impacts to riparian habitats be mitigated at a no net loss of existing function and value based on field survey and analysis of the riparian habitat to be impacted. No net loss may be accomplished by avoidance of the habitat, restoration of existing habitat, or creation of new habitat, or through some combination of the above.

Policy NR.1.10: The City shall avoid the placement of new roadways within habitat preserves to the maximum extent feasible.

Policy NR.1.11: In such cases where habitat preserves are crossed by a roadway, or where two adjacent preserves are separated by a roadway, the roadway shall be designed or updated with wildlife passable fencing separating the roadway from the preserve and/or shall incorporate design features that allow for the movement of wildlife across or beneath the road without causing a hazard for vehicles and pedestrians on the roadway.

Policy NR.2.1: Require mitigation that provides for “no net loss” of wetlands consistent with current State and federal policies.

Policy NR.2.2: Ensure that direct and indirect effects to wetland habitats are minimized by environmentally sensitive project siting and design, to the maximum extent feasible.

Policy NR.2.5: The City shall require that drainage improvements that discharge into areas of wetlands to be preserved are, to the maximum extent feasible, designed to mimic the undeveloped surface water flow conditions of the area in terms of seasonality, volume, and flow velocity.

Policy NR.3.1: Coordinate with property owners and local interest groups, such as the Sacramento Urban Creeks Council, to restore, enhance, and preserve creeks in Rancho Cordova.

Policy NR.4.1: Conserve native oak and landmark tree resources for their historic, economic, aesthetic, educational, and environmental value.

Policy NR.4.4: Prior to the approval of any public or private development project in areas identified or assumed to contain trees, the City shall require that a determinate survey of trees species and size be performed. If any native oaks or other native trees six inches or more in diameter at breast height (dbh), multitrunk native oaks or native trees of 10 inches or greater dbh, or non-native trees of 18 inches or greater dbh that have been determined by a certified arborist to be in good health are found to occur, such trees shall be avoided if feasible. If such trees cannot be avoided, the project applicant shall do one of the following:

All such trees shall be replaced at an inch-for-inch ratio. A replacement tree planting plan shall be prepared by a certified arborist or licensed landscape architect and shall be submitted to the City of Rancho Cordova for approval prior to removal of trees;

or,

The project applicant shall submit a mitigation plan that provides for complete mitigation of the removal of such trees in coordination with the City of Rancho Cordova. The mitigation plan shall be subject to the approval of the City.

If the City of Rancho Cordova adopts a tree preservation ordinance at any time in the future, any future development activities shall be subject to that ordinance instead.

9.1.2 Existing Condition of the Special-Status Species and Their Habitats

This section provides information on special-status species in the Planning Area including SSHCP Covered Species along with the status of each species and their occurrence and acreage of modeled habitat within the Planning Area. Although conditions across a species' range influence factors such as whether it is listed as threatened or endangered, actions and alternatives evaluated in this EIS/EIR are limited to the Planning Area. Therefore, the lead agencies have determined that the primary focus for evaluating the effects of each EIS/EIR alternative on special-status species and their habitats is the Planning Area.

Additional details on the species considered but not further analyzed in this EIS/EIR are provided in Appendix G.

9.1.2.1 Existing Condition of the SSHCP Covered Species

Table 9-1 shows the current regulatory status of the 28 SSHCP Covered Species, and more information on each species, including natural history information, modeled habitat, species occurrences, and Critical Habitat and recovery plan information where applicable, is provided in Appendix G.

9.1.2.4 Designated Critical Habitat

The following special-status species are federally listed and have designated Critical Habitat (see Section 9.1.1) within the Planning Area.

- Vernal pool tadpole shrimp (*Lepidurus packardi*) (36,156 acres of Critical Habitat in Planning Area)
- Vernal pool fairy shrimp (*Branchinecta lynchi*) (36,156 acres of Critical Habitat in Planning Area)
- California tiger salamander (*Ambystoma californiense*) (Central Valley population) (10,192 acres of Critical Habitat in Planning Area)
- Slender Orcutt grass (*Orcuttia tenuis*) (1,061 acres of Critical Habitat in Planning Area)
- Sacramento Orcutt grass (*Orcuttia viscida*) (30,936 acres of Critical Habitat in Planning Area)
- Fleshy owl's clover (*Castilleja campestris* var. *succulenta*) (51 acres of Critical Habitat in Planning Area)

A further description of the Critical Habitat for these species is presented in Appendix G. The total impacts of each alternative on species habitat within the designated critical habitat are presented in Section 9.2.

Recovery Plan Species

The following special-status species analyzed in Chapter 9 are included in the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005); vernal pool tadpole shrimp, vernal pool fairy shrimp, mid-valley fairy shrimp (*Branchinecta mesovallensis)*, western spadefoot (*Spea hammondii)*, Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii)*, Boggs Lake hedge-hyssop (*Gratiola heterosepala*), legenere (*Legenere limosa)*, Sacramento Orcutt grass, and slender Orcutt grass.

In addition, the California tiger salamander (Central Valley population) is covered by the *Draft Recovery Plan for the Central California Distinct Population Segment of the California Tiger Salamander* (USFWS 2016).

The impacts of each alternative on species habitat present within Core Recovery Areas where designated are presented in Section 9.2 where applicable.

The USFWS published a a new recovery plan for giant garter snake (*Thamnophis gigas*) in late 2017 (USFWS 2017). The giant garter snake recovery plan includes giant garter snake recovery areas (recovery units) within the Planning Area portion of the Cosumnes-Mokelumne Basin population of giant garter snake, which is south of the American River and east of Interstate 5, and within the small portion of the Delta Basin giant garter snake population, which is located in the Planning Area west of Interstate 5.

9.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

9.2.1 Methodology for Assessing Impacts of Each Alternative on Special-Status Species, Including SSHCP Covered Species

The general methodologies for assessing the impacts of each alternative are discussed in Chapter 3. That discussion is summarized here along with the specific methods related to the analysis of the impacts of each alternative to special-status species, including SSHCP Covered Species. The projects and activities expected under each alternative, including expected or planned preserves, are described in Chapter 2. Potential impacts of each alternative were analyzed using a 50-year study period, as discussed in Section 3.6.3.

As discussed generally in Sections 3.6.5 and 3.6.6, the lead agencies estimated the direct and the indirect impacts of each alternative using geographic information system (GIS) map-layers of the best available information about the projects and activities included in each alternative (see Chapter 2), GIS data sets of each SSHCP land-cover type, and GIS data sets of habitat models developed for 28 species (Appendix G). The impact to special-status species was based

on impacts to their modeled habitat, which would result in a conservative overestimate of impacts to the species as not all modeled habitat is actually used by the species.

The direct and indirect impacts of each alternative on the special-status species are discussed and analyzed here. Implementation of Covered Activities, including urban development, can produce "environmental stressors" or "impact mechanisms," such as changes in hydroperiod of vernal pools and habitat fragmentation. Different species respond to each environmental stressor in different ways. Take occurs when an environmental stressor kills or injures an individual of the species; when the environmental stressor significantly disrupts normal behavior patterns of individuals, including normal feeding, breeding, or sheltering behaviors; or the environmental stressor significantly modifies or degrades habitat, impairing the essential behavior patterns of individuals, including normal feeding, breeding, or sheltering behaviors. The number of individuals of each species in the Urban Development Area (UDA[1]) and in other parts of Planning Area is not known for the following reasons: there have been few comprehensive surveys of any species in this Planning Area; there are limitations with the data that is available (e.g., the California Natural Diversity Database); many of the special-status species are small and/or cryptic in some or all stages of their life history (e.g. branchiopods);, many of the special-status species spend most of their lives underground; some species move around a lot and/or migrate annually; and most of the special-status plant species and the special-status vernal pool invertebrates are evolutionarily adapted to huge differences in annual rainfall, so individuals can be present (e.g., in the seed bank or as cysts in the soil)without being visible every year. Also, take was estimated over a 50-year period, with uncertainties regarding when or where specific Covered Activities will occur. Therefore, it would be infeasible to quantify or estimate the exact number individuals of each special-status species that would be subject to direct and indirect impacts from the projects and activities implemented under each alternative. Therefore, acres of direct and indirect species modeled habitat under each alternative were used as a surrogate for the number of individuals of each species that implementing the alternative would impact (take).

Direct impact to species and species habitat would result from the removal and loss of modeled species habitat during construction of new urban development and transportation projects, or from other projects and activities that result in permanent ground disturbance and habitat loss.

Some direct impacts may occur for only a relatively short duration and have temporary effects on a certain biological resource. Temporary effects to special-status species would also occur from

[1] As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, the term "UDA" means all lands within the County's Urban Service Boundary that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within Galt's sphere of influence (see Figure 1-1).

stressors such as urban development project construction-noise, nighttime lighting of construction sites, movement and activities of persons or equipment in a construction site, or soil and vegetation disturbance at a construction site or equipment staging area where the disturbed habitat could be returned to pre-project conditions within a year after construction is complete. Temporary effects in this chapter are described and analyzed qualitatively, by evaluating the expected environmental stressors/impact mechanisms of the alternatives' projects/actions and evaluating the likely response of a species to those environmental stressors based on the best available information on the biology and ecology of each species and agency expertise.

Indirect impacts to species and species habitat could result from new urban development and transportation projects. For example, implementation of activities and projects in the watershed or upstream that cause increased stormwater discharge and higher pollutant loads might adversely affect downstream water quality and habitat for the western pond turtle (*Actinemys marmorata*). As another example, development projects can damage duripan that is required for the perched aquifer that supports the vernal pool ecosystem, which would increase water loss from the system, reducing the hydroperiod of the vernal pools and adversely affecting the habitat for vernal pool tadpole shrimp. As a final example, residential development can increase lighting of adjacent natural areas, which may adversely affect habitat for the primarily nocturnal American badger (*Taxidea taxus*). As described in Section 3.6.8, the indirect impacts on vernal pool special-status species and their habitats are analyzed quantitatively in this chapter.

The following methods were used to quantify indirect effects on vernal pool ecosystem aquatic land covers for all three EIS/EIR alternatives.

The quantified indirect effects calculations for the Proposed Action/Proposed Project Alternative were conducted during preparation of the SSHCP using LIDAR data available for the Planning Area. LIDAR is an optical remote-sensing technique that uses laser light to densely sample the surface of the Earth, producing highly accurate locational and topographic information. The LIDAR data was used to identify the watershed boundaries for vernal pool aquatic land covers. GIS was then used to overlay covered activity development locations over the vernal pool aquatic land cover watersheds. Where proposed development overlapped with 10% or more of the watershed, the associated vernal pool aquatic land covers were considered subject to indirect effects. The methodology is explained further in Appendix E of the SSHCP. The LIDAR analysis requires significant time and resources, and it was not feasible to recreate this process for the No Action/No Project Alternative and the Reduced Permit Term Alternative.

In portions of the Planning Area where the development scenario for the No Action/No Project Alternative and Reduced Permit Term Alternative matched the Proposed Action/Proposed

Project Alternative, the results of the LIDAR analysis for these locations was applied to the No Action/No Project Alternative and Reduced Permit Term Alternative.

To calculate remaining indirect effects on aquatic vernal pool land covers for the No Action/No Project Alternative and years 31–50 of the 50-year EIS/EIR study period of the Reduced Permit Term Alternative, GIS was used to create a 250-foot-wide radius around all identified development under each alternative (radius method). Any vernal pool aquatic land covers that overlapped with this radius were considered potentially subject to indirect effects. This broad brush approach places a much larger area of vernal pool aquatic land covers in locations potentially subject to indirect effects than the LIDAR method described above. Therefore, to promote a more equitable comparison between alternatives, various refinements and conversion factors were developed, based on comparisons between the results of the LIDAR and GIS analyses, to generate indirect effects using the buffer method that better paralleled results that would be expected from the LIDAR method.

For the 30-year permit term under the Reduced Permit Term Alternative, where the LIDAR methodology could not be applied, indirect effects were calculated using the buffer method described above, but with refinements and conversion factors specific to the conditions of this portion of the Reduced Permit Term Alternative. For example, a 200-foot buffer extending from the mapped development boundary, rather than 250-foot buffer, was used to take into account the requirements for a minimum 50-foot setback between development and Preserve boundaries included during this early period of the Reduced Permit Term Alternative.

To calculate indirect effects on vernal pool aquatic land covers for the 1,900 acres of shifted or displaced development included as part of the No Action/No Project Alternative, the EIS/EIR used a proportional analysis similar to that described in Section 3.6.7 for direct effects. However, for the indirect effects analysis, the acreages of Vernal Pools and Swales that were already assumed to be directly affected were removed from the inventory of land cover types that could be subject to indirect effects.

The indirect effects on species that utilize other aquatic and terrestrial habitats are described and analyzed qualitatively, by evaluating the expected environmental stressors/impact mechanisms of the alternatives' projects/actions and evaluating the likely response of a species to those environmental stressors based on the best available information on the biology and ecology of each species and agency expertise.

Potential temporary and permanent impacts for each alternative were analyzed based on the anticipated development projects and Preserve establishment, management, and maintenance over the 50-year study period, as described in Section 3.6.3. The lead agencies also assume buildout of urban development as described in Chapter 2, which includes the assumption that

some urban development would be shifted or displaced outside the UDA under the No Action/No Project Alternative.

As described in Section 2.2.3, it is estimated that approximately 1,900 acres of urban development will shift to other locations on undeveloped land outside the UDA under the No Action/No Project Alternative. The methods used to determine potential impacts to land covers from this shifted or displaced development are discussed in Section 3.6.7. To determine the impacts of this shifted or displaced development on special-status species, it was assumed that any impact from shifted or displaced development on land covers within a given species habitat model would be an impact to the species, and the acreage of these impacts were added to the total modeled impact on the species.

Avoidance and Minimization Measures (AMMs) included in the SSHCP (see Table 2-6) would be applied to all Covered Activity projects and activities implemented over the 50-year permit term under the Proposed Action/Proposed Project Alternative, and over the 30-year permit term of the Reduced Permit Term Alternative. AMMs that would reduce impacts to species considered in this chapter are identified in each impact discussion below. As discussed in Section 2.3.5, the No Action/No Project Alternative's projects and activities would implement various best practices that are similar to many of the SSHCP AMMs. However, the Proposed Action/Proposed Project Alternative and the Reduced Permit Term Alternative (the action alternatives) include additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM. These alternatives include processes for annual review of AMM effectiveness and a process making adaptive changes to an AMM that is not fully effective at avoiding impacts. This additional layer of oversight of AMM implementation and AMM effectiveness under the action alternatives increases avoidance and minimization of various impacts. The SSHCP AMMs also provide new avoidance and minimization measures that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen many potential adverse effects compared to the effects of the No Action/No Project Alternative.

Calculations of direct effects to species modeled habitat under the Proposed Action/Proposed Project Alternative and the Reduced Permit Term Alternative assume that the AMMs that avoid and minimize direct impacts to modeled species habitat, including BMP-1 (Construction Fencing), BMP-3 (Equipment Storage and Fueling), BMP-9 (Soil Compaction), and Road-1 (Road Project Location) (Table 2-6) would be effective.

Cumulative effects of each alternative are analyzed consistent with the methodology described in Section 3.7. The cumulative analysis of each EIS/EIR alternative considers whether the incremental impacts of the alternative on each species would be significant (i.e., cumulatively considerable).

9.2.1.1 Determination of Impact Significance

Significance Criteria

As discussed in Section 3.8.1, the criteria used to evaluate the significance of each alternative's impacts on special-status species, including Covered Species, are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines, and on typical thresholds used to evaluate effects on these resources in recent EIRs prepared by Sacramento County. Based on these sources, a significant impact would occur if the alternative would:

1. Have a substantial adverse effect, either directly, or through habitat modifications, on any species identified as a special-status species in local or regional plans, policies, or regulations, or by the U.S. Fish and Wildlife Service or California Department of Fish and Wildlife;
2. Reduce the number or restrict the range of a rare, threatened, or endangered plant or animal;
3. Conflict with any local policies or ordinances protecting biological resources; or
4. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Appendix G of the CEQA Guidelines does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial effect could occur if the alternative would:

1. Reduce direct or indirect effects on any species identified as a special-status species in local or regional plans, policies, or regulations, or by the U.S. Fish and Wildlife Service or California Department of Fish and Wildlife compared to a baseline environmental condition;
2. Have a lesser reduction in numbers or restriction in range of a rare, threatened, or endangered plant or animal compared to a baseline environmental condition;
3. Increase the number, range, or area of local occurrence of any species identified as a special-status species in local or regional plans, policies, or regulations, or by the U.S. Fish and Wildlife Service or California Department of Fish and Wildlife compared to a baseline environmental condition;
4. Reduce or eliminate conflicts with any local policies or ordinances protecting biological resources; or
5. Reduce or eliminate conflicts with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

The impact analysis for the three EIS/EIR Alternatives will consider the context, intensity, and severity of potential impacts to each of these impact-criteria and will present a determination of significance applicable to each of these criteria.

Issues Not Evaluated Further

This section identifies significance criteria for special-status species that are not carried forward into the impact analysis and provides the reasoning for this determination.

There are currently no other HCPs within the Planning Area. Therefore, implementation of any of the alternatives would not conflict with an adopted HCP or natural community conservation plan, or other approved local, regional, or state HCP within the Planning Area.

The following are adopted regional conservation plans that cover areas that are either adjacent to, or near the Planning Area:

- San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan (SJCOG 2000)
- Natomas Basin HCP (Natomas Basin Conservancy 2003)
- Metro Airport HCP (Natomas Basin Conservancy 2001)

The Planning Area does not overlap with the plan areas of these plans or any other approved and permitted HCP; therefore, implementation of any EIS/EIR alternative would not conflict with any approved HCP. The significance criteria of potential conflict with the provisions of an adopted HCP or natural community conservation plan, or other approved local, regional, or state HCP (Section 9.2.1) could not occur under any alternative, so is not evaluated further in this EIS/EIR.

9.2.2 No Action/No Project Alternative

The No Action/No Project Alternative's future projects, activities, and expected future regulatory environment are described in Section 2.2 of Chapter 2.

9.2.2.1 Effects on Vernal Pool Invertebrate/Plant Species and Habitat

The following 11 vernal pool invertebrate and plant species are considered together in this analysis due to their dependence on the vernal pool ecosystem; vernal pool tadpole shrimp, vernal pool fairy shrimp, mid-valley fairy shrimp, Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*), dwarf downingia (*Downingia pusilla*), Ahart's dwarf rush, pincushion navarretia (*Navarretia myersii*), slender Orcutt grass, Sacramento Orcutt grass, Boggs Lake hedge-hyssop, and legenere. While the individual natural history, habitat requirements,

modeled habitat, and documented occurrences in the Planning Area differ for these species (see Appendix G), the direct impact mechanisms and environmental stressors that cause temporary impacts are the same.

Direct and Indirect Effects of the Alternative

Projects and activities under the No Action/No Project Alternative (Section 2.2.1) would permanently remove modeled habitat for vernal pool invertebrate and plant species through development and related infrastructure. While the majority of the urban development would occur within the UDA, transportation and other infrastructure projects would occur outside the UDA. In addition, the regulatory environment under the No Action/No Project Alternative is expected to result in shifted or displaced development outside of the UDA (Section 2.2.3), which would result in additional direct impacts to vernal pool ecosystem and therefore, impacts on some vernal pool invertebrate and plant species. These acres of shifted or displaced development are included in the direct impact acres shown in Table 9-4 for each species below.

Vernal pool invertebrate and plant species near proposed construction activities under the No Action/No Project Alternative will be adversely affected by several temporary construction-related effects (Appendix G) that will result in additional disturbance to habitat or additional harm to vernal pool invertebrate plant and animal species. Generally, these temporary effects will occur within the project boundary or road right-of-way area.

As discussed previously for direct impacts, the majority of indirect impacts under the No Action/No Project Alternative would occur within the UDA, as a result of urban development, with the exception of infrastructure projects and shifted or displaced development. The various environmental stressors that may result from activities under the No Action/No Project Alternative and that would result in indirect effects on vernal pool invertebrate and plant species, potential take of individuals, and degradation of vernal pool species habitat are described here and in Appendix G.

Vernal pool ecosystems and the invertebrate and plant species that are dependent on them are especially vulnerable to hydrologic alteration, because the timing and period of inundation can dictate whether these plants and invertebrates are able to reproduce. An impervious soil layer hydrologically connects land cover types to form the vernal pool ecosystem. Development under the No Action/No Project Alternative may indirectly affect the hydrology of remaining vernal pool ecosystem land covers, and the invertebrate and plant species that depend on them, in three major ways: (1) by permanently interrupting connection to surface water flows from up-gradient swales; (2) by damaging or permanently interrupting hydrologic connections to the perched water table; and (3) by puncturing the impermeable layer within the micro-watershed, permanently increasing rate of water loss from the remaining vernal pool

ecosystem and its associated perched aquifer, and allowing that water to drain into deeper groundwater tables.

Permanently increasing the extent of impermeable surfaces, urban development, and roads may result in increased runoff, especially during storm events. Such increases can result in increased inundation periods for vernal pools, and alterations of downstream hydrology in streams and creeks with vernal pool invertebrate habitat (VPIH). Also, addition of new development may permanently increase the potential for ongoing discharge of point and non-point source pollutants such as grease, oil, fertilizers, and lawn pesticides in creeks and streams with VPIH and other connected waters within the vernal pool ecosystem. An overall increase in the quantity of pollutants, including sediment reaching streams and creeks with VPIH through higher runoff from urban development, as a result of the No Action/No Project Alternative may impact the physical characteristics of the aquatic habitats within the vernal pool ecosystem and result in harm to vernal pool invertebrates and plants.

Changes in the wildlife community structure as a result of increased inundation in vernal pools and other habitat within the vernal pool ecosystem brought on by urban and road runoff can result in the presence of fish species that act as predators on vernal pool invertebrates, reducing vernal pool invertebrate populations.

Development could also impact vernal pool invertebrate and plant species by increasing the presence of invasive plants through species escaping from landscaping. These invasive plants could impact the vernal pool ecosystem by outcompeting native vernal pool plant species and changing the hydrology of the vernal pool ecosystem, shortening the vernal pool ponding period, which in turn could interfere with reproduction of vernal pool invertebrates and plants.

Development may result in an increased wildfire frequency due to increased ignition sources. Wildfire is a natural part of the ecosystem, and low intensity fires would not adversely impact vernal pool invertebrates or plants. However, increased fire frequency would require more fire suppression activities around developed areas that would result in ground disturbance, which would result in habitat removal and additional changes in hydrology that would impact vernal pool invertebrates and plants.

Development under the No Action/No Project Alternative would likely result in habitat fragmentation that would inhibit dispersal of vernal pool invertebrates, and seed dispersal and movement of pollinators for vernal pool plant species. Habitat fragmentation can also increase the impact of other indirect environmental stressors listed here (e.g., urban runoff, invasive plants) on vernal pool invertebrates and vernal pool plant species by increasing the area of impact by these stressors relative to the area of the intact habitat patch.

The previously discussed indirect effects on vernal pool invertebrate and plant species under the No Action/No Project Alternative are analyzed both qualitatively for Valley Grassland land cover type and quantitatively for the other land cover types that make up the vernal pool ecosystem (shown in the impact tables for each species below).

The No Action/No Project Alternative is estimated to result in approximately 17,688 acres of direct impacts to modeled habitat for vernal pool tadpole shrimp and vernal pool fairy shrimp (Table 9-4). Indirect effects on vernal pool tadpole shrimp and vernal pool fairy shrimp modeled aquatic habitat are anticipated to result in approximately an additional 261 acres of impacts. The total impact of the No Action/No Project Alternative on vernal pool tadpole shrimp and vernal pool fairy shrimp modeled habitat within the Planning Area is expected to be approximately 17,949 acres.

Of the vernal pool tadpole shrimp and vernal pool fairy shrimp habitat loss, approximately 9,015 acres would occur within the Mather Core Recovery Area (MCRA), which would affect approximately 50% of the modeled habitat within the MCRA. There would also be approximately 54 acres lost within the Cosumnes/Rancho-Seco Core Recovery Area (C/RS), which would affect approximately 0.1% of modeled habitat within the C/RS.

The No Action/Project Alternative is also expected to remove approximately 886 acres of Critical Habitat for vernal pool tadpole shrimp and vernal pool fairy shrimp in Critical Habitat Unit 13 and approximately 80 acres in Critical Habitat Unit 14a for a total of approximately 966 acres of Critical Habitat lost.

The No Action/No Project Alternative is expected to remove 90 of the 851 documented occurrences of vernal pool tadpole shrimp and 31 of the 581 documented occurrences of vernal pool fairy shrimp in the Planning Area.

Projects and activities under the No Action/No Project Alternative are estimated to remove approximately 13,042 acres of modeled habitat for mid-valley fairy shrimp within the Planning Area. In addition to this direct impact, 178 acres of indirect impact would also occur for a total impact of approximately 13,220 acres on mid-valley fairy shrimp modeled habitat within the Planning Area. This total impact would affect approximately 25% of the total modeled habitat within the Planning Area (Table 9-4).

Of the mid-valley fairy shrimp habitat loss, approximately 6,846 acres would occur within the MCRA, which would affect approximately 48% of modeled habitat within the MCRA. There would also be approximately 42 acres lost within the C/RS, which would affect approximately 0.4% of modeled habitat within the C/RS.

The No Action/No Project Alternative is expected to remove 5 of the 37 documented occurrences of mid-valley fairy shrimp in the Planning Area.

Activities under the No Action/No Project Alternative would cause direct impacts to approximately 17,653 acres of Ricksecker's water scavenger beetle modeled habitat to development and related infrastructure. In addition to this direct impact, approximately 254 acres of indirect impact would also occur for a total impact of approximately 17,907 acres on Ricksecker's water scavenger beetle modeled habitat. The total impact to Ricksecker's water scavenger beetle modeled habitat would be approximately 17% of the existing modeled habitat in the Planning Area (Table 9-4).

The No Action/No Project Alternative is not expected to remove any of the eight documented occurrences of Ricksecker's water scavenger beetle in the Planning Area.

The No Action/No Project Alternative future urban development and related infrastructure would cause direct impacts through the loss of approximately 2,004 acres of modeled habitat for dwarf downingia. In addition to this direct impact, approximately 34 acres of indirect impact would also occur for a total impact of approximately 2,038 acres on dwarf downingia modeled habitat. The total impact to dwarf downingia modeled habitat would be approximately 8% of the existing modeled habitat in the Planning Area (Table 9-4).

The No Action/No Project Alternative is not expected to remove any of the 10 documented occurrences of dwarf downingia in the Planning Area.

The No Action/No Project Alternative would cause permanent loss of approximately 7,930 acres of land cover types suitable for Ahart's dwarf rush due to development and related infrastructure. In addition to this direct impact, 131 acres of indirect impact would also occur for a total impact of approximately 8,061 acres on Ahart's dwarf rush modeled habitat. The total impact to Ahart's dwarf rush modeled habitat would be approximately 32% of the existing modeled habitat in the Planning Area (Table 9-4).

The No Action/No Project Alternative is not expected to remove the two occurrences of Ahart's dwarf rush in the Planning Area.

The No Action/No Project Alternative would cause loss of approximately 8,337 acres of modeled habitat for pincushion navarretia resulting from development and related infrastructure. In addition to this direct impact, approximately 100 acres of indirect impact would also occur for a total impact of approximately 8,437 acres on pincushion navarretia modeled habitat. The total impact to pincushion navarretia modeled habitat would be approximately 15% of the existing modeled habitat in the Planning Area (Table 9-4).

The No Action/No Project Alternative is not expected to remove any of the 48 occurrences of pincushion navarretia in the Planning Area.

The No Action/No Project Alternative would result in an estimated permanent loss of approximately 7,654 acres of land cover types suitable for slender Orcutt grass and Sacramento Orcutt grass resulting from development and related infrastructure. In addition to this direct impact, approximately 108 acres of indirect impact would also occur for a total impact of approximately 7,762 acres on for slender Orcutt grass and Sacramento Orcutt grass modeled habitat. This total impact would be approximately 22% of the total modeled habitat within the Planning Area (Table 9-4).

Of the slender Orcutt grass and Sacramento Orcutt grass habitat loss, approximately 5,018 acres would occur within the MCRA, which would affect approximately 48% of modeled habitat within the MCRA. There would also be approximately 22 acres lost within the C/RS, which would affect approximately 0.1% of modeled habitat within the C/RS.

The No Action/Project alternative is also expected to impact approximately 710 acres of Critical Habitat for Sacramento Orcutt grass in Critical Habitat Unit 2 and approximately 64 acres in Critical Habitat Unit 3 for a total of approximately 774 acres of Critical Habitat lost. Approximately 710 acres of Critical Habitat for slender Orcutt grass would also be lost in Critical Habitat Unit 6.

The No Action/No Project Alternative is expected to remove 2 of the 40 occurrences of Sacramento Orcutt grass and none of the 4 occurrences of slender Orcutt grass in the Planning Area.

The No Action/No Project Alternative would result in loss of approximately 9,126 acres of modeled habitat for Boggs Lake hedge-hyssop resulting from development and related infrastructure. In addition to this direct impact, approximately 122 acres of indirect impact would also occur for a total impact of approximately 9,248 acres on Boggs Lake hedge-hyssop modeled habitat. The total impact to Boggs Lake hedge-hyssop modeled habitat would be approximately 25% of the existing modeled habitat in the Planning Area (Table 9-4).

The No Action/No Project Alternative is expected to remove 2 of the existing 31 occurrences of Boggs Lake hedge-hyssop in the Planning Area.

The No Action/No Project Alternative would cause loss of approximately 11,146 acres of land cover types suitable for legenere from development and related infrastructure. In addition to this direct impact, approximately 137 acres of indirect impact would also occur for a total impact of approximately 11,283 acres on legenere modeled habitat. The total impact to legenere modeled habitat would be approximately 22% of the existing modeled habitat in the Planning Area (Table 9-4).

The No Action/No Project Alternative is expected to remove 1 of the 62 documented occurrences of legenere in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to vernal pool invertebrate and plant species for projects that undergo environmental review under the National Environmental Policy Act (NEPA) or CEQA. The anticipated compensation would be required on a project-by-project basis and would include preservation and re-establishment/establishment of vernal pool invertebrate and plant habitat that would often not be part of a coordinated and linked Preserve System. The acres that are expected to be conserved under the under the No Action/No Project Alternative for each of the 11 vernal pool invertebrate and plant species are shown in their respective species tables above. This result is likely a conservative overestimate as the future regulatory environment used for the No Action/No Project Alternative assumes greater preservation and re-establishment/establishment relative to project impacts than is typically called for today.

Cumulative Effect of the Alternative

The modeled habitat for vernal pool invertebrate and plant species has been lost, degraded, and fragmented by past and present urban and suburban development, associated infrastructure, agriculture, development of agricultural-residential neighborhoods and other rural development, and mining operations within the Planning Area, as described in Section 3.7.1. The effects of the these past and present projects on vernal pool invertebrate and plant species and their habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area, including urban

development in Elk Grove and Rancho Murieta, further rural residential development, continued development of cultivated agricultural lands, and development of infrastructure projects such as California High-Speed Rail and California WaterFix. Although not every reasonably foreseeable future action would affect vernal pool invertebrate and plant species, as a whole these actions would result in the continued loss of modeled habitat and in indirect impacts (e.g., habitat fragmentation, change in vernal pool hydrology) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under ESA and Clean Water Act (CWA) requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for vernal pool invertebrate and plant species. In addition to these mitigation requirements for replacement of land covers that are modeled habitat, vernal pool tadpole shrimp, vernal pool fairy shrimp, Boggs Lake hedge-hyssop, slender Orcutt grass, and Sacramento Orcutt grass are listed under ESA and/or CESA, and additional avoidance, minimization, and mitigation requirements for suitable and occupied habitat would be applied.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct and indirect impacts to modeled vernal pool invertebrate and plant species habitat. The modeled aquatic habitat that would be preserved and would be re-established/established under the No Action/No Project Alternative would exceed the acreage of modeled aquatic habitat lost for vernal pool invertebrate and plant species; however, upland habitat loss would typically exceed the amount preserved. Under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to vernal pool invertebrate and plant species, when considered together with the significant impacts to vernal pool invertebrate and plant species from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

9.2.2.2 Effects on Valley Elderberry Longhorn Beetle and Its Habitat

The description of valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) along with species occurrences within the Planning Area can be found in Appendix G. Modeled habitat within the Planning Area for valley elderberry longhorn beetle is Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub above sea level.

This species is dependent on elderberry shrubs (*Sambucus glauca, S. mexicana, S. caerulea*), which are primarily associated with riparian habitats within the Planning Area, to host the larval stage of its lifecycle.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would result in the direct impacts due to the loss of approximately 554 acres of modeled valley elderberry longhorn beetle habitat to development and related infrastructure. The majority of this loss (approximately 509 acres) is expected to occur within the UDA, though development outside of the UDA would also result in loss of modeled species habitat (approximately 45 acres) including impacts from shifted or displaced development (see Section 9.1.2). The implementation of this alternative would directly affect approximately 7% of the existing modeled habitat within the Planning Area (Table 9-5).

Table 9-5. Effects and Modeled Habitat Conservation for Valley Elderberry Longhorn Beetle under the No Action/No Project Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing Modeled Habitat*	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Mine Tailing Riparian Woodland	641	218	34.0%	0	0
Mixed Riparian Woodland	5,785	147	2.5%	0	256
Mixed Riparian Scrub	1,452	189	13.0%	0	298
Total Modeled Habitat	**7,878**	**554**	7.0%	**0**	**554**

Indirect effects due to activities under the No Action/No Project Alternative are analyzed qualitatively for individual species, and as discussed previously for direct impacts, the majority of indirect impacts would occur within the UDA, as a result of urban development. However, these impacts would also occur to a lesser extent outside of the UDA. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to valley elderberry longhorn beetle and modeled habitat for the species.

Changes to hydrology (e.g., changes in stream and creek flows), and reductions in water quality as a result of increased urban and road runoff that may contain petroleum products, pesticides and herbicides can kill elderberry shrubs through water stress and toxicity, thereby removing habitat for valley elderberry longhorn beetle.

Development could also increase the presence of invasive plants within modeled habitat for valley elderberry longhorn beetle through species escaping from landscaping and by increasing

disturbed areas (e.g., user-created trails) often colonized by invasive plants. Invasive plants could impact valley elderberry longhorn beetle's host plant by outcompeting elderberry shrubs and replacing native riparian plant species with species more susceptible to wildfire.

Populations of medium-sized predators that are tolerant of human disturbance could reduce the population of seed-dispersing birds, thereby reducing the number of new elderberry shrubs that can establish, while potential increases in invasive animals (e.g., Argentine ant (*Linepithema humile*)) as a result of increased runoff and irrigation may increase predation on valley elderberry longhorn beetle larvae.

Also, increased development may lead to the increased use of pesticides that can move into adjacent riparian habitat and could possibly result in mortality of valley elderberry longhorn beetle.

Lastly, habitat fragmentation as a result of loss of modeled habitat for valley elderberry longhorn beetle could restrict movement of adults between remaining patches of elderberry shrubs. Habitat fragmentation can also increase the impact of other indirect environmental stressors listed here (e.g., predation, invasive plants and animals) on valley elderberry longhorn beetle by increasing the area of impact from these stressors relative to the area of the remaining habitat patch.

Temporary effects (Section 3.6.5 and Section 9.1.2) that result from ground-disturbing construction activities under the No Action/No Project Alternative may result in temporary reduction of habitat quality and loss of individual valley elderberry longhorn beetle caused by trampling, construction dust, and other actions that could adversely affect elderberry host plants.

The No Action/No Project Alternative is not expected to remove any of the 156 occurrences of valley elderberry longhorn beetle in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to valley elderberry longhorn beetle for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would include re-establishment/establishment of 554 acres of valley elderberry longhorn beetle modeled habitat within the Planning Area, which equals the direct impact to valley elderberry longhorn beetle modeled habitat under the No Action/No Project Alternative.

Cumulative Effect of the Alternative

Valley elderberry longhorn beetle habitat has been lost, degraded, and fragmented by past and present urban and suburban development, associated infrastructure, agriculture, development of agricultural–residential neighborhoods and other rural development, and mining operations

within the Planning Area, as described in Section 3.7.1. The effects of these past and present projects on valley elderberry longhorn beetle and its habitat are reflected in the current conditions for the species as discussed in Appendix G.
