CITY OF RANCHO CORDOVA

CITY COUNCIL MEETING

Monday, October 15, 2018

5:30 PM – Regular Meeting

AGENDA

Linda Budge, Mayor

Robert J. McGarvey, Vice Mayor

David Sander, Council Member

Garrett Gatewood, Council Member

Donald Terry, Council Member

CITY OF RANCHO CORDOVA

CITY COUNCIL MEETING

City Hall
2729 Prospect Park Drive, Rancho Cordova

Monday, October 15, 2018

5:30 PM – Regular Meeting
David B. Roberts Council Chambers

AGENDA

1. REGULAR MEETING - CALL TO ORDER / ROLL CALL

Council Members Gatewood, McGarvey, Sander, Terry and Mayor Budge.

2. METRO CABLE TV TELEVISION ANNOUNCEMENT

The Clerk will announce the meetings video recording and playback schedules.

3. PLEDGE OF ALLEGIANCE

The Mayor will call on someone in attendance to lead the Pledge.

4. INVOCATION

Principal Amy Hale and Student Government President Charles Sander from St. John Vianney will give the invocation.

5. PRESENTATIONS

5.1 Introduction of New School Principals and Assistant Principals Serving the Rancho Cordova Community.

5.2 Proclamation recognizing Datacate for receiving Sacramento County's Sustainable Business Award.

5.3 Recognition of Council Member Gatewood's Birthday.

6. PUBLIC COMMENT

Citizens wishing to address the Council for any matter not on the agenda may do so at this time by completing and submitting a Speaker Card to the City Clerk. For items on the agenda, speakers will be called up to the podium by the Mayor at the point on the agenda when the item will be heard. Speakers are encouraged to keep comments to three minutes or less and to state name and community of residence.

Under the provisions of the California Government Code, the City Council is prohibited from discussing or taking immediate action on any item not on the agenda unless it can be demonstrated to be of an emergency nature or the need to take immediate action arose after the posting of the agenda.

7. COUNCIL REPORTS

8. CITY MANAGER'S REPORT

9. CONSENT CALENDAR ITEMS - ROLL CALL VOTE

9.1 **Subject:** Adopt Meeting Minutes of October 1, 2018 Regular and Special City Council Meetings.
Recommendation: Adopt Minutes.

9.2 **Subject:** Second Reading of an Ordinance of the City of Rancho Cordova Levying a Special Tax Within the City of Rancho Cordova Grantline 208 Community Facilities District 2018-1.
Recommendation: Waive the second reading and adopt the Ordinance.
Result of Recommended Action: Adoption of this Ordinance will allow the levy of a special tax within City of Rancho Cordova Grantline 208 Community Facilities District 2018-1 (the "CFD"), and, in each year hereafter, the process of determining the special taxes and processing the collection is done administratively by the Administrative Services Director (or a consultant) with no further Council action being needed.
Staff Report: Michelle Mingay, Senior Finance Analyst.
Advances Goal: 5.

9.3 **Subject:** Records and Information Management - Retention Schedule Update.
Recommendation: Adopt a Resolution approving updates to the City of Rancho Cordova City-Wide Records Retention Schedule.
Result of Recommended Action: Adoption of a new Retention Schedule will enable City Staff to facilitate the appropriate and efficient management and retention of City records in accordance with government regulations.
Staff Report: Stacy Leitner, City Clerk.
Advances Goals: 1 and 5.

9.4 **Subject:** Annexation of the Anthology Subdivision into the City of Rancho Cordova Community Facilities District No. 2013-2 (Police Services).
Recommendation: Adopt the Resolution.
Result of Recommended Action: Adoption of the Resolution approves Annexation Map No. 4 for the Anthology Subdivision to Community Facilities District No. 2013-2 (Police Services) (hereinafter "CFD No. 2013-2"), and approves the recording of the

Annexation Map and the Notice of Special Tax Lien.
Staff Report: Michelle Mingay, Senior Finance Analyst.
Advances Goal: 5.

9.5 **Subject:** A Resolution Authorizing the Public Works Director to Submit and Execute Application(s) and Documents for Calrecycle Grants.
Recommendation: Adopt the Resolution.
Result of Recommended Action: Adoption of this Resolution will authorize the City to submit application(s) to CalRecycle for all grants and designates the Public Works Director or his or her designee to execute all grant documents for a period of 5-years from the date of adoption.
Staff Report: Albert Stricker, Public Works Director and Quoc Nham, Associate Civil Engineer.
Advances Goals: 1 and 2.

9.6 **Subject:** Approve the Final Large Lot Map of Montelena Subdivision No. RC-04-132.0.
Recommendation: Approve Final Large Lot Map of Montelena Subdivision No. RC-04-132.0 located on the south side of Douglas Road, west side of Rancho Cordova Parkway and north and south of Chrysanthy Boulevard.
Result of Recommended Action: Approval of this recommended action will result in the recording of the final map creating 8 large lots and 19 miscellaneous lots.
Staff Report: Albert Stricker, Public Works Director and Marilyn Phelps, Assistant Land Surveyor.
Advances Goals: 1 and 2.

10. CONSENT PUBLIC HEARING ITEMS - ROLL CALL VOTE

10.1 **Subject:** First Amendment to the Development Agreement Relative to Anthology at Anatolia.
Recommendation: Introduce and waive the first reading of the Ordinance.
Result of Recommended Action: Adoption of the Ordinance would approve a first amendment to the Development Agreement relative to the Anthology at Anatolia residential project to adjust the park development and park renovation fees to current rates and extend the agreement term to December 31, 2028.
Staff Report: Elizabeth Sparkman, Community Development Director.
Advances Goals: 1, 2, and 5.

10.2 **Subject:** A Resolution Declaring a Protest Hearing and Authorizing the Mailing of Property Owner Ballot Relating to the Imposition of an Annual Stormwater Utility Fee for the European Parts Depot.
Recommendation: Adopt the Resolution.
Result of Recommended Action: Adoption of the Resolution will declare the results of the property owner protest and, if there exists less than a majority protest, authorize the mailing of a ballot to the property owner to approve the levy of the fee to pay for maintenance of storm drainage and flood protection systems for the European Parts Depot project. The action also sets 1:30 p.m. on November 8, 2018 in the office of the City Clerk, as the time and date for the ballot tabulation for the matter.
Staff Report: Elizabeth Sparkman, Community Development Director and Jeanette Cervantes, Management Technician.
Advances Goal: 5.

11. PUBLIC HEARING ITEMS

11.1 **Subject:** Actions Related to Approval of the South Sacramento Habitat Conservation Plan (SSHCP).

Recommendation:

1. Open the public hearing, hear staff presentation, take public testimony, and close the public hearing
2. Accept the certified SSHCP Environmental Impact Statement/Environmental Impact Report (SSHCP EIS/EIR) (Attachment 7, 8, and Attachments 9 through 19) and Adopt by Resolution the California Environmental Quality Act (CEQA), Findings of Fact, the Aquatic Resources Program (Attachment 5), the Nexus Study (Attachment 20) and the SSHCP (Attachments 2, 3, 4) (Exhibit A)
3. Introduce and waive first reading of the Aquatic Protection Ordinance adding Chapter 16.94, Sections 16.94.010 through Section 16.94.110 to Title 16 of the Rancho Cordova Municipal Code (Exhibit B)
4. Adopt the Implementing Resolution (Exhibit C) authorizing the City Manager to execute the Implementing Agreement (Attachment 21)
5. Introduce and waive first reading of the Fee Ordinance adding Chapter 22.45, Sections 22.45.010 through 22.45.201 to Title 22 of the Rancho Cordova Municipal Code related to SSHCP fees (Exhibit D)

Result of Recommended Action: Adoption of the SSHCP and its associated components by all Plan Permittees and the South Sacramento Conservation Agency (SSCA), will set the stage for issuance of a Federal Endangered Species Act Incidental Take Permit (ITP) by the United States Fish and Wildlife Service (USFWS), and a State Endangered Species Act Incidental Take Permit by the California Department of Fish and Wildlife (CDFW). It will also set the stage for issuance of a Clean Water Act Section 404 Programmatic Permit and Abbreviated Permit Strategy by the U.S Army Corps of Engineers (USACOE). This will establish a preserve system to protect habitat lands and aquatic resources within the Plan Area and also create a streamlined federal and state permitting process for development and infrastructure projects in the area.

Staff Report: Elizabeth Sparkman, Community Development Director and Darcy Goulart, Planning Manager.

Advances Goals: 1,2, and 5.

11.2 **Subject:** Woodside Homes Douglas 98 Subdivision Major Design Review and Special Development Permit;

PROJECT NO. DD9793 SEQUOIA AT CYPRESS
PROJECT NO. DD9794 MAGNOLIA AT CYPRESS
PROJECT NO. DD9795 COTTONWOOD AT CYPRESS
PROJECT NO. DD9796 EUCALYPTUS AT CYPRESS

Recommendation: That Council:

a) Determine the project Exempt per Section 15182, of the CEQA Guidelines; and
b) Adopt the Resolution for Douglas 98 Special Development Permit and Major Design Review.

Result of Recommended Action: Adoption of the above referenced Resolution would approve the Special Development Permit and Major Design Review to include 4 neighborhoods for 14 floor plans located within Douglas 98. Approval would allow the applicant to pursue necessary building permits for new construction.

Staff Report: June Cowles, Senior Planner and Nicholas Sosa, Assistant Planner.

Advances Goals: 1, 2, and 6.

11.3 **Subject:** Mather Field Chevron and Carwash Conditional Use Permit, Minor Design

Review, and Letter of Public Convenience and Necessity: Project No. DD9734 – Located at 2931 Mather Field Road.
Recommendation: 1) Determine the Project Exempt per Sections 15183 and 15332 of the CEQA Guidelines; 2) Adopt Resolution for Minor Design Review and Conditional Use Permit (CUP) for a Service Station and Car Wash; and 3) Adopt a Resolution denying a CUP request for alcoholic beverage sales and contingent Letter of Public Convenience and Necessity (PCN).
Result of Recommended Action: Adoption of the Resolution for the Minor Design Review and Conditional Use Permit for the Service Station would allow the applicant to submit for building permits to begin the demolition of the existing convenience store and allow for construction of a new convenience store with drive-thru self-serve carwash.
Staff Report: Nicholas Sosa, Assistant Planner.
Advances Goals: 2 and 6.

12. REGULAR CALENDAR ITEMS

12.1 **Subject:** APPOINTMENT OF LABOR NEGOTIATORS Pursuant to Government Code Section 54957.6. Agency Designated Representatives: Mayor Linda Budge and Adam Lindgren; Unrepresented employee: City Manager.

13. COUNCIL REQUESTS FOR FUTURE AGENDA ITEMS

14. ADJOURNMENT

Mayor Budge will adjourn the meeting to closed session in the Community Board Room.

15. CLOSED SESSION - CALL TO ORDER/ROLL CALL

Council Members Gatewood, McGarvey, Sander, Terry and Mayor Budge.

16. CLOSED SESSION

Council may adjourn to Closed Session to discuss the following item(s):

CONFERENCE WITH LABOR NEGOTIATORS Pursuant to Government Code Section 54957.6. Agency Designated Representatives: Mayor Linda Budge and Adam Lindgren; Unrepresented employee: City Manager.

17. OPEN SESSION - REPORT FROM CLOSED SESSION

The City Attorney will report on action taken in Closed Session.

18. ADJOURNMENT

ADDITIONAL INFORMATION

SPECIAL MEETINGS LISTED BELOW ARE SUBJECT TO CHANGE/CANCELLATION WITHOUT FURTHER NOTICE.

UNLESS THE COUNCIL ADOPTS A MOTION TO EXTEND THE MEETING, ANY ITEM THAT IS NOT INITIATED BEFORE 11:00 PM WILL BE CONTINUED TO THE NEXT DAY AT 5:30 PM OR SCHEDULED ON THE NEXT REGULAR MEETING AGENDA OF THE COUNCIL.

Public documents related to items on the open session portion of this agenda, which are distributed to the City Council less than 72 hours prior to the meeting, shall be available for public inspection at the time the documents are distributed to the Council. Documents are available for inspection at the City Clerk's office located in Rancho Cordova City Hall.

The agenda items are accessible on the City's website at www.cityofranchocordova.org on Thursdays or Fridays prior to the Regular City Council Meeting.

CITYWIDE GOALS - (Adopted March 27, 2012)	
1.	Promote the Positive Image of Rancho Cordova
2.	Ensure a Safe, Inviting and Livable Community
3.	Empower Responsible Citizenship
4.	Establish Logical City Boundaries that Provide Regional Leadership and Address Financial Challenges
5.	Ensure the Availability of the Best Public Services in the Region while Practicing Sound Fiscal Management
6.	Drive Diverse Economic Opportunities

Closed Captioning will be available on the playback cablecast. A DVD copy is available from the City Clerk's Department and a webcast of this meeting will be available for viewing via video streaming from the City's website within 48 hours of adjournment of this meeting.

In compliance with the Americans with Disabilities Act, if you need a disability-related modification or accommodation, including auxiliary aids or services, to participate in this meeting, please contact the City Clerk's Office at (916) 851-8720 at least 48 hours prior to the meeting.

CERTIFICATION OF POSTING OF AGENDA

I, Stacy Leitner, City Clerk for the City of Rancho Cordova, declare that the foregoing agenda for the Monday, October 15, 2018 Regular Meeting of the Rancho Cordova City Council was posted and available for review on October 12, 2018 at City Hall of the City of Rancho Cordova, 2729 Prospect Park Drive, Rancho Cordova, California, 95670. The agenda is also available on the city website at www.cityofranchocordova.org.

Signed October 12, 2018 at Rancho Cordova, California.

Stacy Leitner

Stacy Leitner, City Clerk

CITY COUNCIL MEETING

City Hall
2729 Prospect Park Drive, Rancho Cordova

Monday, October 01, 2018

4:00 PM – Special Meeting
American River Room North

5:30 PM – Regular Meeting
David B. Roberts Council Chambers

Special Meeting/Work Session to Follow the Regular Meeting

DRAFT MINUTES

1. SPECIAL MEETING - CALL TO ORDER/ROLL CALL

Mayor Budge called the Special meeting to order in the American River Room North at 4:05 PM.

Council Members Present: Gatewood, McGarvey, Sander, Terry, Budge.

Council Members Absent: Sander and Terry.

Staff Members Present: Abhar, Carr, Leitner, Lindgren, Siren, Weber.

2. PUBLIC COMMENT

Mayor Budge opened the public comment period. Seeing no speakers, Mayor Budge closed the public comment period.

3. SPECIAL MEETING ITEM

ACTION: Motion to continue the item to a later date when all Council Members can attend by Budge second by McGarvey; Motion passed with a 3:0 vote.

3.1 **Subject:** Discussion and Direction on Various Aspects of Signage Related to Community Events and Way-Finding Signage.
Recommendation: Receive report and direct staff on potential code amendments to address community event and way-finding signage.

Result of Recommended Action: No formal action is requested of Council at this time. Council insight and/or direction to City staff on various aspects of signage will assist staff with potential code amendments related to noncommercial, digital billboards, and way-finding signage.
Staff Report: Darcy Goulart, Planning Manager.
Advances Goals: 1, 2, and 6.

4. ADJOURNMENT OF SPECIAL MEETING

Mayor Budge adjourned to the Regular meeting in the David B. Roberts Council Chambers at 4:07 PM.

5. REGULAR MEETING - CALL TO ORDER / ROLL CALL

Mayor Budge called the Regular meeting to order in the David B. Roberts Council Chamber at 5:34 PM.

Council Members Present: Gatewood, McGarvey, Terry, Sander, Budge.

Council Members Absent: None.

Staff Members Present: Abhar, Boucher, Cook, Ducharme, Gonzalez, Goulart, Haven, Judish, Juran, Kniestedt, Lee, Leitner, Lindgren, Rodriguez, Simpson, Sparkman, Sparks, Stover, Stricker, Taylor, Weber.

6. METRO CABLE TV TELEVISION ANNOUNCEMENT

The City Clerk read the meetings recordings and playback schedules.

7. PLEDGE OF ALLEGIANCE

Assistant Police Chief Lewis, led the pledge.

8. INVOCATION

Anthony Telford, Anatolia Ward Bishopric Member, from Church of Jesus Christ of Latter-day Saints gave the invocation.

9. PRESENTATIONS

9.1 Proclamation Recognizing the Week of October 7-13, 2018 as Code Enforcement Officer Week for the City of Rancho Cordova.

9.2 Proclamation in Support of Manufacturing Awareness and Appreciation Month.

9.3 Vote Center and Ballot Drop off Location for the November 6, 2018 General Election.

10. PUBLIC COMMENT

Mayor Budge opened the public comment period. Seeing no speakers, Mayor Budge closed the public comment period.

11. COUNCIL REPORTS

Council reported on events since the last meeting.

12. CITY MANAGER'S REPORT

City Manager Cyrus Abhar gave his report.

13. CONSENT CALENDAR ITEMS - ROLL CALL VOTE

ACTION: Motion to approve items 13.1 through 13.8 by Terry second by Gatewood; Motion passed with a 5:0 vote.

13.1 **Subject:** Adopt Meeting Minutes from September 4, 2018, September 11, 2018, and September 17, 2018 Special and Regular City Council Meetings.
Recommendation: Adopt Minutes.

13.2 **Subject:** An Ordinance Levying a Special Tax Within Community Facilities District No. 2018-2 (Community Places and Neighborhood Greens).
Recommendation: Waive the second reading and adopt the Ordinance.
Result of Recommended Action: Approval of the Ordinance would authorize the levy of a special tax within CFD 2018-2 (Community Places and Neighborhood Greens) at the rate and in accordance with the rate and method of apportionment of special tax as set forth in the Resolution of Formation adopted by the Council.
Staff Report: Elizabeth Sparkman, Community Development Director.
Advances Goals: 1, 2, and 5.

13.3 **Subject:** Approval of the Annexation Boundary Map for the European Parts Depot Project and Annexation to the City of Rancho Cordova Community Facilities District No. 2008-1 (Street Lighting and Road Maintenance).
Recommendation: Adopt the Resolution.
Result of Recommended Action: Adoption of the Resolution approves Annexation Boundary Map No. 26 for the European Parts Depot Project and Annexation of the Property to Community Facilities District No. 2008-1 (Street Lighting and Road Maintenance, hereinafter "CFD No. 2008-1"). There is no financial impact to existing residents.
Staff Report: Elizabeth Sparkman, Community Development Director and Jeanette Cervantes, Management Technician.
Advances Goal: 5.

13.4 **Subject:** A Resolution Declaring the City's Intention to Impose an Annual Stormwater Utility Fee for the Maintenance of Storm Drainage and Flood Protection Systems for the European Parts Depot Project.
Recommendation: Adopt the Resolution designating a time and place for hearing protests in connection with the annual Stormwater Utility Fee for the European Parts Depot project.
Result of Recommended Action: Action on this item will declare the Council's

intention to impose the annual Stormwater Utility Fee for the maintenance of the storm drainage and flood protection system for the European Parts Depot project and sets a public hearing for October 15, 2018 on the matter.
Staff Report: Elizabeth Sparkman, Community Development Director and Jeanette Cervantes, Management Technician.
Advances Goal: 5.

13.5 **Subject:** A Resolution Declaring the Results of the Mail Ballot Election Relating to the Imposition of the Annual Stormwater Utility Fee on the Douglas 98 Project in the City of Rancho Cordova.
Recommendation: Adopt the Resolution declaring the results of the mail ballot election relating to the imposition of the annual Stormwater Utility Fee on the Douglas 98 Project.
Result of Recommended Action: Adoption of the Resolution will declare the results of the ballot tabulation in connection with the imposition of the annual Stormwater Utility Fee on the Douglas 98 Project. If majority approval exists, the City Council may impose the annual Stormwater Utility Fee on the Douglas 98 Project pursuant to the Fee Ordinance. If there is no majority approval, the Stormwater Utility Fee shall not be imposed for the project.
Staff Report: Elizabeth Sparkman, Community Development Director and Jeanette Cervantes, Management Technician.
Advances Goal: 5.

13.6 **Subject:** Biennial Review and Resolution Updating the Conflict of Interest Code for the City of Rancho Cordova Designated Employees.
Recommendation: Adopt the Resolution.
Result of Recommended Action: Adoption of the Resolution results in the City's compliance with Fair Political Practices Commission requirements.
Staff Report: Stacy Leitner, City Clerk.
Advances Goal: 5.

13.7 **Subject:** A Resolution Rejecting All Bids for On-Call Concrete Maintenance Services.
Recommendation: Adopt the Resolution.
Result of Recommended Action: Adoption of this Resolution will reject all bids received for on-call concrete maintenance services.
Staff Report: Albert Stricker, Public Works Director and Steve Harriman, Operations and Maintenance Division Manager.
Advances Goals: 1, 2 and 5.

13.8 **Subject:** An Ordinance Amending Chapter 17.04 of the Rancho Cordova Municipal Code Relating to the Adoption of State Fire Code with Local Amendments.
Recommendation: Introduce and waive the first reading of an Ordinance amending Chapter 17.04 of the Rancho Cordova Municipal Code, and adopting by reference the California F/ire Code, 2016 Edition, with amendments based upon local climatic, geological, and topographical conditions, and to set a Public Hearing on November 5, 2018 at 5:30 p.m.
Result of Recommended Action: This action adopts the State Fire Code with local amendments, as deemed appropriate by the Fire Marshall of the Sacramento Metropolitan Fire District, and the City Building & Safety Division, which will make the amended provisions of the State Fire Code specific for the needs of the Rancho Cordova community.
Staff Report: Joseph Cuffe, City Building Official.
Advances Goals: 2 and 5.

14. CONSENT PUBLIC HEARING ITEMS - ROLL CALL VOTE

14.1 **Subject:** A Resolution Creating Special Tax Area Zone 24 and an Ordinance Establishing a Special Tax for Transit-Related Services for the European Parts Depot Project.
Recommendation: Adopt a Resolution creating special tax area Zone 24; and introduce and waive first reading of an Ordinance, establishing a special tax for transit-related services for the European Parts Depot project.
Result of Recommended Action: Adoption of the Resolution and Ordinance will assist the City in meeting the costs of providing transit-related services by creating a special tax area zone and establishing a special tax for transit-related services for the European Parts Depot project.
Staff Report: Elizabeth Sparkman, Community Development Director and Jeanette Cervantes, Management Technician.
Advances Goal: 5.

ACTION: Motion to approve item 14.1 by Terry second by Gatewood; Motion passed with a 5:0 vote.

14.2 **Subject:** Action Items Related to the Formation of City of Rancho Cordova Grantline 208 Community Facilities District No. 2018-1.
Recommendation: Staff recommends that Council adopt the iollowing items:
1. Resolution Forming a Community Facilities District and Levying a Special Tax in City of Rancho Cordova Grantline 208 Community Facilities District 2018-1.
2. Resolution Deeming it Necessary to Incur Bonded Indebtedness in City of Rancho Cordova Grantline 208 Community Facilities District 2018-1.
3. Resolution Calling for a Special Election in City of Rancho Cordova Grantline 208 Community Facilities District 2018-1.
4. Resolution Declaring Election Results for City of Rancho Cordova Grantline 208 Community Facilities District 2018-1.
5. Waive First Reading and Introduce Ordinance Levying a Special Tax within City of Rancho Cordova Grantline 208 Community Facilities District 2018-1.
Result of Recommended Action: Adoption of these items will complete the formation of City of Rancho Cordova Grantline 208 Community Facilities District 2018-1 (the "CFD") and authorize a landowner vote which, if successfully passed, authorizes the levy of a special tax. The special tax levy associated with this CFD is for the purpose of financing the acquisition and construction of, and the payment of fees for, the public facilities in and for the Community Facilities District. There is no financial impact to existing residents.
Staff Report: Michelle Mingay, Sr. Finance Analyst.
Advances Goal: 5.

ACTION: Motion to approve items 14.2:

1. Resolution: McGarvey second by Gatewood; Motion passed with a 5:0 vote.
2. Resolution: Sander second by McGarvey; Motion passed with a 5:0 vote.
3. Resolution: Terry second by Gatewood; Motion passed with a 5:0 vote.
4. Resolution: Terry second by Gatewood; Motion passed with a 5:0 vote.
5. Ordinance: Gatewood second by McGarvey; Motion passed with a 5:0 vote.

15. PUBLIC HEARING ITEMS

16. REGULAR CALENDAR ITEMS

16.1 **Subject:** Fiscal Year 2017-18 Preliminary Year-End Financial Report and Budget Amendment.
Recommendation: That the City Council receive the Fiscal Year 2017-18 Preliminary Year-End Financial Report and Adopt a Resolution (Attachment 2) amending the Fiscal Year 2017-18 Budget.
Result of Recommended Action: The Fiscal Year 2017-18 Preliminary Year-End Financial Report provides the City Council with the City's unaudited financial performance for the most recent fiscal year prior to receiving the audited Comprehensive Annual Financial Report (CAFR) later in the year. It also provides the City Council with the opportunity to authorize the proposed budget amendments for the June 30, 2018 fiscal year. The proposed budget amendment would use General Fund surplus dollars to eliminate the interfund loan between the General Fund and the Local Housing Special Revenue Fund by $1,171,499.
Staff Report: Kim Juran-Karageorgiou, Administrative Services Director.
Advances Goal: 5.

ACTION: Motion to approve the item by Sander second by Gatewood; Motion passed with a 5:0 vote.

17. COUNCIL REQUESTS FOR FUTURE AGENDA ITEMS

18. ADJOURNMENT

Mayor Budge adjourned the meeting at 7:14 PM in honor of the Rancho Cordova Police Department and fallen Officer Mark Stasyuk.

_____
Stacy Leitner, City Clerk

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Michelle Mingay, Sr. Finance Analyst

SUBJECT: **SECOND READING OF AN ORDINANCE OF THE CITY OF RANCHO CORDOVA LEVYING A SPECIAL TAX WITHIN THE CITY OF RANCHO CORDOVA GRANTLINE 208 COMMUNITY FACILITIES DISTRCT 2018-1**

RECOMMENDATION

Waive the second reading and adopt the Ordinance.

RESULT OF RECOMMENDED ACTION

Adoption of this Ordinance will allow the levy of a special tax within City of Rancho Cordova Grantline 208 Community Facilities District 2018-1 (the "CFD"), and, in each year hereafter, the process of determining the special taxes and processing the collection is done administratively by the Administrative Services Director (or a consultant) with no further Council action being needed.

BACKGROUND

On October 1, 2018 the City Council waived the first reading and passed to a second reading the Ordinance levying a Special Tax within the CFD.

FISCAL IMPACT

This action established a special tax rate for the Grantline 208 project and has no fiscal impact to existing residents.

ATTACHMENT

1. Ordinance

ATTACHMENT 1

CITY OF RANCHO CORDOVA

ORDINANCE NO. XX-2018

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA, LEVYING A SPECIAL TAX WITHIN CITY OF RANCHO CORDOVA GRANTLINE 208 COMMUNITY FACILITIES DISTRICT NO. 2018-1

The City of Rancho Cordova (the "City") ordains:

1. Pursuant to Government Code Sections 53328 and 53340, and in accordance with the Rate and Method of Apportionment of Special Tax (the "Special Tax Formula") as shown in Exhibit B to a resolution titled "A Resolution of the City Council of the City of Rancho Cordova to Form a Community Facilities District and to Levy a Special Tax in City of Rancho Cordova Grantline 208 Community Facilities District No. 2018-1" ("Resolution of Formation") adopted by this City Council on October 1, 2018, a special tax is hereby levied on all taxable parcels within City of Rancho Cordova Grantline 208 Community Facilities District No. 2018-1 (the "District") for the 2018-19 tax year and for all subsequent years of the authority to levy this special tax.

2. The Administrative Services Director of the City is directed, with the aid of the appropriate officers and agents of the City, to implement the provisions of the Special Tax Formula and to prepare each year, without further action of this City Council, the special tax roll for the District and to provide as necessary information to the Sacramento County Auditor in the form, and in the proper time, necessary to effect the proper billing and collection of the special tax on the secured property tax roll of the County, which may include a billing of the special tax for fiscal year 2018-19 without regard to the timing of the issuance of bonds for the District and the circumstance that bonds are not issued as of the date of submission to the County for billing; alternatively, pursuant to the Resolution of Formation, the special tax for fiscal year 2018-19 and subsequent years may, at the option of the City, be billed directly to owners of property in the District by the Administrative Services Director of the City or other official of the City and need not be collected on the County secured property tax roll.

3. The appropriate officers and agents of the City and of the County of Sacramento are authorized to make adjustments to the special tax roll prior to the final posting of the special taxes to the County tax roll each year, as may be necessary to achieve a correct match of the special tax levy with the assessor's parcel numbers finally utilized by the County in sending out property tax bills.

4. The City agrees that the County of Sacramento may deduct its reasonable and agreed charges for collecting the special tax from the amounts collected, prior to remitting the balance of the special tax collections to the City.

5. If for any cause any portion of this ordinance is found to be invalid, or if the special tax is found inapplicable to any particular parcel by a court of competent jurisdiction, the balance of this ordinance, and the application of the special tax to the remaining parcels, shall not be affected.

ATTACHMENT 1

6. The Mayor shall sign this Ordinance and the City Clerk shall cause the same to be published within fifteen (15) days after its passage at least once in a newspaper of general circulation published and circulated in the City.

7. This ordinance shall go into effect on the earliest day allowable by law.

THE FOREGOING ORDINANCE was adopted this ___ day of _____, 2018 by the following vote:

AYES:

NOES:

ABSTAIN:

ABSENT:

_____
Linda Budge, Mayor

Attest:

_____
Stacy Leitner, City Clerk

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Stacy Leitner, City Clerk

SUBJECT: **RECORDS AND INFORMATION MANAGEMENT - RETENTION SCHEDULE UPDATE**

RECOMMENDATION

Adopt a Resolution approving updates to the City of Rancho Cordova City-Wide Records Retention Schedule.

RESULT OF RECOMMENDED ACTION

Adoption of a new Retention Schedule will enable City staff to facilitate the appropriate and efficient management and retention of City records in accordance with government regulations.

BACKGROUND

The City of Rancho Cordova adopted a Records Retention Schedule by Resolution No. 2-2005 on January 18, 2005 and performed updates in 2014 and early 2018. As a result of working with each department to implement the Records and Information Management (RIM) program, staff identified another revision is needed to reflect the administrative, functional, historical, and legal needs of the city.

The updated Retention Schedule contains updates to record categories and example record types to reflect the current business of the City. It contains 101 record categories and can be used to assign accurate classifications in the electronic environment.

Adoption of a Citywide Records Retention Schedule will enable city staff to continue operating the Records Management Program and process routine records destruction adhering to federal, state, and local guidelines.

FISCAL IMPACT

CITY OF RANCHO CORDOVA

RESOLUTION NO. XX-2018

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA, UPDATING THE RETENTION SCHEDULE FOR THE RECORDS AND INFORMATION MANAGEMENT PROGRAM

WHEREAS, the City has an obligation to protect and consistently manage the records and information assets of the City in accordance with government regulations; and

WHEREAS, the City adopted the Retention Schedule on January 18, 2005 by Resolution No. 2-2005 and adopted revisions in 2014 and early 2018; and

WHEREAS, since that time, staff has identified the need for additional changes to the Retention Schedule record categories and types to reflect current City processes; and

WHEREAS, this Resolution is intended to adopt updates to the current Retention Schedule to facilitate the appropriate and efficient management and retention of City records in accordance with all laws and regulations including, Government Code Section 34090; and

WHEREAS, the Retention Schedule has been reviewed by Department Heads, the City Attorney, and the City Clerk.

NOW, THEREFORE, BE IT HEREBY RESOLVED BY THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA THAT:

1. The Retention Schedule attached hereto as Attachment 3 is hereby approved and adopted.
2. The Retention Schedule shall go into effect immediately for the management of City records and information.

PASSED AND ADOPTED by the City Council of the City of Rancho Cordova on the 15th day of October, 2018 by the following vote:

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Michelle Mingay, Sr. Finance Analyst

SUBJECT: **ANNEXATION OF THE ANTHOLOGY SUBDIVISION INTO THE CITY OF RANCHO CORDOVA COMMUNITY FACILITIES DISTRICT NO. 2013-2 (POLICE SERVICES)**

RECOMMENDATION

Adopt the Resolution.

RESULT OF RECOMMENDED ACTIONS

Adoption of the Resolution approves Annexation Map No. 4 for the Anthology Subdivision to Community Facilities District No. 2013-2 (Police Services) (hereinafter "CFD No. 2013-2"), and approves the recording of the Annexation Map and the Notice of Special Tax Lien.

BACKGROUND

On December 17, 2012, the City adopted a Resolution of Intention to establish a Community Facilities District (CFD) and Future Annexation Area for Citywide police services. On January 22, 2013, the City adopted the Resolution forming CFD No. 2013-2 pursuant to the Mello-Roos Community Facilities Act of 1982 (State of California Government Code Section 5311 et seq.) (the "Act"). The action defining the Future Annexation Area for the District provided for a more efficient process for the annexation of property when the property owners have provided for their unanimous consent. Defining the Future Annexation Area provided the Resolution of Intention, noticing, and public hearing for the entire Future Annexation Area so these steps do not need to be repeated for each annexation.

The annexation process for projects within the Future Annexation Area has been simplified to receiving a petition and waiver from the property owner(s), the City Council approving the Annexation Boundary Map by Resolution, followed by the recording of the Annexation Map and Notice of Special Tax Lien by the City Clerk.

DISCUSSION

The project included in this action was conditioned to annex to provide funding for police services. While this did not occur for this project under the prior owner, the project has changed ownership and the new owners will satisfy this condition by annexation of their project into CFD No. 2013-2. In October 2018, the property owner signed a unanimous approval of the annexation to CFD No. 2013-2. Adoption of the attached Resolution approves Annexation Map No. 4 for the subdivision and directs the Clerk to execute and record the Map and Notice of Special Tax Lien for the project.

RESOLUTION NO. __-2018

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA, APPROVING THE BOUNDARY MAP FOR THE ANTHOLOGY SUBDIVISION ANNEXATION TO THE CITY OF RANCHO CORDOVA COMMUNITY FACILITIES DISTRICT NO. 2013-2 (POLICE SERVICES)

WHEREAS, the Conditions of Approval for the Anthology Subdivision requires the property owner/applicant to provide funding for police services; and

WHEREAS, on December 17, 2012, the City adopted Resolution No. 122-2012 declaring its intention to establish Community Facilities District No. 2013-2 (Police Services) (the "District") and Future Annexation Area. On January 22, 2013, the City adopted Resolution No. 10-2013 forming CFD No. 2013-2 pursuant to the Mello-Roos Community Facilities Act of 1982 (State of California Government Code Section 5311 et seq.) (the "Act"); and

WHEREAS, the action defining the Future Annexation Area for the District provided for a more efficient process for the annexation of property when the property owners have provided for their unanimous consent such that the annexation process for projects within the Future Annexation Area has been reduced to receiving a petition, consent and waiver from the property owner(s); and

WHEREAS, in October of 2018, the property owner executed a unanimous approval form which irrevocably consents to and votes in favor of the annexation of the property to the District and the levy of the special tax on the property to finance the services of the CFD in accordance with the Rate and Method of the District; and

WHEREAS, in the case of annexation proceedings, pursuant to Streets and Highways Code Section 3110.5 a separate map of the area proposed to be annexed is required to be prepared and adopted; and

WHEREAS, City staff has caused to be prepared Annexation Map No. 4 for the property known as the Anthology Subdivision, **EXHIBIT A** attached hereto, for the annexation of the property to CFD No. 2013-2 (Police Services).

NOW, THEREFORE, BE IT HEREBY RESOLVED BY THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, as follows:

1. The Council so finds and determines the above recitals are true and correct.

2. Council approves Annexation Map No. 4 and finds and determines that the territory shown in the Annexation Map is hereby added to and made a part of the District with full legal effect.

3. The City Clerk is directed to execute and record Annexation Map No. 4 in the office of the County Recorder of Sacramento County not later than 15 days after the adoption of this Resolution.

4. The City Council finds and determines that a special tax shall be levied within the Territory to be annexed and which special tax shall be the same as the tax to be levied within the District. Collection of said tax shall commence as outlined in the

ATTACHMENT 1

rate and method of apportionment of said tax and shall be as set forth in the Resolution of Formation of the District.

5. The City Clerk is directed to execute and record a Notice of Special Tax Lien in substantially the same form as shown in **EXHIBIT B** attached hereto, in the office of the County Recorder of Sacramento County not later than 15 days after recordation of the Annexation Map No. 4.

6. The City Council finds and determines that adoption of this Resolution is not a "project" under the California Environmental Quality Act, because the Resolution does not involve any commitment to a specific project which may result in a potentially significant physical impact on the environment, as contemplated by Title 14, California Code of Regulations, Section 15378(b)(4).

PASSED AND ADOPTED by the City Council of the City of Rancho Cordova on the 15th day of October, 2018, by the following vote of the City Council:

AMENDMENT NO. 4 TO NOTICE OF SPECIAL TAX LIEN

CITY OF RANCHO CORDOVA
Community Facilities District No. 2013-2
(Police Services)

Annexation No. 4

Pursuant to the requirements of Section 3117.5 of the Streets and Highways Code of California and the Mello-Roos Community Facilities Act of 1982, as amended, section 53311, *et. seq*., of the California Government Code (the "Act"), the undersigned City Clerk of the City of Rancho Cordova (the "City"), County of Sacramento, State of California, hereby gives notice that a lien to secure payment of a special tax, which the City is authorized to levy, is hereby imposed on the property described herein. The special tax secured by this lien is authorized to be levied for the purpose of paying for certain municipal services set forth in that certain Notice of Special Tax Lien heretofore recorded in the Office of the County Recorder of the County of Sacramento, State of California on March 12, 2013 as Document No. 20130312 page 0318 to which recorded Notice of Special Tax Lien reference is hereby made and the provisions of which are hereby incorporated by this reference.

This Amendment No. 4 to Notice of Special Tax Lien amends the Notice of Special Tax Lien to add to the territory of the CFD. The territory and future annexation area included in the original CFD is set forth in the map of the CFD heretofore recorded in the Sacramento County Recorder's Office at Book 114 of Maps of Assessment and Community Facilities Districts at Page 18 as Document No. 20130102PG1208, (the "Original Boundary Map") to which map reference is hereby made. The territory to be added from the future annexation area is that certain real property identified in the map of the Annexed Territory recorded in the Sacramento County Recorder's Office at Book ____, at Page ____ as Document No. _____, which map together with the Original Boundary Map are now the final boundary maps of the CFD including the Annexed Territory.

This annexed property is placed in Tax Zone 1 for purposes of computation of the Special Tax.

ATTACHMENT 3
Exhibit B to the Resolution

The assessor's tax parcel(s) numbers of all parcels or any portion thereof which are included in this Amendment No. 4 to Notice of Special Tax Lien, together with the name(s) of the owner(s) thereof, as they appear on the latest secured assessment roll as of the date of recording hereof or as are otherwise known to the Authority are as set forth in Exhibit A hereto, and by such reference hereby made a part hereof. The levy is hereby imposed on the property described herein.

For further information concerning the current and estimated future tax liability of owners or purchasers of real property subject to this special tax lien, interested persons should contact the Finance Officer of the City of Rancho Cordova, 2729 Prospect Park Drive, Rancho Cordova, CA 95670 (telephone number: 916-851-8700).

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Albert Stricker, Public Works Director and Quoc Nham, Associate Civil Engineer

SUBJECT: **A RESOLUTION AUTHORIZING THE PUBLIC WORKS DIRECTOR TO SUBMIT AND EXECUTE APPLICATION(S) AND DOCUMENTS FOR CALRECYCLE GRANTS**

RECOMMENDATION

Adopt the Resolution.

RESULT OF RECOMMENDED ACTION

Adoption of this Resolution will authorize the City to submit application(s) to CalRecycle for all grants and designates the Public Works Director or his or her designee to execute all grant documents for a period of 5-years from the date of adoption.

BACKGROUND

CalRecycle requires jurisdictions who wish to apply for grant funds to pass a Resolution that authorizes the submittal of the grant application(s) to CalRecycle and designates signing authority on behalf of the City of Rancho Cordova. CalRecycle allows this Resolution to remain effective for five (5) years. CalRecycle is authorized to administer various grant programs to further California's efforts to reduce, recycle, and reuse solid waste, in turn preserving landfill capacity and protecting public health, safety, and the environment.

The City of Rancho Cordova has identified Sunrise Boulevard Rehabilitation and Active Transportation Project (CP18-2187) as the latest project for construction that would benefit from the available CalRecycle Grant. The project will require approximately 7,000 tons of rubberized hot-mix asphalt to overlay Sunrise Boulevard from Folsom Boulevard to Folsom South Canal. Approximately $100,000 is eligible for reimbursement from CalRecycle's Rubberized Pavement Grant Program.

FISCAL IMPACT

There is no anticipated fiscal impact of the proposed action to the City's General Fund.

CITY OF RANCHO CORDOVA

RESOLUTION NO. XXX-2018

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA, AUTHORIZING THE PUBLIC WORKS DIRECTOR TO SUBMIT AND EXECUTE APPLICATION(S) AND DOCUMENTS FOR CALRECYCLE GRANTS

WHEREAS, Public Resources Code sections 40000 et seq. authorizes the Department of Resources Recycling and Recovery (CalRecycle) to administer various grant programs (grants) in furtherance of the State of California's (state) efforts to reduce, recycle, and reuse solid waste generated in the state; thereby, preserving landfill capacity and protecting public health and safety and the environment; and

WHEREAS, in furtherance of this authority CalRecycle is required to establish procedures governing the application, awarding, and management of the grants; and

WHEREAS, CalRecycle's grant application procedures require, among other things, an applicant's governing body to declare by Resolution certain authorizations related to the administration of CalRecycle grants.

NOW, THEREFORE, BE IT HEREBY RESOLVED THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA does authorize:

1. The submittal of application(s) to CalRecycle for all grants for which the City of Rancho Cordova is eligible; and
2. The Public Works Director, or his/her designee, is hereby authorized and empowered to execute in the name of the City of Rancho Cordova all grant documents, including but not limited to: applications, agreements, amendments and requests for payment, necessary to secure grant funds and implement the approved grant project; and
3. These authorizations are effective for five (5) years from the date of adoption.

PASSED AND ADOPTED by the City Council of the City of Rancho Cordova on the 15th day of October, 2018 by the following vote:

AYES:

NOES:

ABSENT:

ABSTAIN:

_____
Linda Budge, Mayor

ATTEST:

_____
Stacy Leitner, City Clerk

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Albert Stricker, Public Works Director and Marilyn Phelps, Assistant Land Surveyor

SUBJECT: **APPROVE THE FINAL LARGE LOT MAP OF MONTELENA SUBDIVISION NO. RC-04-132.0**

RECOMMENDATION

Approve Final Large Lot Map of Montelena Subdivision No. RC-04-132.0 located on the south side of Douglas Road, west side of Rancho Cordova Parkway and north and south of Chrysanthy Boulevard.

RESULT OF RECOMMENDED ACTION

Approval of this recommended action will result in the recording of the final map creating 8 large lots and 19 miscellaneous lots.

BACKGROUND

The map has been examined and checked for compliance with Title 22 of the City of Rancho Cordova Municipal code and the California Subdivision map Act. The City Council approved the Tentative Map on March 20, 2006. A copy of the final map **(Attachment 1)** and copy of the vicinity map **(Attachment 2)** are included with this letter.

There are no delinquent taxes against the property and the Tax Collector has so certified. The 2018/2019 estimated taxes have been secured with the Sacramento County Tax Collector.

FISCAL IMPACT

There is no fiscal impact to the City.

ATTACHMENTS

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Elizabeth Sparkman, Community Development Director

SUBJECT: **FIRST AMENDMENT TO THE DEVELOPMENT AGREEMENT RELATIVE TO ANTHOLOGY AT ANATOLIA**

RECOMMENDATION

Introduce and waive the first reading of the Ordinance.

RESULT OF RECOMMENDED ACTION

Adoption of the Ordinance would approve a first amendment to the Development Agreement relative to the Anthology at Anatolia residential project to adjust the park development and park renovation fees to current rates and extend the agreement term to December 31, 2028.

BACKGROUND

The Development Agreement for the Anthology at Anatolia project was originally executed by and between the City and CH (ANATOLIA I) Relative to Anthology at Anatolia. The original Development Agreement was recorded against the property on August 23, 2006. This project for the construction of the remaining 102 single family homes located in the Sunridge Specific Plan has recently be purchased by D. R. Horton CA2, Inc. In November of 2013, the City updated the parks and open space standards.

The purpose of this First Amendment to the Development Agreement relative to Anthology at Anatolia is to adjust the park development and park renovation fees to reflect the fee levels associated with the revised standards and to extend the term to December 2028.

FISCAL IMPACT

There is no impact to the general fund.

ATTACHMENTS

1. Ordinance
2. First Amendment to the Development Agreement

DRAFT

ATTACHMENT 1

CITY OF RANCHO CORDOVA

ORDINANCE NO. XX-2018

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA, APPROVING THE FIRST AMENDMENT TO THE DEVELOPMENT AGREEMENT RELATIVE TO ANTHOLOGY AT ANATOLIA

THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA DOES ORDAIN AS FOLLOWS:

Section 1. Purpose and Declarations.

WHEREAS, in order to strengthen the public planning process, encourage private participation in comprehensive planning and reduce the economic risk of development, the Legislature of the State of California adopted Section 65864, *et seq.*, of the Government Code (the "Development Agreement Statute"), authorizing the City, and any person having a legal or equitable interest in the real property, to enter into a development agreement and establish certain development rights in the property, which is the subject of the development project application. Pursuant to Government Code section 65868, Development Agreements may be amended by mutual assent of the parties; and

WHEREAS, in July 2006, the City and CH (ANATOLIA I) entered into a Development Agreement for the Anthology at Anatolia Project, consisting of residential development (Ordinance Number 39-2006); and

WHEREAS, the Anthology at Anatolia Project is within the SunRidge Specific Plan ("SDCP/SRSP") area. The SDCP/SRSP was approved by the County of Sacramento ("County") in July 2002. The County also prepared and certified an Environmental Impact Report ("EIR") (State Clearinghouse Number 97022055) for the SDCP/SRSP. In July 2003, the City of Rancho Cordova incorporated an area that included the SDCP and SRSP. In response to litigation involving the SDCP/SRSP EIR, the City subsequently rescinded approval of the SDCP/SRSP, yet the court held that the SDCP/SRSP is still in effect for projects that were already vested through a development agreement, such as this one. The Court and City allowed projects with development agreements to develop consistent with the Specific Plan which utilized County standards. On November 7, 2012, the City certified a partially Revised EIR for the SDCP/SRSP, however, at that time the City determined to carry out the projects within the SDCP/SRSP area without re-approving the SDCP/SRSP; and

WHEREAS, the Anthology at Anatolia project was analyzed within an earlier adopted Mitigated Negative Declaration (State Clearinghouse Number 2003042004) for Anatolia I, II and III by County of Sacramento Board of Supervisors in March 2003. Within the study of the environmental issues, aesthetics of the new development were identified and the implementation of the adopted design guidelines for the SunRidge Specific Plan, reduced the negative impacts of poor design to less than significant.

WHEREAS, in the previously adopted MND, the City concluded that the Project would not have a significant impact on the environment due to the mitigation measures adopted by the County in the SDCP/SRSP EIR and the MND. All environmental impacts were reviewed and addressed at the time the Project was approved. All recitals and findings of determination in Ordinance 39-2006, which adopted the Development Agreement, are still accurate and relevant to the Amendment; and these amendments, which will result in adjusted park fees and an

extension of the term of the Agreement, will not result in any new or significant impacts that were not previously identified and on this basis there is not substantial evidence that the project amendments will have a significant adverse impact on the environment; and

WHEREAS, pursuant to Government Code section 65868, City and Landowner, D.R. Horton CA2, Inc., now desire to modify the Development Agreement to reflect certain modifications to the obligations of the Landowner to pay certain fees for park renovations to existing City parks and improvements at new City parks, and to extend the term by ten (10) years, all as more fully set forth in the attached Development Agreement Amendment; and

WHEREAS, the City Council is the appropriate authority to hear and take action on this project; and

WHEREAS, the City Council of the City of Rancho Cordova has conducted a properly noticed public hearing pursuant to Government Code Section 65090 and has duly considered all written and verbal testimony presented during the hearing.

Section 2. Findings

The City Council hereby finds that:

A. **CEQA Compliance.** The Anthology at Anatolia Project is within the SunRidge Specific Plan ("SDCP/SRSP") area. The SDCP/SRSP was approved by the County of Sacramento ("County") in July 2002. The County also prepared and certified an Environmental Impact Report ("EIR") (State Clearinghouse Number 97022055) for the SDCP/SRSP. In July 2003, the City of Rancho Cordova incorporated an area that included the SDCP and SRSP. In response to litigation involving the SDCP/SRSP EIR, the City subsequently rescinded approval of the SDCP/SRSP, yet the court held that the SDCP/SRSP is still in effect for projects that were already vested through a development agreement, such as this one. The Court and City allowed projects with development agreements to develop consistent with the Specific Plan which utilized County standards. On November 7, 2012, the City certified a partially Revised EIR for the SDCP/SRSP, however, at that time the City determined to carry out the projects within the SDCP/SRSP area without re-approving the SDCP/SRSP. Additionally, in March, 2003, the County of Sacramento Board of Supervisors adopted the Mitigated Negative Declaration (State Clearinghouse Number 2003042004) for Anatolia I, II and III projects. The changes to the Development Agreement being made through this First Amendment do not require further CEQA review as they address park fees and the term of the Agreement only and do not contain any changes to the physical size or scope of the project that could result in any significant adverse impacts to the environment; and as such further CEQA review is exempt under CEQA Regulation section 15378 as the First Amendment does not meet the definition of a Project and pursuant to CEQA Regulation Section 15162-15164, as an EIR has been adopted for this Project and none of the conditions requiring a subsequent EIR, negative declaration, supplement to the EIR, or an addendum to the EIR have been met.

B. **Required Findings.** The attached Development Agreement Amendment is consistent with the following additional findings, as required by State law and Chapter 23.158 of the Rancho Cordova Municipal Code:

(1) The development agreement is consistent with the General Plan objectives, policies, land uses, and implementation programs and any other applicable Specific Plans.

The Development Agreement Amendment is consistent with the objectives, policies, general land uses and programs specified and contained in the City's General Plan, and in the Sunridge Specific Plan in that (a) the land use designation for the Anthology at Anatolia I site allows for the development of single family residential homes and the proposed project is to create 118 single family lots consistent with that land use, (b) the project is consistent with the fiscal policies of the General Plan and the Sunridge Specific Plan with respect to provision of infrastructure and public services, and (c) the Development Agreement and Amendment include provisions relating to financing, construction and maintenance of public facilities, park development fees and similar provisions set forth in the Sunridge Specific Plan.

(2) The Development Agreement Amendment is in conformance with the public convenience and general welfare of persons residing in the immediate area and will not be detrimental or injurious to property or persons in the general neighborhood or to the general welfare of the residents of the city as a whole.

The Development Agreement Amendment is in conformity with public convenience and general welfare of people residing in the immediate area and won't be detrimental or injurious to the property or people in the area or the city as a whole in that the Anthology at Anatolia I Project will implement land use guidelines set forth in the Sunridge Specific Plan and the General Plan, which have planned for residential uses at this location.

(3) The development agreement will promote the orderly development of property or the preservation of property values.

As described above, the Development Agreement and the project it allows for, including the amendments being made, are entirely consistent with the General Plan and Specific Plan for this site and therefore the development agreement promotes the orderly development of property as well as the preservation of property values, as area properties and their values would be, in part, based on this exact use occurring on this site in the future.

(4) The development agreement does not pertain to any property in the protected 200-year floodplain, unless the development agreement contains conditions that will provide an urban level of protection to the property consistent with California Government Code Section 65865.5.

The Development Agreement, including amendments being made, does not pertain to any property in the protected 200-year floodplain.

Section 3. Approval of the Development Agreement Amendment

The City Council hereby approves the Development Agreement Amendment, attached to this Ordinance and incorporated herein by reference as **Exhibit 1A**, and authorizes the City Manager to sign the Development Agreement Amendment after the effective date of this Ordinance.

Section 4. Severability

If any provision of this Ordinance or the application thereof to any person or circumstance, is held invalid, the remainder of the Ordinance, including the application of such part or provision to other persons or circumstances shall not be affected thereby and shall continue in full force and effect. To this end, provisions of this Ordinance are severable. The City Council hereby

DRAFT

ATTACHMENT 1

declares that it would have passed each section, subsection, subdivision, paragraph, sentence, clause or phrase hereof irrespective of the fact that any one or more sections, subsections, subdivisions, paragraphs, sentences, clauses, or phrases be held unconstitutional, invalid or unenforceable.

Section 5. Effective Date

Within fifteen (15) days after adoption, a Summary of this Ordinance shall be published once in the Grapevine Independent, or the Sacramento Bee, a newspaper of general circulation printed and published in Sacramento County and circulated in the City of Rancho Cordova, in accordance with Government Code Section 36933. This Ordinance shall take effect and be enforced thirty (30) days after its inception.

FIRST AMENDMENT TO DEVELOPMENT AGREEMENT BY AND BETWEEN THE CITY OF RANCHO CORDOVA AND CH (ANATOLIA I), LP RELATIVE TO ANTHOLOGY AT ANATOLIA

This First Amendment to Development Agreement ("**Amendment**") is entered into this _____ day of _____, 2018, by and between the **CITY OF RANCHO CORDOVA**, a municipal corporation ("**City**"), and **D.R. HORTON CA2, Inc.**, a California corporation ("**Landowner**"). City and Landowner are hereinafter collectively referred to as the "**Parties**."

RECITALS

A. City and CH (ANATOLIA 1), LP entered into that certain Development Agreement dated JULY 5, 2006 ("**Agreement**" or **"Development Agreement"**) recorded on August 23, 2006, in the Office of the Sacramento County Recorder in Book 20060823, Page 2347, Official Records, which established certain development rights in certain real property located in the City of Rancho Cordova, California, as more particularly described in **Exhibit A-1**, **Exhibit A-2**, and **Exhibit A-3** of the Agreement (the "**Property**").

B. Following foreclosure of that certain Deed of Trust and Assignment of Rents securing a loan from Exchange Bank, recorded on June 24, 2005 in Book 20050624, Page 1536 of the Official Records of Sacramento County, the Property was transferred by Trustees Deed Upon Sale to Exchange Bank that was recorded on January 20, 2009, in the Official Records of Sacramento County, California, in Book 20090120, Page 0470.

C. The Property was again transferred through a Grant Deed from Exchange Bank to Joseph Mohamed Sr. and Shirley M. Mohamed that was recorded on April 28, 2009 in the Official Records of Sacramento County, California, in Book 20090428, Page 1305, and ultimately conveyed to Mohammed by Correctory Grant Deed that was recorded on May 23, 2017, in the Official Records of Sacramento County, California, in Book 20170523, Page 0857.

D. Joseph Mohamed Sr. and Shirley M. Mohamed Charitable Remainder Unitrust II conveyed the Property and Agreement to D.R. HORTON CA2, INC. via a grant deed recorded in the Office of the Sacramento County Recorder in Book 20180731, Page 0959, Official Records, and these parties also executed an Assignment and Assumption Agreement Relative to Anthology at Anatolia ("Assignment and Assumption Agreement") which assigned all rights and obligations under the Development Agreement to D.R. HORTON CA2, INC. and was recorded on July 31, 2018, in the Official Records of Sacramento County, California, in Book 20180731, Page 0960.

E. Pursuant to Government Code section 65868, City and Landowner now desire to modify and amend the Development Agreement to reflect the change in ownership of the Property and to reflect certain changes to Landowner's obligations to pay certain fees for park renovations at existing City parks and improvements at new City parks, and to make other revisions, all as more fully set forth below in this Amendment.

F. This Amendment amends certain provisions of the Agreement applicable to the entire Property, and was adopted by City Ordinance No. ___-2018 on _____, 2018. All capitalized terms used in this Amendment shall have the same meaning as set forth in the Agreement.

NOW, THEREFORE, in consideration of the foregoing recitals and the mutual covenants contained herein, the Parties hereby agree to amend the Agreement as follows:

AGREEMENT

1. Incorporation of Recitals. Recitals A through F are hereby incorporated herein, including the documents referenced in the Recitals.

2. Amendment of title of Agreement to reflect new Landowner. City and Landowner agree that the Agreement title is hereby amended to read as follows:

"DEVELOPMENT AGREEMENT BY AND BETWEEN CITY OF RANCHO CORDOVA AND D.R. HORTON CA2, INC. AS LANDOWNERS RELATIVE TO ANTHOLOGY AT ANATOLIA"

3. Additional amendments to reflect new Landowner. City and Landowner hereby agree that any and all references in the Agreement to "Landowner" shall mean, as of the date of this First Amendment, D.R. HORTON CA2, INC.

4. Amendment of Section 6 of the Recitals Concerning "Project Approvals." City and Landowner agree that Section 6.6 of the Recitals of the Agreement is hereby amended and restated to read as follows:

"**6.6** This Development Agreement, as adopted on July 5, 2006, by City Ordinance No. 39-2006 (the "**Adopting Ordinance**") as amended on _____, 2018 by City Ordinance No. __-2018 adopting the First Amendment to the Development Agreement."

5. **Amendment to Section 28 of Agreement, "Notices."** City and Landowner agree that the last portion of Section 28, "Notices," related to Landowner notice information on the top of page 17 shall be amended to read as follows:

"D.R. HORTON CA2, INC.

Attn: Forward Planning Department

2260 Douglas Boulevard, Suite 110

Roseville, CA 95661"

6. Amendment of Section 5.2 concerning the "Term." City and Landowner agree that Section 5.2 of the Agreement is hereby amended and restated to read as follows:

"**5.2 Term.** Upon the execution of the First Amendment, the term of this Agreement shall commence on the Effective Date and extend to December 31, 2028, unless said term is terminated, modified or extended by circumstances set forth in this Agreement. Following expiration of the term, this Agreement shall not affect any right or duty created by City approvals for the Property adopted prior to, concurrently with, or subsequent to the approval of this Agreement."

6. Amendment of Section 6.4.1 Concerning the "New Park Development Obligation." City and Landowner agree that Section 6.4.1 of the Agreement is hereby amended and restated to read as follows:

"6.4.1 Park Development Obligation.

(i) Dedication of Park Land, Open Space Land, and In Lieu Fee:

Landowner's obligation to dedicate park land pursuant to California Government Code Section 66477 (the "**Quimby Act**"), and and to dedicate open space land as required by the Rancho Cordova General Plan and Open Space Guidelines, to the Cordova Recreation and Park District (the "**Park District**") has been satisfied by Landowner's use of 2.44 acres of Quimby credits, granted for park land dedication within the Sunridge Specific Plan area pursuant to City of Rancho Cordova Municipal Code Chapter 22.40 and 22.40.045 in effect on the date of the original Development Agreement.

(ii) Park Development Impact Fee:

Landowner shall pay a park development impact fee for each single-family residential parcel or residential parcel equivalent on the Property to mitigate the costs for the Park District and the City to design, construct and install park improvements (the "**Park Development Impact Fee**"). The Park Development Impact Fee will be paid prior to issuance of each residential building permit within the Project. The Park Development Impact Fee will be Eleven Thousand One Hundred Twenty-nine Dollars and ninety-six cents ($11,129.96) for each single-family residential parcel or residential parcel equivalent. Of the Eleven Thousand One Hundred Twenty-nine Dollars and Ninety-six cents ($11,129.96) Park Development Impact Fee, Nine Thousand Seven Hundred Thirty-six Dollars and Sixty-four cents ($9,736.64) is for parks and One Thousand Three Hundred Ninety-three Dollars and thirty-two cents ($1,393.32) to the City is for neighborhood greens, trails, landscaping, community gathering places, and other type of open space improvements as determined appropriate by the City.

The Park Development Impact Fee shall be adjusted on January 1, 2019 and annually thereafter, no later than January 15th by the method provided in City Ordinance No. 05-2014 as follows:

(a) A "mean" index will be computed by averaging the index for 20 U.S. cities with the index for San Francisco by resort to the

most recent October issue of the Engineering News Record magazine Construction Cost Index.

(b) An adjustment factor shall be computed by dividing the "mean" index as calculated in subsection (a) of this Section by the "mean" index for the previous October.

(c) The adjusted Park Development Impact Fee shall be calculated by multiplying the adjustment factor, as calculated in subsection (b) of this Section, by the Park Development Impact Fee in place prior to the annual adjustment.

If and when the City adopts the Citywide Park Improvement Fee, or an Area-Wide Park Improvement Fee applicable to the Project, the Landowner and City agree to explore adjustments to the Park Development Impact Fee. Under no circumstances shall the Landowner be required to pay any new Citywide/ Area-Wide Park Improvement Fee in addition to the Park Development Impact Fee as set forth in this First Amendment."

5. Amendment of Section 6.4.3 Concerning the "In-fill Park and Open Space Renovation and Acquisition Fee." City and Landowner agree that Section 6.4.3 of the Agreement is hereby amended and restated to read as follows:

"6.4.3 In-fill Park and Open Space Renovation and Acquisition Fee. Landowner agrees that development of the Property shall be subject to the park renovation fee (the "Park Renovation Fee"). Landowner agrees that it shall pay City the total sum of One Thousand One Hundred Forty-three Dollars and Ninety-eight Cents ($1,143.98) for each residential parcel shown on the small lot final maps for the Property. Beginning January 1, 2019, the fee shall be adjusted annually on each January 1 based upon the percentage change in the United States Department of Labor Consumer Price Index for all Urban Consumers for the San Francisco-Oakland-San Jose area between August and August of each year. This fee shall be paid to City no later than prior to issuance of the building permit for each residential parcel for the Property. It shall be used by City, at its sole discretion, to acquire, renovate, repair, improve or maintain parks or open space in that portion of the City outlined in Exhibit C to the original Development Agreement. This payment is made voluntarily by Landowner. It is in addition to all other existing park fees, and construction and dedication obligations, including without limitation any fees paid pursuant to the Quimby Act. Landowner agrees that it shall not claim credit or right to reimbursement of any other existing park fees, and construction and dedication obligations, including Quimby Act fees, as a result of paying the Park Renovation Fee required under this Section 6.4.3. If and when the City reduces or eliminates the Park Renovation Fee on a Citywide basis (by adoption of a park tax, special sales tax or other measure), then the Park Renovation Fee under this Section 6.4.3 shall be automatically adjusted or eliminated to correspond to the new Citywide funding mechanism, provided that the Landowner does not challenge or oppose the approval or implementation of the new Citywide funding mechanism."

6. Deletion. City and Landowner agree that Section 10 of the Agreement is hereby deleted.

7. **All Other Terms in Force.** Except as amended by this Amendment, all terms and conditions of the Agreement remain in full force and effect.

8. **Recording.** Within ten (10) days after the Effective Date, City shall record this First Amendment with the Sacramento County Recorder's Office.

9. **Counterparts.** The Parties may execute this First Amendment in counterparts, each of which will be considered an original, but all of which will constitute the same instrument.

10. **Entire Agreement.** The Agreement and this First Amendment set forth the Parties' entire understanding regarding the matters set forth above. It supersedes all prior or contemporaneous agreements, representations, and negotiations regarding those matters (whether written, oral, express, or implied) and may be modified only by another written agreement signed by all Parties. This First Amendment will control if any conflict arises between it and the Agreement.

IN WITNESS WHEREOF, the City of Rancho Cordova, a municipal corporation, has authorized the execution of this Amendment in duplicate by its City Manager and attested to by its City Clerk under the authority of Ordinance No. __-2018, adopted by the Council of the City on the___ day of , 2018, and Landowner has caused this Amendment to be executed. This Ordinance shall take effect thirty (30) days after adoption.

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Elizabeth Sparkman, Community Development Director
Jeanette Cervantes, Management Technician

SUBJECT: **A RESOLUTION DECLARING A PROTEST HEARING AND AUTHORIZING THE MAILING OF PROPERTY OWNER BALLOT RELATING TO THE IMPOSITION OF AN ANNUAL STORMWATER UTILITY FEE FOR THE EUROPEAN PARTS DEPOT PROJECT**

RECOMMENDATION

Adopt the Resolution.

RESULT OF RECOMMENDED ACTION

Adoption of the Resolution will declare the results of the property owner protest and, if there exists less than a majority protest, authorize the mailing of a ballot to the property owner to approve the levy of the fee to pay for maintenance of storm drainage and flood protection systems for the European Parts Depot project. The action also sets 1:30 p.m. on November 8, 2018 in the office of the City Clerk, as the time and date for the ballot tabulation for the matter.

BACKGROUND

The European Parts Depot project has a condition of approval which requires funding for operation and maintenance of the storm drainage system. This condition will be satisfied by the participation in the new Stormwater Utility Fee for storm drainage and flood protection services which is the subject of tonight's action.

The property owner of the European Parts Depot project has requested the City annex the project to the City's Stormwater Utility Fee pursuant to the California Health and Safety Code Section 5471 et seq. to provide the method of financing for the storm drainage and flood protection services required to meet the condition.

On October 1, 2018 Council adopted a Resolution which established Procedures for the Conduct of a Protest Hearing and Balloting Relating to a Stormwater Utility Fee (the "Procedures") and designated October 15, 2018 at 5:30 p.m. as the time and place for hearing protests in connection with the annual Stormwater Utility Fee for the European Parts Depot project.

DISCUSSION

The property owner has submitted a petition and waiver for the City to institute the proceedings to participate in the Stormwater Utility Fee. This annexation to the Stormwater Utility Fee will include the project generally known as the European Parts Depot project, see ATTACHMENT 2. The maintenance services to be funded include the furnishing of services and materials for the ordinary and usual operation, maintenance, and servicing of the storm drain and flood protection systems.

ATTACHMENT 1 is the Resolution declaring the results of the property owner protest and authorizing the mailing of the property owner ballot, as required by Article XIII D of the California Constitution (also known as Proposition 218). The Resolution sets forth the tabulation of ballots on November 8, 2018 at 1:30 p.m. in the office of the City Clerk. The results of the mailed ballot election will be presented to City Council at their regularly scheduled meeting November 19, 2018 and additional actions will be recommended based on the ballot results.

A "Rate Analysis Report" was approved by City Council on September 4, 2014 by Resolution 103-2014 setting Fiscal Year 2014/2015 maximum annual Stormwater Utility Fee amount for each parcel proportionate to the estimated stormwater runoff for each parcel, see ATTACHMENT 3. The maximum annual fee will increase each subsequent Fiscal Year by the annual change in the Consumer Price Index (CPI), during the preceding year, for All Urban Consumers, for the San Francisco-Oakland-San Jose areas, published by the United States Department of Labor, Bureau of Labor Statistics.

A sample of the Stormwater Utility Fees for Fiscal Year 2018/2019 are summarized in the following table:

Table 1

Land Use Description	Total Area (acres)	Sample Fee
Single Family Residential (SFR1)	0.16	$125.98
Single Family Residential (SFR2)	0.22	$138.57
Single Family Residential (SFR3)	0.30	$148.03
Single Family Residential (SFR4)	0.40	$157.46
Single Family Residential (SFR5)	1.00	$157.46
Multi-Family Residential (MFR1)	5.00	$1102.35
Commercial	1.00	$1181.10
Industrial	1.00	$1259.85
Schools	5.00	$787.40
Private Recreation	1.00	$393.69
Parks/Greenbelts	2.00	$157.46
Public Property (with structures)	2.00	$472.43

CITY OF RANCHO CORDOVA

RESOLUTION XX-XXX

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA, DECLARING THE RESULTS OF THE PROPERTY OWNER PROTEST AND AUTHORIZING THE MAILING OF A PROPERTY OWNER BALLOT RELATING TO THE IMPOSITON OF AN ANNUAL STORMWATER UTILITY FEE FOR THE EUROPEAN PARTS DEPOT PROJECT

WHEREAS, this Council has received petitions and waivers from the owners of not less than 100% of the area of land proposed to be annexed into the Stormwater Utility Fee; and

WHEREAS, on October 5, 2018 the City Clerk caused a notice of the time and place of the hearing thereon and on the proposed annexation to the Stormwater Utility Fee to be published and such public hearing was opened on October 15, 2018; and

WHEREAS, the Council adopted Resolution 103-2014 approving a written report entitled, "Rate Analysis Report", dated September 4, 2014 (the "Written Report") prepared by Harris & Associates and filed with the City Clerk containing a description of each parcel of real property within the City to which the Stormwater Utility Fee is applicable (collectively, the "Identified Parcels") and the amount of the Stormwater Utility Fee for each such Identified Parcel for Fiscal Year 2014-15. The Written Report is on file in the office of the City Clerk and is available for public inspection; and

WHEREAS, this Council adopted a Resolution which established Procedures for the Conduct of a Protest Hearing and Balloting Relating to a Stormwater Utility Fee (the "Procedures") and set the date of public hearing; and

WHEREAS, this Council has conducted the public hearing and all interested persons have been afforded the opportunity to be heard, and the City Council has considered all protests against the annexation to the Stormwater Utility Fee; and

WHEREAS, there was no majority protest of the owner of the Identified Parcel subject to the Proposed Stormwater Utility Fee.

NOW, THEREFORE, BE IT HEREBY RESOLVED BY THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA:

1. The foregoing recitals are true and correct.

2. The City Clerk is hereby authorized and directed to mail a property owner ballot in accordance with law and the Procedures.

3. The date of the ballot tabulation shall be November 8, 2018 at 1:30 pm.

4. The date of the public hearing to report the results of the mailed ballot election shall be November 19, 2018 at 5:30 or as soon thereafter as the matter may be heard.

5. The City Council hereby designates Elizabeth Sparkman, Community Development Director, telephone number, (916) 851-8714 to answer inquiries regarding the ballot proceedings and procedural or technical matters.

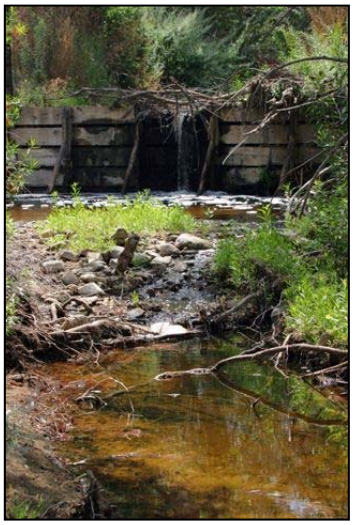
Rate Analysis Report

for the



Stormwater Utility Fee

For the

City of Rancho Cordova

August 7, 2014

Introduction

The City of Rancho Cordova (City) is detaching from the County of Sacramento fee and is creating their own Stormwater Utility Fee, which is being levied per the California Health and Safety Code Section 5471 et seq.

The purpose of this Rate Analysis Report is to:

- Review the Stormwater Utility Fee and improvements to be funded.
- Review the requirements of Article XIIID of the State Constitution (Proposition 218) relating to requirements for apportioning the costs associated with the City's stormwater runoff system.
- Analyze and recommend an appropriate rate structure and provide estimated rates based on cost data information provided by the City.

Proposition 218 Requirements

This fee must comply with the provisions of Article XIIID of the California Constitution (Proposition 218). Section 6 of Proposition 218 has the following requirements for all "new, extended, imposed or increased" fees and charges:

1) "Revenues derived from the fee or charge shall not exceed the funds required to provide the property-related service."

2) "Revenues derived from the fee or charge shall not be used for any purpose other than that for which the fee or charge was imposed."

3) "The amount of a fee or charge imposed upon any parcel or person as an incident of property ownership shall not exceed the proportional cost of the service attributable to the parcel."

4) "No fee or charge may be imposed for a service unless that service is actually used by, or immediately available to, the owner of the property in question. Fees or charges based on potential or future use of service are not permitted. Standby charges, whether characterized as charges or assessments, shall be classified as assessments and shall not be imposed without compliance with [the assessment section of this code]."

5) "No fee or charge may be imposed for general governmental services including, but not limited to, police, fire, ambulance or library services where the service is available to the public at large in substantially the same manner as it is to property owners."

Background Information

In accordance with the Federal Clean Water Act of 1972, the United States Environmental Protection Agency (EPA) is required to establish regulations setting forth National Pollution Discharge Elimination System (NPDES) permit standards. The enactment of 1987 amendments to the Federal Clean Water Act (Act) of 1972 imposes permit requirements for discharge of storm waters. The Act allows the EPA to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is one of the delegated states.

The responsibility for implementing various NPDES permits in the State of California has been delegated to the State Water Resources Control Board (SWRCB). The SWRCB administers NPDES authority through its nine Regional Boards. As an NPDES permittee, the City is required to manage stormwater pollution within its jurisdiction.

In order to provide for the safety of the residents of the City and protect property in the City from the damage associated with flooding and to meet the requirements of the NPDES permit, it is necessary to design, construct, operate, maintain, improve and replace storm drainage facilities which collect storm and surface water runoff and convey and treat such runoff in a safe manner to an acceptable point of discharge. It is also necessary to inspect, monitor, and take enforcement action related to illegal dumping, and illicit discharges. In order to properly fund such facilities and activities, the City has determined that it is necessary to impose on all developing properties in Rancho Cordova a user charge for storm drainage service.

Based on the 2030 General Plan and current specific plan areas, Rancho Cordova is expected to develop as shown in Table 1 below. The proposed boundary for the stormwater utility is shown in Appendix A.

A more detailed land use table by development area is shown in Appendix D.

This development is expected to require significant stormwater drainage and flood control facilities. Based on the development area and improvements that were required in four (4) recent developments

within the County of Sacramento, Table 2 summarizes the improvements that are expected once development is complete.

Table 2 – Expected Improvements

Infrastructure Type	Quantity	
Inlets	6,400	LF
Manholes	4,460	LF

Services Funded

Expenditures from the revenue generated from the Stormwater Utility Fee are intended to comply with the requirements set forth in the NPDES permit. The activities and services funded by this fee include, but are not limited to:

1. Administration and oversight of the requirements set forth in the NPDES permit to City departments, developments, and local agencies.

2. Respond to and investigate incidents of illicit discharges and illegal connections to the storm drain system.

3. Periodically inspect facilities for proper handling of materials, chemicals, pollutants, garbage, waste, and debris and prevent any discharges to the storm drain system.

4. Regularly clean and maintain catch basins, the flowline, and storm drainage facilities.

5. Installation and maintenance of water quality devices required to keep pollutants out of the storm drain system.

6. Discourage illegal dumping or discharge of pollutants into the storm drain system by stenciling all City-owned catch basins with a "No Dumping" message.

7. Augment public education and outreach programs in regards to the proper use and function of the storm drainage system and the receiving waters.

8. Develop programs to promote, publicize, and facilitate public reporting of illicit discharges to the storm drain system.

9. Encourage the proper disposal of household hazardous waste (HHW) to prevent the improper disposal to the storm drain system or to the sewer system.

10. Discourage the improper disposal of litter, garden clippings, leaves, and pet waste into the street or the storm drain system.

11. Capital replacement of storm drainage and flood control improvements at the end of the expected useful life for such improvements.

Rate Structure Analysis

Section 6.b of Article XIIID of the State Constitution (Proposition 218) states that:

> "The amount of a fee or charge imposed upon any parcel or person as an incident of property ownership shall not exceed the proportional cost of the service attributable to the parcel."
>
> and
>
> "No fee or charge may be imposed for a service unless that service is actually used by, or immediately available to, the owner of the property in question."

By definition, all properties that shed stormwater into the City's stormwater drainage system use, or are served by, the City's stormwater drainage system. The amount of use attributed to each parcel is measurable by the amount of storm runoff contributed by the property, which is directly proportional to the amount of impervious area on a parcel (such as buildings and concrete). The more impervious area on a property, the more storm runoff the property generates, the more demand placed on the storm drain system.

The amount each parcel uses the stormwater drainage system is computed by the following formula:

(Parcel Area) x (Impervious Percentage) = Drainage Units

The typical percent impervious (% Impervious) for land uses in the City, have been applied for the purposes of estimating the runoff generated by each property. These are shown in Appendix B.

The more Drainage Units a parcel has, the more storm run-off it generates, and the more it uses and impacts the stormwater drainage system.

It is standard practice to relate other land uses to a developed single family residential (SFR) parcel, instead of working exclusively with drainage units. The median size of a SFR parcel will be approximately 0.16 acre. Therefore, it makes sense to relate all parcels to this median residential property. The runoff from a 0.16-acre SFR parcel is set equal to one Drainage Measurement Unit (DMU) and this base DMU is calculated as follows:

(0.16 acres of area) x 50% = 0.0800 Impervious Area = 1 DMU

Single Family Residential Parcels

As a SFR property increases in size over the median parcel size, the typical percentage of impervious area decreases, as shown in Appendix B. Conversely, as a SFR parcel decreases in size below the median parcel size, the typical percentage of impervious area increases, and such increase is typically proportional to the decrease in size. Therefore, SFR properties are separated into five (5) groups. The median parcel area for each group was used and their DMUs are calculated as follows:

SFR Category	DMU/ Formula
SFR1 – SFR parcels 0.16 acres or less	1.00 DMU
SFR2 – SFR parcels 0.17 - 0.25 acres	1.10 DMUs
SFR3 – SFR parcels 0.26 – 0.33 acres	1.175 DMUs
SFR4 – SFR parcels 0.34 – 0.50 acres	1.25 DMUs
SFR5 – SFR parcels greater than 0.50 acres	$1.25 + \frac{[(\text{acres} - 0.50) \times 5\%]}{0.0800} = \text{DMUs}$

Multi-Family Residential Parcels

Multi-Family Residential (MFR) units (including condominiums) are split into categories by the density, or number of dwelling units per acre (DU/Ac) as follows:

MFR Category	Density	% Impervious
MFR1 - High Density	Greater than 18 DU/Ac	75%
MFR 2 - Med Density	10 – 18 DU/Ac	70%

$$\frac{\text{Acreage} \times \%\text{Impervious}}{0.0800} = \text{DMUs}$$

Condominium unit parcel areas are calculated by dividing the total area of the condominium complex (which includes the common area) by the number of condominium units, and the total imperviousness of the entire complex is attributed to each individual condo parcel in the complex. (This divides the runoff of the entire complex to each of the individual units.) Because these condominium common areas are taken into consideration in this manner, they are exempt from the charge.

Non- Residential Parcels

All non-residential parcel DMUs will be based on the impervious area (runoff coefficient) table shown in Exhibit B, using the following formula:

$$\frac{\text{Acreage} \times \%\text{Impervious}}{0.0800} = \text{DMUs}$$

All parcels draining into Rancho Cordova Stormwater Utility Fee-maintained drainage infrastructure are proposed to be charged the same user fee rate per DMU for stormwater runoff treatment. The Rancho Cordova Stormwater Utility Fee is proposed in perpetuity.

For the purposes of this report, City-maintained drainage infrastructure includes streets, pipes, inlets, outlets, and natural drainage courses. Parcels related to these types of property uses are exempt from the runoff charge, as they are part of the infrastructure being funded. Also exempt from the runoff charge is Caltrans right-of-way, because Caltrans handles its own runoff under a separate NPDES permit.

Drainage units may be adjusted based on appeal from the property owner. See the Appeals Process below.

Table 3, below, provides a preliminary summary of DMUs for the various land uses in Rancho Cordova.

Table 3 – Drainage Measurement Unit Summary Table

Landuse Description	Number of Units	Total Area (acres)	Impervious Area (acres)	DMUs
SINGLE FAMILY RESIDENTIAL (SFR1)	15,107	2,028		15,107.00
SINGLE FAMILY RESIDENTIAL (SFR2)	13,790	2,776		15,169.00
SINGLE FAMILY RESIDENTIAL (SFR3)	14	4		16.45
SINGLE FAMILY RESIDENTIAL (SFR4)				-

PUBLIC		51	15	190.13
TOTAL	**34,993**	**7,190**		**47,124**

Cost Estimate

Table 4 below shows the estimated costs to maintain infrastructure in the developing areas. Unit costs for maintenance were derived using budget information provided by the County, since the County currently maintains the storm drainage system. The budget information is shown in Appendix C.

Table 4 – Estimated Costs

	Estimated Quantity	Unit	Cost ($/unit)	Frequency	Total Cost/Year
Maintenance Costs:					
Trunk Lines (larger than 24") - TV Lines	158210	LF	$ 7.50	25 years	$ 47,463.00
Drainage Lines 10"-24" Cleaning	829850	LF	$ 3.00	10 years	$ 248,955.00
Drainage Lines 10"-24" TV	829850	LF	$ 7.50	25 years	$ 248,955.00
Creek and Channel Maintenance and Repair	65070	LF	$ 0.75	1 year	$ 49,009.83
Pipe Repairs	998920	LF	$ 0.45	1 year	$ 451,380.43
Creeks and Channels Mowing	80	AC	$6,825	1 year	$ 546,000.00
Creeks and Channels Herbicides	80	AC	$680	1 year	$ 54,400.00
HydroMod Basin Maintenance	320	AC	$4,830	1 year	$ 1,545,600.00
Basin De-silt	320	AC	$1,000	25 years	$ 12,800.00
Basins Herbicides	320	AC	$761	1 year	$ 243,360.00
Replacement Costs:					
Inlets	6400	EA	$2,000	75 years	$170,667
Manholes	4460	EA	$3,500	75 years	$208,133
66" Pipe	3950	LF	$550	100 years	$21,725
60" Pipe	10280	LF	$475	100 years	$48,830
54" Pipe	11140	LF	$400	100 years	$44,560
48" Pipe	10210	LF	$325	100 years	$33,183
42" Pipe	28620	LF	$275	100 years	$78,705
36" Pipe	42420	LF	$225	100 years	$95,445
30" Pipe	51050	LF	$175	100 years	$89,338
27" Pipe	540	LF	$150	100 years	$810
24" Pipe	91960	LF	$125	100 years	$114,950
21" Pipe	2230	LF	$115	100 years	$2,565
18" Pipe	100300	LF	$105	100 years	$105,315
15" Pipe	101300	LF	$95	100 years	$96,235
12" Pipe	529890	LF	$85	100 years	$450,407
10" Pipe	4170	LF	$75	100 years	$3,128

Total:	$5,011,917
Annual Fee Administration:	$45,000
Operating (Cash Flow) Reserve (10% of Maintenance Costs):	$344,792
Estimated Total:	**$5,401,709**

Fee Calculations

The estimated annual costs for the proposed storm drain improvements are $5,401,709 as shown in Table 4 above. Dividing that by the total number of proposed DMU's in Rancho Cordova (47,124), the maximum estimated annual Stormwater Utility Fee rate is **$114.63 per DMU**.

This would be the proposed maximum fee rate for fiscal year 2014-15. The maximum rate will be increased each subsequent Fiscal Year by the annual change in the Consumer Price Index (CPI), during the preceding year, for All Urban Consumers, for the San Francisco-Oakland-San Jose areas, published by the United States Department of Labor, Bureau of Labor Statistics (or a reasonably equivalent index should the stated index be discontinued, as determined by the Director of Public Works).

The actual rate to be levied each year will be as approved by the City at a public hearing, after they consider an Annual Fee Report outlining the estimated annual costs of the program for the ensuing fiscal year.

Table 5 provides sample fee calculations for various land uses and parcel sizes.

Table 5 – Sample Calculations

Land Use Description	Total Area (acres)	Impervious Area (acres)	DMUs	Sample Fee
SINGLE FAMILY RESIDENTIAL (SFR1)	0.16		1.000	$ 114.63
SINGLE FAMILY RESIDENTIAL (SFR2)	0.22		1.100	$ 126.09
SINGLE FAMILY RESIDENTIAL (SFR3)	0.30		1.175	$ 134.69
SINGLE FAMILY RESIDENTIAL (SFR4)	0.40		1.250	$ 143.28
SINGLE FAMILY RESIDENTIAL (SFR5)	1.00		1.563	$ 179.10
MULTI-FAMILY RESIDENTIAL (MFR1)	5.00	3.75	46.875	$ 5,373.12
COMMERCIAL[1]	1.00	0.75	9.375	$ 1,074.62
INDUSTRIAL	1.00	0.80	10.000	$ 1,146.27
SCHOOLS	5.00	2.50	31.250	$ 3,582.08
PRIVATE RECREATION	1.00	0.25	3.125	$ 358.21
PARKS/GREENBELTS	2.00	0.20	2.500	$ 286.57
PUBLIC	2.00	0.60	7.500	$ 859.70

[1] Average of Downtown and Neighborhood Commercial as shown in Appendix B

The Preliminary Charge Roll, which is a listing of each parcel to be charged a fee and its proposed maximum fee for FY 2014-15, is on file in the office of the City Clerk.

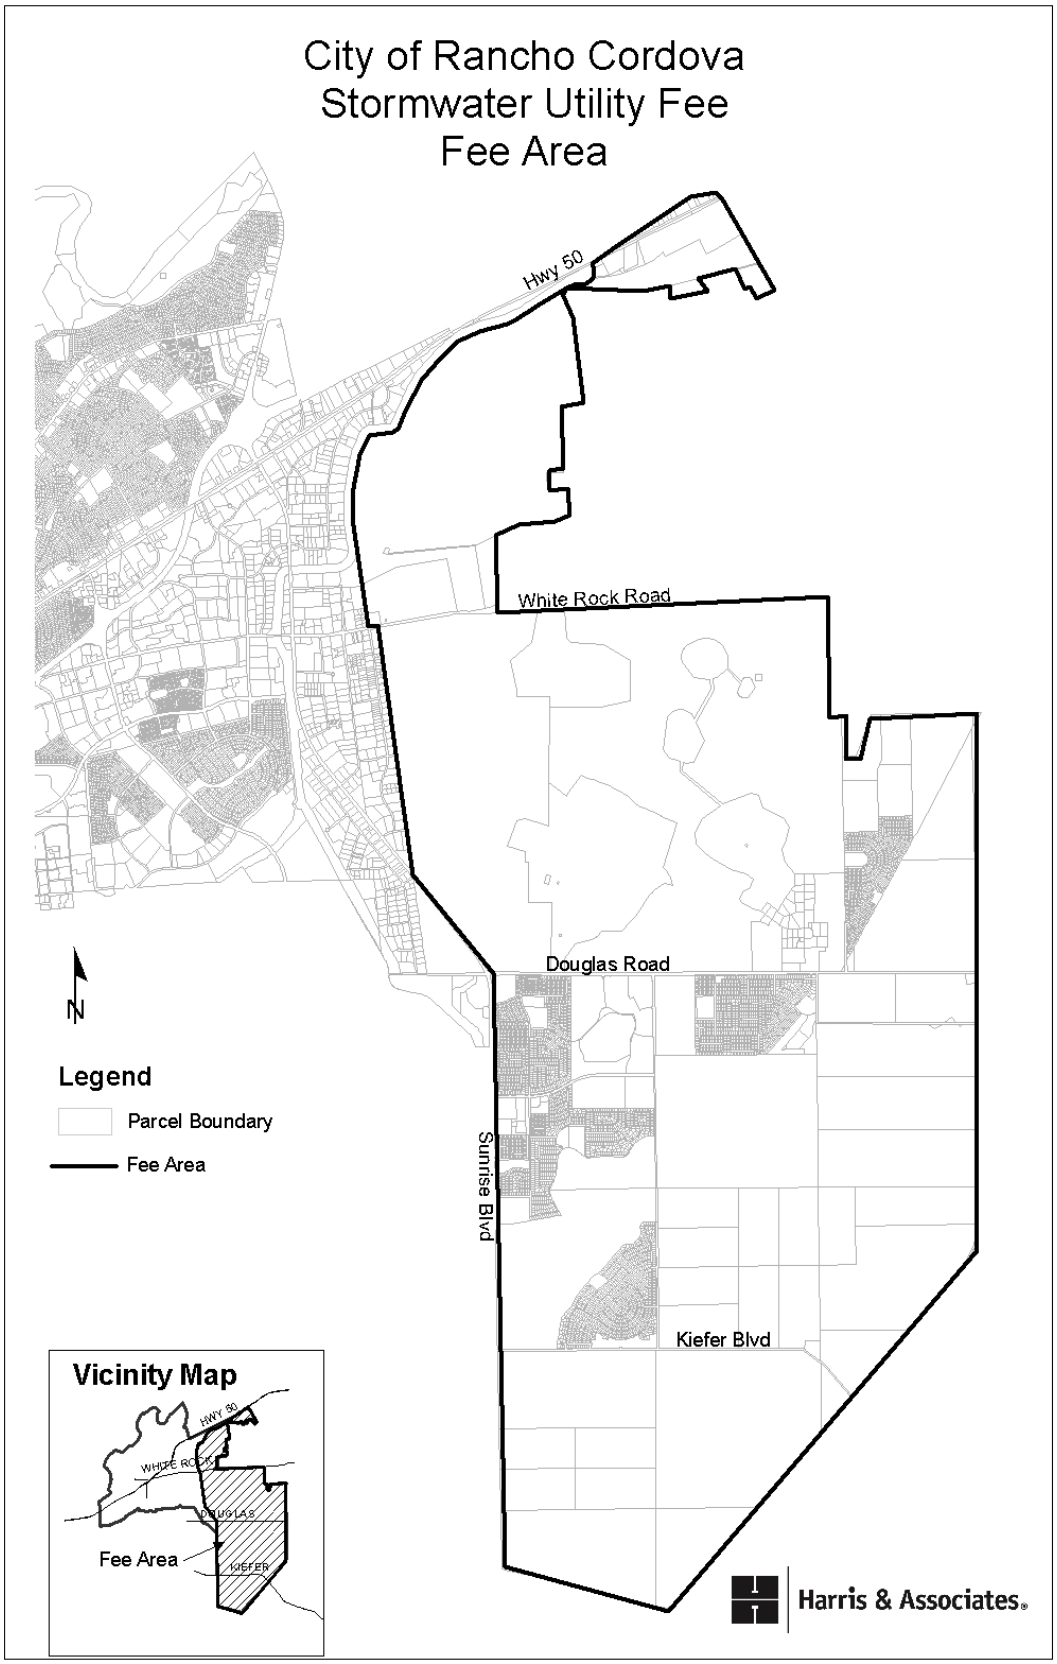
Appeals Process

If a property owner disagrees with the calculation of his or her fee, based on the parcel area and estimated impervious percentage assigned to the property, then the property owner may appeal the calculation as follows:

1. Property owner must provide written documentation explaining the reason why the charge should be changed. This documentation must include:
    a. The name, phone number, mailing address, and email address, if available, of the property owner.
    b. The Assessor's Parcel Number (APN) of the property in question.
2. If additional documentation is required or insufficient documentation was submitted, a representative of the Department of Public Works (Staff) will notify the property owner in writing.
3. Once Staff has determined that sufficient documentation has been submitted, Staff will perform the initial review. Staff will notify the property owner in writing within four (4) weeks from the time sufficient documentation was submitted as to whether or not the fee amount will be changed.
    a. If the determination is to change the fee amount, then the new fee amount will be documented within the City's fee database.

b. If the determination is that the fee should not be changed, the property owner can appeal Staff's decision to the Director of Public Works. The appeal must be made in writing and returned no later than four (4) weeks from the date of mailing of Staff's initial review decision. The Director of Public Works will notify the property owner in writing within four (4) weeks from the date of receipt of the appeal as to whether or not the fee amount will be changed.

   If the owner of any parcel shall have reason to feel that the computation of the DMU for his/her parcel is not correct, that person may file an appeal with the Director of Public Works in the manner prescribed by the Director of Public Works. The Director of Public Works will consider all data provided by the appellant and shall render a decision in writing. The decision of the Director of Public Works will be final with respect to City action on the appeal.



Appeals will be accepted annually up until June 30 for inclusion on the following fiscal year's property tax roll submittal. However, if an appeal is granted by Staff or the Director of Public Works that does not permit inclusion for the following fiscal year's property tax roll submittal, a reimbursement will be provided to the property owner by the City.

Respectfully submitted:

Total Cost	**$ 4,830**

Inspection Includes: Examine gates, fences and access ramp for damage and overgrown vegetation, check basin slopes for erosion, excess vegetation, debris and animal burros, check flow line for excess vegetation and sediment, check for eriosion at water line, large/floating debris, and excess vegetation. Check for debris, creacks and instructure, and erosion at inlets and outlets. Also check access control racks for debris and to snrue they are locked and secured. Check riprap at inlet weir

MEMORANDUM

DATE: October 15, 2018

TO: Honorable Mayor and Council Members

FROM: Elizabeth Sparkman, Community Development Director
Darcy Goulart, Planning Manager

SUBJECT: **ACTIONS RELATED TO APPROVAL OF THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN (SSHCP)**

RECOMMENDATION

1. Open the public hearing, hear staff presentation, take public testimony, and close the public hearing
2. Accept the certified SSHCP Environmental Impact Statement/Environmental Impact Report (SSHCP EIS/EIR) (Attachment 7, 8, and Attachments 9 through 19) and Adopt by Resolution the California Environmental Quality Act (CEQA), Findings of Fact, the Aquatic Resources Program (Attachment 5), the Nexus Study (Attachment 20) and the SSHCP (Attachments 2, 3, 4) (Exhibit A)
3. Introduce and waive first reading of the Aquatic Protection Ordinance adding Chapter 16.94, Sections 16.94.010 through Section 16.94.110 to Title 16 of the Rancho Cordova Municipal Code (Exhibit B)
4. Adopt the Implementing Resolution (Exhibit C) authorizing the City Manager to execute the Implementing Agreement (Attachment 21)
5. Introduce and waive first reading of the Fee Ordinance adding Chapter 22.45, Sections 22.45.010 through 22.45.201 to Title 22 of the Rancho Cordova Municipal Code related to SSHCP fees (Exhibit D)

RESULT OF RECOMMENDED ACTION

Adoption of the SSHCP and its associated components by all Plan Permittees and the South Sacramento Conservation Agency (SSCA), will set the stage for issuance of a Federal Endangered Species Act Incidental Take Permit (ITP) by the United States Fish and Wildlife Service (USFWS), and a State Endangered Species Act Incidental Take Permit by the California Department of Fish and Wildlife (CDFW). It will also set the stage for issuance of a Clean Water Act Section 404 Programmatic Permit and Abbreviated Permit Strategy by the U.S. Army Corps of Engineers (USACOE). This will establish a preserve system to protect habitat lands and aquatic resources within the Plan Area and also create a streamlined federal and state permitting process for development and infrastructure projects in the area.

BACKGROUND

The SSHCP area encompasses 317,656 acres in the southern portion of Sacramento County, including portions of unincorporated Sacramento County, Galt, and the southern half of Rancho Cordova ("Plan Area") (Attachment 1). The Plan Area is defined as the area in which all conservation actions will be

implemented and where all incidental take will occur. The SSHCP will allow Plan Permittees to receive an Incidental Take Permit (ITP) for activities and projects they conduct.Incidental take is generally defined as direct or indirect harm to a species, including habitat loss, which is incidental to an otherwise lawful activity (e.g., land development, improvements to public infrastructure).

The SSHCP (Attachments 2, 3 and 4) is a regional effort that provides development and infrastructure projects with streamlined, predictable federal and state permitting processes while creating a preserve system to protect habitat, open space, and agricultural lands. The SSHCP provides a more effective process for protecting natural resources as compared to the current process of project-by-project mitigation that often results in small and isolated preserves. The SSHCP will ensure the creation of large, interconnected preserves that are sustained in perpetuity by an adequately funded management program.

The SSHCP allows project proponents within the Plan Area to simplify and expedite the state and Endangered Species Act (ESA) permitting process. A separate but parallel multi-tiered permitting program has been developed to streamline the Clean Water Act Section 404 and 401 permitting process. The Aquatic Resources Program ("ARP") (Attachments 5 and 6) was developed to facilitate the Clean Water Act permitting process.

As the initial step in the process to implement the SSHCP, the County of Sacramento (the lead agency) certified the Final Environmental Impact Statement/Environmental Impact Report (EIS/EIR) (Attachments 7, 8, and 9-19) on September 11, 2018, adopted the SSHCP, and took other actions necessary for implementation.

DISCUSSION

The SSHCP defines the six Plan Permittees as the County of Sacramento, the City of Rancho Cordova, the City of Galt, Sacramento County Water Agency, the Capital Southeast Connector Joint Powers Authority (Connector JPA), and the Implementing Entity. These Plan Permittees fall into two categories: (1) Land Use Authority Permittees and (2) Plan Partner Permittees. The Land Use Authority Permittees are the County of Sacramento, the City of Rancho Cordova, and the City of Galt. The Plan Partner Permittees are the Sacramento County Water Agency and the Connector JPA. The Implementing Entity is a JPA called the South Sacramento Conservation Agency (SSCA) which was formed by a Joint Powers Agreement entered into between the Land Use Authority Permittees.

The SSHCP is a coordinated effort of the five local agencies (Plan Permittees) led by Sacramento County. Development of the SSHCP was overseen by a Local Agency Working Group and included staff from each of the Plan Permittees. This group gave guidance and direction to consultants assisting with the preparation of the SSHCP document. An interdisciplinary Regulatory Agency Working Group that included staff from each Plan Permittee, United States Fish and Wildlife Service (USFWS), California Department of Fish and Wildlife (CDFW), U.S. Army Corps of Engineers (USACE), United States Environmental Protection Agency (EPA), Regional Water Quality Control Board (RWQCB), and the State Water Resources Control Board (SWRCB) reviewed SSHCP documents approved by the Local Agency Working Group. Coordination and management of SSHCP development was overseen by a dedicated project manager and staff from the County. In addition to the Plan Permittees, the SSHCP development was heavily influenced by local stakeholder groups representing varied interests.

The SSHCP Conservation Strategy will result in an interconnected preserve system totaling 36,282 acres. All SSHCP preserves will be preserved in perpetuity and would be acquired either in fee title or as conservation easements, although most of the preserve system will be acquired using conservation easements. As the SSHCP is implemented over the 50-year permit term, the new 36,282-acre SSHCP

preserve system will be established in a manner that supplements, complements, and links together many of the existing preserves within the Plan Area.

The SSHCP will allow Plan Permittees to receive an Incidental Take Permit (ITP) for activities and projects they conduct. Incidental take is generally defined as direct or indirect harm to a species, including habitat loss, which is incidental to an otherwise lawful activity (e.g., land development, improvements to public infrastructure). In addition, the three local Land Use Authority Permittees (County, Galt, Rancho Cordova), have the ability to extend incidental take coverage provided by the SSHCP to activities and projects implemented by third-party project proponents. This will allow third-party project proponents to avoid the extensive negotiation and processing currently required to obtain individual project permits under the California Endangered Species Act (CESA) from the CDFW and project ESA compliance from the USFWS. This will also require submittal of information and the analysis associated with the ITP to be conducted earlier in the process and as part of the initial planning entitlement review rather than separately and after that review.

The SSHCP also provides for compliance with two Biological Opinions (BOs) issued by the U.S. Fish and Wildlife Service (USFWS) in response to an Endangered Species Act (ESA) consultation regarding water contracts.

Environmental Review Process

A joint Environmental Impact Statement (EIS) and Environmental Impact Report (EIR) for the SSHCP was prepared pursuant to both the National Environmental Policy Act (NEPA) and the CEQA. The USFWS is the lead agency under NEPA and the County is the lead agency under CEQA for this joint EIS and EIR (SSHCP EIS/EIR). Cooperating agencies are USACE, EPA, and CDFW.

The SSHCP EIS/EIR evaluated the potential environmental impacts from issuing federal and state endangered-species take permits and the implementation of a long-term habitat conservation plan in south Sacramento County. The Plan Permittees have applied for Incidental Take Permits (ITP) from the USFWS under section 10(a)(1)(B) the Federal Endangered Species Act (ESA section 10) and from the CDFW under section 2835 of the California Fish and Game Code.

The EIS/EIR evaluates the potential impacts of ITP issuance by the USFWS and CDFW, approval and execution of an Implementing Agreement (IA) for the SSHCP, approval and implementation of the SSHCP by Sacramento County and the other Plan Permittees, approval and implementation by USACE of a multilevel Clean Water Act (Section 404) permitting program for future SSHCP Covered Activity projects and activities, and approval and implementation of the SSHCP Aquatic Resources Program (ARP) by the Permit Applicants, as further discussed in EIS/EIR.

The purpose of the EIS component of the joint EIS/EIR is to inform USFWS decision-makers and the public of the effects on the human environment that would result from the issuance of the ITPs to these local and state entities and from the implementation of the proposed SSHCP or an alternative HCP within south Sacramento County. The USFWS will use the EIS/EIR to comply with NEPA for their issuance of ITPs to the Plan Permittees. The purpose of the EIR component of the joint EIS/EIR is to inform Plan Permittees decision-makers and the public of the anticipated significant environmental impacts of the SSHCP, measures to mitigate any significant impacts, and reasonable alternatives that could reduce any significant environmental impacts of the proposed project to a less-than-significant level. The EIR will be used by the Plan Permittees to approve the SSHCP in compliance with CEQA.

The County of Sacramento certified the Final EIS/EIR on September 11, 2018. The Southeast Connector JPA Board accepted the certified EIS/EIR and adopted the SSHCP on September 28, 2018. Now that the EIS/EIR has been adopted by the County, the City must consider and accept the certified Final EIS/EIR as a responsible agency for the project and adopt the CEQA Findings of Fact and the Plan (Exhibit A).

Implementation

As required and discussed in the Final EIS/EIR, an Aquatic Resources Program must be approved and implemented by the Plan Permittees. The purpose and intent of the Aquatic Protection Ordinance (Exhibit B) is to achieve no-net-loss of aquatic resources function and services and to enact efficient aquatic resource permitting consistent with the requirements of the federal Clean Water Act (Sections 404 and 401), California Fish and Game Code Section 1600 and the Porter-Cologne Water Quality Control Act (Porter-Cologne).

After CEQA review and adoption of the SSHCP, the next step in the implementation process is the execution of the Implementing Agreement, which is in Appendix C of the Final SSHCP and also attached for convenience (Attachment 21). The purpose of the SSHCP Implementing Agreement is to ensure that all parties understand their responsibilities. It specifies those responsibilities, how the Plan Permittees will ensure the SSHCP Conservation Strategy will be implemented, and various other provisions.

The City will also be adopting an Implementing Resolution (Exhibit C) which will formally incorporate the SSHCP, Implementing Agreement, and ESA and CESA Incidental Take Permits into project review and procedures.

Permit Term

The Permit Term defines the length of time in which ITPs issued by the Wildlife Agencies (USFWS and CDFW) can be used by the Plan Permittees, and the timeframe in which all conservation actions outlined in the SSHCP Conservation Strategy must be completed. The Plan Permittees are requesting a 50-year permit that authorizes incidental take of listed species under the federal ESA and a 50-year permit issued under Fish and Game Code Section 2081. The USFWS will provide “no surprises” assurances to the Plan Permittees, where the USFWS will not require the commitment of additional land, water, or financial compensation (or additional restrictions on the use of land, water, or other natural resources) for impacts to Covered Species beyond the level agreed upon and described in the SSHCP, as long as the Plan Permittees are adequately implementing the SSHCP. Compliance with the SSHCP will also satisfy CEQA mitigation requirements for impacts to the Covered Species. A 50-year permit term is needed to provide enough time to implement Covered Activities, the Conservation Strategy, the monitoring, and adaptive management program and the funding strategy. Each permit will be issued to all permittees collectively.

FINANCIAL ANALYSIS

The federal ESA requires that Plan Participants provide assurances that the SSHCP will be adequately funded over the proposed 50-year permit term. The Biological Goals and Measurable Objectives of the SSHCP cannot be attained without adequate funding. The SSHCP funding program is critical to the successful development, implementation, and viability of the SSHCP. Estimating the full costs of the operating SSHCP is an essential step to demonstrate adequate funding to meet regulatory requirements.

The economic analysis evaluates the many costs associated with the implementation of the SSHCP and identifies the funding mechanism(s) that will be used to pay for the SSHCP. To ensure enough funding, all costs associated with the Conservation Actions necessary to implement the SSHCP had to be identified. Because of the geographic scale of the SSHCP, the complexity of the Conservation Actions, and long-time frame over which these actions will occur, the cost-estimating process involves many assumptions. The costs are identified for planning purposes only to estimate funding levels needed to implement the SSHCP.

The total cost of implementing the SSHCP during the 50-year permit term is estimated at $766,948,000 for an average of approximately $15,339,000 annually. This includes the cost of land and easement acquisition; SSHCP administration; habitat management, monitoring, and adaptive management; addressing changed circumstances; habitat re-establishment/ establishment; recovery of SSHCP development costs; funding for an agricultural enhancement program; and an endowment. Contingency costs and costs for remedial measures are included in some of the cost categories mentioned above.

SSHCP costs were estimated from a detailed model of all expected cost components based on actual costs of tasks. Funding for the SSHCP is derived entirely from fees on private development and public infrastructure. This includes developer mitigation fees or developer land dedications in lieu of fees. A summary of the SSHCP costs is presented in Table 2.

Table 2
Summary of SSHCP Costs

Cost Category	Cost Estimate	Average Annual Cost	Distribution of Costs
Land and Easement Acquisition Costs	$427,854,000	$8,557,000	55.8%
Habitat Re-Establishment/Establishment	$183,098,000	$3,662,000	23.9%
Habitat Management, Monitoring, and Adaptive Management	$59,995,000	$1,200,000	7.8%
Changed Circumstances	$8,231,000	$165,000	1.1%
Agricultural Enhancement	$6,015,000	$120,000	0.8%
Plan Administration	$42,171,000	$843,000	5.5%
Endowment	$30,039,000	$601,000	3.9%
SSHCP Development	$9,547,000	$191,000	1.2%
Total	**$766,948,000**	**$15,339,000**	**100.0%**

The South Sacramento Conservation Agency (SSCA), a Joint Powers Authority will be responsible for implementing the SSHCP. The SSCA governing board is composed of elected representatives from the Sacramento County Board of Supervisors and the City Councils of Rancho Cordova and Galt, with technical support provided by an Executive Director and Technical Advisory Committee.

Mitigation fees are the source of financing to establish the preserve system. A Nexus Study (Attachment 20) was conducted to support the mitigation fee program. The mitigation fees developed in the SSHCP economic model are estimated to cover SSHCP implementation costs. The mitigation fees are expressed per acre of impact, on a gross acre basis by land cover type. The “per acre” basis for the fees ensures that fees for any project are directly tied to its impacts. The differentiation of fees by land cover type provides varied fee levels associated with differential mitigation requirements, including the re-establishment/establishment mitigation costs associated with impacts to aquatic resources.

The mitigation fees focus on mitigating for loss of habitat rather than mitigating for individual species. Revenue from the mitigation fees will be used to fund mitigation actions identified in the SSHCP. The revenue from the mitigation fees will be used to fund the necessary habitat acquisition, habitat re-establishment/establishment, habitat management and monitoring, and program administration costs. This includes the costs associated with the establishment of the non-depleting endowment as well as the SSHCP development costs.

The ESA requires that the Plan Permittees provide assurances that the SSHCP will be adequately funded. As a result, the funding program (mitigation fees) must ensure that the SSHCP remains viable in perpetuity. The mitigation fee schedule described in the Nexus Study (and in the SSHCP) is based on 2015 planning-level implementation cost estimates. Recognizing the fluctuations in implementation costs through time (e.g. land acquisition costs, re-establishment/ establishment costs etc.) due to real estate cycles and typical inflationary increases in costs, HCPs require a system for tracking implementation costs and adjusting mitigation fees as necessary. Similar to other regional, multi-species HCPs, the SSHCP includes automatic mitigation fee adjustments for inflation and periodic mitigation fee audits.

Included in tonight's actions are Council approval of the SSHCP Nexus Study (Attachment 20) and introduction of the Mitigation Fee Ordinance (Exhibit D). The amount of the fees will be approved at a later date by the SSCA and the Council will then adopt them by Resolution.

Covered Activities/Covered Species

Covered activities are projects or activities that are allowable under the SSHCP and thus can use the SSHCP to mitigate for project impacts. The SSHCP provides take authorization for 28 Covered Species, of which, 11 are currently listed as threatened or endangered under the CESA or the federal ESA. The SSHCP includes conservation actions to protect all 28 Covered Species whether or not they are currently listed. Additional information on covered activities and covered species is contained in Exhibit E for informational purposes only.

General Plan Consistency

The City's General Plan recognizes the importance of protecting and preserving diverse wildlife and plant habitat in that it contains goals, policies, and actions to participate in the development of a habitat conservation plan. The General Plan's Natural Resources Element Goal NR.1 is "protect and preserve diverse wildlife and plant habitats, including habitat for special status species." The following General Plan policies and action items support Goal NR.1 and reaffirm the City's desire to participate in the SSHCP.

Policy NR.1.6 – Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.

Policy NR.1.7 – Prior to project approval, the City shall require a biological resources evaluation for private and public development projects in areas identified to contain or possibly contain listed plant and/or wildlife species based upon the City's biological resource mapping provided in the General Plan EIR or other technical materials.

Action NR.1.7.1 - For those areas in which special status species are found or likely to occur, the City shall require feasible mitigation of impacts to those species that ensure that the project does not contribute to the decline of the affected species such that their decline would impact the viability of the species. Feasible mitigation shall be determined by the City after the U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG)

are provided an opportunity to comment, and may emphasize a multi-species approach. This may include development or participation in a habitat conservation plan.

Measures/Evaluation

Compliance monitoring will be required to track and verify that the Plan Permittees are carrying out the terms of the SSHCP document, including financial responsibilities and obligations, and management responsibilities. Effectiveness monitoring will evaluate whether the effectiveness of the operating conservation program of the SSHCP is consistent with the assumptions and predictions made when the SSHCP was developed and determines whether the SSHCP is achieving the Biological Goals and Measurable Objectives. Implementation of the SSHCP will require Annual Reports that will provide a long-term administrative record documenting progress made toward achieving each SSHCP Biological Goals and Measurable Objectives.

Agency Governing Board/South Sacramento Conservation Agency

During the adoption of the Plan by the County, the Board of Supervisors made a request to add a fourth member representing the Sacramento County Board of Supervisors to the Governing Body. This type of change would require modification of the Joint Exercise of Powers Agreement (JPA Agreement) with approval by the County, the cities of Rancho Cordova and Galt, and submittal to the Secretary of State. Additionally, County staff recommended changes restructure the Implementation Review Committee to include stakeholder groups and to modify the Technical Advisory Committee to include Ad-Hoc subcommittees to research scientific issues as they arise.

The proposed governance changes are not part of tonight's actions and would require the jurisdictions to modify and re-adopt the JPA Agreement independently from SSHCP approval. Any proposed changes in governance will come back to the Council at a future date in the context of modification of the JPA Agreement.

CITY OF RANCHO CORDOVA

RESOLUTION NO. XXX-2018

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA, ACCEPTING THE CERTIFIED ENVIRONMENTAL STATEMENT/ENVIRONMENTAL IMPACT REPORT, ADOPTING THE CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) FINDINGS OF FACT, ADOPTING THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN (SSHCP), AND ADOPTING THE SSHCP NEXUS STUDY

WHEREAS, the City Council of the City of Rancho Cordova finds that the ecosystems of the City of Rancho Cordova ("City") and/or southern Sacramento County and the vegetation communities and sensitive species they support are fragile, irreplaceable resources that are vital to the general welfare of all residents; these vegetation communities and natural areas contain habitat value which contributes to the region's environmental resources; and special protections for these vegetation communities and natural areas must be established to prevent future endangerment of the plant and animal species that are dependent upon them.

WHEREAS, the General Plan includes goals, policies and action items that support the preservation of vegetation communities and sensitive species through preservation and participation in the development of a habitat conservation plan, and;

WHEREAS, the South Sacramento Habitat Conservation Plan (SSHCP) will protect the City's and the region's biological resources, vegetation communities, and natural areas, and prevent their degradation and loss by guiding development outside of important resource areas, and by establishing mitigation standards which will be applied to development projects.

WHEREAS, an Environmental Impact Statement/Environmental Impact Report (EIS/EIR) was prepared for the SSHCP and circulated for public review pursuant to the National Environmental Protection Act and California Environmental Quality Act

WHEREAS, on September 11, 2018, the Sacramento County Board of Supervisors certified the EIS/EIR and adopted the CEQA Findings of Fact, and;

WHEREAS, adoption of the SSHCP will enable the City to achieve the conservation goals set forth in the SSHCP, to implement the Plan and to preserve the ability of affected property owners to make reasonable use of their land consistent with the requirements of the National Environmental Policy Act ("NEPA"), the California Environmental Quality Act ("CEQA"), the Federal Endangered Species Act ("FESA"), the California Endangered Species Act ("CESA"), the Federal Clean Water Act, the Porter-Cologne Water Quality Control Act, California Fish and Game Code Section 1600, and other applicable laws.

NOW, THEREFORE, BE IT HEREBY RESOLVED BY THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA accepts the Certified Environmental Impact Statement/Environmental Impact Report, adopts the CEQA Finding of Facts **(Attachment 1)**, adopts the Aquatic Resources Program, adopts the South Sacramento Habitat Conservation Plan, and adopts the SSHCP Nexus Study subject to the following findings:

EXHIBIT A

CEQA Findings

The CEQA findings are included in Attachment 1 of this Resolution.

Adoption of the SSHCP Findings

1. A purpose of the SSHCP is to comprehensively protect and conserve multiple Endangered Species Act and California Endangered Species Act listed species and other native species; to conserve, enhance, and restore the habitats and ecosystems upon which these native species depend, including aquatic resources and aquatic habitats; and to ensure the long-term survival of these species for the continuing benefit of the people in the City of Rancho Cordova. The City seeks to accommodate the population growth and associated planned housing, economic development, and infrastructure expected within the Plan Area, using a streamlined environmental permitting process, while maintaining the existing richness of native plant and animal species in the south Sacramento County Planning Area and the natural ecosystems and agricultural lands on which these species depend.

2. The SSHCP allows an adequate amount of urban development within the Cities of Rancho Cordova and Galt, and the currently adopted Urban Services Boundary (USB) for Sacramento County, to discourage expansion beyond these boundaries and maintain the sound land use planning principles these boundaries encourage (e.g., preventing sprawl outside the USB and leap-frog development; consolidating development to support the efficient provision of utilities and infrastructure; promoting compact mixed-use development that supports viable transit and walkable areas; creating communities with a variety of housing types that support different income levels and socioeconomic conditions; and maintaining compliance with air quality laws and regulations such as Assembly Bill 32, Senate Bill 375, and the Clean Air Act).

3. The SSHCP Supports the development and implementation of streamlined aquatic resource permitting programs under Clean Water Act section 404 and 401, Porter-Cologne, and Section 1600 of the California Fish and Game Code (Streambed Alteration Agreements) by the federal and state agencies with responsibility for implementing those statutes within the Plan Area.

4. The SSHCP achieves a no net loss of the existing functions and services of aquatic resources in the Plan Area. Methods used to achieve no net loss may include the re-establishment and establishment of vernal pools and other aquatic land cover types.

5. Include an interconnected preserve system throughout the Plan Area that is large enough to maintain in perpetuity each type of natural community that is native to the Plan Area, maintain in perpetuity each type of native plant and animal species present within the Plan Area, and maintain in perpetuity or expand the existing distribution of each native animal and plant species within the Plan Area.

Control No. 2003-0637

Re: Adoption of the South Sacramento Habitat) Conservation Plan) **CEQA FINDINGS OF FACT**

CEQA FINDINGS OF FACT

I. INTRODUCTION

The Final Environmental Impact Statement-Environmental Impact Report (Final EIS-EIR) prepared for the South Sacramento Habitat Conservation Plan (SSHCP or Plan) addresses the environmental effects associated with the Plan. These Findings of Fact have been prepared to comply with the requirements of the California Environmental Quality Act ("CEQA") (Pub. Resources Code, § 21000 et seq.) and the CEQA Guidelines (Cal. Code Regs., tit. 14, §15000 et seq.).

II. DEFINITIONS

"Board" means the Board of Supervisors of the County of Sacramento.

"CEQA" means the California Environmental Quality Act.

"CESA" means California Endangered Species Act.

"Condition" means a condition of approval adopted by the County in connection with approval of the Project.

"County" means County of Sacramento.

"CPAC" means Community Planning Advisory Council.

"CWA" means Clean Water Act.

"EIR" means Environmental Impact Report. “EIS”

means Environmental Impact Statement

“Environmental Coordinator” means the Environmental Coordinator for the County of Sacramento.

“ESA” means Endangered Species Act.

“FEIR” or “Final EIR” means the Final Environmental Impact Report for the Project (November 2017).

“FR” means Federal Register

“General Plan” means the Sacramento County 2030 General Plan, adopted November 2011.

“NOA” means Notice of Availability.

“NOC” means Notice of Completion.

“NOI” means Notice of Intent.

“NOP” means Notice of Preparation.

“NAHC” means Native American Heritage Commission.

“NEPA” means National Environmental Policy Act.

“Planning and Environmental Review” means the County of Sacramento, Office of Planning and Environmental Review.

“Planning Commission” means the Planning Commission of the County of Sacramento.

“Staff Report” means the staff report for the Project and any subsequent addenda thereto.

“SOI” means sphere of influence.

“SSHCP” means South Sacramento Habitat Conservation Plan.

“UDA” means Urban Development Area.

“USFWS” means United States Fish and Wildlife Service
“USACOE” means United States Army Corps of Engineers

III. PROJECT DESCRIPTION

Project Location and Setting

The South Sacramento Habitat Conservation Plan Area encompasses approximately 317,655 acres within south Sacramento County. The Plan Area includes Galt and Galt's sphere of influence, and the portion of Rancho Cordova that is located south of U.S. Highway 50. The geographical boundaries of the Plan Area are U.S. Highway 50 and White Rock Road to the north, the Sacramento River levee and County Road J11 (Walnut Grove-Thornton Road) to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and with the San Joaquin County to the south. The Plan Area excludes the northern portion of Sacramento County, the portion of Rancho Cordova located north of U.S. Highway 50, the City of Sacramento, Elk Grove, Folsom, sovereign lands of the Miwok Tribe, and the Sacramento County community of Rancho Murieta. The SSHCP refers to the portion of the Plan Area where future urban development Covered Activities would occur as the "Urban Development Area" (the UDA). Sacramento County has previously adopted an Urban Service Boundary (USB) to demarcate the ultimate extent to which the County would provide future urban services, such as sanitary sewer and water supply. Consequently, the portion of Sacramento County USB that is within the Planning Area is part of the SSHCP's UDA. The portion of the Rancho Cordova's sphere of influence that is within the boundaries of the Plan Area is also part of the UDA. The UDA also includes all lands within Galt and within Galt's sphere of influence. Approximately 67,618 acres within the Plan Area are also within the UDA. The boundaries of the Plan Area also define the area evaluated in the EIS/EIR.

Project Description

The Final SSHCP describes a regional, multi-agency strategy to conserve 28 covered species and their habitats while providing a more streamlined and predictable process for both Federal and State ESA and CWA permitting of future urban development, transportation, and infrastructure covered-activities within a 317,656-acre plan area in south Sacramento County. The covered species include the federally endangered vernal pool tadpole shrimp, the threatened vernal pool fairy shrimp, the threatened Valley elderberry longhorn beetle, the threatened California tiger salamander, the threatened giant garter snake, the endangered Sacramento Orcutt grass, the threatened slender Orcutt grass, as well as 21 unlisted species that have potential to become listed during the proposed permit term.

The SSHCP covers certain categories of covered activities, including the construction and operation of new urban development and associated infrastructure within the County's existing Urban Services Boundary, surface mining within the Urban Services Boundary, specific rural transportation projects outside the Urban Services Boundary, flood control and storm water management activities within the Urban Services Boundary, and the construction and operation of a new recycled-water delivery project. In addition, actions related to preserve maintenance, habitat monitoring, and land management on proposed SSHCP preserves throughout the plan area are also SSHCP covered activities.

In total, the SSHCP covered activities could result in the development and loss of up to 33,497 acres of natural landcovers and species habitat within the plan area. These losses would be minimized and mitigated by the SSHCP conservation strategy, which includes the establishment of a 34,494-acre interconnected preserve system, and the re-establishment or establishment of at least 1,787 acres of aquatic habitat, to provide a total SSHCP Preserve System of 36,281 acres. The future SSHCP Preserve System would be preserved, monitored, and managed in perpetuity for the benefit of the covered species.

Project Objectives

Purpose

A purpose of the SSHCP is to comprehensively protect and conserve multiple ESA and CESA listed species and other native species; to conserve, enhance, and restore the habitats and ecosystems upon which these native species depend, including aquatic resources and aquatic habitats; and to ensure the long-term survival of these species for the continuing benefit of the people in Sacramento County. Sacramento County seeks to accommodate the population growth and associated planned housing, economic development, and infrastructure expected within the Plan Area, using a streamlined environmental permitting process, while maintaining the existing richness of native plant and animal species in the south Sacramento County Planning Area and the natural ecosystems and agricultural lands on which these species depend.

Objectives

The following 18 objectives were identified to meet the above-stated purpose:

1. Include an interconnected preserve system throughout the Planning Area that is large enough to maintain in perpetuity each type of natural community that is native to the Planning Area, maintain in perpetuity each type of native plant and animal species present within the Planning Area, and maintain in perpetuity or expand the existing distribution of each native animal and plant species within the Planning Area.

2. Locate preserves in areas that maximize protection of native plant and animal species and the ecosystems on which they depend.

3. Locate preserves in areas that maximize the protection of intact watersheds and watershed functions.

4. Protect large, contiguous blocks of species habitat. Provide habitat linkages between preserves that are wide enough to allow dispersal of individual native animals and plants and allow genetic exchange between species populations.

5. Protect sufficient cropland and irrigated pasture to provide important foraging habitat on which some native animal species now depend (e.g., Swainson's hawk, white-tailed kite).

6. Preserve adequate roosting and foraging habitat for the greater sandhill crane in the area between the existing Stone Lakes National Wildlife Refuge and the existing Cosumnes River Preserve, to maintain or increase the population of greater sandhill crane over-wintering within the Planning Area.

7. Protect the long-term viability of ranching and farming operations in the Planning Area (consistent with other objectives).

8. Protect all currently documented occurrences and any newly discovered occurrences of Sacramento Orcutt grass, slender Orcutt grass, and Ahart's dwarf rush in the Planning Area.

9. Avoid or minimize impacts to state and federally listed species and their habitats, to the maximum extent practicable.

10. Avoid or minimize impacts to the existing physical, chemical, and biological functions and services of wetlands and streams in the Planning Area to the maximum extent practicable.

11. Achieve no net loss of the existing functions and services of aquatic resources in the Planning Area. Methods used to achieve no net loss may include the re-establishment and establishment of vernal pools and other aquatic land cover types.

12. Include a long-term preserve monitoring and habitat management program sufficient to maintain or improve habitats of targeted native plant and animal species in perpetuity.

13. Support the development and implementation of streamlined aquatic resource permitting programs under CWA 404, CWA 401, Porter-Cologne, and Section 1600 of the California Fish and Game Code (Streambed Alteration Agreements) by the federal and state agencies with responsibility for implementing those statutes within the Planning Area.

14. Facilitate the recovery of federally listed species, and provide sufficient preservation of federally designated recovery areas within the Planning Area.

15. Include adequate amount of urban development with associated fees to meet Objectives 1 through 14. In addition, the associated mitigation-fee structure must be practicable, with fees that are analogous to fees collected under other Northern California permitted HCPs that have similar species habitats and similar impacts.

16. Allow an adequate amount of urban development within the currently adopted spheres of influence for Rancho Cordova and Galt, and the currently adopted USB for Sacramento County, to discourage expansion beyond these boundaries and maintain the sound land use planning principles these boundaries encourage (e.g., preventing sprawl outside the USB and leap-frog development; consolidating development to support the efficient provision of utilities and infrastructure; promoting compact mixed-use development that supports viable transit and walkable areas; creating communities with a variety of housing types that support different income levels and socioeconomic conditions; and maintaining compliance with air quality laws and regulations such as Assembly Bill 32, Senate Bill 375, and the Clean Air Act).

17. Include as Covered Activities the SSHCP Permit Applicant's transportation, utility, and other infrastructure activities and projects as described in the approved master plans of the SSHCP Permit Applicants (Sacramento County, Galt, Rancho Cordova, SCWA, and Connector JPA).

18. Rely on willing sellers for the purchase of land or easements when establishing habitat preserves; do not include condemnation or eminent domain to meet the project needs, purposes, and objectives.

IV. BACKGROUND

The Draft EIS/EIR and Draft SSHCP were released for concurrent public reviews on June 2, 2017, when the USFWS published a Notice of Availability (NOA) for both documents (82 FR 25612), and the County published an NOA and Notice of Completion (NOC) for the Draft EIS/EIR with the California State Clearinghouse (control number 2003-0637; State Clearing House # 20088062030). Separately, the U.S. Army Corps of Engineers (USACE) released its draft Clean Water Act (CWA) Permitting Strategy for the SSHCP.

Pursuant to ESA Section 10 policy, the USFWS provided a minimum 90-day public review and comment period for both draft documents, which ended on September 5, 2017. A total of 26 comment letters were received on the Draft EIS/EIR, the Draft SSHCP, and the CWA Permitting Strategy. During the 90-day comment period, the lead agencies and the SSHCP Plan Partners jointly conducted three public meetings in Wilton, Rancho Cordova, and Galt, to provide additional opportunities for the public to provide comments on the Draft SSHCP and the Draft EIS/EIR (see NOAs for locations). A total of two comment letters were submitted at these public meetings. An additional 24 comment letters were submitted to the lead agencies during the 90-day public comment period.

The lead agencies prepared responses to comments on the Draft EIS/EIR, and the Plan Partners prepared responses to comments on the Draft SSHCP in collaboration with the USFWS (see Final EIS/EIR Chapter 19). The USACE prepared the responses to comments on their Public Notice (Chapter 19). If a response to a comment on the Draft SSHCP resulted in changes to the Final SSHCP, those changes were carried into the project description of the Proposed Action/Proposed Project Alternative in the Final EIS/EIR. Likewise, if the response to comments on the USACE Public Notice resulted in changes to the proposed CWA Permit Strategy, those changes were copied into relevant sections of the Final SSHCP, and into the description of the Proposed Action/Proposed Project Alternative in the Final EIS/EIR, as needed. Using this process, the Proposed Action/Proposed Project Alternative that is described and studied in the Final EIS/EIR is consistent with the Final SSHCP. Overall, the environmental impacts of the Proposed Action/Proposed Project Alternative remained similar relative to the impacts described in the Draft EIS/EIR, because the scope of changes to the Proposed Action/Proposed Project Alternative was minimal.

Changes in the Final EIS/EIR are clearly marked. Changes from the Draft EIS/EIR resulting in added text are shown with bold underline. Changes from the Draft EIS/EIR resulting in deleted text are shown with strikethrough.

The Final Environmental Impact Statement and Environmental Impact Report (Final EIS/EIR) was prepared pursuant to the NEPA and the California Environmental Quality Act (CEQA), which assesses potential effects of issuing a single 50-year incidental take permit under the ESA (section 10(a)(B)) to five permit applicants for incidental take that would result from implementation of the covered activities described in the Final South

Sacramento Habitat Conservation Plan (Final SSHCP). The Final EIS/EIR and the Final SSHCP documents were available for a 30-day public review. A Notice of Availability of the Final EIS/EIR and Final SSHCP was published in the Federal Register as a required step in the NEPA process for the Service's permit decision. The commenters on the Draft EIS EIR were notified of the release of the Final EIS/EIR and Final SSHCP at least 10 days prior to certification of the Final EIS/EIR as required by CEQA. The Final EIS/EIR is available online; printed paper copies are available for review at the County Administration Building and Central Library.

The Final EIS/EIR and the Final SSHCP documents address public comments received during a 90-day public review of the Draft EIS/EIR and the Draft SSHCP documents, and a written response to each comment is presented in the Final EIS/EIR document. Revisions made in the Final EIS/EIR and the Final SSHCP to address public comments consist only of clarifications of text, and other minor changes. The descriptions and the analyses of the three SSHCP alternatives studied in the Final EIS/EIR generally remain the same as presented in the Draft EIS/EIR. This notice of availability provided an opportunity for the public to review the Service's and/or County's response to each public comment received and to review the minor changes in the Final SSHCP and the joint Final EIS/EIR documents, prior to the Service's permit decision and the County Board of Supervisors' approval of the SSHCP and certification of the Final EIS/EIR.

Early Public Scoping Notices and Meetings. In 2008, the scoping process began on June 10 with the publication of the NOI in the Federal Register (pursuant to NEPA) and submittal of the NOP to the State Clearinghouse (pursuant to CEQA). NOPs (and often NOIs for joint NEPA/CEQA documents) are provided to the State Clearinghouse as part of the CEQA review process, and the Clearinghouse distributes the NOPs to various California state agencies. The NOI and NOP notified the public and agencies of the SSHCP; the intent to prepare an EIS/EIR; and the time, date, and location of public scoping meetings. The public was also invited to participate in the scoping process through a variety of media, including e-mail and hard-copy mailers. USFWS, as the NEPA lead agency, and Sacramento County, as the CEQA lead agency, held four joint public scoping meetings in July 2008.

In 2013, the draft SSHCP had been further refined, some conditions had changed, and sufficient time had elapsed that the lead agencies felt that a second public scoping process was warranted. Public scoping began on October 28, 2013, with an NOP provided to the State Clearinghouse and on November 4, 2013, with the publication of a NOI in the Federal Register. The NOI and NOP notified the public and agencies of the SSHCP; the intent to prepare an EIS/EIR; the circumstances for initiating the second scoping process; and the time, date, and location of public scoping meetings. USFWS, as the NEPA lead agency, and Sacramento County, as the CEQA lead agency, held two joint public scoping meetings in November 2013.

For the two meetings, a total of 29 people signed in as meeting participants. Each meeting included a brief presentation and an open house forum where informational

poster boards were available for review and staff from the lead agencies were available to answer questions.

In 2008 and 2013, the lead agencies also contacted the Native American Heritage Commission (NAHC) to obtain a list of tribes, individuals, and organizations that may have knowledge of heritage lands or other resources of interest that could potentially be affected by implementation of an HCP in the Planning Area. The 2008 and 2013 NOIs and NOPs (EIS/EIR Appendix B) were sent to the NAHC through the standard distribution to state agencies via the California State Clearinghouse, and sent directly to the tribal contacts provided by the NAHC at that time. At the time of this writing, no comments on the NOI and NOP or requests for further consultation were received. The most recent list received in 2015 from the NAHC provided 19 tribal contacts for south Sacramento County. Copies of the draft EIS/EIR will be mailed directly to the tribal contacts provided by the NAHC. USFWS is conducting outreach to federally recognized tribes in the Planning Area during the EIS/EIR process. This process will be completed and tribal input considered before the USFWS prepares their Record of Decision. In addition, compliance with Section 106 of the National Historic Preservation Act (NHPA 106) may require USFWS to consult with the State Historic Preservation Officer.

V. RECORD OF PROCEEDINGS

The record of proceedings for the Board's decision on the Project consists of the following documents, at a minimum:

- The Final Environmental Impact Report/Environmental Impact Statement prepared for the Project (February 2018), including comments received on the Draft EIR/EIS and responses to those comments;

- Matters of common knowledge to the Board, including, but not limited to, the following:

    1) Federal, state, and local laws and regulations;
    2) The Sacramento County 2030 General Plan (2011);
    3) The Zoning Code of Sacramento County;
    4) The Sacramento County Code; and
    5) Other formally adopted policies and ordinances.

- Any documents expressly cited in these findings, in addition to those cited above; and

- Any other materials required for the record of proceedings by the Public Resources Code section 21167.6, subdivision (e).

The official custodian of the record is the Clerk of the Sacramento County Board of Supervisors, 700 H Street, Sacramento California 95814.

VI. FINDINGS REQUIRED UNDER CEQA

Public Resources Code section 21002 provides that "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would *substantially lessen* the significant environmental effects of such projects[.]" (Emphasis added.) The same statute states that the procedures required by CEQA "are intended to assist public agencies in systematically identifying both the significant effects of proposed projects and the feasible alternatives or feasible mitigation measures which will *avoid* or *substantially lessen* such significant effects." (Emphasis added.) Section 21002 goes on to state that "in the event [that] specific economic, social, or other conditions make infeasible such project alternatives or such mitigation measures, individual projects may be approved in spite of one or more significant effects thereof."

The mandate and principles announced in Public Resources Code section 21002 are implemented, in part, through the requirement that agencies must adopt findings before approving projects for which EIRs are required. (See Pub. Resources Code, § 21081, subd. (a); CEQA Guidelines, § 15091, subd. (a).) For each significant environmental effect identified in an EIR for a proposed project, the approving agency must issue a written finding reaching one or more of three permissible conclusions. The first such finding is that "[c]hanges or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR." (CEQA Guidelines, § 15091, subd. (a)(1).) The second permissible finding is that "[s]uch changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency." (CEQA Guidelines, §15091, subd. (a)(2).) The third potential conclusion is that "[s]pecific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR." (CEQA Guidelines, § 15091, subd. (a)(3).) Public Resources Code section 21061.1 defines "feasible" to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social and technological factors." CEQA Guidelines section 15364 adds another factor: "legal" considerations. (See also Citizens of Goleta Valley v. Board of Supervisors ("Goleta II") (1990) 52 Cal.3d 553, 565.)

The concept of "feasibility" also encompasses the question of whether a particular alternative or mitigation measure promotes the underlying goals and objectives of a project. (City of Del Mar v. City of San Diego (1982) 133 Cal.App.3d 410, 417.) "[F]easibility' under CEQA encompasses 'desirability' to the extent that desirability is based on reasonable balancing of the relevant economic, environmental, social, and

technological factors." (Id.; see also Sequoyah Hills Homeowners Assn. v. City of Oakland (1993) 23 Cal.App.4th 704, 715.)

The CEQA Guidelines do not define the difference between "avoiding" a significant environmental effect and merely "substantially lessening" such an effect. The County must therefore glean the meaning of these terms from the other contexts in which the terms are used. Public Resources Code section 21081, on which CEQA Guidelines section 15091 is based, uses the term "mitigate" rather than "substantially lessen." The CEQA Guidelines therefore equate "mitigating" with "substantially lessening." Such an understanding of the statutory term is consistent with the policies underlying CEQA, which include the policy that "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." (Pub. Resources Code, § 21002.)

For purposes of these findings, the term "avoid" refers to the effectiveness of one or more mitigation measures to reduce an otherwise significant effect to a less than significant level. In contrast, the term "substantially lessen" refers to the effectiveness of such measure or measures to substantially reduce the severity of a significant effect, but not to reduce that effect to a less than significant level. These interpretations appear to be mandated by the holding in Laurel Hills Homeowners Association v. City Council (1978) 83 Cal.App.3d 515, 519-521, in which the Court of Appeal held that an agency had satisfied its obligation to substantially lessen or avoid significant effects by adopting numerous mitigation measures, not all of which rendered the significant impacts in question less than significant.

Although CEQA Guidelines section 15091 requires only that approving agencies specify that a particular significant effect is "avoid[ed] *or* substantially lessen[ed]," these findings, for purposes of clarity, in each case will specify whether the effect in question has been reduced to a less than significant level, or has simply been substantially lessened but remains significant. Moreover, although section 15091, read literally, does not require findings to address environmental effects that an EIR identifies as merely "potentially significant," these findings will nevertheless fully account for all such effects identified in the Final EIR.

CEQA requires that the lead agency adopt mitigation measures or alternatives, where feasible, to substantially lessen or avoid significant environmental impacts that would otherwise occur. Project modification or alternatives are not required, however, where such changes are infeasible or where the responsibility for modifying the project lies with some other agency. (CEQA Guidelines, § 15091, subd. (a), (b).)

With respect to a project for which significant impacts are not avoided or substantially lessened, a public agency, after adopting proper findings, may nevertheless approve the project if the agency first adopts a statement of overriding considerations setting forth the specific reasons why the agency found that the project's "benefits" rendered "acceptable" its "unavoidable adverse environmental effects." (CEQA

Guidelines, §§ 15093, 15043, subd. (b); see also Pub. Resources Code, § 21081, subd. (b).) The California Supreme Court stated, "[t]he wisdom of approving … any development project, a delicate task which requires a balancing of interests, is necessarily left to the sound discretion of the local officials and their constituents who are responsible for such decisions. The law as we interpret and apply it simply requires that those decisions be informed, and therefore balanced." (Goleta II, 52 Cal.3d at p. 576.).

These findings constitute the County's best efforts to set forth the evidentiary and policy bases for its decision to approve the Project in a manner consistent with the requirements of CEQA. To the extent that these findings conclude that various proposed mitigation measures outlined in the Final EIR are feasible and have not been modified, superseded or withdrawn, the County hereby binds itself to implement these measures. These findings, in other words, are not merely informational, but rather constitute a binding set of obligations that will come into effect when the Board approves the Project.

VII. MITIGATION MONITORING AND REPORTING PROGRAM

A Mitigation Monitoring and Reporting Program ("MMRP") was not prepared for the Project.

VIII. SIGNIFICANT EFFECTS AND MITIGATION MEASURES

These Findings do not address impacts that are considered less than significant or beneficial prior to mitigation. Therefore, there are no necessary Findings, since no significant impacts were identified in the Final EIR/EIS for the SSHCP.

Less-Than-Significant Impacts/No Impacts

The Project's impacts to all environmental issues are less than significant. Therefore, the EIR/EIS did not identify or require mitigation measures. Avoidance and minimization measures are part of the SSHCP project, rather than mitigation required pursuant to CEQA.

The plan area is 317,656 acres within south Sacramento County, including the city of Galt and most of the city of Rancho Cordova. Approximately 33,639 acres of natural land covers and species-habitat, including aquatic resources, would be directly and indirectly impacted over the 50-year permit term, primarily within the existing Urban Services Boundary. However, the south Sacramento Habitat Conservation Plan (SSHCP) conservation strategy includes the establishment of a 36,281-acre interconnected, regional preserve system that would be comprised of relatively large, contiguous blocks of natural land covers with species habitat and aquatic resources. All lands in the 36,281- acre preserve system would be permanently preserved, and would be monitored and managed in perpetuity; including 1,787 acres of aquatic resources that would be re-established or established to replace and mitigate aquatic resource functions and services directly impacted by covered activities. All SSHCP preserves will have endowments to cover long-term monitoring and management needs.

The SSHCP would not change current practices of private land changing hands through willing buyer/willing seller transactions for urban development activities, as well as creation of the 36,281-acre SSHCP Preserve System. The majority of the proposed 36,281-acre SSHCP Preserve System is outside of the Sacramento County Urban Services Boundary and would be established through conservation easements purchased by the SSHCP implementing entity from willing landowners. Lands under conservation easement would not be adversely affected because the lands would stay in private ownership and the existing ranching or farming operations would continue on the property under the agreement terms of the easement. Within the Sacramento County Urban Services Boundary, the SSHCP implementing entity would purchase land from willing sellers to be part of the SSHCP preserve system and hold those lands in fee title. The SSHCP implementing entity will not use condemnation or eminent domain to establish any part of the SSHCP Preserve System.

Each covered activity implemented under SSCHP will implement measures to avoid or minimize project impacts to covered species, to natural communities that provided habitat for these species, and to the aquatic resources at the project site. Species and habitat impacts that cannot be avoided will be offset by the preservation of high-quality habitat within a large and interconnected SSHCP Preserve System. The SSHCP Preserve System will protect terrestrial habitats, aquatic habitats, and species populations in perpetuity and will be managed and monitored in perpetuity to assure that biological goals and objectives of the SSHCP are met. In addition, the direct loss of aquatic resource functions and services will also be offset by the re-establishment or the establishment of aquatic resources within the SSHCP Preserve System.

Significant and Potentially Significant Impacts/Mitigation Required.

The EIR/EIS identified no significant or potentially significant environmental effects (or "impacts") that the Project will or may cause. No mitigation is required pursuant to CEQA.

IX. PROJECT ALTERNATIVES Proposed

Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described earlier in this document in Section III, Project Description.

Environmentally Superior Alternative

Based on the analysis in Chapters 4 through 16 and as summarized in Tables ES-1 and ES-2 of the Final EIS/EIR, the Proposed Action/Proposed Project Alternative was identified as the Environmentally Preferable Alternative and Environmentally Superior Alternative.

No Action/No Project

Under the No Action/No Project Alternative, an HCP for south Sacramento County would not be approved or implemented, and ITPs would not be issued to the Permit Applicants for species impacts from future development projects and activities within the Planning Area. Also, the Permit Applicants would not implement a local ARP or approve associated local aquatic resource protection ordinances. Therefore, the USACE would not develop a CWA 404 permitting strategy for future development

projects and activities. In addition, the CDFW would not develop a streamlined permit strategy for streambed impacts of future development projects and activities, and the CDFW would not issue a Master Streambed Alteration Agreement to the Permit Applicants.
Therefore, the No Action/No Project Alternative would continue the conventional project-by-project regulatory reviews in which individual project developers apply for necessary project permits with multiple state and federal resource agencies, and with permit application review proceeding without a systematic, comprehensive process.
Individual projects/actions in the Planning Area that require authorization under CWA 404 would continue to obtain USACE authorization through existing types of CWA 404 authorizations, and would continue to comply with requirements for providing compensatory mitigation.

The No Action/No Project Alternative assumes that all lands zoned or ultimately planned/contemplated for urban development in adopted General Plans that are not already currently developed would eventually become developed over the next 50 years. In association with the expected future urban development, the public infrastructure systems, such as water, wastewater, recycled water, stormwater, flood control, solid waste, and utility systems, as well as transportation systems, would be expanded or improved, as described in several local and regional infrastructure agency master plans and/or capital improvement programs.

Full buildout means all currently undeveloped lands that are zoned for, or are ultimately planned/contemplated for, future urban development (in the adopted general plans of the Permit Applicants) would become developed. However, full buildout will include some open space and conservation lands within the areas planned for urban development. This includes all lands within the Sacramento County USB that are within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), and all lands within Galt's city limits and within Galt's sphere of influence.
The Mather Core Recovery Area was defined in the 2005 Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon.,

The vast majority of urban development under the No Action/No Project Alternative would occur within the UDA described in Section ES.2. However, the No Action/No Project Alternative also assumes that it will become increasingly more difficult for new projects to obtain authorizations under ESA or CWA within the area now designated as the Mather Core Recovery Area (MCRA) by the USACE.5 Consequently, No Action/No Project Alternative also assumes that not all urban development allowed under current zoning could be accommodated within the MCRA, and approximately 1,900 acres of future development could be "displaced" to locations outside the current USB for Sacramento County.

Reduced Permit Term Alternative
This alternative also includes a regional HCP for south Sacramento County, including an ARP; the issuance of 30-year ITPs by USFWS and CDFW; and development of a 30-year multi-level CWA permit strategy by the USACE for HCP Covered Activities. However, the ITPs and the expedited CWA permit strategy would end at year 30, which generally coincides with the durations of the adopted General Plans and reasonably foreseeable master plan projects for the local jurisdictions. Under the Reduced Permit

Term Alternative, the Permit Applicants would implement the same categories of Covered Activities, and request ESA and CESA take coverage for the same Covered Species.
Urban development would occur within the UDA (described in Section ES.2), with the only development Covered Activities outside the UDA being road and pipeline infrastructure projects.

The Reduced Permit Term Alternative would implement an HCP Conservation Strategy during the 30-year permit term, which would include the same Biological Goals for the Planning Area as the Proposed Action/Proposed Project Alternative. The Reduced Permit Term Alternative would implement the same Avoidance and Minimization Measures (AMMs) as the Proposed Action/Proposed Project Alternative and would provide additional avoidance measures not included in the No Action/No Project Alternative.

However, the acres of natural land covers, species habitats, and aquatic resources preserved under each of the Measurable Objectives would be less under the Reduced Permit Term Alternative‘s Conservation Strategy because less urban development would occur during the 30-year permit term of the Reduced Permit Term Alternative, so fewer development fees would be collected to acquire lands for a Preserve System.

SUMMARY OF CEQA FINDINGS OF FACT

- The final EIR has been completed in compliance with CEQA.
- The FEIR was presented to the Board of Supervisors and that the Board of Supervisors reviewed and considered the information contained in the FEIR.
- The FEIR reflects the Board of Supervisor’s independent judgment and analysis.

ADOPTION OF FINDINGS

The Council hereby recognizes and adopts the Findings of Fact for the Project.

EXHIBIT B

CITY OF RANCHO CORDOVA

ORDINANCE NO. XX-2018

AN ORDINANCE OF THE CITY COUNCIL OF RANCHO CORDOVA RELATING TO AQUATIC RESOURCES PROTECTION

THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA DOES ORDAIN AS FOLLOWS:

Section 1. Purpose and Declarations.

WHEREAS, the City Council recognizes that due to urban and agricultural development only a fraction of the aquatic resources that historically dominated the South Sacramento Habitat Conservation Plan's (SSHCP's) Plan Area landscape remains today, and;

WHEREAS, the City Council also recognizes that the avoidance, minimization and compensatory mitigation of aquatic resources provides several important functions and services, such as flood storage, wildlife habitat, mitigation of storm water and pollutants, filtration for drinking water, and prevention of storm damage to buildings and upland areas, and;

WHEREAS, the Aquatic Resources Program promotes a regional approach to balancing development and conservation of aquatic resources located within the SSHCP Plan Area, and;

WHEREAS, the Aquatic Resources Program supports the anticipated implementation of a parallel multi-tiered permitting program to streamline the Clean Water Act Section 404 and 401 permitting process, and;

WHEREAS, the Aquatic Resources Protection Ordinance implements the Aquatic Resources Program.

Section 2: Findings. The City Council hereby finds:

A. The Aquatic Protection Ordinance achieves no-net-loss of aquatic resource function and services and provides efficient aquatic resource permitting consistent with the requirements of the federal Clean Water Act (Sections 404 and 401), California Fish and Game Code Section 1600 and the Porter-Cologne Water Quality Control Act (Porter-Cologne). The ordinance regulates all aquatic resources within that portion of the incorporated boundaries of the City as depicted in the SSHCP.

B. The ordinance facilitates development consistent with the City's General Plan and ensures that there is enough mitigation available to accommodate aquatic

resource mitigation requirements and that habitat mitigation remains economically feasible within the region.

C. The application procedures will ensure that impacts to aquatic resources are avoided and minimized to the greatest extent practicable during implementation of future development.

D. The ordinance also implements aquatic resource avoidance, minimization and compensatory mitigation at a landscape level to protect largely intact watersheds in the Plan Area, including their associated aquatic resources. A primary goal of implementation is to achieve an overall no net loss of aquatic resources functions and services.

Section 3. Amendments to Rancho Cordova Municipal Code Title 16, "Buildings and Construction"

The City Council hereby adds Chapter 16.94, "Aquatic Resources Protection," to Title 16 of the Rancho Cordova Municipal Code (Buildings and Construction), as shown and incorporated in **Attachment 1** to this Ordinance.

Section 4. Severability

If any provision of this Ordinance or the application thereof to any person or circumstance, is held invalid, the remainder of the Ordinance, including the application of such part or provision to other persons or circumstances shall not be affected thereby and shall continue in full force and effect. To this end, provisions of this Ordinance are severable. The City Council hereby declares that it would have passed each section, subsection, subdivision, paragraph, sentence, clause or phrase hereof irrespective of the fact that any one or more sections, subsections, subdivisions, paragraphs, sentences, clauses, or phrases be held unconstitutional, invalid or unenforceable.

Section 5. Effective Date

Within fifteen (15) days after adoption, a Summary of this Ordinance shall be published once in the Grapevine Independent, or the Sacramento Bee, a newspaper of general circulation printed and published in Sacramento County and circulated in the City of Rancho Cordova, in accordance with Government Code Section 36933. This Ordinance shall take effect and be enforced thirty (30) days after its inception.

EXHIBIT B

PASSED AND ADOPTED by the City Council of the City of Rancho Cordova on the _____ day of _____, 2018 by the following vote:

AYES:

NOES:

ABSENT:

ABSTAIN:

_____
Linda Budge, Mayor

ATTEST:

_____
Stacy Leitner, City Clerk

EXHIBIT B – ATTACHMENT I

CHAPTER 16.94

AQUATIC RESOURCES PROTECTION

Sections

16.94.010 Purpose.
16.94.020 Definition.
16.94.030 Applicability.
16.94.040 Aquatic Resource Impact Permits.
16.94.050 Aquatic Resources Delineation.
16.94.060 Avoidance, Minimization and Compensation Standards.
16.94.070 Compensatory Mitigation Standards.
16.94.080 Setback Standards.
16.94.090 Alternatives for Compliance.
16.94.100 Enforcement.
16.94.110 Severability.

16.94.10 Purpose and Intent.

A. The City Council finds that due to urban and agricultural development only a fraction of the aquatic resources that historically dominated the South Sacramento Habitat Conservation Plan's (SSHCP's) Plan Area landscape remains today and that a regional conservation approach is needed to protect existing aquatic resources within the SSHCP's Plan Area and to streamline the permitting processes for development and infrastructure projects in the Plan Area.

B. The City Council recognizes that the avoidance, minimization and compensatory mitigation of aquatic resources provides several important functions and services, such as flood storage, wildlife habitat, mitigation of storm water and pollutants, filtration for drinking water, and prevention of storm damage to buildings and upland areas.

C. The City Council wishes to avoid or minimize impacts of future activities on SSHCP Plan Area aquatic resources and to ensure "no-net-loss" of aquatic resources and aquatic functions by re-establishing or establishing aquatic resources within the Plan Area as compensatory mitigation when unavoidable impacts to aquatic resources occur.

D. The City Council wishes to facilitate development consistent with the City's General Plan and to ensure that there is enough mitigation available to accommodate aquatic resource mitigation requirements and to ensure that habitat mitigation remains economically feasible within the region.

E. The purpose and intent of this Chapter is to achieve no-net-loss of aquatic resource function and services and to enact efficient aquatic resource permitting consistent with the requirements of the federal Clean Water Act (Sections 404

and 401), California Fish and Game Code Section 1600 and the Porter-Cologne Water Quality Control Act (Porter-Cologne). This Chapter regulates all aquatic resources within that portion of the incorporated boundaries of the City as depicted in the SSHCP.

16.94.020 Definitions.

"Aquatic Resources" means wetland waters (i.e. vernal pools, swales, freshwater marsh, other seasonal wetlands, etc.) Non-wetland waters (i.e. ponds, lakes, streams, rivers, drainages, ditches, etc.), and riparian (i.e. mixed riparian scrub, mixed riparian woodland, etc.).

"Aquatic Resources Impact Permit" means a permit required for any activity permanently or temporarily impacting an Aquatic Resource.

"Avoidance" means avoiding the permanent and/or temporary impact altogether by not taking a certain action or parts of an action.

"Compensatory Mitigation" means the restoration (re-establishment or rehabilitation), establishment (creation), enhancement, of aquatic resources for the purposes of offsetting unavoidable adverse permanent and/or temporary impacts which remain after all appropriate and practicable avoidance and minimization has been achieved.

"Compensatory Mitigation Ratio" means the amount of Compensatory Mitigation that must be provided to offset an acre or fraction thereof of permanent and/or temporary impact.

"City" means the City of Rancho Cordova.

"Director" means the Community Development Director.

"Enhancement" means the manipulation of the physical, chemical, or biological characteristics of an aquatic resource to heighten, intensify, or improve a specific aquatic resource function(s). Enhancement results in the gain of selected aquatic resource function(s), but may also lead to a decline in other aquatic resource function(s). Enhancement does not result in a gain in aquatic resource area.

"Establishment" means the manipulation of the physical, chemical, or biological characteristics present to develop an aquatic resource that did not previously exist at an upland site. Establishment results in a gain in aquatic resource area and functions.

"Habitat" means the place or environment where a plant or animal naturally lives and grows (a group of particular environmental conditions), and as defined in the South Sacramento Habitat Conservation Plan. Habitat may be occupied (i.e.

individuals or a population of species are or have recently been present) or unoccupied.

"Impact" – See "Permanent Impact" and "Temporary Impact."

"Minimization" means to reduce permanent and/or temporary impacts by limiting the degree or magnitude of the action and its implementation.
"Open Water" means a permanent water impoundment that is mostly free from masses of underwater vegetation at very shallow depths.

"Permanent Impact" means the permanent loss of an Aquatic Resource resulting from the adverse effects of grading, filling, excavation, dredging, or changing of drainage of an Aquatic Resource.

"Plan Area" means that portion of the incorporated boundaries of the City as depicted in the SSHCP.

"Re-establishment" means the manipulation of the physical, chemical, or biological characteristics of a site with the goal of returning natural/historic functions to a former aquatic resource. Re-establishment results in rebuilding a former aquatic resource and results in a gain in aquatic resource area and functions.

"Rehabilitation" means the manipulation of the physical, chemical, or biological characteristics of a site with the goal of repairing natural/historic functions to a degraded aquatic resource. Rehabilitation results in a gain in aquatic resource function, but does not result in a gain in aquatic resource area.

"Riparian" means a transitional area between terrestrial and aquatic ecosystems, which is distinguished by gradients in biophysical conditions, ecological processes, and biota, typically adjacent to perennial, intermittent and ephemeral streams, lakes, and estuarine-marine shorelines.

"Setback" means an upland, wetland, and/or riparian area that protects and/or enhances aquatic resource functions associated with wetlands and streams from disturbances associated with adjacent land uses.

"Stream" means a perennial, intermittent, or ephemeral course of water that has a bed and bank and with a definable ordinary high water mark.

"Temporary Impact" means the grading, filling, excavation, dredging, or changing of drainage of an Aquatic Resource where the Aquatic Resource is restored to pre-construction contours and elevations after construction, and revegetated, as appropriate.

"Vernal Pool" means a type of seasonal wetland habitat that is characterized by a specific set of physical parameters and a unique assemblage of highly specialized

endemic plants and animals; a seasonal body of standing water that typically forms in the spring from direct precipitation, with occasional contributions from other sources, dries out completely in the hotter months of summer, and refills in the autumn; pools free of fish that provide important breeding habitat for many terrestrial or semi-aquatic species such as Branchiopods, frogs, and salamanders.
"Watershed" means a drainage basin that is defined by a 10-digit hydrologic unit code as defined by the Federal Standard for Delineation of Hydrologic Unit Boundaries.

"Wetland" means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include freshwater marsh, vernal pools, swales and similar areas.

16.135.030 Applicability.

All proposed projects within the Plan Area that permanently and/or temporarily impact an Aquatic Resource shall require an Aquatic Resources Impact Permit from the City. No person, company, or agency shall permanently or temporarily impact Aquatic Resources as set forth in this Section except as consistent with this Chapter.

A. An Aquatic Resources Impact Permit must be obtained:
   1. In conjunction with any City issued discretionary permit.

   2. Before an activity is performed that impacts Aquatic Resources, if no construction or building permit is required.

B. Exemptions. In general, this Chapter requires permits for permanent and temporary impacts to aquatic resources. However, certain activities are exempt from permit requirements. The following activities and associated uses shall be exempt from the provisions of this Chapter:
   1. Exempt Maintenance Activities.
      a. Maintenance of drainage ditches (does not include new construction of drainage ditches); construction and maintenance of irrigation ditches; maintenance of structures like dams, dikes and levees; and construction and maintenance of stock ponds or farm ponds.
      b. Discharges associated with facilities that are appurtenant and functionally related to irrigation ditches are included in the exemption (e.g. siphons, pumps, headgates, wingwalls, weirs, diversion structures, etc.).
      c. Maintenance, including emergency reconstruction of recently damaged parts, of currently serviceable structures such as dikes, dams, levees, groins, riprap, breakwaters, causeways, bridge abutments or approaches, and transportation structures. Maintenance does not include any modification that changes the character, scope, or size of the original fill design. Emergency reconstruction must occur within a reasonable period

of time after damage occurs in order to qualify for this exemption.

d. If a maintenance activity would involve any modifications to the original fill design, including the location of the fill, the type of material to be used, the amount of material used, etc., then the activity does not qualify for the maintenance exemption.

2. Exempt Farming, Ranching, and Mining Activities.
   a. Established (ongoing) farming and ranching activities such as plowing, seeding, cultivating, minor drainage, and harvesting for the production of food, fiber, or upland soil and water conservation practices are exempt. This exemption pertains to "normal farming" and harvesting activities that are part of an established, ongoing farming operation. Examples of normal farming practices include but are not limited to planting different crops as part of an established rotation, introduction of a new cultivation technique such as discing between crop rows for weed control and discharges associated with ongoing rotations of rice. Activities that bring an Aquatic Resource into farm production where the Aquatic Resource has not previously been used for farming are not considered part of an established operation, and therefore are not exempted. An example includes the conversion of grazing land to cropland that results in impacts to Aquatic Resources.
   b. Construction and maintenance of permanent and temporary farm roads or temporary mining roads. Temporary roads must be constructed and maintained in accordance with best management practices to assure that flow and circulation patterns and chemical and biological characteristics of Aquatic Resources are not impaired and that the reach of the Aquatic Resources is not reduced, and that any adverse effect on the aquatic environment are minimized. These BMPs which must be applied to satisfy this provision shall include those detailed BMPs described in the State's approved program description pursuant to the requirements of 40 CFR 233.22(i)d.
      i. Roads established within farming or mining operations shall be held to the minimum feasible number, width, and total length consistent with the purpose of specific farming or mining operations, and local topographic and climatic conditions;
      ii. Road fill shall be bridged, culverted or designed to prevent the restriction of expected flood flows;
      iii. The fill shall be properly stabilized and maintained during and following construction to prevent erosion;
      iv. Discharges shall be made in a manner that minimizes construction equipment in Aquatic Resources outside of the fill area;
      v. Vegetative disturbance shall be kept to a minimum;
      vi. Construction and maintenance of crossing shall not disrupt the migration or other movement of aquatic life;
      vii. Borrow material shall be taken from upland sources where feasible;
      viii. The discharge shall not take, or jeopardize the continued existence of,

a threatened or endangered species, or adversely modify or destroy the critical habitat of such species;

ix. Discharges into breeding and nesting areas for migratory waterfowl, spawning areas, and Aquatic Resources shall be avoided;

x. The discharge shall not be located in the proximity of a public water supply intake;

xi. The discharge shall not occur in a component of the National Wild and Scenic River System;

xii. The discharge of material shall consist of suitable material free from toxic pollutants in toxic amounts; and

xiii. All temporary fills shall be removed in their entirety and the area restored to its original elevation.

3. Construction of temporary sedimentation basins.
   a. This exemption applies to the construction of temporary sedimentation basins on a construction site which does not permanently impact Aquatic Resources.
   b. Construction site means any site involving the erection of buildings, roads, and other discrete structures and the installation of support facilities necessary for construction and utilization of the structures. Also includes any other land areas which involve land-disturbing excavation activities, including quarrying and other mining areas, where an increase in the runoff of sediment is controlled through the use of temporary sedimentation basins.

C. Interpretation.
   1. When there is a conflict between any provisions of this Chapter or any other regulations adopted by the City, that providing the most protection to aquatic resources shall apply.

   2. If there is any question as to whether a proposed activity qualifies for an exemption, coordination with the City shall occur and results documented in writing.

   3. Compliance with this Chapter does not constitute compliance with other federal, state and local regulations, and permit requirements (for example, Section 106 of the National Historic Preservation Act, USACE Section 404 permits, National Pollutant Discharge Elimination System (NPDES) permits, Section 401 Water Quality Certification, or Porter-Cologne Water Quality Control Act). The project proponent is responsible for complying with all requirements, apart from the provisions of this Chapter.

D. Recapture Provision.
   1. Exemptions do not apply when impacts related to activities change the use of the Aquatic Resource and reduce the reach, or impair the flow or circulation of Aquatic Resources. This "recapture" provision involves a two-part test that

results in an activity being considered not exempt when both parts are met:

a. Does the activity represent a "new use" of the Aquatic Resource; and
b. Would the activity result in a "reduction in reach/impairment of flow or circulation" of Aquatic Resources?
c. Consequently, any impact that results in the destruction of the Aquatic Resource character of an area (e.g., it converts to uplands due to new or expanded drainage) is considered a change in the Aquatic Resource, and by definition, a reduction of their reach and is not exempt.

16.135.040 Aquatic Resource Impact Permits.

A. General.
   1. An Aquatic Resource Impact Permit is required for any development activity that is not exempt pursuant to Section 16.135.030(B) and that permanently and/or temporarily impacts Aquatic Resources.

   2. All Aquatic Resource Impact Permits require approval of a compensatory mitigation plan in accordance with the provisions of Section 16.135.040(J) unless the compensatory mitigation plan requirement is waived under the provisions of Section 16.135.040(J)(3).

B. Standards. Aquatic Resource Impact Permit applications shall comply with all state, local and federal laws, including those related to sediment control, pollution control, floodplain restrictions, storm water management, and on-site wastewater disposal.

C. Pre-Permit Consultation. Any person applying for an Aquatic Resource Impact Permit is encouraged, but not required, to meet with the Director during the earliest possible stages of project planning in order to discuss Aquatic Resource impact avoidance, minimization, compensation, and the required contents of a compensatory mitigation plan before significant commitments have been made to a particular project design. Pre-permit consultations and planning will help project proponents create projects which will be more quickly and easily processed.

D. Permit Applications. Applications for Aquatic Resource Impact Permits shall be made to the Director on forms furnished by the Director. Unless the Director waives one (1) or more of the following information requirements, applications shall include:
   1. Aquatic Resources delineations and setback width designations pursuant to Sections 16.135.050 and 16.135.080;

   2. A site plan for the proposed activity overlaid on an aerial photograph at a scale no smaller than one inch equals one hundred feet (1" = 100', a scaling ratio of 1:1200) showing the location, width, depth and length of all existing and proposed structures, roads, storm water facilities, sewage treatment, installations, stockpiling areas and borrow sites;

3. The exact sites and specifications for all development activities proposed within Aquatic Resources and Setbacks, including:
   a. Timing of construction activity;
   b. Type of equipment;
   c. Type of fill material and cubic yards of each type of fill;
   d. Type and location of permanent and/or temporary impacts to Aquatic Resources.

4. A compensatory mitigation plan meeting the requirements of Section 16.135.040(J).

E. Permit Processing. To the extent practicable and feasible, the processing of Aquatic Resource Impact Permits will be consolidated with other City permits or approvals which affect activities in Aquatic Resources, such as subdivision, grading, site plan, and building permit approval, so as to provide a timely and coordinated permit process.

F. Permit Issuance. The Director shall issue final approval of the Aquatic Resource Impact Permit authorizing commencement of the activity subject to the following conditions:
   1. Submittal and approval of documentation for a project-scale assessment of the effects of a project on Aquatic Resources, including mapping (USACE-verified jurisdictional determination) and a description of the functions and services of the mapped areas' Aquatic Resources; and

   2. Submittal and approval of on-site project alternatives information demonstrating efforts that first avoid, and then minimize permanent and temporary effects to Aquatic Resources; and

   3. Submittal and approval of an alternative that minimizes permanent and temporary impacts to Aquatic Resources and associated functions and services to the greatest extent practicable, if a complete avoidance alternative is not practicable as determined by the Director, Documentation of this Determination of Environmentally Equivalent or Superior Alternative (DEESA) shall be recorded by the Director. See Section 16.135.60(A)(2) for DEESA procedure; and

   4. Submittal and approval of a determination of compliance with SSHCP terms and conditions; and

   5. If compensatory mitigation is required then the following conditions must also be met:
      a. Either the submittal and approval of a permittee-responsible compensatory mitigation plan pursuant to Section 16.135.040(J); and
      b. The recording of a conservation easement as required by Section

16.135.080(C)(2) and (4); and
c. The posting of financial assurance as required by Section 16.135.080(H); or
d. Proof of payment into an in-lieu fee program approved by the USACE and that contains the impact site within its service area; or
e. Proof of compensatory mitigation through payment into a conservation or mitigation bank approved by the USACE and that contains the impact site within its service area.

G. Permit Duration. The Aquatic Resource Impact Permit shall be valid for the period specified in the Aquatic Resource Impact Permit.

H. Aquatic Resource Impact Permit Financial Assurances.
1. Financial Assurance Estimates. The project proponent shall submit itemized cost estimates for the required financial assurances including cost estimates associated with performance assurance and maintenance assurance. The Director may adjust the estimates to ensure that adequate funds will be available to complete the specified compensatory mitigation upon forfeiture. In addition, the cost estimates must include a contingency as follows:
   a. Estimates for bonds shall be multiplied by one hundred fifty percent (150%);
   b. All other estimates shall be multiplied by one hundred ten percent (110%).

2. Waiver of Financial Assurances. The Director may waive the requirement for one or both financial assurances if:
   a. The project proponent demonstrates that it paid into an in-lieu fee program approved by the USACE that contains the impact site within its service area; or
   b. The project proponent used a conservation or mitigation bank that is approved by the USACE and that contains the impact site within its service area.

3. Types of Financial Assurances. The Director shall accept the following forms of financial assurances:
   a. An escrow account secured with an agreement approved by the Director;
   b. A bond provided by a surety for estimates that exceed five thousand dollars ($5,000);
   c. A deposit account with a financial institution secured with an agreement approved by the Director;
   d. A letter of commitment from a public agency; or
   e. Other forms of financial assurance determined to be acceptable by the Director.

4. Acceptance of Work and Release of Financial Assurances.
   a. Release of Performance Assurance. Upon request, the Director shall release the performance assurance when the following conditions are met:

i. Completion of construction and planting specified in the approved compensatory mitigation plan;
ii. Submittal of an as-built report documenting changes to the compensatory mitigation plan (if any) that occurred during construction;
iii. Field inspection of the completed site(s); and
iv. Provision of the required maintenance assurance.

b. Release of Maintenance Assurance. Upon request, the Director shall release the maintenance assurance when the following conditions are met:
i. Completion of the specified monitoring and maintenance program;
ii. Submittal of a final monitoring report demonstrating that the goals and objectives of the compensatory mitigation plan have been met.

c. Incremental Release of Financial Assurances. The Director may release financial assurances incrementally only if specific milestones and associated costs are specified in the approved compensatory mitigation plan and the document legally establishing the financial assurance.

5. Forfeiture. If the aquatic resource impact permit holder fails to perform or maintain compensatory mitigation in accordance with the approved aquatic resource impact permit, the Director may declare the corresponding financial assurance forfeit pursuant to the following process:
a. The Director shall, by registered mail, notify the aquatic resource impact permit holder/agent that is signatory to the financial assurance and the financial assurance holder, of non-performance with the terms of the approved aquatic resource impact permit;
b. The written notification shall cite a reasonable time for the aquatic resource impact permit holder, or legal successor, to either propose alternative compensatory mitigation or to comply with provisions of the aquatic resource impact permit and state the City's intent to forfeit the financial assurance should the required work not be completed in a timely manner.
c. Should the required work not be completed timely, the City shall declare the assurance forfeit.
d. Upon forfeiture of a financial assurance, the proceeds thereof shall be utilized either to correct the deficiencies which resulted in forfeiture or, if such correction is deemed by the Director to be impractical or ineffective, to enhance other aquatic resources in the same watershed or, if deemed impracticable to do so, contribute to an established cumulative effects fund for watershed-scale habitat and aquatic resource conservation.

I. Appeal Process. An Aquatic Resource Impact Permit decision may be appealed to the City Council.

J. Aquatic Resource Impact Permit Compensatory Mitigation Plans.
1. Compensatory mitigation plans are required for activities that permanently and/or temporally impact Aquatic Resources. Content requirements for the Plans that are not applicable to a project may be waived by the Director upon request of the project proponent.

2. The compensatory mitigation plan consists of two (2) parts: baseline information for the site and a conceptual compensatory mitigation plan. If off-site aquatic resource compensatory mitigation is proposed, baseline information for both the project site and mitigation site is required.
   a. Baseline information shall include:
      i. Aquatic Resources delineation as described in Section 16.135.050;
      ii. Description and maps of land cover types and vegetative conditions at the site;
      iii. Description and maps of hydrological conditions at the site;
      iv. Description of soil conditions at the site based on an on-site analysis and available soils information from online or published sources such as the Natural Resources Conservation Service's soils maps;
      v. A topographic map of the site; and
      vi. A functional assessment or condition of the existing aquatic resources.
   b. The contents of the compensatory mitigation plan shall be consistent with the USACE Regional Compensatory Mitigation and Monitoring Guidelines for the South Pacific Division (2015), Appendix D of the ARP, and include:
      i. Title page
      ii. Contributor page;
      iii. Distribution page;
      iv. Table of Contents;
      v. Brief description of proposed compensatory mitigation project and proposed source of compensatory mitigation;
      vi. Determination of goals and objectives of the proposed project. Specific criteria shall be provided for evaluating whether or not the goals and objectives of the compensatory mitigation project are being met. Such criteria may include water quality standards, survival rates of planted vegetation, species abundance and diversity targets, habitat diversity indices, or other ecological, geological or hydrological criteria;
      vii. A description of all permanent and temporary impacts (acreage and linear ft.) that require compensatory mitigation under this Chapter;
      viii. Description of site selection criteria such as watershed overview, landscape setting and position, and site specific information, including consistency with the site selection guidance provided in the ARP (Appendix D);
      ix. Other baseline information such as: map showing locations of permanent and/or temporary impact and compensatory mitigation sites; map showing proposed preserves and setbacks; delineation of Aquatic Resources; functional/condition assessment, if appropriate; species of concern (federal and/or state); cultural resources; existing and planned land uses within and surrounding the proposed compensatory mitigation sites(s); existing site topography/elevations; aerial photos, land uses, site changes (deep ripping, impoundments, channel straightening or realignment); interviews with adjacent landowners, ranchers, land managers regarding locations of seeps, observations of flood events, trespassing/vandalism, opportunities for

education and outreach.

x. Written specifications for the compensatory mitigation project shall be provided. The specifications shall include: the proposed construction sequence, grading and excavation details, water and nutrient requirements for planting, specification of substrate stockpiling techniques, and planting instructions, as appropriate. These written specifications shall be accompanied by detailed site diagrams, scaled cross-sectional drawings, topographic maps showing slope percentage and final grade elevations, and any other drawings appropriate to show construction techniques or anticipated final outcome;

xi. Discussion and map of plant material to be planted and planting densities;

xii. Preliminary drainage plan identifying location of proposed drainage facilities including detention structures and water quality features (e.g., swales);

xiii. Discussion of water sources for all aquatic resources on the site;

xiv. Project schedule;

xv. A monitoring and management program to measure the success of the compensatory mitigation project.

(a) The compensatory mitigation project shall be monitored for a period necessary to determine if the project is meeting its performance standards, and to determine if measures are necessary to ensure that the compensatory mitigation project is accomplishing its objectives. Compensatory mitigation projects are required to have a minimum monitoring period of five years. For aquatic resources with slow development rates (e.g. vernal pools and riparian habitats) a monitoring period of more than five (5) years is required. Monitoring periods may be extended if performance standards are not being met. Before determining success there should be at least two consecutive annual monitoring reports where all the performance standards are met without human intervention (e.g., artificial irrigation).

(b) Monitoring shall be designed to measure the performance standards outlined in the compensatory mitigation plan.

(c) A monitoring protocol shall be included outlining how the monitoring data will be evaluated by agencies that are tracking the progress of the project.

(d) Monitoring reports shall be submitted annually, or on a pre-arranged alternate schedule, for the duration of monitoring period.

(e) Monitoring reports shall analyze the results of monitoring, documenting milestones, successes, problems, and recommendations for corrective and/or contingency actions to ensure success of the compensatory mitigation project.

xvi. A contingency plan that identifies potential courses of action, and any corrective measures to be taken when monitoring or evaluation indicates project performance standards are not being met.

xvii. A monitoring and management program to measure and maintain the

long-term sustainability of the compensatory mitigation project in perpetuity. Monitoring and management programs shall be consistent with established practices of the SSHCP and ARP and information collected in a manner that allows for seamless integration into the SSHCP database.

3. The preparation of a compensatory mitigation plan is not required if all required compensatory mitigation is achieved through the use of:
   a. A conservation or mitigation bank approved by the USACE that contains the impact site within its service area; or
   b. An in-lieu fee program approved by the USACE that contains the impact site within its service area.

16.135.050 Aquatic Resources Delineation.

A. Aquatic Resources Delineation Standards.
   1. In conjunction with the submittal of an application for a discretionary permit, the Director shall determine the probable existence of Aquatic Resources on the parcel involved in the development permit application. If Aquatic Resources are believed to exist on a parcel, project proponents for all projects subject to this Chapter must prepare a Verified Aquatic Resources Delineation. All Verified Aquatic Resources Delineations shall be performed in accordance with the minimum standards set forth by the Sacramento District USACE and State Water Quality Control Board at the time of the delineation. All Aquatic Resources Delineations shall be submitted to the Director. The Director will in turn submit the Aquatic Resources Delineation to the USACE for verification.

16.135.060 Avoidance, Minimization and Compensation Standards.

A. Avoidance, Minimization and Compensation. Documentation must demonstrate that the following hierarchy of avoidance and minimization has been considered as part of an Aquatic Resources Impact Permit:
   1. Avoid permanent and temporary impacts to Aquatic Resources. The proposed project shall first avoid, and then minimize, permanent and temporary impacts to Aquatic Resources to the greatest extent practicable. Those permanent and/or temporary impacts that are unavoidable shall be mitigated such that the lost functions and services are replaced as set forth under the DEESA described below.

   2. Minimize permanent and/or temporary impacts to Aquatic Resources if complete avoidance is infeasible. The Director must find that the project proponent has limited the degree or magnitude of impact to Aquatic Resources by using a site design that follows DEESA. The DEESA shall include the following information to be supplied by the applicant and reviewed by the Director:
      a. A defined project area boundary.
      b. A detailed project description that demonstrates: 1) why an avoidance

alternative is not practicable; and 2) that the project minimizes direct and indirect effects to Aquatic Resources to the greatest extent practicable. This description shall include information regarding any Aquatic Resources on site that are being avoided.

c. Amount (acres and linear feet (if applicable) and cubic yards) of unavoidable permanent and temporary impacts to Aquatic Resources associated with the project.
d. A detailed description of project design features and how the project complies with mitigation measures as described in Chapter 5 of the South Sacramento Habitat Conservation Plan that reduce permanent and/or temporary impacts, including but not limited to: impact minimization, on-site stream realignment, Best Management Practices, Low Impact Design and Avoidance and Minimization Measures.
e. A description and amount of proposed compensatory mitigation. Compensatory mitigation must conform to the minimum mitigation ratios required by Section 16.135.070.
f. An analysis that demonstrates that, although the proposed project would not completely avoid permanent and/or temporary impacts to Aquatic Resources within the area subject to this Chapter with proposed design and compensation measures, the project would be environmentally equivalent or superior to that which would occur under a complete avoidance alternative without these measures, based on one or more of the following factors:
    i. Effects on designated Critical Habitat and Core Recovery Areas.
    ii. Effects on the abundance of Aquatic Resources.
    iii. Effects on listed species.
    iv. Effects on the diversity of Aquatic Resources.
    v. Effects on habitat connectivity and functions.
    vi. Effects on the condition of Aquatic Resources.
g. Compensate for permanent and temporary impacts to Aquatic Resources that will occur, after efforts to avoid and minimize have been exhausted. The Director must find that:
    i. Unavoidable permanent and temporary impacts are compensated in accordance with Section 16.135.070; and
    ii. The required compensatory mitigation is monitored and remedial action is taken when necessary to ensure the success of mitigation activities.

16.135.070 Compensatory Mitigation Standards.

A. Compensatory mitigation for permanent and temporary impacts to Aquatic Resources is based on the following ratios:

Land Cover Type	Compensatory Mitigation Ratio (Re-Establishment/Establishment)
Vernal Pool	1:1
Swale	1:1
Stream/Creek (VPIH)	1:1
Seasonal wetland	1:1
Freshwater marsh	1:1
Open water	1:1
Riparian	1:1
Mine tailing riparian woodland	1:1

B. Compensatory Mitigation Prioritization. When considering options for successfully providing the required compensatory mitigation, the type and location options shall be considered in the order presented in the Department of the Army, Corps of Engineers' Compensatory Mitigation for Losses of Aquatic Resources; Final Rule, 33 C.F.R. Part 332 § 332.3, paragraphs (b)(2) through (b)(6). However the preference hierarchy may be overridden when the required compensatory mitigation involves: larger, more ecologically valuable parcels; is subject to more rigorous scientific and technical analysis, planning and implementation; involves advanced site identification and planning; and utilizes significant investment of financial resources, for sites located to successfully replace lost functions and services, taking into account such watershed-scale features as aquatic habitat diversity, habitat connectivity, relationships to hydrologic sources, trends in land use, ecological benefits, compatibility with adjacent land uses, and in general and when practicable to meet the aforementioned considerations, in the same watershed. Therefore, any ILF Program adopted by the City consistent with the SSHCP Conservation Strategy and the ARP and approved by the USACE can be the preferred option for successfully providing required compensatory mitigation.

C. Compensatory Mitigation. Allowable types of compensatory Aquatic Resource mitigation are listed below, in the general order of preference.
   1. Re-establishment
   2. Rehabilitation
   3. Establishment (Creation)
   4. Enhancement

16.135.080 Setback Standards.

A. Minimum Wetland and Stream Setback Standards.
   1. Refer to Chapter 5 of the South Sacramento Habitat Conservation Plan for minimum wetland and stream setback standards, which may be amended from time to time.

B. Stream Setback Exemptions. The setback standards of this Chapter do not apply where there is:
   1. An existing Drainage Master Plan that was adopted prior to adoption of this Chapter; or

   2. An existing Specific, Master, or Community Plan that was adopted prior to adoption of this Chapter.

C. Land Use Requirements within Wetland or Stream Setbacks.
   1. Any discretionary review of a proposed project must ensure that sufficient area exists outside of the Wetland or Stream Setback to accommodate primary and accessory structures, paved areas, septic systems, and other uses or activities that might adversely affect the functioning of the Wetland or stream.

   2. A conservation easement shall be recorded in a form approved by the Director as adequate to protect and maintain the Aquatic Resources and setback area consistent with the provisions of this Chapter. Conservation easements will run with the land in perpetuity and be binding on the property owner and successors.

   3. Any lands proposed for development that include all or a portion of a wetland or stream setback will, as a condition of any subdivision map, provide for vegetation or re-vegetation of any portions of the setback that are not vegetated at the time of the application or that were disturbed by prior land uses. Vegetation will include native or natural tree and plant species as deemed acceptable by the Director.

   4. For building lots that exist as of the date of adoption of this Chapter, but for which a building permit or a preliminary site plan approval has not been obtained or is no longer valid, the required minimum front, side, and rear structural setbacks may extend into the wetland or stream setback, provided that an easement is recorded that prohibits clearing or construction in the wetland or stream setback.

   5. A permanent physical demarcation along the upland boundary of the wetland or stream setback shall be installed and thereafter maintained. Such demarcation may consist of fencing or other prominent physical marking that does not impede flood flows and must be approved by the Director. Signs, approved by the Director, shall be posted at an interval of one (1) per one

hundred (100) feet, indicating that the setback area is a protected area. Signs must be perpetually maintained at locations along the outer perimeter of the wetland or stream setback.

D. Allowable Uses Within Wetland and Stream Setbacks:
   1. Refer to Chapter 5 of the South Sacramento Habitat Conservation Plan for allowable uses within stream and wetlands setbacks, which may be amended from time to time.

E. Wetland and Stream Setback Waivers. A waiver of wetland and stream setbacks may be granted by the Director under one of the following conditions:
   1. A lot existing as of the date this Chapter is effective for which there is insufficient room outside the wetland or stream setback for uses permitted by the underlying zoning and for which there is no other reasonable or prudent alternative to placement in the setback, including obtaining variances from setback or other requirements that would allow conformance with the setback requirements.

   2. An economic hardship whereby a project proponent demonstrates to the Director's satisfaction that the subject property is not capable of yielding an economic return as a result of unique circumstances specific to the subject property, as follows:
      a. An economic hardship related to or arising from the characteristics of the property due to the particular physical surroundings, shape, or topographical conditions of the property involved, rather than the personal situations of the project proponent or the result of any action or inaction by the project proponent or the owner or predecessors in title.
      b. The necessity of acquiring additional land to locate development outside the wetland or stream setback will not be considered an economic hardship unless the project proponent can demonstrate that there is no adjacent land that is reasonably available or could be obtained, used, expanded, or managed to fulfill the basic purpose of the proposed activity.
      c. The proposed project will serve an essential public health and safety need, as demonstrated to the satisfaction of the Director.

   3. A project proponent may submit a written request for a wetland or stream setback waiver to the Director. The written request must include specific reasons justifying the waiver and any other information necessary to evaluate the proposed waiver request. The Director may require an alternative analysis that clearly demonstrates that no other feasible alternatives exist and that minimal permanent and temporary impact would occur as a result of the project or development.
   4. In granting a request for a wetland or stream setback waiver, the Director may require project design features including site design, landscape planting, fencing, signs, and water quality best management practices to reduce adverse permanent and temporary impacts on wetlands and streams and

other sensitive resources.

F. Nonconforming Structures.
   1. Legally existing but nonconforming structures and uses of land within wetland or stream setbacks may be continued. Encroachment into the wetland or stream setback will only be allowed where previous allowable (i.e., permitted or otherwise legal) development or disturbance exists. Existing impervious surfaces within the wetland or stream setback that resulted from previous allowable disturbances or developments shall not be expanded. If a legally existing but nonconforming use has been discontinued for a period of more than 90 days, it shall not thereafter be re- established, with the exception of agricultural uses that are following prescribed best management practices for crop rotation. However, resumption of agricultural uses must be strictly confined to the extent of disturbance existing at the time of adoption of this Chapter.

   2. Activities that change the use of the Aquatic Resource and reduce the reach, or impair the flow or circulation of Aquatic Resources are required to obtain an Aquatic Resources Impact Permit. See Section 16.135.030(B)(3)(b).

16.135.090 Alternatives for Compliance.

A. All of the provisions of this Chapter can be met by complying with an approved permit that satisfies all state and federal Clean Water Act requirements and Porter-Cologne Water Quality Control Act requirements.
   1. The Permit must provide coverage within the Plan Area that is applicable to this Chapter; and

   2. The Permit must require compensatory mitigation ratios that are equal to or greater than the ratios presented in this Chapter 16.135.070(A).

16.135.100 Enforcement.

A. The City shall have jurisdiction to enjoin any activities in violation of this Chapter.

B. In the event of a violation of this Chapter, the City shall have the power to order restoration of Aquatic Resources. If the responsible person, entity, or agent does not complete such restoration within a reasonable time following the order, the City shall have the authority to restore the affected aquatic resources to their prior condition and the person, entity, or agent responsible for the violation shall be held liable to the City for the cost of restoration.

C. In addition to other remedies provided for elsewhere in this Chapter, the Director may suspend or revoke Aquatic Resource Impact Permit(s) issued in accordance with this Chapter and associated development permits if the project proponent or permittee has not complied with any or all of the conditions or limitations set forth

in the Aquatic Resource Impact Permit, has exceeded the scope of work set forth in the Aquatic Resource Impact Permit, or has failed to undertake the project in the manner set forth in the Aquatic Resource Impact Permit.

D. In the event that a violation of this Chapter occurs, the City will notify the US Army Corps of Engineers, US Environmental Protection Agency, US Fish and Wildlife Service, the Regional Water Quality Control Board, and California Department of Fish and Wildlife. Notification will be in the form of a one-page form that describes the nature and extent of the violation, with an aerial photo depicting the location of the violation.

16.135.110 Severability.

The City Council declares that should any section, paragraph, sentence, or word of this Chapter be declared for any reason to be invalid, it is the intent of the City Council that it would have passed all other portions of this Chapter, independent of the provision declared invalid.

EXHIBIT C

CITY OF RANCHO CORDOVA

RESOLUTION NO. XX-2018

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA, STATE OF CALIFORNIA TO ESTABLISH PROCEDURES AND REQUREMENTS FOR IMPLEMENTATION OF THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

WHEREAS, the City Council of the City of Rancho Cordova finds that the ecosystems of the City of Rancho Cordova ("City") and/or southern Sacramento County and the vegetation communities and sensitive species they support are fragile, irreplaceable resources that are vital to the general welfare of all residents; these vegetation communities and natural areas contain habitat value which contributes to the region's environmental resources; and special protections for these vegetation communities and natural areas must be established to prevent future endangerment of the plant and animal species that are dependent upon them.

WHEREAS, this Resolution will protect the City's and the region's biological resources, vegetation communities, and natural areas, and prevent their degradation and loss by guiding development outside of important resource areas, and by establishing mitigation standards which will be applied to development projects.

WHEREAS, adoption and implementation of this Resolution will enable the City to achieve the conservation goals set forth in the South Sacramento Habitat Conservation Plan ("SSHCP"), to implement the associated Implementing Agreement approved by the City Council on October 15, 2018, and to preserve the ability of affected property owners to make reasonable use of their land consistent with the requirements of the National Environmental Policy Act ("NEPA"), the California Environmental Quality Act ("CEQA"), the Federal Endangered Species Act ("FESA"), the California Endangered Species Act ("CESA"), the Federal Clean Water Act, the Porter-Cologne Water Quality Control Act, California Fish and Game Code Section 1600, and other applicable laws.

NOW, THEREFORE, BE IT HEREBY RESOLVED BY THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA as follows:

SECTION I. APPLICATION OF REGULATIONS.

Except as provided in Section II, this Resolution shall apply to all land within the City shown on the SSHCP Plan Map, attached as Exhibit "1." Upon application to the City for a development project**,** an applicant shall be required to comply with the procedures set forth in this Resolution. Upon the City's initiation of a project that is subject to CEQA, the City shall be required to comply with the procedures set forth in this Resolution. No project requiring a discretionary permit or other approval that could have adverse

impacts to species covered under the SSHCP shall be approved by the City, and no City-initiated public project shall be undertaken, unless the project is consistent with the SSHCP and this Resolution.

SECTION II. EXEMPTIONS.

This Resolution shall not apply to the following:

A. The adoption or amendment of the City's General Plan.

B. The adoption or amendment of any land use or zoning ordinance.

C. Any project for which and to the extent that a vesting tentative map pursuant to the Subdivision Map Act, or a development agreement pursuant to Government Code sections 65864 et seq., approved or executed prior to adoption of this Resolution, confers vested rights under the City's ordinances or state law to proceed with the project notwithstanding the enactment of this Resolution.

Projects subject to this exemption must comply with all provisions of any applicable state and federal law.

D. Any project for which the City Council determines that application of this Resolution would result in the property owner being deprived of all reasonable economic use of the property in violation of federal or state constitutional prohibitions against the taking of property without just compensation.

SECTION III. PROCEDURES

A. The City will be responsible for ensuring that all activities that are covered by the SSHCP ("Covered Activities") that occur within its jurisdiction, including its own projects, complies with the SSHCP including the application processing procedures pursuant to Chapter 10 of the SSHCP. SSHCP Permit Applications are required for all Covered Activities including activities that may not result in project level Incidental Take; however, the covered activity contributes to the loss of land cover types upon which the SSHCP covered species depend.

B. Before extending Incidental Take coverage to a project, the City must receive confirmation in writing from the SSHCP Implementing Entity that the proposed species and habitat take is consistent with the SSHCP's "jump-start" and "stay-ahead" requirements pursuant to Chapter 9 of the SSHCP.

C. The City is responsible for ensuring that the proposed project's design and construction is in compliance with SSHCP requirements pursuant to Chapter 10 of the SSHCP, and for ensuring that monitoring of avoidance and minimization measures occur during construction pursuant to Chapter 8 of the SSHCP.

D. The City will collect all information required for the SSHCP annual report for each Covered Activity that it approves.

E. The City will pay SSHCP fees related to its own projects and collect SSHCP fees from third-party project proponents. If a third party project proponent proposes to provide land or a conservation easement instead of paying a fee to satisfy mitigation requirements, the SSHCP Implementing Entity must review the proposed land dedication or the conservation easement for consistency with the conservation strategy outlined in Chapter 7 of the SSHCP.

F. The City will provide the SSHCP Implementing Entity with copies of each approved project application package, whether it is its own application package or a third-party project proponent's.

G. The City will adopt the SSHCP fee as set by the SSHCP Implementing Entity.

H. The City will ensure that Covered Activities that they undertake and Covered Activities conducted by third-party project proponents are consistent with the requirements of the Aquatic Resources Plan.

SECTION IV. DEFINITIONS

For purposes of this Resolution, the following terms shall have the meaning set forth herein:

"Plan Area" means the area in which all conservation actions will be implemented and generally where the Plan Permittees have Taken Authorization for Covered Species and species habitat resulting from Covered Activities.

"SSHCP" means the South Sacramento Habitat Conservation Plan prepared by Plan Permittees.

"SSHCP Plan Map" means the map of the area encompassed by the SSHCP as set forth in the attached Exhibit "1."

"Project" means any action or activity that is subject to the City's discretionary approval, or any action or activity undertaken directly by the City, for the purpose of developing or improving real property, including, but not limited to, the following: the sale, purchase, or lease of City-owned property; the approval of a tentative subdivision map; the issuance of a license, permit, certificate, variance, or other entitlement for the development or improvement of real property, including the clearing or grading of real property (except for weed or fire hazard abatement); and the construction or improvement of streets, water, sewer, or other public facilities or publicworks.

SECTION V. IMPLEMENTING AGREEMENT

The City Manager is hereby authorized to execute the Implementing Agreement for the Habitat Conservation Plan for South Sacramento County (Attachment 4 – Appendix C)

PASSED AND ADOPTED by the City Council of the City of Rancho Cordova on

EXHIBIT D

CITY OF RANCHO CORDOVA

ORDINANCE NO. ___-2018

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA TO ESTABLISH THE SSHCP MITIGATION FEE FOR FUNDING THE PRESERVATION OF NATURAL ECOSYSTEMS IN ACCORDANCE WITH THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

THE CITY COUNCIL OF THE CITY OF RANCHO CORDOVA DOES ORDAIN AS FOLLOWS:

Section 1. Purpose and Declarations.

WHEREAS, the South Sacramento Habitat Conservation Plan (SSHCP) area encompasses 317,656 acres in the southern portion of Sacramento County, including portions of unincorporated Sacramento County, Galt, and the southern half of Rancho Cordova (Plan Area); and

WHEREAS, the SSHCP is a regional effort that provides development and infrastructure projects with streamlined, predictable federal and state permitting processes while creating a preserve system to protect habitat, open space, and agricultural lands; and

WHEREAS, the SSHCP provides a more effective process for protecting natural resources as compared to the current project-by-project process of mitigation, that often results in small isolated preserves; and

WHEREAS, the SSHCP will help ensure the creation of large, interconnected preserves that are sustained in perpetuity by an adequately funded management program.

Section 2. Findings. The City Council hereby finds and determines as follows:

A. The preservation of vegetation communities and natural areas within the southern portion of Sacramento County which support species covered by the SSHCP is necessary to protect and promote the health, safety, and welfare of all the citizens of the City by reducing the adverse direct, indirect and cumulative effects of urbanization and development and providing for permanent conservation of habitat for species covered by the SSHCP.

B. It is necessary to establish a mitigation fee to ensure that all new development within the County pays its fair share of the costs of acquiring and preserving vegetation communities and natural areas within the City and the region which are known to support plant and wildlife species covered by the SSHCP.

C. A proper funding source to pay the costs associated with mitigating the direct, indirect and cumulative impacts of development to the natural ecosystems within the

City and the region, as identified in the SSHCP, is a development impact fee for residential, commercial, and industrial development. The amount of the fee is determined by the nature and extent of the impacts from the development to the identified natural ecosystems and or the relative cost of mitigating such impacts.

D. The SSHCP and the Nexus Study, a copy of which is on file in the City Clerk's office, provides a basis for the imposition of development impact fees on new construction.

E. The use of the development impact fees to mitigate the impacts to the City's and the region's natural ecosystems is reasonably related to the type and extent of impacts caused by development within the City.

F. The costs of funding the proper mitigation of natural ecosystems and biological resources impacted by development within the City and the region are apportioned relative to the type and extent of impacts caused by the development.

G. The facts and evidence provided to the County establish that there is a reasonable relationship between the need for preserving the natural ecosystems in the City and the region, as defined in the SSHCP, and the direct, indirect and cumulative impacts to such natural ecosystems and biological resources created by the types of development on which the fee will be imposed, and that there is a reasonable relationship between the fee's use and the types of development for which the fee is charged. This reasonable relationship is described in more detail in the SSHCP and the Nexus Study.

H. The cost estimates for mitigating the impact of development on the City's and the region's natural ecosystem and biological resources, as set forth in the SSHCP, are reasonable and will not exceed the reasonably estimated total of these costs.

I. The City Council finds that the benefit to each development project is greater than the amount of the fee to be paid by the project.

J. The fees collected pursuant to this Ordinance shall be used to finance the acquisition of the natural ecosystems and certain improvements described or identified in the SSHCP.

Section 3. CEQA Findings.

The City Council hereby finds that in accordance with CEQA and the State CEQA Guidelines the adoption of this Ordinance is exempt from CEQA pursuant to Section 21080(b)(8) of the California Public Resources Code and Sections 15273 and 15378(b)(4) of the State CEQA Guidelines.

Section 4. Amendment of Title 22 of the Rancho Cordova Municipal Code.

Chapter 22.45 is hereby added to the Rancho Cordova Municipal Code as shown and incorporated in **Attachment 1** of this ordinance.

Section 5. Severability.

EXHIBIT D

This Ordinance and the various parts, sections, and clauses thereof, are hereby declared to be severable. If any part, sentence, paragraph, section, or clause is adjudged unconstitutional or invalid, the remainder of this Ordinance shall be affected thereby. If any part, sentence, paragraph, section, or clause of this Ordinance, or its application to any person entity is adjudged unconstitutional or invalid, such unconstitutionality or invalidity shall affect only such part, sentence, paragraph, section, or clause of this Ordinance, or person or entity; and shall not affect or impair any of the remaining provision, parts, sentences, paragraphs, sections, or clauses of this Ordinance, or its application to other persons or entities. The City Council hereby declares that this Ordinance would have been adopted had such unconstitutional or invalid part, sentence, paragraph, section, or clause of this Ordinance not been included herein; or had such person or entity been expressly exempted from the application of this Ordinance.

Section 6. Effective Date.

This ordinance was introduced and the title thereof read at the regular meeting of the City Council on October 15, 2018. It was adopted on second reading on _____, 2018 and shall become effective 30 days thereafter.

Within fifteen (15) days after adoption, a Summary of this Ordinance shall be published once in the Grapevine Independent, or the Sacramento Bee, a newspaper of general circulation printed and published in Sacramento County and circulated in the City of Rancho Cordova, in accordance with Government Code Section 36933.

PASSED AND ADOPTED by the City Council of the City of Rancho Cordova on the _____ day of _____, 2018 by the following vote:

AYES:

NOES:

ABSENT:

ABSTAIN:

EXHIBIT D
ATTACHMENT I

CHAPTER 22.45

ESTABLISHMENT OF MITIGATION FEES FOR THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

Sections:
22.45.010 Purpose.
22.45.020 Administrative Responsibility.
22.45.030 Definitions.
22.45.040 SSHCP Mitigation Fee.
22.45.050 Imposition of the SSHCP Mitigation Fee.
22.45.060 Payment of the SSHCP Mitigation Fee.
22.45.070 Refunds.
22.45.080 Accounting and Disbursement of Collected SSHCP Mitigation Fees.
22.45.090 Exemptions.
22.45.100 Land Dedication in Lieu of Development Fees.

22.45.010 Purpose and Intent.

A. The purpose of the development fee is to cover the mitigation costs associated with new development in the South Sacramento Habitat Conservation Plan Area.

B. Collectively, the development fees will provide the funding required to implement the SSHCP, and as a result, justify and maintain the incidental take permits for new private and public development in the Plan Area under the Federal Endangered Species Acts to ensure that adequate funding for the plan will be provided.

C. The purpose of this chapter is to implement the SSHCP requirements set forth in subsections (A) and (B) of this section and to use the authority in Article XI, Section 7 of the California Constitution by imposing development fees to mitigate the impacts to the City's and the region's natural ecosystems, the need for which is directly or indirectly generated by the type and extent of development proposed in the City of Rancho Cordova on which the fees will be imposed.

22.45.020 Administrative Responsibility.

The South Sacramento Conservation Agency (SSCA) is hereby appointed as the Administrator of this Ordinance. SSCA is hereby authorized to receive all fees generated from the SSHCP Mitigation Fee within the City, and to invest, account for and expend such fees in accordance with the provisions of this Ordinance and the Mitigation Fee Act.

22.45.030 Definitions.

As used in this Ordinance, the following terms shall have the following meanings:

"City Council" means the City Council of the City of Rancho Cordova.

"City" means the City of Rancho Cordova.

"Development" means a human-created change to improved or unimproved real estate, including buildings or other structures, mining, dredging, filing, grading, paving, excavating, and drilling.

"Development Project" or "Project" means any project undertaken for the purpose of development pursuant to the issuance of a building permit by the County pursuant to all applicable ordinances, regulations, and rules of the County and state law.

"Accessory Dwelling Units" according to the State of California legal definition as following: 1) The second unit is not intended for sale and may be rented; 2) The lot is zoned for single-family dwellings; 3) The lot contains an existing single- family dwelling; 4) The second unit is either attached to the existing dwelling and located within the living area of the existing dwelling or detached from the existing dwelling and located on the same lot as the existing dwelling; and 5) Are ministerially amended by each jurisdiction's local codes.

"Ordinance" means this Ordinance of the City of Rancho Cordova.

"Revenue" or "Revenues" means any funds received by the City pursuant to the provisions of this Ordinance for the purpose of defraying all or a portion of the cost of acquiring and preserving vegetation communities and natural areas within the City and the region which are known to support threatened, endangered or key sensitive populations of plant and wildlife species.

"South Sacramento Conservation Agency" or "SSCA" means the governing body established pursuant to the SSHCP that is delegated the authority to oversee and implement the provisions of the SSHCP.

"South Sacramento Habitat Conservation Plan" or "SSHCP" means the South Sacramento Habitat Conservation Plan, adopted by the City of Rancho Cordova on October 15, 2018.

"SSHCP Mitigation Fee" or "Fee" means the development impact fee imposed pursuant to the provisions of this Ordinance.

Any capitalized term not otherwise defined herein shall carry the same meaning and definition as that term is used and defined in the SSHCP.

22.45.040SSHCP Mitigation Fee.

A. Adoption of SSHCP Mitigation Fee Schedule. The City Council shall adopt an applicable SSHCP Mitigation Fee schedule through a separate resolution, which may be amended from time to time.

B. Periodic Fee Adjustment. The fee schedule may be periodically reviewed and the amounts adjusted by the SSCA Governing Board. By amendment to the Resolution referenced in subsection A, above, the fees may be increased or decreased to reflect the changes in actual and estimated costs of the SSHCP including, but not limited to,

debt service, lease payments and acquisition costs. The adjustment of the fees may also reflect changes in the facilities required to be acquired, in estimated revenues received pursuant to this Ordinance, as well as the availability or lack thereof of other funds with which to implement the SSHCP.

C. Authority. SSCA shall have final determination regarding the appropriate methodology to calculate the fee based on the information provided.

22.45.050 Imposition of the SSHCP Mitigation Fee.

Notwithstanding any other provision of the Rancho Cordova Municipal Code, no permit shall be issued for any Development Project unless the SSHCP Mitigation Fee applicable to such Development Project has been paid.

22.45.060 Payment of SSHCP Mitigation Fee.

A. The SSHCP Mitigation Fee shall be paid in full in accordance with applicable law.

B. The SSHCP Mitigation Fee shall be assessed one time per lot or parcel, except when additional construction or improvement on the lot or parcel results in the disturbance of additional area.

C. The SSHCP Mitigation Fee required to be paid under this Ordinance shall be the fee in effect at the time the permit is issued for which the SSHCP Mitigation Fee is assessed.

D. Notwithstanding anything in the Rancho Cordova Municipal Code, or any other written documentation to the contrary, the SSHCP Mitigation Fee shall be paid whether or not the Development Project is subject to conditions of approval by the City imposing the requirement to pay the fee.

E. If all or part of the Development Project is sold prior to payment of the SSHCP Mitigation Fee, the Project shall continue to be subject to the requirement to pay the fee as provided herein.

22.45.070 Refunds.

There shall be no refund of all or part of any SSHCP Mitigation Fee paid under this Ordinance except in cases of miscalculation of the applicable fee. Only in cases of miscalculation of the fee will the person or entity that paid the SSHCP Mitigation Fee be entitled to a refund provided, however, that the deadlines set forth in Government Code section 66020(d) shall apply to any and all requests for refunds.

22.45.080 Accounting and Disbursement of Collected SSHCP Mitigation Fees.

A. All fees paid pursuant to this Ordinance shall be deposited, invested, accounted

for, and expended in accordance with Section 66006 of the Government Code and all other applicable provisions of law.

B. Subject to the provisions of this section, all fees collected pursuant to this Ordinance shall be remitted to the South Sacramento Conservation Agency at least quarterly.

22.45.090 Exemptions.

The following types of construction shall be exempt from the provisions of this Ordinance:

A. Reconstruction or improvements that are damaged or destroyed by fire or other natural causes, provided that the reconstruction or improvements do not result in additional usable square footage.

B. Rehabilitation or remodeling to an existing Development Project, provided that the rehabilitation or remodeling do not result in additional usable square footage.

C. Accessory Dwelling Units, constructed on developed residential property and meeting all state and County requirements for such units.

D. Existing improvements that are converted from an existing permitted use to a different permitted use, provided that no additional area of the property is disturbed as a result of such conversion.

E. Development Projects which are the subject of a development agreement entered into pursuant to Government Code section 65864 et seq., prior to the effective date this Ordinance wherein the imposition of new fees are expressly prohibited, provided that if the term of such a development agreement is extended by amendment or by any other manner after the effective date of this Ordinance, the SSHCP Fee shall be imposed.

22.45.100 Land Dedication in Lieu of Development Fees.

The implementation strategy outlined in Chapter 9 of the SSHCP describes a land dedication process where project proponents can dedicate land towards satisfying their mitigation requirements and thereby reduce their SSHCP mitigation fees. When the dedication of land is accepted into the SSHCP Preserve System, the SSHCP Mitigation Fee will be adjusted by excluding the appropriate portion of the land acquisition component of the SSHCP Mitigation Fee. The remaining components of the SSHCP Mitigation Fee (i.e., Re-establishment/Establishment, Endowment, and Other) will remain unchanged, as they are used to fund ongoing conservation activities that are required on all Preserve lands.

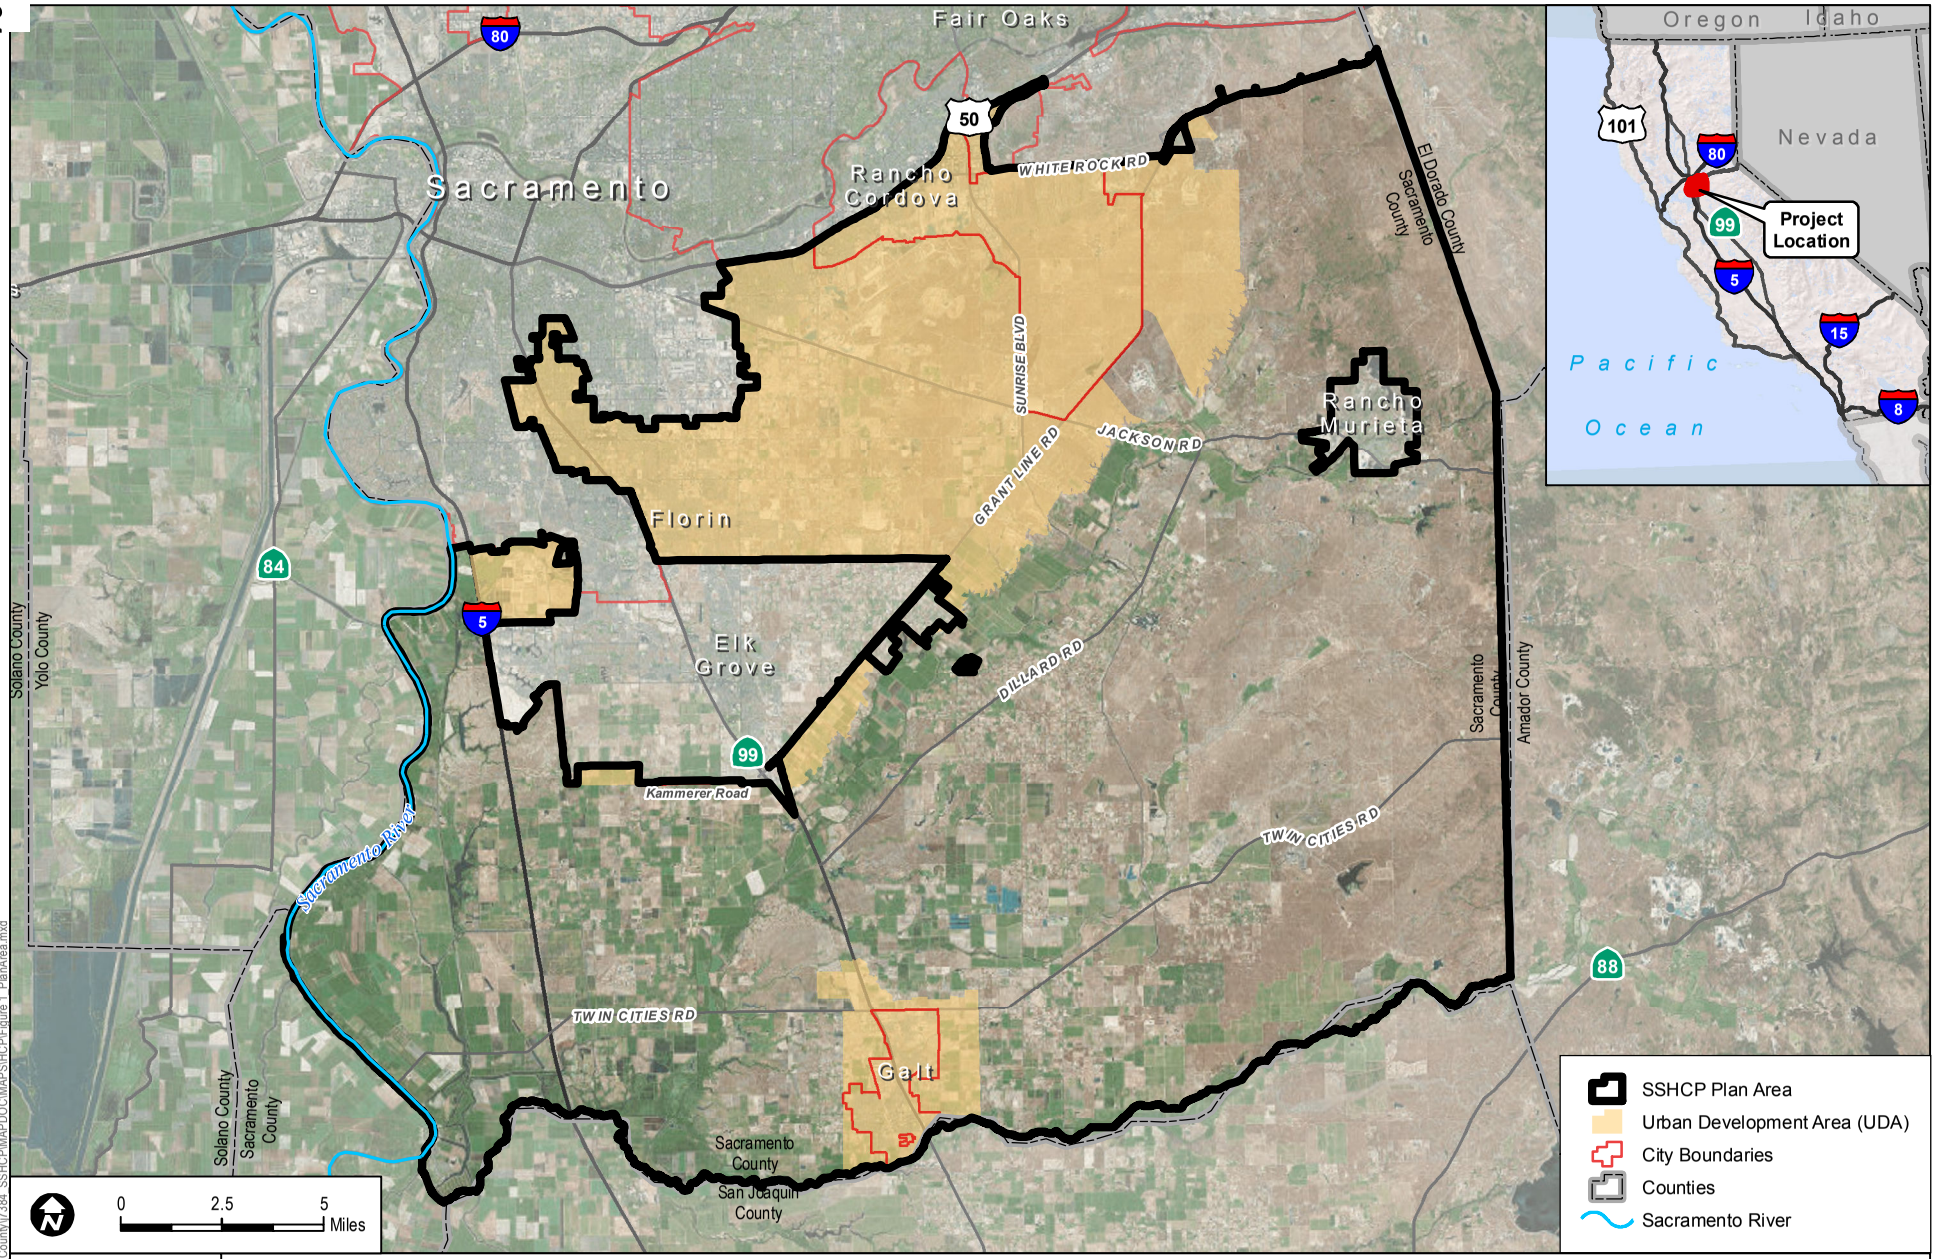
Covered Activities

Covered Activities are projects or activities that are allowable under the SSHCP and thus can use the SSHCP to mitigate for project impacts. Covered Activities within the Urban Development Area (UDA) include activities and projects related to urban development and associated infrastructure. Covered Activities outside of the UDA are limited to specific infrastructure projects related to roadway improvements and recycled water delivery. Covered Activities also include actions within the proposed SSHCP preserve system that are required to manage, monitor, enhance, and re-establish or establish habitat.

The SSHCP Covered Activities fall into eight general categories:

- Urban development in the UDA
- Mining in the UDA
- Rural transportation projects
- Recycled water projects
- Covered Activities in preserve setbacks in the UDA
- Covered Activities in stream setbacks in the UDA
- SSHCP preserve system covered activities
- Covered Activities in the Laguna Creek Wildlife Corridor of the preserve system

Each covered activity implemented under the SSCHP would implement measures to avoid or minimize project impacts to covered species, to natural communities that provide habitat for these species, and to the aquatic resources at the project site. Species and habitat impacts that cannot be avoided would be offset by the preservation of high-quality habitat within a large and interconnected SSHCP preserve system. The SSHCP preserve system would protect terrestrial habitats, aquatic habitats, and species populations in perpetuity and would be managed and monitored in perpetuity to assure that biological goals and objectives of the SSHCP are met. In addition, the direct loss of aquatic resource functions and services would also be offset by the re-establishment or the establishment of aquatic resources within the SSHCP preserve system.



Covered Species

The SSHCP provides take authorization for 28 Covered Species, of which, 11 (shown in bold) are currently listed as threatened or endangered under the CESA or the federal ESA (Table 1). The SSHCP includes conservation actions to protect all 28 Covered Species whether or not they are currently listed. As SSHCP Covered Species, any currently non-listed species that is covered under the SSHCP will not require additional

conservation within the Plan Area should the species become listed under the federal ESA during the SSHCP permit term.

Table 1 - Covered Species

Invertebrates	**Mammals**
1. Vernal pool tadpole shrimp	19. Western red bat
2. Vernal pool fairy shrimp	20. American badger
3. Mid-valley fairy shrimp	
4. Valley elderberry longhorn beetle	**Plants**
5. Ricksecker's water scavenger beetle	21. Dwarf downingia
Amphibians	**22. Boggs Lake hedge-hyssop**
6. California tiger salamander	23. Ahart's dwarf rush
7. Western spadefoot	24. Legenere
Reptiles	25. Pincushion navarretia
8. Western pond turtle	**26. Slender Orcutt grass**
9. Giant garter snake	**27. Sacramento Orcutt grass**
Birds	28. Sanford's arrowhead
10. Cooper's hawk	
11. Tricolored blackbird	
12. Western burrowing owl	
13. Ferruginous hawk	
14. Swainson's hawk	
15. Northern harrier	
16. White-tailed kite	
17. Greater sandhill crane	
18. Loggerhead shrike

ACKNOWLEDGEMENTS

Plan Partner Leadership

Nav Gill, Chief Executive Officer, Sacramento County
Rob Leonard, Chief Deputy County Executive, Sacramento County
Michael Penrose, Interim Community Development Director, Sacramento County
Cyrus Abhar, City Manager, City of Rancho Cordova
Eugene Palazzo, City Manager, City of Galt
Tom Zlotkowski, Executive Director, Southeast Connector Joint Powers Authority
Michael Peterson, Water Resources Director, Sacramento County
Prabhakar Somavarapu, District Engineer, Sacramento Regional County Sanitation District

The plan partner leadership committee wishes to thank the many individuals who have made significant contributions to development of earlier drafts of the South Sacramento Habitat Conservation Plan (SSHCP) over the years. The following list consists of those individuals who most recently provided significant input to the process or were directly involved in preparing this Draft SSHCP.

Stakeholders

This project would not have been possible without the significant contributions of numerous individuals from the environmental, agricultural and development communities. Their investment of countless hours to review and comment on documents, meet with the project team, and provide feedback was invaluable in moving this complex process forward. We wish to express our gratitude to these committed stakeholders, whose important contributions are deeply appreciated.

EXECUTIVE SUMMARY

ES.1 Overview

The South Sacramento Habitat Conservation Plan (SSHCP or Plan) is a regional effort that will provide development and infrastructure projects with streamlined, predictable federal and state permitting processes while creating a Preserve System to protect habitat, open space, and agricultural lands. An approved SSHCP allows project proponents within the Plan Area to simplify and expedite the state and federal Endangered Species Act (ESA) permitting process. In addition to streamlining the ESA permitting processes, a separate but parallel multi-tiered permitting program has been developed to streamline Clean Water Act Section 404 and 401 permitting process (see SSHCP Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) Appendix C) and a Master Streambed Alternation Agreement will be prepared to address Section 1602 of the California Fish and Game Code. The SSHCP will allow the Sacramento County (the County), the City of Rancho Cordova, City of Galt, Sacramento County Water Agency, and the Southeast Connector Joint Powers Authority (collectively referred to as the Plan Permittees) to receive an Incidental Take Permit (ITP) for activities and projects they conduct. In addition, the three local Land Use Authority Permittees (the County, Galt, and Rancho Cordova) have the ability to extend incidental take coverage provided by the SSHCP ITPs to activities and projects implemented by Third-Party Project Proponents that are under the jurisdiction of that Land Use Authority Permittee. This will allow Third-Party Project Proponents to avoid the extensive negotiation and processing currently required to obtain individual project permits under the California Endangered Species Act (CESA) from the California Department of Fish and Wildlife (CDFW) and project ESA compliance from the U.S. Fish and Wildlife Service (USFWS).

The Plan Permittees are requesting a 50-year permit that authorizes incidental take of listed species under the federal ESA and a 50-year permit issued under Fish and Game Code Section 2081. The USFWS will provide “no surprises” assurances to the Plan Permittees, where the USFWS will not require the commitment of additional land, water, or financial compensation (or additional restrictions on the use of land, water, or other natural resources) for impacts to Covered Species beyond the level agreed upon and described in the Plan—as long as the Plan Permittees are adequately implementing the Plan. Compliance with the Plan will also satisfy California Environmental Quality Act (CEQA) mitigation requirements for impacts to biological resources.

The SSHCP was developed in coordination with the five Plan Permittees mentioned previously, the USFWS, CDFW, U.S. Army Corps of Engineers, U.S. Environmental Protection Agency, the Central Valley Regional Water Quality Control Board, a Steering Committee, and various other subcommittees that included a broad range of interests.

The SSHCP provides a more effective process for protecting natural resources as compared to the current process of project-by-project mitigation that often results in small and isolated

preserves. The SSHCP will ensure the creation of large, interconnected preserves that are sustained in perpetuity by an adequately funded management program. The SSHCP also supports the continued success of working landscapes, including certain farming and ranching practices that are integral to implementation of the SSHCP.

ES.2 Geographic Scope

The Plan Area (317,655~~6~~ acres) is located in the southern portion of Sacramento County. The Plan Area includes portions of unincorporated Sacramento County, Galt, and the southern half of Rancho Cordova (see Figure 1-1, SSHCP Plan Area). Parts of southern Sacramento County, including the community of Rancho Murieta, the sovereign lands of the Miwok Tribe, and a majority of the Delta are not included within the Plan Area. The Plan Area is defined as the area in which all conservation actions will be implemented and where all incidental take will occur. The boundary of the Plan Area was defined using political and ecological factors.

The Plan Area is divided into two components: inside and outside of an Urban Development Area (UDA) (see Figure 1-1). Inside the UDA is where all proposed urbanization will occur and there will also be some limited amount of habitat preservation focused mainly on the protection of vernal pools and streams. Geographically, the UDA is the portion of the Sacramento County Urban Services Boundary (USB), the incorporated Cities of Rancho Cordova and Galt, and Galt's Sphere of Influence that are also within the Plan Area. The area outside of the UDA is largely composed of rural communities and agricultural lands. Most of the habitat preservation proposed by the SSHCP will occur outside of the UDA.

ES.3 Permit Term

The Permit Term defines the length of time in which ITPs issued by the Wildlife Agencies (USFWS and CDFW) can be used by the Plan Permittees and the timeframe in which all conservation actions outlined in the SSHCP Conservation Strategy must be completed. The Plan Implementing Entity and the Plan Permittees are seeking ITPs that are valid for a term of 50 years. A 50-year Permit Term is needed to provide enough time to implement Covered Activities, the Conservation Strategy, the monitoring and adaptive management program, and the funding strategy. Each permit will be issued to all Permittees collectively.

ES.4 Covered Activities

Covered Activities are projects or activities that are allowable under the Plan's ITPs and thus can use the Plan to mitigate for impacts that result from implementation of the Covered Activity. Covered Activities within the UDA include activities and projects related to urban development and associated infrastructure. In-stream maintenance occurring within the UDA is also a Covered Activity. Covered Activities outside of the UDA are limited to specific infrastructure projects

related to roadway improvements and recycled water delivery. Covered Activities also include actions within the proposed SSHCP Preserve System that are required to manage, monitor, enhance, and re-establish or establish habitat.

The SSHCP Covered Activities fall into eight general categories:

- Urban development in the UDA
- Mining in the UDA
- Rural transportation projects
- Recycled water projects
- Covered Activities in Preserve Setbacks in the UDA
- Covered Activities in Stream Setbacks in the UDA
- SSHCP Preserve System Covered Activities
- Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System.

ES.5 Covered Species

The Plan provides take authorization for 28 Covered Species, of which, 11 are currently listed as threatened or endangered under the California ESA or the federal ESA (Table ES-1). The 28 species were identified through an evaluation process that began with a list of 90 species. Species were selected for coverage based on their potential to occur within the Plan Area, their potential to be adversely affected by Covered Activities in the Plan Area, the availability of information to adequately evaluate impacts to the species, and the ability to adequately protect the species. The Plan includes conservation actions to protect all 28 Covered Species whether or not they are currently listed. As SSHCP Covered Species, any currently non-listed species that is covered under the Plan will not require additional conservation within the Plan Area should the species become listed under the federal ESA during the Plan's Permit Term.

Status Definitions
Federal:
E = Listed as endangered under the federal ESA
T = Listed as threatened under the federal ESA
* = Species has designated Critical Habitat located within the Plan Area.
— = No federal ESA listing
BCC = Bird of Conservation Concern, USFWS 2008.

State:
E = Listed as endangered under CESA
T = Listed as threatened under CESA
CFP = Fully protected under the California Fish and Game Code
CSC = Species of special concern in California
WL = Watch List
— = No state status

California Native Plant Society California Rare Plant Rank (CRPR)
1B = Rare, threatened, or endangered in California and elsewhere
2 = Rare, threatened, or endangered in California but more common elsewhere

CRPR Threat Ranks
0.1 = Seriously threatened in California (high degree/immediacy of threat)
0.2 = Fairly threatened in California (moderate degree/immediacy of threat)
0.3 = Not very threatened in California (low degree/immediacy of threat)

ES.6 Conservation Strategy

The SSHCP Conservation Strategy mitigates to the maximum extent practicable the impacts of Covered Activities, including all direct and indirect impacts on Covered Species and their habitats. The SSHCP Conservation Strategy provides for conservation of 28 Covered Species and 17 land cover types, avoids or minimizes impacts of Covered Activities, mitigates for the impacts of Covered Activities on the Covered Species and their habitats on the basis of species and habitat needs, provides a regional approach to the mitigation of impacts and the conservation of species and their habitats, protects wetlands and waters of the Plan Area, and conserves natural communities in the Plan Area.

The Conservation Strategy is based on a set of Biological Goals and Measurable Objectives developed specifically for the Plan. Conservation actions were then identified to achieve these goals and objectives. The SSHCP Conservation Strategy is focused on the following major components:

- Create an integrated Preserve System that conserves natural land covers, certain Cropland cover types, and Irrigated Pasture–Grassland in the Plan Area. The Preserve System will preserve at least 34,495 acres of existing habitat and re-establish or establish at least 1,787 acres of habitat for a total Preserve System of 36,282 acres. The Preserve System was developed for the benefit of SSHCP Covered Species, natural communities, biological diversity, and ecosystem functions of the Plan Area.
- Provide for the continued persistence of Covered Species in the Plan Area.
- Protect remaining natural segments of Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, Sun Creek, and their first- and second-order tributaries within the UDA portion of the Plan Area.
- Protect all of the Laguna Creek (North) Corridor within the Plan Area.
- Manage preserved lands to enhance populations of Covered Species and maintain biological diversity within the Preserve System.
- Maintain existing watershed functions in the Plan Area to benefit wetlands (aquatic land cover types) and to support aquatic Covered Species and their habitats.
- Re-establish or establish Vernal Pool land cover to ensure the Plan meets County, state, and federal requirements for "no-net-loss" of waters and wetlands and to offset impacts to vernal pool Covered Species.
- Re-establish or establish riparian and other aquatic land cover to ensure the Plan meets County, state, and federal requirements for "no-net-loss" of waters and wetlands and to offset impacts to riparian and aquatic Covered Species.

ES.7 Preserve System

The SSHCP Conservation Strategy will result in an interconnected Preserve System totaling 36,282 acres. All SSHCP Preserves will be preserved in perpetuity and would be acquired either as fee title or as conservation easements, although most of the Preserve System will be acquired using conservation easements. As the SSHCP is implemented over the 50-Year Permit Term, the new 36,282-acre SSHCP Preserve System will be established in a manner that supplements, complements, and links together many of the existing preserves within the Plan Area.

The SSHCP will preserve approximately 27,554 acres outside of the UDA, including a large 10,500-acre Vernal Pool Grassland Preserve that will be connected to already existing Preserves.

Several smaller Vernal Pool Grassland Preserves and Preserves established to protect other wetland land cover types will also be established outside of the UDA. Preserves that mainly comprise agricultural land will be preserved outside of the UDA in a matrix of open space, agricultural landscapes, and agricultural residential communities. Finally, several Linkage Preserves will be established outside of the UDA, mainly along riparian and stream corridors, to provide connectivity between Preserves.

The SSHCP will preserve approximately 6,941 acres within the UDA. Preserves that are established within the UDA will focus on preserving the Vernal Pool Ecosystem within the Mather Core Recovery Area. These Preserves will be established next to adjacent Preserves when possible and will be connected to one another and to Preserves outside of the UDA via the establishment of Linkage Preserves.

ES.8 Habitat Re-Establishment/Establishment

The SSHCP will re-establish/establish a total of approximately 1,787 acres of aquatic, riparian, and blue oak woodland habitat. Re-establishment/establishment projects will be strategically located within preserved areas where they would provide maximum functional gain. The SSHCP emphasizes re-establishment over establishment; however, limitations to the amount of acreage that can be re-established will necessitate that habitat is established to meet the SSHCP's minimum 1:1 compensatory mitigation ratio requirements.

The SSHCP provides guidelines for re-establishing and establishing aquatic resources within the Plan Area. These guidelines provide the outline (consistent with the U.S. Army Corps of Engineers, South Pacific Division's 2015 Regional Compensatory Mitigation and Monitoring Guidelines) for how compensatory mitigation projects would be planned, designed, implemented, and managed such that the projects would be viable into perpetuity and would adequately compensate for unavoidable impacts to aquatic resources. Construction of all habitat re-establishment/establishment projects will be completed by Year 45 of the Permit Term.

ES.9 Monitoring and Management Programs

The frameworks for two monitoring programs have been developed. The first framework is the "South Sacramento Habitat Conservation Plan (SSHCP) Compliance and Avoidance and Minimization Measure (AMM) Monitoring Program Framework." This monitoring program framework was developed to monitor compliance with the Plan requirements, the Implementing Agreement, and the permits. A second monitoring program framework, the "SSHCP Preserve System Monitoring and Management Program" was developed to monitor the effectiveness of the Plan in terms of protecting Covered Species, natural communities, and ecosystem processes within the SSHCP Preserve System and to evaluate the effects of preserve management actions.

The SSHCP Preserve System Monitoring and Management Program will integrate monitoring and adaptive management into one cohesive program where monitoring will inform and change management actions to continually improve outcomes for Covered Species and natural land cover types. The SSHCP Preserve System Monitoring and Management Program outlines the monitoring and management protocols and standards that the Implementing Entity will use to prepare individual Preserve Management Plans (PMPs) and SSHCP Annual Reports.

The technical details of the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program will be finalized by the Implementing Entity in the first 18 months after permit issuance.

ES.10 Conditions on Covered Activities

The SSHCP includes AMMs as conditions on Covered Activities. Each condition contains several AMMs that are intended to eliminate or reduce direct or indirect effects to species that could result from implementation of a Covered Activity. In addition, the SSHCP provides species-specific take and avoidance measures to avoid or minimize effects of Covered Activities on specific SSHCP Covered Species. Species-specific AMMs include species surveys, pre-construction surveys, and construction monitoring.

Conditions on Covered Activities are included that:

- Avoid and minimize urban development impacts to watershed hydrology and water quality
- Avoid and minimize urban development direct and indirect impacts to existing Preserves and SSHCP Preserves
- Require implementation of construction best management practices
- Avoid and minimize impacts that may result from implementation of transportation-related Covered Activities
- Avoid and minimize impacts that result from public use of low-impact nature trails in Preserves
- Avoid and minimize impacts to existing vernal pools when re-establishing or establishing vernal pool wetlands
- Avoid and minimize impacts to streams and creeks
- Avoid and minimize impacts to Covered Species from utility and utility maintenance Covered Activities
- Avoid and minimize impacts that might result from removing or breaching levees to establish or re-establish riparian habitat

- Avoid and minimize impacts that might result from potential residual contamination of Preserves and related exposure of people to such hazardous materials.

ES.11 Implementation

A new Joint Powers Authority called the South Sacramento Conservation Agency (SSCA) will be created to implement the SSHCP. The SSCA is responsible for ensuring compliance with the terms of the Plan, the Implementing Agreement, and the Permits. The SSCA will be governed by a Governing Board of elected officials from the County, Rancho Cordova, and Galt. An Implementing Commission consisting of a single representative from each of the Land Use Authority Permittees and Plan Partner Permittees will be formed to implement duties that the SSCA Board sees fit to assign to it. An Executive Director and staff will be hired to implement the day-to-day operations of the Plan. Staff for these positions may be hired by the Implementing Entity, or their functions can be contracted out to existing local agencies, nonprofit organizations, or private consultants. Staff or qualified consultants will be retained on an as-needed basis. The Implementing Entity will be advised by representatives of USFWS and CDFW and a technical advisory committee.

The Plan also includes a detailed process for land and easement acquisitions from willing sellers; a process for providing land dedications in lieu of fees; and provisions that prohibit the Plan from falling behind in its mitigation obligations.

ES.12 Cost and Funding

The federal ESA requires that the Plan Permittees provide assurances that the SSHCP will be adequately funded over the proposed 50-year Permit Term. The Biological Goals and Measurable Objectives of the SSHCP cannot be attained without adequate funding. The SSHCP funding program is critical to the successful development, implementation, and viability of the SSHCP. Estimating the full costs of the operating SSHCP is an essential step to demonstrate adequate funding to meet regulatory requirements.

The economic analysis evaluates the many costs associated with implementation of the SSHCP and identifies the funding mechanism(s) that will be used to pay for the SSHCP. In order to ensure enough funding, all costs associated with the Conservation Actions necessary to implement the SSHCP had to be identified. Because of the geographic scale of the Plan, the complexity of the Conservation Actions, and long-time frame over which these actions will occur, the cost-estimating process involves many assumptions. The costs are identified for planning purposes only to estimate funding levels needed to implement the Plan.

The total cost of implementing the SSHCP during the 50-year Permit Term is estimated at $857.6 million for an average of approximately $17.1 million annually. This includes the cost of

land and easement acquisition; Plan administration; habitat management, monitoring, and adaptive management; addressing changed circumstances; habitat re-establishment/ establishment; recovery of plan development costs; funding for an agricultural enhancement program; and an endowment. Contingency costs and costs for remedial measures are included in some of the cost categories mentioned above.

Plan costs were estimated from a detailed model of all expected cost components based on actual costs of tasks. Funding for this Plan is derived entirely from fees on private development and public infrastructure. This includes developer mitigation fees or developer land dedications in lieu of fees. A summary of the Plan costs is presented in Table ES-2.

Table ES-2
Summary of Plan Costs

Cost Category	Cost Estimate	Average Annual Cost	Distribution of Costs
Land and Easement Acquisition Costs	$487,238,000	$9,745,000	56.8%
Habitat Re-establishment/Establishment	$183,098,000	$3,662,000	21.3%
Habitat Management, Monitoring, and Adaptive Management	$61,730,000	$1,235,000	7.2%
Changed Circumstances	$8,404,000	$168,000	1.0%
Agricultural Enhancement	$6,015,000	$120,000	0.7%
Plan Administration	$66,009,000	$1,320,000	7.7%
Endowment	$35,578,000	$712,000	4.1%
SSHCP Development	$9,547,000	$191,000	1.1%
Total	**$857,617,000**	**$17,152,000**	**100.0%**

1 INTRODUCTION

1.1 Overview

The South Sacramento Habitat Conservation Plan (SSHCP or Plan) ensures preservation of species, natural communities, and aquatic resources in the Plan Area; while providing an improved environmental permitting process for Covered Activity projects that impact listed species, listed species habitats, or aquatic resources. The SSHCP is intended to preserve 28 species of plants and wildlife, including 11 that are listed as threatened or endangered under the federal Endangered Species Act (ESA), the California Endangered Species Act (CESA), or both. In addition, because so many of the Covered Species live part or all of their lives in water bodies, the SSHCP also provides additional avoidance and minimization of Covered Activity impacts to wetlands, streams, and other aquatic resources that are also subject to regulation under the federal Clean Water Act (CWA), the California Fish and Game Code, and California's Porter-Cologne Water Quality Control Act.

The SSHCP was prepared by five local agencies, including the County of Sacramento (County), City of Galt, City of Rancho Cordova, Sacramento County Water Agency (SCWA), and the Southeast Connector Joint Powers Authority (Connector JPA). These five local agencies, plus the future SSHCP Implementing Entity (to be named the South Sacramento Conservation Agency), are collectively applying for Incidental Take Permits (ITP) and are referred to as the "Plan Permittees" in this document.

The SSHCP Preserve System will conserve habitat that will be managed and monitored to demonstrate achievement of the Biological Goals and Measurable Objectives for Covered Species (see Chapter 7 for a complete discussion of the Plan's Conservation Strategy). In exchange for habitat conservation and other commitments, the United States Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW) (the Wildlife Agencies) will each issue an ITP that grants take for Covered Species resulting from the implementation of Covered Activities, including urban development and infrastructure construction and maintenance activities (see Chapter 5 for a definition of the SSHCP Covered Activities). The entities that receive take coverage under the ITPs are exempt from take prohibitions of Section 9 of the federal ESA for "take" of Covered Species incidental to otherwise legal activities.

An important component of the SSHCP Conservation Strategy is an Aquatic Resources Program (ARP). As discussed in Chapter 7, the ARP (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report [EIS/EIR]) describes how the SSHCP strategy for the conservation of aquatic habitat in this Plan Area will avoid and minimize Covered Activity impacts on the Plan Area's aquatic resources, and provide adequate compensatory mitigation for unavoidable Covered Activity impacts. In exchange for conservation of wetlands streams, riparian, and other Plan Area aquatic resources, the United States Army Corps of Engineers (USACE) plans to develop a multi-level permitting strategy under Section 404 of the CWA

(CWA 404) for future Covered Activities that are consistent with all SSHCP requirements. This permit strategy is contained in Appendix C of the SSHCP EIS/EIR.

The Plan Permittees have requested that the Regional Water Quality Control Board (RWQCB) use the ARP document to develop a parallel program to issue Water Quality Certifications under Section 401 of the CWA (CWA 401), and a program to issue a Report of Waste Discharge under the California Porter-Cologne Water Quality Control Act. The Plan Permittees will also request that CDFW use the ARP document to develop a Master Streambed Alteration Agreement under Section 1600 of the California Fish and Game Code for Plan Permittee Covered Activities and to streamline permitting for all Covered Activities described with the SSHCP.

Shortly after the Natural Community Conservation Plan (NCCP) Act of 2003 was authorized by the state legislature, CDFW requested that the County convert the SSHCP from a stand-alone Habitat Conservation Plan (HCP) to a joint HCP/NCCP. Because the NCCP Act requires the protection of natural communities beyond what is required to mitigate species impacts, there were concerns that the preparation of a joint HCP/NCCP would not be feasible due to the Plan Area's already limited inventory of land available for mitigation. However, recognizing the benefits that the NCCP Act provides for protection of natural communities, the Plan Permittees elected to include additional voluntary conservation (Appendix J) as a supplement to the SSHCP Conservation Strategy that, where feasible, would encourage preservation of additional acreage of natural communities and species habitat beyond what is required to mitigate effects of the Covered Activities to the maximum extent practicable. In so doing, the SSHCP includes some of the beneficial properties of an NCCP. However, take under CESA will be issued under California Fish and Game Code Section 2081.

Three of the Plan Permittees are also local jurisdictions with authority to permit or approve projects and activities within their jurisdictional boundary. Under the Plan, the three local Land Use Authority Permittees (Sacramento County, the City of Galt, and the City of Rancho Cordova) have the ability to extend incidental take coverage provided by the SSHCP ITPs to Covered Activities implemented by Third-Party Project Proponents that are under the jurisdiction of that Land Use Authority Permittee. This will allow Third-Party Project Proponents to avoid the extensive negotiation and processing currently required to obtain individual project permits under CESA from CDFW and project ESA compliance from USFWS. As discussed in Chapter 9, Third-Party Project Proponents are private project applicants proposing to implement an SSHCP Covered Activity and are seeking ministerial[1] or discretionary[2] project permits from a Land Use Authority Permittee.

[1] A ministerial permit is a permit that requires little to no judgment on behalf of the Land Use Authority Permittee. An example of a ministerial permit is a building permit that states that, as long as a parcel is zoned to allow the building of a structure, the applicant only needs to follow building codes to construct their project.

In addition, Covered Activities implemented by Third-Party Project Proponents can avoid the extensive negotiation and processing currently required to obtain CWA 404 permits from the USACE and U.S. Environmental Protection Agency (USEPA), as well as extensive negotiation and processing currently required to obtain CWA 401 approvals from the RWQCB and to issue Reports of Waste Discharge under the California Porter-Cologne Act.

The future South Sacramento Conservation Agency (the SSHCP Implementing Entity) also has the ability to extend incidental take coverage provided by the ITPs to third-party Participating Special Entities. As discussed in Chapter 9, Participating Special Entities are third-party entities that may wish to implement a Covered Activity allowed by the SSHCP permits, but the entity is not under the jurisdiction of a Land Use Authority Permittee. Participating Special Entities might include school districts, reclamation districts, irrigation or water districts, utilities, or other organizations that are not subject to the regulatory authority of a local jurisdiction.

1.1.1 SSHCP Mission Statement

The Plan Permittees and key stakeholders, participating in a goal-setting process, developed a set of broad program goals that collectively serve as the mission statement for this Plan. The goals developed are to:

- Ensure long-term viability of Covered Species in the Plan Area by preserving an adequate quality and quantity of habitat in an integrated regional manner and further contribute to species recovery.
- Protect, maintain, and restore the functions and services of waters of the United States and maintain the integrity of watersheds throughout the Plan Area.
- Accommodate development in sites consistent with Land Use Authority Permittee plans (County and the Cities of Galt and Rancho Cordova) in exchange for payment of a development fee and other mitigation.
- Promote the long-term viability of agricultural uses consistent with the Plan, and ensure that agricultural lands and operations are not unduly impacted by the SSHCP's implementation.
- Promote awareness and appreciation of the Plan Area's natural history and provide environmental education opportunities for local residents.
- Create a standardized and predictable permitting process without unforeseen mitigation obligations.

[2] A discretionary permit is a permit that requires the use of judgement by a Land Use Permittee before the permit can be issued. An example of a discretionary permit is a permit for a general plan amendment.

- Provide a comprehensive framework for land use by linking plant and animal conservation with local land use programs, consistent with the goals and policies of each local Land Use Authority Permittee.
- Provide for stakeholder involvement and public input during the preparation of Plan documents.

1.1.2 Purpose and Benefits of the SSHCP

The purpose of the SSHCP is to ensure the long-term survival of the species covered in this Plan by preserving and establishing/re-establishing the habitats, natural communities, and ecosystem functions that they rely on, while allowing appropriate and compatible urban growth and development. The Plan also requires measures that will avoid, minimize, and mitigate impacts to the species, thereby addressing the permitting requirements relevant to these species for activities conducted by or under the jurisdiction of the Plan Permittees. These activities (i.e., the SSHCP Covered Activities, see Chapter 5) include urban development and infrastructure projects, such as roadway improvements and sewer and water line construction. The Plan also describes activities associated with operating and maintaining a new SSHCP Preserve System, which will be created to mitigate anticipated impacts resulting from urban development and infrastructure activities.

This Plan is an HCP intended to fulfill the requirements of CESA and the federal ESA. The Plan also addresses Covered Activity permitting requirements for the federal CWA, California's Porter-Cologne Water Quality Control Act, and Fish and Game Code streambed alternation agreement requirements. In addition to providing impact mitigation, this Plan is intended to aid in the recovery and possible delisting of listed species. The Plan's Conservation Strategy (Chapter 7) may help preclude the need to list additional species in the future through the preservation of habitat that benefits species.

The SSHCP will offer numerous benefits, including the following:

- Provides County, City of Galt, and City of Rancho Cordova residents with an interconnected Preserve System that maintains natural communities and species habitat at a regional scale including aquatic resources and other biological resources and maintains open space and intact watersheds for future generations.
- Conservation of native species that live in or move through the Plan Area.
- Offers protection for a broad range of native species and species habitats in a regionally coordinated manner to provide greater opportunity for long-term viability of native species populations; conserves and enhances ecosystem functions; and establishes a substantial system of interconnected Preserves that are located in areas with the highest-quality species habitat. The SSHCP will provide landscape-level Preserves and will

connect the existing patchwork of mostly small, isolated, and noncontiguous Preserves throughout the Plan Area that resulted from past project permitting.

- Provides for the protection and enhancement of stream, riparian, and aquatic resources, which are expected to help maintain water quality throughout the region.
- Re-establishes species habitat where habitat once occurred in the Plan Area.
- Affords an opportunity for landowners to voluntarily sell conservation easements that will preserve existing agricultural practices and uses for future generations.
- Allows for an expedited and predictable process for project permitting under the federal ESA, CESA, and 404 of the CWA. Because the requirements to obtain incidental take coverage are standardized in the SSHCP, the Plan makes the requirements and their associated costs more predictable.
- Allows for an expedited and predictable process for project permitting under Sections 401 of the CWA and Porter-Cologne Water Quality Control Act as well as Section 1600 of the California Fish and Game Code.
- Provides a means to preserve habitat resources that occur within designated Critical Habitat and Core Recovery Areas.
- Provides future incidental take authorization of currently non-listed federal species that may become listed during the Permit Term.
- Allows a reasonable amount of development to occur that supports economic growth.

Incidental take authorization will be granted to the Plan Permittees by the USFWS and CDFW ITPs. The Plan Permittees are asking the USFWS and CDFW to issue permits that allow incidental take of Covered Species when the take is consistent with the provisions of this Plan, the Implementing Agreement[3] (see Appendix C), and the terms and conditions of the ITPs. The Plan includes a Conservation Strategy to compensate for impacts to the Covered Species. The Conservation Strategy also provides for the conservation and management of Covered Species and their habitats.

It is expected that each of the Plan Permittees (including the Plan's future Implementing Entity) will be a permittee on the federal ESA Section 10(a)(1)(B) ITP and a permittee on the California Fish and Game Section 2081 ITP that will authorize species take that results from implementation of SSHCP Covered Activities (Chapter 5). The Plan Permittees will also receive a Master Streambed Alteration Agreement. Finally, the Plan will address federal CWA and California

[3] The purpose of an HCP Implementing Agreement, when used, is to ensure that each permittee and all other parties understand their roles and responsibilities under the HCP, the Endangered Species Act Section 10(a)(1)(B) ITP, and the California Endangered Species Act ITP and to provide remedies should any party fail to fulfill its obligations (USFWS and NOAA 1996).

Porter-Cologne Water Quality Control Act permitting requirements through an ARP and subsequent permitting strategy prepared by the USACE and RWQCB. While the Plan Permittees will not hold permits to address CWA and California Porter-Cologne Water Quality Control Act permitting requirements (with some exceptions as discussed in the ARP) the CWA and California Porter-Cologne Water Quality Control Act permitting strategy prepared by the USACE and RWQCB specifically for the SSHCP will significantly streamline the permitting process.

In addition to their own Covered Activities, the three local Land Use Authority Permittees (County, City of Galt, and City of Rancho Cordova) can also extend incidental take coverage provided by the ITPs to third-party projects that are Covered Activities and under their jurisdiction.[4] The USFWS will also provide "no surprises" assurances to the Plan Permittees, where the USFWS will not require the commitment of additional land, water, or financial compensation (or additional restrictions on the use of land, water, or other natural resources) for impacts to Covered Species beyond the level agreed upon and described in the Plan—as long as the Plan Permittees are adequately implementing the Plan (see Chapter 9). Compliance with the Plan will also satisfy CEQA mitigation requirements for impacts to biological resources.

It should be noted that the SSHCP is not a land use document. All land use decisions will continue to be made by the respective jurisdictions consistent with their existing authority, regulations, and policies. Neither implementation of the SSHCP nor issuance of the ITPs constitutes approval of the activities or projects that could obtain federal ESA and CESA coverage under the SSHCP permits. Such land use approvals can only be obtained from the relevant jurisdiction (the relevant Land Use Authority Permittee) through the existing land use approval processes.

1.1.3 Background

The SSHCP was first initiated to implement Sacramento County General Plan Policies that promote the protection of natural resources while providing an alternative means to comply with ESA permitting processes. In 2011, the County updated its General Plan and incorporated several policies designed to mirror objectives from the SSHCP. The SSHCP provides a means to implement several of those County policies (see Chapter 4, Land Use), including, but not limited to, Policy CO-58, which ensures no-net-loss of wetlands, riparian woodlands, and oak woodlands, and Policy CO-65, which requires the creation of a network of Preserves linked by Wildlife Movement Corridors.

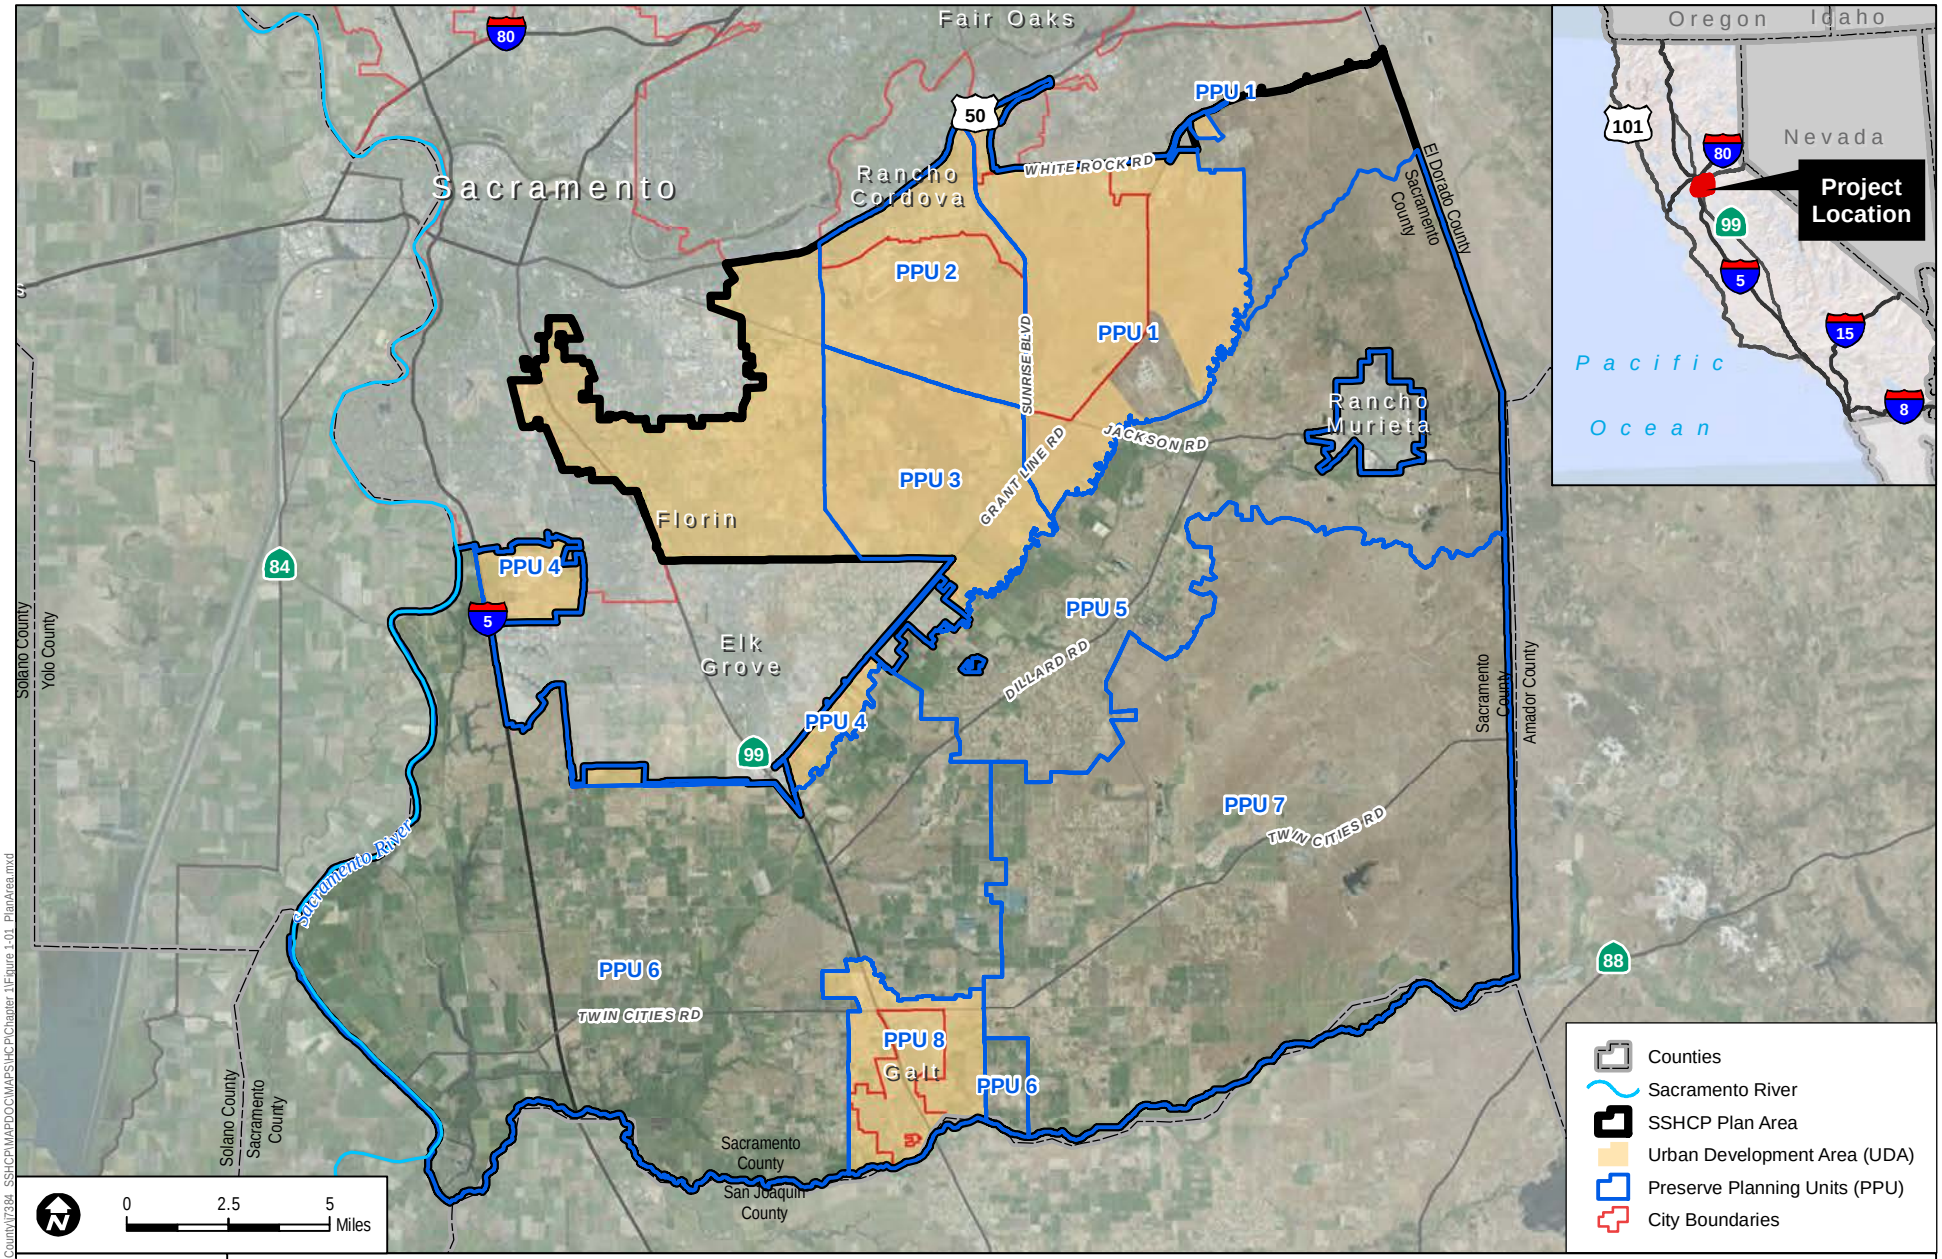
[4] Note that the USFWS and CDFW permits will only authorize the incidental take of Covered Species. Most projects will also require additional local authorization (e.g., California Environmental Quality Act (CEQA)), and some projects will also require additional state or federal authorizations.

The SSHCP also provides a means to comply with two completed Biological Opinions (BOs) issued by the USFWS in response to an ESA consultation regarding water contracts for Sacramento County. In March of 1999, the Zone 40 BO (USFWS 1999) was issued by USFWS regarding water contracts for portions of Sacramento County under Public Law (P.L. 101-514). The Zone 40 BO requires U.S. Bureau of Reclamation, San Juan Water District (District), the County, and SCWA to implement various habitat conservation measures. One such measure requires the Bureau of Reclamation, District, County, and SCWA to identify goals for habitat conservation in their respective jurisdictions to conserve vernal pool species and associated upland habitats; a goal that could be achieved through the preparation of a regional HCP. The Zone 40 BO further specifies that the County shall diligently pursue completion of an HCP to obtain an ITP for indirect effects of the water contracts on federally listed species. In September of 2004, the County, SCWA, SRCSD, and USFWS signed a Memorandum of Agreement that set forth several agreements and courses of action that would allow projects in Sacramento County to proceed through construction permitting, including federal ESA Section 7 consultations, in a reasoned and legally permissible manner (County of Sacramento et al. 2004). The Memorandum of Agreement states that future development projects in Zone 40 will incur direct and indirect effects under the federal ESA, and further outlines the means by which those species effects could be addressed. The four parties agreed that the County will proceed with completion of the SSHCP as the most efficient means to address those future effects.

In December of 2004, the Freeport Regional Water Project BO was issued (USFWS 2004) to cover the Bureau of Reclamation's (1) authorization for East Bay Municipal Utility District (EBMUD) and SCWA to use the new water diversion facility on the Sacramento River at Freeport; (2) authorization for the Freeport Regional Water Agency and EBMUD to use the Folsom South Canal to convey EBMUD's Central Valley Project water; (3) fulfillment of EBMUD contract to complete federal ESA compliance before delivering any water to EBMUD; and (4) approval of an assignment of 30,000 acre-feet annually of water from Sacramento Municipal Utilities District to SCWA. The Freeport Regional Water Project Freeport Regional Water Project BO also reinitiated consultation on the Bureau of Reclamation's long-term Central Valley Project water contract with SCWA. The Freeport Regional Water Project BO heavily references both the Zone 40 BO and the County of Sacramento agencies Memorandum of Agreement (County of Sacramento et al. 2004), including County completion of a regional HCP. Future development projects that would receive water service provided through the new Freeport Regional Water Project facilities must comply with the federal ESA before receiving entitlements from the County, and before water can be delivered. Projects must first demonstrate compliance with the federal ESA or the County will withhold approval of final maps, improvement plans, or building permits, and the SCWA will not issue a will-serve letter. The County and SCWA have determined that the most efficient means to comply with the 2004 Memorandum of Agreement is through preparing and implementing the SSHCP.

1.2 Scope of the Habitat Plan

This section describes the Plan's geographic scope, Covered Activities, Permit Term, and Covered Species.



1.2.1 Geographic Scope of the Plan Area

The Plan Area includes 317,655 acres within south Sacramento County, including the City of Galt and most of the City of Rancho Cordova (see Figure 1-1, SSHCP Plan Area). The Plan Area is defined as the area in which all Conservation Actions will be implemented and where all incidental take will occur. The boundary of the Plan Area was defined using political and ecological factors. The geographical boundaries are U.S. Highway 50 to the north, the Sacramento River levee and County Road J11 (Walnut Grove-Thornton Road) to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and the San Joaquin County line to the south.

The Plan Area excludes the northern portion of Sacramento County, the northern portions of the City of Rancho Cordova, the City of Sacramento, the City of Elk Grove, the City of Folsom, the sovereign lands of the Miwok Tribe, and the Sacramento County community of Rancho Murieta (see Figure 1-1). These areas were excluded from the Plan Area because they were either significantly built out, would not use the SSHCP, or were not likely to benefit from the SSHCP due to the absence of listed species or their habitats. The sovereign lands of the Miwok Tribe are not included as the tribe is not a proposed Plan Permittee.

SSHCP Urban Development Area

The Plan Area is functionally divided into two components: inside and outside of an Urban Development Area (UDA). Inside the UDA is predominantly where development Covered Activities under this Plan will occur and, therefore, where most incidental take will occur. There will also be some habitat preservation within the UDA. The "inside the UDA" component totals 67,618 acres within the Plan Area. Geographically, the UDA is the portion of the Sacramento County Urban Services Boundary (USB), the incorporated Cities of Rancho Cordova and Galt, and Galt's Sphere of Influence that are also within the Plan Area (see Figure 1-1) because these are the Plan Partners for the SSHCP. The Plan Area component located outside of the UDA totals 250,038 acres. No urban development is covered under the SSHCP outside of the UDA. A limited amount of incidental take is requested for specific infrastructure projects and for species conservation activities proposed outside of the UDA. It should be noted that the SSHCP is not a land use plan and does not preclude non-SSHCP activities from occurring outside of the UDA.

INTENTIONALLY LEFT BLANK

SSHCP Preserve Planning Units

To assist with development of the SSHCP Conservation Strategy, the Plan Area was further divided into eight Preserve Planning Units (PPUs) that encompass areas where important Covered Species resources are present, and where habitat preservation will be planned (see Figure 1-1). These eight SSHCP PPUs are geographic subdivisions of the Plan Area designed to ensure that adequate Biological Goals and Measurable Objectives (see Chapter 7) were developed for all biological resources located within the Plan Area.

PPUs were delineated to capture specific habitat or agricultural land cover types or areas identified as being important for a specific suite of species. For instance, PPU 7, which is located in the southeastern portion of the Plan Area, was delineated to encompass the vast majority of vernal pool grasslands remaining in the County. PPU 7 also contains the designated Cosumnes/Rancho-Seco Core Recovery Area (C/RS) (USFWS 2005). PPU 2 contains the designated Mather Core Recovery Area (USFWS 2005). PPU 6, located in the southwestern portion of the Plan Area, was delineated to encompass a vast majority of agricultural cover types that provide foraging habitat for many covered raptor species. While geopolitical or physical landmarks were used to delineate some PPU boundaries, this was done for ease of mapping and to make locating PPU boundaries in the field easier.

PPUs 1 through 4 and 8 are within the UDA. However, a small portion of PPU 1 (2,156 acres near the County landfill) is located outside of the UDA. PPUs 5, 6, and 7 are outside the UDA.

A portion of the Plan Area in the middle of the UDA (14,085 acres) and a small portion of the area outside of the UDA in the extreme northeastern portion of the Plan Area (9,245 acres) are not within a PPU (see Figure 1-1). A complete description of each PPU, including species occurrences and land cover types within each PPU, can be found in Chapter 3, Biological Resources Setting.

1.2.2 Covered Activities

As discussed in Chapter 5, SSHCP Covered Activities are projects or activities that were evaluated during development of the Plan and are allowable under the Plan's ITPs. The Covered Activities provide for the expansion of the urbanizing areas within the County's existing USB, within the current city limits of Galt and Rancho Cordova, and within the extra territorial Sphere of Influence for the City of Galt (i.e., within the SSHCP's UDA, as defined in Section 1.2.1). Covered Activities within the UDA include activities and projects related to urban development and associated infrastructure that are consistent with the General Plans of the three Land Use Authority Permittees, as well as specific activities and projects related to transportation, water, and wastewater development. In-stream maintenance occurring within the UDA (e.g., vegetation and sediment

removal) will also be a Covered Activity under the Plan. Covered Activities outside of the UDA are limited to specific infrastructure projects related to roadway improvements and recycled water delivery. The SSHCP Covered Activities also include actions within the proposed SSHCP Preserve System related to the management and monitoring of preserved habitats, the enhancement of habitat, and the re-establishment of habitat within the SSHCP Preserve System. Chapter 5, Covered Activities, describes the proposed Covered Activities by type, with lists of anticipated covered activities and projects, if currently known.

1.2.3 Permit Term

The Permit Term defines the length of time in which ITPs issued by the Wildlife Agencies (USFWS and CDFW) can be used by the Plan Permittees for incidental take resulting from Covered Activities, and the timeframe in which all Conservation Actions outlined in the SSHCP Conservation Strategy must be completed. The Plan Permittees are seeking ITPs that are valid for a term of 50 years. The Plan Permittees can request a permit extension upon or prior to expiration of the original permit by applying to the state and federal Wildlife Agencies. The ITP term is based on the projected timeframe for buildout to occur within the Plan's UDA, as well as the timeframe to complete proposed capital improvement projects. While it is difficult to predict trends in urban development beyond a 15- to 20-year timeframe, a 50-year permit is believed to be reasonable and necessary to provide sufficient time to implement Covered Activities and to complete the establishment of the Preserve System. For purposes of the SSHCP, the term "full buildout" is defined as the total development of the UDA, with the exception of planned UDA Preserves as described in Chapter 7.

A summary of major local planning documents and their respective time horizons is provided in Table 1-1. Urban development consistent with County and City General Plans accounts for a vast majority of the take that will occur from Covered Activities addressed under the Plan (City of Galt 2009; City of Rancho Cordova 2006; County of Sacramento 2011). The County has a designated USB that acts as a de-facto urban growth line. The County will not provide water or sewer services to projects located outside of the USB. The County predicts that the USB contains enough land to support at least 50 years of urban development (County of Sacramento 2011).

Table 1-1
Local Planning Documents and Time Horizons Relevant to the Permit Term

Document	Date Produced	Projection/Time Horizon	Plan Duration
City of Galt General Plan	2009	2030	16 years
City of Rancho Cordova General Plan	2006	2030/2050	16–36 years
County of Sacramento General Plan	1993; updated 2011	2030	16 years
County of Sacramento General Plan USB	1993	At least until 2060	46 years

Sources: City of Galt 2009; City of Rancho Cordova 2006; County of Sacramento 2011.

In addition, timelines for funding and completing capital improvement projects often extend for decades. A Permit Term that allows for the completion of Covered Activities that are associated with construction of planned capital improvement projects, such as the Southeast Connector and recycled water projects, will likely take more than four decades to complete. Other planned Covered Activity projects (see Chapter 5) may take several decades to receive the funding needed to implement them, such as safety improvements proposed for many roadways within the Plan Area.

Some Covered Activities are not expected to be implemented until later in the 50-year Permit Term. Such activities include the many bridge replacement projects and several road-widening projects, as described in Chapter 5. Therefore, a longer Permit Term is necessary to anticipate and adequately mitigate the impacts of these projects on the Covered Species.

Recurring maintenance activities are expected to continue in perpetuity; consequently, take authorization for these activities is needed for as long a period as is feasible. As described in Chapter 5, these recurring Covered Activities might affect the Covered Species throughout the proposed 50-year Permit Term. For example, road maintenance performed by the County occurs annually. Maintenance on rural roads might affect habitat for many Covered Species, including California tiger salamander (*Ambystoma californiense*), western spadefoot (*Spea hammondii*), western burrowing owl (*Athene cunicularia hypogea*), and many covered plant species. Similarly, recurring maintenance on flood control and storm drainage facilities by SCWA are covered in this Plan (see Chapter 5), and might affect aquatic Covered Species for the duration of the Permit Term. For example, maintenance of waterways has the potential to affect giant gartersnake (*Thamnophis gigas*) and western pond turtle (*Actinemys marmorata)*.

A 50-year Permit Term is also necessary to establish the operational SSHCP Preserve System described in Chapter 7, and to develop and test the Preserve System Management and Monitoring programs described in Chapter 8. Because the Plan only acquires conservation easements or land in fee title from willing sellers (see Chapter 9), it is anticipated that it could take several decades to acquire enough land to complete the SSHCP Preserve System. Many landowners, who may be interested in selling an easement or land, may not be willing to do so now for estate planning and/or tax purposes. A 50-year Permit Term provides adequate time for willing landowners to become available and for the Plan's Implementing Entity to negotiate fee title or conservation easement acquisitions.

Monitoring and assuring the success of habitat re-establishment/establishment actions (described in Chapter 8) is expected to take 5–10 years for each re-establishment/establishment project. Most habitat re-establishment/establishment actions cannot be initiated until land is acquired for the Preserve System. A Permit Term of 50 years is necessary to allow enough time to complete land acquisition with at least 5 years remaining on the permit in which to successfully initiate or complete (and possibly remediate if necessary) all re-establishment/establishment actions. The

Plan Permittees have committed to installing all habitat re-establishment/establishment projects by year 40. Therefore, a 50-year Permit Term is necessary to complete these actions and to leave sufficient time for monitoring the effectiveness of these actions before the Permit Term ends.

A 50-year Permit Term also allows sufficient time to generate the necessary funding for Plan implementation. As described in Chapter 12, Economic Analysis and Funding Program, the Plan will primarily be funded by development fees collected when Covered Activities and projects are approved by the Plan Permittees. Many of the Plan's Covered Activities will not occur for decades, as explained above. A 50-year Permit Term provides the time necessary to ensure adequate funding for Preserve acquisition and to establish the non-wasting endowment that is required to fund monitoring and management in perpetuity.

Based on the implementation horizon for Covered Activities, the recurring operation and maintenance activities, the need to acquire lands and develop a successful Preserve System, and the need for adequate funding, the Plan Permittees have determined that a 50-year Permit Term would best address regulatory and biological considerations. In summary, the 50-year Permit Term provides sufficient time to accomplish the following critical elements of the Plan:

- Fully implement the current general plans of the cities and the County;
- Fully implement the Plan Permittees' capital projects that are covered by the Plan;
- Implement the Plan Permittees' ongoing maintenance activities as long as feasible;
- Allow sufficient time to assemble the SSHCP Preserve System from willing sellers and partnerships with local agencies and private landowners;
- Secure all necessary funding for Plan implementation during the Permit Term and secure funds during the Permit Term to fund the Plan's Conservation Strategy in perpetuity;
- Develop an effective Preserve System maintenance, monitoring, and adaptive management program (Chapter 8) that will be implemented in perpetuity (as discussed in Chapter 8, an adaptive management program will be included in the SSHCP); and
- Provide sufficient incentive for the Plan Permittees to commit the substantial resources necessary to complete the SSHCP (i.e., the Permit Term covers enough projects and activities to make the large up-front investment in the Conservation Strategy cost-effective).

1.2.4 Covered Species

Covered Species are species that will be listed on the CESA and federal ESA ITPs issued by the two Wildlife Agencies (USFWS and CDFW). The Plan addresses 28 Covered Species (20 wildlife species and 8 plants), of which, 11 are currently listed as threatened or endangered under CESA or the federal ESA (see Table 1-2 for a complete list of species covered under this

Plan). The 28 species were identified through a species evaluation and selection process, as discussed below.

Status Definitions

Federal:

E = Listed as endangered under the federal ESA
T = Listed as threatened under the federal ESA
* = Species has designated Critical Habitat located within the Plan Area.
— = No federal ESA listing
BCC = Bird of Conservation Concern, USFWS 2008.

State:

E = Listed as endangered under CESA
T = Listed as threatened under CESA
CFP = Fully protected under the California Fish and Game Code
CSC = Species of special concern in California
WL = Watch List
— = No state status

California Native Plant Society California Rare Plant Rank (CRPR)

1B = Rare, threatened, or endangered in California and elsewhere
2 = Rare, threatened, or endangered in California but more common elsewhere

CRPR Threat Ranks

0.1 = Seriously threatened in California (high degree/immediacy of threat)
0.2 = Fairly threatened in California (moderate degree/immediacy of threat)
0.3 = Not very threatened in California (low degree/immediacy of threats or no current threats known)

Species Evaluation

A Technical Advisory Committee (TAC) composed of local species experts compiled an initial list of 90 species to be considered for coverage under the Plan. The TAC identified all special-status species that also had the potential to occur within the Plan Area using data from a variety of sources, including CDFW's California Natural Diversity Database (CNDDB), USFWS files and databases, California Native Plant Society (CNPS) plant inventories, Sacramento County Audubon files, and solicited opinions from local experts, university researchers, and resource agency staff.

The initial list of 90 special-status species was compiled for the Plan Area. "Special status" is defined using the following criteria:

- Listed as Threatened or Endangered by the USFWS (50 CFR 17.11 [listed animals] 50 CFR 17.12 [listed plants], and various notices in the Federal Register [proposed and candidate species]);
- Listed or candidate for listing as Rare, Threatened, or Endangered under CESA (14 California Code of Regulations [CCR] 670.5);
- Designated as a "bird species of concern" by the USFWS;
- Designated as a species of special concern by the CDFW;
- Subject to protection under California Fish and Game Code Section 3503.5 (breeding raptors);
- Designated as Fully Protected under California Fish and Game Code Section 3511(birds), Section 4700 (mammals), Section 5515 (fish), and Section 5050 (reptiles and amphibians);
- Determined to meet the definition of rare or endangered under CEQA (CEQA Guidelines, Section 15380);
- Designated as a California Rare Plant Rank (CRPR) 1B (rare, threatened, or endangered throughout its range) or CRPR 2 (rare, threatened, or endangered in California but more common elsewhere) in the CNPS inventory; or
- No special status but are believed by local experts to be rare enough to merit listing within the timeframe of this Plan.

The initial list of 90 species was eventually reduced to 28 proposed Covered Species (Table 1-2). Species were eliminated from consideration as Covered Species if the TAC determined the species would not be adversely affected by Covered Activities, if the TAC determined that there was not enough information available to adequately evaluate impacts to the species or to identify adequate conservation measures to offset those impacts.

The Plan includes Conservation Actions to protect all 28 Covered Species whether or not they are currently listed under the ESA or the CESA. As SSHCP Covered Species, any currently non-listed species that is covered under the Plan will not require additional conservation within the Plan Area should the species become listed under the federal ESA during the Plan's Permit Term. As discussed in Chapter 11, the USFWS ITP will include "no surprises" assurances to the Plan Permittees for all Covered Species, regardless of their ESA listing status (Chapter 11). However, Covered Species that are currently not listed but become listed under CESA will require an amendment to the CDFW ITP to be covered by CESA.

Owing to the rarity of slender Orcutt grass (*Orcuttia tenuis)* and Sacramento Orcutt grass (*Orcuttia viscida)*, the Plan Permittees are not requesting incidental take coverage for those Covered Species (see Chapter 5); rather the SSHCP Conservation Strategy (Chapter 7) will fully avoid and protect all slender Orcutt grass and Sacramento Orcutt grass occurrences within the Plan Area.

Two of the proposed SSHCP Covered Species (white-tailed kite [*Elanus leucurus*] and greater sandhill crane [*Grus canadensis tabida*]) are designated as Fully Protected Species under the California Fish and Game Code Section 3511 and thus direct injury or mortality of those Covered Species will not be included in the state or federal ITPs. Therefore, this Plan also includes Avoidance and Minimization Measures (AMMs) to avoid direct death or injury of white-tailed kite and greater sandhill crane during the implementation of any SSHCP Covered Activity.

1.2.5 Areas Outside the UDA

As discussed, the SSHCP provides a streamlined permitting process for Covered Activities identified in the Plan. This does not preclude activities from occurring outside the UDA, provided they obtain the legally required local, state, and federal permits and approvals otherwise and customarily required, including mitigation for impacts caused by those activities. The required mitigation should be crafted in consultation with the Implementing Entity, but the final decision will be made by the applicable lead agency pursuant to their thresholds and regulations.

1.3 Regulatory Setting

The Plan is designed to comply with the federal ESA and the CESA, as well as the federal CWA, the California Porter-Cologne Water Quality Control Act, and the California Fish and Game Code Sections 1600–1616. The Plan is also consistent with other federal and state wildlife and natural resource–related laws and regulations, listed here and described in greater detail below:

- Migratory Bird Treaty Act
- Bald and Golden Eagle Protection Act

- California Fish and Game Code, Sections 3511, 4700, 5050, and 5515 (fully protected species)
- California Fish and Game Code, Section 3503 (bird nests)
- California Fish and Game Code, Section 3503.5 (birds of prey)
- National Environmental Policy Act of 1969 (NEPA)
- California Environmental Quality Act of 1970 (CEQA)
- National Historic Preservation Act (NHPA).

1.3.1 Federal and State Endangered Species Laws

Federal Endangered Species Act

USFWS and the National Marine Fisheries Service (NMFS) administer the federal ESA. The federal ESA requires USFWS and NMFS to maintain lists of threatened and endangered species and affords substantial protection to listed species. NMFS' jurisdiction under the ESA is limited to the protection of marine mammals, marine fishes, and anadromous fishes; all other listed species are subject to USFWS jurisdiction. USFWS and NMFS can list species as either endangered or threatened. An endangered species is at risk of extinction throughout all or a significant portion of its range (16 U.S.C. 1532). A threatened species is likely to become endangered within the foreseeable future (16 U.S.C. 1533). Seven SSHCP Covered Species are listed under the federal ESA: Sacramento Orcutt grass, slender Orcutt grass, vernal pool tadpole shrimp (*Lepidurus packardi*), vernal pool fairy shrimp (*Branchinecta lynchi*), valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), California tiger salamander, and giant gartersnake (Table 1-2).

Section 9

Section 9 of the federal ESA prohibits the "take" of any fish or wildlife species listed under the ESA as endangered or threatened.[5] "Take," as defined by the federal ESA, means "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct" (16 U.S.C. 1533). "Harm" in the definition of "Take" means "an act that kills or injures the species, including significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering" (50 CFR 17.3). "Harass" in the definition of "Take" means "an intentional or negligent act or omission which creates the likelihood of injury to wildlife by

[5] The protection of threatened species under Section 9 is discretionary through a rule issued under Section 4(d) of the federal ESA. By regulation, the USFWS automatically affords Section 9 protections to threatened species at the time of listing.

annoying it to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to breeding, feeding, or sheltering" (50 CFR 17.3). Section 9 also prohibits the "removal or reduction to possession" of any listed plant species "under federal jurisdiction" (e.g., on federal land, where federal funding is provided, or where federal authorization is required). The take prohibition for listed plants is more limited than for listed fish and wildlife. Under Section 9(a)(2)(B) of the ESA, listed plants are protected from "removal, reduction to possession, and malicious damage or destruction" in areas that are under federal jurisdiction. Section 9(a)(2)(B) of the ESA also provides protection to plants from removal, cutting, digging up, damage, or destruction where the action takes place in knowing violation of any state law or regulation or in violation of a state criminal trespass law. Thus, the ESA does not prohibit the incidental take of federally listed plants on private or other nonfederal lands unless the action requires federal authorization or is in violation of state law or regulation.

Even though under the ESA there is limited prohibition for incidental take of plants on nonfederal lands, the SSHCP includes many plant Covered Species (see Table 1-2), and the Plan Permittees are requesting that the plant Covered Species be included on the ITPs when they are issued. Some plants are Covered Species to meet regulatory obligations under ESA Section 7—the USFWS must review the effects of its own actions on federally listed plants, even when those listed plants are found on private lands. Also, all plant species protected by state law (e.g., CESA) are also subject to the ESA Section 9 take prohibition. Incidental take authorization is also requested for the eight plant Covered Species to provide the Plan Permittees with ESA Section 10 "no surprises" assurances for the plant Covered Species.

The federal ESA includes mechanisms that provide exceptions to the Section 9 take prohibitions. These exemption mechanisms are addressed in Section 7 for federal actions and Section 10 for nonfederal actions.

Section 7

Section 7 of the federal ESA requires all federal agencies to ensure that any action they permit, authorize, fund, or carry out is not likely to jeopardize the continued existence of any listed species or result in the destruction or adverse modification of habitat critical to such species' survival. To ensure that its actions do not result in jeopardy to listed species or in the adverse modification of Critical Habitat,[6] each federal agency must consult with USFWS or NMFS or both regarding federal agency actions that may affect listed species. Consultation begins when the federal agency submits a written request for initiation to USFWS or NMFS, along with the

[6] Critical Habitat is defined as specific geographic areas, whether occupied by listed species or not, that are determined to be essential for the conservation and management of listed species, and that have been formally described and designated in the Federal Register.

agency's biological assessment of its proposed action, and when USFWS or NMFS accepts that biological assessment as complete. If USFWS or NMFS concludes that the action is not likely to adversely affect a listed species, the action may be conducted without further review under the federal ESA. Otherwise, USFWS or NMFS must prepare a written BO under ESA Section 7 describing how the agency's action will affect the listed species and its Critical Habitat.

If a BO concludes that the proposed action would jeopardize the continued existence of a listed species or adversely modify its designated Critical Habitat, the opinion will suggest "reasonable and prudent alternatives" that would avoid that result. If a BO concludes that the proposed action would take a listed species but would not jeopardize its continued existence, the BO will include an incidental take statement. Incidental take is take that is "incidental to, and not intended as part of, an otherwise lawful activity" (50 CFR 402.02). The incidental take statement specifies an amount of species take that is allowed to occur as a result of the proposed action, and may require reasonable and prudent measures to minimize the impact of the take.

Projects with a federal lead agency or a federal nexus (e.g., requires a federal permit or federal funding, is carried out by a federal agency, or is a project on federal land) can obtain species take authorization through ESA Section 7 rather than ESA Section 10. The proposed issuance of an ITP by the USFWS for the SSHCP is a federal action, and therefore, requires the USFWS to consult under Section 7 of the ESA. To comply with Section 7 of the ESA, the USFWS Sacramento Field Office would conduct an internal Section 7 consultation with the USFWS Region 8 office concerning the region's decision to issue ITPs to the Plan. The results of this internal consultation would be documented in a BO, which would be prepared prior to the ITP decision for the SSHCP.

Section 10

Until 1982, state, local, and private entities had no means to acquire incidental take authorization as could federal agencies under Section 7. Private landowners and local and state agencies risked violation of the federal ESA no matter how carefully their projects were implemented. This statutory dilemma led Congress to amend Section 10 of the ESA in 1982 to authorize the issuance of an ITP to nonfederal project proponents upon completion of an approved conservation plan. The term "conservation plan" has evolved into "habitat conservation plan."

In cases where federal land, funding, or authorization is not required for an action by a nonfederal entity, the take of listed fish and wildlife species can be permitted by USFWS and/or NMFS through the Section 10 process. Private landowners, corporations, state agencies, local agencies, and other nonfederal entities must obtain a Section 10(a)(1)(B) ITP for "take" of federally listed fish and wildlife species "that is incidental to, but not the purpose of, otherwise lawful activities."

All HCPs must specify the following mandatory elements:

- The impact that will likely result from the taking of Covered Species;
- The steps the Plan Permittees will take to monitor, minimize, and mitigate such impacts to the maximum extent practicable;
- The funding that will be available to implement such steps;
- The procedures to be used to deal with unforeseen circumstances;[7]
- The alternative actions to such taking the Plan Permittees considered and the reasons why such alternatives are not proposed to be utilized; and
- Such other measures that the Director [of the Department of Interior or Commerce] may require as being necessary or appropriate for purposes of the plan (50 CFR 17.22[b]).

The SSHCP is intended to satisfy these requirements. To receive an ITP, Section 10(a)(2)(B) of the federal ESA and permit regulations 50 CFR 17.22(b)(2) and 17.32(b)(2) require that the following permit issuance criteria be met:

- The taking will be incidental to otherwise lawful activities;
- The Plan Permittees will minimize and mitigate the impacts of such taking to the maximum extent practicable;
- The Plan Permittees will ensure adequate funding for the HCP and for procedures to deal with changed and unforeseen circumstances;
- The taking will not appreciably reduce the likelihood of survival and recovery of the species in the wild (i.e., will not cause jeopardy under Section 7(a)(2) of the ESA);
- The Plan Permittees will ensure that other measures that the USFWS may require as being necessary or appropriate will be provided; and
- The USFWS has received such other assurances as may be required that the HCP will be implemented.

Prior to the issuance of an ITP, USFWS is required to undertake an internal Section 7 consultation because issuance of an ITP is a federal action. [8] (See the prior discussion of ESA Section 7.) Elements specific to the Section 7 process that are not required under the Section 10

[7] "Unforeseen circumstances" are changes in circumstances affecting a Covered Species or geographic area covered by the HCP that could not reasonably have been anticipated by the plan developers, and that result in a substantial and adverse change in the status of a Covered Species.

[8] When USFWS issues a permit, they will consult with themselves and the National Marine Fisheries Service (NMFS), if necessary.

process (e.g., analysis of impacts on designated Critical Habitat, analysis of impacts on listed plant species, and analysis of indirect and cumulative impacts on listed species) are included in this Plan in part to meet the requirements of Section 7.

In June 2000, USFWS and NMFS adopted the "Five-Point Policy" designed to clarify elements of the national HCP program as it relates to biological goals, monitoring, adaptive management, permit duration, and public participation (USFWS and NOAA 2000). The Five-Point Policy directs that the following five elements be addressed in the development of all HCPs:

1. **Biological Goals and Measurable Objectives:** HCPs are required to define the Biological Goals and Measurable Objectives that the plan is intended to achieve. Biological Goals and Measurable Objectives clarify the purpose and direction of the plan's Conservation Strategy, including specific measurable targets that the plan is intended to meet. The Biological Goals and Measurable Objectives of the SSHCP are described in Chapter 7, Conservation Strategy.
2. **Monitoring:** Monitoring is a mandatory element of all HCPs. HCPs are required to include provisions for monitoring actual effects, monitoring to gauge the effectiveness of the plan in meeting the Biological Goals and Measurable Objectives, and verification that the terms and conditions of the plan are being implemented properly. Each HCP's monitoring program should be customized to reflect the biological goals, the scope, and the particular implementation tasks of the HCP. The project proponent should structure the monitoring methods and standards so results can be compared from one reporting period to another period, or to compare different areas. Monitoring protocols and units should reflect the biological objectives' measurable units, and be based on sound science. Standard survey or other previously established monitoring protocols should be used. The SSHCP monitoring plan is described in Chapter 8.
3. **Adaptive Management:** The Five-Point Policy encourages the inclusion of adaptive management strategies in HCPs in appropriate circumstances to address uncertainty about species covered by a plan. The USFWS describes adaptive management as a "method for examining alternative strategies for meeting Biological Goals and Measurable Objectives, and then, if necessary, adjusting future conservation management actions according to what is learned" (USFWS and NOAA 2000). As described in Chapter 8, the SSHCP will include an adaptive management plan as part of each Preserve Management Plan.
4. **Permit Duration:** Consistent with the Five-Point Policy, the USFWS considers several factors in determining the term of an ITP. For instance, the agency takes into account the expected duration of the activities proposed for coverage and the anticipated positive and negative effects on Covered Species that would likely occur during the course of Plan implementation. The agency also factors in the level of scientific and commercial data

underlying the proposed Conservation Strategy, the length of time necessary to implement and achieve the benefits of the Conservation Strategy, and the extent to which the program incorporates adaptive management strategies. As described in Section 1.2.3, the proposed duration of the SSHCP ITP is 50 years.

5. **Public Participation:** Under the Five-Point Policy, the USFWS and NOAA have sought to increase public participation in the HCP process, including greater opportunities for the public to assess, review, and analyze HCPs and associated NEPA documentation. As provided by the Five-Point Policy, a minimum 90-day public comment period is appropriate for large-scale, regional, or complex HCPs that include an Environmental Impact Statement (EIS). The Five-Point Policy also encourages applicants for large-scale regional HCP efforts to provide extensive opportunities for public involvement during the HCP planning and implementation processes. The Five-Point Policy encourages the integration of a science advisory committee and other stakeholders during the development and implementation of an HCP, especially HCPs that include an adaptive management strategy. Advisory committees can assist the USFWS and the applicants in identifying key components of uncertainty and determining alternative strategies for addressing that uncertainty. An applicant, with guidance from the USFWS, may seek independent scientific review of specific sections of an HCP and its operating Conservation Strategy to ensure the use of the best scientific information.

California Endangered Species Act

CESA (California Fish and Game Code, Section 2050 et seq.) prohibits the taking of species listed as threatened or endangered under that act, or candidates for listing, except as authorized by state law. "Take" is defined under the California Fish and Game Code (more narrowly than under ESA) as any action or attempt to "hunt, pursue, catch, capture, or kill." Therefore, take under CESA does not include "the taking of habitat alone or the impacts of the taking" rather, the courts have affirmed that under CESA, "taking involves mortality" (*Environmental Council of Sacramento v. City of Sacramento* 2006). In addition, "harass" in the federal ESA definition of "take" is not included in the CESA definition of "take."

Section 2081 of CESA states that the incidental take of an endangered, threatened, or candidate species may be authorized by the CDFW if the impacts of the take are incidental to an otherwise lawful activity, are "minimized and fully mitigated," and do not "jeopardize the continued existence of [the] species." Any mitigation measures imposed under CESA must be measures "roughly proportional in extent to the impact of the authorized taking on the species." The requirements of an application for incidental take under CESA are described in Section 2081 of the California Fish and Game Code.

Plant Covered Species within the Plan Area that are listed by the State of California as endangered are Sacramento Orcutt grass, and plant species listed as threatened are slender Orcutt grass and Boggs Lake hedge-hyssop (*Gratiola heterosepala*). Bird Covered Species protected under the CESA are the state-threatened greater sandhill crane and Swainson's hawk (*Buteo swainsoni*). Other CESA listed animal species in the Plan Area are the state-threatened California tiger salamander and the giant gartersnake (see Table 1-2).

1.3.2 Other Federal and State Wildlife Laws and Regulations

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1918, as amended, implements various treaties and conventions between the U.S. and Canada, Japan, Mexico, and the former Soviet Union for the protection of migratory birds. Under the MBTA, taking, killing, or possessing migratory birds is unlawful, as is taking of any parts, nests, or eggs of such birds (16 U.S.C. 703 et seq.). "Take" is defined more narrowly under the MBTA than under the federal ESA and includes only the death or injury of individuals of a migratory bird species or their eggs, or the removal of active nests. As such, take under the MBTA does not include the concepts of habitat modification/degradation or harassment as defined under ESA take. The MBTA defines migratory birds broadly; all bird Covered Species in this Plan are migratory birds under the MBTA.

The USFWS provides guidance regarding take of federally listed migratory birds (Appendix 5 in the HCP Handbook [USFWS 1996]). According to these guidelines, a federal ITP can function as a Special Purpose Permit under the MBTA (50 CFR 21.27) for the take of all ESA-listed bird Covered Species in the amount and/or number and subject to the terms and conditions specified in an HCP. Any such permitted incidental take will not be in violation of the MBTA (16 U.S.C. 703 et seq.). All bird species covered under this Plan are protected by the MBTA (Table 1-2).

Should any of the covered birds become listed under ESA during the Permit Term, the ESA ITP would constitute a Special Purpose Permit under the MBTA for that species for a 3-year term as specified under 50 CFR 21.27, subject to renewal by the Plan Permittees.

Non-listed bird Covered Species as well as other migratory birds not covered by the permit will benefit from seasonal restrictions on construction and other Covered Activity AMMs described in this Plan. The creation of the SSHCP Preserve System and subsequent habitat restoration and management of each preserve will also be a significant "benefit to the migratory bird resource," as required by the Special Purpose Permit. Compliance with the conditions on Covered Activities described in Chapter 5 is consistent with the requirements of the MBTA for the covered

migratory birds. As discussed in Chapter 9, it will remain the responsibility of individual Third-Party Project Proponents to fully comply with the MBTA for non-covered migratory birds.

California Fully Protected Species

In the 1960s, before CESA was enacted, the California legislature identified specific species for protection under the California Fish and Game Code. These fully protected species may not be taken or possessed at any time, and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of bird species for the protection of livestock. Fully protected species are described in Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish) of the California Fish and Game Code. These protections state that "…no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to take any fully protected [bird], [mammal], [reptile or amphibian], [fish]." This Plan requires all Covered Activities to implement AMMs that avoid taking CESA fully protected species (see Chapter 5). Fully protected Covered Species are white-tailed kite and greater sandhill crane.

California Fish and Game Code, Section 3503

Section 3503 of the California Fish and Game Code makes it "unlawful to take, possess, or needlessly destroy the nests or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto." Therefore, CDFW may issue permits authorizing take. The Plan contains conservation measures to avoid and minimize such take to the maximum extent practicable in order to comply with Section 3503. However, some take to covered birds may still occur; the 2081 permit will serve as the authorization for take of nests or eggs of covered birds pursuant to Section 3503.

California Fish and Game Code, Section 3503.5

Section 3503.5 of the California Fish and Game Code prohibits the take, possession, or destruction of any birds of prey or their nests or eggs "except as otherwise provided by this code or any regulation adopted pursuant thereto." CDFW may issue permits authorizing take of birds of prey or their nests or eggs pursuant to CESA. The Plan requires all Covered Activities to implement AMMs that avoid and minimize take of birds of prey and comply with Section 3503.5.

The 2081 permit will serve as the authorization for take of birds, eggs, or nests that cannot be avoided pursuant to Section 3503.5.

1.3.3 National Environmental Policy Act

NEPA requires federal agencies to include in their decision-making process appropriate and careful consideration of all environmental effects of a proposed action and of possible alternatives, and ensure the environmental information is available to public officials and citizens before decisions are made and before actions are taken. Documentation of the environmental impact analysis and efforts to avoid or minimize the adverse effects of proposed actions must be made available for public notice and review. This analysis is documented in either an environmental assessment or an EIS. NEPA requires full disclosure of environmental effects. The issuance by USFWS of an ITP under Section 10 of the ESA constitutes a federal action. Therefore, a USFWS decision on the proposed SSHCP ITP must comply with NEPA.

NEPA regulations require, in part, that federal agencies eliminate duplication between NEPA and comparable state or local requirements (40 CFR 1500.4, 1506.2, and 43 CFR 46.430). These regulations require that federal agencies conduct: (1) joint planning processes; (2) joint environmental research and studies; (3) joint public meetings and hearings (except where otherwise provided by statute); (4) joint environmental analysis; and (5) to the fullest extent possible, preparation of joint environmental documents. In such cases, the federal agency and a state or local agency can be joint lead agencies on the environmental document. The USFWS and Sacramento County have prepared a joint EIS/EIR so that one environmental document will jointly comply with the federal NEPA and the state CEQA.

1.3.4 California Environmental Quality Act

CEQA requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. CEQA applies to discretionary activities that may cause either a direct physical change in the environment or a reasonably foreseeable indirect change in the environment and that are proposed to be carried out or approved by a California public agency, including state, regional, county, or local agencies. Adoption of the Plan by the Plan Permittees is an activity that is subject to CEQA. The County of Sacramento will serve as the lead agency under CEQA. The County and USFWS will jointly prepare an EIS/EIR so that one environmental document will comply with both NEPA and CEQA. All of the Project Proponents are either a CEQA lead agency (Sacramento County) or CEQA responsible agencies (City of Galt, City of Rancho Cordova, the SCWA, and the Connector JPA), and all are responsible for discretionary approvals of the SSHCP and associated ordinances and would be responsible for the future implementation of the SSHCP.

1.3.5 Federal and State Wetland Laws and Regulations

Federal Clean Water Act, Section 404

The CWA is the primary federal law that protects the physical, chemical, and biological integrity of the nation's waters, including lakes, rivers, wetlands, and coastal waters. Programs conducted under the CWA are directed at both point source pollution (e.g., waste discharged from outfalls and filling of waters) and nonpoint source pollution (e.g., runoff from parking lots). Under the CWA, the USEPA and state agencies set effluent limitations and issue permits under CWA Section 402 governing point-source discharges of wastes to waters. The USACE, applying its regulations and guidelines issued by USEPA, issues permits under CWA Section 404 for discharges of dredged or fill material into waters of the U.S.

The USACE issues two types of permits under Section 404: general permits (either nationwide permits, regional general permits, or programmatic general permits) and individual permits (either letters of permission or standard permits). General permits are issued by the USACE to streamline the Section 404 process for activities that have minimal environmental impacts, individually and cumulatively. Individual permits are issued for activities that do not qualify for a general permit (i.e., that may have more than a minimal adverse environmental impacts).

The Sacramento District of the USACE is considering development of a Section 404 permitting strategy for future SSHCP Covered Activities (USACE 2015). It is likely that the Section 404 permitting strategy would include some type of general permit for Covered Activities with minimal impacts, and an individual permitting process for other proposed Covered Activities. The USACE's future CWA 404 permit decision for Covered Activities would benefit from the extensive analysis completed as part of the SSHCP and associated EIS/EIR.

When a Section 404 permitting strategy for the SSHCP is developed, the USACE would request a programmatic consultation with USFWS under Section 7 of the federal ESA for potential impacts of all Covered Activities permitted under a SSHCP permitting strategy. It is expected that USFWS will not require future Covered Activities to provide species or habitat avoidance, minimization, or compensatory mitigation beyond that already required by the SSHCP. The Conservation Actions required by the SSHCP to avoid, minimize, and mitigate Covered Activity impacts to aquatic habitat are expected to also satisfy CWA 404 requirements for aquatic resources avoidance, minimization, and mitigation.

State of California Porter-Cologne Water Quality Control Act

Under CWA Section 401, the State of California has been granted the authority to certify that proposed activities requiring federal permits for discharges to waters comply with state water quality standards. The USACE cannot issue a permit under CWA Section 404 if the state denies certification

under CWA Section 401. In California, the State Water Resources Control Board (SWRCB) and the RWQCBs are responsible for the review of applications for Section 401 certifications. The Central Valley RWQCB has jurisdiction over all watersheds within the Plan Area.

The Porter-Cologne Water Quality Control Act is the primary state law regulating water quality. It authorizes the SWRCB and RWQCBs to prepare management plans such as regional water quality plans to address the quality of groundwater and surface water. The Porter-Cologne Water Quality Control Act also authorizes the RWQCBs to issue waste discharge requirements defining limitations on allowable discharge to waters of the state. In addition to issuing Section 401 certifications on Section 404 applications to place fill-in waters, the RWQCBs may also issue waste discharge requirements for such activities. Because the authority for waste discharge requirements is derived from the state Porter-Cologne Water Quality Control Act and not the federal CWA, waste discharge requirements apply to somewhat different aquatic resources than does Section 404. Several recent court cases have resulted in restrictions on the USACE's jurisdiction under Section 404. Consequently, waters of the state, subject to Porter-Cologne, constitute a larger suite of aquatic resources, including groundwater, which is not regulated under the CWA. Moreover, some actions may require waste discharge requirements, but not authorization by Section 404. The Plan includes a process for projects that are also SSHCP Covered Activities to comply with Section 401 requirements and waste discharge requirements under the Porter-Cologne Water Quality Control Act.

Streambed Alteration Agreement

CDFW has jurisdictional authority over streams, lakes, and wetland resources associated with these aquatic systems under California Fish and Game Code Section 1600 et seq. California Fish and Game Code Section 1600 et seq. was repealed and replaced with new Sections 1600–1616 that took effect on January 1, 2004. CDFW has the authority to regulate work that will "substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake." Activities of any person, state, or local governmental agency or public utility are regulated by CDFW under Section 1602 of the code. CDFW enters into a streambed or lakebed alteration agreement with the project proponent and can impose conditions on the agreement to ensure no net loss of values or acreage of the stream, lake, associated wetlands, and associated riparian habitat. The lake or streambed alteration agreement is not a permit, but rather a mutual agreement between CDFW and the project proponent. Because CDFW includes under its jurisdiction streamside habitats that may not qualify as wetlands under the CWA definition, CDFW jurisdiction may be broader than USACE jurisdiction. A project proponent must submit a notification of streambed alteration to CDFW before construction. The notification requires an application fee for streambed alteration agreements, with a specific fee

schedule to be determined by CDFW. Many of the concerns raised by CDFW during streambed alteration agreement negotiations are related to special-status species.

1.3.6 National Historic Preservation Act

Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended (16 U.S.C. 470 et seq.), requires federal agencies to take into account the effects of their actions proposed on properties eligible for inclusion in the National Register of Historic Places. "Properties" are defined as "cultural resources," which includes prehistoric and historic sites, buildings, and structures that are listed on or eligible for listing on the National Register of Historic Places. An undertaking is defined by the NHPA as a project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a federal agency, including those carried out by or on behalf of a federal agency; those carried out with federal financial assistance; those requiring a federal permit, license, or approval; and those subject to state or local regulation administered pursuant to a delegation or approval by a federal agency.

The issuance of an ITP by the USFWS would be a federal undertaking subject to Section 106 of the NHPA. USACE approval of a Section 404 permitting strategy for future SSHCP Covered Activities is also a federal undertaking subject to Section 106 of the NHPA. The process by which the USFWS and USACE decisions on SSHCP permits would comply with the NHPA are discussed in detail in the SSHCP EIS/EIR.

1.4 Plan Development Process

1.4.1 Organization of the Planning Process

The SSHCP was a coordinated effort of six local agencies (i.e., the Plan Permittees) led by the County. Development of the SSHCP was overseen by a Local Agency Working Group that included staff from each of the Plan Permittees. The focus of this group was to guide work products and provide direction to consultants who were assisting with the preparation of the SSHCP document. An interdisciplinary Regulatory Agency Working Group that included staff from each Plan Permittee, USFWS, CDFW, USACE, USEPA, and the RWQCB reviewed SSHCP work products approved by the Local Agency Working Group. The focus of this group was to ensure that SSHCP components prepared at the direction of the Local Agency Working Group met the needs of the Permitting Agencies. Coordination and management of the Plan's development was overseen by a dedicated project manager and by staff from the County. In addition to the Plan Permittees and Permitting Agencies, Plan development was heavily influenced by local stakeholder groups representing varied interests. Several committees were formed to allow for stakeholder input, as described below. All SSHCP meetings were open to the public.

Steering Committee

The development of the SSHCP was assisted by a Steering Committee consisting of stakeholder representatives from the development, environmental, agricultural, landowner, and regulatory communities. While the Steering Committee was formed at the request of the Board of Supervisors, committee members did not have the authority to act on behalf of elected officials. The committee's primary responsibility was to review work products, plan elements, and provide advice to consultants and government agencies who were preparing the Plan. The committee was scheduled to meet monthly, but was convened only when work products needed review or when discussion was needed to resolve key issues. All meetings were open to the public and were often attended by interested parties. This committee was instrumental in crafting the Preliminary Draft HCP.

Biological Subcommittee

The Biological Subcommittee was formed to focus on review of scientifically rigorous documents that the Steering Committee felt were too technical for their review. The subcommittee was made up of members of the Steering Committee, and included biological experts specializing in local species or other biological sciences. These meetings, as with all SSHCP meetings, were open to the public.

Economic Subcommittee

Much like the Biological Subcommittee, the Economic Subcommittee was formed to address complex economic issues and report back to the Steering Committee with their findings.

Biological Advisory Committee

The Biological Advisory Committee was formed to evaluate and establish species lists, habitat cover types, and Biological Goals and Measurable Objectives. Members included professional scientists from relevant disciplines and resource agency specialists.

Science Advisors

Early in the process of crafting the SSHCP, the Steering Committee recognized the need for an independent scientific review of Plan documents. They recommended an approach that differs from "normal" HCP or NCCP Scientific Advisory Panels. Instead of hiring a group of scientists to craft a Preserve design strategy at the onset of Plan development and possibly provide generic guidelines not well tailored to the Plan Area, the County chose to use local experts with local knowledge as they were needed. This approach proved to be beneficial as it enabled consultants and planners to seek answers to specific questions regarding local habitats and species populations throughout the Plan development process.

Public Outreach

The Plan Permittees strived to ensure that the public were afforded every opportunity to be part of the SSHCP planning process and to provide comments and feedback as the SSHCP was developed. To ensure public participation, every meeting of the Steering Committee, Biological Subcommittee, and Economic Subcommittee was open to the public. The Plan Permittees maintained an email list of interested individuals and posted meeting notes and draft materials on a website that was dedicated to the SSHCP. The Plan Permittees also held a number of public outreach meetings and made presentations to organizations upon request. In addition, public scoping meetings were conducted by the Permitting Agencies and the Plan Permittees during the preparation of the draft EIS/EIR for the SSHCP, as required under NEPA, CEQA, and HCP regulations. Public scoping and outreach for the SSHCP EIS/EIR is summarized in the EIS/EIR document.

1.5 Document Organization

The SSHCP includes the following chapters and appendices:

Chapter 1: Introduction provides an overview of the SSHCP, the principles and goals used to guide Plan development, the process associated with preparing the document, and the regulatory setting.

Chapter 2: Physical Setting describes the geologic history and composition of the Plan Area, the natural resources, and associated environmental concerns.

Chapter 3: Biological Resources Setting describes the biological resources baseline condition of the Plan Area, including a description of land cover types in the Plan Area, description and maps of modeled habitat for each Covered Species and methodologies employed for establishing these baseline conditions.

Chapter 4: Land Use provides an overview of existing land use conditions and examines future trends in development that could occur over the next 50 years throughout the Plan Area.

Chapter 5: Covered Activities describes the activities for which authorization for the incidental take of SSHCP Covered Species is being sought through the issuance of an ESA Section 10(a)(1)(B) ITP and CESA Section 2081 (b) permit. Chapter 5 also presents conditions on the Covered Activities, including a description of each SSHCP AMM.

Chapter 6: Effects Assessment and Level of Take quantifies effects of the future Covered Activities on each SSHCP Land Cover Type, modeled habitat for each Covered Species, and designated Critical Habitat, and estimates expected take of each Covered Species.

Chapter 7: Conservation Strategy describes the SSHCP Biological Goals, and identifies measurable Biological Objectives and SSHCP Conservation Actions that will achieve each Biological Goal; also describes the proposed SSHCP Preserve System and the associated Preserve acquisition process.

Chapter 8: SSHCP Monitoring and Management Programs describes the required compliance and effectiveness monitoring, the SSHCP reporting schedule, and development of individual preserve management strategies.

Chapter 9: Implementation outlines the structure of the SSHCP Implementing Entity and processes by which the Plan Permittees will implement the SSHCP requirements.

Chapter 10: SSHCP Permit Application Process explains the future process for private (third-party) development or infrastructure Covered Activity projects to obtain project approvals from one of the Land Use Authority Permittees, explains the required components of the project application to a Land Use Authority Permittee, and explains conditions that must be met in order for a private project to be covered under the SSHCP ITPs.

Chapter 11: Changed and Unforeseen Circumstances – Assurances Describes procedures to deal with future Changed Circumstances. Chapter 11 also describes the No Surprises protections for Plan Permittees in the event of unforeseen circumstances. Chapter 11 includes a description of potential climate change effects on the Plan Area, and describes how the SSHCP Conservation Strategy accounts for these potential climate change effects.

Chapter 12: Economics Analysis and Funding Program presents the costs associated with Plan implementation and the various mechanisms for funding those costs, and provides assurances to the USFWS that they can provide adequate funding for the SSHCP Conservation Strategy over the term of the permit.

Chapter 13: Alternatives to Avoid or Reduce Take presents the required analysis of alternatives to the take of Covered Species presented in Chapter 5.

1.6 Appendices

Appendix A: Glossary and Acronyms
Appendix B: Species Accounts
Appendix C: Implementing Agreement
Appendix D: Sample Easement
Appendix E: Land Cover Type Report/Vernal Pool Watershed Mapping
Appendix F: Preserve Documentation Report Template
Appendix G: Preserve Management and Monitoring Details

Appendix H: Implementation Ordinance/Resolution
Appendix I: SSHCP Economic Model
Appendix J: Voluntary Additional Conservation
Appendix K: Project-Specific Avoidance and Minimization Measures
Appendix L: SSHCP Preserve Design

2 PHYSICAL SETTING

2.1 Introduction

This chapter provides an overview of the existing physical conditions of the Plan Area that are used to inform the effects assessment (Chapter 6) and the development of the South Sacramento Habitat Conservation Plan (SSHCP or Plan) Conservation Strategy (Chapter 7). While the information provided in this chapter is central to understanding how the physical setting of the Plan Area informs certain aspects of the Conservation Strategy for each Covered Species, it is especially relevant for plant and animal species associated with vernal pools. As such, many of the sections in this chapter are focused on how the baseline physical setting is related to vernal pools and vernal pool species.

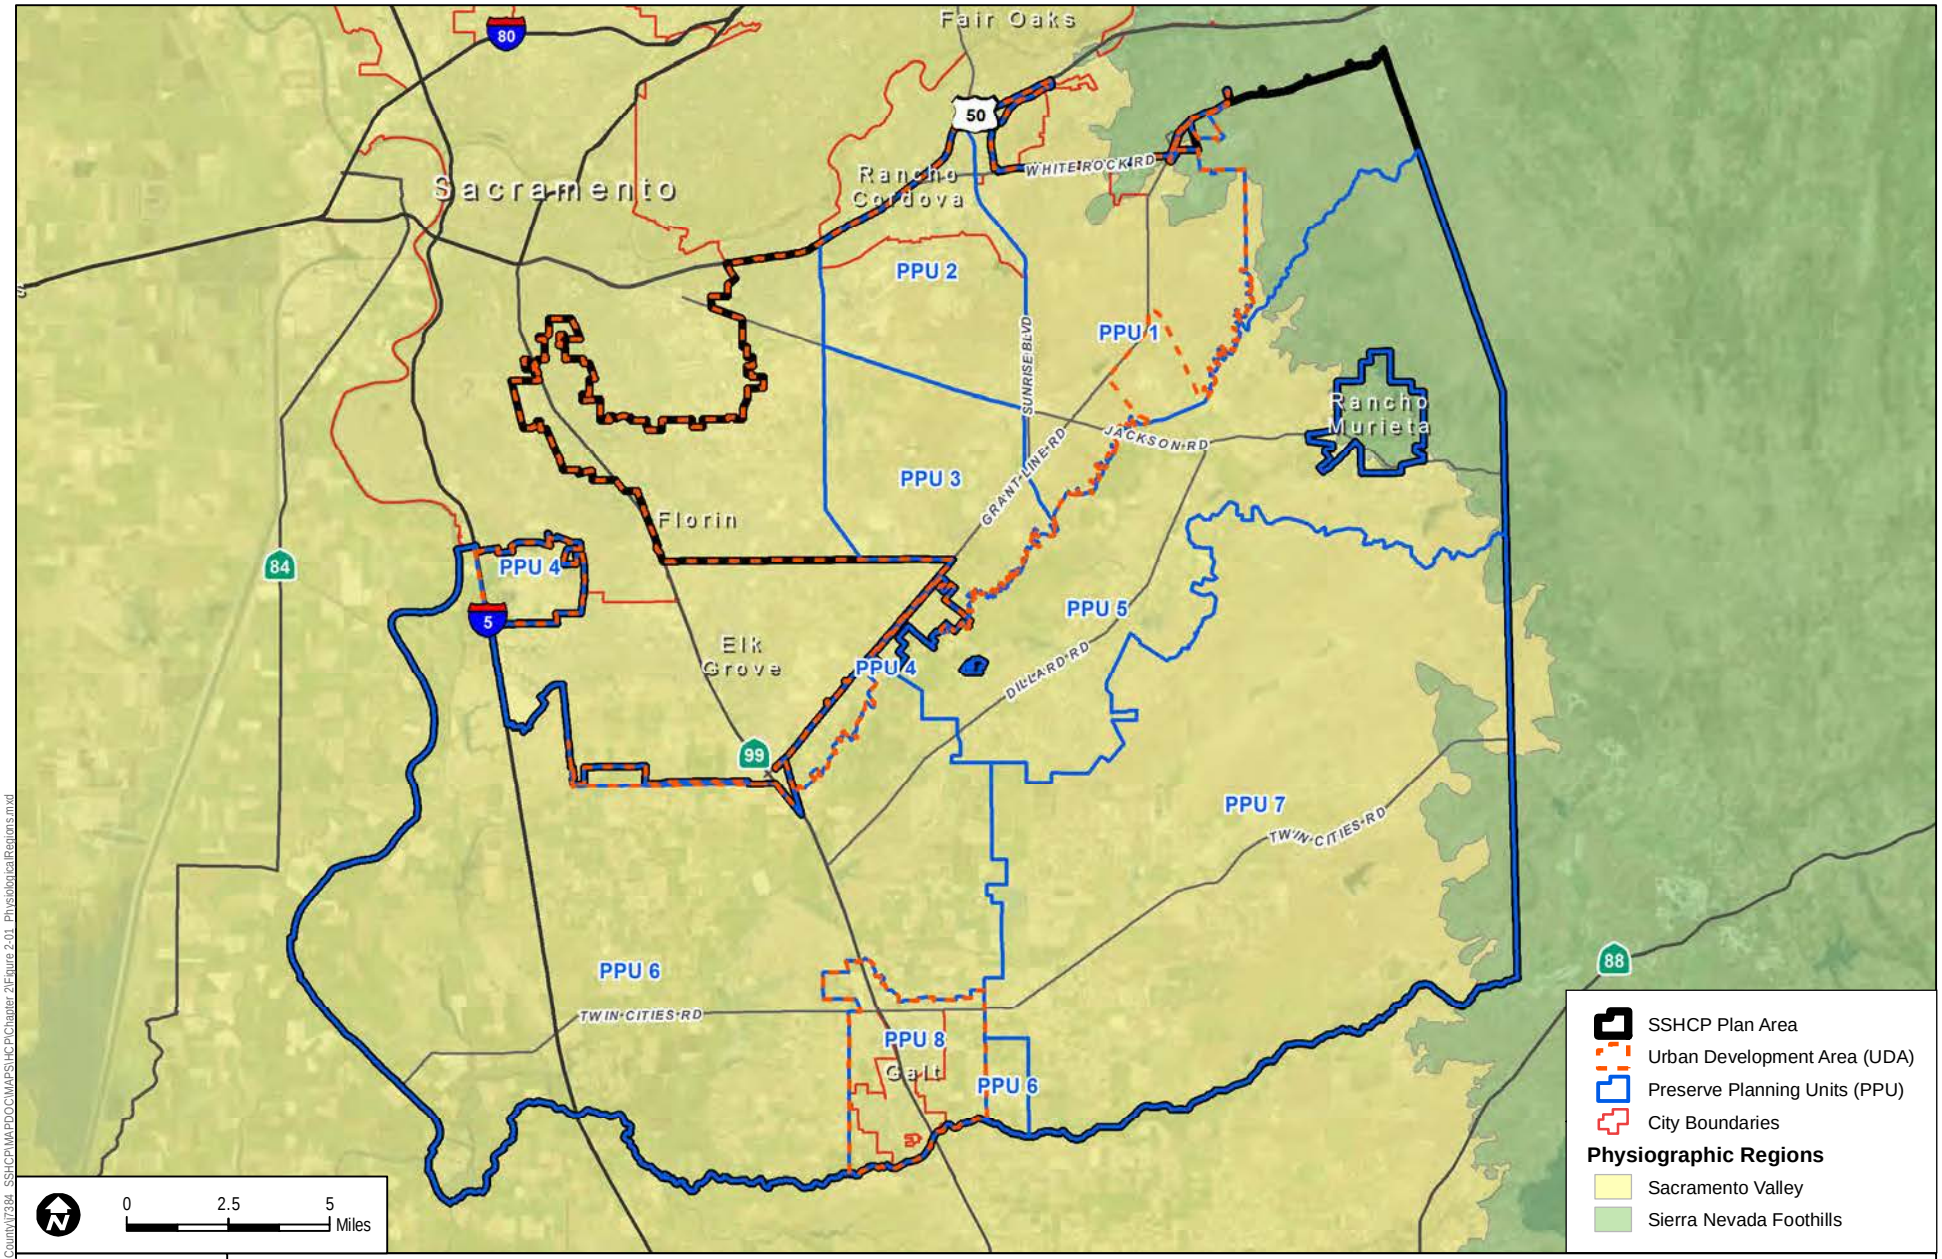
2.2 Physical Landscape

This section presents the physical landscape, including relief, landforms, geologic formation, and soils of the Plan Area. A clear understanding of the physical landscape of the Plan Area was used to help develop the SSHCP Conservation Strategy (see Chapter 7).

The Plan Area is made up of two physiographic regions (see Figure 2-1). The first is the lower Sacramento Valley, which extends through the western and central parts of the County from north to south. The lower Sacramento Valley region is the predominate region within the Plan Area and is characterized as nearly level to gently rolling, although some areas in the eastern part of the Plan Area are rolling to hilly and the relatively flat terrain is broken up by low and high terrace formations. The second region is the Sierra Nevada foothills, which are located along the northeast edge of the Plan Area. The terrain in this area is characterized as rolling to hilly.

2.3 Geomorphology

This section presents information on the landforms, geologic formations, and soils that characterize the Plan Area. A discussion regarding geomorphology is important as vernal pools in the Plan Area are largely characterized by these factors.



2.3.1 Landforms

A landform is a geomorphological unit, and is largely defined by its surface form and location in the landscape (Figure 2-2, Geologic Landforms). As part of the terrain, a landform is an element of topography. Landforms are categorized by characteristic physical attributes such as elevation, slope, orientation, stratification, rock exposure, and soil type. The development of the existing landforms in the Plan Area took place during the Pleistocene and Holocene Epochs. The predominant landforms in the Plan Area are low floodplain, high floodplain, drainageway, low

terrace, high terrace, mudflow, hills, and foothills (Jones and Stokes 1990; USDA NRCS 1993; Smith and Verrill 1998). Through a combination of erosion, alternating changes in climate, and pedogenic (soil-forming) processes, vernal pools originated on certain Central Valley landforms. Perhaps most significant in terms of the SSHCP Conservation Strategy are the low terrace and high terrace landforms that contain a majority of the vernal pools within the Plan Area. In an effort to maintain species heterogeneity and achieve the SSHCP Biological Goals and Objectives (see Chapter 7), the SSHCP Conservation Strategy seeks to preserve vernal pools on each landform.

2.3.1.1 Floodplain Landform (Low and High)

The youngest landform surface in the Plan Area consists of low floodplains. This is an active surface with component landforms that include nearly level tidal and freshwater marshes, natural levees, floodplain splays, and floodplains bordering the Sacramento, American, and Cosumnes Rivers and many smaller channels. Bar and channel topography is evident on the low floodplains along the American River and in a few small areas along the Cosumnes River. The low floodplains are frequently inundated unless they are protected by levees or upstream dams. The landscape is dynamic as new channels are formed and old channels become inactive. Alluvium moving downstream on the low floodplains in the Plan Area has buried older geomorphic surfaces. Upstream from areas where this alluvium is deposited on top of high floodplains, the low floodplains consist of riverwash or channels. Burial of the high floodplains by the low floodplains and the elevation at which the low and high floodplains converge are controlled by the competence and gradient of the stream. The low and high floodplains converge near Sacramento, in an area about 4 miles upstream from the confluence of the Sacramento and American Rivers. High floodplains are an active surface that is somewhat older than that of the low floodplains. Unless protected by levees or upstream dams, the floodplains and basins are occasionally flooded. The components of this surface include backswamps, the edges of backswamps; natural levees, backswamps, and floodplains along the Sacramento River; floodplains along the American and Cosumnes Rivers and other channels; and basins and basin rims in the American Basin. All of these components are nearly level (USDA NRCS 1993; Jones and Stokes 1990; Smith and Verrill 1998).

2.3.1.2 Drainageway Landform

The drainageway landform is composed of relatively recent alluvial deposits at the base of toe slopes and of stream terraces adjacent to incised channels of active waterways, and occur over other geologic formations. These are the second-youngest landform surfaces in the Plan Area, and are present where active streams, creeks, and rivers traverse the other geologic formations found in the Plan Area (discussed below). Consequently, vernal pools that formed on drainageway deposits are often associated with another vernal pool type on the adjacent higher ground and terraces (Jones and Stokes 1990). Because vernal pools on the drainageway landform are interspersed throughout other vernal pool types, they are difficult to map (Jones and Stokes 1990). In contrast to most vernal pools found on the low terrace, high terrace, and mudflow landforms, the vernal pools found on the drainageway landform fill and drain rapidly, and may depend more on overland runoff and direct precipitation to maintain their hydrology (Jones and Stokes 1990). Soils above the restricting claypan or hardpan layers in these pool types may be too deep for perched water tables to become exposed in shallow vernal pools. Additionally, the basins of these types of pools are often shallow, increasing susceptibility to evaporation, or slightly sloped, which encourages drainage.

2.3.1.3 Low Terrace Landform

Low terraces (also referred to as "young terrace"), are of relatively recent geologic origin (Jones and Stokes 1990). They contain late Pleistocene-age geomorphic surfaces that are underlain by stream alluvium. Low terrace landforms occur on the broad, nearly level plain of alluvial deposits that make up the Sacramento Valley floor. Low terrace landforms are relatively young (late Pleistocene, 100,000 years ago) when compared to the high terrace or the mudflow landforms (Smith and Verrill 1998). Low terrace soils are not as well developed when compared to high terrace landforms, but have been forming long enough to have undergone significant pedogenesis, and claypans and duripans are common. Vernal pools occur extensively in certain areas of the low terraces. Within the Plan Area, much of the low terrace landform has been converted to agriculture or developed for urban uses. As discussed in Chapter 3, low terrace soils commonly form seasonal "perched aquifers." Vernal pools found within the low terrace landforms do not exhibit the same richness of flora or specialized species when compared to vernal pools on high terrace landforms (Jones and Stokes 1990). Most young terrace sites have been plowed, graded, or heavily grazed because of their arable soils and proximity to reliable water; this and the relatively young age of the vernal pools may also account for their unspecialized flora in the Plan Area (Jones and Stokes 1990). Many low-terrace pools are shallow or have poorly defined basins. These pools support vernal pool species because they develop on heavy clay Galt soils that retain water in the soil profile for long periods after surface water evaporates (Jones and Stokes 1990).

2.3.1.4 High Terrace Landform

The high terrace landform (also referred to as "old terrace") is restricted to the east side of the Central Valley (Smith and Verrill 1998; Jones and Stokes 1990; Reiner and Swenson 2000). The high terrace landform was laid down from 600,000 to over 1 million years ago in the mid- to early Pleistocene to late Pliocene, and lies topographically above low terraces. In the Plan Area, high terraces are ancient deposits of the Pleistocene American River, which was located south of its present-day site (Jones and Stokes 1990). Very strong soil development has occurred in relatively flat areas on these terraces where the geomorphic surfaces are very old. The most pronounced erosion-induced mound-depression microrelief and vernal pool landscapes are found on the high terraces. The soils and vernal pools of the high terrace landform have essentially been developing for more than a half-million years. Consequently, the high terrace landform exhibit well-developed soils and floristically rich habitat. Similar to low terrace landform, perched aquifers are common in high terrace landform soils. Vernal pools on high terrace landforms typically support more specialized species than vernal pools found within any other landform (Jones and Stokes 1990). In the Plan Area, the high terrace landform supports the Laguna geological formation and Arroyo Seco gravels. Little of the Arroyo Seco gravels have been farmed because irrigation water is lacking and many sites are not arable. Consequently, vernal pools are abundant on level surfaces. Much of the area with high-terrace pools was dryland farmed in the past with wheat or oats. This activity appears to have had little effect on vernal pools in some areas, such as at the Sunrise-Douglas development area, while elsewhere plowing appears to have disrupted surface hydrology (Jones and Stokes 1990). Old-terrace pools are the oldest and most complex vernal pool type in Sacramento County and have developed a stable, predictable hydrology and flora over a long period.

2.3.1.5 Volcanic Mudflow Landform

The northern Sierra Nevada was covered by extensive volcanic mudflows believed to have arisen east of the sierra crest (Jones and Stokes 1990). These ancient mudflow formations were exposed at the base of the Sierra Nevada foothills, and then overlain by a thin soil derived from alluvial, colluvial material, and the residuum from the mudflow parent material (Jones and Stokes 1990). The mudflow landform ranges in age from early Pleistocene to Oligocene (Smith and Verrill 1998; Jones and Stokes 1990). The mudflow formation exists today as low, nearly level to gently sloping ridges and fans along the eastern edge of the Plan Area. The mudflow formation is characterized by a thin, shallow layer of soil (primarily formed from the parent mudflow material) over impermeable bedrock. In the Plan Area, areas of the mudflow landform support the Mehrten geological formation and the Valley Springs formation. Valley Springs formed in the Oligocene, and Mehrten formed in the Miocene or Pliocene (Jones and Stokes 1990). Soils on the mudflow formation are shallow, extremely rocky, excessively drained by surface runoff and high water infiltration rates, and underlain by impervious mudflow that impedes the

downward movement of water and upon which a perched aquifer periodically forms during the wet season (Jones and Stokes 1990).

2.3.1.6 Hill Landform

A hill landform has a raised surface above a surrounding level plain, is distinguished by its sloping sides, and defined peak. Hill landforms can be formed through the geologic processes of faulting and erosion. Within the Plan Area, both processes likely played a role in the formation of the hill landform, which is associated with the Pliocene (5 million years ago) uplift of the Sierra Nevada mountains to the east. These processes continue to shape the hill landform in the present. Within the Plan Area, the hill landform can be found in a narrow band immediately west of the foothills. It primarily comprises the Ione Formation, an Eocene-age (55- to 33-million-year-old) weathered sedimentary sequence (Smith and Verrill 1998; Creely and Force 2007).

2.3.1.7 Foothill Landform

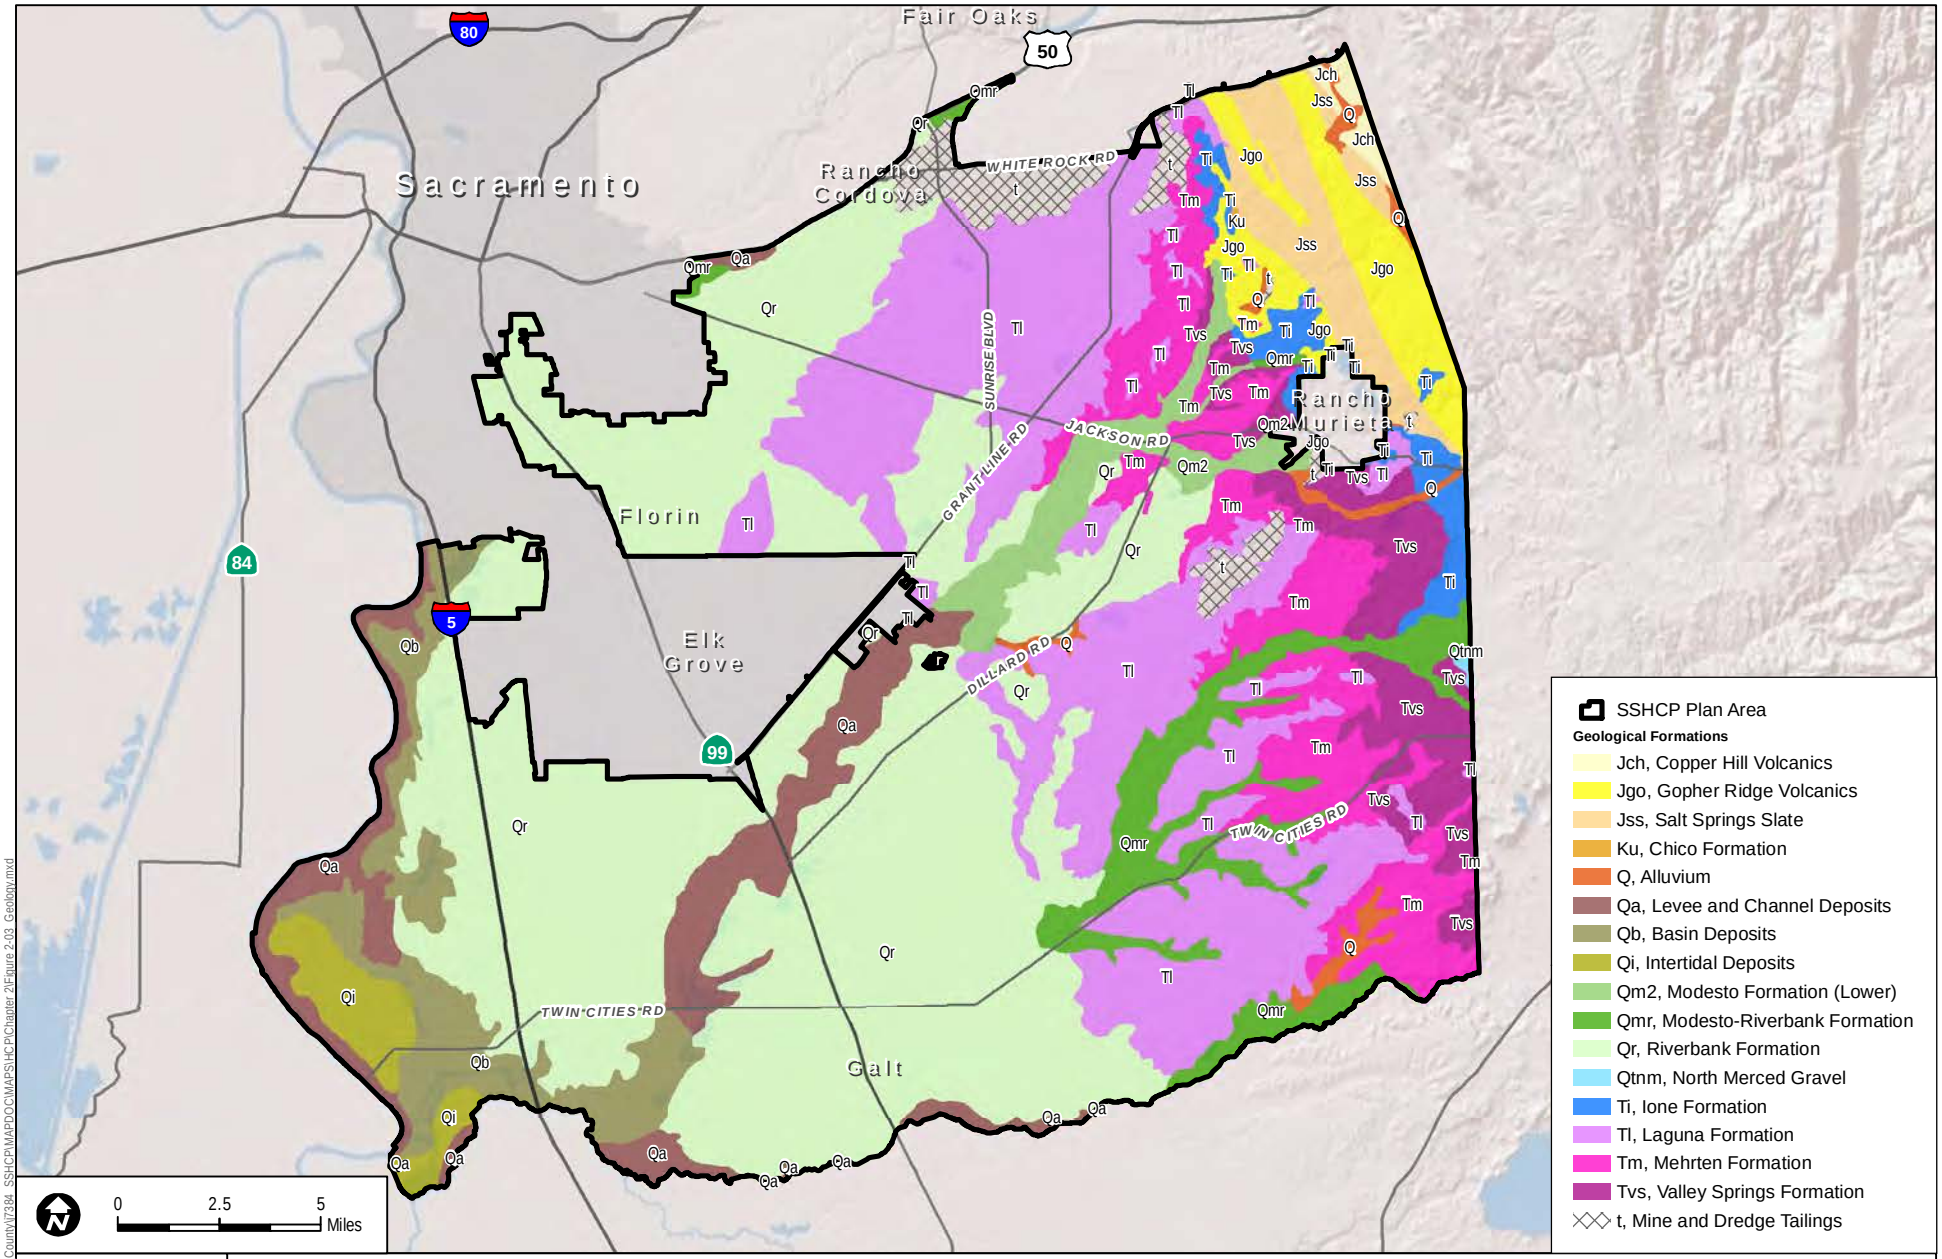
The foothill landform is a surface defined by gradual increase in elevation at the base of a mountain range. They form the transition zone between hills and higher elevation mountains. Within the Plan Area, the foothills comprise the Salt Springs Slate, Copper Hill Volcanics and Gopher Ridge Volcanics geologic formations. The foothill landform is associated with the Pliocene (5 million years ago) uplift of the Sierra Nevada mountains to the east of the Plan Area and is found along the eastern margin of the Plan Area. Uplift from active geologic faults, erosion, and dissection by active stream channels draining the mountain range are the primary forces that shape this landform.

2.3.2 Geologic Formations

The landforms of the Central Valley and the Plan Area can be further subdivided by specific geologic surficial deposits (formations). A geologic formation is a geomorphic feature on the earth's surface representative of an episode of landscape development. Geologic formations are differentiated by various criteria, including age, lithology, strata, compaction, texture, depositional history, geomorphology, and soil-profile development (Smith and Verrill 1998). The geologic formations used in the SSHCP are derived from the Geologic Map of the Sacramento Quadrangle prepared by the California State Geological Survey (CGS 1981) (see Figure 2-3, Geologic Formations).

Of the 17 geologic formations that are found within the Plan Area, 15 are known to contain vernal pools. Of the 15 Plan Area geologic formations that contain vernal pools, there are 5 primary geologic formations that contain the majority of vernal pools in the Plan Area and are of particular importance to the development of the SSHCP Conservation Strategy (Chapter 7). They are the Laguna, Riverbank, Modesto-Riverbank, Mehrten, and Valley Springs Formations. The

five primary Plan Area vernal pool geologic formations are discussed in the sections that follow by vernal pool acres (the most to the least vernal pool acres).



2.3.2.1 Laguna Formation

The Laguna Formation is part of the high terrace landform (Smith and Verrill 1998; Jones and Stokes 1990; Reiner and Swenson 2000). The Laguna Formation, ranging in age from late Miocene to early Pliocene, rests over the older Mehrten Formation. The Laguna Formation is composed of interbedded alluvial gravel, sand, and silt deposited from ancient river channels draining from the Sierra Nevada range, including the Feather, Yuba, American, Cosumnes, and Merced Rivers (Helley and Harwood 1985).

The Laguna Formation occurs in a band several miles wide running north to south along the eastern half of the Plan Area. The Laguna Formation is exposed in the eastern and central portions of the Plan Area. The formation's eastern outcrop extends northward from Dry Creek, where its area of exposure is about 6 miles wide, to its northernmost exposure along Meiss Road. Its central outcrop extends northward from Deer Creek to its northernmost exposure along U.S. 50. The Redding soil series and Red Bluff-Redding complex are the characteristic soil series associated with the Laguna Formation north of the Cosumnes River. South of the Cosumnes River to the headwaters of Badger Creek, the Redding series and Red Bluff-Redding complex are the main soils and they give way to Corning and Hadselville-Pentz south of Badger Creek to Dry Creek at the Sacramento–San Joaquin County line.

The Laguna Formation is the second-most extensive geologic formation in the Plan Area, totaling 61,282 acres (23,608 acres are inside the Urban Development Area (UDA) and 37,674 acres are outside the UDA). It comprises just over 19% of the total Plan Area.

The Laguna Formation encompasses 26,684 or 43% of the total number of vernal pools within the Plan Area. Of the 26,684 vernal pools occurring on this formation, 7,734 are located inside the UDA and 18,950 are outside the UDA. The Laguna Formation ranks first in importance in terms of total number of vernal pools. The Laguna Formation supports a wide variety of vernal pool sizes and densities, including some of the greatest vernal pool densities and most of the very large vernal pools remaining within the Plan Area, primarily within the UDA portion of the Plan Area (Dittes et al. 2007). Dittes et al. 2007 also found significantly lower density of vernal pools, smaller sizes of individual vernal pools, and a different category of "vernal pool complexes" on Laguna Formation soils located outside of the SSHCP UDA when compared to vernal pools on Laguna Formation soils inside the SSHCP UDA. Approximately 34% (1,554 acres) of the total vernal pool acreage within the entire Plan Area occurs on the Laguna Formation. There are 603 acres of vernal pool within the UDA and 951 acres outside the UDA.

INTENTIONALLY LEFT BLANK

2.3.2.2 Riverbank Formation

The Riverbank Formation is part of the low terrace landform. The Riverbank Formation was deposited on a plain of stream alluvium that has been partially dissected. The upper surface of this plain, in most places, represents the upper surface of the Riverbank Formation. The upper surface is characterized by a gently undulating surface. In the vicinity of Elk Grove, the Riverbank Formation is about 10 miles wide from west to east. To the east, it laps onto older materials composed of the Laguna Formation. To the west, it is in turn overlain by younger alluvial materials. Riverbank Formation is generally confined to the central and western portions of the Plan Area and occurs on either side of the Cosumnes River. Soils with claypans and duripans are common, as are vernal pools (Smith and Verrill 1998). The San Joaquin soil series is most closely associated with the Riverbank Formation. Other associated soil series in the Plan Area include Redding, Red Bluff, and Corning. Inclusions of Tehama soil with vernal pools on the low terrace landform are unusual; the only site in the study area, east and west of the intersection of Carbondale and Ione Roads and north of Willow Creek, is surrounded by old-terrace and mudflow pool areas (Jones and Stokes 1990).

The Riverbank Formation is the largest geologic formation in the Plan Area, with a total of 122,228 acres (35,401 acres inside the UDA and 86,827 acres outside the UDA). It comprises just over 38% of the total Plan Area. Although the Riverbank Formation dominates the Plan Area, large portions have been converted for agriculture or developed for urban uses because of their arable soils and proximity to reliable water. Consequently, young-terrace pools are not as common as the extent of the Riverbank Formation might suggest. In addition, most undeveloped portions of the Riverbank Formation were plowed or leveled in the past, further reducing the extent of intact young-terrace pools, and altering species composition and cover (Jones and Stokes 1990).

The Riverbank Formation encompasses 12,367 or 20% of the total number of vernal pools within the Plan Area. Of the 12,367 vernal pools occurring on this formation, 2,800 are located inside the UDA and 9,567 are outside the UDA. The Riverbank Formation ranks second in total number of Plan Area vernal pools.

Approximately 34% (1,533 acres) of the total vernal pool acreage within the entire Plan Area occurs on the Riverbank Formation. There are 289 acres of vernal pool within the UDA and 1,244 acres outside the UDA.

2.3.2.3 Mehrten Formation

The Mehrten Formation is part of the mudflow landform, and consists of eroded, high-standing remnants of andesitic volcanic mudflow fans that were deposited during the Pliocene and Miocene, 10–25 million years ago. Vernal pools tend to be located on the western edge of the

Mehrten Formation because the eastern portion increases in slope, precluding pool development (Smith and Verrill 1998). As discussed in Chapter 3, vernal pools classified as Northern Volcanic Mudflow Vernal Pools are often found on Mehrten Formation soils. Several outcrops of the Mehrten Formation are exposed in a discontinuous band that runs north–south in the eastern portion of the Plan Area in a stratum that underlies the Laguna Formation and overlies the Valley Springs Formation. The exposed band of Mehrten Formation extends from the south county boundary at Dry Creek, where it is about 4 miles wide, north to U.S. 50, where it is less than a mile wide. In the Plan Area, the Mehrten Formation is characterized by the mound-intermound soil series and complexes such as Hadselville-Pentz, Red Bluff-Redding, Corning-Redding, and Pardee-Rancho Seco soil complex. The Corning-Redding and Red Bluff-Redding complexes are predominant north of the Cosumnes River, while the Hadselvill-Pentz and Pardee-Rancho Seco complexes are predominant south of the Cosumnes River.

The Mehrten Formation is divided into two different layers. One is a sedimentary unit composed of gray to black andesitic sands, interbedded bouldery gravels, and blue to brown clay. Frequently laminated, the beds of black sand are commonly about 5 feet thick, although beds of up to 20 feet or more have been reported. Associated with the black sands are beds of stream gravel containing andesitic cobbles and boulders of up to several feet in diameter and beds of brown to blue clay and silt.

The second major unit of the Mehrten Formation is the tuff breccia. This rock is very dense and hard. It is composed of angular pieces and blocks of black, gray, and red fine-grained to porphyritic andesite, which range from less than an inch to over several feet in diameter. The tuff breccia was derived from andesitic eruptions to the east in the Sierra Nevada. During these eruptions, great quantities of highly mobile ash flowed west down the then-existing stream channels and picked up blocks of andesite debris, which were incorporated into the mass. The mass spread out over the westward-sloping plains and solidified as a pavement of hard, concrete-like rock, which ranged from only a few feet to over 30 feet in thickness. Flow patterns are readily evident where the upper surface of the tuff breccia is now exposed. On this surface, soil cover is scant, with the blocks of andesite standing out in bold relief, giving the appearance of a boulder-strewn field. Run-off from precipitation is nearly 100% due to the rocky surface.

The Mehrten Formation covers the third-largest geologic formation in the SSHCP, with a total of 26,459 acres (3,863 acres inside the UDA and 22,596 acres outside the UDA). It comprises just over 8% of the total Plan Area.

The Mehrten Formation encompasses 10,275 or about 17% of the total number of vernal pools within the Plan Area. Of the 10,275 vernal pools occurring on this formation, 648 are located inside the UDA and 9,627 are outside the UDA. The Mehrten Formation ranks third in importance in terms of total number of vernal pools.

Approximately 11% (478) of the total vernal pool acreage within the entire Plan Area occurs on the Mehrten Formation. There are 32 acres of vernal pool on the Mehrten Formation within the UDA and 446 acres on the Mehrten Formation outside the UDA.

2.3.2.4 Modesto-Riverbank Formations

The Modesto-Riverbank Formations are dominantly andesitic, late- to middle-Pleistocene alluvium composed of gravel, sand, silt, and clay derived from the Tuscan Formation via various streams (CGS 1981). The Modesto-Riverbank Formations are generally confined to the eastern portion of the Plan Area forming on either side of Laguna Creek (south) and its tributaries and on either side of Dry Creek. Widths vary from approximately a quarter of a mile wide along the tributaries of Laguna Creek (south) to about 1 mile wide along the main channel of Laguna Creek and Dry Creek. These formations extend west from the boundary with Amador County to a nondescript area east of the City of Galt. There are a number of soil series that are associated with the Modesto-Riverbank Formations, including, but not limited to, the Corning complex, Hicksville loam, Madera loam, Redding gravelly loam, and Tehama loam (CGS 1981).

The Modesto-Riverbank Formations cover the fifth-largest area in the SSHCP, with a total of 14,688 acres (567 acres inside the UDA and 14,121 acres outside the UDA). It comprises nearly 5% of the total Plan Area.

The Modesto-Riverbank Formations encompass 5,272 or about 9% of the total number of vernal pools within the Plan Area. All 5,272 vernal pools occurring on this formation are outside of the UDA. The Modesto-Riverbank Formations rank fourth in importance in terms of total number of vernal pools.

Approximately 11% (503 acres) of the total vernal pool acreage within the entire Plan Area occurs on the Modesto-Riverbank Formations. All 503 acres are found outside of the UDA.

2.3.2.5 Valley Springs Formation

The Valley Springs Formation is also part of the mudflow landform, but is slightly older than the Mehrten Formation. The Valley Springs Formation is made up of eroded, high-standing remnants of rhyolitic volcanic mudflow fans that were deposited 20–35 million years ago. Vernal pools tend to be located on the western edge of the formation because the eastern portion increases in slope, precluding pool development (Smith and Verrill 1998). The Valley Springs Formation is exposed along the southeastern portion of the Plan Area from the southeastern corner along Dry Creek, northward to the headwaters of Carson Creek. The formation is generally exposed over an area from 1 to 2 miles in width. Its widest exposure is along Arkansas Creek, where it is exposed for about 4 miles from east of Ione Road, west to the Cosumnes River. There may be expansible clays present, especially in fine-grained material. The Amador-

Gillender, Hadselville-Pentz, and Pardee-Rancho Seco soil complexes predominate on the Valley Springs Formation.

The Valley Springs Formation is the seventh-largest geologic formation exposed in the SSHCP, with a total of 13,690 acres (141 acres inside the UDA and 13,549 acres outside the UDA). It comprises just over 4% of the total Plan Area.

The Valley Springs Formation contains 4,139 vernal pools, or about 7% of the total number of vernal pools within the Plan Area. Of the 4,139 vernal pools occurring on this formation, 10 are located inside the UDA and 4,129 are outside the UDA. The Valley Springs Formation ranks fifth in importance in terms of total number of Plan Area vernal pools.

Approximately 6% (265 acres) of the total vernal pool acreage within the entire Plan Area occurs on the Valley Springs Formation. With the exception of 0.16 acre, almost all of the vernal pool acreage on this formation occurs outside of the UDA.

2.3.3 Soils

Many different kinds of soils are found within the Plan Area with a wide range of characteristics that influence flora and fauna habitat suitability, including soil wetness, depth to rock, the presence of hardpans, tight layers, erodibility, clay content, and soil slopes. Soils in the Plan Area vary from very deep, nearly level alluvial soils, to undulating shallow soils over restrictive duripans or clay-rich soil horizons, to shallow hilly soils overlying bedrock. These soils also vary from well-drained to poorly drained mineral soils and, to a lesser extent, organic soils. Individual soil units are organized into map units called soil associations, which consist of soil units of the same texture and composition that occur in a geographic position (USDA NRCS 1993). Soils data were used to help define Covered Species modeled habitat (Chapter 3). Soils series that contain vernal pools include an impermeable layer, which can be a claypan, a cemented hardpan (duripan), or rock (Solomeshch et al. 2007).

Soil series are commonly used as part of the name for an area shown on a soil survey map where that series is dominant. Certain soil series have been consistently mapped as the dominant soil in areas that coincide with the occurrence of vernal pools. Most of these soil series are associated one-to-one with geologic formations, although some series may occur on two or more formations. For example, the San Joaquin soil series, a Durixeralf that has been nominated as the California State Soil, is the most extensive soil series mapped in vernal pool areas, covering almost a half-million acres of low terraces on the east side of the Central Valley. The San Joaquin soil is the principal soil that defines the low terrace Riverbank Formation.

The Redding soil series, a more weathered and gravelly Durixeralf that is the second-most extensive soil series mapped in vernal pool terrain at almost 200,000 acres, primarily defines the Laguna

Formation on the eastside of the Central Valley. The Corning soil series is a Palexeralf associated with the Redding series on both the Laguna and Red Bluff Formations on high terraces.

A number of soil series occur as interwoven complexes in a landscape. In some mound-intermound vernal pool landscapes, soil series complexes are differentiated with one series on the mounds and the other in the intermounds. Examples are the mound Pentz soil series and the intermound Hadselville soil series (Smith and Verrill 1998).

The following provides a brief description of the six most prominent soil series within the Plan Area, organized by highest to lowest in elevation on the landscape.

2.3.3.1 Mudflow Soils

Hadselville

The Hadselville series consists of very shallow loamy, moderately well-drained intermound soils formed in material weathered from weakly consolidated basic andesitic tuffaceous sediments primarily from the Mehrten Formation on exposed, upturned edges of mudflow formations at the base of the Sierra Nevada foothills (Jones and Stokes 1990). The Hadselville and Pentz soils are on hills with a mound-intermound microrelief topography. Hadselville soils are in the intermound position, and slopes are 2% to 30%.. Soil depth ranges from 4 to 10 inches. The restrictive layer is bedrock. The soil is dry at the bottom depth in most years for a period of 120 to 150 days from May 15 to October 1, moist in all parts for a period of 135 to 165 days from November 15 to April 15, and moist in some part the rest of the year. The mean annual soil temperature is 64°F to 67°F and the temperature remains above 47°F throughout the year. Organic matter content ranges from 1% to 2% throughout the profile and is higher than the underlying material. Hadselville soils are acidic (with a pH of 5–6.5), with a low cation exchange capacity leading to very poor soil nutrient conditions. This soil is influenced by small amounts of ash inherited from the parent material. Elevation is 110 to 350 feet above mean sea level (amsl). These soils formed in material weathered from consolidated tuffaceous sediments of the Mehrten Formation. The sediments are dominantly composed of basic andesitic sands that are stratified with conglomerate or andesite coarse fragments in some areas. Strongly consolidated strata may outcrop as bands across a hillslope.

The Hadselville soil is very shallow and moderately well drained. It formed in material weathered from weakly consolidated basic andesitic tuffaceous sediments. Typically, the surface layer is grayish-brown sandy loam about 7 inches thick. Weakly consolidated tuffaceous sandstone is at a depth of about 7 inches. In some areas, the surface layer is gravelly sandy loam. In other areas, a thin hardpan caps the bedrock. Permeability is moderately rapid in the Hadselville soil. Available water capacity is very low. The effective rooting depth and the depth

to weakly consolidated bedrock are 4 to 10 inches. Runoff is very slow or medium. The hazard of water erosion is slight or moderate.

Pentz

The Pentz series consists of shallow loamy, well-drained soils formed in material weathered from weakly consolidated basic andesitic tuffaceous sediments primarily from the Mehrten Formation on exposed, upturned edges of mudflow formations at the base of the Sierra Nevada foothills (Jones and Stokes 1990), and supporting primarily annual grassland that formed in material weathered from weakly consolidated basic andesitic tuffaceous sediments. Pentz soils form mound, intermound microrelief and are found on hills and on backslopes of hills. Pentz soils are on the mound position. Slopes are 2% to 50%. Depth to paralithic contact and thickness of the solum is 10 to 20 inches. The restrictive layer is bedrock. The soil is dry between a depth of 8 inches and the paralithic contact in most years from May 15 to October 15 is moist in all parts from December 1 to May 1 and moist in some part the rest of the year. The mean annual soil temperature varies from 64°F to 67°F and the temperature remains above 47°F throughout the year. The weighted average clay content of the particle-size control section ranges from 10% to 20%. Coarse fragments are subrounded or rounded metamorphic rock, quartz, or quartzite. Content of coarse fragments is 0% to 35% with 0% to 25% cobbles or stones. Organic matter in the upper 7 inches mixed is 1% to 3%. Pentz soils are acidic (with a pH of 5–6.5) with a low cation exchange capacity leading to very poor soil nutrient conditions. This soil is influenced by small amounts of ash inherited from the parent material. Pentz soils are on undulating to hilly hills and on steep backslopes of hills, with mound-intermound microrelief. The microrelief is most strongly expressed on slopes of less than 20%. Slopes are convex or plane and are 2% to 50%. Elevation is 110 to 600 feet amsl. The soils formed in material weathered from consolidated tuffaceous sediments of the Mehrten Formation. The sediments are dominantly composed of basic andesitic sands that are stratified with conglomerate or andesitic coarse fragments in some areas. Strongly consolidated strata may outcrop as bands across a hill slope..

The Pentz soil is shallow and well drained. It formed in material weathered from weakly consolidated basic andesitic tuffaceous sediments. Typically, the surface layer is brown fine sandy loam about 9 inches thick. The subsoil also is brown fine sandy loam. It is about 7 inches thick. Weakly consolidated tuffaceous sandstone is at a depth of about 16 inches. In some areas, the surface layer is gravelly sandy loam, sandy loam, or loam. In other areas, a thin hardpan caps the bedrock. Permeability is moderately rapid in the Pentz soil. Available water capacity is low. The effective rooting depth and the depth to weakly consolidated bedrock are 10 to 20 inches. Runoff is medium. The hazard of water erosion is slight or moderate.

2.3.3.2 Low Terrace Soils

San Joaquin

The San Joaquin soil series is the most extensive vernal pool soil. This series, plus others with which it is geographically associated (e.g., Fiddyment, Galt, Madera, and Rocklin), developed on Riverbank-age alluvial terraces along the eastern flank of the Central Valley (in the later Pleistocene, 100,000 to 200,000 years old). This soil series is the oldest continuously recognized soil series within the State of California, yet is the youngest of the Plan Area vernal pool soils geologically. These soils are used for irrigated crops, such as wheat, rice, figs, almonds, oranges, and grapes, and for pasture and urban development. San Joaquin soils formed in old alluvium on hummocky topography. A cemented hardpan (duripan) a few feet beneath the surface restricts roots and water percolation. San Joaquin soils are classified in U.S. Department of Agriculture (USDA) soil taxonomy as fine, mixed, active, thermic abruptic durixeralfs. The San Joaquin series is a loamy mineral soil supporting primarily annual grassland. The soil series consists of moderately deep to a duripan, well and moderately well-drained soils that formed in alluvium derived from mixed but dominantly granitic rock sources. They are on undulating low terraces with slopes of 0% to 9%. San Joaquin soils range from acidic (pH of 5) to mildly alkaline (pH of 8) with a low cation exchange capacity, resulting in generally nutrient-poor soil conditions. Some areas have been leveled. San Joaquin soils account for approximately 17% of soils within Sacramento County and San Joaquin soil complexes comprise an additional 8%, for a total of approximately 25% of Sacramento County. San Joaquin soils are the predominant soil series on the Riverbank Formation occurring on both the high floodplain and low terrace landforms in the County. San Joaquin soils occur in soil complexes with Galt soils, durixeralfs, xerarents, and urban land. San Joaquin soils and associated complexes all have a duripan ranging from 2 to 4 feet below soil surface. Vernal pools tend to form in mound-intermound areas and depressional features within these soil series. Together, the San Joaquin, Redding, and Corning soil series—durixeralfs and palexeralfs—are the core Northern Hardpan Vernal Pool soils. However, there are several dozen additional soil series (but of more limited distribution) that share the iron-silica-cemented duripan, reddish color, landscape position, and depleted nutrient status that characterize Northern Hardpan Vernal Pool soils (Solomeshch et al. 2007).

2.3.3.3 High Terrace Soils

Redding

Redding and Corning soil series developed on older, higher alluvial terrace landforms of the Laguna Formation (Pliocene to early-Pleistocene age). The Redding soil series is a well-drained, gravelly loam mineral soil that is moderately deep over a hardpan and supports primarily annual grassland. It formed in gravelly old valley fill from mixed sources but primarily derives from the

Laguna Formation. Typically, the surface layer is strong brown and yellowish-red gravelly loam and reddish-brown loam about 14 inches thick. The subsoil is dark reddish brown and reddish-brown clay. The hardpan ranges occur at a depth of 2 to 4 feet below surface level. Permeability is very slow. Redding soils are moderately acidic (pH 5–6.5) with a low cation exchange capacity resulting in generally nutrient-poor soil conditions. The available water capacity is 1.5 to 3.0 inches. The effective rooting depth is 20 to 34 inches. Most roots in the clay subsoil are along the faces of peds, which reduces the water available to plants. Surface runoff is slow or medium. The hazard of erosion is slight or moderate. After intense rainstorms, the soil is saturated for a short time. They are on nearly level or dissected and undulating to hilly high terraces. Slopes are 0% to 30%.

The soil between depths of 4 and 18 inches is usually dry all of the time from June until September or early October, and is moist in some or all parts the rest of the year. Weighted average clay content of the upper 20 inches of the argillic horizon is 35% to 60%. Redding soils are on nearly level or dissected and undulating to hilly high terraces. Microrelief may be hummocky. Gravel and cobbles tend to concentrate in the intermound in hummocky areas. Vernal pools with relief that is greater than the intermound are common in areas with slopes of 0% to 3%. Elevations are 40 to 2,000 feet amsl. The soils formed in stratified alluvium of mixed sediments that are gravelly or cobbly. These sediments vary considerably over short distances and may be unrelated to the overlying soil.

The Redding soil is moderately deep and moderately well drained. It formed in gravelly and cobbly alluvium derived from mixed rock sources. Typically, the surface layer is strong brown gravelly loam about 7 inches thick. The upper part of the subsoil is yellowish-red loam and gravelly loam. The lower part is a claypan of reddish brown and yellowish-red gravelly clay about 8 inches thick, at about 20 inches depth. Below this to a depth of 66 inches is a very gravelly hardpan that is strongly cemented with silica. Therefore, the Redding soil series restrictive layer is both claypan and hardpan. In some areas, the surface layer is gravelly sandy loam, loam, or sandy loam. Permeability is very slow in the Redding soil. Water is perched above the claypan/hardpan for short periods after heavy rainfall in winter and early spring. Available water capacity is low. The effective rooting depth is 20 to 40 inches, but roots are restricted to the cracks and faces of peds in the claypan, which is at a depth of 17 to 30 inches. The depth to a hardpan is 20 to 40 inches. The shrink–swell potential is high. Runoff is very slow or slow. The hazard of water erosion is slight. This soil is used as rangeland or for dryland crops, such as wheat. It may provide wetland functions and values. These should be considered when plans are made for enhancement of wildlife habitat or for land use conversion. Redding soils account for approximately 6% of Sacramento County, predominately in the eastern portion of the County. Redding soils are the predominate soil series occurring on the Laguna Formation on low and high terraces. Redding soils occur often in complexes with Red Bluff and Corning soils and

Xerarents. Together, the San Joaquin, Redding, and Corning soil series—durixeralfs and palexeralfs—are the core Northern Hardpan Vernal Pool soils (Solomeshch et al. 2007).

Red Bluff

The Red Bluff series consists of very deep, well-drained loamy mineral soils formed in high (older) terraces of the Laguna Formation. Red Bluff soils are on high terraces and have 0% to 9% slopes in elevations of 75 to 1,500 feet amsl. Thickness of the solum is over 60 inches and the percentage of clay decreases from the maximum amount at 60 inches by 3% to 10% absolute. The mean annual soil temperature is 62°F to 66°F and exceeds 41°F all year. The soil between a depth of 7 and 21 inches is dry in all parts from June to October and moist in some or all parts the rest of the year. The upper 20 inches of the argillic averages more than 35% clay and ranges from 27% to 60% clay. Base saturation (sum) ranges from 45% to 75% throughout the argillic horizon. Red Bluff soils are among the oldest soils in the County. Their base saturation is as low as 45% in the argillic horizon and is even lower in the surface layer. Parent materials for Red Bluff soils are gravelly and cobbly alluvium from mixed sources. The restrictive layer is claypan at a depth of approximately 35 inches (Jones and Stokes 1990). Paleoclimatic influence also is indicated by properties of the Red Bluff soils. A high content of clay, reddish color, low pH (5–6.5), and a significant amount of iron and manganese staining distinguish these soils from other soils in the Plan Area. Low to moderate cation exchange capacity leads to generally nutrient-poor soil conditions. Presumably, a warmer and perhaps wetter paleoclimate influenced the weathering of clay minerals in the Red Bluff soils to kaolinite. Good subsurface drainage and the parent material also were factors.

The well-drained Red Bluff soils are dominant on the high and intermediate terraces. These mature soils have a thick, deeply weathered argillic horizon and a low base saturation. They have a slightly higher reaction in the A and B horizons than is typical for the Red Bluff series, which generally consists of older soils on high terraces. The parent material of the Red Bluff soils is gravelly alluvium derived from fluvial and glacial sources and laid down by an ancestral channel of the American River. It consists of rounded pebbles and cobbles derived from mixed sources, including dark metamorphic, quartzitic, and andesitic rocks in a granitic sand matrix. These American River channel pebbles are approximately 600,000 years old, as regionally correlated from radiometrically dated sediments of a stratigraphic unit in the San Joaquin Valley. Consequently, they are of mid-Pleistocene age. Soils on hills in the eastern part of Sacramento County also are estimated to be of mid-Pleistocene age.

Corning

Corning soils are gravelly loam formed from the Laguna Formation and Arroyo Seco gravels on high terraces and terrace remnant landforms. Corning soils are characterized by mound-

intermound microrelief and on smooth terrace side slopes. They are very deep. They are well drained on the mounds and moderately well drained in the intermound areas. Typically, the surface layer is gravelly fine sandy loam. The restrictive layer is a claypan at approximately 28 inches depth (Jones and Stokes 1990). The substratum is stratified gravelly sandy clay loam and gravelly sandy loam. It formed in old valley fill from mixed sources. Typically, the surface layer is reddish-brown, yellowish-red, and red gravelly loam about 22 inches thick. The subsoil is red and dark red clay about 18 inches thick. The substratum to a depth of 60 inches is strong brown clay loam. Corning soils can range from acidic to mildly alkaline (pH of 5–8.5) with a low cation exchange capacity resulting in generally nutrient-poor soil conditions. Permeability is very slow. The available water capacity is 4.0 to 6.5 inches. The effective rooting depth is 60 inches or more, but most roots in the clay subsoil are along the faces of peds, which reduces the water available to plants. Surface runoff is slow or medium. The hazard of erosion is slight or moderate. After intense rainstorms, the soil is saturated for a short time. The Corning series consists of very deep, well, or moderately well-drained soils formed in gravelly alluvium weathered from mixed rock sources. Corning soils are on high terraces and show mound-intermound microrelief. Slopes are 0% to 30%. Solum thickness is 23 to 60 inches. Soil temperature is greater than 47°F throughout the year. Solum thickness differs over short distances because of hummocky microrelief. Elevations are 75 to 1,300 feet amsl. Slopes are 0% to 30%. The soils formed in gravelly alluvium derived from mixed rock sources.

The well-drained Corning soil is very deep. It formed in gravelly alluvium derived from mixed rock sources. Typically, the surface layer is about 28 inches of strong brown gravelly loam and yellowish-red loam. The subsoil is a claypan of yellowish-red gravelly clay loam about 19 inches thick. The substratum to a depth of 62 inches is yellowish red, stratified gravelly loamy coarse sand to gravelly sandy clay loam. In some areas, the surface layer is gravelly sandy loam, loam, or sandy loam. In other areas, the subsoil and substratum are very gravelly. In places, the subsoil is clay or clay loam. Permeability is very slow in the well-drained Corning soil. Water is perched above the claypan for very brief periods after heavy rainfall in winter and early spring and when the soil is over-irrigated. Runoff is medium. The hazard of water erosion is slight or moderate.

The moderately well-drained Corning soil is very deep. It formed in gravelly alluvium derived dominantly from mixed rock sources. Typically, the surface layer is brown gravelly fine sandy loam and reddish-brown, yellowish-red, and light-brown loam, which extends to a depth of about 20 inches. The subsoil is a claypan of yellowish-red clay about 12 inches thick. The substratum to a depth of 60 inches is yellowish-red, stratified gravelly sandy clay loam to gravelly sandy loam. In some areas, the surface layer is gravelly loam, sandy loam, or loam and the subsoil and substratum are very gravelly. In other areas, the subsoil does not have coarse fragments and is grayish-brown clay and clay loam. Available water capacity is low. The effective rooting depth is more than 60 inches, but roots are restricted to the cracks and faces of peds in the claypan,

which is at a depth of 15 to 30 inches. Together, the San Joaquin, Redding, and Corning soil series—durixeralfs and palexeralfs—are the core Northern Hardpan Vernal Pool soils (Solomeshch et al. 2007).

2.4 Atmospheric Conditions

The climate of the Sacramento region is generally described as being Mediterranean and subtropical. Mediterranean climates are characterized by hot, dry summers and cool, moist winters. The absence of any major physiographic variations within the Plan Area results in a nearly uniform climate for the entire area, with the exception of the Sacramento-San Joaquin Delta, where cooler ocean breezes keep summer temperatures lower than in the remainder of the County. It is this seasonal regime that allows vernal pools to persist within the Plan Area and provides a favorable environment for agriculture that supports many SSHCP bird Covered Species.

Temperatures and Growing Season

Temperatures in July vary from an approximate average daily high of 94°F to an average daily low of 60°F, while temperatures in January vary from an approximate average daily high of 54°F to an average daily low of 40°F. Extreme temperatures in Sacramento County have been recorded as low as 17°F in December of 1932 and as high as 114°F in July of 1925 (Masters-Bevan 2000).

Sacramento County has a long growing season. The growing season is that period of time when the temperature is above 32°F. The growing season in Sacramento County ranges from 250 days in or near the Sierra foothills to over 300 days near the City of Sacramento. Most of the lands being cultivated in the County enjoy a growing season of approximately 275 days a year.

Precipitation and Snowfall

Generally, summers in Sacramento County are dry and winters are moist. Total average rainfall in Sacramento County measures about 19 inches annually. Just over half of the total amount of yearly rainfall occurs during the winter rainy season, which is from November to February. During that period, measurable quantities of precipitation occur, on average, 10 days out of every month. Thunderstorms are rare, but when they do occur, it is usually in the fall, late spring, or late summer. Snowfall is also rare in Sacramento County, and when it does occur, the amount is small and melts quickly (Masters-Bevan 2000).

The County experiences a great deal of sunshine throughout the year. During the winter months, about 53% of the days have sunshine, while sunshine will prevail on about 95% of the days during the summer months. A typical year in Sacramento reports 188 clear days, 77 partly cloudy days, and 100 cloudy or foggy days (Masters-Bevan 2000).

Winds

Winds in Sacramento County are influenced in most instances by the cool marine air entering the Central Valley through the Carquinez Straits. Because of the north–south orientation of the Great California Valley, the winds advancing from the sea to the west, once in the valley, change direction and blow either north toward Sacramento County or south toward San Joaquin County, depending upon existing atmospheric pressures.

Southerly winds prevail in Sacramento County, with an average velocity of about 8 miles per hour. On occasion, this south wind does not extend across the entire valley floor but, instead, a light northerly counter-current may occur on the west side of the valley.

In winter, the wind directions are generally dependent upon the passage of frontal systems through the valley. Southeasterly winds generally occur as a front approaches, with a marked wind shift to the northwest or north after the front has passed. The strongest northerly winds occur after the front has passed, decreasing in speed over a period of a few days.

Air movement may stagnate between storms in winter, but the highest frequency of stagnation occurs in autumn, during the period after the characteristic summer flow ceases and before the season of winter storms has commenced. During any season, nighttime cold density flows may occur in the absence of strong barometric pressure gradients. These flows are most pronounced in sloping mountain valleys and tend to follow water drainage patterns.

These density flows lead to a pooling of cold air with a temperature inversion at the top of the pool; thus, any radiation inversion that might occur independently on the valley floor may be augmented by cold air flowing off of the sloping sides of the valley.

Humidity and Fog

Generally, summers in Sacramento County are dry and winters are moist. The relative humidity ranges from about 30% to 80% during summer months and 60% to 90% during winter months (Masters-Bevan 2000).

Heavy fog, locally called radiation fog or “tule fog,” is experienced in the Plan Area during the winter months, usually December to February, with a higher occurrence along waterways. Several conditions, occurring simultaneously, are conducive to the formation of radiation fog. These include the lack of strong storm systems, an intensifying nighttime inversion caused by cold down-slope drainage flows from the mountains, and short daylight hours. Radiation fog frequently occurs during the nights and mornings and ranges in thickness from 200 feet in lower elevations of the valley to just 10 feet at higher elevations. Fog may persist for periods of several days to 2 or 3 weeks in the absence of a strong weather system, or if solar radiation that normally

heats the ground is reflected back into the atmosphere by the fog itself. On average, fog occurs in Sacramento County 34 days per year (Cunningham 2003).

2.5 Surface Waters

As discussed in Section 2.3.1, Landforms, the easterly and center portion of the Plan Area has rolling terrain, resulting in reasonably well-defined stream channels and steep gradients. The westerly portion of the Plan Area, on the other hand, generally comprises landforms typical of the Central Valley floor with level terrain and poorly defined, meandering streams with gentle gradients. The general pattern of drainage, slope, and gradient in the Plan Area is from northeast to southwest.

Hydrologic conditions of most streams and rivers in the Plan Area are altered from historic conditions. Historically, the hydrology of most streams within the Plan Area was intermittent or ephemeral. The streams would flow in the winter and spring months when precipitation and groundwater conditions were suitable. Under current conditions, summer runoff from various land uses provides augmenting flows to many segments of Plan Area streams, sometimes creating perennial hydrology.

The Cosumnes River and the Mokelumne River are the only rivers within the Plan Area, though the southern border of the Plan Area is the centerline of the Mokelumne River and the western border of the Plan Area is adjacent to the Sacramento River (see a description of the Plan Area in Chapter 1 (Figure 1-1, SSHCP Plan Area)). The Cosumnes River receives flows from its contributing stream tributaries, and flow is also naturally augmented through connection to shallow groundwater basins.

Most of the perennial and larger intermittent streams, creeks, and rivers within the Plan Area are named flowline features. Although some riparian and adjacent wetland habitats are intact and/or being restored in certain locations, the dominant SSHCP land cover types (see Chapter 3) adjacent to named rivers and streams are Valley Grassland, Agricultural, and Non-Habitat land cover types associated with urban development. Some of these streams are channelized, rerouted around agricultural operations, and devoid of riparian areas as a result of agricultural and urban/suburban development.

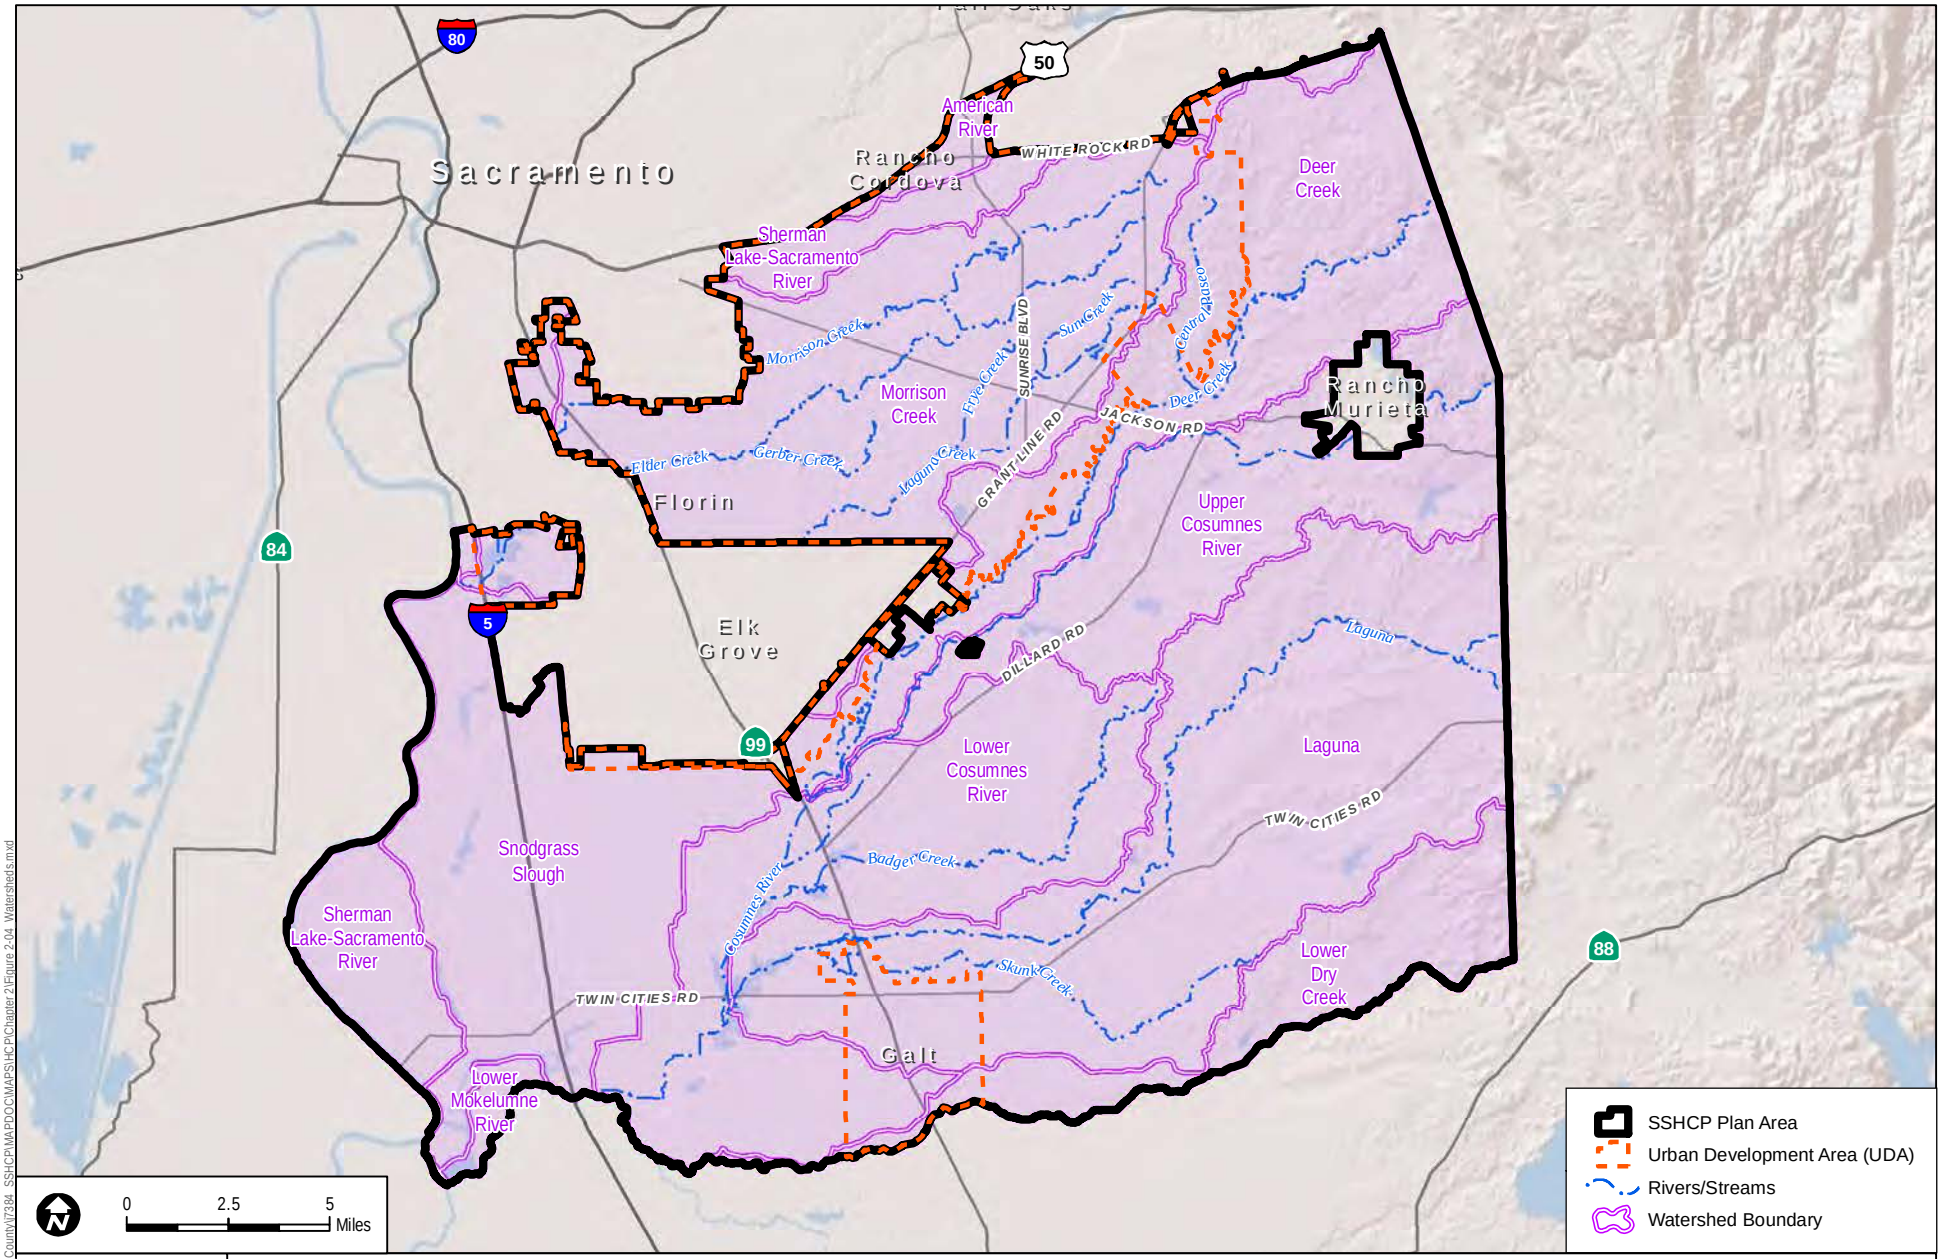
2.5.1 Important Rivers, Streams, and Creeks within the UDA

The following describes specific rivers, streams, and creeks within the UDA that were studied for potential benefits to Covered Species or water quality should they be preserved under this Plan (see Figure 2-4, Watersheds).

2.5.1.1 Central Paseo

The headwaters to the Central Paseo are located in an undescribed portion of the Plan Area proximal to the northeast corner of the SSHCP's UDA. From its headwaters, the stream flows south through Valley Grassland land cover for approximately 36,160 feet within the Cordova Hills Master Plan Area before intersecting Deer Creek. As of the writing of this Plan, there are no portions of the Central Paseo within existing preserves.

2.5.1.2 Elder Creek



The headwaters to Elder Creek are located within the Jackson Township Master Plan Area near the intersection of Kiefer Road and Eagles Nest Road. From its headwaters, the stream flows southwest through a matrix of Valley Grassland and agricultural-residential development for approximately 44,560 feet until it reaches Elk Grove Florin Road. This section of the stream largely retains its natural meander, only occasionally being interrupted in small sections where it has been straightened and widened to accommodate agricultural operations, including a large nursery. From Elk Grove Florin Road, the stream continues for approximately 18,740 feet through an urbanized setting before leaving the Plan Area. The portion of Elder Creek that flows through this urban setting is concrete-lined or riprapped with little or no riparian vegetation remaining. As of the writing of this Plan, there are no portions of Elder Creek within existing preserves.

2.5.1.3 Frye Creek

The headwaters to Frye Creek are located within the New Bridge Master Plan Area proximal to the intersection of Kiefer Boulevard and Sunrise Boulevard. From its headwaters, the stream flows southwest through Valley Grassland and Agricultural lands for approximately 20,990 feet before intersecting Laguna Creek (north). Most of Frye Creek flows as a natural meandering stream with the exception of a small segment (2,580 feet) that has been straightened to accommodate agricultural operations. As of the writing of this Plan, approximately 7,370 feet of Frye Creek is within existing preserves.

2.5.1.4 Gerber Creek

The headwaters to Gerber Creek are located within the West Jackson Master Plan Area near the intersection of Excelsior Road and Florin Road. From its headwaters, the stream flows southwest through a patchwork of mostly Valley Grassland and agricultural-residential development for approximately 30,120 feet before intersecting Elder Creek. Some small segments (1,150 feet) of Gerber Creek are adjacent to urban development. As of the writing of this Plan, there are no portions of Gerber Creek within existing preserves.

INTENTIONALLY LEFT BLANK

2.5.1.5 Laguna Creek (north)

The headwaters to Laguna Creek (north) are located within the Cordova Hills Master Plan Area just south of Glory Lane. From its headwaters, the stream flows southwest through Valley Grassland for approximately 18,890 feet before being dammed and forming a small, privately owned reservoir (Blodget Reservoir). As the stream exits the reservoir it flows due west for approximately 13,060 feet through Valley Grassland and Agricultural lands until it reaches the intersection of Sunrise Boulevard and Jackson Highway. This section of the stream has been straightened and is deeply incised in some areas. Once past the intersection of Sunrise Boulevard and Jackson Highway, the stream runs southwest through a matrix of Agricultural lands and Valley Grassland for 47,230 feet until it exits the Plan Area at Calvin Road. This section of the stream largely retains its natural meander, only occasionally being interrupted in small sections where it has been straightened and widened to accommodate agricultural operations. Laguna Creek (north) reenters the Plan Area west of Franklin Boulevard and flows into the Regional Sanitation Buffer Lands, joins Morrison Creek, and enters the Stone Lakes National Wildlife Refuge. As of the writing of this Plan, approximately 18,450 feet of Laguna Creek (north) is within existing preserves.

2.5.1.6 Morrison Creek

The headwaters to Morrison Creek are located in an undescribed portion of the Plan Area proximal to the intersection of Grant Line Road and White Rock Road. From its headwaters, the stream flows southwest through Valley Grassland for 52,930 feet until it intersects Excelsior Road. A vast majority of this section of the stream (15,700 feet) travels through two master-planned communities that are not participating in the SSHCP (Rio Del Oro and Mather). From Excelsior Road, the stream continues southwest for approximately 17,410 feet through a series of gravel mines until it reaches Jackson Highway. A majority of the stream in this section has been relocated and widened, but has also been engineered to include a meander belt. Continuing southwest past Jackson Highway, the stream travels approximately 7,600 feet through Valley Grassland and a dense stand of Valley Oak Riparian habitat before intersecting Mayhew Road. With the exception of the headwaters east of Grant Line Road, this is the only other section of Morrison Creek within the Plan Area that has not been moved from its original location. Continuing southwest of Mayhew Road, the stream travels approximately 8,100 feet before exiting the Plan Area. The stream in this section travels through a network of gravel mines and has been relocated and widened, but has also been engineered to include a meander belt. Morrison Creek reenters the Plan Area west of Franklin Boulevard and flows into the Regional Sanitation Buffer Lands before entering the Stone Lakes National Wildlife Refuge. As of the writing of this Plan, approximately 21,980 feet of Morrison Creek is within existing preserves.

2.5.1.7 Sun Creek (a.k.a. Kite Creek)

The headwaters to Sun Creek are located within the SunRidge Master Plan Area. From its headwaters, the stream flows southwest through Valley Grassland for approximately 25,230 feet before intersecting Laguna Creek (north). Most of Sun Creek flows as a natural meandering stream with the exception of a small segment (2,190 feet) that has been straightened to accommodate development. As of the writing of this Plan, there are no portions of Sun Creek within existing preserves.

2.5.2 Important Rivers, Streams, and Creeks outside the UDA

The following describes rivers, streams, and creeks outside the UDA that were studied for potential benefits to Covered Species or water quality should they be preserved under this Plan (see Figure 2-4, Watersheds).

2.5.2.1 Cosumnes River

Outside the UDA, the Cosumnes River is the most prominent watercourse. The river originates in the Sierra Nevada, entering the Plan Area at the Sacramento–El Dorado County boundary. The river flows for approximately 212,630 feet through the Plan Area and eventually merges with the Mokelumne River and then drains into the Sacramento-San Joaquin Delta. As the Cosumnes River makes its way through the Plan Area, it passes through a patchwork of alternating Agricultural land cover types and Valley Grassland. The Cosumnes River supports some of the last major remnants of Riparian Oak Woodland within the region, including remnant stands of Valley Oak Riparian Woodland and stands of elderberry shrubs. The river also provides backwaters that support important breeding and roosting habitat for a number of SSHCP Covered Species.

2.5.2.2 Deer Creek

Just north of the Cosumnes River is Deer Creek, whose headwaters originate in western El Dorado County. Deer Creek flows for approximately 189,690 feet through a landscape of Valley Grassland, Blue Oak Woodland, and Agricultural lands before joining the Cosumnes River southeast of the City of Elk Grove. Much of the land between Deer Creek and the Cosumnes River includes a significant amount of vineyards. There is also the occasional remnant stand of Riparian Woodland.

2.5.2.3 Laguna (South), Skunk, Willow, and Badger Creeks

There are a number of streams located outside of the UDA that offer significant habitat value for a number of the Plan's Covered Species. Laguna (South), Skunk, Willow, and Badger Creeks

and their tributaries are all located outside of the UDA in the southern and eastern portions of the Plan Area. All of these creeks flow in a southwesterly direction through a patchwork of Valley Grassland and Agricultural land cover types before they merge with the Cosumnes River northwest of the City of Galt.

2.5.3 Plan Area Watersheds

A watershed is generally described as an area located within a basin that is entirely drained by a common watercourse. The Plan Area comprises a portion or the entirety of 10 watersheds based on 10-digit hydrologic units (HUC), as defined by the Federal Standard for Delineation of Hydrologic Unit Boundaries (USGS and USDA NRCS 2009). These watersheds are depicted on Figure 2-4.

Table 2-1 provides acreages of the 10 watershed areas and the portion of the watershed within the Plan Area.

Table 2-1
Summary of Watersheds in the Plan Area

Watershed	Acres of the Watershed in Plan Area	Total Watershed Acreage	Percent of Watershed in Plan Area	Cumulative Percentage of Watershed in Plan Area
Laguna Creek	73,976	96,788	76.4%	23.3%
Morrison Creek	42,926	69,540	61.7%	13.5%
Snodgrass Slough	40,426	51,616	78.3%	12.7%
Lower Cosumnes River	46,682	46,683	100.0%	14.7%
Deer Creek	43,803	81,504	53.7%	13.8%
Upper Cosumnes River	31,885	114,793	27.8%	10.0%
Lower Dry Creek	18,493	56,110	33.0%	5.8%
Sherman Lake-Sacramento River	13,987	121,608	11.5%	4.4%
American River	3,452	65,103	5.3%	1.0%
Lower Mokelumne River	2,019	141,965	1.4%	1.0%
Grand Total[1]	**317,655**	**845,709**	**28.5%**	**100.0%**

Note:
[1] The total does not include the approximately 268,589 acres of the Cache Slough watershed in the Plan Area, which is not discussed in this document.

Following are brief descriptions of the existing physical attributes and the acres of each SSHCP land cover type present in each of the 10 watersheds (10-digit HUC) within the Plan Area. The SSHCP defines 25 land cover types present in the Plan Area (see Section 3.2 and Table 3-1).

Eight of the SSHCP land cover types (Section 3.2) are classified by the SSHCP as "Developed or other Non-Habitat" (i.e., "Aqueduct," "Disturbed," "High-Density Development," "Low-Density

Development," "Roads," "Mine Tailings," "Recreation/Landscaped," and "Not Mapped"—see Section 3.2.4). The acres of existing Developed/Non-Habitat land covers are quantified below for each watershed within the Plan Area.

Seventeen of the SSHCP land cover types (Section 3.2) are classified by the SSHCP as "Natural Land Covers," which includes 10 Aquatic land cover types and 7 Terrestrial land cover types (see Table 3-1). Agricultural lands that provide Covered Species habitat are included in the "Natural Land Covers" grouping.

SSHCP land cover types that are assumed to be composed primarily of impervious surfaces include Aqueduct, High-Density Development, Major Road, and Mine Tailings.

2.5.3.1 American River Watershed

Approximately 3,452 acres, or about 5%, of the 65,103-acre American River watershed is located within the Plan Area. This watershed comprises 1% of the entire Plan Area and is located in the northern portion of the Plan Area (Figure 2-4).

Hydrology

According to the National Hydrography Dataset (NHD) flowline dataset, the American River watershed contains about 1% of the Plan Area's flowline features. Alder and Buffalo Creeks are the main water sources within this watershed, both of which are tributaries to the American River located north of the Plan Area. Artificial paths (48%) and streams/rivers (46%) account for most of the flowline features in the American River watershed.

Slope and Elevation

The entire American River watershed contains flat to gentle slopes (0%–20%). This watershed does not contain any lands above 20% slopes. Similarly, the majority of the watershed is between an elevation range of 0–500 feet, with only about 2% ranging from 500–1,000 feet.

Geological Formations

The majority of the American River watershed consists of Riverbank Formation, Laguna Formation, and Gopher Ridge volcanics (45%).

Soils

The majority of this watershed (59%) contains dredge tailings, pits, and other remnants from mining operations. The remaining acreage consists mostly of loam (35%) and gravelly loam (about 3%) soils.

SSHCP Land Cover Types

More than half of the American River watershed within the Plan Area is currently developed (2,024 acres), primarily by High-Density Development and by Recreation/Landscaped land covers. Impervious surfaces cover approximately 1,734 acres, or 50% of the 3,452 acres of this watershed located within the Plan Area. Similar to the Morrison Creek (16% impervious surfaces) and Sherman Lake-Sacramento River (24% impervious surfaces) watersheds discussed below, the American River watershed has one of the three highest percentages of impervious surfaces in the Plan Area.

The only Terrestrial land cover type remaining in the American River Watershed is 1,336 acres of Valley Grassland. Aquatic land cover types in the American River Watershed total approximately 91 acres in the Plan Area, with Mine Tailing Riparian Woodland (48 acres) and Seasonal Wetland (23 acres) the most prevalent Aquatic land covers remaining.

2.5.3.2 Sherman Lake-Sacramento River Watershed

The Sherman Lake-Sacramento River watershed is located in the extreme western portion of the Plan Area, with approximately 13,987 of 121,608 acres (12%) of the watershed located within the Plan Area. The watershed intersects the Plan Area in four separate locations that together comprise about 4% of the Plan Area, including a relatively large area along the northern portion of the Plan Area, a small area in the northwest corner of the Plan Area, and two small areas along the western portion of the Plan Area (Figure 2-4).

Hydrology

According to the NHD flowline dataset, the majority of the hydrologic features within this watershed are canal/ditch (70%). The high percentage of canal/ditch features mapped within the Sherman Lake-Sacramento River watershed is related to the large amount of agricultural land covers mapped in the watershed. Artificial path features account for 27% of the watershed, stream/river features total 3%, and the remaining 0.1% of the watershed consists of pipeline connector features. The Sacramento River and the Folsom Canal encompass the artificial path features mapped within this watershed.

Slope and Elevation

The entire watershed is on flat to gentle slopes with elevations ranging from 0–500 feet.

Geological Formations

Geological formation data is only available for a little less than half of the Sherman Lake-Sacramento River watershed. Intertidal and levee and channel deposits dominate this watershed, with basin deposits making up most of the rest of the watershed.

Soils

The majority of the soils located in this watershed are loam subcategories (45%) and clay (12%). The remaining areas contain water (5%), mucky clay (26%), or are listed under the other category (12%). The majority of the other category is related to mining activities (dumps, pits, slickens, and Xerorthents, dredge tailings) or urban development.

SSHCP Land Cover Types

The Sherman Lake-Sacramento River watershed in the Plan Area is dominated by human activities. Impervious surfaces cover approximately 3,384 acres, or 24%, of the watershed, which is the highest percentage of impervious surfaces in any Plan Area watershed. Developed and Non-Habitat land cover types account for 5,064 acres, or 36%, of the watershed within the Plan Area. Of these, the High-Density Development land cover accounts for 3,049 acres, or 22%, of the total 13,987 acres of watershed within the Plan Area.

The Sherman Lake-Sacramento River watershed contains 262 acres of Aquatic land cover types, but generally in small amounts, from 1.4 acre of Swale up to 130 acres of Mixed Riparian Scrub. Terrestrial land cover types in this watershed are mostly agricultural lands, with 4,986 acres of Cropland, 1,749 acres of Orchards, and 1,260 acres of Vineyards. Valley Grassland covers only 665 acres of this watershed within the Plan Area.

2.5.3.3 Deer Creek Watershed

The Deer Creek watershed bisects the Plan Area, comprising 43,803 acres and extending from the northeastern edge to halfway into the center of the Plan Area (Figure 2-4).

Hydrology

Approximately 86% of the NHD data within the Deer Creek watershed contains streams and rivers. Deer Creek and its tributaries are the dominate feature of this watershed. Notable tributaries located within the watershed include Crevis Creek, Carson Creek, and Coyote Creek. The Cosumnes River separates the Deer Creek watershed from the Upper Cosumnes River watershed (Figure 2-4). Artificial paths account for about 6% of this watershed, with the majority related to the southern

extension of the Folsom South Canal. The remaining NHD features within the Deer Creek watershed are canal/ditch (7%), connector (less than 1%), and pipeline (less than 1%).

Slope and Elevation

The Deer Creek watershed contains slopes from 0% to greater than 40%, with the vast majority of the slopes (99%) within the 0%–20% category. Less than 1% is within the 20%–40% category and less than 1% is within the greater than 40% category. The majority of the steep slopes are concentrated along the portion of Deer Creek River located in the northeastern section of the watershed. Of all the watersheds, Deer Creek contains the highest percentage (3%) of acreage within an elevation range of 500–1,000 feet amsl. This acreage is concentrated along the eastern border of the Plan Area.

Geological Formations

Gopher Ridge volcanics, Mehrten Formation, and salt springs slate compose the majority of the Deer Creek watershed, accounting for about 48% of the surface acres within the Plan Area. Several other geological formations are exposed within this watershed and include the Laguna Formation, levee and channel deposits, Modesto Formation, and Riverbank Formation.

Soils

A wide variety of loam soil subcategories occur within this watershed: loam (26%), silt loam (25%), gravelly loam (17%), sandy loam (15%), fine sandy loam (10%), and sandy clay loam (3%). Additional soils include clay (1%) and soils listed in the other category (2%). A small percentage (less than 1%) includes areas covered in water.

SSHCP Land Cover Types

The large majority (94%) of the Deer Creek watershed in the Plan Area comprises Natural land cover types.

Terrestrial land cover types are present on 39,331 acres (71% of the watershed) and are primarily the Valley Grassland land cover (23,643 acres, or 54%, of the watershed). Other SSHCP Terrestrial land covers include Blue Oak Woodland (4,400 acres), Blue Oak Savanna (2,018 acres), Cropland (4,065 acres), and Vineyard (4,231 acres). Approximately 2,006 acres of the watershed consists of Aquatic land cover types such as Mixed Riparian Woodland (836 acres), Stream/Creek (228 acres), Open Water (200 acres), and Vernal Pool (274 acres).

Only 6% (2,467 acres) are Developed/Non-Habitat land covers. Impervious surfaces cover approximately 314 acres, or less than 1%, of the 43,803 acres of this watershed within the Plan Area.

2.5.3.4 Morrison Creek Watershed

The Morrison Creek watershed is located within the northern half of the Plan Area, and includes the town of Mather and the southern part of the City of Rancho Cordova. Of the 69,540 acres that comprise this watershed, 62%, or 42,926 acres, are located within the Plan Area, almost entirely inside the UDA (Figure 2-4).

Hydrology

The Morrison Creek watershed contains approximately 9% of the Plan Area's NHD flowline features. Approximately 83% of the flowline features are stream and river features, including Morrison Creek, Laguna Creek (north), Elder Creek, Strawberry Creek, Unionhouse (Beacon) Creek, and Frye Creek. Folsom South Canal accounts for the majority of the 72,483 linear feet of artificial path features. Canal/ditch features make up approximately 6% of the NHD flowline features within the Plan Area with connectors (1%) and pipeline (less than 1%) rounding out the remaining areas.

Slope and Elevation

The majority of the watershed is on flat to gentle slopes with elevations ranging from 0–500 feet. Only 2 acres of the watershed are within the 20%–40% slope range.

Geological Formations

The Laguna and Riverbank Formations comprise 97% of the acreage in the Morrison Creek watershed. The remaining prominent formations in the watershed include basin deposits and mine and dredge tailings.

Soils

Soils in the Morrison Creek watershed primarily contain loam subcategories such as silt loam, loam, and gravelly loam, which account for about 84% of the watershed. Approximately 50% of the loam soils are from the San Joaquin soil series. Other loam subcategories comprise 4% of the soils, water covers less than 1% of the watershed, and 7% of the soils are listed in the other category. Approximately 3% of the other category is related to mining activities (dumps, pits, slickens, and xerorthents, dredge tailings, 2% to 50% slopes) or urban development.

SSHCP Land Cover Types

The Morrison Creek watershed is located in the urbanizing portion of Sacramento County, and approximately 15,018 acres (35%) of the watershed is Developed/Non-Habitat, primarily the High-Density Development land cover type. Impervious surfaces cover approximately 6,982 acres, or 16%, of the 42,926 acres of this watershed in the Plan Area. Along with the American

River (50% impervious surfaces) and Sherman Lake-Sacramento River (24% impervious surfaces) watersheds, the Morrison Creek watershed has one of the three highest percentages of impervious surfaces in the Plan Area.

Terrestrial land cover types are present on about 25,485 acres (59%) of the Morrison Creek watershed within the Plan Area. Most of this is Valley Grassland (21,294 acres) but Cropland, Irrigated-Pasture Grassland, Orchards, and Vineyards are also present. This watershed includes each type of Aquatic land cover type, including approximately 765 acres of Vernal Pool, 359 acres of Swale, and 107 acres of Seasonal Wetland. Laguna Creek (north) is a significant east–west landscape feature, and is mapped as the Stream/Creek land cover (see Section 3.2).

2.5.3.5 Upper Cosumnes River Watershed

The Upper Cosumnes River watershed is located in the east-central portion of the Plan Area and comprises 31,885 acres within the Plan Area (Figure 2-4).

Hydrology

According to the NHD flowline dataset, approximately 62% of the Upper Cosumnes River watershed consists of stream/river features. The majority of stream/river features in the watershed are tributaries to the Cosumnes River, which is mapped as an artificial path. The river and the Folsom South Canal account for most of the artificial path features mapped in the watershed. Less than 10% of the flowline features within the watershed include canal/ditch and connector or pipeline features.

Slope and Elevation

While the majority of the Upper Cosumnes River watershed is on flat to gentle slopes with elevations ranging from 0–500 feet, a small percentage (0.4%) is located above 500 feet. This watershed contains the highest percentage of land with slopes between 20%–40% and greater than 40%. These areas occur along the eastern border of the Plan Area.

Geological Formations

The Upper Cosumnes River watershed contains a variety of geological formations. Two formations total about 44% of the watershed and include the Riverbank and Laguna Formations. Other prominent formations include Valley Springs, Mehrten, Gopher Ridge, and Modesto Formations.

Soils

The majority of the soils within this watershed are subcategories of loam (87%). Approximately 3% of the watershed contains water, 3% clay, and 7% falls within the other category. Most of the other category (6%) is related to mining activities (pits, slickens and Xerorthents, dredge tailings, 2% to 50% slopes).

SSHCP Land Cover Types

Approximately 31,885 acres, or about 28%, of the Upper Cosumnes River watershed are located in the Plan Area. The majority of the watershed in the Plan Area (23,601 acres, or 74%), consists of Terrestrial land cover types, including 17,530 acres of Valley Grassland and 1,951 acres of Blue Oak Woodland. Aquatic land covers comprise about 2,634 acres (8%) of the watershed in the Plan Area, with no one type dominant. Developed/Non-Habitat land covers, primarily the Low-Density Development land cover, comprise approximately 3,760 acres (12%) of the watershed area within the Plan Area. Impervious surfaces cover approximately 762 acres, or 2.4% of the 31,885 acres of this watershed in the Plan Area.

2.5.3.6 Laguna Creek Watershed

The Laguna Creek watershed is approximately 96,788 acres, of which 73,976 acres are within the Plan Area, and comprises 76% of the Plan Area. It is located in the southeastern portion of the Plan Area and extends from the County line on the east to the City of Galt on the west (Figure 2-4).

Hydrology

According to the NHD flowline dataset, the Laguna Creek watershed contains almost 26% of the flowline types in the Plan Area, which is slightly higher than its total proportion (20%) of the Plan Area. Reflecting the dominance of natural land cover types in the watershed, approximately 86% of the Laguna Creek watershed is stream/river, with artificial paths and canal/ditch accounting for almost all of the remaining 14%.

The main streams/rivers in the Laguna Creek watershed include Laguna Creek (south), which flows west from outside the Plan Area and drains to the Cosumnes River in the western portion of the watershed. Browns, Hadselville, Griffith, and Skunk Creeks all drain into Laguna Creek, with each having various tributaries creating a rich network of drainages in the watershed.

Slope and Elevation

The vast majority (more than 99%) of the Laguna Creek watershed is on flat to gentle slopes (0%–20%), with only 141 acres on 21%–40% slopes and 2 acres on slopes greater than 40%.

Likewise, the entire watershed is at an elevation less than 500 feet. In the Laguna Creek watershed, elevations range from about 250 feet amsl in the hillier areas in the eastern portion of the watershed to less than 15 feet amsl in the western portion of the watershed where Laguna Creek (south) drains into the Cosumnes River.

Geological Formations

The Laguna Creek watershed is underlain mostly by the Laguna and Riverbank Formations (56% of the watershed). Other prominent formations in the watershed include the Mehrten and Modesto-Riverbank Formations.

Soils

Approximately 95% of the soil types located within the Laguna Creek watershed are loam subcategories with the majority of the soil types consisting of gravelly loam, silt loam, loam, and fine sandy loam.

SSHCP Land Cover Types

The large majority (67,662 acres or 91%) of the Laguna Creek watershed is composed of Natural land covers. Combined, the Valley Grassland, Blue Oak Savanna, and Blue Oak Woodland land covers are approximately 46,092 acres (62% of the 73,976 acres of watershed in the Plan Area). Cropland, Irrigated Pasture-Grassland, Orchards, and Vineyards total approximately 17,444 acres (24% of the 73,976 acres of watershed within the Plan Area). The Laguna Creek watershed includes most of the SSHCP Aquatic land covers (see Table 3-1) except the Stream/Creek Vernal Pool Invertebrate Habitat (VPIH) land cover. The area of Laguna Creek watershed within the Plan Area has 2,764 acres of the Vernal Pool, Seasonal Wetland, and Swale land covers (combined); approximately 416 acres of the Stream/Creek land cover; and approximately 300 acres of the Open Water land cover.

There are 6,314 acres of Developed/Non-Habitat land covers (9% of the watershed within the Plan Area), dominated by the Low-Density Development land cover (4,284 acres). Impervious surfaces cover approximately 1,724 acres, or 2.3%, of the 73,976 acres of watershed within the Plan Area.

2.5.3.7 Lower Cosumnes River Watershed

The Lower Cosumnes River watershed is 46,683 acres. The entire watershed is located within the south-central portion of the Plan Area (Figure 2-4).

Hydrology

According to the NHD flowline dataset, the Lower Cosumnes River watershed consists primarily of stream/river (44%), canal/ditch (35%), and artificial path (22%). This watershed contains the lower portion of the Cosumnes River. The Cosumnes River and Badger Creek account for the majority of the stream/river and artificial path flowline data within this watershed. Agricultural areas are the largest land cover in this watershed, which is reflected by the high percentage of NHD flowline features categorized as canal/ditch.

Slope and Elevation

The entire watershed is on flat to gentle slopes with elevations ranging from 0–500 feet amsl.

Geological Formations

Riverbank Formations account for approximately 69% of the Lower Cosumnes River watershed. Other important formations include basin deposits, Laguna Formation, and levee and channel deposits.

Soils

Approximately 65% of the soils within the Lower Cosumnes River watershed are silt loams with the majority falling within the San Joaquin soil series. The remaining soils are subcategories of loam (25%), clay (6%), water (1%), and other (2%).

SSHCP Land Cover Types

The Lower Cosumnes River watershed consists primarily of Terrestrial land covers, accounting for 35,747 acres, or 77%, of the watershed. Terrestrial land covers are dominated by the Valley Grassland land cover (14,593 acres) and Cropland (12,614 acres). Approximately 12% (5,745 acres) of the watershed is Aquatic land cover types, with Freshwater Marsh (1,127 acres) and Mixed Riparian Woodland (1,929 acres) the most prevalent Aquatic land covers.

Approximately 5,191 acres (11%) of the watershed is Developed/Non-Habitat land covers, primarily the Low-Density Development land cover (3,976 acres) and the High-Density Development land cover (667 acres). Impervious surfaces cover approximately 1,061 acres, or only 2.2%, of the 46,683 acres of this watershed.

2.5.3.8 Snodgrass Slough Watershed

Snodgrass Slough is the fifth-largest watershed in the Plan Area (behind the Laguna Creek, Lower Cosumnes, Deer Creek, and Morrison Creek watersheds), and approximately 40,426 of its 51,616 acres are located within the western portion of the Plan Area.

Hydrology

Reflecting the dominance of agricultural land covers within the watershed, approximately 72% of the NHD flowlines in the Snodgrass Slough are canal/ditch features. Artificial paths account for almost 21% of the watershed while stream/river features comprise 7% and connector features are less than 1% of the watershed.

Slope and Elevation

The entire watershed is on flat to gentle slopes with elevations ranging from 0–500 feet.

Geological Formations

Geological formation data are available for approximately 60% of the Snodgrass Slough watershed. Almost the entire watershed consists of Riverbank Formations, which make up approximately 72% of the watershed. The remaining 1% of mapped geological data for the watershed consists of basin, intertidal, and levee and channel deposits.

Soils

The majority of the soils in the Snodgrass Slough watershed are subcategories of loam soils (60%). The largest acreage falls into the silt loam category (32%), most of which contains the San Joaquin soil series. Approximately 32% of the watershed contains clay soils with water (4%) and the other (1%) category rounding out the remaining acreage.

SSHCP Land Cover Types

About 31,729 acres (78%) of the watershed is Terrestrial land cover types, with 16,275 acres composed of Cropland. Other abundant Terrestrial land cover types include Valley Grassland (5,947 acres), Vineyards (5,560 acres), and Irrigated Pasture-Grassland (3,295 acres). Snodgrass Slough watershed has the highest acreage of Aquatic land cover types within the Plan Area, approximately 5,944 acres, 24% of the total Aquatic land cover acres present in the Plan Area. Developed/Non-Habitat lands, dominated by the Low-Density Development land cover type, account for only 2,753 acres, or 7%, of the watershed. Impervious surfaces cover approximately 1,124 acres, or 2.8%, of the 40,426 acres of this watershed in the Plan Area.

2.5.3.9 Lower Dry Creek Watershed

The Lower Dry Creek watershed is located along the southern edge of the Plan Area. Approximately 18,493 acres, or 33%, of the watershed is located within the Plan Area.

Hydrology

Approximately 87% of the flowlines within the Lower Dry Creek watershed are streams and rivers. Artificial path (about 6%), canal/ditch (7%), and connector (less than 1%) account for the remainder of the NHD flowline features in this watershed. This watershed encompasses Dry Creek, which is located along the southern boundary of the Plan Area. The watershed ends where Dry Creek terminates into Mokelumne River located to the west.

Slope and Elevation

The vast majority (99%) of the Lower Dry Creek watershed contains gentle slopes (i.e., 0%–20%) with a small fraction falling within the 20%–40% and >40% ranges. Similarly, most of the watershed is within the 0 to 500-foot elevation range. Only 40 acres (less than 1%), located along the eastern border of the Plan Area, is within the 500 to 1,000-foot elevation range.

Geological Formations

The Lower Dry Creek watershed consists of several different geological formations with the combined Riverbank, Laguna, and Mehrten Formations totaling approximately 67% of the watershed. Other formations include Valley Springs, alluvial deposit formations, and levee and channel deposits.

Soils

Approximately 91% of the watershed consists of fine sandy loam, gravelly loam, and sandy loam. The remaining soils are subcategories of loam (6%), other (2%), clay (less than 1%), and water (less than 1%).

SSHCP Land Cover Types

Of the 18,493 acres of the Lower Dry Creek watershed within the Plan Area, approximately 17,002 acres (92%) are Terrestrial land covers, with only 967 acres of Aquatic land cover types. The Valley Grassland land cover dominates the Upland resources in the watershed, covering 7,965 acres. Other dominant land covers in this watershed are Cropland (2,742 acres) and the Vineyard (3,821 acres) land cover types. Developed/Non-Habitat land covers are present on 524 acres. Impervious surfaces cover approximately 85 acres, or less than 1%, of the watershed within the Plan Area.

2.5.3.10 Lower Mokelumne River Watershed

Although the Lower Mokelumne River Watershed is more than 141,965 acres in size, only 3% of the watershed is located in the far southwest corner of the southern Plan Area. The Mokelumne River

watershed covers only 1% (2,019 acres) of the Plan Area. Due to its minor role in the Plan Area, the discussion in this section is abbreviated compared to the discussions for the other watersheds.

Hydrology

The portion of the Lower Mokelumne River watershed that occurs within the Plan Area contains only artificial path and canal/ditch NHD flowline features. The Mokelumne River, represented by the artificial path features, serves as a portion of the southern border for the Plan Area. This watershed extends to the west as a long sliver surrounding the Mokelumne River. The watershed ends where Lower Dry Creek terminates into the river. The canal and ditch flowline features, which account for 88% of the watershed, cross through the agricultural land covers, providing water to the area.

Slope and Elevation

The entire watershed is on flat to gentle slopes with elevations ranging from 0 to 500 feet.

Geological Formations

Geological information is only available for the eastern sliver of the Lower Mokelumne River watershed. This portion of the watershed is dominated by intertidal deposits (53%), with basin deposits and levee and channel deposits accounting for the rest of the watershed.

Soils

The majority (59%) of the Lower Mokelumne River watershed consists of clay soils, specifically Egbert clay, partially drained, 0% to 2% slopes. The remaining soils are loam subcategories (36%) and water (5%).

SSHCP Land Cover Types

The 2,019 acres of this watershed located within the Plan Area are primarily Terrestrial land covers (1,680 acres), specifically the Cropland land cover type (1,671 acres). Aquatic land cover types total 290 acres, with notable land cover types being Mixed Riparian Woodland (196 acres) and Stream/Creek (67.4 acres). Developed/Non-Habitat land covers total 49.3 acres in this watershed in the Plan Area. Impervious surfaces cover approximately 30 acres, or 1.5%, of the 2,019 acres of this watershed within the Plan Area.

3 BIOLOGICAL RESOURCES SETTING

3.1 Introduction

This chapter summarizes the baseline condition of the biological resources in the Plan Area, including South Sacramento Habitat Conservation Plan (SSHCP or Plan) definitions and descriptions of land cover types in the Plan Area, species addressed by the SSHCP, and a description of species habitat models used to quantify impacts and to prepare the SSHCP Conservation Strategy. Methodologies used to map land cover baseline conditions and map species suitable habitat (habitat models) are also discussed in this chapter.

3.2 SSHCP Land Cover Type Definitions

The land cover classification system developed for the SSHCP is a modification of the California Natural Communities classification system developed by the California Department of Fish and Wildlife (CDFW) (Sayer and Keeler-Wolf 1995). See Section 3.3 for information on the process used to define and map the SSHCP land covers.

There are 24 SSHCP land cover types in the Plan Area. Seventeen land cover types are classified as "natural land covers," which includes native and naturalized environments and agricultural lands that have habitat value for SSHCP Covered Species (Sections 3.2.1 and 3.2.2). Seven SSHCP land cover types are classified as "developed/non-habitat land covers" and provide minimal habitat value for native species, including the SSHCP Covered Species (Section 3.2.3). Table 3-1 lists the SSHCP land cover types within the Plan Area. Figure 3-1 shows the distribution of SSHCP land cover types in the Plan Area. As discussed in Section 1.2.1, the Plan Permittees divided the Plan Area into eight geographic subdivisions called Preserve Planning Units (PPUs) to assist with their development of an adequate SSHCP Conservation Strategy. The acres of each SSHCP land cover type in each SSHCP PPU are outlined in

Table 3-1
SSHCP Land Cover Types within the Plan Area

SSHCP Land Cover Type	Area (Acres) in Plan Area	Percentage of Total Plan Area
Natural Land Cover Category (have habitat value)		
Wetland Waters		
Vernal Pool	4,536	1.4
Swale	1,252	0.4
Seasonal Wetland	2,600	0.8
Freshwater Marsh	2,954	0.9
Non-Wetland Waters		
Stream/Creek (Vernal Pool Invertebrate Habitat)*	73	0.02
Stream/Creek	2,778	0.9

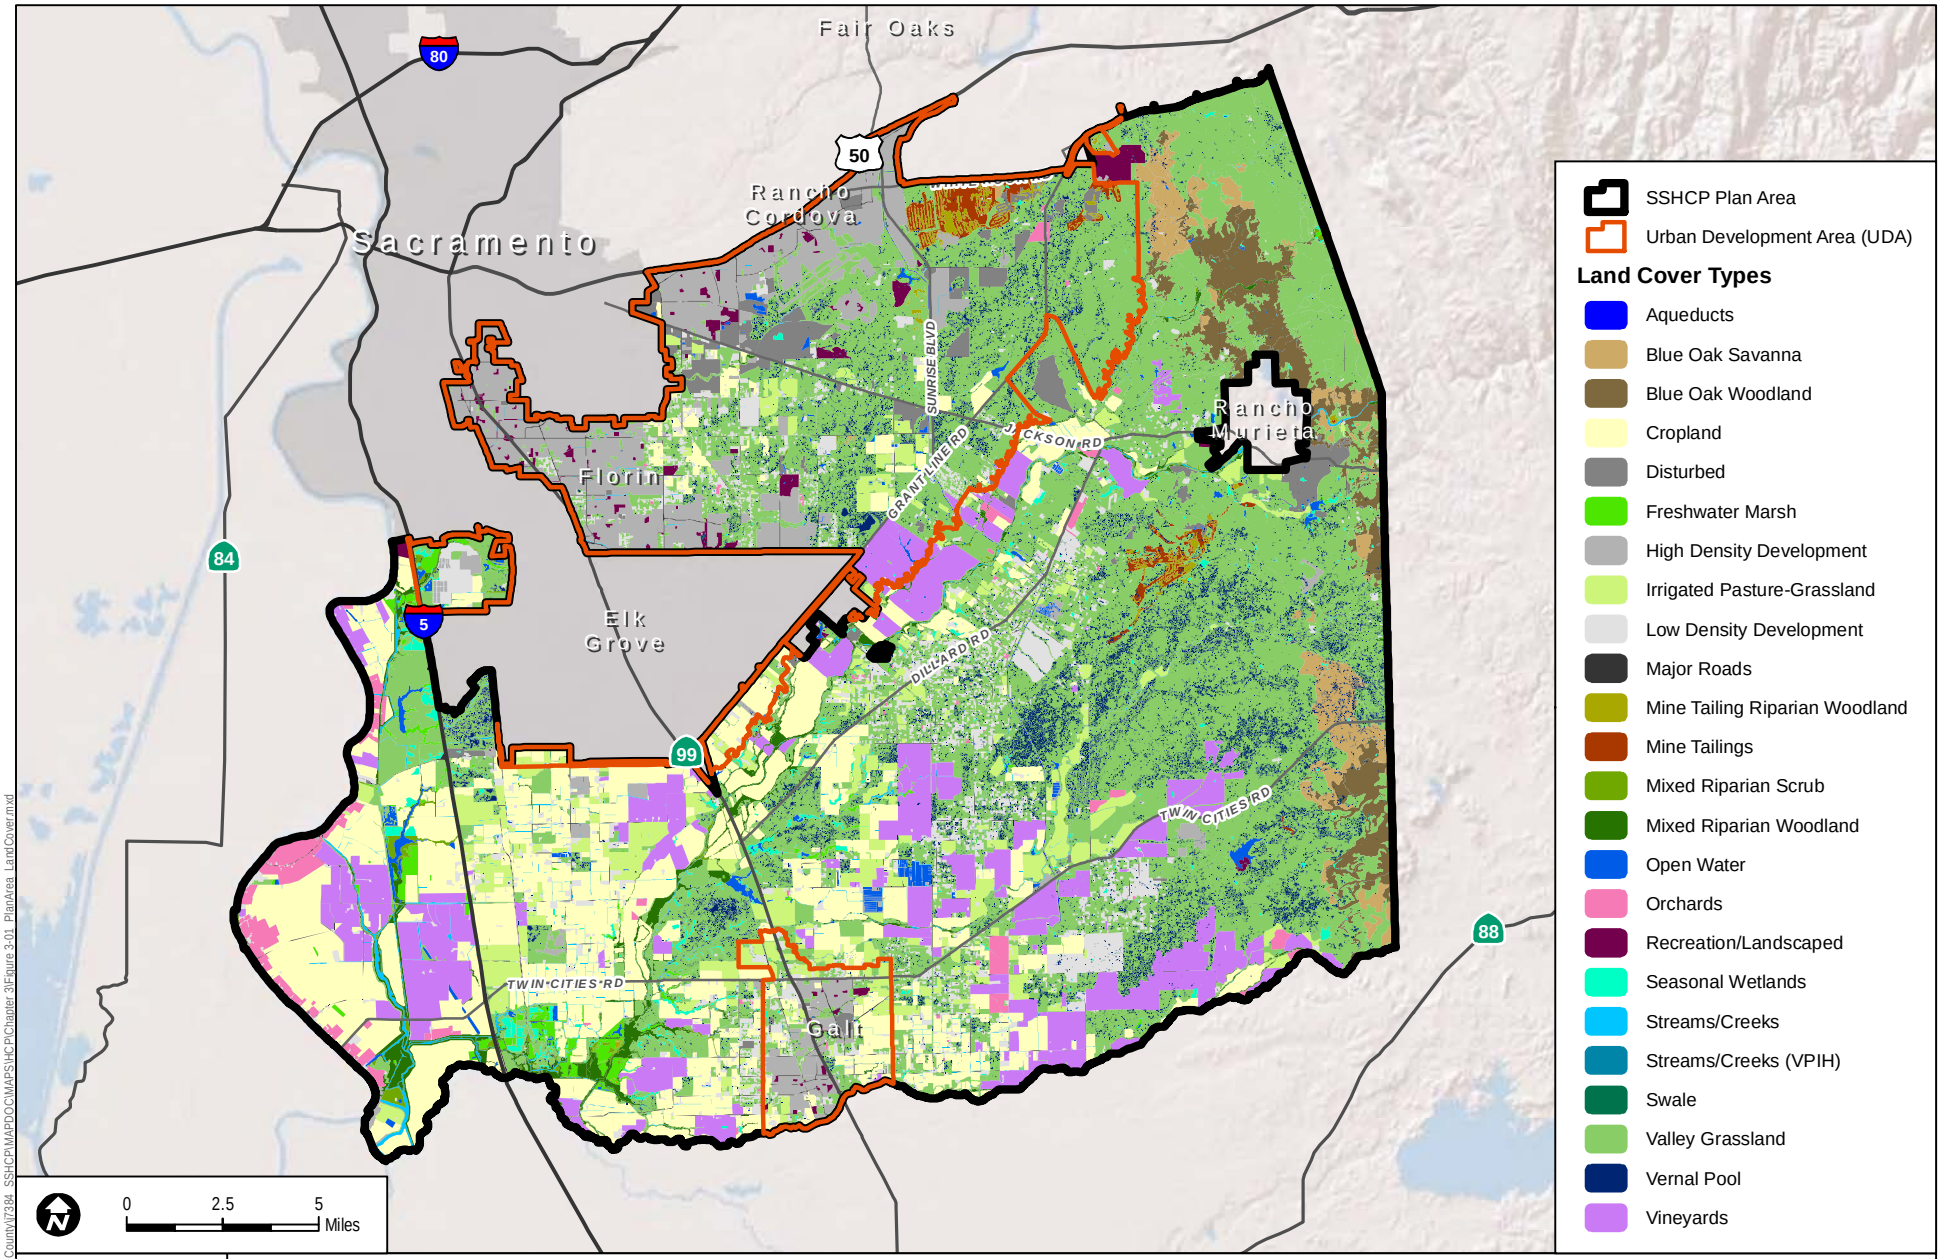

Table 3-1
SSHCP Land Cover Types within the Plan Area

SSHCP Land Cover Type	Area (Acres) in Plan Area	Percentage of Total Plan Area
Open Water	2,344	0.7
Riparian		
Mixed Riparian Woodland	5,856	0.2
Mixed Riparian Scrub	1,454	0.5
Mine Tailings Riparian Woodland	641	0.2
Terrestrial		
Valley Grassland	135,152	42.5
Blue Oak Savanna	5,637	1.8

Low-Density Development	18,608	5.9
Major Roads	2,764	0.9
Mine Tailings	1,098	0.3
Recreation/Landscaped	2,180	0.7
Not Mapped**	784	0.2
Total	**317,655**	**—**

Notes:

* Within the Urban Development Area portion of this Plan Area, occurrences of vernal pool tadpole shrimp (*Lepidurus packardi),* vernal pool fairy shrimp (*Branchinecta lynchi*), and mid-valley fairy shrimp (*Branchinecta mesovallensis*) have been found in certain intermittent streams, creek, and drainages. The SSHCP maps these streams, creeks, and drainages as Vernal Pool Invertebrate Habitat (VPIH).

Sections 3.2.1 and 3.2.2 present descriptions of each of the 17 SSHCP natural land cover types that provide habitat for SSHCP Covered Species and habitat for numerous other native species in the Plan Area.

INTENTIONALLY LEFT BLANK

3.2.1 SSHCP Aquatic Land Cover Types

Vernal Pool Land Cover

Vernal pools are seasonal ephemeral wetlands that fill and dry each year. In Central Valley annual grasslands, they form in shallow depressions that are underlain with a soil or a soil layer impermeable to water. In California's Mediterranean climate (rainy winter months followed by a hot, dry season), vernal pool soils typically become wetted in November. Water collects in the depressions and stands during late winter and early spring, then recedes as temperatures rise and rainfall diminishes. The soil, however, remains moist through April and May, then it desiccates and stays dry until the cycle begins again. The specific hydrological regime of vernal pool inundation—too short and unpredictable to support most aquatic species but long enough to eliminate upland species—is what characterizes vernal pools as ephemeral wetlands and differentiates them from other aquatic ecosystems such as alkali meadows and seasonally flooded emergent bulrush or tule marshes (Solomeshch et al. 2007).

Vernal pools support unique assemblages of highly specialized plants and animals that are adapted to the annual cycle of winter inundation and summer drought. Consequently, vernal pools are one of the few habitats in California still dominated by native plant and animal species (Rains et al. 2008). Many vernal pool plant genera and species are endemic to California, and their presence indicates the specific hydrology and water chemistry of the vernal pool. Vernal pools were once a very common element of the Central Valley landscape, but only a small portion has not been converted to agricultural and urban developments; consequently, many vernal pool taxa are now rare and endangered.

Vernal pools provide habitat for rare and endangered animals such as vernal pool tadpole shrimp (*Lepidurus packardi*), vernal pool fairy shrimp (*Branchinecta lynchi*), conservancy fairy shrimp, Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*), and several amphibians (e.g., western spadefoot toad (*Spea hammondii*), California tiger salamander (*Ambystoma californiense*)), and vernal pools support a number of migratory birds in the winter (Alexander 1976; Helm 1998; Silveira 1998; Solomeshch et al. 2007; USFWS 2004b). A specific group of plant taxa occupies vernal pools, most of which are annuals capable of slow underwater growth in winter and rapid development and reproduction in spring after the water is gone but before soils dry. Plant species are not distributed evenly through the pools, but grow in concentric zones that reflect different lengths of inundation as the pool dries (Solomeshch et al. 2007). As discussed in Chapter 2, Central Valley vernal pools occur on many geological surfaces, but in all cases, vernal pools are underlain by a low-permeability layer such as claypans, hardpans (e.g., silica-cemented duripans), mudflows, or bedrock (Rains et al. 2008). Because vernal pools are associated with specific landforms, geologic formations, and soils (Smith and Verrill 1998), vernal pools tend to be clustered at the landscape scale, forming vernal pool complexes (Rains et

al. 2006). Based on a vernal pool's landform, underlying geology, nature of the soil's water-restricting layer, frequency of ponding, and ponding duration, Sawyer and Keeler-Wolf (1995) have identified five vernal pool types in northern California. As discussed in Section 2.3, most vernal pools in the Plan Area are broadly classified as Northern Hardpan vernal pools and Northern Volcanic Mudflow vernal pools (Jones and Stokes 1990). In addition, a less specialized vernal pool type with generally lower species richness is found on Drainageway formation soils in the Plan Area.

Northern Volcanic Mudflow vernal pools occur on ancient mudflows called lahars (see Section 2.3). These pools are small, form in irregular depressions in gently sloping surfaces, and are often rocky and shallow. Water chemistry is mixo-saline, fresh (Sawyer and Keeler-Wolf 1995). In the Plan Area, Northern Volcanic Mudflow vernal pools are found on the Mehrten and Valley Springs formation in rocky soil series and complexes such as Hadselville-Pentz, Red Bluff-Redding, Corning-Redding, Amador-Gillender, and Pardee-Rancho Seco (Jones and Stokes 1990). Mudflow pools in the Plan Area are hydrologically complex; in some areas, vernal pools are in complex reticulated drainage networks with a high density of interconnected pools, swales, and ephemeral drainages (Jones and Stokes 1990). The seasonal hydrology of Northern Volcanic Mudflow vernal pools includes a perched water table (see Section 3.2.3), but pool hydrology is relatively "flashy" (i.e., pools fill and drain relatively rapidly). Northern Volcanic Mudflow vernal pools contain relatively rich flora that includes several vernal pool obligate species. The species richness and ecological complexity of Northern Mudflow pools in the Plan Area exceed that of the Young-Terrace Northern Hardpan pools and the Drainageway vernal pools in the Plan Area. Possible explanations of the rich (less specialized) flora of Northern Mudflow pools include the recent origin of the pools and their quickly changing or "flashy" hydrology. Mudflow pools fill and drain rapidly, and may be less stressful to most plant life than pools that remain flooded for extended periods, such as the Old-Terrace Northern Hardpan vernal pools (Jokerst 1990; Jones and Stokes 1990).

Northern Hardpan vernal pools form on alluvial terraces in old, acidic, nutrient-depleted soils with iron-silicate cemented soil layer. These soils often exhibit well-developed mound-intermound topography to form aggregations of pools and "mima mounds." Water chemistry is mixo-saline fresh (Sawyer and Keeler-Wolf 1995). Northern Hardpan vernal pools typically have a conductivity of 40 to 70 mhos per 1 centimeter, which is similar to an oligotrophic high Sierran lake (Keeley and Zedler 1998; Williamson et al. 2005). Water in hardpan vernal pools is not only low in dissolved salts, but also in dissolved nitrogen. For example, Rains et al. (2006) reported that, during the growing season, nitrate and phosphate concentrations were below detection limits (i.e., 0.006 milligrams per liter (mg/L) and 0.03 mg/L, respectively), and the amount of ammonium was negligible (0.1 mg/L). Within the Plan Area, Northern Hardpan vernal pools occur on the low (younger) terrace Riverbank Formation soil series (e.g., San Joaquin, Galt,

Madera, Tehama), as well as on the high (older) terrace Laguna Formation and Arroyo Seco gravels (e.g. Corning, Redding, Red Bluff, Mokelumne soil series). Vernal pools occur extensively on both landforms types (Jones and Stokes 1990).

The Plan Area's Low-Terrace Northern Hardpan vernal pools (e.g., on San Joaquin soils) are of recent geologic origin, which may explain their relatively unspecialized flora that often includes non-native plants, low species richness, scarcity of vernal pool obligates, and low numbers of special-status plants. Most young terrace sites in the Plan Area have been plowed, graded, or heavily grazed because of their arable soils and proximity to reliable water; this may also account for their less specialized flora. Low-Terrace Northern Hardpan vernal pools also serve an important function as habitat for shorebirds, waterfowl, and raptors because of their location in the central portion of the valley along the Sacramento River (Jones and Stokes 1990; Silveira 1998).

High-Terrace Northern Hardpan vernal pools (e.g., on Corning and Redding soil series) are the most complex type of vernal pool in the Plan Area because of their rich and varied flora, presence of special-status plant and invertebrate species, and complex hydrology, and because they often occur in areas with complex, highly convoluted interspersions of several soil types. Soils on high-terrace landform sites varies over short distances such that sites in proximity to each other may have entirely different restricting layer types, depth, and vernal pool plant community. High-Terrace Northern Hardpan vernal pools are floristically rich and dominated by vernal pool obligate plant species (true "specialists"), and typically support special-status species. The tremendous age and geographic location of High-Terrace Northern Hardpan pools may account for their rich and highly specialized flora (Jones and Stokes 1990). Little of the high-terrace landform has been farmed in the Plan Area because irrigation water is lacking and many sites are not arable. Some high-terrace vernal pool areas were dryland farmed in the past with wheat or oats; this type of farming appears to have had little effect on high-terrace vernal pools, while on other formations, this disrupted vernal pool surface hydrology. Consequently, High-Terrace Northern Hardpan vernal pools are relatively abundant in the Plan Area (Jones and Stokes 1990).

Drainageway vernal pools are located on no particular Plan Area geologic formation, but formed on recent alluvial deposits adjacent to the incised channels of active watercourses. Consequently, Drainageway vernal pools are interspersed throughout the other three vernal pool types present in the Plan Area. Drainageway vernal pools fill and drain rapidly, and may depend on overland runoff and direct precipitation to maintain their hydrology relative to the other vernal pool types (Jones and Stokes 1990). Additionally, the basins of Drainageway vernal pools are often shallow and susceptible to evaporation, or slightly sloped, which encourages drainage. Drainageway vernal pools have an unspecialized flora relative to the other three vernal pool types in the Plan Area (Jones and Stokes 1990).

The four types of vernal pools present in the Plan Area can be further classified by the presence or absence of certain dominant or less abundant vernal pool plant species (Sawyer et al. 2009). Vernal pool community structure (i.e., the type, number, and relative abundance of species) is largely determined by the pool's physical makeup (e.g., size, depth, substrate, water chemistry) and the pool's hydrology; different patterns of species dominance and the presence or absence of certain species can be indicative of physical and hydrology differences among vernal pools (Holland and Jain 1988). Vernal pools in the Plan Area exhibit a great variety of size, depth, soil, and water chemistry. Key physical parameters may include pool drainage area, slope, soil type, soil structure and depth, pool size and depth, timing of the pool hydrologic cycle, and pool interconnectivity. In particular, several SSHCP vernal pool Covered Species require large, deep pools that are long lasting to successfully complete their life cycles, including Boggs Lake hedge-hyssop (*Gratiola heterosepala*), Sacramento Orcutt grass (*Orcuttia viscida*), slender Orcutt grass (*Orcuttia tenuis*), vernal pool tadpole shrimp, California tiger salamander, and western spadefoot toad. Other vernal pool Covered Species are found in small to medium-sized "flashy" pools that dry out relatively quickly, but may inundate and dry out several times during the wet season, including Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), dwarf downingia (*Downingia pusilla*), and pincushion navarretia (*Navarretia myersii*). For some plants in the latter category, the edges of larger vernal pools may provide conditions equivalent to the smaller, flashy pools. Other Covered Species associated with vernal pools include legenere (*Legenere limosa*), vernal pool fairy shrimp, Ricksecker's water scavenger beetle, most of the bird Covered Species (mostly as foraging habitat), American badger (*Taxidea taxus*), and western red bat (*Lasiurus blossevillii*) (see Table 3-2).

Preserving the full range of physical and hydrologic conditions found in Plan Area vernal pools is necessary to ensure that all vernal pool Covered Species and representative examples of the different Plan Area vernal pool types and existing variation in vernal pool plant and animal associations are considered and protected (Jones and Stokes 1990). By protecting the range of diversity in vernal pool types, the SSHCP can ensure that the entire range of known and unknown ecological and biological values is represented in a Preserve System, and that the intrinsic values of this facet of the region's natural heritage are considered. Preserving the range of plant and animal associations also provides natural laboratories to study the factors influencing the presence or absence of species, migration, and establishment of species, patterns of species dominance, and other phenomena (Jones and Stokes 1990).

Plan Area vernal pools occur in complexes of pools interconnected by intermittent surface swales and by the seasonal perched aquifer that forms between the soil surface and the sub-surface restricting layer. Consequently, the Vernal Pool land covers in the Plan Area cannot be described or analyzed in isolation of their ecologically and hydrologically connected SSHCP land covers of Swale, Valley Grassland, and Stream/Creek (Vernal Pool Invertebrate Habitat [VPIH]). Therefore, in addition to discussing the Vernal Pool land cover individually in SSHCP

Chapters 3, 6, and 7, the Plan Permittees also define and discuss an SSHCP Vernal Pool Ecosystem (see Section 3.2.3).

Seasonal Wetland Land Cover

Seasonal Wetland is a wetland that ponds for an extended period during a portion of the year. Seasonal Wetlands generally fill during the rainy winter season then dry relatively slowly, typically in the summer or early fall. Seasonal Wetlands tend to be isolated wetlands that occur within moderate to large depressional features along streams, creeks, and rivers; along the edges of open water, or scattered within the Valley Grassland land cover. In addition, some impounded drainages, excavated stock ponds, and graded or excavated former vernal pools can also be Seasonal Wetland. The Seasonal Wetland land cover is often characterized by herbaceous annual and perennial species such as curly dock (*Rumex crispus*), sedges (*Carex* spp.), nutsedges (*Cyperus* spp.), spikerushes (*Eleocharis* spp), and occasionally cattail (*Typha* spp.). Seasonal Wetland provides habitat for some Covered Species (Table 3-2). The SSHCP does not consider Seasonal Wetland to be suitable habitat for vernal pool crustaceans.

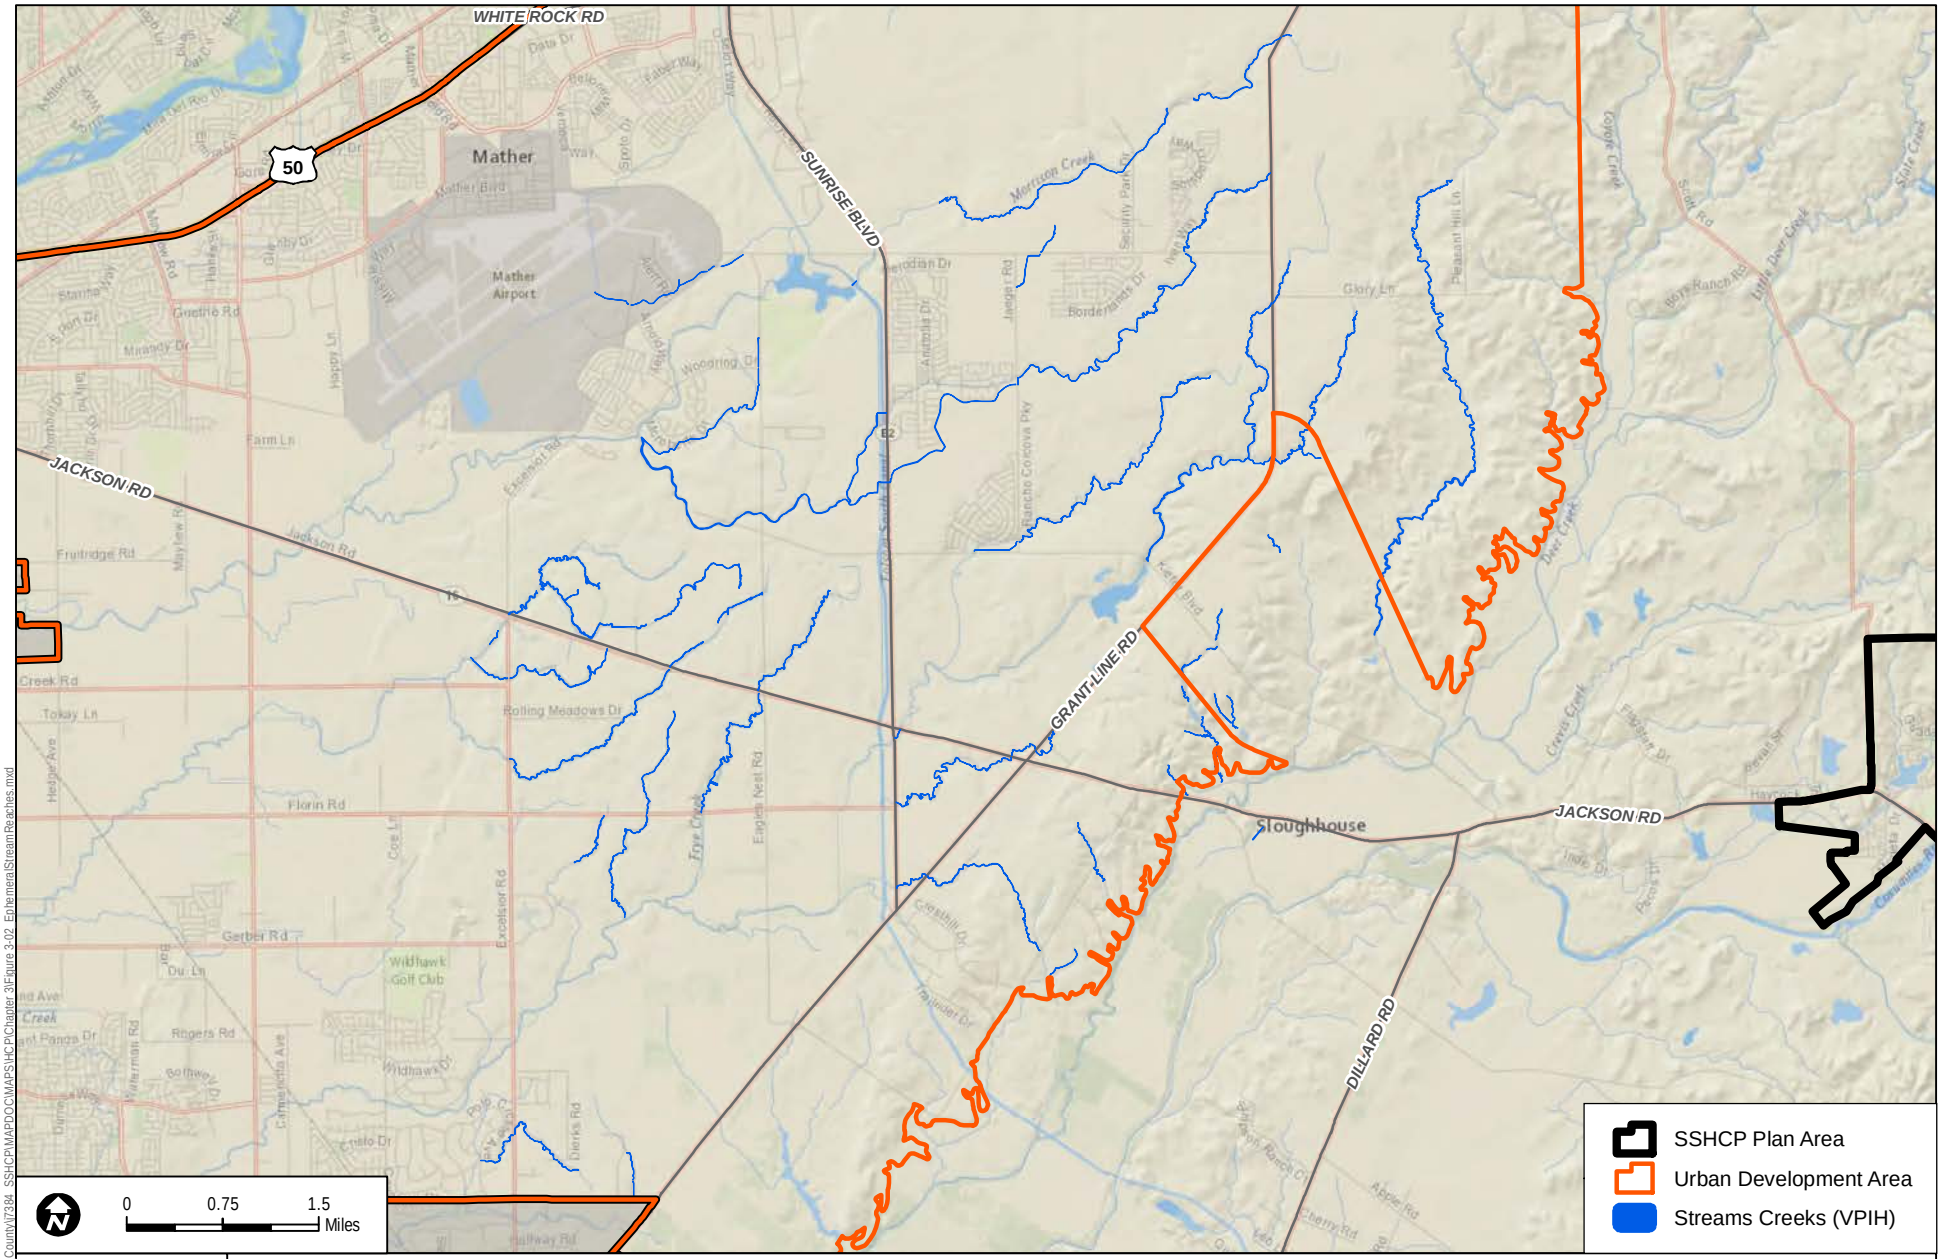
Covered Species associated with the Seasonal Wetland land cover include Boggs Lake hedge-hyssop, legenere, Sanford's arrowhead (*Sagittaria sanfordi*), California tiger salamander, western spadefoot, giant gartersnake (*Thamnophis gigas*), all of the bird Covered Species (mostly as foraging habitat) except Cooper's hawk (*Accipiter cooperii*), American badger, and western red bat.

Swale Land Cover

The movement of surface water between vernal pools can occur in a network of narrow and intermittent surface "swales" (Solomeshch et al. 2007). Swales are shallow ephemeral drainages found in flat to gently rolling Valley Grassland in association with vernal pool complexes, on soils with an impermeable layer (see Section 2.3). Swales convey runoff as shallow, gently sloping ephemeral wetlands during, and for short periods after, winter rainstorms. Soils within the Swale land cover type may remain saturated during the winter and early spring, but dry by summer. Swales are associated with vernal pools and provide intermittent conduits between vernal pools for movement of surface water and propagules of vernal pool plant and animal Covered Species (seeds, cysts, eggs, and spores), and movement of adult California tiger salamanders and western spadefoots. Swales support several native plant species commonly found in vernal pools. Swales also often include smaller shallow depressional features that may pond during the rainy season to provide suitable reproductive habitat for some vernal pool Covered Species, and may be considered vernal pools. Generally, the Swale land cover provides suitable habitat for portions or all of the life cycle of many of the Covered Species that occur in the Vernal Pool land cover types, including Ahart's dwarf rush, dwarf downingia, pincushion navarretia, mid-valley fairy shrimp (*Branchinecta mesovallensis*), vernal pool fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, and western spadefoot. In

addition, all of the bird Covered Species (except Cooper's hawk and greater sandhill crane (*Grus canadensis tabida*)) use Swale land cover (primarily as foraging habitat), along with American badger and western red bat (see Table 3-2).

The Swale land cover type cannot be adequately described or analyzed separately or in isolation of other ecologically and hydrologically connected SSHCP land covers (i.e., Vernal Pool, Valley Grassland, and Stream/Creek VPIH). Therefore, in addition to discussing the Swale land cover individually in SSHCP Chapters 3, 6, and 7, the Plan Permittees also define, discuss, and analyze a combined SSHCP Vernal Pool Ecosystem (see Section 3.2.3).



Stream/Creek Vernal Pool Invertebrate Habitat Land Cover

As discussed below, the larger SSHCP Stream/Creek land cover type includes intermittent and perennial linear water features such as rivers, streams, creeks, and drainages. The SSHCP Stream/Creek VPIH land cover type is typically an intermittent drainage that is vegetated with Valley Grassland plant species and conveys water after rain events (is ephemeral). Unlike the Swale land cover type, the Stream/Creek (VPIH) land cover is less likely to support vegetation characteristic of vernal pools, and the SSHCP does not consider the Stream/Creek (VPIH) land cover habitat for vernal pool plant Covered Species. However, the Stream/Creek (VPIH) land cover is known to provide movement corridors, and may provide suitable habitat for vernal pool crustaceans, including mid-valley fairy shrimp, vernal pool fairy shrimp, and vernal pool tadpole shrimp, within depressional features of the drainage that pond water between storm events. Western burrowing owl (*Athene cunicularia hypugaea*) may also use Stream/Creek (VPIH) habitat. See Figure 3-2 for locations of Stream/Creek (VPIH) habitat.

The Stream/Creek (VPIH) land cover cannot be adequately described or analyzed separately or in isolation of other ecologically and hydrologically connected SSHCP land covers (i.e., the Vernal Pool, Valley Grassland, and Swale land covers). Therefore, in addition to discussing Stream/Creek (VPIH) individually in SSHCP Chapters 3, 6, and 7, the Plan Permittees also define, discuss, and analyze a combined SSHCP Vernal Pool Ecosystem (see Section 3.2.3).

Freshwater Marsh Land Cover

Most of California's freshwater marshes occur in the Sacramento Valley and San Joaquin Delta regions. The majority of Freshwater Marsh in the Plan Area occurs along the perennial Cosumnes River and Deer Creek, and along the margins of streams and open water in the Plan Area. Freshwater Marsh is typically dominated by perennial herbaceous plant species such as cattails, tules (*Scirpus* spp.), and other emergent plant species, and is generally found along the edges of aquatic habitats such as ponds, lakes, and rivers. It is important habitat for western pond turtle (*Actinemys marmorata*), giant gartersnake, northern harrier (*Circus cyaneus*), tricolored blackbird (*Agelaius tricolor*), and western red bat (Table 3-2).

INTENTIONALLY LEFT BLANK

Open Water Land Cover

Open Water includes perennial or features, such as natural or built ponds, lakes, and reservoirs. Open Water may contain no vegetation, or non-rooted aquatic vegetation, such as algae, floating pondweeds, and other plants. Along shorelines, rooted, emergent vegetation may occur, forming Freshwater Marsh. Like Freshwater Marsh, Open Water habitat is used by numerous bird, mammal, amphibian, and reptile species, including several Covered Species, such as western pond turtle, giant gartersnake, tricolored blackbird, and western red bat. The marshy shorelines may be used by tricolored blackbird for nesting colonies (Table 3-2).

The Open Water land cover type is found throughout the SSHCP Plan Area. Open Water features are largely unnamed with the exception of Blodgett Reservoir located inside the Urban Development Area (UDA) and Rancho Seco Lake outside the UDA.

Stream/Creek Land Cover

Outside of the UDA, the Stream/Creek land cover type includes intermittent and perennial linear water features such as rivers, streams, creeks, drainages, and roadside and irrigation ditches. Within the UDA, this land cover type includes streams identified by the U.S. Army Corps of Engineers. A separate category was created for aqueducts throughout the Plan Area.

The SSHCP Stream/Creek land cover includes rivers such as the Cosumnes River, streams such as Laguna Creek, and smaller intermittent or perennial creeks. The Stream/Creek land cover type was mapped from aerial photographs. Where a river or stream channel was not discernable because of dense over story cover, the centerline of the channel has been approximated and buffered by a width of 6 feet. Polygons of the Stream and Creek land cover occur in Valley Grassland, Blue Oak Woodland, Blue Oak Savanna, Agriculture, and Developed land cover types.

Covered species associated with the Stream/Creek land cover type include Sanford's arrowhead, giant gartersnake, western pond turtle, and western red bat (Table 3-2).

Mixed Riparian Woodland Land Cover

Riparian land covers are associated with Plan Area streams and creeks and typically occur in the zone between the active stream channel and adjacent upland land covers. While "riparian" has various definitions, the SSHCP uses the National Research Council's 2002 definition: "Riparian areas are transitional between terrestrial and aquatic ecosystems and are distinguished by gradients in biophysical conditions, ecological processes, and biota. They are areas through which surface and subsurface hydrology connect water bodies with their adjacent uplands. They include those portions of terrestrial ecosystems that significantly influence exchanges of energy

and matter with aquatic ecosystems (i.e., a zone of influence)." Riparian areas in the Plan Area are adjacent to perennial, intermittent, and ephemeral streams and lakes.

Riparian ecosystems are highly dependent on landscape setting and numerous physical and biotic interactions. Riparian ecosystems provide essential foraging, shelter, and breeding habitat for several of the Covered Species and other native plant and animal species, including both resident and migratory species.

The Mixed Riparian Woodland land cover type is distinguishable by an open canopy layer dominated by tall Fremont cottonwood trees. Beneath this open layer, a moderately dense mid-canopy layer is composed of tree species such as Oregon ash (*Fraxinus latifolia*), Goodding's willow (*Salix gooddingii*), walnut (*Juglans* spp.), valley oak (*Quercus lobata*), and box elder (*Acer negundo*). In some areas, a subcanopy of dense Riparian Scrub dominated by willow species, including arroyo willow and sandbar willow, is present. A discontinuous shrub layer is also present, particularly along the northern boundary of the Plan Area, and includes species such as blue elderberry, Himalayan blackberry, coyote-brush, wild rose, and wild grape. The ground layer is sparsely to densely vegetated with herbaceous species.

Included in the Mixed Riparian Woodland Land Cover Type are valley oak riparian woodlands. Although they are not a separate land cover type, owing to an inability to distinguish them from other riparian communities, valley oak riparian woodlands are notable as they were once a dominate community along waterways in the Plan Area. Valley oak riparian woodland intergrades with the Valley Grassland land cover type and wooded borders along streams and agricultural fields in the Plan Area. Tree associates in the Plan Area include California sycamore (*Platanus racemosa*), California black walnut, interior live oak (*Quercus wislizeni*), and box elder. The shrub understory includes western poison-oak, blue elderberry, California wild grape, and California blackberry (*Rubus ursinus*). Various grasses, including wild oats (*Avena* spp.), brome (*Bromus* spp.), barley (*Hordeum* spp.), and ryegrass (*Lolium* spp.), and other herbaceous, species may occur in the sparse to densely vegetated ground cover.

Covered species associated with the Mixed Riparian Woodland land cover type include valley elderberry longhorn beetle, western pond turtle, Cooper's hawk, Swainson's hawk, white-tailed kite, and western red bat (Table 3-2).

Mixed Riparian Scrub Land Cover

Mixed Riparian Scrub land cover type is interspersed with Mixed Riparian Woodland in the floodplains of waterways throughout Sacramento County. In the Plan Area, this land cover type consists of an open to dense shrubby thicket dominated by a mixture of sandbar willow (*Salix exigua*), arroyo willow (*S. lasiolepis*), red willow (*S. laevigata*), and immature stands of mixed

riparian woodland tree species (see description below). This plant community can also be a subcanopy community in Mixed Riparian Woodland. Though dense stands of Riparian Scrub in the Plan Area typically lack an understory, some of the more open canopy mixed Riparian Scrub stands do support an understory of native and non-native species, including wild rose (*Rosa californica*), wild grape (*Vitis californica*), perennial pepperweed (*Lepidium latifolium*), Himalayan blackberry (*Rubus discolor*), curly dock, and various non-native grasses.

Covered species associated with the Mixed Riparian Scrub land cover type include valley elderberry longhorn beetle, giant gartersnake, western pond turtle, Cooper's hawk, loggerhead shrike, Swainson's hawk, white-tailed kite, and western red bat (Table 3-2).

Mine Tailing Riparian Woodland Land Cover

The Mine Tailings Riparian Woodland land cover type is distributed in networks of relatively narrow linear areas that naturally established on abandoned mine tailing surface deposits in the Plan Area. This human-made land cover type contains species commonly found in Riparian Woodlands and Riparian Scrub habitats, such as Fremont cottonwood (*Populus fremontii*), blue elderberry (*Sambucus mexicana*), willow (*Salix* spp.), and coyote-brush (*Baccharis pilularis*). In the Plan Area, this land cover type can also intergrade with mixed riparian forest along bodies of water.

Covered species associated with the Mine Tailing Riparian Woodland land cover type include valley elderberry longhorn beetle, western pond turtle, Cooper's hawk, loggerhead shrike, white-tailed kite, and western red bat (Table 3-2).

3.2.2 SSHCP Terrestrial Land Cover Types

SSHCP includes seven terrestrial land cover types. One are dominated by herbaceous vegetation (Valley Grassland), two have oak trees (Blue Oak Woodland and Blue Oak Savanna), and four are farming land covers (Cropland, Irrigated Pasture-Grassland, Orchard, and Vineyard).

Valley Grassland Land Cover

Valley Grassland is by far the most common single land cover in the Plan Area. Including non-habitat land covers, it accounts for about 43% of the land covers in the Plan Area. Valley Grassland, being so widespread throughout the Plan Area, is essential for both the long-term survival of many of the Covered Species and for conserving ecological functions of other land cover types within the Plan Area.

Valley Grassland in the SSHCP Plan Area is an annual herbaceous plant community now characterized mostly by naturalized annual grasses. Generally, its composition in the Plan Area varies with geographic, and land use factors, such as rainfall, temperature, elevation, slope, aspect,

grazing, and other herbivory (e.g., livestock, wildlife, rodent, songbird, and insect use), and fire frequency and duration. In the Plan Area, Valley Grassland is dominated by naturalized herbaceous annual forbs, and includes patches with relatively high proportions of native grasses and forbs along the eastern border of the Plan Area. Naturalized annual grasses that dominate the Plan Area's Valley Grassland land cover include wild oats (*Avena fatua*), soft chess (*Bromus hordeaceus*), ripgut brome (*B. diandrus*), red brome (*B. madritensis* ssp. *rubens*), wild barley (*Hordeum* spp.), and foxtail fescue (*Vulpia myuros*). Common herbaceous forbs include the naturalized broadleaf filaree (*Erodium botrys*), redstem filaree (*E. cicutarium*), turkey mullein (*Eremocarpus setigerus*), true clovers (*Trifolium* spp.), and bur clover (*Medicago polymorpha*).

Valley Grassland in the Plan Area is associated with several natural communities, including vernal pools, and occurs as an understory within Valley Oak Riparian Woodland, Blue Oak Woodland, and Blue Oak Savanna. Valley Grassland also may occur as a co-dominant with perennial grasses within some of the areas mapped as Valley Grassland in the Plan Area. For example, purple needlegrass (*Stipa pulchra*) can be found as the dominant grass (i.e., comprising greater than 20% cover) in small patches along ridgetops of low-lying hills in the eastern portion of Sacramento County.

Valley Grassland supports numerous wildlife species, including several Covered Species. Covered Species associated with Valley Grassland included California tiger salamander, western spadefoot giant gartersnake, western pond turtle, all of the bird Covered Species (except Cooper's hawk), American badger, and western red bat (Table 3-2).

As a critical element of the Vernal Pool Ecosystem, much of the Valley Grassland land cover within the Plan Area also supports vernal wetlands (i.e., Vernal Pools, Swales, and Stream/Creek-VPIH), and vernal pool-dependent species (vernal pool crustaceans and plants) (see Section 3.2.3). Approximately 97,349 acres of the total 135,152 acres of Valley Grassland present within the Plan Area (approximately 72%) are believed to be ecologically and hydrologically associated with Vernal Pools, Swales, or Stream/Creek-VPIH land covers to comprise the Plan Area's Vernal Pool Ecosystem (see Section 3.2.3).

Cropland Land Cover (Row and Field Crops)

Most of the Plan Area's Cropland is concentrated in the western part of the Plan Area in the Sacramento River and Cosumnes River floodplains. Cropland includes annual row and field crops (e.g., small grains, corn, tomatoes, melons, peppers, safflower, sunflower) and short-term perennial crops (e.g., asparagus). Rice is a row crop grown in Sacramento County, but is seldom grown in the Plan Area. Small fields of rice have recently been planted on the existing Cosumnes River Preserve.

An important ecological function of Cropland in the Plan Area is to provide rodent and insect prey and plant material forage for a number of the bird Covered Species. Small rodents are important prey for raptors, such as Swainson's hawks, white-tailed kite, and Cooper's hawk. Western burrowing owls consume a mix of small rodents, arthropods, and other small animals. Loggerhead shrikes primarily prey on ground-dwelling insects but also take small rodents. Swainson's hawks switch to a diet of insects after the breeding season. Greater sandhill crane is a winter visitor to the Plan Area and forages for seeds and small animals. Tricolored blackbird forages on invertebrates during the nesting season and plant material during the non-nesting season (Table 3-2).

Irrigated Pasture-Grassland Land Cover

Irrigated Pasture-Grassland is fairly common, but occurs in a scattered distribution generally in the central portion of the Plan Area. The Irrigated Pasture-Grassland land cover includes hay production (alfalfa, clovers, and mixed grasses), seasonal summer pasture for livestock (primarily cattle), and year-round pasture for livestock (primarily cattle or horses). Seasonal pasture appears to be the most common use. Irrigated Pasture-Grassland is typically seeded, cut/grazed, and reseeded on a regular basis on an approximately 5- to 7-year cycle before the fields are left fallow to rest, and the cycle is started over again.

Within the Irrigated Pasture-Grassland land cover type, alfalfa fields provide by far the most productive foraging habitat for raptors and are used by other Covered Species, such as greater sandhill crane, and tricolored blackbird (Table 3-2). As a perennial crop grown for several years before removal and replacement, alfalfa provides good cover for rodents and time for establishment of a good prey base. Farming operations during the growing season consist of periodic flood irrigation and four to six mowings. Both types of operations result in temporary increases in prey availability.

Many of the Covered Species that use Cropland also use Irrigated Pasture-Grassland. Pasture is suitable tricolored blackbird foraging habitat if it is within two miles of a colony nesting site. Greater sandhill cranes use Irrigated Pasture-Grassland for roosting and foraging (Table 3-2).

Orchard Land Cover (Fruit and Nut Orchards)

Orchards are scattered throughout the Plan Area, with the largest concentration along the western boundary of the Plan Area. The Orchard land cover has limited wildlife habitat value (Table 3-2), but provides perches for raptors foraging in adjacent Cropland and Valley Grassland. In particular, larger nut trees and other trees at these edge areas may be used by "sight predators" such as Swainson's hawk for perches to find prey in adjacent fields. Western red bat is known to roost in orchards, including apricot, peach, pear, almond, walnut, and orange trees (Constantine 1959; Pierson et al. 2006) (Table 3-2).

Vineyard Land Cover

Vineyard land cover is located mostly in the southern portion of the Plan Area outside of the UDA. In Sacramento County, vineyards are primarily established for wine grape production, with some minor table grape producers. Vineyards are primarily "clean cultivated," meaning no other vegetation is allowed to grow between the rows or on the edges of fields and irrigation ditches. As such, vineyards typically provide only limited habitat for native plants and wildlife (Table 3-2). However, vineyards using "environmentally friendly" management practices may provide habitat value through use of bat boxes, raptor perches, and owl boxes to encourage presence of these species and reduce insect and predation damage.

Blue Oak Woodland Land Cover and Blue Oak Savanna Land Cover

Blue Oak Woodland and Blue Oak Savanna comprise approximately 5% of the Plan Area, a majority of which is located in the far eastern portion of the Plan Area.

Blue oaks are typically drought-tolerant, and unlike interior live oaks, are deciduous, dropping their leaves during periods of extreme moisture stress. This survival trait may explain the observed patterns of blue oak distribution, with blue oaks occupying drier, shallower, and well-drained soils than interior live oaks or valley oaks (McDonald 1985).

In general, the SSHCP differentiated and mapped Blue Oak Woodland land cover and Blue Oak Woodland Savanna by their tree-cover densities.

Blue Oak Woodland is characterized by greater than 10% tree cover formed primarily by blue oak with other foothill tree species mixed in. Blue Oak Woodland generally has a sparse shrub layer and well-developed Valley Grassland layer, sometimes including vernal pools and other wetland features. Other tree species that may occur in Blue Oak Woodland include foothill pine (*Pinus sabiniana*), interior live oak (*Quercus wislizenii*), valley oak (*Quercus lobata*), and California buckeye (*Aesculus californica*). The shrub layer, where present, only includes scattered individuals of poison oak (*Toxicodendron diversilobum*), and coyote brush (*Baccharis pilularis*). Blue Oak Woodland often has a relatively open canopy, when compared to the riparian land covers present in the Plan Area.

Blue Oak Savanna land cover type is characterized by a sparse (less than 10%) tree canopy structure that ranges from scattered blue oak trees and small clusters of blue oaks, to small areas of blue oak stands. Like Blue Oak Woodland, it generally has little to no shrub layer, but has a well-developed Valley Grassland layer. Blue Oak Savanna is typically transitional between Valley Grassland and Blue Oak Woodland.

Oak Woodland and Savanna provide important cover, nesting, and roosting sites for native bird species, as well as caching sites for acorn storage, for a variety of birds, mammals, and other native species. Covered Species that use Blue Oak Woodland and/or Savanna include American badger, western red bat, Cooper's hawk, western burrowing owl, and white-tailed kite. Where suitable aquatic land cover occurs in association with Blue Oak Woodland and Blue Oak Savanna land cover, California tiger salamander, western spadefoot, and western pond turtle may also occur. Old, large oak trees are of particular habitat value, providing an array of living and dead branches as sites for woodpeckers to excavate cavities and for insect-eaters to forage for larvae and adult insects. Dead branches and trunks are critically important for cavity nesting birds, for mammals as storage sites for acorns, and as perches for sight-dependent predators, such as raptors (Gutierrez and Koenig 1978). The fallen logs of dead oaks provide sustenance and cover for arthropods, fungi, and wildlife, and may potentially extend activity periods for these species in drier climates by retaining soil moisture and providing shade (Giusti et al. 2004).Oak trees produce a critically important food crop, acorns. Acorn production is typically episodic, some years with copious acorn production and other years with minimal acorn production. High yield acorn years appear critical in triggering pulses in invertebrate and vertebrate population sizes (McShea and Rappole 2000; McShea and Schwede 1993). Blue Oak Woodland and Blue Oak Savanna provide different habitat functions for some of the Covered Species. For example, western burrowing owl and American badger may occur in the open savannas but not denser woodlands. White-tailed kites may nest in woodlands and forage in savannas.

3.2.3 SSHCP Vernal Pool Ecosystem

One of the stated goals of the SSHCP is to protect several Plan Area vernal pool species (see Chapter 7). To accomplish protection of vernal pool species, the SSHCP focuses on the preservation of seasonal vernal-wetlands, such as Vernal Pools, Swales, and Streams/Creeks VPIH, where vernal pool invertebrates and plant species spend their entire life cycle and where amphibians such as California tiger salamander and spadefoot toad breed and forage. However, as discussed in Section 2.3.1, and in Section 3.2.1, these seasonal wetlands cannot exist absent the adjacent uplands. Essential vernal pool ecology and functions (such as the seasonal hydrologic cycle, nutrient cycling, water chemistry, and food chain support) are closely tied to the surrounding uplands. To ensure that the Plan achieves its goal of protecting vernal pool species, the Plan must protect both the vernal wetlands and the adjacent upland valley grassland that support and maintain the vernal wetlands. To that end, the SSHCP identified areas where the SSHCP vernal-wetland land cover types (i.e. Vernal Pool, Swale, and Stream/Creek-VPIH) are ecologically connected with the adjacent Valley Grassland land cover. Taken together, the Valley Grassland and Vernal Pool, Swale, and Stream/Creek VPIH land cover types in these areas comprise the Vernal Pool Ecosystem. This Vernal Pool Ecosystem approach allowed the

Plan Permittees to consider the ecological interconnectivity that occurs between Swale and Vernal Pool, between Valley Grassland and Vernal Pool, and between vernal pool complexes and adjacent Stream/Creek habitat. This ecosystem approach was used by the Plan Permittees when developing the SSHCP Conservation Strategy (see Chapter 7), and will be used to establish the SSHCP Preserve System (Chapter 7).

Hydrology

An intact vernal pool ecosystem is necessary to maintain the soil perched aquifer and hydrological functions of vernal wetlands. Plan Area vernal pools receive water from three sources: direct precipitation, water in the soil's sub-surface "perched aquifer," and intermittent flows in surface swales. As discussed in Section 2.3, the seasonal hydrology of the Plan Area vernal pools differs between the different geologic formations and associated soils, which determines vernal pool type, pool water chemistry, and affects the species community composition of the pool.

Hydrologic connectivity between individual vernal pools and between vernal pool complexes occurs from subsurface lateral flows where soil-restrictive layers form seasonal perched aquifers, and hydrologic connectivity occurs from surface flows through seasonal swales or seasonal drainages. In addition to its role in a seasonal wetland's hydrologic regime, hydrologic connectivity via surface swales and ephemeral drainages allow dispersal of vernal pool organisms between vernal pools and between vernal pool complexes, including several SSHCP plant and animal vernal pool Covered Species.

Hydrology studies conducted within the Plan Area indicate that Plan Area Vernal Pools receive winter rainwater from subsurface lateral flows (Hanes et al. 1990; Hanes and Stromberg 1998; Rains et al. 2006, 2008; Williamson et al. 2005). This occurs when a soil-restrictive layer prevents percolation of rainwater into the deeper groundwater aquifer, causing a seasonal sub-surface perched aquifer (a perched water table) to form. Once the soils that are above the soil-restrictive layer have become saturated, water moves laterally above the impervious restrictive layer from upland into vernal pools, causing the vernal pools to fill. Similarly, water moves laterally out of a vernal pool and into the surrounding uplands as the vernal pool dries. These lateral subsurface flows stabilize the water level of vernal pools and vernal pool complexes, causing Plan Area vernal pools to be inundated for much longer periods than would be the case if the vernal pools were recharged only by rainfall. Water held in the saturated perched aquifer of a single watershed may ultimately drain downslope to exit as late-season flow in a stream or creek (Hanes et al. 1990; Hanes and Stromberg 1998; Rains et al. 2006; Williamson et al. 2005). Within the Plan Area, the perched aquifer can supply as much as 60% or more of the water needed to fill a vernal pool completely (Williamson et al. 2005). However, individual Plan Area vernal pools display

different seasonal hydrology due to variations in topography and soil properties near each pool (Leibowitz and Brooks 2008).

The movement of winter rainwater between vernal pools also travels via surface swales, and in such a situation, the hydrologic connection between pools is obvious (Solomeshch et al. 2007). Plan Area surface swales typically flow during, and for short periods after, large winter rainstorms. When the upper soil layers are fully saturated and the subsurface perched water table has filled a vernal pool, the vernal pool then overflows into an adjacent surface swale. Rainwater infiltration into the upper layers of soils that include a hardpan/duripan is relatively rapid, so overland flow rarely occurs on the Plan Area's grassland landscapes, except for slow, intermittent flows through interconnecting surface swales from up-gradient vernal pools. In the vernal pool landscapes within the Plan Area, vernal pools overflow through seasonal swales to other vernal pools, which may then overflow into other swales and vernal pools or vernal pool complexes, and ultimately overflow to a swale that discharges to a seasonal stream or creek (Rains et al. 2006, 2008).

Water Chemistry and Other Abiotic Factors

An intact vernal pool ecosystem is also necessary to maintain water chemistry and other abiotic factors that support biodiversity and abundance of vernal pool aquatic plants and aquatic animals (Kneitel and Lessin 2010; Poirier 2012). Altered vernal pool watersheds may no longer have adequate rainwater infiltration and subsurface flows for the vernal pools to function adequately as suitable habitat for certain vernal pool species. In addition, where human activities have significantly affected upland watersheds, the vernal pool's abiotic aquatic habitat components that are determined by subsurface and surface flows through the watershed's soils (such as water chemistry and amounts of dissolved nutrients) will also be altered, further reducing suitability of the vernal pool to support certain vernal pool species (Rains et al. 2008). For example, permanently removing or truncating the associated upland watershed that forms the seasonal perched aquifer could convert the ecological functions and processes of a perched-aquifer vernal pool into that of a direct-precipitation/surface-runoff-driven vernal pool system. These indirectly impacted vernal pools may continue to pond water to some extent from the direct precipitation, but the vernal pool's normal hydrologic regime, natural water chemistry, and ecological functions would be fundamentally and permanently altered.

Ecological Interconnectivity

Ecological interconnectivity between pools and pool complexes is an important consideration for life-history needs and dispersal of covered vernal pool plant and animal species. Amphibians, including western spadefoot toad and California tiger salamander, require contiguous uplands for refugia and for terrestrial migration of adults between upland refugia habitat and wetland habitats

to maintain larger meta-populations. Plant seeds and invertebrate cysts and eggs may also be transported between vernal pools by animals that cross uplands. Solitary bees that are obligate vernal pool plant pollinators depend on the uplands surrounding vernal pools as well. To maintain adequate biological interconnectivity, the SSHCP must acquire enough Valley Grassland within the vernal pool ecosystem to support movement and dispersal of individuals between larger meta-populations, and to provide habitat needs for the entire life history of each vernal pool Covered Species.

3.2.4 Developed and Other Non-Habitat Land Cover Types

Seven SSHCP cover types provide little or no Covered Species habitat value, and are not a focus of the SSHCP Conservation Strategy (Chapter 7); these are: aqueducts, disturbed, low- and high-density development, major roads, mine tailings, and recreation/landscaped areas.

Aqueduct Land Cover

The aqueduct land cover type in the Plan Area is represented by the Folsom South Canal.

Disturbed Land Cover

The disturbed land cover type is defined as open-space areas that have been subject to previous or ongoing disturbances such as along roadsides, trails, and parking lots. Scraped or graded land, gravel mining, and waste disposal sites are included in this land cover type. Disturbed land cover type is vegetated with diverse weedy flora. These areas are of special concern as they tend to harbor and facilitate the spread of invasive plant species. Vascular plant species associated with the disturbed land cover typically include Johnson grass, Canadian horseweed (*Conyza canadensis*), milk thistle (*Silybum marianum*), yellow-star thistle (*Centaurea solstitialis*), stinkwort (*Dittrichia graveolens*) and field bindweed (*Convolvulus arvensis*).

High-Density Development Land Cover

The high-density development land cover type includes urban and suburban residential neighborhoods, urban centers, industrial areas, airports, and wastewater treatment plants. Most of this high-density development occurs in the SSHCP UDA in the northwestern portion of the Plan Area.

Low-Density Development Land Cover

The low-density development land cover type consists of relatively sparse residences and other structures, such as farm buildings, and small rural neighborhoods with large individual property sizes per house. Plant nurseries are also included in this category. While the majority of low-density development occurs outside of the UDA, it is found throughout the Plan Area.

Major Roads Land Cover

The major roads land cover type includes linear features with paved surfaces and can vary from large freeways to smaller arterial roads found within urban settings. Smaller roads not mapped as Major Roads were mapped as an element of High-Density or Low-Density Development.

Mine Tailings Land Cover

Mine Tailings Land Cover is defined by the large tailing piles that rise significantly above the surrounding landscape as a result of gold dredging occurring in the early 1900s through approximately 1960. The large tailing piles are composed almost entirely of rounded river rock that was excavated from ancient riverbeds. Most of the mine tailings are associated with historic gold mining are located in the northeastern portion of the Plan Area. Smaller outcroppings of tailings in are often the result of current and recent gravel mining activities. The mine tailings are unvegetated; the SSHCP mapped any woody vegetation observed between tailings piles as the Mine Tailing Riparian Woodland land cover type (see Section 3.2.1).

Recreation/Landscaped Land Cover

The recreation/landscaped land cover type includes gardens, parks, golf courses, off-highway vehicle (OHV) parks, and greenbelts. Most landscaped and recreation areas are planted with non-native grasses, shrubs, and trees. Species composition in urban habitats varies with planting design and climate. Monoculture is commonly observed in tree groves and street tree strips. For example, many of the windbreaks in south Sacramento County are planted with pure stands of eucalyptus, olive (*Olea europaea*) trees, or other hardwoods. Most recreation and landscaped areas are regularly maintained by irrigation, mowing, pruning, or other management techniques.

3.3 Land Cover and Vernal Pool Watershed Mapping

3.3.1 Land Cover Mapping

A principal component of the Plan Area biological resources baseline is the composition and distribution of the SSHCP land cover types throughout the Plan Area. SSHCP land cover types represent classifications of land surface interpreted from aerial photographic signatures. SSHCP land cover types generally represent vegetation associations, water, or specific human land uses.

SSHCP land cover mapping occurred in several stages. Vernal Pool and Swale land cover type mapping occurred early in the SSHCP planning process and was accomplished through interpretation of black-and-white aerial imagery dated March 2001 and mapped at a scale of 1 inch = 200 feet (1:2,400) and interpretation of color aerial imagery dated November 2002 and mapped at a scale of 1 inch = 400 feet (1:4,800). See Appendix E for more information on the

process used to map Vernal Pool and Swale in the Plan Area. The primary mapping of all other SSHCP land cover types was completed in 2004 and was developed from the interpretation of color aerial imagery dated November 2002 and mapped at a scale of 1 inch = 400 feet (1:4,800).

These initial mapping efforts were periodically updated and refined during the development of the SSHCP to reflect subsequent modifications of SSHCP land covers (such as land cover conversion), to expand the initial Plan Area boundaries, and to verify the original 2001 and 2004 aerial imagery interpretation based on field visits or other site specific information. The baseline SSHCP land cover map (Figure 3-1) also reflects final mapping refinements that occurred in 2012–2014 based on interpretations of various recent color aerial photos. See Appendix E for more information.

3.3.2 Vernal Pool Mocro-Watershed Mapping

As discussed in Sections 3.2.1 and 3.2.3, habitat for vernal pool plants and animals may be impacted if the adjacent upland and watershed of the individual vernal pool or the vernal pool complex is altered. For this reason, it is important to understand if a Covered Activity will directly or indirectly impact an individual vernal pool's watershed. Beginning is 2013, the SSHCP mapped the individual watershed of select vernal pools inside the UDA using the following five-step approach: (1) acquire high-resolution classified LIDAR data; (2) develop a digital terrain model (DTM) of the Urban Development Area (UDA); (3) use industry-standard hydrologic assessment tools to determine the hydrologic characteristics of the UDA; (4) divide the UDA into subareas to facilitate a faster model run time; and (5) identify the hydrologic boundaries of the contributing area for each vernal pool feature. These terms and the process used by the SSHCP to map of individual vernal pool watersheds are discussed in greater detail in Appendix E.

The maps of individual vernal pool watersheds were used in SSHCP Chapter 6 to estimate the total acres of Vernal Pool that could be indirectly impacted by implementing SSHCP Covered Activities over the proposed 50-year ITP permit term. In addition, the maps of each individual vernal pool watershed will be used during SSHCP implementation to help plan individual Covered Activities, and to help adjust any on-site SSHCP Preserve boundaries to reduce the Covered Activity's indirect impacts to vernal wetlands and vernal pool species. The individual vernal pool watershed maps will also be used during implementation of the SSHCP to determine if any indirect impacts will result from the construction and implementation of an individual Covered Activity project or activity.

As discussed in Appendix E, the digital terrain model was specifically designed only for use in the portion of the Southeastern Sacramento Valley Vernal Pool Region (Keeler-Wolf et al. 1998) that is located within south Sacramento County.

3.4 Covered Species Habitat Models

Habitat models were prepared for all 28 Covered Species to define suitable habitat and to map where suitable habitat for each Covered Species is likely to be present in the Plan Area. The species habitat models were used to map locations and to estimate total acres of suitable species habitat within the Plan Area.

In addition, the Covered Species habitat models were used by the Plan Permittees to estimate potential effects of all SSHCP Covered Activity projects and activities on each Covered Species (see Chapter 6), and were used by the Plan Permittees to develop the SSHCP Conservation Strategy (see Chapter 7).

The following section explains the process used to define and then delineate Covered Species modeled habitat within the Plan Area. Each species habitat discussion below includes a brief description of the available literature about habitat requirements of each Covered Species during each life history stage, followed by a list of SSHCP land cover types that are expected to provide life history habitat requirements for that species. Each species model discussion presents the number and locations of documented species occurrences within the Plan Area. In addition, any assumptions used by the Plan Permittees to define or map a Covered Species' habitat model for this Plan Area are discussed and explained.

Methodology Used to Create Each Covered Species Habitat Model

The Plan Permittees worked with local species experts and wildlife agency biologists to define and map Covered Species suitable habitat in this Plan Area by using the best available information about the life history and biology of each Covered Species and locations in the Plan Area known to support the species or where the species has been observed (see SSHCP Appendix B, Species Accounts).

Specifically, information concerning the species' needs for breeding, feeding, and sheltering at each life history stage; information from Plan Area species-surveys; documented species-occurrences within the Plan Area; and information on species range, including soil type associations and elevation limits were used to build the habitat models.

This information was compiled using GIS to generate a map-based model of suitable habitat within the Plan Area for each SSHCP Covered Species. Table 3-2 lists land cover types that are known to provide Covered Species' habitat. Note that Covered Species may associate with a land cover at varying degrees of frequency over its lifetime due to seasonal habitat changes (i.e., wet and dry season, crop rotations, irrigation/flooding, food availability), and seasonal changes in a Covered Species life history and habitat needs.

The process to prepare each species habitat model was initiated with an in-depth literature review to determine specific life history needs for each species (e.g., peer-reviewed scientific literature, published species accounts, survey reports, and other environmental documents). The literature reviews focused on the identification of habitats in which the species has been documented over its range and habitat necessary for the species to complete its lifecycle. Plan Permittees, local species experts, and agency biologists then evaluated each SSHCP land cover type for meeting the habitat requirements of each Covered Species (see Table 3-2). Details on the biology of each Covered Species can be found in Appendix B (Species Accounts), including regulatory status, ecological information, range, threats, population trends, and conservation and management considerations.

After completing the literature review and defining which SSHCP land cover types could provide suitable habitat, the Plan Permittees, local species experts, and agency biologists used available Plan Area occurrence information for each Covered Species, including species survey information in agency files and survey results entered in CDFW's California Natural Diversity Database (CNDDB) to further refine the habitat models. For example, California tiger salamander is known to occupy vernal pool complexes within Valley Grassland. However, the species has never been recorded north of the Cosumnes River despite extensive surveys to locate the species in this part of the Plan Area. Therefore, habitat north of the Cosumnes River was not included in the SSHCP habitat model for this species.

For some Covered Species, especially the plant Covered Species, occurrence-location records in the CNDDB is the only species survey data available for this Plan Area. CNDDB data is based on voluntary submission of records by public and agency biologists. CNDDB survey data has the following limitations: (1) data is geographically biased toward areas that have received greater survey effort; (2) data is not confirmed by independent review and therefore is sometimes inaccurate; (3) data is often less well represented for very rare or cryptic species; and (4) mapping precision for species occurrences varies from specific (points within an 80-meter radius) to non-specific (point within an area defined by a radius between 0.1 and 1.0 mile).

For four Covered Species (giant gartersnake, western pond turtle, Swainson's hawk, and greater sandhill crane) the species modeled habitat also identifies "high-value" habitat within the Plan Area. High-value habitat is defined differently for each of the four species, but refers to areas in the Plan Area considered to be particularly important for that species. High-value habitat is considered in the effects analysis (Section 6) and in the SSHCP Conservation Strategy (Chapter 7).

Habitat models were prepared for each vernal pool plant Covered Species by the process described above; however soil units were also used to help further refine plant species habitat models. Numerous studies have correlated the distribution of vernal pools as well as vernal pool

endemic species with specific geologic surfaces and their associated soils (Helm and Vollmar 2002; Holland and Dains 1990; Metz 2001, as cited in Vollmar et al. 2013). Therefore, the Plan Permittees used soil unit maps from the Soil Survey Geologic Database (SSURGO) for Sacramento County (USDA 2014) to identify correlations between plant Covered Species documented occurrences and soils within the Plan Area. Only SSHCP land cover types that also occurred within a soil unit that is known to be occupied by the plant species, for which the model was being developed, were considered suitable habitat for the species. For instance, Ahart's dwarf rush in only known to occupy vernal pool land cover types that are within Red Bluff loam, Red Bluff-Redding complex and Redding gravelly Loam soil types. So only vernal pools within the Plan Area that occur on these three soil units were considered suitable habitat for Ahart's dwarf rush.

For each documented plant occurrence, the occurrence's "precision-code" size used by the CNDDB was also used to determine suitable modeled habitat. For instance, if a documented plant occurrence was cited by CNDDB to have a location accuracy of 1/10 of a mile, then any soil type within 0.10 mile of the occurrence polygon's "centroid" point was considered a potential suitable soil for the species.

3.4.1 Plant Covered Species Habitat Models

Ahart's Dwarf Rush (*Juncus leiospermus* var. *ahartii*)

Habitat Requirements

Ahart's dwarf rush occupies, shallow vernal pools, the margins of large vernal pools and swales (CDFG 2002; Dittes and Guardino pers. obs., as cited in SSHCP Appendix B). It is frequently associated with recent gopher mounds where, potentially, the lack of competition from other plants allows Ahart's dwarf rush to persist (Dittes and Guardino pers. obs., as cited in SSHCP Appendix B; CDFG 2010).

Plan Permittee analysis of documented occurrences suggests that in Sacramento County, Ahart's dwarf rush is associated with the Red Bluff loam, Red Bluff-Redding complex and Redding gravelly Loam soil types.

Land Cover Types Relevant to Habitat Requirements

SSHCP Land Cover types that provide suitable habitat based on life history descriptions are Vernal Pool and Swale. Vernal pools are their primary habitat in the Plan Area. Swales may also provide suitable habitat as Ahart's dwarf rush appears to prefer short inundation periods (see Table 3-2). Because Vernal Pools and Swales are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Documented Occurrences within the Plan Area

There are two documented occurrences of Ahart's dwarf rush within the Plan Area, one within PPU 1 and the other in PPU 2. Both are within the UDA.

Model Assumptions

- Soil types known to support the single documented occurrence of Ahart's dwarf rush in the Plan Area include Red Bluff loam, 0 to 2% slopes; Red Bluff-Redding complex 0 to 5% slopes; and Redding gravelly loam, 0 to 8% slopes.
- Ahart's dwarf rush occupies shallow vernal pools, vernal pool margins, and swales (Dittes and Guardino pers. obs., as cited in SSHCP Appendix B; CDFG 2002).
- Valley Grasslands are necessary to support the Vernal Pool and Swale land cover types that Ahart's dwarf rush occupies.

Ahart's Dwarf Rush Modeled Habitat

Modeled habitat for Ahart's dwarf rush is all Vernal Pool, Swale, and Valley Grassland land covers on Fiddyment fine sandy loam, 1% to 8% slopes; Red Bluff-Redding complex, 0 to 5% slopes; and Redding gravelly loam, 0 to 8% slopes.

Figure 3-3 illustrates the location of modeled habitat as well as the documented occurrences of Ahart's dwarf rush within the Plan Area.

Boggs Lake Hedge-Hyssop (*Gratiola heterosepala*)

Habitat Requirements

Boggs Lake hedge-hyssop is reported to grow in well-developed vernal pools, and playa lakes, as well as along the seasonally fluctuating margins of more permanent water bodies (small lakes, reservoirs, stock ponds, seasonally saturated clay flats in meadows). Boggs Lake hedge-hyssop often grows in comparatively barren areas within deeper portions of vernal pools, sometimes in barren openings with common spikerush (*Eleocharis macrostachya*) (Dittes and Guardino, as cited in SSHCP Appendix B).

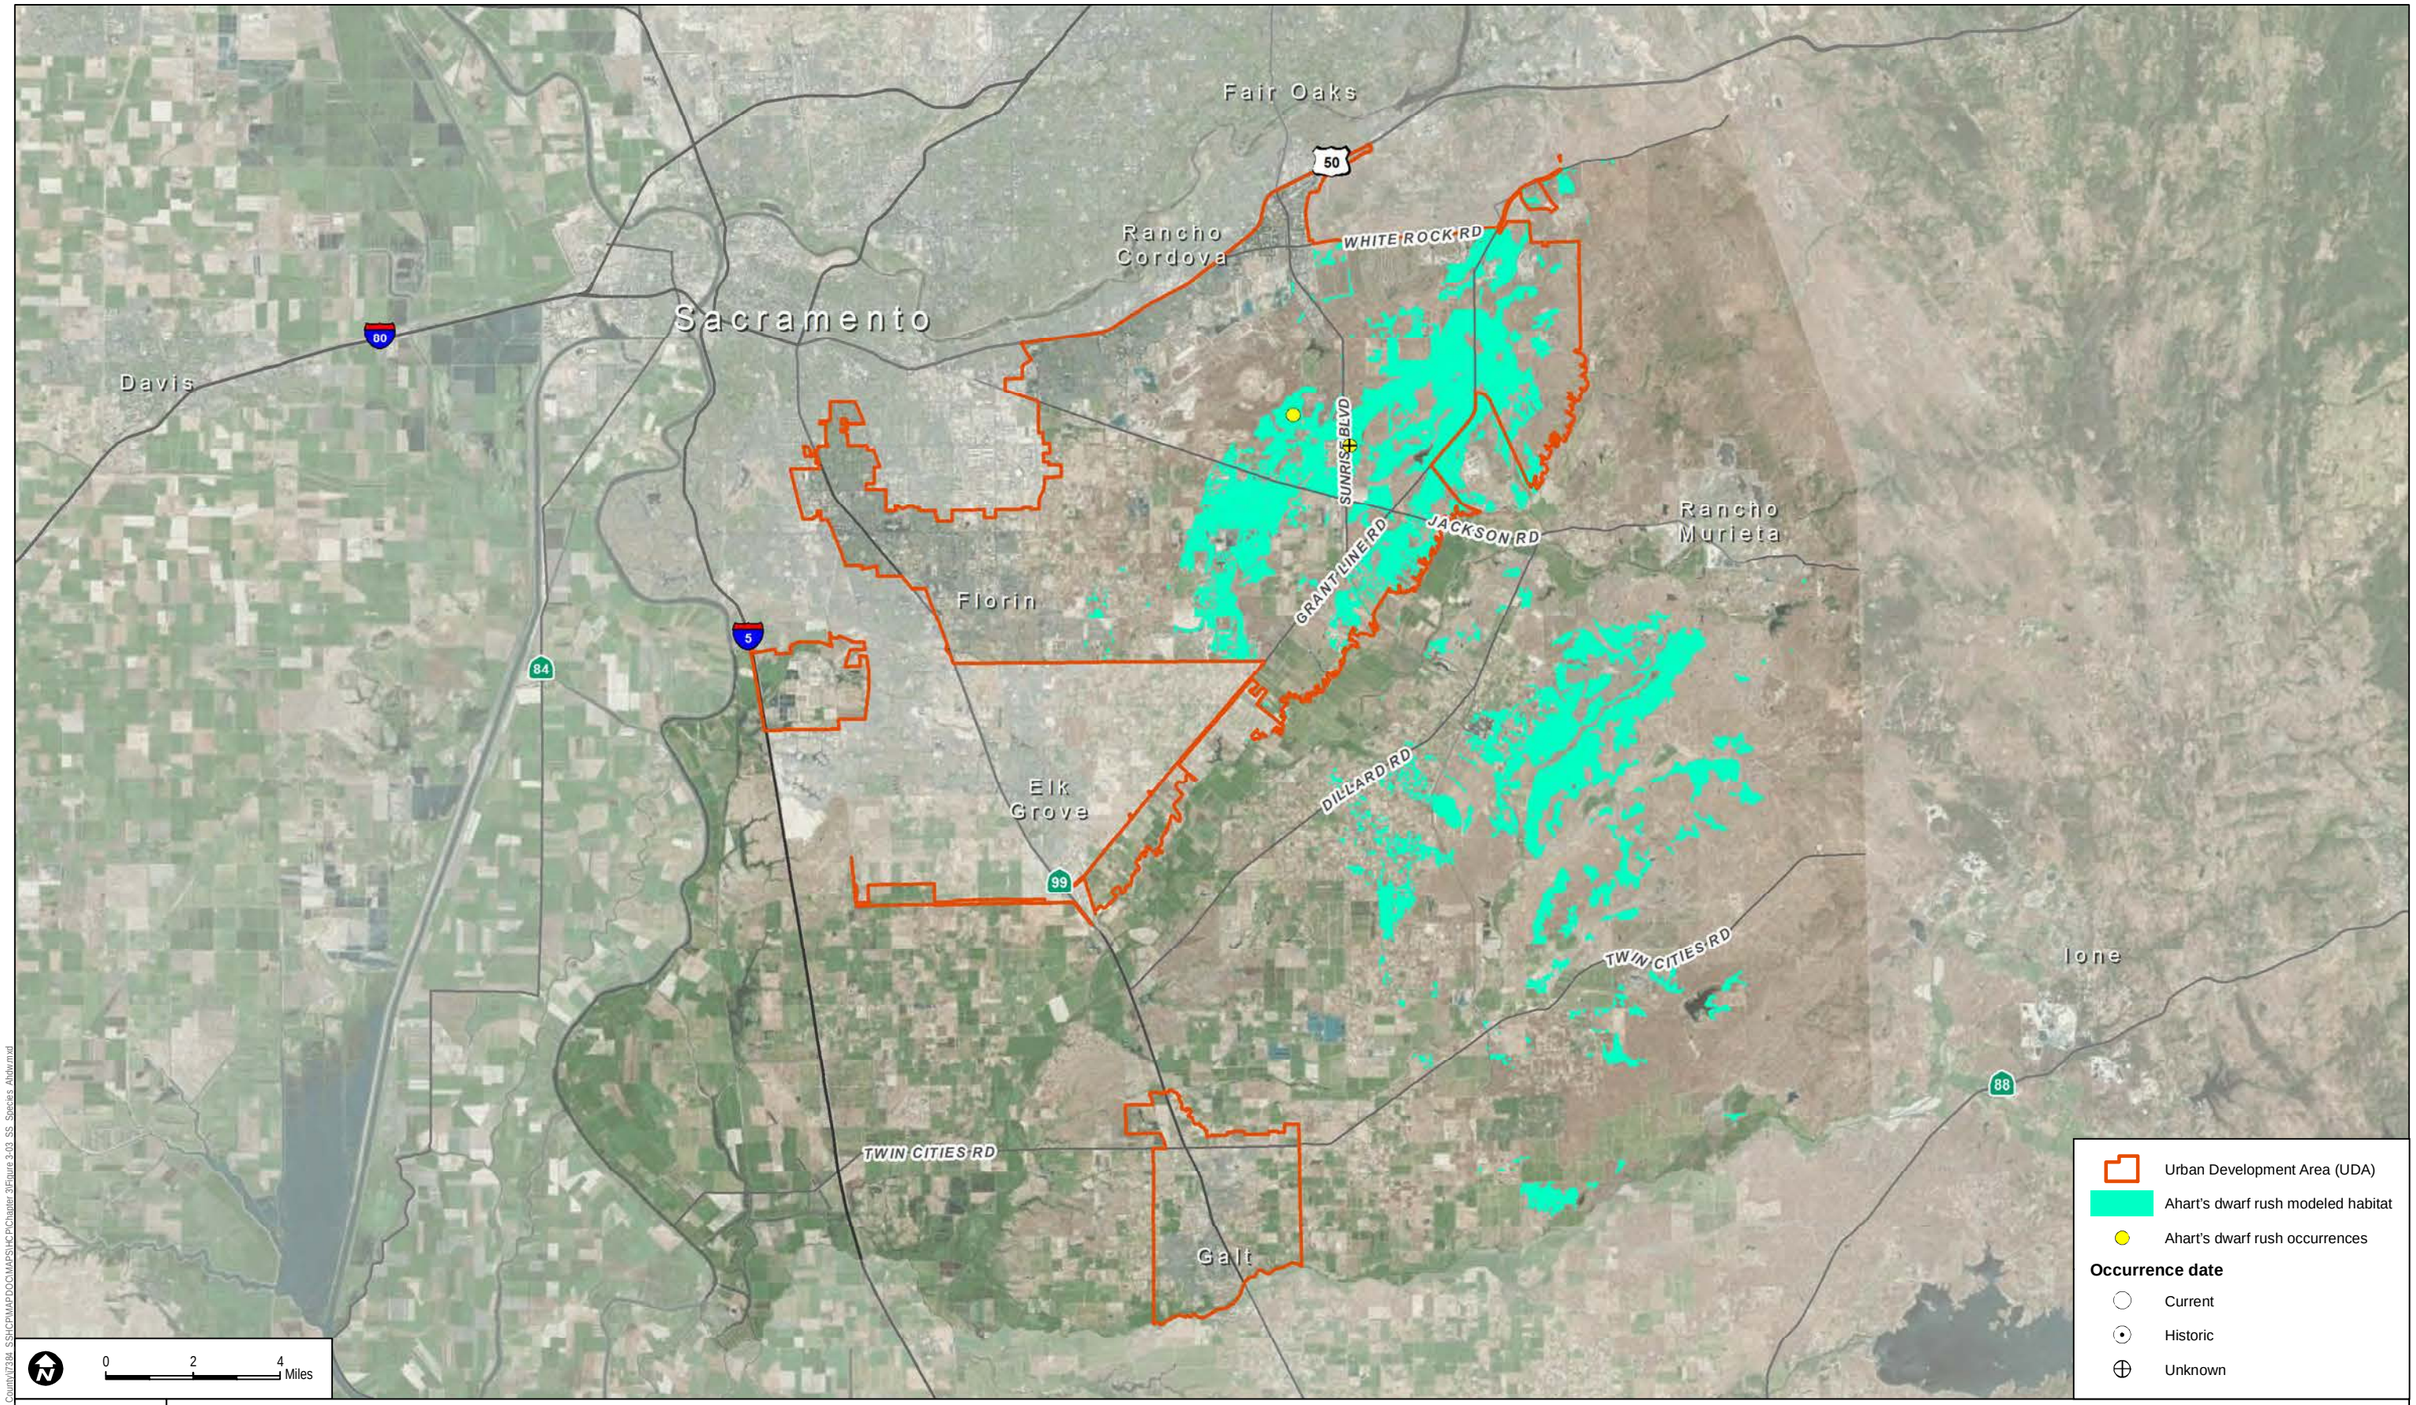
Plan Permittee analysis of documented occurrences suggests that in Sacramento County, known Boggs Lake hedge-hyssop occurrences are associated with Red Bluff loam, Red Bluff-Redding complex, Red Bluff-Xerarents complex, Redding gravelly loam, San Joaquin silt loam, San Joaquin-Durixeralfs complex, and Vleck gravelly loam soil types.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat based on life history descriptions are Vernal Pool and Seasonal Wetland (Table 3-2). Because Vernal Pools and Seasonal Wetlands are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are 31 documented occurrences of Boggs Lake hedge-hyssop within the Plan Area. Twenty occurrences are located within the UDA. Of the 20 occurrences within the UDA, 16 are in PPU 1 and there is one occurrence each in PPUs 2 and 3. Two occurrences are not within a PPU. Eleven occurrences are located outside the UDA, all in PPU 1.



Model Assumptions

- Soil types known to support Boggs Lake hedge-hyssop in the Plan Area include Red Bluff loam, 2% to 5% slopes; Red Bluff-Redding complex, 0 to 5% slopes; Red Bluff-Xerarents complex, 0 to 2% slopes; Redding gravelly loam, 0 to 8% slopes; San Joaquin silt loam, 0 to 3% slopes; San Joaquin-Durixeralfs complex, 0 to 1% slopes; and Vleck gravelly loam, 2% to 15% slopes.
- Boggs Lake hedge-hyssop is known to occupy well-developed vernal pools, and playa lakes, as well as along the seasonally fluctuating margins of more permanent water bodies.
- Valley Grasslands are necessary to support the Vernal Pool and Seasonal Wetland land cover types that Boggs Lake hedge-hyssop occupies.

Boggs Lake Hedge-Hyssop Modeled Habitat

Modeled habitat for Boggs Lake hedge-hyssop is Vernal Pool, Seasonal Wetland, and Valley Grassland land cover types on Red Bluff loam, 2% to 5% slopes; Red Bluff-Redding complex, 0 to 5% slopes; Red Bluff-Xerarents complex, 0 to 2% slopes; Redding gravelly loam, 0 to 8% slopes; San Joaquin silt loam, 0 to 3% slopes; San Joaquin-Durixeralfs complex, 0 to 1% slopes; Sailboat silt loam, drained, 0 to 2% slopes; occasionally flooded, and Vleck gravelly loam, 2% to 15% slopes.

Figure 3-4 illustrates the location of modeled habitat as well as documented occurrences of Boggs Lake hedge-hyssop within the Plan Area.

Dwarf Downingia (*Downingia pusilla*)

Habitat Requirements

Dwarf downingia occurrences are associated mainly with northern claypan vernal pools in central Sacramento County, with northern hardpan vernal pools in the foothills of the Sierra Nevada, and with vernal pools of the Interior Valleys of the Coast Range in Napa and Sonoma Counties (CDFG 2010). Dwarf downingia occupies more commonly occurring, smaller and/or shallower vernal pools with comparatively more "flashy" hydrology (CDFG 2010; Dittes pers. obs., as cited in SSHCP Appendix B). Dwarf downingia also grows along the margins of vernal pools as well as mesic sites within Valley Grassland (CNPS 2010).

Plan Permittee analysis of documented occurrences suggests that in Sacramento County, documented dwarf downingia occurrences are associated with Amador-Gillender complex, Clear Lake clay, Corning complex, Hadselville-Pentz complex, Redding gravelly loam, San Joaquin silt loam, and San Joaquin-Galt complex soil types.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat based on life history descriptions are Vernal Pool and Swale. Vernal pools are their primary habitat in the Plan Area. Swales may also provide suitable habitat as dwarf downingia prefers short periods of inundation (Table 3-2). Because Vernal Pools and Swales are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are 10 documented occurrences of dwarf downingia within the Plan Area. All occurrences are outside of the UDA, with eight occurrences in PPU 6 and two occurrences in PPU 7.

Model Assumptions

- Soil types known to support dwarf downingia in the Plan Area include Amador-Gillender complex, 2% to 15% slopes; Clear Lake clay, partially drained, 0 to 2% slopes, frequently flooded; Corning complex, 0 to 8% slopes; Hadselville-Pentz complex, 2% to 30% slopes; Redding gravelly loam, 0 to 8% slopes; San Joaquin silt loam, 0 to 3% slopes; and San Joaquin-Galt complex, 0 to 3% slopes.
- Dwarf downingia is known to occupy commonly occurring, smaller and/or shallower vernal pools but has also been found at the margins of larger or deeper vernal pools.

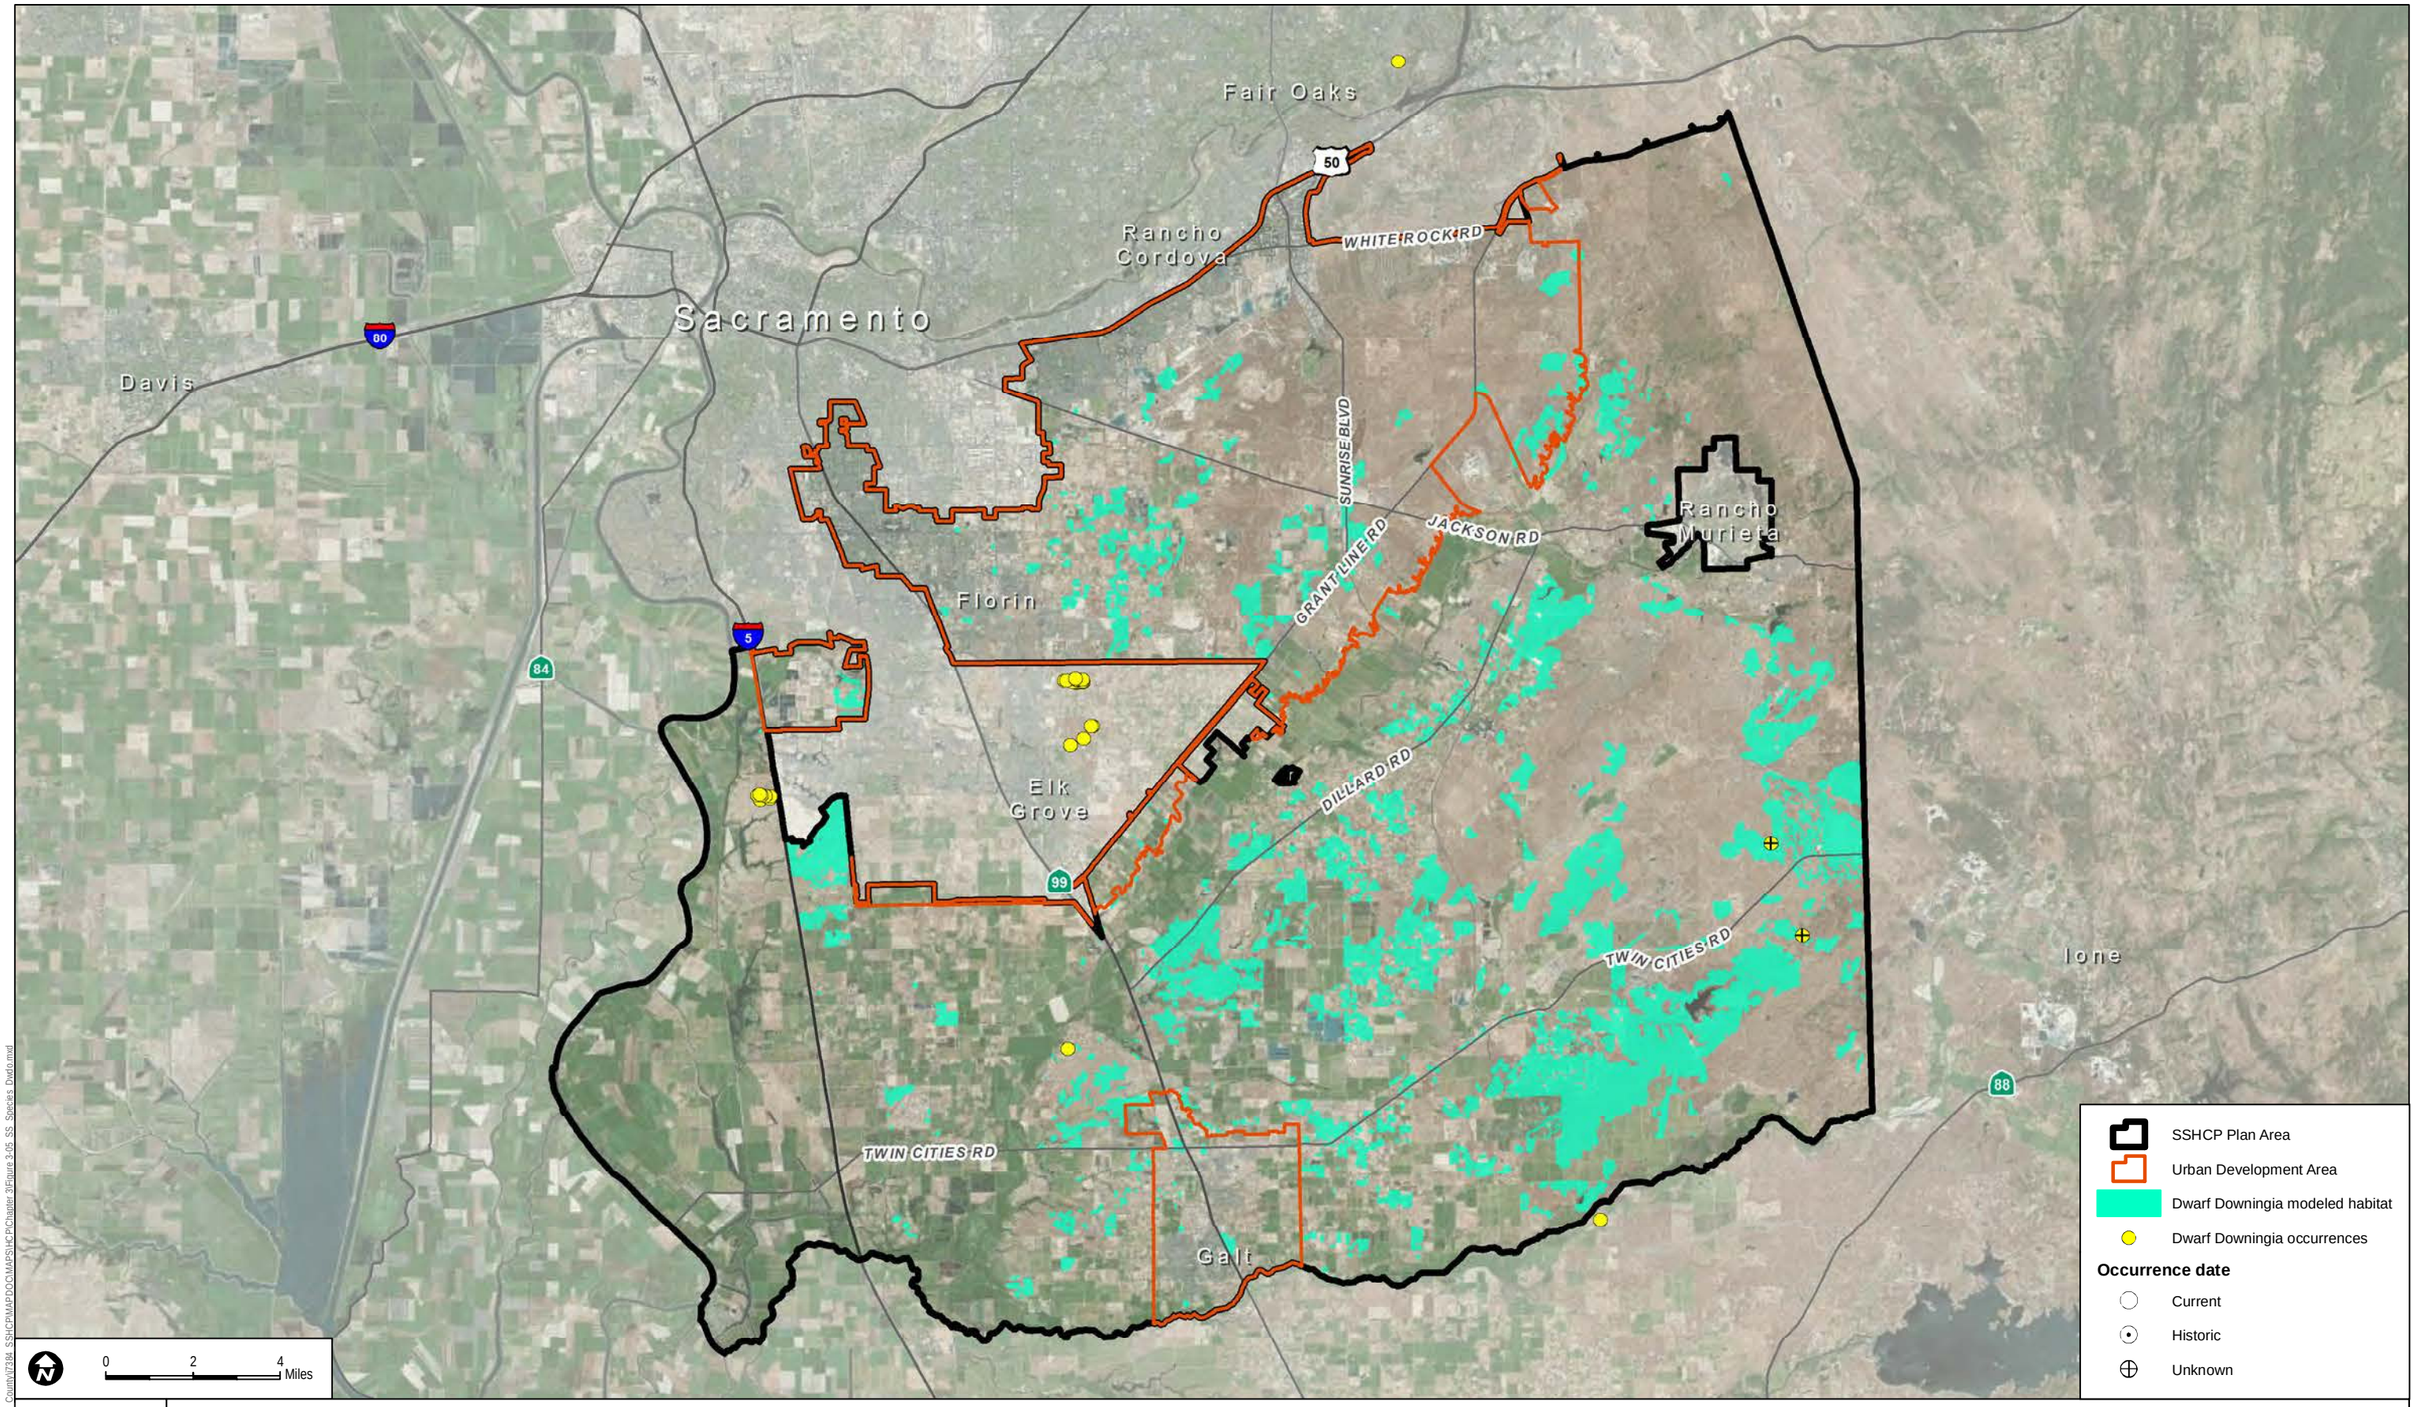
- Valley Grasslands are necessary to support the Vernal Pool and Swale land cover types that dwarf downingia occupies.

Dwarf Downingia Modeled Habitat:

Modeled habitat for dwarf downingia is considered to be all Vernal Pool, Swale, and Valley Grassland land cover on Amador-Gillender complex, 2% to 15% slopes; Clear Lake clay, partially drained, 0 to 2% slopes, frequently flooded; Corning complex, 0 to 8% slopes; Durixeralfs-Galt complex, 0 to 2% slopes; San Joaquin silt loam, 0 to 3% slopes; and San Joaquin-Galt complex, 0 to 3% slopes.

Figure 3-5 illustrates the location of modeled habitat as well as documented occurrences of dwarf downingia within the Plan Area.

Legenere (*Legenere limosa*)



Habitat Requirements

Legenere grows in well-developed vernal pools and playa lakes, as well as along the seasonally fluctuating margins of more permanent water bodies (small lakes, ponds, stock ponds), and basins within seasonal drainages (CDFG 2010; Holland 1983). Topographical position within pools and associated plant species indicate tolerance of, or preference for, the more extreme (longer-duration) inundation regimes encountered in vernal wetlands (Dittes and Guardino, as cited in SSHCP Appendix B).

Plan Permittee analysis of documented occurrences suggests that in Sacramento County, legenere documented occurrences are associated with Clear Lake clay, Corning complex, Creviscreek sandy loam, Dierssen sandy clay loam, Dierssen clay loam, Fiddyment fine sandy loam, Hadselville-Pentz complex, Hedge loam, Hicksville loam, Hicksville gravelly loam, Liveoak sandy clay loam, Madera loam, Natomas loam, Red Bluff loam, Red Bluff-Redding complex, Redding gravelly loam, San Joaquin silt loam, San Joaquin-Galt complex, Xerorthents, and dredge tailings.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat based on life history descriptions are Vernal Pool and Seasonal Wetland (Table 3-2). Because Vernal Pools and Seasonal Wetlands are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

INTENTIONALLY LEFT BLANK

Occurrences within the Plan Area

There are 62 documented occurrences of legenere in the Plan Area. Thirty-six are located within the UDA including 20 within PPU 1, seven in PPU 2, seven in PPU 3, one in PPU 4 and one is not within a PPU. There are 26 occurrences outside of the UDA, including 1 in PPU 5, 16 in PPU 6, and 9 in PPU 7.

Model Assumptions

- Soil types at documented legenere occurrences in the Plan Area include Clear Lake clay, partially drained, 0 to 2% slopes, frequently flooded; Corning complex, 0 to 8% slopes; Creviscreek sandy loam, 0 to 3% slopes; Dierssen sandy clay loam, drained, 0 to 2% slopes; Fiddyment fine sandy loam, 1% to 8% slopes; Hedge loam, 0 to 2% slopes; Madera-Galt complex, 0 to 2% slopes; Red Bluff loam, 0 to 2% slopes; Red Bluff loam, 2% to 5% slopes; Red Bluff-Redding complex, 0 to 5% slopes; Redding gravelly loam, 0 to 8% slopes; San Joaquin silt loam, 0 to 3% slopes; and San Joaquin-Galt complex, 0 to 3% slopes.
- Legenere grows in well-developed vernal pools, as well as along the seasonally fluctuating margins of more permanent water bodies and basins within seasonal drainages (Holland 1983; CDFG 2010).
- Legenere has been reported to inhabit vernal wetlands ranging in size from 40 square feet to 100 acres (Holland 1983).
- Valley Grasslands are necessary to support the Vernal Pool and Seasonal Wetland land cover types that legenere occupies.

Legenere Modeled Habitat

Modeled habitat for legenere is considered to be all Vernal Pool, Seasonal Wetland, and Valley Grassland land cover types on Clear Lake clay, partially drained, 0 to 2% slopes; frequently flooded, Corning complex, 0 to 8% slopes; Creviscreek sandy loam, 0 to 3% slopes; Dierssen sandy clay loam, drained, 0 to 2% slopes; Fiddyment fine sandy loam, 1 to 8% slopes; Hedge loam, 0 to 2% slopes; Madera-Galt complex, 0 to 2% slopes; Red Bluff loam, 0 to 2% slopes; Red Bluff loam, 2% to 5% slopes; Red Bluff-Redding complex, 0 to 5% slopes; Redding gravelly loam, 0 to 8% slopes; San Joaquin silt loam, 0 to 3% slopes; and San Joaquin-Galt complex, 0 to 3% slopes.

Figure 3-6 illustrates the location of modeled habitat as well as documented occurrences of legenere within the Plan Area.

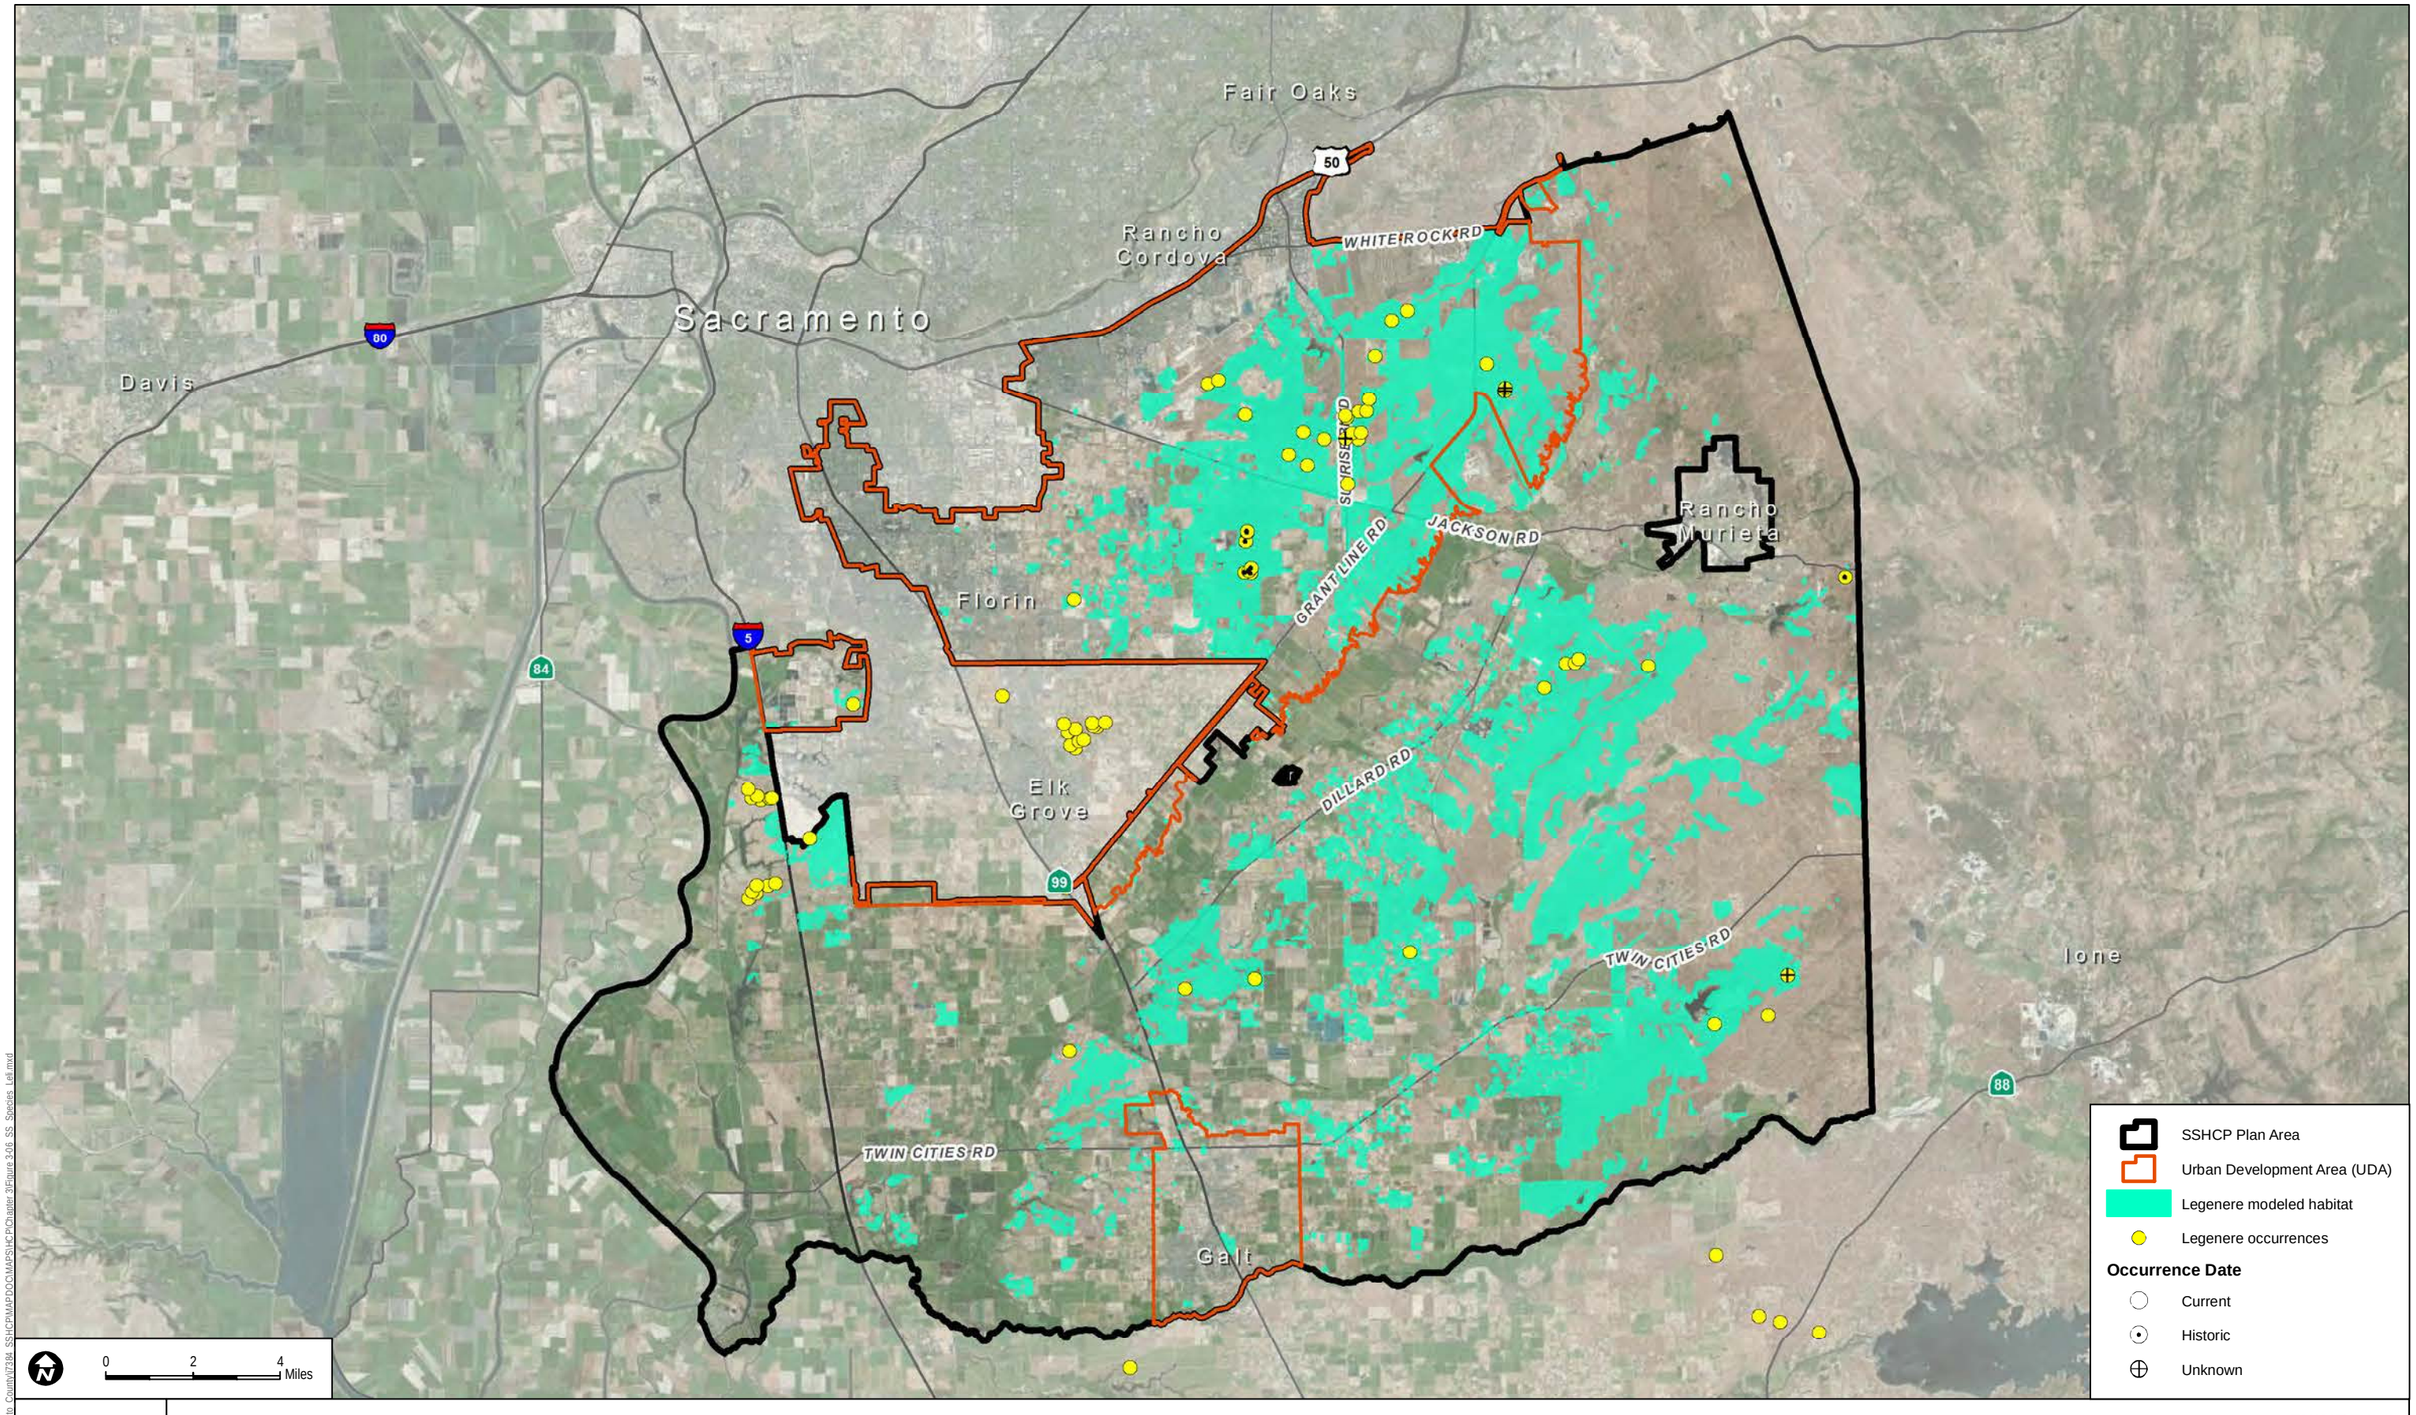
Pincushion Navarretia (*Navarretia myersii*)

Habitat Requirements

Pincushion navarretia is a strict vernal pool endemic. Pincushion navarretia occupies more commonly occurring, smaller and/or shallower vernal pools with comparatively more "flashy" hydrology (Dittes and Guardino, as cited in SSHCP Appendix B).

Plan Permittee analysis of documented occurrences suggests that in Sacramento County, documented pincushion navarretia occurrences are associated with Amador-Gillender complex, Corning complex, Corning-Redding complex, Creviscreek sandy loam, Hadselville-Pentz complex, Hicksville sandy clay loam, Pardee-Rancho Seco complex, Pentz-Lithic Xerorthents complex, and Redding gravelly loam soil types.

Land Cover Types Relevant to Habitat Requirements



SSHCP land cover types that provide suitable habitat based on life history descriptions are Vernal Pool and Swale. Vernal pools are their primary habitat in the Plan Area. Swales may also provide suitable habitat as pincushion navarretia appears to prefer short inundation periods (Table 3-2). Because Vernal Pools and Swales are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are 48 documented occurrences of pincushion navarretia in the Plan Area. All 48 occurrences are located in PPU 7 outside of the UDA.

Model Assumptions

- Soil types known to support pincushion navarretia occurrences in the Plan Area include Amador-Gillender complex, 2% to 15% slopes; Corning complex, 0 to 8% slopes; Corning-Redding complex, 8 to 30% slopes; Creviscreek sandy loam, 0 to 3% slopes; Hadselville-Pentz complex, 2% to 30% slopes; Hicksville sandy clay loam, 0 to 2% slopes; occasionally flooded, Pardee-Rancho Seco complex, 3% to 15% slopes; Pentz-Lithic Xerorthents complex, 30% to 50% slopes; Peters clay, 1% to 8% slopes; and Redding gravelly loam, 0 to 8% slopes.
- Pincushion navarretia occupies small to medium size vernal pool types and the margins of larger and/or deeper pools.
- Valley Grasslands are necessary to support the Vernal Pool and Swale land cover types that pincushion navarretia occupies.

Pincushion Navarretia Modeled Habitat

Modeled habitat for pincushion navarretia is considered to be all Vernal Pool, Swale, and Valley Grassland land cover types on Amador-Gillender complex, 2% to 15% slopes; Corning complex, 0 to 8% slopes; Corning-Redding complex, 8% to 30% slopes; Creviscreek sandy loam, 0 to 3% slopes; Hadselville-Pentz complex, 2% to 30% slopes; Hicksville sandy clay loam 0 to 2% slopes; Pardee-Ranchoseco complex, 3% to 15% slopes; Pentz-Lithic Xerorthents complex, 30% to 50% slopes; and Redding gravelly loam, 0 to 8% slopes.

Figure 3-7 illustrates the location of modeled habitat as well as documented occurrences of pincushion navarretia within the Plan Area.

Sacramento Orcutt Grass (*Orcuttia viscida*)

Habitat Requirements

Sacramento Orcutt grass is a strict vernal pool endemic. Sacramento Orcutt grass appears to be the most specific of the genus Orcuttia with regard to niche breadth, as indicated by restriction to the largest of pools (Stone et al. 1988).

Plan Permittee analysis of documented occurrences suggests that in Sacramento County, Sacramento Orcutt grass is associated with Corning complex; Hicksville sandy clay loam; Red Bluff-Redding complex; and Redding gravelly loam soil types.

Land Cover Types Relevant to Habitat Requirements

The SSHCP land cover type that provides suitable habitat based on life history descriptions is vernal pool (Table 3-2). Because Vernal Pools are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are 40 documented occurrences of Sacramento Orcutt grass within the Plan Area. Of the 40 documented occurrences in the Plan Area, 10 are located within the UDA, including 8 within PPU 1 and 2 within PPU 3. Thirty are outside of the UDA, including 28 within PPU 1 and two within PPU 7.

Model Assumptions

- Soil types known to support Sacramento Orcutt grass occurrences in the Plan Area include Corning complex, 0 to 8% slopes; Hicksville sandy clay loam, 0 to 2% slopes; Red Bluff-Redding complex, 0 to 5% slopes; and Redding gravelly loam, 0 to 8% slopes soil types.

- Sacramento Orcutt grass occupies medium to large size vernal pool types.
- Valley Grasslands are necessary to support the Vernal Pools that Sacramento Orcutt grass occupies.

Sacramento Orcutt Grass Modeled Habitat

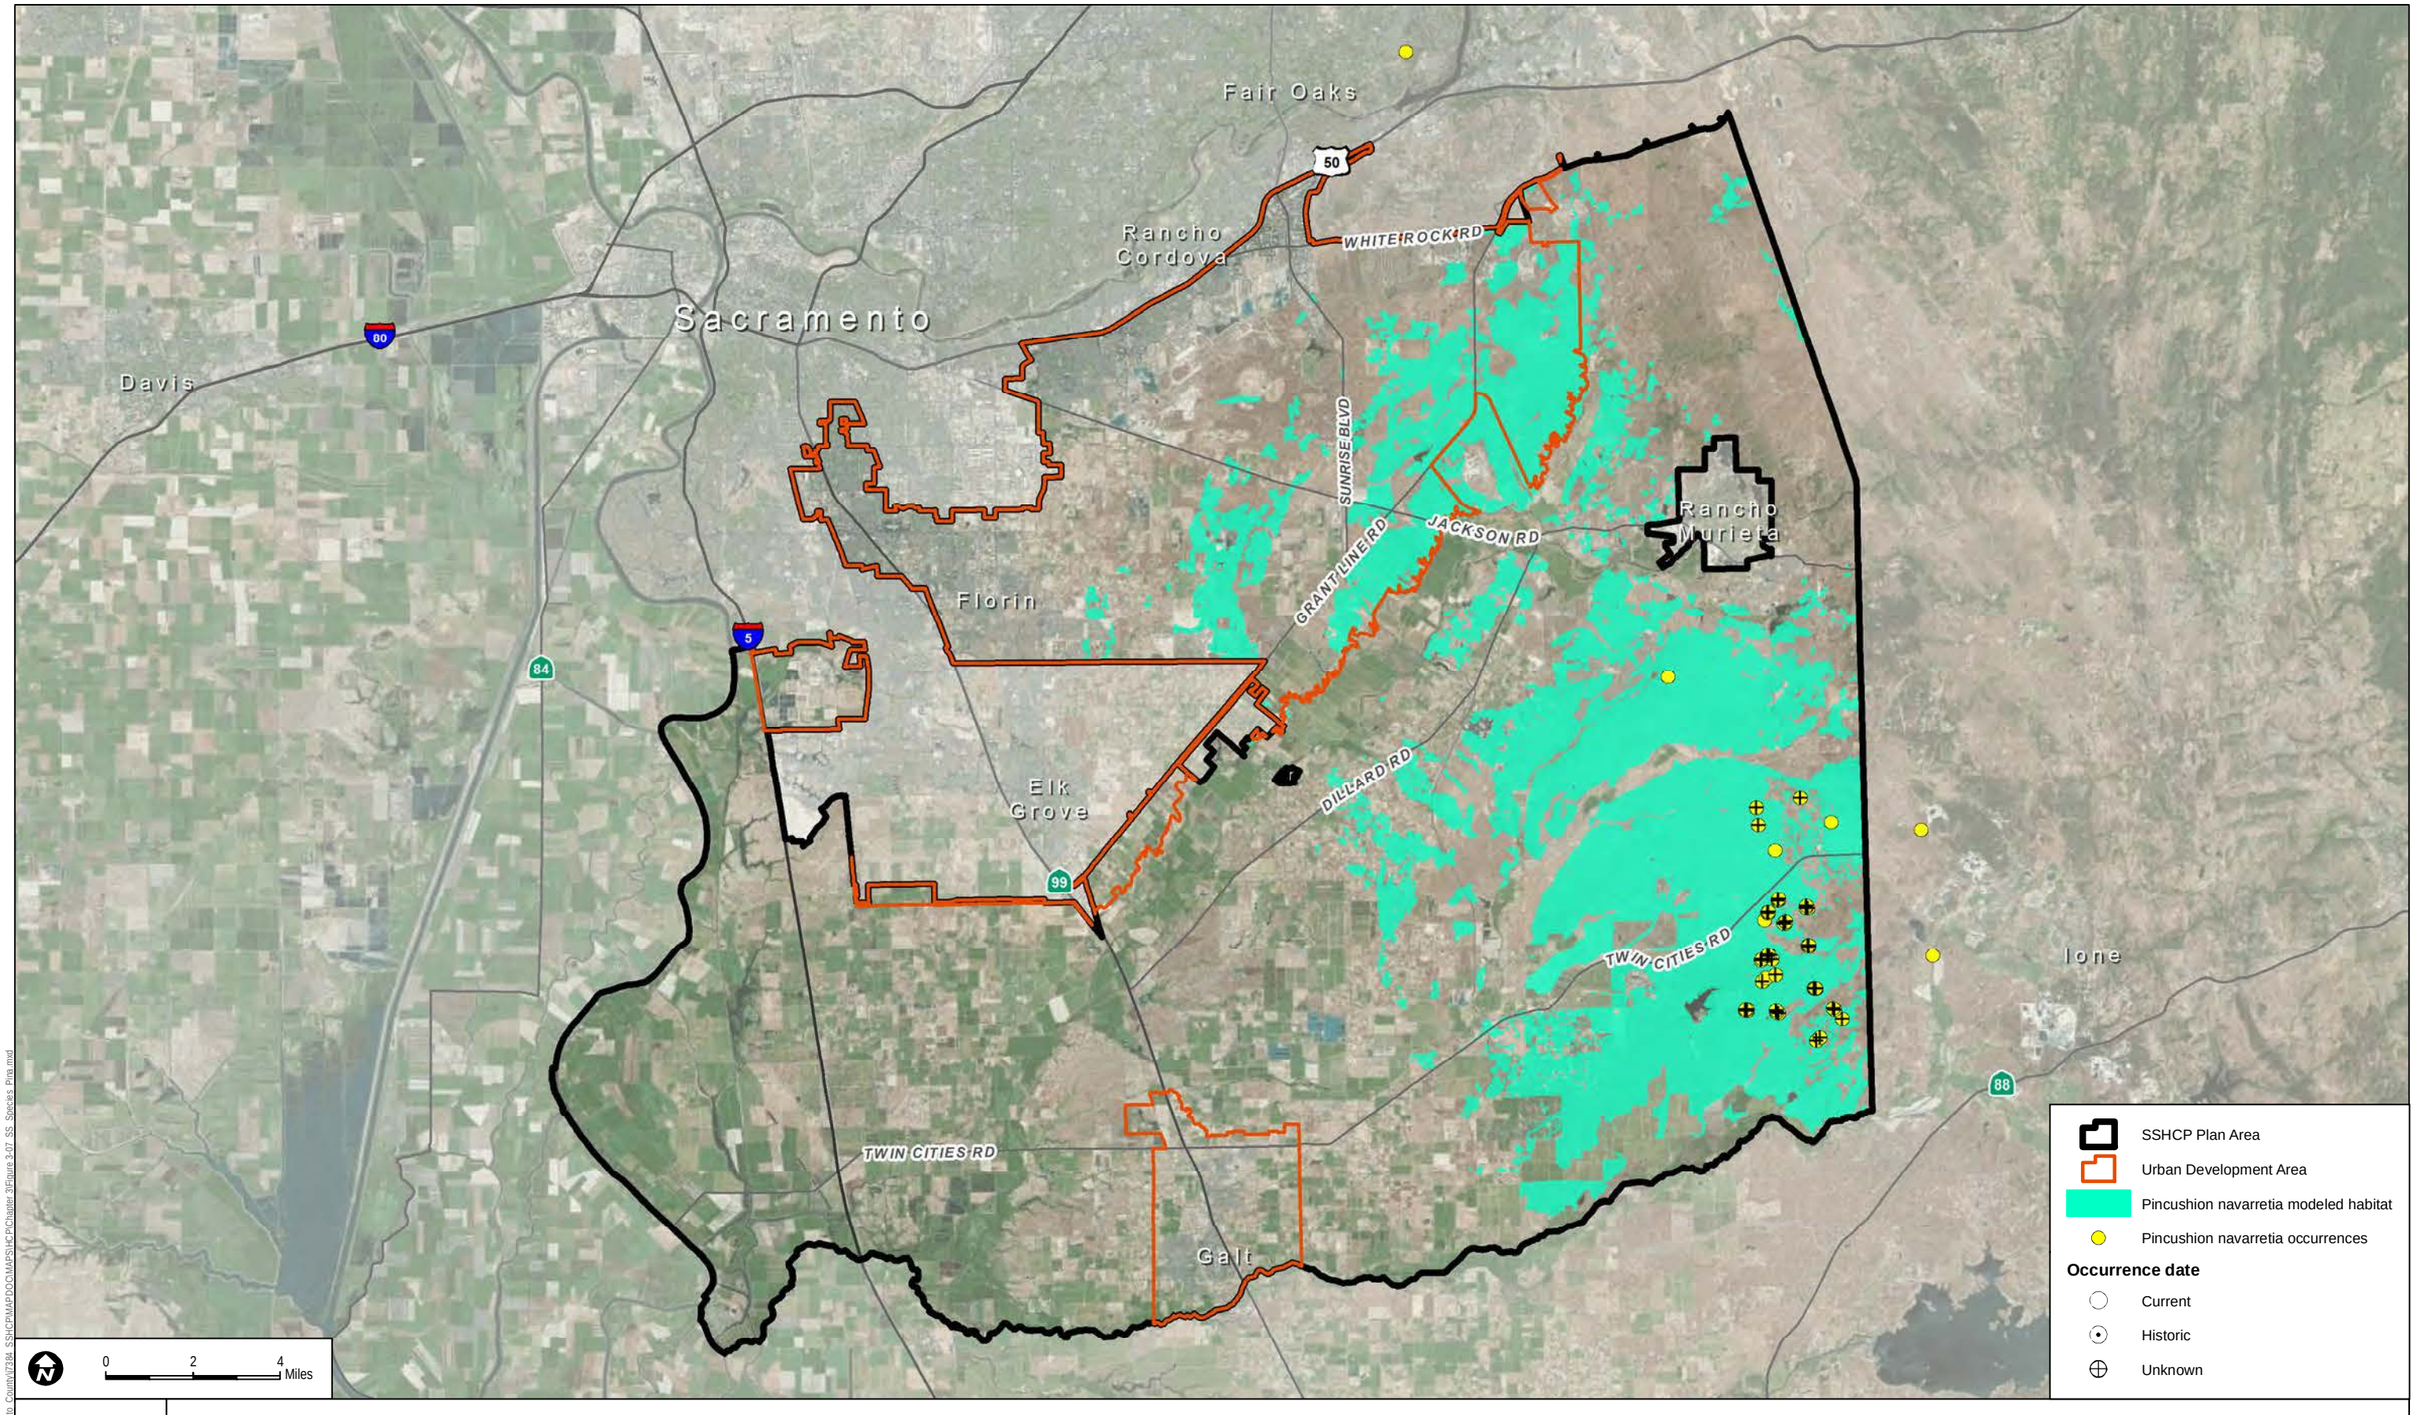
Modeled habitat for Sacramento Orcutt grass is considered to be all Vernal Pools and Valley Grassland land cover types on Corning complex, 0 to 8% slopes; Hicksville sandy clay loam, 0 to 2% slopes; Red Bluff-Redding complex, 0 to 5% slopes; and Redding gravelly loam, 0 to 8% slopes soil types.

Figure 3-8 illustrates the location of modeled habitat as well as documented occurrences of Sacramento Orcutt grass within the Plan Area.

Slender Orcutt Grass (*Orcuttia tenuis*)

Habitat Requirements

Slender Orcutt grass is a strict vernal pool endemic. It is strongly adapted to the hydrologic cycles encountered in the deeper spectrum of vernal pool types, e.g., they are typically associated with larger or deeper vernal pools that tend to possess more extreme regimes of inundation (Crampton 1959; Griggs 1974).



Plan Permittee analysis of documented occurrences suggests that in Sacramento County, documented occurrences of slender Orcutt grass are associated with Redding gravelly loam soil types.

Land Cover Types Relevant to Habitat Requirements

The SSHCP land cover type that provides suitable habitat based on life history descriptions is vernal pool (Table 3-2). Because Vernal Pools are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are four documented occurrences of slender Orcutt grass within the Plan Area. All four occurrences are in the UDA with one in PPU 1 and three in PPU 3.

Model Assumptions

- Soil types known to support slender Orcutt grass in the Plan Area include Redding gravelly loam, 0 to 8% slopes.
- Slender Orcutt grass occupies medium to large size vernal pool types.
- Valley Grasslands are necessary to support the Vernal Pools that slender Orcutt grass occupies.

Slender Orcutt Grass Modeled Habitat

Modeled habitat for slender Orcutt grass is all Vernal Pool and Valley Grassland land cover types on Redding gravelly loam, 0 to 8% slopes.

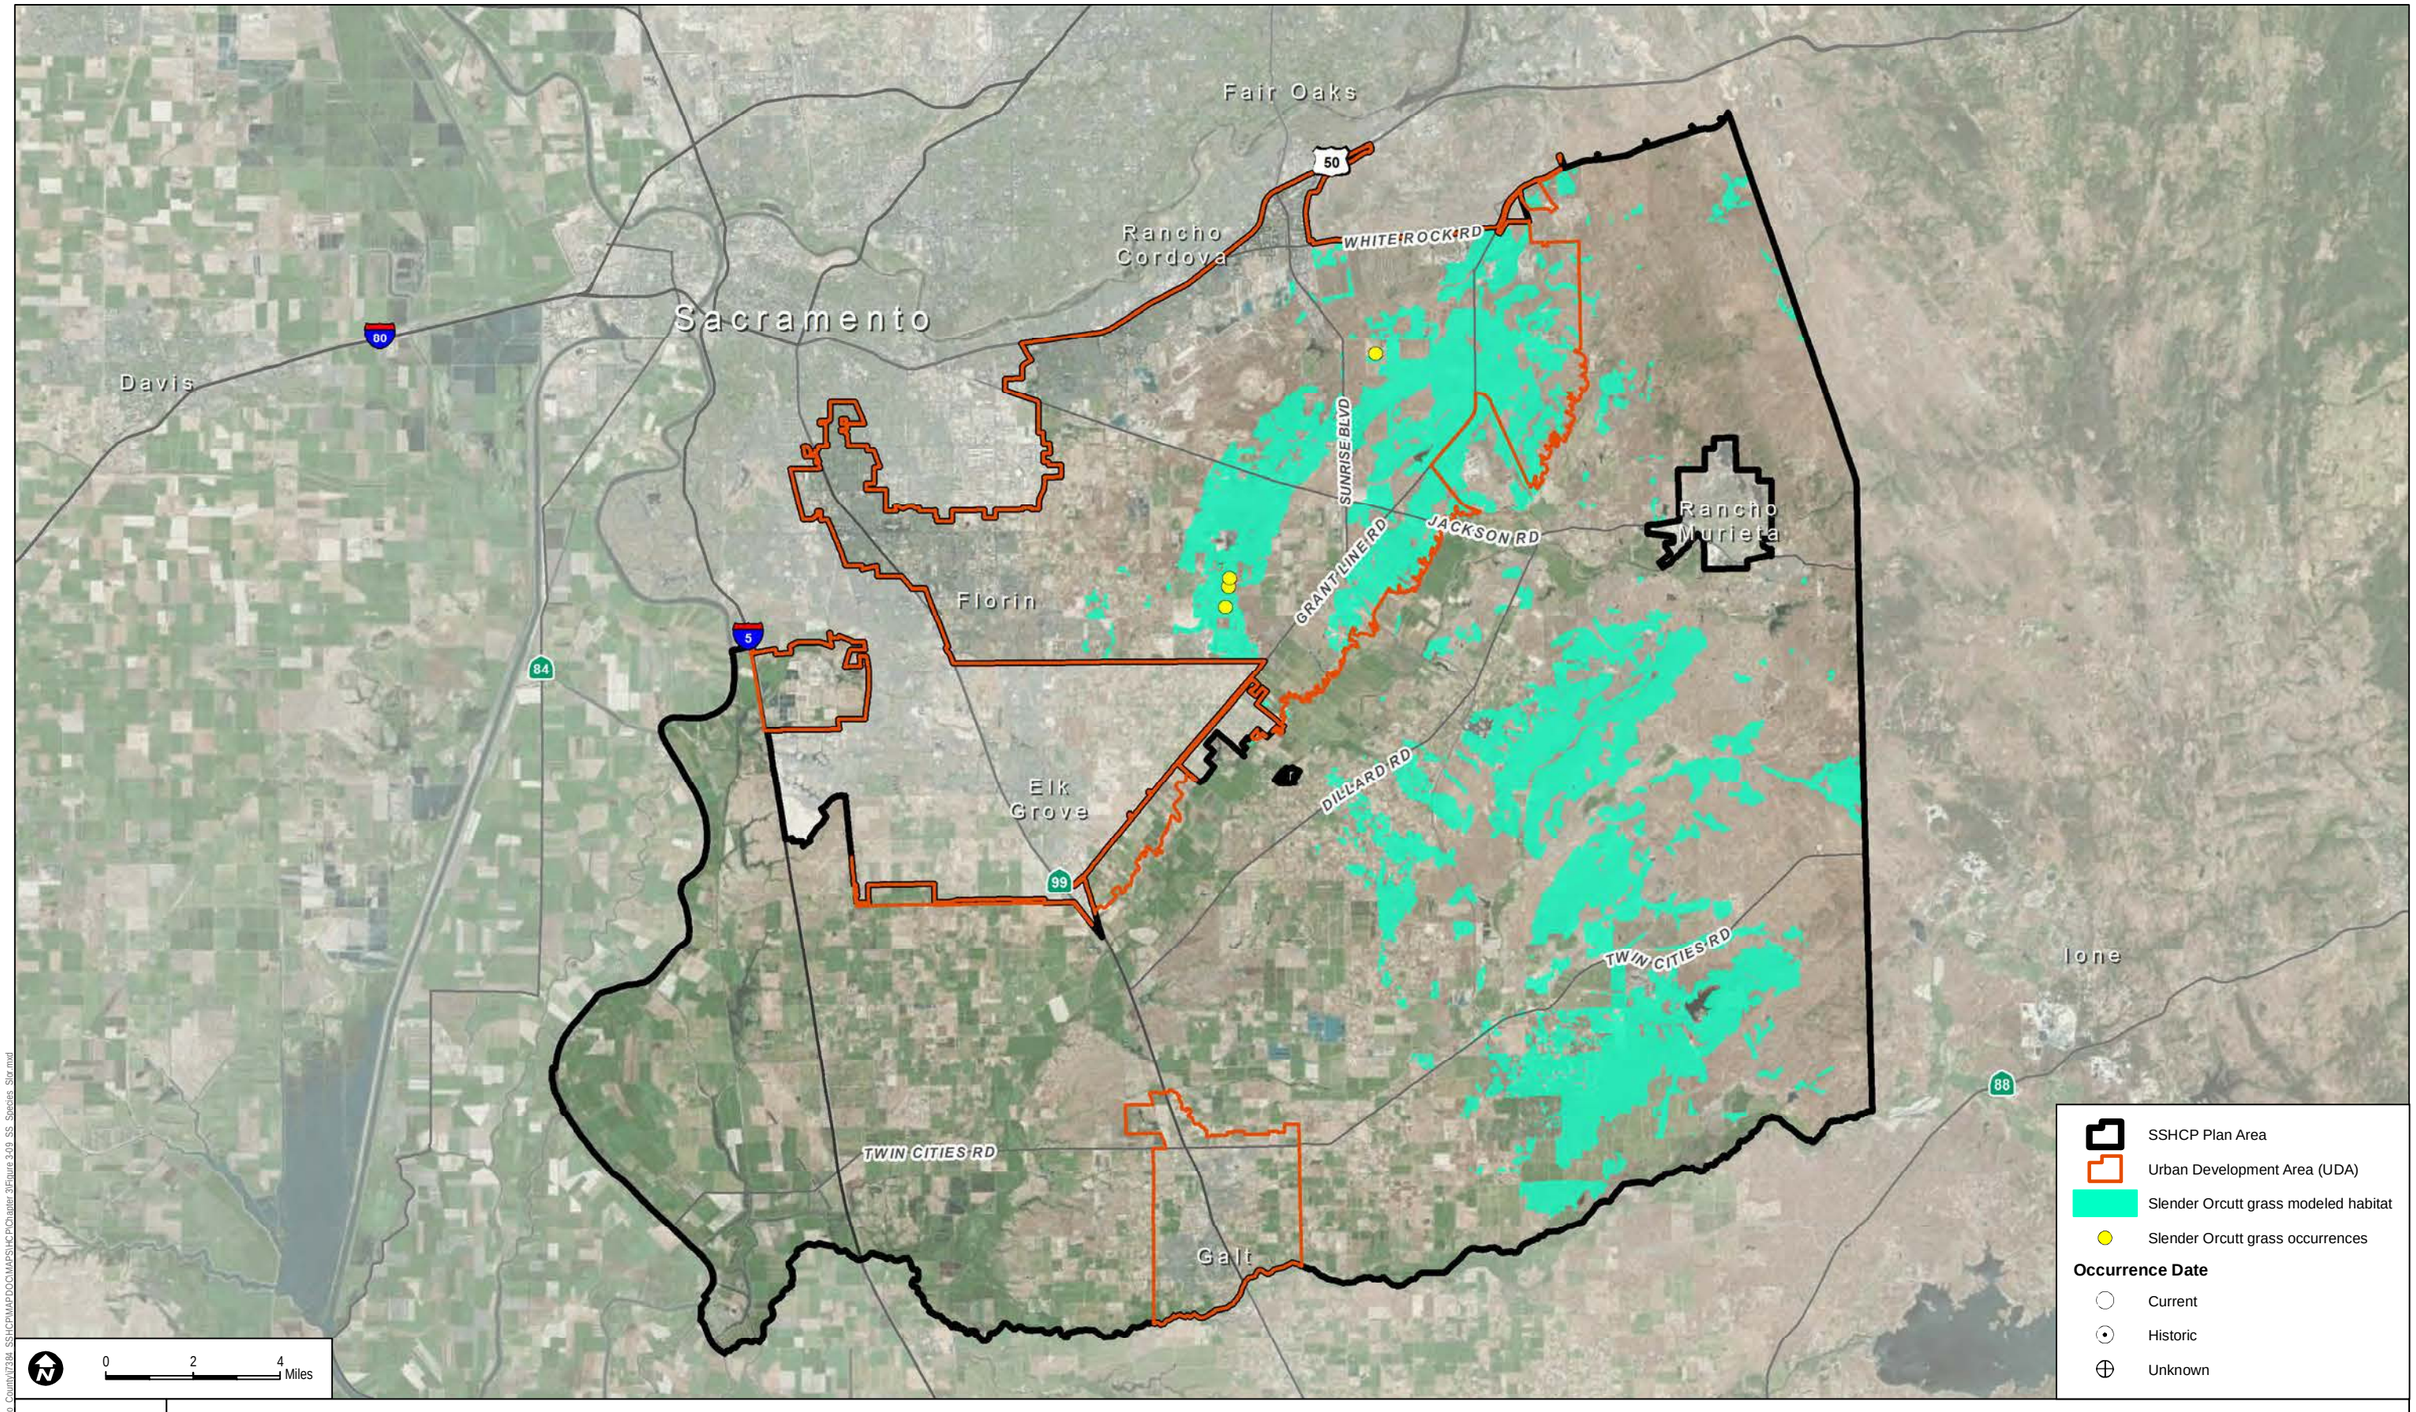
Figure 3-9 illustrates the location of modeled habitat as well as documented occurrences of slender Orcutt grass within the Plan Area.

Sanford's Arrowhead (*Sagittaria sanfordi*)

Habitat Requirements

Sanford's arrowhead is associated with freshwater wetland hydrology. This includes emergent wetlands as well as the margins of rivers, streams, ponds, reservoirs, irrigation and drainage canals and ditches, and stock-ponds. Sanford's arrowhead is occasionally reported to occur in Seasonal Wetland with sufficient ponding period to support emergent wetland species. All freshwater emergent wetlands, natural, modified, and built/created, regardless of landform association, should be considered potentially suitable habitat for Sanford's arrowhead.

Land Cover Types Relevant to Habitat Requirements



SSHCP land cover types that provide suitable habitat based on life history descriptions are Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek (Table 3-2). Because Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek land cover types are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are 64 documented occurrences of Sanford's arrowhead in the Plan Area. Fifteen occurrences are located in the UDA with three in PPU 2, two in PPU 3, one in PPU 4, and nine that are not within a PPU. Forty-nine occurrences are located outside of the UDA with three in PPU 5, 42 in PPU 6, three in PPU 7, and one that is not within a PPU.

Model Assumptions

- Soil types known to support Sanford's arrowhead in the Plan Area include Argonaut-Auburn complex, 3% to 8% slopes; Clear Lake clay, partially drained, 0 to 2% slopes frequently flooded; Columbia sandy loam, partially drained, 0 to 2% slopes; Columbia sandy loam, drained, 0 to 2% slopes, occasionally flooded; Cosumnes silt loam, drained, 0 to 2% slopes, occasionally flooded; Creviscreek sandy loam, 0 to 3% slopes; Dierssen sandy clay loam, drained, 0 to 2% slopes; Dierssen clay loam, deep, drained, 0 to 2% slopes; Durixeralfs, 0 to 1% slopes; Egbert clay, partially drained, 0 to 2% slopes; Egbert clay, partially drained, 0 to 2% slopes, frequently flooded; Fiddyment fine sandy loam, 1% to 8% slopes; Fluvaquents, 0 to 2% slopes, frequently flooded; Hedge loam, 0 to 2% slopes; Hicksville loam, 0 to 2% slopes, occasionally flooded; Hicksville gravelly loam, 0 to 2% slopes, occasionally flooded; Kimball-Urban land complex, 0 to 2% slopes; Liveoak sandy clay loam, 0 to 2% slopes, occasionally flooded; Madera loam, 2% to 8% slopes; Mokelumne-Pits mine complex, 15% to 50% slopes; Red Bluff-Redding complex, 0 to 5% slopes; Redding loam, 2% to 8% slopes; Redding gravelly loam, 0 to 8% slopes; San Joaquin silt loam, leveled, 0 to 1% slopes; San Joaquin silt loam, 0 to 3% slopes; San Joaquin silt loam, 3% to 8% slopes; San Joaquin-Galt complex, leveled, 0 to 1% slopes; San Joaquin-Urban land complex, 0 to 2% slopes; San Joaquin-Xerarents complex, leveled, 0 to 1% slopes; Reiff fine sandy loam, 0 to 2% slopes, occasionally flooded; Scribner clay loam, partially drained, 0 to 2% slopes; and Tinnin loamy sand, 0 to 2% slopes.
- Sanford's arrowhead is strictly associated with wetland systems supporting emergent marsh vegetation, both naturally occurring and built/created.
- Valley Grasslands are necessary to support the Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek that Sanford's arrowhead occupies.

Sanford's Arrowhead Modeled Habitat

Modeled habitat for Sanford's arrowhead is all Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek associated with Argonaut-Auburn complex, 3% to 8% slopes; Clear Lake clay, partially drained, 0 to 2% slopes frequently flooded; Columbia sandy loam, partially drained, 0 to 2% slopes; Columbia sandy loam, drained, 0 to 2% slopes, occasionally flooded; Cosumnes silt loam, drained, 0 to 2% slopes, occasionally flooded; Creviscreek sandy loam, 0 to 3% slopes; Dierssen sandy clay loam, drained, 0 to 2% slopes; Dierssen clay loam, deep, drained, 0 to 2% slopes; Durixeralfs, 0 to 1% slopes; Egbert clay, partially drained, 0 to 2% slopes; Egbert clay, partially drained, 0 to 2% slopes, frequently flooded; Fiddyment fine sandy loam, 1% to 8% slopes; Fluvaquents, 0 to 2% slopes, frequently flooded; Hedge loam, 0 to 2% slopes; Hicksville loam, 0 to 2% slopes, occasionally flooded; Hicksville gravelly loam, 0 to 2% slopes, occasionally flooded; Kimball-Urban land complex, 0 to 2% slopes; Liveoak sandy clay loam, 0 to 2% slopes, occasionally flooded; Madera loam, 2% to 8% slopes; Mokelumne-Pits mine complex, 15% to 50% slopes; Red Bluff-Redding complex, 0 to 5% slopes; Redding loam, 2% to 8% slopes; Redding gravelly loam, 0 to 8% slopes; San Joaquin silt loam, leveled, 0 to 1% slopes; San Joaquin silt loam, 0 to 3% slopes; San Joaquin silt loam, 3% to 8% slopes; San Joaquin-Galt complex, leveled, 0 to 1% slopes; San Joaquin-Urban land complex, 0 to 2% slopes; San Joaquin-Xerarents complex, leveled, 0 to 1% slopes; Reiff fine sandy loam, 0 to 2% slopes, occasionally flooded; Scribner clay loam, partially drained, 0 to 2% slopes; and Tinnin loamy sand, 0 to 2% slopes.

Figure 3-10 illustrates the location of modeled habitat as well as documented occurrences of Sanford's arrowhead within the Plan Area.

3.4.2 Invertebrate Covered Species Modeled Habitat

Mid-Valley Fairy Shrimp (*Branchinecta mesovallensis*)

Habitat Requirements

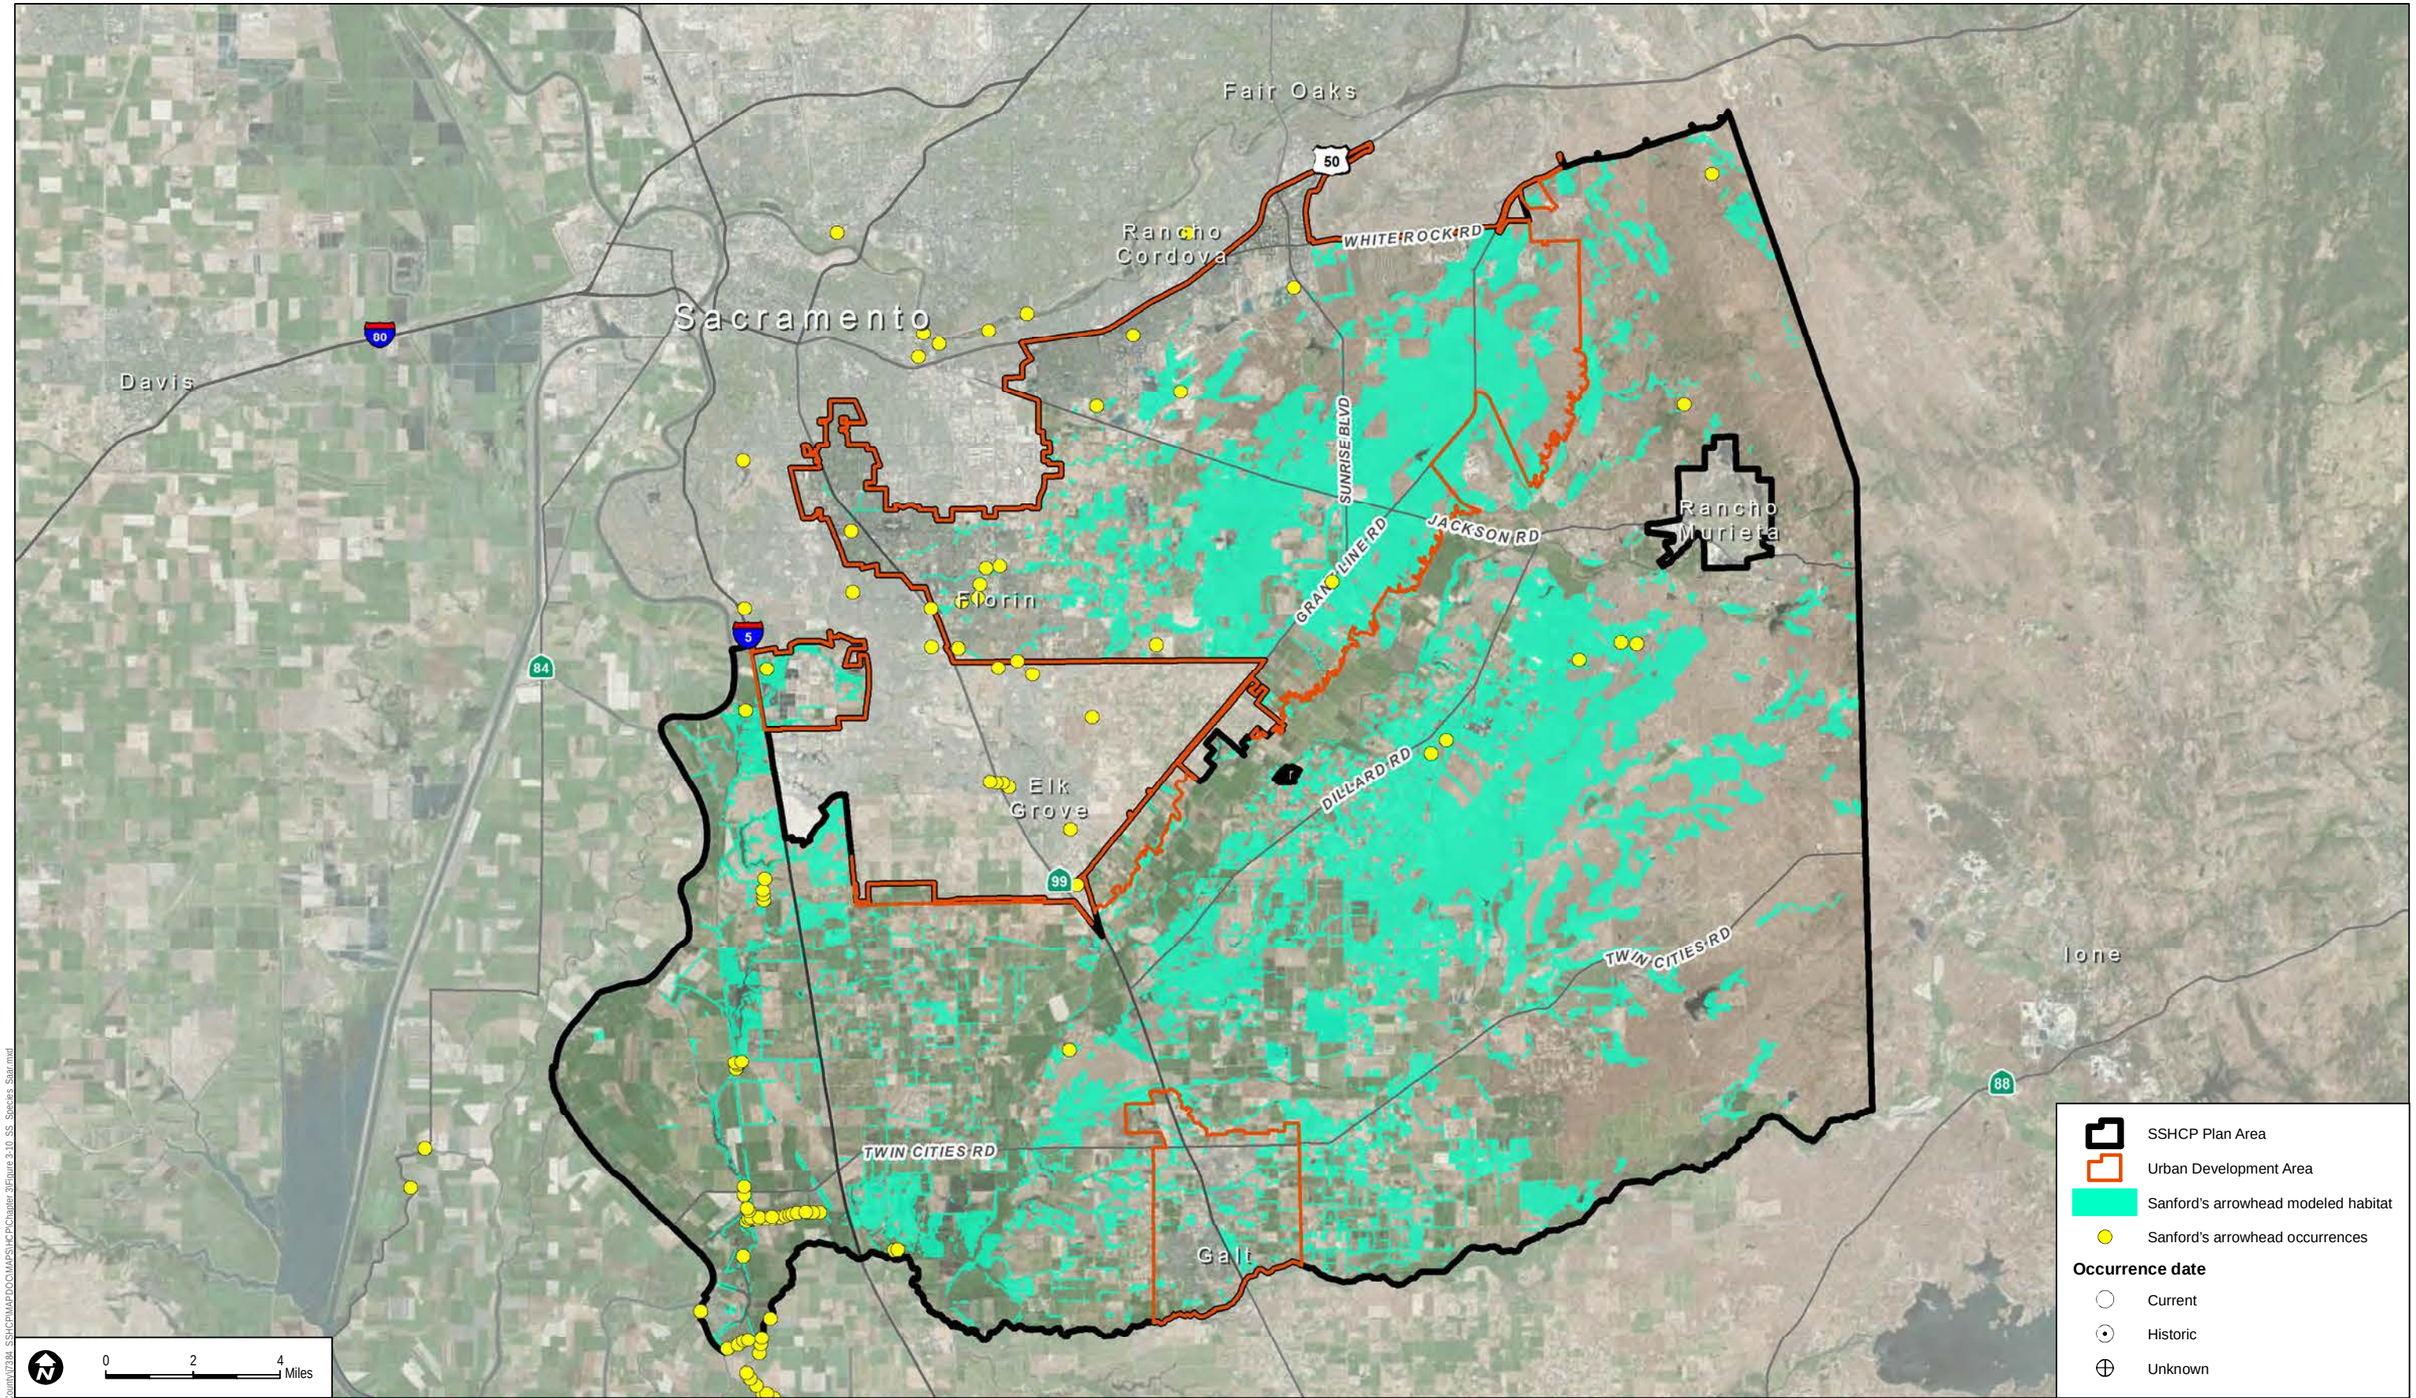
This small vernal pool crustacean is entirely dependent upon the aquatic environment provided by vernal pool ecosystems. Mid-valley fairy shrimp depends upon the presence of water in the winter and early spring and the absence of water during the summer. These specific vernal pool wetland characteristics are dependent upon the surrounding uplands (Rogers, as cited in SSHCP Appendix B).

Mid-valley fairy shrimp are typically in Central Valley California floristic provinces below 300 meters in elevation. Typical habitat for mid-valley fairy shrimp in California includes vernal pools and seasonally ponded areas within vernal swales (Eng et al. 1990).

Optimal mid-valley fairy shrimp habitat tends to be small vernal pools, with an abbreviated hydroperiod, neutral to slightly alkaline, clear vernal pools, low in dissolved salts, dominated

with vernal pool plants, and sustains a complex vernal pool crustacean community (Eriksen and Belk 1999; Rogers 1998).

Land Cover Types Relevant to Habitat Requirements



SSHCP land cover types that provide suitable habitat based on life history descriptions include Vernal Pool and Swale. Vernal pools are considered primary habitat in the Plan Area. Swales are considered suitable habitat as they provide connectivity between vernal pool cover types and facilitate the transport of genetic material from one location to another (Table 3-2).). Because Vernal Pools and Swales are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are 37 documented occurrences of mid-valley fairy shrimp located within the Plan Area. Twenty-two are located within the UDA including 10 in PPU 2, 9 in PPU 3, 2 in PPU 8, and 1 that is not within a PPU. Fifteen are located outside of the UDA, including nine in PPU 6 and six within PPU 7.

Model Assumptions

- Soil types known to support mid-valley fairy shrimp in the Plan Area include Bruella sandy loam, 0 to 2% slopes; Capay clay loam, 0 to 2% slopes, occasionally flooded; Clear Lake clay, hardpan substratum, drained, 0 to 1% slopes; Clear Lake clay, partially drained, 0 to 2% slopes; frequently flooded; Creviscreek sandy loam, 0 to 3% slopes; Durixeralfs-Gat complex, 0 to 2% slopes; Durixeralfs, 0 to 1% slopes; Fiddyment fine sandy loam, 1% to 8% slopes; Galt clay, 0 to 2% slopes; Hedge loam, 0 to 2% slopes; Hicksville loam, 0 to 2% slopes occasionally flooded; Kimball-silt loam, 0 to 2% slopes; Madera loam, 0% to 2% slopes; Natomas loam, 0 to 2 percent slopes; Red Bluff-Redding complex, 0 to 5% slopes; Red Bluff-Xerarents complex, 0 to 2% slopes; Red Bluff loam, 0 to 2% slopes; Red Bluff loam, 2 to 5% slopes; Redding gravelly loam, 0 to 8% slopes; Sailboat silt loam, drained, 0 to 2% slopes, occasionally flooded; San Joaquin-Durixeralfs complex, 0 to 1 percent slopes; San Joaquin-Galt complex, 0 to 3% slopes; San Joaquin-Galt complex, leveled, 0 to 1% slopes; San Joaquin-Xerarents complex, leveled, 0 to 1% slopes; San Joaquin silt loam, 0 to 3% slopes; San Joaquin silt loam, 3 to 8% slopes; San Joaquin silt loam, leveled, 0 to 1% slopes; Vleck gravelly loam, 2 to 15% slopes; Xerarents-Redding complex, 0 to 2% slopes; Xerarents-San Joaquin complex, 0 to 1% slopes.
- SSHCP land cover types that provide suitable habitat based on life history descriptions are all Vernal Pool and all Swale land cover.
- Valley Grasslands are necessary to support the Vernal Pool and Swale land cover types that mid-valley fairy shrimp occupies.

Mid-Valley Fairy Shrimp Modeled Habitat

Modeled habitat for mid-valley fairy shrimp is all Vernal Pool, Swale, and Valley Grassland land cover types associated with Bruella sandy loam, 0 to 2% slopes; Capay clay loam, 0 to 2% slopes, occasionally flooded; Clear Lake clay, hardpan substratum, drained, 0 to 1% slopes; Clear Lake clay, partially drained, 0 to 2% slopes; frequently flooded; Creviscreek sandy loam, 0 to 3% slopes; Durixeralfs-Gat complex, 0 to 2% slopes; Durixeralfs, 0 to 1% slopes; Fiddyment fine sandy loam, 1% to 8% slopes; Galt clay, 0 to 2% slopes; Hedge loam, 0 to 2% slopes; Hicksville loam, 0 to 2% slopes occasionally flooded; Kimball-silt loam, 0 to 2% slopes; Madera loam, 0% to 2% slopes; Natomas loam, 0 to 2 percent slopes; Red Bluff-Redding complex, 0 to 5% slopes; Red Bluff-Xerarents complex, 0 to 2% slopes; Red Bluff loam, 0 to 2% slopes; Red Bluff loam, 2 to 5% slopes; Redding gravelly loam, 0 to 8% slopes; Sailboat silt loam, drained, 0 to 2% slopes, occasionally flooded; San Joaquin-Durixeralfs complex, 0 to 1% slopes; San Joaquin-Galt complex, 0 to 3% slopes; San Joaquin-Galt complex, leveled, 0 to 1% slopes; San Joaquin-Xerarents complex, leveled, 0 to 1% slopes; San Joaquin silt loam, 0 to 3% slopes; San Joaquin silt loam, 3% to 8% slopes; San Joaquin silt loam, leveled, 0 to 1% slopes; Vleck gravelly loam, 2% to 15% slopes; Xerarents-Redding complex, 0 to 2% slopes; Xerarents-San Joaquin complex, 0 to 1% slopes throughout the Plan Area.

Figure 3-11 illustrates the location of modeled habitat as well as the documented occurrences of mid-valley fairy shrimp within the Plan Area.

Ricksecker's Water Scavenger Beetle (*Hydrochara rickseckeri*)

Habitat Requirements

This vernal pool insect is entirely dependent upon the aquatic environment provided by vernal pool. The Ricksecker's water scavenger beetle depends upon the presence of water in the winter and early spring and the absence of water during the summer. These specific vernal pool wetland characteristics are dependent upon the surrounding uplands (Rogers, as cited in SSHCP Appendix B).

Vernal pools supporting Ricksecker's water scavenger beetle are typically in Central Valley California floristic provinces below 300 meters in elevation. Collection records suggest that the Ricksecker's water scavenger beetle is not sensitive to the size of vernal pools, and uses both vernal pools and swales, as well as constructed vernal pools (Rogers pers. obs., as cited in SSHCP Appendix B)

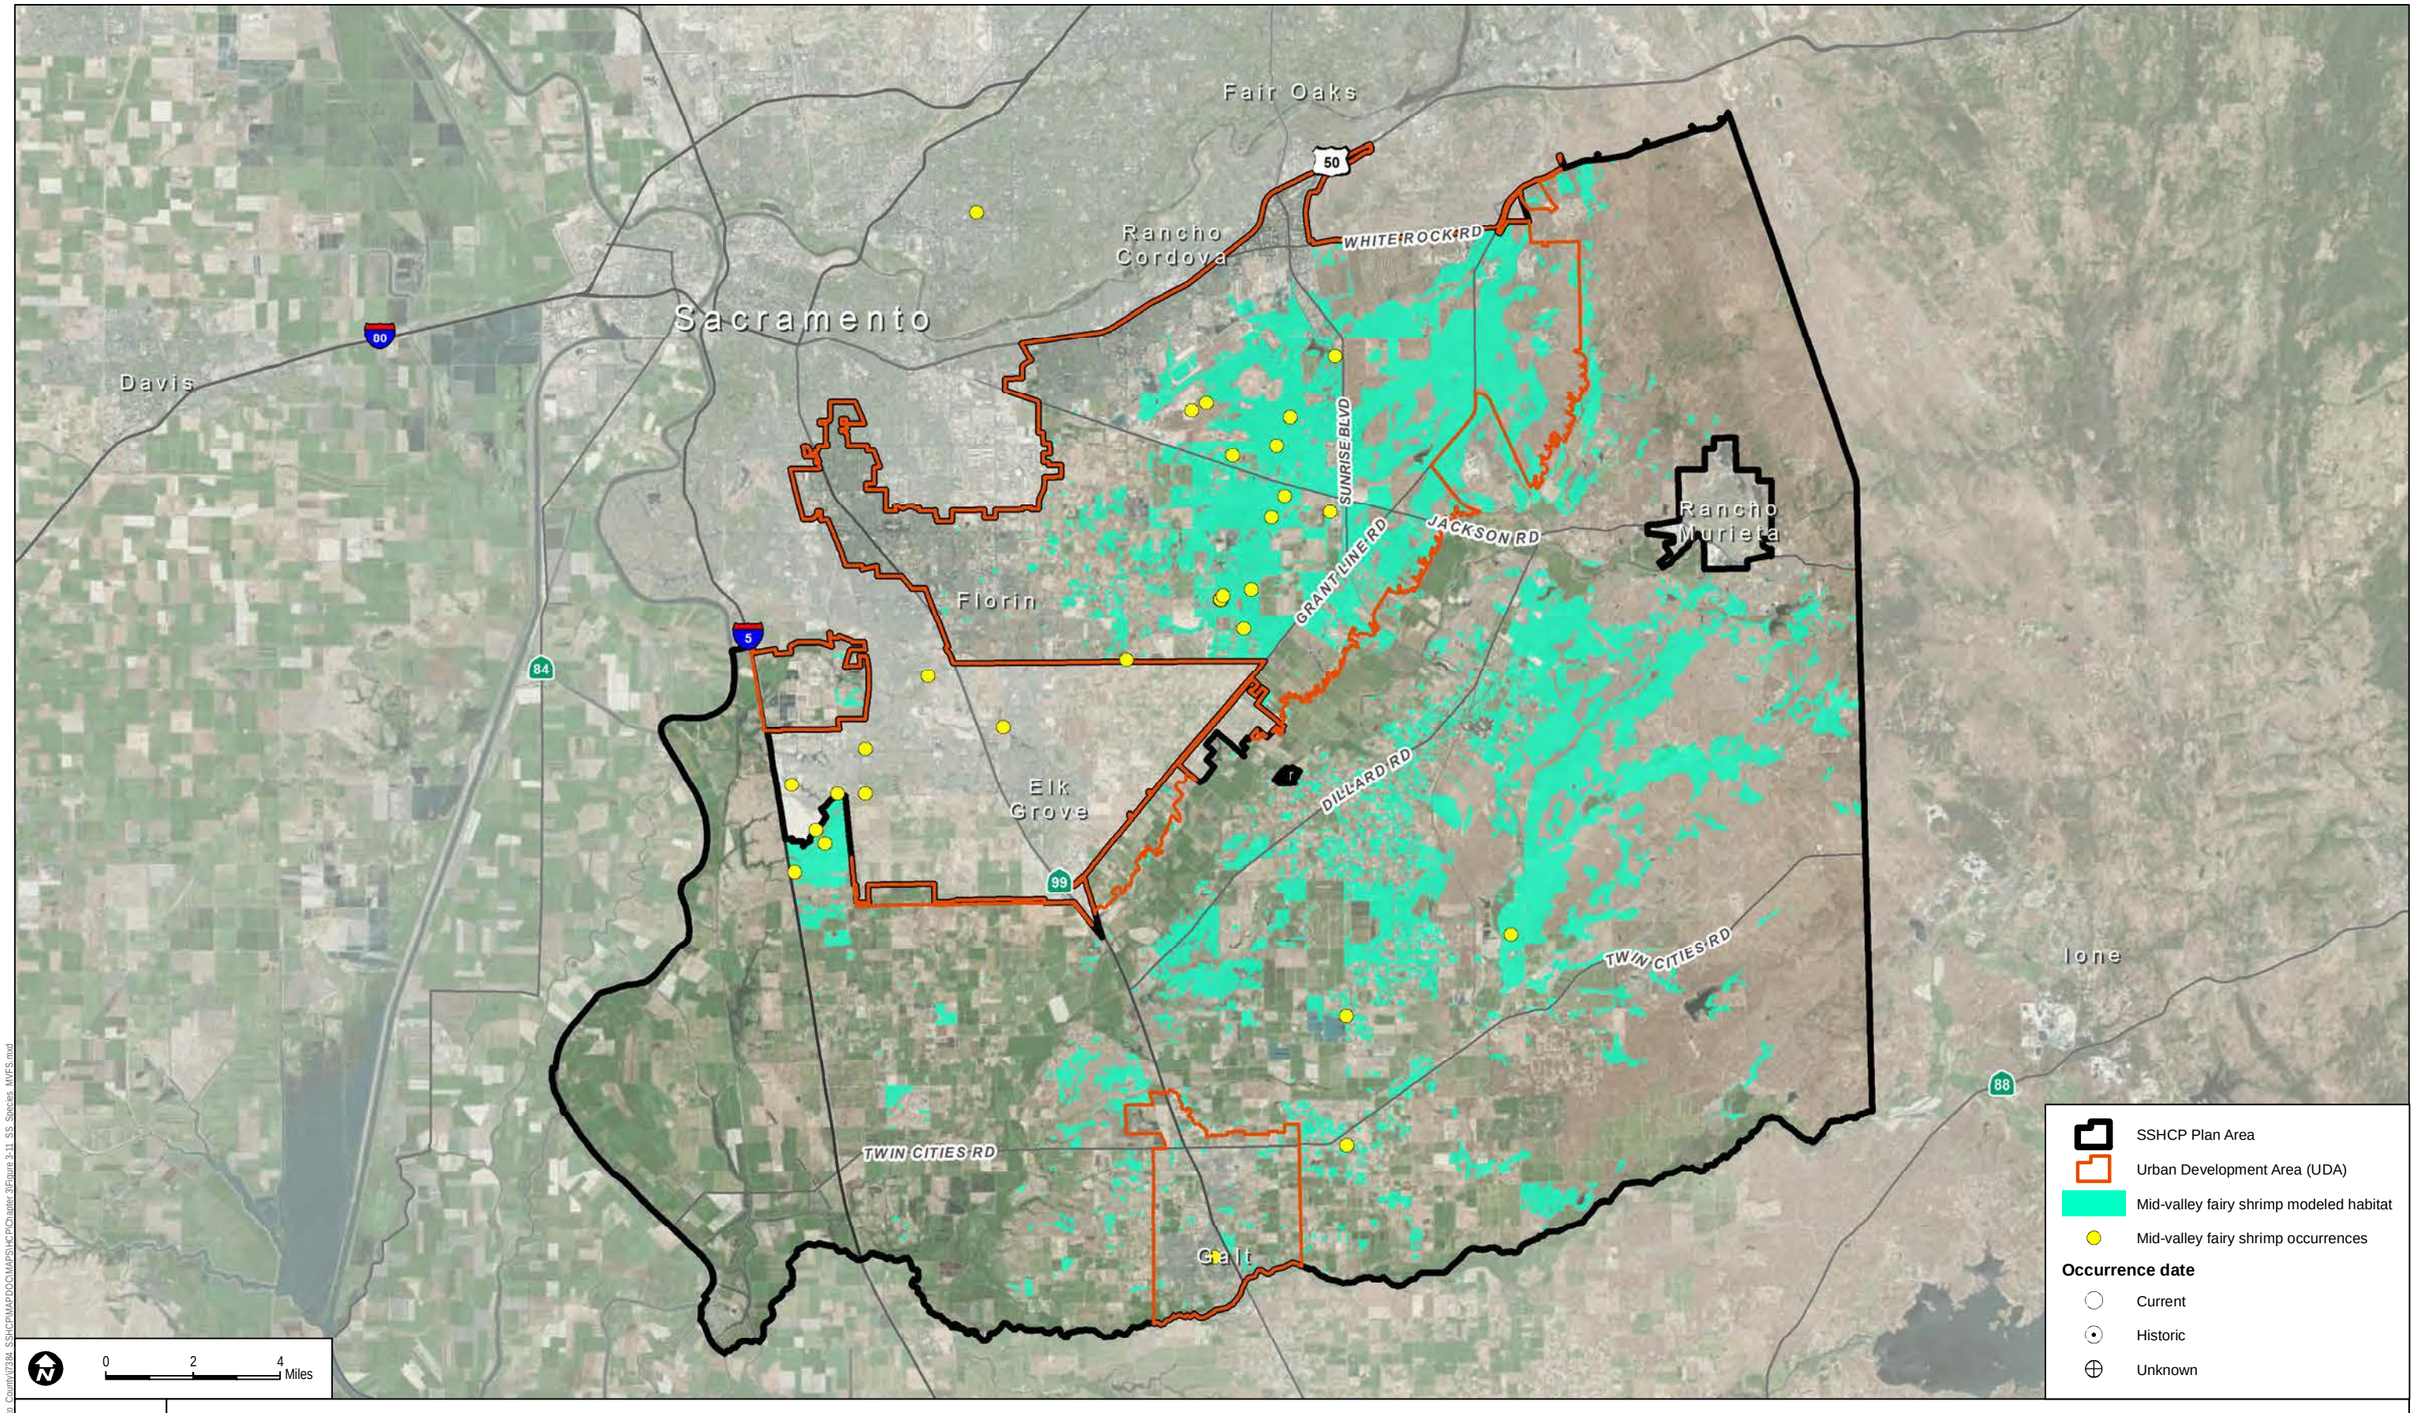
Optimal Ricksecker's water scavenger beetle habitat tends to be neutral to slightly alkaline, clear vernal pools, low in dissolved salts, dominated with vernal pool plants, sustaining a complex vernal pool crustacean community (Rogers 1998).

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat, based on life history descriptions are Vernal Pool and Swale land cover types (Table 3-2). Because Vernal Pools and Swales are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are eight documented occurrences of Ricksecker's water scavenger beetle in the Plan Area. Four occurrences are located inside the all in PPU 2 and four occurrences are located outside of the UDA including one in PPU 6 and three in PPU 7.



Model Assumptions

- Ricksecker's water scavenger beetle is not sensitive to the size of vernal pools or other aquatic habitats (Rogers pers. obs., as cited in SSHCP Appendix B).
- All Vernal Pool and Swale cover types are suitable habitat.
- Valley Grasslands are necessary to support the Vernal Pool and Swale land cover types that Ricksecker's water scavenger beetle occupies.

Ricksecker's Water Scavenger Beetle Modeled Habitat

Modeled habitat for Ricksecker's water scavenger beetle is all Vernal Pool, Swale, and Valley Grassland land cover types within the Plan Area.

Figure 3-12 illustrates the location of modeled habitat as well as the documented occurrences of Ricksecker's water scavenger beetle within the Plan Area.

Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*)

Habitat Requirements

The valley elderberry longhorn beetle is completely dependent upon its host plant, the elderberry shrub, the only recorded larval host plant (*Sambucus glauca, S. mexicana, S. caerulea*) (Barr 1991; Collinge et al. 2001; Eng 1984; Linsley and Chemsak 1972, 1997). Valley elderberry longhorn beetle spends most of its life in the larval stage, living within the stems of the elderberry plant. Adults eat the elderberry foliage until about June when they mate. The females lay eggs in crevices in the bark. Upon hatching, the larvae then begin to tunnel into the elderberry shrub, where they will spend 1 to 2 years eating the interior wood, which is their sole food source. The U.S. Fish and Wildlife Service (USFWS) considers all elderberry shrubs 2.5 centimeters (1 inch) or greater diameter at ground level within the species' range to be potential habitat (USFWS 1999a). The elderberry shrub is a component of riparian forests throughout the Central Valley. Although this shrub occasionally occurs outside of riparian areas, shrubs supporting the greatest beetle densities are where the shrubs are abundant and interspersed among dense riparian forest (Barr 1991; Collinge et al. 2001; USFWS 1999a). Within the Plan Area elderberry shrubs are commonly found interspersed in Mine Tailing Riparian Woodland cover type, an important cover type for the species.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat based on life history descriptions are Mine Tailing Riparian Woodland, Mixed Riparian Woodland and Mixed Riparian Scrub (Table 3-2).

Occurrences within the Plan Area

There are 156 documented occurrences of valley elderberry longhorn beetle within the Plan Area. There is one occurrence within the UDA in PPU 1 and 155 occurrences outside the UDA including 154 within PPU 5 and one within PPU 6.

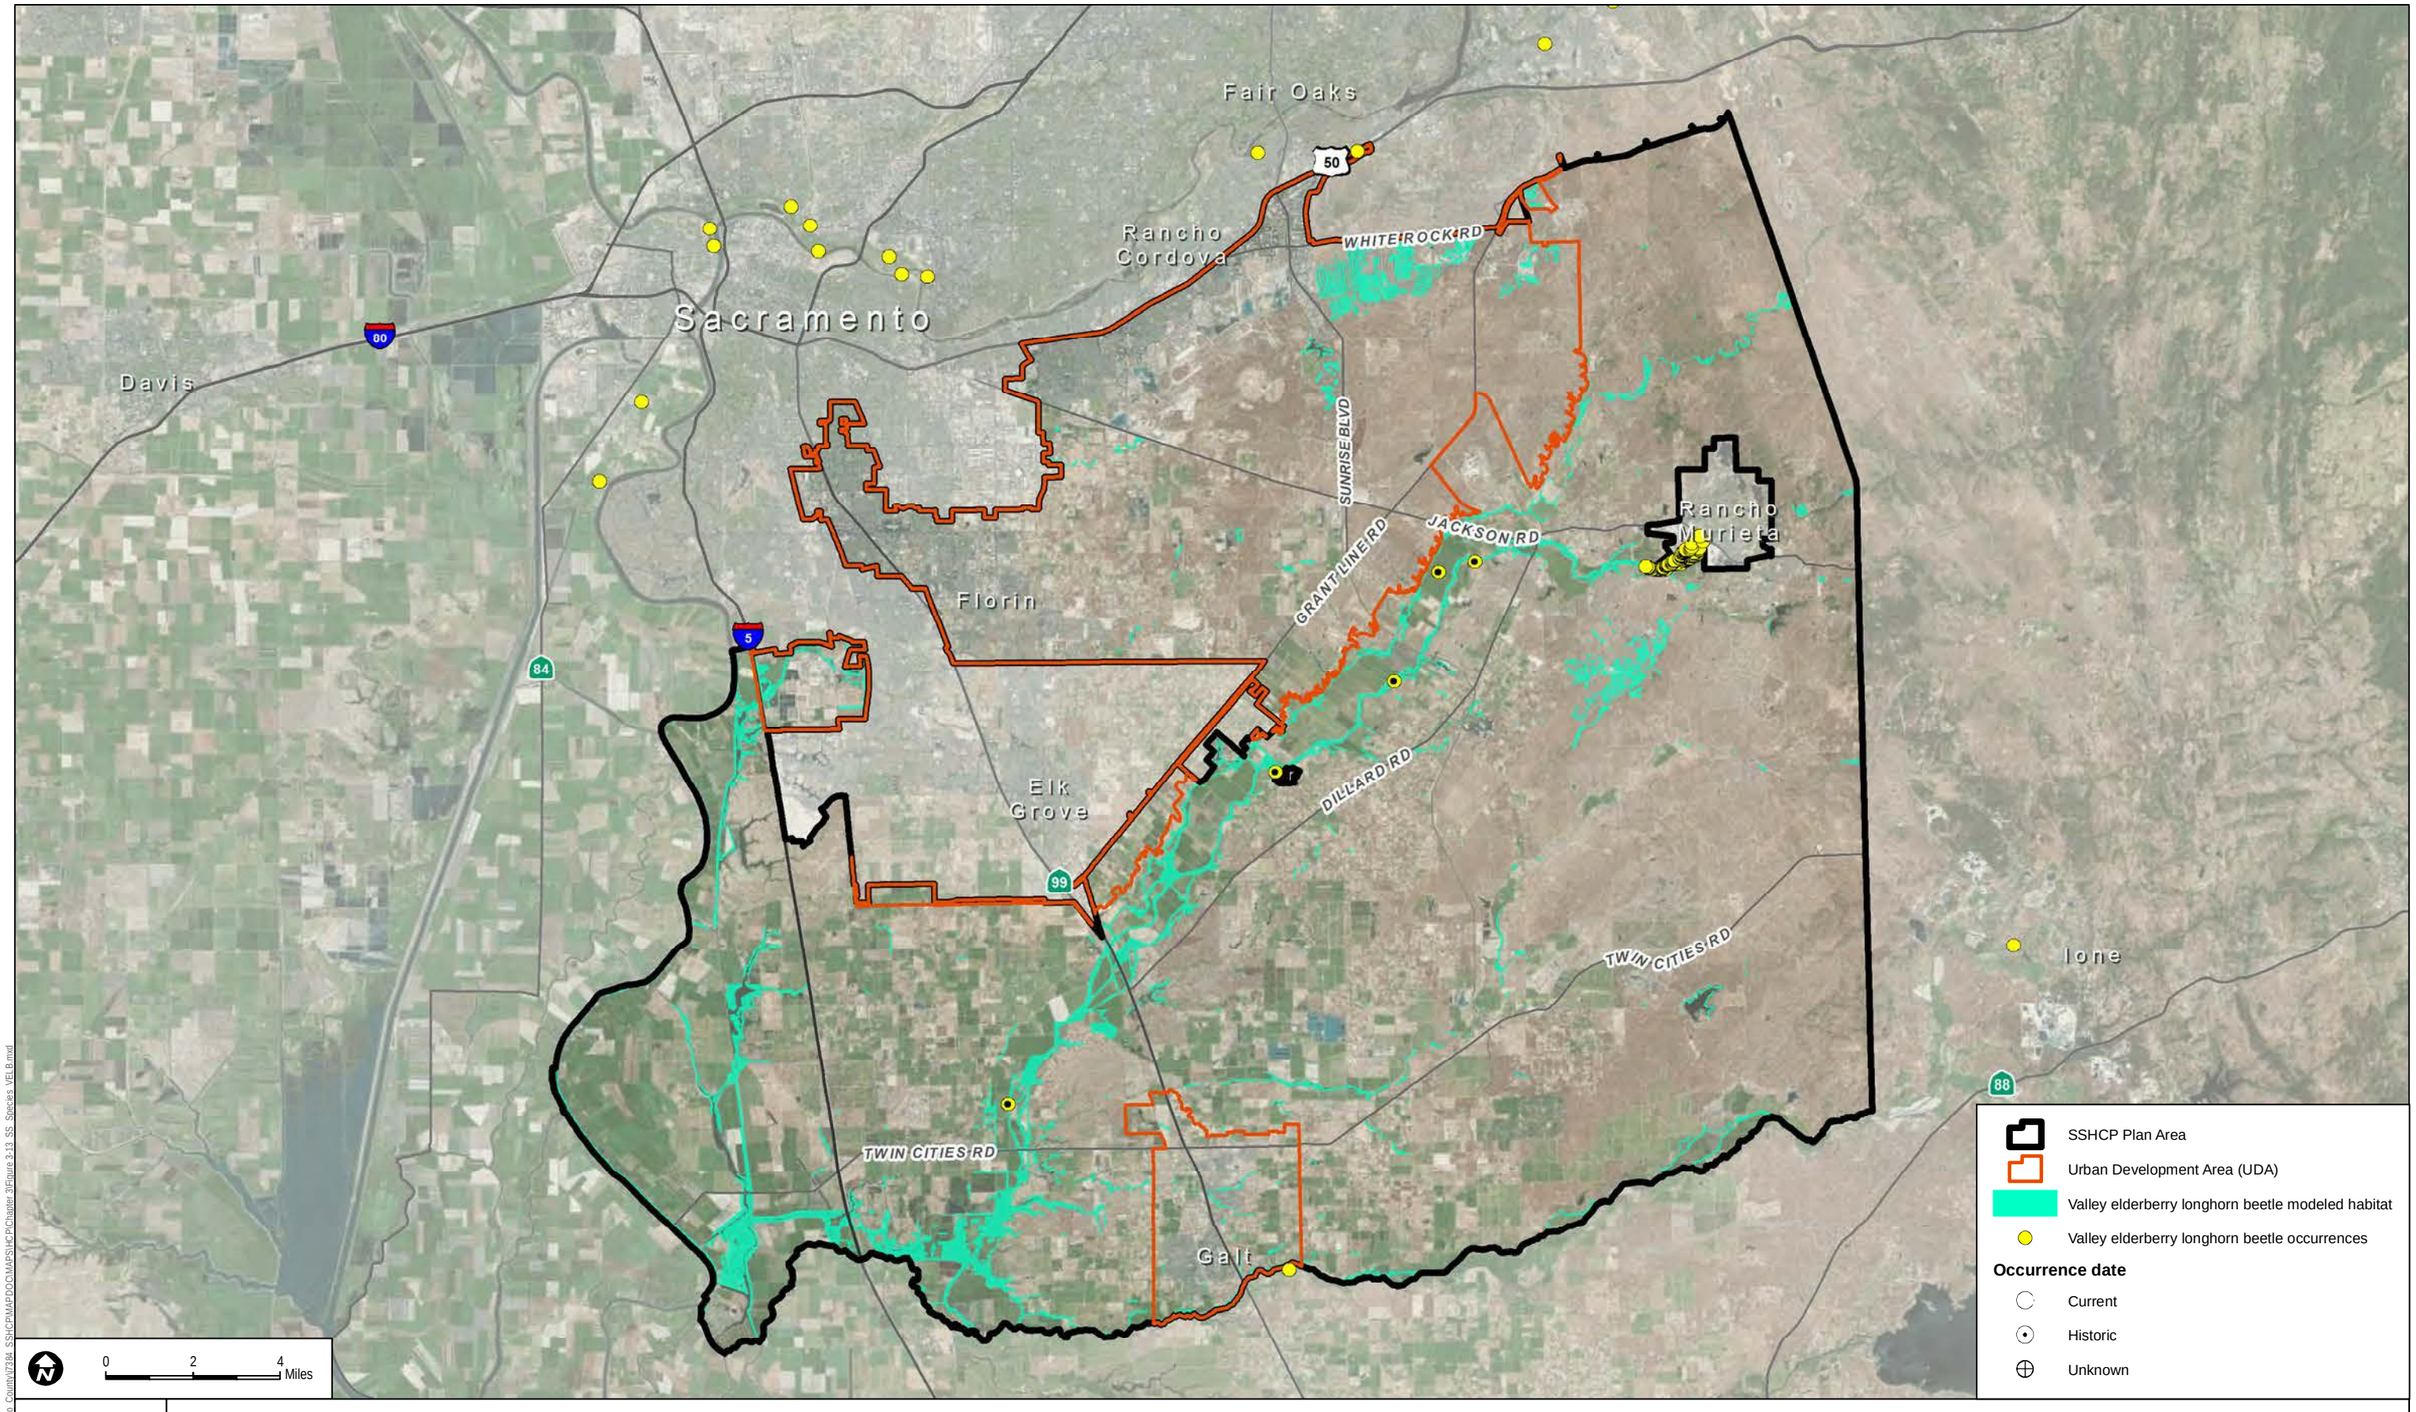
Model Assumptions

- The valley elderberry longhorn beetle is completely dependent upon the elderberry plant.
- The elderberry and the valley elderberry longhorn beetle are largely found within riparian ecosystems.
- Isolated elderberry shrubs separated from contiguous habitat provide limited habitat value.

Valley Elderberry Longhorn Beetle Modeled Habitat

Modeled habitat for valley elderberry longhorn beetle is Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub throughout the Plan Area.

Figure 3-13 illustrates the location of modeled habitat as well as the documented occurrences for valley elderberry longhorn beetle within the Plan Area.



Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)

Habitat Requirements

This small vernal pool crustacean is entirely dependent upon the aquatic environment provided by vernal pool wetland ecosystems. Vernal pool fairy shrimp depends upon the presence of water in the winter and early spring and the absence of water during the summer (Rogers, as cited in SSHCP Appendix B).

Habitats supporting the vernal pool fairy shrimp are typically in Central Valley California floristic provinces below 300 meters elevation. Typical habitat for vernal pool fairy shrimp in California include vernal pools, seasonally ponded areas within vernal swales, rock outcrop ephemeral pools, playas, and alkali flats (Eng et al. 1990). Vernal pool fairy shrimp have also been found in water pooled in sandstone outcrops and in alkaline vernal pools.

Optimal habitat for vernal pool fairy shrimp tends to be neutral to slightly alkaline, clear vernal pools, low in dissolved salts, dominated with vernal pool plants, and sustains a complex vernal pool crustacean community (Eriksen and Belk 1999; Rogers 1998). Fairy shrimp occurs only in cool-water pools. Individuals hatch from cysts during cold-weather winter storms; they require water temperatures of 50^{o}F or lower to hatch (Eriksen and Belk 1999; Helm 1998). The time to maturity and reproduction is temperature-dependent, varying between 18 days and 147 days, with a mean of 40 days (Helm 1998). Pool volume is also important in determining potential shrimp habitat because deeper pools with a large surface area can more easily maintain their dissolved oxygen levels. Similarly, deeper pools will pond long enough to allow the shrimp to complete their life cycle (Rogers, as cited in SSHCP Appendix B).

INTENTIONALLY LEFT BLANK

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat based on life history descriptions include Vernal Pool, Swale, and Stream/Creek (VPIH). Vernal pools are the species primary habitat in the Plan Area. Swales and Stream/Creek (VPIH) are considered suitable habitat as they provide connectivity between Vernal Pool cover types and facilitate the transport of genetic material from one location to another (Table 3-2). These specific vernal pool wetland characteristics are dependent on the surrounding uplands. Because Vernal Pools, Swales, and Stream/Creek (VPIH) are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

Occurrences within the Plan Area

There are 581 documented occurrences of vernal pool fairy shrimp within the Plan Area. There are 193 located within the UDA including 30 in PPU 1, 48 in PPU 2, 95 in PPU 3, four in PPU 4, one in PPU 8, and 15 that are not within a PPU. There are 388 occurrences outside of the UDA including 26 in PPU 1, 11 in PPU 5, 26 in PPU 6, 324 in PPU 7, and one that is not within a PPU.

Model Assumptions

- Vernal pool fairy shrimp are widely distributed throughout the Plan Area, although they appear to be more abundant outside of the Urban Development Area (UDA) than inside the UDA.
- All Vernal Pool and Swale cover types are suitable habitat.
- A select group of ephemeral steams or portions of those streams in this Plan Area are considered suitable habitat.
- Valley Grasslands are necessary to support the Vernal Pool, Swale, and Stream/Creek (VPIH) land cover types that vernal pool fairy shrimp occupies.

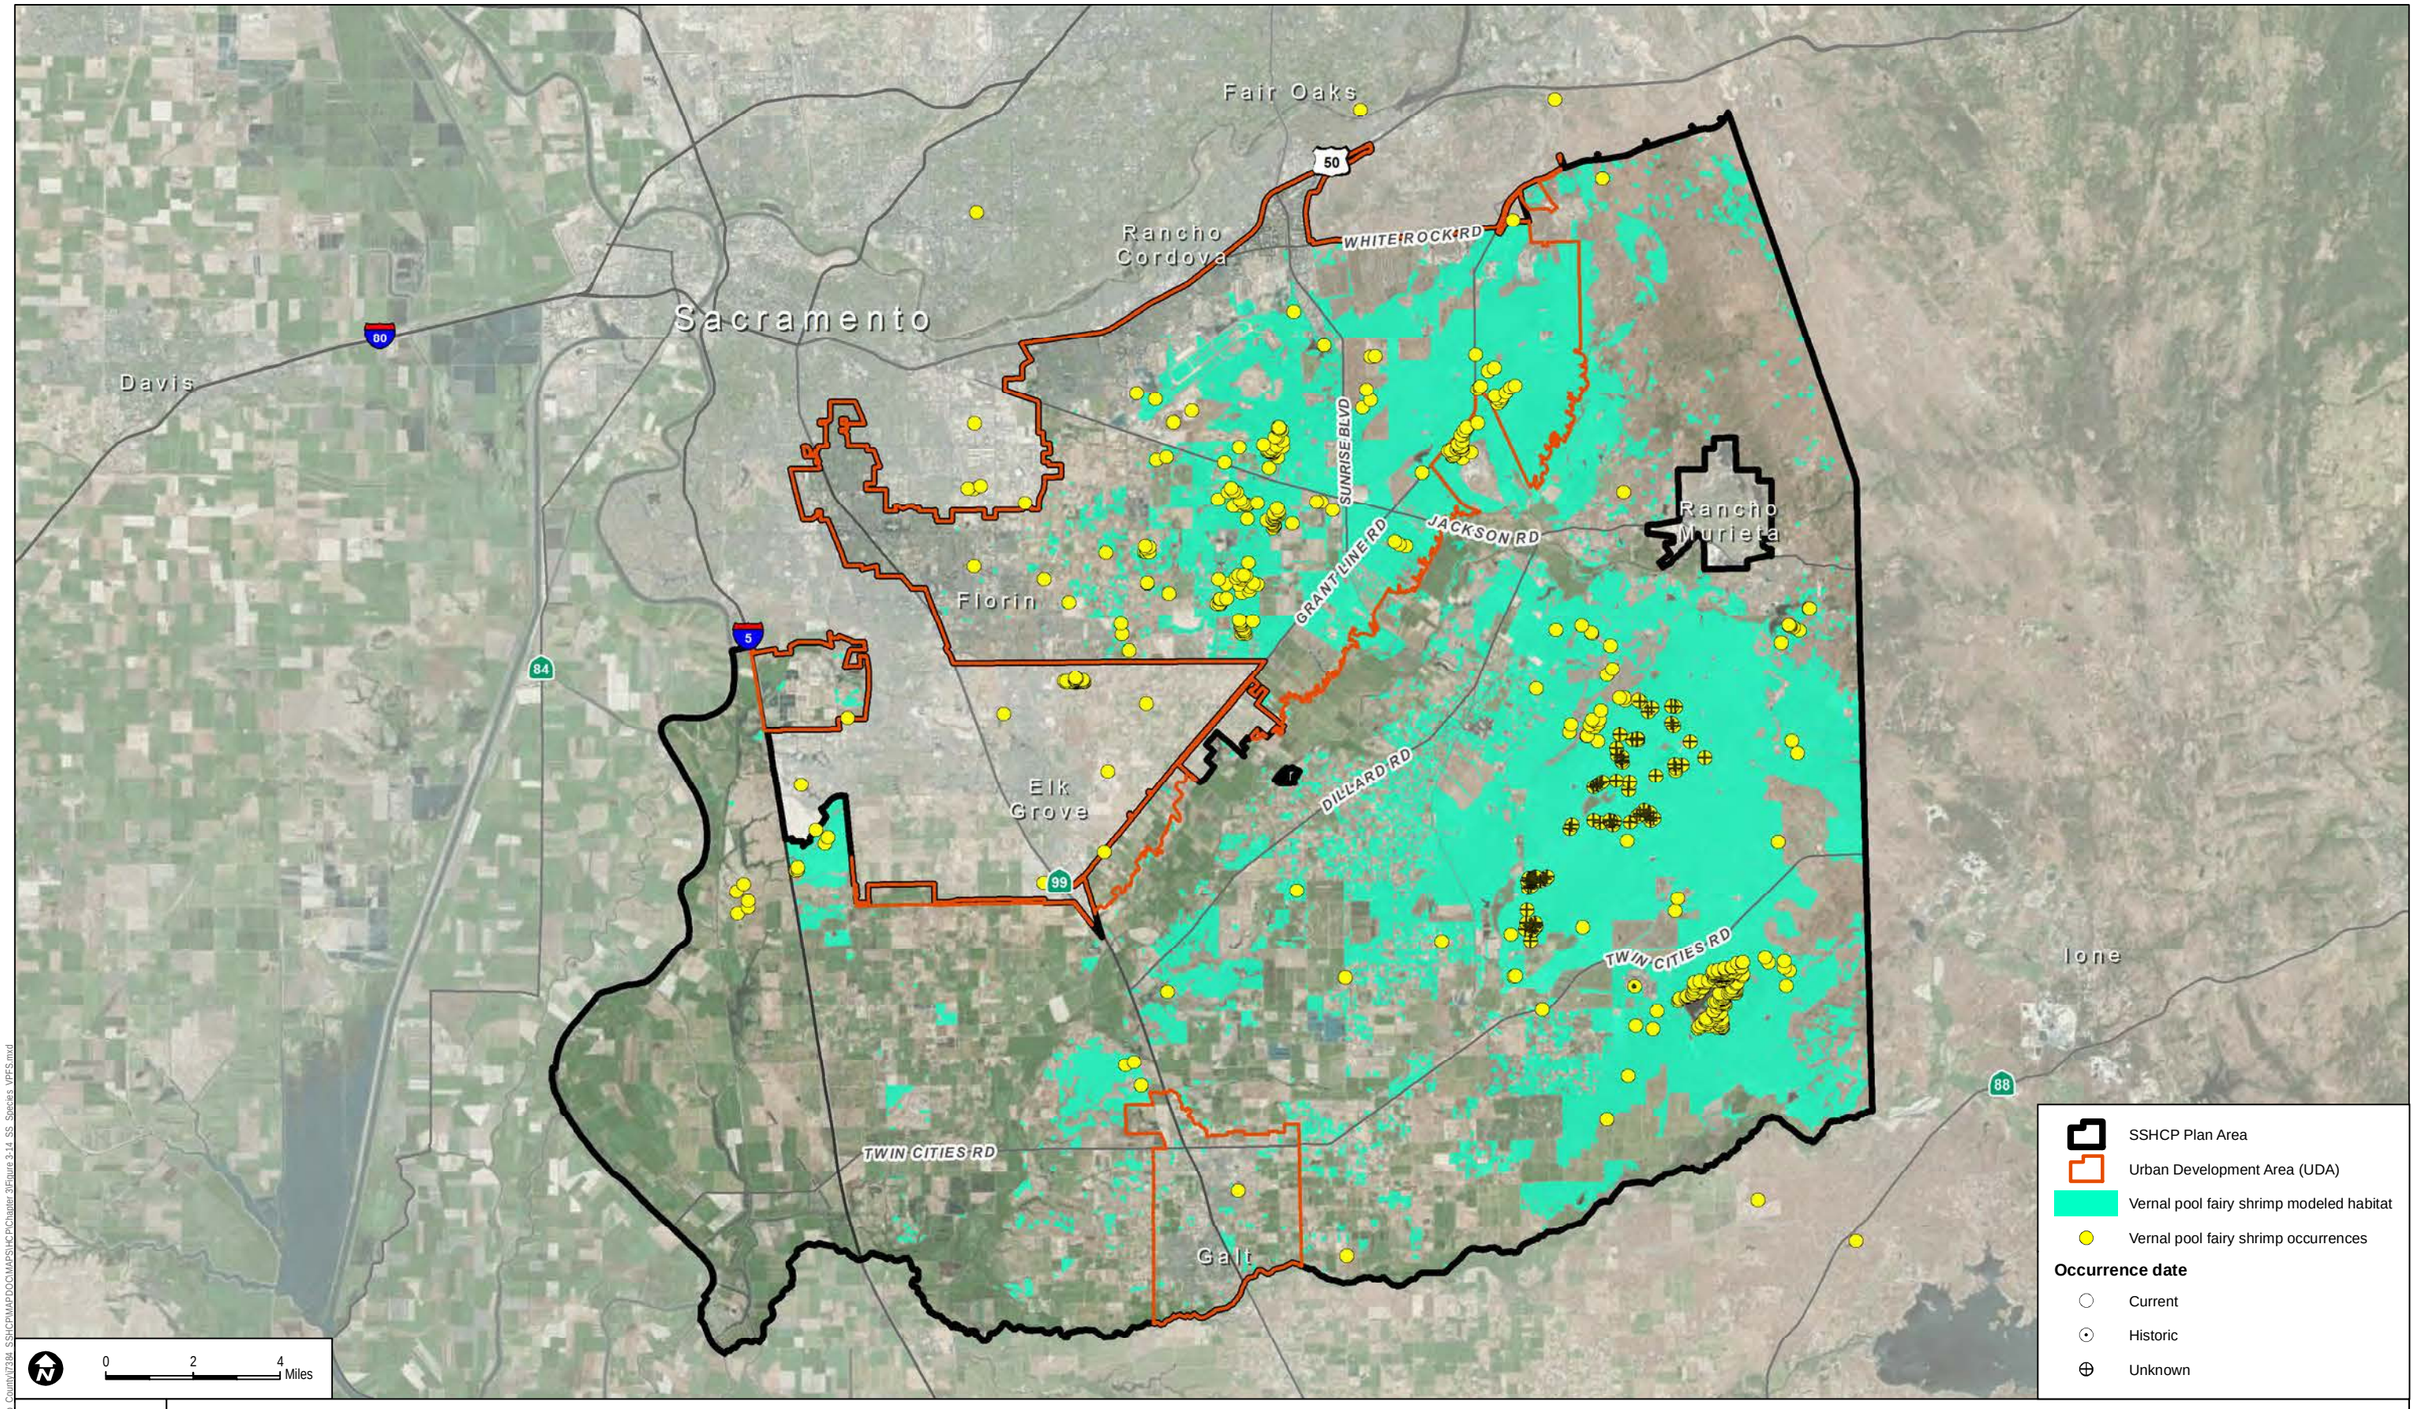
Vernal Pool Fairy Shrimp Modeled Habitat

Modeled habitat for vernal pool fairy shrimp is all vernal Pool, Swale, Stream/Creek (VPIH), and Valley Grassland throughout the Plan Area.

Figure 3-14 illustrates the location of modeled habitat as well as the documented occurrences of vernal pool fairy shrimp within the Plan Area.

Vernal Pool Tadpole Shrimp (*Lepidurus packardi*)

Habitat Requirements



This small vernal pool crustacean is entirely dependent upon the aquatic environment provided by vernal pool wetland ecosystems. Vernal pool tadpole shrimp depends upon the presence of water in the winter and early spring and the absence of water during the summer. These specific vernal pool wetland characteristics are dependent upon the surrounding uplands.

Habitats supporting the Vernal pool tadpole shrimp are typically in Central Valley California floristic provinces below 300 meters in elevation. Typical habitat for vernal pool tadpole shrimp in California includes vernal pools, seasonally ponded areas within vernal swales, rock outcrop ephemeral pools, playas, and alkali flats (Eriksen and Belk 1999; Rogers 2001). Vernal pool tadpole shrimp have also been found in alkaline vernal pools.

Optimal habitat for vernal pool tadpole shrimp tends to be neutral to slightly alkaline, clear vernal pools, low in dissolved salts, dominated with vernal pool plants, and sustains a complex vernal pool crustacean community (Eriksen and Belk 1999). Pool volume is also important in determining potential shrimp habitat because deeper pools with a large surface area can more easily maintain their dissolved oxygen levels. Similarly, deeper pools will pond long enough to allow the shrimp to complete their life cycle. Occupied pools may have aquatic vegetation that may provide shelter from predators and range in size from 54 square feet to 84 acres (59 Federal Register 48136–48153). Although the tadpole shrimp is found on a variety of geologic formations and soil types, Helm (1998) found that, throughout the range, more than 50% of tadpole shrimp occurrences were on High Terrace, also known as old terrace landforms and Laguna Formation Redding and Corning soils. In the Plan Area, vernal pool tadpole shrimp has been observed in many of the vernal streams in the UDA (Adelsbach, pers. comm. 2013).These are mapped by the Permittees as the “Creek/Stream VPIH” land cover.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat based on life history descriptions include Vernal Pool, Swale, and Stream/Creek (VPIH). Vernal pools are considered the species primary habitat in the Plan Area. Swale and Stream/Creek (VPIH) land cover types are considered suitable habitat as they provide connectivity between the Vernal Pool land cover type and facilitate the transport of genetic material from one location to another (Table 3-2). These specific Vernal Pool Wetland characteristics are dependent on the surrounding uplands. Because Vernal Pools, Swales, and Stream/Creek (VPIH) are dependent on surrounding uplands, the Valley Grassland land cover type is also considered suitable habitat for this species.

INTENTIONALLY LEFT BLANK

Occurrences within the Plan Area

There are 851 documented occurrences of vernal pool tadpole shrimp within the Plan Area. Of the 851 documented occurrences, 587 are within the UDA including 266 in PPU 1, 145 in PPU 2, 147 in PPU 3, six in PPU 4, four in PPU 8, and 19 that are not within a PPU. There are 264 occurrences outside of the UDA including 42 in PPU 1, 26 in PPU 6, 194 in PPU 7, and two that are not within a PPU.

Model Assumptions

- Vernal pool tadpole shrimp are widely distributed throughout the Plan Area, although they appear to be more abundant within the Urban Development Area (UDA) than outside the UDA.
- All Vernal Pool, Vernal Stream, and Swale cover types are suitable habitat.
- A select group of ephemeral steams or portions of those streams in the Plan Area are considered suitable habitat (classified as Stream/Creek (VPIH)).
- Valley Grasslands are necessary to support the Vernal Pool, Swale, and Stream/Creek (VPIH) land cover types that vernal pool tadpole shrimp occupies.

Vernal Pool Tadpole Shrimp Modeled Habitat

Modeled habitat for vernal pool tadpole shrimp is all Vernal Pool, Swale, Stream/Creek (VPIH), and Valley Grassland land cover types throughout the Plan Area.

Figure 3-15 illustrates the location of modeled habitat as well as the documented occurrences of vernal pool tadpole shrimp within the Plan Area.

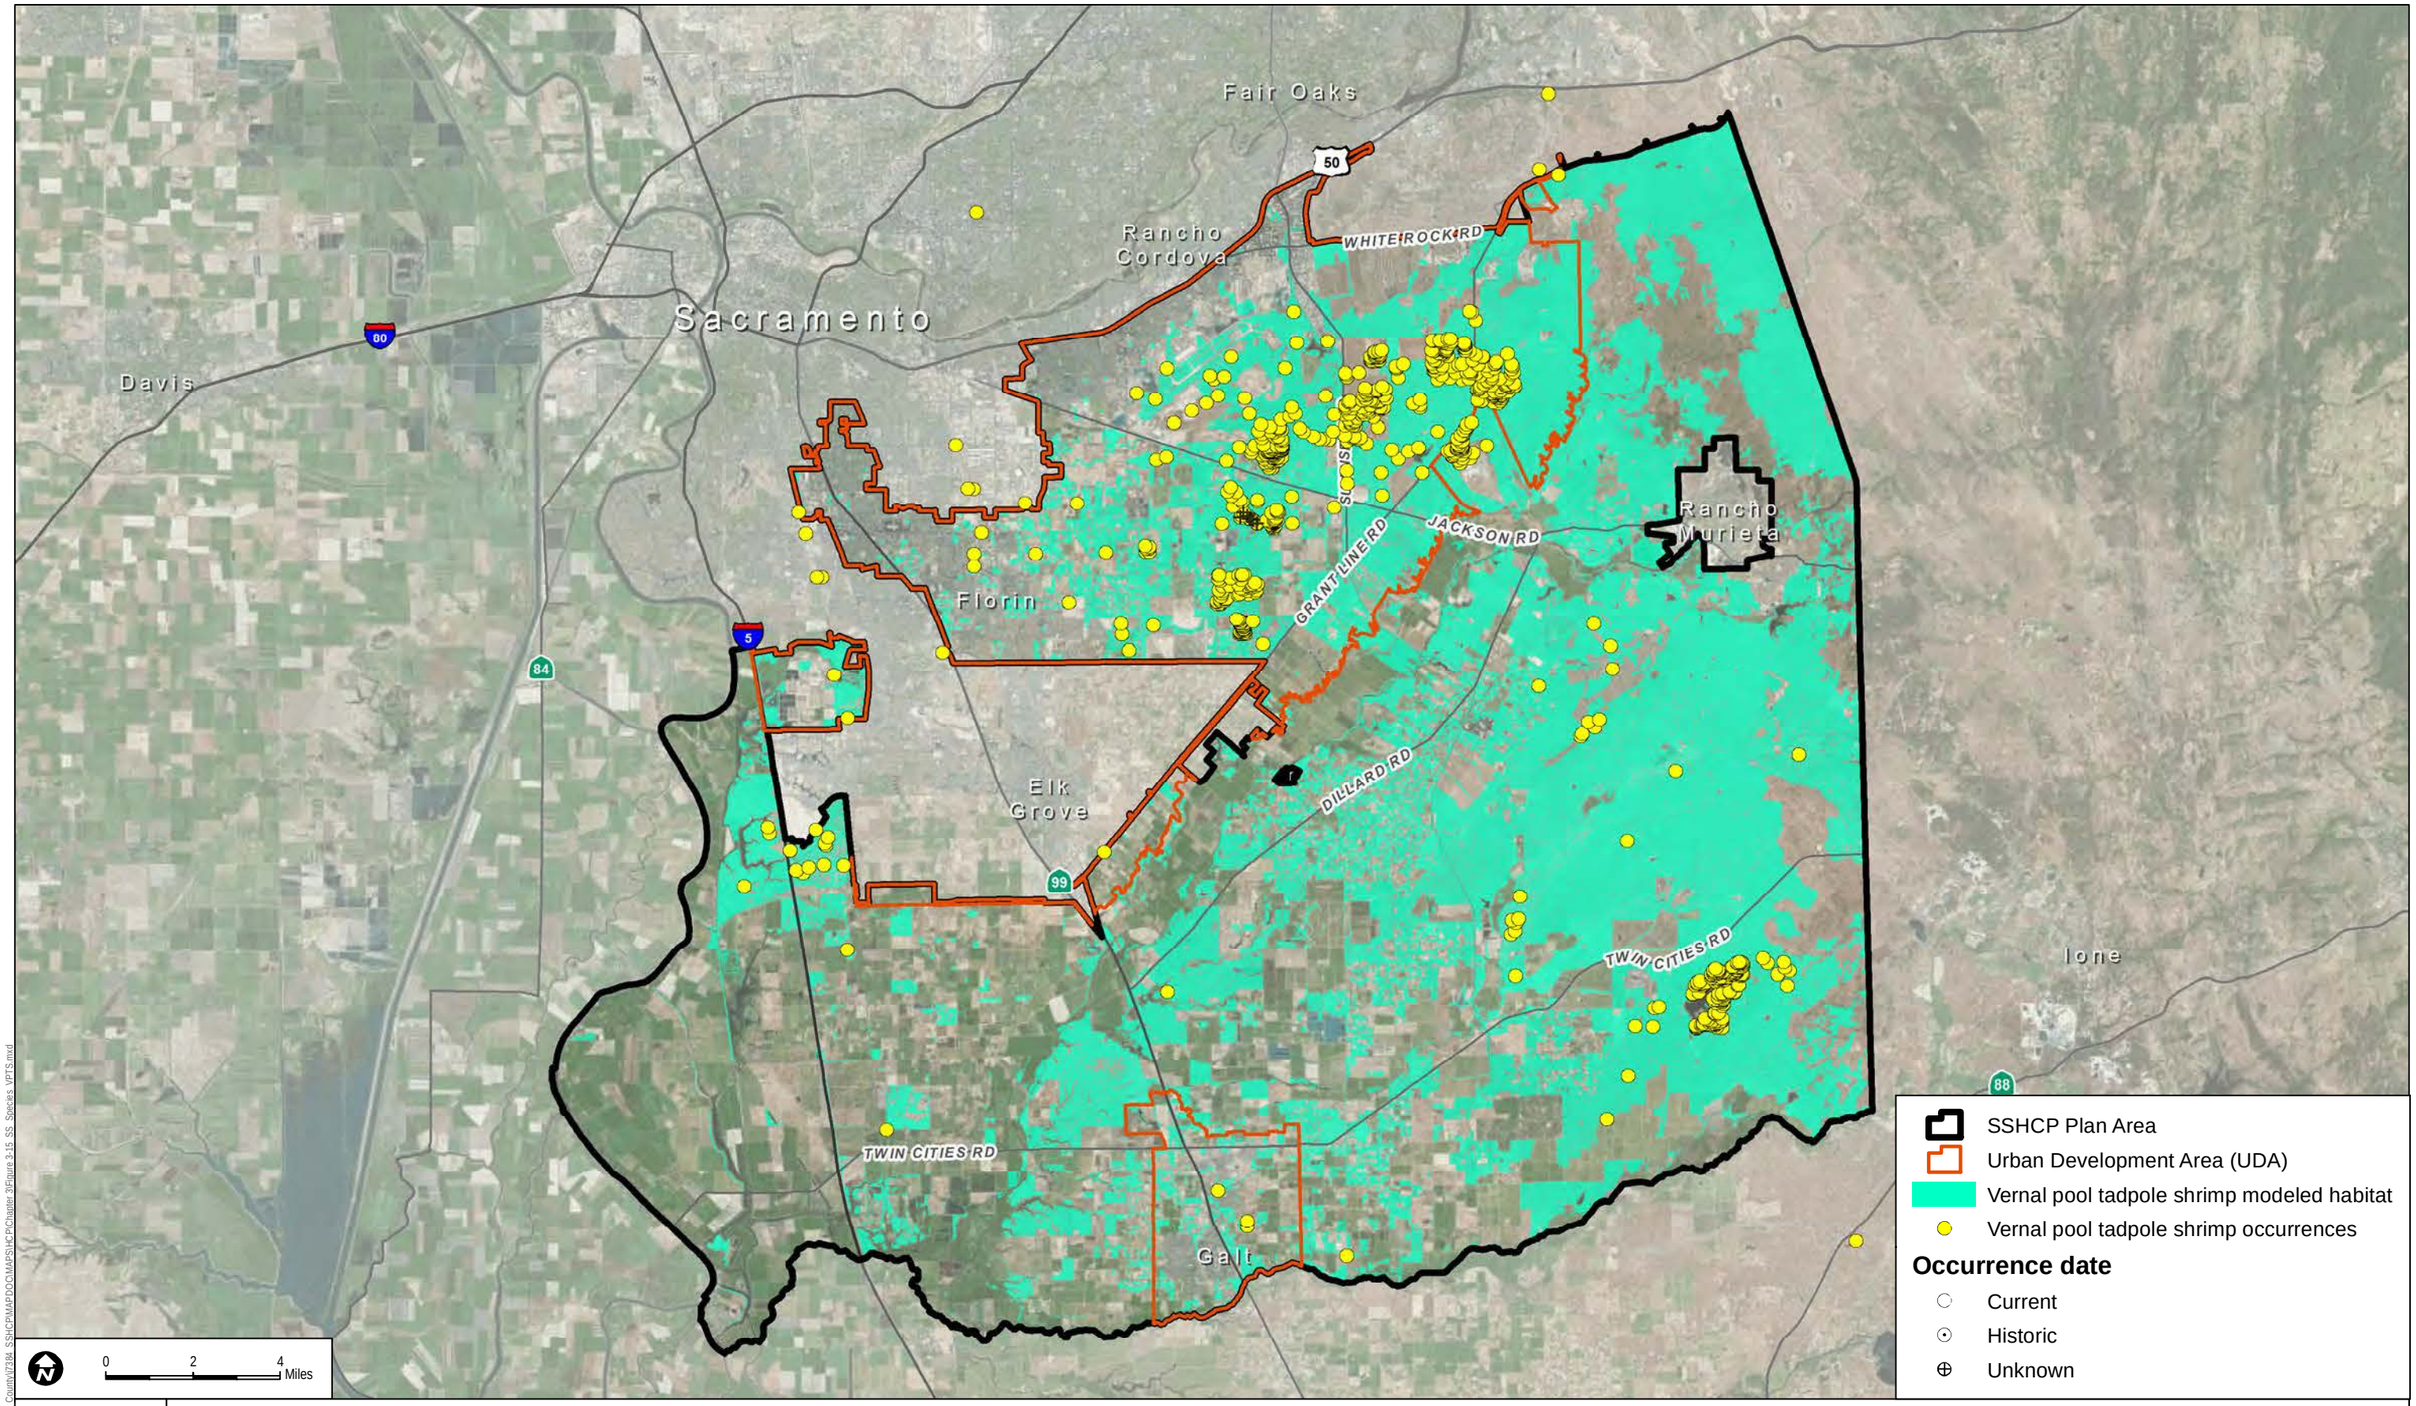
3.4.3 Amphibians

California Tiger Salamander (*Ambystoma californiense*)

Habitat Requirements

The upland component of California tiger salamander habitat typically consists of Grassland or Blue Oak Savanna (Shaffer et al. 1993; USFWS 2004a). California tiger salamander spends most of its life cycle underground in grassland habitat, primarily in rodent burrows. Breeding adults comprise approximately 30% of a California tiger salamander population, while approximately 70% consists of juveniles who have not yet reached sexual maturity. These juveniles remain underground in burrows year-round and typically do not return to breeding habitat during the winter. (Searcy, pers. comm. 2012). California tiger salamanders typically use underground

burrows constructed by ground squirrels or other fossorial animals in open grassland or under isolated oaks, and less commonly in woodlands (Shaffer et al. 1993). Adults are terrestrial outside of the breeding season, and have been known to inhabit rodent burrows located up to 1.3 miles from breeding ponds.



Once fall or winter rains begin, adult California tiger salamanders emerge from their upland refugia at night to migrate to breeding ponds (Stebbins 1985, 1989; Shaffer et al. 1993). Males remain at the breeding pools on average for 44.7 days and females averaged 11.8 days (Trenham et al. 2000). Historically, vernal pools and other natural seasonal ponds constituted primary breeding sites used by California tiger salamanders (Feaver 1971; Storer 1925; Trenham et al. 2000; Zeiner et al. 1988). In the absence of historical breeding ponds, stock ponds have become important aquatic habitats for the California tiger salamander throughout its range (USFWS 2004a). During this species' lifetime, individuals from sub-populations could migrate between aquatic and upland habitats, colonizing newly created and geographically isolated ponds provided the intervening habitat could be successfully traversed by dispersing individuals (USFWS 2004a).

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable aquatic habitat based on life history descriptions include Vernal Pool and Seasonal Wetland. Suitable habitat for upland refugia includes Valley Grassland, Blue Oak Woodland, and Blue Oak Savanna (Table 3-2).

Occurrences within the Plan Area

There are 31 documented occurrences of California tiger salamanders in the Plan Area. Two occurrences are located within the UDA in PPU 8 and 29 occurrences are outside of the UDA in PPU 7.

SOURCE: Bing Maps, County of Sacramento 2014, CDFG 2012, C. Witham 2011, C. Little 2011,ECORP 2012, EcoAnalysts 2008, Foothill Associates 2011, Gibson & Skordal 2011, Helm 2011, Richard Hill 1999, Sugnet & Associated 1997, Kassiss-Sylva 2011, Kiefer 2011, LSA 2009, USFWS 2014, Vollmar 2011, Wildlands 2010

FIGURE 3-15

Path: Z:\Projects\Sacramento County\2084 SSHCP\MAPPDOC\MAPS\HCP\Chapter 3\Figure 3-15_SS_Species_VPTS.mxd

INTENTIONALLY LEFT BLANK

Model Assumptions

- California tiger salamanders have not been recorded within the Sacramento County Urban Services Boundary or north of the Cosumnes River despite extensive surveys in very large areas with presumably suitable habitat including Mather Field, Sacramento Valley Conservancy's Vernal Pool Prairie Preserve, the Sunrise Douglas Area, Kiefer landfill, Rancho Murieta, and areas East of Grant Line Road.
- In a 5-year study, Orloff (2011) found the majority of California tiger salamanders migrated at least 0.5 mile (0.8 kilometer) from the breeding site. A smaller number of salamanders appeared to migrate even farther, traveling 0.75 mile (1.2 kilometer) to almost 1.3 miles (2.2 kilometers) to and from the breeding ponds and upland habitat on adjacent property.
- A study by Searcy and Shaffer (2011) found that California tiger salamanders are physiologically capable of migrating up to 2,484 meters (1.5 miles) each breeding season and that 95% of the population occurs in upland habitat within 1,867 meters of the breeding pond.
- Trenham et al. (2001) recommended that plans to maintain local populations of California tiger salamanders should include pond(s) surrounded by at least 173-meter (567-foot) wide buffers of terrestrial habitat occupied by burrowing mammals.

California Tiger Salamander Modeled Habitat

Modeled aquatic habitat for California tiger salamander is Vernal Pool and Seasonal Wetland land cover located south of the Cosumnes River. Modeled upland refugia habitat is all Blue Oak Woodland, Blue Oak Savanna, and Valley Grassland land cover located within 1.5 miles of modeled aquatic habitat (i.e., within 1.5 miles of any Vernal Pool or Seasonal Wetland that is south of the Cosumnes River).

Figure 3-16 illustrates the location of modeled habitat as well as the documented occurrences of California tiger salamander within the Plan Area.

Western Spadefoot (*Spea hammondii*)

Habitat Requirements

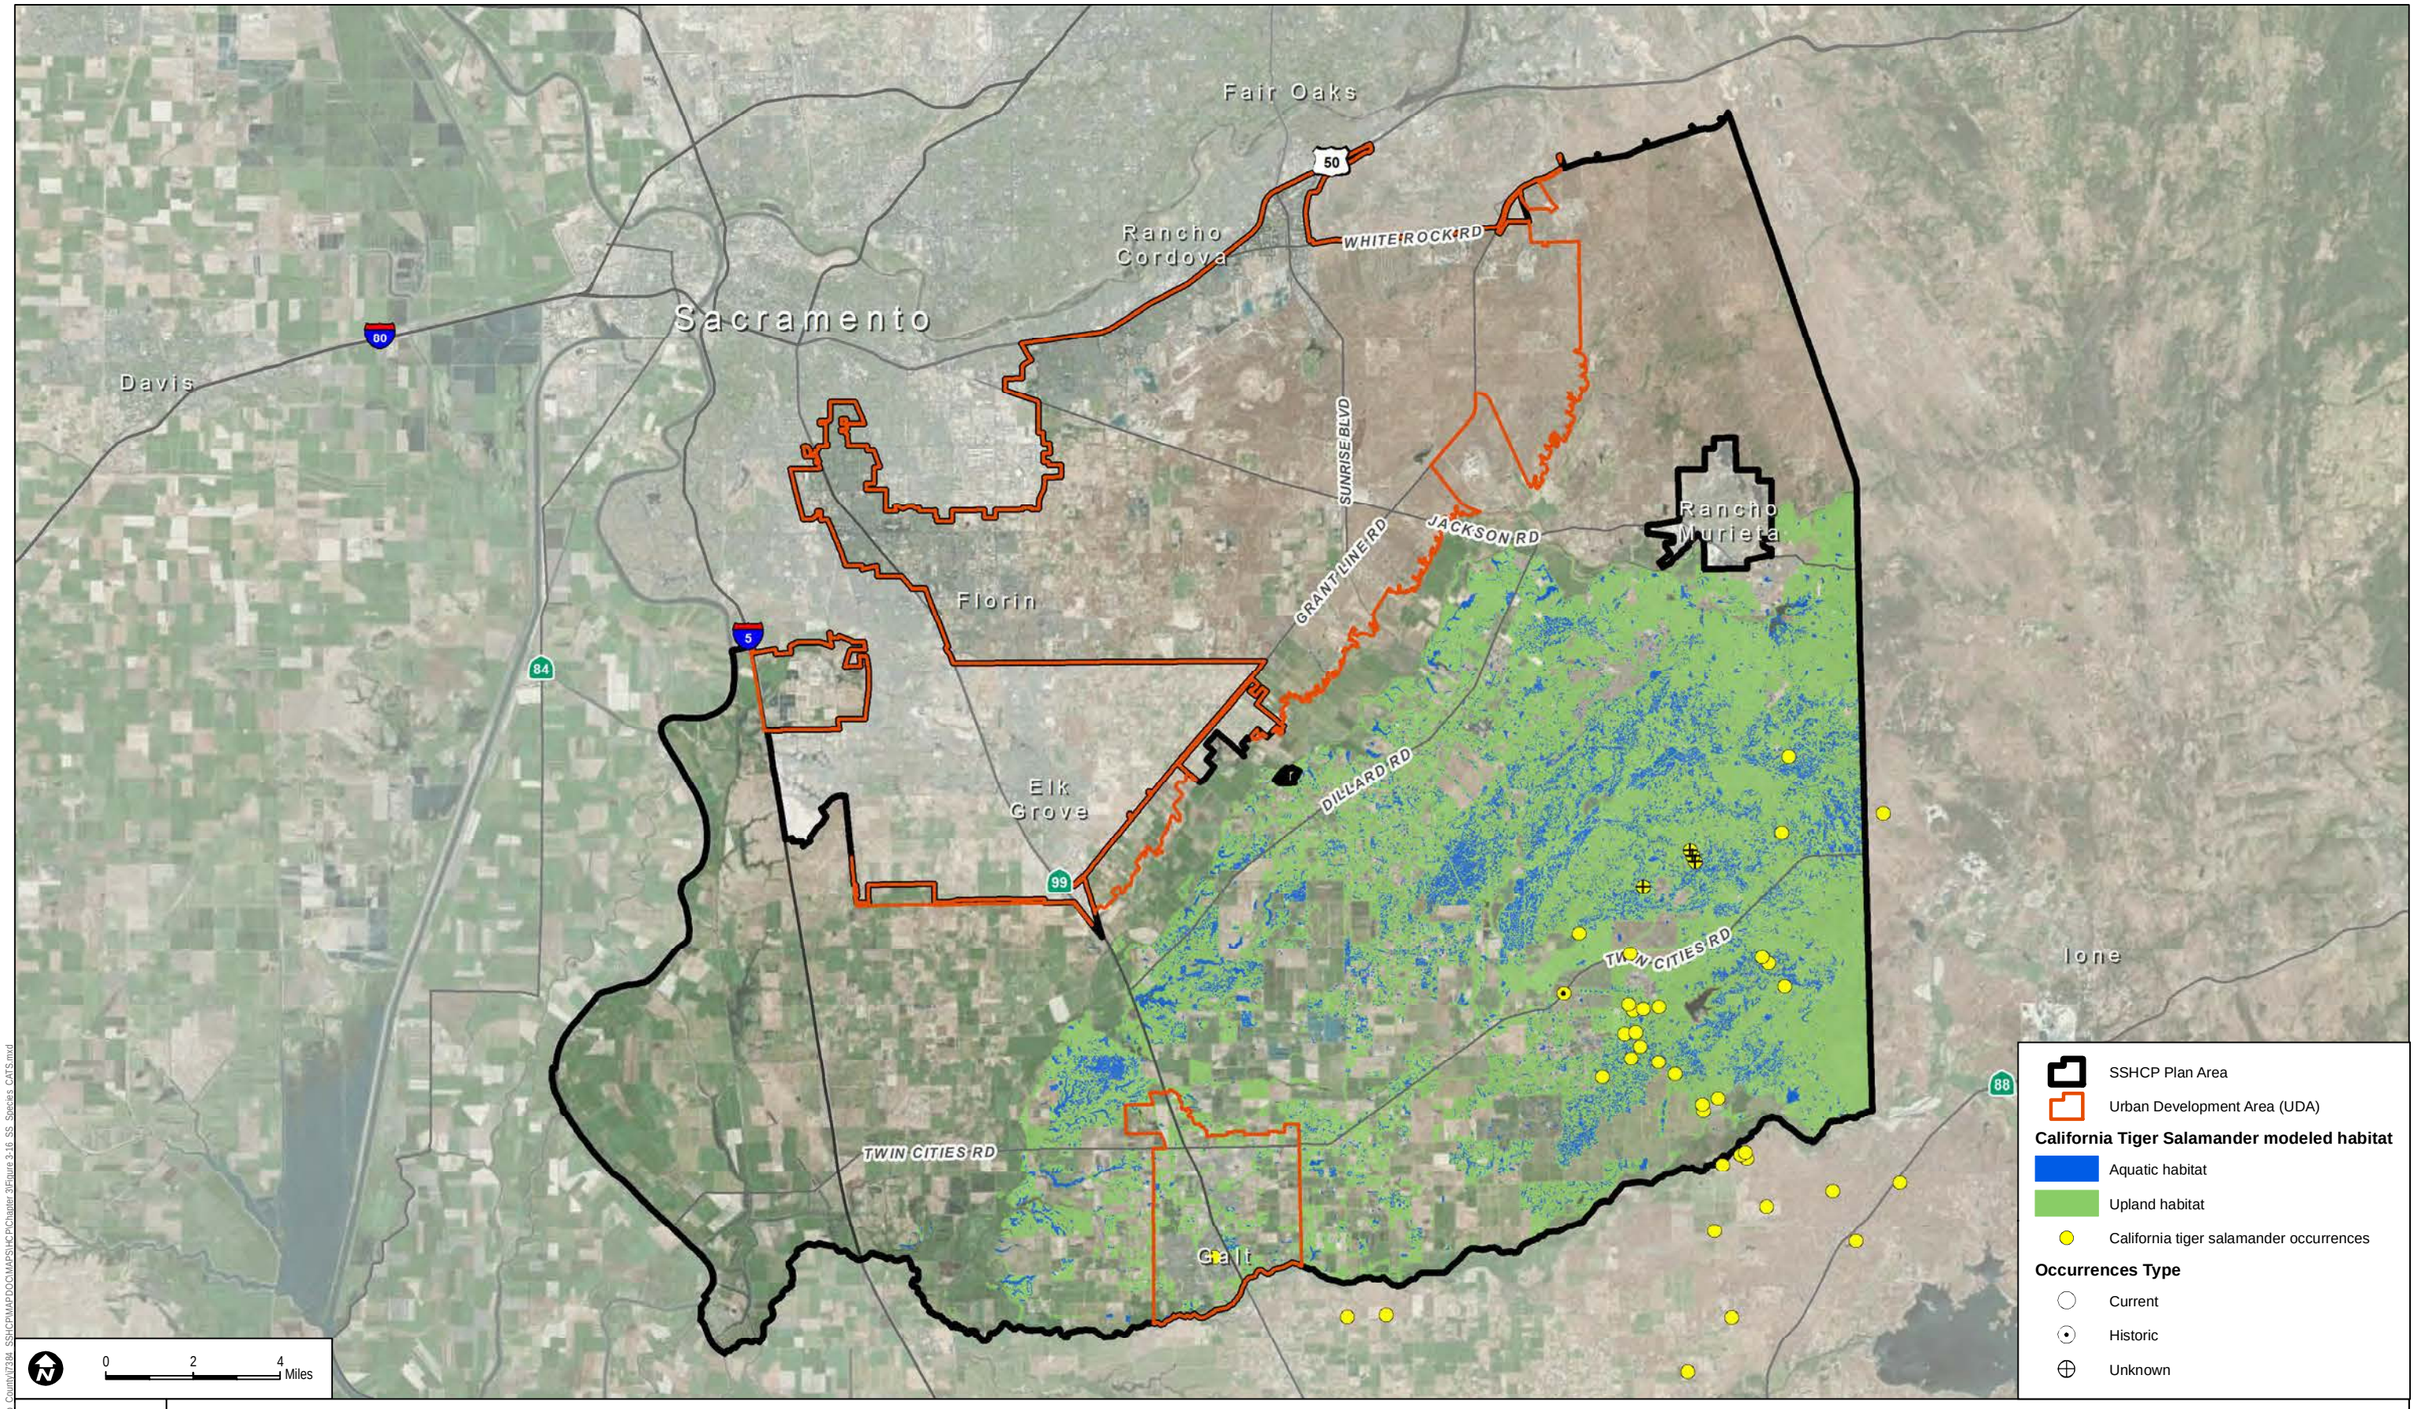
Western spadefoot primarily occurs in lowland habitats generally below 900 meters (3,000 feet) within or adjacent to washes, floodplains of rivers, alluvial fans, playas, and alkali flats. They also occur in the foothills and mountains (Stebbins 1985) up to 1,363 meters (4,500 feet) (Morey 1988). Associated vegetative communities include valley-foothill grassland, open chaparral, pine-oak woodland and lower montane conifer and mixed conifer forest within open areas comprised of short grasses and sandy or gravelly soil. Western spadefoots have two distinct habitat requirements including quiet streams (Stebbins 2003) or seasonal pools for breeding and uplands for foraging and dry-season aestivation. Western spadefoot eggs and larvae have been

observed in a variety of permanent and temporary wetlands including rivers, creeks, pools in intermittent streams, vernal pools, and temporary rain pools (CDFG 2010). They have also been found in altered wetlands including vernal pools that have been disturbed by activities such as earthmoving, disking, intensive livestock use, and off-road vehicle use, and created wetlands such as artificial ponds, livestock ponds, sedimentation and flood control ponds, irrigation and roadside ditches, roadside puddles, tire ruts, and borrow pits (Fisher and Shaffer 1996; CDFG 2010). Often undervalued in conservation planning, terrestrial habitats surrounding aquatic breeding sites are critical to the survival of many semiaquatic species that depend on mesic ecotones to complete their life cycles (Semlitsch and Bodie 2003).

Land Cover Types Relevant to Habitat Requirements

Suitable aquatic habitat based on life history descriptions includes Vernal Pool, Seasonal Wetland, Swale, Open Water, and Stream/Creek. Suitable habitat for upland foraging includes Blue Oak Woodland, Blue Oak Savanna, and Valley Grassland (Table 3-2).

Occurrences within the Plan Area



There are 41 documented occurrences of western spadefoot in the Plan Area. Twenty occurrences are inside the UDA with seven in PPU 1, 12 in PPU 2, and one in PPU 3. There are 21 occurrences outside of the UDA with two in PPU 5 and 19 in PPU 7.

Model Assumption

- Very little information is available regarding dispersal distances or minimum habitat size.
- Semlitsch and Brodie (2003) summarized data from the literature on the use of terrestrial habitats by 19 frog and 13 salamander species representing 1,363 individuals that are otherwise typically associated with wetlands. In general, plethodontid stream salamanders (e.g., *Desmognathus fuscus, Eurycea bislineata, Eurycea longicauda*), although migratory at some stage of their life cycle, remain close to the edges of ponds and streams and seldom move more than 20 to 30 meters from aquatic habitats. Alternatively, some species of frogs, toads and newts are highly mobile and move 1,000 to 1,600 meters (5,249 feet or about 1 mile) (e.g., *Bufo bufo, Rana catesbbeiana*, *Notophthalmus viridescens*). The majority of the remaining species occur at intermediate distances, where they emigrate to find suitable terrestrial habitat. The overall core terrestrial habitat ranged from 159 to 290 meters (522 to 951 feet) from the edge of aquatic breeding sites.

Western Spadefoot Modeled Habitat

Modeled aquatic habitat for western spadefoot is Vernal Pool, Seasonal Wetland, Swale, Open Water, and Stream/Creek land cover types in the Plan Area. Modeled upland habitat is Blue Oak Woodland, Blue Oak Savanna, and Valley Grassland within 1,600 meters (5,249 feet or approximately 1 mile) from modeled aquatic habitat.

Figure 3-17 illustrates the location of modeled habitat and the documented occurrences of western spadefoot within the Plan Area.

3.4.4 Reptiles

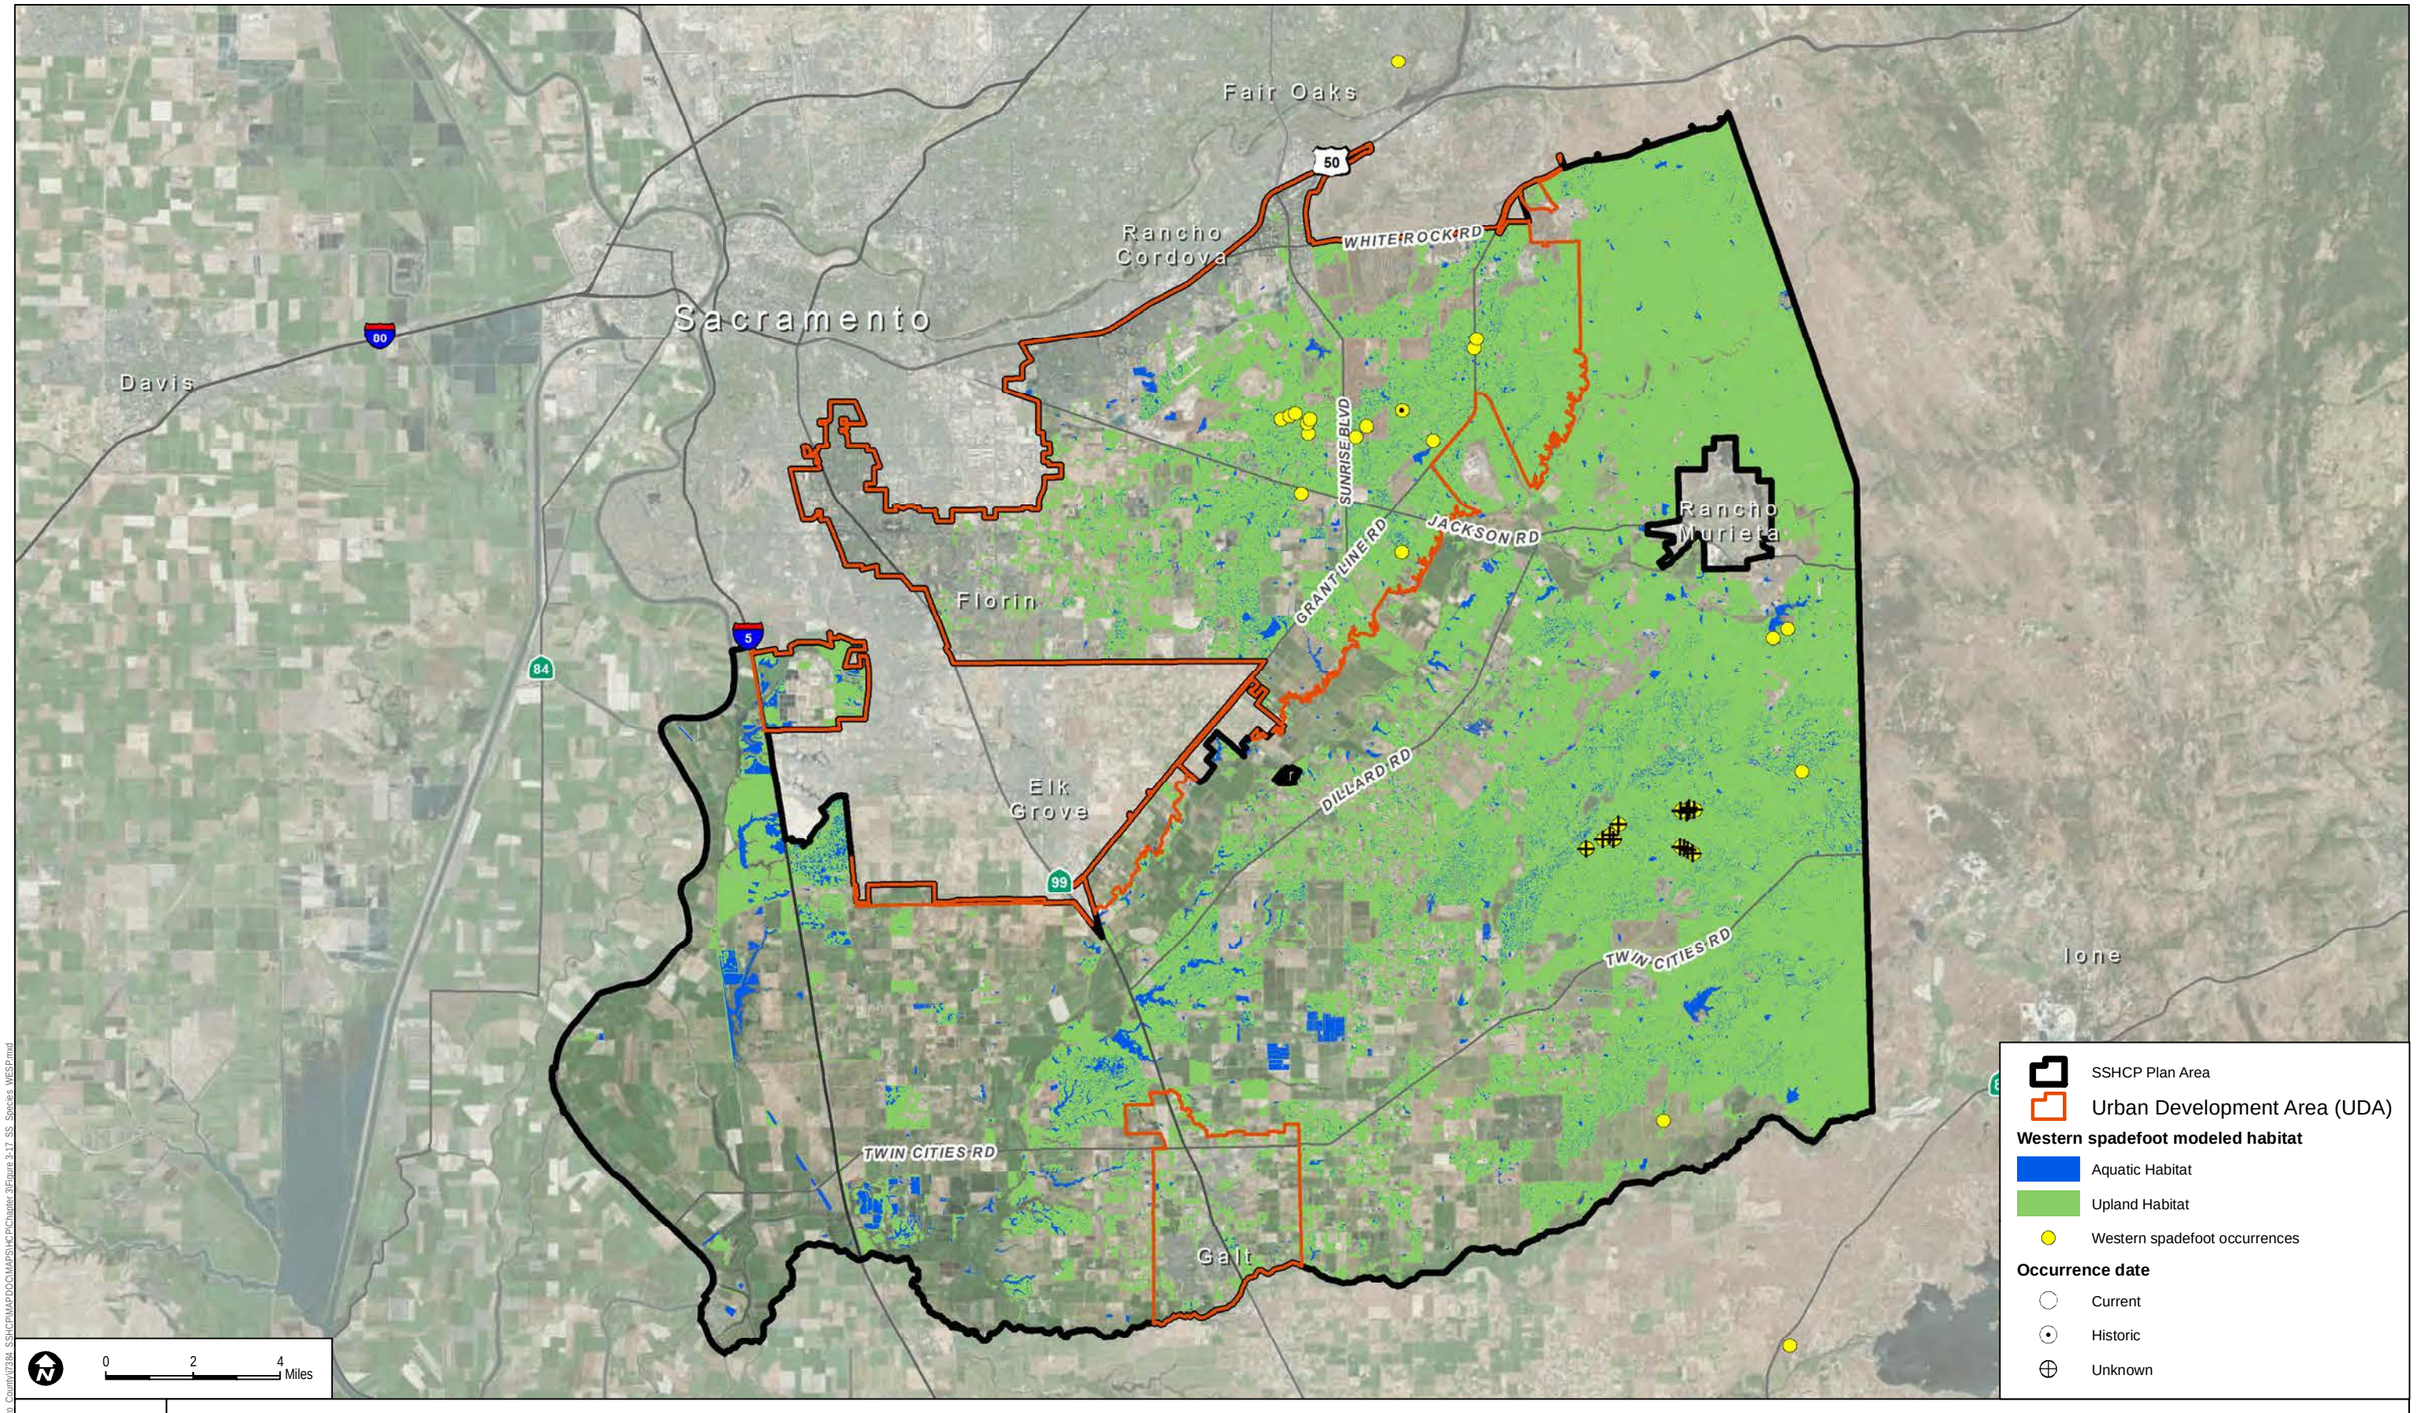
Giant Gartersnake (*Thamnophis gigas*)

Habitat Requirements

Endemic to valley floor wetlands in California's Central Valley, the giant gartersnake inhabits marshes, sloughs, low gradient streams, and other waterways and agricultural wetlands such as irrigation and drainage canals and rice fields. Suitable habitat consists of (1) adequate water during the snake's active season (early spring through mid-fall) to provide food and cover, (2) emergent, herbaceous wetland vegetation, such as Scirpus and Typha spp. for escape cover and foraging habitat during the active season, (3) grassy banks and openings in waterside vegetation for basking, and (4) higher elevation uplands for cover and refuge from flood waters during the snake's dormant season in the winter (Hansen 1988). Wylie et al. (2010) found that giant garter snakes will persist in areas dominated by rice, by foraging in flooded rice fields after the rice plants have grown sufficiently to provide cover from predators. It appears that giant garter snakes do not tolerate seasonal wetlands managed for waterfowl if there is no aquatic habitat available during the active summer season. A study of Body Condition Index (BCI) and population estimates strongly indicates that perennial marshes provide the highest quality giant garter snake habitat, rice agriculture is acceptable habitat, and seasonal winter wetlands provides the least suitable habitat of the three types (Wylie et al. 2010). Although rice fields are a key habitat for giant garter snakes throughout most of its range, there is no active rice cultivation within the Plan Area. The nearest region of rice production is the Natomas Basin located in northwest Sacramento County. Giant garter snakes are absent from larger rivers and other water bodies that support introduced populations of large, predatory fish, and from wetlands with sand, gravel, or rock substrates (Brode 1988; Hansen 1980; Hansen 1988; Rossman and Stewart 1987). Riparian woodlands do not typically provide suitable habitat because of excessive shade, lack of basking sites, and absence of prey populations (Hansen 1980).

In addition to grassy banks, giant garter snakes will bask in bulrush, cattails, shrubs overhanging the water, patches of waterweed (*Ludwigia peploides*) and other floating vegetation. In the San Joaquin Valley, giant garter snakes also bask in openings within saltbush (*Atriplex* spp.) (Brode 1988; Van Denburgh and Slevin 1918). Riparian vegetation such as saltbush and willows (Salix spp.) provide cover from predation. Giant gartersnakes also bask in openings in vegetation created by rip-rap placed around water control structures. Giant garter snakes use small mammal burrows and other soil crevices above prevailing flood elevations during the winter (i.e., November to mid-March), typically with sunny exposures along south- and west-facing slopes (USFWS 1999b). During the active season, small mammal burrows, crayfish burrows, and soil crevices provide retreats from extreme heat (Hansen and Brode 1993).

Land Cover Types Relevant to Habitat Requirements



Suitable aquatic habitat for giant gartersnake based on life history descriptions include Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek. Suitable upland habitat includes Mixed Riparian Scrub and Valley Grassland (Table 3-2).

Occurrences within the Plan Area

There are 14 documented occurrences of giant gartersnake within the Plan Area. Two occurrences are within the UDA in PPU 2. Twelve occurrences are outside the UDA, including 11 in PPU 6 and one in PPU 7.

Model Assumptions

- Giant gartersnake occurrences have been documented along Plan Area stream reaches, primary in the southwestern portion of the Plan Area.
- The range of giant gartersnake within the Plan Area included the Central Valley great "tule" marsh (below 70 feet above sea level), and likely included emergent marsh areas along floodplains of streams and creeks up to an elevation of 230 feet above sea level.
- Stream reaches considered important suitable habitat owing to known use within the Plan Area include the following:
    - Elliot Mitigation site contains a prominent drainage that links to Stone Lakes and is wet year round.
    - Drainage canals south of Elk Grove have a past occurrence and link to Stone Lakes. The perennial segments of these canals are suitable habitat.
    - Badger Creek and all other creeks that drain into the marsh at the Cosumnes River Preserve is likely high-quality habitat due to its proximity and connectivity to a significant population of giant gartersnakes. The perennial segments of these creeks are suitable habitat.
    - The perennial segments of Laguna Creek (south) and tributaries are suitable habitat due to presence of Freshwater Marsh habitat and proximity to documented occurrences.
    - The perennial segments drainages and canals leading from the Cosumnes River Preserve including Deadman's Gulch.
- Giant gartersnakes use rice lands extensively and depend on them for habitat (Fuller, pers. comm. 2005)
- The average distance between upland, over wintering sites and aquatic breeding sites is thought to be approximately 150 meters, ranging from 50 to 400 meters (Wylie, pers. comm. 2005).
- Hansen and Brode (1993) also documented giant gartersnakes moving at least 400 meters (0.25 mile) between small lateral ditches and larger canals within the Natomas Basin.

INTENTIONALLY LEFT BLANK

Giant Garter Snake Modeled Habitat

The following streams, creeks or drainages are locations that are known to support giant gartersnakes within the Plan Area.

- A prominent drainageway on the Elliot mitigation site, which links to Stone Lakes National Wildlife Refuge (NWR) and is wet year-round.
- Drainage canals south of Elk Grove, which have a past occurrence and link to Stone Lakes NWR; the perennial segments of these canals are suitable habitat.
- Badger Creek and all other creeks that drain into the marsh at the Cosumnes River Preserve, which are likely high-quality habitat due to proximity and connectivity to a significant population of giant gartersnakes; the perennial segments of these creeks are suitable habitat.
- The perennial segments of Laguna Creek (south) and tributaries, which are suitable habitat due to presence of Freshwater Marsh habitat and proximity to documented occurrences.
- The perennial segments of drainages and canals leading from the Cosumnes River Preserve including Deadman's Gulch, which provides suitable habitat.

Giant gartersnake is known to occur at elevations of up to 230 feet above sea level and to travel up to 400 meters (0.25 mile) between aquatic and upland habitat. Therefore, the waterways described above plus Stream/Creek, Freshwater Marsh, Open Water, and Seasonal Wetland that are entirely or partially within 0.25 mile of the aforementioned waterways and are at or below 230 feet in elevation are modeled as high-value aquatic habitat. In addition to high-value aquatic habitat, non-high value aquatic habitat was defined as Stream/Creek, Freshwater Marsh, Open Water, and Seasonal Wetland that is up to 0.25 mile away from high-value habitat and is at or below 230 feet in elevation.

Upland habitat for giant gartersnake is Mixed Riparian Scrub and Valley Grassland within a distance of 0.25 mile from modeled aquatic habitat and is at or below an elevation of 230 feet. High-value upland habitat for giant gartersnake is defined as upland habitat within 200 feet of high-value aquatic giant gartersnake habitat (i.e., Stream/Creek, Freshwater Marsh, Open Water, and Seasonal Wetland) that is at or below 230 feet in elevation.

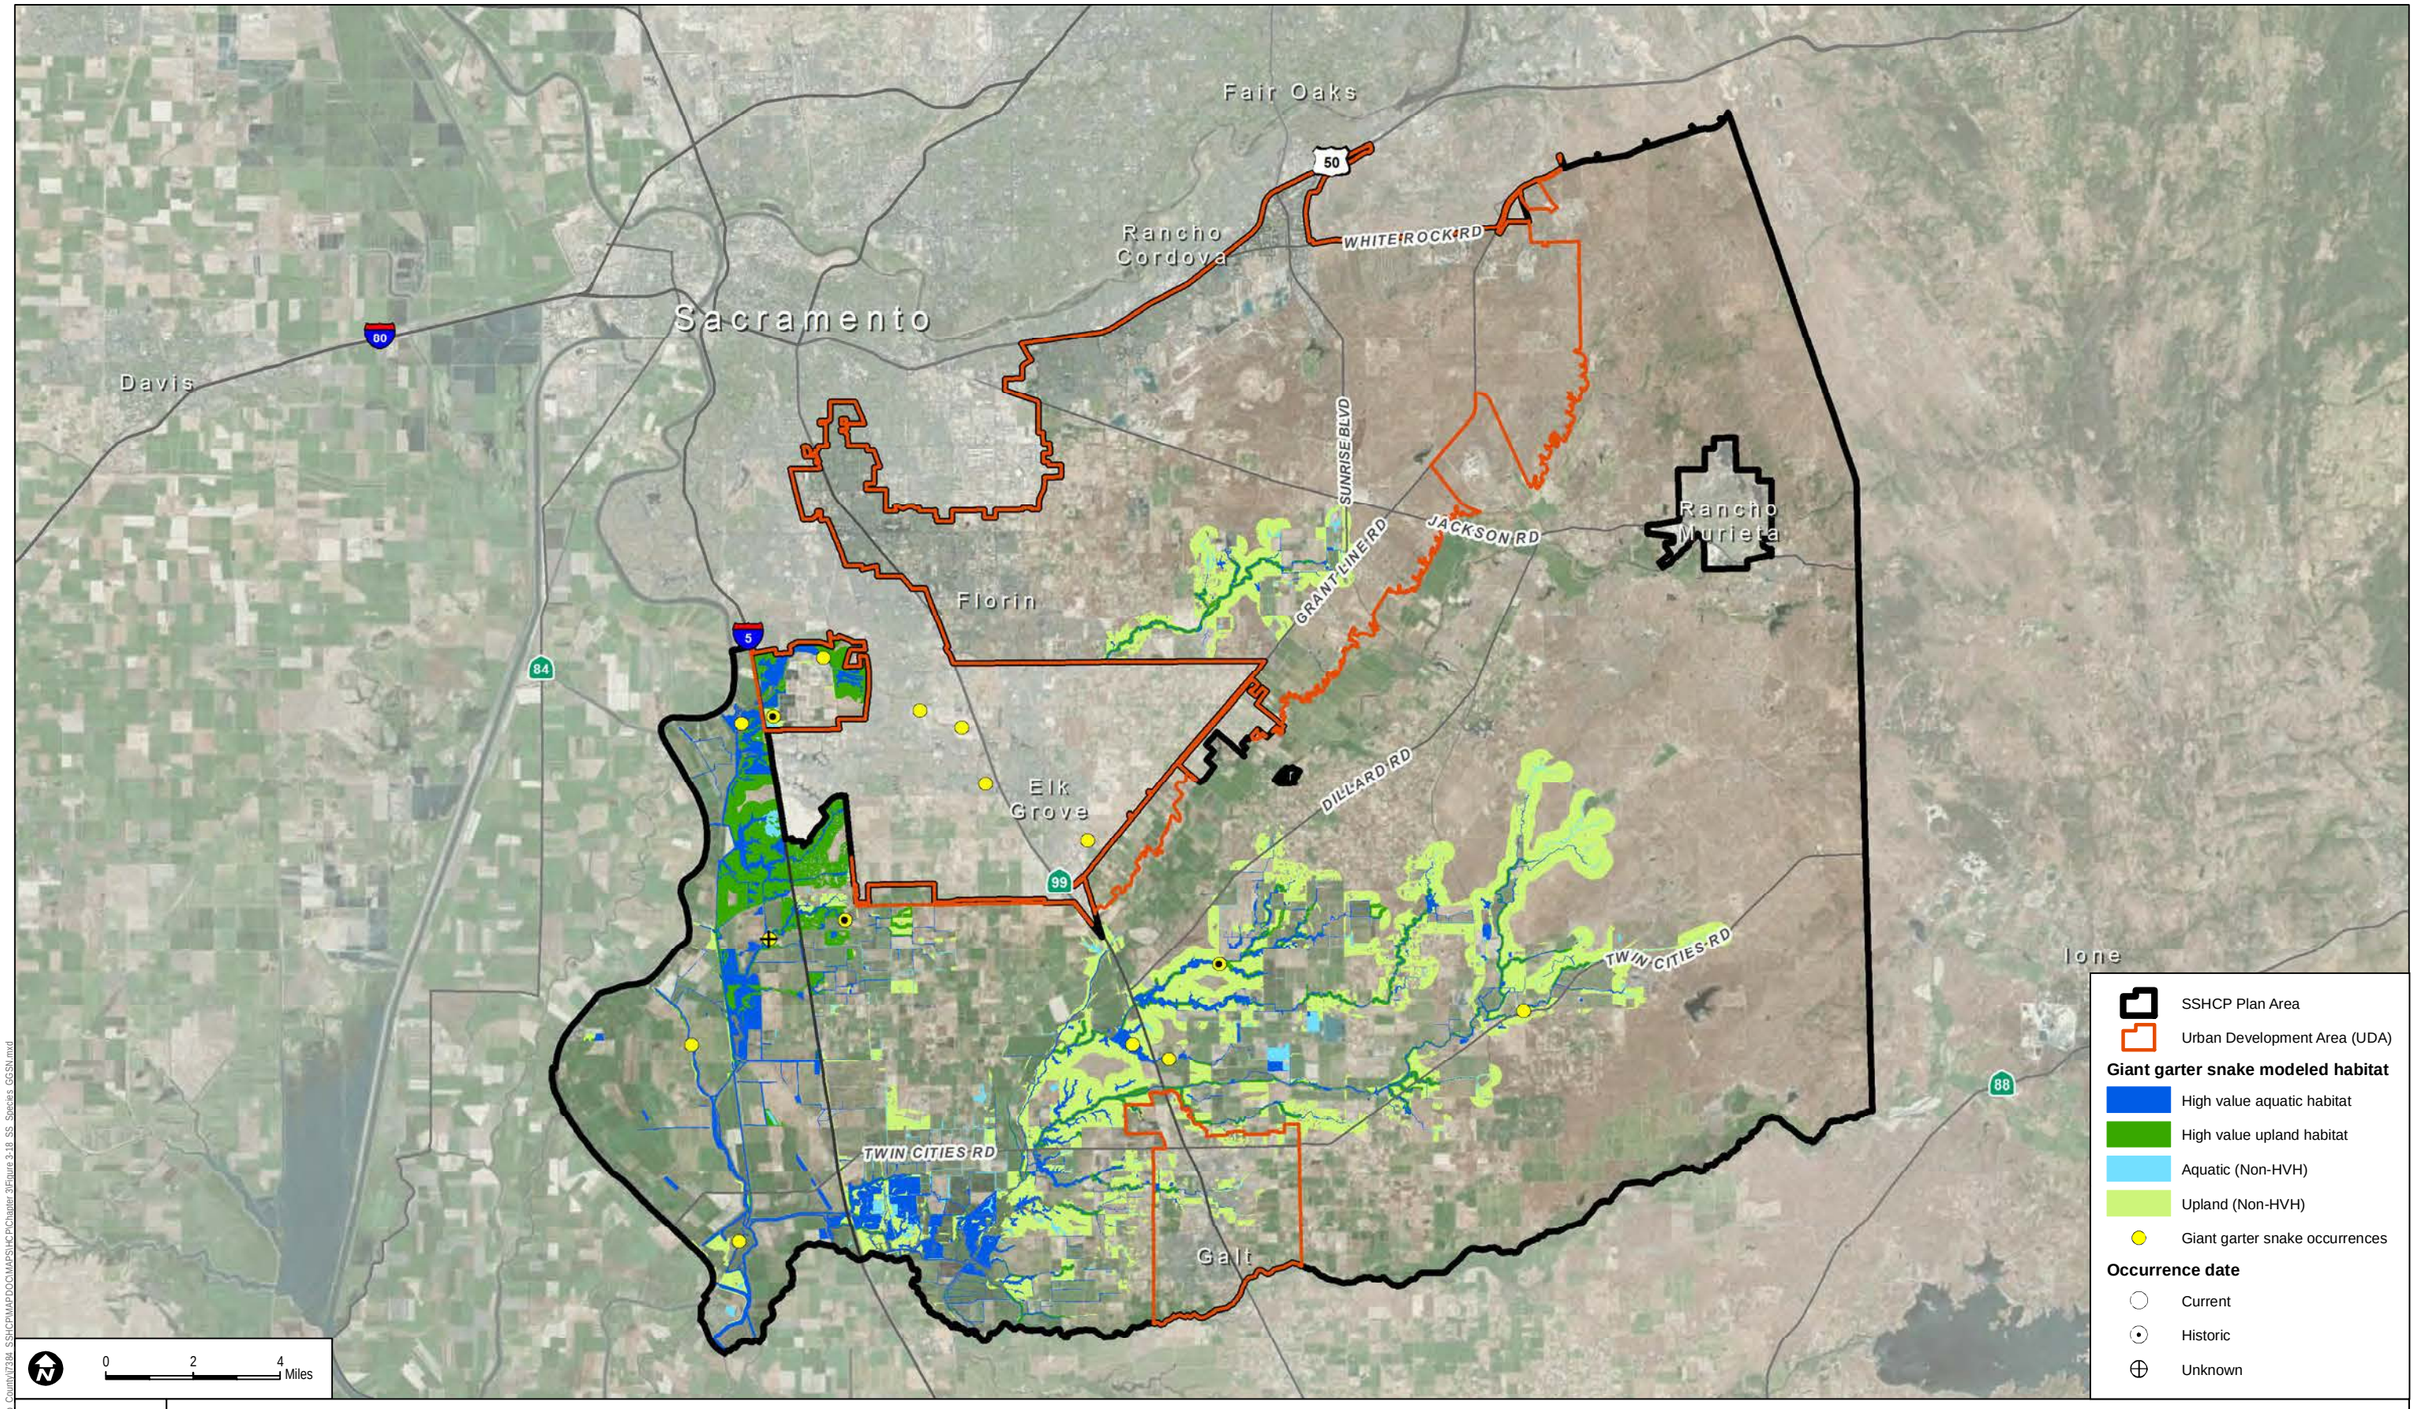

Figure 3-18 illustrates the location of modeled habitat as well as the documented occurrences of giant gartersnake within the Plan Area.

Western Pond Turtle (*Actinemys marmorata*)

Habitat Requirements

Western pond turtles inhabit a variety of aquatic habitats from sea level to elevations of 1,980 meters (6,500 feet). They are found in fresh to brackish aquatic habitats including marshes, rivers, ponds, and streams. Western pond turtles also may occur in created habitats such as irrigation ditches, reservoirs, and sewage and millponds. Preferred aquatic habitat is characterized by slow moving or quiet water, emergent aquatic vegetation, deep pools with undercut banks for refugia, partially submerged rocks and logs, open mud banks and matted floating vegetation for thermoregulatory basking. Western pond turtles use aquatic habitats primarily for foraging, thermoregulation, breeding, and avoidance of predators (Boyer 1965; Holland 1994; Reese and Welsh 1998a). Hatchling and young turtles (1 year) require shallow water areas (less than 30 centimeters [12 inches] deep) dominated primarily by emergent aquatic reeds (*Juncus* spp.) and sedges (Holland 1991), and have been observed to avoid areas of open water lacking these emergent plant species (Boyer 1965; Holland 1994; Hays et al. 1999; Reese and Welsh 1998a). Highly fluctuating flow rates associated with aquatic habitats may diminish habitat quality for western pond turtle (Reese and Welsh 1998b).

Western pond turtles "hibernate" in both aquatic and upland habitats. Aquatic hibernacula consist of rocks, logs, mud, and undercut areas along banks while upland hibernacula consist of burrows in leaf litter, heavy brush, or soil (Holland 1994). Western pond turtles are believed to hibernate between November 1 and March 1 (McDermott, pers. comm. 2015). In woodland and sage scrub habitats along coastal streams in central California, most western pond turtles leave the drying creeks in late summer and return after winter floods. Upland nesting sites must be dry and often have a high clay or silt component. Typically, western pond turtles dig nests in open sunny areas that are on slopes no steeper than 25 degrees, and typically within 300 feet of the aquatic habitat (McDermott, pers. comm. 2015).

INTENTIONALLY LEFT BLANK

Land Cover Types Relevant to Habitat Requirements

Based on life history descriptions aquatic land cover types that provide suitable habitat for western pond turtles include Freshwater Marsh, Open Water, and Stream/Creek. Land cover types that provide suitable upland habitat include Blue Oak Woodland, Blue Oak Savanna, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland when these land covers are near suitable aquatic habitat (Table 3-2).

Occurrences within the Plan Area

There are 19 documented occurrences of western pond turtle within the Plan Area. Three occurrences are within the UDA including two in PPU 2 and one in PPU 4. Sixteen occurrences are outside of the UDA including one in PPU 5, seven in PPU 6, and eight in PPU 7.

Model Assumptions

- Western pound turtle has been recorded along creek and stream reaches throughout the Plan Area.
- Holland (1994) reported that in the fall and spring, hatchling turtles may move as far as 400 meters (0.25 mile) from their upland nest locations to aquatic sites nearby.

Western Pond Turtle Habitat Model

Western pond turtle modeled aquatic habitat include all Stream/Creek land cover that occurs throughout the Plan Area and Freshwater Marsh and Open Water land covers within 400 meters (0.25 mile) of all Stream/Creek land cover. Western pond turtle modeled upland habitat is Blue Oak Woodland, Blue Oak Savanna, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland within 0.25 mile of modeled aquatic habitat.

Figure 3-19 illustrates the location of modeled habitat as well as the documented occurrences of western pond turtle within the Plan Area.

3.4.5 Birds

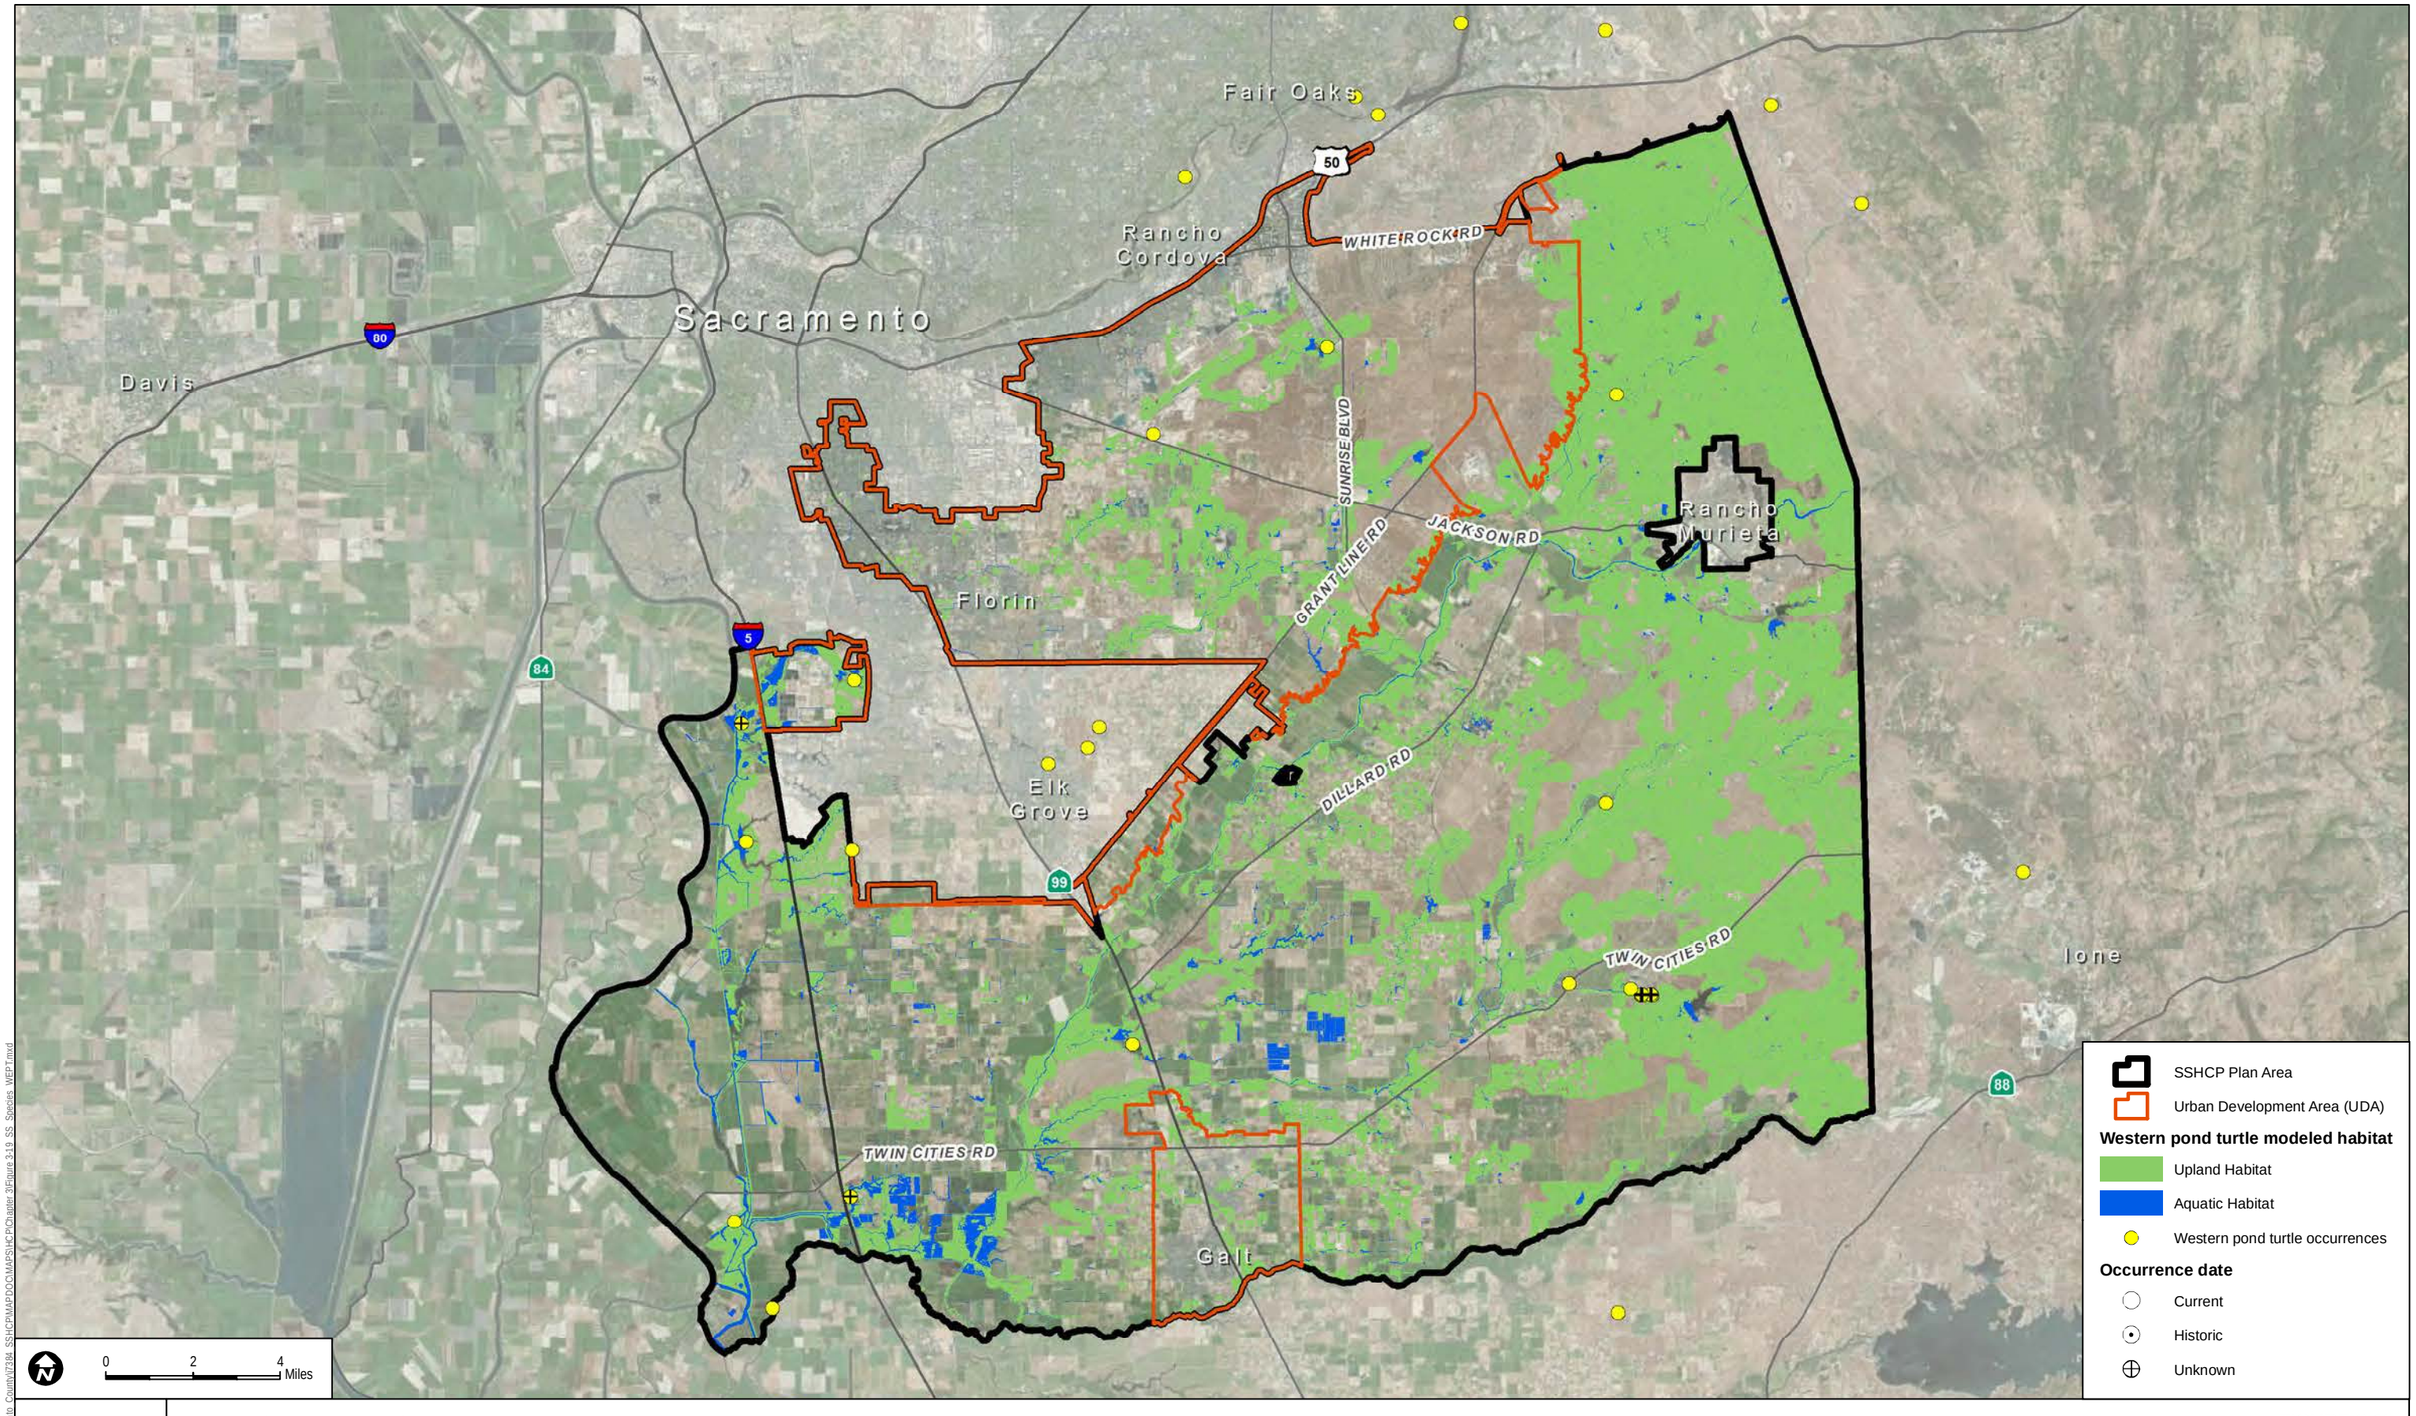
Cooper's Hawk (*Accipiter cooperii*)

Habitat Requirements

Throughout its range, the Cooper's hawk nests in a wide variety of woodland and forest habitats, including oak woodland, riparian woodland, coniferous, deciduous, and mixed forest, woodlots,

and suburban and urban areas. In much of California's lowland valley and foothill landscapes, including those within the Plan Area, this species appears strongly associated with live oak woodland (Asay 1987). Dense canopy closure is a consistent feature of most nest sites, and the tallest tree in the stand is often selected for nesting (Kennedy 1988). In a study of 77 Cooper's hawk nests in California, Asay (1987) found that nearly all nests (i.e., 75) were in live oak trees. The other two nests were in a blue oak and California sycamore; and these trees were in stands of live oak. Riparian woodlands also provide important habitat for Cooper's hawks in Sacramento County (Trochet, pers. comm. 2004).

Cooper's hawks also breed in urban and suburban areas. Several urban populations of Cooper's hawks have been well documented (Beebe 1974; Mannan et al. 2004; Murphy et al. 1988; Rosenfield et al. 1991; Stahlecker and Beach 1979). Cooper's hawks appear tolerant of habitat fragmentation and human disturbance near the nest (Beebe 1974; Murphy et al. 1988; Palmer 1988; Rosenfield et al. 1992). Urban nest sites have included isolated trees within 492 feet (150 meters) of commercial and recreational activities, and 66 to 98 feet (20 to 30 meters) of residential houses (Rosenfield and Bielefeldt 1993; Stahlecker and Beach 1979).



Cooper's hawks are considered aggressive ambush predators, using concealment to catch prey. Surprise attacks are often initiated at close range from behind an obstruction (Roth and Lima 2003). They often use a series of brief perch and scan episodes to locate and capture prey. In open habitats, Cooper's hawks occasionally hunt from the air, scanning the ground and stooping on prey (Rosenfield and Bielefeldt 1993). Cooper's hawks forage in structurally diverse woodland habitats that provide suitable prey abundance and diversity (i.e., medium-sized birds) and large numbers of sites within which to perch, scan, and launch attacks on potential prey.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Blue Oak Woodland, Blue Oak Savanna, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub. Suitable habitat for nesting includes Blue Oak Woodland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub (Table 3-2).

Occurrences within the Plan Area

There are 20 documented occurrences of Cooper's hawk within the Plan Area. Seven are within the UDA including one in PPU 1, two in PPU 2, one in PPU 3, two in PPU 4, and one that is not within a PPU. Thirteen occurrences are outside of the UDA including two in PPU 5, eight in PPU 6, two in PPU 7, and one that is not within a PPU.

INTENTIONALLY LEFT BLANK

Model Assumptions

- Overall distribution, abundance, and population structure for Cooper's hawk are not well known within the Plan area.
- In urban Tucson, Arizona, home range size for nine subadult Cooper's hawks during their first fall/winter averaged 1,905 acres (771 hectares) (Mannan et al. 2004).
- In Tucson, Mannan and Boal (2000) studied the movements of adult male Cooper's hawks in adjacent home ranges during the breeding season. Home range sizes for nine individuals ranged between 33 and 323 acres (13 and 131 hectares) and averaged 162 acres (66 hectares).
- In a study of nesting Cooper's hawks in the Sacramento area, the average distance between adjacent nests was 0.99 mile (1.6 kilometers) (Asay 1987).
- Most Cooper's hawks breeding in California are permanent, non-migratory residents; however, Cooper's hawks breeding in montane habitats may exhibit seasonal movements, moving to snow-free lower elevations during winter (Zeiner et al. 1990).

Cooper's Hawk Habitat Model

Modeled foraging habitat is Blue Oak Woodland, Blue Oak Savanna, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub throughout the Plan Area. Modeled nesting habitat is Blue Oak Woodland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub throughout the Plan Area.

Figure 3-20 illustrates the location of modeled habitat as well as the documented occurrences of Cooper's hawk within the Plan Area.

Ferruginous Hawk (*Buteo regalis*)

Habitat Requirements

The ferruginous hawk is considered an "open country" species that inhabits the grasslands, shrub steppes, and deserts of western North America. During the winter, ferruginous hawks use grasslands and arid areas, particularly where pocket gophers, ground squirrels, rabbits, or prairie dogs are abundant. Ferruginous hawks also winter near cultivated fields that support populations of pocket gophers (Bechard and Schmutz 1995), and are known to use urban open space grasslands as long as prey is available (Berry et al. 1998). Ferruginous hawks have been observed in open grassland habitats and non-vineyard agricultural areas in the Plan Area (Manolis, pers. comm. 2004). Characteristics of these grasslands and agricultural lands are that

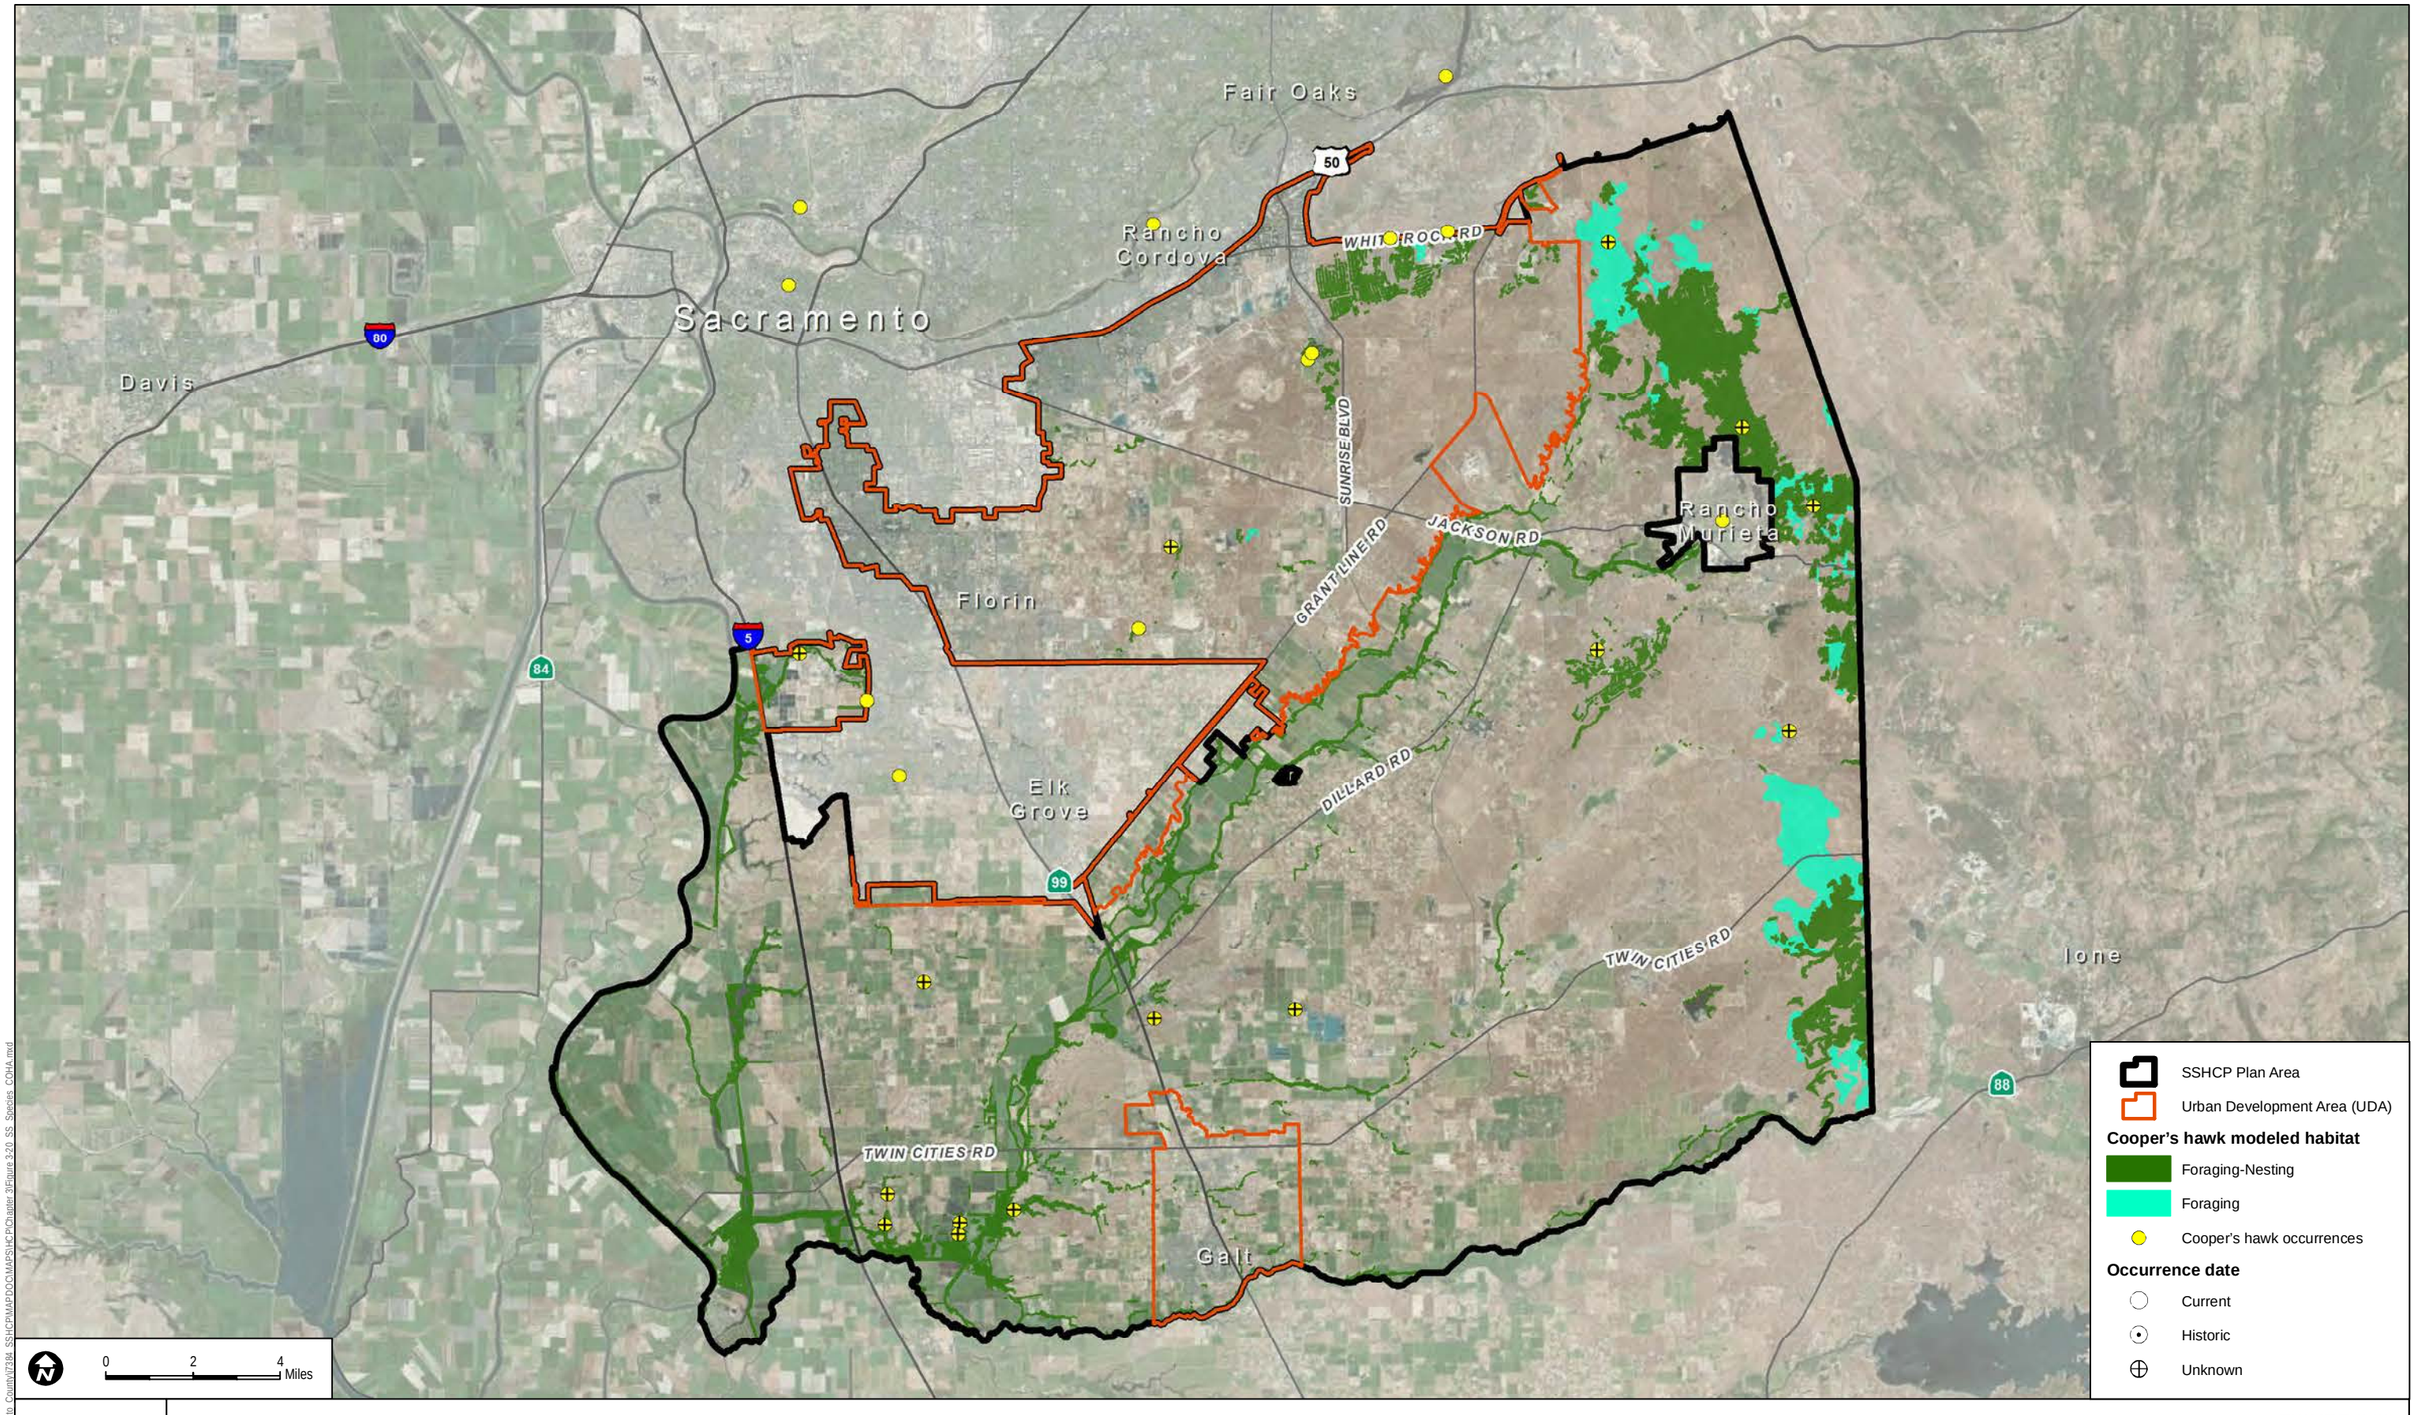
they support abundant prey and include friable soils (for digging and burrowing), moderate to dense vegetative cover (particularly grasses), and some topographic variation.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Valley Grassland, Irrigated Pasture-Grassland, Vernal Pool, Seasonal Wetland, and Swale (Table 3-2).

Occurrences within the Plan Area

There are 26 documented occurrences of Ferruginous hawk within the Plan Area. Eight occurrences are within the UDA including seven in PPU 2 and one in PPU 4. Eighteen occurrences are outside of the UDA including six in PPU 5, four in PPU 6, seven in PPU 7, and one that in not within a PPU.



Model Assumptions

- Ferruginous hawks do not regularly breed in California, with the most recent breeding being recorded in 1989 in northeastern California (Harlow and Bloom 1989).
- Occurrence information is not well documented from within the Plan Area.
- The spatial requirements of ferruginous hawks during winter have not been widely reported (Bechard and Schmutz 1995) and what constitutes the minimum size of suitable winter foraging habitat is unknown for most areas.
- Bechard and Schmutz (1995) suggest the Ferruginous hawk may defend winter territories. Winter densities in Utah have been reported at one individual per 3.60 square miles (Smith and Murphy 1978), and Plumpton and Andersen (1997) found a mean daily Minimum Convex Polygon home range size of 1.36 square miles.

Ferruginous Hawk Habitat Model

Modeled foraging habitat is Valley Grassland, Irrigated Pasture-Grassland, Vernal Pool, Seasonal Wetland, and Swale land cover located anywhere in the Plan Area.

Figure 3-21 illustrates the location of modeled habitat as well as the documented occurrences of Ferruginous hawk within the Plan Area.

INTENTIONALLY LEFT BLANK

Greater Sandhill Crane (*Grus canadensis tabida*)

Habitat Requirements

Greater sandhill cranes wintering in and adjacent to the Plan Area use open agricultural habitats, natural vegetation communities, and seasonally managed wetlands. After the onset of winter rains, Sandhill Cranes begin foraging for invertebrates by probing soils in grassland habitats and overturning cattle dung. They also hunt for mice in taller grassland vegetation (Littlefield and Ivey 2000). They appear to avoid grassland habitats when vegetation exceeds 10 inches (25 centimeters). Invertebrates are also consumed in natural and managed seasonal wetlands.

Grain is also an important component to the sandhill crane's diet and as such agricultural habitat types are frequently utilized as foraging habitat. Common habitat types used for foraging include pastures, alfalfa, corn (chopped, disked, flooded, and stubble), tomatoes (flooded, ripped), and wheat (disked, ripped, flooded, stubble) (Ivey and Herziger 2003). Ivey (pers. comm. 2004) rated agriculture crops in the Plan Area in order of importance. Rice and corn were rated the highest, followed by winter wheat and irrigated pasture. Alfalfa was the next highest rated crop, followed by hay, dryland pasture, and row crops. Sandhill Crane use in the above crop types occurs even though the crops are harvested for farming income.

Habitats also important for greater sandhill cranes include flooded fields for roosting and rocky uplands (e.g., dirt and gravel roads) for collecting "grit." Roosting areas are located in shallowly flooded areas where cranes loaf during the day and seek protection from terrestrial predators at night. Although they will select sites with emergent vegetation along the periphery of the wetland, they rarely use roosts with heavy emergent vegetation (Littlefield and Ivey 2000).

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Cropland, Irrigated Pasture-Grassland, Valley Grassland, Seasonal Wetland, and Freshwater Marsh. Suitable habitat for night roosting include Vernal Pool, Seasonal Wetland, and Freshwater Marsh (Table 3-2).

Occurrences within the Plan Area

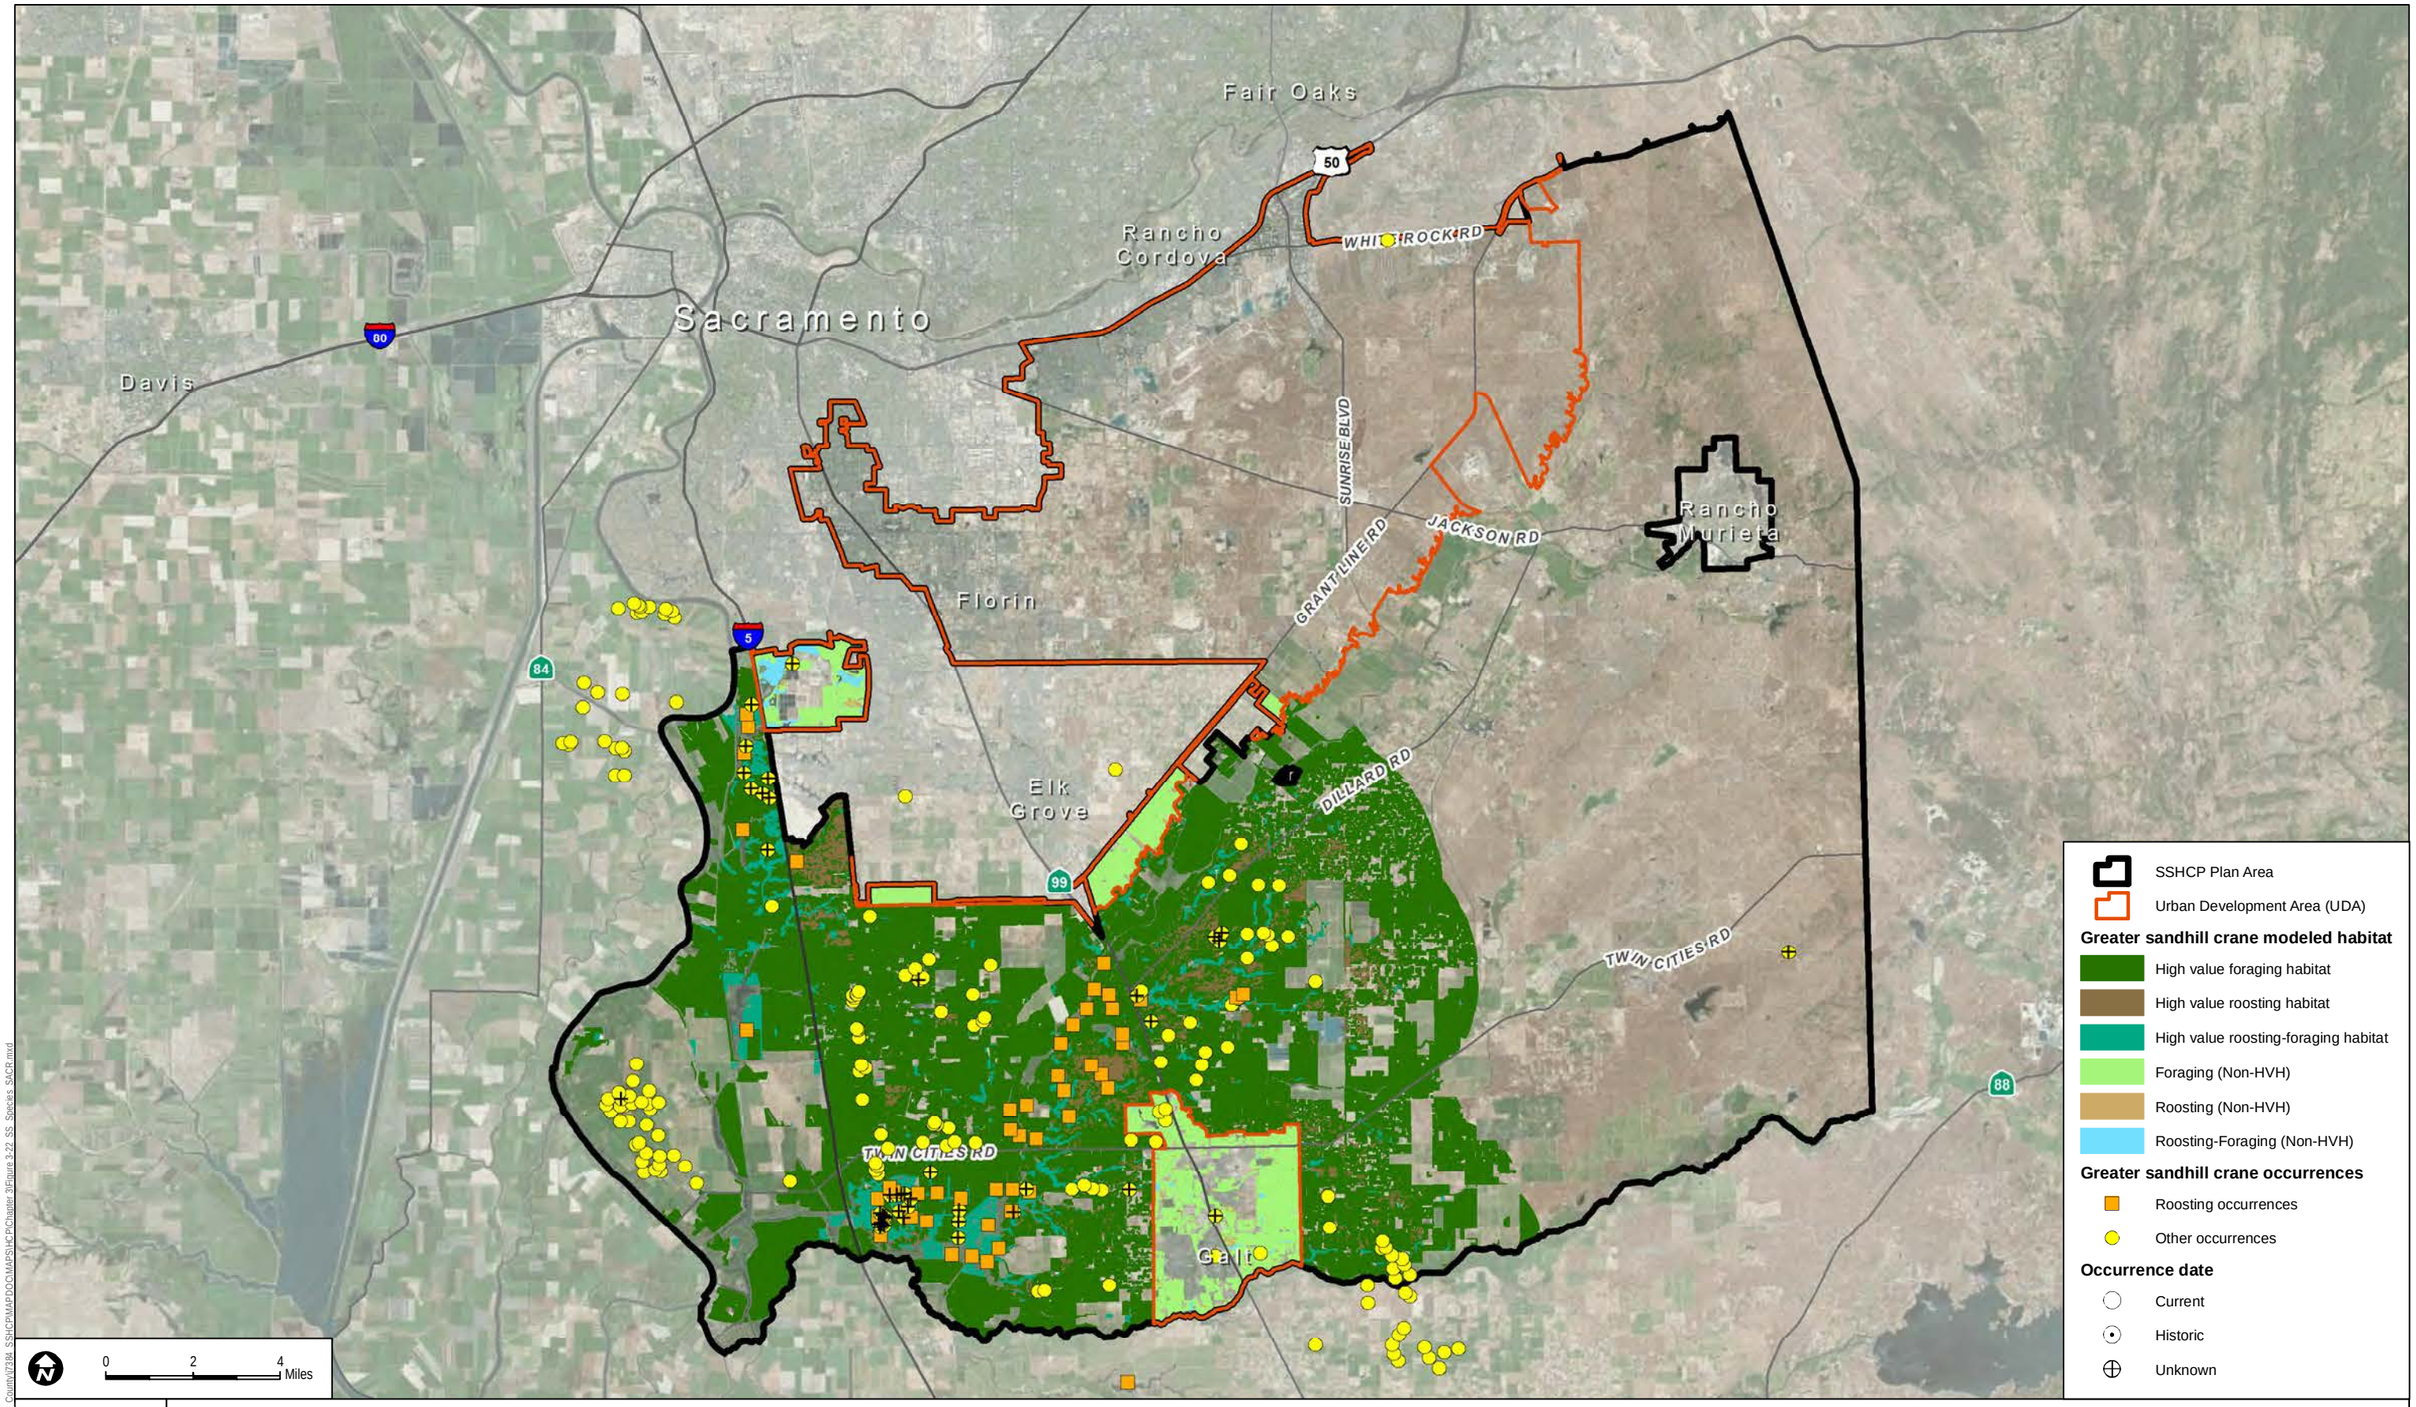
There are 210 documented occurrences of greater sandhill crane within the Plan Area. Eight are within the UDA including one in PPU 1, one in PPU 4, and six in PPU 8. Two hundred and two are outside the UDA, including 191 in PPU 6 and 11 in PPU 7.

Model Assumptions

- Greater sandhill cranes travel limited distances to foraging sites from night roost areas. The average distance traveled was 0.88 mile (range 0.17 to 1.89 miles) (Ivey and Herziger 2003) and 1.74 miles (Pogson 1990) between roost sites and foraging areas.
- The size of roost sites is variable. Sandhill cranes roosting in Oregon used sites between 1 and 300 acres (0.5 and 120 hectares).
- Littlefield (1993) recommended roost sites should be at least 20 acres (8 hectares).
- Greater sandhill crane use in the Plan Area principally occurs in the Cosumnes Floodplain (Sloat, as cited in SSHCP Appendix B).

Greater Sandhill Crane Habitat Model

Modeled night roosting habitat is Vernal Pool, Seasonal Wetland, and Freshwater Marsh within 2 miles of greater sandhill crane occurrences per discussion with USFWS staff and CDFW staff (Gardner, pers. comm. 2010; Adelsbach, pers. comm. 2010). This element of the species' model is consistent with the *Conservation Assessment for Greater Sandhill Cranes Wintering on the Cosumnes River Floodplain and Delta Regions of California* (Littlefield and Ivey 2000), although extends beyond the Cosumnes River Floodplain within the Plan Area. Modeled foraging habitat is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Seasonal Wetland, and Freshwater Marsh within 1.75 miles of modeled roosting habitat.



High-value habitat for greater sandhill crane is defined as modeled habitats above sea level and outside the UDA (i.e., modeled habitats within the UDA are excluded).

Figure 3-22 illustrates the location of modeled habitat as well as the documented occurrences of greater sandhill crane within the Plan Area.

Loggerhead Shrike (*Lanius ludovicianus*)

Habitat Requirements

Loggerhead shrikes occur in dry, open habitats including grasslands, pastures with fence rows, agricultural fields, open woodlands (savannas), scrub, and riparian areas. They inhabit open areas with clear visibility for hunting, perches for scanning, and scattered small trees and large shrubs for nesting. Loggerhead shrikes typically avoid completely treeless and shrubless areas (Cade and Woods 1997), as well as urbanized and densely wooded areas (Grinnell and Miller 1944). Winter foraging habitat is similar to summer breeding and foraging habitat, however, shrikes also use idle pastures and hayfields during the winter (Bartgis 1992).

INTENTIONALLY LEFT BLANK

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale; suitable habitat for nesting include Mine Tailing Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland (Table 3-2).

Occurrences within the Plan Area

There are 34 documented occurrences of loggerhead shrike within the Plan Area. Seven are within the UDA including two in PPU 1, one in PPU 2, two in PPU 3, one in PPU 4, and one in PPU 8. Twenty-seven occurrences are outside of the UDA, including three in PPU 5, 15 in PPU 6, seven in PPU 7, and two that are not within a PPU.

Model Assumptions

- In mainland California, the average size of territories averaged 21 acres (9 hectares) and ranged between 11 acres (4 hectares) and 40 acres (16 hectares) (Yosef 1996).
- Loggerhead shrikes occur year-round in suitable habitat throughout the Plan Area. They are probably regular breeders in the Plan Area in low densities (Trochet, pers. comm. 2004); however, their overall distribution, abundance, and population structure are not well known.

Loggerhead Shrike Habitat Model

Modeled foraging habitat is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale throughout the Plan Area. Modeled nesting habitat is Mine Tailing Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland throughout the Plan Area.

Figure 3-23 illustrates the location of modeled habitat as well as the documented occurrences of loggerhead shrike within the Plan Area.

Northern Harrier (*Circus cyaneus*)

Habitat Requirements

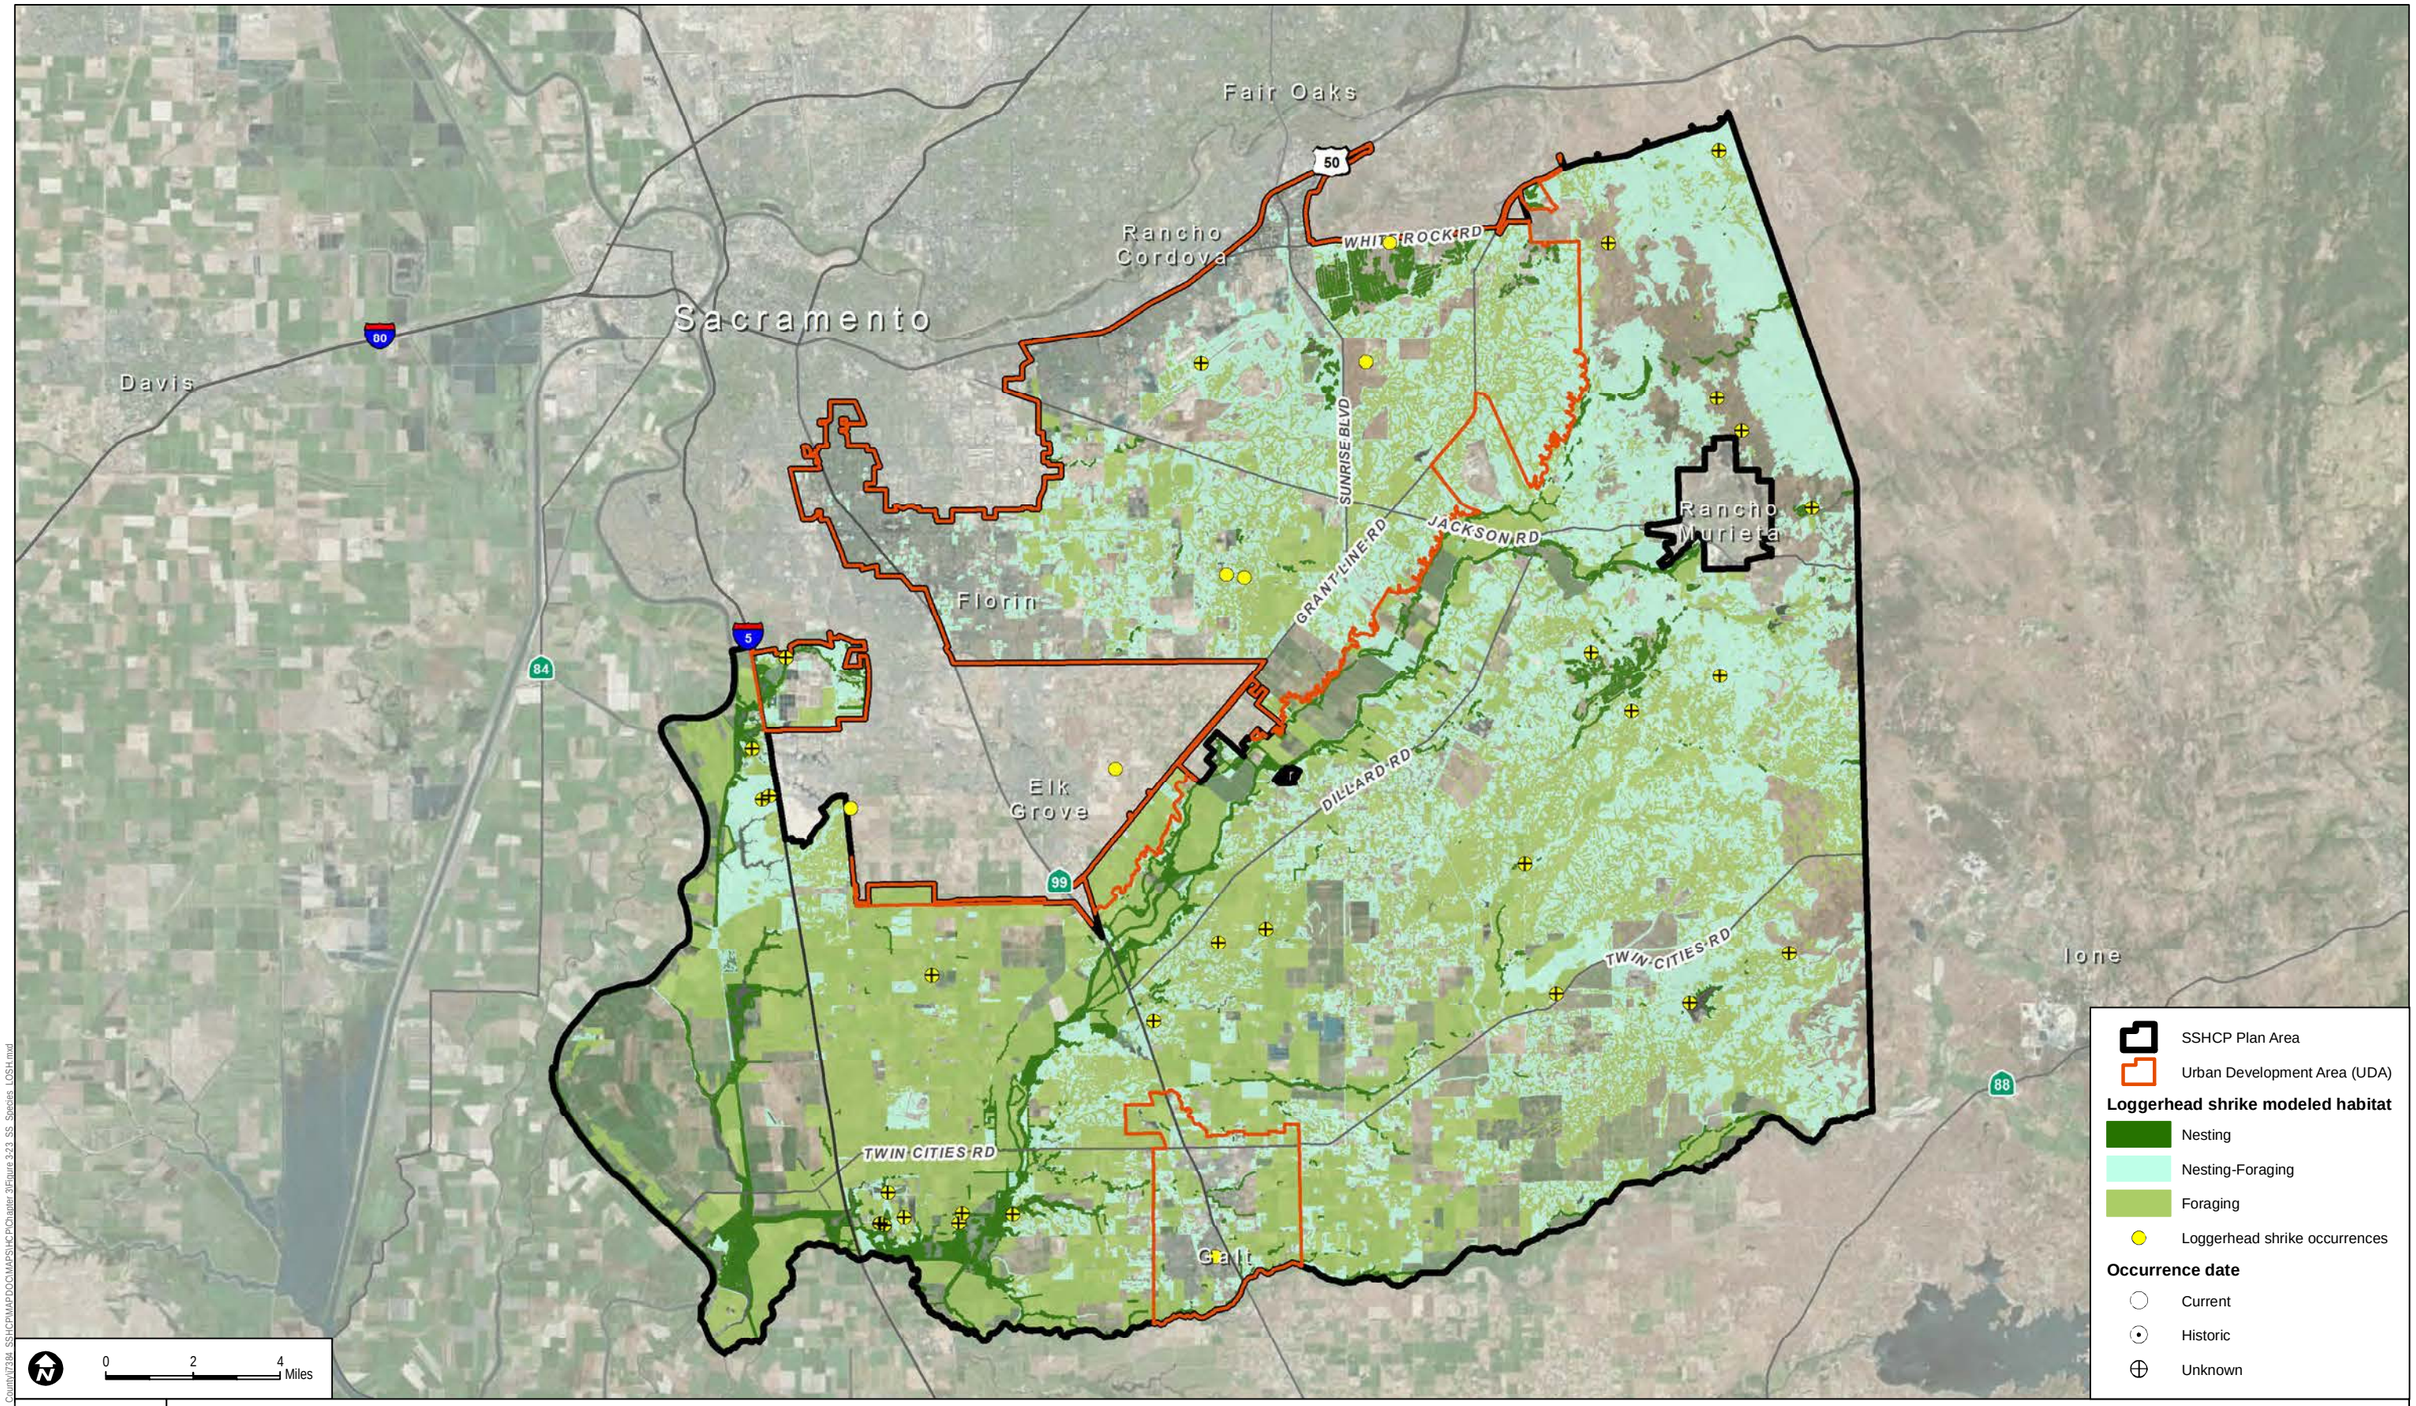
Northern harrier breeds in a variety of open grassland, wetland, and agricultural habitats. Open wetland habitats used for breeding include marshy meadows, wet and lightly grazed pastures, and freshwater and brackish marshes. Northern Harrier breeding habitat also includes dry upland habitats, including grasslands, croplands, drained marshlands, and shrub-steppe in cold deserts.

Although Midwestern populations use wetland habitats more frequently, western populations tend to use upland habitats (e.g., grasslands) disproportionately. Northern harriers winter throughout California where suitable habitat occurs. Wintering habitat includes open areas dominated by herbaceous vegetation, including grasslands, pastures, croplands, coastal sand dunes, brackish and freshwater marsh, and estuaries. Northern harriers rarely occur in forested areas (Grinnel and Miller 1944; MacWhirter and Bildstein 1996; Martin 1987).

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, and Freshwater Marsh. Suitable habitat for nesting includes Cropland, Irrigated Pasture-Grassland, and Valley Grassland (Table 3-2).

Occurrences within the Plan Area



There are 70 documented occurrences of northern harrier within the Plan Area. Twelve are within the UDA including, four in PPU 1, two in PPU 2, two in PPU 3, two in PPU 4, and two in PPU 8. Fifty-eight occurrences are outside of the UDA, including five in PPU 5, 42 in PPU 6, seven in PPU 7, and four that are not within a PPU.

Model Assumptions

- Reported territory sizes for males range from 2 to 272 acres (0.8 to 110 hectares); females typically defend a smaller territory (Martin 1987; Simmons 1983).
- During the breeding season, reported average home range sizes from eight studies were 420 to 37,067 acres (170 to 15,000 hectares) (MacWhirter and Bildstein 1996).
- Males reportedly will hunt ≥10 kilometers (≥6 miles) from the nest (Barnard 1983; Thompson-Hanson 1984).
- Northern harriers occur in suitable habitat within the Plan Area and are probably regular breeders (Trochet, pers. comm. 2004); however, their overall range, abundance, and population structure are not well known.

Northern Harrier Habitat Model

Modeled foraging habitat is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, and Freshwater Marsh throughout the Plan Area. Modeled nesting habitat is Cropland, Irrigated Pasture-Grassland, and Valley Grassland throughout the Plan Area.

INTENTIONALLY LEFT BLANK

Figure 3-24 illustrates the location of modeled habitat as well as the documented occurrences of northern harrier within the Plan Area.

Swainson's Hawk (*Buteo swainsoni*)

Habitat Requirements

In the Central Valley of California, there are about 25 different tree species that have been utilized for nesting (CDFG 2010). The most common nest trees are Fremont's cottonwood (*Populus fremontii*), oaks (*Quercus* spp.), willows (*Salix* spp.), walnuts (*Juglans* spp.), eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and Deodar cedar (*Cedrus deodara*). Most nest trees are associated with riparian systems. Schlorff and Bloom (1984) found 87% of all Swainson's hawk's nests in the Central Valley to be associated with riparian systems. Within his study area in parts of Yolo, Sacramento and San Joaquin Counties, Estep (1989) found 78% of nest trees to be in riparian systems. Swainson's hawk's nests are also found well away from waterways in lone trees in fields and pastures, in trees along roadside edges, in small groves, around farm buildings, and in some urban areas. Nest trees can also be found in proximity to farm buildings (Bloom 1980; Swolgaard 2004), often in large, well-established, exotic tree species or relict natives.

Nesting in completely urbanized areas is an unusual phenomenon that has recently been discovered in some particular urban settings: 1979 in Davis and 1983 in Stockton (D. Yee, pers. comm. 2004). Urban-nesting always occurs in association with suitable foraging habitat being relatively close to the nest (e.g., Stockton and Davis are surrounded in all directions by high-quality foraging habitat in suitable agricultural crops) (Holt pers. obs., as cited in SSHCP Appendix B).

Swainson's hawks forage successfully in a variety of farming habitats. Alfalfa is the crop that provides the highest foraging value due to high prey densities and regular harvesting and irrigation that make prey available for capture. However, a variety of suitable farming habitats also provide valuable foraging habitats at differing times and for different prey species during the period of time when Swainson's hawks are in the Plan Area. This mosaic of suitable foraging habitats provides the best opportunity for regular and successful hunting during the nesting season (Holt pers. obs., as cited in SSHCP Appendix B).

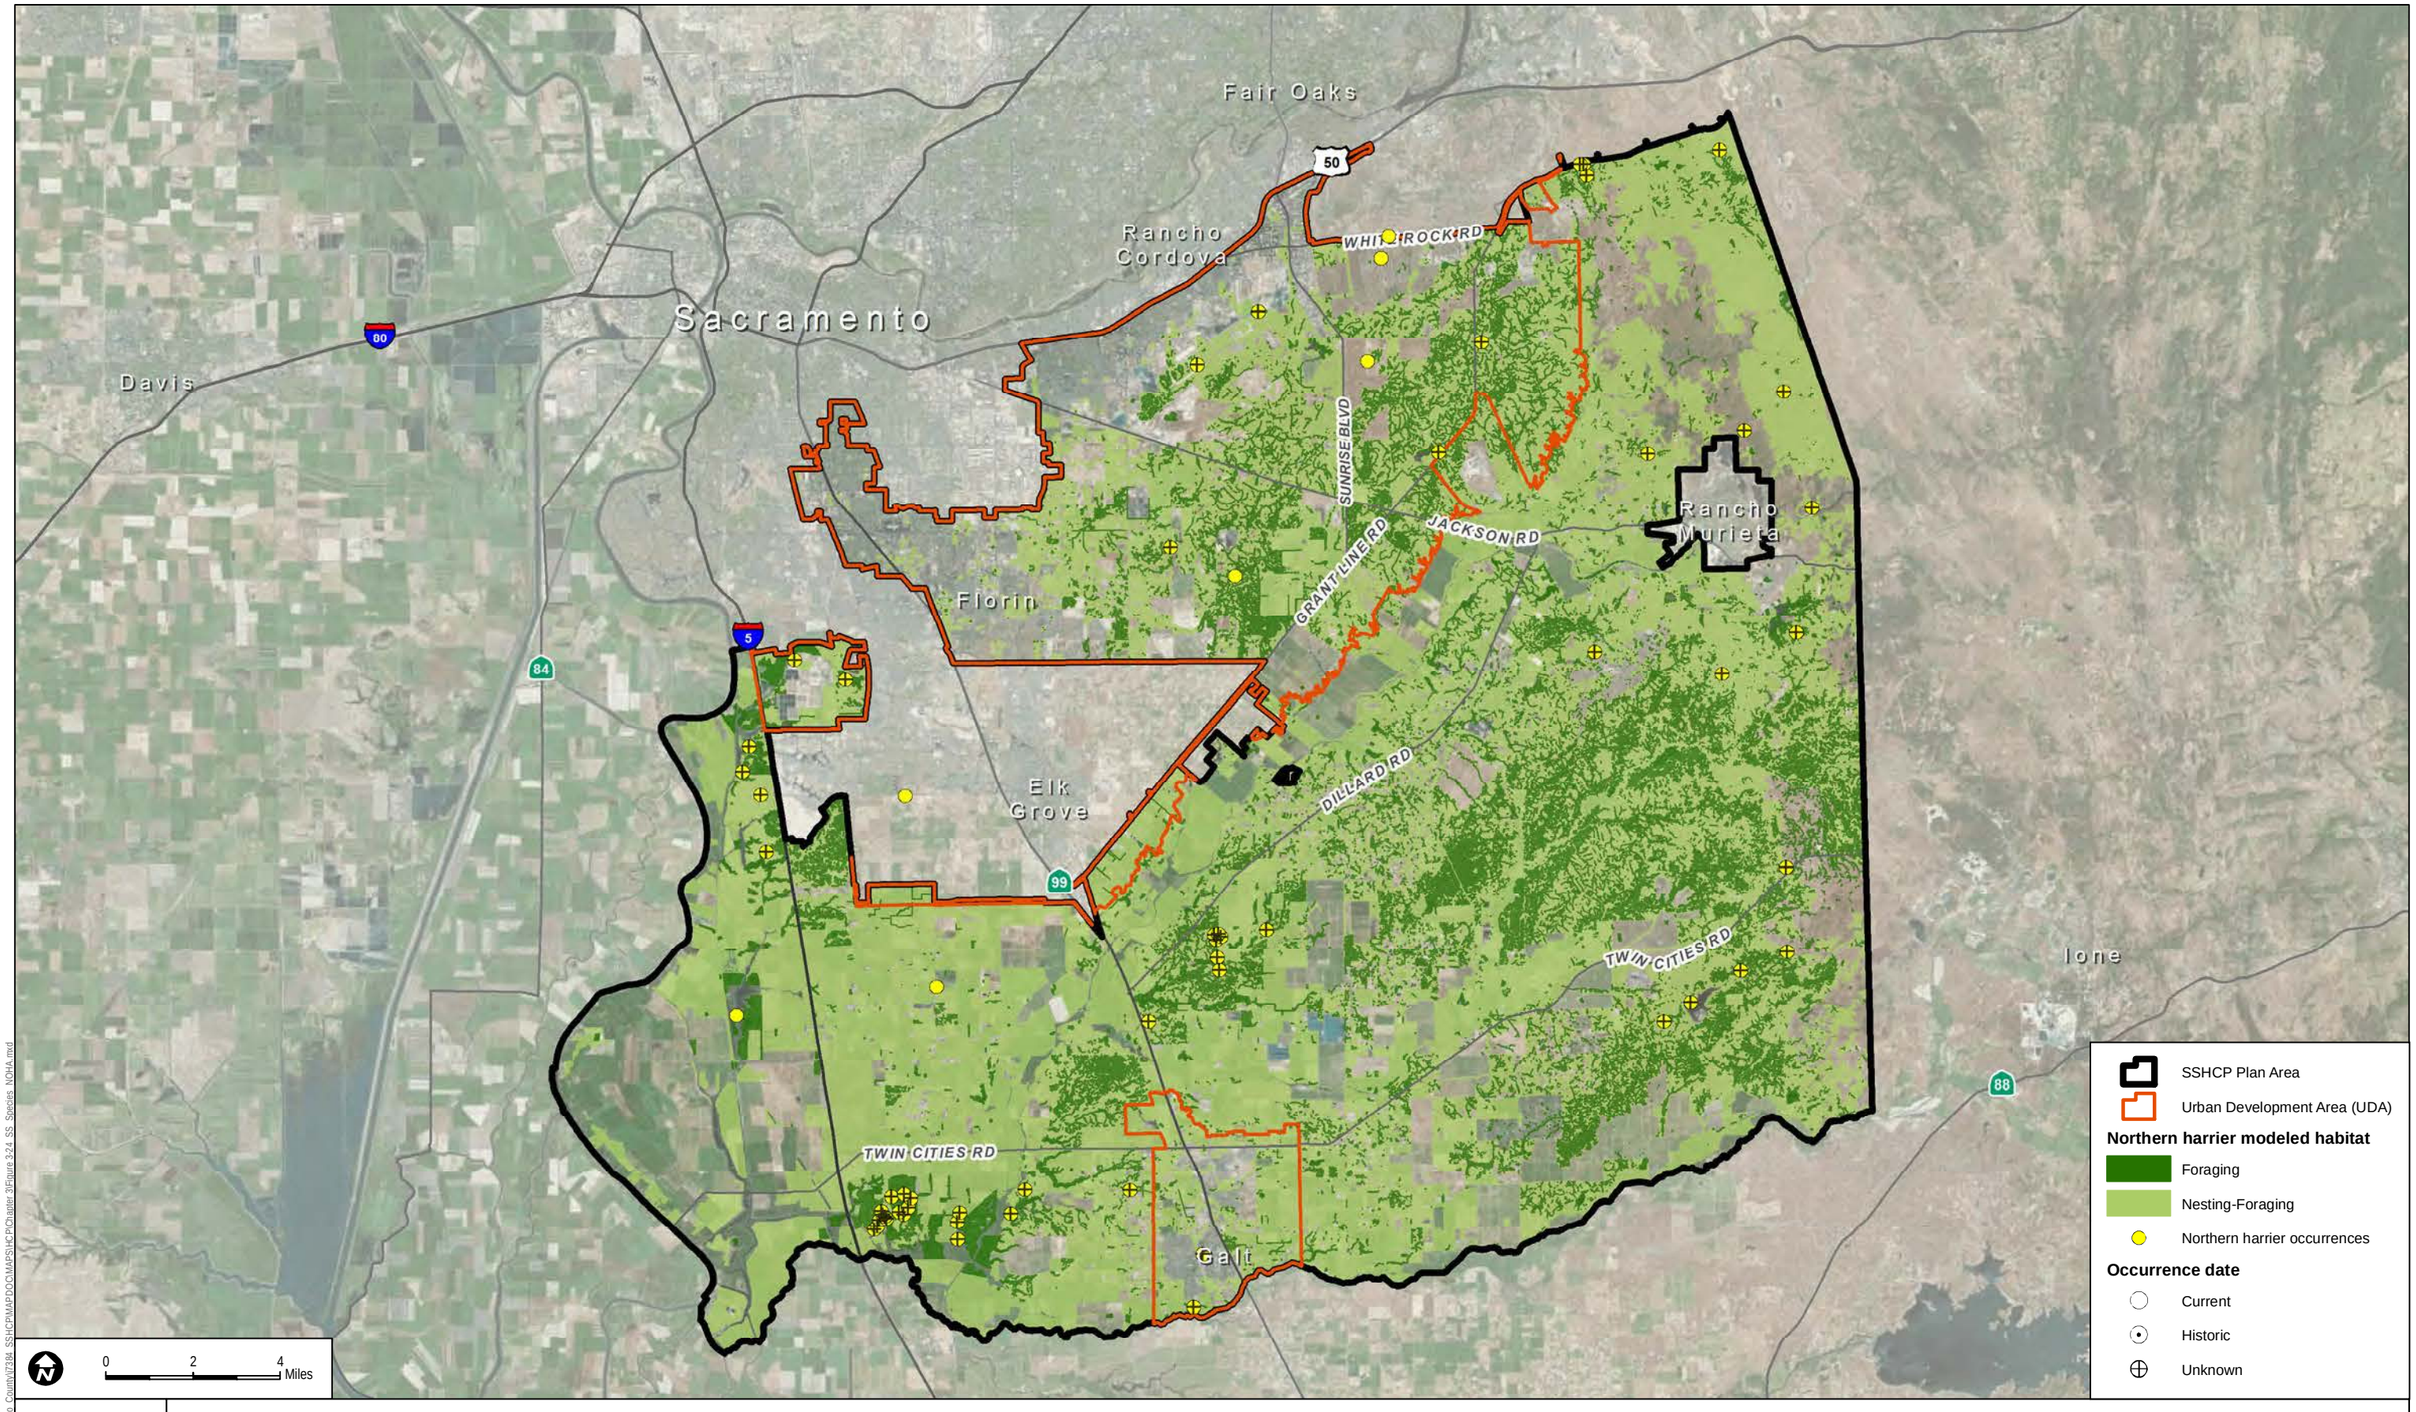
Dry pasture is largely comprised of annual grassland land covers and is grazed primarily by cattle during some part of the year. A large portion of the Swainson's hawk's historical habitat is believed to be similar to dry pasture, although the prey species, their abundance, and availability are likely quite different today as introduced grasses and forbs and introduced grazers now dominate this habitat (Holt pers. obs., as cited in SSHCP Appendix

B). Therefore, direct comparisons with historical conditions should be considered with caution. Swolgaard (2004) observed Swainson's hawks foraging in grassland habitats, but noted that its frequency of use was lower than expected based on its availability.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale. Suitable habitat for nesting includes mixed Riparian Woodland and Mixed Riparian Scrub (Table 3-2).

Occurrences within the Plan Area



There are 410 documented occurrences of Swainson's hawk within the Plan Area. Sixty-two are within the UDA, including 10 within PPU 1, five in PPU 2, eight in PPU 3, 17 in PPU 4, 20 in PPU 8, and two that are not within a PPU. Three hundred and forty either are outside of the UDA, including 35 in PPU 5, 284 in PPU 6, 28 in PPU 8, and one that in not within a PPU.

Model Assumptions

- Radio-tagged male Swainson's hawks were recorded to travel as far as 17 miles (Estep 1989) and 18 miles (Babcock 1995) from a nest to exploit more favorable agricultural foraging opportunities.
- Estep (1989) found mean home ranges to be 6,818 acres. While Babcock (1995) plotted out 9,978 acres as the mean home range in his study area in eastern Yolo County.
- Swainson's hawks are typically not found at elevations above 500 feet in Sacramento County (Gifford et al. 2012).
- Swainson's hawk occurrences are recorded throughout the Plan Area (CDFG 2010; ebird.org 2005–2010; Estep 2006 and 2007; Gill Ranch Survey 2003).

Swainson's Hawk Habitat Model

Modeled foraging habitat is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale throughout the Plan Area at elevations below 500 feet. Modeled nesting habitat is mixed Riparian Woodland and Mixed Riparian Scrub throughout the Plan Area at elevations below 500 feet.

INTENTIONALLY LEFT BLANK

High-value habitat for Swainson's hawk is defined by the SSHCP as modeled foraging habitat occurring in the western portion of the Plan Area (within PPUs 4, 6, and 8).

Figure 3-25 illustrates the location of modeled habitat as well as the documented occurrences of Swainson's hawk within the Plan Area.

Tricolored Blackbird (*Agelaius tricolor*)

Habitat Requirements

During the breeding season, tricolored blackbirds typically nest in dense colonies (some estimated as having 200,000+ nests), with males defending small territories and mating with one to four females (Beedy and Hamilton 1999). They are also considered itinerant breeders, sometimes nesting more than once at different locations during the breeding season. Studies by Neff (1937) reported that nesting colonies are often located in seasonal wetlands with tules and cattails present. More recent studies indicate that nesting colonies are also regularly found in Himalayan blackberries (*Rubus discolor*) (Cook 1999) and grain fields (DeHaven 2000). Other substrates where they have been observed nesting include giant European reed (*Arundo donax*), safflower (*Carthamus tinctorius*) (DeHaven et al. 1975), tamarisk (*Tamarix* spp.), elderberry (*Sambucus* spp.), poison-oak (*Toxicodendron diversilobum*), and riparian scrublands and forests (e.g., *Salix, Populus*, and *Fraxinus* spp.) (American Birds file data).

Tricolored blackbird foraging habitats in all seasons include annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields (such as large tracts of alfalfa and pastures with continuous haying schedules, and recently tilled fields), cattle feedlots, and dairies. They also forage occasionally in Mixed Riparian Scrub habitats along marsh borders. Weed-free row crops, intensively managed vineyards, and orchards do not serve as regular foraging sites (Beedy and Hamilton 1997, 1999; DeHaven 2000).

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, and Open Water. Suitable habitat for nesting includes Cropland, Valley Grassland, Seasonal Wetland, and Freshwater Marsh (Table 3-2).

Occurrences within the Plan Area

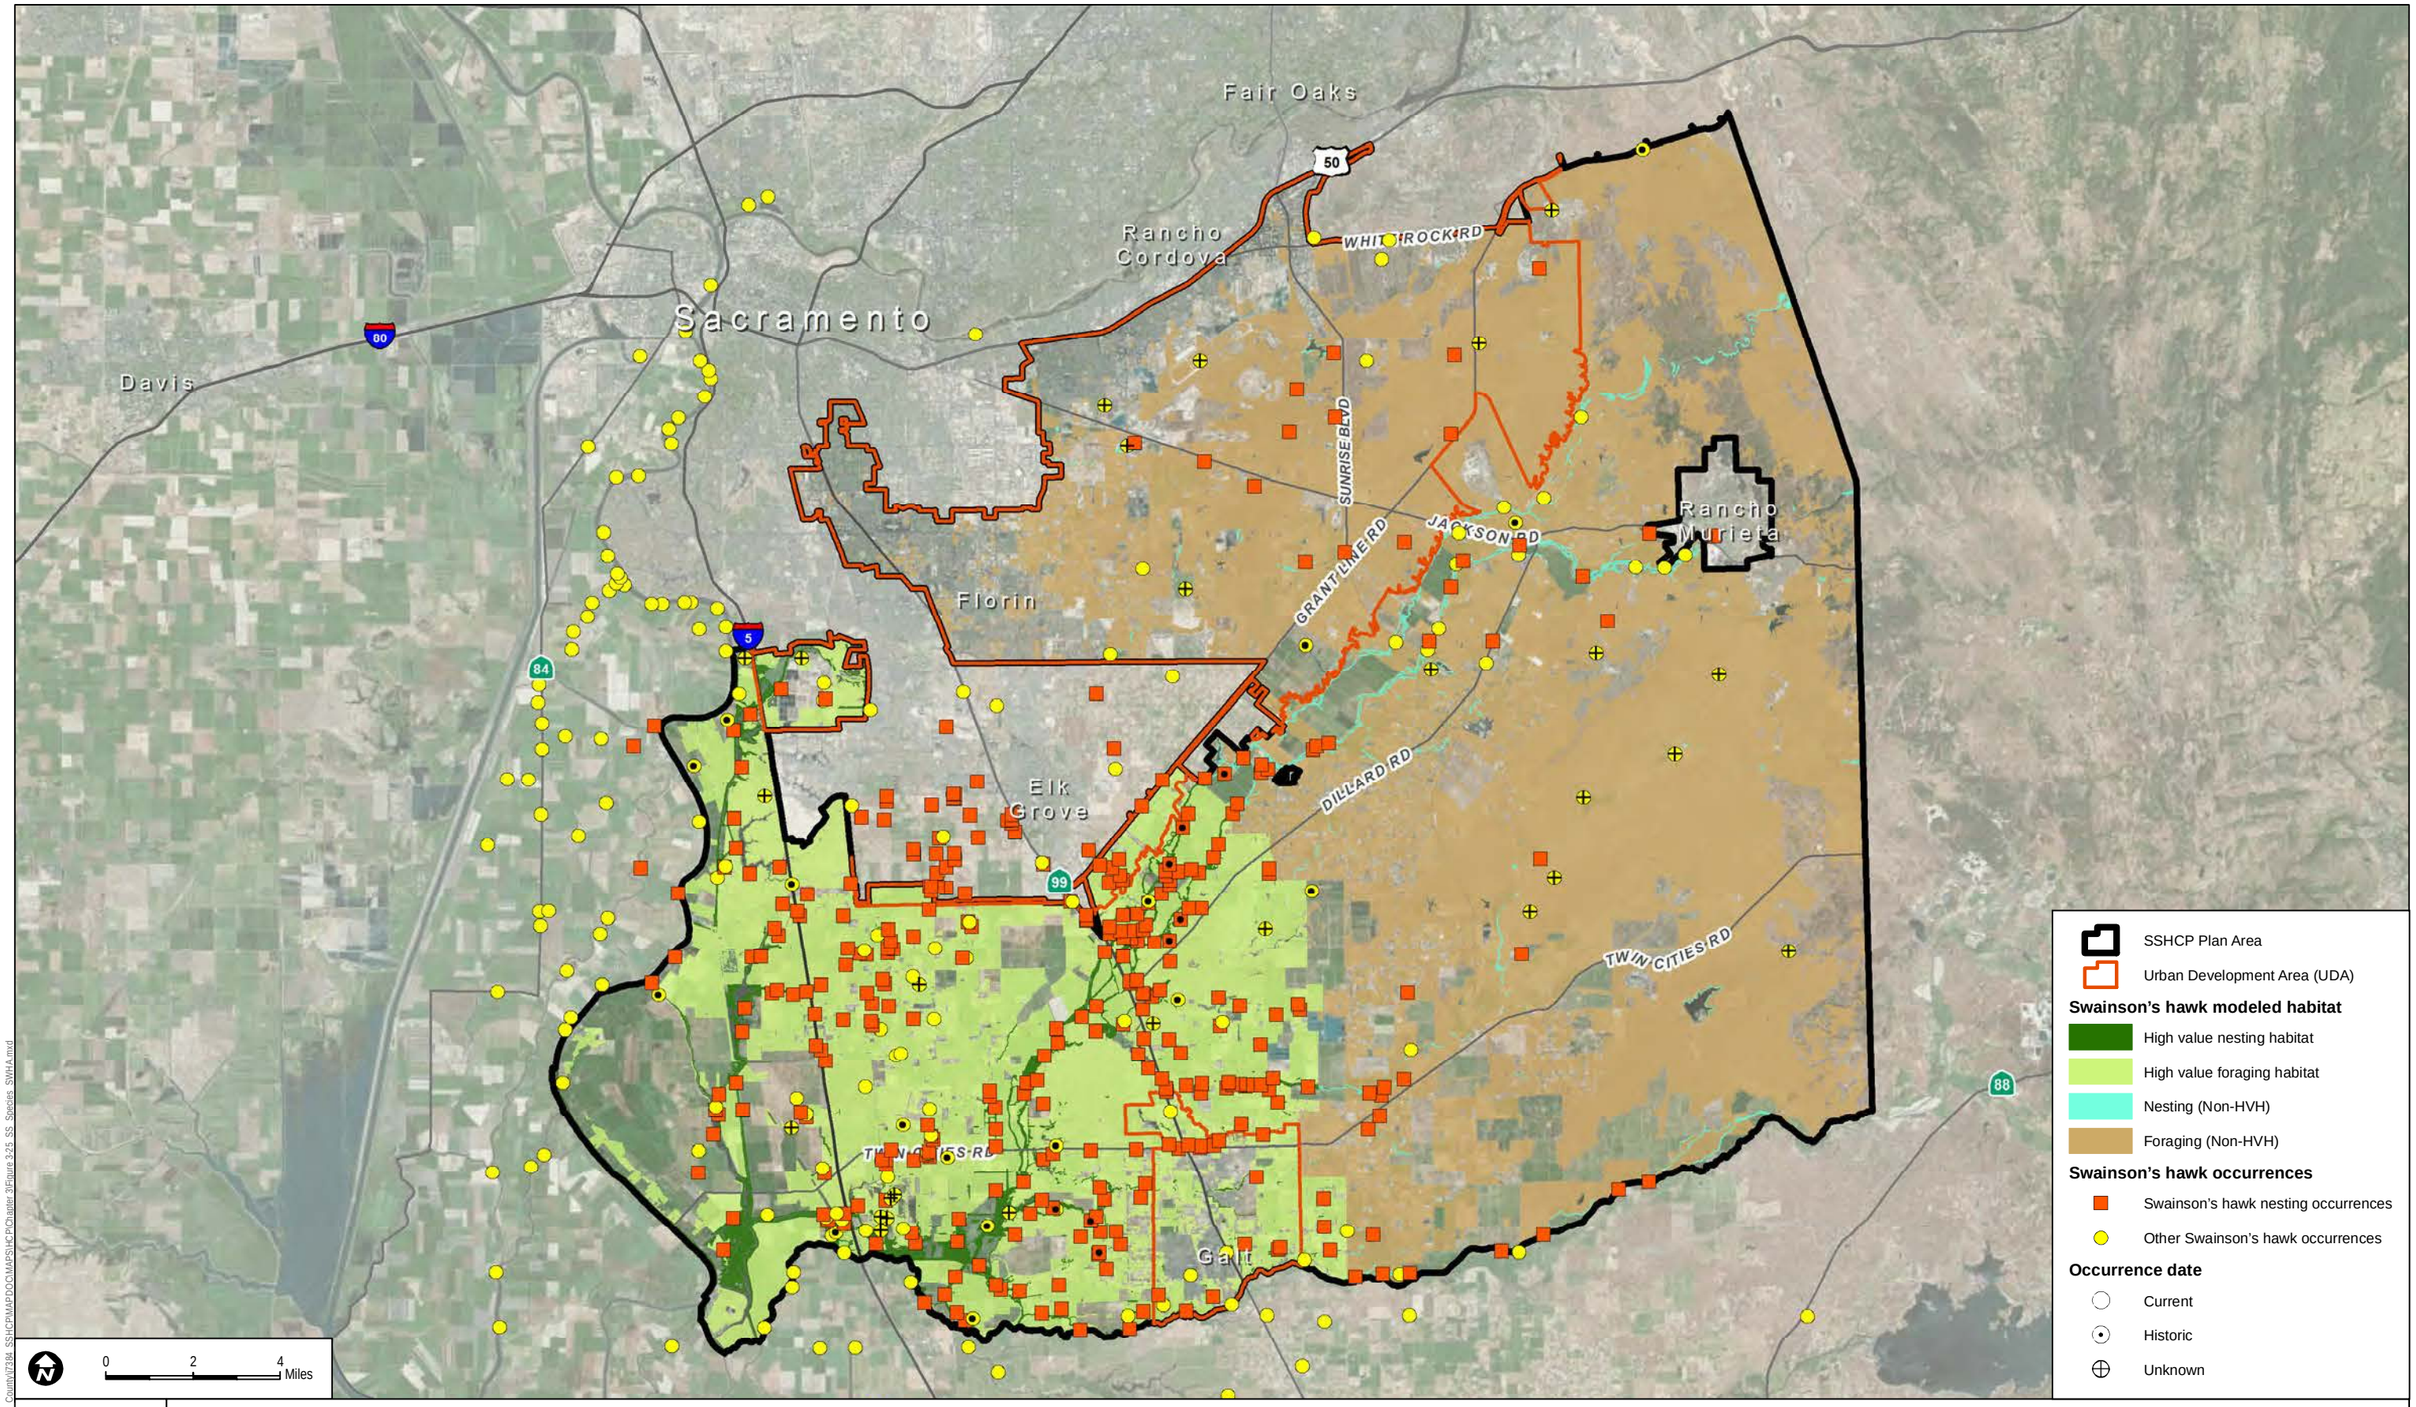
There are 36 documented occurrences of tricolored blackbird within the Plan Area. Twenty-two occurrences are within the UDA, including three in PPU 2, 15 in PPU 3, one in PPU 4, and three

that are not within a PPU. Fourteen occurrences are outside of the UDA, including three in PPU 5, four in PPU 6, five in PPU 7, and two that are not within a PPU.

Model Assumptions

- Over the past couple of decades tricolored blackbird colony sites have been documented throughout the Plan Area.
- DeHaven et al. (1975) banded 33,058 nestlings and only 39% of band recoveries were re-located within 16 kilometers (10 miles) of natal colonies.
- Most tricolored blackbirds forage within five kilometers (three miles) of their colony sites (Orians 1961), but commute distances of up to 13 kilometers (8 miles) have been reported (Hamilton, pers. comm. 2004).

Tricolored Blackbird Habitat Model



Modeled foraging habitat is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, and Open Water throughout the Plan Area. Modeled nesting habitat is Cropland, Valley Grassland, Seasonal Wetland, and Freshwater Marsh throughout the Plan Area.

Figure 3-26 illustrates the location of modeled habitat as well as the documented occurrences of tricolored blackbird within the Plan Area.

Western Burrowing Owl (*Athene cunicularia hypugaea*)

Habitat Requirements

The most important habitat consideration for burrowing owls is the availability of underground burrows throughout their life cycle. Throughout their range, they use burrows excavated by fossorial mammals or reptiles (Karalus and Eckert 1987). Where the number and availability of natural burrows are limited, owls may occupy other natural and unnatural sites such as rock outcrops (Gleason and Johnson 1985; Rich 1986), concrete and asphalt (Trulio 1994), cavities under piles of rubble, drainage culverts, discarded pipe and other tunnel-like structures, and human-made artificial burrows (Collins and Landry 1977).

INTENTIONALLY LEFT BLANK

Over their range, burrowing owls inhabit grasslands, deserts, sagebrush scrub, agricultural areas (including pastures and untilled margins of Cropland), earthen levees and berms, coastal uplands, and urban vacant lots, as well as the undeveloped margins of airports, golf courses, roads, and railroad beds. In California, the four cover types most frequently occupied by burrowing owls are: grasslands adjacent to intensive agriculture; intensive agriculture where owls nest along irrigation banks; large, unfragmented grasslands; and small grassland and ruderal patches surrounded by and adjacent to urban development (Rosenberg and DeSante 1997; Rosenberg and Haley 2004).

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable foraging habitat based on life history descriptions include Blue Oak Savanna, Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, and Stream/Creek (VPIH); suitable habitat for nesting include Valley Grassland, Blue Oak Savanna, Cropland, and Irrigated Pasture-Grassland (Table 3-2).

Occurrences within the Plan Area

There are 97 documented occurrences of western burrowing owl within the Plan Area. Thirty-six are within the UDA, including two in PPU 1, 16 in PPU 2, two in PPU 3, 12 in PPU 4, and four that are not within a PPU. Sixty-one are outside of the UDA, including three in PPU 1, one in PPU 5, 30 in PPU 6, 23 in PPU 7, and four that are not within a PPU.

Model Assumptions

- During the breeding season, adult male Burrowing Owls have been documented foraging over a range of 0.8 to 1.2 square miles (2 to 3 square kilometers) (Haug and Oliphant 1987), and primarily within 0.4 mile (600 meters) of the nest burrow (Gervais et al. 2003; Rosenberg and Haley 2004).
- In two burrowing owl demography studies conducted in the San Francisco Bay Area, owls moved an average distance of 0.5 to 0.9 mile (0.8 to 1 kilometers) between breeding seasons. Of this sample population, 27% remained at the same nest site; 14% dispersed less than 265 feet (81 meters) away; 34% dispersed 0.05 to 0.5 mile (80 to 805 meters); 8% dispersed 0.5 to 1.0 mile (805 meters to 2 kilometers); 14% dispersed 1 to 5 mile (2 to 8 kilometers); and 2% moved 5 to 10 miles (8 to 16 kilometers) (Chromczak unpublished data, cited in CBD et al. 2003).
- Western burrowing owls occur in suitable habitat throughout the Plan Area; however, their overall distribution, abundance, and population structure are not well known.

- Although burrowing owl populations have declined or disappeared from much of their historical habitat, outlying areas of Sacramento County still provide suitable habitat for the species. Burrowing owls are known to occupy patches of habitat in the western part of the Plan Area that extend from the Sacramento Regional County Sanitation District Bufferlands (Jones, pers. comm. 2004) to The Nature Conservancy's Cosumnes River Preserve (Reiner, pers. comm. 2004), as well as patches of habitat in the rolling grasslands in eastern Sacramento County. The Meadowview and Pocket areas within the City of Sacramento (outside the Plan Area) support disjunct, isolated populations north to Florin Road.

Western Burrowing Owl Habitat Model

Modeled wintering habitat is Blue Oak Savanna, Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, and Stream/Creek (VPIH) throughout the Plan Area. Modeled nesting habitat is Valley Grassland, Blue Oak Savanna, Cropland, and Irrigated Pasture-Grassland throughout the Plan Area.

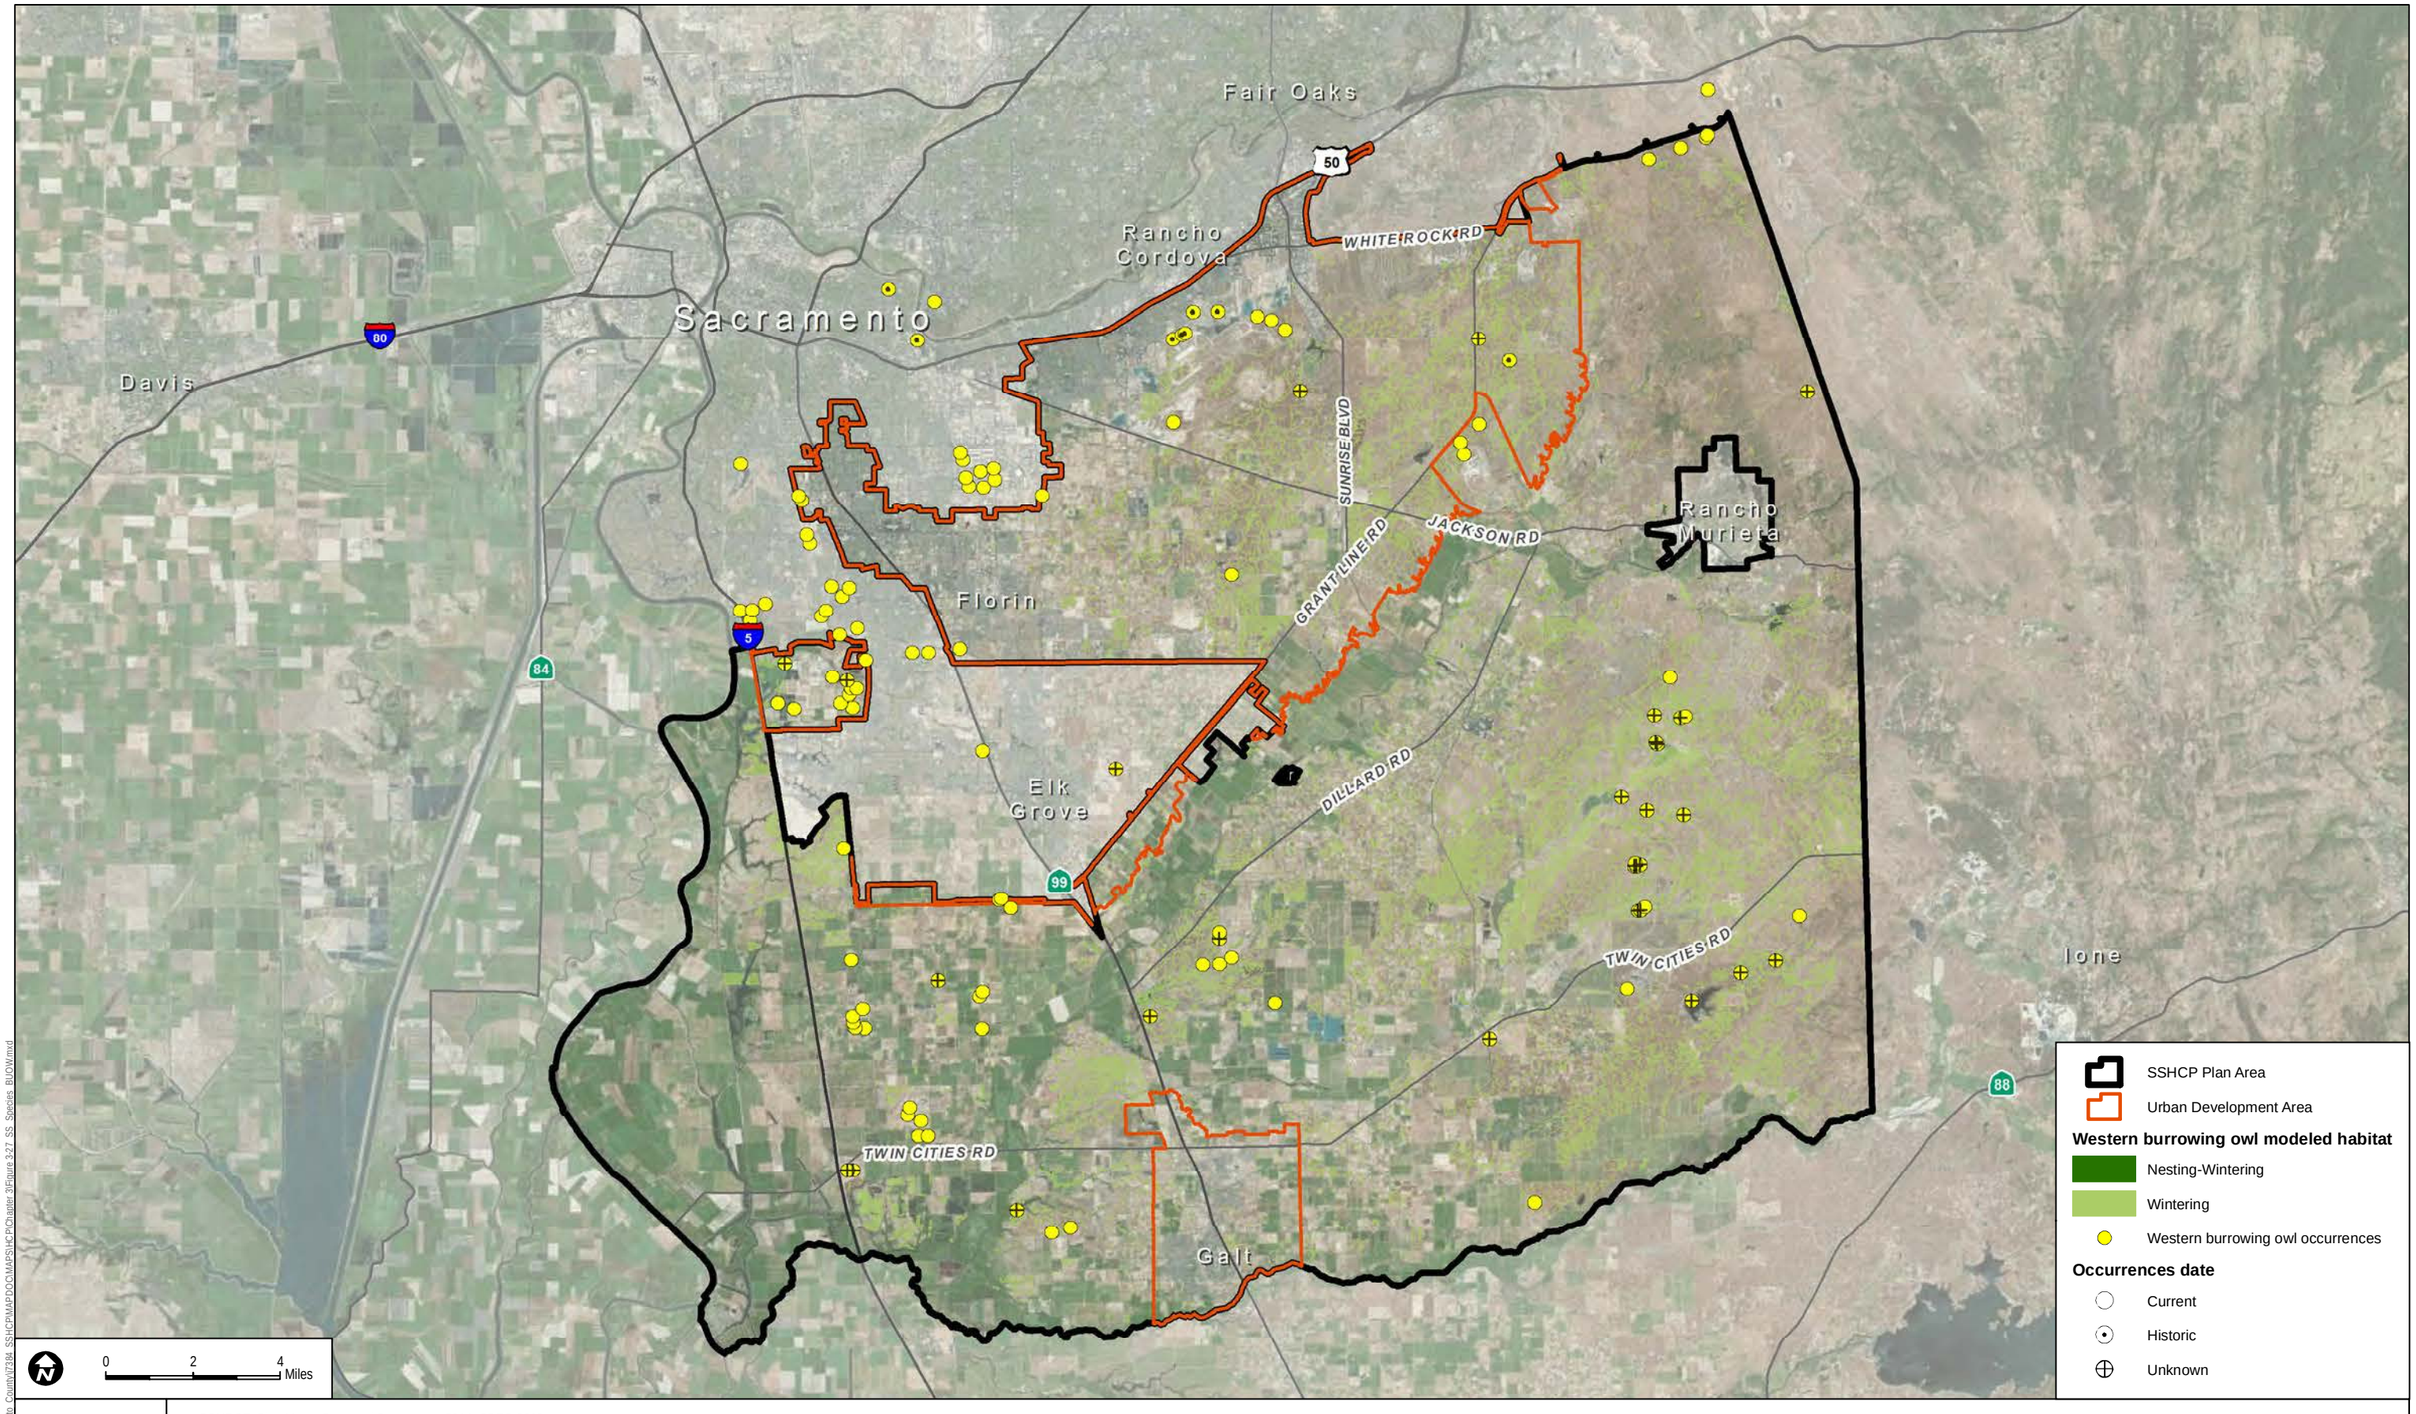

Figure 3-27 illustrates the location of modeled habitat as well as the documented occurrences of western burrowing owl within the Plan Area.

White-Tailed Kite (*Elanus leucurus*)

Habitat Requirements

White-tailed kites generally inhabit low-elevation grasslands, wetlands dominated by grasses, oak woodlands, and agricultural and riparian areas (Dunk 1995). Nest sites are rarely found in isolated trees. They are usually located on the edge of riparian habitats, or in hedgerows and groups of trees, and are commonly found adjacent to natural vegetation, pasture crops (alfalfa) and sugar beets (Sloat, as cited in SSHCP Appendix B).

White-tailed kites use a variety of habitat types for foraging and the importance of these habitats is dependent on vegetation structure and prey abundance. Lightly grazed or ungrazed grasslands/pastures support larger prey populations and are thus considered more suitable, although intensively cultivated areas are also used (Dunk 1995). In cultivated areas, perennial crops such as alfalfa and sugar beets tend to support higher prey numbers, and White-tailed kite nest densities have been highly correlated with these two crops (Erichsen et al. 1994). Warner and Rudd (1975) reported that foraging primarily occurred in two habitat types, riparian and irrigated cultivated land (e.g., alfalfa, tomatoes, sugar beets).

INTENTIONALLY LEFT BLANK

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Blue Oak Savanna, Cropland, Irrigated Pasture-Grassland, Valley Grassland, Mixed Riparian Scrub, Vernal Pool, Seasonal Wetland, and Swale. Suitable habitat for nesting include Blue Oak Woodland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub (Table 3-2).

Occurrences within the Plan Area

There are 62 documented occurrences of white-tailed kite within the Plan Area. Twenty are within the UDA including two in PPU 1, seven in PPU 2, four in PPU 3, two in PPU 4, one in PPU 8, and four that are not within a PPU. Forty-two are outside the UDA, including five in PPU 5, 34 in PPU 6, and three that are not within a PPU.

Model Assumptions

- Territory sizes estimated along the south coast of California near Long Beach ranged from 22 to 128 acres (nine to 52 hectares) (Waian 1973) and near San Diego from 42 to 217 acres (17 to 88 hectares) (Henry 1983).
- During winter and the breeding season, Warner and Rudd (1975) found foraging from nest or perch sites extended up to 2 miles, but most were less than 0.6 mile.
- No regularly occurring surveys have been conducted throughout the SSHCP Study Area, however, White-tailed kites are known to nest or forage throughout the Study Area (Conard, pers. comm. 2004).

White-Tailed Kite Habitat Model

Modeled foraging habitat is Blue Oak Savanna, Cropland, Irrigated Pasture-Grassland, Valley Grassland, Mixed Riparian Scrub, Vernal Pool, Seasonal Wetland, and Swale throughout the Plan Area. Modeled nesting habitat is Blue Oak Woodland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub throughout the Plan Area.

Figure 3-28 illustrates the location of modeled habitat as well as the documented occurrences of white-tailed kite within the Plan Area.

3.4.6 Mammals

American Badger (*Taxidea taxus*)

Habitat Requirements

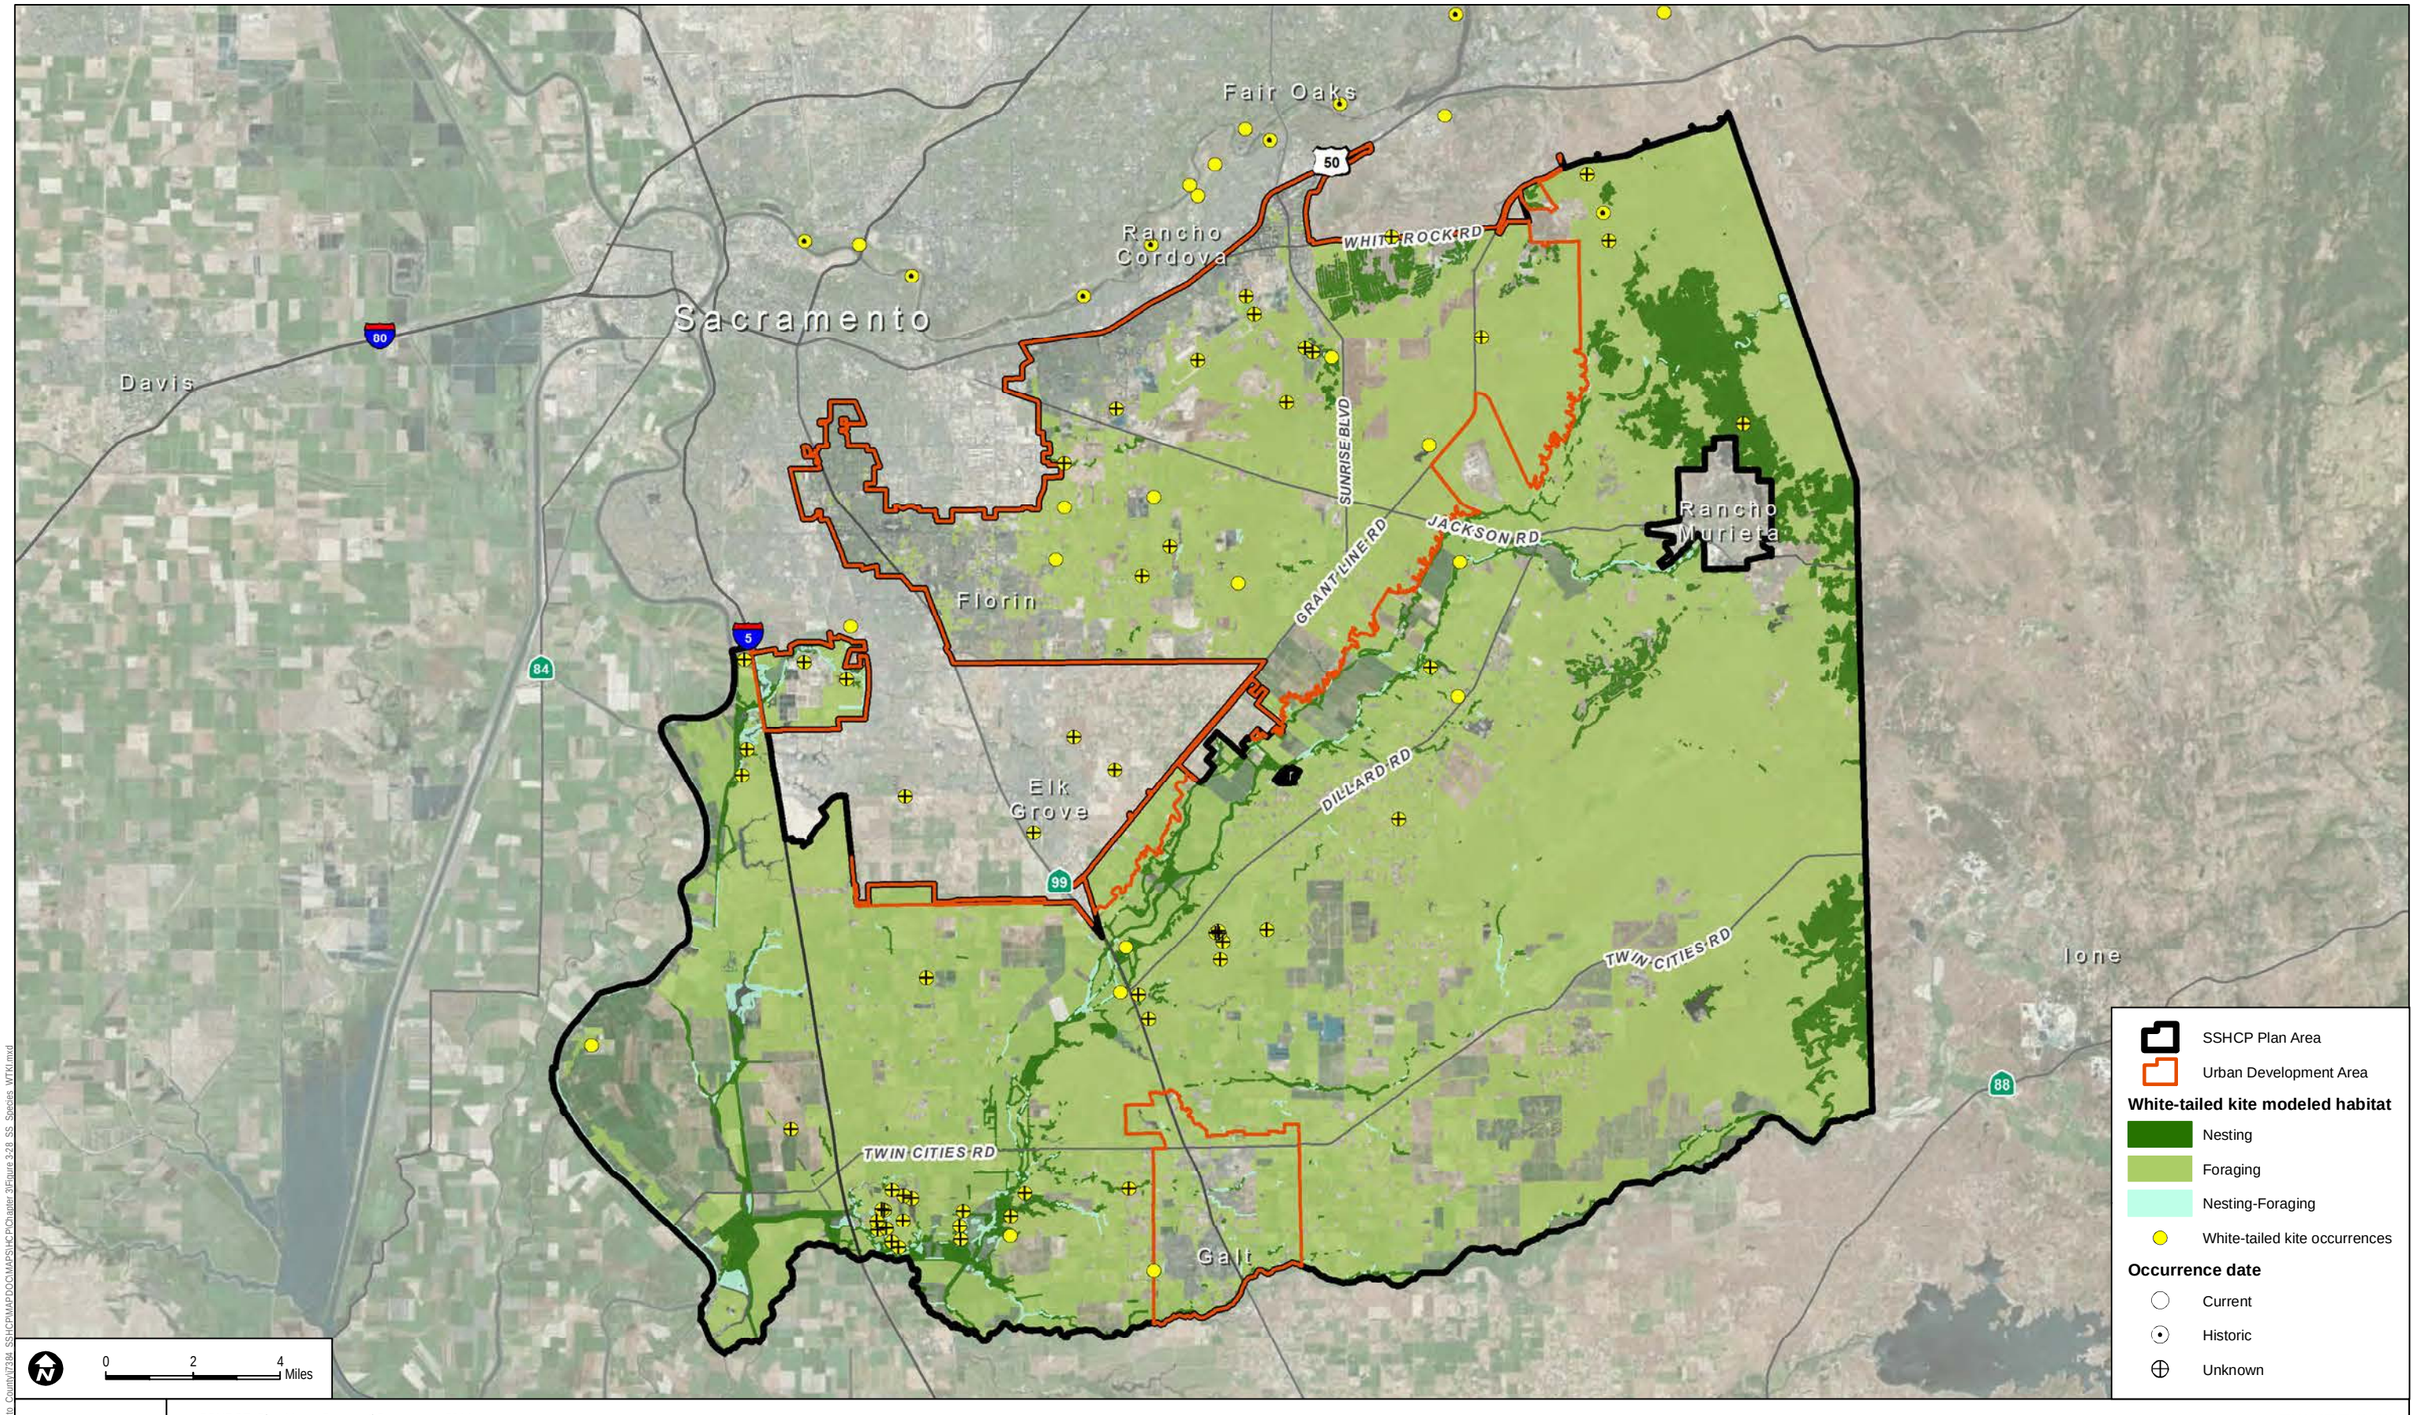
American badger occurs in a variety of open habitats, including grasslands, shrublands, savannas, and meadows. The Plan Area is within American badger's range in California. American badgers have been documented in the northeastern portion of the Plan Area.

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat based on life history descriptions include Blue Oak Savanna, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale (Table 3-2).

Occurrences within the Plan Area

There are nine documented occurrences of American badger within the Plan Area. Eight are within the UDA, including one in PPU 1 and seven in PPU 2. One occurrence is outside of the UDA in PPU 1.



Model Assumptions

- Female and male home range sizes in Utah have been estimated at 338–751 acres and 1,327–1,549 acres, respectively (Lindzey 1978). In Idaho, female and male badger home ranges averaged 400 acres and 600 acres, respectively (Messick and Hornocker 1981).
- The SSHCP Study Area is positioned within American badger's California range; and Badgers have been documented in the northeastern portion of the Plan Area.
- Badgers require large relatively undisturbed areas; therefore, primary habitat occurs in the eastern grasslands and rangelands of the Plan Area.

American Badger Habitat Model

Modeled habitat is Blue Oak Savanna, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale within rural portions of the Plan Area.

Figure 3-29 illustrates the location of modeled habitat as well as the documented occurrences of American badger within the Plan Area.

INTENTIONALLY LEFT BLANK

Western Red Bat (*Lasiurus blossevillii*)

Habitat Requirements

Western red bat roosts in the foliage of large shrubs and trees in habitats bordering forests, rivers, agricultural areas, and urban areas (Harvey et al. 1999). Roosts are commonly in edge habitats adjacent to streams or open fields, in orchards, and sometimes in urban areas with mature trees (Western Bat Working Group 1998). Pierson et al. (1999) describe roosting habitat as large diameter riparian cottonwoods and sycamores, and older orchard trees (particularly walnuts).

Foraging has been noted in habitats such as mature orchards, oak woodland, low elevation conifer forest, and non-native trees in urban and rural residential areas. In addition, this species may forage in habitats adjacent to streams and rivers that do not provide roosting habitat. Water features are a vital habitat component because bats often drink immediately after emergence and water is an important source of concentrated insects (Johnson, as cited in SSHCP Appendix B).

Land Cover Types Relevant to Habitat Requirements

SSHCP land cover types that provide suitable habitat for foraging based on life history descriptions include Valley Grassland, Blue Oak Woodland, Blue Oak Savanna, Orchard, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, Open Water, and Stream/Creek. Suitable habitat for roosting include Blue Oak Woodland, Blue Oak Savanna, Orchard, Mine Tailing Riparian Woodland, and Mixed Riparian Woodland (Table 3-2).

Occurrences within the Plan Area

There are seven documented occurrences of western red bat within the Plan Area. Five are within the UDA including one in PPU 2, one in PPU 8 and three that are not within a PPU. Two occurrences are outside of the UDA including one in PPU 5 and one in PPU 7.

Model Assumptions

- Data regarding reported territory sizes and distances traveled between roosting and foraging sites is not available.
- Fifty-six records for the western red bat (1977 to 2002) varied in location precision from "Sacramento County" to "Sacramento" to an actual address. Over 30 western red bats were from localities reported as the City of Sacramento, Folsom, Rancho Cordova, Wilton, Elk Grove, and Galt (Constantine, unpubl. data 2004).

Western Red Bat Habitat Model

Modeled foraging habitat is Valley Grassland, Blue Oak Woodland, Blue Oak Savanna, Orchard, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, Open Water, and Stream/Creek throughout the Plan Area. Modeled roosting habitat is Blue Oak Woodland, Blue Oak Savanna, Orchard, Mine Tailing Riparian Woodland, and Mixed Riparian Woodland throughout the Plan Area.

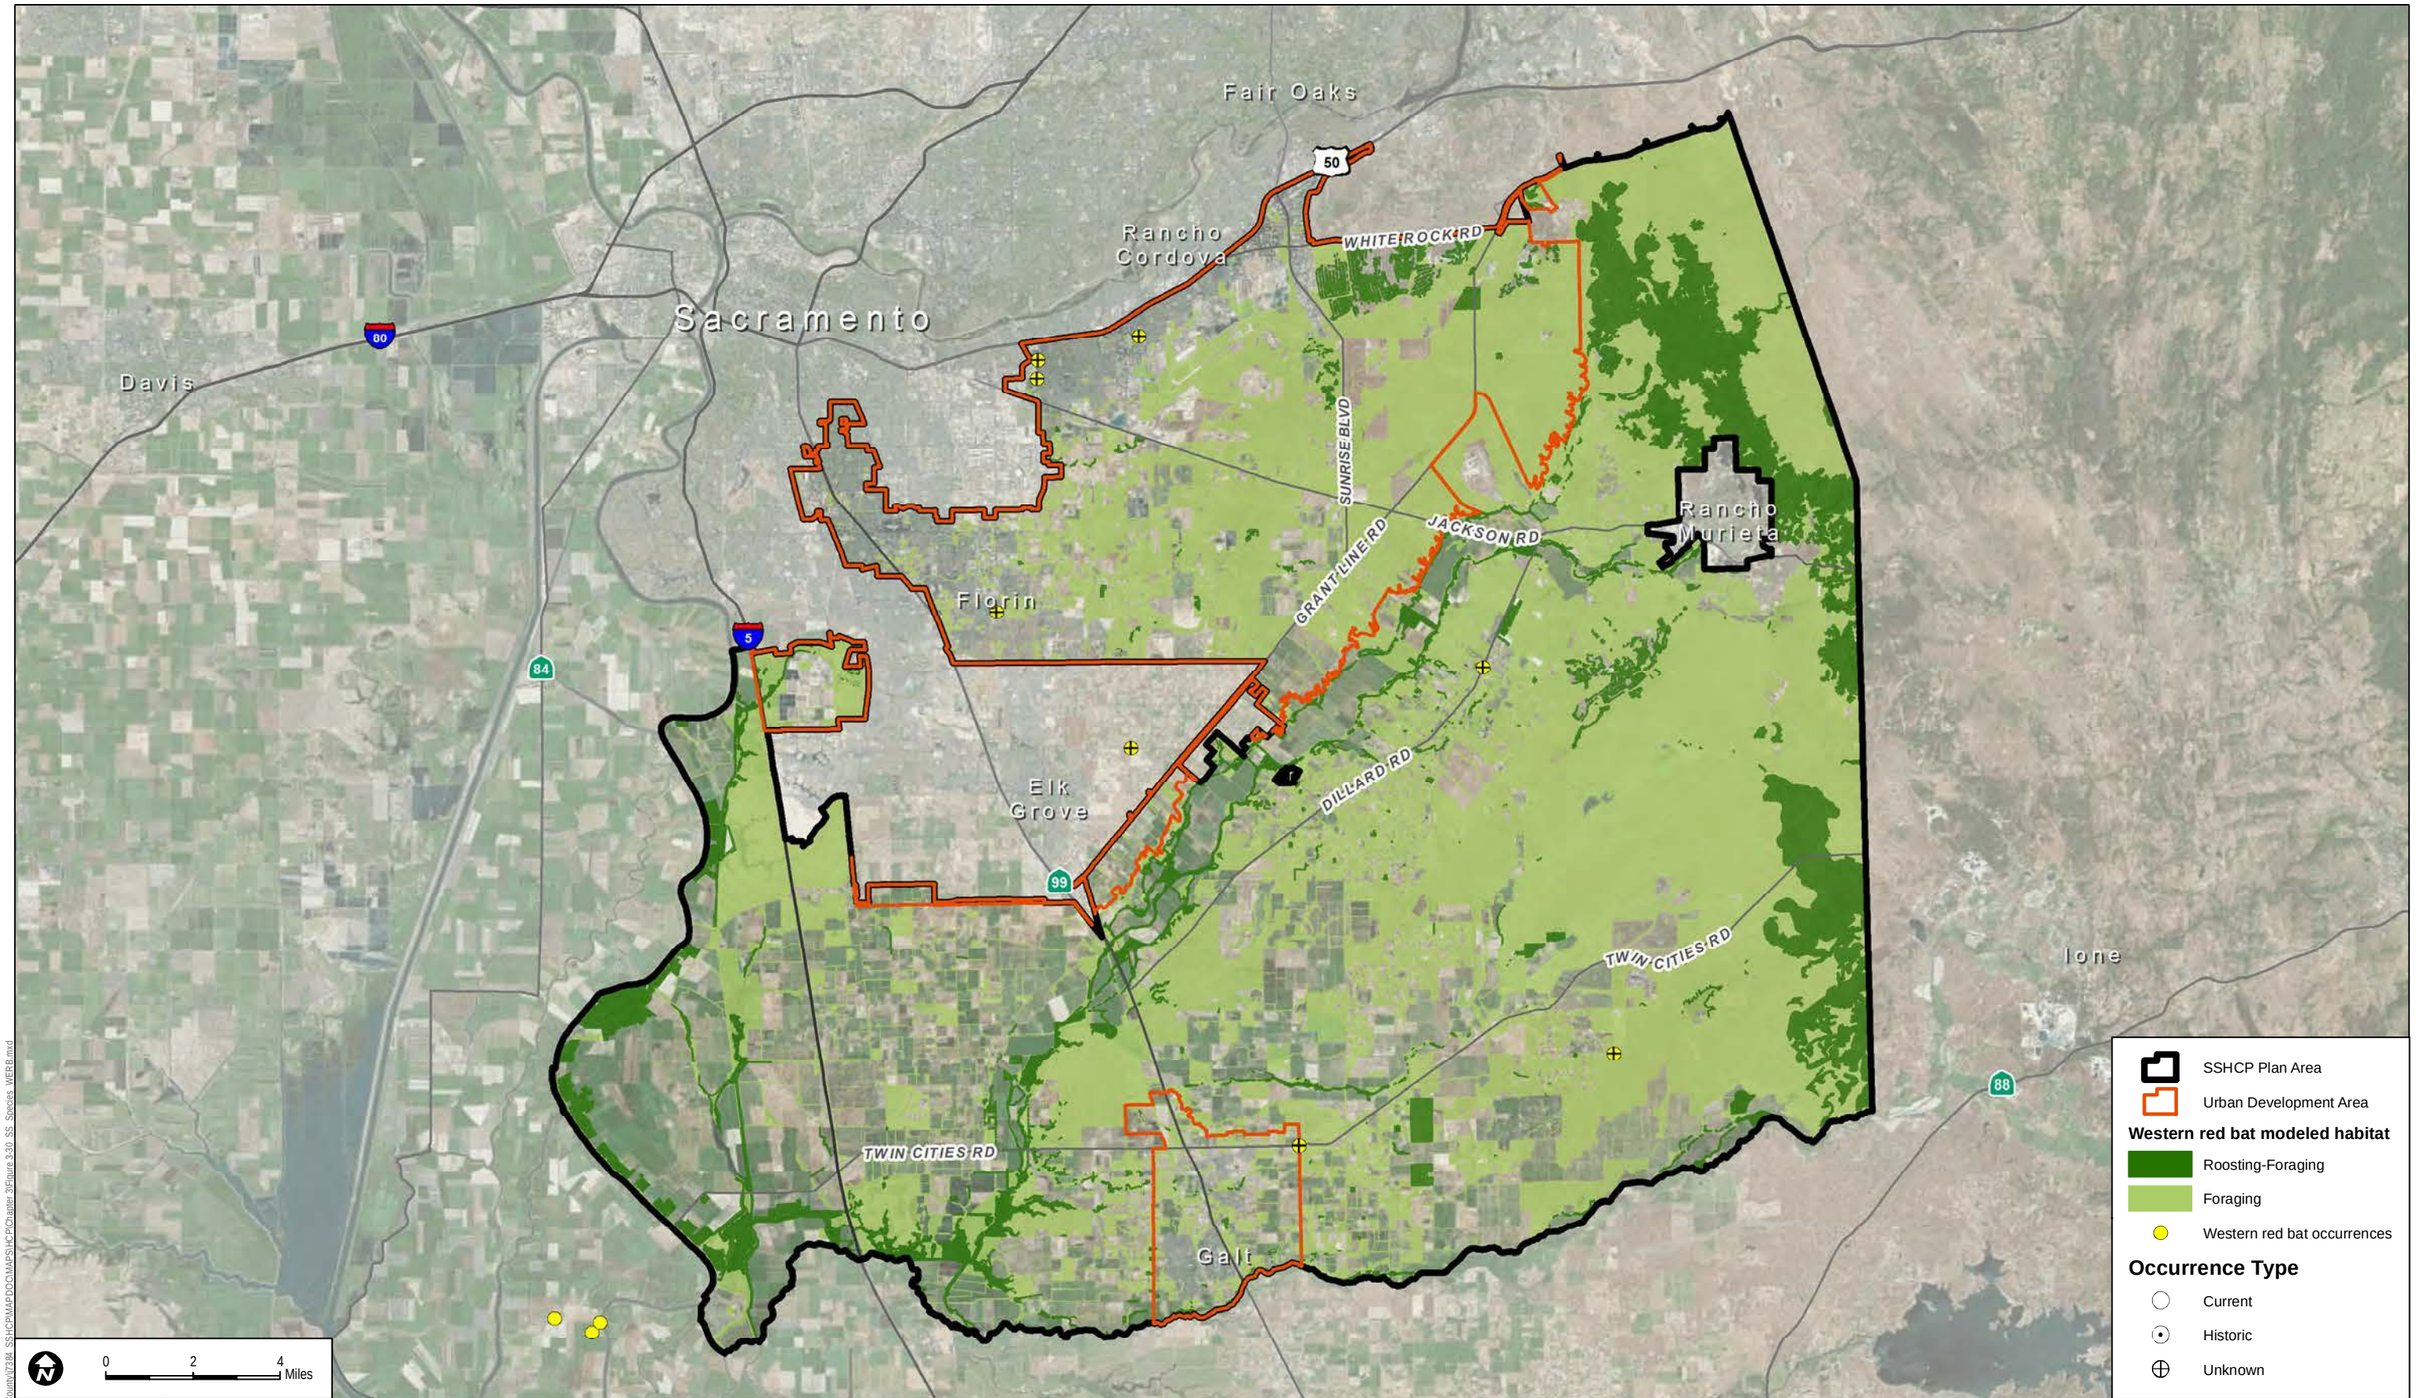

Figure 3-30 illustrates the location of modeled habitat as well as the documented occurrences of western red bat within the Plan Area.

3.5 Existing Preserves in the Plan Area

The Plan Area includes several established existing Preserves both inside and outside of the UDA. Existing Preserves within the Plan Area totals approximately 64,500 acres and includes wildlife refuges, nature preserves, lands under conservation easements, conservation/mitigation banks, and individual project mitigation sites. Of the approximately 64,500 acres of existing Preserve, approximately 3,170 acres are inside the UDA and about 61,330 acres are outside the UDA (Figure 3-40).

The largest grouping of existing Preserves inside the UDA occurs in the Sacramento Valley Vernal Pool Prairie Preserve area located south of Jackson Highway between Excelsior and Eagles Nest roads north of Grant Line Road in PPU 3. The Preserve area includes lands under conservation easement or owned by the Sacramento Valley Conservancy, two conservation or mitigation banks: Arroyo Seco, Bryte Ranch, and other mitigation sites. Other sites with permanent conservation easements are scattered throughout the UDA, with concentrations occurring along northern Laguna Creek, sites within the City of Rancho Cordova, at the Sacramento Regional County Sanitation District Bufferlands and at the Keifer Landfill Bufferlands. Preserved lands at the Sacramento Regional County Sanitation District Bufferlands are on termed easements.

Outside of the UDA, significant Preserves and conservation banks are established west of Interstate 5 (PPU 6), within the Cosumnes River floodplain (PPU 6), and in eastern Sacramento County (PPU 7). Major Preserves larger than 500 acres include the Stone Lakes National Wildlife Refuge, Deer Creek Hills, Chance Ranch, Borden Ranch, Snyder Preserve, Clay Station Conservation Bank, Laguna Terrace Conservation Bank, Gill Ranch Conservation Bank, Elliot mitigation site, Delta Meadows, Sacramento Municipal Utilities District (SMUD) mitigation site, and the Cosumnes River Preserve. Smaller conservation sites are distributed within the Cosumnes River and Deer Creek corridor, eastern Sacramento County grasslands, and agricultural lands west of State Route 99. In addition to established Preserves, the conservation network outside of the UDA includes conservation/mitigation banks with available conservation credits approved by USFWS and the U.S. Army Corps of Engineers.

INTENTIONALLY LEFT BLANK

Because existing Preserves generally are located in areas with high resource value, they will provide important existing "building blocks" that the SSHCP Plan Permittees considered during the development of the SSHCP Conservation Strategy, including the proposed SSHCP Preserve System. As discussed in Chapter 7, the SSHCP Conservation Strategy supplements, complements, and links together the existing Preserves by establishing new SSHCP Preserves adjacent to these existing Preserves. Although the Implementing Entity will use existing Preserves to build from, the SSHCP does not count acres of existing Preserves toward achieving the SSHCP Biological Goals and Objectives, and the SSHCP does not seek conservation "credits" for the existing Preserves. Nonetheless, the existing Preserves have conserved resources within the Plan Area, and help to inform the development of the SSHCP conservation strategy by providing building blocks from which the SSHCP Preserve System can grow.

3.6 SSHCP Covered Species Critical Habitat

Federal Critical Habitat has been designated for six of the SSHCP Covered Species: vernal pool species (slender Orcutt grass, Sacramento Orcutt grass, vernal pool fairy shrimp, and vernal pool tadpole shrimp), valley elderberry longhorn beetle, and California tiger salamander.

On August 11, 2005, the USFWS designated Critical Habitat units for four vernal pool crustaceans and 11 vernal pool species, including slender Orcutt grass, Sacramento Orcutt grass, vernal pool fairy shrimp, and vernal pool tadpole shrimp. On February 10, 2006, USFWS identified Critical Habitat units for each individual species identified in the 2005 final rule: 597,821 total acres of Critical Habitat for vernal pool fairy shrimp, 228,785 total acres of Critical Habitat for vernal pool tadpole shrimp, 33,273 total acres of Critical Habitat for Sacramento Orcutt grass, and 94,213 total acres of Critical Habitat for slender Orcutt grass (USFWS 2006).

3.6.1 Slender Orcutt Grass and Sacramento Orcutt Grass

USFWS has designated 33,273 acres of Critical Habitat for Sacramento Orcutt grass, and 94,213 acres of Critical Habitat for slender Orcutt grass (USFWS 2006).

Within the Plan Area, PPU 2 includes 527 acres of Critical Habitat for both slender Orcutt grass and Sacramento Orcutt grass. PPU 7 includes 9,587 acres of Critical Habitat for just Sacramento Orcutt grass. Of the 9,587 acres of Critical Habitat for Sacramento Orcutt grass within PPU 7, 4,444 acres occur within existing Preserves.

The primary constituent elements of Critical Habitat for Sacramento Orcutt grass (*Orcuttia viscida*) and slender Orcutt grass (*Orcuttia tenuis*) are as follows:

1. Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing

surface water in the depressional features including swales connecting the pools described in paragraph (c)(12)(ii) of this section, providing for dispersal and promoting hydroperiods of adequate length in the pools; and

2. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

3.6.2 Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

As discussed above, USFWS designated 597,821 acres of Critical Habitat for vernal pool fairy shrimp and 228,785 acres of Critical Habitat for vernal pool tadpole shrimp (USFWS 2006).

Within the Plan Area, Critical Habitat for vernal pool fairy shrimp (13-Mather Unit, 14A and 14B-Cosumnes Unit) and vernal pool tadpole shrimp (8-Mather Unit, 9A and 9B-Cosumnes Unit) overlaps exactly and include 1,204 acres in PPU 2, 29,534 acres in PPU 7, and less than 0.1 acre in PPU 5. Of the 1,204 acres of Critical Habitat for within PPU 2, 7.3 acres of Critical Habitat occur within existing Preserves. Of the 29,534 acres of Critical Habitat within PPU 7, 13,223 acres of Critical Habitat occur within existing Preserves.

USFWS (2006) described the primary constituent elements for vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*) as follows:

1. Topographic features characterized by mounds, swales, and depressions within a matrix of surrounding uplands that result in complexes of continuously, or intermittently, flowing surface water in the swales connecting vernal pools, providing for dispersal and promoting hydroperiods of adequate length in the pools.
2. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water for a minimum of 18 days, in all but the driest years; thereby providing adequate water for species incubation, maturation, and reproduction. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.
3. Sources of food, expected to be detritus occurring in the pools, contributed by overland flow from the pools' watershed, or the results of biological processes within

the pools themselves, such as single-celled bacteria, algae, and dead organic matter, to provide for feeding.

4. Structure within the pools described in paragraph (c)(3)(ii) of this section, consisting of organic and inorganic materials, such as living and dead plants from plant species adapted to seasonally inundated environments, rocks, and other inorganic debris that may be washed, blown, or otherwise transported into the pools, that provide shelter.

3.6.3 Valley Elderberry Longhorn Beetle

On August 8, 1980 (USFWS published the final rule listing the valley elderberry longhorn beetle as a threatened species, and designating Critical Habitat within two areas within Sacramento. The Critical Habitat was designated in two units: Sacramento Zone and American River Parkway Zone. These two units lie outside the Plan Area and are not considered further in the SSHCP.

3.6.4 California Tiger Salamander

On August 25, 2005, USFWS published the final rule designating Critical Habitat for the central population of the California tiger salamander, within 19 counties in California (USFWS 2005a). The USFWS Critical Habitat designation included 97,045 acres in the Central Valley, 20,293 acres in southern San Joaquin, 68,873 acres in the East Bay, and 12,898 acres in the Central Coast, totaling 199,109 acres.

The Plan Area includes 7,420 acres of California tiger salamander Critical Habitat within PPU 7 (designated as California tiger salamander Critical Habitat unit 3)., USFWS 2005a described the primary constituent elements for the central population of California tiger salamander as follows:

1. Standing bodies of fresh water (including natural and created (e.g., stock)) ponds, vernal pools, and other ephemeral or permanent water bodies, which typically support inundation during winter rains and hold water for a minimum of 12 weeks in a year of average rainfall.
2. Upland habitats adjacent and accessible to and from breeding ponds that contain small mammal burrows or other underground habitat that California tiger salamander depend on for food, shelter, and protection from the elements and predation.
3. Accessible upland dispersal habitat between occupied locations that allow for movement between such sites.

Of the 7,420 acres of Critical Habitat for California tiger salamander within PPU 7, 3,436 acres of Critical Habitat occur within existing Preserves.

3.7 SSHCP Covered Species Recovery Plans

Federal recovery plans have been published for 12 SSHCP Covered Species including Ahart's dwarf rush, Boggs Lake hedge-hyssop, legenere, pincushion navarretia, slender Orcutt grass, Sacramento Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, western spadefoot, and valley elderberry longhorn beetle. In addition, a draft Recovery Plan has been published for giant gartersnake.

3.7.1 Vernal Pool Species

USFWS published the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon in 2005 for 33 species (20 listed species and 13 species of concern), including Ahart's dwarf rush, Boggs Lake hedge-hyssop, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, and western spadefoot (USFWS 2005b). It delineates two large core recovery areas in the Plan Area: (1) the Mather Core Recovery Area located within the UDA; and (2) the Cosumnes/Rancho Seco Core Recovery Area, located outside of the UDA. According to USFWS (2005c), the "core areas are the specific sites that are necessary to recover these endangered or threatened species or to conserve sites that are necessary to recover these endangered or threatened species or to conserve the species of concern addressed in this recovery plan." USFWS (2005c) also states that "the core areas were developed in part using critical habitat boundaries, but the two areas differ in that core areas not included in critical habitat have no legal mandate for protection under the Endangered Species Act and solely rely upon voluntary implementation." The Recovery Plan focuses on five elements: (1) habitat protection, (2) adaptive habitat management and monitoring, (3) status surveys, (4) research, and (5) public participation and outreach. The Recovery Plan establishes recovery criteria for these five elements (USFWS 2005b):

1. Habitat protection criteria:
    a. Suitable vernal pool habitat within each prioritized core area for the species is protected.
    b. Species occurrences distributed across the species' geographic and genetic range are protected. Protection of extreme edges of populations protects the genetic differences that occur there.
    c. Reintroductions and introductions must be carried out and meet success criteria established in action 2.5.3.7.
    d. Additional occurrences identified through future site assessments, GIS and other analyses, and status surveys that are determined essential to recovery are protected.

Any newly found occurrences may count towards recovery goals if the occurrences are permanently protected as described in this plan.

e. Habitat protection results in protection of hydrology essential to vernal pool ecosystem function, and monitoring indicates that hydrology that contributes to population viability has been maintained through at least one multi-year period that includes above average, average, and below average local rainfall as defined above, a multi-year drought, and a minimum of 5 years of post-drought monitoring (see Chapter 3).

Table 3-3 depicts the species-specific recovery criteria for the vernal pool species in the Mather Core Recovery Area. The Mather Core Recovery Area has been designated as Zone 1.[1]

Table 3-3
Recovery Criteria for the Mather Core Recovery Area and Cosumnes/Rancho Seco Recovery Area

Common Name	Percent Occurrences to Protect	Percent Suitable Habitat to Protect in Each Core Recovery Area	Reintroductions/ Introductions	Collection Sources
Boggs Lake hedge-hyssop	80% (to conserve)	**Mather Core** 95% (to conserve)	Reintroduce to vernal pool regions and soil types from which status surveys indicate species has been extirpated to conserve.	At least one population from each core area.
Ahart's dwarf rush	100% (to conserve)	**Mather Core** 95% (to conserve)	Reintroduce to vernal pool regions and soil types from which status surveys indicate species has been extirpated to conserve.	Each population.
Legenere	80% (to conserve)	**Mather Core** 95% (to conserve) **Cosumnes/Rancho Seco** 95% (to conserve)	Reintroduce to vernal pool regions and soil types from which status surveys indicate species has been extirpated to conserve.	At least one population from each core area.
Slender Orcutt grass	80% (to delist)	95% (to delist)	Reintroduce to vernal pool regions and soil types from which status surveys indicate species has been extirpated to delist.	Each vernal pool region. Mather Core Recovery Area contains small populations or few occurrences and should

[1] "Core areas were identified as Zone 1 in cases where they were occupied by very narrowly endemic species (with few populations and narrow or disjunct distributions that are known to be, or are likely to be, genetically or ecologically distinct) or where the core area supported a high diversity of the species covered by this recovery plan. Protection of Zone 1 core areas is necessary to prevent the extinction or irreversible decline of one or more species" (USFWS 2005b, p. III-118).

Table 3-3
Recovery Criteria for the Mather Core Recovery Area and Cosumnes/Rancho Seco Recovery Area

Common Name	Percent Occurrences to Protect	Percent Suitable Habitat to Protect in Each Core Recovery Area	Reintroductions/ Introductions	Collection Sources
				be a first source for seedbanking.
Sacramento Orcutt grass	100% (to delist/ downlist)	**Mather Core** 95% (to downlist) 100% (to delist) **Cosumnes/Rancho Seco** 95% (to downlist) 100% (to delist)	Reintroduce to appropriate soils in the Orangevale-Folsom area and Rancho Seco area to replace extirpated occurrences. Additional populations must be discovered or established in order to delist.	Each population.
Vernal pool fairy shrimp	80% (to delist)	**Mather Core** 85% (to delist) **Cosumnes/Rancho Seco** 85% (to delist)	Reintroduce to vernal pool regions and soil types from which status surveys indicate species has been extirpated to delist.	Not given.
Mid-valley fairy shrimp	80% (to delist)	**Mather Core** 95% (to conserve) **Cosumnes/Rancho Seco** 95% (to conserve)	Not given.	Not given.
Vernal tadpole shrimp	80% (to downlist) 100% of re-introduced populations (to delist)	**Mather Core** 95% (to downlist) **Cosumnes/Rancho Seco** 95% (to downlist)	Reintroduce to vernal pool regions and soil types from which status surveys indicate species has been extirpated to delist.	Not given.
Western spadefoot	80% (where it co-occurs with other vernal pool species) (to conserve)	**Mather Core** 85% (to conserve) **Cosumnes/Rancho Seco** 95% (to conserve)	Not given.	Not given.

2. Adaptive habitat management and monitoring criteria:

   a. Habitat management and monitoring plans that facilitate maintenance of vernal pool ecosystem function and population viability have been developed and implemented for all habitat protected in (1) A through E above. Plans must be developed and implemented within 5 years of protection of individual parcels/properties/areas to

ensure that populations are stable or increasing and progress toward reaching recovery goals is being made while additional habitat protections are being developed. Plans must include provisions for managing non-native and native competitors, appropriate grazing, fire or other management regimes, adaptive habitat management, incorporation of new information resulting from implementation of research actions, and addressing site-specific threats.

b. Mechanisms are in place to provide for management in perpetuity and long-term monitoring of (1) A through E above (e.g., funding, personnel).

c. Monitoring indicates ecosystem function has been maintained in the areas protected under (1) A through D for at least one multi-year period that includes above average, average, and below average local rainfall as defined above, a multi-year drought, and a minimum of 5 years of post-drought monitoring.

d. Seed banking actions have been completed for species that would require it as insurance against risk of stochastic extirpations or that will require reintroductions or introductions to contribute to meeting recovery criteria (see Table 3-3).

3. Status surveys criteria:

   a. Status surveys, 5-year status reviews, and population monitoring show populations within each vernal pool region where the species occur are viable (e.g., evidence of reproduction and recruitment) and have been maintained (stable or increasing) for at least one multi-year period that includes above average, average, and below average local rainfall as defined above, a multi-year drought, and a minimum of 5 years of post-drought monitoring. (Determining when this criterion is met may rely partly on completion of research actions to model population viability or development of standardized monitoring and survey protocols to determine appropriate parameters to measure during status surveys).

   b. Status surveys, status reviews, and habitat monitoring show that threats identified during and since the listing process have been ameliorated or eliminated. Site-specific threats identified through standardized site assessments and habitat management planning also must be ameliorated or eliminated (see Chapter 3).

4. Research criteria:

   a. Research actions necessary for recovery and conservation of the Covered Species have been identified (these are research actions that have not been specifically identified in the recovery actions but for which a process to develop them has been identified). Research actions (both specifically identified in the recovery actions and determined through the process) on species biology and ecology, habitat management and restoration, and methods to eliminate or ameliorate threats have been completed

and incorporated into habitat protection, habitat management and monitoring, and species monitoring plans, and refinement of recovery criteria and actions.

b. Research on genetic structure has been completed (for species where necessary for reintroduction and introduction, seed banking) and results incorporated into habitat protection plans to ensure that within and among population genetic variation is fully represented by populations protected in Habitat Protection (1) A through E above.

c. Research necessary to determine appropriate parameters to measure population viability for each species have been completed (see Chapter 3).

5. Public participation and outreach criteria:

   a. Recovery Implementation Team is established and functioning to oversee range-wide recovery efforts.

   b. Vernal Pool Region working groups are established and functioning to oversee regional recovery efforts.

   c. Participation plans for each Vernal Pool Region have been completed and implemented.

   d. Vernal Pool Region working groups have developed and implemented outreach and incentive programs that develop partnerships contributing to achieving recovery criteria 1-4 (see Chapter 3).

6. The Recovery Plan indicates that an HCP that addresses the species in the Vernal Pool Recovery Plan may be considered equivalent to the Vernal Pool Recovery Plan if the HCP addresses the six elements described below.

   a. Permanently protected Vernal Pool Preserves within the area covered by the Habitat Conservation Plan in large contiguous blocks of suitable habitat.

   b. Protection of the entire genetic range of each listed species within the area covered by the Habitat Conservation Plan.

   c. Protection of all populations of species with 25 or fewer total occurrences addressed in this plan within the area covered by the Habitat Conservation Plan.

   d. Connectivity with other Preserves within the area covered by the Habitat Conservation Plan.

   e. Adaptive management of the Preserves within the area covered by the Habitat Conservation Plan to support the species addressed in this Recovery Plan.

   f. Sufficient funding for management, maintenance and monitoring of the Preserves in perpetuity.

The recovery criteria for seven of the species listed in Table 3-3 include conservation of 95% of suitable habitat within each the Mather Core Recovery Area. The Plan Permittees recognize that protecting 95% of suitable species habitat in the Mather Core Recovery Area is not feasible because past land use decisions, developments, and agreements, approved by the regulatory agencies since 2005 have already precluded the preservation of that much suitable habitat in the Mather Core Recovery Area. The Recovery Plan does, in item 6 above, however, provide for alternative conservation mechanisms to be used in lieu of the Recovery Plan. One such mechanism is an HCP that takes a comprehensive approach to protecting large interconnected blocks of habitat to protect species (see Chapter 7 for the SSHCP Conservation Strategy).

3.7.2 Giant Gartersnake

USFWS published the *Draft Recovery Plan for the Giant Garter Snake (*Thamnophis gigas*)* (USFWS 1999b). The Draft Recovery Plan sets forth recovery criteria for four recovery units in the Central Valley: Sacramento Valley, Mid-Valley, San Joaquin Valley, and South Valley (USFWS 1999b). The goal of the Draft Recovery Plan is to achieve recovery by 2028 and initiate delisting of the giant gartersnake. The SSHCP Plan Area is within the Mid-Valley recovery unit (see Figure 7 of the Draft Recovery Plan) and generally identifies giant gartersnake populations in the "Sacramento Area" (see Table 2 of the Draft Recovery Plan).

The Draft Recovery Plan recovery criteria for giant gartersnake are as follows (USFWS 1999b, p. v):

a. Monitoring shows that in 17 out of 20 years, 90% of the subpopulations in the four recovery units contain both adults and young
b. All extant populations within the recovery unit are protected from threats that limit populations
c. Supporting habitat within the recovery unit is adaptively managed and monitored
d. Subpopulations are well connected by corridors of suitable habitat
e. Repatriation (reintroduction) has been successful at a specified number of suitable sites

The recovery criteria for the Mid-Valley Recovery Unit are the same as listed above for the entire recovery area, except for "b," which states that "the six existing populations within the recovery unit are protected from threats that limit these populations" (USFWS 1999b, p. 47).

The Draft Recovery Plan identified six actions needed to achieve the recovery criteria (USFWS 1999b, p. v):

1. Protect existing populations and habitat
2. Restore populations to former habitat

3. Survey to determine species distributions
4. Monitor populations
5. Conduct necessary research, including studies on demographics, population genetics, and habitat use
6. Develop and implement incentive programs, and an outreach and education plan

The Draft Recovery Plan defines a "population" as "all the giant gartersnakes within a basin or area (e.g., Colusa Basin, American Basin, Mendota Area" and a subpopulation as "a cluster of locality records in a contiguous habitat area." The Sacramento Area, which includes the SSHCP Plan Area, therefore would support a population of giant gartersnake. The SSHCP Plan Area subpopulations would include clusters of occurrences in areas such as Cosumnes River, Morrison Creek, and Laguna Creek.

The Draft Recovery Plan provides more detailed step-down narratives of the six actions, including details for the Mid-Valley Recovery Unit that apply to the Plan Area.

1. Protect known populations of the giant gartersnake.

   1.1 Protect populations on private lands.

   This action focuses on protecting populations on private lands that are not already under protection by a public or conservation agency through acquisition, easement, or some other mechanism (USFWS 1999b). For the SSHCP Plan Area, the Draft Recovery Plan identifies Task 1.1.9 for the Stone/Beach Lakes area, including the Cosumnes River area (see Table 3 in Draft Recovery Plan). Task 1.1.9 refers to the SSHCP planning efforts, with mitigation on private lands to focus on areas east and west of Interstate 5, acquire lands and restore wetlands south of Lambert Road to connect the giant gartersnake population to the Badger Creek/Willow Creek population, and maintain compatible agricultural practices. These actions are Priority 1 actions in the Draft Recovery Plan, indicating that these actions are needed to prevent extinction or to present the species from declining irreversibly in the foreseeable future (USFWS 1999b).

   1.2 Develop or update management recommendations for giant gartersnake habitats.

   1.3 Develop, update, and implement management plans for populations on public and conservation lands.

   These actions focus on developing or periodically refining management recommendations for ricelands, ditch and canal maintenance, wetlands, and nonaquatic habitats based on new information and incorporating them into management plans for existing public and conservation lands. Where habitat

restoration is recommended as part of management, restoration guidelines should be include. Within the SSHCP Plan Area, management recommendations for these actions are included in Table 4 of the Draft Recovery Plan (USFWS 1999b). Task 1.3.5 states that the USFWS and County of Sacramento should incorporate giant gartersnake considerations into management guidelines, build refugia from flooding, and expand habitat at the Stone Lakes NWR.

Other protection actions that should generally be implemented and are applicable to the SSHCP include expediting permit approvals for levee repairs to protect adjacent giant gartersnake habitat (1.4), reviewing water efficiency measures (e.g., reduced agriculture runoff) that may conflict with management recommendations for giant gartersnake and its habitat (1.5), assurance of water delivery for giant gartersnake (1.6), and monitoring of existing populations (1.7).

2. Surveys for new populations of giant gartersnake.

   Action 2.3 includes surveys for giant gartersnake in the Mid-Valley Recovery Unit, especially because it is rapidly urbanizing. Such surveys will help establish appropriate mitigation.

3. Re-establish populations of giant gartersnakes to suitable habitat within former range.

   Action 3.1 is to identify suitable sites and conduct surveys for repatriation of giant gartersnakes. However, the Draft Recovery Plan does not identify any potential repatriation sites in the Mid-Valley Recovery Unit, so this action does not apply to the SSHCP.

4. Conduct necessary research on the giant gartersnake.

   This action includes: mark-recapture studies to understand demographics (mortality rates, fecundity, population size) (4.1), genetic studies to determine relatedness of different populations (4.2), radiotelemetry studies (4.3), population viability studies (4.4), developing guidelines for collecting giant gartersnake specimens for research (4.5), buffer/edge effects studies to determine appropriate buffer distances (4.6), studies of contaminant effects such as selenium (4.7), studies of health in selected populations (4.8), studies of effects of introduced predators and development and implementation of a management program (4.9), and studies of how quickly giant gartersnakes colonize new created marsh (4.10). Specific sites for these studies are not identified in the Draft Recovery Plan.

5. Develop and implement an outreach and education program.

   This action includes: developing guidelines for appropriate land use practices to distribute to landowners and agencies, including ditch and canal maintenance and rodenticide, herbicide and pesticide use (5.1) and developing and distributing

informational material to interested parties, including private and public landowners (5.2). Specific sites or areas for outreach and education are not identified in the Draft Recovery Plan.

6. Develop and implement economic and other incentives for conservation and recovery on private lands.

   This action focuses on creating incentives for landowners to maintain practices that benefit the giant gartersnake, including agricultural incentives (6.1), construction incentives for water districts and users (6.2), and promoting habitat conservation plans that are consistent with the Draft Recovery Plan (6.3).

3.7.3 Valley Elderberry Longhorn Beetle

USFWS published the *Valley Elderberry Longhorn Beetle Recovery Plan* in 1984. The Recovery Plan states that in order to recover the beetle, habitat must be protected along the several rivers, including the American, Sacramento, Feather, Stanislaus, Mokelumne, Calavera, Cosumnes, and San Joaquin. The Mokelumne and Cosumnes Rivers are located in the central and southern portions of the SSHCP Plan Area. The main components of the Valley Elderberry Longhorn Beetle Recovery Plan include: surveys for presence of the valley elderberry longhorn beetle; development of habitat protection plans, restoration of conserved sites (including exotics removal); and management and maintenance, including minimizing the use of herbicides and insecticides, preventing removal of riparian vegetation, and preventing riprapping of habitat sites. The Recovery Plan includes narratives for the following objectives (USFWS 1984).

1. Preserve and protect known habitat sites to provide adequate habitat conditions for valley elderberry longhorn beetle.

   The Recovery Plan identified occupied sites along three specific rivers for habitat preservation through long-term administrative actions: American River, Merced River, and Putah Creek (USFWS 1984, p. 22). The Mokelumne and Cosumnes Rivers within the SSHCP Plan Area are not specifically identified for protection in the Recovery Plan. The Recovery Plan has a specific objective (13) for developing management plans for protected sites.

2. Survey riparian forests of the Sacramento and San Joaquin Valleys for presence of valley elderberry longhorn beetle and incorporate findings into short-term and long-term management programs.

   This objective included surveys along the Mokelumne River from Comanche Reservoir Dam and along the Cosumnes River from Bridgehouse downstream to their confluences with the San Joaquin River.

3. Determine ecological requirements and management needs of valley elderberry longhorn beetle.

   This objective includes: field studies of the autecology of the species at known and newly discovered sites (31), laboratory studies on life history (32), field studies on potential management needs at certain sites (Goethe Park, Ancil Hoffman Park, American River Parkway, and Solano Lake Park) (33), studies of habitat rehabilitation methods for riparian areas and incorporate results into short- and long-term management programs (34), determination of population status and success of management (35), and determination of delisting criteria.

   With the exception of management needs at certain sites, these actions could be conducted throughout the Recovery Plan area.

4. Preserve and protect newly discovered valley elderberry longhorn beetle habitat to provide suitable habitat conditions for the species.

   This objective includes: minimizing further degradation, development, or modification of habitat (41); protecting newly discovered populations (42); minimizing use of insecticides, herbicides, and other toxic substances (43); and minimizing other activities that are incompatible with habitat maintenance (44).

5. Reestablish valley elderberry longhorn beetle at rehabilitated sites within the species' historical range.

   This objective includes: determining suitability of potential existing habitat and rehabilitation sites for reintroduction (51), protecting habitat sites (52), developing and implementing a management program for each site (53), and reintroducing valley elderberry longhorn beetle at selected sites (54).

6. Increase public awareness of valley elderberry longhorn beetle through education and information programs.

   This objective includes: signage at county parks (61); various audio-visual programs, publications, brochures, and press releases (62); and distribution of information to local parks, schools, newspapers, radio, and television (63). Specific site-specific actions for education are not identified in the Draft Recovery Plan. Also, because the Recovery Plan dates back to 1984, education actions will need to be update to take advantage of current information technologies (e.g., websites, social media).

7. Enforce law and regulation to protect valley elderberry longhorn beetle.

   This objective includes: informing local agencies about legal status of valley elderberry longhorn beetle, including applicable laws and regulations (71), eliminating illegal

collecting (72), and examining the effectiveness of existing laws and regulations and proposing changes as necessary (73).

3.8 SSHCP Preserve Planning Units

To assist with development of an adequate SSHCP Conservation Strategy, the Plan Area was divided into eight PPUs that encompass areas where important Covered Species resources are present, and where habitat preservation will be planned (see Section 1.2.1 and Figure 1-1). These eight SSHCP PPUs are geographic subdivisions of the Plan Area designed to ensure that adequate Biological Goals and Measurable Objectives (see Chapter 7) were developed for all biological resources located within the Plan Area.

PPUs were delineated to capture specific habitat or agricultural land cover types or areas identified as being important for a specific suite of species. For instance, PPU 7, which is located in the southeastern portion of the Plan Area, was delineated to encompass the vast majority of vernal pool grasslands remaining in the County. PPU 7 also contains the designated Cosumnes/Rancho-Seco Core Recovery Area (C/RS) (USFWS 2005b), which is considered an important area for protection of vernal pool species. This section describes the existing conditions within each PPU including natural land cover types and species occurrences within each PPU. Tables 3-4 and 3-5 provide a summary of the existing land cover types within each PPU and Table 3-6 provides a summary of the species occurrences within each PPU.

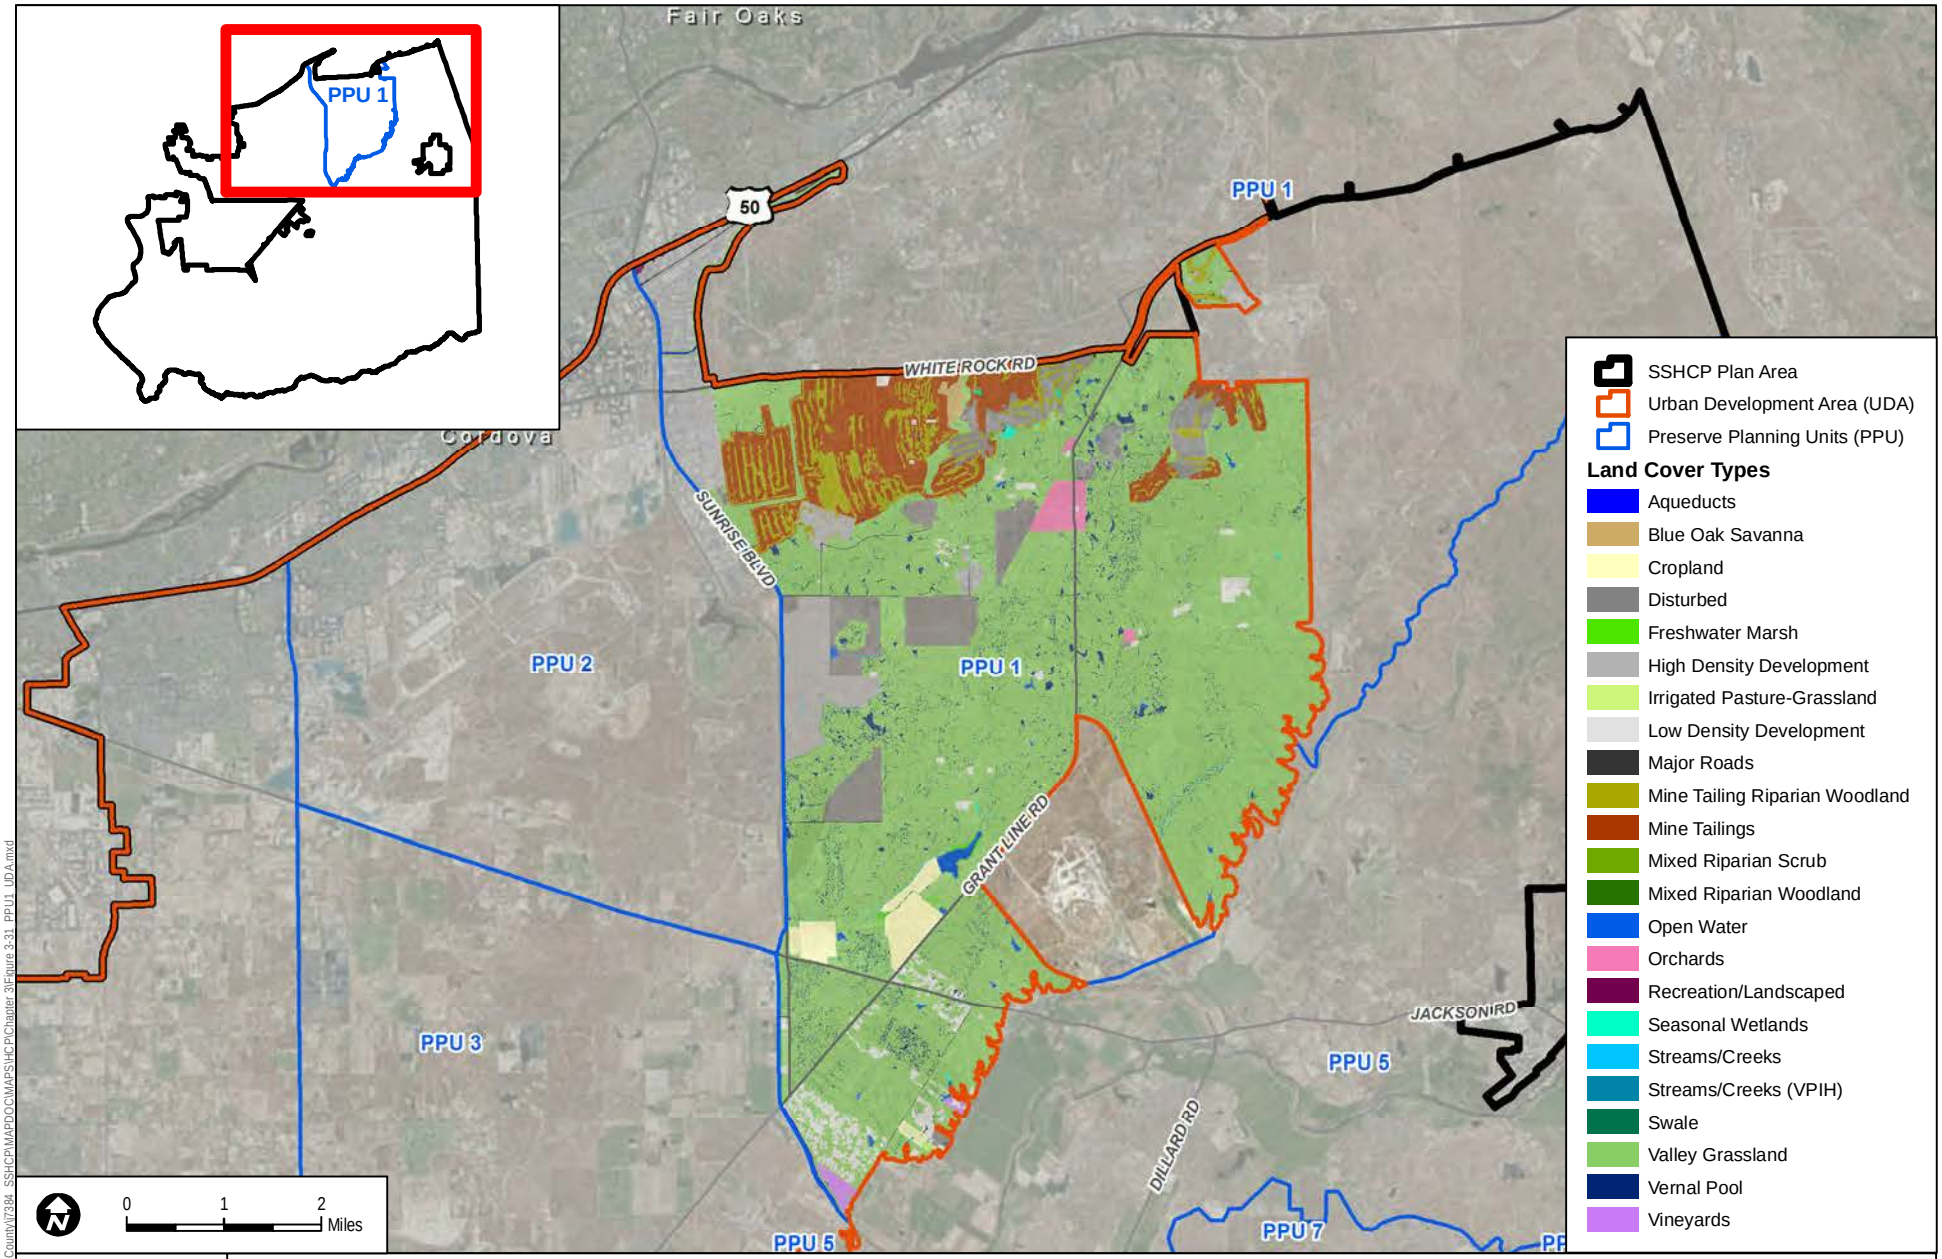
Inside UDA Preserve Planning Units

PPU 1 encompasses approximately 19,729 acres located in the northern portion of the Plan Area of which about 17,573 acres are inside the UDA (see Figure 3-31). Although the large majority of PPU 1 is inside the UDA, about 2,156 acres of PPU 1 lie outside the UDA (see section describing Outside Preserve Planning Units below). PPU 1 is bordered by U.S. Highway 50 to the north, Prairie City Road to the northeast, the Deer Creek floodplain boundary to the southeast, Sloughhouse to the south, and Sunrise Boulevard to the west. The following describes that portion of the UDA that is within the UDA.

The dominant land cover in PPU 1 is Valley Grassland, which comprises approximately 13,378 acres of the unit. PPU 1 also contains the greatest amount of Vernal Pool (approximately 289 acres) and Swale (approximately 193 acres) acreage of any PPU within the UDA, making it an important PPU for preservation of vernal pool species. Some urbanization has already occurred in this PPU, south of U.S. Highway 50 and east of Sunrise Boulevard, with high-density development comprising approximately 1,158 acres of the unit. PPU 1 encompasses the City of Rancho Cordova in the Plan Area, as well as lands east of Rancho Cordova in unincorporated areas of the County. There are two Preserves within PPU 1 encompassing approximately 680 acres. They include the Sunrise-Douglas Conservation Bank and the Montolina Preserve. PPU 1 also contains 15,827 acres of the 24,245 acre Mather Core Recovery Area (USFWS 2005b).



Species with documented occurrences within PPU 1 include Ahart's dwarf rush, Boggs Lake hedge-hyssop, legenere, Sacramento Orcutt grass, slender Orcutt grass, valley elderberry longhorn beetle, vernal pool fairy shrimp, vernal pool tadpole shrimp, western spadefoot, American badger, and all of the bird Covered Species except ferruginous hawk and loggerhead shrike.

PPU 2 encompasses approximately 9,271 acres and is located in the northern portion of the Plan Area (Figure 3-32). PPU 2 is bordered on the north by U.S. Highway 50, on the east by Sunrise Boulevard, on the south by Jackson Highway, and on the west by Bradshaw Road.

A substantial portion of PPU 2 is developed, including Mather Field and urban development directly north and southeast of the airport. PPU 2 includes 3,180 acres of high-density development, 239 acres of low density development, and 1,426 acres of disturbed land covers. PPU 2 also includes 3,589 acres of Valley Grassland with 70 acres of Vernal Pool and 40 acres of Swale. There is approximately 30 acres of existing Preserve within PPU 2. PPU 2 also contains 3,081 acres of the 24,245 acre Mather Core Recovery Area (USFWS 2005b); all of Slender Orcutt Grass Critical Habitat Unit 6 (1,160 acres); all of Sacramento Orcutt Grass Critical Habitat Unit 2 (1,160 acres); all of Vernal Pool Fairy Shrimp Critical Habitat Unit 13 (2,450 acres); and all of Vernal Pool Tadpole Shrimp Critical Habitat Unit 8 (2,450 acres).

PPU 2 contains documented occurrences for many of the Covered Species, including occurrences of Ahart's dwarf rush, Boggs Lake hedge-hyssop, legenere, Sanford's arrowhead, mid-valley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, vernal pool tadpole shrimp, western spadefoot, western pond turtle, American badger, western red bat and all of the bird Covered Species except greater sandhill crane.

PPU 3 encompasses approximately 14,303 acres located in the northwestern portion of the Plan Area (Figure 3-33). PPU 3 is bordered by Jackson Highway on the north, by Sunrise Boulevard on the east, by the Deer Creek and the Cosumnes River floodplain boundary on the south, the Central California Traction railroad line on the southeast, and by Bradshaw Road on the west.

FIGURE 3-33

Preserve Planning Unit 3

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

INTENTIONALLY LEFT BLANK

The dominant land cover in PPU 3 is Valley Grassland, which makes up about 7,072 acres of the Unit. Valley Grassland supports about 341 acres of Vernal Pool and about 167 acres of Swale, making this unit particularly important for vernal pool species. PPU 3 contains substantial urban development with high- and low-density development together totaling about 2,169 acres of the unit. PPU 3 also contains substantial agriculture (Cropland, Irrigated Pasture-Grassland, Orchard, and Vineyard), totaling about 3,409 acres of the unit. Existing Preserve in PPU 3 totals approximately 2,200 acres. Most of the Preserve acres are located within the Vernal Pool Prairie Preserve Area, and includes several mitigation sites (e.g. Klotz Preserve, Were Preserve, Cook Preserve) and two conservation banks (Arroyo Seco Conservation Bank and Bryte Ranch Conservation Bank). This unit also contains Preserves established to protect Laguna Creek. PPU 3 also contains approximately 4,574 acres of the 24,245 acre Mather Core Recovery Area (USFWS 2005b).

PPU 3 contains documented occurrences for many of the Covered Species, including occurrences of Boggs Lake hedge-hyssop, legenere, Sacramento Orcutt grass, Sanford's arrowhead, slender Orcutt grass, mid-valley fairy shrimp, vernal pool fairy shrimp, vernal pool tadpole shrimp, western spadefoot, and all of the bird Covered Species except ferruginous hawk and greater sandhill crane.

PPU 4 encompasses approximately 5,253 acres and is located in the northwestern portion of the Plan Area (Figure 3-34). PPU 4 includes three disjunct areas that are within the UDA. These areas are physically separated from other locations within the UDA by the City of Elk, which is not participating in the Plan. PPU 4 is generally bordered by the Sacramento City limits to the north, Highway 99 to the east, Eschinger Road to the south and Interstate 5 to the west.

The dominant land cover in PPU 4 is Cropland, which occupies about 1,817 acres. PPU 4 also includes about 1,168 acres of Valley Grassland. There are no existing Preserves within PPU 4.

PPU 4 contains documented occurrences for many of the Covered Species, including legenere, Sanford's arrowhead, vernal pool fairy shrimp, vernal pool tadpole shrimp, giant gartersnake, western pond turtle, and all of the bird Covered Species.

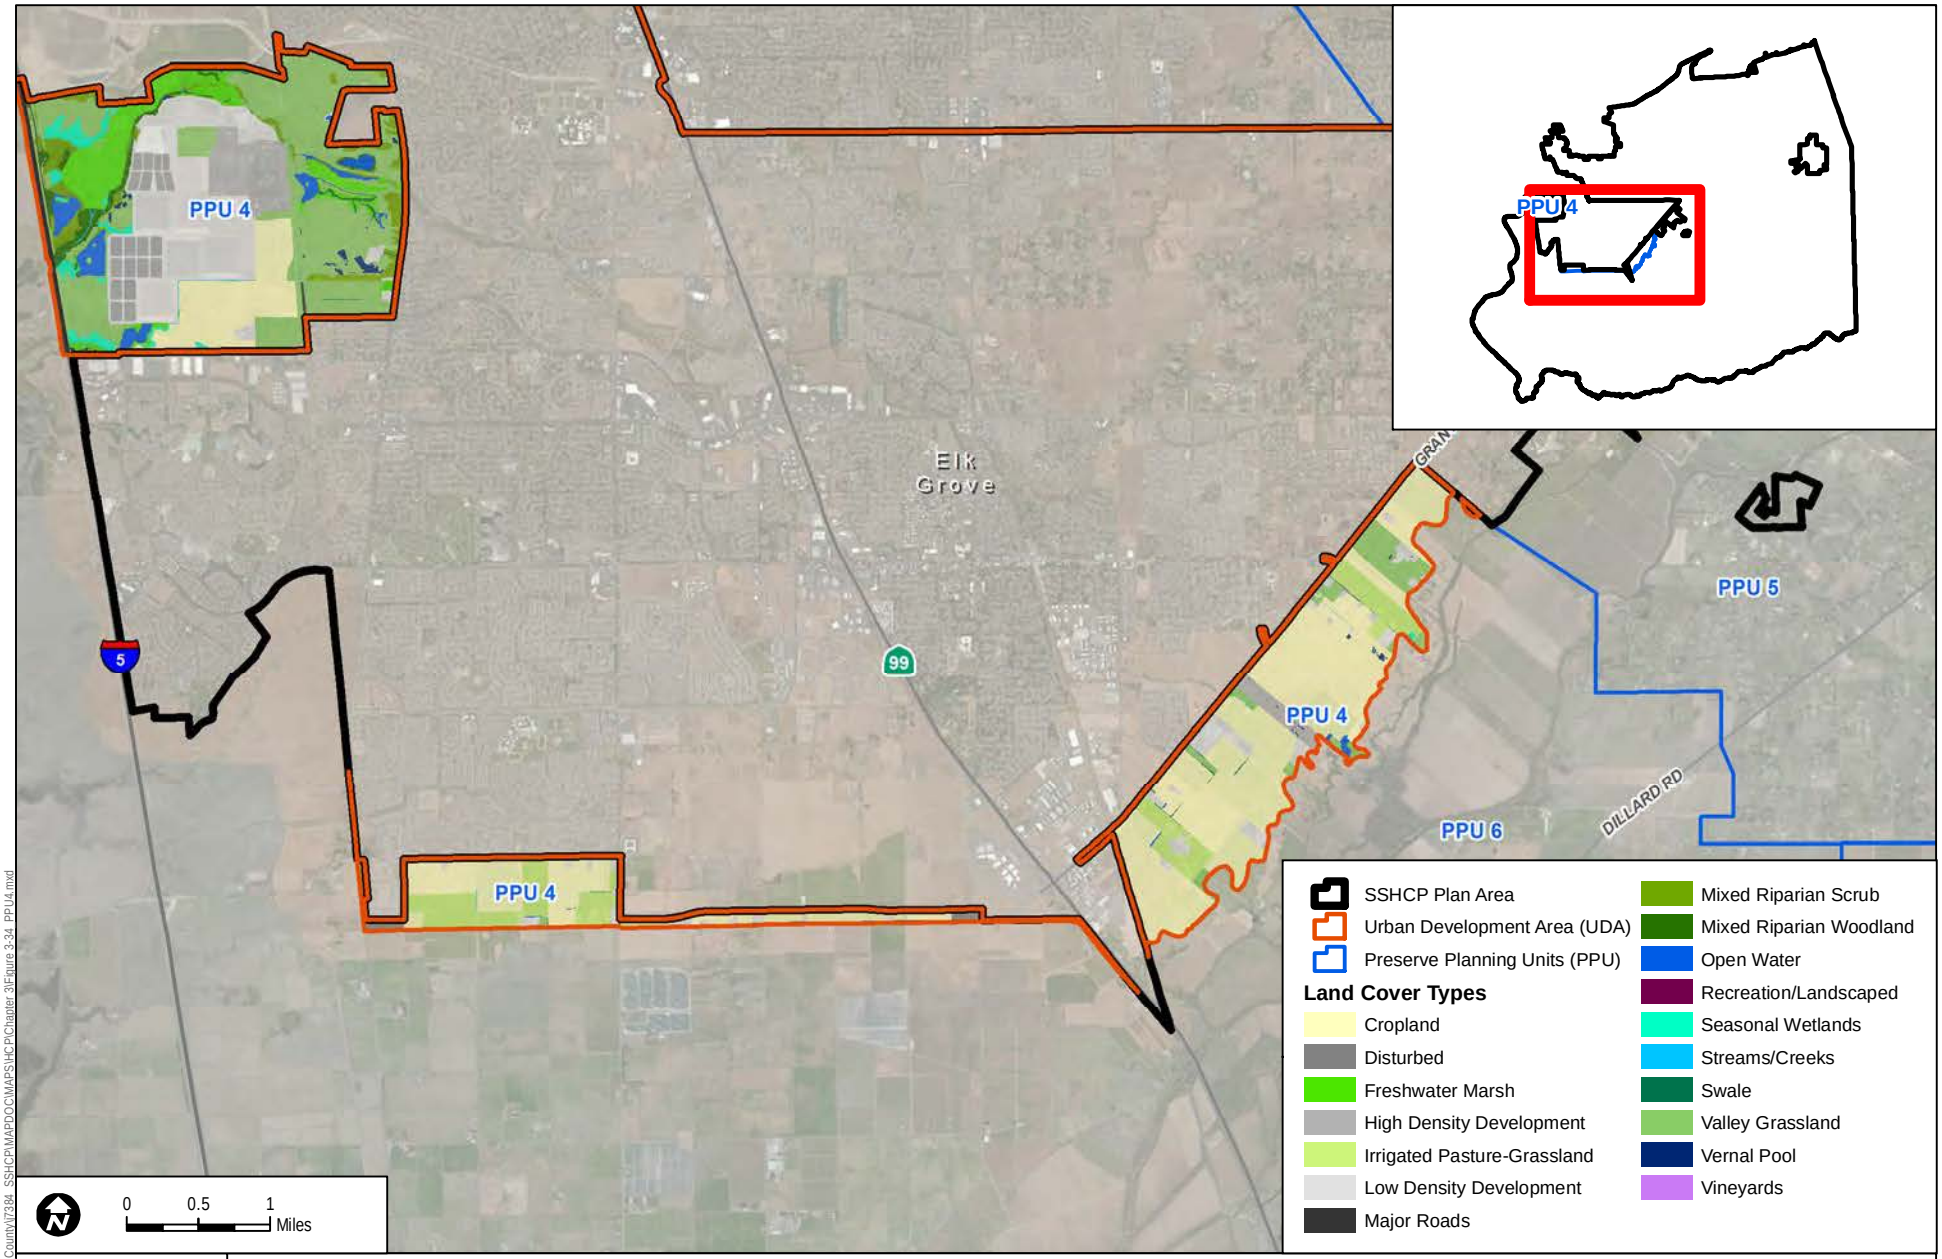
PPU 8 encompasses approximately 7,132 acres and is located in the southern portion of the Plan Area. PPU 8 is entirely within Galt's sphere of influence (Figure 3-35). PPU 8 is bordered by the northern boundary of Galt's sphere of influence to the north, Cherokee Lane to the east, Dry Creek to the south and Sargent Avenue to the west.

PPU 8 is dominated by farmland land cover types, including about 1,773 acres of Cropland and 1,097 acres of Irrigated Pasture-Grassland. Other significant cover types within PPU 8 include approximately 1,488 acres of Valley Grassland and 986 acres of high density development and

1,097 acres of low density development. There is approximately 95 acres of existing Preserve within PPU 2 located mainly along Dry Creek and Deadman Gulch.

PPU 8 contains documented occurrences for several of the Covered Species, but does not support significant occurrence concentrations for any particular species with the exception of Swainson's hawk and greater sandhill crane.

Outside UDA Preserve Planning Units



PPU 1 includes approximately 2,156 acres that are outside the UDA boundary (Figure 3-36). PPU 1 outside of the UDA is dominated by Valley Grassland (about 1,468 acres) and disturbed land cover (531 acres) associated with the Kiefer Landfill. There is approximately 500 acres of existing Preserve within PPU 1 including the Kiefer Landfill Preserve south of and adjacent to the UDA boundary at Grant Line Road.

PPU 1 outside of the UDA contains documented occurrences for several of the Covered Species, but does not support significant occurrence concentrations for any particular species with the exception of Sacramento Orcutt grass.

PPU 5 encompasses approximately 52,534 acres in the central-eastern portion of the Plan Area outside the UDA (Figure 3-37). PPU 5 is situated between PPU 7 to the south and the UDA part of PPU 1 to the north, and is bordered by the county line to the east. The dominant land cover in PPU 5 is Valley Grassland (about 27,540 acres). PPU 5 also includes approximately 1,169 acres of Mixed Riparian Woodland, making it import for species dependent on riparian land cover types. There are 6,500 acres of existing Preserves in PPU 5, including the Deer Creek Hills Preserve and several smaller, scattered Preserve sites. PPU 5 also contains 243 acres of the 24,245 acre Mather Core Recovery Area (USFWS 2005b).

PPU 5 contains documented occurrences for many of the Covered Species, including occurrences of legenere, vernal pool fairy shrimp, western spadefoot, western pond turtle and all of the bird Covered Species except greater sandhill crane. PPU 5 is most notable for encompassing most of the Plan Area documented occurrences for valley elderberry longhorn beetle clustered in a reach of the Cosumnes River extending approximately 2 miles west of Jackson.

PPU 6 encompasses approximately 95,196 acres located in the southwestern portion of the Plan Area (Figure 3-38). PPU 6 is generally bound on the west by State Highway 160 and the Sacramento River, on the north by Eschinger Road, on the south by the Mokelumne River west and just east of I-5, and by Dry Creek on the south from its confluence with the Mokelumne River to north-south alignment of Sargent Avenue, which defines its southeastern boundary.

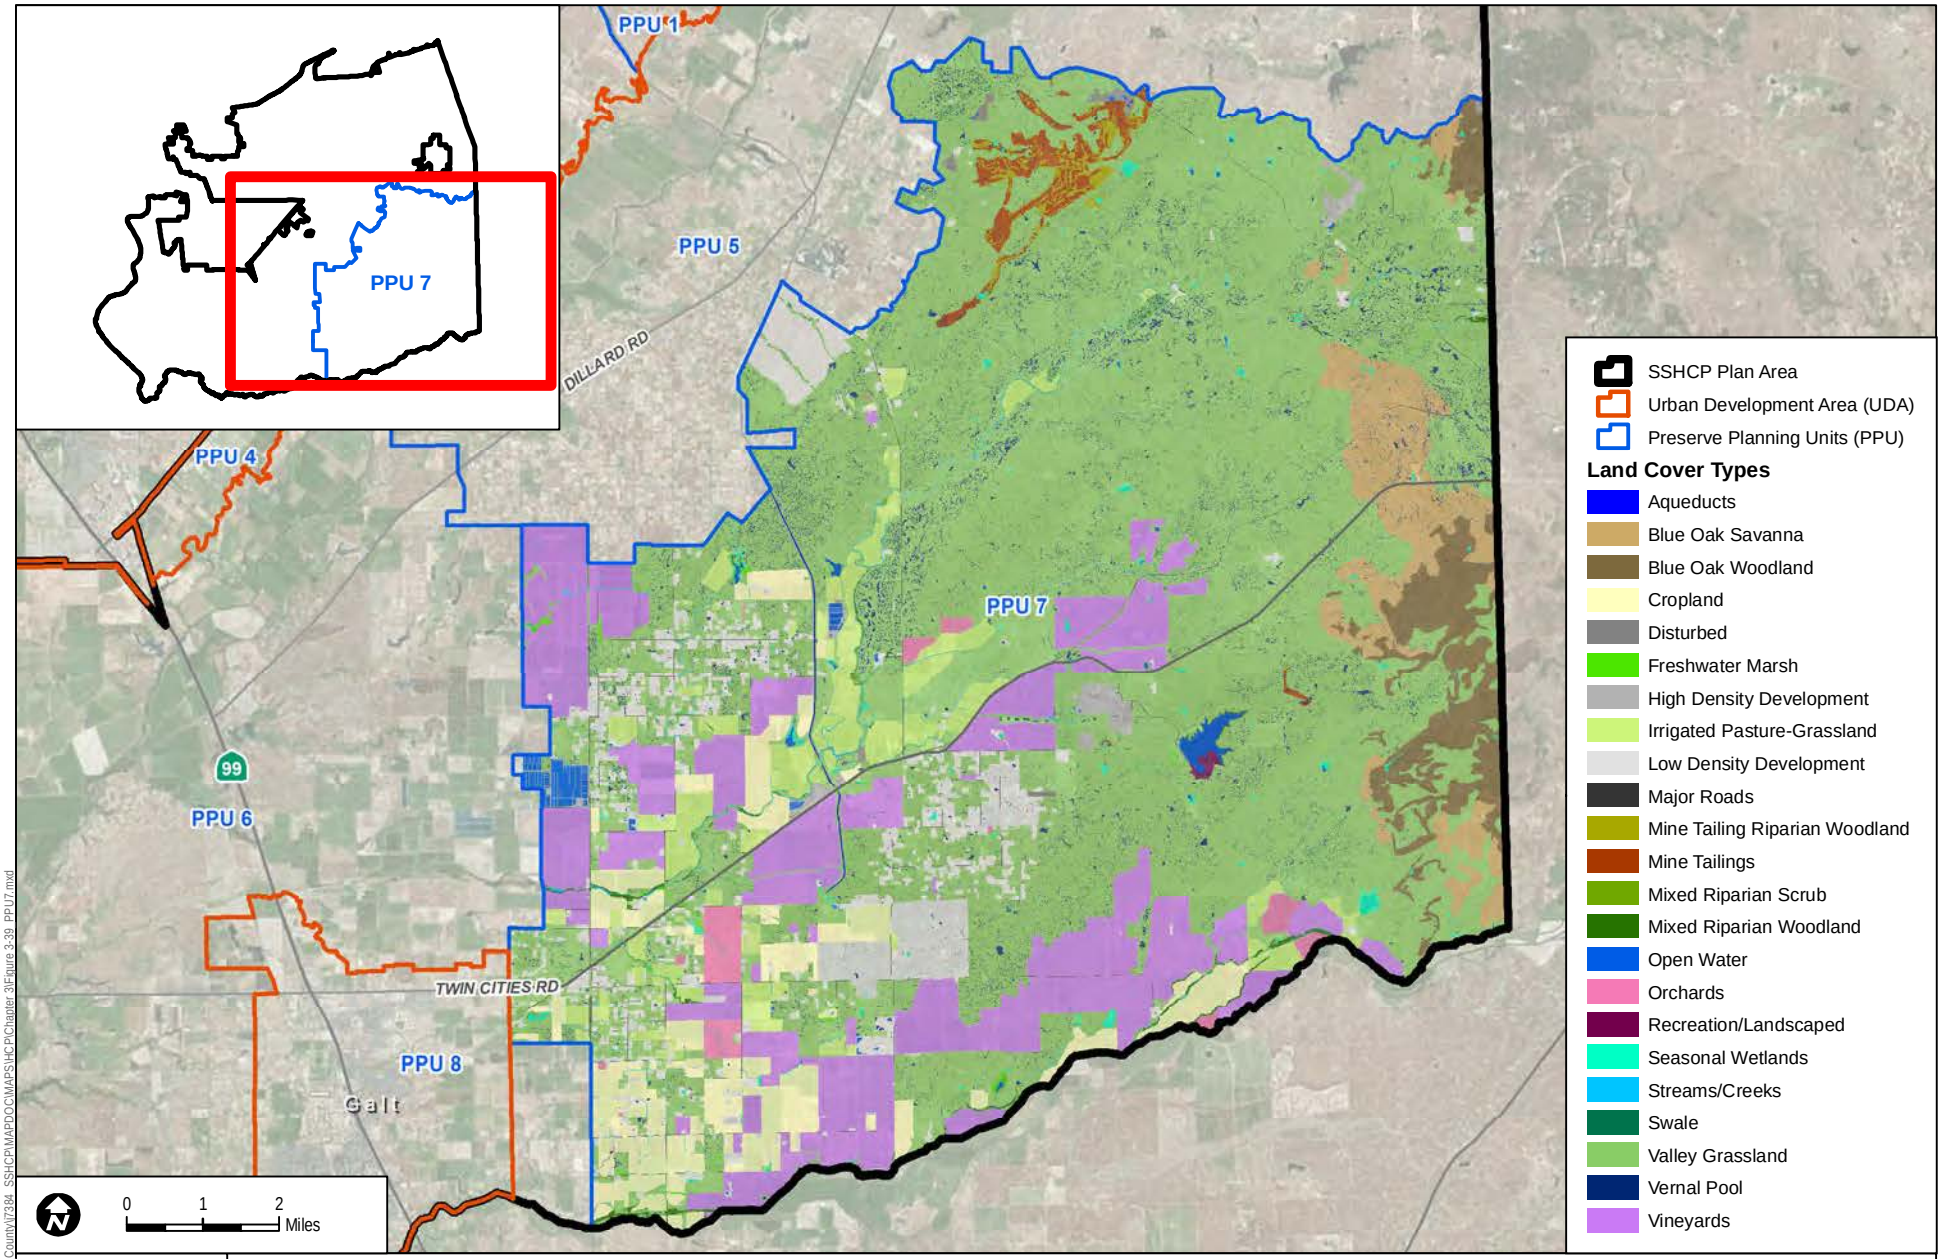
The dominant land covers in PPU 6 are farmland with about 39,102 acres of Cropland, about 6,948 acres of Irrigated Pasture-Grassland about 2,496 acres of Orchard and about 9,912 acres of Vineyard. The unit also contains approximately 17,633 acres of Valley Grassland with about 944 acres of vernal pools. Notably, PPU 6 contains about 4,096 acres of Mixed Riparian Woodland and about 984 acres of Mixed Riparian Scrub. There are approximately 28,000 acres of existing Preserves in PPU 6. A majority of this acreage is part of the Cosumnes River Preserve and the Stone Lakes National Wildlife Refuge.



PPU 6 contains documented occurrences for many of the Covered Species, including occurrences of dwarf downingia, legenere, Sanford's arrowhead, mid-valley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, vernal pool tadpole shrimp, giant gartersnake and western pond turtle. PPU 6 is most notable for the high number of bird Covered Species that populate this unit. This unit contains all bird Covered Species and an exceptionally high number of documented occurrences for Swainson's hawk, greater sandhill crane and northern harrier, white-tailed kite and burrowing owl.

PPU 7 encompasses approximately 90,906 acres in the southeastern portion of the Plan Area (Figure 3-39). PPU 7 is bordered by PPU 5 on the north, the county line and Dry Creek to the south, the county line on the east, and the north-south alignments of Cherokee Lane and Davis Road to the west. The dominant land cover in PPU 7 is Valley Grassland, which encompasses 52,278 acres. PPU 7 is most notable for the amount of Vernal Pool (about 2,221 acres) and Swale (531 acres) that it contains. There is also about 11,623 acre of Vineyard within this unit.

There are approximately 26,000 acres of existing Preserves in PPU 7. Preserve in PPU 7 include the Chance Ranch Preserve, Laguna Creek Conservation Bank, Gill Ranch Conservation Bank, Clay Station Conservation Bank, SMUD Preserve and several other smaller Preserve sites. PPU 7 also includes the entire 44,388 acre Rancho Seco Core Recovery Area; the entire California Tiger Salamander Critical Habitat Unit 3 (10,193 acres); the entire Vernal Pool Tadpole Shrimp Critical Habitat Unit 9A (96 acres); 34,880 acres of the 36,996 acre Vernal Pool Tadpole Shrimp Critical Habitat Unit 9B; 34,880 acres of the 36,996 acre Vernal Pool Fairy Shrimp Critical Habitat Unit 14A; the entire Vernal Pool Fairy Shrimp Critical Habitat Unit 14B (96 acres); and 29,870 acres of the 32,086 acre Sacramento Orcutt Grass Critical Habitat Unit 3.

PPU 7 contains documented occurrences for many of the Covered Species including dwarf downingia, legenere, Sacramento Orcutt grass, Sanford's arrowhead, mid-valley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, vernal pool tadpole shrimp, western spadefoot, giant gartersnake, western pond turtle, western red bat and all of the bird Covered Species with the exception of the white-tailed kite. Most notable is that this is the only unit with pincushion navarretia and is the most important unit for California tiger salamander.

4 LAND USE

4.1 Introduction

This chapter provides an overview of historic, existing, planned, and projected long-term land use conditions in the Plan Area. This chapter also examines forecasted demands for housing, commercial goods, and services in the Plan Area over the next 50 years.

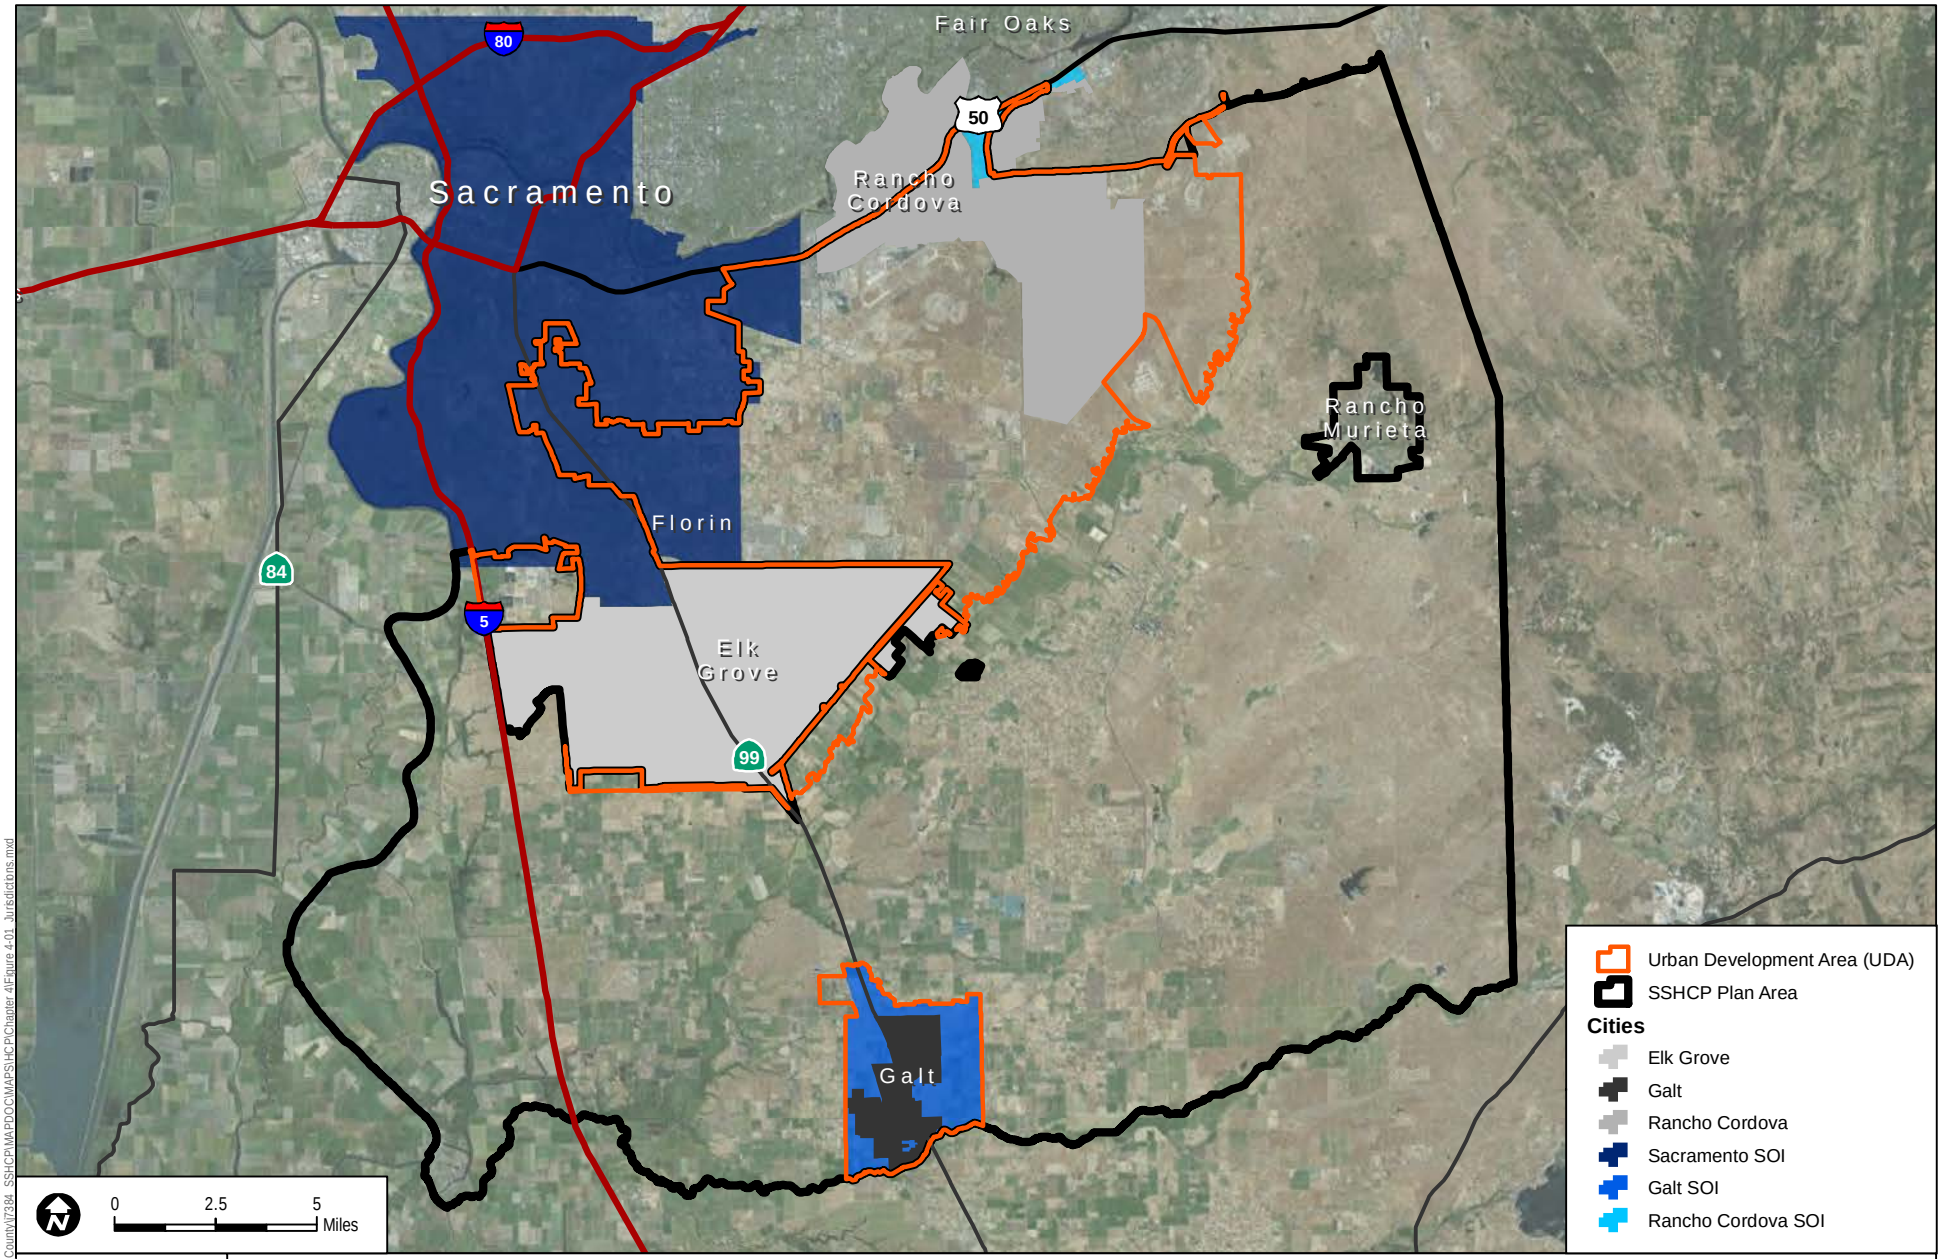
4.2 Historical Land Use Conditions of the Plan Area

During the early part of the 20th century, agricultural and grazing lands dominated the landscape of Sacramento County, interrupted only by small pockets of urbanization. In the 1940s, Sacramento County experienced a rapid increase in population with a majority of new growth occurring within or near the City of Sacramento and in smaller cities, such as Folsom, Galt, and Isleton. A second wave of growth occurred between 1950 and 1960 when Sacramento County's population grew by 81%, and the unincorporated county saw an expansion of urbanization to the south (Florin) and the east (Rancho Cordova). During the 1960s, 1970s, 1980s, and early 1990s, moderate but steady increases in population growth occurred along with an expansion of urban infrastructure farther into the southern and eastern portions of the county, resulting in conversion of grazing and croplands to urban uses.

In the early 1990s, a downturn in the housing market precipitated a sharp decrease in home sales, and a slowdown in urban expansion ensued. However, during the first 5 years of the 21st century, the entire region experienced explosive housing production and unprecedented urban sprawl as long-term interest rates reached historical lows, and jurisdictions struggled to keep up with housing demand. The housing market slowed and then softened considerably from 2007 to 2009 due to market contraction and asset value decline. Development slowed and home values dropped as housing supply exceeded demand for the first time in approximately 4 or 5 years.

4.3 Existing and Planned Land Use by Jurisdiction

The following section describes existing and planned land uses and General Plan policies related to the protection of natural resources by each jurisdiction located in the Plan Area. The majority of the information presented in this section is derived from the jurisdictions' adopted General Plans. General Plans are documents prepared and adopted by local land use authorities, usually a county or city, to guide the location of land uses within their planning boundaries for the life of the General Plan. Figure 4-1 illustrates the jurisdictional boundaries that lie within the Plan Area.



4.3.1 Sacramento County

The County of Sacramento's General Plan will guide development until the year 2030 (County of Sacramento 2011). Existing and planned land uses in the Plan Area located in the unincorporated county are summarized in Table 4-1 and depicted in Figure 4-2.

Table 4-1
Sacramento County General Plan Land Uses (2030)

General Plan Land Use Designation	
Land Use Component	*Acreage*
Agricultural Cropland	68,019
Agricultural Cropland (RCA)	15,166
Agricultural-Residential (1–10 du/ac)	25,540
Cemetery, Public, and Quasi-Public	7,308
Cemetery, Public, and Quasi-Public (RCA)	1,645
Commercial and Offices	1,371
Extensive Industrial	4,659
General Agriculture (20 ac)	39,157
General Agriculture (20 ac) (RCA)	6
General Agriculture (20 ac) (SM)	27
General Agriculture (80 ac)	87,087
General Agriculture (80 ac) (RCA)	21,628
High-Density Residential (31–50 du/ac)	16
Intensive Industrial	3,488
Low-Density Residential (1–12 du/ac)	11,890
Medium-Density Residential (13–30 du/ac)	724
Natural Preserve	18,021
Recreation	5,163
Recreation (RCA)	472
Urban Development Area	94
Urban Reserve	1,909
Urban-Transit-Oriented Development	223
Other	44
Total	**313,657**

Urban Policy Area and Urban Services Boundary

Urbanization in the unincorporated county is largely shaped by the Urban Policy Area (UPA) and Urban Services Boundary (USB). The UPA for Sacramento County was established in 1993 and is still maintained pursuant to Policy LU-1 of the 2030 Sacramento County General Plan. The UPA identifies the area in the county that is capable of providing a 20-year supply of developable land sufficient to accommodate projected growth (Figure 4-3). The intent of the UPA is to direct growth in a logical manner and to identify areas where infrastructure requiring large capital investments will be needed in the near future.

The USB was established in 1993 and is still maintained pursuant to Policy LU-2 of the 2030 Sacramento County General Plan. The USB indicates the ultimate boundary of the urban area in the unincorporated county (beyond 25 years) (Figure 4-3). It is intended to be a permanent growth boundary not subject to modification except under extraordinary circumstances. Sacramento General Plan Policy LU-1 restricts the UPA from expanding beyond the USB except when the County determines it is necessary for health and safety purposes.

The UPA and USB are the backbone of Sacramento County's urban planning philosophy. These growth boundaries are intended to protect the county's natural resources from urban encroachment, as well as to limit costly sprawling development patterns. While the USB is intended to be a permanent boundary, the UPA is adjusted incrementally as needed to ensure that the county can accommodate anticipated growth over the next 25-year planning cycle. The area between the two lines is reserved for future urbanization and is only to be developed when lands within the existing UPA can no longer accommodate projected growth or the project meets expansion criteria pursuant to Policy LU-120. Note that the UPA and USB only apply to the unincorporated areas of Sacramento County.

A majority of the land within the UPA identified for urban residential and commercial use is located north of the City of Elk Grove and east of the City of Sacramento. Industrial land uses are located just south of Mather Field and on properties owned by Aerojet, immediately east of Rancho Cordova and south of U.S. 50. In addition, there are three master plans that have been initiated along the Jackson Highway corridor: New Bridge, West Jackson, and Jackson Township. All three propose to expand the UPA.

Unincorporated Sacramento County (Outside the USB)

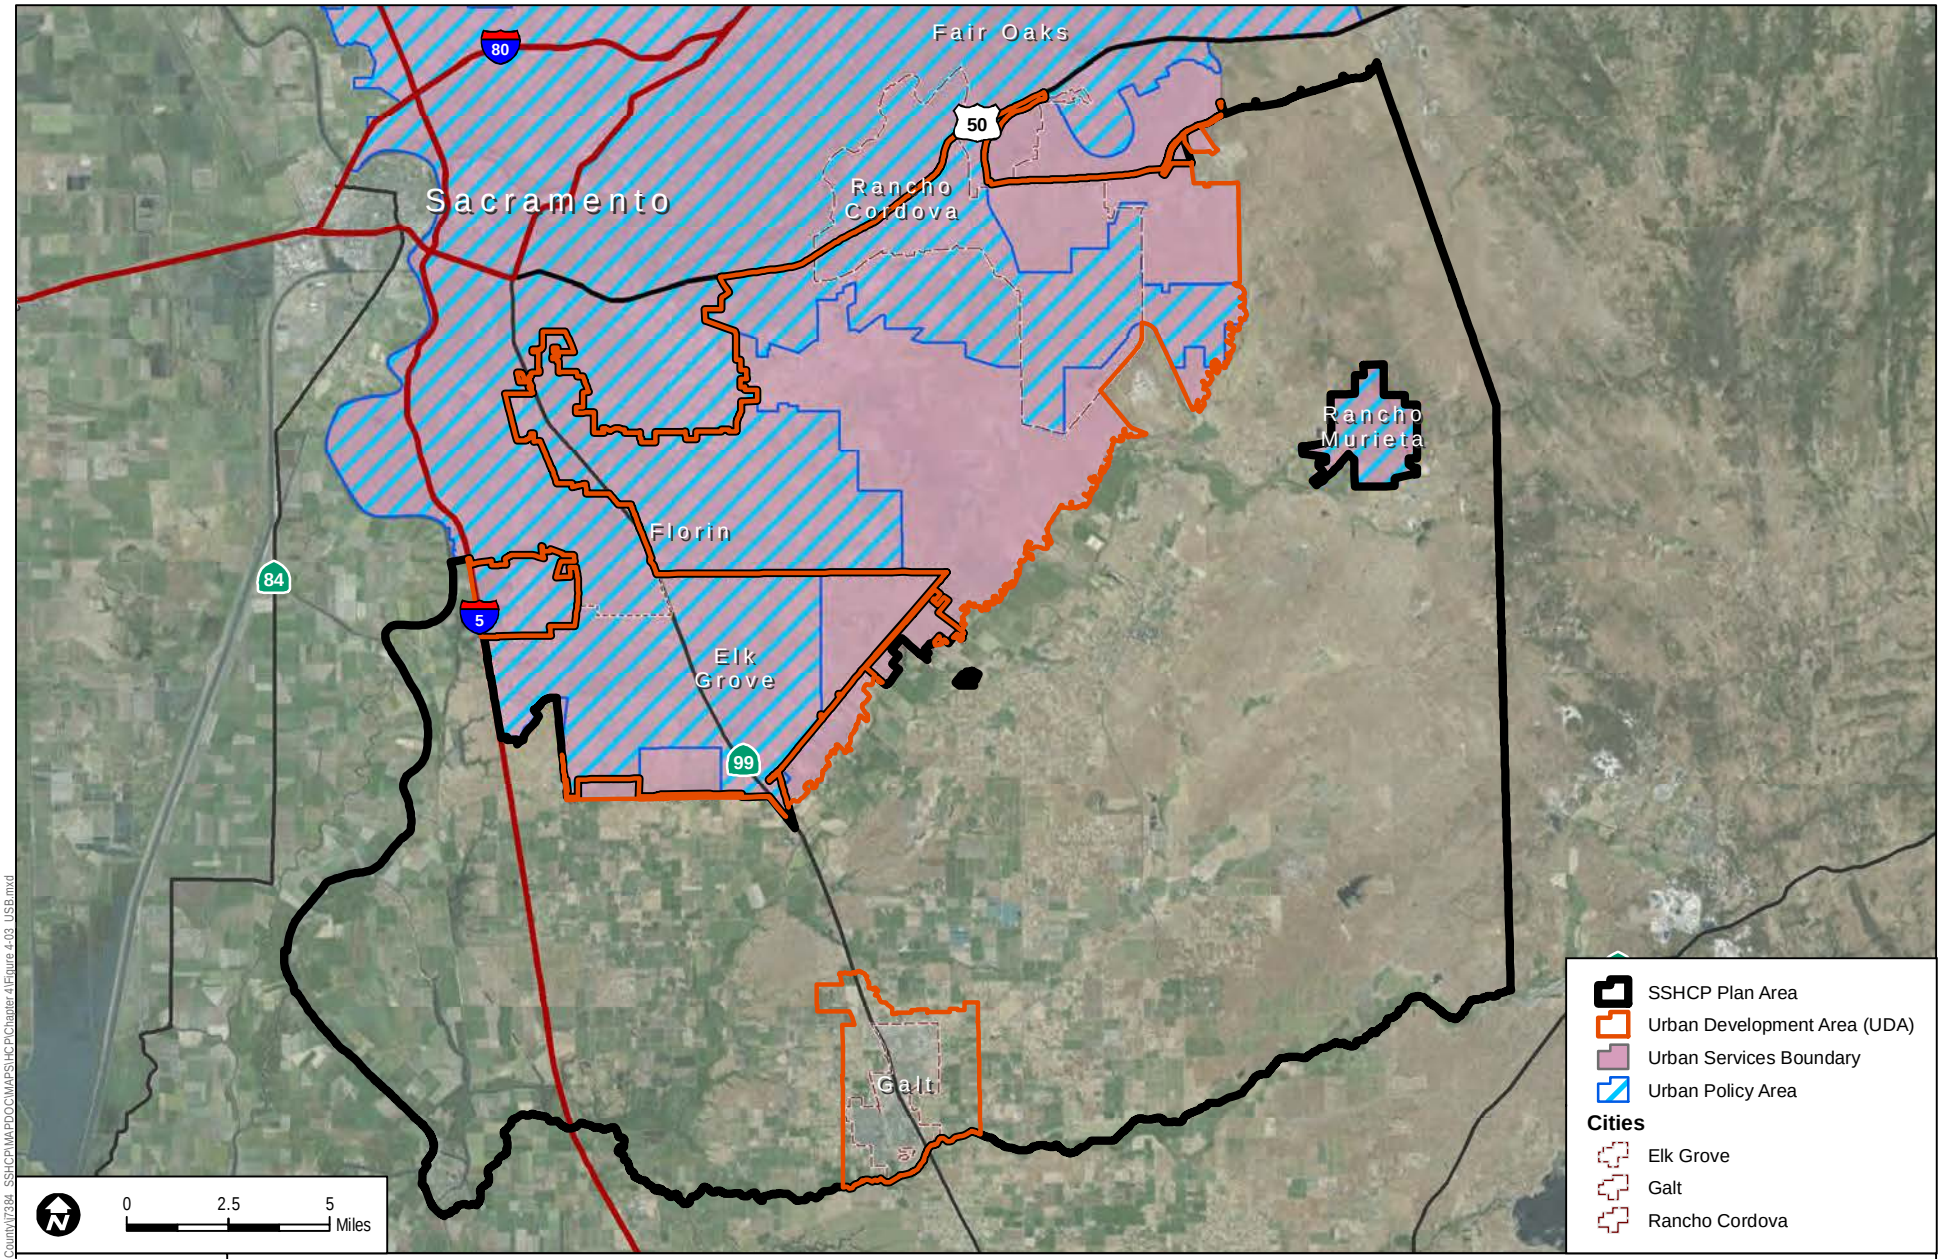
Outside the Urban Development Area (UDA), the eastern portion of the county within the Plan Area consists of dry pastureland suitable for cattle grazing. The land use designations are for General Agriculture with a minimum parcel size of 80 acres. The central and western portions are suitable for growing a variety of crops, including row crops, orchards, vineyards, and some

irrigated pasture. These areas commonly also have General Agriculture land use designations, but with minimum parcel sizes of 20 or 40 acres. Scattered throughout the agricultural landscape are several agricultural-residential communities, including Alta Mesa (2,590 acres), Clay Station (3,095 acres), Herald (2,005 acres), Point Pleasant (471 acres), Sloughhouse (1,030 acres), and Wilton (9,785 acres).

Conservation and Open Space Policies

The Sacramento County General Plan includes several elements such as the agricultural, conservation, and open space elements that guide open space/agricultural resource management for areas within the unincorporated County. These elements provide a strategy for vegetation and wildlife conservation as well as protection of agricultural resources. The following is a list of policies from these elements that also support the SSHCP's goals and objectives (County of Sacramento 2011).

AG-1 The County shall protect prime, statewide importance, unique and local importance farmlands located outside of the USB from urban encroachment.



AG-5 Projects resulting in the conversion of more than fifty (50) acres of farmland shall be mitigated within Sacramento County, except as specified in the paragraph below, based on a 1:1 ratio, for the loss of the following farmland categories through the specific planning process or individual project entitlement requests to provide in-kind or similar resource value protection (such as easements for agricultural purposes):

- Prime, statewide importance, unique, local importance, and grazing farmlands located outside the USB;
- Prime, statewide importance, unique, and local importance farmlands located inside the USB.

The Board of Supervisors retains the authority to override impacts to Unique, Local, and Grazing farmlands, but not with respect to Prime and Statewide farmlands.

However, if that land is also required to provide mitigation pursuant to a Sacramento County endorsed or approved Habitat Conservation Plan (HCP), then the Board of Supervisors may consider the mitigation land provided in accordance with the HCP as meeting the requirements of this section including land outside of Sacramento County.

Note: This policy is not tied to any maps contained in the Agricultural Element. Instead, the most current Important Farmland map from the Department of Conservation should be used to calculate mitigation.

INTENTIONALLY LEFT BLANK

AG-12 The County will cooperate with landowners of agriculturally zoned properties to promote the placing of natural preserve/mitigation amenities on land, such as trees and other biota enhancing improvement, by making sure amenities are assets to both the natural preserve/mitigation areas and agriculture practices.

AG-15 The County shall pursue opportunities to create mitigation banks, environmental mitigation sites, wildlife refuges, or other natural resource preserves wherein substantial agricultural activities that are compatible with protection of high habitat values continue, but incompatible activities and conversion for development are precluded by conservation easements.

AG-16 Maintain private ownership by coordinating with non-profit organizations to acquire conservation easements for preserving farmlands.

AG-17 The establishment of conservation easements combining preservation of agricultural uses, habitat values, and open space on the same property should be encouraged where feasible.

AG-30 Provide a plan focused on noxious weed control in agricultural areas.

CO-24 Comply with the Sacramento Areawide National Pollutant Discharge Elimination System Municipal Stormwater Permit (NPDES Municipal Permit) or subsequent permits, issued by the Central Valley Regional Water Quality Control Board (RWQCB) to the County, and the Cities of Sacramento, Elk Grove, Citrus Heights, Folsom, Rancho Cordova, and Galt (collectively known as the Sacramento Stormwater Quality Partnership [SSQP]).

CO-25 Support the preservation, restoration, and creation of riparian corridors, wetlands, and buffer zones.

CO-26 Protect areas susceptible to erosion, natural water bodies, and natural drainage systems.

CO-58 Ensure no net loss of wetlands, riparian woodlands, and oak woodlands.

CO-59 Ensure mitigation occurs for any loss of or modification to the following types of acreage and habitat function:

- Vernal pools,
- Wetlands,
- Riparian,

- Native vegetative habitat, and
- Special-status species habitat.

CO-61 Mitigation should be consistent with Sacramento County-adopted habitat conservation plans.

CO-65 Create a network of preserves linked by wildlife corridors of sufficient size to facilitate the movement of species.

CO-66 Mitigation sites shall have a monitoring and management program including an adaptive management component including an established funding mechanism. The programs shall be consistent with Habitat Conservation Plans that have been adopted or are in draft format.

CO-67 Preserves and conservation areas should have an established funding mechanism, and where needed, an acquisition strategy for its operation and management in perpetuity. This includes existing preserves such as the American River Parkway, Dry Creek Parkway, Cosumnes River Preserve and other plans in progress for riparian areas like Laguna Creek.

CO-69 Avoid, to the extent possible, the placement of new major infrastructure through preserves unless located along disturbed areas, such as existing roadways.

CO-71 Development design shall help protect natural resources by:

- Minimizing total built development in the floodplain, while designing areas of less frequent use that can support inundation to be permitted in the floodplain,
- Ensuring development adjacent to stream corridors and vernal pools provide, where physically reasonable, a public street paralleling at least one side of the corridor with vertical curbs, gutters, foot path, street lighting, and post and cable barriers to prevent vehicular entry.
- Projects adjacent to rivers and streams shall integrate amenities, such as trail connectivity, that will serve as benefits to the community and ecological function.
- Siting of wetlands near residential and commercial areas should consider appropriate measures to minimize potential for mosquito habitation.
- Development adjacent to steam corridors and vernal pools shall be designed in such a manner as to prevent unauthorized vehicular entry into protected areas.

CO-73 Secure easement or fee title to open space lands within stream corridors as a condition of development approval.

CO-74 Evaluate feasible on-site alternatives early on in the planning process and prior to the environmental review process that reduce impacts on wetland and riparian habitat and provide effective on-site preservation in terms of minimum management requirements, effective size, and evaluation criteria.

CO-75 Maintain viable populations of special status species through the protection of habitat in preserves and linked with natural wildlife corridors.

CO-76 Habitat conservation plans shall be adopted by the County to provide a comprehensive strategy to protect and aid in the recovery of special status species.

CO-77 Development of open space acquisition programs within natural areas shall consider whether the area is occupied by special status species.

CO-78 Plans for urban development and flood control shall incorporate habitat corridors linking habitat sites for special status species. (Please also refer to the Open Space Element for related policies.)

CO-125 Restore concrete sections of rivers and streams to natural or naturalized channels, where feasible for increased flood or conveyance capacity and groundwater recharge.

CO-126 Prohibit obstruction or underground diversion of natural waterways.

CO-132 Protect native vegetative habitats from improper grazing regimes on public lands and inform private land operators of how they may minimize impacts to these habitats.

CO-133 Prohibit native vegetative habitat mitigation and/or other public plantings onto incompatible substrates i.e., tree planting in vernal pool hardpan.

CO-134 Maintain and establish a diversity of native vegetative species in Sacramento County.

CO-135 Protect the ecological integrity of California Prairie habitat.

CO-138 Protect and preserve non-oak native trees along riparian areas if used by Swainson's Hawk, as well as landmark and native oak trees measuring a minimum of 6 inches in diameter or 10 inches aggregate for multi-trunk trees at 4.5 feet above ground.

OS-1 Actively plan to protect, as open space, areas of natural resource value, which may include but are not limited to wetlands preserves, riparian corridors, woodlands, and floodplains associated with riparian drainages.

OS-2 Maintain open space and natural areas that are interconnected and of sufficient size to protect biodiversity, accommodate wildlife movement and sustain ecosystems.

Demographics

The County of Sacramento is approximately 994 square miles. As of 2013, the estimated population of Sacramento County was approximately 1,462,131 persons with a 2010 U.S. Census estimate base of 1,418,788 persons (U.S. Census Bureau 2014a). There are approximately 558,807 housing units in the County as of 2010 (U.S. Census Bureau 2014a).

4.3.2 Rancho Cordova

The City of Rancho Cordova is located in central Sacramento County. Rancho Cordova is bisected by U.S. 50 between Bradshaw Road and Sunrise Boulevard. Between those points, the city extends north to the American River and south to Old Placerville Road. The eastern part of the city continues south of Folsom Boulevard between Sunrise Boulevard and Grant Line Road to the west and east, respectively. The southeastern part of the city is defined by Grant Line Road and Jackson Highway (Figure 4-1). Rancho Cordova encompasses approximately 20,000 acres and has a population of approximately 65,000 people (U.S. Census Bureau 2010a). With approximately 15,179 acres located within the Plan Area, Rancho Cordova makes up approximately 4.5% of the entire Plan Area.

Rancho Cordova's General Plan will guide development until the year 2030 (City of Rancho Cordova 2006). The most prevalent planned land use within the City of Rancho Cordova, as identified by the City's General Plan, is residential (Table 4-2 and Figure 4-4). A majority of the existing urban residential land use designations are located in the northwestern portion of the city, while expanding, new residential land use designations are dominant in the southeastern half. Areas identified for industrial uses are prevalent along U.S. 50. Commercial land use designations are also located along U.S. 50 but additionally occur along commercial corridors like Sunrise Boulevard, Folsom Boulevard, and Coloma Road. Some infill in the form of residential and commercial land use is likely to occur within already established areas of the city; however, a majority of new development will occur in greenfield areas (undeveloped areas earmarked for future development) in southeastern Rancho Cordova.

Table 4-2
City of Rancho Cordova General Plan Land Uses

General Plan Land Use	
Land Use Component	*Acreage*
Low-Density Residential (2.1–6.0 du/ac)	1,055
Medium-Density Residential (6.1–18.0 du/ac)	564
High-Density Residential (18.1–40.0 du/ac)	127
Commercial Mixed-Use	122
Village Center Mixed-Use	12
Office Mixed-Use	1,003
Light Industry	252
Public/Quasi-Public	109
Parks and Open Space	347
Natural Resources	714
Special Planning Area/Specific Plan Area/Other	2,099
Total	**14,706**

Note: du = dwelling unit; ac = acre

Conservation and Open Space Policies

The City of Rancho Cordova's General Plan includes several policies that provide for the conservation of natural resources for areas within the City. The following is a list of policies from the City of Rancho Cordova's General Plan that support the SSHCP's Conservation Strategy (City of Rancho Cordova 2006).

- Policy NR.1.1 – Protect rare, threatened, and endangered species and their habitats in accordance with state and federal law.
    - Action NR.1.1.1 – Incorporate large habitat preserves and interconnected wildlife corridors in new development areas to provide ample space for animal movement.
    - Action NR.1.1.2 – Review projects through the entitlement process and [California Environmental Quality Act] CEQA analysis to ensure that they comply with this policy if the site contains unique habitat, creeks, and/or wooded corridors.
    - Action NR.1.1.3 – As part of the consideration of development applications for individual Planning Areas containing habitats that support special-status plant and animal species that are planned to be preserved, the City shall require that these preserved habitats have interconnections with other habitat areas in order to maintain the viability of the preserved habitat to support the special-status species identified. The determination of the design and size of the "interconnections" shall be made by the City, as recommended

by a qualified professional, and will include consultation with the California Department of Fish and Game [Wildlife] and U.S. Fish and Wildlife Service.

  - Action NR.1.1.4 – Prior to the approval of any public or private development project in areas containing trees, the City shall require that a determinate survey be conducted during the nesting season (March 1 and August 31) to identify if active nesting by birds protected under the Migratory Bird Treaty Act (MBTA) is taking place. If all site disturbance is to occur outside this time, the actions described in this mitigation measure are not required. If nesting activity is observed, consultation with the City of Rancho Cordova Planning Department shall be conducted in order to determine the appropriate mitigation, if any, required to minimize impacts to nesting birds. No activity may occur within 100 feet of any nesting activity or as otherwise required following consultation with the California Department of Fish and Game [Wildlife].

- Policy NR.1.2 – Conserve Swainson's hawk habitat consistent with state policies and Department of Fish and Game [Wildlife] guidelines.
  - Action NR.1.2.1 – Establish a Swainson's Hawk Ordinance in coordination with the California Department of Fish and Game [Wildlife] to establish the process of mitigating for the loss of Swainson's hawk foraging habitat based on habitat value lost to development. The ordinance will set forth a process where habitat lost to development will be mitigated through the permanent protection of equivalent or better existing habitat conditions (referred to hereafter as "mitigation lands"). The specific required mitigation ratios (habitat acreage lost versus mitigation lands) and any other provisions to mitigation process shall be established through technical studies as part of the development of the ordinance and will take into account value of habitat to be converted in relation to habitat value of the mitigation lands (e.g., relation to nesting sites), proximity of the mitigation lands to adjacent conditions affecting habitat (e.g., nearby land uses and already permanently protected lands), and other relevant factors. The ordinance will also establish standards ensuring that mitigation land will be adequately protected and managed in perpetuity (e.g., via conservation easement, deed restriction or other appropriate method), and setting forth the timing of the required provision of mitigation lands in relation with the timing of the loss of habitat in the City (as its boundaries may be changed through subsequent annexations), such that mitigation lands shall be provided no later than prior to ground disturbance.
- Policy NR.1.4 – Discourage the planting of invasive species.
  - Action NR.1.4.1 – Create an educational leaflet that identifies common invasive species and recommends the planting of non-invasive species.
  - Action NR.1.4.2 – The City shall adopt and maintain a Noxious Weed Ordinance. The Noxious Weed Ordinance shall include regulatory standards for construction

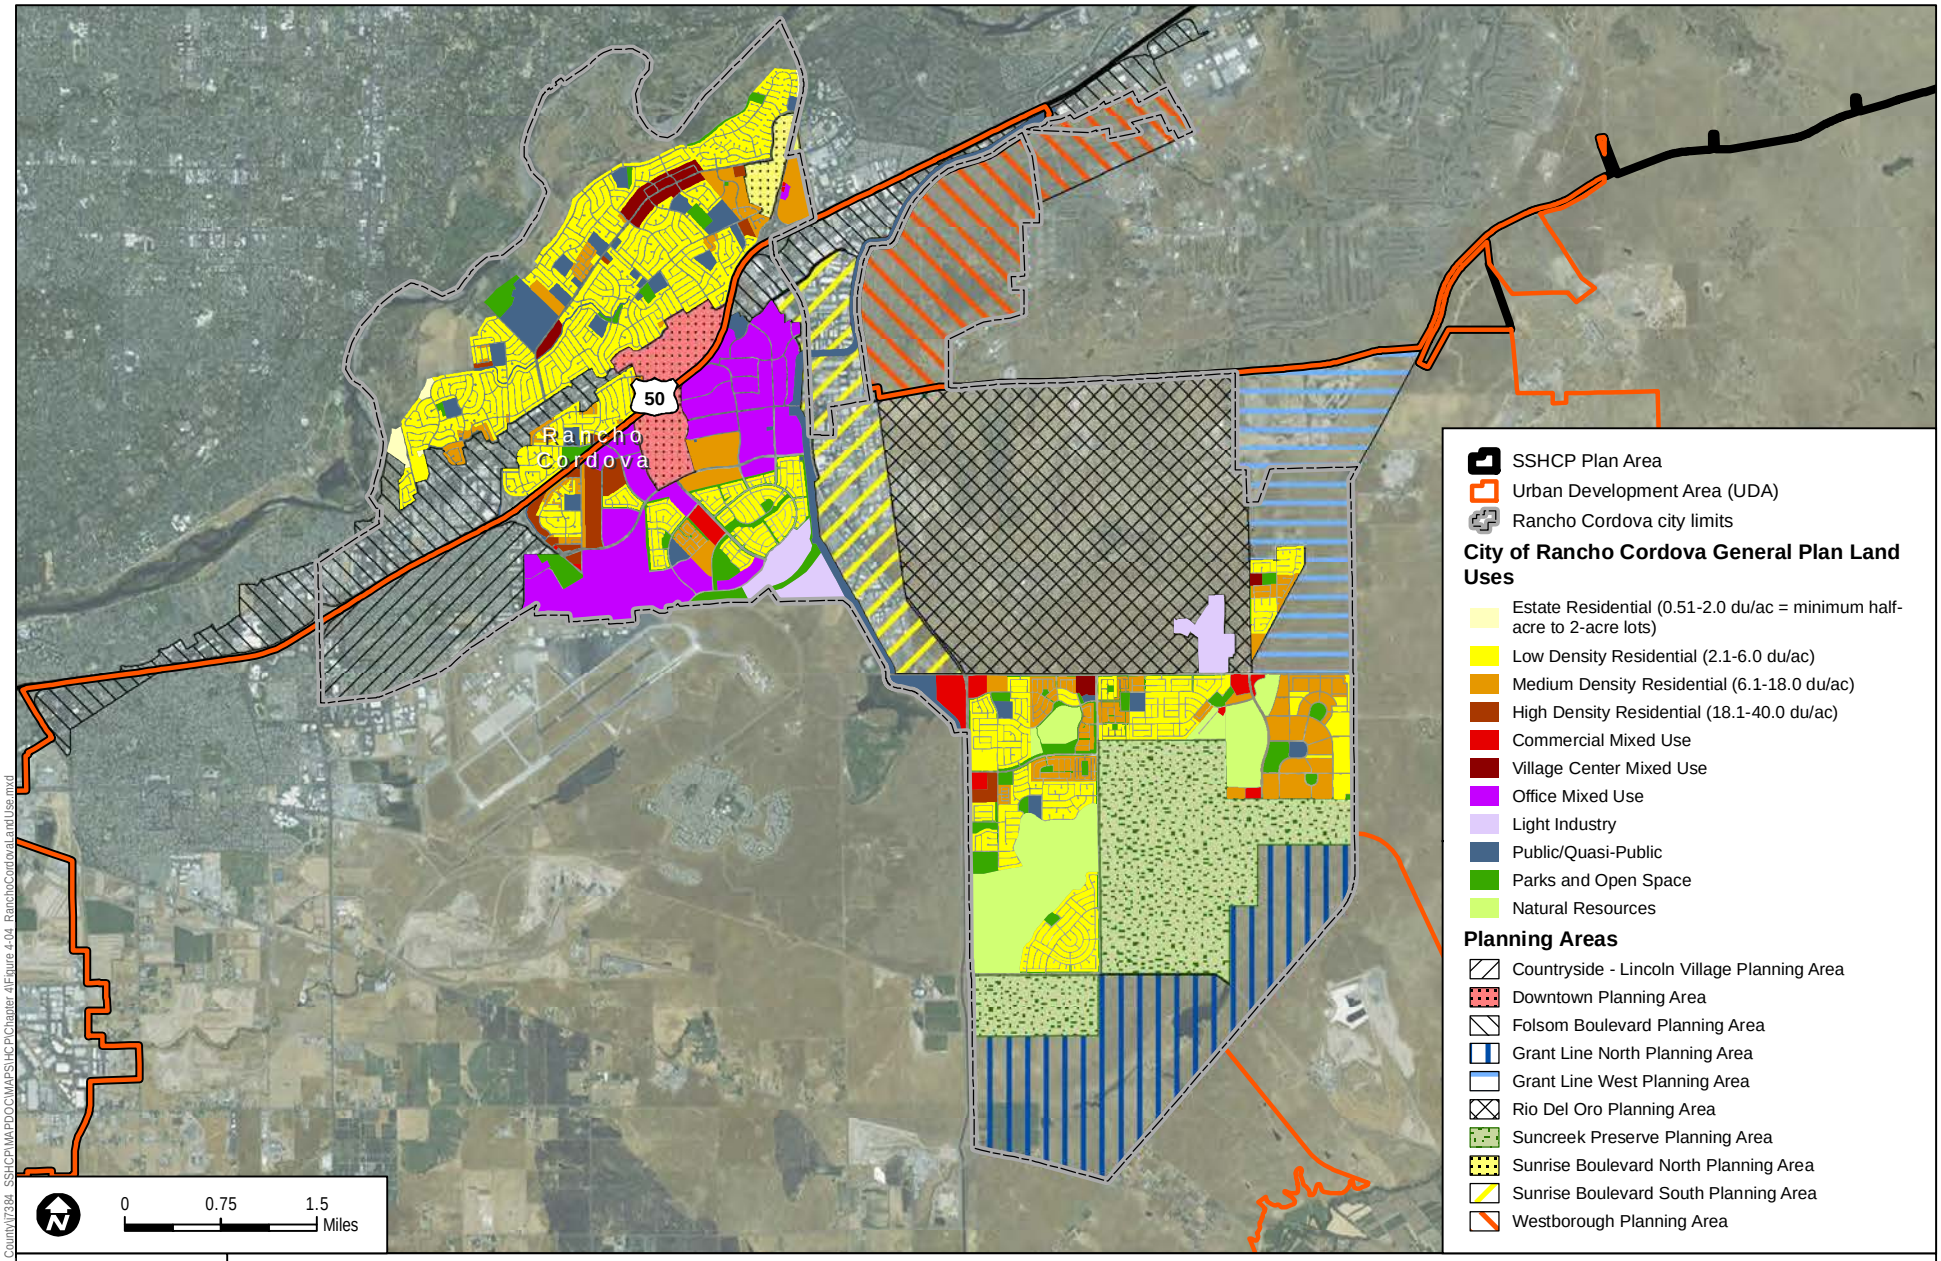
activities that occur adjacent to natural areas to inhibit the establishment of noxious weeds through accidental seed import.

- Policy NR.1.6 – Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.
- Policy NR.1.8 – The City shall encourage creation of habitat preserves that are immediately adjacent to each other in order to provide interconnected open space areas for animal movement.
- Policy NR.1.9 – The City shall require that impacts to riparian habitats be mitigated at a no net loss of existing function and value based on field survey and analysis of the riparian habitat to be impacted. No net loss may be accomplished by avoidance of the habitat, restoration of existing habitat, or creation of new habitat, or through some combination of the above.
- Policy NR.1.10 – The City shall avoid the placement of new roadways within habitat preserves to the maximum extent feasible.
- Policy NR.1.11 – In such cases where habitat preserves are crossed by a roadway, or where two adjacent preserves are separated by a roadway, the roadway shall be designed or updated with wildlife passable fencing separating the roadway from the preserve and/or shall incorporate design features that allow for the movement of wildlife across or beneath the road without causing a hazard for vehicles and pedestrians on the roadway.
- Policy NR.2.1 – Require mitigation that provides for "no net loss" of wetlands consistent with current State and federal policies.
    - Action NR.2.1.1 – During the environmental review process, evaluate feasible on-site alternatives that will reduce impacts to wetland resources and effectively preserve these resources.
- Policy NR.2.2 – Ensure that direct and indirect effects to wetland habitats are minimized by environmentally sensitive project siting and design, to the maximum extent feasible.
- Policy NR.3.2 – In general, the City will encourage the preservation of existing location, topography, and meandering alignment of creeks. Where necessary, and if consistent with other City policies, the creation and realignment of creek corridors shall be constructed to recreate the character of the natural creek corridor. Channelization and the use of concrete within creek corridors shall not be supported.
    - Action NR.3.2.1 – Develop guidelines for channel creation or modification that will ensure channel meander, naturalized side slope, and varied channel bottom elevation are considered in design.
    - Action NR.3.2.2 – Adopt and implement improvement standards for soft bottom channels.

Demographics

The City of Rancho Cordova is approximately 34 square miles. As of 2013, the estimated population of Rancho Cordova was 67,911 persons with a 2010 U.S. Census estimate base of 64,805 persons (U.S. Census Bureau 2010a, 2014b). There were approximately 25,479 housing units in the City as of 2010 (U.S. Census Bureau 2014b).

4.3.3 Galt



The City of Galt is located in southern Sacramento County and can be generally described as extending from Dry Creek on the south to Twin Cities Road on the north, and from McFarland Street/Sparrow Drive on the west to Marengo Road on the east (Figures 4-1 and 4-5). Galt encompasses approximately 3,760 acres of land and has a population of approximately 23,600 (U.S. Census Bureau 2010b).

Galt makes up approximately 1% of the Plan Area. Galt's 2030 General Plan will guide development until the year 2030 (City of Galt 2009). The most prevalent planned land use in Galt is low-density residential (Table 4-3).

Table 4-3
City of Galt General Plan Land Uses

General Plan Land Use	
Land Use Component	*Acreage*
Rural Residential	1
Low-Density Residential (0–6 du/ac)	1,401

Conservation and Open Space Policies

The City of Galt General Plan includes several policies that provide for the conservation of natural resources for areas within the City. The following is a list of policies from the City of Galt's General Plan that support the SSHCP's Conservation Strategy (City of Galt 2009).

- **Policy COS-1.10: Ecological Features Retention.** The City shall retain to the extent feasible the ecological features of the creeks, sloughs, and rivers in their natural state.
- **Policy COS-1.11: Riparian Corridor Protection.** The City shall endeavor to protect, preserve, and improve riparian corridors.
- **Policy COS-1.13: No Net Loss of Wetlands.** The City shall review development proposals in accordance with applicable local, State, and Federal statues protecting jurisdictional wetlands (Section 404 of the Clean Water Act) and require that new developments have no net loss of existing wetland habitats.
- **Policy COS-2.1: Sensitive Species Protection.** The City should require minimization of impacts to protect mature trees, vernal pools, and any threatened endangered or other sensitive species when approving new development.
- **Policy COS-2.3: Biologically Sensitive Area Development.** The City should require new development in areas that are known to have particular value for biological resources to maximize preservation of sensitive vegetation and wildlife habitat.
- **Policy COS-2.4: Federal, State, and Local Statutes Compliance.** The City shall review development proposals in accordance with applicable Federal, State, and local statutes protecting special-status species and jurisdictional wetlands.
- **Policy COS-2.7: Regional Habitat Conservation Efforts Coordination.** The City shall continue to coordinate efforts with Sacramento County to develop the South Sacramento Habitat Conservation Plan.
- **Policy COS-3.1: Riparian Protection.** The City should require the protection of existing riparian vegetation along stream courses in the city.
- **Policy COS-3.2: Mature Tree and Woodland Preservation.** The City shall encourage retention of mature trees and woodlands to the maximum extent possible.
- **Policy COS-4.1: Prime Agricultural Land Preservation.** The City shall work to preserve prime agricultural lands surrounding the Planning Area from future development by creating a clear and sensitive urban transition to minimize land use conflicts and protect long-term agriculture.

- **Policy COS-4.4: Open Space Protection.** The City shall, where appropriate, permanently protect as open space areas of natural resource value, including wetlands preserves, riparian corridors, woodlands, and floodplains.
- **Policy COS-4.8: Open Space and Natural Area Connectivity.** The City shall maintain open space and natural areas that are interconnected and of sufficient size to protect biodiversity, accommodate wildlife movement, and to provide more sustainable ecosystems.
- **Policy COS-4.9: Open Space Preservation.** The City shall work to preserve open space that provides both habitat for wildlife and increases the quality of life for people. This can include maintaining areas for trails, bike and pedestrian paths, and open space buffers used as separators between neighborhoods to provide an identity and a sense of place.
- **Policy PFS-2.3: Surface Water Protection.** The City shall protect surface water resources, including rivers, creeks, streams, sloughs, and marshes, from development impacts.

Demographics

The City of Galt is approximately 6 square miles. As of 2013, the estimated population of Galt was approximately 24,472 persons with a 2010 U.S. Census estimate base of 23,647 persons (U.S. Census Bureau 2010b, 2014c). There are approximately 7,678 housing units in the City as of 2010 (U.S. Census Bureau 2014c).

4.3.4 Existing and Proposed Extra-Territorial Spheres of Influence

A sphere of influence (SOI) is "a plan for the probable physical boundaries and service area of a local government agency" (California Government Code, Section 56076). An SOI may reflect the limits of probable future growth of a jurisdiction. An extra-territorial SOI is one that extends beyond a local governmental jurisdiction's formal boundary. SOI applications are reviewed and approved by the Sacramento Local Agency Formation Commission (LAFCO). The following provides descriptions of extra-territorial and proposed SOI areas within the Plan Area. They are depicted in Figure 4-1.

City of Sacramento SOI

The City of Sacramento has four extra-territorial SOI areas that extend into the Plan Area. The largest is approximately 9,500 acres in size and includes the unincorporated South Sacramento area along Interstate 5 bounded to the east by Elk Grove Florin Road and to the south by Calvine Road. This area is largely developed but does have pockets of scattered open lands, particularly to the southeast along Elk Grove Florin Road. The second area extends 164 acres beyond the existing city limits to Hedge Avenue between Fruitridge Road and Elder Creek Road. It is characterized by scattered agricultural-residential development with several larger

open lots. The third area overlaps with the Plan Area by approximately 1,930 acres. The area that overlaps with the Plan Area is bounded by the Sacramento city limits to the west, U.S. 50 to the north, Bradshaw Road to the east, and Jackson Highway to the south. This area is also largely developed. The fourth SOI area overlaps with the Plan Area by approximately 700 acres located within the Beach Lake area. The land is owned by the Sacramento Regional County Sanitation District (SRCSD) south of the existing city limits between Interstate 5 and Franklin Boulevard and largely acts as a buffer to the existing wastewater treatment plant. Annexation of land from any of these areas to the City of Sacramento would transfer land use authority for the area to the city, replacing existing land use regulation by Sacramento County and the County's planning and zoning designations.

City of Galt SOI

The City of Galt's SOI encompasses roughly 4,500 acres of land to the west, east, and north of the existing city limits. The western portion of the SOI is formed by the Sacramento County line, Sargent Avenue, and Twin Cities Road. The eastern portion of the Galt SOI is bounded by the County line, Cherokee Lane, and Twin Cities Road. The northern portion of their SOI includes lands north of Twin Cities Road between Cherokee Lane on the east and the Union Pacific Railroad on the west, and then generally following Skunk Creek east and southwest of Highway 99, south to a point approximately one-third of a mile north of Twin Cities Road easterly to Cherokee Lane (see Figure 4-1). Much of the SOI area west and north of Galt is scattered agricultural-residential development, but larger intact cropland and pasture areas are still present, particularly toward the southern extent of the SOI where it borders Dry Creek. The eastern portion of the SOI exhibits some agricultural-residential development but is predominantly crop and pasture lands. Growth in the Galt SOI is proposed to be a mixture of residential, commercial, industrial, and office professional development, as well as some unspecified public and quasi-public land uses. Annexation of land from any of these areas to the City of Galt would transfer land use authority for the area from Sacramento County to the City, replacing existing County land use regulations and the County's planning and zoning designations.

4.4 Demographics of the Plan Area

General Projections

As coastal communities continue to build out and the cost of living in those communities steadily increases, new growth will continue to shift to inland regions, mimicking patterns of growth that were observed in Southern California during the 1980s and 1990s. Sacramento Area Council of Governments (SACOG) has forecast that Sacramento County will see an increase in population from 2,057,200 in 2005 to 2,519,947 by 2020 and over 3,000,000 by 2035 (SACOG 2005, 2012; County of Sacramento 2011). Population growth is not expected to slow much past 2025, and

current SACOG projections are that the population within the Sacramento region could swell to approximately 3,653,000 people by 2050. A large portion of this growth is expected to occur in southern Sacramento County within the Plan Area. Although Sacramento County's population and housing needs are clearly expected to grow over time, the rate of growth is not expected to be linear. SACOG estimates slower growth rates through 2020 followed by a period of higher growth to approximately 2035 (County of Sacramento 2013, Chapter 5). Population and housing projections have an inherent level of uncertainty; however, a population model such as SACOG's population synthesis process is a standard, widely accepted approach to developing population projections.

SACOG Blueprint Project

SACOG recognized that the pattern of growth in the six-county area of El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba Counties may lead to the loss of habitat, an increase in traffic congestion, an increase in pollution, and the loss of agricultural land and open space. The SACOG Blueprint Project set out to identify the region's housing/employment needs and to propose different scenarios for development to accommodate that need for the next 45 years. SACOG identified a "base-case scenario"[1] representing current development trends and made projections out to 2050. Alternative strategies were developed, each implementing differing levels of smart growth strategies. After extensive outreach and public involvement, the SACOG Board adopted its preferred scenario in December 2004. The preferred scenario represents a balanced approach that emphasizes infill and revitalization, and relies on smart growth principles to encourage development at higher densities, while offering a wider choice of housing options (SACOG 2010). It should be noted that the growth projections used to develop the blueprint are now viewed as being overly optimistic.

Both the blueprint base-case scenario and the blueprint preferred alternative identify urban development within the Plan Area. The preferred scenario in Rancho Cordova and eastern Sacramento County (within the USB) are identified for more compact development with almost twice the population of the base-case scenario, which slates the areas for continued low-density growth. The remaining portion of the Plan Area (i.e., the east, southeast, and south county outside the USB) would see limited development to the south of the City of Elk Grove and the City of Folsom under the preferred scenario, as opposed to the base-case scenario that shows significant growth into these rural areas.

[1] A projection of how the six-county Sacramento region would grow if recent development trends continued for the next 50 years.

5 COVERED ACTIVITIES

5.1 Introduction

This chapter describes specific categories of South Sacramento Habitat Conservation Plan (SSHCP or Plan) Covered Activities that may occur within the SSHCP Plan Area and for which incidental take authorization is requested by the Plan Permittees from the Wildlife Agencies. The Plan will provide avoidance, minimization, and compensation for impacts to SSHCP Covered Species and their habitats that result from implementation of SSHCP Covered Activities. Covered Activities are also referred to as "activities" or "projects" in this document. The Covered Activities described below are analyzed in Chapter 6, Effects Assessment and Level of Take.

The SSHCP Covered Activities described in this chapter will be implemented by the Plan Permittees and by third parties (e.g., project proponents or private developers) that are subject to the jurisdiction of a Plan Permittee. On occasion, Covered Activities may be implemented by a third party that is not subject to the jurisdiction of a Plan Permittee (see Participating Special Entity in Chapter 9). All Covered Activities described in Section 5.2 are eligible to be covered by a Plan Permittee's Incidental Take Permit (ITP), provided the activity or project can satisfy the application process described in Chapter 10.

The three Land Use Authority Permittees (the County of Sacramento and the Cities of Galt and Rancho Cordova) may extend incidental take coverage provided by the ITPs to Covered Activities proposed by third parties. The Implementing Entity may extend incidental take coverage provided by the ITPs to Covered Activities proposed by Participating Special Entities. All Third-Party Project Proponents seeking coverage for Covered Activities under the SSHCP permits must obtain approval from the Land Use Authority Permittee with jurisdiction over the activity or project. Where a Land Use Authority Permittee does not have approval authority over a Third-Party Project Proponent, the Third-Party Project Proponent will request approval authority from the Implementing Entity. See Chapter 9 for definitions of entities discussed in this Plan, and see Chapter 10 for a description of the third-party project approval process.

This Plan includes measures to avoid and minimize take of Covered Species. Section 5.4 describes conditions on the implementation of each Covered Activity that will avoid or minimize effects of that Covered Activity. All Covered Activities must incorporate the relevant Avoidance and Minimization Measures described in Section 5.4. The approval process for Covered Activities proposed by third parties seeking ITP coverage under the SSHCP permits includes demonstration that the required Avoidance and Minimization Measures have been properly incorporated or will be incorporated into the proposed Covered Activity or project.

Proposed projects or activities that do not fall clearly within the description of an SSHCP Covered Activity provided in this chapter will be evaluated on a case-by-case basis. If a Land

Use Authority Permittee or the Implementing Entity, in instances when a Participating Special Entity in involved, determines that a specific project or activity is not included within the Covered Activity descriptions in this chapter or is not covered as a new type of activity as described below, then the proposed project will not receive incidental take coverage under the SSHCP permits.

However, a new type of activity not specifically identified in Section 5.2 might be covered under the SSHCP ITP if the activity meets all of these criteria:

- The activity is (1) conducted by one of the Plan Permittees, (2) subject to the jurisdiction of one of the Plan Permittees, or (3) conducted by a Participating Special Entity under the purview of the Implementing Entity (see Chapter 10) for the process by which projects or activities proposed by a non-permittee (a Third-Party Project Proponent) could receive incidental take coverage under the SSHCP permits.
- The activity is not listed in Section 5.3, Activities and Actions Not Covered by the SSHCP Permits.
- The activity meets the requirements of the application process as described in Chapter 10.
- The activity does not preclude achieving any Biological Goal or Measurable Objective of the SSHCP (see Chapter 7, Conservation Strategy). The determination as to whether it would preclude achievement will be made in coordination with the Wildlife Agencies.
- The proposed activity does not result in any impacts to Covered Species or natural communities that were not quantified and analyzed in Chapter 6. The determination as to whether a proposed activity was analyzed adequately will be made in coordination with the Wildlife Agencies.
- The proposed activity does not result in any impacts that were not analyzed in the SSHCP Environmental Impact Statement/Environmental Impact Report (EIS/EIR). The determination as to whether a proposed activity was analyzed adequately in the SSHCP EIS/EIR will be made in coordination with the Wildlife Agencies.
- Adequate take coverage as determined by the Implementing Entity remains available under the SSHCP ITPs.

Provided that proposed projects meet the criteria above, they may be covered by a Permittee's ITP. Identification as a Covered Activity, either in this chapter or through a future determination by the Implementing Entity, does not imply or grant entitlement for project implementation. Third-Party Project Proponents are required to gain other project approvals from local jurisdictions and other Permitting Agencies as necessary. All Covered Activities described in this

chapter are eligible to be covered by the two ITPs (federal Endangered Species Act (ESA) and California Endangered Species Act (CESA)) held by the Plan Permittee.

5.2 Covered Activity Categories

The majority of the SSHCP Covered Activities will be implemented within the region of the Plan Area designated as the Urban Development Area (UDA) (see Chapter 1, Figure 1-1). As discussed below, the Chapter 6 effects analysis assumes that all undeveloped parcels located within the UDA boundary will be developed during the 50-year SSHCP Permit Term, except for the following: (1) parcels that are an existing Preserve or permanently protected by a conservation easement, (2) parcels that are in the planned SSHCP Preserve System (see Chapter 7, Conservation Strategy), or (3) parcels that are the site of a proposed project with existing ESA Incidental Take authorization and other required entitlements.[1] Therefore, future Urban Development and associated infrastructure, as well as Mining Covered Activities, to be implemented within the UDA are broadly defined in this chapter, and information on the precise locations of most Covered Activities within the UDA is not presented. Two categories of Covered Activities (Rural Transportation Projects and Recycled Water Projects) will be constructed within the Plan Area outside the UDA (see Sections 5.2.3 and 5.2.4). Specific project details and locations of the rural road improvement and Recycled Water Project Covered Activities are provided in Sections 5.2.3 and 5.2.4.

Covered Activities related to the management and improvement of species habitats within the proposed SSHCP Preserve System will occur on Preserves located inside the UDA and outside the UDA (see Chapter 7, Conservation Strategy, for information on the SSHCP Preserve System). The Covered Activities described in Section 5.2.7, SSHCP Preserve System Covered Activities, are the responsibility of the Implementing Entity.

Descriptions in this chapter of Covered Activities and their construction methods are mostly qualitative. Additional quantitative assumptions of Covered Activity footprints and frequency of occurrence are described in the impact analysis methodology in Chapter 6.

The SSHCP Covered Activities fall into eight general categories:

- Urban Development in the UDA
- Mining in the UDA
- Rural Transportation Projects

[1] The Mather Field Specific Plan is still pursuing its own Endangered Species Act (ESA) consultation with the U.S. Fish and Wildlife Service and a Clean Water Act Section 404 permit from the U.S. Army Corps of Engineers; however, the SSHCP Chapter 6 effect analysis treats parcels within the boundary of the Mather Field Specific Plan the same as parcels with existing ESA incidental take authorization and other entitlements.

- Recycled Water Projects
- Covered Activities in Preserve Setbacks in the UDA
- Covered Activities in Stream Setbacks in the UDA
- SSHCP Preserve System Covered Activities
- Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System

Each of these categories of Covered Activities is described in further detail below. In some cases, specific activities or projects are discussed as examples to illustrate the Covered Activity category.

It is expected that the Permittees may identify additional Covered Activities over the 50-year SSHCP Permit Term. If an additional Covered Activity , as generally and qualitatively described below, meets all criteria in Section 5.1, which are not expressly limited by this chapter, and its environmental effects are adequately evaluated in Chapter 6 of this Plan and adequately evaluated in the EIS/EIR for the SSHCP, the additional Covered Activity will also be covered by the ITPs.

5.2.1 Urban Development in the UDA

This category includes all development projects and activities that occur inside the UDA (see Figure 1-1). The Covered Activities described under this category are defined broadly to include planned urban growth and all ground-disturbing activities associated with Urban Development. It includes construction of typical urban facilities, public and private, consistent with local general plans; master plans; and local, state, and federal laws; and the post-construction maintenance of those urban facilities.

This category of Covered Activities includes, but is not limited to, the construction, use, and maintenance of the following urban facilities:

- **Residential, Commercial, and Industrial Structures.** These include construction, use, and maintenance of residential, commercial, and industrial buildings, structures, and associated infrastructure. Residential development includes urban, suburban, and agricultural-residential housing (e.g., homes on 2- to 10-acre lots). Commercial and Industrial development includes construction of retail centers, office buildings, factories, and warehouses. This Covered Activity also includes construction of public service and cultural facilities, including new fire stations, police stations, community policing centers, communications facilities, public administration centers, convention centers, theatres, museums, community centers, community gardens, and concession buildings. Other public facilities include hospitals, other public health centers, schools, colleges, universities, libraries, maintenance facilities, parking lots, administration centers, and similar facilities, and funeral/interment facilities such as cemeteries, mortuaries,

crematorium, columbaria, and mausoleums. This category also includes removal of existing facilities and the use and maintenance of existing and new facilities. Long-term maintenance activities include, but are not limited to, the inspection, cleaning, rehabilitation, repair, and/or replacement of buildings, structures, and facilities.

- **Park and Recreation Facilities**. These include construction and maintenance of recreational facilities such as regional parks, neighborhood parks, dog parks, indoor and outdoor sports complexes, sports fields and facilities, recreation trails, community trails, equestrian trails, restrooms, trailheads, playgrounds, golf courses, racetracks, campgrounds, kiosks, nature centers, nature interpretation facilities, and associated infrastructure such as roads, bridges, parking areas, and restrooms.
- **Water Supply Facilities.** Water supply activities include the construction and installation of new potable and recycled water supply facilities, extension of existing facilities, and removal and maintenance of existing water supply facilities. Covered activities related to water supply include all activities that support production, conveyance, treatment, and storage of water. New water supply facilities include, but are not limited to, pumping stations, water treatment facilities, storage facilities, wells, pipelines, valves, gates, weirs, groundwater recharge and reclamation facilities (e.g., percolation ponds), other miscellaneous structures and equipment (e.g., power, control, diversion, discharge, junction, metering, telemetry), and access facilities (e.g., structures, vaults, maintenance holes, roads). All associated activities required to complete routine and emergency operations and maintenance work on water supply facilities, such as traffic control, are also Covered Activities.

  Construction actions related to water supply facilities generally include, but are not limited to, vegetation clearing, grading, trenching or excavation of soil, trenchless construction methods, staging equipment and materials, pouring of concrete or asphalt, compacting soil, and maintenance of water supply facilities and surrounding landscaping.

  Extension of existing water pipelines and installation of new pipelines typically require open cut trenching to place the pipeline 3 to 20 feet below ground level. Construction may require up to a 100-foot-wide temporary construction easement to accommodate staging of equipment and materials. Planned pipeline alignments will follow existing or new roadways to the extent feasible. Manhole access is needed at intervals of approximately 1,000 feet. In some instances, temporary dewatering of aquatic habitats may be required during pipeline construction to lower the groundwater level to at least 2 feet below the pipe installation depth. After construction, the water level is monitored to ensure that it returns to its pre-construction level. Where pipeline obstacles are confronted, such as a creek or railroad, trenchless construction methods may be used to install the new pipeline. During construction of infrastructure or public utilities, it may be

necessary to temporarily divert stream channels, using appropriate measures to avoid or minimize impacts to stream habitat. Refer to Condition 7 in Section 5.4 for Avoidance and Minimization Measures that are required when diverting stream channels.

Groundwater extraction wells are built in either one- or two-phase projects. In the two-phase projects, the well is drilled and equipped at separate times, often years apart. Extraction wells range from 400 to 1,500 feet in depth. Typically, the wells have a 3- to 4-foot-diameter hole at the surface, with a final pad that is approximately 6 by 6 feet. In two-phase projects, the pump casing is extended 24 inches above the ground and capped with a locking steel lid. Additional space needed for well equipment varies from site to site. The typical well site property is 100 by 100 feet. Typically during construction, the entire site is used for staging the pipe casings, construction equipment, and spoils, and for a laydown area for soil samples. Test pumping of the well requires discharge of significant amounts of water. In rare instances when there is no local source to discharge the test pumping waters, a temporary detention ditch may be constructed on an adjacent property. Typical complete well sites may include a 16- by 40-foot concrete block/steel roof well enclosure, on-site drainage systems, electrical transformer, shielded electrical control panels, access driveway, and perimeter fencing. Operation and maintenance actions on water supply facilities occur within existing rights-of-way (ROWs) or easements, and include the inspection, cleaning, rehabilitation, repair, and/or replacement of Sacramento County Water Agency facilities. These facilities include, but are not limited to, maintenance holes, access vaults, pipelines, force mains, pumping stations, booster pumps, valves, gates, weirs, flow monitoring equipment, telemetry equipment, electrical power and control equipment, storage tanks, access roads, and other miscellaneous structures. Over the 50-year Permit Term, some of these facilities will require replacement and may involve surface and subsurface construction activities, methods, and disturbances equivalent to new construction.

The Plan Permittees reviewed planning documents prepared by the Sacramento County Water Agency to identify the proposed locations of future water supply pipelines. The planned pipeline alignments were relocated to the maximum extent practicable so that the pipeline will be built within existing roadways or within areas that will not impact natural land covers and Covered Species habitat. There will likely be a limited number of locations where pipeline alignments will need to cross a Preserve where the location of that Preserve cannot be anticipated at this time. If this is necessary, direct and indirect impacts will be avoided or minimized by Condition 8, as listed in Section 5.4. The Plan Permittees estimate that up to 1,000 linear feet of new water supply pipeline may cross under planned Preserves.

Construction, operation, and maintenance of water supply facilities are Covered Activities. Entities that are not Plan Permittees that propose construction of water supply

projects may be treated by the Implementing Entity as a Participating Special Entity (see Chapter 9, Section 9.3.1).

- **Flood Control and Stormwater Management in the UDA.** Activities related to flood control and storm drainage include all activities that support flood control as described in water drainage, capital improvement, flood control, and storm drain master plans for the Land Use Authority Permittees (the County of Sacramento and the Cities of Rancho Cordova and Galt). This Covered Activity includes construction of new facilities and maintenance of new and existing facilities. Stormwater abatement and treatment facilities include, but are not limited to, detention basins, stormwater channels, weirs, stormwater pumping stations, pressure control structures, and natural or re-aligned stream channels.

  Operations and maintenance activities implemented under the oversight of Land Use Authority Permittees for flood control and stormwater management are also SSHCP Covered Activities. These activities include the following:

  - Vegetation Control: Operations and maintenance activities include aquatic and terrestrial vegetation control consistent with conditions in Sections 5.4.1 and 5.4.2 that may be performed with the use of mechanical devices or hand labor,[2] as follows:

    - Control of vegetation, including aquatic plants, weeds, grasses, shrubs, and woody growth, to remove obstructions to flow in both improved and unimproved channels.
    - Control of weeds and grasses on maintenance roads within the banks by mechanical means, hand labor, or chemical application[3] (see ROAD-3).
    - Control of the lower branches of woody growth less than 4 inches diameter at breast height, growing on lower streambanks from ground level to a distance of 6 feet above ground level.
    - Where appropriate, removal of non-native vegetation, including stump and root removal between creek banks.
    - Removal of debris, trash, rubbish, flood-deposited woody and herbaceous vegetation, fallen trees, dead trees that are in clear danger of falling in or across the channel, branches, and associated debris that noticeably reduces channel capacity, would result in accelerated erosion, and/or would cause pump damage. This category also includes mowing vegetation for fire abatement and beaver dam removal.

[2] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land-management tool, provided the pesticide application is otherwise legal and the application conforms to all conditions in Section 5.4.

[3] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and the application conforms to all conditions in Section 5.4.

- Removal or displacement of silt, sand, or sediment that obstructs flow in the immediate vicinity of bridges, concrete box culverts, culvert pipes, and outfall pipes.
- Erosion control through repair of failed rock, riprap, concrete, or gabion sections or culvert replacement. Maintenance activities will be confined to a failed section and immediately adjacent areas. These activities may require temporary diversion of water within the channel area (only as necessary to perform the maintenance) and/or temporary placement of sandbags or other appropriate best management practices (BMPs). Generally, small excavation equipment, small power tools, and hand labor will be used to perform this work.

  - Stream Bank Stabilization Projects: These include installation of in-stream structures for erosion control (e.g., appropriate bio-engineering methods).

- **Public and Private Utilities.** Includes construction, replacement, augmentation, and maintenance of electric transmission and distribution lines, electrical substations, telecommunications lines (aboveground and belowground), towers and related facilities, petroleum distribution pipelines (underground and aboveground), and natural gas distribution pipelines (underground and aboveground).

  During construction of public utilities, it may be necessary to temporarily divert stream channels to avoid or minimize impacts to stream habitat (refer to Condition 7 in Section 5.4).

  Operation and maintenance actions related to underground gas lines include, but are not limited to, hydrostatic testing, electronic telecommunications switching systems, cathode protection, pipeline coating, pipeline lowering or replacement, and access road maintenance.

  Urban solar energy projects and other energy-generating projects within the UDA may be Covered Activities, provided they meet all criteria in Section 5.1.

  The Plan Permittees estimate that there are approximately 70 miles of existing high-voltage transmission lines (18 miles within the UDA and 52 miles outside the UDA) in areas that are existing Preserves or may become SSHCP Preserves, and approximately 16 miles of existing natural gas pipeline (1 mile within the UDA and 15 miles outside the UDA) in areas that are in existing Preserves or may become SSHCP Preserves. Figure 5-1 illustrates the alignments of existing high-voltage electrical transmission lines in the Plan Area. The repair and maintenance of utility facilities within planned SSHCP Preserves are Covered Activities, consistent with the utility's existing ROW easements.

- **Solid Waste Management Facilities.** These include the expansion and decommissioning of existing landfills, construction and operation of new transfer stations, and construction and operation of new recycling stations within the UDA. Additionally, long-term operation and maintenance activities include inspection, cleaning, rehabilitation, repair, and/or replacement of these sanitation facilities.

Operation and maintenance of existing groundwater extraction and monitoring wells and associated groundwater treatment facilities at Kiefer Landfill, and construction, operation, and maintenance of new groundwater extraction and monitoring wells at Kiefer Landfill are SSHCP Covered Activities.

- **Wastewater (Sewer) Facilities**. Covered Activities related to wastewater facilities include all activities in the UDA that support the provision of wastewater services (e.g., collection, conveyance, diversion, delivery, storage, treatment, transmission, distribution, discharge). Covered Activities include construction, installation, operation, and maintenance of new wastewater facilities, as well as extension, removal, replacement, abandonment, operation, and maintenance of existing wastewater facilities. Wastewater facilities generally include, but are not limited to, pumping stations, booster pumps, wastewater and water treatment facilities (including satellite, scalping, and separation facilities), sewage force mains, gravity sewage pipelines (interceptor, trunk, collector pipelines), pressurized pipelines (water, gas, sludge, chemical), valves, gates, weirs, recharge ponds and spreading basins, small containment berms, groundwater wells, tanks, landscaped areas near facilities, storage facilities, other miscellaneous structures and equipment (power, control, diversion, discharge, junction, metering, telemetry), and access facilities (structures, vaults, maintenance holes, roads). Access structures for gravity pipelines (typically maintenance holes) are necessary for maintenance, inspection, and safety purposes at approximately 1,000-foot intervals for interceptors, approximately 500-foot intervals for trunks, and approximately 400-foot intervals for collectors.

  Construction of wastewater facilities generally includes, but is not limited to, vegetation clearing, grading, trenching, excavating soil, trenchless construction (including tunneling support activities), placing backfill material, compacting soil, staging equipment and materials, hauling equipment and material, installing underground sewage pipelines and structures, soil stabilization/improvement activities, drilling/boring activities, pouring concrete, stockpiling materials, installing linings or liner systems, and building above- and below-grade structures. Underground wastewater facilities typically use open cut construction and installation methods. However, as discussed below, sewage pipelines and force mains may also be installed using trenchless construction methods in areas where open cut construction is not practical (e.g., depth, obstacle, risk). Although trenchless construction methods may be used to avoid impacts to specific areas, they usually require additional temporary construction area (for shafts and at-grade support equipment) and extend for the duration of overall construction project.

  Extension of existing sewage pipelines and installation of new sewage pipelines and structures typically require open cut excavation to place the pipelines and structures 10 to 40 feet below ground level. Where construction of a new sewage pipeline or other underground wastewater facility crosses a creek or other body of water, temporary

diversion of the stream channel or dewatering aquatic habitats may be required during pipeline or structure construction to lower the groundwater level to at least 2 feet below the installation depth. After construction, the water level of the feature that was dewatered will be monitored to ensure that it returns to its pre-construction level.

All-weather access is typically required to access structures and manholes, which are typically spaced at intervals of approximately 1,000 feet for interceptors, 500 feet for trunks, and 400 feet for collectors. This access requires construction of a gravel access road to all access structures that do not have existing all-weather access roads. Construction of wastewater facilities may also require temporary construction easements with an average width of approximately 120 feet. Temporary staging areas for office trailers associated with construction (contractor's field office), equipment parking, and material storage are sometimes used and may require up to a 1-acre site adjacent to and/or within proximity to the project. When required, these sites are temporarily disturbed to provide an all-weather surface (top layer of soil sometimes removed and stored, typically with 12 to 18 inches of gravel placed on top of a layer of barrier fabric over the entire site). These sites will be restored to their pre-construction condition (when possible) after construction activities are complete.

Sewage pipelines may also be installed using trenchless construction methods in areas where open cut construction is not practical due to depth, where pipeline obstacles such as a creek or railroad are confronted, or to avoid direct or indirect effects on Covered Species and their habitats. Trenchless construction methods for large pipelines require launching and receiving shafts at each end of the tunneled section, usually several feet deeper than the tunnel invert. These shafts may involve large excavations up to 7,500 square feet to provide space for inserting the tunnel boring machine, trailing gear, and pipe segments; removing excavated tunnel material; and performing other tunneling support activities. Temporary construction staging areas (up to 2 acres) adjacent to and/or close to tunnel shafts are usually required to store tunnel lining material and pipe sections, support dewatering activities, and process tunnel muck. Depth of tunneled unpressurized pipelines is relatively consistent with the connecting open-cut sections (i.e., 10 to 40 feet below ground level), and cannot typically be adjusted to avoid mining through subsurface soil features. After the tunneling activity is completed, grout can be injected around the exterior of the tunnel lining or pipe to prevent water from migrating along the interface between the pipe exterior and the soil.

Covered Activities also include the routine operations and maintenance work that occurs on new and existing wastewater facilities. Operations and maintenance activities typically occur within existing ROWs or easements, and generally include inspection, cleaning, rehabilitation, repair, and/or replacement of aboveground and belowground wastewater facilities. These facilities include, but are not limited to, pumping stations, booster pumps,

wastewater and water treatment facilities (including satellite, scalping, and separation facilities), sewage force mains, gravity pipelines (e.g., interceptor, trunk, collector), pressurized pipelines (e.g., water, gas, sludge, chemical), valves, gates, weirs, groundwater recharge and reclamation facilities (including recharge ponds or spreading basins for indirect groundwater recharge purposes), small containment berms, groundwater wells, tanks, landscape areas, storage facilities, other miscellaneous structures and equipment (e.g., power, control, diversion, discharge, junction, metering, telemetry), and access facilities (e.g., structures, vaults, maintenance holes, roads). All associated activities required to complete routine and emergency operations and maintenance work are also included as Covered Activities. Over the 50-year Permit Term, some existing facilities will require replacement and may involve surface and subsurface construction activities, methods, and disturbances equivalent to new construction.

Operation and maintenance of existing wastewater projects required to provide sewer service to existing communities outside the UDA are also Covered Activities. These projects serve areas such as the rural communities of Walnut Grove and Courtland.

The Plan Permittees have reviewed planning documents prepared by the Sacramento Regional County Sanitation District to identify the proposed locations of future wastewater pipelines. The planned pipeline alignments were relocated, to the maximum extent practicable, so that the pipeline will be built within existing or planned roadways (Figure 5-2). There remains the possibility that some of the pipeline alignments will need to cross a Preserve where the location of that Preserve cannot be anticipated at this time. The Plan Permittees estimate that up to 1.5 miles of wastewater pipeline may cross existing or planned Preserves. The repair and maintenance of wastewater pipelines within planned and existing Preserves are Covered Activities. If this is necessary, impacts will be avoided or minimized to the maximum extent practicable by Condition 8, as listed in Section 5.4.

The construction, operation, and maintenance of wastewater facilities are Covered Activities. Entities that are not Plan Permittees that propose construction of wastewater projects may be treated by the Implementing Entity as a Participating Special Entity (see Chapter 9, Section 9.3.1).

- **Urban Transportation.** Urban Transportation includes construction, realignment, widening, extension, abandonment, and removal of public and private roadways (includes state-owned facilities such as State Route (SR-) 16 and U.S. Route 50), intersections, interchanges, culverts, bridges, light rail lines, railroads, bike and pedestrian paths, sidewalks, street lights, traffic signs, roadside drainages, public and private bus transit lines, and other activities and appurtenances necessary to implement adopted transportation or capital improvement plans of the three Land Use Authority Permittees (the County of Sacramento and Cities of Galt and Rancho Cordova).

Major roadways are proposed in the circulation/transportation elements of each Land Use Authority Permittee's general plan, and are classified (from larger to smaller) as expressways, thoroughfares, arterials, urban collectors, rural collectors, and streets. Roadway standards vary by jurisdiction and may change during the 50-year Permit Term because circulation elements and general plans are updated over time. Future changes to the circulation element or general plan with regard to specific transportation facilities are Covered Activities under this Plan. Covered Activities include in-stream activities for transportation improvements at stream/creek crossings, including bridges, culverts, or other stream-crossing facility construction, replacement, and repair. During the construction of transportation infrastructure, it may be necessary to temporarily divert stream channels using appropriate measures to avoid or minimize impacts to stream habitat (refer to Condition 7 in Section 5.4).

Urban Development road projects will be designed to avoid and minimize, to the extent feasible, direct and indirect effects to Covered Species, and maintain wildlife movement and dispersal through the SSHCP Preserve System in accordance with the Biological Goals and Measurable Objectives (Table 7-1), and may need to incorporate wildlife crossing structures (see Condition 4 in Section 5.4).

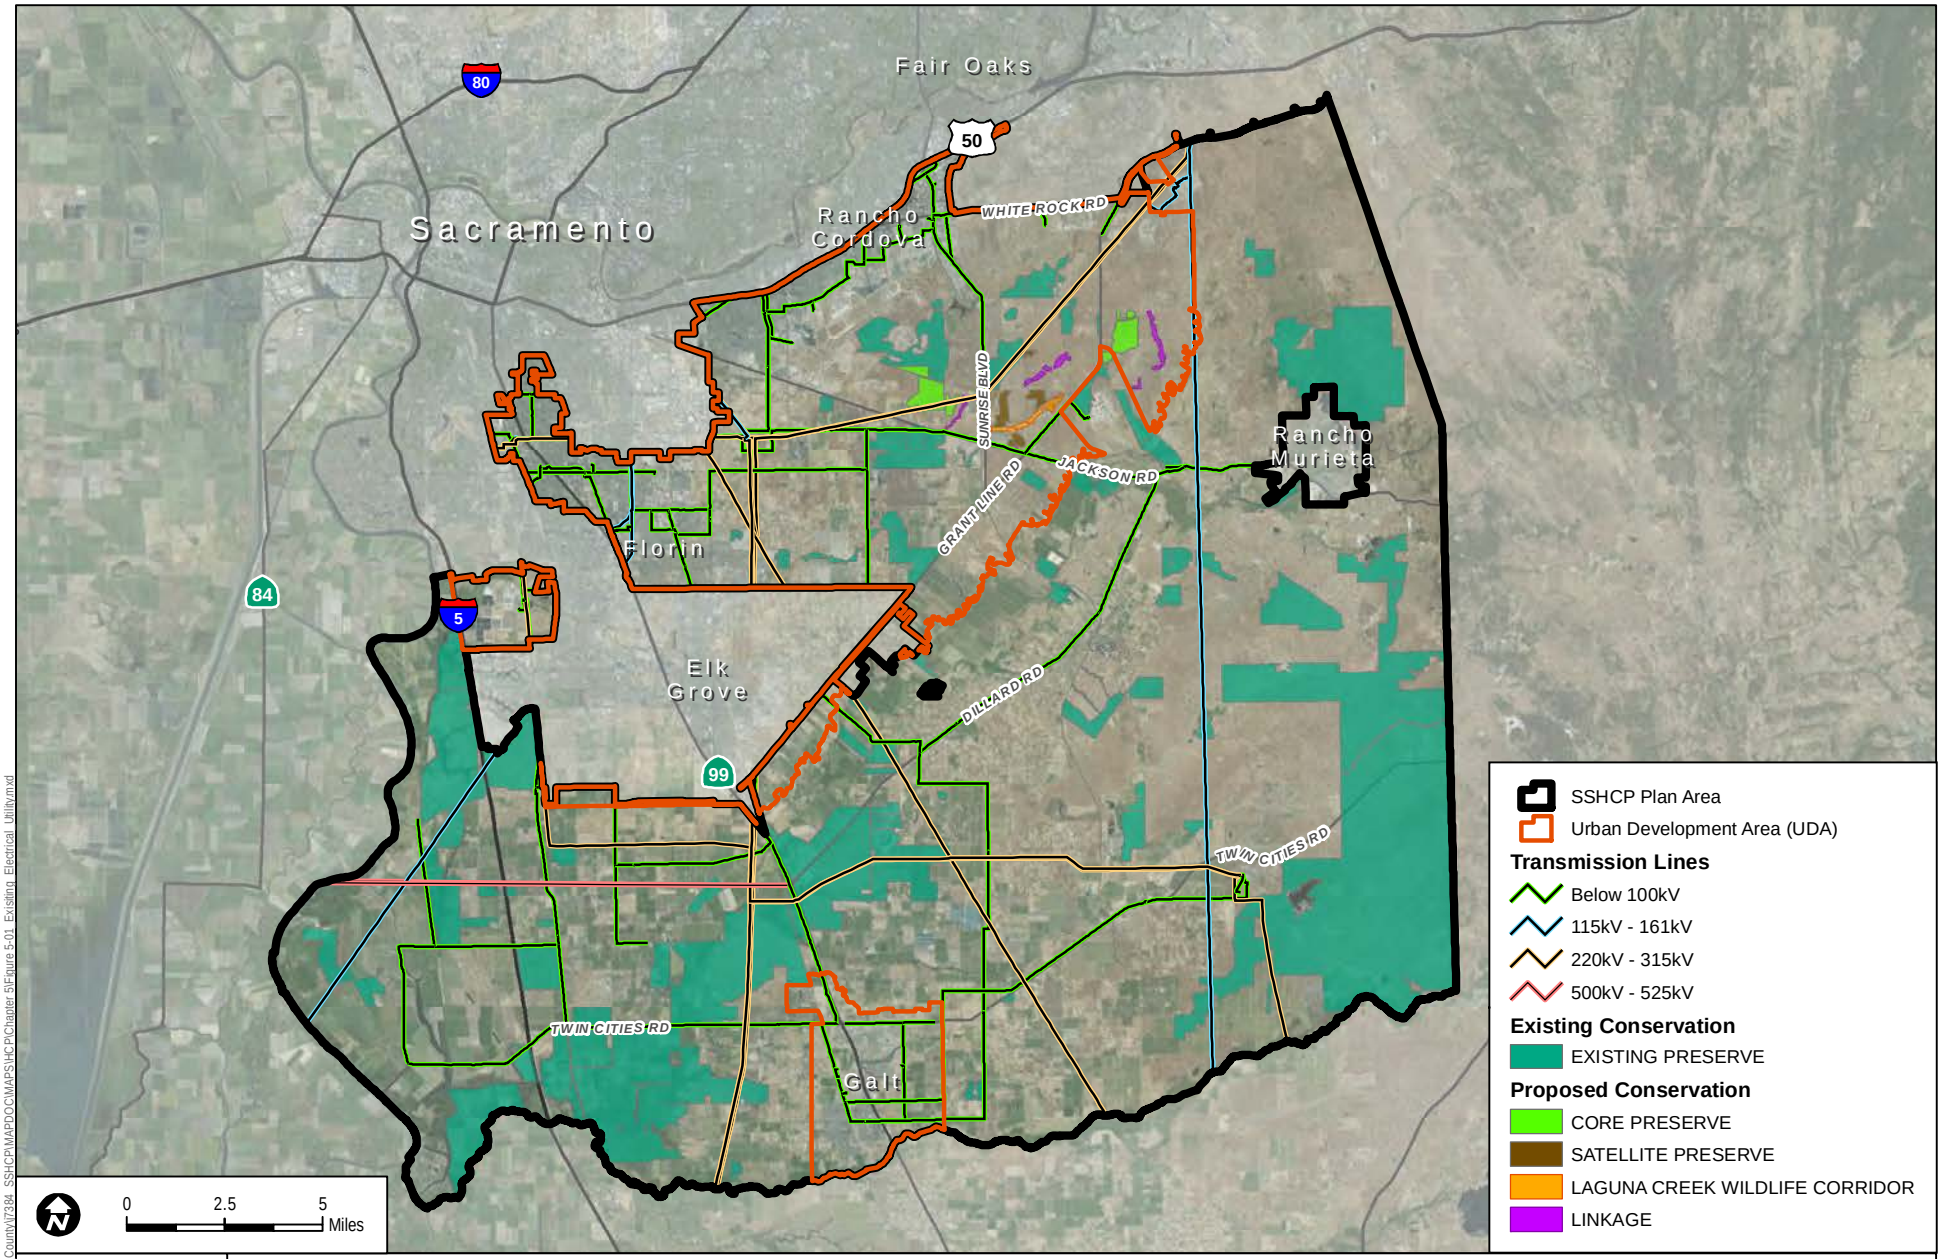
Most roadway projects will be constructed while maintaining existing vehicle access. Travel lanes will be narrowed and traffic will be shifted to one side of the existing roadway to construct improvements on the other side. Drainage facilities such as cross culverts and box culverts will be installed. Roadway and ditch excavation will follow with the removal of native soils to accommodate a new pavement structural section where the roadway is being widened. New roadside drainage ditches will also be excavated at this time. The new roadway section will be built up, usually consisting of aggregate base material and followed with asphalt concrete pavement. Upon completion of the improvements on one side, existing traffic will be shifted over onto the newly constructed roadway section, and a similar construction activity sequence will occur on the other side of the roadway. Improvements at intersections will also occur. If the project includes landscaped medians, installation of irrigation and landscaping components will follow roadway construction, with existing traffic shifted to the outsides of the widened roadway to allow construction access to the center median. These projects will be finished with a final asphalt concrete pavement overlay of the entire roadway section, followed by roadway striping and signing.

All routine road operation and maintenance activities conducted under the jurisdiction of Plan Permittees are Covered Activities. Road maintenance activities generally include, but are not limited to, signage maintenance or replacement; traffic control device maintenance or replacement; guardrail, fence, or crash cushion inspection, maintenance, and replacement; pavement maintenance and resurfacing, including replacing pavement

striping or markers; tree trimming and removal; collection and removal of debris from roads, including from road shoulders and trash racks; natural disaster, storm, and vehicle accident damage repair and cleanup; manual, mechanical, and chemical[4] weed control (see ROAD-3); mowing of medians and shoulders; grading shoulders and other areas within the ROW; grading existing dirt roadways; roadside ditch and irrigation ditch sediment removal; repair, replacement, and maintenance of retaining walls, curbs, gutters, sidewalks, culverts, and drop inlet structures; bridge repair and maintenance; ditch, catch basin, and hydrauger clearing; landscaping maintenance; and other routine road operation and maintenance activities.

The Plan Permittees have reviewed planning documents prepared by the Sacramento County Department of Transportation to identify the proposed locations of future roadways. The planned roadways were relocated to the maximum extent practicable so that the roadways will not impact planned Preserves. Potential impacts from all road construction will be avoided or minimized to the maximum extent by Condition 4 as listed in Section 5.4.

The County of Sacramento is a Plan Permittee and is one of the primary agencies responsible for the construction, operation, and maintenance of transportation projects in the Plan Area. However, construction and maintenance of transportation projects by other Plan Permittees are also Covered Activities. The future Implementing Entity and the three Land Use Authority Permittees (the County of Sacramento and the Cities of Galt and Rancho Cordova) may extend incidental take coverage provided by the ITPs to urban transportation Covered Activities proposed by third parties. All Third-Party Project Proponents (e.g., private developers) seeking coverage for urban transportation Covered Activities under the SSHCP permits must obtain approval from the Land Use Authority Permittee with jurisdiction over the activity or project. Entities that are not Plan Permittees that propose construction of transportation projects may be treated by the Implementing Entity as a Participating Special Entity (see Section 9.3.1).



- **Stream Channel Modification.** This Covered Activity includes the permanent deepening, widening, or re-routing of existing stream channels during Urban Development. During construction of water supply, wastewater, and urban transportation infrastructure or public and private utilities, it may also be necessary to temporarily divert stream channels, using appropriate measures to avoid or minimize impacts to Stream habitat (refer to Condition 7 in Section 5.4).

[4] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land-management tool, provided the pesticide application is otherwise legal and the application conforms to all conditions in Section 5.4.

5.2.1.1 Capital Southeast Connector

In 2002, the Sacramento Area Council of Governments initiated the Capital Southeast Connector (formerly known as the Elk Grove–Rancho Cordova–El Dorado Connector Project) during preparation of Metropolitan Transportation Plan 2025 (SACOG 2002). The Capital Southeast Connector is a proposed 35-mile-long multi-modal transportation facility spanning from Interstate 5, south of Elk Grove, northeast through the SSHCP UDA, to U.S. Route 50 in El Dorado County (just east of El Dorado Hills, outside the Plan Area). The Capital Southeast Connector will link communities in El Dorado and Sacramento Counties and the Cities of Folsom, Rancho Cordova, and Elk Grove. (Those portions of the Capital Southeast Connector that are in El Dorado County are outside the Plan Area.) Approximately 26.5 linear miles of the proposed Capital Southeast Connector are within the Plan Area, with 17.3 of those miles inside the UDA and 9.2 miles outside the UDA (Figure 5-3). As discussed in Chapter 1, the Capital Southeast Connector Joint Powers Authority is an SSHCP Permittee.

Construction Covered Activities for the Capital Southeast Connector include, but are not limited to, initial vegetation clearing, grading of the project footprint, pouring of concrete or asphalt, excavating, staging of equipment and materials, compacting soil, and landscaping, as well as operation and maintenance. During construction of the Capital Southeast Connector, it may be necessary to temporarily divert stream channels, using appropriate measures to avoid or minimize impacts to Stream habitat (refer to Condition 7 in Section 5.4).

INTENTIONALLY LEFT BLANK

In March 2012, the Board of Directors for the Capital Southeast Connector Joint Powers Authority certified a program-level EIR for the Capital Southeast Connector project under the California Environmental Quality Act (CEQA), and adopted a general alignment for the project (see Figure 5-3). Only the general alignment is described (Chapter 5) and analyzed (Chapter 6) in this SSHCP document. Generally, the Capital Southeast Connector includes the following project segments:

- A four-lane expressway segment from the Interstate 5/Hood-Franklin Road Interchange easterly along an extension of Kammerer Road to the existing Kammerer Road/ Bruceville Road intersection
- A four- to six-lane thoroughfare segment east of the Kammerer Road/Bruceville Road intersection along Kammerer Road, and then northeast on Grant Line Road to its intersection with Bond Road (note: this road segment is within the UDA)
- A four-lane limited access rural thoroughfare along Grant Line Road from the intersection of Bond Road, northeasterly to the intersection of Calvine Road (note: this road segment is within the UDA)
- A four- to six-lane expressway segment on Grant Line Road from its intersection with Calvine Road, northeasterly to the intersection of White Rock Road, and then on White Rock Road from its intersection with Grant Line Road easterly to the Sacramento County/El Dorado County Line
- A four- to six-lane thoroughfare segment on White Rock Road from the Sacramento County/El Dorado County line northeasterly to the intersection with U.S. Highway 50 at a future interchange at Silva Valley Parkway (note: this segment and interchange are outside of the Plan Area, so are not SSHCP Covered Activities or covered by the SSHCP permits)

Future vehicular access to and from the completed Capital Southeast Connector will be minimized and strictly controlled so as to allow through-travel mobility of the Capital Southeast Connector, consistent with the description of the general alignment. Access will be limited to grade-separated interchanges (either undercrossing or overcrossing), signalized intersections, and limited-access intersections. Other existing and future access not intended to have direct access to the Capital Southeast Connector may be consolidated and conveyed to appropriate interchanges, traffic signals, and/or limited-access intersections via a frontage roadway. At-grade signalized intersections and limited-access intersections may be converted to grade-separated interchanges as required by the future travel demand and level of service (LOS) conditions.

Within the expressway segments, the minimum interchange/traffic signal spacing will be 1 mile, with spacing less than 0.50 mile allowed only in unique situations and where an acceptable LOS and design speed can be maintained. Within the thoroughfare segments, the minimum

interchange/traffic signal spacing will be 0.50 mile, with 1-mile spacing preferred. Access planning and control must balance the need to maximize the Capital Southeast Connector's capacity with the need to accommodate local traffic, including that of residents and the need for access to accommodate agricultural and other business activity where appropriate. Vehicle access will be limited in the expressway portions of the Capital Southeast Connector to grade-separated interchanges (either undercrossing or overcrossing) or to signalized intersections where an acceptable LOS and design speed can be maintained. Existing and future access along the Capital Southeast Connector between grade-separated interchanges and/or at-grade signalized intersections will be consolidated and conveyed to appropriate interchange and/or traffic signals via a frontage roadway. At-grade signalized intersections may be converted to grade-separated interchanges as required by the future travel demand and LOS conditions.

The Capital Southeast Connector will also accommodate bicyclists, pedestrians, and equestrians. In the expressway segments, the Capital Southeast Connector will include a separated, 12-foot-wide Class I (multiuse) path with graded shoulders. Consideration will be given to providing either an undercrossing or overcrossing of the Class I path at grade-separated interchanges. The Class I path will also include some bicycle/pedestrian overcrossings/undercrossings at key locations between the interchange locations to provide bicycle and pedestrian connectivity to local development. Within the thoroughfare segment, bicyclists and pedestrians will be accommodated on a 10-foot-wide Class I path located on both sides of the Capital Southeast Connector. Bicyclists will also be accommodated with Class II bike lanes on the roadway. Within the four-lane limited access rural thoroughfare along Grant Line Road from the intersection of Bond Road, northeasterly to the intersection of Calvine Road, bicyclists, pedestrians, and equestrians will be accommodated on a 10-foot-wide separated Class I (multiuse) path and a Class III shoulder.

The majority of ground disturbance expected from construction of the Capital Southeast Connector will occur within the UDA. However, ground disturbance will also occur outside the UDA (see Figure 1-1). Activities related to segments of the connector alignment that are within the Plan Area will be SSHCP Covered Activities.

The Capital Southeast Connector is designed to avoid and minimize direct and indirect effects, and maintain existing wildlife movement and Preserve connectivity in accordance with the Biological Goals and Measurable Objectives (Table 7-1), and will incorporate wildlife crossing structures (refer to Condition 4 in Section 5.4).

The entire footprint of the Capital Southeast Connector within the boundaries of Sacramento County is included in the SSHCP Plan Area, and activities related to the connector are SSHCP Covered Activities.

Although the City of Folsom is not a Plan Permittee, the planned improvements to White Rock Road inside the Plan Area and the area needed for the expansion of White Rock Road as part of the Capital Southeast Connector or independently by a Plan Permittee are within the SSHCP Plan Area, and activities related to White Rock Road are SSHCP Covered Activities.

As discussed in Chapter 6, the SSHCP impact analysis assumes that 100 feet from the centerline of existing road segments (200-foot-wide ROW corridor) will be impacted for the Capital Southeast Connector. The methods for construction will be similar to those described under Urban Transportation, above.

5.2.1.2 Mather Airport Master Plan Development Projects

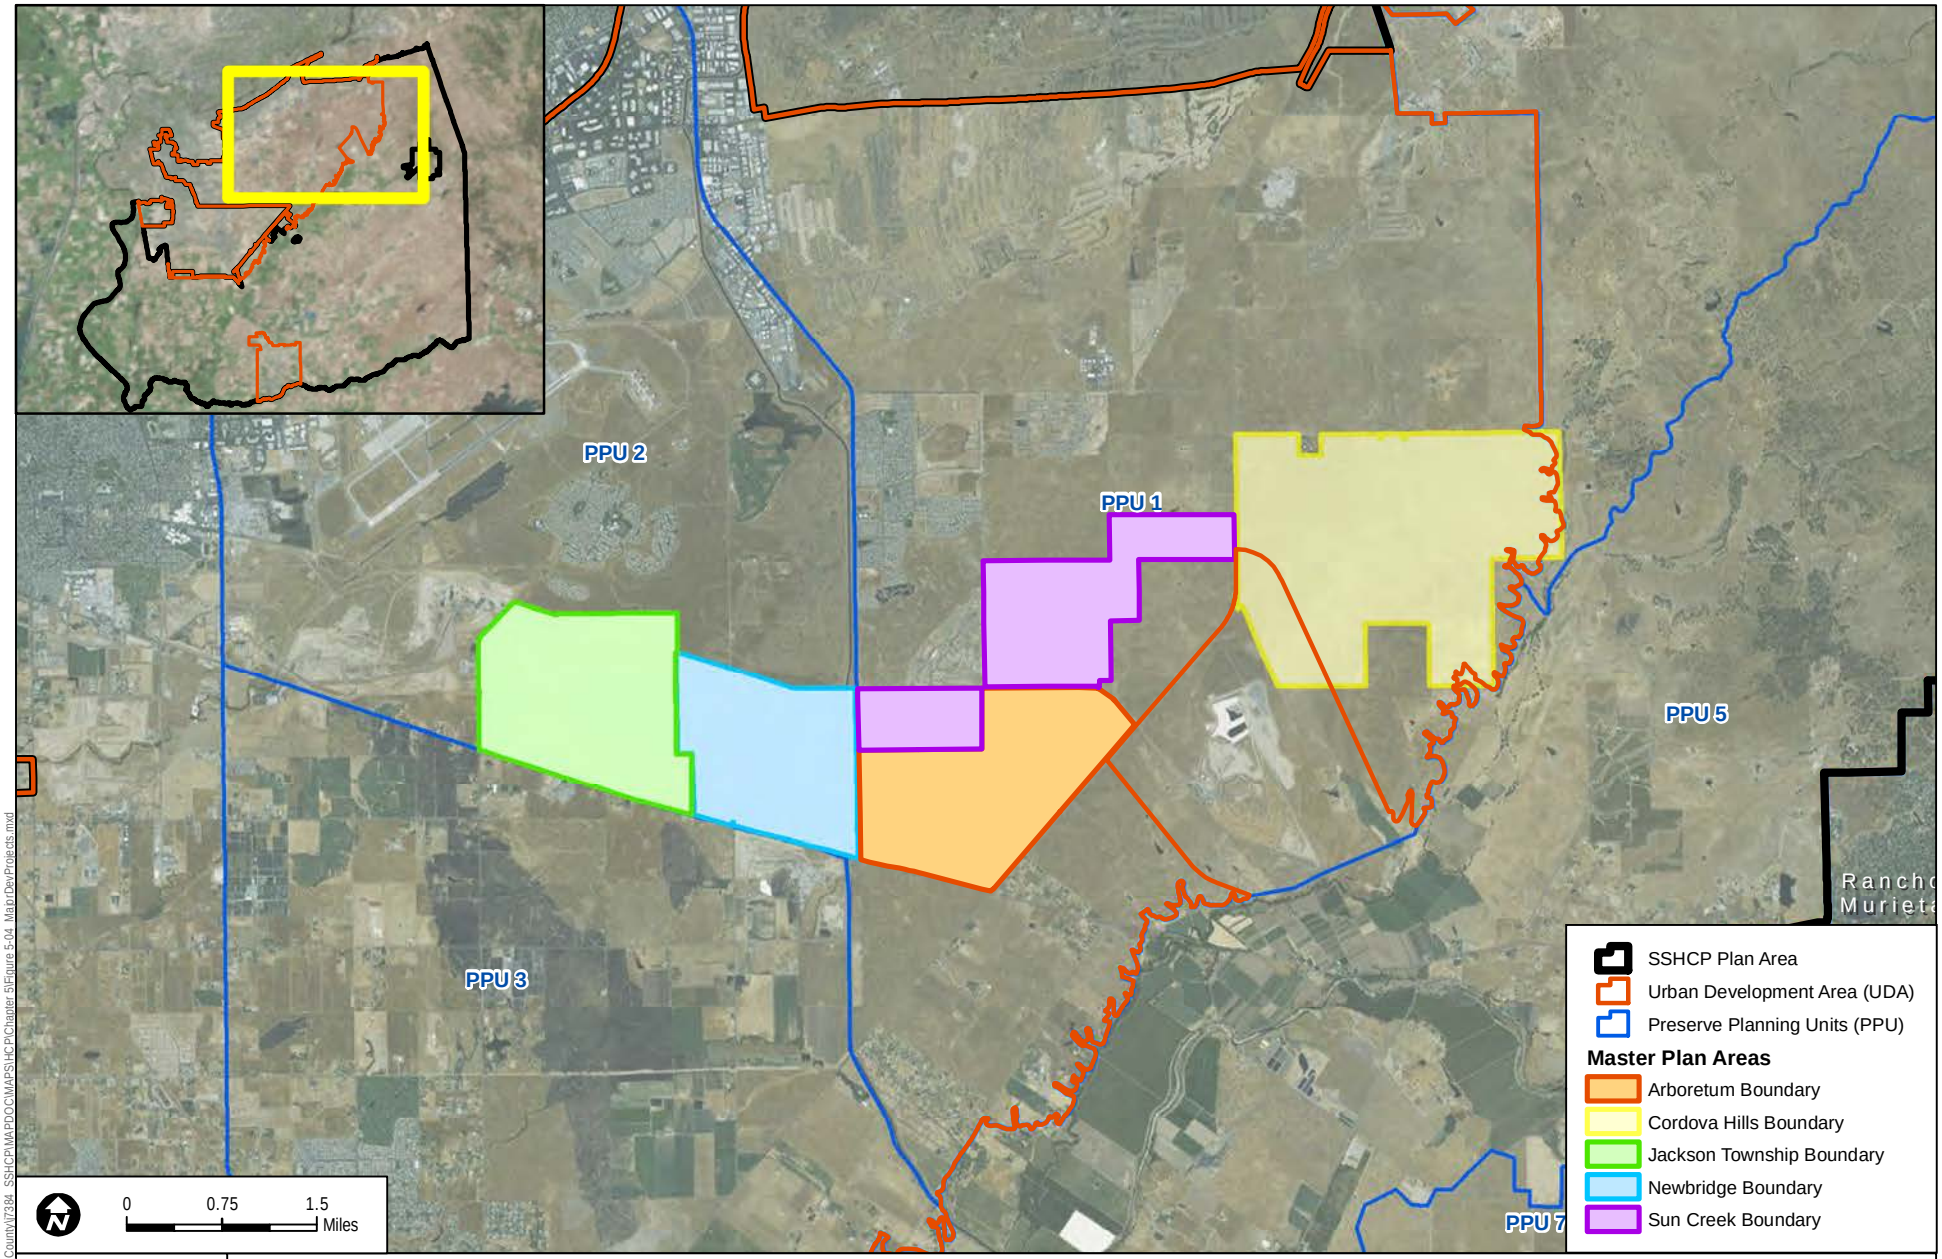
Mather Airport is located in Preserve Planning Unit (PPU) 2 inside the UDA. Covered Activities related to Mather Airport Master Plan development projects include maintenance of, replacement of, and improvements to existing airfields (e.g., runway extensions, new taxiways and aprons), aircraft storage facilities, aircraft maintenance facilitates, jet fuel storage and dispensary facilities, commercial facilities, and instrument landing systems,[5] and construction of new airfields.

5.2.1.3 Master Plans Known at Time of SSHCP Preparation

Five large Urban Development Master Plans (Arboretum, Cordova Hills, Jackson Township, NewBridge, and SunCreek) are proposed by Third-Party Project Proponents within the UDA (Figure 5-4). These master plans meet the definition of an Urban Development Covered Activity, and the Plan Permittees anticipate that these master plans or builders purchasing large lots from the master plan developer will use the SSHCP to obtain authorization for species incidental take under the ESA and CESA and to expedite their individual Clean Water Act permitting requirements. These five master plans were designed to comply with SSHCP requirements, including compliance with the Covered Activity descriptions and the SSHCP Avoidance and Minimization Measures (AMMs) listed in this chapter. See Appendix K for additional information on these five master plans and for any SSHCP AMMs that may be specific to these master plans.

5.2.2 Mining in the UDA

Mining includes the surface extraction of rock or mineral resources and construction of associated infrastructure, buildings, and facilities. Facilities may include surface mining pits, processing sites, and aggregate transfer systems such as conveyors and access roads and similar facilities. This Covered Activity includes construction and operation of detention basins to capture and reuse water on site.



[5] This Covered Activity does not include development associated with the Mather Field Specific Plan, which is pursuing its own Endangered Species Act and Clean Water Act Section 404 permits.

The Plan Permittees estimate that up to five more surface mines totaling up to 500 acres will occur within the UDA during the 50-year Permit Term. These mines have a typical depth of 30 to 40 feet, but can be deeper depending on the location of the resource. These mines will be operated to extract alluvial sand and gravel deposits. They will be located within PPU 2 and/or PPU 3 (Figure 1-1). Covered Activities include the reclamation of previously mined land in accordance with the federal Surface Mining and Reclamation Act of 1977 and the California Surface Mining and Reclamation Act of 1975. Reclamation may include restoration of original topography, revegetation of mined areas, and other measures as would be included in a reclamation plan approved by the California Geological Survey.

5.2.3 Rural Transportation Projects

Rural Transportation Projects include transportation projects outside the UDA that are approved pursuant to the circulation element of Sacramento County's 2030 General Plan. Rural Transportation Projects that are SSHCP Covered Activities are designed to improve traffic circulation for existing communities, roadway alignments, and safety on public roadways. Roadways that are proposed in Sacramento County's General Plan circulation/transportation element are classified (from larger to smaller) as expressways, thoroughfares, arterials, urban collectors, and rural collectors. In some instances, the SSHCP proposes to shift roadway alignments from what is currently proposed in the General Plan circulation/transportation element to avoid impacts to aquatic resources. These shifts are very minor and do not alter the general alignment of Rural Transportation Projects depicted in the County's General Plan. The preliminary alignment for each Rural Transportation Project is shown in Figure 5-5.

Construction actions generally include, but are not limited to, initial vegetation clearing, grading, pouring concrete or asphalt, excavation, staging equipment and materials, compacting soil, landscaping, and maintenance. See Section 5.2.1, Urban Development in the UDA, for a more detailed description of roadway construction methods. Rural Transportation Covered Activities include up to 48 relatively small in-stream activities for transportation improvements at stream/creek crossings for bridge, culvert, or other stream crossing facility construction, replacement, and repair (Figure 5-5).

INTENTIONALLY LEFT BLANK

All routine rural road operations and regular maintenance are Covered Activities. Actions generally include, but are not limited to, signage maintenance and replacement; traffic control device maintenance and replacement; guardrail, fence, and crash cushion inspection, maintenance, and replacement; pavement maintenance and resurfacing, including replacing pavement striping and markers; tree trimming and removal; collection and removal of debris from roads and shoulders; natural disaster, storm, and vehicle accident damage repair and cleanup; weed control, mowing medians and shoulders, and grading shoulders and other areas within the ROW; grading existing dirt roadways; roadside ditch and irrigation ditch sediment removal; repair, replacement, and maintenance of retaining walls, curbs, gutters, sidewalks, culverts, and drop inlet structures; bridge repair and maintenance; ditch, catch basin, and hydrauger clearing; landscaping maintenance; and other routine road operation and maintenance activities. The construction of Rural Transportation Projects may temporarily divert stream channels, using appropriate measures to avoid or minimize impacts to Stream habitat (refer to Condition 7 in Section 5.4).

Rural Collector Road Improvements

Rural collectors are two-lane roads in rural areas. Improvements to these roadways include widening the pavement to add or increase the road shoulder and drainage improvements. The following rural collector road projects are Covered Activities that will occur outside the UDA. Estimated lengths of the road projects located outside the UDA are rounded to the nearest 0.5 mile.

- Scott Road between White Rock Road and Latrobe Road (8 miles)
- Latrobe Road between Scott Road and Stonehouse Road (less than 0.15 mile)
- Stonehouse Road between Latrobe Road and Jackson Highway (1.5 miles)
- Ione Road between Jackson Highway and the Sacramento County line (6 miles)
- Select stream crossings along Clay Station Road between Dillard Road and the Sacramento County line (less than 0.3 mile)
- Borden Road between Twin Cities Road and Clay Station Road (4.5 miles)
- Bruceville Road between Twin Cities Road and Kammerer Road (5.5 miles)
- Twin Cities Road between Interstate 5 and River Road (12.5 miles)

Arterial Road Improvements

Arterials provide a link between thoroughfares and collectors. Arterials are typically developed as four-lane roadways with a center two-way left-turn lane or a raised center median with adjacent Class I, Class II, or Class III bikeway facilities. The following arterial road widening projects are Covered Activities that will occur outside the UDA:

- Dillard Road between SR-99 and Jackson Highway (14.5 miles)

- Alta Mesa Road between Twin Cities Road and Dillard Road (8.5 miles)
- Valensin Road between Arno Road and Colony Road (3.5 miles)
- Arno/Riley Road between SR-99 and Valensin Road (3.3 miles)
- Franklin Boulevard between Kammerer Road and Twin Cities Road (6 miles)
- Twin Cities Road between SR-99 and Interstate 5 (8 miles)
- Green Road between Dillard Road and Wilton Road (2.5 miles)
- Wilton Road between Dillard Road and Grant Line Road (3 miles)
- Jackson Highway between Grant Line Road and Stonehouse Road (5.5 miles)

Road Realignment Projects

Road realignment projects entail rerouting existing roadways, generally to facilitate more direct or new road connections. Direct impacts associated with these projects will encompass the entire construction ROW on land that did not previously include a roadway. The following road construction project is a Covered Activity that will occur outside the UDA:

- Valensin Road will be extended 1 mile east from Colony Road to Alta Mesa Road.

Road Interchange Projects

The Sacramento County 2030 General Plan (SACOG 2011) indicates that four interchange projects are planned outside the UDA, located in PPU 6 and PPU 7. Capital Southeast Connector interchanges are also covered by the SSHCP, as discussed in Section 5.2.1.1.

Construction actions generally include, but are not limited to, initial vegetation clearing, grading, pouring concrete or asphalt, excavation, staging equipment and materials, compacting soil, landscaping, and maintenance. The following road interchange projects are Covered Activities:

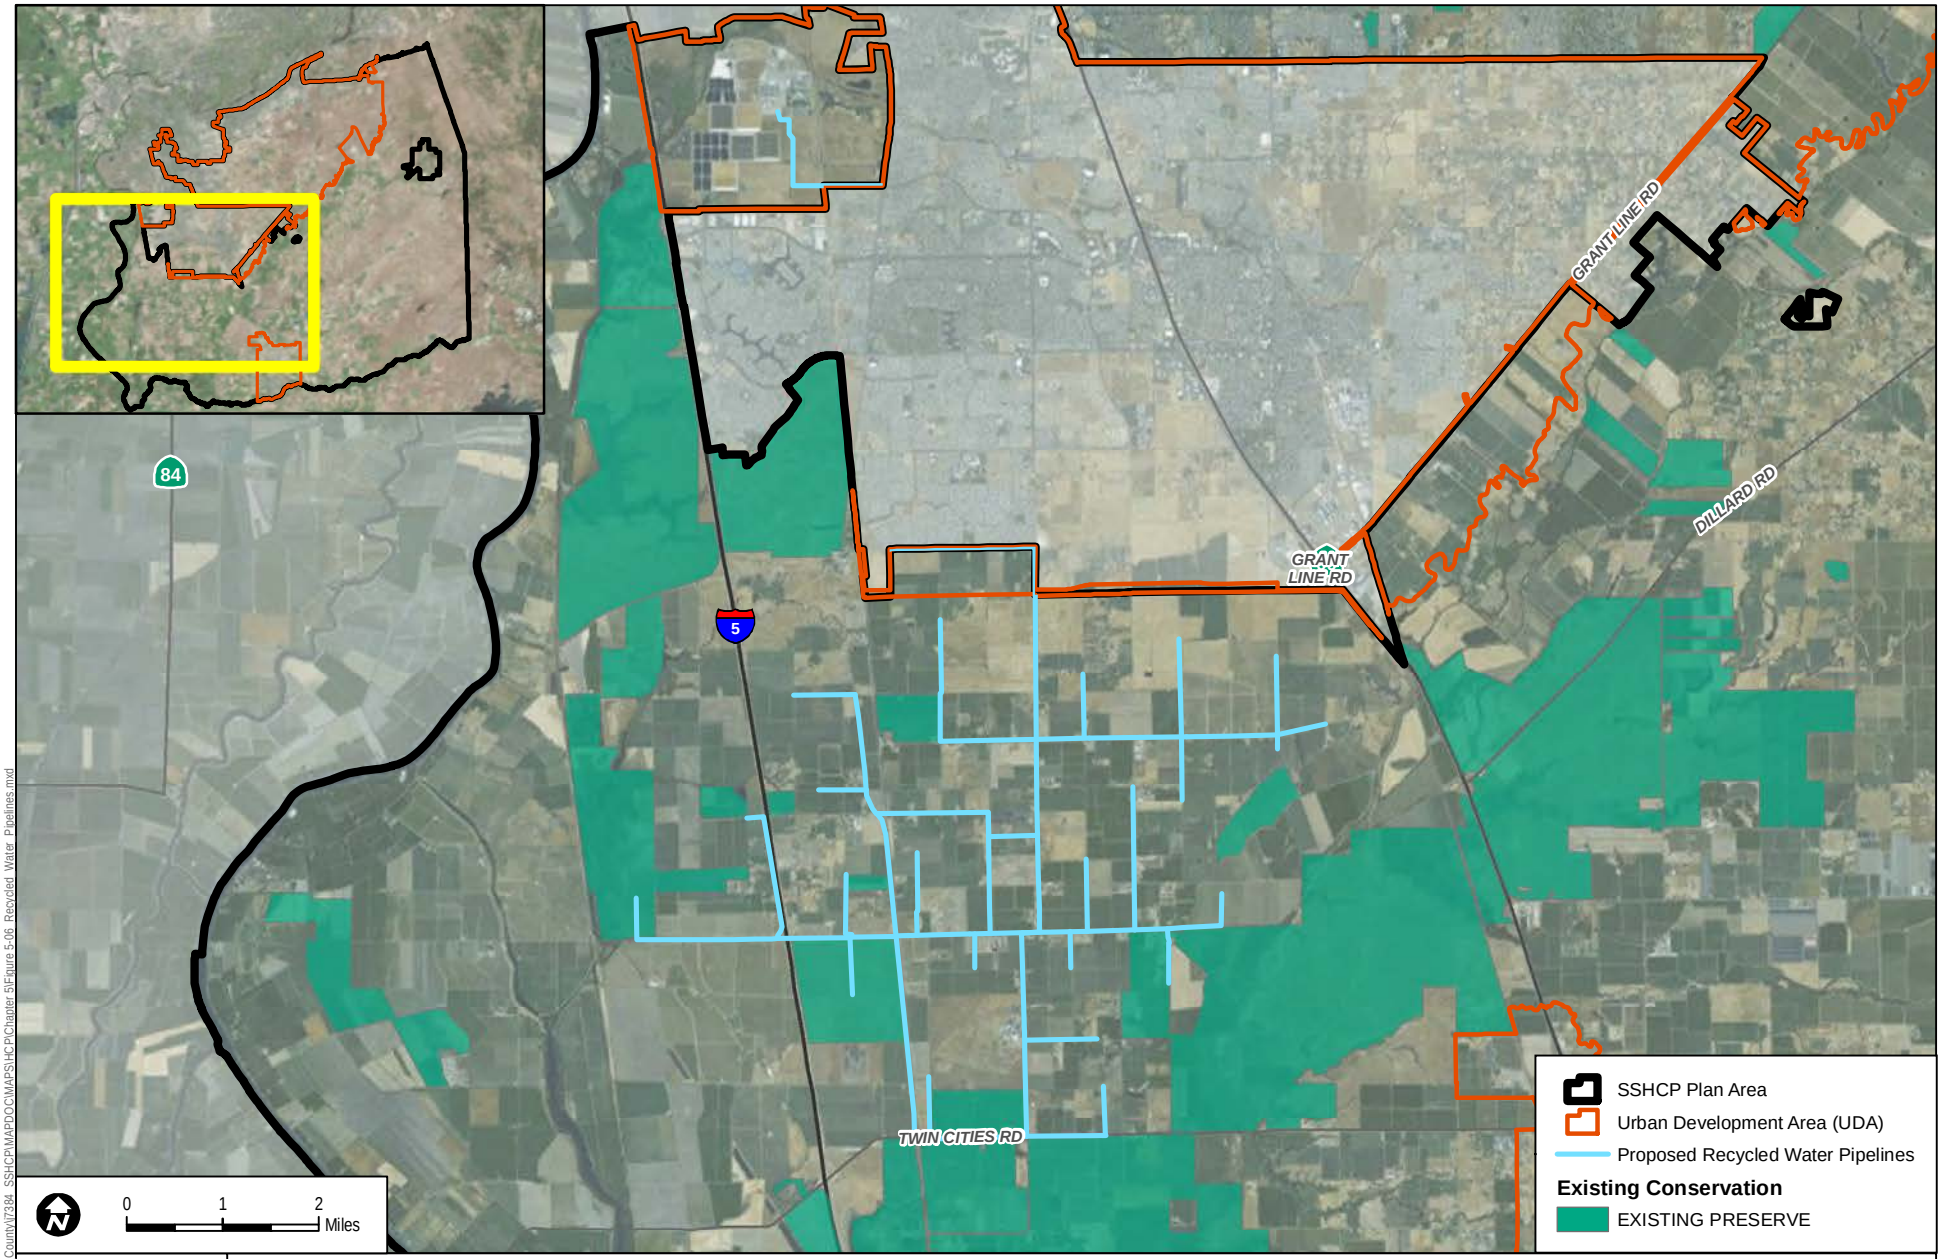
- Modification of the interchange at Hood Franklin Road and Interstate 5 in coordination with expansion of the Capital Southeast Connector to a four-lane thoroughfare.
- Modification of the interchange at Twin Cities Road and Interstate 5 in coordination with expansion of Twin Cities Road to a four-lane arterial.
- Modification of the interchange at Arno Road and SR-99 in coordination with expansion of Arno Road to a four-lane arterial.
- Modification of the interchange at Dillard Road and SR-99 in coordination with expansion of Dillard Road to a four-lane arterial.

5.2.4 Recycled Water Projects

The SSHCP permits cover two Recycled Water Projects. The first is a small section of pipeline that will provide recycled water to the existing Bartley-Cavanaugh Golf Course, as described in the Sacramento Regional County Sanitation District/Special Plan Area/City of Sacramento Recycled Water Feasibility Study (SRCSD 2015a). The alignment of the first Recycled Water Project follows Freeport Boulevard south where it intersects the UDA for approximately 0.2 mile before turning east for an additional 0.4 mile, until it reenters the UDA (see Figure 5-6).

The second Covered Activity Recycled Water Project is the South Sacramento County Agriculture and Habitat Lands Recycled Water Project (South County Agricultural Program), which was initially identified in the Sacramento Regional County Sanitation District Water Recycling Opportunities Study (SRCSD 2007). In 2011, the Sacramento Regional County Sanitation District initiated the process to develop a more detailed feasibility study for the South County Agricultural Program (SRCSD 2015b). Through this updated feasibility study, the South County Agricultural Program expanded the potential uses of recycled water and the acreage of irrigated areas. The South County Agricultural Program will provide recycled water service from the existing Sacramento Regional Wastewater Treatment Plant to agriculture and habitat lands in the southwest portion of the Plan Area. Recycled water will be used to irrigate agricultural lands and improve aquatic and terrestrial habitat on existing and future conservation lands near the existing Cosumnes River Preserve. Recycled water may also be used to irrigate re-established/established wetlands and groundwater recharge basins.

A portion of the facilities (i.e., pumping and water transmission pipelines) associated with the South County Agricultural Program will be located within the UDA (approximately 4.3 linear miles), and the South County Agricultural Program will also include open cut trenching for approximately 41.1 linear miles of water distribution pipelines outside the UDA. The proposed transmission pipeline will leave the UDA at the intersection of Kammerer Road and Franklin Boulevard and continue south following the Franklin Boulevard corridor toward its terminus at Twin Cities Road (Figure 5-6). The pipeline footprint will generally follow existing roadways; however, pipelines will cross agricultural lands, including existing and planned Agricultural Preserves. The construction footprint of the water transmission pipeline is anticipated to require a 75-foot-wide ROW for the length of the pipeline, which may overlap the existing and/or future Franklin Boulevard ROW. In addition, approximately one recharge pond totaling approximately 560 acres will be constructed to operate the recycled water system.



Construction and maintenance of facilities associated with the Recycled Water Projects are Covered Activities. Activities generally include, but are not limited to, inspection, cleaning, rehabilitation, repair, and/or replacement of aboveground and belowground recycled water facilities. These facilities include, but are not limited to, recycled water pipelines, pumping

stations, underground pressurized pipelines (e.g., water, recycled water, chemical), valves, gates, weirs, other groundwater recharge and reclamation facilities (including recharge ponds or spreading basins for indirect groundwater recharge purposes), other miscellaneous structures and equipment (e.g., power, control, diversion, discharge, junction, metering, telemetry), and access facilities (e.g., structures, vaults, maintenance holes, roads). All associated activities required to complete routine and emergency operations and maintenance work, such as traffic control, are also Covered Activities. Maintenance activities for recycled water facilities are Covered Activities and could include periodic vehicle trips to areas along pipeline corridors.[6] However, construction of new water diversions associated with Recycled Water Projects is not a Covered Activity and would require separate ESA consultation and permitting (see Section 5.3).

5.2.5 Covered Activities in Preserve Setbacks in the UDA

As discussed in Section 5.4, Conditions on Covered Activities, the AMM EDGE-3 requires that a setback of at least 50 feet be established outward from the boundary of any existing or planned Preserve within the UDA to reduce direct and indirect impacts that may result from adjacent Urban Development Covered Activities. The Plan Permittees estimate that approximately 625 acres of Preserve Setback along 105 linear miles will be established within the UDA, based on the perimeters of existing and planned Preserves. The minimum 50-foot-wide setback will remain in its natural state and function as a transition area between urban development and the Preserves. However, specific Covered Activities that entail minimum ground disturbance will be allowed to occur within an SSHCP Preserve Setback, as specified below. Although effects from the construction, use, and maintenance of Covered Activities inside the Preserve Setbacks are expected to be small, some permanent loss of habitat and take of individuals is expected. Figures 5-7 through 5-9 illustrate different applications of the Preserve Setback allowed under the SSHCP, and show minimum requirements of each application.

[6] Access roads will be limited to the pipeline right-of-way.

FIGURE 9

Stream Setback

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

For illustration purposes only. See section 5.4 for AMM descriptions.

INTENTIONALLY LEFT BLANK

Where an existing or planned Preserve is adjacent to an existing roadway (e.g., rural collectors, arterials, thoroughfares), the 50-foot Preserve Setback will not be required. In addition, where a planned roadway crosses a planned or existing Preserve, no Preserve Setback will be required. In these two instances, any bicycle or pedestrian trail will be established in the road ROW. Many ground-disturbing Covered Activities will occur within a road or pipeline ROW (e.g., roads, sewer and water supply pipelines, and other underground utilities). Where planned Preserves, Preserve Setbacks, or Stream Setbacks are located adjacent to a ROW, Covered Activities necessary for construction, such as grading and equipment storage, will be allowed within the entire width of the ROW. Ground disturbance will be allowed up to the boundary of the Preserve or Preserve Setback, but not within the Preserve or Preserve Setback. All BMPs and other applicable SSHCP AMMs for the Covered Activity will be implemented.

Several entities may own or be responsible for land within Preserve Setbacks, including, but not limited to, Land Use Authority Permittees, parks and recreation districts, and community service districts. The entity that owns the property within a Preserve Setback will be responsible for managing and maintaining the habitat and developed features (e.g., firebreaks, trails, and bioswales) in the setback in accordance with this section and the conditions in Section 5.4. An easement will be granted to the Implementing Entity that gives the Implementing Entity the ability to enforce the conditions of the easement in perpetuity (see sample easements in Appendix D).

The primary vehicle for public interaction with the SSHCP Preserve System is the incorporation of optional trails within Preserve Setbacks (see Figures 5-7 through 5-9) potentially located around the perimeter of Preserves within the UDA. The public will be able to view and enjoy the Preserve System from trails in the Preserve Setbacks.

As discussed in Chapter 7, the main purpose of the SSHCP Preserve System is to preserve and enhance Plan Area biological resources to achieve the Biological Goals and Measurable Objectives of the SSHCP. The UDA's Preserve Setback trail system and environmental educational opportunities on certain UDA Preserves will provide indirect benefits to the SSHCP Covered Species through the following:

- Fostering public awareness and public support for the SSHCP Preserve System.
- Providing a general appreciation of Sacramento's natural history.
- Providing opportunities to view vernal pools (from the trail), birds, and other wildlife, and for recreation.

Covered Activities within an SSHCP Preserve Setback include the following, as allowed under each Preserve Setback easement:

- **Trails.** Construction and maintenance of permeable or semi-permeable hiking trails and paved community trails are Covered Activities in the UDA for Preserve Setbacks,

provided that they conform to AMM EDGE-3 described in Condition 2 (also see Figures 5-7 through 5-9). Use by pedestrians, bicycles, and domestic animals (including horses and leashed dogs) is a Covered Activity for trails within SSHCP Preserve Setbacks. The maximum trail width will be 16 feet, including 2-foot-wide shoulders. The Plan Permittees request that the SSHCP permits cover construction, operation, and maintenance of up to 105 linear miles of trails to be constructed within Preserve Setbacks located in the UDA.

- **Low-velocity bio-retention swales.** These swales will be designed to hold rainwater runoff from trails and prevent runoff entry into Preserves. These are typically small linear features that will be placed on one or both sides of trails within the setback (see Figures 5-7 through 5-9). Construction, operation, and maintenance of these swales are SSHCP Covered Activities and are covered by the SSHCP permits. Construction practices that cut into or disrupt the soil's hardpan or duripan will not be used to construct swales within setbacks (see EDGE-7). Any fill soil imported to construct the swale will be free of invasive species.
- **Fencing.** Post and cable, split rail, or other open fencing will be installed adjacent to Preserve Setback trails and are intended to keep pedestrians on the trail. Additional fencing at the Preserve boundary will also be necessary to keep livestock in the Preserve and out of the setback (see Figures 5-7 through 5-9**)**. The type of fencing required for livestock will be specified in the Preserve Management Plan (see Chapter 8, SSHCP Monitoring and Management Programs).
- **Firebreaks.** A firebreak is a gap in combustible material (vegetation) that acts to slow or stop the spread of a wildfire. Firebreaks will be allowed inside Preserve Setbacks when necessary. To maintain functionality of the soil perched aquifer, firebreaks allowed inside the setbacks must be created by methods that will not disturb the soil duripan layer, such as mowing, shallow tilling, and minor scraping of surface vegetation. If approved by the local authorities, the setback trail may also be used as a firebreak. The width of firebreaks must comply with applicable local codes.
- **Benches, shade structures, shade trees, and trash receptacles.** Benches, shade structures, shade trees, and trash receptacles will be allowed along trails in Preserve Setbacks. Shade trees, benches, shade structures, and trash receptacles must be located on the outer edge of the trail farthest from the Preserve. Shade tree species must be native trees that are found in California grasslands and that can survive on the Vernal Pool/Grassland border without long-term irrigation or fertilization (i.e., valley oak, black oak, blue oak, oracle oak). Irrigation will be allowed for a maximum of 5 years to establish saplings. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation does not affect the Preserve. Plantings in Preserve

Setbacks will not include invasive plant species listed on the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory Database or listed on the Cal-IPC California Invasive Plant Watch List.[7]

- **Interpretive signs and kiosks.** Signs and kiosks are intended to educate trail users about the benefits of the SSHCP Preserve System and the importance of the environmental resources that the Preserves are protecting. Safety and directional signs may also be installed. The construction, operation, and maintenance of these signs and kiosks are SSHCP Covered Activities covered by the SSHCP permits.
- **Outdoor Lighting.** Outdoor lighting in Preserve Setbacks may be allowed where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution.
- **Livestock Access to Preserves.** Access points and facilities for delivery and collection of grazing animals (livestock) will be permitted in Preserve Setbacks. The type of fencing required for livestock will be specified in the Preserve Management Plan (see Chapter 8, SSHCP Monitoring and Management Programs).

The Plan Permittees have not identified nonconforming uses or structures within setbacks of planned Preserves. If any nonconforming uses or structures in Preserve Setbacks are identified during SSHCP implementation, the Implementing Entity will coordinate with the Plan Permittee and the Wildlife Agencies to appropriately address the nonconforming use or structure.

5.2.6 Covered Activities in Stream Setbacks in the UDA

Stream Setbacks are an increasingly common tool employed to address disturbances to and management of streams and riparian zones and to reduce degradation of water quality. Research studying the effective widths of Stream Setbacks has appeared in the scientific literature since the mid-1960s (Robins 2002). Over the past 40 years, Stream Setbacks have become increasingly recognized for their benefit in controlling non-point- and point-source pollutants (Robins 2002; Semlitsch and Bodie 2003; Wenger 1999).

Urbanization adjacent to streams can adversely impact hydrologic functions and water quality. Potential impacts on streams from adjacent Covered Activities may include the following:

- Increased erosion and decreased transmittance of light through the water column due to sediment runoff into streams.

[7] http://www.cal-ipc.org/paf/

- Excessive nutrient loading into streams or water bodies that could raise nutrient concentrations above safe drinking water levels and cause eutrophication (depletion of oxygen in water).
- Introduction of fecal coliform into streams that contributes to nutrient loading and can introduce pathogenic organisms.
- Introduction of chemicals, pesticides,[8] and heavy metals into streams that may result in mortality of aquatic species.
- Modification of stream water temperature and stream microclimate that may damage the aquatic ecosystem.
- Modification of stream channel complexity that may reduce bank stabilization and increase erosion.

Condition 7 (Section 5.4.1) will be applied to all UDA Covered Activities to avoid or minimize potential indirect and direct impacts to streams and creeks by establishing minimum 100-foot-wide Stream Setbacks measured from the top of the bank on both sides of the following streams within the UDA: Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek (also see discussion of the Laguna Creek Wildlife Corridor in Section 5.2.8).

The primary purpose of a Stream Setback is to minimize indirect effects of adjacent Urban Development Covered Activities on Plan Area waterway hydrologic functions, including water quality, and to avoid or reduce other undesired disturbances to sensitive resources. However, the SSHCP Conservation Strategy (Chapter 7) does not count the avoided area within the Stream Setbacks to be mitigation for Covered Activity impacts on species. In addition, stream segments within an SSHCP Preserve do not require setbacks because the Preserve lands surrounding the stream segment will function to protect the stream. Under certain circumstances, the Stream Setback requirement can be waived for property owners of very small lots, as discussed in Section 9.5.2.

Several entities may own or be responsible for land within Stream Setbacks, including, but not limited to, Land Use Authority Permittees, parks and recreation districts, and community service districts. The entity that owns the property within a Stream Setbacks will be responsible for managing and maintaining the habitat and any constructed features (e.g., trails, bioswales) in the setback. An easement must be granted to the Implementing Entity that gives the Implementing Entity the ability to enforce the conditions of the easement in perpetuity (see sample easements in Appendix D).

[8] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and the application conforms to all conditions in Section 5.4.

Limited Covered Activities are allowed within Stream Setbacks. This section lists the allowed activities within Stream Setbacks. However, where the listed allowable Covered Activities conflict with other laws, regulations, and policies regarding streams, erodible soils, wetlands, floodplains, land disturbance activities, or other environmental protective measures, the more restrictive allowable use will apply. The listed allowable Covered Activities are not intended to supersede any previously issued active permits by Permitting Agencies. Where a permit has been issued, the existing permit conditions (including the terms and conditions of recorded conservation easements required as a permit condition) will supersede the allowable SSHCP Covered Activities. The following are allowed Covered Activities within SSHCP Stream Setbacks:

- **Trails.** Construction and maintenance of permeable or semi-permeable hiking trails and paved community trails are Covered Activities in the UDA for Stream Setbacks. Use by pedestrians, bicycles, and domestic animals (including horses and leashed dogs) is a Covered Activity for trails within SSHCP Stream Setbacks. The maximum trail width will be 16 feet, including 2-foot-wide shoulders. The Plan Permittees estimate that approximately 150 linear miles of trails will be built within Stream Setbacks located in the UDA.
- **Low-velocity bio-retention swales.** These swales will be designed to hold and remove runoff from trails and prevent runoff entry into Preserves. These will typically be small linear features that will be placed on one or both sides of trails within the setback or roadways adjacent to the setback (see Figures 5-7 through 5-9). Construction, operation, and maintenance of these swales are SSHCP Covered Activities, covered by the SSHCP permits. Any fill soil imported to construct the swale will be free of invasive species.
- **Crossings perpendicular to the stream**. Covered Activity crossings of new roads, bike or pedestrian trails, railroads, sewer lines, water lines, recycled water lines, or utility lines are allowed in SSHCP Stream Setbacks as long as they cross perpendicular to the stream. The Land Use Authority Permittees (County of Sacramento and Cities of Galt and Rancho Cordova) will ensure that Third-Party Project Proponents implementing the crossing correctly implement all applicable conditions and AMMs for the aquatic land cover types (see Section 5.4). The Land Use Authority Permittees will also review and approve crossing designs to ensure that the area of the crossing is stabilized (e.g., appropriate bio-engineering solutions) to prevent potential erosion due to its use as a crossing.
- **Stream bank stabilization projects**. As discussed in Section 5.2.1, stream bank stabilization projects include installation of in-stream structures for erosion control (e.g., appropriate bio-engineering methods). Plan Permittees will review and approve stabilization designs to ensure that they will avoid and minimize impacts to the aquatic land cover types.

- **Fencing**. Post and cable fencing, split rail, or other open fencing will be installed adjacent to trails and are intended to keep pedestrians on the trail.
- **Benches, shade structures, and shade trees.** Benches, shade structures, and trash receptacles will be allowed along trails in the SSHCP Stream Setbacks. Shade trees will be allowed at bench sites. Shade trees, benches, shade structures, and trash receptacles must be located on the outer edge of the trail farthest from the creek. Shade tree species must be native trees that are found in SSHCP Riparian land cover types (see Chapter 3) and that can survive in the planted location without long-term irrigation or fertilization. Irrigation will be allowed for a maximum of 5 years to establish saplings. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation does not affect the waterway. Invasive plant species listed on Cal-IPC's California Invasive Plant Inventory Database or listed on Cal-IPC's California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/) will not be planted in Stream Setbacks.
- **Interpretive signs and kiosks.** Signs and kiosks are intended to educate trail users about the benefits of the SSHCP Preserve System and the importance of the environmental resources that the Preserves are protecting. Safety and directional signs may also be installed. The construction, operation, and maintenance of these signs and kiosks are SSHCP Covered Activities covered by the SSHCP permits.
- **Riparian habitat re-establishment or establishment.** Re-establishment or establishment[9] of riparian vegetation in Stream Setbacks may be desirable to minimize indirect effects of adjacent development or to enhance stream water quality. As discussed in Chapter 9, vegetation re-establishment or establishment plans must be reviewed and approved by the Implementing Entity and Permitting Agencies prior to implementation.
- **Outfalls.** Construction and operation of outfall structures that allow the discharge of stormwater into a stream from adjacent urban development areas are allowed in SSHCP Stream Setbacks. The Land Use Authority Permittees will review and approve outfall designs to ensure that they correctly apply all applicable design and construction AMMs (refer to Section 5.4).
- **Flood control structures and stormwater management**. As discussed in Section 5.2.1, flood control and stormwater structures include, but are not limited to, detention basins, bio-retention swales, and water quality facilities that are designed to be compatible with the habitat and wildlife values of the adjacent stream corridor. Land Use Authority Permittees will review and approve designs to ensure that they include all appropriate SSHCP design and construction AMMs (refer to Section 5.4).

[9] In the context of this Plan, the word "establish" is synonymous with "create."

Nonconforming[10] Structures and Uses

Existing nonconforming structures and nonconforming uses of land may be located within SSHCP Stream Setbacks. Existing nonconforming structures or uses are not Covered Activities, but are allowable activities within Stream Setbacks and are subject to the following requirements:

- Legally existing but nonconforming structures or uses may be continued.
- Existing impervious surfaces within the setbacks that resulted from previous allowable disturbances or developments will not be expanded.
- If a legally existing but nonconforming use has been discontinued for more than 90 days, re-establishment will be prohibited by the appropriate Land Use Authority Permittee, with the exception of agricultural uses that are following prescribed BMPs for crop rotation. However, resumption of agricultural uses must be strictly confined to the extent of disturbance existing at the time of adoption of the SSHCP.

Septic Systems

Subsurface sewage disposal systems that currently exist within an area that will become an SSHCP Stream Setback are not Covered Activities but will be "grandfathered" and allowed to remain in the SSHCP Stream Setback. Parcels entitled to install subsurface sewage disposal systems before or at the time of SSHCP permit issuance will also be allowed to install such systems within a Stream Setback, but the operation, maintenance, or replacement of entitled or currently existing subsurface sewage disposal systems are not Covered Activities.

5.2.7 SSHCP Preserve System Covered Activities

In addition to the activities and actions described above, the SSHCP permits will provide take authorization for activities and actions associated with implementation of the SSHCP Conservation Strategy described in detail in Chapter 7. Most of these activities and actions will take place within the SSHCP Preserve System assembled by the Plan. See Section 5.2.8 for Covered Activities allowed in the Laguna Creek Wildlife Corridor area of the Preserve System. All SSHCP Conservation Actions will take place within the SSHCP Plan Area (see Chapter 7 for a description of all SSHCP Conservation Actions).

As described in Chapter 7, the SSHCP Preserve System will benefit and protect Covered Species within the Plan Area and achieve the SSHCP's Biological Goals and Measurable Objectives. However, future land management, monitoring, habitat enhancement, habitat re-establishment, and maintenance activities on SSHCP Preserves have some potential to result

[10] Nonconforming structures or uses are structures and uses of land that lawfully existed before an amendment to a local land use authority's code made the structure or use non-conforming.

in adverse effects to Covered Species habitats and individuals. For that reason, Conservation Actions are also SSHCP Covered Activities and are covered by the SSHCP permits. As discussed in detail below, this Preserve System Covered Activity category includes all Plan Permittee actions that might be necessary to achieve the SSHCP Conservation Strategy, including the SSHCP Biological Goals and Measurable Objectives (see Chapter 7). Most of the Conservation Strategy Covered Activities will occur within the SSHCP Preserve System or on lands planned for inclusion in the Preserve System (see Chapter 7 for a description of all SSHCP Conservation Actions). The SSHCP Implementing Entity will oversee implementation of Preserve System Covered Activities, including management and monitoring of the SSHCP Preserve System.

Preserve Management and Monitoring

This category includes all Preserve System land management actions required by the Plan or other actions that might be necessary to achieve the SSHCP Biological Goals and Measurable Objectives (Chapter 7). Activities associated with management of the SSHCP Preserves have the potential to affect Covered Species. This category also includes construction, maintenance, and use of facilities needed to manage the SSHCP Preserve System, including, but not limited to, roads, bridges, culverts, fences, gates, wells, stock tanks, stock ponds, and livestock handling facilities (e.g., corrals, pens, and chutes). As much as possible, Preserve management structures (e.g., Preserve field offices, maintenance sheds, carports) will be located outside Preserve boundaries. Those accessing Preserves for management and monitoring will likely use all-terrain vehicles to the extent feasible, which do not require improved roads. However, access to some infrastructure may require establishment of new dirt roads. Roads, structures, and facilities existing at the time of land acquisition will be used whenever feasible to minimize impacts to species habitats in the Preserve. Where Preserve management structures or access roads must be constructed on Preserve lands, they must be identified in an approved Preserve Resources Management Plan (see Chapter 8) and will be sited to minimize direct and indirect impacts to Covered Species habitat.

Management and monitoring actions that will be used within the SSHCP Preserve System are described in detail in Chapter 8, SSHCP Monitoring and Management Programs. Preserve management activities and facility Covered Activities may include, but are not limited to, the following:

- Demolition or removal of structures, roads, or built livestock ponds to enhance or re-establish habitat.
- Hazardous materials remediation, such as appropriate closure of underground storage tanks, soil remediation, and cleanup of illegal dumping.

- Preserve vegetation management, including grazing of livestock, mowing, manual labor, and prescribed burns. See additional information under "Pesticide Use for Land Management," below.[11]
- Fire management, including prescribed burning and mowing.
- Fuel break establishment on Preserves outside the UDA.
- Vehicle and pedestrian travel, including by all-terrain vehicles or trucks, for inspecting or maintaining facilities, moving, or managing livestock and patrolling.
- Use of mechanized equipment for construction, maintenance, and resource management projects in the Preserve System (e.g., vehicles, weed trimmers, mowers).
- Restoration of historical hydrologic conditions through creation of berms, creation of channels and ditches, filling or plugging of channels and ditches, creation of swales, and demolition or removal of preexisting structures or roads.
- Installation and repair of fencing.
- Construction, rehabilitation, and maintenance of facilities (e.g., pens, corrals, gates, feed storage, wells, water delivery, and water storage) to support livestock grazing as a Covered Species management tool. See additional information under "Water Supply for Livestock," below.
- Construction, operation, and maintenance of recycled water pipelines providing irrigation to Cropland and Irrigated Pasture Preserves.
- Construction, operation, and maintenance of small solar photovoltaic panels to provide electricity for Preserve management.
- Actions to control non-native species (e.g., feral cats and dogs, red fox, non-native fish, bullfrogs).
- Actions to enhance or re-establish species habitat. See additional information under "Habitat Enhancement, Re-Establishment, and Establishment," below.
- Certain agricultural activities, such as tilling fields, harvesting crops, and grazing, when they are consistent with provisions of an SSHCP Conservation Easement (see Section 9.4.3) and are consistent with an SSHCP Preserve Management Plan (see Chapter 8).
- Modification and use of structures existing at the time of property acquisition for uses related to Preserve management or public education.

[11] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and the application conforms to all conditions in Section 5.4.

- Installation of monitoring and extraction wells for groundwater remediation at Kiefer Landfill. See additional information under "Groundwater Monitoring and Extraction Wells," below.
- Construction of new unpaved roads will likely be necessary to access areas of the Preserve System to implement management, monitoring, and restoration plans. Roads will be limited to the minimum width and distance necessary. The Plan Permittees request that the SSHCP permits cover construction, operation, and maintenance of up to 5 miles of new dirt road and up to 15 creek or swale crossings within the SSHCP Preserve System.
- Species and habitat surveys and monitoring. See additional information under "Species Surveys, Monitoring, Research, and Adaptive Management Activities," below.

Low-Impact Nature Trails

In addition to trails within Preserve Setbacks, the SSHCP permits will also cover creation of a limited number of low-impact nature trails within planned SSHCP Preserves. The Plan Permittees anticipate that these trails will primarily be located in UDA Preserves near urban development to promote awareness and appreciation of the Plan Area's natural history and provide environmental education opportunities. These trails will not traverse the entirety of a Preserve, but will be constructed as short segments or loops and will be identified in an approved Preserve Management Plan (see Chapter 8). These trails will not be located in SSHCP Preserves or conservation easements that are farmed or could be farmed in the future. Construction and maintenance of low-impact nature trails within Preserves will be SSHCP Covered Activities and covered on SSHCP permits. Construction of low-impact nature trails may impact natural resources within the Preserve System, including Covered Species and their habitats.

The Plan Permittees request that the ITPs cover construction, operation, and maintenance of low-impact nature trails installed within Landscape, Core, and Minor Preserves. Nature trails will be unpaved trails that will vary in width depending on terrain and existing constraints, but will never exceed 4 feet in width. Improvements include mowing vegetation to create or maintain a trail, minor grading to remove trip hazards, and signs providing directional and educational information. Where a trail crosses a swale, wooden walkways elevated to a height no greater than 2 feet will be installed. See Condition 5 for additional design and AMMs related to nature trails (Section 5.4.1).

Public education will be provided to enhance user awareness and understanding of the Preserve System and its natural resources in accordance with an approved Preserve Management Plan (Chapter 8). Public education will include the following:

- Online or printed trail maps, field guides, and information about Preserve species and habitat.

- Trail signage at appropriate locations.
- Interpretive signs at appropriate locations.

See Condition 5 for additional design and AMMs related to nature trails. Habitat Enhancement, Re-Establishment, and Establishment

Activities to enhance, re-establish, or establish species habitat may result in temporary and permanent effects to Covered Species. Enhancement is modifying an existing habitat to better suit species' needs. Enhancement actions may involve, but are not limited to, improving the hydrologic regime of a site to benefit Covered Species; managing vegetation; installing perching poles; and providing bat houses, burrows, or other nesting/roosting improvements. The types and amounts of habitat enhancement planned in the SSHCP Preserve System are discussed in Chapter 7.

Habitat re-establishment is defined as restoring species habitat where it previously existed but has been degraded or removed. Habitat establishment (creation) involves establishing species habitat in new sites where it historically did not exist. Of these two, the SSHCP Conservation Strategy (Chapter 7) emphasizes habitat re-establishment. However, because of incomplete information about the precise historical locations of some habitats (such as the historical location of each vernal pool on a restored landscape), habitat creation is included in the SSHCP Conservation Strategy (see Chapter 7). All activities related to habitat re-establishment and habitat establishment are SSHCP Covered Activities. SSHCP Conservation Strategy requirements for species habitat re-establishment are discussed in AMM RE-ESTABLISHMENT/ ESTABSLISHMENT-1, AMM RE-ESTABLISHMENT/ESTABSLISHMENT-2, and in Chapter 7. Habitat re-establishment and establishment generally include, but are not limited to, earth moving; regrading or recontouring a site; restoring the past hydrologic regime or creating a hydrologic regime; and seeding or planting herbaceous vegetation, trees, shrubs, grasses, or other vegetation. Habitat re-establishment and establishment will generally be disruptive in the short term because these activities may involve soil disturbance, removal of undesirable plants, and limited grading. All habitat restoration and creation is expected to result in a net long-term benefit for Covered Species and natural communities. However, these activities may have temporary or short-term adverse effects, and may result in limited take of Covered Species (see Chapter 6, Effects Assessment and Level of Take). Impacts to existing vernal pools from re-establishment and establishment activities will be avoided or minimized by implementing the AMMs discussed below under Condition 6.

Removal or Breaching of Farm Levees

The purpose of removing or breaching of farm levees is to facilitate the establishment or re-establishment of riparian habitat. Similar to activities to enhance, re-establish, or establish species habitat, the removal or breaching of farm levees may result in temporary and permanent effects to

Covered Species. Actions associated with the removal or breaching of farm levees may involve, but are not limited to, improving the hydrologic regime of a site to benefit Covered Species, managing vegetation, and introduction of riparian vegetation.

Removal or breaching of farm levees include, but are not limited to, earth-moving activities; re-grading or re-contouring a site; restoring the past hydrologic regime or creating a hydrologic regime; and seeding or planting herbaceous vegetation, trees, shrubs, grasses, or other vegetation. These actions would generally be disruptive in the short term because these activities may involve soil disturbance, limited grading, and short-term flooding of uninhabited land. Removal or breaching of farm levees is expected to result in a net long-term benefit for Covered Species and natural communities. However, these activities may have temporary or short-term adverse effects, and may result in limited take of Covered Species (see Chapter 6, Effects Assessment and Level of Take).

Species Surveys, Monitoring, Research, and Adaptive Management Activities

Species surveys will be conducted on SSHCP Preserves and on properties identified for potential acquisition as Preserves. Preserve surveys will be conducted regularly as part of the SSHCP monitoring and adaptive management program (Chapter 8). These surveys may require Covered Species to be handled, marked, measured, or inspected, which may result in species take under the ESA or CESA. Research conducted in support of the SSHCP is a Covered Activity when implemented in accordance with the SSHCP Conservation Strategy.

Species monitoring activities may include, but are not limited to, surveys for Covered Species. Surveys will use the most current species-specific survey methodology and protocols. Habitat monitoring may include establishing and walking line transects or quadrants. As discussed in Chapter 8, monitoring, land management, and research activities that require handling of listed species (e.g., translocation, banding, marking, measuring physical features) will be supervised by a Wildlife Agencies–approved biologist with a valid ESA Section 10(a)(1)(A) permit and/or state Scientific Collecting Permit that covers the specific activity and the specific species.

SSHCP Preserves will be managed by the SSHCP Implementing Entity using standard monitoring and adaptive management principles, where species and land management actions are adjusted in response to monitoring data collected as part of the SSHCP Monitoring Plan (see Chapter 8). In managing SSHCP Preserves and Preserve Setbacks, habitat management research or experiments may be undertaken for the benefit of a Covered Species. Adaptive management research trials or pilot studies conducted on SSHCP Preserves or Preserve Setbacks may require manipulation or intensive management of habitat. Examples may include implementing new grazing regimes with different animals, controlled burns, varying restoration techniques, cycling crop patterns, cycling harvest techniques/times, or any number of experimental operations.

These types of Preserve research and adaptive management activities are SSHCP Covered Activities covered by the SSHCP permits. These activities are intended to aid in the conservation of Covered Species, although they may adversely affect a small number of individuals. The intent of the research and adaptive management Covered Activities is to promote more informed and efficacious management of the SSHCP Preserve System to meet the stated SSHCP Biological Goals and Measurable Objectives (see Chapter 7).

Water Supply for Livestock

Preserves in the UDA are expected to need links to existing or future water infrastructure. Connection of a livestock water trough to existing or future water infrastructure will require installation of small-diameter pipelines. These will be sized and buried to the specification of the local jurisdiction; the relevant Preserve Management Plan (Section 7) will determine appropriate locations and specific design measures to minimize impacts to species habitat. Outside the UDA, new extraction wells may be needed on more remote Preserves to provide water for livestock that are used to manage vegetation as part of a Preserve Management Plan. Existing wells will be used whenever possible. New wells will be installed only as necessary for natural resource management purposes and when no alternative surface water supplies are available. If new wells are necessary, they will be sited to avoid direct and indirect impacts to vernal pools. Plan Permittees estimate that one new well will be needed for every 2,000 acres of Grassland Preserve outside the UDA. The Plan Permittees therefore request that the ITPs cover construction of up to 10 new wells. The Plan Permittees also request that the ITPs cover replacement of existing wells and operation and maintenance of all new and existing wells to support the Preserve System, as identified in an approved Preserve Management Plan. This Covered Activity will include construction and maintenance of a cement pad, well house covering, electrical equipment and connections, fencing around the well house, and other equipment necessary for operation of the wells. In addition, construction and maintenance of pipelines that may be necessary to transfer water from the new wells are Covered Activities.

Groundwater Monitoring and Extraction Wells

At the existing Kiefer Landfill in PPU 5 on land owned by the County of Sacramento, leachates from an older portion of the landfill are entering the aquifer and have contaminated the groundwater. To remediate this condition, the County of Sacramento is required to maintain several monitoring wells to test for contaminants and maintain several extraction wells to treat contaminated groundwater. Existing monitoring and extraction wells for testing and treating contaminated water, and new monitoring and extraction wells are Covered Activities on that portion of the Kiefer Landfill that is a planned SSHCP Preserve.

Pesticide Use for Land Management

Pesticide use for SSHCP Preserve management is covered under the CESA Incidental Take Permit, but not the ESA Incidental Take Permit.[12] Pesticide use is allowed only when necessary to achieve the SSHCP Biological Goals and Measurable Objectives (e.g., exotic plant or exotic animal control). When necessary, pesticide use is allowed within SSHCP Preserves, within Preserve Setbacks, and within road ROWs that border SSHCP Preserves. As discussed in Chapter 8, Preserve Management Plans will be prepared for each SSHCP Preserve. Each Preserve Management Plan will identify processes to identify, document, evaluate, and then control invasive and other exotic target species by combining biological, cultural, physical, and chemical tools in a way that will minimize environmental risks. Pesticide use as part of a Preserve management strategy is not expected to adversely affect Covered Species over the Permit Term because pesticide use will be limited, and pesticide use will strictly comply with the pesticide label and all other applicable federal, state, and local laws pertaining to the use, safety, storage, disposal, and reporting of pesticides.

Detention Basins

As discussed in Section 5.2.1, Urban Development can require construction of stormwater management facilities, including detention basins. Detention basins collect stormwater through gravity flow and gradually release the stormwater to a natural stream or waterway. The SSHCP requires Urban Development Covered Activities to direct stormwater flows away from existing or planned Preserves and into stormwater detention basins or other stormwater facilities inside the development footprint, consistent with the requirements of EDGE-4.

As discussed in Section 7.5, the SSHCP Preserve System includes Linkage Preserves in the UDA. Some of the UDA Linkage Preserves surround natural streams, creeks, or intermittent drainages that must receive stormwater from the adjacent urban development. Therefore, in limited situations, stormwater detention basins will be allowed on those SSHCP Linkage Preserves. The detention basins will capture storm flows and runoff, and discharge to stormwater facilities or bio-swales and through percolation and discharge to the perched aquifer. Detention basins can include emergent wetland vegetation or other biological measures to remove contaminants from stormwater, or other measures as specified by the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions.

At the time of SSHCP preparation, the SSHCP Preserve System includes seven Linkage Preserves with natural drainages: L1, L2, L4, L7, L8, L9, and L10. A limited number of

[12] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and the application conforms to all conditions in Section 5.4.

detention basins will be allowed on Linkage Preserves with natural drainages, consistent with the requirements of EDGE-6. Also see project-specific measures in Appendix K.

Existing Utility Maintenance and Repair

Repair and maintenance of existing utility facilities within planned SSHCP Preserves, including electrical, natural gas, water, wastewater, and cell tower facilities, are SSHCP Covered Activities, when implemented consistent with the utility's existing ROW easements.

5.2.8 Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System

As discussed in Chapter 7, the Laguna Creek Wildlife Corridor is a component of the SSHCP Preserve System. The SSHCP permits will provide take authorization for activities and actions associated with management and monitoring of the wildlife corridor, as described in detail in Chapter 7 and summarized below.

Limited Covered Activities are allowed within the Laguna Creek Wildlife Corridor. However, where the listed allowable activities conflict with other laws, regulations, and policies regarding streams, erodible soils, wetlands, floodplains, land disturbance activities, or other environmental protective measures, the more restrictive allowable use will apply. The listed allowable activities are not intended to supersede any previously issued active permits by Permitting Agencies. Where a permit has been issued, the existing permit conditions will supersede the allowable SSHCP Covered Activities. Allowed activities within the Laguna Creek Wildlife Corridor include the following:

- **Trails.** Activities relating to permeable or semi-permeable hiking trails and paved community trails, and benches and trash receptacles along trails are Covered Activities for the Laguna Creek Wildlife Corridor. Use by pedestrians, bicycles, and domestic animals (including horses and leashed dogs) is a Covered Activity for trails within the Laguna Creek Wildlife Corridor. The maximum trail width will be 16 feet, with 12 feet of permeable, paved, or semi-permeable trail and 2-foot-wide shoulders on either side of the trail. Plan Permittees estimate that up to 20 miles of trails will be built within the Laguna Creek Wildlife Corridor.
- **Low-velocity bio-retention swales.** These swales will be designed to hold and remove runoff from trails and prevent runoff entry into Preserves. These are typically small linear features that will be placed on one or both sides of a trail within the setback or roadway adjacent to the setback (see Figures 5-7 through 5-9). The construction, operation, and maintenance of these swales are SSHCP Covered Activities and are covered by the SSHCP permits. Any fill soil imported to construct swales will be free of invasive species.

- **Fencing.** Post and cable, split rail, or other open fencing will be installed adjacent to trails and are intended to keep pedestrians on the trail. Additional fencing may also be necessary to keep livestock in the Preserve and out of the setback (see Section 5.4 and Figures 5-7 through 5-9**)**. The type of fencing required for livestock will be specified in the Preserve Management Plan.
- **Benches, shade structures, shade trees, and trash receptacles.** Benches, shade structures and trees, and trash receptacles will be allowed along trails in the Laguna Creek Wildlife Corridor. Planting of shade trees will be allowed at bench sites, if needed. Shade trees, benches, shade structures, and trash receptacles must be located on the outer edge of the trail farthest from the creek. Shade tree species must be native trees that are found in SSHCP Riparian land cover types (Chapter 3), and that can survive in the planted location without long-term irrigation or fertilization. Irrigation will be allowed for a maximum of 5 years to establish saplings. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation will not affect the waterway. Plantings in the Preserve Setback will not include invasive plant species listed on Cal-IPC's California Invasive Plant Inventory Database or listed on the Cal-IPC California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/).
- **Crossings perpendicular to the stream**. Covered Activity crossings of new roads, bike or pedestrian trails, railroads, sewer lines, water lines, recycled water lines, or utility lines are allowed in the Laguna Creek Wildlife Corridor as long as they cross perpendicular to the stream. The Land Use Authority Permittees (County of Sacramento and City of Rancho Cordova) will ensure that Third-Party Project Proponents implementing the crossing correctly implement all applicable Conditions and AMMs for the aquatic land cover types (see Section 5.4).
- **Stream bank stabilization projects**. These include installation of in-stream structures for erosion control, as discussed in Section 5.2.1 (e.g., appropriate bio-engineering methods). Plan Permittees will review and approve stabilization designs to ensure that they will avoid and minimize impacts to the aquatic land cover types.
- **Interpretive signs and kiosks.** Signs and kiosks are intended to educate trail users about the benefits of the SSHCP Preserve System, including specifics about the Laguna Creek Wildlife Corridor and the importance of the environmental resources that the Preserves are protecting. Safety and directional signs may also be installed. The construction, operation, and maintenance of these signs and kiosks are SSHCP Covered Activities covered by the SSHCP permits.

- **Riparian habitat re-establishment or establishment.** Re-establishment or establishment[13] of riparian vegetation in the Laguna Creek Wildlife Corridor may be desirable to minimize indirect effects of adjacent development or enhance stream water quality. As discussed in Chapter 9, vegetation re-establishment or establishment plans must be reviewed and approved by the Implementing Entity and Permitting Agencies prior to implementation.
- **Outfalls.** Construction and operation of outfall structures that allow the discharge of stormwater into a stream from adjacent urban development areas are allowed in the Laguna Creek Wildlife Corridor. The Land Use Authority Permittees will review and approve outfall designs to ensure that they correctly apply all applicable design and construction AMMs.
- **Flood control structures and stormwater management**. As discussed in Section 5.2.1, Urban Development in the UDA, flood control and stormwater structures include, but are not limited to, detention basins, bio-retention swales, and water quality facilities that are designed to be compatible with the habitat and wildlife values of the Laguna Creek Wildlife Corridor. The Land Use Authority Permittees will review and approve designs to ensure that they include all appropriate SSHCP design and construction AMMs (refer to Section 5.4).

Nonconforming[14] Structures and Uses

Existing nonconforming structures and nonconforming uses of land may be located within the Laguna Creek Wildlife Corridor. Operation and maintenance of existing nonconforming structures or uses are not Covered Activities, but are allowable activities within the Laguna Creek Wildlife Corridor and are subject to the following requirements:

- Legally existing but nonconforming structures or uses may be continued.
- Existing impervious surfaces within Laguna Creek Wildlife Corridor that resulted from previous allowable disturbances or developments will not be expanded.
- If a legally existing but nonconforming use has been discontinued for more than 90 days, re-establishment will be prohibited by the appropriate Land Use Authority Permittee.

Existing Septic Systems

Subsurface sewage disposal systems that currently exist within the Laguna Creek Wildlife Corridor are not Covered Activities but will be "grandfathered" and allowed to remain in the

[13] In the context of this Plan, the word "establish" is synonymous with "create."

[14] Nonconforming structures or uses lawfully existed before an amendment to a local land use authority made the structure or use non-conforming.

Laguna Creek Wildlife Corridor once the corridor is established. Parcels already entitled for installation of subsurface sewage disposal systems at the time of permit issuance will be allowed such systems within the Laguna Creek Wildlife Corridor. Operation, maintenance, and replacement of existing and entitled subsurface sewage disposal systems are not Covered Activities but will be allowed within the Laguna Creek Wildlife Corridor.

Wildlife Corridor Management and Monitoring

Future land management, monitoring, habitat enhancement, habitat re-establishment, and maintenance activities in the Laguna Creek Wildlife Corridor have some potential to adversely affect Covered Species habitats and individuals. For that reason, Conservation Actions in the wildlife corridor are also SSHCP Covered Activities and are covered by the SSHCP permits. The SSHCP Implementing Entity will oversee implementation of Covered Activities in the wildlife corridor, including management and monitoring.

Management and monitoring actions that will be used in the Laguna Creek Wildlife Corridor are the same as those that will be used in the SSHCP Preserve System and are described in detail in Chapter 8, SSHCP Monitoring and Management Programs. A Preserve Management Plan will be developed for the Laguna Creek Wildlife Corridor (see Chapter 8). Management, monitoring, and maintenance Covered Activities may include, but are not limited to, the following:

- Demolition or removal of structures or roads to enhance or re-establish habitat.
- Remediation of hazardous materials such as soil remediation and cleanup of illegal dumping.
- Preserve vegetation management, including livestock grazing, mowing, manual labor, and prescribed burns. See additional information under "Pesticide Use for Land Management,"[15] below.
- Vehicle and pedestrian travel on trails, including by all-terrain vehicles or trucks, for purposes such as inspecting and maintaining facilities, moving and managing livestock, and patrolling.
- Use of mechanized equipment for construction, maintenance, and resource management projects in the Preserve System.
- Restoration of historical hydrologic conditions through installation of pumps, creation of berms, creation of channels and ditches, creation of swales, and demolition or removal of preexisting structures or roads.
- Installation and repair of fencing.

[15] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided pesticide application is otherwise legal and the application conforms to all restrictions in Section 5.4.

- Construction, rehabilitation, and maintenance of facilities (e.g., pens, corrals, gates, feed storage, and water storage) to support livestock grazing as a Covered Species management tool.
- Actions to control non-native species (e.g., feral cats and dogs, red fox, non-native fish, bullfrogs).
- Actions to enhance or re-establish species habitat. See additional information under "Habitat Enhancement, Re-Establishment, and Establishment," below.
- Modification and use of structures existing at the time of property acquisition for uses related to Preserve management or public education.
- Species and habitat surveys and monitoring. See additional information under "Species Surveys, Monitoring, Research, and Adaptive Management Activities," below.

Habitat Enhancement, Re-Establishment, and Establishment

Activities to enhance, re-establish, or establish species habitat may result in temporary and permanent effects to Covered Species. Enhancement is modifying an existing habitat to better suit species' needs. Enhancement actions may involve, but are not limited to, improving the hydrologic regime of a site to benefit Covered Species; managing vegetation; installing perching poles; and providing bat houses, burrows, or other nesting/roosting improvements. The types and amounts of habitat enhancement planned in the Laguna Creek Wildlife Corridor are discussed in Chapter 7.

Habitat re-establishment is defined as restoring species habitat where it previously existed but has been degraded or removed. Habitat establishment (creation) involves establishing species habitat in new sites where it historically did not exist. Of these two, the SSHCP Conservation Strategy (Chapter 7) emphasizes habitat re-establishment. However, because of incomplete information about the precise historical locations of some habitats, habitat creation is included in the SSHCP Conservation Strategy (see Chapter 7). All activities related to habitat re-establishment and habitat establishment are SSHCP Covered Activities. Requirements for habitat re-establishment are discussed in detail in AMM RE-ESTABLISHMENT/ESTABSLISHMENT-1, AMM RE-ESTABLISHMENT/ESTABSLISHMENT-2, and Chapter 7. Habitat re-establishment and establishment generally include, but are not limited to, earth moving; regrading or recontouring a site; restoring the past hydrologic regime or creating a hydrologic regime; and seeding or planting herbaceous vegetation, trees, shrubs, grasses, or other vegetation. Habitat re-establishment and establishment will generally be disruptive in the short term because these activities may involve soil disturbance, removal of undesirable plants, and limited grading. All habitat restoration and creation is expected to result in a net long-term benefit for Covered Species and natural communities. However, these activities

may have temporary or short-term adverse effects and may result in limited take of Covered Species (see Chapter 6).

Species Surveys, Monitoring, Research, and Adaptive Management Activities

Species surveys will be conducted in the Laguna Creek Wildlife Corridor. Preserve surveys will be conducted regularly as part of the SSHCP monitoring and adaptive management program (Chapter 8). These surveys may require that Covered Species are handled, marked, measured, and inspected, which may result in species take under ESA or CESA. Surveys for all Covered Species will be conducted by approved biologists, as defined in Chapters 7 and 8. Research conducted in support of the SSHCP is a Covered Activity when implemented in accordance with the SSHCP Conservation Strategy (see Chapter 7).

Species monitoring activities may include, but are not limited to, surveys for Covered Species. Surveys will use the most current species-specific survey methodology and protocols. Habitat monitoring may include establishing and walking line transects or quadrants. Monitoring, land management, and research activities that require handling listed species (e.g., translocating, banding, marking, measuring physical features) will be supervised by Wildlife Agencies–approved biologists with valid ESA Section 10(a)(1)(A) permits and/or state Scientific Collecting Permit that covers the specific activity and the specific species.

SSHCP Preserves, including the Laguna Creek Wildlife Corridor, will be managed by the SSHCP Implementing Entity using standard monitoring and adaptive management principles under which species and land management actions will be adjusted in response to monitoring data collected as part of the SSHCP Monitoring Plan (see Chapter 8). In managing the Laguna Creek Wildlife Corridor, habitat management research or experiments may be undertaken for the benefit of Covered Species. Adaptive management research trials or pilot studies conducted on SSHCP Preserves and Preserve Setbacks may require manipulation or intensive management of habitat. Examples include implementing new grazing regimes with different animals, varying restoration techniques, and other experimental operations.

These types of Preserve research and adaptive management activities are SSHCP Covered Activities covered by the SSHCP permits. These activities are intended to aid in the conservation of Covered Species, although they may adversely affect a small number of individuals. The intent of the research and adaptive management Covered Activities is to promote more informed and effective management of the SSHCP Preserve System to meet the stated SSHCP Biological Goals and Measurable Objectives (see Chapter 7).

Pesticide Use for Land Management

Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and the application conforms to all conditions in Section 5.4. Pesticide use for Preserve management, including in the Laguna Creek Wildlife Corridor, is covered under the CESA Incidental Take Permit, but not the ESA Incidental Take Permit. Pesticide use is allowed in Preserves only to achieve the SSHCP Biological Goals and Measurable Objectives (e.g., exotic plant or exotic animal control). Preserve Management Plans (see Chapter 8) will prescribe an integrated pesticide use process as a Preserve management tool, modeled after the California Department of Fish and Wildlife's pesticide use approval process (CDFW Forms 679 and 680). At a minimum, this will include compliance with pesticide label instructions and state and local laws. Use must also comply with existing injunctions related to the use of pesticides.

5.3 Activities and Actions Not Covered by the SSHCP Permits

The projects and activities listed below were considered but rejected for coverage under the SSHCP and SSHCP permits. Incidental take coverage for these activities, if needed, will require an amendment to the SSHCP and its permits, or require individually and independently acquired ITPs.

Agricultural Practices

All agricultural practices on public or private land inside or outside the UDA are not covered by the SSHCP permits unless such actions (1) occur on an SSHCP Preserve and are an SSHCP Covered Activity described in Section 5.2.7, SSHCP Preserve System Covered Activities, or (2) occur on a property under an SSHCP Conservation Easement and are an SSHCP Covered Activity described in Section 5.2.7.

Community of Rancho Murieta

The community of Rancho Murieta, which is within the County of Sacramento's Urban Service Boundary, is surrounded by, but not included in, the Plan Area (Figure 1-1). Projects and activities within the community of Rancho Murieta are not Covered Activities under the SSHCP permits.

Native American Tribal Lands

Projects and activities that occur on sovereign land owned or controlled by a recognized Native American tribe are not Covered Activities.

Agricultural-Residential Development Outside the UDA

Agricultural-residential development consists of homes on large lots from 2 to 10 acres that are generally not supported by municipal services such as sewer and water. Several agricultural-residential communities exist within the Plan Area outside the UDA. New agricultural-residential development located outside the UDA is not an SSHCP Covered Activity and is not covered by SSHCP permits. However, all development activities within the UDA, including agricultural-residential development within the UDA, are a Covered Activity and covered by the SSHCP permits.

Trail Systems Outside the UDA

Construction and operation of proposed trail systems outside the UDA (including the County of Sacramento's east county quarry trails) are not SSHCP Covered Activities and are not covered by the SSHCP permits. However, roadside community trails associated with any Rural Transportation Project Covered Activity described in Section 5.2.3 are SSHCP Covered Activities.

Airport Operations and Expansion Outside the UDA

Airport operations and expansions outside the UDA are not SSHCP Covered Activities and are not covered by the SSHCP permits. Due to Federal Aviation Administration regulations, the Sacramento County Airport System is compelled to actively discourage wildlife and wildlife attractants that are considered to be potentially hazardous to airport operations. Nothing within the SSHCP will preclude staff or agents of the Sacramento County Airport System from engaging in or conducting otherwise lawful wildlife abatement activities on properties owned by the Sacramento County Airport System.

Rural Infrastructure that Is Not Identified as a Covered Activity

New infrastructure projects (e.g., water supply, sewer, roadways) located outside the UDA are not covered by the SSHCP permits, unless the project is specifically identified in Section 5.2.3, Rural Transportation Projects, or Section 5.2.4, Recycled Water Projects.

Landfills

Construction of new landfills is not an SSHCP Covered Activity, and is not covered by the SSHCP permits. However, operation, maintenance, expansion, and decommissioning of existing landfills, as described in Section 5.2.1, is a Covered Activity.

Mining Outside of the UDA

Any current or future mining operations or mine reclamation projects located outside the UDA are not SSHCP Covered Activities and are not covered by the SSHCP permits.

Oil and Gas Extraction or Production

Any current or future construction, maintenance, or operations for oil and gas extraction or production in the Plan Area is not an SSHCP Covered Activity and is not covered by the SSHCP permits.

Projects Related to the Cosumnes River

Any alteration to, damming of, or new levee system on the Cosumnes River or other river within the Plan Area is not an SSHCP Covered Activity and is not covered by the SSHCP permits.

Projects Permitted in Advance of the SSHCP

There are development project sites within the Plan Area that already hold permits from the Permitting Agencies. Projects on these sites will follow their existing permit requirements. These permitted projects are not covered by the SSHCP permits.

Existing or Planned Preserves Not Under SSHCP Management

Land management and Preserve maintenance activities on existing Preserves inside and outside the UDA, as described in Chapter 3 and shown in Figure 3-40, are not under the jurisdiction of the SSHCP Plan Permittees and cannot be covered by the SSHCP permits.

Mitigation and Conservation Banking Operations

Permitted mitigation banks and permitted conservation banks are present inside the Plan Area (see Chapter 3 and Figure 3-40). As discussed in Chapter 9, these existing mitigation and conservation banks might be used by the Implementing Entity to meet certain Biological Goals and Measurable Objectives of the SSHCP Conservation Strategy. However, the establishment of new management and operation of existing mitigation and conservation banks is not an SSHCP Covered Activity and is not covered by the SSHCP permits. Mitigation banks and conservation banks will continue to be operated and managed under their own agreements and permits from the Permitting Agencies.

Pesticide Use

Species take resulting from pesticide use in the Plan Area is not covered by the ESA Incidental Take Permit. However, limited pesticide use is covered by the CESA Incidental Take Permit for roadside ditch maintenance, stormwater channel maintenance, and SSHCP Preserve management. If the Implementing Entity determines that pesticide use is appropriate on an SSHCP Preserve parcel, it will include that allowance within a proposed Preserve Management Plan. The Preserve Management Plan is subject to review and approval by the Technical

Advisory Committee, which would include members from the environmental community and wildlife agencies (see Section 9.3.4, Technical Advisory Committee/Interagency Review Team). The Implementing Entity expects the use of pesticides will not be warranted or allowed on most SSHCP Preserves. However, to maintain a pool of willing sellers of conservation easements on agricultural lands, the Plan cannot completely prohibit their use within the SSHCP Preserve System. If the Technical Advisory Committee approves a Preserve Management Plan that includes the use of pesticides, the use would be subject to limitations in the Preserve Management on timing and area of application, amounts to be used, and acceptable pesticides. If appropriate, those restrictions could be incorporated into the conservation easement (Section 9.4.3).

Dam Construction or Removal

Dam construction, removal, or maintenance projects are not SSHCP Covered Activities and are not covered by the SSHCP permits.

Water Diversion

New water diversions or operation and maintenance of existing water diversions are not SSHCP Covered Activities and are not covered under the SSHCP permits.

Wind Energy

Construction and operation of wind turbines and other wind energy infrastructure are not SSHCP Covered Activities and are covered under the SSHCP permits.

Power Lines Outside the UDA

The SSHCP permits do not cover construction, operation, and maintenance of power lines located outside the UDA, with the exception of electrical distribution lines needed to support Preserve operation and management.

Emergency, Safety, and Police Services

Law enforcement, medical, rescue, firefighting, and other emergency service providers will be allowed access to SSHCP Preserves to carry out operations necessary for the health, safety, and welfare of the public. However, these operations are not under the control of any SSHCP Plan Permittee and, therefore, cannot be SSHCP Covered Activities.

Existing public infrastructure and utility facilities are currently located in areas anticipated to be incorporated into the SSHCP Preserve System. Emergency repairs may be required to public infrastructure facilities and utilities located on Preserves as necessary for the health, safety, and

welfare of the public. Although access to the Preserves will be allowed by the Implementing Entity and Wildlife Agencies, these emergency repairs are not covered by SSHCP permits.

The Permitting Agencies will not obstruct any emergency response decisions regarding Preserves made by the Implementing Entity. However, existing ESA consultation regulations will apply to all emergency activities (50 Code of Federal Regulations 402.05).

5.4 Conditions on Covered Activities

As required by the ESA (Section 10(a)(2)(A)(ii)) and Fish and Game Code Section 2081, this Plan includes measures to avoid and minimize take of Covered Species. This section describes the Avoidance and Minimization Measures that will be implemented as part of each SSHCP Covered Activity to avoid or minimize direct and indirect impacts to Covered Species and their habitats to the maximum extent, including species habitats that are also waters of the state and waters of the United States. AMMs are presented in this chapter as conditions on Covered Activities. Each condition contains several AMMs that are intended to eliminate or reduce direct or indirect effects to species that could result from implementation of a Covered Activity.

Third-Party Project Proponents are responsible for incorporating all SSHCP requirements (including appropriate AMMs) into their project design. The Land Use Authority Permittee with authority over a Covered Activity is responsible for reviewing and ensuring that all applicable AMMs are appropriately incorporated into project design, and is responsible for ensuring that the required AMMs are correctly applied by the Third-Party Project Proponent during implementation of the Covered Activity.

The CEQA process for individual Covered Activities may result in additional conditions for third-party projects that are not related to the ESA, CESA, or Clean Water Act. The SSHCP AMMs described in this chapter do not supersede requirements by other agencies and are not intended to provide a basis for non-compliance with other applicable design guidelines and avoidance measures required by federal, state, and local agencies. Compliance with the SSHCP does constitute full CEQA compliance with regard to mitigation of impacts to Covered Species. Ultimately, the Plan Permittees are responsible for ensuring that implementation of each SSHCP Covered Activity fully complies with the SSHCP, but it remains the Third-Party Project Proponent's responsibility to ensure project compliance with all applicable laws and regulations.

Before construction begins, the Third-Party Project Proponent must demonstrate to the Land Use Authority Permittee that all necessary AMMs will be fulfilled. This is accomplished by having pre-construction AMMs in place prior to construction and by having a plan that shows how all applicable post-construction AMMs will be addressed. During construction, it is the responsibility of the Land Use Authority Permittee to ensure that the AMMs are being

implemented. The Land Use Authority Permittee can compel a Third-Party Project Proponent to stop working if a project is not in compliance with all SSHCP AMMs.[16] Upon construction completion, the Land Use Authority Permittee will monitor and confirm that post-construction conditions are acceptable and consistent with the requirements of the SSHCP permits (e.g., revegetation, soil treatments).[17] Once the constructed project has received final clearance from the Land Use Authority, it is the responsibility of the Land Use Authority to monitor continued operation of installed AMMs (e.g., swales, retention basins) and to monitor compliance with AMMs required for future operations and maintenance of the Covered Activity. The Implementing Entity may also assist with and in some instances may assume responsibility for monitoring continued operation of installed AMMs when those AMMs are part of the Preserve System, Preserve Setbacks, or Stream Setbacks.

On occasion, a local Land Use Authority Permittee may not have authority over a Covered Activity proposed by a Third-Party Project Proponent. In that event, the SSHCP Implementing Entity may develop a Participating Special Entity agreement with the Third-Party Project Proponent (see Chapter 9). As a Participating Special Entity, the Third-Party Project Proponent will incorporate and implement all applicable design and construction AMMs. The Implementing Entity will ensure that AMMs specific to that SSHCP Covered Activity are included in the project's Participating Special Entity agreement and ensure that AMMs are being implemented during construction.

As the SSHCP will be implemented over a 50-year Permit Term, the results of construction monitoring may indicate that certain AMMs are ineffective. Should the Plan Permittees wish to modify or replace an SSHCP AMM, they will follow the modification process outlined in the Adaptive Management Program (see Chapter 8).

5.4.1 General Avoidance and Minimization Measures

General AMMs are designed to avoid or minimize effects of Covered Activities on SSHCP land cover types and Covered Species.

Condition 1. Avoid and Minimize Urban Development Impacts to Watershed Hydrology and Water Quality

National Pollution Discharge Elimination System permits are issued by the Regional Water Quality Control Board to jurisdictions in the region, including the jurisdictions that are also SSHCP Land Use Authority Permittees (i.e., County of Sacramento, and Cities of Rancho

[16] In a situation like this, the Local Land Use Authority Permittee will suspend one or more local permits (e.g., grading permit, building permit) until compliance with terms of all SSHCP requirements is demonstrated.

[17] Post-construction monitoring by the Land Use Authority Permittee could continue for several years.

Cordova and Galt). The National Pollution Discharge Elimination System permit is issued to each of the Land Use Authority Permittees every 5 years, and is referred to as the Municipal Separate Storm Sewer System (MS4) permit. MS4 permits contain specific design measures required for all projects constructed within the region. The Stormwater Quality Design Manual for the Sacramento and South Placer Regions (Stormwater Manual) outlines planning tools and requirements to reduce urban runoff from new development and redevelopment projects within the region (Sacramento Stormwater Quality Partnership 2007). The Stormwater Manual is used as a general guidance document to aid with the selection, siting, design, operation, and long-term maintenance of stormwater quality control measures. The Stormwater Manual contains control measures intended to meet the standard of "reducing pollutants in urban runoff to the maximum extent practicable" set forth in the local agencies' MS4 permits issued by the Central Valley Regional Water Quality Control Board. AMM LID-1 (see below) is designed to ensure compliance with MS4 requirements by requiring Third-Party Project Proponents to minimize increases of peak discharge of stormwater and to eliminate or reduce runoff of pollutants.

Development Covered Activities may adversely alter watershed hydrology and degrade water quality, which, in turn, could diminish or eliminate the conservation benefits provided by the SSHCP Preserve System. Condition 1 is designed to conserve and/or rehabilitate on-site natural creeks and streams. This condition will require the provision of BMPs and low-impact development (LID) drainage control measures to ensure that runoff from developed lands will closely mimic the pre-development hydrograph and retain most pre-development hydrologic functions. Condition 1 will accomplish the hydrograph and hydrologic objectives through application of the listed AMMs to all UDA Covered Activities that occur at the parcel, subdivision, or master plan scale.

LID-1 (Stormwater Quality): When the size of a Covered Activity project exceeds the thresholds established by the State Water Resources Control Board (SWRCB) (see the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions, or future SWRCB-approved design manuals applicable to the Plan Area), incorporate stormwater management into site design to satisfy the requirements outlined in the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions. Stormwater management may include groundwater recharge (LID-2) and natural site features (LID-3).

LID-2 (Groundwater Recharge): When siting SSHCP Preserves containing Riparian, Open Water, or Freshwater Marsh SSHCP land cover types, the Implementing Entity will prioritize locations that are suitable for groundwater recharge.

LID-3 (Natural Site Features): Incorporate preservation of a site's natural aquatic features (such as creeks and streams) into project design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species.

Condition 2. Avoid and Minimize Urban Development Direct and Indirect Impacts to Existing Preserves and SSHCP Preserves

Development Covered Activities adjacent to Preserves may adversely impact species that use the Preserve, and erode or eliminate the conservation benefits provided by the Preserve. Condition 2 seeks to avoid or minimize the following Covered Activity environmental stressors that may result in direct and indirect impacts to the SSHCP Preserve System:

- Alterations to landscape hydrology from new impervious surfaces may adversely affect natural communities in the lower watershed, the ecology of a Preserve, and/or downstream aquatic resources.
- Water runoff from development or from roadways directed into Preserves may introduce harmful substances into Preserves. Unseasonal and/or additional water entering a Preserve may eliminate vernal pools and other seasonal wetlands native to the region by converting them to low-functioning perennial wetlands.
- Development adjacent to Preserves may partially to fully remove the soil's "perched aquifer" (see Chapter 3) and reduce or eliminate the micro-watersheds that support the hydrology of vernal pools within the Preserve boundary. These changes may adversely affect the existing hydrologic regime of vernal pools by changing the timing, depth, and/or duration of vernal pool saturation and/or ponding, causing long-term changes to a suite of vernal pool functions. For example, changes to water chemistry could adversely affect species habitat. Although the vernal pools remain, the environmental conditions of the pools may no longer provide habitat for vernal pool Covered Species, or provide the benefit of other wetland functions (e.g., stormwater attenuation) compared to pre-project conditions.
- Introduction or proliferation of non-native or invasive plant and wildlife species may displace native species.
- Landscaping in the interface of a development and a Vernal Pool–Grassland Preserve often includes native or non-native trees and other plant species that are not found in California grasslands and, therefore, cannot survive on the Vernal Pool–Grassland Preserve border without intensive irrigation and cultivation. In addition to adverse effects from irrigation and landscape maintenance, adult trees may become landscape barriers that inhibit species movement and may act to isolate individual Preserves from the larger SSHCP Preserve System.
- Recreational use of Preserves near developed areas may compact soils, eliminate vegetation, impair hydrologic functions, introduce weeds or invasive plant species, and disturb plants and wildlife.

- Introduction of light, noise, or vibrations may disrupt normal nocturnal and diurnal cycles of native species.

AMMs associated with Condition 2 must be applied to all UDA Covered Activities that border an existing Preserve or planned SSHCP Preserve.

EDGE-1 (Compatible Land Uses): To the maximum extent practicable, development project Covered Activities will locate compatible land uses (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) in areas immediately adjacent to existing or planned Preserve boundaries. The compatible land use will provide additional buffering of Preserves from potential indirect effects of adjacent urban development. The soil surfaces in a compatible land use area may be re-contoured provided that the soil restrictive layer remains undamaged and most of the soil profile above the restrictive layer remains intact. The Land Use Authority will determine when it is not practicable to locate a compatible land use adjacent to existing or planned Preserve boundaries.

EDGE-2 (Single-Loaded Streets): To the maximum extent practicable, the design of Urban Development Covered Activities will locate single-loaded streets adjacent to existing or planned Preserve. The Land Use Authority will determine when single-loaded streets are not practicable.

EDGE-3 (Preserve Setbacks): Urban Development Covered Activities constructed adjacent to existing or planned Preserves must establish a minimum 50-foot-wide setback outward from the boundary of any existing Preserve or planned SSHCP Preserve. This minimum 50-foot-wide setback will function as a transition between Urban Development and the Preserve, and must be managed to maintain the natural community of vegetation present in the adjacent Preserve. As much of the setback as possible should remain in the same natural habitat as the Preserve.

However, as discussed in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA, where an existing or planned Preserve is adjacent to an existing roadway (e.g., collectors, arterials, thoroughfares), the 50-foot Preserve Setback will not be required, and any bicycle or pedestrian trail will be established in the road right-of-way. In addition, where a planned roadway crosses an existing or planned Preserve, no Preserve Setback will be required, and any bicycle or pedestrian trail will be established in the road right-of-way.

EDGE-3a (Setback Recreational Trails): Trails are best suited outside of the setback; however, certain types of recreational trails or facilities (e.g., benches, trash receptacles, shade structures, fencing) that can be constructed with minimum ground disturbance and in compliance with EDGE-7 may be allowed within a Preserve Setback, as specified in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA. Preserve Setback design must locate trails on the side nearest development, away from the Preserve boundary. Trails may be permeable or semi-permeable hiking trails or paved community trials. The maximum trail width will be 16 feet total, including 2-foot-wide shoulders. Post and cable fencing, split rail, or other open fencing will be installed adjacent to recreation trails to keep pedestrians on the trail.

EDGE-3b (Setback Firebreaks): If approved by the local authorities, the Preserve Setback trail may also be used as a firebreak. In instances where a trail cannot act as a firebreak, the firebreak will be located between the trail and the Preserve boundary (see Section 5.2.7). Firebreaks allowed inside the setbacks must be created by methods that will not disturb the soil's restrictive layer, such as mowing, minor scraping of surface vegetation, or shallow tilling, to comply with EDGE-7. Firebreak width within Preserve Setbacks is the minimum width needed to comply with applicable local codes.

EDGE-3c (Setback Shade Trees and Landscaping): To prevent potential impacts from irrigation water or from accumulation of leaf litter onto the grasslands or vernal pools of a Preserve, planting of shade trees or landscaping vegetation will be limited to the area of the Preserve Setback located between the recreation trail and the adjacent urban development (i.e., away from Preserves).

- Only drought-tolerant plant species will be planted. The planting pallet used for Preserve Setback landscaping will not include invasive plant species listed in the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory Database or listed in the Cal-IPC California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/). Any shade trees planted along Preserve Setback trails will be native species that are found in California grasslands and that can survive in the Vernal Pool–Grassland border without long-term irrigation or fertilization (e.g., valley oak, black oak, blue oak, oracle oak). In general, no more than 30% of any 1,000-foot-long segment of a Preserve Setback trail will have canopy cover from tree plantings (to be consistent with maximum tree densities naturally found within native California grasslands and savanna).

- Drip irrigation will be allowed for a maximum of 5 years to establish shade trees or landscape vegetation between the recreation trail and adjacent urban development. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation will not affect the Preserve. Any irrigation systems located within Preserve Setbacks will be inspected quarterly to determine if such systems are affecting soils or vegetation not part of the intended plantings. Irrigation system repairs will be completed immediately if it is determined that the irrigation system is affecting vegetation or soil moisture not part of the intended tree planting.
- If, during annual monitoring of the adjacent Preserve (see Chapter 8), adverse indirect effects (e.g., leaf litter accumulation, irrigation runoff, plant encroachment) of the Preserve Setback's planted vegetation are detected, then the SSHCP Implementing Entity, the Preserve Manager, and the entity responsible for the Preserve Setback will identify appropriate adaptive management of the Preserve Setback tree or landscape plantings in accordance with the Preserve Setback Easement (see Section 5.2.5 and Chapter 9).

EDGE-4 (Locate Stormwater Control Outside Preserves): Roads, sidewalks, and other impermeable surfaces of Urban Development Covered Activities adjacent to existing or planned Preserves will slope away from Preserves and Preserve Setbacks or intercept drainage with swales or curbs and gutters to preclude drainage from entering Preserves and Preserve Setbacks. Stormwater flows must be directed away from Preserves and Preserve Setbacks and directed into stormwater control facilities inside the development (outside Preserves and Preserve Setbacks)[18] (see EDGE-6 for exception to EDGE-4 in certain SSHCP Linkage Preserves).

EDGE-5 (Stormwater Control in Preserve Setbacks): If trails are established in any Preserve Setback in compliance with EDGE-3, the trail must be sloped away from the Preserve, and rainwater leaving the trail surface must flow into an adjacent low-velocity bio-retention swale or cell to keep rainwater runoff and trail contaminants from entering the Preserve. Low-velocity bio-retention swales or cells are typically small linear features placed on one or both sides of a trail. As required by EDGE-3, trails and their adjacent bio-retention swales or cells must be located on the side of the Preserve Setback nearest development.

[18] Detention basins are allowed in some Linkage Preserves consistent with the requirements of EDGE-6. At the time of SSHCP preparation, seven Linkage Preserves with drainages are planned SSHCP Preserves: L1, L2, L4, L7, L8, L9, and L10 (see Section 5.2.7 and Section 7.5). Also see project-specific measures in Section 5.5.1.

EDGE-6 (Detention Basins in Linkage Preserves): Because planned SSHCP Linkage Preserves L1, L2, L4, L7, L8, L9, and L10 (see Section 7.5) surround natural creeks or streams that must receive stormwater from planned adjacent Urban Development Covered Activities, a limited number of stormwater detention basins will be allowed on those Linkage Preserves. Detention basins within Linkage Preserves (see Section 5.2.7) will be designed and constructed with fill material to build up the perimeter of the detention basin so as not to impact the soil restrictive layer (duripan or hardpan) and function of the soil perched aquifer. Detention basins within Linkage Preserves will capture stormwater flows and runoff, and will discharge water to the stream/creek or percolate collected water to the soil perched aquifer. Detention basin structures that collect stormwater entering the basin or convey stormwater leaving the basin must be designed to avoid and minimize effects to Covered Species habitat in the Linkage Preserve.

EDGE-7 (Hardpan/Duripan Protection): To protect the soil perched aquifer and the micro-watersheds supporting existing vernal pool hydrology, activities that have the potential to cut into, disrupt, or remove the soil's restrictive layer (hardpan or duripan) will not occur within Preserves or Preserve Setbacks. However, in certain circumstances, the Covered Activities defined in Section 5.2.6, Covered Activities in Stream Setbacks in the UDA, and Section 5.2.8, Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System, may result in punctures[19] or other minor disruptions of the soil hardpan or duripan if approved by the Implementing Entity and the Technical Advisory Committee according to the process described in Chapter 9 of the SSHCP. If a Covered Activity on a Preserve or Preserve Setback results in a puncture or other disruption to the soil hardpan or duripan, the puncture will be sealed using bentonite clay or other material that maintains the functionality of the soil's restrictive layer and associated perched aquifer.

EDGE-8 (Outdoor Lighting): All outdoor lighting in Urban Development Covered Activity projects will be designed to minimize light pollution into existing and planned Preserves, except where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target SSHCP Covered Species (e.g., western spadefoot (*Spea*

[19] Punctures may include small holes that penetrate the soil hardpan or duripan such as might occur when digging or drilling holes for the installation of fence posts, sign posts, or trees.

hammondii), Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i)).

EDGE-9 (Livestock Access to Preserves): Urban Development Covered Activity projects that include on-site Preserves will include in their design an adequate number of access points and facilities for delivery and pick up of grazing animals (livestock), such that these activities will not significantly alter the Preserve's habitat and are consistent with the protection of livestock and protection of adjacent public property, and include adequate public safety measures.

EDGE-10 (Prevent Invasive Species Spread): Completed Covered Activities (including roads) will be maintained in a manner that avoids the spread of invasive species into Preserve and Open Space areas. Such maintenance measures will include the following:

- To prevent the transport of non-native invasive species onto Preserves, before bringing any equipment onto an SSHCP Preserve or Preserve Setback, equipment must be cleaned of mud, dirt, and plant material. Cleaning will occur in the infested area or another appropriate location as approved by a Plan Permittee.
- Mowing rotation will start in un-infested areas and move to infested areas.
- Invasive plant prevention techniques will be incorporated into maintenance plans.
- The SSHCP Implementing Entity will survey road shoulders, ditches, and rights-of-way that border SSHCP Preserves for invasive weeds or other exotic plant species. Where roadside weed infestations have reached a critical control point, the Implementing Entity or Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment.

Condition 3. Implement Construction Best Management Practices

AMMs associated with Condition 3 must be applied to all UDA Covered Activities.

BMP-1 (Construction Fencing): Orange construction fencing will be installed to ensure that ground disturbance does not extend beyond the allowed construction footprint (i.e., the limit of project construction plus equipment staging areas and access roads). Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will mark the outer boundary of any Preserve Setback or Stream Setback adjacent to or within the project site with orange construction fencing prior to ground disturbance. This fencing will remain in place until project completion, as identified by the Plan Permittee.

BMP-2 (Erosion Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will install temporary control measures for sediment, stormwater, and pollutant runoff as required by the Plan Permittee to protect water quality and species habitat. Silt fencing or other appropriate sediment control device(s) will be installed downslope of any Covered Activity that disturbs soils.

Fiber rolls and seed mixtures used for erosion control will be certified as free of viable noxious weed seed. As discussed in Section 5.4.2, Covered Species Take Avoidance and Minimization Measures, erosion controls installed in or adjacent to Plan Area modeled habitat for giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), California tiger salamander (*California tiger salamander*), or western spadefoot (see Chapter 3) must be of appropriate design and materials that will not entrap the species (e.g., not contain mesh netting). Regular monitoring and maintenance of the project's erosion control measures will be conducted until project completion to ensure effective operation of erosion control measures.

BMP-3 (Equipment Storage and Fueling): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will ensure that equipment storage and staging will occur in the development footprint only (not sited in any existing on-site Preserve, planned on-site Preserve, Preserve Setback, Stream Setback, or aquatic land cover type). Fuel storage and equipment fueling will occur away from waterways, stream channels, stream banks, and other environmentally sensitive areas within the development footprint.

However, certain equipment storage and fueling activities can be allowed on Preserves within habitat re-establishment/establishment sites (refer to Section 5.2.7) if no location outside of the site is available. If a Covered Activity results in a spill of fuel, hydraulic fluid, lubricants, or other petroleum products, the spill will be absorbed and waste disposed of in a manner to prevent pollutants from entering a waterway, Preserve, Preserve Setback, or Stream Setback.

BMP-4 (Erodible Materials): Plan Permittees and Third-Party Project Proponents implementing Covered Activities must not deposit erodible materials into waterways. Vegetation clippings, brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks. Erodible material must be disposed of such that it cannot enter a waterway, Preserve, Preserve Setback, Stream Setback, or aquatic land cover type. If water and sludge must be pumped from a subdrain or other structure, the material will be conveyed to a temporary settling basin to prevent sediment from entering a waterway.

BMP-5 (Dust Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will water active construction sites regularly, if warranted, to avoid or minimize impacts from construction dust on adjacent vegetation and wildlife habitats. No surface water will be used from aquatic land covers; water will be obtained from a municipal source or existing groundwater well.

BMP-6 (Construction Lighting): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas.

BMP-7 (Biological Monitor): If a Covered Activity includes ground disturbance within Covered Species modeled habitat, an approved biologist will be on site during the period of ground disturbance, and may need to be on site during other construction activities depending on the Covered Species affected. After ground-disturbing project activities are complete, the approved biologist will train an individual to act as the on-site construction monitor for the remainder of construction, with the concurrence of the Permitting Agencies. The on-site monitor will attend the training described in BMP-8. The approved biologist and the on-site monitor will have oversight over implementation of Avoidance and Minimization Measures, and will have the authority to stop activities if any of the requirements associated with those measures are not met. If the monitor requests that work be stopped, the Wildlife Agencies will be notified within one working day by email. The approved biologist and/or on-site monitor will record all observations of listed species on California Natural Diversity Database field sheets and submit them to the California Department of Fish and Wildlife. The approved biologist or on-site monitor will be the contact source for any employee or contractor who might inadvertently kill or injure a Covered Species or who finds a dead, injured or entrapped individual. The approved biologist and on-site monitor's names and telephone numbers will be provided to the Wildlife Agencies prior to the initiation of ground-disturbing activities. Refer to species-specific measures for details on requirements for biological monitors.

BMP-8 (Training of Construction Staff): A mandatory Worker Environmental Awareness Program will be conducted by an approved biologist for all construction workers, including contractors, prior to the commencement of construction activities. The training will include how to identify Covered Species that might enter the construction site, relevant life history information and habitats, SSHCP and

statutory requirements and the consequences of non-compliance, the boundaries of the construction area and permitted disturbance zones, litter control training (SPECIES-2), and appropriate protocols if a Covered Species is encountered. Supporting materials containing training information will be prepared and distributed by the approved biologist. When necessary, training and supporting materials will also be provided in Spanish. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all of the Avoidance and Minimization Measures. Written documentation of the training must be submitted to the Implementing Entity within 30 days of completion of the training, and the Implementing Entity will provide this information to the Wildlife Agencies.

BMP-9 (Soil Compaction): After construction is complete, all temporarily disturbed areas will be restored similar to pre-project conditions, including impacts relating to soil compaction, water infiltration capacity, and soil hydrologic characteristics.

BMP-10 (Revegetation): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will revegetate any cut-and-fill slopes with native or existing non-invasive, non-native plants (e.g., non-native grasses) suitable for the altered soil conditions and in compliance with EDGE-2 and EDGE-8, if applicable.

BMP-11 (Speed Limit): Project-related vehicles will observe the posted speed limits on paved roads and a 10-mile-per-hour speed limit on unpaved roads and during travel in project areas. Construction crews will be given weekly tailgate instruction to travel only on designated and marked existing, cross-country, and project-only roads.

Condition 4. Avoid and Minimize Impacts that May Result from Implementation of Covered Transportation Projects

Urban Development transportation project and Rural Transportation Project Covered Activities, including bridge projects, can affect Covered Species. AMMs included for Condition 4 seek to avoid or minimize direct and indirect impacts that may result from construction of roadways or roadway improvements. Condition 4 applies to all transportation-related Covered Activities (see Sections 5.2.1 and 5.2.3).

Plan Permittees and Third-Party Project Proponents implementing Urban Development transportation or Rural Transportation Project Covered Activities must comply with the roadway siting, design, and construction AMMs described below.

ROAD-1 (Road Project Location): Road projects will be located in the least environmentally sensitive area to avoid, to the maximum extent practicable, impacts on Covered Species, Covered Species habitat, and waters of the United States. Road project alignments will follow existing roads, road easements, and rights-of-way, or be sited in disturbed areas to minimize habitat loss and additional habitat fragmentation.

ROAD-2 (Wildlife Crossing Structures): Road projects that are Urban Development Covered Activities (see Section 5.2.1) (including the Capital Southeast Connector, see Section 5.2.1.1) or are Rural Transportation Covered Activities (see Section 5.2.3) will include an adequate number of wildlife crossing structures, as depicted in Figure 5-10. An adequate number of wildlife crossing structures within the Urban Development Area (UDA) and outside the UDA will provide for continued dispersal and movement of native wildlife throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Objectives (see Chapter 7).

The Plan defines "wildlife crossing structure" as a physical structure specifically designed or retrofitted to facilitate undercrossing for target wildlife species. The Plan further classifies wildlife crossings as hydrologic crossings and dry crossings. Hydrologic crossings are built where there is an existing stream, creek, or intermittent drainage to maintain existing hydrologic connectivity within the Plan Area. As described below, hydrologic crossings require specialized features to be built into the crossing structure, such as elevated platforms to allow wildlife to pass under a crossing structure when it is inundated with water. Dry wildlife crossings are built where there is no hydrologic feature but where a crossing is needed to provide for overland connectivity. SSHCP wildlife crossing structures may include structures such as bridges, arches, or box and pipe culverts.

Plan Permittees expect that future wildlife movement and dispersal within the UDA will occur almost entirely within the boundaries of the future interconnected SSHCP Preserve System (see Section 7.5). Therefore, wildlife crossings are needed wherever a roadway crosses (bisects) the conceptual SSHCP Preserve System (see Figure 5-10). Wildlife crossing structures inside the UDA will be sized to accommodate movement of a highly mobile native indicator species (i.e., coyote (*Canis latrans*)). By designing UDA wildlife crossing structures to meet the movement and dispersal requirements of coyote, the Plan Permittees anticipate that the crossing structure will also accommodate most native wildlife species that currently occupy the UDA (see Chapter 3).

The Plan Permittees expect that most of the Plan Area outside of the UDA will remain as Open Space over the 50-year Permit Term (see Chapter 4). Therefore,

the Plan Permittees expect that the Rural Transportation Project Covered Activities proposed outside the UDA will have a relatively small effect on the movement and dispersal of larger or more mobile native wildlife species, including coyote. Consequently, the Plan Permittees anticipate that the design of Rural Transportation Project Covered Activities outside the UDA will need to include wildlife crossing structures primarily where the Rural Transportation Project Covered Activities occur within California tiger salamander modeled habitat (see CTS-3 and also Chapter 3, Figure 3-16).

The design and location of wildlife crossing structures both inside the UDA and outside the UDA will be determined by collaboration between the Third-Party Project Proponent, the Land Use Authority, and the Implementing Entity. Crossing design will use the best available scientific and commercial information for the target species. The design of crossing structures will be based on demonstrated effectiveness of design for the target species when such information is available, or will be designed with a high level of certainty of success based on studies of similar taxa in similar environmental settings. The proposed wildlife crossing structures designs will be reviewed and approved by the Implementing Entity prior to final design.

The Implementing Entity will develop a Wildlife Crossing Maintenance Manual to be provided to the entity responsible for maintaining the wildlife crossing. The Wildlife Crossing Maintenance Manual will identify vegetation management, clearing of obstructions, and other techniques to maintain the desired movement and hydrologic connectivity, and to avoid effects to adjacent Preserves.

All SSHCP wildlife crossing structures in the UDA will include the following design elements:

- Open-bottom bridges or arches where the roadway crosses a river or stream. Where an open-bottom bridge or arch is used, the span of the crossing will be at least 1.2 times the bankfull width of the stream and span the banks to allow for dry wildlife passage along each side of the stream and to avoid or minimize piers or footings within the stream. (Bankfull width refers to the width of a stream channel at the point where over-bank flow begins during a flood event.)
- Any wildlife crossing structure that also maintains hydrologic connectivity will be designed to maintain pre-construction water capacity, depth, and velocity. The crossing structure will not restrict or impede normal flows or flood flows, unless a primary purpose of the structure is to manage such

flow(s). Wildlife crossing structures must be designed to provide a dry passage (e.g., a platform ledge) higher than flows for a 10-year storm event to allow wildlife to pass through an inundated crossing structure.

- Wildlife crossing structures in the UDA will be designed and sized to accommodate movement of at least medium-sized mammals (e.g., coyote). The opening must be at least 3 feet high and the crossing structure must have a minimum openness ratio of at least 0.4.
- Vegetation leading up to the entrance of a crossing structure and the substrate leading into and within the crossing structure will be natural and appropriate to provide for continuity of habitat, attract the target animal species for which the crossing is designed, and facilitate use of the crossing structure.
- A wildlife crossing under six-lane roads or larger will be designed to provide ambient light and temperature in the longer crossing structures (e.g., either by providing a larger opening or a grate at the top of the structure to improve the attractiveness of the crossing to certain Covered Species and wildlife that may hesitate to cross through dark, confined structures or one with a temperature gradient (Jackson and Griffin 2000)). If a road is less than six lanes in width, these designs will be optional.
- Lighting will not be placed at or near the entrance of a wildlife crossing structure to maintain natural ambient light conditions at night and to increase chances of wildlife use. However, a Land Use Authority Permittees may allow lighting if necessary for human health or safety.

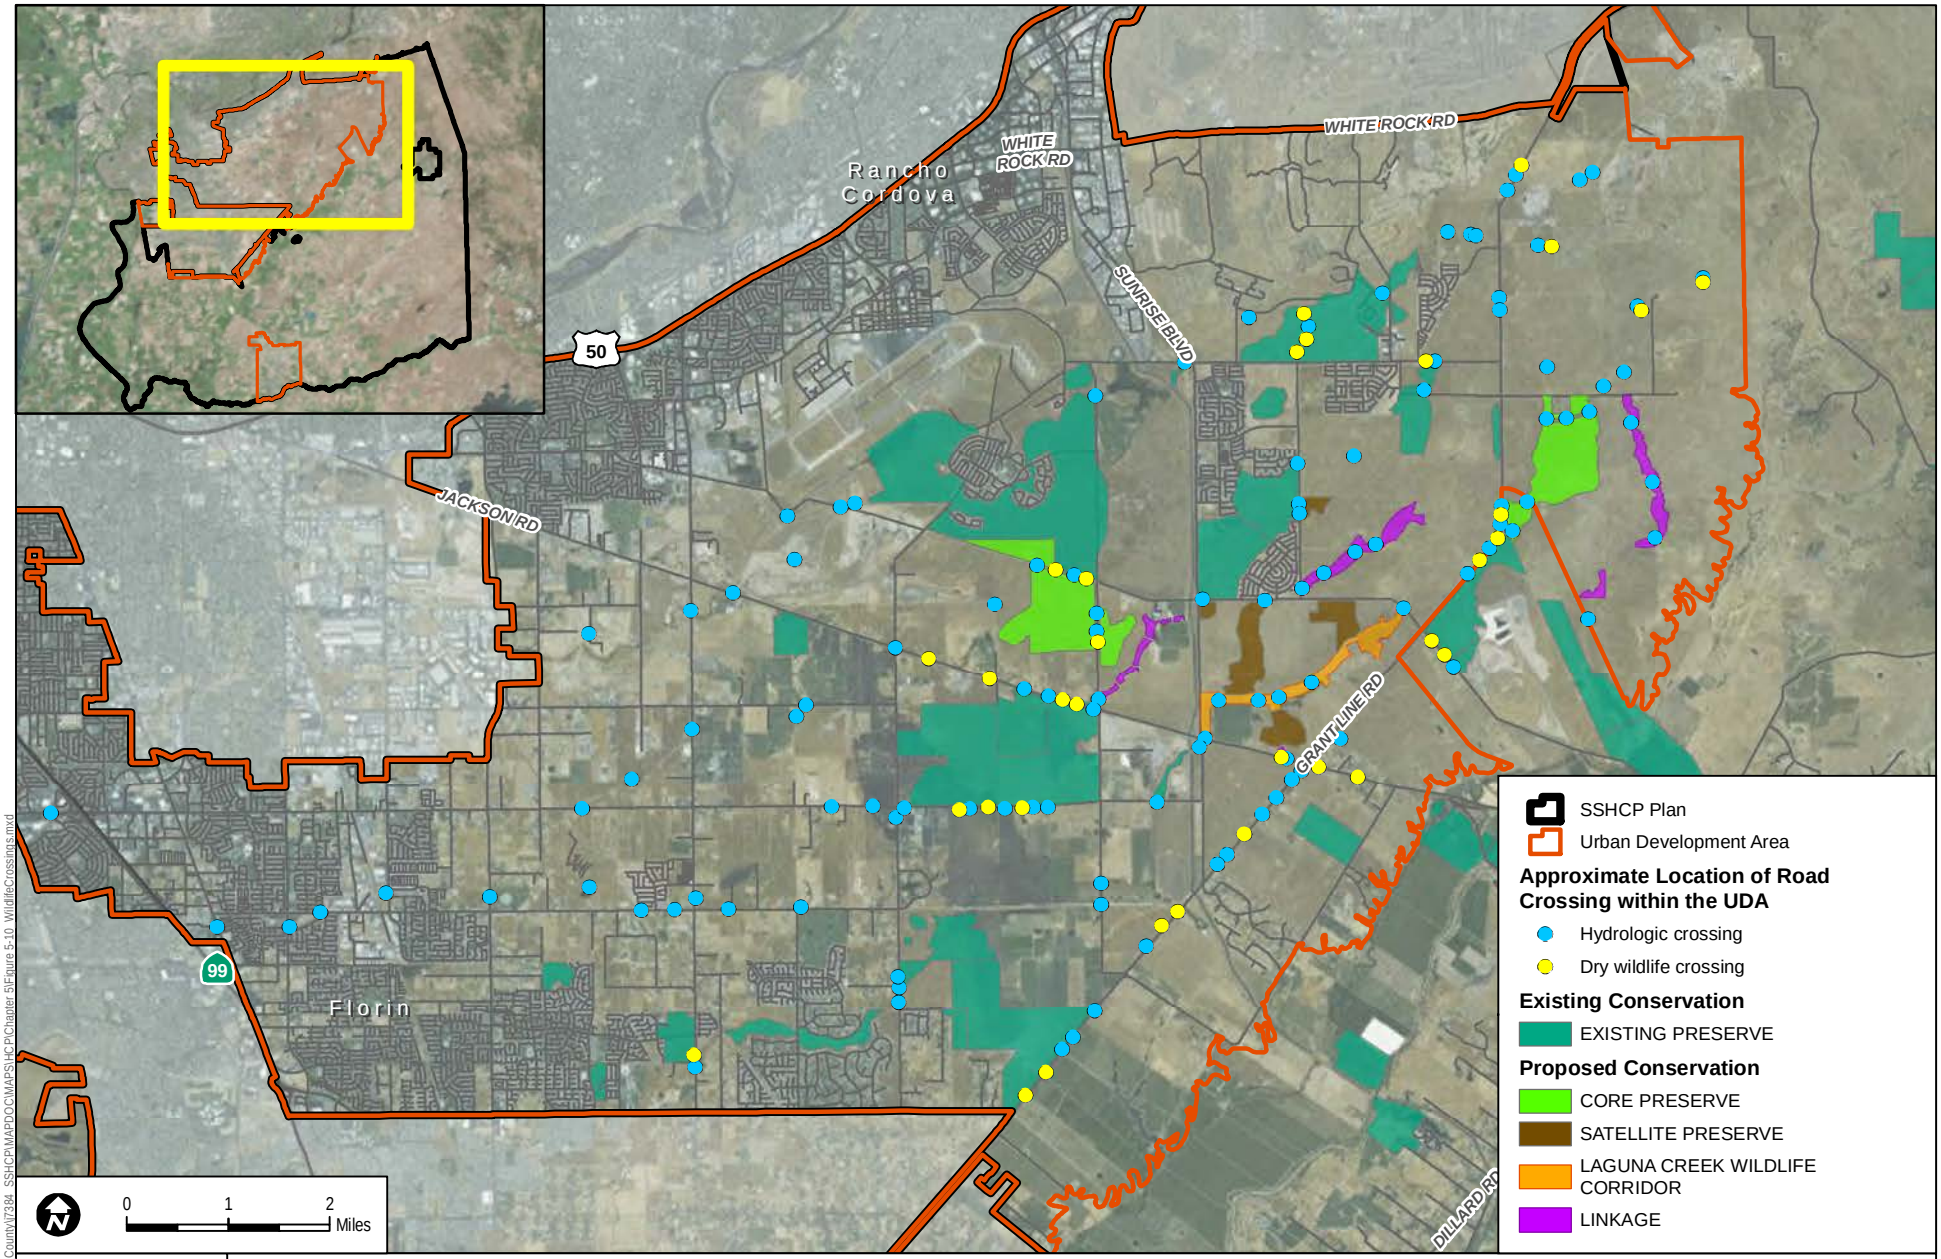
Outside the UDA, wildlife crossing structures may be required for California tiger salamander (refer to CTS-1), and could also be required for other native species.

ROAD-3 (Roadside Pesticide Use[20]): If pesticide use is necessary along roadsides, the appropriate SSHCP Permittee will ensure that the pesticide application strictly complies with the pesticide label and all other applicable federal, state, and local authorities pertaining to the use, safety, storage, disposal, and reporting of the pesticide. Where roadside weed infestations have reached a critical control point, the Implementing Entity or a Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment. In addition, the Implementing Entity or appropriate Land Use Authority Permittee will post signs along road shoulders adjacent to sensitive areas that are within the SSHCP

[20] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and conforms to all conditions in Section 5.4.

Preserve System (e.g., California tiger salamander breeding ponds, endemic plant populations, vertebrates that rely on insects for part of their diet). The signs will identify pesticide use restrictions or other roadside maintenance restrictions.

Condition 5. Avoid and Minimize Impacts that Result from Public Use of Low-Impact Nature Trails in Preserves



Preserves within the UDA are likely to be surrounded by urban development. As discussed in Section 5.2.7, allowing limited use of SSHCP Preserves will help to foster a sense of community ownership and will provide an opportunity to educate the community about the natural resources to be protected within the SSHCP Preserve System.

Low-impact nature trails will be designed following the AMMs outlined below.

NATURE TRAIL-1 (Nature Trail Plan): A nature trail plan must be prepared for each Preserve where a trail is allowed by the Preserve Management Plan. Nature trails will be unpaved trails that vary in width depending on terrain and existing constraints, but will never exceed 4 feet in width. Where a trail crosses a swale, wooden walkways elevated to a height no greater than 2 feet will be installed. Trail improvements may include mowing vegetation to create or maintain a trail, minor grading to remove trip hazards, and signs providing directional and educational information. Public access to land acquired for preservation will be prohibited until a trail plan can be prepared by the Implementing Entity and approved by the Permitting Agencies. A trail plan will include the following:

- Maps identifying areas that contain sensitive habitats or species occurrences.
- Maps that show the location and footprint of proposed trails.
- Methods used to control public access.
- Trail and use monitoring methods, schedules, and responsibilities.
- Trail operation and maintenance guidelines and responsibilities.
- Clear triggers for use restrictions or closure based on sensitive biological indicators (e.g., seasonal closures of some trails on the basis of activity periods of Covered Species or sensitive species).

NATURE TRAIL-2 (Nature Trail Protection of Duripan): Nature trails will be sited and constructed so as not to interfere with existing soil duripan and the perched aquifer that support the existing hydrologic regime of the Vernal Pool–Grassland, and will not interfere with existing pool hydrology. Trails within Preserves will not be paved.

SOURCE: ESRI, County of Sacramento 2014, USFWS 2015

FIGURE 5-10

Wildlife Crossings

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

INTENTIONALLY LEFT BLANK

NATURE TRAIL-3 (Nature Trail Location): Nature trails will be located away from sensitive natural resources (e.g., vernal pools, riparian habitat, woodland habitat, Covered Species occurrences, raptor nesting sites, tricolored blackbird (*Agelaius tricolor*) colony sites). The Wildlife Agencies will determine the distance necessary to avoid impacts to sensitive natural resources.

NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design): Biological studies will be conducted within the area being considered for nature trail construction prior to project design. The studies will include land cover type mapping and focused species surveys and/or wetland delineations. The biological studies will include assessments of potential effects of trail construction on Preserve System resources, and recommendations for avoidance and minimization that may be incorporated into project siting, design, construction, and operation.

NATURE TRAIL-5 (Monitoring of Nature Trail Impacts): Impacts that could result from use of a nature trail within a Preserve will be monitored according to the Preserve Management Plan (Chapter 8) to ensure that uses do not conflict with the individual Preserve Management Plan. If use of a trail is found to conflict with the individual Preserve Management Plan, use of that trail will be discontinued until adjustments in the use can be made to reduce or eliminate conflicts. The Implementing Entity will make decisions about discontinuing or modifying use of a trail in consultation with the Preserve Manager or other applicable Preserve management agency or organization.

Condition 6. Avoid and Minimize Impacts When Re-Establishing or Establishing Wetlands

As discussed in Chapter 7, the Plan Permittees anticipate that 389 acres of Vernal Pool habitat will be re-established or established[21] within the Plan Area as part of the SSHCP Conservation Strategy. Although re-establishment or establishment of vernal pools is a Measurable Objective under this Plan, if not done correctly, the action could have an adverse impact on existing vernal pools.

RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool): Re-establish or establish Vernal Pool Wetland according to the following guidelines:

- Re-establishment will always take priority over establishment of vernal pools. Establishment will be permitted only after it has been determined that sites with the potential to re-establish vernal pools no longer exist in the Plan Area or cannot be acquired through a willing seller/buyer agreement.

[21] In the context of this Plan, "establish" is synonymous with "create."

- When possible, re-established or established sites will be located adjacent to an existing Preserve(s) to maximize connectivity and Preserve area.
- Re-establishment or establishment will not result in direct or indirect adverse impacts to the hydrologic regime of existing vernal pools. Vernal pool re-establishment or establishment actions will not remove more than 10% of any existing vernal pool watershed, as defined by the SSHCP LIDAR analysis (see Section 3.3 and Conservation Action VPI1.2 in Table 7.1).
- Vernal pool re-establishment will attempt to restore the historical density and range of vernal pool sizes to the maximum extent feasible using historical aerial photography of the site, if available. Where aerial photography of the site's historical conditions is not available, vernal pool re-establishment will include a range of pool sizes (area and depth) to accommodate the different habitat needs and life history characteristics of the vernal pool invertebrate Covered Species.
- Established vernal pools must be located on sites with vernal pool soils, defined as any Plan Area soil type where vernal pools currently exist.
- Established vernal pool sites will include a range of pool sizes to accommodate the different habitat needs and life history characteristics of the three vernal pool invertebrate Covered Species.
- The total density of vernal pools will not exceed 10% of the suitable soil areas in any vernal pool re-establishment and/or establishment site, unless it can be shown that the suitable areas of that site historically supported greater densities.
- Re-establishment or establishment may include inoculation when it is likely that no seed or cyst bank of vernal pool species remains at a site. Vernal Pool inocula will come from nearby vernal pools that are on the same geologic formation and soil type.

RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank): Vernal pool re-establishment or establishment may include "soil inoculation" when it is likely that no seed or cyst bank of vernal pool species remains at a re-establishment or establishment site.

- During conversion of Urban Development Area vernal pools to a developed land cover type, project proponents will excavate and retain soil from vernal pools following protocols developed by the SSHCP Technical Advisory Committee (Chapter 9).

- Inocula applied in re-established or established vernal pools must be harvested from a vernal pool that is on the same geologic formation and soil type shown on the County General Soil Map as the re-establishment/establishment site. Geologic formations and soil types will follow U.S. Department of Agriculture Soil Conservation Service's 1993 Soil Survey of Sacramento County, California. Proposed off-site inocula sources must be approved by the Wildlife Agencies.

RE-ESTABLISHMENT/ESTABLISHMENT-3 (Re-Establishment/Establishment of Freshwater Marsh or Open Water Near Airports): During review of proposed re-establishment/establishment projects for freshwater marsh or open water on SSHCP Preserves, the Implementing Entity shall consider the potential for the location of the re-establishment/establishment projects to increase the risk of wildlife strikes or generation of ground fog at airports. If a re-establishment/establishment project would result in (1) a net increase in open water or freshwater marsh acreage over baseline conditions[22] within 5 miles of Mather Field, Sacramento Executive Airport, or Franklin Field; or (2) replacement of open water/freshwater marsh habitat that is located 2 or more miles from Mather Field or Sacramento Executive Airport with open water/freshwater marsh habitat that is located less than 2 miles from those airports, a qualified biologist shall prepare a concise letter report. The letter report shall summarize the biologist's findings regarding (1) the species likely to use the re-established/established habitat, (2) a rough order of magnitude estimate on the peak number of birds that might use the re-established/established habitat, and (3) potential movement patterns for birds using the re-established/established habitat and whether they might cross through the airport safety zones (e.g., to reach foraging habitat or another wildlife attractant). The letter report will also provide recommendations to the Implementing Entity on how they could reduce any of the identified wildlife hazards if there are any feasible means to do so that would not conflict with the biological goals and measurable objectives of the Conservation Plan.

Condition 7. Avoid and Minimize Impacts to Streams and Creeks

AMMs associated with Condition 7 must be applied to all Covered Activities where a stream or creek is located within a project footprint.

[22] For purposes of establishing baseline conditions, Freshwater Marsh and Open Water acreages will be calculated using that version of the SSHCP Land Cover Type Map in existence as of the date that the SSHCP permit was issued to the Plan Permittees by the USFWS.

STREAM-1 (Laguna Creek Wildlife Corridor): A 150-foot setback measured from the top of the bank on both sides of the stream will be applied to Laguna Creek within the Urban Development Area (minimum 300-foot corridor width). If trails are located within the Laguna Creek Wildlife Corridor, the nearest edge of the trail will be located at least 80 feet from the top of the bank.

STREAM-2 (UDA Stream Setbacks): A 100-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all streams listed in Table 5-1 (see also Figure 2-4). If a stream reach supports woody riparian vegetation, the setback will be equal to the riparian edge plus 25 feet or will be the setback defined above, whichever is greater. If trails are located within the Stream Setback, the nearest edge of the trail will be located at least 50 feet from the top of the bank.

Table 5-1
Stream Setback Minimum Requirements in the Urban Development Area

Stream	Minimum Setback (from the Top of Bank Measured in Aerial Perspective) on Both Sides of the Stream
Elder Creek	100 feet
Frye Creek	100 feet or as depicted as part of the NewBridge development project hardline Preserve (see Appendix K)
Gerber Creek	100 feet
Morrison Creek	100 feet
Central Paseo	100 feet or as depicted as part of the Cordova Hills development project hardline Preserve (Appendix K)
Sun Creek	100 feet or as depicted as part of the Sun Creek development project hardline Preserve (see Appendix K)

STREAM-3 (Minor Tributaries to UDA Streams): A 25-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all avoided first and second order tributaries to the streams listed in Table 5-1 and Laguna Creek. Refer to Objective W6 in Chapter 7 (Table 7-1) regarding avoided first and second order tributaries. Trails are not permitted within headwater ephemeral Stream Setbacks.

STREAM-4 (Minimize Effects from Temporary Channel Re-Routing): When an Urban Development Covered Activity temporarily re-routes a stream, creek, or drainage, the re-routing will be completed in a manner that minimizes impacts to beneficial uses and habitat. The following measures will be employed to minimize disturbances that will adversely impact water quality:

- No equipment will be operated in areas of flowing or standing water.
- Construction materials and heavy equipment must be stored outside of the active flow of any waters.

- When work within waters is necessary, the entire stream flow will be diverted around the work area.
- In the event of rain, the disturbed in-water work area will be temporarily stabilized before water body flow exceeds the capacity of the diversion structure. The disturbed water body will be stabilized so that the disturbed areas will not come in contact with the flow.
- Once construction is complete, all project-introduced material (e.g., pipes, gravel, cofferdam, sandbags) must be removed, leaving the water as it was before construction. Excess materials will be disposed of at an appropriate disposal site.
- All work areas will be effectively isolated from stream flows using suitable control measures before commencement of any in-water work. The diverted stream flow will not be contaminated by construction activities. Structures for isolating the in-water work area and/or diverting the stream flow (e.g., cofferdam, geo-textile silt curtain) will not be removed until all disturbed areas are cleaned and stabilized.
- Any flow diversion used during construction will be designed in a manner to prevent pollution and minimize siltation, and will provide flows to downstream reaches. Flows will be maintained to support existing aquatic life, riparian wetlands, and habitat that may be located upstream and downstream from any temporary diversion.
- All surface waters, including ponded waters, will be diverted away from areas undergoing grading, construction, excavation, vegetation removal, and/or any other activity that may result in a discharge to waters.
- All temporary dewatering methods will be designed to have the minimum necessary impacts to waters to isolate the immediate work area. All dewatering methods will be installed such that natural flow is maintained upstream and downstream of the diversion area. Any temporary dams and diversions will be installed such that the diversion does not cause sedimentation, siltation, or erosion upstream or downstream of the diversion area. All dewatering methods will be removed immediately upon completion of diversion activities.
- A method of containment must be used below any bridge, boardwalk, and/or temporary crossing to prevent debris from falling into the waters through the entire duration of a project.

- If temporary surface water diversions and/or dewatering are anticipated, the Third-Party Project Proponent will develop and maintain on site a surface water diversion and/or dewatering plan. The plan(s) must be developed prior to initiation of any water diversions and will include the proposed method and duration of diversion activities. The plan(s) must be made available to Central Valley Water Board staff upon request.
- When work in a flowing stream is unavoidable and any dam or other artificial obstruction is being constructed, maintained, or placed in operation, sufficient water will be allowed at all times to pass downstream to maintain beneficial uses of waters below the dam. Construction, dewatering, and removal of temporary cofferdams will not violate the turbidity, settle-able matter, pH, temperature, or dissolved oxygen requirements of any Water Quality Control Plan.
- Any temporary dam or other artificial obstruction will only be built from clean materials such as sandbags, gravel bags, water dams, or clean/washed gravel that will cause little or no siltation. Stream flow will be temporarily diverted using gravity flow through temporary culverts or pipes, or pumped around the work site with the use of hoses.

STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening): When an Urban Development Covered Activity alters a stream, creek, or drainage by re-routing, widening, or deepening a channel, the project design will include the following:

- The main channel of a re-routed channel will be free to migrate laterally over its active and terrace floodplain.
- Channel geometry (plan, profile, and cross-section) of the site will be appropriate for the watershed location and physical/hydrologic condition.
- Local, native materials will be used as fill material to the extent practicable.
- Bioengineering techniques will be used for construction and maintenance of bank stabilization. Bioengineered bank stabilization structures will use vegetation in combination with bank reshaping; biodegradeable geotextile materials; and, in some cases, a minimal amount of rock or wood to the extent practicable to dissipate erosive energy. Third-Party Project Proponents will consult a professional engineer when considering using bioengineering techniques.
- All re-routed, widened, or deepened streams are required to establish Stream Setbacks with minimum widths required under STREAM-1, STREAM-2, or STREAM-3. All re-routed, widened, or deepened streams must re-establish/

establish and maintain native Woody Riparian land cover and/or native Grassland Riparian land cover in the entire Stream Setback.

Condition 8. Avoid and Minimize Impacts to Covered Species from Utility and Utility Maintenance Covered Activities

AMMs associated with Condition 8 must be applied to all Covered Activities associated with construction and maintenance of infrastructure projects.

UTILITY-1 (Avian Collision Avoidance): Installation of new, or relocation of existing, utility poles, lines, and cell towers located within the Preserve System or within 1,000 feet of a Preserve boundary will be coordinated with the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife. The applicant or relevant utility/service provider will install utility poles, lines, and cell towers in conformance with Avian Powerline Interaction Committee (APLIC) standards for collision-reducing techniques, as outlined in Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012), or any superseding document issued by the APLIC.

UTILITY-2 (Utility Maintenance on Preserves): Utility maintenance inside SSHCP Preserves and SSHCP Preserve Setbacks containing vernal pools will occur only when vernal pools have been dry for 30 days, except in emergency situations related to human health and safety.

UTILITY-3 (Trenchless Construction Methods): Where a pipeline or conduit crosses an existing or planned Preserve or will be located between adjacent Preserves (e.g., under a roadway that has a Preserve on both sides), trenchless construction methods will be used to minimize impacts to the existing soil profile (including impacts to a hardpan or duripan) to maintain the perched aquifer in Vernal Pool Grassland land cover type.

UTILITY-4 (Siting of Entry and Exit Location): The entry and exit locations for the trenchless construction method (see Utility-3) will be sited to avoid impacts to vernal pools and Riparian Woodland, and to avoid direct take of SSHCP Covered Species.

Condition 9. Avoid and Minimize Impacts That Might Result From Removing or Breaching Levees to Establish or Re-establish Riparian Habitat

LEVEE-1 (Preparation of Hydrologic Analysis): Prior to approving a draft Preserve Management Plan that includes (1) modifying or breaching an existing levee, or (2) would place a potential impedance to high-water event flood-flows on the water side of an existing levee (including new riparian vegetation plantings or

other new Preserve facilities), a hydrologic analysis will be conducted. The Preserve activity will only be implemented if the hydrologic analysis concludes that the activity will not result in a substantial increase in flood stage elevations or flood risk on lands outside the Preserve.

Condition 10. Avoid and Minimize Impacts That Might Result From Potential Residual Contamination of Preserves and Related Exposure of People to Such Hazardous Materials

HAZARDOUS MATERIALS-1 (Preparation of Phase I Environmental Site Assessment): Prior to the acquisition of a preserve site or implementation of a stream or riparian restoration project, a Phase I Environmental Site Assessment shall be conducted in general accordance with the American Society for Testing and Materials Standard Practice E1527-05. The purpose of this Environmental Site Assessment is to identify, to the extent feasible pursuant to the American Society for Testing and Materials Standard, recognized environmental conditions in connection with the potential site. The term "recognized environmental condition" means the presence or likely presence of hazardous substances or petroleum products on the property under conditions that may indicate an existing release, a past release, or a material threat of release of these substances to the property. If the Phase 1 Environmental Site Assessment indicates the presence of a recognized environmental condition, the Implementing Entity shall consider the following options.

- Determine that the acquisition/project can proceed on the basis that the Habitat Plan goals and objectives can be met on the site even with the presence of a recognized environmental condition.
- Conduct a Phase II Environmental Site Assessment, including soil and groundwater testing, to further study the potential for contamination to limit the Implementing Entity's management activities.
- If the results of the Phase I (or Phase II) Environmental Site Assessment indicate that the Habitat Plan goals and objectives cannot be met on the site, the Implementing Entity should not acquire the site.

HAZARDOUS MATERIALS-2 (Contingency Plan): As part of each Preserve Management Plan or site restoration plan, a Contingency Plan shall be prepared to address the actions that would be taken during construction in the event that unexpected contaminated soil or groundwater is discovered. The Contingency Plan shall include health and safety considerations, handling and disposal of wastes, reporting requirements, and emergency procedures. The Contingency Plan shall include a requirement that if evidence of contaminated materials is encountered

during construction, construction would cease immediately and applicable requirements of the Comprehensive Environmental Release Compensation and Liability Act and the California Code of Regulations Title 22 regarding the disposal of waste would be implemented.

5.4.2 Covered Species Take Avoidance and Minimization Measures

The following section describes measures to avoid or minimize effects of Covered Activities on specific SSHCP Covered Species. Species-specific AMMs include species surveys, pre-construction surveys, and construction monitoring. Most species-specific AMMs require that species surveys be conducted if Covered Species modeled habitat is within the proposed Covered Activity footprint or within a specified distance of the proposed Covered Activity. Section 3.4 provides maps and descriptions of modeled habitat for each Covered Species. The AMMs described below apply to Covered Activities when Covered Species modeled habitat or a Covered Species occurrence are at a project site. The Implementing Entity and Wildlife Agencies may update specific SSHCP AMMs over the Permit Term to provide the best and most appropriate protective measures for a Covered Species.

General Covered Species Take Avoidance and Minimization Measures

The following AMMs will apply to all Covered Activities that are required to implement Covered Species take AMMs.

SPECIES-1 (Litter Removal Program): A litter control program will be instituted for the entire project site. All workers will ensure that their food scraps, paper wrappers, food containers, cans, bottles, and other trash are deposited in covered or closed trash containers. All garbage will be removed from the project site at the end of each work day, and construction personnel will not feed or otherwise attract wildlife to the area where construction activities are taking place.

SPECIES-2 (No Pets in Construction Areas): To avoid harm and harassment of native species, workers and visitors will not bring pets onto a project site.

SPECIES-3 (Take Report): If accidental injury or death of any Covered Species occurs, workers will immediately inform the approved biologist or on-site monitor and site supervisor. The approved biologist or on-site monitor will phone the appropriate contact person at the Implementing Entity. The Implementing Entity will immediately contact the Wildlife Agencies by telephone. A memorandum will be provided to the Implementing Entity and Wildlife Agencies within 1 working day of the incident. The report will provide the date and location of the incident, number of individuals taken,

the circumstances resulting in the take, and any corrective measures taken to prevent additional take.

SPECIES-4 (Post-Construction Compliance Report): A post-construction compliance report will be submitted to the SSHCP Implementing Entity within 30 calendar days of completion of construction activities or within 30 calendar days of any break in construction activity that lasts more than 30 days. The report will detail the construction start and completion dates, any information about meeting or failing to meet species take Avoidance and Minimization Measures (AMM), effectiveness of each AMM that was applied at the project site, and any known project effects to Covered Species.

Rare Plants

PLANT-1 (Rare Plant Surveys): If a Covered Activity project site contains modeled habitat for Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii)*, Bogg's Lake hedge-hyssop (*Gratiola heterosepala)*, dwarf downingia (*Downingia pusilla),* Legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii),* or Sanford's arrowhead (*Sagittaria sanfordii*), the Covered Activity project site will be surveyed for the rare plant by an approved biologist and following the California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or the most recent CDFW rare plant survey protocols. An approved biologist will conduct the field surveys and will identify and map plant species occurrences according to the protocols. See Chapter 10 for the process to submit survey information to the Plan Permittee and the Permitting Agencies.

PLANT-2 (Rare Plant Protection): If a rare plant listed in AMM PLANT-1 is detected within an area proposed to be disturbed by a Covered Activity or is detected within 250 feet of the area proposed to be disturbed by a Covered Activity, the Implementing Entity will assure one unprotected occurrence of the species is protected within a SSHCP Preserve before any ground disturbance occurs a the project site.

Sacramento and Slender Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is a federally and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Slender Orcutt grass (*Orcuttia tenuis*) is a federally threatened and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Both Orcutt grasses are very rare, and the likelihood of finding new occurrences within the Plan Area is low. Due to their rarity, take of either of these species is not permitted under the SSHCP, with the exception of take related to Preserve management and monitoring (see Section 5.2.7, SSHCP Preserve System Covered Activities).

ORCUTT-1 (Orcutt Grass Surveys): If a Covered Activity project site is located within 1 mile of the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for Sacramento and slender Orcutt grass by an approved biologist following California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or most recent CDFW guidelines to determine if Sacramento and/or slender Orcutt grass is present. An approved biologist will conduct the field investigation to identify and map occurrences. See Chapter 10 for the process to conduct and submit survey information.

ORCUTT-2 (Orcutt Grass Protection): Where known or new Sacramento or slender Orcutt grass occurrences are found, they will be protected within an SSHCP Preserve that is at least 50 acres. The occurrence will be located interior to the Preserve at a distance of no less than 300 feet from the edge of the Preserve boundary. If a Third-Party Project Proponent encounters a previously undiscovered occurrence of Sacramento or slender Orcutt grass on a Covered Activity project site, the Third-Party Project Proponent will contact the Implementing Entity or Land Use Authority Permittee with authority over the project, who will coordinate with the Wildlife Agencies for written concurrence of avoidance to ensure that the project does not cause take of the species.

California Tiger Salamander

To avoid direct and indirect effects of Covered Activities on California tiger salamander (*Ambystoma californiense*), the following AMMs will be implemented.

CTS-1 (California Tiger Salamander Daily Construction Schedule): Ground-disturbing Covered Activities within California tiger salamander modeled habitat (Figure 3-16) will occur outside the breeding and dispersal season (occur after July 31 and before October 15), to the maximum extent practicable. If Covered Activities must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), construction activities will not start until 30 minutes after sunrise and must be complete 30 minutes prior to sunset.

CTS-2 (California Tiger Salamander Exclusion Fencing): If a Covered Activity must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), exclusion fencing will be installed around the project footprint before October 15. Temporary high-visibility construction fencing will be installed along the edge of work areas, and exclusion fencing will be installed immediately outside of the temporary high-visibility construction fencing to exclude California tiger salamanders from entering the construction area or becoming entangled in the construction fencing. Exclusion fencing will be at least 1 foot tall and be buried

at least 6 inches below the ground to prevent salamanders from going under the fencing. Fencing will remain in place until all construction activities within the construction area are complete. No project activities will occur outside the delineated project footprint. An approved biologist must inspect the exclusion fencing and project site every morning before 7:00 a.m. for integrity and for any entrapped California tiger salamanders. If a California tiger salamander is encountered, refer to CTS-5, below. (However, the Implementing Entity may, with approval of the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), determine that it is appropriate for a Covered Activity project to not implement CTS-2 for certain long and linear roadway Covered Activity projects if it appears that the exclusion fencing will likely trap individuals or cause more take of California tiger salamander than it would prevent.)

CTS-3 (California Tiger Salamander Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-16), an approved biologist experienced with California tiger salamander identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site for California tiger salamander every morning before 7:00 a.m., or prior to construction activities. As required by BMP-8 (Training of Construction Staff), the approved biologist will also train construction personnel on the required California tiger salamander avoidance procedures, exclusion fencing, and correct protocols in the event that a California tiger salamander enters an active construction zone. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-4 (Avoid California Tiger Salamander Entrapment): If Covered Activities must be implemented in modeled habitat, all excavated steep-walled holes or trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes or trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within California tiger salamander modeled habitat will be inspected for California tiger salamanders by the approved biologist prior to being moved. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-5 (California Tiger Salamander Encounter Protocol): If a California tiger salamander is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately (California Department of Fish and Wildlife (CDFW)

and U.S. Fish and Wildlife Service (USFWS)). Construction activities will be suspended in a 100-foot radius of the animal until the animal is relocated by an approved biologist with appropriate handling permits from the Wildlife Agencies. Prior to relocation, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the salamander, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to USFWS and CDFW immediately. Any worker who inadvertently injures or kills a California tiger salamander or who finds dead, injured, or entrapped California tiger salamander(s) must immediately report the incident to the approved biologist.

CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat): If erosion control (BMP-2) is implemented within California tiger salamander modeled habitat (Figure 3-16), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that salamanders are not trapped (no monofilament). Coconut coir matting and fiber rolls with burlap are examples of acceptable erosion control materials. This limitation will be communicated to the contractor through use of special provisions included in the bid solicitation package.

CTS-7 (Rodent Control): CTS-7 only applies to projects that are within California tiger salamander modeled habitat (Figure 3-16) and on Covered Activities. Rodent control will be allowed only in developed portions of a Covered Activity project site. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Western Spadefoot

To avoid direct and indirect effects of Covered Activities on western spadefoot (*Spea hammondii*), the following AMMs will be implemented.

WS-1 (Western Spadefoot Work Window): Ground-disturbing Covered Activities within western spadefoot modeled habitat (Figure 3-17) will occur outside the breeding and dispersal season (after May 15 and before October 15), to the maximum extent practicable.

WS-2 (Western Spadefoot Exclusion Fencing): If Covered Activities must be implemented in modeled habitat (Figure 3-17) after October 15 and before May 15, exclusion fencing

will be installed around the project footprint before October 15, and the project site must be monitored by an approved biologist following rain events. Temporary high-visibility construction fencing will be installed along the edge of work areas, and silt fencing will be installed immediately behind the temporary high-visibility construction fencing to exclude western spadefoot from entering the construction area. Fencing will remain in place until all construction activities within the construction area are completed. No project activities will occur outside the delineated project footprint. If a western spadefoot is encountered, refer to WS-6, below.

WS-3 (Western Spadefoot Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-17) in the breeding and dispersal season (after October 15 and before May 15), an approved biologist experienced with western spadefoot identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site daily for western spadefoot prior to construction activities. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western spadefoot enters an active construction zone (i.e., outside the buffer zone). If a western spadefoot is encountered, refer to WS-6, below.

WS-4 (Avoid Western Spadefoot Entrapment): If a Covered Activity occurs in western spadefoot modeled habitat (Figure 3-17), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western spadefoot modeled habitat will be inspected for western spadefoot by the approved biologist prior to being moved. If a western spadefoot is encountered, refer to WS-6, below.

WS-5 (Erosion Control Materials in Western Spadefoot Habitat): If erosion control (BMP-2) is implemented within western spadefoot modeled habitat (Figure 3-17), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that western spadefoots are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WS-6 (Western Spadefoot Encounter Protocol): If Covered Activities must be implemented in modeled habitat (Figure 3-17) during the breeding and dispersal season (after October 15 and before May 15), and a western spadefoot is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the western spadefoot within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife immediately. Any worker who inadvertently injures or kills a western spadefoot or who finds dead, injured, or entrapped western spadefoot(s) must immediately report the incident to the approved biologist.

Giant Gartersnake

To avoid direct and indirect effects of Covered Activities on giant gartersnake (*Thamnophis gigas*), the following AMMs will be implemented.

GGS-1 (Giant Gartersnake Surveys): If the SSHCP giant gartersnake modeled habitat maps (Figure 3-18) show that modeled habitat for giant gartersnake is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate giant gartersnake aquatic habitat within the project footprint and adjacent areas within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-18, giant gartersnake aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, agricultural ditches, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide these maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated giant gartersnake habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as giant gartersnake habitat is identified and fully avoided. Otherwise, Covered Activities must comply with GGS-2 through GGS-8, below. See Chapter 10 for the process to conduct and submit survey information.

GGS-2 (Giant Gartersnake Work Window): Covered Activities that do not fully avoid giant gartersnake modeled habitat (Figure 3-18) will be conducted during the snake's active

season. Construction and ground-disturbing activities will be initiated after May 1 and will end prior to September 15. If it appears that construction activities may go beyond September 15, the Third-Party Project Proponent or Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1. The Local Land Use Permittee and the Implementing Entity will discuss with the Wildlife Agencies additional measures necessary to minimize take.

GGS-3 (Giant Gartersnake Monitoring): If a Covered Activity is occurring in giant gartersnake modeled habitat (Figure 3-18), an approved biologist experienced with giant gartersnake identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for giant gartersnake prior to construction activities. If a giant gartersnake is encountered, refer to GGS-7. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a giant gartersnake enters an active construction zone (i.e., outside the buffer zone).

GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion): If construction activities will occur in giant gartersnake aquatic habitat, aquatic habitat will be dewatered and then remain dry and absent of aquatic prey (e.g., fish and tadpoles) for 15 days prior to initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to giant gartersnake. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent snakes from attempting to move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify the construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Giant gartersnake habitat outside construction fencing will be avoided by all construction personnel. The fencing and the work area will be inspected by the approved biologist to ensure that the fencing is intact and that no snakes have entered the work area before the start of each work day. The fencing will be maintained by the contractor until completion of the project. If giant gartersnake is encountered, refer to GGS-7, below.

GGS-5 (Avoid Giant Gartersnake Entrapment): If a Covered Activity occurs in giant gartersnake modeled habitat (Figure 3-18), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or

provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within giant gartersnake modeled habitat will be inspected for giant gartersnake by the approved biologist prior to being moved. If a giant gartersnake is encountered, refer to GGS-7.

GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat): If erosion control (BMP-2) is implemented within giant gartersnake modeled habitat (Figure 3-18), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure snakes are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

GGS-7 (Giant Gartersnake Encounter Protocol): If a giant gartersnake is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the giant gartersnake within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a giant gartersnake or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

GGS-8 (Giant Gartersnake Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation. Refer to the U.S. Fish and Wildlife Service's (USFWS) Guidelines for the Restoration and/or Replacement of Giant Gartersnake Habitat (USFWS 1997), or the most current USFWS guidelines at the time of the

activity. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Western Pond Turtle

To avoid direct and indirect effects of Covered Activities on western pond turtle (*Actinemys marmorata*), the following AMMs will be implemented.

WPT-1 (Western Pond Turtle Surveys): If the SSHCP western pond turtle modeled habitat maps (Figure 3-19) show that modeled habitat for western pond turtle is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate western pond turtle aquatic habitat within the project footprint and within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-19, western pond turtle aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide those maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated western pond turtle habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as western pond turtle habitat is identified and fully avoided. Otherwise, Covered Activities must comply with WPT-2 through WPT-9. See Chapter 10 for the process to conduct and submit survey information.

WPT-2 (Western Pond Turtle Work Window): Maintenance and improvements to existing structures may occur throughout the year as long as western pond turtle habitat is identified and avoided, and movement of equipment is confined to existing roads. Otherwise, construction and ground-disturbing Covered Activities must be conducted outside of western pond turtle's active season. Construction and ground-disturbing activities will be initiated after May 1 and will commence prior to September 15. If it appears that construction activities may go beyond September 15, the appropriate Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1, to determine if additional measures are necessary to minimize take.

WPT-3 (Western Pond Turtle Monitoring): If a Covered Activity is occurring in western pond turtle modeled habitat (Figure 3-19), an approved biologist experienced with western pond turtle identification and behavior will monitor the project site, including the

integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for western pond turtle prior to construction activities. The approved biologist will also training construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western pond turtle enters an active construction zone (i.e., outside the buffer zone).

WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion): If construction activities will occur in western pond turtle aquatic habitat, aquatic habitat for the turtle will be dewatered and then remain dry and absent of aquatic prey (e.g., crustaceans and other aquatic invertebrates) for 15 days prior to the initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to western pond turtle. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent turtles from attempting to burrow or move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Western pond turtle habitat outside construction fencing will be avoided by all construction personnel. The fencing and work area will be inspected by the approved biologist to ensure that the fencing is intact and that no turtles have entered the work area before the start of each work day. Fencing will be maintained by the contractor until completion of the project. If, after exclusion fencing and dewatering, western pond turtles are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will discuss the next best steps with the Implementing Entity and Wildlife Agencies.

WPT-5 (Avoid Western Pond Turtle Entrapment): If a Covered Activity occurs within western pond turtle modeled habitat (Figure 3-19), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western pond turtle modeled habitat will be inspected for western pond turtle by the approved biologist prior to being moved.

WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat): If erosion control (BMP-2) is implemented within western pond turtle modeled habitat (Figure 3-19), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that turtles are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit): Covered Activity construction and maintenance vehicles will observe a 20-mile-per-hour speed limit within western pond turtle modeled upland habitat (Figure 3-19).

WPT-8 (Western Pond Turtle Encounter Protocol): If a western pond turtle is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the turtle, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a western pond turtle or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

WPT-9 (Western Pond Turtle Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation and placing appropriate artificial or natural basking areas in waterways and wetlands. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Tricolored Blackbird

To avoid direct and indirect effects of Covered Activities on tricolored blackbird (*Agelaius tricolor*), the following AMMs will be implemented.

TCB-1 (Tricolored Blackbird Surveys): If modeled habitat for tricolored blackbird is present within a Covered Activity's project footprint or within 500 feet of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting or foraging sites are present within the project footprint and adjacent areas within 500 feet of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Within the Plan Area, potential tricolor blackbird nest sites are often associated with freshwater marsh and seasonal wetlands, or in thickets of willow, blackberry, wild rose, thistle, and other thorny vegetation. Tricolored blackbirds are also known to nest in crops associated with dairy farms. Foraging habitat is associated with annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields (such as large tracts of alfalfa and pastures with continuous haying schedules and recently tilled fields), cattle feedlots, and dairies. The Third-Party Project Proponent will map all existing or potential nesting or foraging sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

TCB-2 (Tricolored Blackbird Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 500 feet of a project footprint if existing or potential nest sites were found during design surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and within 3 days of ground-disturbing activities, and within the proposed project footprint and 500 feet of the proposed project footprint to determine the presence of nesting tricolored blackbird. Pre-construction surveys will be conducted during the breeding season (March 1 through August 31). Surveys conducted in February (to meet pre-construction survey requirements for work starting in March) must be conducted within 14 days and 3 days in advance of ground-disturbing activities. If a nest is present, then TCB-3 and TCB-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and the Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

TCB-3 (Tricolored Blackbird Nest Buffer): If active nests are found within the project footprint or within 500 feet of any project-related Covered Activity, the Third-Party Project Proponent will establish a 500-foot temporary buffer around the active nest until the young have fledged.

TCB-4 (Tricolored Blackbird Nest Buffer Monitoring): If nesting tricolored blackbirds are present within the project footprint or within 500 feet of any project-related Covered

Activity, then an approved biologist experienced with tricolored blackbird behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place near the disturbance buffer. Work within the nest disturbance buffer will not be permitted. If the approved biologist determines that tricolored blackbirds are exhibiting agitated behavior, construction will cease until the buffer size is increased to a distance necessary to result in no harm or harassment to the nesting tricolored blackbirds. If the biologist determines that the colonies are at risk, a meeting with the Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will be held to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a tricolored blackbird flies into an active construction zone (i.e., outside the buffer zone).

TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves): On SSHCP Agricultural Preserves, pesticides (including herbicides) will not be applied from January 1 through July 15.

Swainson's Hawk

To avoid direct and indirect effects of Covered Activities on Swainson's hawk (*Buteo swainsoni*), the following AMMs will be implemented.

SWHA-1 (Swainson's Hawk Surveys): If modeled habitat for Swainson's hawk (Figure 3-25) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a survey to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Nest sites are often associated with Riparian land cover, but also include lone trees in fields, trees along roadways, and trees around structures. Nest trees may include, but are not limited to, Fremont's cottonwood (*Populus fremontii*), oaks (*Quercus* spp.), willows (*Salix* spp.), walnuts (*Juglans* spp.), eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and Deodar cedar (*Cedrus deodara*). The Third-Party Project Proponent will map all existing and potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

SWHA-2 (Swainson's Hawk Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites were found during initial surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities to determine presence of nesting Swainson's hawk. Pre-construction surveys will be conducted during the breeding season (March 1 through September 15). If a nest is present, then SWHA-3 and SWHA-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

SWHA-3 (Swainson's Hawk Nest Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.25 mile disturbance buffer around the active nest until the young have fledged, with concurrence from the Wildlife Agencies.

SWHA-4 (Swainson's Hawk Nest Buffer Monitoring): If nesting Swainson's hawks are present within the project footprint or within 0.25 mile of any project-related Covered Activity, then an approved biologist experienced with Swainson's hawk behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting Swainson's hawks begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a Swainson's hawk flies into an active construction zone (i.e., outside the buffer zone).

Greater Sandhill Crane

To avoid direct and indirect effects of Covered Activities on greater sandhill crane (*Grus canadensis*), the following AMMs will be implemented.

GSC-1 (Greater Sandhill Crane Surveys): If modeled habitat for greater sandhill crane (Figure 3-22) is present within a Covered Activity's project footprint or within 0.5 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential roosting sites are present within the project footprint and adjacent areas within 0.5 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Roosting sites within the Plan Area are often associated with flooded fields, seasonal wetlands, and freshwater marsh. The Third-Party Project Proponent will map all existing or potential roosting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Roosting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

GSC-2 (Greater Sandhill Crane Pre-Construction Surveys): Pre-construction surveys will be required to determine if active roosting sites are present within a project footprint or within 0.5 mile of a project footprint if existing or potential roosting sites were found during initial surveys and construction activities will occur when wintering flocks are present within the Plan Area (September 1 through March 15). An approved biologist will conduct pre-construction surveys within 15 days of ground-disturbing activities, and within 0.5 mile of a project footprint, to determine presence of roosting greater sandhill cranes. Pre-construction surveys will be conducted September 1 through March 15, when wintering flocks are present within the Plan Area. If birds are present, then GSC-3, GSC-4, and GSC-5 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

GSC-3 (Greater Sandhill Crane Roosting Buffer): If active roosting sites are found within the project footprint or within 0.5 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.5 mile temporary roosting disturbance buffer around the roosting site until the cranes have left.

GSC-4 (Greater Sandhill Crane Visual Barrier): Greater sandhill cranes have low tolerance for human disturbance, and such disturbance has caused cranes to abandon foraging and roosting sites. Repeat disturbance affects their ability to feed and store energy needed for survival. If project-related activities occur within 0.5 mile of a known roosting site as identified by surveys conducted during implementation of GSC-1 or GSC-2, a visual barrier will be constructed.

GSC-5 (Greater Sandhill Crane Roosting Buffer Monitoring): If roosting sites are found within the project footprint or within 0.50 mile of any project-related Covered Activity, an

approved biologist experienced with greater sandhill crane behavior will be retained by the Third-Party Project Proponent to monitor the roosting site throughout the roosting season and to determine when the birds have left. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary disturbance buffer can only occur with the written permission of the Implementing Entity and Wildlife Agencies. If greater sandhill cranes are abandoning their roosting and/or forage sites, the approved biologist will have the authority to shut down construction activities. If roost abandonment occurs, the approved biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid harm and harassment of individuals. The approved biologist will also train construction personnel on the avoidance procedures, buffer zones, and protocols in the event that greater sandhill cranes move into an active construction zone (i.e., outside the buffer zone).

Western Burrowing Owl

To avoid direct and indirect effects of Covered Activities on western burrowing owl (*Athene cunicularia*), the following AMMs will be implemented.

WBO-1 (Western Burrowing Owl Surveys): Surveys within modeled habitat are required for both the breeding and non-breeding season. If the project site falls within modeled habitat, an approved biologist will survey the project site and map all burrows, noting any burrows that may be occupied. Occupied burrows are often (but not always) indicated by tracks, feathers, egg shell fragments, pellets, prey remains, and/or excrement. Surveying and mapping will be conducted by the approved biologist while walking transects throughout the entire project site plus all accessible areas within a 250-foot radius from the project site. The centerline of these transects will be no more than 50 feet apart and will vary in width to account for changes in terrain and vegetation that can preclude complete visual coverage of the area. For example, in hilly terrain with patches of tall grass, transects will be closer together, and in open areas with little vegetation, they can be 50 feet apart. This methodology is consistent with current survey protocols for this species (California Burrowing Owl Consortium 1993). Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If suitable habitat is identified during the initial survey, and if the project does not fully avoid the habitat, pre-construction surveys will be required. Burrowing owl habitat is fully avoided if project-related activities do not impinge on a 250-foot buffer established by the approved biologist around suitable burrows. See Chapter 10 for the process to conduct and submit survey information.

WBO-2 (Western Burrowing Owl Pre-Construction Surveys): Prior to any Covered Activity ground disturbance, an approved biologist will conduct pre-construction surveys in all areas that were identified as suitable habitat during the initial surveys. The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the project site, particularly in areas within 250 feet of construction activities. To maximize the likelihood of detecting owls, the pre-construction survey will last a minimum of 3 hours. The survey will begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total), or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites. A minimum of two pre-construction surveys will be conducted (if owls are detected on the first survey, a second survey is not needed). All owls observed will be counted and their location will be mapped. Surveys will conclude no more than 2 calendar days prior to construction. Therefore, the Third-Party Project Proponent must begin surveys no more than 4 days prior to construction (2 days of surveying plus up to 2 days between surveys and construction). To avoid last-minute changes in schedule or contracting that may occur if burrowing owls are found, the Third-Party Project Proponent may also conduct a preliminary survey up to 15 days before construction. This preliminary survey may count as the first of the two required surveys as long as the second survey concludes no more than 2 calendar days in advance of construction.

WBO-3 (Burrowing Owl Avoidance): If western burrowing owl or evidence of western burrowing owl is observed on the project site or within 250 feet of the project site during pre-construction surveys, then the following will occur:

During Breeding Season: If the approved biologist finds evidence of western burrowing owls within a project site during the breeding season (February 1 through August 31), all project-related activities will avoid nest sites during the remainder of the breeding season or while the nest remains occupied by adults or young (nest occupation includes individuals or family groups foraging on or near the site following fledging). Avoidance is establishment of a minimum 250-foot buffer zone around nests. Construction and other project-related activities may occur outside of the 250-foot buffer zone. Construction and other project-related activities may be allowed inside of the 250-foot non-disturbance buffer during the breeding season if the nest is not disturbed, and the Third-Party Project Proponent develops an avoidance, minimization, and monitoring plan that is approved by the Implementing Entity and Wildlife Agencies prior to project construction based on the following criteria:

- The Implementing Entity and Wildlife Agencies approve of the avoidance and minimization plan provided by the project applicant.

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline nesting and foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl nesting and foraging behavior in response to construction activities.

If there is any change in owl nesting and foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer. Construction cannot resume within the 250-foot buffer until any owls present are no longer affected by nearby construction activities, and with written concurrence from the Wildlife Agencies.

If monitoring by the approved biologist indicates that the nest is abandoned prior to the end of nesting season and the burrow is no longer in use, the non-disturbance buffer zone may be removed if approved by the Wildlife Agencies. The approved biologist will excavate the burrow in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl to prevent reoccupation after receiving approval from the Wildlife Agencies.

The Implementing Entity and Wildlife Agencies will respond to a request from the Third-Party Project Proponent to review the proposed construction monitoring plan within 21 days.

During Non-Breeding Season: During the non-breeding season (September 1 through January 31), the approved biologist will establish a minimum 250-foot non-disturbance buffer around occupied burrows. Construction activities outside of this 250-foot buffer will be allowed. Construction activities within the non-disturbance buffer will be allowed if the following criteria are met to prevent owls from abandoning over-wintering sites:

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities.
- If there is any change in owl foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer.
- If the owls are gone for at least 1 week, the Third-Party Project Proponent may request approval from the Implementing Entity and Wildlife Agencies that an approved biologist excavate usable burrows and install one-way exclusionary

devices to prevent owls from re-occupying the site. After all usable burrows are excavated, the buffer zone will be removed and construction may continue.

Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.

WBO-4 (Burrowing Owl Construction Monitoring): During construction of Covered Activities, 250-foot construction buffer zones will be established and maintained around any occupied burrow. An approved biologist will monitor the site to ensure that buffers are enforced and owls are not disturbed. The approved biologist will also train construction personnel on avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.

WBO-5 (Burrowing Owl Passive Relocation): Passive relocation is not allowed without the express written approval of the Wildlife Agencies. Passive owl relocation may be allowed on a case-by-case basis on project sites during the non-breeding season (September 1 through January 31) with the written approval of the Wildlife Agencies if the other measures described in this condition preclude work from continuing. Passive relocation must be done in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl. Passive relocation will only be proposed if the burrow needing to be removed or with the potential to collapse from construction activities is the result of a Covered Activity. If passive relocation is approved by the Wildlife Agencies, an approved biologist can passively exclude birds from their burrows during the non-breeding season by installing one-way doors in burrow entrances. These doors will be in place for 48 hours to ensure that owls have left the burrow, and then the biologist will excavate the burrow to prevent reoccupation. Burrows will be excavated using hand tools only. During excavation, an escape route will be maintained at all times. This may include inserting an artificial structure into the burrow to avoid having materials collapse into the burrow and trap owls inside. Other methods of passive relocation, based on best available science, may be approved by the Wildlife Agencies over the 50-year Permit Term.

WBO-6 (Burrowing Owl Timing of Maintenance Activities): All activities adjacent to existing or planned Preserves, Preserve Setbacks, or Stream Setback areas will be seasonally timed, when safety permits, to avoid or minimize adverse effects on occupied burrows.

WBO-7 (Rodent Control): Rodent control will be allowed only in developed portions of a Covered Activity project site within western burrowing owl modeled habitat. Where rodent control is allowed, the method of rodent control will comply with the methods of

rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Covered Raptor Species

To avoid direct and indirect effects of Covered Activities on covered raptor species, the following AMMs will be implemented. This measure applies to Cooper's hawk (*Accipiter cooperii*), loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). The following AMMs do not apply to ferruginous hawk (*Buteo regalis*), as they do not nest in the Plan Area. The following AMMs also do not apply to Swainson's hawk or burrowing owl, as specific AMMs have been developed for these covered raptor species.

RAPTOR-1 (Raptor Surveys): If modeled habitat for a covered raptor species (Figures 3-20, 3-23, 3-24, or 3-28) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

RAPTOR-2 (Raptor Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present with a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites are found during initial surveys and construction activities will occur during the raptor breeding season. An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities within the proposed project footprint and within 0.25 mile of the proposed project footprint to determine presence of nesting covered raptor species. Pre-construction surveys will be conducted during the raptor breeding season. If a nest is present, then RAPTOR-3 and RAPTOR-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

RAPTOR-3 (Raptor Nest/Roost Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project

Proponent will establish a 0.25 mile temporary nest disturbance buffer around the active nest until the young have fledged.

RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring): If project-related Covered Activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an approved biologist experienced with raptor behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting raptors begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist/monitor will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a covered raptor species flies into an active construction zone (i.e., outside the buffer zone).

Western Red Bat

To avoid direct and indirect effects of Covered Activities on western red bat (*Lasiurus blossevillii*), the following AMMs will be implemented.

BAT-1 (Winter Hibernaculum Surveys): If modeled habitat (Figure 3-30) for western red bat is present within 300 feet of a Covered Activity's project footprint, then an approved biologist will conduct a field investigation of the project footprint and adjacent areas within 300 feet of a project footprint to determine if a potential winter hibernaculum is present, and to identify and map potential hibernaculum sites. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If potential hibernaculum sites are found, the Third-Party Project Proponent will note their locations on project designs and will design the project to avoid all areas within a 300-foot buffer around the potential hibernaculum sites. Winter hibernaculum habitat is fully avoided if project-related activities do not impinge on a 300-foot buffer established by the approved biologist around an existing or potential winter hibernaculum site. See Chapter 10 for the process to conduct and submit survey information.

BAT-2 (Winter Hibernaculum Pre-Construction Surveys): If the Third-Party Project Proponent elects not to avoid potential winter hibernaculum sites within the project footprint plus a 300-foot buffer, additional surveys are required. Prior to any ground disturbance related to Covered Activities, an approved biologist will conduct a pre-construction survey within 3 days of ground-disturbing activities within the project footprint and 300 feet of the project footprint to determine the presence of winter hibernaculum sites. Pre-construction surveys will be conducted during the winter hibernaculum season (November 1 through March 31). If a winter hibernaculum is present, then BAT-3 and BAT-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

BAT-3 (Winter Hibernaculum Buffer): If active winter hibernaculum sites are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will establish a 300-foot temporary disturbance buffer around the active winter hibernaculum site until bats have vacated the hibernaculum and the Implementing Entity and Wildlife Agencies concur.

BAT-4 (Bat Eviction Methods): An approved biologist will determine if non-maternity and non-hibernaculum day and night roosts are present on the project site. If necessary, an approved biologist will use safe eviction methods to remove bats if direct impacts to non-maternity and non-hibernaculum day and night roosts cannot be avoided. If a winter hibernaculum site is present, Covered Activities will not occur until the hibernaculum is vacated, or, if necessary, safely evicted using methods acceptable to the Wildlife Agencies.

5.5 How Conditions on Covered Activities are Applied to Various Urban Development Permit Types Approved by the Land Use Authority Permittees

Covered Activities can be approved by Land Use Authority Permittees at different scales. For example, master plans (including specific plans, comprehensive plans, and special planning areas) generally include large areas of land, and other permit types (conditional use permits, grading permits, and building permits) can apply over a range of project footprints. The process that Land Use Authority Permittees will use to approve Covered Activities in these planning documents is described in Chapter 10. See Table 5-2 for a list of projects and activities that are considered Covered Activities.

5.5.1 Master Plans

A master plan is a document that broadly defines land use, circulation, and infrastructure for a specific area (Master Plan Area) and includes implementation measures that guide how development within the Master Plan Area will occur. The requirements for master plans can be fulfilled by a variety of planning tools, including specific plans, comprehensive plans, special planning areas, or any combination thereof. Preparation of a master plan can generally be dived into four phases: pre-application phase, initiation phase, plan preparation phase, and master plan hearing and adoption phase. Master plan proponents receive entitlements for large lot maps within the Master Plan Area, then sell those large lots to individual home, commercial, and industrial builders who then construct Urban Development Covered Activities in accordance with the master plan. Therefore, both master plan proponents and individual builders can be Third-Party Project Proponents under the SSHCP.

As discussed in Chapter 10, it is during the plan preparation phase that Local Land Use Permittees will work with Third-Party Project Proponents to prepare a master plan that includes SSHCP requirements, including specific AMMs. Incorporating SSHCP requirements into a master plan ensures that the Urban Development Covered Activities constructed under that master plan can be covered by SSHCP permits.

Each Land Use Authority Permittee will condition Third-Party Project Proponents constructing a Covered Activity within a Master Plan Area to comply with master plan's specific AMMs.

As discussed in Section 5.2.1.3, five master plans are currently under preparation or have recently been approved in the UDA (Figure 5-4). Appendix K provides further information on the five master plans, and discusses how each master plan will meet SSHCP requirements, including applicable Conditions and Covered Activity AMMs.

5.5.2 Use Permits

All property in the Plan Area is zoned for a specific land use by the local Land Use Authority Permittee. Each Land Use Authority Permittee has a zoning ordinance that lists land uses that are permitted by right in each zoning district. The zoning ordinance also lists uses on a property that may be allowed only under specified conditions, which trigger the requirement for a Third-Party Project Proponent to obtain a conditional use permit. Third-Party Project Proponents applying for a conditional use permit who seek coverage under the SSHCP permits must apply all SSHCP requirements, including AMMs, as conditions of Land Use Authority approval.

5.5.3 Grading Permits

Grading permits are issued by the Land Use Authority Permittees to authorize grading, filling, clearing, and grubbing operations, which can be Covered Activities. Grading permits can cover grading associated with multiple contiguous lots or individual lots. Land Use Authority Permittees do not require grading permits for agricultural ground disturbance or grading; refuse disposal sites; mining or quarry operations; underground utilities; or pools, basements, or footings of structures authorized by a building permit. The City of Rancho Cordova and the County of Sacramento require a grading permit when 350 cubic yards or more of soil or earthly material are graded, filled, excavated, stored, or disposed of, or when 1 acre or greater of land is cleared and grubbed. The City of Galt requires a grading permit for disturbance when the volume of material graded is more than 50 cubic yards or the depth of cut and fill is greater than 2 feet. Third-Party Project Proponents applying for a grading permit and who seek coverage under the SSHCP permits must apply all SSHCP requirements, including AMMs, as conditions of Land Use Authority approval.

5.5.4 Building Permits

Building permits are issued by Land Use Authority Permittees to authorize construction of new buildings or demolition or improvements to existing buildings. Third-Party Project Proponents applying for a building permit and who seek coverage under the SSHCP permits must apply all SSHCP requirements, including AMMs, as conditions of Land Use Authority approval.

6 EFFECTS ASSESSMENT AND LEVEL OF TAKE

6.1 Introduction

This chapter estimates and analyzes the effects of the South Sacramento Habitat Conservation Plan (SSHCP) Covered Activities (see Chapter 5) on land cover types and Covered Species and their habitats. The analysis presented in this chapter is programmatic to address all SSHCP Covered Activities that will be implemented within the SSHCP Plan Area over the proposed 50-year Permit Term. This chapter analyzes effects programmatically rather than with a site-specific approach. Consequently, the effects presented in this chapter represent the maximum effects of the SSHCP Covered Activities on land cover types, Covered Species, and their habitats. Therefore, the acres of land cover conversion presented in this chapter represent the total allowable under the Plan's permits.

This effects analysis includes the eight major categories of Covered Activities described in Section 5.2:

- Urban Development in the Urban Development Area (UDA)
- Mining in the UDA
- Rural Transportation Projects
- Recycled Water Projects
- Covered Activities in Preserve Setbacks in the UDA
- Covered Activities in Stream Setbacks in the UDA
- SSHCP Preserve System Covered Activities
- Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System.

6.2 Species Effects Definitions

Covered Activities result in environmental stressors (see Section 6.3) that affect Covered Species and species habitat. Species effects can be permanent or temporary.

Permanent Effects

Permanent effects can be direct or indirect. Direct effects are caused by the activity and occur at the same time and place (50 CFR 402.02). Indirect effects are those effects that are caused by or will result from the activity and are later in time, but are still reasonably certain to occur (50 CFR 402.02).

Environmental stressors resulting from Covered Activities can permanently affect species by directly harming, harassing, killing, or injuring an individual of any Covered Species, or by directly removing, modifying, or degrading a land cover type that provides habitat for a SSHCP Covered Species.

Environmental stressors resulting from Covered Activities can also indirectly affect species when they modify or degrade species habitat over time, eventually causing a significant modification fully removing the value of the habitat for breeding, feeding, or sheltering. While more difficult to quantify and track, indirect impacts can substantially affect species habitat, especially if multiple indirect or direct impacts work cumulatively to degrade the habitat. All indirect effects are permanent.

Temporary Effects

All temporary effects are direct (i.e., are caused by the Covered Activity and occur at the same time and place as the Covered Activity). Temporary effects alter a land cover or species habitat for less than 1 year, and the disturbed area recovers or is restored to pre-project habitat conditions within 1 year of completing the ground disturbance (e.g., prescribed burning, construction staging areas, and construction dust). Permanent effects analyzed include (1) effects from Covered Activities that have a duration exceeding 1 year, and (2) effects from ground-disturbing Covered Activities with a duration of less than 1 year but the disturbed land cover or species modeled habitat require more than 1 year to restore to pre-activity condition (restoration begins immediately following end of the ground disturbance).

Incidental Take

Direct and indirect effects of Covered Activities will result in the incidental take of Covered Species. “Incidental take” is the take of fish or wildlife species that results from, but is not the purpose of, carrying out otherwise lawful activity (50 CFR 17.3). The federal Endangered Species Act (ESA) defines “take” as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct” (16 U.S.C. 1532(3)(9)). Take is defined under the California Endangered Species Act (CESA) as “to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill” (California Fish and Game Code Section 86). Unlike federal law, the CESA does not include “harm” or “harass” in the definition of take.

“Harm” in the federal ESA definition of “take” means an act that actually kills or injures wildlife. Such acts may include significant habitat modifications or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. “Harass” in the ESA definition of “take” means an intentional or negligent act or omission that creates the likelihood of injury to wildlife by

annoying it to such an extent as to significantly disrupt normal behavioral patterns, which include, but are not limited to, breeding, feeding, or sheltering (50 CFR 17.3). The effects analysis in this chapter considers a significant modification to be removal of an SSHCP natural land cover type and conversion to another land cover type; for example, vernal pool converted to a developed land cover type, cropland, or vineyard would be a significant modification. This effects analysis considers significant degradation to an SSHCP land cover type to be when the land cover type remains, but an ecological function is adversely affected to the extent that the land cover type is unlikely to provide modeled Covered Species habitat. For example, damage to a vernal pool micro-watershed can change filling, depth, water chemistry, and period of ponding of the vernal pool.

Section 6.3 discusses specific environmental stressors for each of the major categories of Covered Activities that will temporarily or permanently affect species and result in "take."

Effects on Critical Habitat

As discussed in Section 3.6, the U.S. Fish and Wildlife Service (USFWS) designates Critical Habitat in specific areas that are essential to the conservation of a listed species. In addition to regulating "take" of listed species, the ESA also prohibits the "destruction or adverse modification" of designated Critical Habitat. Section 3(5)(A) of the ESA defines "Critical Habitat," in part, as "the specific areas within the geographical area occupied by the species, at the time it is listed…, on which are found those physical or biological features (I) essential to the conservation of the species and (II) which may require special management considerations or protection." ESA Critical Habitat rules use the term "constituent elements" of Critical Habitat to define features "that are essential to the conservation of the species," including, but not limited to, "roost sites, nesting grounds, spawning sites, feeding sites, seasonal wetland or dryland, water quality or quantity, host species or plant pollinator, geological formation, vegetation type, tide, and specific soil types" (50 CFR 424.12). Thus, to issue an Incidental Take Permit (ITP), the USFWS must ensure that the constituent elements of designated Critical Habitat will not be altered or destroyed by HCP proposed activities to the extent that the species' designated Critical Habitat (range-wide) would no longer remain functional to service its intended recovery role. Therefore, all HCPs must be reviewed by the USFWS to determine whether they are likely to cause adverse modification to designated Critical Habitat. It is possible for the USFWS to permit an HCP that authorizes land use or development activities within an area designated as Critical Habitat, provided the HCP proposed activities will not appreciably diminish the capability of the designated Critical Habitat to fulfill its intended role in the recovery of listed species. As discussed in Section 3.6, six SSHCP Covered Species have one or more designated Critical Habitat units located within the SSHCP Plan Area. Therefore, this chapter also quantifies the acres of Critical Habitat affected by the proposed Covered Activities.

6.3 Environmental Stressors from Covered Activities

This section describes how environmental stressors resulting from a Covered Activity affect land covers, species habitat, and individuals of Covered Species. The effects of these environmental stressors on Covered Species, species habitat, and land covers are analyzed in Section 6.5 and in Section 6.6, which identifies the amount of take the Permittees are requesting under the ITPs. Twenty-four environmental stressors are described below, organized by: (1) environmental stressors that would occur on an ongoing and permanent basis during operation of a Covered Activity over the Permit Term, and (2) those that would be temporary and occur only during and immediately after construction of a Covered Activity.

Permanent Environmental Stressors of Covered Activities

- Loss of land covers and Covered Species habitat
- Permanent alterations to watershed hydrographs and downstream water quality effects
- Habitat fragmentation
- Increased wildfire
- Vernal pool hydrologic alterations
- Chronic ground vibration and noise
- Lighting
- Increased human activity
- Wildlife community alterations
- Invasive plants
- Invasive animals
- Mesopredators
- Wildlife disease
- Pesticides and fertilizers
- Vehicle and aircraft collisions with wildlife
- Aboveground electrical utilities collision and electrocution

Temporary Environmental Stressors during Construction of Covered Activities

- Temporary alterations to hydrographs and construction water quality effects
- Laydown or trampling of vegetation

- Construction noise
- Construction ground vibration
- Construction lighting
- Construction dust
- Increased human presence during construction
- Construction trash and debris.

Table 6-1 presents a matrix identifying which environmental stressors could result from the various categories of Covered Activities. Table 6-2 provides a matrix for which species are affected by each environmental stressor.

6.3.1 Permanent Environmental Stressors of Covered Activities

Loss of Land Covers and Covered Species Habitat

The major effect of new urban development, transportation, and utility projects is conversion from undeveloped to developed land cover types. In addition to the net loss of undeveloped land cover in the Plan Area, such conversion may further isolate remaining natural habitat rendering it less suitable or unsuitable for Covered Species.

Natural land covers would be permanently converted to developed uses from construction of residential, commercial, and industrial structures, park and recreation facilities, some public and private utilities, solid waste management facilities, urban and rural transportation, and wastewater facilities. Construction of the Capital Southeast Connector would result in permanent direct effects within its footprint, temporary direct effects during construction, and potential indirect effects on Covered Species by creating barriers or hazards to movement and dispersal and fragmenting habitat. The Capital Southeast Connector is described in Section 5.2.1.1.

Habitat Fragmentation

Fragmentation and isolation of plant and wildlife populations can affect wildlife movement and dispersal as well as seed dispersal and movement and dispersal of plant pollinators. These may cause extinction of local populations as a result of two processes: (1) reduction in total habitat area, which reduces effective population sizes; and (2) isolation of local populations, which affects dispersal and immigration rates (Wilcox and Murphy 1985; Wilcove et al. 1986). Because of complex community-level interactions (e.g., mutualistic species, habitat guilds, and keystone species), the loss of one or a few species from a habitat patch as a direct result of habitat fragmentation ("primary" extinctions) also may result in multiple "secondary" extinctions within

the habitat patch (Wilcox and Murphy 1985). At the larger landscape scale, change in regional abundance and distribution of habitat may change the migration and habitat use patterns of some wildlife species, which in turn affects the metapopulation dynamics of numerous organisms and alters multiple landscape-scale ecological functions. For example, many species will either not cross roads, drainages, disturbed lands, and urbanized areas or do so infrequently or unsuccessfully. The necessity of crossing roads also increases the risk of vehicle collisions, especially for small rodents, reptiles, amphibians, and low- or slow-flying birds. Roadway mortality or limitations on species movement leads to a variety of problems, including reduction and isolation of populations. As populations become isolated and smaller, they become particularly vulnerable to negative demographic trends, including genetic bottlenecks, genetic drift, and inbreeding depression. These changes in turn can affect ecological functions and the long-term viability of species, including those for which roads are not a major barrier, but which have important ecological relationships with high-risk species (e.g., predator/prey relationships, mutualisms such as burrow construction and use, pollination). This disruption may also affect vegetation communities if the spatial behavior of plant dispersers and pollinators is altered.

Fragmentation also decreases the functional size of conserved habitat patches. As remaining habitat areas diminish in size, the ratio of vulnerable edge to preserved interior area increases, especially with narrow or irregularly shaped habitat patches. Ecological consequences arise because, as this ratio increases, any given interior point (habitat or organism) is closer to potential threats existing outside the preserve boundary. Increased edge effects heighten species' vulnerability to stochastic disturbances, pollution, and invasion by non-native plant and animal species.

Fencing may inhibit the movement of some species that have large home ranges, such as badgers (*Taxidea taxus*), coyotes (*Canis latrans*), and mule deer (*Odocoileus hemionus*). Disrupting the ability of these species to move freely throughout their ranges may alter their foraging and social behavior, and may expose them to greater risks in other areas they may normally avoid or use less frequently due to lower habitat suitability, greater risks of predation, or greater risks of vehicle collisions.

Wildlife Community Alterations

Wildlife community alterations will occur in developed areas, and may occur along the open space–urban interface due to development-induced habitat degradation. Rottenborn (1999), for example, characterized wildlife species as being "tolerant" or "sensitive" to urbanization. The "tolerant" species include several birds that are commonly thought of as urban-related, such as pigeons (*Columbia livia*), mourning doves (*Zenaida macroura*), western scrub-jays (*Aphelocoma californica*), American crows (*Corvus brachyrhynchos*), northern mockingbirds (*Mimus polyglottos*), European starlings *(Sturnus vulgaris*), and bushtits (*Psaltriparus minimus*). Urban

"sensitive" species included both year-long resident species, such as California quail (*Callipepla californica*), acorn woodpecker (*Melanerpes formicivorus*), and Bewick's wren (*Thryomanes bewickii*), as well as migrants, such as willow flycatcher (*Empidonax traillii*) and yellow warbler (*Setophaga petechia*). Permeability to invasive or urban-tolerant species may be increased through reductions in plant structure and cover related to increased human activity in the area, and especially related to fuel-modification activities along habitat edges. These species may out-compete resident native species for resources (e.g., habitat, food, nesting locations) or directly prey on or parasitize the native residents. European starlings, for example, may directly compete with native cavity nesters for nest sites in urban settings.

Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects

By permanently increasing the extent of impermeable surfaces, urban development results in increased runoff, especially during storm events. Such increases can change the hydrograph of local creeks and streams, result in greater levels of scour and/or incision of local creeks, increased sediment loads downstream, alterations of downstream hydrology, and decreased groundwater recharge. Also, addition of new development may permanently increase the amount of pollutants such as grease, oil, and lawn pesticides in local creeks and streams transported from residences during wet weather. An increase in the quantity of pollutants reaching local creeks through higher runoff may affect the biological and physical characteristics of aquatic habitats. Pollutants can also enter groundwater when development occurs over percolation zones in streams, which can affect drinking water quality. However, Covered Activity AMMs (see Section 5.4) require construction in urban and rural areas to manage runoff so that existing runoff conditions and hydrograph (i.e., rate of runoff) are maintained and to reduce pollutants entering local streams. High runoff temperature may also result in an increase of in-stream water temperatures when runoff enters local streams. Permanent increases in impermeable surfaces or compaction of soils may also inhibit natural percolation of stormwater into groundwater basins, which may lead to a drawdown in groundwater levels.

Covered Activities could result in temporary hydrologic and water quality-related effects associated with construction, realignment, widening, extension, or abandonment and removal of culverts, bridges, or other stream-crossing facilities can have hydrologic effects to creeks and streams.

Covered Activities increase the potential for permanent ongoing discharge of point and non-point source pollutants to the natural landscape through surface and subterranean water flows, windblown trash accumulation, windblown dispersion of chemicals, and illegal dumping of industrial and household trash and garden waste in natural ecosystems. Pesticides, herbicides, and fertilizers may enter adjacent landscapes through runoff from irrigated landscapes or from storm events on a frequent basis. Contaminants from automobiles that collect on roadways, parking lots, and driveways and enter natural landscapes during storm events include oil, gas,

brake dust, and other fluids. Road materials, leaks, and spills also permanently adversely affect riparian, wetland, aquatic, and semiaquatic species by contaminating their habitats. Illegal dumping of unwanted items such as trash, tires, and appliances in vacant habitat areas also crush vegetation and restrict photosynthesis by blocking the sun. Discarded electronics (i.e., e-waste) can introduce various toxic chemicals into the environment, including heavy metals that may leach into soil and water. These waste materials may chronically disrupt natural hydrology by forming obstructions and blocking flows and may create permanent habitat for pest species, such as non-native rats.

Vernal Pool Hydrologic Alterations

Vernal pool ecosystems are especially vulnerable to hydrologic alteration, because the timing and period of inundation can dictate whether annual plants and invertebrates are able to reproduce. As discussed in Chapter 3, in addition to direct filling of vernal pools by rainfall, vernal pools in the Plan Area are supported by perched water tables (perched aquifers) resulting from an impervious rock and clay duripan (hardpan) in the soil profile. This impervious soil layer hydrologically connects Valley Grassland, Vernal Pool, Swale, and Stream/Creek (Vernal Pool Invertebrate Habitat (VPIH)) to form the Vernal Pool Ecosystem. Subsurface flows from perched water tables stabilize vernal pool water levels, causing them to be inundated for longer periods of time than would be the case if the vernal pools were recharged only by rainfall (Rains et al. 2006). During and after local storm events, up to 60% of the water entering a vernal pool does so from the perched water table (Rains et al. 2006). Urban development can affect vernal pool hydrology in three major ways: (1) by permanently interrupting connection to surface water flows from up-gradient swales; (2) by damaging or permanently interrupting hydrologic connections to the perched water table; and (3) by puncturing the duripan within the vernal pool's micro-watershed, permanently increasing rate of water loss from the vernal pool and its associated perched aquifer, and allowing that water to drain into deeper groundwater tables.

Invasive Plants

Development, including roads and utility corridors, can promote invasive, non-native plant species that negatively affect habitat in a variety of ways, ultimately changing ecological functions and adversely affecting native species. As new urban development and infrastructure encroach into natural landscapes, newly disturbed areas and/or the new interface between developed areas and native habitats provide an opportunity for invasive plant species to establish and eventually invade natural habitat settings, degrading habitat and potentially displacing native species. Ornamental plants and native cultivars may spread to adjacent protected habitats and outcompete and displace native plant species; they can also hybridize (interbreed) with local native plants and thereby disrupt the genetics of the native population. Such hybridization can cause a number of problems for the native plant population, including poor growth and reproduction.

According to the *Invasive Plants of California's Wildlands* (Bossard et al. 2000), non-native invasive plant species can alter ecosystem processes, such as nutrient cycling, hydrologic cycles, frequencies of wildfires, and erosion and sediment deposition. Invasive plants interfere in ecosystem functions by outcompeting and displacing native plants and wildlife by providing refuge for non-native animals and by hybridizing with native species (Bossard et al. 2000). Several organizations, such as the California Native Plant Society (CNPS) and the California Invasive Plant Council (Cal-IPC) (formerly known as the California Exotic Pest Plant Council), have provided detailed documentation regarding invasive plant species that threaten California's native plants and animals.

Invasive plant species, and especially upland species, are often identified as an indirect "edge effect" of new urban development because invasive plants generally colonize modified or otherwise disturbed zones between development and remaining natural areas. However, invasive species can colonize virtually any upland area that is subject to some kind of disturbance, such as road shoulders, cleared zones along railroad lines, clearings along utility easements, areas affected by fire, fire breaks, and grazed areas.

Future development in the Plan Area will likely increase local sources of nitrogenous air pollutants, primarily due to increased transportation and demand for electricity generation. Increased nitrogen deposition (N-deposition) facilitates the growth of non-native plant species, especially invasive annual grasses in low-biomass ecosystems. Increased abundance of non-native plants, and invasive annual grasses in particular, represents a potentially significant effect to native vegetation communities and wildlife habitat. Nitrogen deposition can be locally elevated near roadways, with nitrogen flux along busy roads up to four times above background levels (Redling et al. 2013). However, nitrogen deposition can also result from emissions within the greater air basin.

Broadleaved pepperweed (*Lepidium latifolium*), yellow star-thistle (*Centaurea solstitialis*), and medusahead (*Elymus caput-medusae*) are common invasive species in grasslands and/or along Plan Area roadsides (Kleinschmidt Associates 2008).

Riparian and wetland ecosystems are also extremely vulnerable to invasive plants because of the highly effective transport of invasive species along rivers and streams. Invasive species can dominate the biomass of riparian and wetland communities where they become established, virtually choking out the native vegetation. Invasive plants commonly found in wetlands, riparian systems, and/or waterways in the Plan Area include broadleaved pepperweed, common water hyacinth (*Eichhornia crassipes*), Brazilian waterweed (*Egeria densa*), and Himalayan blackberry (*Rubus armeniacus*) (Kleinschmidt Associates 2008). Several other invasive species potentially affecting vernal pools and associated watersheds have also been identified, including waxy mannagrass (*Glyceria declinata*), barbed goatgrass (*Aegilops triuncialis*), Italian thistle

(*Carduus pycnocephalus*), stinkwort (*Dittrichia graveolens*), Klamath weed (common St. Johnswort) (*Hypericum perforatum*), yellow glandweed (*Parentucellia viscosa*), and milk thistle (*Silybum marianum*) (Appendix B).

Invasive Animals

Human activities associated with urban development can exacerbate the introduction or spread of non-native animal species. Non-native aquatic wildlife is known to have serious effects on native amphibian populations, including California tiger salamander (*Ambystoma californiense*). For example, aquarium species released in the wild may introduce new diseases to wild amphibian or fish populations. Feral cats (*Felis catus*) are a serious threat to native birds, especially birds that nest on or near the ground, as well as native reptiles and amphibians. They can also cause a shift in small mammal populations from native to non-native species. An increase in year-round water availability due to irrigation and water features can result in increased abundance of bullfrogs.

Invasive wildlife can negatively affect extant native wildlife and plants in many ways. Common native wildlife (e.g., ravens (*Corvus corax*), crows, pigeons, raccoons (*Procyon lotor*), skunks (*Mephitis mephitis)*, and gopher snakes (*Pituophis catenifer*)) and non-native species (e.g., Argentine ants (*Linepithema humile*), European starlings, wild turkeys (*Meleagris gallopavo*), bullfrogs (*Rana catesbeiana*), opossums (*Didelphimorphia*), house mice (*Mus musculus*), rats (*Rattus* spp.), and feral cats and dogs (*Canis lupus familiaris*)) may thrive in disturbed or otherwise marginal habitats and can harm native species through predation, competition, and displacement. Some of these non-native species may also have the potential to spread diseases and parasites to other native wildlife, as discussed below.

Urban Development Covered Activities in the UDA will increase the number of pet cats and dogs, and increase the potential for stray and feral animals. Unconstrained pets at the interface between habitat preserves and residential development can have significant predation effects on native wildlife, including birds, rodents, reptiles, and amphibians (e.g., Churcher and Lawton 1987; Kelly and Rotenberry 1993). Lost or abandoned pets may penetrate even farther into open space areas in search of food or refugia, including native prey.

Also, as noted below in the discussion of disease, domestic cats and dogs may be vectors for diseases that affect native wildlife, such as feline immunodeficiency virus, feline leukemia virus, feline infectious peritonitis, feline and canine distemper, panleukopenia, and rabies (Foley et al. 1999; Florida Fish and Wildlife Conservation Commission 2003).

Mesopredators

A related indirect consequence of habitat fragmentation and isolation is an increase in urban-adapted or urban-tolerant mesopredators, such as raccoons, skunks, opossums, and foxes (*Vulpes*

spp.), in small habitat fragments where top predators, such as coyotes and bobcats (*Lynx rufus*), have been removed (i.e., the "mesopredator release" effect) (Crooks and Soulé 1999). Non-native mesopredators also may include free-roaming stray and feral cats and dogs, which can have the same effects as wild mesopredators. These species can out-compete smaller native species for available resources and increase predation rates, thus reducing the distribution and populations of vulnerable native species (Crooks and Soulé 1999). The increase in mesopredators in fragmented habitats is often considered an indirect edge effect, but because some of these species can penetrate long distances in natural habitats in the absence of top predators (e.g., coyotes, bobcats), they also have landscape-level ecosystem effects.

Pesticides and Fertilizers

Pesticide (including fungicide, herbicide, and rodenticide) and fertilizer use associated with urban development may affect vegetation communities and habitat quality, be directly toxic to species, or indirectly toxic through prey vectors, or reduce prey abundance. These substances may penetrate the open space–urban interface through urban runoff from residential and commercial landscape areas and golf courses, overspray, wind, direct application in interface areas, soil penetration, and wildlife vectors.

Pesticides, for example, can act in several ways. The original pesticide can be toxic, its decomposed elements can be even more toxic, and it can "bioaccumulate," whereby the contaminant concentrates further in each successive link of the food chain, and thus reaches higher concentrations at higher levels of the food chain. Dichlorodiphenyltrichloroethane (DDT) and other chlorinated hydrocarbon pesticides have been used worldwide to control crop pests and disease-carrying insects since the 1940s. DDT was banned in the United States by the U.S. Environmental Protection Agency (EPA) in 1972 because of unacceptable risks to the environment and potential harm to human health (EPA 1972). Long-term ecological exposure and accumulation resulted in eggshell thinning and loss of young in many raptorial bird species, resulting in serious declines in reproductive success (Terres 1980; Henny and Wight 1972).

In a similar manner, fertilizers can enter wetland and riparian systems and cause eutrophication (excessive nutrients in water bodies) and result in large algae blooms. They also can enhance growth of non-native species in edge areas.

Rodenticides may also affect wildlife in various ways. Rodenticides are directly toxic to rodents, but may also indirectly affect rodent predators, such as hawks and owls, coyotes, snakes, etc., either through loss or contamination of prey. Eradication of rodents can also affect habitat quality for other species, such as burrowing owls (*Athene cunicularia*) that use ground squirrel (*Otospermophilus beecheyi*) burrows and many species of reptiles, amphibians, and insects that use rodent burrows as refugia and aestivation and hibernation habitat.

Chronic Ground Vibration and Noise

Chronic increases in noise related to urban development primarily result from increased traffic volumes at all hours. Other sources of development-related increases in noise that may affect native wildlife include operation of landscape maintenance equipment and tools (e.g., mowers, blowers, trimmers, wood chippers), active recreation at parks (particularly at night), loud music from vehicles and residences, noise from aircraft operations at Mather Airport, and on-site heavy equipment and machinery use by commercial and industrial businesses.

Some of these noise sources, such as traffic noise, are relatively constant (although with daily cycles related to peak traffic periods), and some wildlife species may habituate and adapt to the chronic ambient noise levels, while others may avoid noisy areas. Other noise sources are more occasional or discrete and are more likely to startle wildlife and at least temporarily disrupt their behavior at the time. Noise may affect wildlife in several ways that disrupt both their behavior and physiology in complex and interactive ways, including startling or annoying, raising stress levels, interrupting sleep and rest, interfering with acoustic communications, interfering with prey detection, and in the case of loud abrupt noises, causing permanent injury to the auditory system (Dooling 2006; Barrass and Cohn 1984; Brattstrom and Bondello 1983).

Lighting

Ecological light pollution associated with “full-buildout of the UDA” will increase ambient light and direct glare from sky glare, lighted buildings, streetlights, and security lights, and would generally be chronic. Lighting from vehicles will be both chronic and unexpected.

Longcore and Rich (2004) address the ecological effects of light pollution at three levels: (1) behavioral and population ecology, (2) community ecology, and (3) large-scale ecosystem functions. Effects at the behavioral and population ecology level include orientation/ disorientation and attraction/repulsion, reproduction, and communication, and are the main effects of lighting related to construction activities. Orientation and disorientation are responses to ambient light levels, while attraction and repulsion are responses to the source of light (e.g., moths attracted to a light bulb). Orientation includes artificially expanding behavioral repertoires of normally diurnal (active during the day) or crepuscular (active during dawn or twilight hours) species, such as foraging or territorial advertisement or mate attraction (e.g., singing birds), into nighttime periods. Disorientation may occur in nocturnal species that normally orient during dark periods and whose visual systems are adapted to low light levels. Attraction to lights affects birds, which may suffer injury or mortality due to collisions with permanent lighted structures. Many insects are attracted to light sources, resulting in high numbers of prey being taken by nocturnal insectivores such as bats. Repulsion of nocturnal wildlife by lights is probably quite common and may cause them to avoid lighted areas in their normal home ranges.

Wildlife reproduction may be affected by lighting in various ways. Movement to breeding areas, chorus behavior, and mate selection by some amphibians may be affected (Longcore and Rich 2004). Lighting may disturb the nighttime rest and sleep periods of diurnal species, including most passerine (perching) birds, having effects similar to noise, including annoying individuals and causing them to abandon nests that are otherwise perfectly suitable. Nest site selection by some birds may be affected by light, with nests being established farther from light sources (Longcore and Rich 2004). Artificial light may simulate increased day length, affecting reproductive cycles by triggering premature reproductive activity at a time when environmental conditions are not conducive to successful reproduction (e.g., cold temperatures and/or poor food resources). Because light may interfere with sleep, it can be stressful and may disrupt normal biological rhythms and raise the level of stress hormones, which may in turn affect reproductive capacity.

At the level of community ecology, light pollution may affect competition and predation (Longcore and Rich 2004). Behavioral interactions by groups of species may be affected by lighting as species move into the "light niche" (Longcore and Rich 2004). Species groups that normally partition foraging periods in relation to ambient light levels may be in direct competition under artificial light conditions (e.g., some bats). Likewise, species that are adapted to higher light levels (e.g., crepuscular species) may out-compete strictly nocturnal species, which normally forage in the darkest part of the night.

Lighting may increase the risk of predation of both nocturnal and diurnal species because they may be more detectable to nocturnal predators. Some species, such as amphibians, may be attracted to light because insect prey may congregate around light sources, which may in turn increase the risk of the amphibians being preyed upon. Longcore and Rich (2004) characterize this as a tradeoff in the benefit of foraging longer (or at richer sources) with the cost of higher predation risk. Many small species, such as rodents, rabbits, snakes, and bats, actually forage at lower rates at high illumination levels (Longcore and Rich 2004), which may be a biological adaptation to high levels of moonlight. Chronic ecological light pollution may favor light-tolerant species over those that are dark-adapted (Longcore and Rich 2004).

Lighting can also indirectly affect vegetation communities, potentially by altering the behavior of seed dispersers (e.g., small rodents and ants); other potential plant dispersers, such as larger mammals and birds that transport seeds and plant parts over longer distances; and pollinators.

Increased Human Activity

Urban development results in permanent increases in human presence from adjacent development. Increased human presence near preserves will affect essential and normal behavioral patterns and physiology of wildlife. Similar to noise and lighting effects, permanent increases in human activity from adjacent urban development will disturb nocturnal animals

during their rest or sleep periods, annoying them and causing harm to them if they abandon nests or den sites, as well as harming them by disrupting their normal biological rhythms and raising the level of stress hormones. Abandonment (even temporary) of active nests or dens increases the risk to eggs, nestlings, fledglings, and other dependent young. Flushing animals from nests, dens, and other refuges also increases their risk of injury or mortality from collisions with vehicles, as well as predation. Human presence may also alter the spatial behavior of animals, causing them to avoid certain parts of their home range, which may prevent them from using critical resources such as water.

Increases in human activity along the open space–urban interface may also result in trampling of vegetation and compaction of soils, affecting the viability of vegetation communities, wildlife habitat quality, and species that are sensitive to habitat structure, such as shrub and herbaceous vegetation integrity, soil friability, and burrowing substrate quality (e.g., rodents, reptiles, amphibians, and invertebrates). Increased human activity near preserves will also increase the amount of trash and debris that enters preserves and natural communities. Trash and debris can degrade vegetation communities and wildlife habitat, and can attract nuisance and pest species. Trash and debris include discarded packaging materials, plastic bags, and plastic and other lighter materials may be dispersed into natural areas by wind or along creeks and streams.

Increased Wildfire

Increased human activity related to urban development Covered Activities can result in increased wildfires. These fires are a result of human activities at the habitat preserve–urban interface, including accidental ignitions from sparks from equipment (e.g., mowers striking rocks), cigarettes, children playing with matches, etc., as well as intentional ignitions (i.e., arson). However, fires also may be ignited by downed or arcing power lines or cars catching on fire along roadways.

In most cases, wildfires in the UDA would be quickly suppressed for public safety and to protect property, but in some cases wildfires become uncontrollable and catastrophic. Wildfire suppression activities (e.g., grading, fire line construction) can also affect plant and animals through ground disturbance.

Outside the UDA, Covered Activities would not result in increased frequency, duration, or intensity of wildfire in that portion of the Plan Area.

Wildlife Disease

The increased human and associated pet population can increase the risk of disease transmission to native wildlife in the Plan Area. For example, free-ranging domestic cats and dogs can transmit new diseases to wild animals. Native wildlife in the Plan Area, including American

badger, gray fox (*Urocyon cinereoargenteus*), and coyote, may be at risk of canine distemper (Deem et al. 2000). Diseases transmitted from humans and pets also may affect raptors, such as Cooper's hawk (*Accipiter cooperii*). Boal and Mannan (1999) found that mortality of nestling Cooper's hawks in urban settings primarily was from trichomoniasis, which is caused by the parasitic protozoan *Trichomonas gallinae* that occurs in the digestive and urogenital tracts of many animals and humans. This parasite causes lesions in the mouth, throat, and crop of birds and prevents infected individuals from eating. An important vector of trichomoniasis in urban areas may be domestic pigeons and potentially wild doves, which are preyed on by hawks and falcons. Stabler (1941), for example, found that of 242 pigeons originating from Pennsylvania, Maryland, and New Jersey, 64.5% were infected with *Trichomonas gallinae*. West Nile virus has been identified as a potential factor in loggerhead shrike (*Lanius ludovicianus*) declines in the Central Valley based on a correlation between higher infection rates of the virus and greater declines in shrike abundance in Central Valley counties compared to other counties (Pandolfino 2008). Chytrid fungus is implicated in the decline of several amphibian species, and can infect California tiger salamander. However, chytrid fungus has not been found to be responsible for California tiger salamander mortality in the lab or the field (CDFG 2010).

Vehicle and Aircraft Collisions with Wildlife

The increased capacity of roads in urban areas and increased capacity of roads from rural transportation projects likely will increase the risk of vehicle collisions where wildlife use or attempt to cross roadways, particularly in areas that were frequently used by wildlife before roads were constructed or improved and other development was built. Wildlife may be able to cross two-lane, low-density, and lower-speed roads in relative safety, but if roads are expanded to four and six lanes, and traffic densities and speeds increase, vehicle strikes can increase dramatically. Factors related to the number and types of species affected therefore include vehicle speeds, traffic volume, traffic pulses, accessibility of cover, structure of the road (e.g., whether the road is raised or at grade level with the surrounding environment), barrier walls to prevent access to a roadway, and availability of alternative crossings, such as bridges and culverts (Dodd et al. 2004).

Increased use of Mather Airport following proposed expansions will also result in increased chance of bird strikes; however, such strikes are relatively uncommon and are not included in take estimates for covered bird species.

Aboveground Utilities

Power lines, transmission towers, and utility poles can cause collisions, entanglements, and electrocution of birds, especially raptors (Franson et al. 1995; Lehman et al. 2007). Bird Covered Species known to be at particular risk of collisions with aboveground utilities include

ferruginous hawk (*Buteo regalis*) and greater sandhill crane (*Grus canadensis*), as discussed in more detail in Section 6.6.

6.3.2 Temporary Environmental Stressors During Construction of Covered Activities

Construction Noise

Temporary direct effects related to noise will be generated during Covered Activities construction, including vegetation clearing, grading and earthmoving, excavation, trenching and tunneling, pouring of concrete and asphalt, and vehicle use. Construction may affect normal or essential behavioral patterns of covered wildlife in several ways. Excessive noise may affect bird Covered Species, for example, in at least four ways: (1) noise may annoy and cause birds to abandon nests that are otherwise suitable; (2) noise can raise the level of stress hormones, interfering with sleep and other activities; (3) intense noise can cause permanent injury to the auditory system; and (4) noise can interfere with acoustic communication by masking important sounds or sound components (Dooling 2006). Similar effects may occur in other taxa. For example, noise may interfere with communication in toads and frogs that use calls to advertise their location and attract mates (e.g., Barrass and Cohn 1984). Loud noise, such as off-road vehicles, may damage the hearing of some terrestrial species (Berry 1980; Brattstrom and Bondello 1983).

Construction Ground Vibration

Ground vibration will be generated during Covered Activities construction, including grading and earthmoving, excavation, trenching, and tunneling. Vibration caused by construction equipment may affect normal and essential behavioral patterns and the habitat of wildlife in several ways. Vibration from equipment operating in or near vernal pools, creeks, and other aquatic habitats may affect semi-aquatic Covered Species, such as giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), western spadefoot (*Spea hammondii*), and California tiger salamander, possibly causing them to alter their behavior and potentially abandon areas. For example, vibration can cause western spadefoot to emerge from burrow sites at inappropriate times because vibration created by machinery and construction equipment can mimic the effect of rainfall, which triggers western spadefoot emergence (Dimmitt and Ruibal 1980). Vibration may also directly disturb fossorial species that occupy burrows, dens, and depressions, including the covered western burrowing owl and American badger, as well as rodents, coyotes, and lagomorphs (rabbits and hares), causing them to abandon these areas and increase predation and vehicle collision risks. Excessive vibration might also cause the collapse of burrow systems and dens of fossorial species in areas with highly friable soils.

Construction Lighting

Ecological light pollution directly associated with construction ultimately would be temporary, but it may be considered chronic to some extent in terms of effects on wildlife. For example, lighting for security and public safety in some construction areas may extend for several months or more, thus potentially disrupting critical phases of species' life cycles, such as reproduction, or causing animals to abandon lighted areas. Other lighting effects may be short term or unexpected. Lighting during Urban Development Covered Activity construction primarily would occur during concrete and asphalt pouring and from vehicular use (Table 5-2), but also may be used for security and public safety and off-hours equipment maintenance (e.g., at staging areas). Lighting for nighttime construction or maintenance of construction equipment typically involves high-intensity lighting systems that may have very wide lightsheds and high glare values. Vehicle ingress and egress at construction sites may occur during twilight or nighttime hours (especially during winter months), resulting in unexpected light changes.

Construction Dust

Fugitive dust generated by Covered Activity construction, especially vegetation clearing and grading and earthmoving, can decrease photosynthesis and can kill individual plants by blocking or reducing light and penetration as well as photosynthesis, respiration, and transpiration; increased penetration of phytotoxic gaseous pollutants; and increased incidence of pests and diseases. The loss of plant vigor and productivity can directly affect covered plant species and covered wildlife that depend on plants for food or refuge. Construction vehicle traffic can also result in construction dust.

Increased Human Presence During Construction

Covered Activity temporary construction effects include activity at the construction site and ingress and egress to and from the construction area. Increased human presence during construction will temporarily affect essential and normal behavioral patterns and physiology of wildlife. Similar to noise and lighting effects, temporary increased human activity during construction will disturb nocturnal animals during their rest or sleep periods, annoying them and causing harm to them if they abandon nests or den sites, as well as harming them by disrupting their normal biological rhythms and raising the level of stress hormones. Abandonment (even temporary) of active nests or dens increases the risk to eggs, nestlings, fledglings, and other dependent young. Flushing animals from nests, dens, and other refuges also increases their risk of injury or mortality from collisions with construction equipment and other vehicles, as well as predation. Human presence may also alter the spatial behavior of animals, causing them to avoid certain parts of their home range, which may prevent them

from using critical resources such as water. In addition, construction traffic can result in crushing or disturbance of animal and plant species in and near construction sites.

Laydown or Trampling of Vegetation

Trampling of vegetation communities and wildlife habitat in designated construction zones may occur during construction activities such as vegetation clearing, equipment storage, and vehicle use. Accidental trampling of vegetation communities and wildlife habitat may also occur outside designated construction zones. These effects may occur for various reasons, including incorrect construction plans, human error in interpreting plans, human error or accidents in operating construction equipment, and misunderstandings or disregard by construction personnel in adhering to construction plan requirements, including avoidance of natural resources.

Construction Trash and Debris

Covered Activity construction might cause trash and other non-toxic debris to enter species habitat. Trash and debris can degrade vegetation communities and wildlife habitat, and can attract nuisance and pest species. Trash and debris include discarded construction-related materials, such as packaging materials, plastic bags, and plastic sheeting that may be dispersed into natural areas by wind or along creeks and streams. Trash generated by construction personnel, such as food packaging and cigarette butts, also can be dispersed by wind and water into natural areas. Pest and predatory species, such as crows and ravens, gulls (*Laridae*), coyotes, skunks, and raccoons, may be attracted to discarded food. Certain kinds of construction debris, such as fiberglass insulation, can be directly dangerous to wildlife. Trash and debris may also blow into preserves from adjacent development and roadways.

Temporary Alterations to Hydrographs and Water Quality Effects

Covered Activity construction will result in temporary release of contaminants in uplands during activities such as vegetation clearing, grading and earthmoving, excavation, trenching and tunneling, pouring concrete or asphalt, and landscaping, and equipment and vehicle refueling and maintenance. Chemical and toxic compound pollution (fuel, oil, lubricants, paints, release agents, and other construction materials) may affect the health of upland vegetation communities, covered wildlife habitats, and covered wildlife species. Wildlife may be affected by contaminants through direct exposure (e.g., to the skin, fur, or feathers), through consumption of contaminated food, or by reduced habitat quality.

Temporary hydrologic alterations potentially occurring from construction of Covered Activities, including dewatering activities, include changes in flow rates and patterns in streams and rivers that may temporarily affect adjacent and downstream aquatic, wetland, and riparian vegetation communities, and aquatic species (e.g., fish), semi-aquatic species (including SSHCP covered

reptiles such as giant gartersnake and western pond turtle), and riparian nesting birds. Construction of some Covered Activities may require temporary diversions or impoundments of surface waters and thus remove or degrade wetland and aquatic habitats during the period of diversion or impoundment.

Temporary water temperature changes also may occur due to temporary Covered Activity changes in the active channel morphology, thus affecting Covered Species associated with aquatic habitats (such as giant gartersnake, western pond turtle, western spadefoot, and California tiger salamander) that may have specific thermal tolerances.

6.4 Methods to Assess Effects of Covered Activities

Implementation of Covered Activities will result in incidental take of Covered Species and their modeled habitats. To meet regulatory requirements, properly mitigate effects, achieve the SSHCP Conservation Strategy (Chapter 7), and charge fees equitably (Chapter 9), the amount of species take must be quantified. Because of the broad geographic scope of the Plan, length of the proposed Permit Term, and because the details of many future activities and projects are not known at the time of SSHCP preparation, this effects assessment in is conducted at a programmatic level. The direct and indirect effects presented in this chapter reflect the maximum potential effects of the SSHCP Covered Activities on each land cover type and species modeled habitat. As discussed in Chapter 9, once these effect levels are reached, no further take is allowed under the SSHCP permits. The individual Covered Activity categories described in Chapter 5 do not have specific effect limits. This effects analysis assumes that all Covered Activities will effectively implement required SSHCP Avoidance and Minimization Measures (AMMs, described in Section 5.4 and summarized in Section 6.4.1) to assure effects are minimized to the maximum extent.

This effects analysis assumes that all currently undeveloped parcels located within the UDA boundary will be developed during the proposed 50-year SSHCP Permit Term, except for UDA parcels that are: (1) an existing preserve or permanently protected by a conservation easement (see Chapter 3), (2) are in the planned SSHCP Preserve System (see Chapter 7, Conservation Strategy), (3) within areas of Preserve Setbacks not altered through development of trails (Section 5.3), (4) within Non-Vernal Pool Ecosystem land cover types within Stream Setbacks that are not altered through development of trails[1] (Section 5.3), (5) within 8,660 acres of the approximately 9,160 acres of already subdivided parcels (defined as large lot sizes of 0.5 to 4.5 acres for the purposes of this effects analysis) primarily west of Excelsior Road in the UDA,[2] or (6) are the site of a proposed project with existing ESA incidental take authorization and other required entitlements.[3] Therefore,

1 All Vernal Pool, Swale, and Stream/Creek (VPIH) located within SSHCP Stream Setbacks were assumed to be permanently impacted.

2 Most of these 0.5- to 4.5-acre lots contain single-family dwellings in a matrix of agricultural uses or Valley Grassland (e.g., estate homes, hobby farms, or horse properties). Based on historical land use patterns and the expertise of County planners related to these areas, the Plan Permittees assume that these properties are likely to remain as single-family dwelling units and are unlikely to be further developed or significantly modified over the proposed 50-year Permit Term. Therefore, the SSHCP assumes that Urban Development Covered Activities occurring on these 0.5- to 4.5-acre lots mostly west of Excelsior Road will result in a maximum conversion of 500 acres over the Permit Term. These assumptions are used only to develop estimates of effects to Covered Species modeled habitats within the UDA.

3 The Mather Field Specific Plan is still pursuing its own ESA consultation with the USFWS and a Clean Water Act Section 404 permit from the U.S. Army Corps of Engineers; however, the SSHCP effect analysis treats parcels within the boundary of the Mather Field Specific Plan the same as parcels with existing ESA incidental take authorization and other entitlements.

future urban development and associated infrastructure as well as mining Covered Activities to be implemented within the UDA were broadly defined in Chapter 5, and information on the precise locations of most Covered Activities within the UDA is not presented. Consequently, this chapter's analysis of Covered Activity effects within the UDA did not attempt to discern the effect of individual, separate activities.

The species effects presented in this chapter are based on the best available information on extent and duration of effects for each SSHCP Covered Activity (Chapter 5) and the best available information on modeled habitat and occurrences for each SSHCP Covered Species (Chapter 3 and Appendix B). When available, project-specific geographic information system (GIS) layers for project footprints were used. Absent project-specific GIS layers, general plan designations were used to estimate projected development locations and boundaries. Further, the Permittees conducted an extensive review of Covered Species occurrences in the Plan Area (Appendix B), and updated the database of occurrences during SSHCP preparation as new information became available (e.g., tricolored blackbird counts conducted every three years). Therefore, this chapter presents valid estimates of the effects of the SSHCP Covered Activities on Covered Species and Covered Species modeled habitat.

6.4.1 SSHCP Avoidance and Minimization Measures

As described in Section 5.4, AMMs are required elements of all Covered Activity design or implementation. The impact calculations presented in this chapter assume full implementation and effectiveness of all SSHCP AMMs, including:

- Low-effect development measures (LIDs);
- Road design requirements;
- BMPs for road construction and maintenance;
- BMPs for construction adjacent to preserves, habitat linkages, and wetland/riparian areas;
- Post-construction BMPs adjacent to preserves, habitat linkages, and wetland/riparian areas;
- Design features and requirements for public access in the SSHCP Preserve System; and
- Species-specific measures.

The SSHCP Covered Activity AMMs are described in Section 5.4. Table 6-3 lists the general AMMs, Covered Species affected, and the environmental stressor that the measure reduces.

In analyzing effects of Covered Activities, the Permittees assumed that (1) the required AMMs will always be included and implemented along with each SSHCP Covered Activity (see Section 5.4), (2) the appropriate AMMs will always be correctly implemented by the Permittees and by

Third-Party Project Proponents implementing Covered Activities (see Chapter 9), and that (3) each AMM will be effective in avoiding or minimizing both direct and indirect effects to the maximum extent. The SSHCP assumes that AMM implementation will ensure that the actual acres of impact will not exceed the acres or locations of effects presented herein. The effectiveness of AMMs will be ensured through monitoring, as described in Chapter 8.

Table 6-3
Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
Condition 1. Avoid and Minimize Urban Development Impacts to Watershed Hydrology and Water Quality			
LID-1	Stormwater Quality	All	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Pesticides and Fertilizers.
LID-2	Groundwater Recharge	All	Permanent Alterations to Hydrographs and Downstream Water Quality Effects.
LID-3	Natural Site Features	All	Loss of Land Covers and Covered Species Habitat; Permanent Alterations to Hydrographs and Downstream Water Quality Effects.
Condition 2. Avoid and Minimize Urban Development Direct and Indirect Impacts to Existing Preserves and SSHCP Preserves			
EDGE-1	Compatible Land Uses	All	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Pesticides and Fertilizers; Vernal Pool Hydrologic Alterations; Invasive Plants; Invasive Animals; Chronic Ground Vibration and Noise; Lighting; Increased Human Activity; Increased Wildfire; Wildlife Disease; Vehicle and Aircraft Collisions with Wildlife.
EDGE-2	Single-Loaded Streets	All	Wildlife Community Alterations; Invasive Animals; Chronic Ground Vibration and Noise; Lighting; Increased Human Activity; Increased Wildfire; Wildlife Disease; Vehicle and Aircraft Collisions with Wildlife.
EDGE-3	Preserve Setbacks	All	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Pesticides and Fertilizers; Vernal Pool Hydrologic Alterations; Invasive Plants; Invasive Animals; Chronic Ground Vibration and Noise; Lighting; Increased Human Activity; Increased Wildfire; Wildlife Disease; Vehicle and Aircraft Collisions with Wildlife.

Table 6-3
Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
EDGE-4	Locate Stormwater Control Outside Preserves	All	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Vernal Pool Hydrologic Alterations; Pesticides and Fertilizers.
EDGE-5	Stormwater Control in Preserve Setbacks	All	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Pesticides and Fertilizers.
EDGE-6	Detention Basins in Linkage Preserves	All	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Vernal Pool Hydrologic Alterations; Pesticides and Fertilizers.
EDGE-7	Hardpan/Duripan Protection	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat	Vernal Pool Hydrologic Alterations
EDGE-8	Outdoor Lighting	Ricksecker's water scavenger beetle ,valley elderberry longhorn beetle, California tiger salamander, western spadefoot, giant gartersnake, western pond turtle, Cooper's hawk, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat	Lighting

Table 6-3
Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
EDGE-9	Livestock Access to Preserves	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Vernal Pool Hydrologic Alterations; Invasive Plants; Increased Human Activity; Vehicle and Aircraft Collisions with Wildlife.
EDGE-10	Prevent Invasive Species Spread	All	Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Pesticides and Fertilizers; Vernal Pool Hydrologic Alterations; Invasive Plants.
Condition 3. Implement Construction Best Management Practices (BMPs)			
BMP-1	Construction Fencing	All	Construction Noise; Construction Ground Vibration; Construction Lighting; Construction Dust; Increased Human Presence During Construction; Laydown or Trampling of Vegetation; Construction Trash and Debris; Temporary Alterations to Hydrographs and Water Quality Effects
BMP-2	Erosion Control	All	Temporary Alterations to Hydrographs and Water Quality Effects
BMP-3	Equipment Storage and Fueling	All	Increased Human Presence During Construction; Laydown or Trampling of Vegetation; Construction Trash and Debris; Temporary Alterations to Hydrographs and Water Quality Effects

AGENDA ITEM 11.1

657

Table 6-3
Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
BMP-4	Erodible Materials	All	Temporary Alterations to Hydrographs and Water Quality Effects
BMP-5	Dust Control	All	Construction Dust
BMP-6	Construction Lighting	Ricksecker's water scavenger beetle , valley elderberry longhorn beetle, California tiger salamander, western spadefoot, giant gartersnake, western pond turtle, Cooper's hawk, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat.	Construction Lighting
BMP-7	Biological Monitor	All	Construction Noise; Construction Ground Vibration; Construction Lighting; Construction Dust; Increased Human Presence During Construction; Laydown or Trampling of Vegetation; Construction Trash and Debris; Temporary Alterations to Hydrographs and Water Quality Effects
BMP-8	Training of Construction Staff	All	Construction Noise; Construction Ground Vibration; Construction Lighting; Construction Dust; Increased Human Presence During Construction; Laydown or Trampling of Vegetation; Construction Trash and Debris; Temporary Alterations to Hydrographs and Water Quality Effects
BMP-9	Soil Compaction	All	Temporary Alterations to Hydrographs and Water Quality Effects; Wildlife Community Alterations; Permanent Alterations to Hydrographs and Downstream Water Quality Effects; Invasive Plants.
BMP-10	Revegetation	All	Temporary Alterations to Hydrographs and Water Quality Effects; Wildlife Community Alterations; Laydown or

Table 6-3

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
			Trampling of Vegetation.
BMP-11	Speed Limit	All	Construction Noise; Construction Ground Vibration; Construction Dust;
Condition 4. Avoid and Minimize Effects that May Result From Implementation of Covered Transportation Projects			
ROAD-1	Road Project Location	All	Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Wildlife Community Alterations; Vernal Pool Hydrologic Alterations; Invasive Plants; Pesticides and Fertilizers; Chronic Ground Vibration and Noise; Lighting
ROAD-2	Wildlife Crossing Structures	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, American badger	Habitat Fragmentation; Wildlife Community Alterations; Mesopredators; Vehicle and Aircraft Collisions with Wildlife
ROAD-3	Roadside Pesticide Use	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot	Wildlife Community Alterations; Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Invasive Plants; Pesticides and Fertilizers
Condition 5. Avoid and Minimize Impacts that Result From Public Use of Low-Impact Nature Trails in Preserves			
NATURE TRAIL-1	Nature Trail Plan	All	Invasive Plants; Invasive Animals; Lighting; Increased Human Activity; Wildlife Disease
NATURE TRAIL-2	Nature Trail Protection of Duripan	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp,	Vernal Pool Hydrologic Alterations

Table 6-3
Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
		vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat	
NATURE TRAIL-3	Nature Trail Location	All	Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Increased Human Activity; Wildlife Disease
NATURE TRAIL-4	Biological Studies Prior to Nature Trail Design	All	Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Increased Human Activity; Wildlife Disease
NATURE TRAIL-5	Monitoring of Nature Trail Impacts	All	Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Invasive Plants; Invasive Animals; Lighting; Increased Human Activity; Wildlife Disease
Condition 6. Avoid and Minimize Impacts to Existing Vernal Pools When Re-establishing or Establishing Vernal Pools Wetlands			
RE-ESTABLISHMENT/ ESTABLISHMENT-1	Vernal Pool	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat	Vernal Pool Hydrologic Alterations

Table 6-3
Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
RE-ESTABLISHMENT/ ESTABLISHMENT-2	Vernal Pool Inocula Bank	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat	Invasive Plants; Wildlife Community Alterations
Condition 7. Avoid and Minimize Impacts to Streams and Creeks			
STREAM-1	Laguna Creek Wildlife Corridor	Valley elderberry longhorn beetle, giant gartersnake, western pond turtle, Cooper's hawk, Swainson's hawk, white-tailed kite, western red bat	Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Wildlife Community Alterations, Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Invasive Plants; Mesopredators; Pesticides and Fertilizers; Increased Human Activity; Chronic Ground Vibration and Noise; Lighting; Wildlife Disease; Vehicle and Aircraft Collisions with Wildlife
STREAM-2	UDA Stream Setbacks	Valley elderberry longhorn beetle, giant gartersnake, western pond turtle, Cooper's hawk, Swainson's hawk, white-tailed kite, western red bat	Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Wildlife Community Alterations, Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Invasive Plants; Mesopredators; Pesticides and Fertilizers; Increased Human Activity; Chronic Ground Vibration and Noise; Lighting; Wildlife Disease; Vehicle and Aircraft Collisions with Wildlife
STREAM-3	Minor Tributaries to UDA Streams	Valley elderberry longhorn beetle, giant gartersnake, western pond turtle, Cooper's hawk, Swainson's hawk, white-tailed kite, western red bat	Loss of Land Covers and Covered Species Habitat; Wildlife Community Alterations, Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Invasive Plants; Pesticides and Fertilizers; Lighting

Table 6-3
Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals

Measure	Title of Measure	Covered Species	Relevant Environmental Stressors
STREAM-4	Minimize Effects from Temporary Channel Re-Routing	Valley elderberry longhorn beetle, giant gartersnake, western pond turtle, Cooper's hawk, Swainson's hawk, white-tailed kite, western red bat	Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Wildlife Community Alterations, Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Invasive Plants
STREAM-5	Design for Stream Channel Re-Routing, Widening, or Deepening	Valley elderberry longhorn beetle, giant gartersnake, western pond turtle, Cooper's hawk, Swainson's hawk, white-tailed kite, western red bat	Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Wildlife Community Alterations, Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Invasive Plants
Condition 8. Avoid and Minimize Impacts to Covered Species from Utility and Utility Maintenance Covered Activities			
UTILITY-1	Avian Collision Avoidance	Ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird,	Aboveground Utilities
UTILITY-2	Utility Maintenance on Preserves	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, ferruginous hawk, Swainson's hawk, white-tailed kite, northern harrier, western burrowing owl, loggerhead shrike, greater sandhill crane, tricolored blackbird, American badger, western red bat	Laydown or Trampling of Vegetation; Temporary Alterations to Hydrographs and Water Quality Effects
UTILITY-3	Trenchless Construction Methods	Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, mid-valley fairy shrimp, vernal pool tadpole shrimp, Ricksecker's water scavenger beetle, California tiger salamander, western spadefoot, ferruginous hawk, Swainson's	Construction Dust; Increased Human Presence; Loss of Land Covers and Covered Species Habitat; Habitat Fragmentation; Wildlife Community Alterations; Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects; Vernal Pool Hydrologic Alterations; Invasive Plants

BAT-4	Bat Eviction Methods	Western red bat	Take of Covered Species Occurrences; Increased Human Presence During Construction

6.4.2 GIS-Driven Calculation of Permanent Effects

The effects of Covered Activities on each SSHCP land cover and each Covered Species were quantified using a GIS. The Permittees used GIS to overlay an electronic map-layer of Covered Activity footprints onto an electronic map-layer of the Plan Area Land Cover Types baseline map (Figure 3-1) and quantified the acres of overlap to determine acres of direct impact to each SSHCP land cover type and each species modeled habitat.

This chapter's impact methodology assumes that all Covered Species modeled habitat currently existing within the UDA will be permanently removed, except:

- Within existing preserves,
- Within the areas proposed for the SSHCP Preserve System (Section 7.5),
- Within areas of Preserve Setbacks not altered through development of trails (Section 5.3),
- Non-Vernal Pool Ecosystem land cover types within Stream Setbacks that are not altered through development of trails[4] (Section 5.3);
- Sites of proposed projects with existing ESA incidental take authorization and other required entitlements;[5] and
- Within 8,660 acres of the approximately 9,160 acres of already-subdivided parcels (defined as large lot sizes of 0.5 to 4.5 acres for the purposes of this effect analysis) primarily west of Excelsior Road in the UDA[6]. As discussed in Chapter 5, only three categories of development Covered Activities (Rural Transportation Projects, Recycled water Projects, and operations/maintenance of flood control facilities) will be constructed within the Plan Area outside the UDA (see Figures 5-5 and 5-6). For Covered Activities outside the UDA, specific project details and planned locations are known at this time, and are presented in Sections 5.2.3 and 5.2.4.

---

4 All Vernal Pool, Swale, and Stream/Creek (VPIH) located within SSHCP Stream Setbacks were assumed to be permanently impacted.

5 The Mather Field Specific Plan is still pursuing its own ESA consultation with USFWS and a Clean Water Act Section 404 permit from the U.S. Army Corps of Engineers; however, the SSHCP effects analysis treats parcels within the boundary of the Mather Field Specific Plan the same as parcels with existing ESA incidental take authorization and other entitlements.

6 Most of these 0.5- to 4.5-acre lots contain single-family dwellings in a matrix of agricultural uses or Valley Grassland (e.g., estate homes, hobby farms, or horse properties). Based on historical land use patterns and the expertise of County planners related to these areas, the Plan Permittees assume that these properties are likely to remain as single-family dwelling units and are unlikely to be further developed or significantly modified over the proposed 50-year Permit Term. Therefore, the SSHCP assumes that Urban Development Covered Activities occurring on these 0.5- to 4.5-acre lots mostly west of Excelsior Road will result in a maximum conversion of 500 acres over the Permit Term. These assumptions are used only to develop estimates of effects to Covered Species modeled habitats within the UDA.

Effects of projects outside the UDA were estimated by overlaying an electronic GIS map of the maximum project footprints (including Construction Zones) onto the GIS maps of known species occurrences, Covered Species modeled habitats, and any designated species Critical Habitat. These effect footprints incorporate maximum estimated construction, grading, and staging areas associated with construction and operations activities. Habitats for covered vernal pool plants and invertebrates partially located within the effect footprint of a Covered Activity were assumed to be completely affected.

Buffers were applied using GIS to all transportation project Covered Activities outside the UDA to identify Construction Zones that enclose areas of direct and indirect effects:

- Thoroughfares (typically four to six lanes (see Section 5.2.3): Permittees used the GIS "buffer" tool to delineate a 80-foot distance on either side of the roadway's centerline to map the maximum 160-foot-wide Construction Zone for each Thoroughfare project described in Section 5.2.3. To accommodate new turn lanes at intersections, the Thoroughfare project maximum Construction Zone width was increased from 80 to 186 feet on both sides of an intersection, beginning 500 feet from the intersection center.
- Arterial roads (typically four-lane roadways with a center two-way left-turn lane or a raised center median): Permittees used the GIS "buffer" tool to delineate a 67-foot distance from the road centerline to create a 134-foot Construction Zone along road segments for each arterial road project described in Section 5.2.3.
- Collector roads (two-lane roads in rural areas): Permittees used the GIS "buffer" tool to delineate a 62-foot distance from the road centerline to create a 125-foot Construction Zone along road segments for each collector road project described in Section 5.2.3.
- Roads forming interchange overpass, on-ramps, and off-ramps for I-5 and SR-99: Permittees used the GIS "buffer" tool to delineate a 75-foot distance from the road centerline to create a 150-foot Construction Zone were buffered by 150 feet using GIS.
- Roads planned for re-aligning: Permittees used the GIS "buffer" tool to delineate a 200-foot distance from the road centerline to create a 400-foot Construction Zone along road segments planned for re-alignment. This 400-foot-wide Construction Zone is necessary because is many instances the final combination of alignments has not been determined, so a conservatively large Construction Zone ensures that any areas that might possibly be affected are included in calculations.
- In compliance with AMM ROAD-1 (Section 5.4), new Roadways that cross planned SSHCP preserves within the UDA will be designed by project proponents to avoid and minimize direct effects on vernal pools and other wetlands.

- GIS buffers were developed on a case-by-case basis for roads that are planned for widening adjacent to existing preserves, roads in areas where existing infrastructure or an abundance of wetland resources may limit expansion on one side of the road, and at right-angle turns. The Permittees used their professional judgment when reviewing aerial imagery and SSHCP land cover type mapping and applied GIS buffers to create Construction Zones that are appropriate for each individual situation.
- The Construction Zone is wider where any of the above roadways cross streams. In particular, larger roadway Construction Zones were mapped at stream crossings to allow for greater flexibility and movement of construction equipment. Section 5.2.3 identifies a total of 48 stream crossings of rural road improvements projects outside the UDA. At these 48 stream crossings, an additional 25-foot GIS buffer was applied on either side of the road Construction Zone to create a stream crossing Construction Zone 50 feet greater than the initial road Construction Zone. For example, if the initial road Construction Zone is 108 feet then the portion of that road that crosses a stream has a Construction Zone of 158 feet).

For the Capital Southeast Connector, the Southeast Connector Joint Powers Authority (Connector JPA) provided project-specific construction footprints (Section 5.2.1.1). Although the roadway widths along the Capital Southeast Connector would vary, the Permittees assumed the Construction Zone for the Capital Southeast Connector is 200 feet wide across the entire alignment, centered on the road centerline. This provides for a conservative estimate of permanent effect, considering that the Construction Zone for a thoroughfare is assumed to be only 160 feet wide. The one exception to this uniform 200-foot-wide Construction Area for the Capital Southeast Connector is at intersections, where the Construction Zone was determined on a case-by-case basis.

- Construction Zones for planned UDA pipelines (Section 5.2.1) that could affect existing preserves or SSHCP Preserves were determined in GIS as follows:
    - Planned UDA sewer lines were buffered in GIS by 30 feet to map a 60-foot Construction Zone.
    - Planned UDA water pipelines were buffered in GIS by 20 feet to map a 40-foot Construction Zone.
    - Planned UDA recycled water pipelines were buffered in GIS by 37.5 feet to map a 75-foot Construction Zone.
    - For UDA pipeline segments that are planned to be constructed using trenchless construction methods, permanent effects were mapped for a 12-foot-wide dirt access road along the trenchless pipeline alignment. The entry and exit locations were assumed to be located outside Preserves within the area of permanent effect in the

UDA. Access road alignments were adjusted in GIS to avoid effects on jurisdictional waters and wetlands.

Outside the UDA, the Permittees calculated the permanent effects of construction and ongoing maintenance and operations by applying GIS buffers to the footprints of proposed projects (i.e., roadways, recycled-water delivery projects). These footprints were obtained from the project proponents, including the Connector JPA, SRCSD, and others.

The Permittees assume in the land cover effect analysis in Section 6.5 and the Covered Species effects analysis in Section 6.6 that all temporary effects associated with Covered Activities will occur within the permanent effect footprint or would be contained through AMMs before entering preserves. The Permittees assume that Covered Activity temporary construction activities such as equipment and material staging will occur within the UDA permanently affected areas, or in the Construction Zones included as permanently effected outside the UDA. Therefore, temporary construction effects were not calculated separately. Similarly, the Permittees assume that most operation and maintenance will not result in additional effects to habitat because the analysis assumes full removal of natural land cover types within permanent effect footprints. Operations and maintenance activities could result in some recurring direct take of birds, which is discussed qualitatively for each species as appropriate in Section 6.6. In addition, flood control and stormwater management maintenance activities in the UDA will result in temporary loss of habitat for western pond turtle. However, these activities will not affect giant gartersnake because they will be limited to the UDA which does not contain modeled giant gartersnake habitat.

6.4.2.1 Determining Take of Covered Species and Removal of Modeled Habitat

As discussed in Chapter 3, maps were generated of each Covered Species' modeled habitat to show portions of the Plan Area that will be used for species breeding, feeding, roosting, sheltering, foraging, or other important life history activities (Section 3.4). The Covered Activity footprints described above were overlaid in GIS onto the maps of Covered Species modeled habitat, and wherever the two overlapped, Covered Species modeled habitat was considered removed. When Valley Grassland is converted to Vernal Pool or other wetland types as a result of re-establishment or establishment actions, the conversion is counted as a loss of Valley Grassland.

As discussed in Chapter 3, for giant gartersnake, Swainson's hawk, and greater sandhill crane, the SSHCP identified a subset of the Covered Species modeled habitat as "high-value" habitat for the species in this Plan Area. For each of these three Covered Species, high-value habitat and the methodology by which it was delineated is defined in Chapter 3. Effects on high-value habitat for these three species was calculated using the same GIS methods described above, but with the

habitat map restricted to only the high-value modeled habitat. These effects are presented separately from overall modeled habitat effects for these species in Section 6.6.

Generally, occurrence data for Covered Species in the Plan Area are incomplete. Comprehensive surveys for Covered Species have not been conducted to allow a reasonable level of confidence in estimates of individual take, with the exception of the Covered Species plants. For these plant species, the Plan Permittees calculated direct effects to the Covered Species by assuming that all occurrences located within the GIS-derived project footprint will be taken. For all other Covered Species, the SSHCP impact analysis uses the species modeled habitat as a "surrogate" for quantifying direct and indirect take of individuals. For vernal pool species, all modeled aquatic habitat (Vernal Pool, Swale, and Stream/Creek (VPIH)) were assumed to be occupied. This assumption is appropriate because Plan Area aquatic habitat is a more mature system than in other locations (e.g., Placer County), and surveys conducted within the Plan Area generally indicate that pools are occupied by one or more of the three covered branchiopods. By assuming that all pools are occupied, mitigation will balance out take of individual vernal pool Covered Species over time. The Plan Permittees also assumed that all known and unknown occurrences within that removed acreage will be taken.

Most indirect impacts will occur within the UDA, as that is where urban development will abut existing preserves and proposed preserves. Outside the UDA, indirect impacts will occur within zones along rural transportation Covered Activities. Most indirect effects do not disturb land cover types or Covered Species modeled habitat, and thus cannot be quantified using GIS-based methods. Therefore, indirect effects to Covered Species and Covered Species modeled habitat were assessed mostly qualitatively for the SSHCP. Indirect effects that were quantified using GIS are for micro-watershed effects on the Vernal Pool Ecosystem in planned and existing preserves, including effects on the Vernal Pool, Swale, and Stream/Creek (VPIH) land cover types (Section 6.4.2.2).

6.4.2.2 Effects on the Vernal Pool Ecosystem

If a Covered Activity project footprint overlaid any portion of a Vernal Pool, Swale, or Stream/Creek (VPIH), that entire Vernal Pool, Swale, or Stream/Creek (VPIH) was assumed to be completely directly affected. All Vernal Pool Ecosystem aquatic land cover types located in planned Stream Setbacks and Preserve Setbacks were also assumed as permanently directly affected (see Sections 6.4.2.3 and 6.4.2.4).

As discussed in Section 6.3.1 (under the heading Vernal Pool Hydrologic Alterations), Covered Activities also have the potential to indirectly affect Vernal Pool, Swale, and Stream/Creek (VPIH) by disruption of soil duripan that supports the perched aquifer or disrupts the micro-watershed of the vernal pool. The surface watershed of vernal pools was modeled using data

gathered from Light Detection and Ranging (LIDAR) data (Appendix E). If more than 10% of a watershed of a Vernal Pool land cover type was removed, that Vernal Pool was considered indirectly affected. Indirect affects to stream/creeks (VPIH) were determined using a different methodology. When a Swale and Stream/Creek (VPIH) land cover type feature intersected a vernal pool that is directly affected, it is assumed that the Swale or Stream/Creek (VPIH) land cover type is indirectly affected.

The effects analysis for Covered Species assumes that indirectly affected vernal pools, swales, or Stream/Creek (VPIH) are no longer modeled Vernal Pool, Swale, or Stream/Creek (VPIH) habitat.

6.4.2.3 Effects on Preserve Setbacks

This chapter quantifies direct effects to SSHCP land covers within each proposed Preserve Setback by overlaying Preserve Setback Covered Activities footprints (e.g., trails, fire breaks). Where project-level information was not available, GIS layers from the County and City general plans were used to identify road crossing and trail locations within proposed setbacks. The impact methodology assumes that all Vernal Pool, Swale, and Stream/Creek (VPIH) land covers located in proposed Preserve Setbacks will be permanently affected. This is because trail construction. Bioswales, and other Covered Activities allowed in Preserve Setbacks cannot be guaranteed to avoid effects on Vernal Pool, Swale, or Stream/Creek (VPIH). Though this may overestimate actual effects to the Vernal Pool Ecosystem in Preserve Setbacks, it ensures that any effects will be mitigated. Other SSHCP land cover types in Preserve Setbacks were quantified as neither affected nor preserved. This assumption is intended to capture the future uses of the Preserve Setbacks and likely effects on non-Vernal Pool Ecosystem land cover types. These land cover types would generally remain in a natural state similar to that seen along the wider expanses of the American River Parkway, but will include enough development of trails and other infrastructure that they cannot be considered preserved.

6.4.2.4 Effects on Streams and Stream Setbacks

Effects on streams were calculated in GIS for all Covered Activities that may have in-stream effects. Examples of Covered Activities resulting in permanent effects to the natural structure or function of a wetland or stream include installing hardscape in the channel, creating a culvert through the channel, constructing a new bridge over the channel, or reducing channel complexity (e.g., removing riffle, runs, or pools).

This chapter quantified direct effects to SSHCP land covers within each planned Stream Setback by overlaying Stream Setback Covered Activities footprints (i.e., trails) or the footprints of other Covered Activities that enter Stream Setbacks. Where project-level information was not available, GIS layers from the County and City general plans were used to identify road crossing

and trail locations within proposed setbacks. The impact methodology assumes that any Vernal Pool, Swale, and Stream/Creek (VPIH) land covers located in proposed Stream Setbacks will be permanently affected. This is because trail construction, utility crossings, and road crossings allowed in Stream Setbacks cannot be guaranteed to avoid effects on Vernal Pool, Swale, or Stream/Creek (VPIH). Though this may overestimate actual effects to the Vernal Pool Ecosystem in Stream Setbacks, it ensures that any effects will be mitigated. Those portions of Stream Setbacks not directly or indirectly affected were considered neither affected nor preserved. These methods reflect that the Implementing Entity will not control public usage and habitat conditions within the Stream Setback in the same way as on SSHCP Preserves, and thus the Permittees are not requesting credit for this habitat as preserved. However, the land cover types and Covered Species modeled habitat present within the Stream Setback will generally remain undisturbed, so it is appropriate to consider it not affected.

6.4.2.5 Effects on Critical Habitat

As discussed in Chapter 3, vernal pool fairy shrimp (*Branchinecta lynchi*), vernal pool tadpole shrimp, Sacramento Orcutt grass, slender Orcutt grass, and California tiger salamander have designated Critical Habitat within the Plan Area. There are four Primary Constituent Elements (PCEs) for the Critical Habitat of the three vernal pool crustaceans (USFWS 2006):

1. Topographic features characterized by mounds and swales and depressions within a matrix of surrounding uplands that result in complexes of continuously, or intermittently, flowing surface water in the swales connecting the pools described below in (2) providing for dispersal and promoting hydroperiods of adequate length in the pools;
2. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water for a minimum of 41 days (VPTS) or 18 days (VPFS), in all but the driest years.
3. Sources of food, expected to be detritus occurring in the pools, contributed by overland flow from the pools' watershed, or the results of biological processes within the pools themselves; and
4. Structure within the pools described above in (2), consisting of organic and inorganic materials that provide shelter.

Sacramento Orcutt grass and slender Orcutt grass Critical Habitat has two PCEs:

1. Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features, including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools; and

2. Depressional features, including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

California tiger salamander Critical Habitat has four PCEs:

1. Standing bodies of fresh water, including natural and man-made (e.g., stock) ponds, vernal pools, and other ephemeral or permanent water bodies that typically become inundated during winter rains and hold water for a sufficient length of time necessary for the species to complete the aquatic portion of its life cycle.
2. Barrier-free upland habitats adjacent to breeding ponds that contain small mammal burrows.
3. Upland areas between occupied locations (PCE 1) and areas with small mammal burrows (PCE 2) that allow for dispersal among such sites.
4. The geographic, topographic, and edaphic features that support aggregations or systems of hydrologically interconnected pools, swales, and other ephemeral wetlands and depressions within a matrix of surrounding uplands, which together form hydrologically and ecologically functional units called vernal pool complexes.

Using the GIS methodology discussed in Section 6.4.2, acres of direct permanent loss in each Critical Habitat Unit were determined by overlaying the footprints of Covered Activities on the boundaries of each Critical Habitat unit located in the Plan Area. This method identified loss of PCEs 1 and 2 for the vernal pool crustaceans; PCEs 1 and 2 for Sacramento Orcutt grass and slender Orcutt grass; and PCEs 1, 2, and 3 for California tiger salamander.

The acreage of indirect effects on the Vernal Pool Ecosystem in Critical Habitat from adjacent development were calculated as discussed above. This chapter presents the acres of direct and indirect effects to SSHCP land cover types within each Critical Habitat Unit, including developed land covers. This method identified potential loss of biological function within vernal pools, corresponding to PCEs 3 and 4 for the vernal pool crustaceans, and interruption of hydrologic connection of the Vernal Pool Ecosystem, corresponding to PCE 4 for California tiger salamander. The USFWS will use those calculations and related maps when completing a Critical Habitat Adverse Modification Analysis under Section 7 of the ESA.

6.4.3 Qualitative Analysis of Indirect Effects

Most indirect effects are analyzed qualitatively in tables and in the narrative for each Covered Species and SSHCP land cover types. As discussed above, estimates of direct effects on land cover types and Covered Species modeled habitat have been quantified conservatively (i.e., somewhat overestimated). These conservative estimates are intended, in part, to incorporate many of the indirect effects of the environmental stressors described in Section 6.3 and ensure that the SSHCP Conservation Strategy provides enough conservation to offset these indirect effects.

6.5 Effects of Covered Activities on Land Cover Types

6.5.1 Permanent Effects on Land Cover Types

This section quantifies the estimated permanent direct effects of Covered Activities on land cover types within the Plan Area. As described in Section 3.2, Valley Grassland is categorized as those lands that are hydrologically connected to, or inside, the Vernal Pool Ecosystem and those that are not hydrologically connected to, or outside, the Vernal Pool Ecosystem. Of the total 135,152 acres of Valley Grassland within the Plan Area there are 97,349 acres that are part of the Vernal Pool Ecosystem and 37,803 acres that are outside of the Vernal Pool Ecosystem. In Table 6-4, the Valley Grassland in the Vernal Pool Ecosystem is categorized as aquatic and those areas that are outside the Vernal Pool Ecosystem are categorized as terrestrial.

Table 6-4 shows the permanent direct and indirect effects to natural land cover types within the Plan Area that will be affected by SSHCP Covered Activities. In total, approximately 33,497 acres, or 12%, of the 272,596 acres of natural land covers in the Plan Area would be removed over the proposed 50-year Permit Term. This includes the removal of approximately 32,054 acres of natural land covers inside the UDA and approximately 1,443 acres of natural land covers outside the UDA.

Approximately 65% of the permanent direct impacts to all natural land covers are to Valley Grassland, with approximately 22,014 acres of the 135,152 acres of Valley Grassland present in the Plan Area being removed. More specifically, of the 97,349 acres of Valley Grassland in the Vernal Pool Ecosystem, 16,472 acres will be removed, and of the 37,803 acres of Valley Grassland outside of the Vernal Pool Ecosystem, 5,542 acres will be removed. The next largest permanent direct impact (16%) is to Cropland; of the approximately 51,829 acres in the Plan Area, 5,285 acres of Cropland would be removed. Permanent direct impacts to 2,749 acres of the 15,991 acres of Irrigated Pasture–Grassland in the Plan Area and 1,455 acres of the 26,460 acres of Vineyard in the Plan Area represent approximately 8% and 4%, respectively, of the total permanent direct impacts to all land cover types. The remainder of the land covers represents 6% of the total permanent direct impacts. Similar to the Plan-wide impacts, permanent direct impacts to Valley Grassland, Cropland, Irrigated Pasture–Grassland, and Vineyard account for

approximately 94% of the total permanent direct impacts in the UDA and approximately 88% of total permanent direct impacts outside of the UDA.

With respect to the total acreage of the land cover type that will be removed compared to the acreage of that land cover type present in the Plan Area, the land covers that will be most affected are Mine Tailing Riparian Woodland and Stream/Creek (VPIH). Of the 641 acres of Mine Tailing Riparian Woodland in the Plan Area, 218 acres, or 34%, would be directly and permanently impacted. Also, SSHCP Covered Activities will permanently and directly impact 22 acres, or 30%, of the approximately 73 acres of Stream/Creek (VPIH) in the Plan Area. Permanent direct impacts to the remainder of the land cover types compared to the amount that exists in the Plan Area are less than 20% for each type, and the acreages are listed in Table 6-4. Because the majority of the SSHCP Covered Activities will be implemented within the UDA, for most of the land cover types, more than half of the land cover type present within the UDA will be permanently and directly impacted. Land cover types for which this is not true are Blue Oak Savanna, Freshwater Marsh, Stream/Creek (VPIH), and Vernal Pool. In contrast, outside of the UDA, no more than 1.2% of any one land cover type will be removed by SSHCP Covered Activities.

Table 6-4
Permanent Direct and Indirect Effects on Natural Land Covers

Land Cover	Direct Effects (acres)	Indirect Effects (acres)	Total Impacts (acres)	Total Available in Plan Area (acres)	Percent of Total in Plan Area Affected
Aquatic					
Vernal Pool	389	94	483	4,536	11%
Swale	234	44	278	1,252	22%
Seasonal Wetland	105	Qualitative[1]	105	2,600	4%
Freshwater Marsh	127	Qualitative	127	2,954	4%
Streams/Creeks (VPIH)	22	4	26	73	36%
Streams/Creeks	117	Qualitative	117	2,778	4%
Open Water	155	Qualitative	155	2,344	7%
Mixed Riparian Woodland	184	Qualitative	184	5,856	3%
Mixed Riparian Scrub	189	Qualitative	189	1,454	13%
Mine Tailing Riparian Woodland	218	Qualitative	218	641	34%
Valley Grassland (in Vernal Pool Ecosystem)	16,472	Qualitative	16,472	97,349	17%
Terrestrial					
Valley Grassland (Outside of Vernal Pool Ecosystem)	5,542	Qualitative	5,542	37,803	15%
Blue Oak Woodland	9	Qualitative	9	9,132	0.1%
Blue Oak Savanna	38	Qualitative	38	5,637	1%
Cropland	5,285	Qualitative	5,285	51,829	10%
Irrigated Pasture-Grassland	2,749	Qualitative	2,749	15,991	17%

Table 6-4
Permanent Direct and Indirect Effects on Natural Land Covers

Land Cover	Direct Effects (acres)	Indirect Effects (acres)	Total Impacts (acres)	Total Available in Plan Area (acres)	Percent of Total in Plan Area Affected
Orchards	207	Qualitative	207	3,907	5%
Vineyards	1,455	Qualitative	1,455	26,460	6%
Grand Total	**33,497**	**142**	**33,639**	**272,596**	**12%**

1. Most indirect effects (Section 6.3) do not disturb land cover types or Covered Species modeled habitat, and thus cannot be quantified using the GIS-based methods. Therefore, most Covered Activity indirect effects to land cover types were assessed qualitatively for the SSHCP.

Permanent indirect effects from Covered Activities on the Vernal Pool Ecosystem include altered hydrology of vernal pools from removal or disturbance to their micro-watersheds. Indirect impacts are quantified for Vernal Pool, Swale, and Stream/Creek (VPIH) in Table 6-4 and also are quantified in Table 6-5 because these three land covers are components of the Vernal Pool Ecosystem. Valley Grassland that is hydrologically connected to the Vernal Pool Ecosystem is also a component of the Vernal Pool Ecosystem, but indirect impacts to this specific land cover are not quantified. In total, approximately 17,259 acres, or 17%, of the 103,210 acres of the Vernal Pool Ecosystem in the Plan Area would be removed or indirectly impacted over the proposed 50-year Permit Term; indirect impacts account for 142 acres of the total impact acreage. This includes the following impacts to the Vernal Pool Ecosystem: removal of 16,795 acres (64%) and indirect impacts to 132 acres (0.5%) of the 26,048 acres present inside the UDA; and removal of 322 acres (0.4%) and indirect impacts to 9.5 acres (0.01%) of 77,162 acres present outside the UDA.

Table 6-5
Direct and Indirect Effects on the Vernal Pool Ecosystem

Land Cover	Direct Effects (acres)	Indirect Effects (acres)	Total Impacts (acres)	Total Available in Plan Area (acres)	Percent of Total in Plan Area Affected
Valley Grassland (in Vernal Pool Ecosystem)	16,472	Qualitative	16,472.29	97,349	17%
Vernal Pool	389	944	483	4,536	11%
Swale	234	44	278	1,252	22%
Stream/Creek (VPIH)	22	4	26	73	34%
Grand Total	**17,116.39**	**141.54**	**17,258.93**	**103,210**	**17%**

Other than Vernal Pool, Swale, and Stream/Creek (VPIH) for which indirect effects were quantified, the permanent indirect effects of the remainder of the natural land covers are discussed

qualitatively and are summarized in Table 6-6. Indirect effects will be greatest within the UDA because most Covered Activities will occur within the UDA. The Plan Permittees expect that the indirect effects of Covered Activities on natural land covers will be minor outside the UDA because no Urban Development Covered Activities will occur outside, the UDA and indirect effects to natural land covers outside the UDA will be limited to those resulting from rural roadways and water pipeline projects. Additionally, since the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and proposed UDA preserves, edge effects of Covered Activities within Preserves will be less than those within the UDA. Permanent indirect effects of Covered Activities to natural land covers are described qualitatively in Table 6-6, along with AMMs that avoid and minimize these effects.

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 2, LID-2 (Groundwater Recharge) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams) Condition 7, STREAM-5 (Permanent Stream Channel Re-Establishment) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Absent AMMs, the close proximity of planned development and roads to natural land covers will increases the likelihood of hydromodification, such as impacting duripan or hardpan, increasing impermeable surfaces, and decreasing opportunities for groundwater recharge, and will result in the degradation of water quality through the release of pollutants and toxins. Directly impacting the upstream watershed or aquatic land covers, re-routing streams, and stabilizing stream banks using impervious materials will indirectly affect the hydrology of natural land covers. Edge effects such as irrigation overspray or faulty irrigation systems will alter hydrology, which can allow invasive species to establish or type-convert the land cover. Increased traffic resulting in the increased release of chemicals such as fuel, oils, and lubricants, improper management of stormwater and livestock, and the improper use of pesticides will degrade water quality. The adverse effects of altering the watershed hydrographs will be avoided and minimized through the implementations of AMMs such as: (1) the avoidance of direct impacts to streams and other natural land covers through, for example, siting and design and the use of trenchless technology; (2) the avoidance of impacts to duripan and hardpan; (3) requiring Preserve Setbacks; (4) the avoidance of impacts from irrigation in the Preserves by requiring landscaping adjacent to Preserves to be installed between trails and development (away from Preserves); requiring drought-tolerant landscaping to minimize the amount of water required to maintain the landscaping; limiting irrigation adjacent to Preserves to 5 years (temporary) and requiring the use of drip irrigation only to avoid overspray; and requiring monitoring of irrigation to ensure system is functioning properly to avoid leaks; (5) providing design criteria for re-routing streams, if re-routing cannot be avoided, that would minimize hydromodification, such as allowing the re-routed

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
		stream to migrate laterally over its active and terrace floodplain; (6) limiting utility maintenance in Preserves to periods when vernal pools are dry to avoid inadvertently modifying the hydrology (e.g., creating road ruts in wet soils conditions, etc.); and (7) treating all temporarily disturbed areas, after construction is completed, to remove soil compaction and restore water infiltration capacity and soil hydrologic characteristics similar to pre-project conditions. The degradation of water quality will be limited further through implementation of AMMs that require proper management of stormwater, pesticides, and livestock, such as: (1) requiring stormwater be managed consistent with the State Water Resources Control Board (SWRCB) regulations; (2) requiring stormwater from urban development be directed from Preserves and Preserve Setbacks; (3) requiring stormwater from trails, located in Preserve Setbacks, be directed into low-velocity bioretention swales outside of Preserves; (4) requiring application of roadside pesticides comply with applicable regulations and limiting the use of pesticides near sensitive areas; and (5) ensuring that livestock access points are planned to avoid impacts resulting from concentrating livestock in a limited number locations, which could modify hydrology and degrade water quality. Additionally, the degradation of water quality adjacent to Preserves will limited by requiring streets adjacent to the Preserve be single-loaded, to the maximum extent feasible, which would reduce the number of vehicles on the road and, thus, reduce potential for the release of chemicals such as fuel, oils, and lubricants by vehicles. Condition 1, LID-2, ensures prioritization of Preserves that are suitable for groundwater recharge; this AMM will ensure that the

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
		Preserves offset the decrease in groundwater recharge that would result from increasing impermeable surfaces associated with urban development.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP Preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	The Landscape Preserves established outside the UDA will primarily avoid effects of habitat fragmentation on natural land covers through maintaining large, interconnected Preserves. Implementation of AMMs will further reduce edge effects along Preserve boundaries outside of the UDA. Within the UDA, Preserves will be smaller and bordered by urban development, resulting in increased habitat fragmentation as development occurs. Implementation of AMMs will ameliorate the edge effects that can decrease the functionality of fragmented Preserves with a higher edge to preserved interior ratio. AMMs will prevent fragmentation of habitat within Preserves and/or setbacks, because these measures will: (1) require stormwater management facilities to be located outside of Preserves; (2) require avoidance of impacts to duripan and hardpan; (3) ensure that livestock access points are planned to avoid trampling vegetation; (4) require that trails are planned to avoid impacts to natural land covers; and (5) avoid the spread of invasive species by incorporating invasive plant prevention techniques into Preserve Maintenance Plans in addition to other AMMs. AMMs that site less-intensive land uses, such as parks, and single-loaded streets, adjacent to Preserves, and require appropriate setbacks from the Preserves, including a 50-foot setback from urban development, will minimize edge effects. The avoidance of direct impacts to natural features, such streams and providing appropriate setbacks throughout the Plan Area will

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
		provide linkages that connect Preserves and, thus, reduce habitat fragmentation.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA Covered Activities would not substantially affect wildfire frequency, duration, or intensity. Within the UDA, most wildfires will be quickly suppressed and the primary impacts to natural land covers will result from wildfire suppression activities, such as grading. Less often, if wildfires become uncontrollable, they can be catastrophic, especially if fuel loads have built up and fire intensity or fire frequency is high; these types of fire can prevent natural land covers from successfully recovering. Implementation of AMMs that reduce the potential ignition sources adjacent to the Preserves will reduce the risk of increased wildfire. Specifically, minimizing roads, except single-loaded streets, and urban development adjacent to Preserves and trail planning and monitoring to reduce and monitor potential ignition sources along trails will reduce the risk of increased fire. As discussed in Section 6.3, invasive plant species can alter natural frequencies of wildfires. Therefore, to avoid altering the frequency of wildfires, invasive plant prevention techniques will be incorporated into Preserve Maintenance Plans, along with other AMMs, will reduce the spread of invasive species. Also, effects of wildfire suppression on natural land covers will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memorandum of agreement with responsible fire agencies.

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 5, NATURE TRAIL-2 (Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Vernal pools, a component of the Vernal Pool Ecosystem, will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Additionally, indirect effects will occur to an estimated 142 acres of the Vernal Pool Ecosystem (Table 6-5). Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and planned vernal pool Preserves because: (1) direct impacts to hardpan and duripan will be avoided and minimized through siting and design and the use of trenchless technology; (2) livestock access points will be planned to avoid soil compaction in vernal pools that could result from concentrating livestock in a limited number locations; and (3) roads adjacent to the Preserve will be minimized, which will reduce changes in hydrology. Additionally, vernal pools will be re-established or established in the Plan Area, as required by AMMs, which will improve hydrologic conditions of vernal pools. The Vernal Pool Ecosystem Conservation Strategy (Section 7.6.1.1.1) will offset unavoidable indirect impacts.
Chronic Ground Vibration and Noise	None required	Does not affect land cover types.
Lighting	None required	Does not affect land cover types.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Trail Plan) Condition 5, NATURE TRAIL-3 (Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Trail Impacts)	Increased human activity can adversely affect natural land covers due to impacts, such trampling of vegetation. Implementation of AMMs ensures that increased human activity in and near Preserves is limited and that it does not substantially affect natural land covers. Implementation of AMMs will minimize increased human activity adjacent to and within Preserves because: (1) land uses adjacent to the Preserves will be, to the maximum extent practicable, land uses with less intensive human activity and appropriate Preserve Setbacks will be established; (2)

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
	Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	roads adjacent to the Preserves will be single-loaded streets, which will result in less-intensive human activity as compared to a higher-use roads; (3) public access to trails will be monitored and managed in accordance with a trail plan and management actions, such as discontinuation of trail use, will be taken if adverse effects of human activity are occurring in the Preserves; and (4) trails will be sited away from sensitive natural land covers to limit the human activity to areas that are less sensitive. Within the UDA, increased human activity can adversely affect streams, which may contain aquatic natural land covers. However, the application of Stream Setbacks throughout the Plan Area would reduce the level of human activity adjacent to streams.
Wildlife Community Alterations	None required	Does not affect land cover types.
Invasive Plants	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 7, STREAM-5 (Permanent Stream Channel Re-Establishment) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Unmanaged trails and new disturbances in the Preserves and landscaping with invasive species adjacent to Preserves will encourage the spread invasive plants into adjacent habitat. Additionally, nitrogen deposition associated with increased vehicle emissions from vehicles associated with new urban development traveling along Plan Area rural roadway projects will also result in competitive advantages for non-native invasive plants. Unmanaged proliferation of invasive, non-native plants will adversely affect the composition of natural land covers by displacing native species and potentially converting the land type from natural to disturbed. Implementation of AMMs ensures that the spread of invasive plants in and near Preserves is limited and does not substantially affect natural land covers. Implementation of AMMs will minimize the spread of invasive, non-native plant species adjacent to and/or within Preserves because: (1) land uses adjacent to the Preserves will be, to the maximum extent practicable, land uses

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
		with less-intensive human activity and appropriate Preserve Setbacks will be established; (2) roads adjacent to the Preserves will be single-loaded streets, which will result in less vehicle emissions as compared to a higher-use roads; (3) landscaping adjacent to the Preserves will be limited to areas between trails and development (away from Preserves) with drought-tolerant species that are not included on the Cal-IPC list; (4) invasive plant prevention techniques will be incorporated into Preserve Maintenance Plans in addition to other AMMs; (5) trails will be planned to reduce the spread of invasive species, will be monitored for the establishment of invasive species along trail corridors, and will be managed to reduce the spread of invasive weeds; and (6) new disturbances within Preserves will be avoided through the use of trenchless technology and ensuring that livestock access points are planned to avoid impacts resulting from concentrating livestock in a limited number locations. Implementation of AMMs also will minimize the spread of invasive, non-native plants in the Plan Area through treating roadside weed infestations; requiring that local, native plants are used for re-routing streams; and retaining natural aquatic features, such as creeks and streams, into Preserve design in lieu of landscaping. Additionally, preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	None required	Does not affect land cover types.
Mesopredators	None required	Does not affect land cover types.
Wildlife Disease	None required	Does not affect land cover types.

Table 6-6
Permanent Indirect Effects on Natural Land Cover Types

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Natural Land Cover Types
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Pesticide and fertilizer use associated with urban development may affect the quality of natural land covers through the reduction of pollinators or exterminating or weakening native species and/or allowing establishment of non-native species. The adverse effects of pesticide and fertilizer use will be avoided and minimized through implementation of AMMs because: (1) land uses adjacent to the Preserves will be, to the maximum extent practicable, land uses with less intensive human activity (e.g., residential and commercial landscape area, golf courses, or single-loaded streets) and appropriate Preserve Setbacks will be established; (2) roads will be sited in less-sensitive areas, which will reduce the spread of invasive species and, thus, the need for pesticide use in sensitive natural land covers; (3) application of roadside pesticides will comply with applicable regulations and the use pesticides near sensitive areas will be limited; (4) the spread of invasive plants will be limited and managed such that pesticides are not necessary to treat weed infestations; and (5) stormwater will be directed from Preserves and Preserve Setbacks and will be managed consistent with the SWRCB regulations.
Vehicle and Aircraft Collisions with Wildlife	None required	Does not affect land cover types.
Aboveground Electrical Utilities Collision and Electrocution	None required	Does not affect land cover types.

6.5.2 Temporary Effects on Land Cover Types

Natural land covers near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to natural land covers. Generally, these temporary effects will occur within the project footprint or road right-of-way area, which are already quantified as permanently impacted as described in Section 6.5.1 and listed in Tables 6-4 and 6-5. Potential construction-related environmental stressors are described in Section 6.3.2, and their effects on natural land covers are qualitatively described in Table 6-7.

Table 6-7
Temporary Effects to Natural Land Cover Types

Environmental Stressor	Effect Reduced By	Potential Effect on Natural Land Cover Types
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single-Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into natural land covers will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of natural land covers will adversely affect the viability of vegetation communities. Implementation of AMMs ensures that trampling and compaction do not occur.
Construction Noise	None required	Does not affect land cover types.
Construction Ground Vibration	None required	Does not affect land cover types.
Construction Lighting	None required	Does not affect land cover types.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-10 (Revegetation) Condition 3, BMP-11 (Speed Limit)	The generation of fugitive dust during construction can decrease photosynthesis and can kill individual plants, and, thus, can degrade the viability of natural land covers. Implementation of AMMs ensures that dust is controlled and will not affect natural land covers.
Increased Human Presence during Construction	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Increased human activity can result in direct impacts, such as trampling of vegetation and compaction of soils, which can negatively affect the viability of natural land cover. Implementation of AMMs ensures that the adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Trash and debris will degrade the habitat value of natural land covers. Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6 Effects of Covered Activities on Covered Species

The direct effects analysis addresses permanent and temporary removal or degradation of modeled habitat that will reduce available habitat for important life history needs for Covered Species, including breeding, foraging, and cover. The direct effects analysis takes into consideration the anticipated direct effects resulting from the Covered Activities, including the following:

1. The likely placement of Covered Activities over the term of the permit (see Section 6.4, Methods to Assess Effects of Covered Activities)
2. Best information on the components or elements of each Covered Activity (i.e., construction, operation, and maintenance elements)
3. The likely environmental stressors associated with each element of a Covered Activity
4. Best information on the likely response of each Covered Species to the environmental stressors.

Direct effects are quantified as modeled habitat land cover conversion and removal of documented occurrences of the Covered Species. Indirect effects on documented occurrences and their modeled habitat are provided for vernal pool plant and invertebrate species.

6.6.1 Ahart's Dwarf Rush

Permanent Effects

Permanent direct and indirect effects of Covered Activities on Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*) will include removal, modification, or significant degradation of modeled habitat, as well as direct and indirect take of all individual Ahart's dwarf rush occupying removed, modified, or degraded habitat.

All modeled habitat for Ahart's dwarf rush is within the Vernal Pool Ecosystem, which includes Valley Grassland, Vernal Pool, and Swale (see Section 3.4.1, Plant Covered Species Habitat Models, and Figure 3-3). In addition to the direct removal, modification, or degradation of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds will remove part or all of the perched aquifer and existing hydrology that supports vernal pool and swale habitat. In addition, edge effects will heighten Ahart's dwarf rush's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of vernal pool and swale habitat. Effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for Ahart's dwarf rush.

These indirect effects on vernal pool and swale habitat are included in all permanent effects calculations presented in this section.

There is one documented occurrence of Ahart's dwarf rush in the Plan Area within the UDA in Preserve Planning Unit (PPU) 1. This occurrence will be preserved in a proposed preserve. This occurrence will not be directly or indirectly impacted. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 7,403 acres of Ahart's dwarf rush modeled habitat within the Plan Area (see Table 6-8), including 310 acres of Ahart's dwarf rush modeled aquatic habitats (i.e., vernal pools and swales) and 7,093 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on Ahart's dwarf rush modeled habitat will occur primarily inside the UDA, with approximately 7,340 acres of permanent effects on Vernal Pool Ecosystem in the UDA and approximately 63 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

Table 6-8
Ahart's Dwarf Rush Permanent Effects

Habitat Model Land Cover Types	Plan Area (acres)				Inside UDA (acres)				Outside UDA (acres)			
	Total Available	*Direct Effect*	*Indirect Effect*	*Total Effect*	*Total Available*	*Direct Effect*	*Indirect Effect*	*Total Effect*	*Total Available*	*Direct Effect*	*Indirect Effect*	*Total Effect*

As shown in Table 6-8, approximately 71 acres of Ahart's dwarf rush modeled habitat will be indirectly affected in the Plan Area, 70 acres of which will occur in the UDA as a result of Urban Development Covered Activities. Outside the UDA, 1 acre of Ahart's dwarf rush modeled habitat will be indirectly affected. In addition to the 71 acres of indirect effects quantified in Table 6-8, Covered Activities in the Plan Area will cause other indirect effects to Ahart's dwarf rush that are not easily quantified (Table 6-9 and 6-10). These "other" indirect effects to Ahart's dwarf rush (Table 6-9) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the Ahart's dwarf rush present on existing preserves, future SSHCP proposed preserves (see Chapter 7, Conservation Strategy), and other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on Ahart's dwarf rush will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to Ahart's dwarf rush outside the UDA will occur to Ahart's dwarf rush habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, and pesticide use that will affect Ahart's dwarf rush habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing Ahart's dwarf rush habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-8). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on Ahart's dwarf rush that are not quantified are described qualitatively in Table 6-9, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect Ahart's dwarf rush. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-9
Permanent Indirect Effects on Ahart's Dwarf Rush

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to Ahart's dwarf rush habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats or the hardpan/duripan, avoidance and project design outside of sensitive habitats, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter Ahart's dwarf rush habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on Ahart's dwarf rush. Within the UDA, habitat fragmentation will affect Ahart's dwarf rush because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves will be reduced

Table 6-9
Permanent Indirect Effects on Ahart's Dwarf Rush

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-4 (Nature Trail Location)	through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on Ahart's dwarf rush.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-4 (Nature Trail Location) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, Environmental Stressors from Covered Activities, Covered Activities outside the UDA would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on Ahart's dwarf rush habitat will result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on Ahart's dwarf rush will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memoranda of agreement with responsible fire agencies. In addition, the potential for increased wildfires will be minimized through the implementation of AMMs that reduce the open space–urban interface and control public access within the Preserve.
Vernal Pool Hydrologic Alterations	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Ahart's dwarf rush will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and planned vernal pool Preserves, but indirect effects will occur to an estimated 67.3 acres of Ahart's dwarf rush modeled aquatic habitat (Table 6-8). However, the Ahart's dwarf rush Conservation Strategy (Section 7.6.2.1, Ahart's Dwarf Rush) will offset these unavoidable impacts.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses)	No effects on Ahart's dwarf rush are expected from increased

AGENDA ITEM 11.1

702

Table 6-9
Permanent Indirect Effects on Ahart's Dwarf Rush

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	human activity on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and Ahart's dwarf rush modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter Ahart's dwarf rush aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in Ahart's dwarf rush habitat will not occur.

Table 6-9

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants within the Vernal Pool Ecosystem will introduce competition for resources along with affecting critical hydroperiods for supporting the Ahart's dwarf rush. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on Ahart's dwarf rush. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the Vernal Pool Ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	None required for this species.	No effect on this species.

Table 6-9
Permanent Indirect Effects on Ahart's Dwarf Rush

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on Ahart's dwarf rush or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-10
Temporary Effects to Ahart's Dwarf Rush

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling)	Runoff from construction activities into Ahart's dwarf rush habitat will be fully avoided through implementation of AMMs.

Table 6-10
Temporary Effects to Ahart's Dwarf Rush

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of Ahart's dwarf rush habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. Implementation of AMMs ensures that trampling and compaction will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction dust effects on Ahart's dwarf rush individuals, modeled habitat, and vernal pool water quality will reduce habitat quality for Ahart's dwarf rush. Implementation of AMMs will ensure that dust is controlled and will not affect Ahart's dwarf rush.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas)	Increased human activity in construction and maintenance areas will affect Ahart's dwarf rush habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets will access occupied pools causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect Ahart's dwarf rush habitat quality through direct effects on water quality. Implementation of AMMs will ensure that construction trash and debris are controlled.

Temporary Effects

Ahart's dwarf rush occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to Ahart's dwarf rush. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-8).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on Ahart's dwarf rush are qualitatively described in Table 6-10.

6.6.2 Boggs Lake Hedge-Hyssop

Permanent Effects

Permanent direct and indirect effects of Covered Activities on Boggs Lake hedge-hyssop (*Gratiola heterosepala*) will include removal, modification, or significant degradation of modeled habitat, as well as direct and indirect take of all individual Boggs Lake hedge-hyssop occupying removed, modified, or degraded habitat.

All modeled habitat for Boggs Lake hedge-hyssop is within seasonal wetlands and the Vernal Pool Ecosystem, which includes Valley Grassland and Vernal Pool (see Section 3.4.1, Plant Covered Species Habitat Models, and Figure 3-4). In addition to the direct removal, modification, or degradation of modeled habitat, edge effects on seasonal wetlands or vernal pool micro-watersheds will remove part or all of the perched aquifer and existing hydrology that supports Boggs Lake hedge-hyssop modeled habitat. In addition, edge effects will heighten Boggs Lake hedge-hyssop's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of modeled habitat. In particular, seasonal wetland ecosystems are extremely vulnerable to invasive plants because of the highly effective transport of invasive species along waterways. Invasive species can dominate the biomass of wetland communities where they become established, virtually choking out the native vegetation. In addition, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for Boggs Lake hedge-hyssop. These indirect effects on Boggs Lake hedge-hyssop modeled habitat are included in all permanent effects calculations presented in this section.

Of the 30 documented occurrences of Boggs Lake hedge-hyssop within the Plan Area, 19 are located within the UDA in PPU 1 and PPU 3 and 11 are located outside the UDA in PPU 1. One of the 30 occurrences of Boggs Lake hedge-hyssop will be preserved within a proposed preserve (inside the UDA in PPU 1). Seven of the documented occurrences will be directly impacted: 1 outside the PPUs, 5 in PPU 1, and 1 in PPU 3. No occurrences will be indirectly impacted. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 8,724 acres of Boggs Lake hedge-hyssop modeled habitat within the Plan Area (see Table 6-11), including approximately 292 acres of vernal pools, approximately 8,419 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the vernal pools, and 13 acres of seasonal wetlands. Covered Activity impacts on Boggs Lake hedge-hyssop modeled habitat will occur primarily inside the UDA, with approximately 8,584 acres of permanent effects on modeled habitat in the UDA and approximately 140 acres of permanent effects on modeled habitat outside the UDA.

Table 6-11
Boggs Lake Hedge-Hyssop Permanent Effects

As shown in Table 6-11, approximately 52 acres of Boggs Lake hedge-hyssop modeled habitat will be indirectly affected in the Plan Area, 51 acres of which will occur in the UDA as a result of Urban Development Covered Activities. Outside the UDA, 1 acre of Boggs Lake hedge-hyssop modeled habitat will be indirectly affected. In addition to the 52 acres of indirect effects quantified in Table 6-11, Covered Activities in the Plan Area will cause other permanent indirect effects to Boggs Lake hedge-hyssop that are not easily quantified (Table 6-12). These "other" indirect effects to Boggs Lake hedge-hyssop (Table 6-12) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the Boggs Lake hedge-hyssop present on existing preserves, on future SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on Boggs Lake hedge-hyssop will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to Boggs Lake hedge-hyssop outside the UDA will occur to Boggs Lake hedge-hyssop habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, etc., that will affect Boggs Lake hedge-hyssop habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing Boggs Lake hedge-hyssop habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to seasonal wetlands and Vernal Pool Ecosystem reported in Table 6-11). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on Boggs Lake hedge-hyssop that are not quantified are described qualitatively in Table 6-12, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect Boggs Lake hedge-hyssop. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-12
Permanent Indirect Effects on Boggs Lake Hedge-Hyssop

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to Boggs Lake hedge-hyssop habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents that will impact seasonal wetlands and the Vernal Pool Ecosystem. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats or the hardpan/duripan, avoidance and project design outside of sensitive habitats, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter Boggs Lake hedge-hyssop habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on Boggs Lake hedge-hyssop. Within the UDA, habitat fragmentation will affect Boggs Lake hedge-hyssop because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA

Table 6-12
Permanent Indirect Effects on Boggs Lake Hedge-Hyssop

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-4 (Nature Trail Location)	Preserves will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on Boggs Lake hedge-hyssop.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, Environmental Stressors from Covered Activities, Covered Activities outside the UDA would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on Boggs Lake hedge-hyssop habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on Boggs Lake hedge-hyssop will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memoranda of agreement with responsible fire agencies. In addition, the potential for increased wildfires will be minimized through the implementation of AMMs that reduce the open space–urban interface and control public access within the Preserve.
Vernal Pool Hydrologic Alterations	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Boggs Lake hedge-hyssop will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and planned vernal pool Preserves, but indirect effects will occur to an estimated 52.4 acres of Boggs Lake hedge-hyssop modeled aquatic habitat (Table 6-11). However, the Boggs Lake hedge-hyssop Conservation Strategy (Section 7.6.2.2, Boggs Lake Hedge-Hyssop) will offset these unavoidable impacts.

Table 6-12
Permanent Indirect Effects on Boggs Lake Hedge-Hyssop

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on Boggs Lake hedge-hyssop are expected from increased human activity on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and Boggs Lake hedge-hyssop modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter Boggs Lake hedge-hyssop aquatic habitat, that water chemistry of modeled aquatic habitat will not be affected, and that resultant wildlife community alterations in Boggs Lake hedge-hyssop habitat will not occur.

Table 6-12
Permanent Indirect Effects on Boggs Lake Hedge-Hyssop

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants within seasonal wetlands and the Vernal Pool Ecosystem will introduce competition for resources along with affecting critical hydroperiods for supporting the Boggs Lake hedge-hyssop. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on Boggs Lake hedge-hyssop. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen

Table 6-12
Permanent Indirect Effects on Boggs Lake Hedge-Hyssop

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		deposition will be minimized through monitoring and adaptive management of seasonal wetlands and the Vernal Pool Ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on Boggs Lake hedge-hyssop, seasonal wetlands, or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-13
Temporary Effects to Boggs Lake Hedge-Hyssop

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	Runoff from construction activities into Boggs Lake hedge-hyssop habitat will be fully avoided through implementation of AMMs.

Table 6-13
Temporary Effects to Boggs Lake Hedge-Hyssop

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Water Quality Effects	Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of Boggs Lake hedge-hyssop habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. Implementation of AMMs ensures that trampling and compaction will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction dust effects on Boggs Lake hedge-hyssop individuals, modeled habitat, and vernal pool water quality will reduce habitat quality for Boggs Lake hedge-hyssop. Implementation of AMMs will ensure that dust is controlled and will not affect Boggs Lake hedge-hyssop.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas)	Increased human activity in construction and maintenance areas will affect Boggs Lake hedge-hyssop habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets will access occupied habitat causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect Boggs Lake hedge-hyssop habitat quality through direct effects on water quality. Implementation of AMMs will ensure that construction trash and debris are controlled.

Temporary Effects

Boggs Lake hedge-hyssop occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to Boggs Lake hedge-hyssop. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to seasonal wetlands and Vernal Pool Ecosystem reported in Table 6-11).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on Boggs Lake hedge-hyssop are qualitatively described in Table 6-13.

6.6.3 Dwarf Downingia

Permanent Effects

Permanent direct and indirect effects of Covered Activities on dwarf downingia (*Downingia pusilla*) will include removal, modification, or significant degradation of modeled habitat, as well as direct and indirect take of all individual dwarf downingia occupying removed, modified, or degraded habitat.

All modeled habitat for dwarf downingia is within the Vernal Pool Ecosystem, which includes Valley Grassland, Vernal Pool, and Swale (see Section 3.4.1, Plant Covered Species Habitat Models, and Figures 3-5). In addition to the direct removal, modification, or degradation of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds will remove part or all of the perched aquifer and existing hydrology that supports vernal pool and swale habitat. In addition, edge effects will heighten dwarf downingia's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of vernal pool and swale habitat. Effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for dwarf downingia. These indirect effects on vernal pool and swale habitat are included in all permanent effects calculations presented in this section.

Of the 10 documented dwarf downingia occurrences in the Plan Area, all are located outside the UDA: 8 in PPU 6 and 2 in PPU 7. Covered activities will not directly or indirectly impact any documented occurrence of dwarf downingia. Exhaustive surveys for dwarf downingia have not

been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 1,982 acres of dwarf downingia modeled habitat within the Plan Area (see Table 6-14), including 159 acres of dwarf downingia modeled aquatic habitats (i.e., vernal pools and swales) and 1,823 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on dwarf downingia modeled habitat will occur primarily inside the UDA, with approximately 1,900 acres of permanent effects on Vernal Pool Ecosystem in the UDA and approximately 82 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

As shown in Table 6-14, approximately 19 acres of dwarf downingia modeled habitat will be indirectly affected in the Plan Area, all of which will occur in the UDA as a result of Urban Development Covered Activities. Outside the UDA, no dwarf downingia modeled habitat will be indirectly affected. In addition to the 19 acres of indirect effects quantified in Table 6-14, Covered Activities in the Plan Area will cause other permanent indirect effects to dwarf downingia that are not easily quantified (Table 6-15). These "other" indirect effects to dwarf downingia (Table 6-15) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the dwarf downingia present on existing preserves, on future SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on dwarf downingia will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to dwarf downingia outside the UDA will occur to dwarf downingia habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, etc., that will affect dwarf downingia habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing dwarf downingia habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-14). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on dwarf downingia that are not quantified are described qualitatively in Table 6-15, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect dwarf downingia. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-15
Permanent Indirect Effects on Dwarf Downingia

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to dwarf downingia habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats or the hardpan/duripan, avoidance and project design outside of sensitive habitats, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter dwarf downingia habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on dwarf downingia. Within the UDA, habitat fragmentation will affect dwarf downingia because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves will be reduced through

Table 6-15
Permanent Indirect Effects on Dwarf Downingia

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-4 (Nature Trail Location)	EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on dwarf downingia.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, Environmental Stressors from Covered Activities, Covered Activities outside the UDA would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on dwarf downingia habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on dwarf downingia will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memoranda of agreement with responsible fire agencies. In addition, the potential for increased wildfires will be minimized through the implementation of AMMs that reduce the open space–urban interface and control public access within the Preserve.
Vernal Pool Hydrologic Alterations	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Dwarf downingia will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and planned vernal pool Preserves, but indirect effects will occur to an estimated 19.4 acres of dwarf downingia modeled aquatic habitat (Table 6-14). However, the dwarf downingia Conservation Strategy (Section 7.6.2.3, Dwarf Downingia) will offset these unavoidable impacts.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses)	No effects on dwarf downingia are expected from increased human

Table 6-15

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	activity on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and dwarf downingia modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter dwarf downingia aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in dwarf downingia habitat will not occur.

Table 6-15
Permanent Indirect Effects on Dwarf Downingia

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants within the Vernal Pool Ecosystem will introduce competition for resources along with affecting critical hydroperiods for supporting the dwarf downingia. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on dwarf downingia. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the Vernal Pool Ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	None required for this species.	No effect on this species.

Table 6-15

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on dwarf downingia or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-16
Temporary Effects to Dwarf Downingia

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling)	Runoff from construction activities into dwarf downingia habitat will be fully avoided through implementation of AMMs.

Table 6-16
Temporary Effects to Dwarf Downingia

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of dwarf downingia habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. Implementation of AMMs ensures that trampling and compaction will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction dust effects on dwarf downingia individuals, modeled habitat, and vernal pool water quality will reduce habitat quality for dwarf downingia. Implementation of AMMs will ensure that dust is controlled and will not affect dwarf downingia.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas)	Increased human activity in construction and maintenance areas will affect dwarf downingia habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets will access occupied pools causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect dwarf downingia habitat quality through direct effects on water quality. Implementation of AMMs will ensure that construction trash and debris are controlled.

Temporary Effects

Dwarf downingia occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to dwarf downingia. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-14).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on dwarf downingia are qualitatively described in Table 6-16.

6.6.4 Legenere

Permanent Effects

Permanent direct and indirect effects of Covered Activities on legenere (*Legenere limosa*) will include removal, modification, or significant degradation of modeled habitat, as well as direct and indirect take of all individual legenere occupying removed, modified, or degraded habitat.

All modeled habitat for legenere is within seasonal wetlands and the Vernal Pool Ecosystem, which includes Valley Grassland and Vernal Pool (see Section 3.4.1, Plant Covered Species Habitat Models, and Figure 3-6). In addition to the direct removal, modification, or degradation of modeled habitat, edge effects on seasonal wetlands or vernal pool micro-watersheds will remove part or all of the perched aquifer and existing hydrology that supports legenere modeled habitat. In addition, edge effects will heighten legenere's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of modeled habitat. In particular, seasonal wetland ecosystems are extremely vulnerable to invasive plants because of the highly effective transport of invasive species along waterways. Invasive species can dominate the biomass of wetland communities where they become established, virtually choking out the native vegetation. In addition, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for legenere. These indirect effects on legenere modeled habitat are included in all permanent effects calculations presented in this section.

Of the 56 documented occurrences in the Plan Area, 30 are located within the UDA and 26 are outside the UDA. Covered activities will directly impact 2 documented occurrences within the UDA, including 1 in PPU 1 and 1 in PPU 3. Covered activities will indirectly impact 3

documented occurrences within the UDA in PPU 1 and 2 in PPU 3. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 10,778 acres of legenere modeled habitat within the Plan Area (see Table 6-17), including 341 acres of vernal pools, 10,401 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the vernal pools, and 36 acres of seasonal wetlands. Covered Activity impacts on legenere modeled habitat will occur primarily inside the UDA, with approximately 10,625 acres of permanent effects on modeled habitat in the UDA and approximately 153 acres of permanent effects on modeled habitat outside the UDA.

Table 6-17
Legenere Permanent Effects

As shown in Table 6-17, approximately 65 acres of legenere modeled habitat will be indirectly affected in the Plan Area, 64 acres of which will occur in the UDA as a result of Urban Development Covered Activities. Outside the UDA, 1 acre of legenere modeled habitat will be indirectly affected. In addition to the 65 acres of indirect effects quantified in Table 6-17, Covered Activities in the Plan Area will cause other permanent indirect effects to legenere that are not easily quantified (Table 6-18). These "other" indirect effects to legenere (Table 6-18) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the legenere present on existing preserves, on future SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on legenere will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to legenere outside the UDA will occur to legenere habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, etc., that will affect legenere habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing legenere habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to seasonal wetlands and Vernal Pool Ecosystem reported in Table 6-17). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on legenere that are not quantified are described qualitatively in Table 6-18, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect legenere. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-18
Permanent Indirect Effects on Legenere

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to legenere habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents that will impact seasonal wetlands and the Vernal Pool Ecosystem. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats or the hardpan/duripan, avoidance and project design outside of sensitive habitats, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter legenere habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on legenere. Within the UDA, habitat fragmentation will affect legenere because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves will be reduced through

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and legenere modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter legenere aquatic habitat, that water chemistry of modeled aquatic habitat will not be affected, and that resultant wildlife community alterations in legenere habitat will not occur.

Table 6-18
Permanent Indirect Effects on Legenere

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants within seasonal wetlands and the Vernal Pool Ecosystem will introduce competition for resources along with affecting critical hydroperiods for supporting the legenere. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on legenere. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of seasonal wetlands and the Vernal Pool Ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	None required for this species.	No effect on this species.

Table 6-18
Permanent Indirect Effects on Legenere

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on legenere, seasonal wetlands, or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-19
Temporary Effects to Legenere

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling)	Runoff from construction activities into legenere habitat will be fully avoided through implementation of AMMs.

Table 6-19
Temporary Effects to Legenere

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of legenere habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. Implementation of AMMs ensures that trampling and compaction will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction dust effects on legenere individuals, modeled habitat, and vernal pool water quality will reduce habitat quality for legenere. Implementation of AMMs will ensure that dust is controlled and will not affect legenere.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas)	Increased human activity in construction and maintenance areas will affect legenere habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets will access occupied habitat causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect legenere habitat quality through direct effects on water quality. Implementation of AMMs will ensure that construction trash and debris are controlled.

Temporary Effects

Legenere occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to legenere. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to seasonal wetlands and Vernal Pool Ecosystem reported in Table 6-17).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on legenere are qualitatively described in Table 6-19.

6.6.5 Pincushion Navarretia

Permanent Effects

Permanent direct and indirect effects of Covered Activities on pincushion navarretia (*Navarretia myersii*) will include removal, modification, or significant degradation of modeled habitat, as well as direct and indirect take of all individual pincushion navarretia occupying removed, modified, or degraded habitat.

All modeled habitat for pincushion navarretia is within the Vernal Pool Ecosystem, which includes Valley Grassland, Vernal Pool, and Swale (see Section 3.4.1, Plant Covered Species Habitat Models, and Figure 3-7). In addition to the direct removal, modification, or degradation of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds will remove part or all of the perched aquifer and existing hydrology that supports vernal pool and swale habitat. In addition, edge effects will heighten pincushion navarretia's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of vernal pool and swale habitat. Effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for pincushion navarretia. These indirect effects on vernal pool and swale habitat are included in all permanent effects calculations presented in this section.

Of the 48 documented occurrences of pincushion navarretia in the Plan Area, all are located outside the UDA in PPU 7. No documented occurrences of pincushion navarretia will be directly or indirectly impacted. Exhaustive surveys for pincushion navarretia have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 8,258 acres of pincushion navarretia modeled habitat within the Plan Area (see Table 6-20), including 271 acres of pincushion navarretia aquatic habitats (i.e., vernal pools and swales) and 7,987 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on pincushion navarretia modeled habitat will occur primarily inside the UDA, with approximately 8,175 acres of permanent effects on Vernal Pool Ecosystem in the UDA and approximately 83 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

Table 6-20
Pincushion Navarretia Permanent Effects

Habitat Model Land Cover Types	Plan Area (acres)				Inside UDA (acres)				Outside UDA (acres)			
	Total Available	*Direct Effect*	*Indirect Effect*	*Total Effect*	*Total Available*	*Direct Effect*	*Indirect Effect*	*Total Effect*	*Total Available*	*Direct Effect*	*Indirect Effect*	*Total Effect*
Valley Grassland	54,967	7,987	Qualitative	7,987	11,440	7,910	Qualitative	7,910	43,527	77	Qualitative	77
Vernal Pool	1,844	118	36	154	475	114	35	149	1,369	4	1	5
Swale	627	96	21	117	186	95	21	116	441	1	0	1
Vernal Pool Ecosystem	**57,438**	**8,201**	**57**	**8,258**	**12,101**	**8,119**	**56**	**8,175**	**45,337**	**82**	**1**	**83**

As shown in Table 6-20, approximately 57 acres of pincushion navarretia modeled habitat will be indirectly affected in the Plan Area, 56 acres of which will occur in the UDA as a result of Urban Development Covered Activities. Outside the UDA, 1 acre of pincushion navarretia modeled habitat will be indirectly affected. In addition to the 57 acres of indirect effects quantified in Table 6-20, Covered Activities in the Plan Area will cause other permanent indirect effects to pincushion navarretia that are not easily quantified (Table 6-21). These "other" indirect effects to pincushion navarretia (Table 6-21) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the pincushion navarretia present on existing preserves, on future SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on pincushion navarretia will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to pincushion navarretia outside the UDA will occur to pincushion navarretia habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, etc., that will affect pincushion navarretia habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing pincushion navarretia habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-20). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on pincushion navarretia that are not quantified are described qualitatively in Table 6-21, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect pincushion navarretia. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-21
Permanent Indirect Effects on Pincushion Navarretia

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to pincushion navarretia habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats or the hardpan/duripan, avoidance and project design outside of sensitive habitats, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter pincushion navarretia habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on pincushion navarretia. Within the UDA, habitat fragmentation will affect pincushion navarretia because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA

Table 6-21
Permanent Indirect Effects on Pincushion Navarretia

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-4 (Nature Trail Location)	Preserves will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on pincushion navarretia.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, Environmental Stressors from Covered Activities, Covered Activities outside the UDA would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on pincushion navarretia habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on pincushion navarretia will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memoranda of agreement with responsible fire agencies. In addition, the potential for increased wildfires will be minimized through the implementation of AMMs that reduce the open space–urban interface and control public access within the Preserve.
Vernal Pool Hydrologic Alterations	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Pincushion navarretia will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and planned vernal pool Preserves, but indirect effects will occur to an estimated 57.5 acres of pincushion navarretia modeled aquatic habitat (Table 6-20). However, the pincushion navarretia Conservation Strategy (Section 7.6.2.5, Pincushion Navarretia) will offset these unavoidable impacts.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.

Table 6-21
Permanent Indirect Effects on Pincushion Navarretia

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on pincushion navarretia are expected from increased human activity on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and pincushion navarretia modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter pincushion navarretia aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in pincushion navarretia habitat will not occur.

	Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants within the Vernal Pool Ecosystem will introduce competition for resources along with affecting critical hydroperiods for supporting the pincushion navarretia. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on pincushion navarretia. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the Vernal Pool Ecosystem on Preserves and through AMMs related to invasive species.

Table 6-21
Permanent Indirect Effects on Pincushion Navarretia

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Animals	None required for this species.	No effect on this species. As described above in Wildlife Community Alterations, invasion by non-native plants will be avoided through preservation of existing vernal pool inundation period and water chemistry.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on pincushion navarretia or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-22
Temporary Effects to Pincushion Navarretia

Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	Runoff from construction activities into pincushion navarretia habitat will be fully avoided through implementation of AMMs.

Table 6-22
Temporary Effects to Pincushion Navarretia

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of pincushion navarretia habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. Implementation of AMMs ensures that trampling and compaction will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction dust effects on pincushion navarretia individuals, modeled habitat, and vernal pool water quality will reduce habitat quality for pincushion navarretia. Implementation of AMMs will ensure that dust is controlled and will not affect pincushion navarretia.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas)	Increased human activity in construction and maintenance areas will affect pincushion navarretia habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets will access occupied pools causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect pincushion navarretia habitat quality through direct effects on water quality. Implementation of AMMs will ensure that construction trash and debris are controlled.

Temporary Effects

Pincushion navarretia occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to pincushion navarretia. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-20).

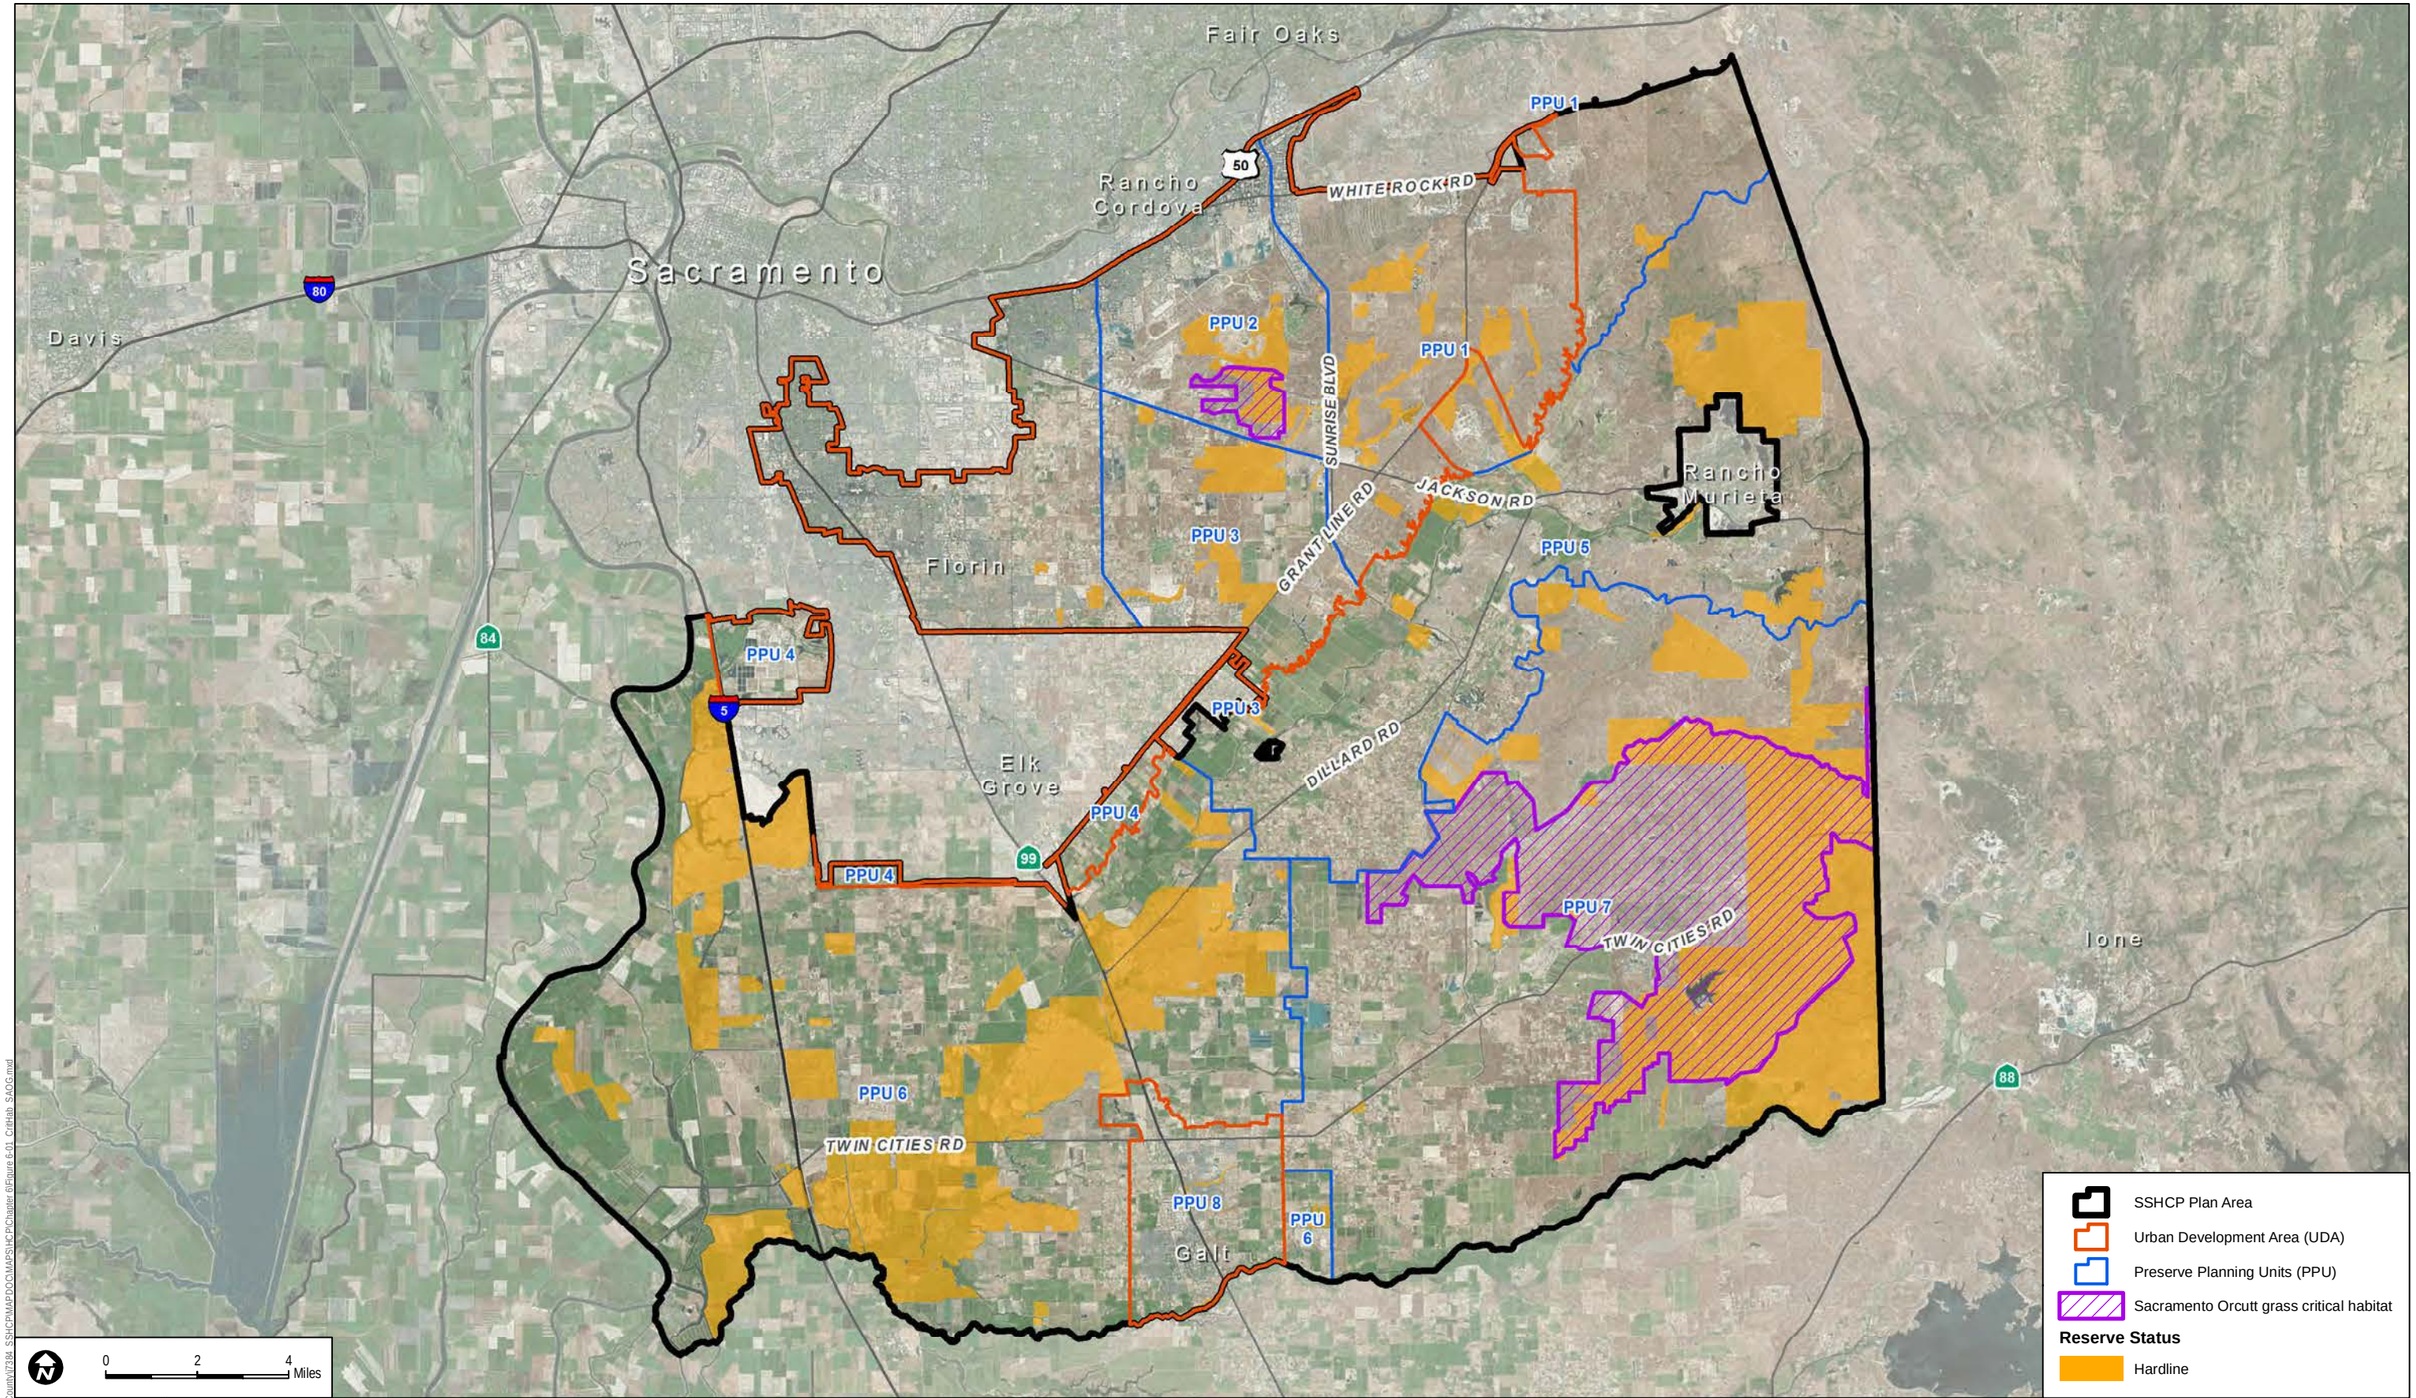
These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on pincushion navarretia are qualitatively described in Table 6-22.

6.6.6 Sacramento Orcutt Grass

Permanent Effects

Permanent direct and indirect effects of Covered Activities on Sacramento Orcutt grass (*Orcuttia viscida*) will include removal, modification, or significant degradation of modeled habitat. No individual Sacramento Orcutt grass occurrences will be removed.

All modeled habitat for Sacramento Orcutt grass is within the Vernal Pool Ecosystem, which includes Valley Grassland and Vernal Pool (see Section 3.4.1, Plant Covered Species Habitat Models, and Figure 3-8). In addition to the direct removal, modification, or degradation of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds will remove part or all of the perched aquifer and existing hydrology that supports vernal pool habitat. In addition, edge effects will heighten Sacramento Orcutt grass's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of vernal pool habitat. Effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for Sacramento Orcutt grass, or non-native species outcompeting Sacramento Orcutt grass. These indirect effects on vernal pool habitat are included in all permanent effects calculations presented in this section.



There are 40 documented occurrences of Sacramento Orcutt grass distributed in the Plan Area, 30 of which are outside the UDA, including 28 in PPU 1 and 2 in PPU 7. There are 10 occurrences in the UDA including 8 in PPU 1 and 2 in PPU 3. Covered activities will not directly impact any occurrences of this species. Exhaustive surveys for Sacramento Orcutt grass have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area; however, additional occurrences will be avoided. Due to its rarity,

take of this species is not permitted under the SSHCP with the exception of take related to Preserve management and monitoring.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 7,187 acres of Sacramento Orcutt grass modeled habitat within the Plan Area (see Table 6-23), including 196 acres of Sacramento Orcutt grass modeled aquatic habitats (i.e., vernal pools) and 6,991 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on Sacramento Orcutt grass will occur primarily inside the UDA, with approximately 7,116 acres of permanent effects on Vernal Pool Ecosystem in the UDA and approximately 70 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

The total 7,187 acres of permanent direct and indirect effects to Sacramento Orcutt grass modeled habitat includes removal of approximately 4,704 acres of Vernal Pool Ecosystem within the two Plan Area Core Recovery Areas (USFWS 2005). Effects inside the UDA include permanent effects to approximately 4,683 acres of Vernal Pool Ecosystem in the Mather Core Recovery Area (Table 6-24). Outside the UDA, 21 acres of Vernal Pool Ecosystem within the Cosumnes/Rancho-Seco Core Recovery Area will be affected by Covered Activities.

Permanent direct and indirect effects to Sacramento Orcutt grass modeled habitat include removal of approximately 248 acres of Vernal Pool Ecosystem in designated Critical Habitat (USFWS 2006) inside the UDA within Unit 2 and outside the UDA in Unit 3 (see Figure 6-1). Approximately 235 acres of Vernal Pool Ecosystem will be removed in Unit 2, including 12 acres of modeled aquatic habitat and 223 acres of supporting upland habitat. In Unit 3, a total of 13 acres of Vernal Pool Ecosystem will be removed (see Tables 6-23, 6-24, 6-25, and Figure 3-8).

As shown in Table 6-23, approximately 48 acres of Sacramento Orcutt grass modeled habitat will be indirectly affected in the Plan Area, 47 acres of which will occur in the UDA as a result of Urban Development Covered Activities. Outside the UDA, 1 acre of Sacramento Orcutt grass modeled habitat will be indirectly affected. In addition to the 48acres of indirect effects quantified in Table 6-23, Covered Activities in the Plan Area will cause other permanent indirect effects to Sacramento Orcutt grass that are not easily quantified (Table 6-26). These "other" indirect effects to Sacramento Orcutt grass (Table 6-26) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the Sacramento Orcutt grass present on existing preserves, on future SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on Sacramento Orcutt grass will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to Sacramento Orcutt grass outside the UDA will occur to Sacramento Orcutt grass habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, etc., that will affect the Vernal Pool Ecosystem that provides Sacramento Orcutt grass habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing Sacramento Orcutt grass habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-23). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on Sacramento Orcutt grass that are not quantified are described qualitatively in Table 6-26, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect Sacramento Orcutt grass. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-26
Permanent Indirect Effects on Sacramento Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to Sacramento Orcutt grass habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats or the hardpan/duripan, avoidance and project design outside of sensitive habitats, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter Sacramento Orcutt grass habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	The Landscape Preserves established outside the UDA, including in the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on Sacramento Orcutt grass. Within the UDA, habitat fragmentation will affect Sacramento Orcutt grass because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of

Table 6-26
Permanent Indirect Effects on Sacramento Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-4 (Nature Trail Location)	EDGE AMMs. The effects of roads fragmenting some UDA Preserves will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on the Sacramento Orcutt grass population in the Mather Core Recovery Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, Environmental Stressors from Covered Activities, Covered Activities outside the UDA would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on Sacramento Orcutt grass habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on Sacramento Orcutt grass will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memoranda of agreement with responsible fire agencies. In addition, the potential for increased wildfires will be minimized through the implementation of AMMs that reduce the open space–urban interface and control public access within the Preserve.
Vernal Pool Hydrologic Alterations	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Sacramento Orcutt grass will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and planned vernal pool Preserves, but indirect effects will occur to an estimated 47.9 acres of Sacramento Orcutt grass modeled aquatic habitat (Table 6-23). However, the Sacramento Orcutt grass Conservation Strategy (Section 7.6.2.6, Sacramento Orcutt Grass) will offset these unavoidable impacts.

Table 6-26
Permanent Indirect Effects on Sacramento Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on Sacramento Orcutt grass are expected from increased human activity on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and Sacramento Orcutt grass modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter Sacramento Orcutt grass aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in Sacramento Orcutt grass habitat will not occur.

Table 6-26
Permanent Indirect Effects on Sacramento Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants within the Vernal Pool Ecosystem will introduce competition for resources along with affecting critical hydroperiods for supporting the Sacramento Orcutt grass. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on Sacramento Orcutt grass. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and

Table 6-26
Permanent Indirect Effects on Sacramento Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		adaptive management of the Vernal Pool Ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on Sacramento Orcutt grass or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-27
Temporary Effects to Sacramento Orcutt Grass

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	Runoff from construction activities into Sacramento Orcutt grass habitat will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) ORCUTT-1 (Orcutt Grass Survey) ORCUTT-2 (Orcutt Grass Protection)	Inadvertent trampling and compaction of Sacramento Orcutt grass habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. In addition, if a Covered Activity is located within 1 mile of the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for Sacramento Orcutt grass. Any occurrences detected will be protected within an SSHCP Preserve at least 50 acres in size. Implementation of AMMs ensures that trampling, compaction, and take of this species will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction dust effects on Sacramento Orcutt grass individuals, modeled habitat, and vernal pool water quality will reduce habitat quality for Sacramento Orcutt grass. Implementation of AMMs will ensure that dust is controlled and will not affect Sacramento Orcutt grass.

Table 6-27
Temporary Effects to Sacramento Orcutt Grass

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas)	Increased human activity in construction and maintenance areas will affect Sacramento Orcutt grass habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets will access occupied pools causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect Sacramento Orcutt grass habitat quality through direct effects on water quality. Implementation of AMMs will ensure that construction trash and debris are controlled.

Temporary Effects

Sacramento Orcutt grass occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to Sacramento Orcutt grass. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-23).

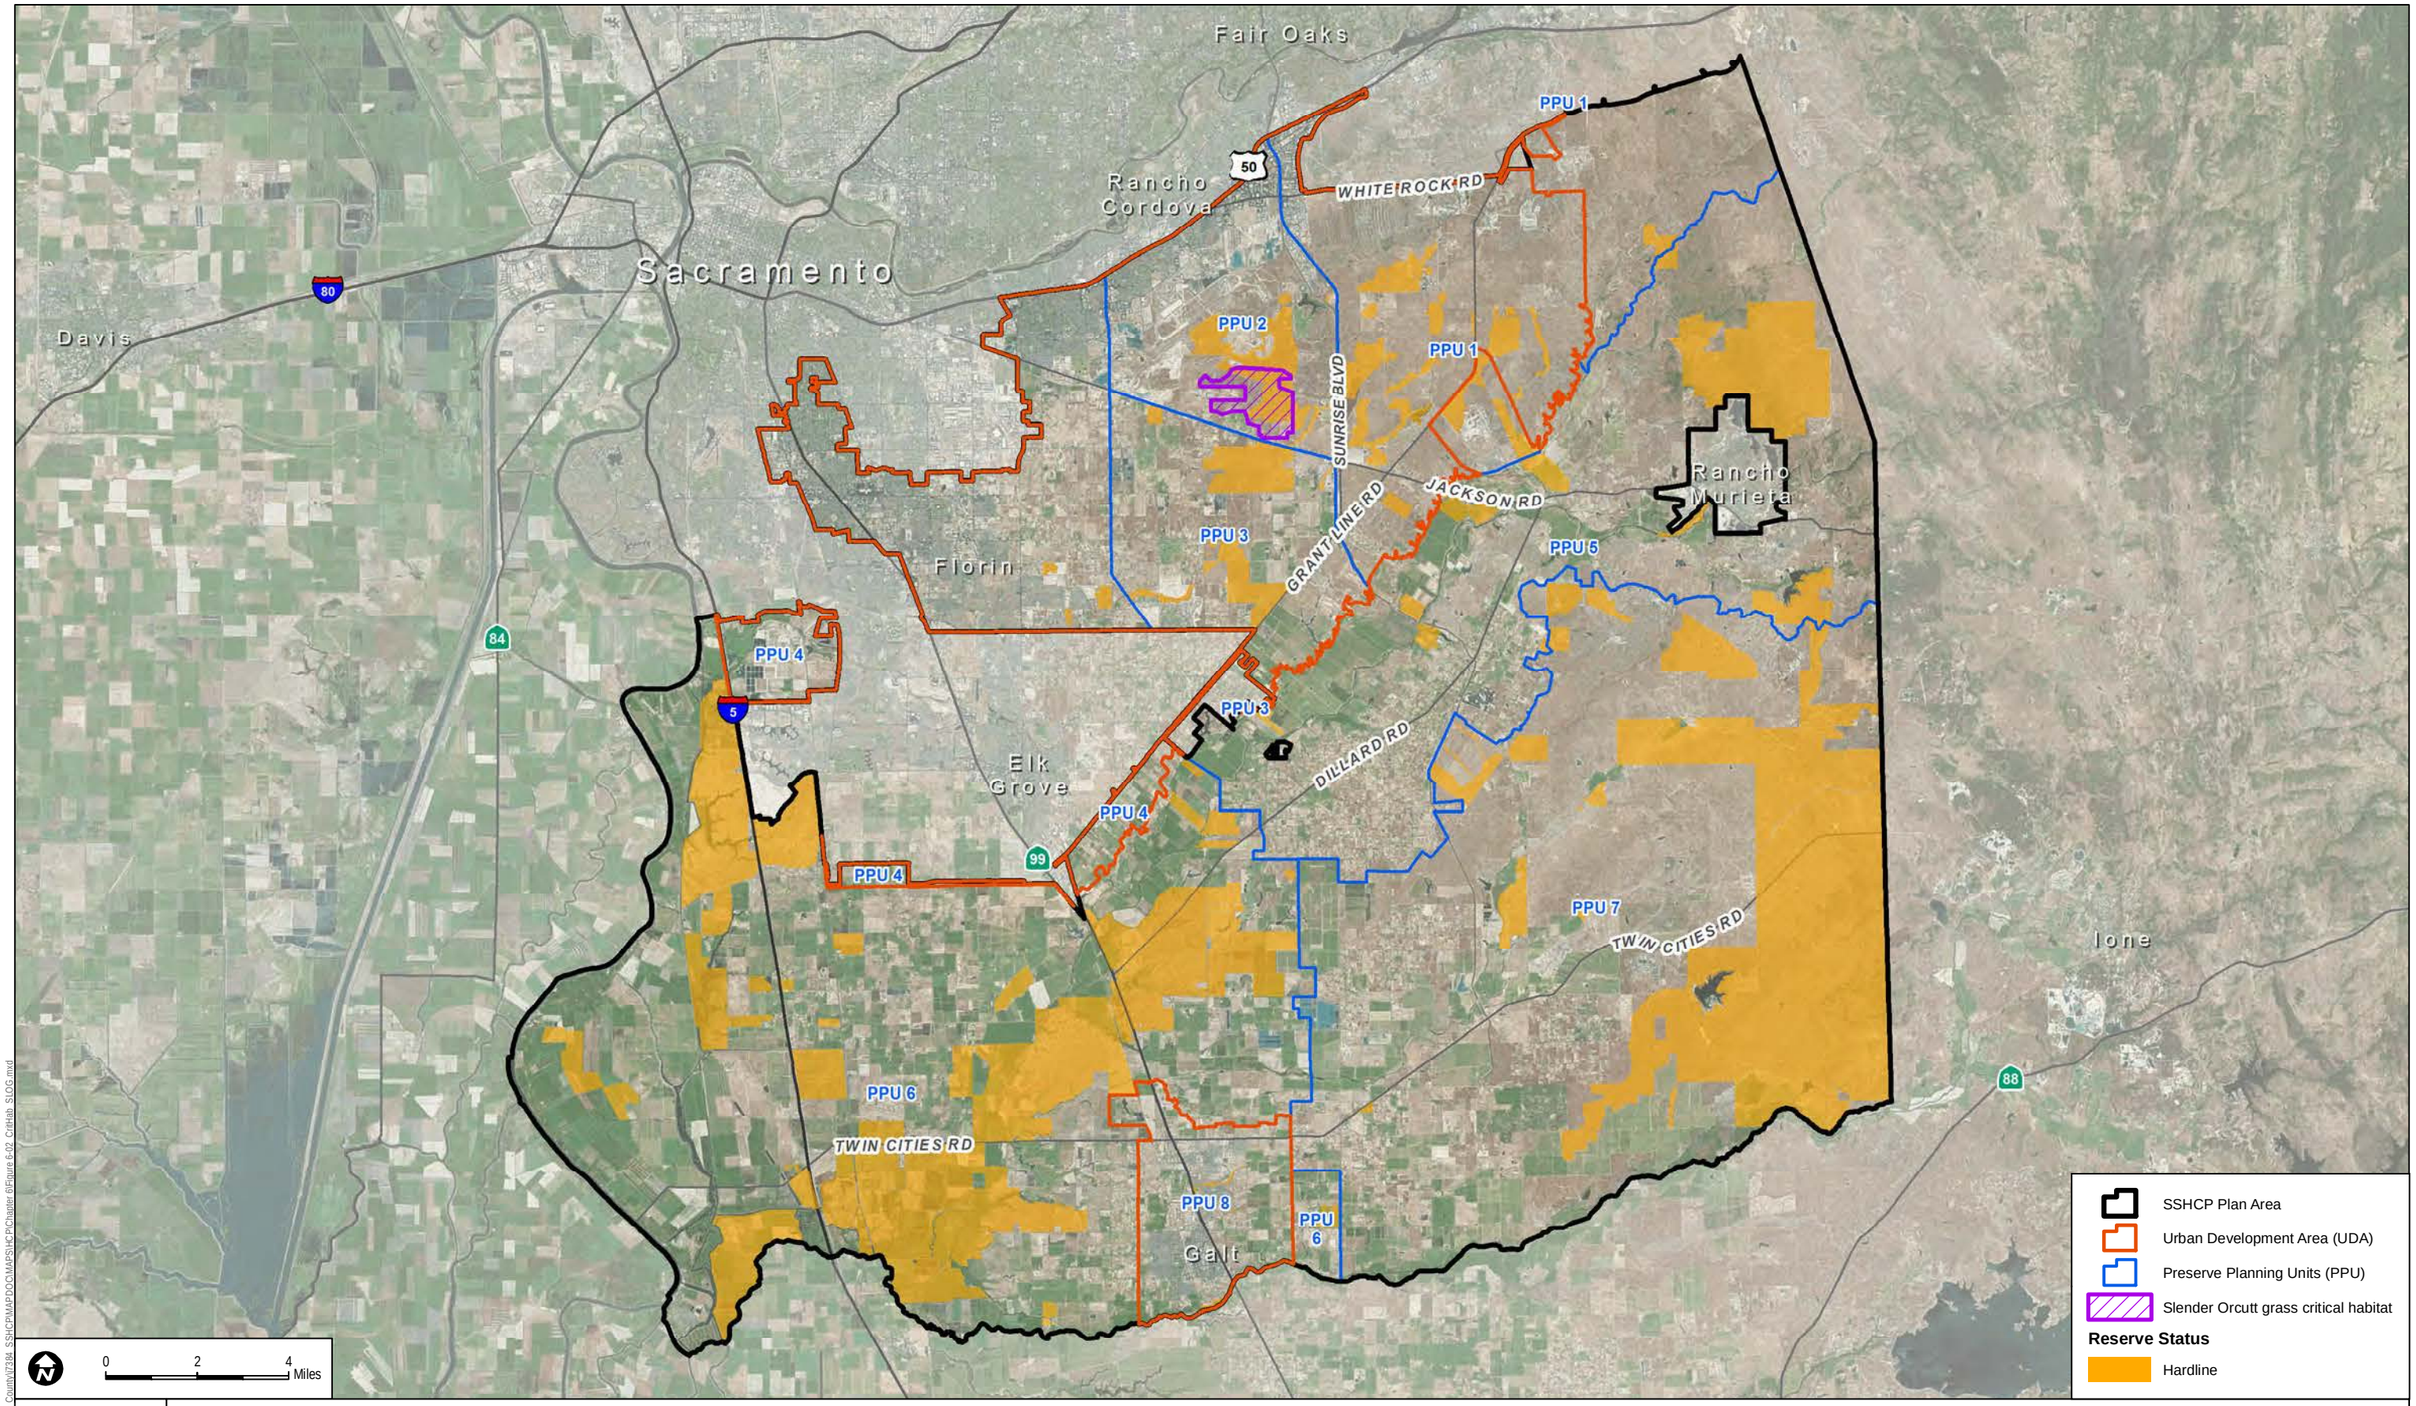
These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on Sacramento Orcutt grass are qualitatively described in Table 6-27.

6.6.7 Slender Orcutt Grass

Permanent Effects

Permanent direct and indirect effects of Covered Activities on slender Orcutt grass (*Orcuttia tenuis*) will include removal, modification, or significant degradation of modeled habitat. No individual slender Orcutt grass occurrences will be removed.

All modeled habitat for slender Orcutt grass is within the Vernal Pool Ecosystem, which includes Valley Grassland and Vernal Pool (see Section 3.4.1, Plant Covered Species Habitat Models, and Figure 3-9). In addition to the direct removal, modification, or degradation of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds will remove part or all of the perched aquifer and existing hydrology that supports vernal pool habitat. In addition, edge effects will heighten slender Orcutt grass's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of vernal pool habitat. Effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for slender Orcutt grass. These indirect effects on vernal pool habitat are included in all permanent effects calculations presented in this section.



There are four documented occurrences of slender Orcutt grass distributed in the Plan Area, all within the UDA: one of the occurrences is in PPU 1 and three are in PPU 3. Three (75%) of the four occurrences will be preserved in a proposed preserve (all inside the UDA in PPU 3). Covered activities will not directly impact any occurrences of this species. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area; however, additional occurrences will be

avoided. Due to its rarity, take of this species is not permitted under the SSHCP with the exception of take related to Preserve management and monitoring.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 7,187 acres of slender Orcutt grass modeled habitat within the Plan Area (see Table 6-28), including 196 acres of slender Orcutt grass aquatic habitats (i.e., vernal pools) and 6,991 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on slender Orcutt grass modeled habitat will occur primarily inside the UDA, with approximately 7,116 acres of permanent effects on Vernal Pool Ecosystem in the UDA and approximately 71 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

The total 7,187 acres of permanent direct and indirect effects to slender Orcutt grass modeled habitat includes removal of approximately 4,704 acres of Vernal Pool Ecosystem within the two Plan Area Core Recovery Areas (USFWS 2005). Effects inside the UDA include permanent effects to approximately 4,683 acres of Vernal Pool Ecosystem in the Mather Core Recovery Area (Table 6-29). Outside the UDA, 21 acres of Vernal Pool Ecosystem within the Cosumnes/Rancho-Seco Core Recovery Area will be affected by Covered Activities.

Permanent direct and indirect effects include removal of approximately 235 acres of Vernal Pool Ecosystem in designated Critical Habitat (USFWS 2006) inside the UDA within Unit 6, including 12 acres of modeled aquatic habitat and approximately 223 acres of supporting upland habitat (see Tables 6-28, 6-29, 6-30, and Figures 3-9 and 6-2).

As shown in Table 6-28, approximately 48 acres of slender Orcutt grass modeled habitat will be indirectly affected in the Plan Area, 47 acres of which will occur in the UDA as a result of Urban Development Covered Activities. Outside the UDA, 1 acre of slender Orcutt grass modeled habitat will be indirectly affected. In addition to the 48 acres of indirect effects quantified in Table 6-28, Covered Activities in the Plan Area will cause other permanent indirect effects to slender Orcutt grass that are not easily quantified (Table 6-31). These "other" indirect effects to slender Orcutt grass (Table 6-31) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the slender Orcutt grass present on existing preserves, on future SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on slender Orcutt grass will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to slender Orcutt grass outside the UDA will occur to slender Orcutt grass habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, etc., that will affect slender Orcutt grass habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing slender Orcutt grass habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-28). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on slender Orcutt grass that are not quantified are described qualitatively in Table 6-31, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect slender Orcutt grass. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-31
Permanent Indirect Effects on Slender Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to slender Orcutt grass habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats or the hardpan/duripan, avoidance and project design outside of sensitive habitats, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter slender Orcutt grass habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets)	The Landscape Preserves established outside the UDA, including in the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on slender Orcutt grass. Within the UDA, habitat fragmentation will affect slender Orcutt grass because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The

Table 6-31
Permanent Indirect Effects on Slender Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-4 (Nature Trail Location)	effects of roads fragmenting some UDA Preserves will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on the slender Orcutt grass population in the Mather Core Recovery Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, Environmental Stressors from Covered Activities, Covered Activities outside the UDA would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on slender Orcutt grass habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on slender Orcutt grass will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memoranda of agreement with responsible fire agencies. In addition, the potential for increased wildfires will be minimized through the implementation of AMMs that reduce the open space–urban interface and control public access within the Preserve.
Vernal Pool Hydrologic Alterations	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Slender Orcutt grass will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and planned vernal pool Preserves, but indirect effects will occur to an estimated 47.9 acres of slender Orcutt grass modeled aquatic habitat (Table 6-28). However, the slender Orcutt grass Conservation Strategy (Section 7.6.2.7, Slender Orcutt Grass) will offset these unavoidable impacts.

Table 6-31
Permanent Indirect Effects on Slender Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on slender Orcutt grass are expected from increased human activity on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and slender Orcutt grass modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter slender Orcutt grass aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in slender Orcutt grass habitat will not occur.

Table 6-31
Permanent Indirect Effects on Slender Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants within the Vernal Pool Ecosystem will introduce competition for resources along with affecting critical hydroperiods for supporting the slender Orcutt grass. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on slender Orcutt grass. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the Vernal Pool Ecosystem on Preserves and through AMMs related to invasive species.

Table 6-31
Permanent Indirect Effects on Slender Orcutt Grass

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on slender Orcutt grass or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-32
Temporary Effects to Slender Orcutt Grass

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	Runoff from construction activities into slender Orcutt grass habitat will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) ORCUTT-1 (Orcutt Grass Survey) ORCUTT-2 (Orcutt Grass Protection)	Inadvertent trampling and compaction of slender Orcutt grass habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. In addition, if a Covered Activity is located within 1 mile of the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for slender Orcutt grass. Any occurrences detected will be protected within an SSHCP Preserve at least 50 acres in size. Implementation of AMMs ensures that trampling, compaction, and take of this species will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction dust effects on slender Orcutt grass individuals, modeled habitat, and vernal pool water quality will reduce habitat quality for slender Orcutt grass. Implementation of AMMs will ensure that dust is controlled and will not affect slender Orcutt grass.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Increased human activity in construction and maintenance areas will affect slender Orcutt grass habitat quality through personnel

Table 6-32
Temporary Effects to Slender Orcutt Grass

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	SPECIES-2 (No Pets in Construction Areas)	bringing pets (e.g., dogs) to work sites. Pets will access occupied pools causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction)	Runoff from construction activities into slender Orcutt grass habitat will be fully avoided through implementation of AMMs.

Temporary Effects

Slender Orcutt grass occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to slender Orcutt grass. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool Ecosystem reported in Table 6-28).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on slender Orcutt grass are qualitatively described in Table 6-32.

6.6.8 Sanford's Arrowhead

Permanent Effects

Permanent direct and indirect effects of Covered Activities on Sanford's arrowhead (*Sagittaria sanfordii*) will include removal, modification, or significant degradation of modeled habitat, as well as direct and indirect take of all individual Sanford's arrowhead occupying removed, modified, or degraded habitat.

All modeled habitat for Sanford's arrowhead includes Freshwater Marsh, Open Water, Seasonal Wetland, Streams/Creek, and Valley Grassland that supports the hydrology and ecology of the aquatic habitats (see Section 3.4.1, Plant Covered Species Habitat Models, and Figure 3-10). In addition to the direct removal, modification, or degradation of modeled habitat, edge effects will heighten Sanford's arrowhead's vulnerability to stochastic disturbances, pollution, and invasion by non-native plants, which displace native species and adversely affect the composition of modeled habitat. By permanently increasing the extent of impermeable surfaces, urban development will result in increased runoff, which will change the hydrograph (i.e., rate of runoff) of creeks and streams, result in greater levels of scour and/or incision, increase sediment loads downstream, alter downstream hydrology, and decrease groundwater recharge. In addition, an increased quantity of pollutants will reach local creeks and affect the characteristics of Sanford's arrowhead modeled aquatic habitats. In addition, riparian and wetland ecosystems are extremely vulnerable to invasive plants because of the highly effective transport of invasive species along rivers and streams. Invasive species can dominate the biomass of riparian and wetland communities where they become established, virtually choking out the native vegetation. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for Sanford's arrowhead. These indirect effects on modeled habitat are included in all permanent effects calculations presented in this section.

Of the 63 documented occurrences of Sanford's arrowhead within the Plan Area, 14 are located inside the UDA and 49 are located outside the UDA. Twelve of the documented occurrences will be directly impacted, all of which are inside the UDA (7 outside of the PPUs, 3 in PPU 2, 1 in PPU 3, and 1 in PPU 4). No documented occurrences will be indirectly impacted. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 10,620 acres of Sanford's arrowhead modeled habitat within the Plan Area (see Table 6-33), including 103 acres of freshwater marsh, 68 acres of open water, 72 acres of seasonal wetlands, 83 acres of streams/creeks, and 10,294 acres of surrounding Valley Grassland that supports the hydrology and ecology of the aquatic habitats. Covered Activity impacts on Sanford's arrowhead will occur primarily inside the UDA, with approximately 10,397 acres of permanent effects on modeled habitat in the UDA and approximately 223 acres of permanent effects on modeled habitat outside the UDA.

As shown in Table 6-33, Covered Activities in the Plan Area will cause permanent indirect effects to Sanford's arrowhead that are not easily quantified. These "other" indirect effects to Sanford's arrowhead (Table 6-33) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the Sanford's arrowhead present on existing preserves, on future SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will be avoided inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on Sanford's arrowhead will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and future SSHCP proposed preserves outside the UDA are much larger than the existing and planned UDA Preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the modeled habitat within Preserves.

Most indirect effects to Sanford's arrowhead outside the UDA will occur to Sanford's arrowhead habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, pesticide use, etc., that will affect Sanford's arrowhead habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing Sanford's arrowhead habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects reported in Table 6-33). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on Sanford's arrowhead that are not quantified are described qualitatively in Table 6-34, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect Sanford's arrowhead. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-34
Permanent Indirect Effects on Sanford's Arrowhead

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-2 (Groundwater Recharge) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams) Condition 7, STREAM-4 (Minimize Effects from Temporary Channel Re-routing) Condition 7, STREAM-5 (Design for Stream Channel Re-Routing) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	The close proximity of planned development and roads to Sanford's arrowhead habitat will increase hydrologic and water quality effects, including urban runoff that alter normal hydroperiods in occupied pools and contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Hydrologic factors are important in triggering germination and providing a suitable environment for completing the reproductive cycle (see Appendix B, Species Accounts, for more details). Implementation of AMMs such as those that require control of stormwater runoff, control of pollutants and toxins, protection of sensitive habitats, avoidance and project design outside of sensitive habitats, setbacks for streams/creeks, measures to minimize effects from channel re-routing, educational awareness for workers, and monitoring of biological resources will ensure pollutants will not enter Sanford's arrowhead modeled habitat and that water quality of modeled aquatic habitat will not be affected.

Table 6-34
Permanent Indirect Effects on Sanford's Arrowhead

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-4 (Nature Trail Location)	The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on Sanford's arrowhead. Within the UDA, habitat fragmentation will affect Sanford's arrowhead because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads and trails fragmenting some UDA Preserves will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on Sanford's arrowhead.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	As discussed in Section 6.3, Environmental Stressors from Covered Activities, Covered Activities outside the UDA would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on Sanford's arrowhead habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on Sanford's arrowhead will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memoranda of agreement with responsible fire agencies. In addition, the potential for increased wildfires will be minimized through the implementation of AMMs that reduce the open space–urban interface, require setbacks for streams/creeks, and control public access within the Preserve.
Vernal Pool Hydrologic Alterations	None required for this species.	No effect on this species.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.

Table 6-34
Permanent Indirect Effects on Sanford's Arrowhead

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 4, ROAD-1 (Road Project Location) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Outdoor lighting could indirectly affect the use of Sanford's arrowhead modeled habitat by potential pollinators (e.g., bees, flies, wasps; see Appendix B, Species Accounts, for more details) via behavioral disruptions due to night time light pollution. Implementation of AMMs will ensure that outdoor lighting effects on Sanford's arrowhead will be minimized.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	No effects on Sanford's arrowhead are expected from increased human activity on or near Preserves or Preserve Setbacks since access to the Preserves will be tightly controlled through implementation of NATURE TRAIL AMMs and an approved Preserve Management Plan.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection)	Wildlife community alterations in developed areas will facilitate the presence (and increase) of wildlife species that live and reproduce well in urban landscapes. Urban-tolerant species, such as squirrels and mice, will facilitate a shift in vegetation community structure and Sanford's arrowhead modeled habitat if their seed caches are placed within adjacent Preserves and consist of non-native or introduced plant species (see Invasive Plants below). Implementation of AMMs such as those that require control of stormwater runoff or non-native species will ensure pollution will not enter Sanford's arrowhead aquatic habitat, that water chemistry of

Permanent Indirect Effects on Sanford's Arrowhead

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams) Condition 8, UTILITY-3 (Trenchless Construction Method) Condition 8, UTILITY-4 (Siting of Entry and Exit Locations)	vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in Sanford's arrowhead habitat will not occur.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control)	Unmanaged proliferation of non-native plants within Sanford's arrowhead modeled habitat will introduce competition for resources along with affecting modeled habitat soil and hydrologic characteristics for supporting the Sanford's arrowhead. Implementation of AMMs will minimize proliferation of invasive plants, and Preserve management for thatch such as grazing or prescribed fire will reduce biomass of upland non-native plants. In addition to implementation of AMMs, small infestations of invasive

Table 6-34
Permanent Indirect Effects on Sanford's Arrowhead

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	plants will be addressed on a case-by-case basis through Preserve management under a Preserve Management Plan. These will substantially reduce effects of non-native plants on Sanford's arrowhead. Effects of proliferation of non-native plants will be reduced under the SSHCP relative to existing unmanaged conditions (see Chapter 7, Conservation Strategy). New Urban Development Covered Activities and new rural roadway projects will result in additional vehicle trips in the Plan Area. Nitrogen deposition associated with increased vehicle emissions from these trips will result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of Sanford's arrowhead modeled habitat on Preserves and through AMMs related to invasive species.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Adverse effects on Sanford's arrowhead or modeled habitat plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs that limit edge effects, Stream/Creek setbacks, and monitoring and control of pesticide use near Preserves (Chapter 8, SSHCP Monitoring and Management Programs) will also reduce pesticide drift and limit pesticide effects.

Table 6-35
Temporary Effects to Sanford's Arrowhead

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 1, LID-2 (Groundwater Recharge) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Runoff from construction activities into Sanford's arrowhead habitat will be fully avoided through implementation of AMMs.

Table 6-35
Temporary Effects to Sanford's Arrowhead

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Inadvertent trampling and compaction of Sanford's arrowhead habitat will adversely affect the species propagation by damaging individuals or microhabitat nutrients and soil resources. Implementation of AMMs ensures that trampling and compaction will not occur.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	Condition 3, BMP-6 (Construction Lighting) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Construction lighting directed towards Sanford's arrowhead modeled habitat may temporarily affect the behavior of potential pollinators (e.g., bees, flies, wasps; see Appendix B, Species Accounts, for more details) via behavioral disruptions. Implementation of AMMs will minimize construction lighting effects on Sanford's arrowhead by ensuring that construction lighting is directed away from adjacent natural habitats.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Construction dust effects on Sanford's arrowhead individuals and/or modeled habitat will reduce habitat quality, including water quality, for Sanford's arrowhead. Implementation of AMMs will ensure that dust is controlled and will not affect Sanford's arrowhead.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Increased human activity in construction and maintenance areas will affect Sanford's arrowhead habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets will access occupied habitat causing general disturbance and affecting water quality. Implementation of AMMs ensures that these adverse effects of increased human presence will not occur.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Trash and debris will adversely affect Sanford's arrowhead habitat quality through direct effects on water quality. Implementation of

Table 6-35
Temporary Effects to Sanford's Arrowhead

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	SPECIES-1 (Litter Removal Program) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	AMMs will ensure that construction trash and debris are controlled.

Temporary Effects

Sanford's arrowhead occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2, Temporary Environmental Stressors During Construction of Covered Activities) that will result in additional disturbance to habitat or additional harm to Sanford's arrowhead. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Sanford's arrowhead modeled habitat reported in Table 6-33).

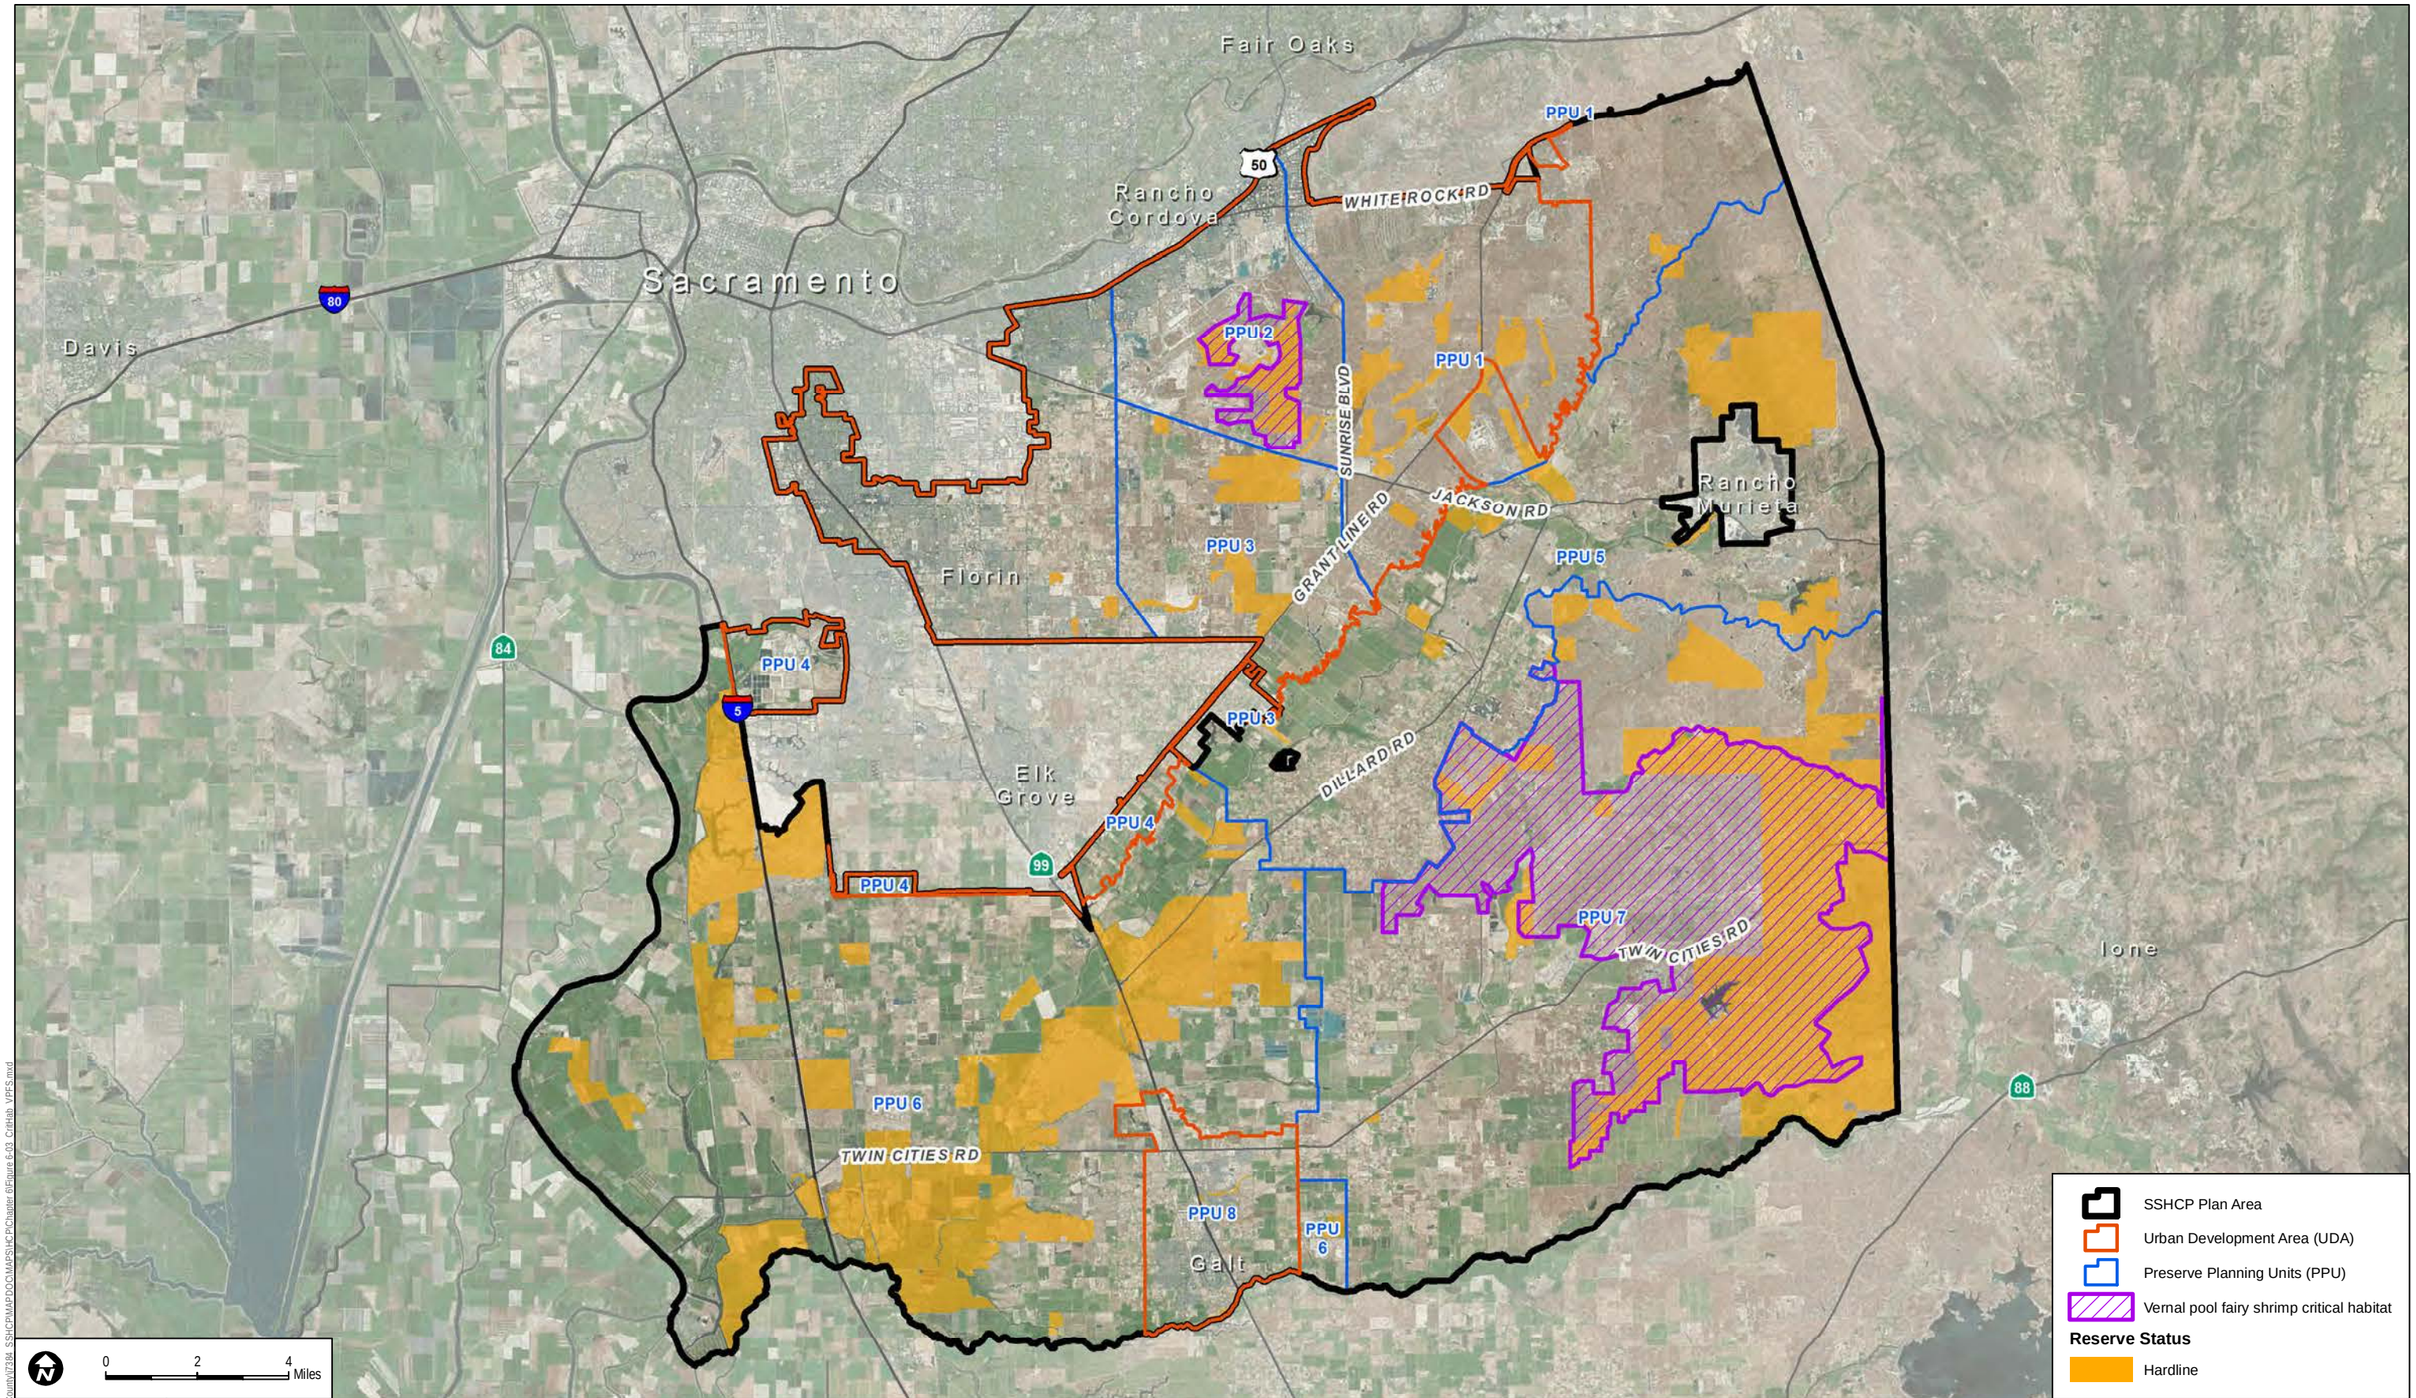
These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on Sanford's arrowhead are qualitatively described in Table 6-35.

6.6.9 Vernal Pool Fairy Shrimp

Permanent Effects

Permanent direct and indirect effects of Covered Activities on vernal pool fairy shrimp will include modification or significant degradation of modeled habitat and the direct and indirect take of all vernal pool fairy shrimp individuals occupying that modified or degraded habitat.

All modeled habitats for vernal pool fairy shrimp are within the Vernal Pool Ecosystem, which includes the Vernal Pool, Swale, Stream/Creek (VPIH) and hydrologically connected Valley Grassland land cover types (see Section 3.2 and Figure 3-14). In addition to direct removal of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds remove part or all of the perched aquifer, existing hydrology, and ecosystem that supports Vernal Pool, Swale, and Stream/Creek (VPIH) habitat. Over time, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for vernal pool fairy shrimp. These indirect effects on Vernal Pool, Swale, and Stream/Creek (VPIH) habitat are included in all permanent effects acreages presented in this section.



Vernal pool fairy shrimp historically occurred throughout the Plan Area; however, all of the extant occurrence records within the Plan Area (a total of 28) are located outside the UDA in PPU 7 (see Section 3.4).

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 17,259 acres of vernal pool fairy shrimp modeled habitat within the Plan Area (see Table 6-36), including 787 acres of vernal pool fairy shrimp modeled aquatic habitats (i.e., Vernal Pools, Swales, and Streams/Creeks (VPIH)) and 16,472 acres of surrounding Valley Grassland land cover

that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on vernal pool fairy shrimp modeled habitat will occur primarily inside the UDA, with approximately 16,927 acres of permanent effects on Vernal Pool Ecosystem in the UDA and a total of 332 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

The total 17,259 acres of permanent direct and indirect effects to vernal pool fairy shrimp modeled habitat includes removal of a total of 8,553 acres of Vernal Pool Ecosystem within the two Plan Area Core Recovery Areas (USFWS 2005). Effects inside the UDA include permanent effects to 8,500 acres of Vernal Pool Ecosystem in the Mather Core Recovery Area (Table 6-37). Outside the UDA, 53 acres within the Cosumnes/Rancho-Seco Core Recovery Area will be permanently affected.

Permanent direct and indirect effects include removal of approximately 746 acres of Vernal Pool Ecosystem in designated Critical Habitat (USFWS 2006) (see Figure 6-3). A total of 695 acres of Vernal Pool Ecosystem will be removed in Unit 13, including 32 acres of modeled aquatic habitat and 663 acres of supporting upland habitat. In Unit 14a, a total of 51 acres of Vernal Pool Ecosystem will be removed, including 7 acres of modeled aquatic habitat and 44 acres of supporting upland habitat (see Table 6-38 and Figure 3-14).

As shown in Table 6-36, approximately 142 acres of vernal pool tadpole shrimp modeled aquatic habitat will be indirectly impacted in the Plan Area, most of which will occur in the UDA (132 acres) as a result of urban development Covered Activities. Outside the UDA, 10 acres of vernal pool tadpole shrimp modeled aquatic habitat will be indirectly impacted. In addition to the 142 acres of indirect effects quantified above in Table 6-36, Covered Activities in the Plan Area will cause other permanent indirect effects to vernal pool tadpole shrimp that are not easily quantified (Table 6-39).

The Plan Permittees expect that the indirect effects of Covered Activities on vernal pool fairy shrimp will be minor outside the UDA, based on two primary factors. First, no urban development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and SSHCP proposed preserves outside the UDA are much larger than the existing and proposed UDA preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to vernal pool fairy shrimp outside the UDA will occur to vernal pool fairy shrimp aquatic habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, pesticide use, etc. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing vernal pool fairy shrimp habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to vernal pool hydrology reported in Tables 6-36 through 6-38). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on vernal pool fairy shrimp that are not quantified are described qualitatively in Table 6-39, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or proposed SSHCP preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect vernal pool fairy shrimp. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-39
Permanent Indirect Effects on Vernal Pool Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality). Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to vernal pool fairy shrimp habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in occupied pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter vernal pool fairy shrimp aquatic habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	The Landscape Preserves established outside the UDA, including in the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on vernal pool fairy shrimp. Within the UDA, habitat fragmentation will affect vernal pool fairy shrimp because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2) will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on the vernal pool fairy shrimp population in the Mather Core Recovery Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Trail Impacts)	As discussed in Section 6.3, outside the UDA Covered Activities would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on vernal pool tadpole shrimp habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on vernal pool fairy shrimp will be minimized through implementation of the Preserve System Monitoring and Management Program,

Table 6-39
Permanent Indirect Effects on Vernal Pool Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		which will include a commitment to develop memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Vernal pool fairy shrimp will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs minimize hydrologic alterations to the micro-watersheds of existing and proposed vernal pool preserves, but indirect effects will occur to an estimated 142 acres of vernal pool fairy shrimp modeled aquatic habitat (Table 6-36). However, the vernal pool fairy shrimp Conservation Strategy (Chapter 7) will offset these unavoidable impacts.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on vernal pool fairy shrimp are expected from increased human activity on Preserves or Preserve Setbacks. Implementation of AMMs ensures that increased human activity in and near Preserves is limited and that it does not substantially affect vernal pool fairy shrimp habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	Increases in inundation period may facilitate wildlife community alterations, including invasion by non-native predators of vernal pool fairy shrimp such as non-native fishes (e.g., mosquitofish (*Gambusia affinis*)) and American bullfrogs (Balfour and Morey 1999). Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter vernal pool fairy shrimp aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in vernal pool fairy shrimp habitat will not occur.

Table 6-39
Permanent Indirect Effects on Vernal Pool Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plant valley grasslands of the Vernal Pool Ecosystem will affect critical hydroperiods for supporting the vernal pool fairy shrimp's lifecycle. Implementation of AMMs will minimize proliferation of non-native plants, and preserve management for thatch, such as grazing or prescribed fire, will reduce biomass of upland non-native plants. These will substantially reduce effects of non-native plants on vernal pool fairy shrimp. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7). Nitrogen deposition associated with increased vehicle emissions from vehicles associated with new urban development traveling along Plan Area rural roadway projects will also result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the vernal pool ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described above in Wildlife Community Alterations, invasion by non-native predators of vernal pool fairy shrimp such as non-native fishes (e.g., mosquitofish) and bullfrogs (Balfour and Morey 1999) is avoided through preservation of existing vernal pool inundation period and water chemistry.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.

Table 6-39
Permanent Indirect Effects on Vernal Pool Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use	Adverse effects on vernal pool fairy shrimp or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Temporary Effects

Vernal pool fairy shrimp occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to vernal pool fairy shrimp. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool hydrology reported in Tables 6-36 through 6-38).

These potential construction-related environmental stressors were described above generally in Section 6.3.2, and their additional effects on vernal pool fairy shrimp are qualitatively described in Table 6-40.

Table 6-40
Temporary Effects to Vernal Pool Fairy Shrimp

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location). Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into vernal pool fairy shrimp habitat will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Inadvertent trampling and compaction of vernal pool vegetation will adversely affect vernal pool fairy shrimp propagation by damaging cysts. Implementation of AMMs ensures that trampling and compaction do not occur. No effect on vernal pool fairy shrimp.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control)	Construction dust effects on vernal pool vegetation communities and vernal pool water quality will reduce habitat quality for vernal pool fairy shrimp. Implementation of AMMs ensures that dust is controlled and will not affect vernal pool fairy shrimp.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Increased human activity in construction and maintenance areas would affect vernal pool habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets accessing occupied pools would cause general disturbance and affect water quality. Implementation of AMMs ensures that increased human presence does not occur. No effect on vernal pool fairy shrimp.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor)	Trash and debris would adversely affect vernal pool fairy shrimp habitat quality through direct effects on water quality and by

Table 6-40
Temporary Effects to Vernal Pool Fairy Shrimp

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-8 (Training of Construction Staff)	possibly attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled, and that no effect on vernal pool fairy shrimp will occur.

6.6.10 Mid-Valley Fairy Shrimp

Permanent Effects

Permanent direct and indirect effects of Covered Activities on mid-valley fairy shrimp will include modification or significant degradation of modeled habitat and the direct and indirect take of all mid-valley fairy shrimp individuals occupying that modified or degraded habitat.

All modeled habitats for mid-valley fairy shrimp are within the Vernal Pool Ecosystem, which includes the Vernal Pool, Swale, Stream/Creek (VPIH) and hydrologically connected Valley Grassland land cover types (see Section 3.2 and Figure 3-11). In addition to direct removal of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds remove part or all of the perched aquifer, existing hydrology, and ecosystem that supports Vernal Pool, Swale, and Stream/Creek (VPIH) habitat. Over time, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for mid-valley fairy shrimp. These indirect effects on Vernal Pool, Swale, and Stream/Creek (VPIH) habitat are included in all permanent effects acreages presented in this section.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 12,639 acres of mid-valley fairy shrimp modeled habitat within the Plan Area (see Table 6-41), including approximately 633 acres of mid-valley fairy shrimp aquatic habitats (i.e., Vernal Pools, Swales, and Streams/Creeks (VPIH)) and 12,006 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on mid-valley fairy shrimp will occur primarily inside the UDA, with a total of 12,402 acres of permanent effects on Vernal Pool Ecosystem in the UDA and a total of 237 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

The total 12,639 acres of permanent direct and indirect effects to mid-valley fairy shrimp modeled habitat includes removal of a total of 6,308 acres of Vernal Pool Ecosystem within the two Plan Area Core Recovery Areas (USFWS 2005). Effects inside the UDA include permanent effects to 6,267 acres of Vernal Pool Ecosystem in the Mather Core Recovery Area (Table 6-42). Outside the UDA, 41 acres within the Cosumnes/Rancho-Seco Core Recovery Area will be permanently affected.

* Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively.

As shown in Table 6-41, approximately 106 acres of mid-valley fairy shrimp modeled aquatic habitat will be indirectly impacted in the Plan Area, most of which will occur in the UDA (103 acres) as a result of urban development Covered Activities. Outside the UDA, 3 acres of mid-valley fairy shrimp modeled aquatic habitat will be indirectly impacted. In addition to the 106 acres of indirect effects quantified in Table 6-41, Covered Activities in the Plan Area will cause other permanent indirect effects to mid-valley fairy shrimp that are not easily quantified (Table 6-43).

The Plan Permittees expect that the indirect effects of Covered Activities on mid-valley fairy shrimp will be minor outside the UDA, based on two primary factors. First, no urban development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and SSHCP proposed preserves outside the UDA are much larger than the existing and proposed UDA preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves.

Most indirect effects to mid-valley fairy shrimp outside the UDA will occur to mid-valley fairy shrimp aquatic habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, pesticide use, etc. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing mid-valley fairy shrimp habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to vernal pool hydrology reported in Tables 6-41 and 6-42). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on mid-valley fairy shrimp that are not quantified are described qualitatively in Table 6-43, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or proposed SSHCP preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect mid-valley fairy shrimp. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Temporary Effects

Mid-valley fairy shrimp occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to mid-valley fairy shrimp. Generally, these temporary effects will occur within the project footprint or road right-of-way

area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to vernal pool hydrology reported in Table 6-41).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on mid-valley fairy shrimp are qualitatively described in Table 6-44.

Table 6-43
Permanent Indirect Effects on Mid-Valley Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality). Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to mid-valley fairy shrimp habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in occupied pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter mid-valley fairy shrimp aquatic habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	The Landscape Preserves established outside the UDA, including in the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on mid-valley fairy shrimp. Within the UDA, habitat fragmentation will affect mid-valley fairy shrimp because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2) will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on the mid-valley fairy shrimp population in the Mather Core Recovery Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA Covered Activities would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on mid-valley fairy shrimp habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on mid-valley fairy shrimp will be minimized through implementation of the Preserve System Management Program, which will include a

Table 6-43
Permanent Indirect Effects on Mid-Valley Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		commitment to develop memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Mid-valley fairy shrimp will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs minimize hydrologic alterations to the micro-watersheds of existing and proposed vernal pool preserves, but indirect effects will occur to an estimated 142 acres of mid-valley fairy shrimp modeled aquatic habitat (Table 6-41). However, the mid-valley fairy shrimp Conservation Strategy (Chapter 7) will offset these unavoidable impacts.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on mid-valley fairy shrimp are expected from increased human activity on Preserves or preserves setbacks. Implementation of AMMs ensures that increased human activity in and near Preserves is limited and that it does not substantially affect mid-valley fairy shrimp habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	Increases in inundation period may facilitate wildlife community alterations, including invasion by non-native predators of mid-valley fairy shrimp such as non-native fishes (e.g., mosquitofish) and American bullfrogs (Balfour and Morey 1999). Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter mid-valley fairy shrimp aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in mid-valley fairy shrimp habitat will not occur.

Table 6-43
Permanent Indirect Effects on Mid-Valley Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plant valley grasslands of the Vernal Pool Ecosystem will affect critical hydroperiods for supporting the mid-valley fairy shrimp's lifecycle. Implementation of AMMs will minimize proliferation of non-native plants, and preserve management for thatch, such as grazing or prescribed fire, will reduce biomass of upland non-native plants. These will substantially reduce effects of non-native plants on mid-valley fairy shrimp. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7). Nitrogen deposition associated with increased vehicle emissions from vehicles associated with new urban development traveling along Plan Area rural roadway projects will also result in competitive advantages for non-native invasive plants. The unavoidable effects of Nitrogen deposition will be minimized through monitoring and adaptive management of the vernal pool ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described above in Wildlife Community Alterations, invasion by non-native predators of mid-valley fairy shrimp such as non-native fishes (e.g., mosquitofish) and bullfrogs (Balfour and Morey 1999) is avoided through preservation of existing vernal pool inundation period and water chemistry.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.

Table 6-43
Permanent Indirect Effects on Mid-Valley Fairy Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use	Adverse effects on mid-valley fairy shrimp or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-44
Temporary Effects to Mid-Valley Fairy Shrimp

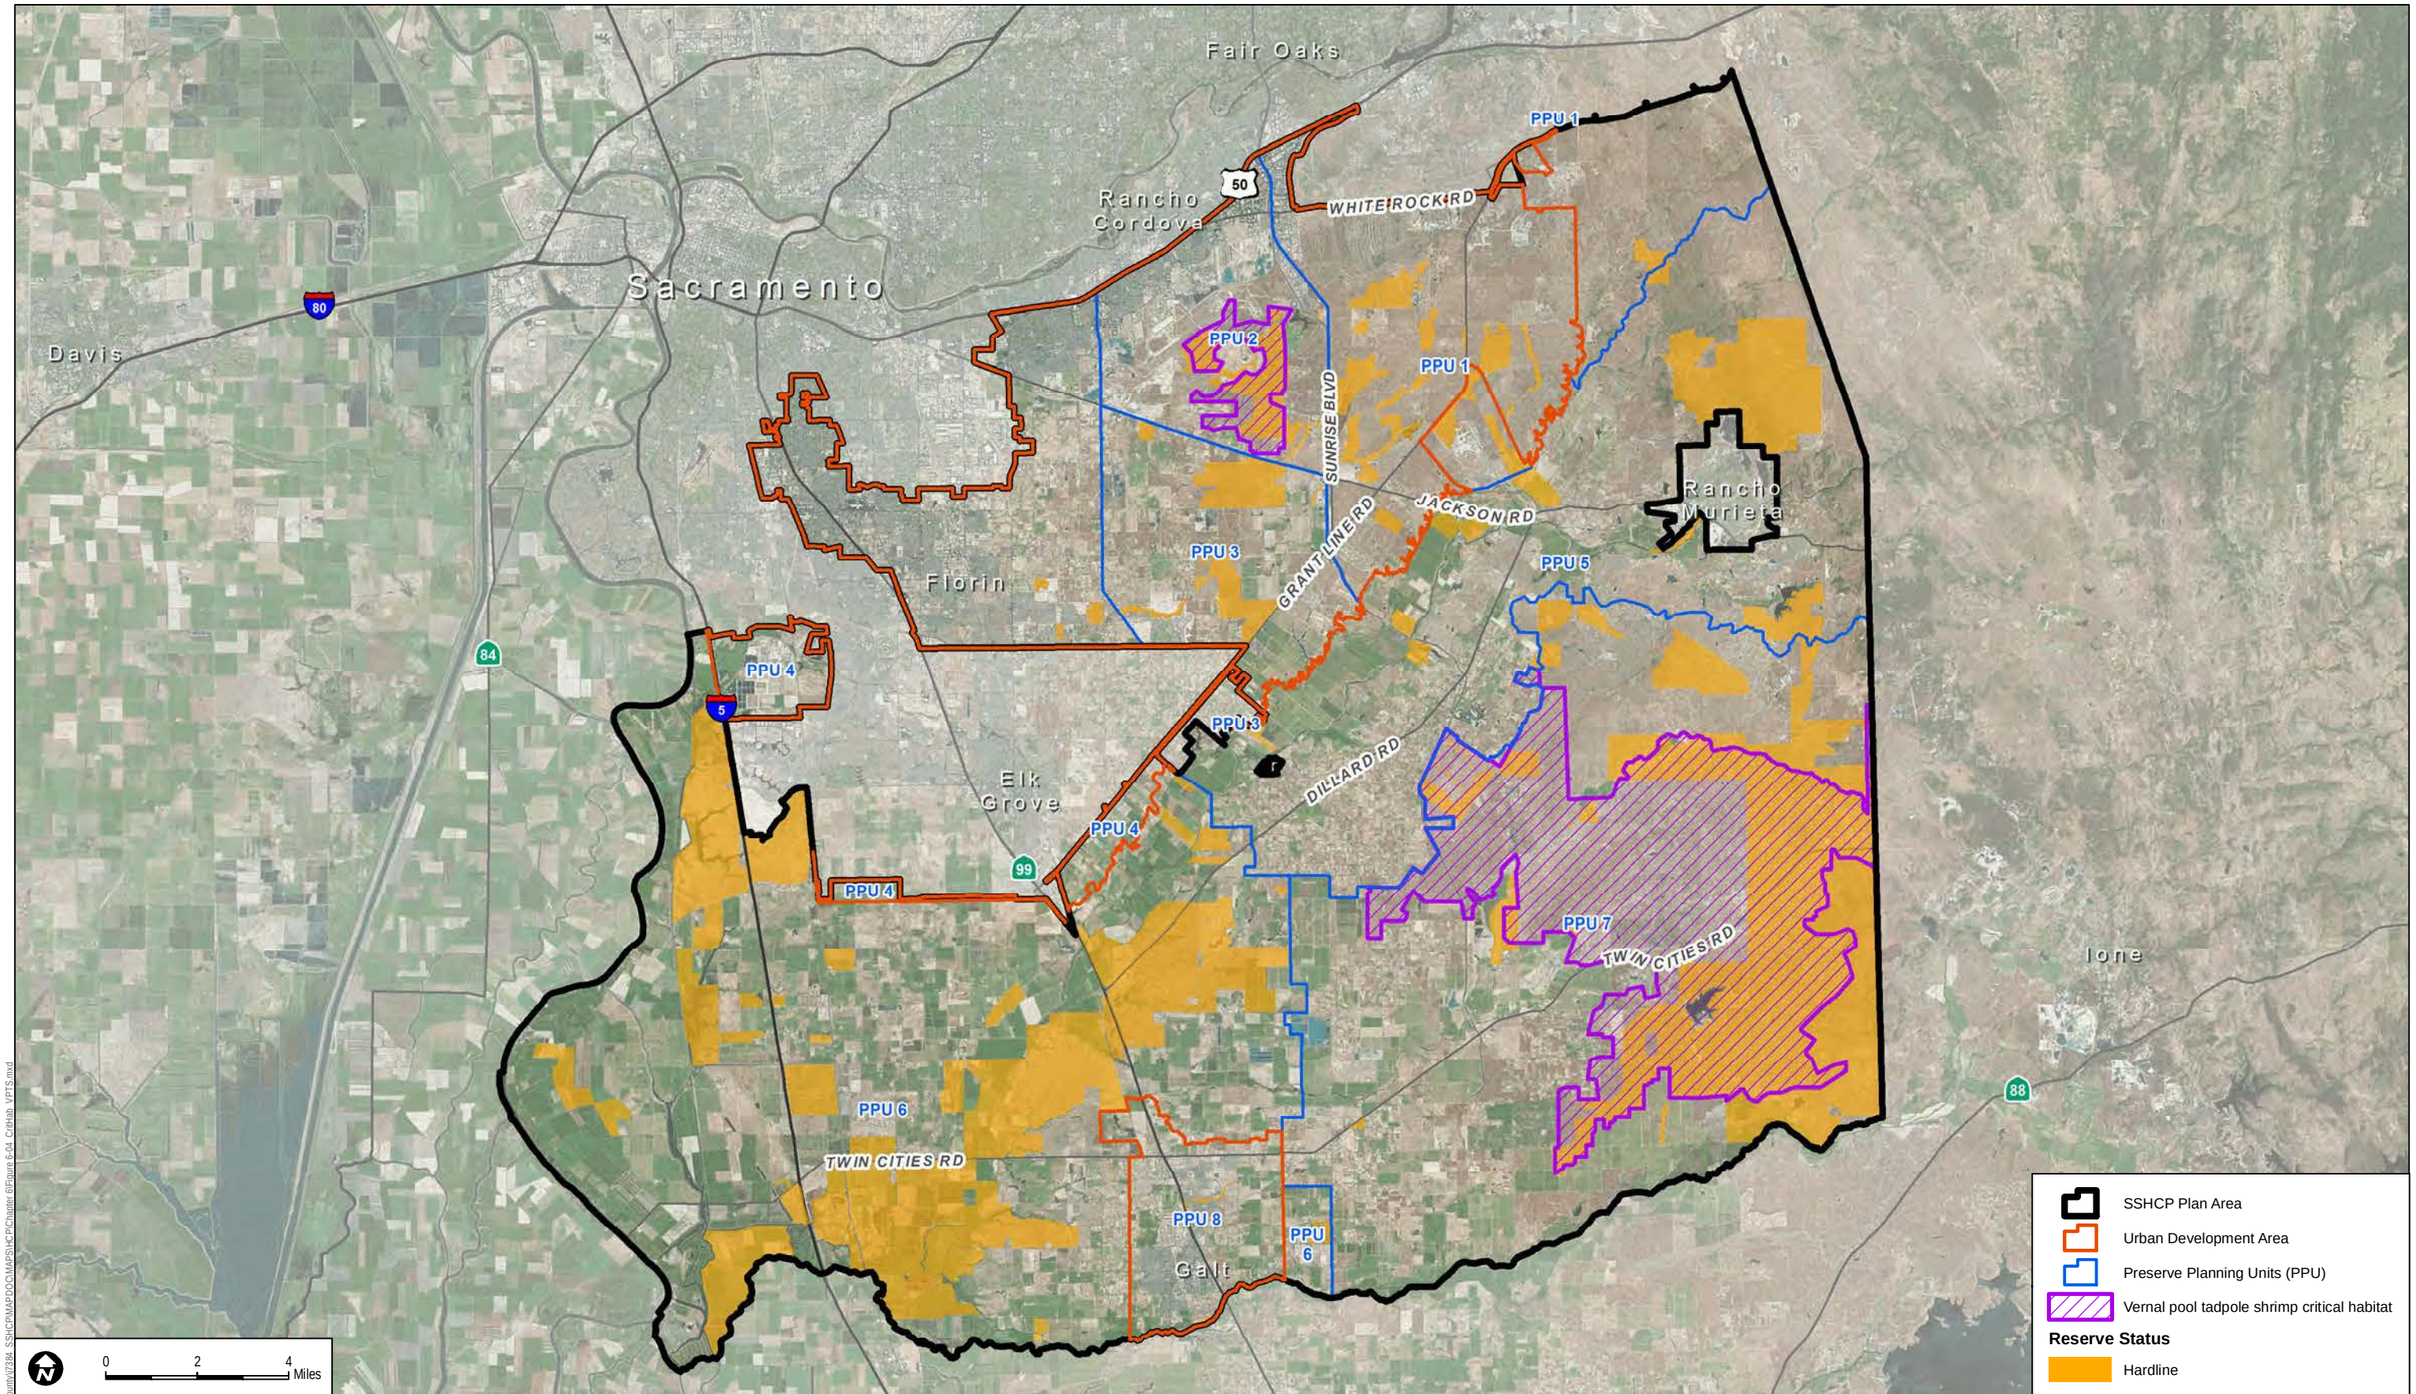
Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location). Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials)	Runoff from construction activities into mid-valley fairy shrimp habitat will be fully avoided through implementation of AMMs.

Table 6-44
Temporary Effects to Mid-Valley Fairy Shrimp

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Inadvertent trampling and compaction of vernal pool vegetation will adversely affect mid-valley fairy shrimp propagation by damaging cysts. Implementation of AMMs ensures that trampling and compaction do not occur. No effect on mid-valley fairy shrimp.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control)	Construction dust effects on vernal pool vegetation communities and vernal pool water quality will reduce habitat quality for mid-valley fairy shrimp. Implementation of AMMs ensures that dust is controlled and will not affect mid-valley fairy shrimp.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Increased human activity in construction and maintenance areas would affect vernal pool habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets accessing occupied pools would cause general disturbance and affect water quality. Implementation of AMMs ensures that increased human presence does not occur. No effect on mid-valley fairy shrimp.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Trash and debris would adversely affect mid-valley fairy shrimp habitat quality through direct effects on water quality and by possibly attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled. No effect on mid-valley fairy shrimp.

6.6.11 Vernal Pool Tadpole Shrimp

Permanent Effects



Permanent direct and indirect effects of Covered Activities on vernal pool tadpole shrimp will include modification or significant degradation of modeled habitat and the direct and indirect take of all vernal pool tadpole shrimp individuals occupying that modified or degraded habitat.

All modeled habitats for vernal pool tadpole shrimp are within the Vernal Pool Ecosystem, which includes the Vernal Pool, Swale, Stream/Creek (VPIH) and hydrologically connected Valley Grassland land cover types (see Section 3.2 and Figures 3-2 and 3-15). In addition to direct removal of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds remove part or all of the perched aquifer, existing hydrology, and ecosystem that supports Vernal Pool, Swale, and Stream/Creek (VPIH) habitat. Over time, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; and reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for vernal pool tadpole shrimp. These indirect effects on Vernal Pool, Swale and Stream/Creek (VPIH) habitat are included in all permanent effects acreages presented in this section.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 17,259 acres of vernal pool tadpole shrimp modeled habitat within the Plan Area (see Table 6-45), including 787 acres of vernal pool tadpole shrimp aquatic habitats (i.e., Vernal Pools, Swales, and Streams/Creeks (VPIH)) and 16,472 acres of surrounding Valley Grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on vernal pool tadpole shrimp modeled habitat will occur primarily inside the UDA, with a total 16,927 acres of permanent effects on Vernal Pool Ecosystem in the UDA and a total of 332 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

The total 17,259 acres of permanent direct and indirect effects to vernal pool tadpole shrimp modeled habitat includes removal of a total of 8,553 acres of Vernal Pool Ecosystem within the two Plan Area Core Recovery Areas (USFWS 2005). Effects inside the UDA include permanent effects to approximately 8,500 acres of Vernal Pool Ecosystem in the Mather Core Recovery Area (Table 6-46). Outside the UDA, 53 acres of Vernal Pool Ecosystem within the Cosumnes/Rancho-Seco Core Recovery Area will be affected by Covered Activities.

Permanent direct and indirect effects to vernal pool tadpole shrimp modeled habitat include removal of 746 acres of Vernal Pool Ecosystem in designated Critical Habitat (USFWS 2006) (see Figure 6-4). A total of 695 acres of Vernal Pool Ecosystem will be removed in Unit 8, including 32 acres of modeled aquatic habitat and 663 acres of supporting upland habitat. In Unit 9b, a total of 51 acres of Vernal Pool Ecosystem will be removed, including 7 acres of modeled aquatic habitat and 44 acres of supporting upland habitat (see Tables 6-45, 6-46, 6-47, and Figure 3-15).

As shown in Table 6-45, approximately 142 acres of vernal pool tadpole shrimp modeled aquatic habitat will be indirectly impacted in the Plan Area, most of which will occur in the UDA (132 acres) as a result of Urban Development Covered Activities. Outside the UDA, 10 acres of vernal pool tadpole shrimp modeled aquatic habitat will be indirectly impacted. In addition to the 142 acres of indirect effects quantified above in Table 6-45, Covered Activities in the Plan Area will cause other permanent indirect effects to vernal pool tadpole shrimp that are not easily quantified (Table 6-48).

As discussed previously for vernal pool fairy shrimp (see Section 6.6.9), these "other" indirect effects to vernal pool tadpole shrimp (Table 6-46) will be greatest within the UDA because most Covered Activities will occur within the UDA, resulting in extensive contact between new urban development and the vernal pool tadpole shrimp present on existing preserves, on SSHCP proposed preserves (see Chapter 7), and on other habitat areas that will remain inside the UDA.

The Plan Permittees expect that the indirect effects of Covered Activities on vernal pool tadpole shrimp will be minor outside the UDA, based on two primary factors. First, no Urban Development Covered Activities will occur outside the UDA, so indirect effects will be limited to those from rural roadways and water pipeline projects. Second, the existing preserves and SSHCP proposed preserves outside the UDA are much larger than the existing and proposed UDA preserves (see Chapter 7), which dramatically reduces edge effects of Covered Activities on the Vernal Pool Ecosystem within Preserves. Most indirect effects to vernal pool tadpole shrimp outside the UDA will occur to vernal pool tadpole shrimp aquatic habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which are expected to increase contaminants in road runoff, potential spread of invasive plants, pesticide use, etc. that will affect vernal pool tadpole shrimp habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing vernal pool tadpole shrimp habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to vernal pool hydrology reported in Table 6-45). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on vernal pool tadpole shrimp that are not quantified are described qualitatively in Table 6-48, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or proposed SSHCP preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect vernal pool tadpole shrimp. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Temporary Effects

Vernal pool tadpole shrimp occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to vernal pool tadpole shrimp. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to Vernal Pool hydrology reported in Table 6-45).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on vernal pool tadpole shrimp are qualitatively described in Table 6-49.

Table 6-48
Permanent Indirect Effects on Vernal Pool Tadpole Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality). Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to vernal pool tadpole shrimp habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in occupied pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter vernal pool tadpole shrimp aquatic habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP Preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	The Landscape Preserves established outside the UDA, including in the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on vernal pool tadpole shrimp. Within the UDA, habitat fragmentation will affect vernal pool tadpole shrimp because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2) will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on the vernal pool tadpole shrimp population in the Mather Core Recovery Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA Covered Activities would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on vernal pool tadpole shrimp habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on vernal pool tadpole shrimp will be minimized through implementation of the Preserve System Management Program,

Table 6-48
Permanent Indirect Effects on Vernal Pool Tadpole Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		which will include a commitment to develop memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Vernal pool tadpole shrimp will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs minimize hydrologic alterations to the micro-watersheds of existing and proposed vernal pool preserves, but indirect effects will occur to an estimated 142 acres of vernal pool tadpole shrimp modeled aquatic habitat (Table 6-45). However, the vernal pool tadpole shrimp Conservation Strategy (Chapter 7) will offset these unavoidable impacts.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on vernal pool tadpole shrimp are expected from increased human activity on Preserves or preserves setbacks. Implementation of AMMs ensures that increased human activity in and near Preserves is limited and that it does not substantially affect vernal pool tadpole shrimp habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 5, NATURE TRAIL-6 (Nature Trail Public Education)	Increases in inundation period may facilitate wildlife community alterations, including invasion by non-native predators of vernal pool tadpole shrimp such as non-native fishes (e.g., mosquitofish) and bullfrogs (Balfour and Morey 1999). Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter vernal pool tadpole shrimp aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in vernal pool tadpole shrimp habitat will not occur.

Table 6-48
Permanent Indirect Effects on Vernal Pool Tadpole Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plant valley grasslands of the Vernal Pool Ecosystem will affect critical hydroperiods for supporting the vernal pool tadpole shrimp's lifecycle. Implementation of AMMs will minimize proliferation of non-native plants, and preserve management for thatch, such as grazing or prescribed fire, will reduce biomass of upland non-native plants. These will substantially reduce effects of non-native plants on vernal pool tadpole shrimp. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7). Nitrogen deposition associated with increased vehicle emissions from vehicles associated with new urban development traveling along Plan Area rural roadway projects will also result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the vernal pool ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 5, NATURE TRAIL-6 (Nature Trail Public Education)	As described in Wildlife Community Alterations, invasion by non-native predators of vernal pool tadpole shrimp such as non-native fishes (e.g., mosquitofish) and bullfrogs (Balfour and Morey 1999) is avoided through preservation of existing vernal pool inundation period and water chemistry.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.

Table 6-48
Permanent Indirect Effects on Vernal Pool Tadpole Shrimp

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use	Adverse effects on vernal pool tadpole shrimp or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-49
Temporary Effects to Vernal Pool Tadpole Shrimp

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials)	Runoff from construction activities into vernal pool tadpole shrimp habitat will be fully avoided through implementation of AMMs.

Table 6-49
Temporary Effects to Vernal Pool Tadpole Shrimp

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Inadvertent trampling and compaction of vernal pool vegetation will adversely affect tadpole shrimp propagation by damaging cysts. Implementation of AMMs ensures that trampling and compaction do not occur. No effect on vernal pool tadpole shrimp.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	Condition 3, BMP-5 (Dust Control)	Construction dust effects on vernal pool vegetation communities and vernal pool water quality will reduce habitat quality for vernal pool tadpole shrimp. Implementation of AMMs ensures that dust is controlled and will not affect vernal pool tadpole shrimp.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Increased human activity in construction and maintenance areas would affect vernal pool habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets accessing occupied pools would cause general disturbance and affect water quality. Implementation of AMMs ensures that increased human presence does not occur. No effect on vernal pool tadpole shrimp.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Trash and debris would adversely affect vernal pool tadpole habitat quality through direct effects on water quality and by possibly attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled. No effect on vernal pool tadpole shrimp.

6.6.12 Ricksecker's Water Scavenger Beetle

Permanent Effects

Permanent direct and indirect effects of Covered Activities on Ricksecker's water scavenger beetle will include modification or significant degradation of modeled habitat and the direct and indirect take of all Ricksecker's water scavenger beetle individuals occupying that modified or degraded habitat. Ricksecker's water scavenger beetle has not been documented within the UDA, but it is assumed to be present in all modeled habitat.

All modeled habitats for Ricksecker's water scavenger beetle are within the Vernal Pool Ecosystem, which includes the Vernal Pool, Swale, and hydrologically connected Valley Grassland land cover types (see Section 3.2 and Figures 3-2 and 3-12). In addition to direct removal of Vernal Pool Ecosystem land cover types, edge effects on vernal pool micro-watersheds remove part or all of the perched aquifer, existing hydrology, and ecosystem that supports vernal pool and swale habitat. Over time, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter the chemistry of the vernal pool; reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for Ricksecker's water scavenger beetle. These indirect effects on vernal pool and swale habitat are included in all permanent effects acreages presented in this section.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 17,233 acres of Ricksecker's water scavenger beetle modeled habitat within the Plan Area (see Table 6-50), including 761 acres of Ricksecker's water scavenger beetle aquatic habitats (i.e., vernal pools and swales) and 16,472 acres of surrounding valley grassland land cover that support the hydrology and ecology of the aquatic habitats. Covered Activity impacts on Ricksecker's water scavenger beetle modeled habitat will occur primarily inside the UDA, with a total 16,901 acres of permanent effects on Vernal Pool Ecosystem in the UDA and a total of 332 acres of permanent effects on Vernal Pool Ecosystem outside the UDA.

Relatively little is known about specific threats to Ricksecker's water scavenger beetle in the Plan Area other than removal and degradation of vernal pools. However, based on its known life history, it will be affected by several permanent indirect effects on modeled habitat (Table 6-51). Potential permanent indirect effects of the Covered Activities include habitat fragmentation and isolation, lighting, increased human activity (including collection by humans, recreation, and increased trash/debris), hydrologic alterations, pollutants and toxins, traffic and vehicle collisions, mesopredators, altered fire regime, invasive plant and animal species, and wildlife community alterations (including increased predation).

Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on Ricksecker's water scavenger beetle is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas and the requirement of extensive infrastructure. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities that increase the risk of accidental fire ignitions and other road-related effects (e.g., vehicle collisions, road runoff, potential spread of invasive plants, etc.) that will affect Ricksecker's water scavenger beetle individuals and habitat. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on Ricksecker's water scavenger beetle habitat (although some of these indirect effects are already accounted for in the indirect effect acreage reported in Table 6-50).

Management and monitoring activities in the Preserves and Preserve Setbacks have the potential to indirectly affect Ricksecker's water scavenger beetle. Vegetation management, for example, will include livestock grazing. While Ricksecker's water scavenger beetle benefits from some level of grazing, and which will be an important management tool (see Chapter 8), grazing management activities that affect stocking rates and distributional patterns (e.g., placement of water and mineral sources, fencing, handling facilities etc.) will also adversely affect Ricksecker's water scavenger beetle.

Temporary Effects

Ricksecker's water scavenger beetle occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to Ricksecker's water scavenger beetle. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects and the area of indirect impacts to vernal pool hydrology reported in Table 6-51).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on Ricksecker's water scavenger beetle are qualitatively described in Table 6-52.

Table 6-51
Permanent Indirect Effects on Ricksecker's Water Scavenger Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to Ricksecker's water scavenger beetle habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in occupied pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter Ricksecker's water scavenger beetle aquatic habitat and that water chemistry of vernal pool aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses)	The Landscape Preserves established outside the UDA, including in the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on Ricksecker's water scavenger beetle. Within the UDA, habitat fragmentation will affect Ricksecker's water scavenger beetle because all UDA Preserves will be bordered by urban development, which will be reduced

Table 6-51
Permanent Indirect Effects on Ricksecker's Water Scavenger Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2) will be reduced through EDGE AMMs and ROAD AMMs.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA Covered Activities would not affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on Ricksecker's water scavenger beetle habitat could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on Ricksecker's water scavenger beetle will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Ricksecker's water scavenger beetle will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs minimize hydrologic alterations to the micro-watersheds of existing and proposed vernal pool preserves, but indirect effects will occur to an estimated 138 acres of Ricksecker's water scavenger beetle modeled aquatic habitat (Table 6-5). However, the Ricksecker's water scavenger beetle Conservation Strategy (Chapter 7) will offset these unavoidable impacts.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks)	The use of outdoor lighting could affect Ricksecker's water scavenger beetle by causing mortality due to exhaustion, attraction of predators, or disruption of biological cycles.

Table 6-51
Permanent Indirect Effects on Ricksecker's Water Scavenger Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-8 (Outdoor Lighting) Condition 4, ROAD-1 (Road Project Location)	
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	No effects on Ricksecker's water scavenger beetle are expected from increased human activity on Preserves or Preserve Setbacks. Implementation of AMMs ensures that increased human activity in and near Preserves is limited and that it does not substantially affect Ricksecker's water scavenger beetle habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	Increases in inundation period may facilitate wildlife community alterations, including invasion by non-native predators of Ricksecker's water scavenger beetle such as non-native fishes (e.g., mosquitofish) and bullfrogs (Balfour and Morey 1999). Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter Ricksecker's water scavenger beetle aquatic habitat, that water chemistry of vernal pool aquatic habitat will not be affected, and that resultant wildlife community alterations in Ricksecker's water scavenger beetle habitat will not occur.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants in valley grasslands of the Vernal Pool Ecosystem will affect critical hydroperiods for supporting the Ricksecker's water scavenger beetle lifecycle. Implementation of AMMs will minimize proliferation of non-native plants, and preserve management for thatch, such as grazing or prescribed fire, will reduce biomass of upland non-native plants. These will substantially reduce effects on non-native plants on Ricksecker's water scavenger beetle. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).

Table 6-51
Permanent Indirect Effects on Ricksecker's Water Scavenger Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		Nitrogen deposition associated with increased vehicle emissions from vehicles associated with new urban development traveling along Plan Area rural roadway projects will also result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the vernal pool ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described in Wildlife Community Alterations, invasion by non-native predators of Ricksecker's water scavenger beetle such as non-native fishes (e.g., mosquitofish) and bullfrogs (Balfour and Morey 1999) is avoided through preservation of existing vernal pool inundation period and water chemistry.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	Adverse effects on Ricksecker's water scavenger beetle or the vernal pool plant and animal ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs.

Table 6-51

	Condition 4, ROAD-3 (Roadside Pesticide Use	
Vehicle and Aircraft Collisions with Wildlife	None required for this species.	No effect on this species.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-52
Temporary Effects to Ricksecker's Water Scavenger Beetle

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into Ricksecker's water scavenger beetle habitat will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Inadvertent trampling and compaction of vernal pool vegetation will adversely affect Ricksecker's water scavenger beetle propagation by damaging eggs. Implementation of AMMs ensures that trampling and compaction do not occur. No effect on Ricksecker's water scavenger beetle.
Construction Noise	None required for this species.	No effect on this species.

Table 6-52
Temporary Effects to Ricksecker's Water Scavenger Beetle

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	Condition 3, BMP-6 (Construction Lighting) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction lighting directed toward Ricksecker's water scavenger beetle habitat can cause mortality to Ricksecker's water scavenger beetle due to exhaustion, attraction of predators, or disruption of biological cycles. Implementation of AMMs will minimize construction lighting effects on Ricksecker's water scavenger beetle by ensuring that construction lighting is directed away from adjacent natural habitats.
Construction Dust	Condition 3, BMP-5 (Dust Control)	Construction dust effects on vernal pool vegetation communities and vernal pool water quality will reduce habitat quality for Ricksecker's water scavenger beetle. Implementation of AMMs ensures that dust is controlled and will not affect Ricksecker's water scavenger beetle.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Increased human activity in construction and maintenance areas would affect vernal pool habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets accessing occupied pools would cause general disturbance and affect water quality. Implementation of AMMs ensures that increased human presence does not occur. No effect to Ricksecker's water scavenger beetle.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Trash and debris would adversely affect Ricksecker's water scavenger beetle habitat quality through direct effects on water quality and by possibly attracting nuisance pest species. Temporary fencing will also entrap some newly emerged adults as they fly to different vernal pools. Implementation of AMMs ensures that construction trash and debris will be controlled, and that there will be no substantial effect on Ricksecker's water scavenger beetle.

6.6.13 Valley Elderberry Longhorn Beetle

Permanent Effects

Permanent direct and indirect effects of Covered Activities on valley elderberry longhorn beetle will include modification or significant degradation of modeled habitat and the direct and indirect take of all valley elderberry longhorn beetle individuals occupying that modified or degraded habitat. Modeled habitats for valley elderberry longhorn beetle are limited to the three Riparian land cover types: Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 591 acres of modeled habitat for valley elderberry longhorn beetle within the Plan Area (see Table 6-53). Covered Activity impacts on valley elderberry longhorn beetle modeled habitat will occur primarily inside the UDA, with a total of approximately 550 acres of permanent effects in the UDA and a total of 41 acres of permanent effects outside the UDA.

The 218 acres of effects on Mine Tailing Riparian Woodland will account for 40% of the total effects on valley elderberry longhorn beetle modeled habitat within the Plan Area. A total of 184 acres of Mixed Riparian Scrub and 189 acres of Mixed Riparian Woodland will be directly affected.

Valley elderberry longhorn beetle in the Plan Area will be affected by several permanent indirect effects on modeled habitat (Table 6-54). Notable permanent indirect effects of the Covered Activities include habitat fragmentation and isolation, hydrologic alterations, pollutants and toxins, lighting, increased human activity (including recreation, risk of collection, and increased trash/debris), invasive plant and wildlife species, and wildlife community alterations (including increased predation).

Table 6-54
Permanent Indirect Effects on Valley Elderberry Longhorn Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality). Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	Valley elderberry longhorn beetle is sensitive to altered hydrology affecting the quality of riparian habitats, and particularly effects on its host plant, elderberry. Such changes will occur over the long term as a result of hydrologic alterations related to runoff regimes from irrigation and runoff from impervious surfaces (e.g., roads, parking lots, etc.). The close proximity of planned roads and development to habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters flows in riparian areas and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution does not enter valley elderberry longhorn beetle habitat and that the host plant is not affected.

Table 6-54
Permanent Indirect Effects on Valley Elderberry Longhorn Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams) Condition 8, UTILITY-2 (Utility Maintenance on Preserves)	
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams)	Covered Activities will result in fragmentation and isolation of modeled valley elderberry longhorn beetle habitat. After emergence from pupal cells, adults readily fly from shrub to shrub to feed on leaves and flowers, but their ability to fly between disjunct habitat patches is limited. The SSHCP Preserves large habitat blocks and ensures habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7.This, in concert with a range of AMMs that protect Preserves from edge effects, will maintain contiguous modeled habitat patches within drainages and minimize this effect.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread)	Covered Activities are expected to increase the frequency of fires in the Plan Area due to increased population and risk of ignitions. However, the beetle's host plant, blue elderberry (*Sambucus nigra* ssp. *cerulean*), is generally a fire-tolerant species and is able to

Table 6-54
Permanent Indirect Effects on Valley Elderberry Longhorn Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks)	regenerate by resprouting and seed germination following fire (Crane 1989). Severe fires that expose and kill the root system and stem buds from which resprouting occurs could affect existing plants, although seed viability appears to be unaffected (Crane 1989). Valley elderberry longhorn beetle will also be adversely affected when fires kill the aboveground part of the plant supporting individuals (Crane 1989). Combined with their limited dispersal capability, fires that extirpate isolated local populations will result in permanent loss of a local population due to a lack of recolonization. Wildfire is not expected to be common in the riparian habitats where valley elderberry longhorn beetle lives, however. If wildfire does occur, adverse effects of wildfire suppression will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	None required for this species.	No effect on this species.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 4, ROAD-1 (Road Project Location)	The use of outdoor lighting could affect valley elderberry longhorn beetle by causing mortality related to exhaustion, attraction of predators, or disruption of biological cycles.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-11 (Speed Limit) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan)	Increased human activity will indirectly affect riparian habitats through introduction of invasive plant species such as Himalayan blackberry, illegal dumping, accidental and intentional wildfire ignitions, and potentially collecting of adult beetles. Implementation of AMMs ensures that increased human activity in and near Preserves and Stream Setbacks is limited and that it does not substantially affect valley elderberry longhorn beetle habitat or individual beetles.

Table 6-54
Permanent Indirect Effects on Valley Elderberry Longhorn Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams)	
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor)	Altered hydrology related to Urban Development Covered Activities will facilitate invasion of Argentine ants, which prey on valley elderberry longhorn beetle larvae (Huxel 2000). AMMs that avoid changes to hydrology regimes and habitat will minimize effects on wildlife community structure. Further, implementation of EDGE measures and other measures that minimize habitat disturbance will allow native species to better compete with Argentine ants and limit invasions.

Table 6-54
Permanent Indirect Effects on Valley Elderberry Longhorn Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams)	
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams)	Covered Activities will increase human activity near riparian areas, which increases the risk of introduction and proliferation of invasive plant species, such as Himalayan blackberry, giant reed (*Arundo donax*), tamarisk (*Tamarix* spp.), and pampas grass (*Cortaderia* spp.). These species quickly take over riparian corridors and outcompete elderberry bushes for resources, including water and space. Implementation of AMMs, especially the EDGE measures and Stream Setbacks, will minimize invasive plant effects on valley elderberry longhorn beetle habitat in the Plan Area.
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-1 (Construction Fencing) Condition 4, ROAD-1 (Road Project Location) Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams)	Irrigation and urban runoff will increase populations of Argentine ant, which is a known predator of beetle larvae (Huxel 2000). As stated for Wildlife Community Alterations, AMMs that avoid changes to hydrology regimes and habitat will minimize effects on wildlife community structure. Further, implementation of EDGE measures and other measures that minimize habitat disturbance will allow native species to better compete with Argentine ants and limit invasions.
Mesopredators	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	Mesopredators prey on bird species that eat elderberries and disperse elderberry seeds. Therefore, an increase in mesopredators related to Covered Activities will adversely affect habitat availability for valley

Table 6-54
Permanent Indirect Effects on Valley Elderberry Longhorn Beetle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-2 (Wildlife Crossing Structures)	elderberry longhorn beetle. Implementation of AMMs will minimize increases in mesopredator abundance in Preserves and resultant effects on valley elderberry longhorn beetle habitat.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams)	Adverse effects on the valley elderberry longhorn beetle or its elderberry host plant from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-11 (Speed Limit) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 8, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 8, STREAM-2 (UDA Stream Setbacks) Condition 8, STREAM-3 (Minor Tributaries to UDA Streams)	Increased vehicle traffic associated with Urban Development Covered Activities and Rural Transportation Projects will result in increased vehicle strikes on adult valley elderberry longhorn beetles. This effect will be minimized through establishment of large, interconnected Preserves that are protected by EDGE measures and Stream Setbacks.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-55
Temporary Effects to Valley Elderberry Longhorn Beetle

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Runoff from construction activities into valley elderberry longhorn beetle habitat will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Inadvertent trampling and compaction of riparian vegetation could include damage to elderberry bushes. Implementation of AMMs ensures that trampling and compaction do not occur. No effect on valley elderberry longhorn beetle.
Construction Noise	None required for this species.	No effect on this species.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	Condition 3, BMP-6 (Construction Lighting) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Construction lighting directed toward valley elderberry longhorn beetle can cause mortality to valley elderberry longhorn beetle due to exhaustion, attraction of predators, or disruption of biological cycles. Implementation of AMMs will minimize construction lighting effects on valley elderberry longhorn beetle by ensuring that construction lighting is directed away from adjacent natural habitats.
Construction Dust	Condition 3, BMP-5 (Dust Control)	Construction dust effects on elderberry bushes and riparian water quality

Table 6-55
Temporary Effects to Valley Elderberry Longhorn Beetle

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	will reduce habitat quality for valley elderberry longhorn beetle. However, low to moderate levels of dust have been shown to not substantially affect elderberry density and condition, or beetle presence (Talley and Holyoak 2009). Implementation of AMMs ensures that dust is controlled and will not affect valley elderberry longhorn beetle.
Increased Human Presence during Construction	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Increased human activity in construction and maintenance areas would affect habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets disturb occupied elderberry bushes and would cause general disturbance water quality effects. Implementation of AMMs ensures that pets are not brought to construction sites. No effect on valley elderberry longhorn beetle.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	Trash and debris will adversely affect habitat through direct effects on water quality and by possibly attracting nuisance pest species, including Argentine ants. Implementation of AMMs ensures that construction trash and debris will be controlled and that there will be no substantial effect to Ricksecker's water scavenger beetle.

Temporary Effects

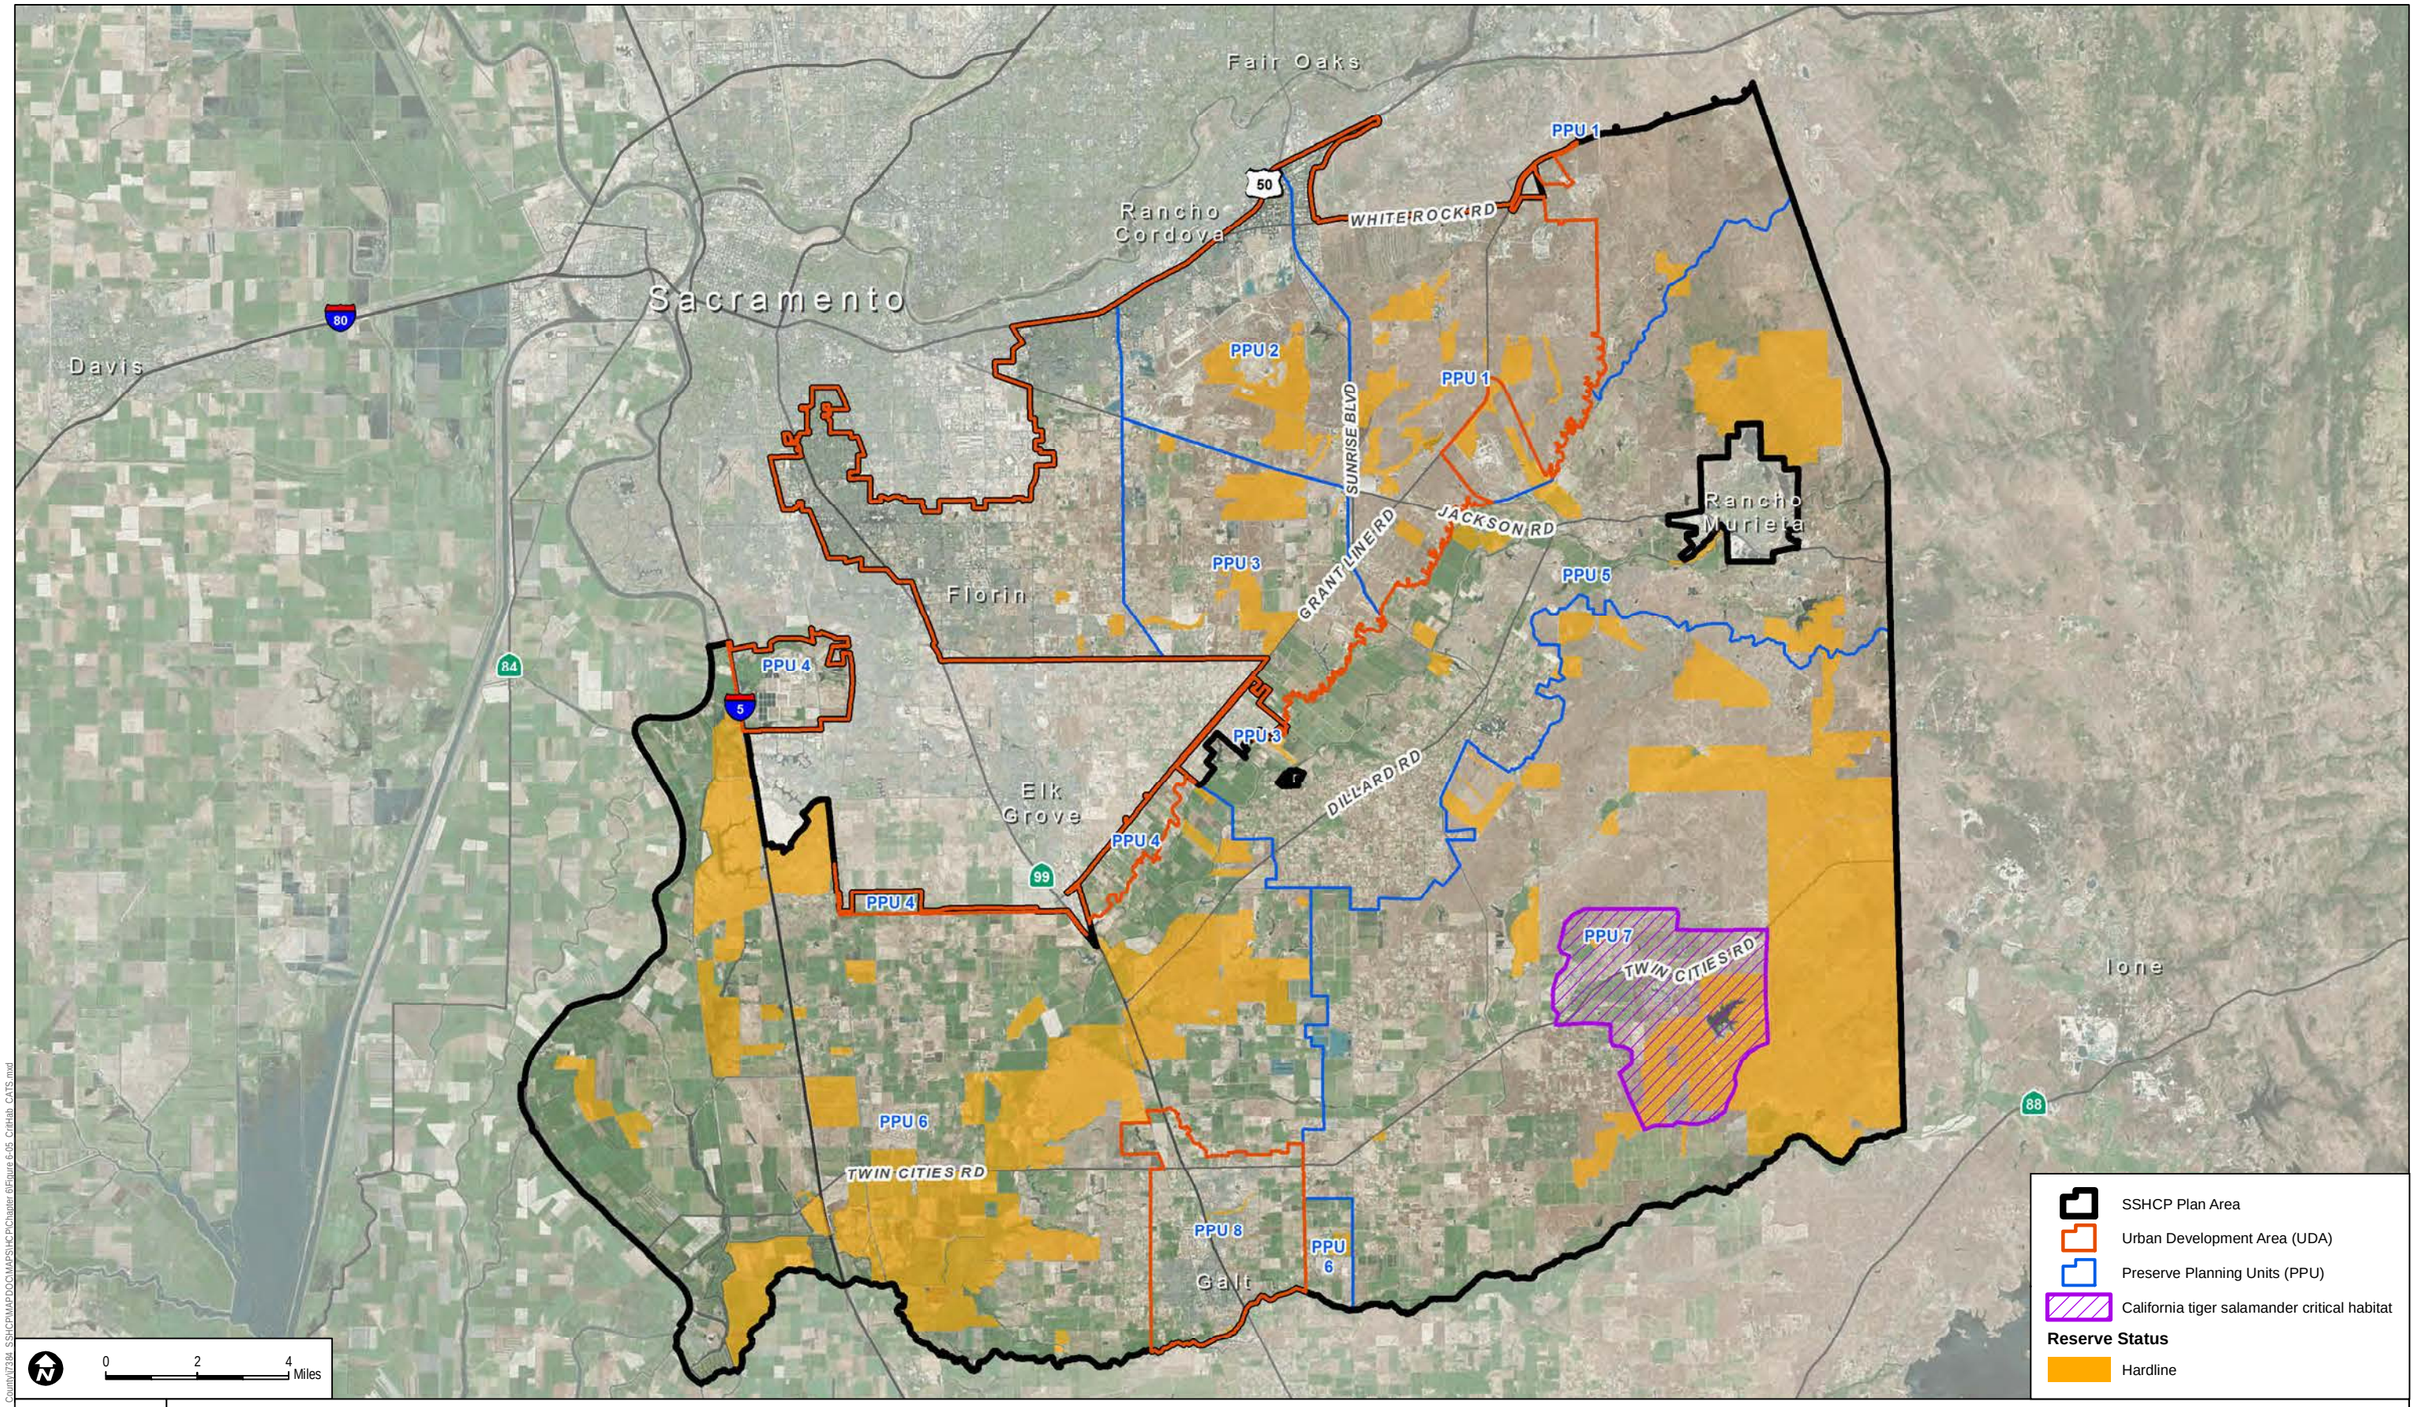
Valley elderberry longhorn beetle occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to valley elderberry longhorn beetle. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects reported in Table 6-53).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on valley elderberry longhorn beetle are qualitatively described in Table 6-55.

6.6.14 California Tiger Salamander

Permanent Effects

Permanent direct and indirect effects of Covered Activities on California tiger salamander will include modification or significant degradation of modeled aquatic and upland habitats (see Section 3.2 and Figures 3-2 and 3-16). Modeled species habitat for California tiger salamander includes aquatic habitat comprising Vernal Pools and Seasonal Wetlands, and upland habitat including Valley Grassland, Blue Oak Woodland, and Blue Oak Savanna habitat within 1.5 miles of modeled aquatic habitat. California tiger salamander historically occurred throughout the Plan Area; however, all of the extant occurrence records within the Plan Area (a total of 28) are located outside the UDA in PPU 7 (see Section 3.4.3).



Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 1,757 acres (out of a total of 89,794 acres) of total modeled aquatic and upland habitats within the Plan Area (Table 6-56), including 80 acres (out of a total of 4,424 acres) of modeled aquatic habitat and approximately 1,677 acres (out of a total of 85,370) of modeled upland habitat. Effects of Covered Activities on modeled upland habitat will occur primarily inside the UDA, with a total of approximately 1,366 acres (out of a total of approximately 1,488 acres) of permanent effects inside the UDA and a total of approximately 311 acres (out of a total of approximately 83,882 acres) of permanent effects outside the UDA. Permanent effects of Covered Activities on modeled aquatic habitat will also occur primarily inside the UDA, with 55 acres (out of a total of approximately 63 acres) of permanent effects inside the UDA and a total of 23 acres (out of a total of approximately 4,361 acres) of permanent effects outside the UDA. No effects on documented occurrences within the Plan Area will occur as a result of Covered Activities. Although the majority of modeled habitats inside the UDA would be directly affected, the lack of any recent occurrences of California tiger salamander and the high existing level of

anthropogenic effects in this portion of the UDA indicates that these modeled habitat effects are unlikely to have substantial, if any, effects on extant California tiger salamander populations in the Plan Area.

Covered Activities will permanently affect approximately 80 acres of modeled aquatic habitat within the Plan Area including 59 acres of vernal pool habitat (out of a total of 3,033) and 21 acres of seasonal wetland (out of a total of 1,391 acres). Additionally, Covered Activities will also have permanent indirect effects on 2 acres of vernal pool habitat within the Plan Area, all of which will occur outside the UDA, as shown in Table 6-56. Covered Activities in the Plan Area will cause other permanent indirect effects to California tiger salamander that cannot be easily quantified.

The approximately 1,757 total acres of permanent effects to the California tiger salamander includes removal of a total of 52 acres of modeled upland and aquatic habitat within the Cosumnes/Rancho-Seco Core Recovery Area, outside the UDA. Of the 52 acres of permanent effects to modeled habitat within the Cosumnes/Rancho-Seco Core Recovery Area, 46 acres are modeled upland habitat and 6 acres are modeled aquatic habitat (Table 6-57).

The Plan Area also includes 7,420 acres of federally designated Critical Habitat (USFWS 2005) outside the UDA and south of the Cosumnes River. However, designated Critical Habitat will not be directly affected by Covered Activities within the Plan Area outside the UDA. The 7,420 acres of Critical Habitat for California tiger salamander occurs within Critical Habitat Unit 3, (Table 6-58 and Figure 6-5) and includes approximately 246 acres of modeled aquatic habitat and 7,174 acres of modeled upland habitat. Covered Activities will not affect either modeled upland or aquatic habitats within designated Critical Habitat. As a result, no direct or indirect effects to California tiger salamander Critical Habitat (upland and aquatic habitats) are expected to occur as a result of Covered Activities within the Plan Area. Additionally, Covered Activities will not affect any documented occurrences of the California tiger salamander in Critical Habitat.

In addition to direct removal of modeled vernal pool habitat, vernal pools within Vernal Pool Ecosystem habitats will also be indirectly affected. Within the Plan Area, Covered Activities will indirectly affect 2 acres of aquatic habitat (out of a total of 4,361 acres) located outside the UDA. However, not all of the vernal pools modeled as habitat would actually provide suitable breeding habitat for California tiger salamanders since many of these pools may lack sufficient depth and inundation periods to support breeding. Edge effects on vernal pool micro-watersheds can remove part or all of the perched aquifer, existing hydrology, and ecosystem that supports vernal pool habitat. Over time, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter water chemistry of the vernal pool; and reduce the frequency of flows between swales

and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for breeding. In addition to the 2.1 acres of indirect effects quantified above in Table 6-56, Covered Activities in the Plan Area will cause other permanent indirect effects to California tiger salamander that are not easily quantified (Table 6-58).

Indirect effects to California tiger salamander modeled habitat inside the UDA will be higher than outside the UDA, because the majority of indirect effects to California tiger salamander modeled habitat resulting from Covered Activities (Urban Development) will occur inside the UDA. However, since extant California tiger salamander populations have not been documented inside the UDA, indirect environmental stressors will have negligible effects on this species or its remaining habitat (Table 6-59). Most indirect effects to California tiger salamander outside the UDA will occur to modeled aquatic habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which is expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, increased risk of accidental fire ignitions, and other road-related effects that will affect California tiger salamander habitat. As a result, indirect effects will likely be restricted to a fairly narrow linear area of varying length. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on existing California tiger salamander habitat within the project footprint. Some of these "other" indirect effects will occur within the road right-of-way area (already quantified as permanently affected in the direct effects and the area of indirect effects to vernal pool hydrology reported in Tables 6-56 through 6-58). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on California tiger salamander that are not quantified are described qualitatively in Table 6-59, along with AMMs that avoid and minimize these effects.

Based on the previously provided information, the Plan Permittees expect that the indirect effects of Covered Activities on California tiger salamander will be minor inside the UDA (due primarily to the lack of occurrences). Indirect effects of Covered Activities outside the UDA will also be minor since the amount of affected acreage is relatively small, and edge effects will be minimized by the establishment of large Preserves and the much lower development densities south of the Cosumnes River.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or proposed SSHCP preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect California tiger salamander. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-59
Permanent Indirect Effects on California Tiger Salamander

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Altered hydrology and water quality degradation will adversely affect the suitability of aquatic habitats to support successful reproduction for this species. Altered hydrology adversely affects vernal pools, seasonal wetlands, stock ponds, and California tiger salamanders by reducing pool water depths and altering the length of the inundation period which can affect the ability of larvae to complete metamorphosis prior to the pool drying, and by increasing the potential for predation due to shallower water depths. Water quality degradation including introduction of various pollutants, toxins, pesticides, and fertilizers, will adversely affect vernal pool communities and reproductive success of California tiger salamanders. The close proximity of planned roads and development to California tiger salamander habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution does not enter California tiger salamander aquatic habitat and that water chemistry of aquatic habitats will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks)	Habitat fragmentation and isolation should be a relatively minor effect to California tiger salamander aquatic habitat and to California tiger salamanders since this indirect effect was considered in the SSHCP preserve design strategy, including preserving large habitat blocks and ensuring habitat connectivity throughout the Preserve System. The Landscape Preserves established outside the UDA, including the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on California tiger salamander. The effects of roads fragmenting modeled habitat in Preserves outside the UDA will be reduced through implementation of EDGE and ROAD AMMs.

Table 6-59
Permanent Indirect Effects on California Tiger Salamander

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-8 (Outdoor Lighting) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location)	Within the UDA, habitat fragmentation will only affect a small amount of remaining modeled habitat; however, since this species has not been documented within the UDA and the remaining habitat is unoccupied, indirect effects will be minimal. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on the California tiger salamander population in the Cosumnes/Rancho-Seco Core Recovery Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Repeated wildfires could eliminate or reduce the quality of upland refugia and foraging habitat for California tiger salamanders by direct mortality to small mammal populations (primarily ground squirrels and pocket gophers (*Geomyidae* spp.)) and to available prey items. As discussed in Section 6.3, Covered Activities outside the UDA will not substantially affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on remaining California tiger salamander habitat will result from wildfire suppression (e.g., fire trucks, retardant, fire breaks); however, since this habitat is unoccupied and this species is not known to occur within the UDA, no effects will occur to California tiger salamanders. Effects of wildfire suppression on California tiger salamander habitat will be minimized through implementation of these AMMs and the Preserve System Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection)	Increased upland erosion, runoff, and subsequent sedimentation of vernal pools will also occur as a result of Covered Activities within the micro-watershed of vernal pool habitats. Erosion in the micro-watershed around individual vernal pools and seasonal wetlands will result in increased sedimentation of the pool, which will reduce water depths and shorten the inundation period ultimately affecting the suitability of the pool to support successful reproduction of

Table 6-59
Permanent Indirect Effects on California Tiger Salamander

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	California tiger salamanders. Vernal pool habitat that supports California tiger salamander will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and proposed vernal pool preserves.
Chronic Ground Vibration and Noise	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) CTS-1 (California Tiger Salamander Surveys)	Vibration and noise could indirectly affect the use of aquatic and upland habitats by California tiger salamanders (e.g., disruption of nocturnal movement patterns and diurnal cycles). As with many frogs and salamanders, California tiger salamanders are sensitive to vibration (especially when aestivating in underground refugia). Vibration can adversely affect California tiger salamanders by forcing them to leave existing underground refugia and move to other locations further away from the vibration source, which can make them more susceptible to predation and desiccation especially during the summer and fall months. Migrating California tiger salamanders and those in underground refugia sites will be indirectly affected by any activities that create chronic ground vibration and noise. Implementation of AMMs will minimize chronic ground vibration and noise in close proximity to California tiger salamander upland habitat.
Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks)	The use of outdoor lighting could indirectly affect the use of vernal pools and upland habitat by California tiger salamanders (e.g., disruption of nocturnal movement patters and diurnal cycles). As with many frogs and salamanders, California tiger salamanders are

Table 6-59
Permanent Indirect Effects on California Tiger Salamander

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-8 (Outdoor Lighting) Condition 4, ROAD-1 (Road Project Location)	sensitive to light (primarily when migrating to and from breeding locations). With the exception of wet periods when California tiger salamanders move aboveground during daylight, the majority of aboveground movement (primarily to and from breeding pools) occurs at night. The use of outdoor lighting in California tiger salamander upland habitat will indirectly affect California tiger salamanders primarily by restricting aboveground movement during the night when most migration occurs. Implementation of AMMs will ensure that outdoor lighting effects on California tiger salamander movement will be minimized.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design)	Increased human activity (including trash, debris, pets, off-highway vehicles (OHVs), and trampling) within the micro-watershed of vernal pool and seasonal wetland habitats will adversely affect these habitats and California tiger salamanders. The presence of trash in the vicinity of vernal pools and seasonal wetlands can attract predators. Additionally, pets also prey on California tiger salamanders but can also physically affect vernal pool habitats, and OHV use can disrupt soils and drainage pathways increasing erosion and introduce harmful substances to the micro-watershed. Access to the preserve will be allowed via low effect trails. Implementation of AMMs will ensure that increased human activity in and near Preserves is limited and that it does not substantially affect California tiger salamander aquatic habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks)	Vernal pool community alterations are most likely to affect California tiger salamanders through changes in prey availability as a result of habitat degradation, and through introduction of non-native aquatic species that predate on the eggs and larvae of California tiger salamanders. Wildlife community alterations that reduce the number and types of prey items and favor potential competitors such as bullfrogs, could adversely affect California tiger salamander breeding habitat. Increases in inundation period may facilitate wildlife community alterations, including invasion by

Table 6-59
Permanent Indirect Effects on California Tiger Salamander

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-8 (Outdoor Lighting) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location)	non-native predators of California tiger salamander such as American bullfrogs and non-native fishes including western mosquitofish. Implementation of EDGE and ROAD AMMs, including those that require control of stormwater runoff, will ensure pollution will not enter California tiger salamander aquatic habitat. Additionally, water chemistry of aquatic habitats will not be affected, invasive species spread will be controlled, and resultant wildlife community alterations will not occur.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank)	Unmanaged proliferation of non-native plant Valley Grasslands of the Vernal Pool Ecosystem will affect critical hydroperiods that support breeding by California tiger salamanders. Implementation of AMMs will minimize proliferation of non-native plants, and preserve management for thatch, such as grazing or prescribed fire, will reduce biomass of upland non-native plants. These will substantially reduce effects of non-native plants on California tiger salamander breeding habitat. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7). Implementation of AMMs will minimize the potential for indirect effects of invasive plants on California tiger salamander habitat. Nitrogen deposition associated with increased vehicle emissions from vehicles associated with new urban development traveling along Plan Area Rural roadway projects will also result in competitive advantages for non-native invasive plants. The unavoidable effects of Nitrogen deposition will be minimized through monitoring and adaptive management of the vernal pool ecosystem on Preserves and through AMMs related to invasive species.

Table 6-59
Permanent Indirect Effects on California Tiger Salamander

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	As described in Wildlife Community Alterations, invasion by non-native predators of California tiger salamander such as American bullfrogs and non-native fishes including western mosquitofish will be avoided through preservation of existing vernal pool inundation period and water chemistry. Implementation of AMMs will minimize the potential for indirect effects from invasive animals.
Mesopredators	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	Adverse effects on California tiger salamander juveniles and adults will occur as a result of the presence of mesopredators during periods of surface activity movement to and from breeding pools. Implementation of AMMs will minimize the potential for predation by mesopredators at road crossing locations.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread)	California tiger salamanders are susceptible to Ranavirus infection, specifically the *Ambystoma tigrinum* virus (ATV). Implementation of this AMM will minimize the potential for introduction of this virus into local California tiger salamander populations.
Pesticides and Fertilizers	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Indirect effects on California tiger salamander, vernal pool plant and animal ecosystem, and seasonal wetlands from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near Preserves will be avoided by implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks)	Vehicles can adversely affect California tiger salamanders, primarily by running them over during night-time migrations to and from breeding pools. The primary approach to reducing effects on roads due to vehicle collisions is to provide culvert undercrossings

Table 6-59
Permanent Indirect Effects on California Tiger Salamander

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	in areas where salamanders are moving across roads to and from breeding pools. Indirect effects on California tiger salamander associated with vehicle collisions will be avoided by locating planned road projects in the least environmentally sensitive location relative to California tiger salamander habitat. Additionally, installing wildlife crossing structures outside the UDA where California tiger salamanders are present will provide for continued dispersal and movement of this species throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Measurable Objectives (see Chapter 7). Implementation of AMMs will minimize potential indirect effects associated with vehicle collisions.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-60
Temporary Effects to California Tiger Salamander

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 1, LID-1 (Stormwater Quality). Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control)	Potential erosion, runoff, and water quality effects on California tiger salamander aquatic habitat resulting from construction activities will be fully avoided through implementation of AMMs.

Table 6-60
Temporary Effects to California Tiger Salamander

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing) CTS-7 (Rodent Control)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing)	Inadvertent trampling of vernal pool vegetation will adversely affect California tiger salamander eggs and larvae. Implementation of AMMs ensures that trampling of vegetation outside the project footprint will not occur.
Construction Noise	Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-7 (Biological Monitor) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing)	Loud noise can affect California tiger salamanders when they are above ground. Implementation of AMMs will minimize construction noise effects in the vicinity of California tiger salamander habitat.
Construction Ground Vibration	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing)	Ground vibrations can force California tiger salamanders to leave underground refugia to move away from the vibration source, exposing them to potential predation by predators. Implementation of AMMs will minimize construction ground vibration effects near California tiger salamander habitat.
Construction Lighting	Condition 3, BMP-6 (Construction Lighting) Condition 3, BMP-7 (Biological Monitor)	Construction lighting directed towards California tiger salamander upland habitat can restrict the ability of California tiger salamanders

Table 6-60
Temporary Effects to California Tiger Salamander

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-8 (Training of Construction Staff) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing)	to move above ground (i.e., migrate to and from breeding pools). Implementation of AMMs will minimize construction lighting effects on California tiger salamander by ensuring that construction lighting is directed away from adjacent natural habitats.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing)	Construction dust effects on vernal pool vegetation communities and vernal pool and seasonal wetland water quality will reduce habitat quality for California tiger salamander. Implementation of AMMs ensures that dust is controlled.
Increased Human Presence during Construction	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing) CTS-6 (California Tiger Salamander Encounter Protocol) CTS-7 (Rodent Control)	Increased human activity in construction and maintenance areas would affect vernal pool and seasonal wetland habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets that access occupied pools would cause general disturbance and affect water quality. Implementation of AMMs ensures that increased human presence does not occur.
Construction Trash and Debris	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) CTS-1 (California Tiger Salamander Daily Construction Schedule) CTS-2 (California Tiger Salamander Monitoring) CTS-3 (California Tiger Salamander Exclusion Fencing)	Trash and debris would adversely affect California tiger salamanders by degrading water quality and by attracting nuisance pest species. Implementation of AMMs will ensure that construction trash and debris will be monitored and controlled.

Temporary Effects

California tiger salamander occurrences near proposed ground-disturbing Covered Activities (outside the UDA) will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to the California tiger salamander. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently affected in the direct effects and the area of indirect effects to Vernal Pool and Seasonal Wetland hydrology reported in Table 6-56). Specific AMMs have been developed to minimize potential effects on California tiger salamander, including CTS-1, daily construction schedule when Covered Activities occur during the breeding and dispersal season; CTS-2, monitoring requirements when Covered Activities occur during the breeding and dispersal season; CTS-3, use of exclusion fencing when Covered Activities occur during the breeding and dispersal season; CTS-4, procedures to avoid entrapment of California tiger salamanders when Covered Activities occur during the breeding and dispersal season; CTS-5, California tiger salamander encounter protocol when Covered Activities occur during the breeding and dispersal season; and CTS-6, the use of non-entangling erosion control materials.

These potential construction-related environmental stressors were generally described in Section 6.3.2, and their additional effects on California tiger salamander are qualitatively described in Table 6-60.

6.6.15 Western Spadefoot

Permanent Effects

Permanent direct and indirect effects of Covered Activities on western spadefoot will include modification or significant degradation of modeled aquatic and upland habitats (see Section 3.2 and Figure 3-17) and the direct and indirect take of western spadefoot individuals occupying that modified or degraded habitat.

Modeled species habitat for western spadefoot includes aquatic habitat comprising Seasonal Wetlands, Swale, Open Water, Streams/Creeks, and Streams/Creeks (VPIH), and upland habitat consisting of Valley Grassland, Blue Oak Woodland, and Blue Oak Savanna habitat within 1,600 meters (5,249 feet) of modeled aquatic habitat. However, the primary breeding habitats for western spadefoot usually include vernal pools, seasonal wetlands, and various depressional features (temporary rain pools) that remain inundated for a sufficient period (at least 30 days) to complete metamorphosis. Western spadefoots may also breed in pools in swales, various shallow open water habitats, streams/creeks, and a variety of other features including tire ruts, although use of these habitats may be sporadic. Western spadefoot occur throughout the Plan Area,

although the majority of the occurrence records (21 out of a total of 29 records within the Plan Area) are located outside the UDA, mostly within PPU 7 (see Section 3.4.3).

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 23,207 acres of total modeled aquatic and upland habitats within the Plan Area (Table 6-61), including 1,164 acres (out of a total of 13,479 acres) of modeled aquatic habitat and approximately 22,043 acres (out of a total of 149,603 acres) of modeled upland habitat. Permanent effects of Covered Activities on modeled upland habitat will occur primarily inside the UDA, with a total of approximately 21,329 acres (out of a total of 30,345 acres) of permanent effects inside the UDA and a total of approximately 714 acres outside the UDA. Covered Activity effects on modeled aquatic habitat will also occur primarily within the UDA, with approximately 1,089 acres (out of a total of approximately 2,026 acres) of permanent effects inside the UDA; and a total of 75 acres (out of a total of 11,453 acres) of permanent effects outside the UDA.

Aquatic and upland habitat within the two Core Recovery Areas is important for western spadefoot as evidenced by the 18 occurrences in the Cosumnes/Rancho-Seco Core Recovery Area and 8 occurrences in the Mather Core Recovery Area (Figure 3-17). Covered Activities within these two Core Recovery Areas will permanently affect approximately 8,600 acres (out of a total of 60,042 acres) of modeled upland and aquatic habitat (Table 6-62). Within the Mather Core Recovery Area, Covered Activities will permanently affect approximately 8,547 acres of habitat, including approximately 8,127 acres of upland habitat and 420 acres of aquatic habitat. Outside the UDA and within the Cosumnes/Rancho-Seco Core Recovery Area, Covered Activities will permanently affect approximately 53 acres of habitat including 46 acres of upland habitat and approximately 7 acres of aquatic habitat. Similar to other western spadefoot habitat within the Plan Area, the majority of indirect effects within the two Core Recovery Areas will occur within the UDA in the Mather Core Recovery Area.

Western spadefoots in the Plan Area will be affected by permanent indirect effects to modeled habitat, as well as harm and harassment of individuals. Covered Activities will have permanent indirect effects on 142 acres of modeled aquatic habitat. Most of these permanent effects will occur primarily inside the UDA, with a total of approximately 132 acres (out of a total of 2,026 acres) of modeled aquatic habitat inside the UDA. Outside the UDA, approximately 10 acres of modeled aquatic habitat will be permanently affected.

However, not all of the modeled aquatic habitat would actually provide suitable breeding habitat for western spadefoot since many of these pools may lack sufficient depth and inundation periods to support breeding. Edge effects on vernal pool micro-watersheds can remove part or all of the perched aquifer, existing hydrology, and ecosystem that supports vernal pool habitat. Edge effects on vernal pool micro-watersheds remove part or all of the perched aquifer, existing hydrology, and ecosystem that supports Vernal Pool, Swale, and Stream/Creek (VPIH) habitat. Over time, effects on the micro-watersheds will indirectly change the timing, duration, and depth of vernal pool filling; alter water chemistry of the vernal pool; and reduce the frequency of flows between swales and vernal pools and connectivity between the pools. Collectively, these effects will result in the affected aquatic habitat becoming unsuitable for western spadefoot breeding. In addition to the 142 acres of indirect effects quantified in Table 6-61 and 6-62, Covered Activities in the Plan Area will cause other permanent indirect effects to western spadefoot that are not easily quantified (Table 6-63).

Although indirect effects will occur throughout the Plan Area, their potential to have substantial effects on western spadefoot is greatest within the UDA due to the closer and more extensive contact between urban development that will occur within the UDA and adjacent to preserved areas and the requirement of extensive infrastructure. It is expected that most of the indirect effects outside the UDA south of the Cosumnes River will be fairly minor since the amount of affected acreage is relatively small, and edge effects will be minimized by the establishment of large Preserves and the much lower development densities south of the Cosumnes River. Most indirect effects to western spadefoot outside the UDA will occur to modeled aquatic habitats located along Rural Transportation Projects, including improved roadways that will support higher traffic densities, which is expected to increase contaminants in road runoff, potential spread of invasive plants, increased pesticide use, increased risk of accidental fire ignitions, and other road-related effects that will affect western spadefoot habitat. As a result, indirect effects will likely be restricted to a fairly narrow linear area of varying length. In particular, improvement of Clay Station Road that passes through the Landscape Preserve in PPU 7 (see Chapter 7) will have permanent indirect effects on vernal pool habitat (although some of these indirect effects are already accounted for in the indirect effect acreage reported in Table 6-61). Some of these “other” indirect effects will occur within the road right-of-way area (already quantified as permanently affected in the direct effects and the area of indirect effects to vernal pool hydrology reported in

Table 6-61). Remaining indirect effects of Rural Transportation Projects and other Covered Activities on western spadefoot that are not quantified are described qualitatively in Table 6-63, along with AMMs that avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or proposed SSHCP preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect western spadefoot. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Table 6-63
Permanent Indirect Effects on Western Spadefoot

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location) WS-1 (Western Spadefoot Surveys)	Altered hydrology and water quality degradation will adversely affect the suitability of aquatic habitats to support successful reproduction for this species. Altered hydrology adversely affects vernal pools, seasonal wetlands, stock ponds, rain pools, and other suitable aquatic habitats and western spadefoots by reducing pool water depths and altering the length of the inundation period which can affect the ability of larvae to complete metamorphosis prior to the pool drying, and by increasing the potential for predation due to shallower water depths. Water quality degradation, including introduction of various pollutants, toxins, pesticides, and fertilizers. will adversely affect vernal pool communities and reproductive success of western spadefoots. The close proximity of planned roads and development to habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution does not enter western spadefoot aquatic habitat and that water chemistry of aquatic habitats will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside	Habitat fragmentation and isolation should be a relatively minor effect to western spadefoot aquatic habitat and to western spadefoots since this indirect affect was considered in the SSHCP preserve design strategy, including preserving large habitat blocks and ensuring habitat connectivity throughout the Preserve System. The Landscape Preserves established inside the UDA including the Mather Core Recovery Area, and outside the UDA including the Cosumnes/Rancho-Seco Core Recovery Area, will avoid effects of habitat fragmentation on western spadefoot. The effects of roads

Table 6-63
Permanent Indirect Effects on Western Spadefoot

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-8 (Outdoor Lighting) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) WS-1 (Western Spadefoot Surveys)	fragmenting modeled habitat in Preserves outside the UDA will be reduced through implementation of EDGE and ROAD AMMs. Within the UDA, habitat fragmentation will affect a small amount of remaining modeled habitat; however, since this species has not been documented within the UDA and the remaining habitat is unoccupied, indirect effects will be minimal. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on the western spadefoot population in both the Mather and Cosumnes/Rancho-Seco Core Recovery Areas.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Repeated wildfires could eliminate or reduce the quality of upland refugia and foraging habitat for western spadefoots by direct mortality to small mammal populations (primarily ground squirrels and pocket gophers) and to available prey items. As discussed in Section 6.3, Covered Activities outside the UDA will not substantially affect wildfire frequency, duration, or intensity. Within the UDA, potential effects of increased wildfire on western spadefoot habitat will result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on western spadefoot habitat will be minimized through implementation of AMMs and the Preserve System Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection)	Increased erosion, runoff, and subsequent sedimentation of vernal pools will also occur as a result of Covered Activities within the micro-watershed of vernal pool habitats. Erosion in the micro-watershed around individual vernal pools and seasonal wetlands will result in increased sedimentation of the pool, which will reduce water depths and shorten the inundation period, ultimately affecting the suitability of the pool to support successful reproduction of

Table 6-63
Permanent Indirect Effects on Western Spadefoot

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	western spadefoots. Vernal pool habitat that supports western spadefoot will be indirectly affected by any activities that interrupt the perched aquifer supporting vernal pool hydrology. Implementation of AMMs will minimize hydrologic alterations to the micro-watersheds of existing and proposed vernal pool preserves.
Chronic Ground Vibration and Noise	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) WS-1 (Western Spadefoot Surveys)	Vibration and noise could indirectly affect the use of aquatic and upland habitats by western spadefoot (e.g., disruption of nocturnal movement patters and diurnal cycles). As with many frogs and salamanders, western spadefoots are sensitive to vibration (especially when aestivating in underground refugia). Vibration can adversely affect western spadefoots by forcing them to leave existing underground refugia and move to other locations further away from the vibration source, which can make them more susceptible to predation and desiccation especially during the summer and fall months. Migrating western spadefoots and those in underground refugia sites will be indirectly affected by any activities that create chronic ground vibration and noise. Implementation of AMMs will minimize the effects of chronic ground vibration and noise in close proximity to western spadefoot upland habitat.

Table 6-63
Permanent Indirect Effects on Western Spadefoot

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 4, ROAD-1 (Road Project Location)	The use of outdoor lighting could indirectly affect the use of vernal pools and upland habitat by western spadefoots (e.g., disruption of nocturnal movement patterns and diurnal cycles). As with many frogs and salamanders, western spadefoots are sensitive to light (primarily when migrating to and from breeding locations). With the exception of wet periods when western spadefoots move aboveground during daylight, the majority of aboveground movement (primarily to and from breeding pools) occurs at night. The use of outdoor lighting in western spadefoot upland habitat will indirectly affect western spadefoots primarily by restricting aboveground movement during the night when most migration occurs. Implementation of AMMs will ensure that outdoor lighting effects on western spadefoot movement will be minimized.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Increased human activity (including trash, debris, pets, OHVs, and trampling) within the micro-watershed of vernal pool and seasonal wetland habitats will adversely affect these habitats and western spadefoots. The presence of trash in the vicinity of vernal pools and seasonal wetlands can attract predators. Additionally, pets also prey on western spadefoots but can also physically affect vernal pool habitats, and OHV use can disrupt soils and drainage pathways increasing erosion and introduce harmful substances to the micro-watershed. Access to the preserve will be allowed via low effect trails. Implementation of AMMs will ensure that increased human activity in and near Preserves is limited and that it does not substantially affect western spadefoot aquatic habitat.

Table 6-63
Permanent Indirect Effects on Western Spadefoot

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-9 (Soil Compaction Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location)	Vernal pool community alterations are most likely to affect western spadefoots through changes in prey availability as a result of habitat degradation, and through introduction of non-native aquatic species that predate on the eggs and larvae of western spadefoot. Wildlife community alterations that reduce the number and types of prey items and favor potential competitors such as bullfrogs, could adversely affect western spadefoot breeding habitat. Increases in inundation period may facilitate wildlife community alterations, including invasion by non-native predators of western spadefoot such as American bullfrogs and non-native fishes including western mosquitofish. Implementation of EDGE and ROAD AMMs, including those that require control of stormwater runoff, will ensure pollution will not enter western spadefoot aquatic habitat, water chemistry of aquatic habitats will not be affected, invasive species spread will be controlled, and resultant wildlife community alterations in western spadefoot aquatic habitat will not occur.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank)	Unmanaged proliferation of non-native plant Valley Grasslands of the Vernal Pool Ecosystem will affect critical hydroperiods that support breeding by western spadefoot. Implementation of AMMs will minimize proliferation of non-native plants, and preserve management for thatch, such as grazing or prescribed fire, will reduce biomass of upland non-native plants. These will substantially reduce effects of non-native plants on western spadefoot breeding habitat. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7). Nitrogen deposition associated with increased vehicle emissions

Table 6-63
Permanent Indirect Effects on Western Spadefoot

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		from vehicles associated with new urban development traveling along Plan Area rural roadway projects will also result in competitive advantages for non-native invasive plants. The unavoidable effects of nitrogen deposition will be minimized through monitoring and adaptive management of the vernal pool ecosystem on Preserves and through AMMs related to invasive species.
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	As described in Wildlife Community Alterations, invasion by non-native predators of western spadefoot such as American bullfrogs and non-native fishes including western mosquitofish will be avoided through preservation of existing vernal pool inundation period and water chemistry and implementation of AMMs.
Mesopredators	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	Adverse effects on western spadefoot juveniles and adults will occur as a result of the presence of some mesopredators during periods of surface activity movement to and from breeding pools. Larvae are consumed by several aquatic and terrestrial predators both native and introduced, including California tiger salamander larvae, American bullfrogs, and wading birds. However, post-metamorphic juveniles and adults produce skin secretions that may make them unpalatable to some predators. Mesopredators that have been documented predating on western spadefoot include raccoons and dabbling ducks (especially mallards (*Anas platyrhynchos*)). Implementation of AMMs will minimize the potential for predation by mesopredators at road crossing locations.
Wildlife Disease	None required for this species.	No effect on this species.

Table 6-63
Permanent Indirect Effects on Western Spadefoot

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Pesticides and Fertilizers	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Indirect effects on western spadefoot, vernal pool plant and animal ecosystem, and seasonal wetlands from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near Preserves will be avoided by implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	Vehicles can adversely affect western spadefoots, primarily by running them over during night-time migrations to and from breeding pools. The primary approach to reducing effects on roads due to vehicle collisions is to provide culvert undercrossings in areas where salamanders are moving across roads to and from breeding pools. Indirect effects on western spadefoot associated with vehicle collisions will be avoided by locating planned road projects in the least environmentally sensitive location relative to western spadefoot habitat. Additionally, installing wildlife crossing structures outside the UDA where western spadefoots are present will provide for continued dispersal and movement of this species throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Measurable Objectives (see Chapter 7). Implementation of AMMs will minimize indirect effects associated with vehicle collisions.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-64
Temporary Effects to Western Spadefoot

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-3 (Trenchless Construction Methods) Condition 8, UTILITY-4 (Siting of Entry and Exit Location) WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing)	Potential erosion, runoff, and water quality effects on western spadefoot aquatic habitat resulting from construction activities will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing)	Inadvertent trampling of vernal pool vegetation will adversely affect western spadefoot eggs and larvae. Implementation of AMMs ensures that trampling of vegetation outside the project footprint will not occur.

Table 6-64
Temporary Effects to Western Spadefoot

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Construction Noise	Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-7 (Biological Monitor) WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing)	Loud noise can affect western spadefoot when they are aboveground. Implementation of AMMs will minimize construction noise effects in the vicinity of western spadefoot habitat.
Construction Ground Vibration	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing)	Ground vibrations can force western spadefoots to leave underground refugia to move away from the vibration source, exposing them to potential predation by predators. Implementation of AMMs will minimize construction ground vibration effects near western spadefoot habitat.
Construction Lighting	Condition 3, BMP-6 (Construction Lighting) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing)	Construction lighting directed towards western spadefoot upland habitat can restrict the ability of western spadefoots to move aboveground (i.e., migrate to and from breeding pools). Implementation of AMMs will minimize construction lighting effects on western spadefoot by ensuring that construction lighting is directed away from adjacent natural habitats.
Construction Dust	Condition 3, BMP-5 (Dust Control) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing)	Construction dust effects on vernal pool vegetation communities and vernal pool and seasonal wetland water quality will reduce habitat quality for western spadefoot. Implementation of AMMs ensures that dust is controlled.
Increased Human Presence during Construction	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff)	Increased human activity in construction and maintenance areas would affect vernal pool and seasonal wetland habitat quality through personnel bringing pets (e.g., dogs) to work sites. Pets that

Table 6-64
Temporary Effects to Western Spadefoot

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing) WS-7 (Western Spadefoot Encounter Protocol)	access occupied pools would cause general disturbance and affect water quality. Implementation of AMMs ensures that increased human presence does not occur.
Construction Trash and Debris	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WS-1 (Western Spadefoot Surveys) WS-2 (Western Spadefoot Work Window) WS-3 (Western Spadefoot Monitoring) WS-4 (Western Spadefoot Exclusion Fencing)	Trash and debris would adversely affect western spadefoot habitat by degrading water quality and by attracting nuisance pest species which could adversely affect this species. Implementation of AMMs will ensure that construction trash and debris will be monitored and controlled.

Temporary Effects

Western spadefoot occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to the western spadefoot. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently affected in the direct effects and the area of indirect effects to Vernal Pool and Seasonal Wetland hydrology reported in Table 6-61). Specific AMMs have been developed to minimize potential effects on western spadefoot including WS-1, work window outside the breeding and dispersal season; WS-2, monitoring requirements when Covered Activities occur during the breeding and dispersal season; WS-3, use of exclusion fencing when Covered Activities occur during the breeding and dispersal season; WS-4, procedures to avoid entrapment of western spadefoot when Covered Activities occur in western spadefoot modeled habitat; WS-5, use of non-entangling materials if erosion control BMP-2 is implemented; and WS-6, use of western spadefoot encounter protocol when Covered Activities occur during the breeding and dispersal season.

These potential construction-related environmental stressors were generally described in Section 6.3.2, and their additional effects on western spadefoot are qualitatively described in Table 6-64.

6.6.16 Giant Gartersnake

Permanent Effects

Permanent direct and indirect effects of Covered Activities on giant gartersnake will include modification or significant degradation of modeled aquatic and upland habitats (see Section 3.2 and Figures 3-2 and 3-18) and the direct and indirect take of giant gartersnake individuals occupying that modified or degraded habitat.

Modeled species habitat for giant gartersnake includes aquatic habitat comprising Seasonal Wetlands, Freshwater Marsh, Open Water (excluding ski lakes), and Streams/Creeks; and upland habitat that includes Valley Grassland and Mixed Riparian Scrub habitat within 820 feet of modeled aquatic habitat. Modeled aquatic and upland habitat for giant gartersnake within the Plan Area includes both high-value and non-high-value habitat (Figure 3-18), with the majority of high-value habitat located outside the UDA. Rice fields also provide potential habitat for giant gartersnake; however, since very little rice farming occurs within the Plan Area, impacts to crop land were not calculated. Giant gartersnakes occur throughout the Plan Area, although the majority of the occurrence records (9 out of a total of 11 records within the Plan Area) are located outside the UDA, mostly in PPU 6 (see Section 3.4.4).

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 2,358 acres of total modeled aquatic and upland habitats (which includes both high-value and non-high-value habitat) within the Plan Area (Table 6-65), including approximately 169 acres (out of a total of 7,290 acres) of modeled aquatic habitat and approximately 2,189 acres (out of a total of 27,868 acres) of modeled upland habitat. Covered Activity effects on modeled aquatic habitat will occur primarily within the UDA, with approximately 144 acres (out of a total of 483 acres) of permanent effects inside the UDA, and a total of approximately 25 acres (out of a total of 6,807 acres) of permanent effects outside the UDA. Permanent effects of Covered Activities on modeled upland habitat will also occur primarily inside the UDA, with a total of approximately 1,965 acres (out of a total of 4,053 acres) of permanent effects inside the UDA, and a total of approximately 224 acres (out of a total of 23,816 acres) outside the UDA. Covered Activities will not have a direct permanent effect on any giant gartersnake occurrence records within the Plan Area.

Covered Activities will permanently affect approximately 606 acres of high-value giant gartersnake habitat within the Plan Area (Table 6-66), including approximately 104 acres (out of a total of 3,628 acres) of modeled aquatic habitat and approximately 502 acres (out of a total of 6,853 acres) of modeled upland habitat. Permanent effects of Covered Activities on modeled upland habitat will also occur primarily inside the UDA, with a total of approximately 461 acres (out of a total of 1,056 acres) of permanent effects inside the UDA, and a total of approximately 41 acres (out of a total of 5,797 acres) outside the UDA (Table 6-66). High-value habitat also includes the Badger Creek and Stone Lakes National Wildlife Refuge (NWR) areas where known subpopulations of giant gartersnake have been documented in this portion of the Plan Area (see Section 3.4.4).

Covered Activities in the Plan Area will cause permanent indirect effects to giant gartersnake that are not easily quantified (Table 6-65). Giant gartersnakes in the Plan Area will be affected by permanent indirect effects to both aquatic and upland habitats, as well as harm and harassment of individuals. Indirect effects of the Covered Activities include management and monitoring; habitat fragmentation and isolation; altered hydrology and water quality degradation including introduction of pollutants, toxins, pesticides, and fertilizers; increased human activity (including trash, pets, debris, OHVs, and trampling); altered fire regime; aquatic community alterations (including increased predation); vibration and noise issues; and vehicle collisions.

Although indirect effects to giant gartersnake modeled habitat will occur throughout the Plan Area, their potential to have substantial effects on giant gartersnake is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, accidental fire ignitions, and other road-related effects (e.g., road runoff, potential spread of invasive plants, etc.). The potential permanent indirect effects of Covered Activities are described in Table 6-67, along with AMMs to avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or proposed SSHCP preserves, certain uses will be allowed inside Preserves and in Preserve Setbacks that may indirectly affect giant gartersnake. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize “other” indirect impacts.

Table 6-67
Permanent Indirect Effects on Giant Gartersnake

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 4, ROAD-1 (Road Project Location) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) GGS-8 (Giant Gartersnake Post-Construction Restoration)	Altered hydrology and water quality degradation will adversely affect the suitability of aquatic habitats to support foraging, movement pathways, and winter hibernacula sites for giant gartersnakes. Altered hydrology adversely affects giant gartersnakes by increasing water depths which will affect habitat by inundating small mammal burrows used as winter hibernacula and altering the length of the inundation period. Water quality degradation, including introduction of various pollutants, toxins, pesticides, and fertilizers, will have an adverse effect on giant gartersnakes, although this species has been observed in degraded water quality conditions. The close proximity of planned roads and development to habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution does not enter giant gartersnake aquatic habitat and that water chemistry of aquatic habitats will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves)	Habitat fragmentation and isolation will have several adverse effects on giant gartersnakes although this species can cross upland habitats (typically from 820 feet to 3.1 miles) to reach other suitable aquatic habitats even though they prefer to move along aquatic pathways. These adverse effects include: (1) exposing aquatic habitat located in close proximity to development and roads to disruptive urban edge effects such as altered hydrology (e.g., increased runoff), pollutants, toxins, and pesticides and fertilizers, and human activities (trampling, OHVs, pets, trash and debris, etc.), collisions with vehicles even though this species is not likely to cross paved roads, and urban-related predators; (2) increased vulnerability to negative demographic trends, including genetic bottlenecks, genetic drift, and inbreeding depression in areas

AGENDA ITEM 11.1
876

Table 6-67
Permanent Indirect Effects on Giant Gartersnake

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) GGS-8 (Giant Gartersnake Post-Construction Restoration)	where other aquatic habitats are not within approximately a mile of occupied aquatic habitat; and (3) disruption of natural interconnectivity of occupied aquatic habitats important for dispersal and colonization, thus reducing the natural genetic exchange of giant gartersnakes between aquatic habitats. Many effects of habitat fragmentation and isolation on giant gartersnakes, including most of the edge effects, are most likely to occur inside the UDA where the preserves will be bordered by urban development and roads are planned to cross some proposed preserves, such as the Core Preserve in PPU 3.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Altered fire regimes can have adverse effects on riparian vegetation by removing important cover and protection for giant gartersnakes. Repeated wildfires can affect upland habitat by eliminating or reducing the numbers of small fossorial mammals (primarily ground squirrels and pocket gophers) and associated burrows which provide winter aestivation habitat for giant gartersnake. Repeated fires in upland habitat can also alter watershed hydrology and adversely affect aquatic habitats. Effects of wildfire suppression on giant gartersnake habitat will be minimized through implementation of these AMMs and the Preserve System Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	None required for this species.	No effect on this species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) GGS-1 (Giant Gartersnake Surveys)	Vibration and noise issues will indirectly affect the use of upland habitats by giant gartersnake (e.g., disruption of movement patterns and diurnal cycles). As with many amphibians and reptiles, giant gartersnakes are sensitive to vibration (especially when aestivating in underground refugia) and noise. Vibration can adversely affect giant gartersnakes by forcing them to leave existing underground refugia, basking areas, and cover habitat, and to move to other locations further away from the vibration source,

Table 6-67
Permanent Indirect Effects on Giant Gartersnake

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		which can make them more susceptible to predation. Since giant gartersnakes are sensitive to disturbance and tend to remain hidden under cover while out of the water, noise can drive them from cover habitat and into open areas where they are more susceptible to predation. Implementation of these AMMs will minimize the potential for indirect effects from vibration and noise.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Increased human activity (including trash, debris, pets, OHVs, and trampling) in the vicinity of suitable aquatic habitats (Streams/Creeks, Freshwater Marshes, Seasonal Wetlands, and Open Water) and adjacent upland (aestivation) habitats will adversely affect the secretive giant gartersnake. The presence of trash in the vicinity of aquatic habitats can attract predators of giant gartersnake, and the presence of pets also results in predation of giant gartersnakes. OHV use can disrupt soils, runoff patterns, and small mammal activity and can affect drainage pathways, increasing erosion and introducing harmful substances to the watershed and aquatic habitats. Access to the preserve will be allowed via low effect trails. Implementation of AMMs will reduce potential effects of increased human activity within Preserves.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-9 (Soil Compaction)	Aquatic community alterations are most likely to affect giant gartersnakes through changes in prey base (which consists of amphibians, tadpoles, and small fish) resulting from habitat degradation, and through introduction or increases in the numbers of non-native aquatic predators, such as bullfrogs, that predate on young giant gartersnakes (neonates). Wildlife community alterations that reduce the number and types of prey items and favor potential competitors such as American bullfrogs, will adversely affect giant gartersnakes and associated aquatic habitat. Successful implementation of the Conservation Strategy described in Chapter 7 and the Monitoring and Management Program described in

AGENDA ITEM 11.1

Table 6-67
Permanent Indirect Effects on Giant Gartersnake

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) GGS-8 (Giant Gartersnake Post-Construction Restoration)	Chapter 8 will be key in addressing potential wildlife community alterations. Implementation of EDGE and ROAD AMMs, including those that require control of stormwater runoff, will ensure pollution will not enter giant gartersnake aquatic habitat, water chemistry of aquatic habitats will not be affected, invasive species spread will be controlled, and resultant wildlife community alterations in giant gartersnake aquatic habitat will not occur.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) GGS-8 (Giant Gartersnake Post-Construction Restoration)	Unmanaged proliferation of non-native aquatic vegetation will affect aquatic habitat for giant gartersnakes by outcompeting native vegetation and creating movement barriers for giant gartersnakes. Implementation of AMMs will minimize proliferation of non-native aquatic vegetation and reduce effects of non-native aquatic vegetation on giant gartersnake aquatic habitat relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	As described in Wildlife Community Alterations, invasion by non-native predators of giant garter snake such as American bullfrogs, non-native fishes including largemouth bass (*Micropterus salmoides*) and catfish (*Siluriformes* spp.), and the southern watersnake (*Nerodia fasciata*) can have adverse effects on aquatic communities and on the giant gartersnake. The introduction of predatory fish into giant gartersnake habitat generally results in eradication of giant gartersnakes. Additionally, invasive aquatic species typically consume the same aquatic organisms as the giant gartersnake which can substantially alter the prey base for giant gartersnakes. Indirect effects to giant gartersnakes and their habitat associated with invasive aquatic species will be minimized through the implementation of AMMs.

Table 6-67
Permanent Indirect Effects on Giant Gartersnake

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Mesopredators	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition, 4 ROAD-2 (Wildlife Crossing Structures)	Adverse effects on giant gartersnakes will occur as a result of the presence of mesopredators in aquatic habitats and during periods of upland movement and activity. Potential domestic and native mesopredators of giant gartersnake include domestic cats, river otters (*Lontra canadensis)*, raccoons, skunks, opossums, and foxes, as well as several bird species. Implementation of these AMMs will minimize the potential for predation by mesopredators.
Wildlife Disease	None required for this species.	No effect on this species.
Pesticides and Fertilizers	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Indirect effects on giant gartersnake and suitable aquatic habitats will occur from pesticides (such as glyphosate) and fertilizer runoff (by killing potential prey items) from agriculture and from new urban developments in or near Preserves. These will be avoided by implementation of these AMMs.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition, 4 ROAD-2 (Wildlife Crossing Structures) GGS-1 (Giant Gartersnake Surveys)	Even though giant gartersnakes tend to avoid roads (especially paved roads), vehicles can adversely affect this species, primarily by running them over during early morning periods or after leaving aestivation burrows when metabolic rates are low. Recent research indicates that wildlife crossing structures may be effective in reducing road mortality of some snakes, including giant garter snake. Implementation of AMMs will reduce the potential for vehicle collisions with giant gartersnake.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-68
Temporary Effects to Giant Gartersnake

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-4 (Siting of Entry and Exit Location) GGS-1 (Giant Gartersnake Surveys) GGS-2 (Giant Gartersnake Work Window) GGS-3 (Giant Gartersnake Monitoring) GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion)	Potential erosion, runoff, and water quality effects on giant gartersnake aquatic habitat resulting from construction activities will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) GGS-1 (Giant Gartersnake Surveys) GGS-2 (Giant Gartersnake Work Window) GGS-3 (Giant Gartersnake Monitoring) GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion)	Inadvertent trampling of vegetation can adversely affect cover habitat used by giant gartersnakes. Implementation of AMMs ensures that trampling of potential cover vegetation for giant gartersnakes will not occur.
Construction Noise	Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-7 (Biological Monitor) GGS-1 (Giant Gartersnake Surveys) GGS-2 (Giant Gartersnake Work Window) GGS-3 (Giant Gartersnake Monitoring) GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion)	Loud noise can potentially affect giant gartersnakes while aboveground and possibly in underground refugia by forcing them to leave the area. Implementation of AMMs will reduce construction noise effects in the vicinity of giant gartersnake habitat.

AGENDA ITEM 11.1

Table 6-68
Temporary Effects to Giant Gartersnake

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Construction Ground Vibration	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) GGS-1 (Giant Gartersnake Surveys) GGS-2 (Giant Gartersnake Work Window) GGS-3 (Giant Gartersnake Monitoring) GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion)	Ground vibration can force giant gartersnakes to leave underground refugia to move away from the vibration source, exposing them to potential predation. Implementation of AMMs will reduce ground vibration effects from construction activities near giant gartersnake habitat.
Construction Lighting	Condition 3, BMP-6 (Construction Lighting) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) GGS-1 (Giant Gartersnake Surveys) GGS-2 (Giant Gartersnake Work Window) GGS-3 (Giant Gartersnake Monitoring) GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion)	Construction lighting directed towards giant gartersnake upland habitat can restrict the ability of giant gartersnakes to forage aboveground during the night. Implementation of AMMs will minimize construction lighting effects on giant gartersnakes by ensuring that construction lighting is directed away from adjacent natural habitats.
Construction Dust	None required for this species.	No effect on this species.
Increased Human Presence during Construction	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) GGS-1 (Giant Gartersnake Surveys) GGS-2 (Giant Gartersnake Work Window) GGS-3 (Giant Gartersnake Monitoring) GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion) GGS-7 (Giant Gartersnake Encounter Protocol)	Due to the giant gartersnake's secretive nature and its sensitivity to human presence, increased human activity in construction and maintenance areas will affect the utilization of adjacent upland habitat by giant gartersnakes. Additionally, personnel bringing pets (e.g., dogs) to work sites could also adversely affect giant gartersnakes. Implementation of AMMs ensures that increased human presence does not occur.
Construction Trash and Debris	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) GGS-1 (Giant Gartersnake Surveys) GGS-2 (Giant Gartersnake Work Window) GGS-3 (Giant Gartersnake Monitoring) GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion)	Trash and debris would adversely affect giant gartersnakes by attracting nuisance pest species which could adversely affect this species. Implementation of AMMs will ensure that construction trash and debris will be monitored and controlled.

AGENDA ITEM 11.1

Temporary Effects

Giant gartersnake occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to the giant gartersnake. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently affected in the direct effects and the area of indirect effects to Seasonal Wetland, Freshwater Marsh, Open Water, and Streams/Creeks hydrology reported in Table 6-65). Specific AMMs have been developed to minimize potential effects on giant gartersnake including GGS-1, surveys to delineate aquatic habitat and adjacent areas within 300 feet of a project footprint; GGS-2, work window during the snake's active season; GGS-3, monitoring requirements when Covered Activities occur in giant gartersnake modeled habitat; GGS-4, habitat dewatering procedures and installation of exclusion fencing; GGS-5, procedures to avoid entrapment of giant gartersnake in modeled habitat; GGS-6, use of non-entangling erosion control material; GGS-7, giant gartersnake encounter protocol during construction activities; and GGS-8, post construction restoration of temporarily disturbed areas.

These potential construction-related environmental stressors were generally described in Section 6.3.2, and their additional effects on western spadefoot are qualitatively described in Table 6-68.

6.6.17 Western Pond Turtle

Permanent Effects

Permanent direct and indirect effects of Covered Activities on western pond turtle will include modification or significant degradation of modeled aquatic and upland habitats (see Section 3.2 and Figures 3-2 and 3-19) and the direct and indirect take of western pond turtle individuals occupying that modified or degraded habitat.

Modeled species habitat for western pond turtle includes aquatic habitat comprising Freshwater Marsh, Open Water, and Streams/Creeks; and upland habitat that includes Blue Oak Woodland, Blue Oak Savanna, Valley Grassland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub habitat. Western pond turtles occur throughout much of the Plan Area, although the majority of the occurrence records (14 out of a total of 16 records within the Plan Area) are located outside the UDA, primarily in PPUs 6 and 7 (Figure 3-19).

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 10,972 acres of total modeled aquatic and upland habitats within the Plan Area, including approximately 316 acres (out of a total of 6,355 acres) of modeled aquatic habitat and approximately 10,656 acres (out of a total of 110,846 acres) of modeled upland habitat (Table 6-69). Permanent effects of Covered Activities on modeled aquatic habitat will occur

primarily within the UDA, with approximately 282 acres (out of a total of 638 acres) of permanent effects inside the UDA, and a total of approximately 34 acres (out of a total of 5,717 acres) of permanent effects outside the UDA. Covered Activity effects on modeled upland habitat will also occur primarily inside the UDA, with a total of approximately 10,064 acres (out of a total of 13,503 acres) of permanent effects inside the UDA, and a total of approximately 592 acres (out of a total of 97,343 acres) outside the UDA. Although the majority of modeled habitats inside the UDA would be directly affected, the few occurrence records and the high existing level of anthropogenic effects in this portion of the UDA indicates that these modeled habitat effects are unlikely to have substantial, if any, effect on extant western pond turtle populations in the Plan Area.

Western pond turtles in the Plan Area will be affected by permanent indirect effects to both aquatic and upland habitats, as well as harm and harassment of individuals. Potential indirect effects of the Covered Activities include management and monitoring; habitat fragmentation and isolation; altered hydrology and water quality degradation including introduction of pollutants, toxins, pesticides, and fertilizers; increased human activity (including trash, pets, debris, OHVs, and trampling); altered fire regime; aquatic community alterations (including increased predation); vibration and noise issues; and vehicle collisions.

Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on western pond turtle is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be accidental fire ignitions and other road-related effects (e.g., road runoff, potential spread of invasive plants). The potential permanent indirect effects of Covered Activities are described in Table 6-70, along with AMMs to avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing preserves or proposed SSHCP preserves, certain uses will be allowed inside Preserve and in Preserve Setbacks that may indirectly affect western pond turtle. This effects analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize “other” indirect impacts.

Table 6-70
Permanent Indirect Effects on Western Pond Turtle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 4, ROAD-1 (Road Project Location) Condition 7, STREAM-1 (Laguna Creek Wildlife Corridor) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams) Condition 8, UTILITY-2 (Utility Maintenance on Preserves)	Altered hydrology and water quality degradation will adversely affect the suitability of aquatic habitats to support foraging and movement pathways. Altered hydrology will adversely affect western pond turtles by affecting water levels and movement through aquatic pathways to other aquatic habitats and dispersal of juvenile turtles to other habitats. Water quality degradation including introduction of various pollutants, toxins, pesticides, and fertilizers will have an adverse effect on western pond turtles (which prefer good water quality conditions), especially for developing hatchling turtles. The close proximity of planned roads and development to habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that alters normal hydroperiods in pools and contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution does not enter western pond turtle aquatic habitat and that water chemistry of aquatic habitats will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP Preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread)	Habitat fragmentation and isolation will have several adverse effects on western pond turtles although this species will move short distances through upland habitats to reach other suitable aquatic habitats, even though they prefer to move along aquatic pathways. These adverse effects include: (1) exposing aquatic habitat located close to development and roads to disruptive urban edge effects such as altered hydrology (e.g., increased runoff), pollutants, toxins, pesticides and fertilizers, and human activities (trampling, OHVs, pets, trash and debris, etc.); (2) collisions with vehicles when crossing paved roads; (3) interactions with urban-related predators; (4) increased vulnerability to negative demographic trends, including genetic bottlenecks, genetic drift, and inbreeding depression in areas where aquatic links to other occupied aquatic habitats are not available; and (5) disruption of

Table 6-70
Permanent Indirect Effects on Western Pond Turtle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 7, STREAM-2 (UDA Stream Setbacks) Condition 7, STREAM-3 (Minor Tributaries to UDA Streams)	natural interconnectivity of occupied aquatic habitats important for dispersal and colonization, thus reducing the natural exchange of western pond turtles between aquatic habitats. Many of the effects of habitat fragmentation and isolation on western pond turtles, including the majority of the edge effects, are most likely to occur inside the UDA where the Preserves will be bordered by urban development and roads are planned to cross some proposed preserves.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Altered fire regimes can have adverse effects on western pond turtles by removing riparian vegetation that provides important cover and protection adjacent to aquatic habitats and removing upland vegetation (shrubs, woodlands, etc.) used for cover. Increased fires could also adversely affect nest sites (where hatchlings may reside for several months following emergence) and upland overwintering sites (where they bury themselves in loose soil until the weather warms). Repeated fires in upland habitat can also alter watershed hydrology and adversely affect aquatic habitats. Effects of wildfire suppression on western pond turtle habitat will be minimized through implementation of these AMMs and the Preserve Management Plan, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	None required for this species.	No effect on this species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) WPT-1 (Western Pond Turtle Surveys)	As with many amphibians and reptiles, western pond turtles are sensitive to vibration and noise. Vibration and noise issues will indirectly affect the use of aquatic and upland habitats by western pond turtle (e.g., disruption of movement patterns and basking and foraging activities, disturbance of nest sites where hatchlings may reside for several months following emergence or abandonment of nest sites, and disturbance of upland overwintering sites (where they bury themselves in loose soil until the weather warms).

Table 6-70
Permanent Indirect Effects on Western Pond Turtle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		Depending on the proximity of the vibration source, western pond turtles may abandon sites and move further away from the vibration source, which can make them more susceptible to predation. Since western pond turtles are sensitive to disturbance, noise can disturb basking sites and potentially overwintering sites. Implementation of these AMMs will minimize the potential for indirect effects from vibration and noise.
Lighting	None required for this species.	No effect on this species.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Increased human activity (including trash, debris, pets, OHVs, trampling, and just the presence of humans) in the vicinity of suitable aquatic habitats (streams/creeks, freshwater marshes, and open water) and adjacent upland (aestivation) habitats will adversely affect western pond turtles. Since western pond turtles are very shy and cryptic, just the presence of humans and other activities near aquatic habitats can adversely affect western pond turtle foraging and basking activities. Increased human activity will also indirectly affect overwintering sites (where they bury themselves in loose soil until the weather warms) and nest sites (where hatchlings may reside for several months following emergence). The presence of trash in the vicinity of aquatic habitats can attract predators of western pond turtles, and the presence of pets can also result in predation of western pond turtles. Trash in the vicinity of aquatic habitats can attract predators of western pond turtles. OHV use can disrupt soils and runoff patterns, and western pond turtle aestivation sites and can affect drainage pathways, increasing erosion and introducing harmful substances to the watershed and aquatic habitats. Access to the Preserve will be allowed via low effect trails. Implementation of AMMs will reduce potential effects of increased human activity on western pond turtles in Preserves.

Table 6-70
Permanent Indirect Effects on Western Pond Turtle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location)	Aquatic community alterations are most likely to affect western pond turtles through changes in prey base (primarily larvae of aquatic insects, earthworms, mollusks, crustaceans, and vertebrates such as tadpoles, frogs, small fish, and various aquatic/emergent plants) resulting from habitat degradation, and through introduction or increases in the numbers of non-native aquatic predators, such as the American bullfrog and introduced warm freshwater fish, such as bass, which prey on small juvenile turtles and hatchlings. Wildlife community alterations that reduce the number and types of prey items and favor potential competitors such as American bullfrogs and warm water fish species will adversely affect western pond turtles and associated aquatic habitat. Successful implementation of the Conservation Strategy described in Chapter 7 and the Monitoring and Management Program described in Chapter 8 will be key in addressing potential wildlife community alterations. Implementation of EDGE and ROAD AMMs, including those that require control of stormwater runoff, will ensure pollution will not enter western pond turtle aquatic habitat, water chemistry of aquatic habitats will not be affected, invasive species spread will be controlled, and resultant wildlife community alterations in western pond turtle aquatic habitat will not occur.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native aquatic vegetation will affect shallow water areas which provide nursery habitat for hatchlings. Implementation of AMMs will minimize proliferation of non-native aquatic vegetation and reduce effects of non-native aquatic vegetation on hatchling nursery habitat relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses)	As described in Wildlife Community Alterations, the introduction of non-native predators can have adverse effects on aquatic

Table 6-70
Permanent Indirect Effects on Western Pond Turtle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	communities and on western pond turtle. Many species of animals are predators of western pond turtles, including most animals that are sufficiently large to consume either a hatchling or adult. Most mustelids inhabiting areas near aquatic habitats, including river otters and mink (*Mustelidae* spp.), are predators of adult western pond turtles. Many other mammals including canids and many bird species such as great blue herons (*Ardea herodias)*, may be an important predator of hatchlings. Introduced American bullfrogs, smallmouth bass (*Micropterus dolomieu*), and largemouth bass have been documented predating on hatchlings. Raccoons and striped skunks have been documented as nest predators. In human-altered landscapes, predation may be higher due to a greater abundance of medium-sized predators. Indirect effects to western pond turtles and their habitat associated with invasive aquatic species will be minimized through the implementation of AMMs.
Mesopredators	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition, 4 ROAD-2 (Wildlife Crossing Structures)	Adverse effects on western pond turtles will occur as a result of the presence of mesopredators in aquatic habitats and during periods of upland movement and activity. Potential domestic and native mesopredators of western pond turtles include river otters, raccoons, skunks, as well as several large bird species (e.g., great blue herons). Implementation of these AMMs will minimize the potential for predation by mesopredators.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread)	The pet trade also threatens western pond turtles through the release of non-native pet turtles into natural areas. This practice could increase competition for limited resources and introduce diseases to native turtles. Introduction of pet turtles, release of captive-reared turtles, and translocations from one location to another may increase the risk of disease transmission. Implementation of AMMs will reduce the potential for transmission of diseases from non-native turtles to western pond turtles.

Table 6-70
Permanent Indirect Effects on Western Pond Turtle

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Pesticides and Fertilizers	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Indirect effects on western pond turtles and suitable aquatic habitats that occur from pesticides (such as glyphosate) and fertilizer runoff (by killing potential prey items and potentially affecting hatchling turtles) from agriculture and from new urban developments in or near Preserves will be avoided by implementation of these AMMs.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) WPT-1 (Western Pond Turtle Surveys) WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit)	Even though western pond turtles tend to avoid roads (especially paved roads), vehicles can adversely affect this species, primarily by running them over during surface movements or after leaving nest sites. Road mortality is an important threat particularly in urban and recreational areas. Implementation of AMMs will reduce the potential for vehicle collisions with western pond turtles.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-71
Temporary Effects to Western Pond Turtle

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 3, BMP-2 (Erosion Control)	Potential erosion, runoff, and water quality effects on western pond turtle aquatic habitat resulting from construction activities will be fully avoided through implementation of AMMs.

AGENDA ITEM 11.1

Table 6-71
Temporary Effects to Western Pond Turtle

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location) Condition 8, UTILITY-2 (Utility Maintenance on Preserves) Condition 8, UTILITY-4 (Siting of Entry and Exit Location) WPT-1 (Western Pond Turtle Surveys) WPT-2 (Western Pond Turtle Work Window) WPT-3 (Western Pond Turtle Monitoring) WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WPT-1 (Western Pond Turtle Surveys) WPT-2 (Western Pond Turtle Work Window) WPT-3 (Western Pond Turtle Monitoring) WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	Inadvertent trampling of vegetation outside the project footprint can adversely affect overwintering sites (where they bury themselves in loose soil until the weather warms) and nest sites where hatchlings may reside for several months following emergence, and hatchlings using vegetation for cover or while moving to aquatic locations. Implementation of AMMs ensures that trampling of vegetation will not occur outside the project footprint.
Construction Noise	Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-7 (Biological Monitor) WPT-1 (Western Pond Turtle Surveys) WPT-2 (Western Pond Turtle Work Window) WPT-3 (Western Pond Turtle Monitoring) WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	Loud noise can potentially affect western pond turtles while basking at aquatic sites, at nest sites where hatchlings may reside for several months following emergence, and at overwintering sites (where they bury themselves in loose soil until the weather warms) by forcing them to leave the area. Implementation of AMMs will reduce construction noise effects in the vicinity of western pond turtle habitat.
Construction Ground Vibration	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WPT-1 (Western Pond Turtle Surveys) WPT-2 (Western Pond Turtle Work Window) WPT-3 (Western Pond Turtle Monitoring) WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	Ground vibration can force western pond turtles to leave shoreline basking sites, nest sites (where hatchlings may reside for several months following emergence), and upland overwintering sites (where they bury themselves in loose soil until the weather warms) and move to other locations away from the vibration source, exposing them to potential predation. Implementation of AMMs will

Table 6-71
Temporary Effects to Western Pond Turtle

Environmental Stressor	Effect Reduced By	Potential Effect on Species
		reduce ground vibration effects from construction activities near western pond turtle habitat.
Construction Lighting	None required for this species.	No effect on this species.
Construction Dust	None required for this species.	No effect on this species.
Increased Human Presence during Construction	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WPT-1 (Western Pond Turtle Surveys) WPT-2 (Western Pond Turtle Work Window) WPT-3 (Western Pond Turtle Monitoring) WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion) WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit) WPT-8 (Western Pond Turtle Encounter Protocol)	Due to the secretive and shy nature of the western pond turtle and its sensitivity to human presence, increased human activity in construction and maintenance areas will affect the use of basking sites and upland overwintering sites (where they bury themselves in loose soil until the weather warms). Additionally, personnel bringing pets (e.g., dogs) to work sites could also adversely affect western pond turtle hatchlings, juveniles, and adults. Implementation of AMMs ensures that increased human presence does not occur.
Construction Trash and Debris	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) WPT-1 (Western Pond Turtle Surveys) WPT-2 (Western Pond Turtle Work Window) WPT-3 (Western Pond Turtle Monitoring) WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	Trash and debris would adversely affect western pond turtles by attracting nuisance pest species which could adversely affect this species. Implementation of AMMs will ensure that construction trash and debris will be monitored and controlled.

Temporary Effects

Western pond turtle occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to the western pond turtle. Additionally, overwintering sites (where juveniles and adults bury themselves in loose soil) and nest sites where hatchlings may reside for several months following emergence, may also be temporarily affected by Covered Activities. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently affected in the direct effects and the area of indirect effects to freshwater marsh, open water, and stream/creek hydrology reported in Table 6-69). Specific AMMs have been developed to minimize potential effects on western pond turtles including WPT-2, western pond turtle surveys; WPT-2, work window outside western pond turtle's active season; WPT-3, monitoring requirements when Covered Activities occur; WPT-4, habitat dewatering and exclusion fencing when Covered Activities occur in aquatic habitat; WPT-5, procedures to avoid entrapment of western pond turtles when Covered Activities occur in modeled habitat; WPT-6, use of non-entangling materials if erosion control BMP-2 is implemented; WPT-7, modeled habitat speed limit; and WPT-9 western pond turtle encounter protocol when western pond turtles are encountered.

These potential construction-related environmental stressors were generally described in Section 6.3.2, and their additional effects on western pond turtle are qualitatively described in Table 6-71.

6.6.18 Cooper's Hawk

Permanent Effects

Permanent direct and indirect effects of Covered Activities on Cooper's hawk (*Accipiter cooperii*) will include modification or removal of modeled habitat, increased human activity, invasive plants and animals introduced into modeled habitat, vehicle and aircraft collisions with Cooper's hawk, and increased risk of wildlife disease.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 638 acres of modeled habitat for Cooper's hawk in the Plan Area out of a total of 22,646 acres available, including 600 acres of modeled nesting/foraging habitat and 38 acres of modeled foraging habitat (Table 6-72). The 98% of direct effects on modeled nesting/foraging habitat will occur inside the UDA. Nearly all modeled foraging habitat for Cooper's hawk is located outside the UDA in areas that will not be affected by Covered Activities. Overall, outside the UDA, 36 of 5,619 acres of foraging habitat and 50 of 16,304 acres of modeled nesting/foraging habitat will be directly affected. Inside the UDA, 550 of 705 acres of modeled nesting/foraging habitat and 2 acres of 18 acres of modeled foraging habitat will be directly affected.

In addition to the direct effects quantified in Table 6-72, Covered Activities will indirectly affect Cooper's hawk nesting/foraging and foraging habitats, and will also indirectly injure, kill, or harass individual Cooper's hawk in the Plan Area (Table 6-73). These effects will be reduced through implementation of the AMMs described in Table 6-73. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on Cooper's hawk is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, human activity, trash, and utility strikes.

In addition to the general AMMs (Section 5.4.1), raptor-specific measures (Section 5.4.2) will be implemented to minimize permanent direct and indirect effects on Cooper's hawk due to Covered Activities. Mortality and injury of individual Cooper's hawks will occur in the Plan Area due to Covered Activities; however, mortality and injury will be minimized through the implementation of AMMs. There is also a small risk of take in the form of harassment over the duration of the Permit Term (e.g., inhibiting individuals from nesting or foraging in some areas). Some nest sites will be directly affected by Covered Activities because Cooper's hawk is a nesting resident in the Plan Area.

Table 6-73
Permanent Indirect Effects on Cooper's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter waterways that run through riparian areas where Cooper's hawk prey could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) RAPTOR-1 (Raptor Surveys)	Although Cooper's hawks are highly mobile and able to fly over unsuitable landscapes, habitat fragmentation will have at least two adverse effects on the species: (1) potentially exposing suitable nesting habitat to urban edges, thus increasing the potential for disruptive effects, such as noise, lighting, human activities, and urban-related predators; and (2) forcing birds to fly farther to suitable foraging areas, thus increasing energetic demands and time away from the nest, thereby increasing the potential for egg and/or chick predation, as well as increasing other risks, such as collisions with vehicles and man-made structures. The Landscape Preserves established[7] outside the UDA will avoid effects of habitat fragmentation on Cooper's hawk. Within the UDA, habitat fragmentation will affect Cooper's hawk because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP

[7] Note that in the context of this Plan, the word "establish" is synonymous with "create."

Table 6-73
Permanent Indirect Effects on Cooper's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		Preserve System will minimize the effects of habitat fragmentation on Cooper's hawk in the Plan Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Within the UDA, wildfire can eliminate or reduce suitable nesting substrates for Cooper's hawk. Repeated or intense wildfires will also affect foraging habitat quality through direct mortality of prey (e.g., birds, small mammals, reptiles, and amphibians) and general habitat degradation. Effects of increased wildfire on Cooper's hawk habitat will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Does not apply to this species.	No effect on this species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Noise could indirectly affect the use of nesting and foraging habitat by Cooper's hawk. Implementation of these AMMs will minimize chronic noise in close proximity to Cooper's hawk habitat.
Lighting	EDGE-8 (Outdoor Lighting) RAPTOR-1 (Raptor Surveys)	Lighting will affect Cooper's hawks if it is near a nest (the lighted area will depend on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation), and will primarily act to disrupt normal nighttime rest and sleep patterns, and increase stress levels. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally active birds, causing them to abandon the nest and/or become disoriented. Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittee determines lighting is necessary for public safety or security. During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to Cooper's hawk.

Table 6-73
Permanent Indirect Effects on Cooper's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects on Cooper's hawk are expected from increased human activity on Preserves and Preserve Setbacks. Potential effects include nest disturbance, introduction of invasive species, and collisions with vehicles. Implementation of AMMs ensures that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect Cooper's hawks or their habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) RAPTOR-1 (Raptor Surveys)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community by increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Implementation of AMMs such as those that require Trail Public Education will ensure human activity will have minimal effects to the wildlife community within Cooper's hawk habitat. Competition from non-native predators (dogs, coyotes) on prey species, and invasive plant and animal species that either outcompete or create unsuitable habitat for prey could also affect Cooper's hawk.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within Cooper's hawk habitat in the Plan Area. A change in vegetation structure could have an effect on prey species use of habitat and also restrict maneuverability of Cooper's hawk through the forest. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).

Table 6-73
Permanent Indirect Effects on Cooper's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described previously in Wildlife Community Alterations, invasion by non-native predators of Cooper's hawk and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects to Cooper's hawk and its prey by mesopredators will be minimized by implementing AMMs that reduce interaction between Cooper's hawk and urban wildlife (raccoon, opossum, fox) and pets.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Diseases transmitted from humans and pets could affect Cooper's hawk, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. Cooper's hawk is susceptible to avian flu and the protozoan *Trichomonas gallinae*. The SSHCP will have little direct control over potential disease transmission from ingested prey, such as pigeons and doves, because active control of these well-established and very common species is not likely feasible and therefore would not be an effective management action. However, potential transmission of diseases from human and pets in Preserves will be minimized by controlling access to Preserves through Condition 2 and Condition 5. Implementation of these AMMs will minimize the potential for introduction of this virus into local Cooper's hawk populations.

Table 6-73
Permanent Indirect Effects on Cooper's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on Cooper's hawk or their modeled habitat from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided by the implementation of AMMs.
Vehicle and Aircraft Collisions With Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) RAPTOR-1 (Raptor Surveys)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by Cooper's hawks near heavily trafficked areas and in urbanized areas. Covered Activities will therefore increase the frequency of vehicle and window strikes by Cooper's hawks. Indirect effects on Cooper's hawk associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to Cooper's hawk habitat. Otherwise, Cooper's hawk will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7).
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) RAPTOR-1 (Raptor Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all raptors, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on Cooper's hawk by incorporating the most current practices for avoiding avian powerline collisions.

Temporary Effects

In addition to the permanent removal of habitat described previously, Cooper's hawk nesting/foraging habitat or nest sites within 500 feet of proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects that will result in additional disturbance to habitat or additional injury, mortality, or harassment of individual Cooper's hawks. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects reported in Table 6-72).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on Cooper's hawk are qualitatively described in Table 6-74.

Table 6-74
Temporary Effects to Cooper's Hawk

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into Cooper's hawk riparian habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	None required for this species.	No effect on this species.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Loud noise can affect Cooper's hawk foraging patterns. Implementation of AMMs will minimize construction noise effects in the vicinity of Cooper's hawk foraging habitat.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	BMP-6 (Construction Lighting) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to Cooper's hawk.
Construction Dust	None required for this species.	No effect on this species.
Increased Human Presence During Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff)	Ground-disturbing activities that could affect Cooper's hawk involving increased human presence will be reduced by

Table 6-74
Temporary Effects to Cooper's Hawk

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	SPECIES-2 (No Pets in Construction Areas) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring	implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring	Trash and debris would adversely affect Cooper's hawk habitat quality through direct effects, such as attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.19 Ferruginous Hawk

Permanent Effects

Permanent direct and indirect effects of Covered Activities on ferruginous hawk (*Buteo regalis*) will include modification or removal of modeled habitat, increased human activity, invasive plants and animals introduced into modeled habitat, vehicle and aircraft collisions with ferruginous hawk, and increased risk of wildlife disease.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 25,491 acres of modeled foraging habitat for ferruginous hawk in the Plan Area (Table 6-75). Most of the direct effects on modeled foraging habitat will occur inside the UDA. Overall, 863 acres of modeled foraging habitat for ferruginous hawk outside the UDA will be directly affected. Inside the UDA, 24,628 of 35,221 acres of modeled foraging habitat will be directly affected.

Table 6-75
Ferruginous Hawk Permanent Effects

Habitat Model Land Cover Types	Total Plan Area (acres)				Inside UDA (acres)				Outside UDA (acres)			
	Total Available	*Direct Effect**	*Indirect Effect*	*Total Effect*	*Total Available*	*Direct Effect**	*Indirect Effect*	*Total Effect*	*Total Available*	*Direct Effect**	*Indirect Effect*	*Total Effect*

Total Nesting/ Foraging Habitat	**159,491**	**25,491**	**0**	**25,491**	**35,121**	**24,628**	**0**	**24,628**	**124,370**	**863**	**0**	**863**

* Indirect effects to Vernal Pool and Swale are not presented for this species, as interruption of the supporting hydrology would result in conversion to Valley Grassland, which is assumed in the SSHCP to provide comparable foraging habitat.

In addition to the direct effects quantified in Table 6-75, Covered Activities will indirectly affect ferruginous hawk foraging habitats, and will also injure, kill, or harass ferruginous hawk individuals in the Plan Area (Table 6-76). These effects will be reduced through implementation of the AMMs described in Table 6-76. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on ferruginous hawk is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, human activity, trash, and utility strikes.

In addition to the general AMMs (Section 5.4.1), raptor-specific measures (Section 5.4.2) will be implemented to minimize permanent direct and indirect effects on ferruginous hawk due to Covered Activities. Mortality and injury of individual ferruginous hawks will occur in the Plan Area due to Covered Activities; however mortality and injury will be minimized through the implementation of AMMs. There is also a small risk of take in the form of harassment over the duration of the Permit Term (e.g., inhibiting individuals from foraging in some areas).

Table 6-76
Permanent Indirect Effects on Ferruginous Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter waterways that run through riparian areas where ferruginous hawk prey could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) RAPTOR-1 (Raptor Surveys)	Habitat fragmentation will have adverse effects on this species, forcing birds to fly farther to suitable foraging areas, thus increasing energetic demands, as well as increasing other risks, such as collisions with vehicles and man-made structures. The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on ferruginous hawk. Within the UDA, habitat fragmentation will affect ferruginous hawk because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on ferruginous hawk in the Plan Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Repeated or intense wildfires will affect foraging habitat quality through direct mortality of prey (e.g., birds, small mammals, reptiles, and amphibians) and general habitat degradation. Effects of increased wildfire on ferruginous hawk habitat will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.

Table 6-76
Permanent Indirect Effects on Ferruginous Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Effects on ferruginous hawks due to vernal pool hydrologic alterations are mainly associated with prey base. Hydrologic alterations could affect patterns of foraging for small mammals that make up the prey base for ferruginous hawks. Implementation of AMMs will significantly reduce effects of vernal pool hydrologic alterations on prey species.
Chronic Ground Vibration and Noise	Does not apply to this species. Noise would only affect nesting birds and ferruginous hawks are winter visitors to the Plan Area.	No effect on this species.
Lighting	EDGE-8 (Outdoor Lighting) BMP-6 (Construction Lighting) RAPTOR-1 (Raptor Surveys)	Lighting will mildly affect ferruginous hawks, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation, and will act primarily to disrupt normal nighttime rest and sleep patterns and increase stress levels. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally-active birds, causing them to become disoriented. Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittee determines lighting is necessary for public safety or security. During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to ferruginous hawk.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-11 (Speed Limit) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects on ferruginous hawk from increased human activity on Preserves and Preserve Setbacks are expected. Potential effects include introduction of invasive species and collisions with vehicles. Implementation of AMMs ensures that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect ferruginous hawks or their habitat.

Table 6-76
Permanent Indirect Effects on Ferruginous Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) RAPTOR-1 (Raptor Surveys)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community by increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Implementation of AMMs such as those that require Trail Public Education will ensure human activity will have minimal effects to the wildlife community within ferruginous hawk habitat. Competition from non-native predators (e.g., dogs, coyotes) on prey species, and invasive plant and animal species that either outcompete or create unsuitable habitat for prey could also affect ferruginous hawk.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within ferruginous hawk habitat in the Plan Area. A change in vegetation structure could have an effect on prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	As described previously in Wildlife Community Alterations, invasion by non-native predators of ferruginous hawk and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.

Table 6-76
Permanent Indirect Effects on Ferruginous Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects to ferruginous hawk and its prey by mesopredators will be minimized by implementing AMMs that reduce interaction between ferruginous hawk and urban wildlife (raccoon, opossum, fox) and pets.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	Diseases transmitted from humans and pets could affect ferruginous hawk and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. Ferruginous hawks are susceptible to avian flu and the protozoan *Trichomonas gallinae*. The SSHCP will have little direct control over potential disease transmission from ingested prey, such as pigeons and doves, because active control of these well-established and very common species is not likely feasible and therefore would not be an effective management action. However, potential transmission of diseases from human and pets in Preserves will be minimized by controlling access to Preserves through Conditions 2 and 5. Implementation of these AMMs will minimize the potential for introduction of these diseases into local ferruginous hawk populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on ferruginous hawk or the Valley Grassland Ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near the SSHCP Preserves will be avoided through the implementation of AMMs.

Table 6-76
Permanent Indirect Effects on Ferruginous Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Vehicle and Aircraft Collisions With Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures) RAPTOR-1 (Raptor Surveys)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by ferruginous hawks near heavily trafficked areas and in urbanized areas. Covered Activities will therefore increase the frequency of vehicle and window strikes by ferruginous hawks. Indirect effects on ferruginous hawk associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to ferruginous hawk habitat. Otherwise, ferruginous hawk will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7).
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) RAPTOR-1 (Raptor Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all raptors, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on ferruginous hawk by incorporating the most current practices for avoiding avian powerline collisions.

Temporary Effects

Ferruginous hawks wintering and foraging in the Plan Area will be affected by several temporary construction-related effects that could result in additional habitat disturbance or additional injury, mortality, or harassment of individual ferruginous hawks (Table 6-77). These potential construction-related effects were generally described in Section 6.3.2 and include dust; noise and ground vibration; general human activity; inadvertent grading, clearing, or trampling of habitat; and trash and debris.

Table 6-77
Temporary Effects to Ferruginous Hawk

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into ferruginous hawk riparian habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of vegetation could cause ferruginous hawk prey to avoid habitat. Implementation of AMMs ensures that trampling and compaction do not occur.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Loud noise can affect ferruginous hawk foraging patterns. Implementation of AMMs will minimize construction noise effects in the vicinity of ferruginous hawk foraging habitat.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	BMP-6 (Construction Lighting) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to ferruginous hawk.
Construction Dust	None required for this species.	No effect on this species.

Table 6-77
Temporary Effects to Ferruginous Hawk

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Increased Human Presence During Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Ground-disturbing activities that could affect ferruginous hawk involving increased human presence will be reduced by implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Trash and debris would adversely affect ferruginous hawk habitat quality through direct effects, such as attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled.

Temporary direct effects on ferruginous hawk will occur in two main ways: (1) directly inhibiting use of foraging sites, and (2) effects on foraging habitat quality. Ferruginous hawks could avoid foraging in areas near construction activities, especially those involving mass grading and noisy construction equipment and a high number of construction personnel and vehicles. Noise associated with large-scale construction activities, such as mass grading, as well as noisy maintenance Covered Activities, affects foraging by ferruginous hawks by causing them to avoid noisy areas. However, such noise effects will be temporary and limited to areas immediately adjacent to noisy Covered Activities and will not have a substantial adverse effect on ferruginous hawk foraging behavior, given the remaining large expanse of suitable foraging habitat in the SSHCP Preserve System and Plan Area in general (see Chapter 7).

Foraging habitat quality will be reduced in areas bordering construction sites, including degradation of vegetation communities from dust and the absence or reduced abundance of important prey, such as rabbits, California ground squirrels (*Otospermophilus beecheyi*), and pocket gophers (*Geomyidae* spp.). These prey species could actively avoid construction areas due to effects, such as noise, lighting, and human activity, or because forage quality (e.g., fresh herbaceous vegetation) in areas near construction has been degraded by dust or inadvertent grading, clearing, or trampling. In addition, trash and debris at construction sites will attract urban-tolerant species, such as coyotes, that will compete with ferruginous hawks for prey. A variety of design and setback requirements and construction-related AMMs will be implemented to address temporary direct effects on ferruginous hawk habitat and individuals.

6.6.20 Swainson's Hawk

Permanent Effects

Permanent direct and indirect effects of Covered Activities on Swainson's hawk (*Buteo swainsoni*) will include modification or removal of modeled habitat, increased human activity, invasive plants and animals introduced into modeled habitat, vehicle and aircraft collisions with Swainson's hawk, and increased risk of wildlife disease.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 31,112 acres of total modeled habitat for Swainson's hawk in the Plan Area, including 373 acres of modeled nesting habitat and 30,739 acres of modeled foraging habitat (Table 6-78). Of the 30,739 acres of effects to modeled foraging habitat, 7,413 acres are high-value foraging habitat (Table 6-79). The 7,413 acres of high-value habitat effects are out of a total of 70,127 acres of high-value habitat in the Plan Area. Therefore, Covered Activities will affect relatively less of the high-value habitat compared to the overall effects on modeled foraging habitat in the Plan. Most of the permanent effects on modeled nesting and foraging habitat will occur inside the UDA, including 332 acres out of a total of 486 acres of modeled nesting habitat and 29,550 acres out of a total of 40,602 acres of

modeled foraging habitat. Permanent effects on modeled nesting and foraging habitat that will occur outside of the UDA include impacts to 41 out of 6,748 acres of modeled nesting habitat, 1,189 out of 165,387 acres of modeled foraging habitat, and 659 out of 62,393 acres of high-value habitat.

GRAND TOTAL	**70,127**	**7,413**	**0**	**7,413**	**7,734**	**6,754**	**0**	**6,754**	**62,393**	**659**	**0**	**659**

* High-value habitat for Swainson's hawk is modeled foraging habitat occurring in the western portion of the Plan Area (within PPUs 4, 6, and 8) (see Section 3.4.5). The Swainson's hawk habitat model only includes land covers at elevations below 500 feet (see Section 3.4.5).

** Indirect effects to Vernal Pool and Swale are not presented for this species, as interruption of the supporting hydrology would result in conversion to Valley Grassland, which is assumed in the SSHCP to provide comparable foraging habitat.

In addition to the direct effects quantified in Table 6-79, Covered Activities will indirectly affect Swainson's hawk nesting, foraging, and high-value habitats, and will also injure, kill, or harass Swainson's hawk individuals in the Plan Area (Table 6-80). These effects will be reduced through implementation of the AMMs described in Table 6-80. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on Swainson's hawk is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, human activity, trash, and utility strikes.

In addition to the general AMMs (Section 5.4.1), raptor-specific measures (Section 5.4.2) will be implemented to minimize permanent direct and indirect effects on Swainson's hawk due to Covered Activities. Mortality and injury of individual Swainson's hawks will occur in the Plan Area due to Covered Activities; however, mortality and injury will be minimized through the implementation of AMMs. There is also a small risk of take in the form of harassment over the duration of the Permit Term (e.g., inhibiting individuals from nesting or foraging in some areas). Some nest sites will be directly affected by Covered Activities because Swainson's hawk is a nesting resident in the Plan Area.

Table 6-80
Permanent Indirect Effects on Swainson's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Altered hydrology will adversely affect Swainson's hawks by reducing habitat quality of Mixed Riparian Woodland and Mixed Riparian Scrub land covers (nesting) and Vernal Pool and Valley-Grassland land covers (foraging). Riparian habitats are important nesting substrates for Swainson's hawks that will be degraded by altered hydrology, including significant increases or decreases in hydrology that will alter riparian community structure. Loss of riparian habitat is one of the factors contributing to the Swainson's hawk decline in the Central Valley (Bloom 1980; England et al. 1995). Altered hydrology will also affect foraging habitat. In particular, voles (*Muridae* ssp.), which are important prey for Swainson's hawk, occur in irrigated pastures, wet meadows, and dense grasslands that provide substantial cover and refugia. If these habitats become too dry and sparse, vole populations decline and will be replaced by less suitable prey. The close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter waterways that run through agricultural areas where Swainson's hawk prey could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control In Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) SWHA-1 (Swainson's Hawk Surveys)	Although Swainson's hawks are highly mobile and able to fly over unsuitable landscapes, habitat fragmentation and isolation will have at least two adverse effects on the species: (1) cause active nests to be close to habitat edges, thus exposing the nest to other disruptive edge effects, such as noise, lighting, and human activities; and (2) force birds to fly farther to suitable foraging areas, thus increasing energetic demands and time away from the nest and increasing the potential for egg and/or chick predation. Further, small, otherwise suitable, active nesting sites in fragmented habitat patches will be abandoned, functionally reducing the numbers of suitable nesting areas in the Plan Area. The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on Swainson's hawk. Within the UDA, habitat fragmentation will affect Swainson's hawk because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads

Table 6-80
Permanent Indirect Effects on Swainson's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on Swainson's hawk in the Plan Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring Of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Repeated or intense wildfires will affect foraging habitat quality through direct mortality of prey (e.g., insects, birds, small mammals, reptiles, and amphibians) and general habitat degradation. Effects of increased wildfire on Swainson's hawk habitat will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting Of Entry And Exit Location)	Effects on Swainson's hawks due to vernal pool hydrologic alterations are mainly associated with prey base. Hydrologic alterations could affect patterns of foraging for small mammals that make up the prey base for Swainson's hawks. Implementation of AMMs will significantly reduce effects of vernal pool hydrologic alterations on prey species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Noise could indirectly affect the use of nesting and foraging habitat by Swainson's hawk. Implementation of these AMMs will minimize chronic noise in close proximity to Swainson's hawk habitat.
Lighting	EDGE-8 (Outdoor Lighting) SWHA-1 (Swainson's Hawk Surveys)	Lighting could affect Swainson's hawks, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation, and will primarily act to disrupt normal nighttime rest and sleep patterns and increase stress levels. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally-active birds, causing them to become disoriented or leave a nest. Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittee determines lighting is necessary for public safety or security.

Table 6-80
Permanent Indirect Effects on Swainson's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to Swainson's hawk.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior To Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring Of Nature Trail Impacts)	Effects on Swainson's hawk are expected from increased human activity on Preserves and Preserve Setbacks. Potential effects include introduction of invasive species and collisions with vehicles. Implementation of AMMs ensures that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect Swainson's hawks or their habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control In Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access To Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring Of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) SWHA-1 (Swainson's Hawk Surveys)	Wildlife community alterations are most likely to affect Swainson's hawk through changes in prey availability as a result of habitat degradation. For example, voles in irrigated pastures, wet meadows, and dense grasslands may be replaced by less suitable prey, such as native and non-native mice and rats that occur in lower densities and are mostly active at night, if factors, such as altered hydrology and wildfire, degrade habitat for voles. Wildlife community alterations that favor potential competitors, such as red-tailed hawks (*Buteo jamaicensis*) and red-shouldered hawks (*Buteo lineatus*) (both of which are relatively urban-tolerant), and potential nest predators, such as great horned owl (*Bubo virginianus*), ravens, and American crows (*Corvus brachyrhynchos*), will also adversely affect Swainson's hawk. Implementation of AMMs such as those that require Trail Public Education will ensure human activity will have minimal effects to the wildlife community within Swainson's hawk habitat. Competition from non-native predators (e.g., dogs, coyotes) on prey species, and invasive plant and animal species that either outcompete or create unsuitable habitat for prey could also affect Swainson's hawk.

Table 6-80
Permanent Indirect Effects on Swainson's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring Of Nature Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within Swainson's hawk habitat in the Plan Area. A change in vegetation structure could have an effect on prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control In Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring Of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described previously in Wildlife Community Alterations, invasion by non-native predators of Swainson's hawk and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring Of Nature Trail Impacts)	Effects to Swainson's hawk and its prey by mesopredators will be minimized by implementing AMMs that reduce interaction between Swainson's hawk and urban wildlife (raccoon, opossum, fox) and pets.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks)	Diseases transmitted from humans and pets could affect Swainson's hawk, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. Swainson's hawks are susceptible to avian flu and the protozoan

Table 6-80
Permanent Indirect Effects on Swainson's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior To Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring Of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	*Trichomonas gallinae*. The SSHCP will have little direct control over potential disease transmission from ingested prey, such as pigeons and doves, because active control of these well-established and very common species is not likely feasible and therefore would not be an effective management action. However, potential transmission of diseases from human and pets in Preserves will be minimized by controlling access to Preserves through Conditions 2 and 5. Implementation of these AMMs will minimize the potential for introduction of these diseases into local Swainson's hawk populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control In Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins In Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on Swainson's hawk or the agriculture and Valley Grassland Ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments and Cropland in or near SSHCP Preserves will be avoided through the implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures) SWHA-1 (Swainson's Hawk Surveys)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by Swainson's hawks near heavily trafficked areas and in urbanized areas. Covered Activities will therefore increase the frequency of vehicle and window strikes by Swainson's hawks. The main approach to reducing the risk of vehicle collisions with Swainson's hawk is through an SSHCP Preserve System design that takes the existing spatial relationship between nesting and foraging areas into consideration (Chapter 3), such that the need to fly over or near heavily trafficked roads is reduced. This can be accomplished by ensuring close proximity of suitable nesting and foraging habitats in areas with few major roads. Indirect effects on Swainson's hawk associated with vehicle collisions and

Table 6-80
Permanent Indirect Effects on Swainson's Hawk

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to Swainson's hawk habitat. Otherwise, Swainson's hawk will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7).
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) SWHA-1 (Swainson's Hawk Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all raptors, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on Swainson's hawk by incorporating the most current practices for avoiding avian powerline collisions.

Temporary Direct Effects on Swainson's Hawk

In addition to the permanent removal of habitat and nest sites described previously, Swainson's hawk foraging habitat, nesting habitat, or nest sites located within 600 feet of proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects that could result in additional habitat disturbance or additional injury, mortality, or harassment of individual Swainson's hawks (Table 6-81). These potential construction-related effects were generally described in Section 6.3.2 and include dust; noise and ground vibration; construction lighting; general human activity; inadvertent grading, clearing, or trampling of habitat; and trash and debris. Design and setback requirements SWHA-1 (Swainson's Hawk Surveys), SWHA-2 (Swainson's Hawk Pre-Construction Surveys), SWHA-3 (Swainson's Hawk Nest Buffer), and SWHA-4 (Swainson's Hawk Nest Buffer Monitoring) will generally avoid potential adverse edge effects from development and roads listed previously by minimizing the contact zone between construction activities and habitat used for nesting and foraging by Swainson's hawk.

Table 6-81
Temporary Effects to Swainson's Hawk

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into Swainson's hawk nesting and foraging habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of vegetation could cause Swainson's hawk prey to avoid habitat. Implementation of AMMs ensures that trampling and compaction do not occur.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location)	Loud noise can affect nesting Swainson's hawk, potentially causing them to abandon the nest. Abandonment (even temporary) of active nests increases the risk to eggs, nestlings, fledglings, and other dependent young. Implementation of AMMs will minimize

Table 6-81
Temporary Effects to Swainson's Hawk

Environmental Stressor	Effect Reduced By	Potential Effect on Species
		construction noise effects in the vicinity of Swainson's hawk nesting habitat.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	BMP-6 (Construction Lighting) SWHA-1 (Swainson's Hawk Surveys) SWHA-2 (Swainson's Hawk Pre-Construction) Surveys SWHA-3 (Swainson's Hawk Nest Buffer) SWHA-4 (Swainson's Hawk Nest Buffer) Monitoring	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid abandonment of nests and disorienting effects to Swainson's hawk.
Construction Dust	Condition 3, BMP-5 (Dust Control)	Dust can affect foraging habitat and prey taken by Swainson's hawk. Excessive dust generated by construction can decrease the vigor and productivity of vegetation communities through effects on light penetration, as well as photosynthesis, respiration, and transpiration; increased penetration of phytotoxic gaseous pollutants; and increased incidence of pests and diseases. These effects reduce habitat quality for important small rodent prey, such as young ground squirrels, pocket gophers, deer mice (*Peromyscus* ssp.), and voles, as well insects, such as grasshoppers (*Orthoptera* ssp.) and crickets (*Gryllidae* ssp.).
Increased Human Presence During Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) SWHA-1 (Swainson's Hawk Surveys) SWHA-2 (Swainson's Hawk Pre-Construction) Surveys SWHA-3 (Swainson's Hawk Nest Buffer) SWHA-4 (Swainson's Hawk Nest Buffer)	Ground-disturbing activities that could affect Swainson's hawk involving increased human presence will be reduced by implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) SWHA-1 (Swainson's Hawk Surveys) SWHA-2 (Swainson's Hawk Pre-Construction) Surveys SWHA-3 (Swainson's Hawk Nest Buffer) SWHA-4 (Swainson's Hawk Nest Buffer)	Trash and debris would adversely affect Swainson's hawk habitat quality through direct effects, such as attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.21 White-Tailed Kite

Permanent Effects

Permanent direct and indirect effects of Covered Activities on white-tailed kite (*Elanus leucurus*) will include modification or removal of modeled habitat, increased human activity, invasive plant and animal introduction into modeled habitat, vehicle and aircraft collisions with white-tailed kite, and increased risk of wildlife disease.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 31,419 acres of total modeled habitat for white-tailed kite in the Plan Area (Table 6-82). Most of the direct effects on modeled foraging habitat will occur inside the UDA. Overall, 1,217 acres of modeled habitat for white-tailed kite outside the UDA will be directly affected. Inside the UDA, 31,102 of 41,325 acres of modeled habitat will be directly affected.

In addition to the direct effects quantified in Table 6-82, Covered Activities will indirectly affect white-tailed kite nesting, nesting/foraging, and foraging habitats, and will also injure, kill, or harass individuals in the Plan Area (Table 6-83). These effects will be reduced through implementation of the AMMs described in Table 6-83. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on white-tailed kite is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, human activity, trash, and utility strikes.

In addition to the general AMMs (Section 5.4.1), raptor-specific measures (Section 5.4.2) will be implemented to minimize permanent direct and indirect effects on white-tailed kite due to Covered Activities. Mortality and injury of individual white-tailed kite will occur in the Plan Area due to Covered Activities; however, mortality and injury will be minimized through the implementation of AMMs. There is also a small risk of take in the form of harassment over the duration of the Permit Term (e.g., inhibiting individuals from nesting or foraging in some areas). Some nest sites will be directly affected by Covered Activities because white-tailed kite is a nesting resident in the Plan Area.

Table 6-83
Permanent Indirect Effects on White-Tailed Kite

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter waterways that run through riparian areas where white-tailed kite prey could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) RAPTOR-1 (Raptor Surveys)	Habitat fragmentation will have adverse effects on this species forcing birds to fly farther to suitable foraging areas, thus increasing energetic demands, as well as increasing other risks, such as collisions with vehicles and man-made structures. The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on white-tailed kite. Within the UDA, habitat fragmentation will affect white-tailed kite because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on white-tailed kite in the Plan Area. White-tailed kites are more sensitive to habitat fragmentation and isolation than Cooper's hawk or Swainson's hawk during the nest season because white-tailed kites do most of their foraging within 0.5 mile of the

Table 6-83
Permanent Indirect Effects on White-Tailed Kite

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		nest site (Hawbecker 1942). Nest sites that do not have sufficient nearby foraging habitat due to habitat fragmentation will be abandoned or have reduced nest success. Further, potential permanent indirect effects on favored prey, such as voles, would be similar to those described previously for Swainson's hawk, including degradation of foraging habitat resulting from altered hydrology and wildfire regimes. AMMs in Condition 2 and in specific RAPTOR measures will reduce effects of habitat fragmentation on white-tailed kite.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Repeated or intense wildfires will affect foraging habitat quality through direct mortality of prey (e.g., birds, small mammals, reptiles, and amphibians) and general habitat degradation. Effects of increased wildfire on white-tailed kite habitat will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Effects on white-tailed kite due to vernal pool hydrologic alterations are mainly associated with prey base. Hydrologic alterations could affect patterns of foraging for small mammals that make up the prey base for white-tailed kite. Implementation of AMMs will significantly reduce effects of vernal pool hydrologic alterations on prey species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Noise could indirectly affect the use of nesting and foraging habitat by white-tailed kite. Implementation of these AMMs will minimize chronic noise in close proximity to white-tailed kite habitat.

Table 6-83
Permanent Indirect Effects on White-Tailed Kite

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Lighting	EDGE-8 (Outdoor Lighting) BMP-6 (Construction Lighting) RAPTOR-1 (Raptor Surveys)	Lighting will mildly affect white-tailed kite, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation, and will act primarily to disrupt normal nighttime rest and sleep patterns and increase stress levels. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally-active birds, potentially causing them to become disoriented. Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittee determines lighting is necessary for public safety or security. During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to white-tailed kite.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-11 (Speed Limit) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects on white-tailed kite are expected from increased human activity on Preserves and Preserve Setbacks. Potential effects include introduction of invasive species and collisions with vehicles. Implementation of AMMs ensures that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect white-tailed kite or their habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community by increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Implementation of AMMs such as those that require Trail Public Education will ensure human

Table 6-83
Permanent Indirect Effects on White-Tailed Kite

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) RAPTOR-1 (Raptor Surveys)	activity will have minimal effects to the wildlife community within white-tailed kite habitat. Competition from non-native predators (e.g., dogs, coyotes) on prey species, and invasive plant and animal species that either outcompete or create unsuitable habitat for prey could also affect white-tailed kite.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within white-tailed kite habitat in the Plan Area. A change in vegetation structure could have an effect on prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described previously in Wildlife Community Alterations, invasion by non-native predators of white-tailed kite and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects to white-tailed kite and its prey by mesopredators will be minimized by implementing AMMs that reduce interaction between white-tailed kite and urban wildlife (raccoon, opossum, fox) and pets.

Table 6-83
Permanent Indirect Effects on White-Tailed Kite

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	Diseases transmitted from humans and pets could affect white-tailed kite, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. White-tailed kite are susceptible to avian flu and the protozoan *Trichomonas gallinae*. The SSHCP will have little direct control over potential disease transmission from ingested prey, such as pigeons and doves, because active control of these well-established and very common species likely is not feasible and therefore would not be an effective management action. However, potential transmission of diseases from human and pets in Preserves will be minimized by controlling access to Preserves through Condition 2 and Condition 5. Implementation of these AMMs will minimize the potential for introduction of these diseases into local white-tailed kite populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on white-tailed kite or the Valley Grassland Ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided through the implementation of AMMs.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by white-tailed kite near heavily trafficked areas and in urbanized areas. Covered Activities will therefore increase the frequency of vehicle and window strikes by white-tailed kite. White-tailed kites foraging in fields near

Table 6-83
Permanent Indirect Effects on White-Tailed Kite

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	RAPTOR-1 (Raptor Surveys)	major roads or near development would be at higher risk of collisions. As described previously, increased collision risks are inevitable with urbanization and are difficult to predict or control directly because birds fly some distance between nesting locations and preferred foraging areas. Indirect effects on white-tailed kite associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to white-tailed kite habitat. Otherwise, white-tailed kite will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7).
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) RAPTOR-1 (Raptor Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all raptors, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on white-tailed kite by incorporating the most current practices for avoiding avian powerline collisions.

Temporary Effects

In addition to the permanent removal of habitat described previously, white-tailed kite foraging, nesting, and nesting/foraging habitats near proposed ground-disturbing Covered Activities be adversely affected by several temporary construction-related effects that will result in additional habitat disturbance or additional injury, mortality, or harassment of individual white-tailed kites (Table 6-84). These potential construction-related effects were generally described in Section 6.3.2 and include dust; noise; construction lighting; general human activity (including trash and debris); inadvertent grading, clearing, or trampling of habitat; and hydrologic alterations, such as increased runoff and associated pollutants and toxic compounds. Temporary direct effects on white-tailed kite will generally be similar to the temporary direct effects on Cooper's hawk described in Section 6.6.18. However, noise and ground vibration, lighting, and increased human activity in construction areas or during operations and maintenance activities will have a more pronounced effect on white-tailed kites at nest and roost sites than the more urban-tolerant Cooper's hawk. For example, human disturbance in urban areas has caused white-tailed kites to abandon some communal roost sites (Waian 1973; Dunk 1995), and it is reasonable to expect that large-scale construction activities or noisy operation and maintenance activities will have similar effects. On the other hand, white-tailed kites have established nest sites in areas such as parks and areas at the urban fringe (CDFG 2010; Whisler, pers. comm., as cited in Appendix B), although one nest site monitored by Erichsen (pers. comm., as cited in Appendix B) failed to produce young. White-tailed kites are often observed foraging in developed areas with high human, traffic, and noise levels, such as along the side of and in-between the Interstate 5 corridor and major arterial roadways and in agricultural and vacant fields adjacent to residential and commercial development (Behrends, pers. obs.). Therefore, foraging activities in areas bordering construction or operations and maintenance sites will not be substantially affected.

Table 6-84
Temporary Effects to White-Tailed Kite

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into white-tailed kite riparian nesting habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of vegetation could cause white-tailed kite prey to avoid habitat. Implementation of AMMs ensures that trampling and compaction do not occur.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Loud noise can affect nesting white-tailed kites, potentially causing them to abandon the nest. Implementation of AMMs will minimize construction noise effects in the vicinity of white-tailed kite nesting habitat.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	BMP-6 (Construction Lighting) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid abandonment of nests and disorienting effects to white-tailed kite.
Construction Dust	None required for this species.	No effect on this species.

AGENDA ITEM 11.1

Table 6-84
Temporary Effects to White-Tailed Kite

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Increased Human Presence during Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) RAPTOR-1 (Raptor Surveys) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Ground-disturbing activities that could affect white-tailed kite involving increased human presence will be reduced by implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Trash and debris would adversely affect white-tailed kite habitat quality through direct effects, such as attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.22 Northern Harrier

Permanent Effects

Permanent direct and indirect effects of Covered Activities on northern harrier (*Circus cyaneus*) will include modification or removal of modeled habitat, increased human activity, invasive plants and animals introduced into modeled habitat, vehicle and aircraft collisions with northern harrier, and increased risk of wildlife disease.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 30,903 acres of total modeled habitat for northern harrier in the Plan Area (Table 6-85). Most of the direct effects on modeled foraging habitat will occur inside the UDA. Overall, 47 acres of modeled foraging habitat for northern harrier outside the UDA will be directly affected. Inside the UDA, 808 of 1,950 acres of modeled foraging habitat will be directly affected. Most of the effects on modeled nesting/foraging habitat in the Plan Area (22,014 acres) will be to Valley Grassland. Of the 210,318 acres of modeled habitat in the Plan Area, total effects to nesting/foraging habitat will be to 30,048 acres, most of which will occur in the UDA.

In addition to the direct effects quantified in Table 6-85, Covered Activities will indirectly affect northern harrier nesting/foraging and foraging habitats, and will also injure, kill, or harass northern harrier individuals in the Plan Area (Table 6-86). These effects will be reduced through implementation of the AMMs described in Table 6-86. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on northern harrier is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, human activity, trash, and utility strikes.

In addition to the general AMMs (Section 5.4.1), raptor-specific measures (Section 5.4.2) will be implemented to minimize permanent direct and indirect effects on northern harrier due to Covered Activities. Mortality and injury of individual northern harrier will occur in the Plan Area due to Covered Activities; however, mortality and injury will be minimized through the implementation of AMMs. There is also a small risk of take in the form of harassment over the duration of the Permit Term (e.g., inhibiting individuals from nesting or foraging in some areas). Some nest sites will be directly affected by Covered Activities because northern harrier is a nesting resident in the Plan Area.

Table 6-86
Permanent Indirect Effects on Northern Harrier

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	The close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter waterways that run through vernal pools and wetlands where northern harrier forages and nests.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) RAPTOR-1 (Raptor Surveys)	Habitat fragmentation will have adverse effects on this species forcing birds to fly farther to suitable nesting and foraging areas, thus increasing energetic demands, as well as increasing other risks, such as collisions with vehicles and man-made structures. The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on northern harrier. Within the UDA, habitat fragmentation will affect northern harrier because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on northern harrier in the Plan Area. AMMs in Condition 2 and in specific RAPTOR measures will reduce effects of habitat fragmentation on northern harrier.

Table 6-86
Permanent Indirect Effects on Northern Harrier

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Repeated or intense wildfires will affect foraging habitat quality through direct mortality of prey (e.g., birds, small mammals, reptiles, and amphibians) and general habitat degradation, such as facilitating invasion by non-native exotic plant species. Increased wildfire can have similar effects to altered hydrology on nesting and foraging habitat for northern harriers. Repeated or intense wildfires will affect nesting habitat by removing vegetation cover and degrading hydrologic conditions. As with hydrologic effects, factors that degrade habitat for important prey would reduce foraging habitat quality for northern harrier. Effects of increased wildfire on northern harrier habitat will be minimized through implementation of the Preserve System Monitoring and Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Effects on northern harrier due to vernal pool hydrologic alterations are mainly associated with prey base. Hydrologic alterations could affect patterns of foraging for small mammals that make up the prey base for northern harrier. Implementation of AMMs will significantly reduce effects of vernal pool hydrologic alterations on prey species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Noise could indirectly affect the use of nesting and foraging habitat by northern harrier. Implementation of these AMMs will minimize chronic noise in close proximity to northern harrier habitat.

Table 6-86
Permanent Indirect Effects on Northern Harrier

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Lighting	EDGE-8 (Outdoor Lighting) RAPTOR-1 (Raptor Surveys)	Lighting will mildly affect northern harrier, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation, and will act primarily to disrupt normal nighttime rest and sleep patterns and increase stress levels. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally-active birds, potentially causing them to become disoriented. Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittee determines lighting is necessary for public safety or security. During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to northern harrier.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-11 (Speed Limit) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As a ground nester, northern harrier will be relatively more sensitive to edge effects, such as human disturbances (Davis and Niemela 2008) and urban-related predators. Given the high sensitivity of nesting northern harriers to human activities, nest sites that do not have sufficient buffers from adjacent land uses will be abandoned or have reduced nest success Further, potential permanent indirect effects on favored prey, such as voles, would include degradation of foraging habitat resulting from altered hydrology and increased wildfire. Effects on northern harrier are expected from increased human activity on Preserves and Preserve Setbacks. Potential effects include introduction of invasive species and collisions with vehicles. Implementation of AMMs ensures that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect northern harrier or their habitat.

Table 6-86
Permanent Indirect Effects on Northern Harrier

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) RAPTOR-1 (Raptor Surveys)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community by increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Implementation of AMMs such as those that require Trail Public Education will ensure human activity will have minimal effects to the wildlife community within northern harrier habitat. Competition from non-native predators (e.g., dogs, coyotes) on prey species, and invasive plant and animal species that either outcompete or create unsuitable habitat for prey could also affect northern harrier.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within northern harrier habitat in the Plan Area. A change in vegetation structure could have an effect on prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As a ground nester, northern harrier will be relatively more sensitive to edge effects, such as human disturbances (Davis and Niemela 2008) and urban-related predators. Given the high sensitivity of nesting northern harriers to human activities, nest sites that do not have sufficient buffers from adjacent land uses will be abandoned or have reduced nest success. Further, potential permanent indirect effects on favored prey, such as voles, would include degradation of foraging habitat resulting from altered hydrology and increased wildfire. As described previously in Wildlife Community Alterations, invasion by non-native

Permanent Indirect Effects on Northern Harrier

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		predators of northern harrier and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects to northern harrier nests and its prey by mesopredators will be minimized by implementing AMMs that reduce interaction between northern harrier and urban wildlife (raccoon, opossum, fox) and pets.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	Diseases transmitted from humans and pets could affect northern harrier, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. Northern harriers are susceptible to avian flu and the protozoan *Trichomonas gallinae*. The SSHCP will have little direct control over potential disease transmission from ingested prey, such as pigeons and doves, because active control of these well-established and very common species likely is not feasible and therefore would not be an effective management action. However, potential transmission of diseases from human and pets in Preserves will be minimized by controlling access to Preserves through Conditions 2 and 5. Implementation of these AMMs will minimize the potential for introduction of these diseases into local northern harrier populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread)	Adverse effects on northern harrier or the Valley Grassland Ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided through the implementation of AMMs.

Table 6-86
Permanent Indirect Effects on Northern Harrier

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures) RAPTOR-1 (Raptor Surveys)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by northern harrier near heavily trafficked areas and in urbanized areas. Covered Activities will therefore increase the frequency of vehicle and window strikes by northern harrier. Northern harriers foraging in fields near major roads or near development would be at higher risk of collisions. Indirect effects on northern harrier associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to northern harrier habitat. Otherwise, northern harrier will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7).
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) RAPTOR-1 (Raptor Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all raptors, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on northern harrier by incorporating the most current practices for avoiding avian powerline collisions.

Temporary Effects

In addition to the permanent removal of habitat described previously, northern harrier nesting and foraging habitats near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects that will result in additional habitat disturbance or additional injury, mortality, or harassment of individual northern harriers (Table 6-87). These potential construction-related effects were generally described in Section 6.3.2 and include dust; noise and ground vibration; construction lighting; general human activity (including trash and debris); inadvertent grading, clearing, or trampling of habitat; and hydrologic alterations, such as increased runoff and associated pollutants and toxic compounds. Nests will be more exposed to disturbances related to Covered Activities because they are constructed on the ground in open, vegetated habitats, such as grasslands and agricultural fields, even though the nest itself is typically concealed in dense, tall vegetation. Because human activities, such as passive recreation (e.g., dog-walking) and off-road vehicle driving, near a nest can cause nest failure (Davis and Niemela 2008), it is expected that a construction-related Covered Activities and operations and maintenance involving human activities near nests will also result in nest failures. However, northern harrier foraging behavior will be less affected by construction activities near foraging areas, as they commonly forage for suitable prey, such as voles, brush rabbits (*Sylvilagus bachmani*), and small birds, such as blackbirds and sparrows, in Cropland and other Disturbed habitats near human activities and development.

Table 6-87
Temporary Effects to Northern Harrier

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into northern harrier wetland nesting habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of vegetation could cause northern harrier prey to avoid habitat. Implementation of AMMs ensures that trampling and compaction do not occur.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location)	Loud noise can affect nesting northern harriers, potentially causing them to abandon the nest. Implementation of AMMs will minimize construction noise effects in the vicinity of northern harrier nesting habitat.
Construction Ground Vibration	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Ground vibrations can force northern harriers to leave nests exposed to vibration, exposing them to potential predation by predators and failure of a nest. Implementation of AMMs will minimize construction ground vibration effects near northern harrier nesting habitat.
Construction Lighting	BMP-6 (Construction Lighting) RAPTOR-3 (Raptor Nest/Roost Buffer)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid abandonment of nests and disorienting effects to northern harrier.
Construction Dust	None required for this species.	No effect on this species.

Table 6-87
Temporary Effects to Northern Harrier

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Increased Human Presence during Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring	Ground-disturbing activities that could affect northern harrier involving increased human presence will be reduced by implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Trash and debris would adversely affect northern harrier habitat quality through direct effects, such as attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.23 Western Burrowing Owl

Permanent Effects

Permanent direct and indirect effects of Covered Activities on burrowing owl (*Athene cunicularia*) will include modification or removal of modeled habitat, increased human activity, invasive plants and animals introduced into modeled habitat, vehicle and aircraft collisions with burrowing owl, and increased risk of wildlife disease.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 30,086 acres of total modeled habitat for burrowing owl in the Plan Area. Most of the direct effects on modeled habitat will occur inside the UDA. Overall, 1,223 of 165,583 acres of modeled nesting/foraging habitat for burrowing owl outside the UDA will be directly affected. Inside the UDA, 28,863 of 39,062 acres of modeled nesting/foraging habitat will be directly affected. Most of the effects on modeled nesting/foraging habitat in the Plan Area (22,014 acres of the 204,645 acres of total effects) will be to Valley Grassland, which is the primary habitat used by burrowing owl.

In addition to the direct effects quantified in Table 6-88, Covered Activities will indirectly affect burrowing owl nesting/foraging, and will also injure, kill, or harass burrowing owl individuals in the Plan Area (Table 6-89). These effects will be reduced through implementation of the AMMs described in Table 6-89. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on burrowing owl is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, human activity, trash, and utility strikes.

In addition to the general AMMs (Section 5.4.1), raptor-specific measures (Section 5.4.2) will be implemented to minimize permanent direct and indirect effects on burrowing owl due to Covered Activities. Mortality and injury of individual burrowing owls will occur in the Plan Area due to Covered Activities; however, mortality and injury will be minimized through the implementation of AMMs. There is also a small risk of take in the form of harassment over the duration of the Permit Term (e.g., inhibiting individuals from nesting or foraging in some areas). Some nest sites will be directly affected by Covered Activities because burrowing owl is a nesting resident in the Plan Area.

Table 6-89
Permanent Indirect Effects on Western Burrowing Owl

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses)	The close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially

Table 6-89
Permanent Indirect Effects on Western Burrowing Owl

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter waterways that run through areas where burrowing owl prey could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) WBO-1 (Burrowing Owl Surveys) WBO-2 (Burrowing Owl Pre-Construction Survey) WBO-3 (Burrowing Owl Avoidance) WBO-4 (Burrowing Owl Construction Monitoring) WBO-5 (Burrowing Owl Passive Relocation) WBO-6 (Burrowing Owl Timing of Maintenance) Activities	Burrowing owls are somewhat less sensitive to habitat fragmentation and isolation compared the other wider-ranging covered raptors because most their foraging, at least during the nesting season, occurs in areas immediately surrounding their burrows; in agricultural areas in the San Joaquin and Imperial Valleys, approximately 80% of foraging during the nesting season was within approximately 1,970 feet (600 meters of the nest burrow) (Gervais et al. 2008), which equates to an approximately 280-acre circular foraging area around the nest. However, habitat fragmentation will have adverse effects on this species forcing birds to fly farther to suitable foraging areas, thus increasing energetic demands, as well as increasing other risks, such as collisions with vehicles and man-made structures. The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on burrowing owl. Within the UDA, habitat fragmentation will affect burrowing owl because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on burrowing owl in the Plan Area. Nest sites that do not have sufficient nearby foraging habitat due to habitat fragmentation could be abandoned or have reduced nest success. Further,

Table 6-89
Permanent Indirect Effects on Western Burrowing Owl

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		potential permanent indirect effects on favored prey, such as voles, would include degradation of foraging habitat resulting from altered hydrology and wildfire regimes. AMMs in Condition 2 and in specific RAPTOR measures will reduce effects of habitat fragmentation on burrowing owl.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Repeated or intense wildfires will affect foraging habitat quality through direct mortality of prey (e.g., small mammals, reptiles, and insects) and general habitat degradation. Effects of increased wildfire on burrowing owl habitat will be minimized through implementation of the Preserve System Monitoring and Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Effects on burrowing owl due to vernal pool hydrologic alterations are mainly associated with prey base. Hydrologic alterations could affect patterns of foraging for small mammals and insects that make up the prey base for burrowing owl. Implementation of AMMs will significantly reduce effects of vernal pool hydrologic alterations on prey species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Ground vibration and noise could indirectly affect the use of nesting habitat by burrowing owl. Implementation of these AMMs will minimize chronic noise in close proximity to burrowing owl habitat.

Table 6-89
Permanent Indirect Effects on Western Burrowing Owl

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Lighting	EDGE-8 (Outdoor Lighting) BMP-6 (Construction Lighting) WBO-1 (Burrowing Owl Surveys)	Lighting will mildly affect burrowing owl, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally crepuscular birds, potentially causing them to become disoriented. However, burrowing owls frequently forage near lights that attract large numbers of insects. Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittee determines lighting is necessary for public safety or security. During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to burrowing owl.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-11 (Speed Limit) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects on western burrowing owl are expected from increased human activity on Preserves and Preserve Setbacks. Potential effects include introduction of invasive species and collisions with vehicles. Implementation of AMMs ensures that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect western burrowing owl or their habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community by increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Implementation of AMMs such as those that require Trail Public Education will ensure human activity will have minimal effects to the wildlife community within burrowing owl habitat. Competition from non-native predators (e.g., dogs, coyotes) on western burrowing owls and prey species, and invasive plant and animal species that either

Table 6-89
Permanent Indirect Effects on Western Burrowing Owl

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) WBO-1 (Burrowing Owl Surveys)	outcompete or create unsuitable habitat for prey could also affect burrowing owl.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within burrowing owl habitat in the Plan Area. A change in vegetation structure could have an effect on prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of non-native plant proliferation will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described previously in Wildlife Community Alterations, invasion by non-native predators of burrowing owl and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects to burrowing owl and its prey by mesopredators will be minimized by implementing AMMs that reduce interaction between burrowing owl and urban wildlife (raccoon, opossum, fox) and pets.

Table 6-89
Permanent Indirect Effects on Western Burrowing Owl

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	Diseases transmitted from humans and pets could affect burrowing owl, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. Burrowing owls are susceptible to avian flu and the protozoan *Trichomonas gallinae*. The SSHCP will have little direct control over potential disease transmission from ingested prey, such as pigeons and doves, because active control of these well-established and very common species likely is not feasible and therefore would not be an effective management action. However, potential transmission of diseases from human and pets in Preserves will be minimized by controlling access to Preserves through Conditions 2 and 5. Implementation of these AMMs will minimize the potential for introduction of these diseases into local burrowing owl populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Adverse effects on burrowing owl or the Valley Grassland Ecosystem from pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided through the implementation of AMMs. Use of rodenticides on ground squirrel colonies could indirectly affect western burrowing owl through ingestion of the toxin or reduction of western burrowing owl prey. If the Technical Advisory Committee (Chapter 9) approves a Preserve Management Plan (Chapter 8) that includes use of rodenticides, that use would be subject to limitations in the Preserve Management Plan on timing and area of application, amounts to be used, and acceptable rodenticides. If appropriate, those restrictions could be incorporated into the conservation easement.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by burrowing owl near heavily trafficked areas and in urbanized areas. Burrowing owls will also be at relatively higher risk of vehicle collisions compared to the other covered raptors. Vehicular collisions, which accounted for

Table 6-89
Permanent Indirect Effects on Western Burrowing Owl

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	WBO-1 (Burrowing Owl Surveys)	25% to 60% of burrowing owl mortalities in three studies (Poulin et al. 2011), are a significant cause of mortality because burrowing owls habitually perch and hunt on roadways at night (Bent 1938; Poulin et al. 2011). As described for the other covered raptors, increased collision risks are inevitable with urbanization and are difficult to predict or control directly because birds fly some distance between nesting locations and preferred foraging areas (although less than the other covered raptors). For example, siting roads away from environmentally sensitive locations (ROAD-1) probably would not make a significant contribution to reducing collision risks because burrowing owls will be flying between nesting and foraging burrow locations and preferred foraging areas in unpredictable and uncontrollable patterns and frequencies. Covered Activities will therefore increase the frequency of vehicle and window strikes on burrowing owl. Burrowing owls foraging in fields near major roads or near development would be at higher risk of collisions. Increased collision risks are inevitable with urbanization and are difficult to predict or control directly because birds fly some distance between nesting locations and preferred foraging areas. Indirect effects on burrowing owl associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to burrowing owl habitat. Otherwise, burrowing owl will be preserved from collisions through establishing large, interconnected Preserves (Chapter 7).
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) WBO-1 (Burrowing Owl Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all raptors, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on burrowing owl by incorporating the most current practices for avoiding avian powerline collisions.

Temporary Effects

In addition to the permanent removal of habitat described previously, burrowing owl nesting and foraging habitats near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects that could result in additional habitat disturbance or additional injury, mortality, or harassment of individual burrowing owls (Table 6-90). These potential construction-related effects were generally described in Section 6.3.2 and include dust; noise and ground vibration; construction lighting; general human activity (including trash and debris); and inadvertent grading, clearing, or trampling of habitat. Burrowing owls are often drawn to construction sites, likely due to the availability of disturbed soils and mounds of dirt that make for easy burrowing. Active burrows will be more exposed to disturbances related to Covered Activities because they are typically located on the ground in exposed areas. It is therefore expected that construction-related Covered Activities involving human activities near occupied burrows will also result in burrow abandonment, including potential nest failures. On the other hand, many burrowing owl individuals are relatively tolerant of human activities near nest sites, given that the most productive nesting areas in California are in agricultural areas in the Central Valley and Imperial Valley, and the species persists at least in low numbers in some highly developed urban areas (Gervais et al. 2008). It is expected that different owl individuals would have different levels of tolerance to Covered Activities near nests and winter dens.

Table 6-90
Temporary Effects to Western Burrowing Owl

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into burrowing owl habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of vegetation could cause burrowing owl prey to avoid habitat. Implementation of AMMs ensures that trampling and compaction do not occur.

Table 6-90
Temporary Effects to Western Burrowing Owl

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location) WBO-1 (Burrowing Owl Surveys) WBO-2 (Burrowing Owl Pre-Construction Survey) WBO-3 (Burrowing Owl Avoidance) WBO-4 (Burrowing Owl Construction Monitoring) WBO-5 (Burrowing Owl Passive Relocation) WBO-6 (Burrowing Owl Timing of Maintenance)	Loud noise can affect nesting burrowing owls when they are above ground. Implementation of AMMs will minimize construction noise effects in the vicinity of burrowing owl habitat.
Construction Ground Vibration	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) WBO-1 (Burrowing Owl Surveys) WBO-2 (Burrowing Owl Pre-Construction Survey) WBO-3 (Burrowing Owl Avoidance) WBO-4 (Burrowing Owl Construction Monitoring) WBO-5 (Burrowing Owl Passive Relocation) WBO-6 (Burrowing Owl Timing of Maintenance)	Ground vibrations can force burrowing owls to leave underground burrows that could collapse due to vibration, exposing them to potential predation by predators and failure of a nest. Implementation of AMMs will minimize construction ground vibration effects near burrowing owl nesting habitat.
Construction Lighting	BMP-6 (Construction Lighting) WBO-1 (Burrowing Owl Surveys) WBO-2 (Burrowing Owl Pre-Construction Survey) WBO-3 (Burrowing Owl Avoidance) WBO-4 (Burrowing Owl Construction Monitoring) WBO-5 (Burrowing Owl Passive Relocation) WBO-6 (Burrowing Owl Timing of Maintenance)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid abandonment of nests and disorienting effects to burrowing owl.
Construction Dust	None required for this species.	No effect on this species.
Increased Human Presence during Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) WBO-1 (Burrowing Owl Surveys) WBO-2 (Burrowing Owl Pre-Construction Survey) WBO-3 (Burrowing Owl Avoidance) WBO-4 (Burrowing Owl Construction Monitoring) WBO-5 (Burrowing Owl Passive Relocation) WBO-6 (Burrowing Owl Timing of Maintenance)	Ground-disturbing activities that could affect burrowing owl involving increased human presence will be reduced by implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) WBO-1 (Burrowing Owl Surveys) WBO-2 (Burrowing Owl Pre-Construction Survey) WBO-3 (Burrowing Owl Avoidance) WBO-4 (Burrowing Owl Construction Monitoring) WBO-5 (Burrowing Owl Passive Relocation) WBO-6 (Burrowing Owl Timing of Maintenance)	Trash and debris would adversely affect burrowing owl habitat quality through direct effects, such as attracting nuisance pest species. Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.24 Loggerhead Shrike

Permanent Effects

Permanent direct and indirect effects of Covered Activities on loggerhead shrike will include modification or removal of modeled habitat, increased human activity, invasive animals introduced into modeled habitat, vehicle and aircraft collisions with loggerhead shrike, and increased risk of wildlife disease.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 31,367 acres of modeled habitat for loggerhead shrike in the Plan Area, including approximately 591 acres of nesting habitat, 22,014 acres of modeled nesting/foraging habitat, and 8,762 acres of modeled foraging habitat (Table 6-91). Most of the direct effects for loggerhead shrike, 30,100 acres (96%), will occur inside the UDA, including approximately 550 acres of nesting habitat, 21,345 acres of modeled nesting/foraging habitat, and 8,205 acres of modeled foraging habitat. Outside of the UDA, a total of approximately 1,267 acres of modeled habitat will be directly affected, including approximately 41 acres of nesting habitat, 669 acres of modeled nesting/foraging habitat and 557 acres of modeled foraging habitat. Permanent effects on specific nest sites are not analyzed because the SSHCP database does not contain any confirmed loggerhead shrike nest sites for the Plan Area (Section 3.4.5).

In addition to the direct effects quantified in Table 6-91, Covered Activities will indirectly affect loggerhead shrike nesting/foraging, and will also injure, kill, or harass individuals in the Plan Area (Table 6-92). These effects will be reduced through implementation of the AMMs described in Table 6-92. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on loggerhead shrike is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be associated with habitat fragmentation and isolation and areas along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, human activity, trash, and utility strikes, accidental fire ignitions, and potential spread of invasive plants.

In addition to the general AMMs (Section 5.4.1), raptor-specific measures (Section 5.4.2) will be implemented to avoid permanent direct and indirect effects on loggerhead shrike to Covered Activities. With implementation of the proposed AMMs, the proposed Covered Activities will not directly kill or injure individual loggerhead shrikes in the Plan Area. However, there is a small risk of take in the form of harassment over the duration of the permit (e.g., inhibiting individuals from nesting or foraging in some areas). Some nest sites will be directly affected by Covered Activities because suitable loggerhead shrike nesting habitat exists within the Plan Area.

Temporary Effects

In addition to the permanent removal of habitat described previously, loggerhead shrike nesting and foraging habitats near proposed ground-disturbing Covered Activities could be adversely affected by several temporary construction-related effects that would result in additional habitat disturbance or additional injury, mortality, or harassment of individual loggerhead shrikes. These potential construction-related effects include dust; noise and ground vibration; construction lighting; general human activity (including trash and debris); inadvertent grading, clearing, or trampling of habitat; and hydrologic alterations, such as increased runoff and associated pollutants and toxic compounds.

Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently impacted in the direct effects reported in Table 6-91).

These potential construction-related environmental stressors were described previously in Section 6.3.2, and their additional effects on loggerhead shrike are qualitatively described in Table 6-93.

Table 6-92
Permanent Indirect Effects on Loggerhead Shrike

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-2 (Groundwater Recharge) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-2 (Erosion Control) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Pesticide Use)	Long-term hydrologic alterations would degrade the quality of riparian scrub and woodland nesting habitat for loggerhead shrike, as well as alter water quality within the Plan Area. The close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including decreased groundwater recharge that supports riparian vegetation, urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that foster groundwater recharge and the control of pesticide use and stormwater runoff will ensure that riparian habitat does not degrade as a result of reduced groundwater levels and that pollution will not enter waterways that run through areas where loggerhead shrike prey could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 8, UTILITY-1 (Avian Collision Avoidance) RAPTOR-1 (Raptor Surveys)	Loggerhead shrikes are sensitive to habitat fragmentation and isolation because territories in mainland California have been estimated to range from approximately 11 acres to approximately 40 acres, and smaller habitat patches would not support viable nesting pairs. Habitat fragmentation reduces the amount of available foraging habitat near nest sites, potentially forcing birds to travel farther and reducing their fitness due to higher energy costs and reduced time at the nest. In addition, longer travel from nest sites to foraging areas increase their risk of collisions with man-made structures and vehicles, which has been shown to be a significant source of shrike mortality in Virginia and Texas (Humple 2008). The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on loggerhead shrike by preserving large habitat blocks and ensuring connectivity throughout the Preserve System. Within the UDA, habitat fragmentation will affect loggerhead shrike because all UDA Preserves will be bordered by urban

AGENDA ITEM 11.1
967

Table 6-92
Permanent Indirect Effects on Loggerhead Shrike

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		development, which will be reduced through implementation of EDGE and UTILITY AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs, UTILITY AMMs, and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on loggerhead shrike in the Plan Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Repeated or intense wildfires will affect foraging and nesting habitat quality and quantity through direct mortality of prey (e.g., small mammals, reptiles, and insects) and general habitat degradation. Because loggerhead shrikes hunt in open habitats characterized by short grasses, forbs, or bare ground, they may be particularly sensitive to habitat degradation resulting from increased wildfire that facilitate invasion by non-native grasses and weeds (Humple 2008); such invasions may reduce availability and detectability of prey, such as large, ground-dwelling insects, as well small mammals, reptiles, and amphibians. Effects of increased wildfire on loggerhead shrike habitat will be minimized through implementation of the Preserve System Monitoring and Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Effects on loggerhead shrike due to vernal pool hydrologic alterations are mainly associated with prey base. Hydrologic alterations could affect patterns of foraging for insects, small birds, and mammals that make up the prey base for loggerhead shrike. Implementation of AMMs will significantly reduce effects of vernal pool hydrologic alterations on prey species.

Table 6-92
Permanent Indirect Effects on Loggerhead Shrike

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Chronic Ground Vibration and Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Ground vibration and noise could indirectly affect the use of nesting habitat by loggerhead shrike. Implementation of these AMMs will minimize chronic noise in close proximity to loggerhead shrike habitat.
Lighting	EDGE-8 (Outdoor Lighting) BMP-6 (Construction Lighting) RAPTOR-1 (Raptor Surveys)	Lighting will mildly affect loggerhead shrike, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally active birds, potentially causing them to abandon nests and/or become disoriented. Lighting could also lure prey insects that the loggerhead shrike depend on, reducing their abundance within loggerhead shrike habitat preserves. Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittees determines lighting is necessary for public safety or security. During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid disorienting effects to loggerhead shrike.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-11 (Speed Limit) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Trail Impacts) Condition 8, UTILITY-1 (Avian Collision Avoidance) EDGE-8 (Outdoor Lighting)	Effects on loggerhead shrike are expected from increased human activity on Preserves and Preserve Setbacks. Potential effects include introduction of invasive species and collisions with vehicles and aboveground utilities. Implementation of AMMs ensures that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect loggerhead shrike or their habitat.

Table 6-92
Permanent Indirect Effects on Loggerhead Shrike

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) RAPTOR-1 (Raptor Surveys)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community by increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Implementation of AMMs such as those that require Trail Public Education will ensure human activity will have minimal effects to the wildlife community within loggerhead shrike habitat. Competition from non-native predators (e.g., cats, dogs, coyotes) on loggerhead shrike and their prey species, and invasive plant and animal species that either outcompete or create unsuitable habitat for prey species could also affect loggerhead shrike.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within loggerhead shrike habitat in the Plan Area. A change in vegetation structure could have an effect on prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	As described previously in Wildlife Community Alterations, invasion by non-native predators of loggerhead shrike and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.

Table 6-92
Permanent Indirect Effects on Loggerhead Shrike

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Effects to loggerhead shrike and its prey by mesopredators will be minimized by implementing AMMs that reduce interaction between loggerhead shrike and urban wildlife (raccoon, opossum, fox, feral cat) and pets.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	Diseases transmitted from humans and pets could affect loggerhead shrike, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. Loggerhead shrikes are susceptible to avian flu and the protozoan *Trichomonas gallinae*. Pandolfino (2008) showed that a decline in the winter abundance of loggerhead shrikes in the Central Valley in the 3 years following the summer of 2005 was correlated with elevated virus infection levels in the Central Valley compared to non-Central Valley Counties, and suggested that West Nile virus played a role in the decline. The SSHCP will have little direct control over potential disease transmission from ingested prey, such as small birds, which are used as prey during the winter months. However, potential transmission of diseases from human and pets in Preserves will be minimized by controlling access to Preserves through Conditions 2 and 5. Implementation of these AMMs will minimize the potential for introduction of these diseases into local loggerhead shrike populations.
