Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves)	Loggerhead shrike and their prey are susceptible to adverse effects from pesticides as ingestion of pesticide-laden arthropods can lead to toxic effects on adults and in eggs, and it can significantly reduce the local availability of insects (especially grasshoppers). Adverse effects on loggerhead shrike, their prey, or the Valley Grassland Ecosystem from insecticides/pesticides (such

Table 6-92
Permanent Indirect Effects on Loggerhead Shrike

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be minimized through the implementation of AMMs. Specific restrictions on pesticide use in certain preserves may be included in Preserve Management Plans, further minimizing the effects of pesticides on the insect prey of loggerhead shrike.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures) RAPTOR-1 (Raptor Surveys)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by loggerhead shrike near heavily trafficked areas and in urbanized areas. As discussed in Humple (2008), collisions with vehicles are a significant source of loggerhead shrike mortality in Virginia and Texas. Consequently, loggerhead shrike will be at a relatively higher risk of vehicle collisions compared to the other Covered Species, as they use road margin habitat to hunt, as perches are abundant and there is a clear view of the surrounding landscape to visually search for prey. As described for the covered raptors, increased collision risks are inevitable with urbanization and are difficult to predict or control directly because birds fly some distance between nesting locations and preferred foraging areas (although less than the other covered raptors). For example, siting roads away from environmentally sensitive locations (ROAD-1) probably would not make a significant contribution to reducing collision risks because it would not remove the road margin habitat that is used for hunting. Covered Activities will therefore increase the frequency of vehicle and window strikes on loggerhead shrikes as the number roads in the Plan Area will be increased from existing conditions. Indirect effects on loggerhead shrike associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to burrowing owl habitat. Otherwise, loggerhead shrike will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7).

Table 6-92
Permanent Indirect Effects on Loggerhead Shrike

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Aboveground Electrical Utilities Collision And Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) RAPTOR-1 (Raptor Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all avian species, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on loggerhead shrike by incorporating the most current practices for avoiding avian powerline collisions.

Table 6-93
Temporary Effects to Loggerhead Shrike

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	Runoff from construction activities into loggerhead shrike habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit)	Inadvertent trampling and compaction of vegetation could cause loggerhead shrike prey to avoid habitat. Implementation of AMMs ensures that trampling and compaction do not occur.

Table 6-93
Temporary Effects to Loggerhead Shrike

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location)	Loud noise can affect nesting loggerhead shrikes. Implementation of AMMs will minimize construction noise effects in the vicinity of loggerhead shrike nesting habitat.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	BMP-6 (Construction Lighting) RAPTOR-3 (Raptor Nest/Roost Buffer)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid abandonment of nests and disorienting effects to loggerhead shrike. Lighting could also lure prey insects that the loggerhead shrike depend on, reducing their abundance within loggerhead shrike habitat preserves. By directing lighting away from preserves, this effect would be reduced but not eliminated.
Construction Dust	None required for this species.	No effect on this species.
Increased Human Presence During Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) RAPTOR-2 (Raptor Pre-Construction Surveys) RAPTOR-3 (Raptor Nest/Roost Buffer) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Effects associated with increased human presence during construction that could affect loggerhead shrike habitat and behavior will be reduced by implementing AMMs.
Construction Trash And Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	Trash and debris would adversely affect loggerhead shrike habitat quality through direct effects, such as attracting nuisance pest species and potential predators (e.g., feral cats). Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.25 Greater Sandhill Crane

Permanent Effects

Permanent direct and indirect effects of Covered Activities on greater sandhill crane (*Grus canadensis*) will include modification or removal of modeled roosting/foraging habitat, modeled roosting habitat, and modeled foraging habitat, habitat fragmentation and isolation, noise, lighting, increased human activity (including trash and debris), altered hydrology, altered fire regime, vehicle collisions, electrocution and collisions associated with aboveground transmission lines, wildlife community alterations, disease, and pesticides.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 7,42 of the 89,765 acres of modeled habitat for greater sandhill crane in the Plan Area, including 124 of the 4,487 acres of modeled roosting/foraging habitat, 66 of the 1,156 acres of modeled roosting habitat, and 7,752 of the 84,122 acres of modeled foraging habitat (Table 6-94). Most of the direct effects for greater sandhill crane, approximately 7,115 acres , will occur inside the UDA, including approximately 115 acres of modeled roosting/foraging habitat, 47 acres of modeled roosting habitat, and 6,953 acres of modeled foraging habitat. Outside of the UDA, a total of approximately 827 acres of modeled habitat will be directly affected, including approximately 9 acres of modeled roosting/foraging habitat, 19 acres of modeled roosting habitat, and 799 acres of modeled foraging habitat.

Of the approximately 7,942 acres of total effects on modeled habitat for greater sandhill crane, approximately 820 acres (10%) are high-value foraging habitat (Table 6-95). The 820 acres of high-value habitat effects are 1% of the approximately 81,473 acres of high-value habitat in the Plan Area.

In addition to the direct effects quantified in Table 6-94 and 6-95, Covered Activities will indirectly affect greater sandhill crane roosting and foraging, and will also injure, kill, or harass individuals in the Plan Area (Table 6-96). Although most indirect effects are qualitatively assessed in Table 6-96, some indirect effects can be quantified (Table 6-94 and 6-95). These effects are specific to roosting habitat within Vernal Pool Ecosystems in that approximately 7 acres of Vernal Pool Ecosystem roosting habitat will be indirectly impacted in the Plan Area—6 acres within the UDA and 1 acre outside the UDA.

All permanent indirect effects (both qualitative and quantitative) to greater sandhill crane will be reduced through implementation of the AMMs described in Table 6-96. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on greater sandhill crane is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. As described in more detail in Table 6-96,

greater sandhill cranes are very sensitive to human activities. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that would increase the risk of vehicle collisions, accidental fire ignitions, and other road-related effects (e.g., traffic noise, road runoff, potential spread of invasive plants).

In addition to the general AMMs (Section 5.4.1), greater sandhill crane-specific measures (Section 5.4.2) will be implemented to avoid permanent direct and indirect effects on greater sandhill crane to Covered Activities. With implementation of the proposed AMMs, the proposed Covered Activities will result in a small risk of killing or injuring individual greater sandhill cranes in the Plan Area due to collisions with fixed structures or vehicles. Additionally, there is a small risk of take in the form of harassment over the duration of the permit (e.g., inhibiting individuals from roosting or foraging in some areas). This incrementally increased risk of take is mitigated through the SSHCP Conservation Strategy (Chapter 7).

Temporary Effects

In addition to the permanent removal of habitat described previously, greater sandhill crane roosting and foraging habitats near proposed ground-disturbing Covered Activities could be adversely affected by several temporary construction-related effects that will result in additional habitat disturbance or additional injury, mortality, or harassment of individual greater sandhill cranes (Table 6-97). These potential construction-related effects were generally described in Section 6.3.2 and include dust; noise and ground vibration; construction lighting; general human activity (including trash and debris); inadvertent grading, clearing, or trampling of habitat; and hydrologic alterations, such as increased runoff and associated pollutants and toxic compounds, as well as temporary fencing. Temporary fencing during construction is an additional potential temporary effect that is more specific to greater sandhill crane. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified, as permanently impacted in the direct effects reported in Table 6-94).

These potential construction-related environmental stressors were described generally in Section 6.3.2, and their additional effects on greater sandhill crane are qualitatively described in Table 6-96, as are AMMs that would avoid and/or minimize these temporary effects.

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-2 (Groundwater Recharge) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-2 (Erosion Control) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Pesticide Use)	Long-term hydrologic alterations could modify flooding and dewatering events and would degrade the quality of wetland roosting and foraging habitat for greater sandhill crane, as well as alter water quality within the Plan Area. For example, occupied night roosts in the Sacramento-San Joaquin Delta, including the Cosumnes River Preserve and Stone Lakes National Wildlife Refuge in the Plan Area, averaged approximately 3.9 inches (10 centimeters) water depth (range 1.2–8.3 inches [3–21 centimeters) (Ivey et al. 2015). Substantial deviations from these depths could reduce suitability and result in roost abandonment. In addition, the close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides,

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		pesticides, fuel, oil, lubricants, paints, and release agents. Specific effects of these chemicals and pollutants on greater sandhill cranes may have toxic effects either directly (e.g., dermal contact) or through ingestion of contaminated food sources, or may reduce prey/forage abundance. Further, water quality at foraging sites (e.g., Seasonal Wetland) may be an important factor and could be degraded by runoff from development and roads of various pollutants and chemicals, including fuel, oil, lubricants, paints, and release agents, and pesticides. Implementation of AMMs such as those that require control of stormwater runoff, restrict pesticide use, and reduce erosion will preserve roosting and foraging habitat from actions that can result in altered hydrology, and ensure pollution will not enter waterways that could degrade greater sandhill crane roosting and foraging habitat and wetland areas where greater sandhill crane prey and forage could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 8, UTILITY-1 (Avian Collision Avoidance) GSC-1 (Greater Sandhill Crane Surveys)	Greater sandhill cranes are sensitive to habitat fragmentation and isolation, especially between roosting and foraging sites. Habitat fragmentation reduces the size of available roosting sites and available foraging habitat near nest sites. Ivey et al. (2015) found that habitat fragmentation that reduced suitable roost sites to less than approximately 67 acres would not be viable roost sites, recommend roost site complexes of 247–2,470 acres (100–1,000 hectare), with an individual site at least 12.3 acres (5 hectares). Roost sites that do not have sufficient size to support greater sandhill cranes due to habitat fragmentation could be abandoned. Habitat fragmentation also reduces the amount of available foraging habitat near roost sites. Pogson (1990) and Ivey and Herziger (2003) observed distances between roosting and foraging

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		sites have averaged from approximately 0.9 mile to 1.7 miles. In addition, habitat fragmentation and longer travel to and from roost sites to foraging areas exacerbate the effects of other potential permanent indirect effects, including increased human activity, altered hydrology, increased wildfire, vehicle collisions, aboveground utilities, altered wildlife communities, and their risk of collisions with man-made structures and vehicles. The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on greater sandhill crane by preserving large habitat blocks and ensuring connectivity throughout the Preserve System. Within the UDA, habitat fragmentation will affect greater sandhill crane because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of GSC AMMs, EDGE AMMs, and UTILITY AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs, UTILITY AMMs, and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System, along with GSC-1, will minimize the effects of habitat fragmentation on greater sandhill crane in the Plan Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Increased wildfire can have similar effects to altered hydrology on foraging habitat for greater sandhill crane. While Cropland and Irrigated Pasture-Grassland are important foraging habitats for greater sandhill crane in the Plan Area and are less prone to wildfire effects, Valley Grassland and Vernal Pool Ecosystems are also a suitable foraging and roosting habitat. Repeated or intense wildfires could affect Valley Grassland and Vernal Pool Ecosystems foraging and roosting habitat by removing vegetation cover and facilitating invasion by non-native exotic plant species. As with hydrologic effects, factors that degrade habitat for

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		important prey and forage would reduce foraging habitat quality for greater sandhill crane. As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Effects of increased wildfire on greater sandhill crane habitat will be minimized through implementation of the Preserve System Monitoring and Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Effects on greater sandhill crane due to vernal pool hydrologic alterations are mainly associated with roosting habitat. Hydrologic alterations could affect patterns of roosting within Vernal Pool Ecosystems. Implementation of AMMs will significantly reduce effects of vernal pool hydrologic alterations on greater sandhill crane roosting habitat.
Chronic Ground Vibration And Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) GSC-1 (Greater Sandhill Crane Surveys) GSC-4 (Greater Sandhill Crane Visual Barrier)	Greater sandhill cranes are very sensitive to human disturbances and vibration and noise could indirectly affect the use of foraging and roosting habitat by greater sandhill crane. Implementation of these AMMs will minimize chronic noise in close proximity to greater sandhill crane roosting and foraging habitat.
Lighting	EDGE-8 (Outdoor Lighting) BMP-6 (Construction Lighting) GSC-1 (Greater Sandhill Crane Surveys) GSC-4 (Greater Sandhill Crane Visual Barrier)	Lighting will mildly affect greater sandhill crane, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally active birds, potentially causing them to abandon roosts and/or become disoriented. Implementation of these AMMs would ensure that Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittees determines lighting is necessary for public safety or security.

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-11 (Speed Limit) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-1 (Avian Collision Avoidance) EDGE-8 (Outdoor Lighting) GSC-1 (Greater Sandhill Crane Surveys) GSC-4 (Greater Sandhill Crane Visual Barrier)	Greater sandhill cranes are very sensitive to human disturbances, including even human presence and passive recreation activities, such as birding, walking, equestrian activities, bicycling, and boating (Ivey and Herziger 2003). Ivey et al. (2015) found that greater sandhill cranes tend to avoid roost sites in the Sacramento-San Joaquin Delta, which is used for waterfowl hunting. Littlefield and Ivey (2000) indicated that only one predawn disruption is usually necessary before cranes abandon a roosting site. Potential effects of increased human activity will be reduced through implementation of these AMMs, including GSC-1 and GSC-4 and Conditions 2 and 5, which will ensure that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect greater sandhill cranes or their habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) GSC-1 (Greater Sandhill Crane Surveys)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community through increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Competition and predation from non-native predators (cats, dogs, coyotes) on greater sandhill crane and their prey species, and invasive plant and animal species that either outcompete or create unsuitable habitat for prey or forage species, could also affect greater sandhill cranes. Implementation of AMMs such as those that require Trail Public Education, Preserve Setbacks, prevention invasive species spread, proper location of road projects, and greater sandhill crane surveys will ensure human activity will have minimal effects to the wildlife community within greater sandhill crane habitat.

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Unmanaged proliferation of non-native plants could affect species composition within greater sandhill crane habitat in the Plan Area. A change in vegetation structure could have an effect on forage habitat and prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described previously in Wildlife Community Alterations, invasion by non-native predators of greater sandhill crane and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.
Mesopredators	None required for this species.	No effect on this species.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	Greater sandhill crane may be vulnerable to disease transmitted from humans and pets, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. In areas where large numbers of greater sandhill cranes are forced to use limited roost areas, epizootic events, such as cholera, avian botulism, aspergillosis, salmonella, and avian tuberculosis, are likely to occur and are known to kill sandhill cranes (Tacha et al. 1992). Avian cholera has resulted in sandhill crane mortality in San Joaquin County (Lindstedt, pers. comm. n.d., as cited in Appendix B, Species Accounts). While these disease factors generally cannot be addressed wholly through specific AMMs, the SSHCP Conservation Strategy of preserving adequate roosting

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		habitat in several locations in the Preserve System will help reduce the risk of epizootic events related to increased contact between individuals. Implementation of these AMMs will also act to minimize the potential for introduction of these diseases into local greater sandhill crane populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) GSC-1 (Greater Sandhill Crane Surveys)	Greater sandhill cranes have been demonstrated to be sensitive to pesticides. Mortality of sandhill cranes has been attributed to anticholinesterase pesticides, which include organophosphorus and carbamate compounds, which may be ingested through contaminated water, seeds, foliage, invertebrates, and vertebrates or by dermal contact and inhalation (Fleischli et al. 2004). Harris and Mirande (2013) report crane deaths from chemicals (primarily pesticides) but do not provide specific information about these deaths. Adverse effects on greater sandhill crane, their prey/forage, or their roosting and foraging habitat from insecticides/pesticides (such as glyphosate) or fertilizers used in new urban developments in or near SSHCP Preserves will be avoided through the implementation of AMMs.
Vehicle and Aircraft Collisions With Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures) GSC-1 (Greater Sandhill Crane Surveys)	Greater sandhill cranes are highly vulnerable to collisions with structures that interfere with flight takeoff (Pogson and Lindstedt 1988). Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by greater sandhill crane near heavily trafficked areas and in urbanized areas. As described for the covered raptors, increased collision risks are inevitable with urbanization and are difficult to predict or control directly because birds fly some distance between roosting locations and preferred foraging areas. However, unlike many raptors, siting roads away from environmentally sensitive locations (ROAD-1) would provide some separation between roosting and foraging habitats and lessen collision risks because it would increase the distance between flight takeoff and landing and the roadways. Still, Covered Activities will increase the frequency of greater sandhill

Table 6-96
Permanent Indirect Effects on Greater Sandhill Crane

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		cranes with vehicle and windshield collisions as the amount of roadways within the Plan Area will be increased from existing conditions. Indirect effects on greater sandhill cranes associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to roosting and foraging habitat. Otherwise, greater sandhill cranes will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7) that will lessen roadway interaction.
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) GSC-1 (Greater Sandhill Crane Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all avian species, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Pogson and Lindstedt (1988) concluded that power line collisions seem to be the largest source of unnatural mortality of greater sandhill cranes in the Central Valley. Implementation of these AMMs will reduce effects of utility-related Covered Activities on greater sandhill cranes by incorporating the most current practices for avoiding avian power line collisions.

Table 6-97
Temporary Effects to Greater Sandhill Crane

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing)	Runoff from construction activities into greater sandhill crane habitat will be fully avoided through the implementation of AMMs.

Table 6-97
Temporary Effects to Greater Sandhill Crane

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation)	
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) GSC-2 (Greater Sandhill Crane Pre-Construction Surveys) GSC-3 (Greater Sandhill Crane Roosting Buffer) GSC-4 (Greater Sandhill Crane Visual Barrier) GSC-5 (Greater Sandhill Crane Roost Buffer Monitoring)	Inadvertent trampling and compaction of vegetation could cause greater sandhill crane and their prey to avoid habitat. Implementation of AMMs ensures that trampling and compaction do not occur.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location) GSC-2 (Greater Sandhill Crane Pre-Construction Surveys) GSC-3 (Greater Sandhill Crane Roosting Buffer) GSC-4 (Greater Sandhill Crane Visual Barrier) GSC-5 (Greater Sandhill Crane Roost Buffer Monitoring)	Loud noise can affect greater sandhill cranes and cause abandonment of roosting sites. Implementation of AMMs will minimize construction noise effects in the vicinity of greater sandhill crane roosting and foraging habitat.
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	BMP-6 (Construction Lighting) GSC-1 (Greater Sandhill Crane Surveys) GSC-2 (Greater Sandhill Crane Pre-Construction Surveys) GSC-3 (Greater Sandhill Crane Roosting Buffer) GSC-4 (Greater Sandhill Crane Visual Barrier) GSC-5 (Greater Sandhill Crane Roost Buffer Monitoring)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid abandonment of roosts and disorienting effects to greater sandhill crane.

Table 6-97
Temporary Effects to Greater Sandhill Crane

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Construction Dust	None required for this species.	No effect on this species.
Increased Human Presence during Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) GSC-1 (Greater Sandhill Crane Surveys) GSC-2 (Greater Sandhill Crane Pre-Construction Surveys) GSC-3 (Greater Sandhill Crane Roosting Buffer) GSC-4 (Greater Sandhill Crane Visual Barrier) GSC-5 (Greater Sandhill Crane Roost Buffer Monitoring)	Effects associated with increased human presence during construction that could affect greater sandhill crane habitat and behavior will be reduced by implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) GSC-3 (Greater Sandhill Crane Roosting Buffer) GSC-4 (Greater Sandhill Crane Visual Barrier) GSC-5 (Greater Sandhill Crane Roost Buffer Monitoring)	Trash and debris would adversely affect greater sandhill crane habitat quality through direct effects, such as attracting nuisance pest species and potential predators (e.g., feral cats). Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.26 Tricolored Blackbird

Permanent Effects

Permanent direct and indirect effects of Covered Activities on tricolored blackbird (*Agelaius tricolor*) will include modification or removal of modeled nesting/foraging habitat, modeled foraging habitat, habitat fragmentation and isolation, noise, lighting, increased human activity (including trash and debris), altered hydrology, altered fire regime, vehicle collisions, electrocution and collisions associated with aboveground transmission lines, wildlife community alterations, disease, and pesticides.

Over the proposed 50-year Permit Term, Covered Activities will directly affect approximately 31,058 of the 212,632 acres of modeled habitat for tricolored blackbird in the Plan Area, including approximately 27,531of the 188,539 acres of modeled nesting/foraging habitat and approximately 3,527 of the 24,093 acres of modeled foraging habitat (Table 6-98). Most of the direct effects for tricolored blackbird, approximately 29,823 acres (96%), will occur inside the UDA, including approximately 26,488 acres of modeled nesting/foraging habitat and 3,335 acres of modeled foraging habitat. Outside of the UDA, a total of approximately 1,235 acres of modeled habitat will be directly affected, including approximately 1,043 acres of modeled nesting/foraging habitat and 192 acres of modeled foraging habitat.

In addition to the direct effects quantified in Table 6-98, Covered Activities will indirectly affect tricolored blackbird modeled nesting and foraging habitat, and will also injure, kill, or harass individuals in the Plan Area (Table 6-99). All indirect effects (both qualitative and quantitative) to tricolored blackbird will be reduced through implementation of the AMMs described in Table 6-99. These potential indirect effects would be expected to generally affect tricolored blackbird in a similar manner to their effects on the other covered avian species, but some of the effects would have relatively greater effects on tricolored blackbird, as discussed in the following text. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on tricolored blackbird is greatest within the UDA because of the closer and more extensive contact between urban development and preserved areas. It is expected that most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA would be along improved roads supporting higher traffic densities and speeds that would increase the risk of vehicle collisions, accidental fire ignitions, and other road-related effects (e.g., traffic noise, road runoff, potential spread of invasive plants).

In addition to the general AMMs (Section 5.4.1), tricolor blackbird-specific measures (Section 5.4.2) will be implemented to avoid permanent direct and indirect effects on tricolor blackbird to Covered Activities. With implementation of the proposed AMMs, the proposed Covered

Activities will result in a small risk of killing or injuring individual tricolor blackbird in the Plan Area due to collisions with fixed structures or vehicles. Additionally, there is a small risk of take in the form of harassment over the duration of the permit (e.g., inhibiting individuals from roosting or foraging in some areas). This incrementally increased risk of take is mitigated through the SSHCP Conservation Strategy (Chapter 7).

Temporary Effects

In addition to the permanent removal of habitat described previously, tricolored blackbird nesting and foraging habitats near proposed ground-disturbing Covered Activities would be adversely affected by several temporary construction-related effects that could result in additional habitat disturbance or additional injury, mortality, or harassment of individual tricolored blackbirds. The various off-site direct effects that would affect tricolored blackbirds are generally described in Section 6.3.2 and include dust; noise and ground vibration; lighting; altered hydrology; chemicals and pollution; general human activity (including trash and debris); and inadvertent grading, clearing, or trampling of habitat.

These potential construction-related environmental stressors were described previously in Section 6.3.2, and their additional effects on tricolored blackbird are qualitatively described in Table 6-100, as are AMMs that would avoid and/or minimize these temporary effects.

Table 6-99
Permanent Indirect Effects on Tricolored Blackbird

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-2 (Groundwater Recharge) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-2 (Erosion Control) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Pesticide Use) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	Long-term hydrologic alterations or reductions in water quality within the Plan Area would substantially affect tricolored blackbird nesting and foraging habitat, both in quantity and in quality. In addition, the colonial nature of this species and the close proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Specific effects of these chemicals and pollutants on tricolored blackbirds may be toxic either directly (e.g., dermal contact) or through ingestion of contaminated food sources (grain and invertebrates), or may reduce prey/forage abundance. Implementation of AMMs such TCB-5 and those that require control of stormwater runoff, restrict pesticide use, and reduce erosion will preserve nesting and foraging habitat from actions that can result in altered hydrology, and ensure pollution will not enter waterways that could degrade tricolored blackbirds nesting and foraging habitat areas and where their primary food sources could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 8, UTILITY-1 (Avian Collision Avoidance) TCB-1 (Tricolored Blackbird Surveys) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	Tricolored blackbirds are sensitive to habitat fragmentation and isolation. Habitat fragmentation will reduce relatively undisturbed nesting and foraging habitat patch sizes inside the UDA, increasing the chance that surrounding development will be closer to potential nest colonies and will potentially cause disturbance and possible abandonment of otherwise suitable colony sites. Additionally, habitat fragmentation would reduce available foraging habitat near nest colonies, forcing birds to travel farther and potentially reducing their fitness due to higher energy costs and reduced time at the nest. For example, during the breeding season, tricolored blackbirds do most of their foraging within approximately 3 miles of the nest colony, although they commute up to 8 miles (Beedy

Table 6-99
Permanent Indirect Effects on Tricolored Blackbird

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		2008). Habitat fragmentation would increase and exacerbate the effects of other potential permanent indirect effects to tricolored blackbird including increased human activity, altered hydrology, increased wildfire, vehicle collisions, aboveground utilities, altered wildlife communities, and risk of collisions with man-made structures and vehicles. The Landscape Preserves established outside the UDA will avoid effects of habitat fragmentation on tricolored blackbird by preserving large habitat blocks and ensuring connectivity throughout the Preserve System. Within the UDA, habitat fragmentation will affect tricolored blackbird because all UDA Preserves will be bordered by urban development, which will be reduced through implementation of TCB AMMs, EDGE AMMs, and UTILITY AMMs. The effects of roads fragmenting on some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2), will be reduced through EDGE AMMs, TCB AMMS, UTILITY AMMs, and ROAD AMMs. Overall, the large Core Preserves and connectivity provided by the SSHCP Preserve System, along with TCB-1, will minimize the effects of habitat fragmentation on tricolored blackbird in the Plan Area.
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Increased wildfire can have similar effects to altered hydrology on foraging and nesting habitat for tricolored blackbird. While Cropland and Irrigated Pasture-Grassland are important foraging habitats for tricolored blackbird in the Plan Area and are less prone to wildfire effects, Valley Grassland and Vernal Pool Ecosystems are also a suitable foraging and/or nesting habitat. Repeated or intense wildfires could affect Valley Grassland and Vernal Pool Ecosystems foraging and/or nesting habitat by removing vegetation cover and facilitating invasion by non-native exotic plant species. As with hydrologic effects, factors that degrade habitat for important food sources would reduce foraging habitat quality for

Table 6-99
Permanent Indirect Effects on Tricolored Blackbird

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		tricolored blackbird. As discussed in Section 6.3, outside the UDA, Covered Activities would not affect wildfire frequency, duration, or intensity. Effects of increased wildfire on tricolored blackbird habitat will be minimized through implementation of the Preserve System Monitoring and Management Program, which will include a commitment to develop a memorandum of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) Condition 8, UTILITY-4 (Siting of Entry and Exit Location)	Effects on tricolored blackbird due to Vernal Pool hydrologic alterations are mainly associated with foraging habitat. Hydrologic alterations could affect patterns of foraging (localized forage/prey abundance and quality) within Vernal Pool Ecosystems. Implementation of AMMs will significantly reduce effects of Vernal Pool hydrologic alterations on tricolored blackbird foraging habitat.
Chronic Ground Vibration and Noise	None required for this species.	No effect on this species.
Lighting	EDGE-8 (Outdoor Lighting) BMP-6 (Construction Lighting) TCB-1 (Tricolored Blackbird Surveys)	Lighting will mildly affect tricolored blackbird, depending on several factors, including light intensity, height of lighted structure, and physical shielding and vegetation. Sudden and unexpected onset of lighting (e.g., from vehicles) will also startle normally diurnally active birds, potentially causing them to abandon nests and/or become disoriented. Lighting could also lure prey insects that the tricolored blackbird depend on, reducing their abundance within tricolored blackbird habitat preserves. Implementation of these AMMs would ensure that Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittees determines lighting is necessary for public safety or security. By directing lighting away from preserves, this effect would be reduced but not eliminated.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread)	Tricolored blackbirds are sensitive to human disturbances, and nesting tricolored blackbirds are very sensitive to human disturbances, abandoning colonies with a single disturbance

Table 6-99
Permanent Indirect Effects on Tricolored Blackbird

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 3, BMP-11 (Speed Limit) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 8, UTILITY-1 (Avian Collision Avoidance) EDGE-8 (Outdoor Lighting) TCB-1 (Tricolored Blackbird Surveys) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	(Beedy and Hamilton 1999). Potential effects of increased human activity will be reduced through implementation of these AMMs, including TCB-1 and TCB-5 and Conditions 2, 3, 4, and 5, will ensure that increased human activity in and near Preserves is limited, that precautions are taken to minimize anthropogenic effects, and that effects are monitored so that human activity does not substantially affect tricolored blackbirds or their habitat.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education) TCB-1 (Tricolored Blackbird Surveys)	Covered Activities may facilitate wildlife community alterations by changing the structure of the wildlife community by increased human activity (and non-native predators, such as dogs), pesticides, livestock, and invasive species. Known nocturnal predators of tricolored blackbirds that would increase in urbanized and agricultural settings include opossum, skunk, raccoon, American crows, ravens, and cattle egrets (*Bubulcus ibis*) (Mailliard 1914; Meese 2011; Neff 1937), as well as cats (*Felis catus*) (Payne 1969). In the Central Valley, coyotes are also major predator of tricolored blackbird colonies, especially in silage field colonies and cattail colonies when water is withdrawn (Hamilton, pers. comm. n.d., as cited in Appendix B, Species Accounts.) Implementation of AMMs such as those require Trail Public Education and Preserve Setbacks prevent invasive species spread road project location and tricolored blackbird surveys will ensure human activity will have minimal effects to the wildlife community within tricolored blackbird habitat.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks)	Unmanaged proliferation of non-native plants could affect species composition within tricolored blackbird habitat in the Plan Area. A

Table 6-99
Permanent Indirect Effects on Tricolored Blackbird

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	change in vegetation structure could have an effect on forage habitat and prey species use of habitat. Implementation of AMMs will minimize proliferation of non-native plants. Effects of proliferation of non-native plants will be reduced relative to existing unmanaged conditions (see Chapter 7).
Invasive Animals	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, NATURE TRAIL-6 (Nature Trail Public Education)	As described previously in Wildlife Community Alterations, invasion by non-native predators of tricolored blackbird and its prey is avoided through AMMs such as Preserve Setbacks and Monitoring of Trail Impacts.
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 6, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) TCB-1 (Tricolored Blackbird Surveys)	Effects to tricolored blackbird by mesopredators will be minimized by implementing AMMs that reduce interaction between tricolored blackbird and urban wildlife (raccoon, opossum, fox) and pets.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 4, ROAD-3 (Roadside Pesticide Use)	No information on diseases directly affecting tricolored blackbird are available in literature published on the species. However, the West Nile virus has been documented in the closely related red-winged blackbird (*Agelaius phoeniceus*), as well as Brewer's blackbird (*Euphagus cyanocephalus*) and common grackle (*Quiscalus quiscula*) (Bernard et al. 2001; Komar 2003), and the virus has been implicated in the decline of at least one species in Central Valley—loggerhead shrike (Pandolfino 2008). The risk of

Table 6-99
Permanent Indirect Effects on Tricolored Blackbird

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	TCB-1 (Tricolored Blackbird Surveys) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	West Nile virus infections will be managed through vector control for public health and safety, such as through spraying with pesticides, but management will need to consider potential adverse effects to native wildlife, as spraying with mosquito abatement oil has resulted in mass mortality of tricolored blackbirds (Beedy and Hamilton 1999). While these disease factors generally cannot be addressed wholly through specific AMMs, the SSHCP Conservation Strategy of preserving adequate nesting and foraging habitat in several locations in the Preserve System will help reduce the risk of epizootic events related to increased contact between colonies. Implementation of these AMMs will also act to minimize the potential for introduction of these diseases into local tricolored blackbird populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use) TCB-1 (Tricolored Blackbird Surveys) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	Tricolored blackbirds have been demonstrated to be sensitive to pesticides and herbicides. For example, the application of herbicides and pesticides are known to affect the nesting success of colonies in agricultural areas (Beedy and Hamilton 1999). Various poisons and contaminants have also caused mass mortality, including poisoning by strychnine and selenium and spraying with mosquito abatement oil (McCabe 1932; Beedy and Hayworth 1992; Beedy and Hamilton 1999; Beedy 2008). Pesticides may also reduce the abundance of insect prey that tricolored blackbird depend on. Adverse effects on tricolored blackbird and/or their nesting and foraging habitat from insecticides/pesticides or fertilizers used in new urban developments in or near SSHCP Preserves will be minimized through the implementation of AMMs that will reduce and/or restrict the use of these chemicals in the Plan Area. Specific restrictions on pesticide use in certain preserves may be included in Preserve Management Plans, further minimizing the effects of pesticides on

Table 6-99
Permanent Indirect Effects on Tricolored Blackbird

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		tricolored blackbird nesting habitat and the insect prey of tricolored blackbird.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) ROAD-1 (Road Project Location) ROAD-2 (Wildlife Crossing Structures) TCB-1 (Tricolored Blackbird Surveys)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by tricolored blackbirds near heavily trafficked areas and in urbanized areas. As described for the covered raptors, increased collision risks are inevitable with urbanization and are difficult to predict or control directly because birds fly some distance between nesting locations and preferred foraging areas. Covered Activities will increase the frequency of tricolored blackbird vehicle and windshield collisions as the amount of roadways within the Plan Area will be increased from existing conditions. Indirect effects on tricolored blackbird associated with vehicle collisions and aircraft will be avoided by locating planned road projects in the least environmentally sensitive location relative to nesting and foraging habitat. Otherwise, tricolored blackbird will be preserved from collisions by establishment of large, interconnected Preserves (Chapter 7) that will lessen roadway interaction.
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance) TCB-1 (Tricolored Blackbird Surveys)	Aboveground utilities such as transmission towers, utility poles, and powerlines pose a general risk to all avian species, with mortalities and injuries from collisions (powerlines), entanglements, and electrocutions (Franson et al. 1995; Lehman et al. 2007). Implementation of these AMMs will reduce effects of utility-related Covered Activities on tricolored blackbirds by incorporating the most current practices for avoiding avian power line collisions.

Table 6-100
Temporary Effects to Tricolored Blackbird

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single Loaded Streets) Condition 4, ROAD-1 (Road Project Location) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	Runoff from construction activities into tricolored blackbird habitat will be fully avoided through the implementation of AMMs.
Laydown or Trampling of Vegetation	Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-11 (Speed Limit) TCB-1 (Tricolored Blackbird Surveys) TCB-2 (Tricolored Blackbird Pre-Construction Surveys) TCB-3 (Tricolored Blackbird Nest Buffer) TCB-4 (Tricolored Blackbird Nest Buffer Monitoring)	Inadvertent trampling and compaction of vegetation could cause tricolored blackbird to avoid habitat or reduce the quantity or quality of foraging and nesting habitat. Implementation of AMMs ensures that trampling and compaction will not occur.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location) TCB-1 (Tricolored Blackbird Surveys) TCB-2 (Tricolored Blackbird Pre-Construction Surveys) TCB-3 (Tricolored Blackbird Nest Buffer) TCB-4 (Tricolored Blackbird Nest Buffer Monitoring) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural	Loud noise can affect tricolored blackbird and cause abandonment of nesting sites. Implementation of AMMs will minimize construction noise effects in the vicinity of tricolored blackbird nesting and foraging habitat.

AGENDA ITEM 11.1

998

Table 6-100
Temporary Effects to Tricolored Blackbird

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	Preserves)	
Construction Ground Vibration	None required for this species.	No effect on this species.
Construction Lighting	BMP-6 (Construction Lighting) TCB-1 (Tricolored Blackbird Surveys) TCB-2 (Tricolored Blackbird Pre-Construction Surveys) TCB-3 (Tricolored Blackbird Nest Buffer) TCB-4 (Tricolored Blackbird Nest Buffer Monitoring) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	During construction periods, ground-disturbing Covered Activities will direct all temporary construction lighting away from adjacent natural habitats to avoid abandonment of nests and disorienting effects to tricolored blackbird. Lighting could also lure prey insects that the tricolored blackbird depend on, reducing their abundance within tricolored blackbird habitat preserves. By directing lighting away from preserves, this effect would be reduced but not eliminated.
Construction Dust	None required for this species.	No effect on this species.
Increased Human Presence during Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) TCB-1 (Tricolored Blackbird Surveys) TCB-2 (Tricolored Blackbird Pre-Construction Surveys) TCB-3 (Tricolored Blackbird Nest Buffer) TCB-4 (Tricolored Blackbird Nest Buffer Monitoring) TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves))	Effects associated with increased human presence during construction that could affect greater tricolored blackbird and behavior will be reduced by implementing AMMs.
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program) TCB-1 (Tricolored Blackbird Surveys) TCB-2 (Tricolored Blackbird Pre-Construction Surveys) TCB-3 (Tricolored Blackbird Nest Buffer) TCB-4 (Tricolored Blackbird Nest Buffer Monitoring)	Trash and debris would adversely affect tricolored blackbird habitat quality through direct effects, such as attracting nuisance pest species and potential predators (e.g., feral cats). Implementation of AMMs ensures that construction trash and debris will be controlled.

6.6.27 American Badger

Permanent Effects

Permanent direct and indirect effects of Covered Activities on American badger (*Taxidea taxus*) will include modification or significant degradation of modeled habitat and direct and indirect take of all American badger individuals occupying that modified or degraded habitat. Modeled habitats for American badger are Valley Grassland, Blue Oak Savanna, Vernal Pool, Seasonal Wetland, and Swale.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 22,780 acres of modeled habitat for American badger within the Plan Area (see Table 6-101). Covered Activity impacts on American badger will occur primarily inside the UDA, with approximately 22,036 acres of permanent effects in the UDA and 744 acres of permanent effects outside the UDA.

American badger in the Plan Area will be affected by several permanent indirect effects on habitats, as well as injury, mortality, or harassment of individuals (Table 6-102). Potential permanent indirect effects of the Covered Activities include habitat fragmentation and isolation, noise, lighting, increased human activity (including recreation and trash and debris), altered fire regime, vehicle collisions, wildlife community alterations, disease, and pesticides. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on American badger is greatest within the UDA because of the closer and more extensive contact between urban development and protected areas. It is expected that most of these indirect effects, with the exception of vehicle collisions, will be relatively minor outside the UDA because of the larger Preserves and much lower development densities. Most potential indirect effects outside the UDA will be along improved roads supporting higher traffic densities and speeds that increase the risk of vehicle collisions, accidental fire ignitions, and other road-related effects (e.g., traffic noise, potential spread of invasive plants). The potential permanent indirect effects of Covered Activities are described below, along with AMMs to avoid and minimize these effects.

Table 6-101

Temporary Effects

American badgers near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to American badger. Generally, these temporary effects will occur within the project footprint or road right-of-way area (already quantified as permanently affected in the direct effects reported in Table 6-101). These potential construction-related environmental stressors were generally described in Section 6.3.2, and their additional effects on American badger are qualitatively described in Table 6-103.

Table 6-102
Permanent Indirect Effects on American Badger

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 3, BMP-9 (Soil Compaction) Condition 4, ROAD-1 (Road Project Location)	Planned development and roads, both in the UDA and outside the UDA, would be located near American badger habitat. This development will result in hydrologic and water quality effects on this habitat, including urban runoff that alters normal hydroperiods in vernal pools and seasonal wetlands and that contains pollutants and toxins, including fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure pollution will not enter American badger habitat and that water chemistry of aquatic habitat will not be affected.
Habitat Fragmentation	Habitat fragmentation was minimized in the SSHCP Preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	Habitat fragmentation, especially in the UDA, will be the primary indirect effect on American badgers. American badger is a mobile species that often uses large areas within its home range (Lindzey 1978; Long 1973; Messick and Hornocker 1981; Minta 1993; Sargeant and Warner 1972). Minimum patch size is estimated to be approximately 25 acres (Laudenslayer and Parisi 2007). Young also may disperse long distances, with females moving more than 32 miles and males moving more than 63 miles (Messick and Hornocker 1981). These large home ranges and long-distance movements mean that fragmented habitats will expose badgers to various risks, including encounters with humans and dogs and vehicle collisions. Because badgers naturally occur in low population densities, additional effects from habitat fragmentation and isolation can quickly result in local extirpations, which have been observed in the Central Valley possibly more than in any other portion of California (Larsen 1987). Additionally, habitat fragmentation from Covered Activities will reduce habitat patch size and expose American badgers to adverse edge effects such as noise and lighting. Habitat fragmentation will be minimized in the UDA through establishment of large and interconnected Preserves.

Table 6-102
Permanent Indirect Effects on American Badger

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	As discussed in Section 6.3, Covered Activities outside the UDA will not affect wildfire frequency, duration, or intensity. Within the UDA, increased wildfire will cause direct mortality of American badger prey (e.g., ground squirrels, rabbits, other small rodents) and general habitat degradation that reduces prey abundances over time. Other adverse habitat effects could result from wildfire suppression (e.g., fire trucks, retardant, fire breaks). Effects of wildfire suppression on American badge will be minimized through implementation of the Preserve System Management Program, which will include a commitment to develop memorandums of agreement with responsible fire agencies.
Vernal Pool Hydrologic Alterations	None required for this species.	No effect on this species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	Increased vibration and noise levels in American badger habitat will degrade habitat quality for American badger, resulting in avoidance of high-noise areas such as roadways (Iglesias et al. 2012). Effects of noise on badgers will be minimized through EDGE AMMs, including establishment of Preserve Setbacks and design of compatible land uses near Preserves. Noise effects will also be considered in design of wildlife crossings (ROAD-2).
Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 4, ROAD-1 (Road Project Location)	American badger is primarily nocturnal, so lighting will have particularly adverse effects on this species, reducing habitat suitability near urban development and roads. Also, prey such as small rodents may avoid lighted areas, reducing prey resources in these areas. AMMs will minimize light pollution in Preserves in the UDA by requiring that lighting be shielded and directed away from adjacent natural habitats, establishing Preserve Setbacks, and ensuring that compatible land uses are placed adjacent to Preserves as much as possible.

AGENDA ITEM 11.1
1004

Table 6-102
Permanent Indirect Effects on American Badger

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Increased human activity related to public access in the Preserve System will disrupt essential American badger behaviors such as foraging, reproducing, and dispersing. In addition to effects such as inadvertent or intentional harassment of wildlife and habitat degradation (e.g., off-trail use), specific effects related to increased human activity are increased pets, trash, and debris. American badgers are especially susceptible to harassment by dogs. Potential effects of increased public access in the Preserve System will be addressed through Condition 5 AMMs.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location)	For American badgers, wildlife community alteration effects will occur as a result of changes in prey availability caused by habitat degradation and potentially increased competition for resources by mesopredators. As omnivores, badgers prey on a variety of native prey, including squirrels, rabbits, small rodents, birds (including eggs and nestlings) and snakes, and are sensitive to factors that alter predator/prey relationships. However, their omnivory also makes them resilient to changes in wildlife communities. This resilience, coupled with the minimization provided by the AMMs, will result in minimal effects on American badger.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves)	Invasion and proliferation of invasive plant species related to Covered Activities will adversely affect American badger through changes in rodent prey populations that eat native plant species.

AGENDA ITEM 11.1

1005

Table 6-102
Permanent Indirect Effects on American Badger

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 6, RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank)	Invasive plants will also adversely affect American badger by changing soil conditions and making it more difficult for badgers to dig burrows. Invasion and proliferation of invasive plant species will be controlled through implementation of AMMs that restrict development near Preserves, establish Preserve Setbacks, and control invasive species spread in Preserves and Preserve Setbacks.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	Because American badgers are mesopredators, an increase in the population of other mesopredators will increase competition for prey and habitat. Increases in mesopredator populations will be limited through AMMs that reduce interaction between badgers on Preserves and pets and urban-adapted wildlife (e.g., raccoon, opossum, fox).
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Urban development near existing and proposed Preserves will increase transmission of disease to American badgers. Quinn et al. (2012) found that American badgers near urban areas had been exposed to several bacterial infectious agents associated with pets and wildlife, and to canine distemper virus. The SSHCP will have little direct control over potential disease transmission from ingested prey such as rodents because active control of these well-established and very common species likely is not feasible. However, potential transmission of diseases from pets will be minimized by through EDGE measures and by restricting public access to Preserves.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside	Pesticides (including rodenticides) will enter American badger habitat through rodent control programs (e.g., ground squirrels), runoff from irrigated landscapes and from storm events, use during windy conditions, and from otherwise incorrect application methods resulting in problems such as drift and overspray into Preserves. Because badgers often prey on ground squirrels, rodent controls

AGENDA ITEM 11.1
1006

Table 6-102
Permanent Indirect Effects on American Badger

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	that reduce prey abundance and expose badgers to toxic chemicals will adversely affect the species in the Plan Area. Quinn et al. (2012) found badger tissue that contained anticoagulant rodenticides brodifacoum and bromadiolone, commonly used to control rodent pests.
Vehicle and Aircraft Collisions with Wildlife	Habitat fragmentation was minimized in the SSHCP Preserve design, including preserving large habitat blocks and habitat connectivity throughout the Preserve System, as discussed in detail in Chapter 7. Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-7 (Hardpan/Duripan Protection) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures)	Habitat fragmentation associated with Covered Activities, especially in the UDA, will increase the chance of vehicle collisions for badgers attempting to cross improved roads that have higher traffic densities and speeds. It is difficult to predict precise locations where collisions are most likely to occur because there are few known American badger occurrences in the Plan Area, and its spatial movement patterns are unknown. However, Condition 4 road project study requirements, wildlife crossings, and other AMMs to reduce the effects of habitat fragmentation on movement and associated increased collision risks will be implemented. These AMMs, in combination with establishment of large and interconnected Preserves, will help maintain American badger movement in the Plan Area and minimize the chances of death, injury, and harassment of American badger through vehicle collisions.
Aboveground Electrical Utilities Collision and Electrocution	None required for this species.	No effect on this species.

Table 6-103
Temporary Effects to American Badger

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single-Loaded Streets) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location)	Runoff from construction activities into American badger aquatic land cover types will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	None required for this species.	No effect on this species.
Construction Noise	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location)	Construction-related noise will degrade habitat quality for American badger, resulting in avoidance of the construction vicinity. Effects of noise on badgers will be minimized through BMPs and EDGE AMMs, including establishment of Preserve Setbacks and design of compatible land uses near Preserves.
Construction Ground Vibration	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 4, ROAD-1 (Road Project Location)	Construction-related vibration will degrade habitat quality for American badger, resulting in avoidance of the construction vicinity. Generally, non-disturbance setbacks for non-critical den use such as winter dens can be smaller (e.g., at least 50 feet), but need to be larger for maternity dens until young are mobile (e.g., at least 200 feet). Effects of vibration on badgers will be minimized through BMPs and EDGE AMMs, including establishment of Preserve Setbacks and design of compatible land uses near Preserves.
Construction Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-6 (Construction Lighting) Condition 4, ROAD-1 (Road Project Location)	American badgers are primarily nocturnal, so lighting will have particularly adverse effects on this species and reduce habitat suitability near urban development and roads. Also, prey such as small rodents may avoid lighted areas, reducing prey resources in these areas. AMMs will minimize light pollution into Preserves in the

AGENDA ITEM 11.1

1008

Environmental Stressor	Effect Reduced By	Potential Effect on Species
		UDA by requiring that lighting be shielded and directed away from adjacent natural habitats, establishing Preserve Setbacks, and ensuring that compatible land uses are placed adjacent to Preserves as much as possible.
Construction Dust	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-3 (Dust Control)	Dust will affect habitat and prey availability for American badger. Dust effects on vegetation communities will reduce habitat quality for important prey such as small mammals, reptiles, amphibians, and ground nesting birds. An AMM requiring control of construction dust will minimize this effect.
Increased Human Presence during Construction	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas)	Increased human activity in construction areas will disrupt essential American badger behaviors such as foraging, reproduction, and dispersal. In addition to effects such as inadvertent or intentional harassment of wildlife and habitat degradation, specific effects related to increased human activity are increased pets, trash, and debris. Badgers are especially susceptible to harassment by dogs. Potential effects of increased human presence in construction areas will be addressed through staff training.
Construction Trash and Debris	Condition 2, EDGE-3 (Preserve Setbacks) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect American badger habitat quality through direct effects such as attracting nuisance pest species and mesopredators, which could harass American badgers or compete with them for prey. Implementation of AMMs will ensure that construction trash and debris are controlled.

6.6.28 Western Red Bat

Permanent Effects

Permanent direct and indirect effects of Covered Activities on western red bat (*Lasiurus blossevillii*) will include modification or significant degradation of modeled habitat and the direct and indirect take of all roost sites in that modified or degraded habitat. The SSHCP database does not contain any confirmed western red bat roost sites in the Plan Area.

Over the proposed 50-year Permit Term, Covered Activities will permanently affect approximately 23,986 acres of western red bat modeled habitat within the Plan Area (see Table 6-16) consisting of 23,330 acres of foraging habitat and 656 acres of roosting/foraging habitat. Covered Activity impacts on western red bat modeled habitat will occur primarily inside the UDA, with approximately 23,142 acres of permanent effects on modeled habitat in the UDA and 844 acres of permanent effects on modeled habitat outside the UDA (Table 6-104).

Western red bat in the Plan Area will be affected by several permanent indirect effects on roosting/foraging and foraging habitats, and will be affected by injury, mortality, and harassment of individuals (Table 6-105). Western red bat is a tree-roosting species; individuals or small groups of reproductive females roost in the foliage of broadleaf trees such as cottonwoods (*Populus* spp.) and sycamores (*Platanus racemosa*), and also in orchards (often walnut (*Juglans* spp.)). Constantine (1959) reported that human activities in orchards caused bats to fly from the roosts, although they returned the next day. Human talking and walking around roost sites did not appear to substantially disturb bats, but any attempt to handle the bat did. Based on this, human activities associated with Covered Activities will affect roosting and reproduction, especially if pregnant and lactating females are roosting in areas subject to high levels of human activity during construction or operation. Although these indirect effects will occur throughout the Plan Area, their potential to have substantial effects on western red bat is greatest within the UDA because of the closer and more extensive contact between urban development and protected areas. Most of these indirect effects will be relatively minor outside the UDA because of the larger Preserves and much lower development densities, and the potential for human activities near roost sites. Most potential indirect effects outside the UDA would be to potential foraging habitat along improved roads supporting higher traffic densities that increase the risk of accidental fire ignitions and other road-related effects (e.g., traffic noise that will mask acoustic signals, road runoff, potential spread of invasive plants). The permanent indirect effects of Covered Activities on western red bat are described in Table 6-105, along with AMMs to avoid and minimize these effects.

In addition to indirect effects from Covered Activities near or adjoining existing Preserves or planned SSHCP Preserves, certain uses will be allowed inside Preserves and in Preserve

Setbacks that may indirectly affect western red bat. This impact analysis assumes that proper implementation of AMMs on Preserves and Preserve Setbacks over the Permit Term will avoid and minimize "other" indirect impacts.

Temporary Effects

Western red bat occurrences near proposed ground-disturbing Covered Activities will be adversely affected by several temporary construction-related effects (see Section 6.3.2) that will result in additional disturbance to habitat or additional harm to the species. Generally, these temporary effects will occur within the project footprint or road right-of-way area (quantified as permanently impacted in the direct effects reported in Table 6-104). These potential construction-related environmental stressors were described in Section 6.3.2, and their additional effects on western red bat are qualitatively described in Table 6-106.

AGENDA ITEM 11.1

1012

Table 6-105
Permanent Indirect Effects on Western Red Bat

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Permanent Alterations to Watershed Hydrographs and Downstream Water Quality Effects	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	The proximity of planned development and roads to aquatic habitat increases the likelihood that hydrologic and water quality effects will occur, including urban runoff that could potentially contain pollutants and toxins such as fertilizers, herbicides, pesticides, fuel, oil, lubricants, paints, and release agents. Implementation of AMMs such as those that require control of stormwater runoff will ensure that pollution will not enter waterways that run through riparian areas and aquatic habitats where western red bat prey could be directly affected.
Habitat Fragmentation	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location)	Although western red bat are mobile and able to fly over unsuitable landscapes, habitat fragmentation will have at least two adverse effects on the species: (1) exposing suitable roosting sites to urban edges, thus increasing the potential for disruptive effects such as noise, lighting, human activities, and urban-related predators, and (2) forcing bats to fly farther to suitable foraging areas, thus increasing energetic demands and time away from the roost. Habitat fragmentation also increases other risks such as collisions with vehicles and human-built structures. The Landscape Preserves and agricultural Preserves established outside the UDA will avoid effects of habitat fragmentation on western red bat. Within the UDA, habitat fragmentation will affect western red bat because all UDA Preserves will be bordered by urban development; this will be reduced through implementation of EDGE AMMs. The effects of roads fragmenting some UDA Preserves, such as Core Preserve 1 in PPU 1 and Core Preserve 2 in PPU 2 (Chapter 7, Section 7.5.2) will be reduced through EDGE AMMs and ROAD AMMs. Overall, the large Preserves and connectivity provided by the SSHCP Preserve System will minimize the effects of habitat fragmentation on western red bat in the Plan Area.

Table 6-105
Permanent Indirect Effects on Western Red Bat

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
Increased Wildfire	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Increased wildfire can have similar effects as altered hydrology on riparian roosting and foraging habitat of western red bat. However, because western red bat depends on larger, mature trees such as Fremont's cottonwood, western sycamore, and valley oak in the Central Valley, it is sensitive to fire effects on mature trees. Implementation of AMMs under Conditions 2 and 5 will help reduce indirect effects to western red bat associated with increased wildfire.
Vernal Pool Hydrologic Alterations	None required for this species.	No effect on this species.
Chronic Ground Vibration and Noise	Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	The sensitivity of western red bats to noise and vibration is not well understood; however, they are likely sensitive to human disturbances, and vibration and noise could indirectly affect the use of foraging and roosting habitat for western red bat. Implementation of these AMMs will minimize chronic noise near western red bat roosting and foraging habitat.
Lighting	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-8 (Outdoor Lighting) Condition 4, ROAD-1 (Road Project Location)	Increased lighting will attract insects, and foraging Western red bats will be attracted to this lighting in urban development areas near Preserves. This effect will not necessarily be adverse, but exposure to urban development could increase lighting spillover onto Preserves. Lighting could also lure prey insects that the western red bat depend on, reducing their abundance within tricolored blackbird habitat preserves. Implementation of these AMMs would ensure that Covered Activities that require lighting in the UDA will minimize light pollution into Preserves, except where a Plan Permittee determines that lighting is necessary for public safety or security. By directing lighting away from preserves, this effect would be reduced but not eliminated.
Increased Human Activity	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-1 (Road Project Location)	Increased human activity related to public access in the Preserve System should have minimal effects on nocturnal foraging species like western red bat, but will potentially disrupt roosting. Potential effects on roosting from public access in the Preserve System will

Table 6-105
Permanent Indirect Effects on Western Red Bat

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
	Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Effects) Condition 5, NATURE TRAIL-6 (Nature Trail Public Education)	be addressed through Conditions 2, 4, and 5.
Wildlife Community Alterations	Condition 1, LID-1 (Stormwater Quality) Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts) Condition 5, NATURE TRAIL-6 (Nature Trail Public Education)	Wildlife community alterations will affect western red bat through changes in prey availability and exposure to urban-related competitors and predators. Roosting western red bats are vulnerable to urban-related predators, including skunks, opossums, cats, rats, and crows, as well as western scrub-jays.
Invasive Plants	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-3 (Roadside Pesticide Use) Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Invasion and proliferation of invasive plants can result in wildlife community alterations that result in reduced insect prey abundance for western red bat. These effects will be limited through implementation of AMMs.
Invasive Animals	None required for this species.	No effect on this species.
Mesopredators	Condition 1, LID-3 (Natural Site Features) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-2 (Wildlife Crossing Structures) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Several mesopredators prey on adult and juvenile western red bats, including Virginia opossum and domestic cats. Exposure of western red bats to these mesopredators will increase with urban development under the SSHCP. Effects to western red bat and its insect prey by mesopredators will be minimized by implementing AMMs that reduce interaction between western red bat and urban

Table 6-105
Permanent Indirect Effects on Western Red Bat

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		wildlife (raccoon, opossum, fox) and pets.
Wildlife Disease	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 4, ROAD-3- Roadside Pesticide Use Condition 5, NATURE TRAIL-1 (Nature Trail Plan) Condition 5, NATURE TRAIL-2 (Nature Trail Protection of Duripan) Condition 5, NATURE TRAIL-3 (Nature Trail Location) Condition 5, NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design) Condition 5, NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Although no diseases have been identified as affecting western red bat, the species has not been well studied. Diseases transmitted from humans and pets could affect western red bat, and the risk of such transmission is expected to increase in the Plan Area with buildout of the UDA. Condition 2 EDGE measures will minimize the interaction of western red bat with humans and pets. Transmission of diseases from humans and pets in Preserves will be minimized by controlling access to Preserves through Condition 2 and Condition 5. Implementation of these AMMs will minimize the potential for introduction of diseases into local western red bat populations.
Pesticides and Fertilizers	Condition 1, LID-1 (Stormwater Quality) Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-4 (Locate Stormwater Control Outside Preserves) Condition 2, EDGE-5 (Stormwater Control in Preserve Setbacks) Condition 2, EDGE-6 (Detention Basins in Linkage Preserves) Condition 2, EDGE-10 (Prevent Invasive Species Spread) Condition 4, ROAD-1 (Road Project Location) Condition 4, ROAD-3 (Roadside Pesticide Use)	Pesticides are of particular concern for western red bats because they roost in orchards. Pierson et al. (2006) expressed concern that pesticide use at occupied orchards could result in injury, mortality, and harassment of western red bats, either through direct poisoning or indirectly through effects on prey abundance, especially if the bats are using the orchards as compensation for the historical loss of native riparian habitats (particularly walnut orchards along the Sacramento River). Adverse effects on western red bat or their habitat from pesticides or fertilizers used in new urban developments and in or near SSHCP Preserves will be minimized by implementation of AMMs. Specific restrictions on pesticide use in certain preserves may be included in Preserve Management Plans, further minimizing the effects of pesticides on the insect prey of western red bat.
Vehicle and Aircraft Collisions with Wildlife	Condition 2, EDGE-1 (Compatible Land Use) Condition 2, EDGE-2 (Single-Loaded Streets) Condition 2, EDGE-3 (Preserve Setbacks) Condition 2, EDGE-9 (Livestock Access to Preserves) Condition 4, ROAD-1 (Road Project Location)	Buildout in the UDA will result in higher traffic densities and speeds on improved roads and more frequent flights by western red bats in heavily trafficked and urbanized areas. Covered Activities will increase the frequency of vehicle and window strikes by western red bats. Indirect effects on western red bat associated with vehicle collisions and aircraft will be avoided by locating road projects in the

Table 6-105
Permanent Indirect Effects on Western Red Bat

Environmental Stressor (Section 6.3)	Indirect Effect Reduced By	Potential Indirect Effect on Species
		least environmentally sensitive location relative to western red bat habitat. Western red bat will be protected from collisions by establishment of large, interconnected Preserves (Chapter 7).
Aboveground Electrical Utilities Collision and Electrocution	Condition 8, UTILITY-1 (Avian Collision Avoidance)	Although UTILITY-1 is designed to avoid collisions with raptors, the same design measures should also reduce the likelihood of collisions with western red bats.

Table 6-106
Temporary Effects to Western Red Bat

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Temporary Alterations to Hydrographs and Construction Water Quality Effects	Condition 2, EDGE-1 (Compatible Land Uses) Condition 2, EDGE-2 (Preserve Setbacks) Condition 2, EDGE-3 (Single-Loaded Streets) Condition 3, BMP-1 (Construction Fencing) Condition 3, BMP-2 (Erosion Control) Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-4 (Erodible Materials) Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) Condition 3, BMP-9 (Soil Compaction) Condition 3, BMP-10 (Revegetation) Condition 4, ROAD-1 (Road Project Location)	Runoff from construction activities into western red bat riparian and aquatic land cover types will be fully avoided through implementation of AMMs.
Laydown or Trampling of Vegetation	None required for this species.	No effect on this species.
Construction Noise	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) BAT-1 (Winter Hibernaculum Surveys) BAT-2 (Winter Hibernaculum Pre-Construction Surveys)	Construction-related noise near winter hibernacula will disrupt colonies, and could lead to roost abandonment (e.g., Constantine 1959). Noise disturbance of these bats will be avoided through implementation of AMMs, including species-specific measures that

AGENDA ITEM 11.1
1017

Table 6-106
Temporary Effects to Western Red Bat

Environmental Stressor	Effect Reduced By	Potential Effect on Species
	BAT-3 (Winter Hibernaculum Buffer) BAT-4 (Bat Eviction Methods)	require identification and avoidance of any roosts.
Construction Ground Vibration	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) BAT-1 (Winter Hibernaculum Surveys) BAT-2 (Winter Hibernaculum Pre-Construction Surveys) BAT-3 (Winter Hibernaculum Buffer) BAT-4 (Bat Eviction Methods)	Construction-related ground vibration near winter hibernacula will disrupt colonies, and could lead to roost abandonment (e.g., Constantine 1959). Vibration disturbance of these bats will be avoided through implementation of AMMs, including species-specific measures that require identification and avoidance of any roosts.
Construction Lighting	Condition 3, BMP-6 (Construction Lighting) BAT-1 (Winter Hibernaculum Surveys) BAT-2 (Winter Hibernaculum Pre-Construction Surveys) BAT-3 (Winter Hibernaculum Buffer) BAT-4 (Bat Eviction Methods)	Construction-related noise, vibration, and lighting near winter hibernacula will disrupt colonies, including abandonment (e.g., Constantine 1959). Nighttime lighting could disrupt foraging by this nocturnal species, altering behavior by their prey insects and requiring additional energy expenditure by the bats to find food. Lighting could also lure prey insects that the western red bat depend on, reducing their abundance within tricolored blackbird habitat preserves. These effects will be minimized through avoidance of nighttime lighting, and identification and buffering of occupied roosts.
Construction Dust	Condition 3, BMP-7 (Dust Control)	Dust will affect foraging habitat quality for western red bat by decreasing the vigor and productivity of vegetation communities and reducing habitat quality for important insect prey such as moths, beetles, grasshoppers, and crickets. This effect will be minimized by AMMs so that it does not substantially affect the species.
Increased Human Presence during Construction	Condition 3, BMP-3 (Equipment Storage and Fueling) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-2 (No Pets in Construction Areas) BAT-1 (Winter Hibernaculum Surveys) BAT-2 (Winter Hibernaculum Pre-Construction Surveys) BAT-3 (Winter Hibernaculum Buffer) BAT-4 (Bat Eviction Methods)	Increased human presence during construction near a winter hibernaculum will disrupt normal behavior and physiology. Disturbance of these bats will be avoided through implementation of AMMs, including species-specific measures that require identification and avoidance of any roosts.

Table 6-106
Temporary Effects to Western Red Bat

Environmental Stressor	Effect Reduced By	Potential Effect on Species
Construction Trash and Debris	Condition 3, BMP-7 (Biological Monitor) Condition 3, BMP-8 (Training of Construction Staff) SPECIES-1 (Litter Removal Program)	Trash and debris will adversely affect western red bat habitat quality through direct effects such as attracting nuisance pest species or mesopredators, which could prey on juvenile bats. Implementation of AMMs will ensure that construction trash and debris are controlled.

7 CONSERVATION STRATEGY

The South Sacramento Habitat Conservation Plan (SSHCP) Conservation Strategy includes the Avoidance and Minimization Measures (AMMs) (Section 5.4); the SSHCP Biological Goals and Measurable Objectives (Table 7-1), including the development of the Preserve System (Section 7.4); monitoring and adaptive management programs (Chapter 8), and an Aquatic Resources Program (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report). The SSHCP Conservation Strategy will meet the regulatory requirements of the federal Endangered Species Act (ESA) and California Endangered Species Act (CESA). In addition, as discussed in Chapter 1, the SSHCP Conservation Strategy will "streamline" compliance of third-party projects with Sections 401 and 404 of the Clean Water Act (CWA), with Section 1600 of the California Fish and Game Code, and the California's Porter-Cologne Water Quality Control Act (see Section 1.3.5).

The SSHCP Conservation Strategy mitigates to the maximum extent practicable the impacts of Covered Activities described in Chapter 6, Effects Assessment and Level of Take, including all direct and indirect impacts on Covered Species and their habitats. The SSHCP Conservation Strategy provides for conservation of 28 Covered Species and 17 land cover types; avoids or minimizes impacts of Covered Activities; mitigates for the impacts of Covered Activities on the Covered Species and their habitats on the basis of species and habitat needs; provides a regional approach to the mitigation of impacts and the conservation of species and their habitats; protects wetlands and waters of the Plan Area; and conserves natural communities in the Plan Area.

The SSHCP Conservation Strategy is based on the best scientific data available at the time of its preparation (see Chapter 3, Biological Resources Setting, and Appendix B, Species Accounts, as well as Figure 7-1, Conservation Strategy Conceptual Diagram). The components of the SSHCP Conservation Strategy include the Covered Activity impact AMMs described in Chapter 5; the Biological Goals and Measurable Objectives of the SSHCP described in Section 7.3; and the SSHCP Monitoring and Management Programs (Chapter 8), which includes preparing Preserve Management Plans for all SSHCP Preserve lands. All Preserve Management Plans will include monitoring of land management actions and adaptive management of each SSHCP Preserve.

To achieve the Biological Goals and Measurable Objectives, the SSHCP Conservation Strategy is focused on the following:

- Create an integrated Preserve System that conserves the natural land covers, certain Cropland, and Irrigated Pasture–Grassland in the Plan Area. The Preserve System will preserve at least 34,495 acres of existing habitat and re-establish or establish at least 1,787 acres of habitat for a total Preserve System of 36,282 acres. The Preserve System

was developed for the benefit of SSHCP Covered Species, natural communities, biological diversity, and ecosystem functions of the Plan Area.

- Provide for the continued persistence of Covered Species in the Plan Area.
- Protect remaining natural segments of Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, Sun Creek, and their first and second order tributaries within the Urban Development Area (UDA) portion of the Plan Area.
- Protect all of the Laguna Creek Corridor within the Plan Area.
- Manage preserved lands to enhance populations of Covered Species and maintain biological diversity within the Preserve System.
- Maintain existing watershed functions in the Plan Area to benefit wetlands (aquatic land cover types), and to support aquatic Covered Species and their habitats.
- Re-establish or establish Vernal Pool land cover to ensure the Plan meets County of Sacramento (County), state, and federal requirements for "no-net-loss" of waters and wetlands and to offset impacts to vernal pool Covered Species.
- Re-establish or establish riparian and other aquatic land cover to ensure the Plan meets County, state, and federal requirements for "no-net-loss" of waters and wetlands and to offset impacts to riparian Covered Species.

INTENTIONALLY LEFT BLANK

7.1 Guiding Principles of the SSHCP Conservation Strategy

The SSHCP Conservation Strategy is based on the principles of conservation biology and landscape ecology and the nature, quality, and geographical distribution of the resources in the Plan Area. The key principles of conservation biology that guide the Conservation Strategy include:

1. **Minimize Habitat Fragmentation.** Habitat fragmentation reduces in size and isolates areas of habitat for species. As habitats become increasingly isolated, species migration, immigration, and dispersal become less common or impossible, thereby limiting or preventing opportunities for populations to exchange individuals and genetic information, escape inhospitable habitats, and recolonize areas. Ultimately, these effects can result in extinction of the species in the fragmented habitat patches. Habitat fragmentation can also alter natural ecosystem functions as well as processes such as the effects of fires and flooding, timing of pollination, habitat recovery, and other stochastic environmental events (e.g., pest outbreaks) that species have adapted to over their evolutionary history. The SSHCP Conservation Strategy minimizes habitat fragmentation by focusing on the establishment of large Preserves, and by linking existing preserves and SSHCP Preserves together to allow wildlife movement:

    a. ***Form Large Preserves***. Larger preserves have several advantages over multiple smaller preserves, even if the total area preserved is the same. Larger preserves have a greater chance of preserving habitat diversity at all scales, support larger local populations, help maintain functioning metapopulations (partially isolated subpopulations of the same species that support immigration and emigration and provide for recolonizations following local extirpations), support greater species genetic diversity, and are more likely to maintain intact watershed functions. They also have less habitat fragmentation and provide greater protection from edge effects due to a larger area-to-perimeter ratio compared to smaller preserves. Additionally, large preserves usually facilitate more cost-effective land management, such as viable livestock grazing operations and controlled fire regimes that are better carried out on a landscape scale.

    b. ***Maintain Habitat Linkages Between Preserves.*** Natural land covers preserved as habitat linkages, including species upland habitats linkages and aquatic/riparian habitat linkages in streams, creeks, and unimproved water channels, should connect larger habitat tracts that would otherwise be isolated to movement of wildlife and movement of plant species pollinators between preserves (i.e., movement corridors). Movement corridors should be as wide, continuous, natural, and vegetatively diverse as practicable to accommodate as many species as possible and protect against adverse edge effects. Some smaller, less mobile species may actually reside in the linkage and larger and/or

more mobile species may only use each linkage as a movement corridor. Redundant or multiple habitat linkages between large blocks of preserved habitat are better than a single linkage, and linkages should ensure regional connectivity to natural habitats outside of the Plan Area, where biologically appropriate, and to the maximum extent practicable.

2. **Protect Watersheds and their Ecosystem Functions.** Watershed and sub-watershed functions are an important determinant for maintaining or enhancing habitat for certain stream- and wetland-dependent and wetland-associated plants and wildlife habitats. In addition, considering watersheds as part of an overall conservation strategy helps maintain ecosystem function and promotes avoidance and minimization of development-related impacts at larger scales. Sufficient sub-watershed areas should be preserved to maintain hydrologic functions such as recharge. Also, development-related increases in surface runoff and non-point source pollution (e.g., runoff from roads, roofs, paved surfaces, utility pipes, landscaped areas) can be addressed through watershed protection. Watershed protection also assists in the conservation of streams and their water quality. The SSHCP Conservation Strategy protects watersheds and their ecosystem functions through Stream Setbacks, preservation and re-establishment of riparian land cover types, and a range of water quality protection measures.

3. **Preserve Irreplaceable and Threatened Resources.** A site with high irreplaceability has unique species or natural communities that cannot be preserved or restored elsewhere. Examples of irreplaceable resources in the study area are slender Orcutt grass (*Orcuttia tenuis*) and Sacramento Orcutt grass (*Orcuttia viscida)*, which have very limited distribution, but occur within this Plan Area. Threatened resources are those most under threat from natural or anthropogenic (human-related) factors. The SSHCP Conservation Strategy will preserve irreplaceable and threatened resources such as slender Orcutt grass and Sacramento Orcutt grass by protecting all occurrences in the Plan Area. The Preserve System will protect biological diversity and natural communities that have a high level of irreplaceability and a high degree of threat.

4. **Minimize Edge Effects.** Edge effects occur at the interface between natural and developed areas. Examples of edge effects are light and noise pollution, vibration, altered surface and subsurface hydrology, runoff and water pollution, dumping of trash and other debris and toxic chemicals, spread of invasive non-native plants and animals, and presence of pets that may adversely affect native species (see Section 6.6 for discussions of indirect effects on Covered Species). Edge effects are most severe along the perimeter of a preserve within the urban boundary. The SSHCP Conservation Strategy addresses edge effects in several ways: during Preserve design by ensuring that SSHCP Preserves are large and minimize the amount of edge area; by providing setbacks between Preserves and development; by requiring development design features that reduce edge

effects (e.g., single-loaded streets, low-impact development measures); by implementing SSHCP Avoidance and Minimization Measures during Covered Activities to reduce or eliminate adverse effects of Covered Activities on adjacent biotic resources and the ecosystem processes that support them; and by monitoring Preserves for potential long-term edge effects that could not be completely eliminated by Preserve design and other Avoidance and Minimization Measures and adaptively managing to take corrective actions. Also see setbacks description (item five in this list).

5. **Utilize Setbacks.** Setbacks will be utilized between urban development and streams and between urban development and SSHCP Preserves or existing preserves. The purpose of the setbacks is to eliminate or reduce edge effects on Covered Species and natural communities, including waters and wetlands, from urban development. Setbacks provide important space between sensitive natural resources present in preserves or streams, and potential anthropogenic edge effects caused by lighting, noise, vibration, invasive species, pets, etc. By restricting the types of recreation facilities and loss of natural land covers within setbacks, the SSHCP setbacks may also provide additional habitat for some native wildlife species and beneficial insects (e.g., pollinators of native plants).

6. **Maintain Plan Area Land Cover Heterogeneity Within Preserves.** Heterogeneous natural communities generally contain greater biodiversity, are more likely to be ecologically complex, and may be more resilient over time when compared to more homogenous areas. Preserving the biotic and abiotic habitat heterogeneity of the Plan Area to the maximum extent practicable increases the likelihood of capturing the ecosystem functions and processes needed for the long-term conservation of Covered Species, their habitat, and overall biodiversity of the Plan Area. The Conservation Strategy is targeted toward maintaining existing heterogeneity of land covers inside and outside the UDA.

7. **Maintain or Increase Population Size.** Species populations with larger numbers of individuals are known to be more stable in the long term, less vulnerable to adverse demographic effects caused by environmental stochasticity (probabilistic events such as floods, fires, and disease), and less vulnerable to extirpation (extermination), when compared to smaller populations. Larger populations tend to possess higher genetic diversity, which can reduce the chance of genetic bottlenecks, genetic drift, and inbreeding depression. Larger populations better cope with and/or adapt to changing environmental conditions and local stochastic effects due to their greater number of individuals and likely greater genetic heterogeneity. For narrowly distributed species such as the Orcutt grasses, all existing occurrences will be preserved to maintain existing population sizes. The Conservation Strategy includes establishment of large and interconnected habitat Preserves that will be actively managed to improve the quality and extent of habitat for all Covered Species populations.

8. **Maintain Species Distribution in the Plan Area.** Maintaining population distributions over a landscape may limit the effects of stochastic disturbances to localized sub-populations (e.g., local extirpations). If populations persist in areas that escaped the stochastic disturbance, they may serve as sources for natural recolonizations of suitable habitat formerly occupied by the extirpated population. Maintaining population distributions also helps assure preservation of the species' genetic diversity, which may provide inherent resilience that would allow the species to adapt to changing environmental conditions. The Conservation Strategy includes establishment of large and interconnected habitat preserves throughout the Plan Area that will be actively managed to maintain viable populations of Covered Species consistent with their existing distribution in the Plan Area.

These guiding principles provided the conceptual foundation for the development of the Biological Goals and Measurable Objectives described in Section 7.3. Although the SSHCP is not a state Natural Community Conservation Plan (NCCP), the guiding principles of the SSHCP Conservation Strategy are consistent with six requirements of the NCCP Act (Fish and Game code 2820 (a)(4)]): (1) conserve, restore, and provide for the management of representative natural and semi-natural landscapes; (2) establish preserves that provide conservation of covered species within the Plan Area and linkages to adjacent habitat outside the Plan Area; (3) protect and maintain habitat areas that are large enough to support sustainable populations of covered species; (4) incorporate in the preserves a range of environmental gradients and high habitat diversity to provide for shifting species distributions in response to changing circumstances; (5) sustain the effective movement and interchange of organisms between habitat areas; and (6) contribute to species recovery to help to delist the listed species and prevent the listing of non-listed species through the protection, restoration, and enhancement of natural communities and species habitat. Although species recovery is not a statutory requirement of habitat conservation plans (HCPs), the SSHCP will provide additional habitat conservation for some amphibian, reptile, bird, and mammal Covered Species (beyond that required to mitigate impacts of Covered Activities, and the Conservation Strategy will conserve all Covered Species in the Plan Area. Further, the U.S. Fish and Wildlife Service (USFWS) recognizes that HCPs may present opportunities to conserve species habitat and meet the rationales for the species-specific recovery criteria (see Section 7.6.2.1).

7.2 Information Relevant to Conservation Strategy Development

The SSHCP Conservation Strategy was developed using a compilation of the best available scientific information, including the following:

- **Mapping of Land Covers within the Plan Area** – Color and black and white aerial photographs of the Plan Area spanning several years were reviewed and interpreted to identify the types and extent of Plan Area land covers (Section 3.2).

- **Existing Conditions of Species and Habitat at the Time of Plan Preparation** – The existing condition of the natural resources in the Plan Area (e.g., species occurrence data, topographic data, hydrologic unit code (HUC) 10 watersheds, soil types, existing preserves) was compiled, species accounts were developed for potential Covered Species (Appendix B), and SSHCP land cover types/natural communities were defined and described (Chapter 3). A vernal pool density analysis was conducted (Dittes et al. 2007). In 2014 and 2015, light detection and ranging (LIDAR) technology was used to further identify vernal pool complexes and define vernal pool micro-watersheds in the Plan Area (Section 3.2.3 and Appendix E).
- **Regional Threats and Environmental Stressors** – Stressors that might affect the persistence and population size of each Covered Species were considered when developing the Biological Goals and Measurable Objectives. Information in the most recent USFWS species 5-Year Reviews was used to identify threats and stressors for each federally listed Covered Species. Some of these threats are common across the range of each species (e.g., loss of vernal pools due to land conversion) and some are more Plan Area-specific (e.g., disturbance to particular creeks relied upon by giant gartersnake (*Thamnophis gigas*)). Biological Objectives (Table 7-1) were developed to completely avoid or to minimize the effects of these local stressors.
- **Recovery Plans and Reviews** – Existing conservation needs or management recommendations for covered species in state or federal recovery plans, federal 5-Year Reviews, or State Status Reviews, including the following:
    - *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005a), which describes conservation measures for most of the vernal pool plant and animal species that are Covered Species under the SSHCP
    - *Draft Recovery Plan for the Giant Garter Snake* (Thamnophis gigas) (USFWS 1999a)
    - *Valley Elderberry Longhorn Beetle Recovery Plan* (USFWS 1984)
    - Most recent USFWS 5-Year Reviews of each federally listed Covered Species:
        - *Slender Orcutt Grass (*Orcuttia tenuis*) 5-Year Review: Summary and Evaluation* (USFWS 2009)
        - *Orcuttia viscida (*Sacramento Orcutt Grass*) 5-Year Review: Summary and Evaluation* (USFWS 2008)
        - *California Tiger Salamander Central California Distinct Population Segment (*Ambystoma californiense*) 5-Year Review: Summary and Evaluation* (USFWS 2014)
        - *Giant Garter Snake* (Thamnophis gigas) *5-Year Review: Summary and Evaluation* (USFWS 2006a)

- *Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*) 5-Year Review: Summary and Evaluation* (USFWS 2006b)
- *Vernal Pool Fairy Shrimp* (Branchinecta lynchi) *5-Year Review: Summary and Evaluation* (USFWS 2007a)
- *Vernal Pool Tadpole Shrimp* (Lepidurus packardi) *5-Year Review: Summary and Evaluation* (USFWS 2007b)

o *Status Assessment and Conservation Plan for the Western Burrowing Owl in the United States* (USFWS 2003)

o *A Status Review of the California Tiger Salamander* (Ambystoma californiense) (CDFG 2010).

As applicable, recovery needs for this region identified in the recovery plans and reviews informed and are incorporated into the SSHCP Conservation Strategy. Some of the Biological Goals and Measurable Objectives listed in Table 7-1 directly reflect recovery needs, such as Objective VP1, which requires preservation within or adjacent to the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Recovery Area.

- **Critical Habitat** – The Plan Area contains designated Critical Habitat for four federally listed vernal pool plants and animals (i.e., vernal pool tadpole shrimp, vernal pool fairy shrimp, Sacramento Orcutt grass, and slender Orcutt grass), as well as designated Critical Habitat for the federally listed California tiger salamander (USFWS 2005b). This Critical Habitat was identified as a priority for preservation, so Measurable Objectives were established that require preservation of a particular acreage of each Critical Habitat Unit (CHU) within the Plan Area.

Each of these elements was incorporated into an SSHCP geographic information system (GIS) database (Section 7.2.1) that was used to develop the SSHCP Biological Goals and Measurable Objectives (Section 7.3) and to inform the SSHCP Preserve System (Sections 7.4 and 7.5).

7.2.1 SSHCP GIS Database

Based on the best available scientific information identified above, the Plan Permittees developed a GIS spatial database including, but not limited to, maps of the following parameters:

- SSHCP land cover types for the Plan Area
- Preserve Planning Unit boundaries (see Section 7.2.1.1)
- Modeled habitat for each Covered Species, including high-value habitat (see Section 3.4)
- Infrastructure and urban development Covered Activity project footprints

- Areas of planned urban development in the UDA
- Existing preserves
- USFWS-designated Critical Habitat
- USFWS-designated Core Recovery Areas
- Watersheds, including large HUC-10 watersheds, and small micro-watersheds for individual vernal pools mapped by LIDAR technology (see Appendix E).

This GIS spatial database was used by the Plan Permittees to develop a Conservation Strategy, including Biological Goals and Measurable Objectives (Section 7.3), and to inform the Preserve System (Sections 7.4 and 7.5).

7.2.1.1 Plan Area Subdivisions

To assist with development of an adequate SSHCP Conservation Strategy, the Plan Area was further divided into eight Preserve Planning Units (PPUs) that encompass areas where important Covered Species resources are present and where habitat preservation would occur (see Figure 1-1). These eight SSHCP PPUs are geographic subdivisions of the Plan Area and were delineated to ensure that adequate Biological Goals and Measurable Objectives (Section 7.3) would be developed for biological resources in all parts of the Plan Area, including the location and implementation of the Preserve System.

PPUs were delineated to capture specific habitat or agricultural land cover types or areas identified as being important for a specific suite of species. For instance, PPU 7, which is located in the southeastern portion of the Plan Area, was delineated to encompass the vast majority of Valley Grassland in the Vernal Pool Ecosystem remaining in the County. PPU 7 also contains the designated Cosumnes/Rancho-Seco Core Recovery Area (USFWS 2005a). PPU 2 contains the designated Mather Core Recovery Area (USFWS 2005a). PPU 6, located in the southwestern portion of the Plan Area, was delineated to encompass a vast majority of agricultural land cover types that provide foraging habitat for many covered raptor species. Although geopolitical or physical landmarks were used to delineate some PPU boundaries, this was done for ease of mapping and to make locating PPU boundaries in the field easier.

PPUs 1 through 4 and PPU 8 are within the UDA. However, a small portion of PPU 1 (2,156 acres near the County landfill) is located outside of the UDA. PPUs 5, 6, and 7 are outside the UDA.

A portion of the Plan Area in the middle of the UDA (14,085 acres) and a small portion of the area outside of the UDA in the extreme northeastern portion of the Plan Area (9,245 acres) are not within a PPU (see Figure 1-1). These areas are not within a PPU as there are no resources identified for protection in these locations. A complete description of each PPU, including

species occurrences and land cover types within each PPU, can be found in Chapter 3, Biological Resources Setting. Section 7.5 describes the Conservation Strategy for each PPU.

7.2.1.2 SSHCP Covered Species Models

As described in Section 3.4, suitable Covered Species habitat within the Plan Area was modeled and then mapped for each Covered Species. Areas of modeled habitat for each Covered Species were used to guide development of Measurable Objectives.

Modeled habitat mapped for western pond turtle (*Actinemys marmorata*), giant gartersnake, Swainson's hawk (*Buteo swainsoni*), and greater sandhill crane (*Grus canadensis*) also include areas of "high-value habitat" for those species. High-value habitat is defined as an area/location of the Covered Species modeled habitat (Section 3.4) that is highly suitable for one or more biological needs of the Covered Species (e.g., nesting, roosting, or foraging). The habitat value of a particular area was determined by the Permittees, Wildlife Agencies, and species experts during their reviews of the best available information (summarized in Chapter 3 and the species accounts in Appendix B), information used to define and delineate Covered Species modeled habitat, and other factors, such as proximity to water sources, distance from development, and other relevant Plan Area factors.

7.2.2 SSHCP Preserve Categories

The SSHCP Permittees have identified seven categories of Preserves to help the SSHCP Conservation Strategy conform with the SSHCP mission statement (Section 1.1.1), and the SSHCP guiding principles (Section 7.1), and meet the Biological Goals and Measurable Objectives for the operating SSHCP (Section 7.3.2):

- **Landscape Preserve:** Preserves that are at least 10,500 acres in size and containing extensive areas of contiguous natural land covers where natural ecological functions can continue to operate, typically without extensive land management activities. Because existing development has already fragmented much of the remaining habitat within the UDA, the Landscape Preserve will be located outside the UDA.
- **Core Preserve:** Preserves that are at least 800 acres in size and contain extensive areas of contiguous habitat. Most Core Preserves will be located within the UDA.
- **Minor Preserve:** Preserves that are between 250 and 800 acres in size that contain populations that are important to the viability of a Covered Species, have unusually high biological diversity, and/or have a high concentration of sensitive biological resources. Minor Preserves will be required to connect to existing preserves and/or to the new SSHCP Core Preserves via Linkage Preserves. Most Minor Preserves will be located within the UDA.

- **Satellite Preserve:** Preserves that are smaller than Core and Minor Preserves (i.e., less than 250 acres), but contain populations that are important to the viability of a Covered Species in the Plan Area or have a particularly high concentration of sensitive biological resources. Satellite Preserves may not have the biological diversity of Core and Minor Preserves and may or may not be connected to other Preserves by habitat linkages due to other planning constraints (e.g., existing development, highly parcelized areas). Most Satellite Preserves will be located within the UDA.
- **Linkage Preserve:** Preserves that are generally more linear-shaped landscape features that connect large habitat blocks (e.g., Core and Minor Preserves) and are designed to provide for dispersal and movement of species between Preserve areas. Linkage Preserves have a minimum width of 600 feet.
- **Wildlife Movement Corridor:** There will be a minimum of two Wildlife Movement Corridors. The Laguna Creek Wildlife Movement Corridor is an important landscape feature in the Plan Area and will be an important component of the Preserve System for maintaining movement and resident habitat for wildlife, preserving riparian habitat, and maintaining hydrologic connections between preserves inside the UDA. Outside the UDA, the Cosumnes River/Deer Creek Wildlife Movement Corridor will serve a similar function.
- **Cropland Preserve:** Preserves consisting of existing agricultural lands mostly in PPU 6 that have been identified as uniquely important foraging and roosting habitat in the Plan Area for some Covered Species, including Swainson's hawk, white-tailed kite (*Elanus leucurus*), and greater sandhill crane. Cropland Preserves can be any acreage or shape.

In addition to these seven main Preserve categories, 500 acres of "flexible" Preserve are included in the SSHCP Conservation Strategy to assure that the operational Preserve System is providing the conservation benefits to the Vernal Pool Ecosystem within the Mather Core Recovery Area anticipated at the time of SSHCP preparation. Flexible Preserves can be of any SSHCP Preserve size category (Core, Minor, Satellite, Linkage) but must be within 1 mile of the Mather Core Recovery Area in PPUs 1, 2, or 3; and adjacent to a SSHCP Preserve or existing preserve. The 500 acres of Flexible Preserve is primarily intended to preserve existing Vernal Pool Ecosystem, but Flexible Preserve can also be used to preserve areas that previously supported vernal pools that can be used for vernal pool re-establishment/establishment. If Flexible Preserve is being used for re-establishment or establishment of vernal pools, the Flexible Preserve site must meet the requirements of AMM RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool) in Section 5.4. Flexible Preserves will complement the SSHCP Preserve System (Section 7.5) to ensure the Implementing Entity can meet all of the Biological Goals and Measurable Objectives for conservation of vernal pool species.

7.3 Biological Goals and Measurable Objectives

Biological Goals provide the broad guiding principles of an HCP's operating conservation strategy and are required to be included in all HCPs (USFWS and NOAA 2000). For more complex HCPs such as the SSHCP, Measurable Objectives are used to "step down" a Biological Goal to smaller, more understandable and directly measurable units. Measurable Objectives can be described as a condition to be met or a change to be achieved relative to the existing condition (USFWS and NOAA 2000). Measurable Objectives should include all of the following: species or habitat indicator, location, an action, a quantity/state, and the timeframe needed to meet the objective. Measurable Objectives are quantitative; they clearly state a desired result and will collectively achieve the Biological Goal (USFWS and NOAA 2000).

7.3.1 Identification of SSHCP Biological Goals and Measurable Objectives

The SSHCP Biological Goals and Measurable Objectives were developed by the Plan Permittees at a series of meetings with Plan Permittee staff, local species experts and stakeholders, and biologists and species experts familiar with the Plan Area, and with assistance from USFWS, the California Department of Fish and Wildlife (CDFW), and the U.S. Army Corps of Engineers.

Development of the Conservation Strategy began with a review of the Plan Area's natural communities and species, as described in Section 7.2, including key existing threats and ecological and conservation needs of Plan Area species. The Permittees articulated the SSHCP mission statement (Section 1.1.1), defined the SSHCP land cover types (Section 3.2), identified appropriate SSHCP Covered Species (Section 1.2.4), defined Covered Species modeled habitats (Section 3.4) and articulated the guiding principles of the SSHCP Conservation Strategy (Section 7.1) to clarify the purpose and direction of the operating SSHCP Conservation Strategy.

Permittees then identified broad Biological Goals at three spatial scales: landscape-level, natural-community-level (SSHCP Land Covers), and Covered-Species-level. The Permittees formulated manageable and Measurable Objectives that specify the different components needed to achieve each SSHCP Biological Goal. Discussions and revisions of each SSHCP Biological Goal and each Measurable Objective were iterative, and continued until the Plan Permittees and all participants were satisfied that the Biological Goals and Measurable Objectives were consistent with the SSHCP mission statement and guiding principles, and clearly defined the desired outcome of the operating SSHCP Conservation Strategy.

Because of the size and complexity of the SSHCP, each Measurable Objective was further "stepped down" into smaller "Conservation Actions" that provide requirements for implementing the Measurable Objective within the operating Conservation Strategy. These Conservation Actions include tools, strategies, comprehensive programs, and actions to protect natural communities, habitats, and landscape-level processes that would achieve that Measurable Objective. Because they

"tier" from the Biological Goals and Measurable Objectives, the Conservation Actions also occur at the landscape-level, natural-community-level, and species-level.

7.3.2 SSHCP Biological Goals and Measurable Objectives

The Biological Goals for the SSHCP include goals pertaining to the Plan Area's landscape functions, the Plan Area's natural communities (i.e., SSHCP land cover types), and the Plan's Covered Species, as follows:

- **Biological Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.**

  The intent of Biological Goal 1 is to maintain the existing heterogeneity of natural land covers (and their associated geologic formations and landforms) present within the Plan Area, minimize habitat fragmentation, and maintain landscape ecosystem functions by establishing a system of large and interconnected preserves. Biological Goal 1 is a landscape-level Biological Goal.

- **Biological Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.**

  The intent of Biological Goal 2 is to avoid or minimize impacts of future Covered Activities on Plan Area aquatic resources and to ensure "no net loss" of aquatic resources and aquatic functions by preserving existing aquatic resources and by re-establishing or establishing aquatic resources within the Plan Area. Biological Goal 2 is a landscape-level Biological Goal.

- **Biological Goal 3. Preserve, re-establish, and establish natural land covers (including cropland and irrigated pasture-grassland) that provide habitat for Covered Species.**

  The intent of Biological Goal 3 is to ensure that adequate acreage of each SSHCP natural land cover remains in the Plan Area to provide necessary breeding, foraging, and/or sheltering habitat for the Covered Species and other Plan Area native species that are associated with that land cover type. Biological Goal 3 is a Natural-Community-level Biological Goal.

- **Biological Goal 4. Maintain or improve habitat value of natural land covers (including cropland and irrigated pasture-grassland) that are preserved within the Plan Area.**

  Biological Goal 4 provides appropriate management and monitoring of lands preserved by the SSHCP to ensure that natural communities remain functional in perpetuity for the

benefit of Covered Species and other Plan Area native species. Biological Goal 4 is a Natural-Community-level Biological Goal.

- **Biological Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.**

  The intent of Biological Goal 5 is to ensure that each Covered Species persists within the Plan Area in perpetuity, and that unoccupied but suitable habitat for each Covered Species is preserved or re-established to provide for future Covered Species population growth and dispersal. Biological Goal 5 is a species-level Biological Goal.

For some Covered Species, the landscape- and/or natural community-level Measurable Objectives will be sufficient to achieve the SSHCP's Biological Goal for that species. For example, preserving and managing large amounts of the Valley Grassland land cover type within the Vernal Pool Ecosystem (Objective VG1 under Biological Goal 3) will also maintain winter foraging habitat for ferruginous hawk (*Buteo regalis*) (Objective FH1 under Biological Goal 5). However, where portions of the Plan Area are critical for conserving a particular Covered Species, then the Permittees identified species-specific Measurable Objectives for those areas. For example, for giant gartersnake, specific Plan Area creeks will be protected under Objective GGS1 to achieve Biological Goal 5 for this species.

The SSHCP landscape-level, natural-community-level, and Covered Species-level Biological Goals and Measurable Objectives are listed and described in Table 7-1 and Section 7.6. For each Biological Goal, there is a set of Measurable Objectives and Conservation Actions to achieve that goal.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	
Objective L1. Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or establishes 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment, at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.	L1.1. The minimum land acquisition required under the SSHCP for natural land cover types is 33,796 acres. Additional minimum land acquisition requirements will apply to some conservation analysis zones and for aquatic land cover types, as described below. Actual acquisition of some land cover types will likely be greater than the combined minimum requirements because parcel boundaries typically do not follow ecological boundaries, and the boundaries of acquired parcels will include land cover types that are not specified by acquisition requirements (e.g., minor roads, aqueducts). In addition, qualitative requirements for habitat connectivity or for preservation of plant occurrences could require additional acreage. All SSHCP land acquisitions must be accomplished by Year 45 of the Permit Term to ensure that all Preserve lands have at least 5 years to be managed, enhanced, and monitored according to the terms of the SSHCP. This time period will enable the Permitting Agencies to closely monitor the final land acquisitions to ensure that the Implementing Entity will complete the land acquisition strategy and achieve the final Biological Goals and Objectives. Management of these lands, however, will occur in perpetuity. Refer to Objectives under Goal 3 for minimum preservation and re-establishment/establishment requirements for individual SSHCP natural land cover types. Re-establishment/establishment requirements are separate and distinct from preservation requirements and cannot overlap. Acquisitions of land below sea level are prohibited.
Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).	L2.1. The Implementing Entity will acquire lands to link SSHCP Preserves and existing preserves in the Plan Area via Linkage Preserves. Linkage Preserves will have a minimum width of 600 feet. The Implementing Entity will select Linkage Preserve sites considering the following criteria: • Connects SSHCP Preserves together or connects SSHCP Preserve to existing preserves. • Provides known connectivity for Covered Species and other native terrestrial species. • Includes Covered Species modeled habitat.
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	
Objective W1. Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.	W1.1. Implement Stream Setback requirements in the UDA pursuant to Table 5-1.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective W2. Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (Low-Impact Development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)	W2.1. Each Urban Development Covered Activity will implement LID AMMs in accordance with Section 5.4.
	W2.2. Each ground-disturbing Covered Activity will implement BMP measures (see Section 5.4).
	W2.3. Each urban development road construction and rural transportation Covered Activity will implement ROAD and BMP measures for road siting, design, pre-construction, construction, post-construction, and maintenance requirements (see Section 5.4).
Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams, as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.	W3.1. Implement AMMs STREAM-1, STREAM-2, STREAM-3, and STREAM-4.
Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).	W4.1. The Implementing Entity will select Preserve sites for Valley Grassland within the Vernal Pool Ecosystem considering certain criteria, including the following: • Known to include herbaceous native plant species. • Includes Covered Species modeled habitat. • Adjacent to currently preserved lands. • On parcels 20 acres or greater and/or occurring within a larger open space area.
	W4.2. The Implementing Entity will select Preserve sites for Vernal Pool and Swale habitat considering certain criteria including, the following: • Includes Covered Species modeled habitat. • Has naturally occurring high densities of vernal pools. • Has heterogeneity in vernal pool size, depth, and density. • Contains large or deep vernal pools. • Adjacent to currently preserved lands.

AGENDA ITEM 11.1
1046

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	• Contains a soil type that is not currently preserved in the Plan Area or is underrepresented in the Preserve System; • On parcels 20 acres or greater and/or occur in larger, open space areas. • Can be managed to enhance or restore natural Vernal Pool Ecosystem processes.
	W4.3. The Implementing Entity will select Preserve sites for Seasonal Wetland and Stream/Creek (VPIH) habitat considering certain criteria, including the following: • Links preserved vernal pools. • Includes Covered Species modeled habitat. • On parcels 20 acres or greater and/or occur in larger, open space areas.
	W4.4. The Implementing Entity will select Preserve sites for Freshwater Marsh considering certain criteria, including the following: • Includes Covered Species modeled habitat. • Can be managed to enhance or restore natural Freshwater Marsh ecosystem processes.
	W4.5. The Implementing Entity will select Preserve sites for Stream/Creek considering certain criteria, including the following: • Located in modeled habitat for aquatic Covered Species (particularly giant gartersnake and western pond turtle). • Proximity to the mouth of the stream/creek to benefit giant gartersnake and western pond turtle. • Adjacent to an existing preserve. • Water present during early spring through mid-fall (April through October). • Can be managed to enhance or restore natural Stream and Creek Ecosystem processes.
	W4.6. The Implementing Entity will select Preserve sites for Open Water considering certain criteria, including the following: • Includes Covered Species modeled habitat. • Can be managed to enhance or restore natural Open Water Ecosystem processes.
	W4.7. The Implementing Entity will select Preserve sites for Riparian land cover types considering certain criteria, including the following: • Includes Covered Species modeled habitat. • Located within 3 miles of foraging habitat for bird Covered Species that use Riparian habitat for nesting and/or roosting. • Closed canopy consisting of multiple vegetation layers and includes mature trees. • Large, relatively unfragmented, and connected to Valley Grassland and Agriculture areas. • Can be managed to enhance or restore Riparian land cover type ecosystem processes.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective W5. Ensure that aquatic resources are re-established and/or established at a minimum 1:1 ratio during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in this table (see Objectives VP2, VP5, SW2, FWM2, OW2, RIP2, and RIP4).	Refer to Conservation Actions VP2.1, VP5.1, SW2.1, FWM 2.1, OW2.1, RIP2.1, and RIP4.1.
Objective W6. Covered Activities will avoid a minimum of 20% of first and second order tributaries to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek in the UDA.	W6.1. Required avoidance will comply with requirements of AMM STREAM-3.
Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment will occur within the Morrison Creek Watershed.	Refer to Conservation Actions VP2.1, VP5.1, and FWM 2.1,
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture/Grassland) that provide habitat for Covered Species.	
Aquatic	
Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	VG1.1. Prioritize selection of Preserve sites for Valley Grassland prioritized based on the following criteria: • Located in Vernal Pool Ecosystem. • Known to support native herbaceous plants in uplands. • Adjacent to currently preserved lands. • On parcels 20 acres or greater and/or occurring within larger open space area. • Management could enhance natural ecosystem processes of the Vernal Pool landscape.
Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area.	VP1a.1. Prioritize selection of Preserve sites for vernal pools based on the following criteria: • Includes modeled habitat for vernal pool Covered Species. • Ecosystem functions of the uplands, micro-watersheds, and perched aquifer surrounding the vernal pools are undisturbed.

AGENDA ITEM 11.1
1048

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	• Adjacent to currently preserved lands. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Can be managed to maintain natural Vernal Pool Ecosystem processes. • Depending on what is already preserved in the Plan Area, prioritize either naturally occurring high-density vernal pool complexes or more isolated pools to ensure heterogeneity of spatial patterns and connectivity. • Depending on what is already preserved in the Plan Area, prioritize preservation of pools with each of the different landforms, geologic formations, floristic assemblages, and vernal pool sizes/depths. • Has available water for grazing animals on Preserves.
Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area.	VP1b.1 Prioritize selection of Preserve sites for vernal pools in Recovery Areas based on the following criteria: • Is within the Mather Core Recovery Area or Cosumnes/Rancho-Seco Recovery Area. • If not within the recovery areas, is within 1 mile of one of the two recovery areas. • Includes modeled habitat for vernal pool Covered Species. • Ecosystem functions of the uplands, micro-watersheds, and perched aquifer surrounding the vernal pools are undisturbed. • Adjacent to currently preserved lands. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Can be managed to maintain natural Vernal Pool Ecosystem processes. • Depending on what is already preserved in the Plan Area, prioritize either naturally occurring high-density vernal pool complexes or more isolated pools to ensure heterogeneity of spatial patterns and connectivity. • Depending on what is already preserved in the Plan Area, prioritize preservation of pools with each of the different landforms, geologic formations, floristic assemblages, and vernal pool sizes/depths. • Has available water for grazing animals on Preserves.
Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area.	VP2.1. Implement vernal pool re-establishment and establishment consistent with the requirements of AMM RE-ESTABLISHMENT/ESTABLISHMENT-1 and -2. Adhere to specific protocols, described in detail in Appendix D of the Aquatic Resources Program, and outlined in 33 CFR Part 325 Sections 332.4(c)(2) through (c)(14) of the USACE's Mitigation Rule.
Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in this table and in	VP3.1. Prioritize selection of Preserve sites for Swale or Stream/Creek (Vernal Pool Invertebrate Habitat (VPIH)), based on the following criteria: • Located in Vernal Pool Ecosystem. • Links existing preserved Vernal Pool areas.

AGENDA ITEM 11.1

1049

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
accordance with Section 7.5.	• Includes Covered Species modeled habitat. • On parcels 20 acres or greater and/or occurs in larger, open space areas.
Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	VP4.1. Prioritize selection of Preserve sites for Swale or Stream/Creek (VPIH) based on the following criteria: • Located in Vernal Pool Ecosystem. • Swale preservation is preferred over preservation of Stream/Creek (VPIH). • Links existing preserved Vernal Pool areas. • Includes Covered Species modeled habitat. • On parcels 20 acres or greater and/or occurs in larger, open space areas.
Objective VP5. Re-establish and/or establish a minimum of 256 acres of Swale or vernal pool for impacts to the Swale and Stream/Creek (VPIH) land covers. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.	VP5.1. Prioritize selection of re-establishment/establishment sites for Swale based on the following criteria: • Located in Vernal Pool Ecosystem. • Links existing preserved Vernal Pool areas • Includes Covered Species modeled habitat. • On parcels 20 acres or greater and/or occurs in larger, open space areas.
Objective VP6. Re-establish and/or establish a minimum of 300 acres of functional Vernal Pool Ecosystem within or adjacent to (within 1 mile of) the Mather Core Recovery Area.	VP2.1. Implement vernal pool re-establishment and establishment consistent with the requirements of AMM RE-ESTABLISHMENT/ESTABLISHMENT-1 and -2. Adhere to specific protocols, described in detail in Appendix D of the Aquatic Resources Program, and outlined in 33 CFR Part 325 Sections 332.4(c)(2) through (c)(14) of the USACE's Mitigation Rule.
Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	SW1.1. Prioritize selection of Preserve sites for Seasonal Wetland based on the following criteria: • Includes Covered Species modeled habitat. • On parcels 20 acres or greater and/or occurs in larger, open space areas, to the maximum extent feasible.
Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.	SW2.1. Prioritize selection of re-establishment and/or establishment sites for Seasonal Wetland based on the following criteria: • Links existing preserved areas of Seasonal Wetland or other aquatic land cover types that provide modeled species habitat. • On parcels 20 acres or greater and/or occurs in larger, open space areas, to the maximum extent feasible. • Supports soils and topography modeled for re-establishing and/or establishing Seasonal Wetland.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	FWM1.1. Prioritize selection of Preserve sites for Freshwater Marsh based on the following criteria: • Includes Covered Species modeled habitat. • Currently exhibits hydrology sufficient to support perennial Freshwater Marsh habitat. • Currently supports emergent vegetation such as tules and cattails.
Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.	FWM2.1. Prioritize selection of re-establishment and/or establishment sites for Freshwater Marsh based on the following criteria: • Historically supported Freshwater Marsh habitat. • Has soils and topography consistent with the Freshwater Marsh land cover type modeled for re-establishment and/or establishment of Freshwater Marsh. • Site links existing preserve areas of Freshwater Marsh other aquatic land cover types that provide modeled species habitat. • After re-establishment and/or establishment, would provide Covered Species modeled habitat. • Has hydrology sufficient to support perennial Freshwater Marsh habitat or a water source to re-establish historical hydrology of the site.
Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	SC1.1. Prioritize selection of Preserve sites for Stream/Creek based on the following criteria: • Potential to support Covered Species (particularly giant gartersnake and western pond turtle). • Proximity to the mouth of the stream/creek. • Adjacent to an existing preserve. • Water present during early spring through mid-fall (April through October). • Management can be used to enhance natural stream and creek ecosystem processes.
Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.	SC2.1. Prioritize selection of re-establishment and/or establishment sites for Stream/Creek based on the following criteria: • Potential to support Covered Species (particularly giant gartersnake and western pond turtle). • Site links existing preserve areas of Aquatic land cover types that provide modeled species habitat. • Proximity to the mouth of the stream/creek. • Adjacent to an existing preserve. • Water present during early spring through mid-fall (April through October). • Management can be used to enhance natural stream and creek ecosystem processes.
Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of	OW1.1. Prioritize selection of Preserve sites for Open Water based on the following criteria: • Includes Covered Species modeled habitat. • Site links existing preserved land cover types that provide modeled species habitat.

AGENDA ITEM 11.1
1051

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Open Water, as determined by the Technical Advisory Committee (TAC)). The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	• Management can be used to enhance or restore natural ecosystem processes.
Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.	• OW2.1. Prioritize selection of re-establishment and/or establishment sites for Open Water based on the following criteria: Site links existing preserve areas of Aquatic land cover that provide Covered Species modeled habitat. • Management can be used to enhance or restore natural ecosystem processes.
Objective RIP1. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	RIP1.1. Prioritize selection of Preserve sites for Mixed Riparian Woodland or Mixed Riparian Scrub based on the following criteria: • Includes Covered Species modeled habitat. • Located within 3 miles of foraging habitat for Covered Species that use Riparian habitat for nesting and/or roosting. • Closed canopy consisting of multiple vegetation layers and includes mature trees. • Large, relatively unfragmented and connected to Valley Grassland and Agriculture areas. • Management can be used to enhance or restore natural ecosystem processes.
Objective RIP2. Re-establish and/or establish a minimum of 591 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.	• RIP2.1. Prioritize selection of re-establishment and/or establishment sites for Mixed Riparian Woodland or Mixed Riparian Scrub based on the following criteria: Potential re-establishment/establishment sites will fill gaps between existing Mixed Riparian Woodland or Mixed Riparian Scrub land cover sites, or establish a link between existing Riparian Woodland or Mixed Riparian Scrub land cover sites. • Includes Covered Species modeled habitat. • Located within 3 miles of foraging habitat for Covered Species that use Riparian habitat for nesting and/or roosting. • Closed canopy consisting of multiple vegetation layers, including mature trees. • Large, unfragmented and connected to Valley Grassland and Agriculture areas. • Management can be used to enhance or restore natural ecosystem processes.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	• Re-establishment sites will be located along existing Riparian corridors where habitat likely existed in the past, such as areas along the Cosumnes River, Deer Creek, South Laguna Creek, Willow Slough, North Badger Creek, South Badger Creek, Deadman's Gulch, or Skunk Creek. • Re-establishment will avoid locations preserved or restored for giant gartersnake. • Establishment of riparian communities will avoid locations that historically did not support Riparian vegetation. • Establishment of Riparian communities will avoid any existing Vernal Pool landscapes. • Re-establishment will use the historical signature of Riparian communities and aim to restore the historical conditions. • Re-establishment and establishment sites will be located within an SSHCP Preserve. • Re-establishment and establishment sites will support soils and topography modeled for re-establishment and/or establishment of Riparian communities. • Re-established and established Riparian communities will be designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat.
Terrestrial	
Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	BOW1.1. Prioritize selection of Preserve sites for Blue Oak Woodland/Savanna that expand on or link to the Deer Creek Hills Preserve to the maximum extent feasible.
Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.	BOW2.1. Prioritize selection of re-establishment/establishment sites for Blue Oak Woodland/Savanna that will expand the existing Deer Creek Hills Preserve to the maximum extent feasible, or will establish a habitat link between a SSHCP preserve and the existing Deer Creek Hills Preserve. Any potential re-establishment/establishment sites will fill gaps between existing preserved Mixed Blue Oak Woodland or Blue Oak Savanna land covers, or would link existing preserved Blue Oak Woodland or Blue Oak Savanna land covers. Re-establishment is preferred over establishment.

AGENDA ITEM 11.1
1053

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	AG1.1. The Implementing Entity will select Preserve sites with existing agriculture land covers considering certain criteria, including the following: • Contains margins that support suitable nesting trees and/or could support plantings of additional trees and shrubs for future use as nesting or perching habitat and/or habitat for prey. • Contains soils identified in the Soil Survey of Sacramento County as highly productive. • Has existing irrigation system that is engineered to provide for crop production. • The site supports high prey densities for avian Covered Species or is capable of supporting crops that support high prey densities. • Management can be used to enhance or restore natural ecosystem processes.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture/Grassland) that are preserved within the Plan Area.	
Objective HAB1. Develop Preserve Management Plans for the benefit of Covered Species.	HAB1.1. Prepare a Preserve Management Plan for each Preserve within 1 year of acquisition. The Preserve Management Plans will identify Preserve-specific preservation objectives for Covered Species and habitats, and will be consistent with the Preserve System Management Program.
Objective HAB2. Assess whether SSHCP Preserves are being managed and maintained for the benefit of Covered Species.	HAB2.1. Individual Preserve Management Plans will be reviewed periodically (e.g., every 3–5 years) after development in coordination with the Preserve System Management Program. If Preserve sites are not meeting habitat success standards as determined by the TAC, modifications such as remedial actions (e.g., adaptive management) or other additional preservation actions (e.g., adding acreage) will be implemented.
Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing Initial Preserve Management Plan (PMP).	HAB 3.1. Implementing Entity will interview individuals that have been involved in management of acquired parcels, to the maximum extent feasible. This could include landowners, property managers, ranch managers, and any others with management responsibility. For parcels that are part of a group (e.g., a ranch), separate reports for each parcel need not be prepared, but any variation in management treatment between the component parcels should be noted. To the maximum extent feasible, interviews will be audio or video recorded and summarized in a memorandum. Those memoranda will be reviewed, and any relevant information should be included as appendices in the Initial and Individual Preserve Management Plan. Preserve Managers will not change the management approach from existing management without a sound scientific basis for the change.
Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. The program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.	HAB4.1. Include invasive plant and wildlife control strategies in all Preserve Management Plans. These strategies may include site-specific grazing regimes, controlled burning protocols, and mowing/mechanical maintenance guidelines consistent with native plant re-establishment needs, invasive plant and wildlife removal, and consideration of endemic plant and wildlife species population needs.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter)	HAB5.1. Include in Preserve Management Plans a requirement to regularly monitor noise and light intensity, frequency and quantity of trash, qualitative hydrology changes, and other issues along a transect from the boundary toward the interior. Preserve Managers will include this information in annual reports, noting any changes in these attributes over time. Quantitative monitoring for edge effects will occur on the same Preserves hosting permanent plots for vernal pool plants and invertebrate species, and will be timed to allow for correlational analysis between edge effects and species presence or abundance over the long term.
Objective HAB6. Collect weather data throughout Sacramento County to assist in developing status and trends and tracking climate change and data.	HAB6.1. During assembly of the SSHCP Preserve System, install weather stations at selected Preserves for fine-scale monitoring of climate trends and combine with data from existing weather stations to provide a comprehensive weather dataset. Preserves will be selected to receive weather stations based on gaps in geographic coverage of existing weather stations in Sacramento County.
Objective HAB7. Monitor vegetation biomass within Grassland land covers.	HAB7.1. During assembly of all non-agricultural Preserves (Valley Grassland, Blue Oak Savanna, Valley Grassland), measure vegetation biomass. Measurement will be by releve, residual dry matter (RDM), or similar technique. Technique selected will be used consistently across Preserves on an annual basis at the end of the growing season (i.e., September or October).
Objective AG2. Of the 9,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as corn, alfalfa, or wheat) preferred by tricolored blackbird (*Agelaius tricolor*), greater sandhill crane (*Grus canadensis*), and the Covered raptor species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.	AG2.1. Maintain a minimum of 2,000 acres as food plots that are planted with crops preferred by avian Covered Species as foraging habitat such as corn, alfalfa, or wheat. Food plots will be distributed throughout PPUs 4, 5, or 6 at a minimum of 10 different locations, none of which will be less than 20 acres.
Objective AG3. Maintain or increase raptor prey availability and improve raptor foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species.	AG3.1. Plant 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other small prey (e.g., amphibians, reptiles) within and on the borders of Cropland Preserves within PPUs 4, 5, and/or 6 to increase prey availability for Covered avian species. One hundred linear feet of hedgerow will be planted each year until 5,000 linear feet is established within the Plan Area. Planting of hedgerows can be delayed for up to 5 years after issuance of permits to allow time to acquire Preserves where hedgerows can be planted. At least 1,000 feet must be planted within 10 years after issuance of permits. Acceptable hedgerow plants include native trees, shrubs, and grasses as approved by the TAC. Hedgerows must grow to be at least 5 feet in width and must be located on upland areas not prone to inundation from normal irrigation practices. Hedgerows that fail to establish or succumb to disease or other causes will be replaced within 1 year of removal or failure. Providing refuge habitat for prey species adjacent to agricultural settings will allow areas that have been harvested or with temporarily reduced or eliminated populations of prey to re-establish more quickly.

AGENDA ITEM 11.1
1055

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective RIP5. Monitor groundwater table as it relates to status and trends for Riparian habitat.	RIP5.1. During assembly of the SSHCP Preserve System, identify parcels that have existing water wells. To the maximum extent feasible, obtain history of depth to groundwater table from property owners or managers. During assembly of the SSHCP Preserve System, take a reading of depth to groundwater at each existing well. Repeat measurement annually at a consistent time of year to allow comparison between years, and monitor any groundwater depletion or recharge.
	RIP5.2. During assembly of the SSHCP Preserve System, ensure availability of water for grazing animals on Preserves, Cropland Preserves, and habitat restoration.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	
Plant Covered Species	
Objective VPP1. Protect the one currently documented unpreserved occurrence of Ahart's dwarf rush in the Plan Area. Prior to take of any occurrence of Ahart's dwarf rush (*Juncus leiospermus*), protect six currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrences of Ahart's dwarf rush within the Plan Area. After six currently unpreserved occurrences are protected, prior to take of an occurrence of Ahart's dwarf rush, protect one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of Ahart's dwarf rush within the Plan Area.	VPP1.1. Conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when Ahart's dwarf rush are observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of Ahart's dwarf rush, identify one unprotected occurrence of the species and protect within a new minimum satellite-sized Preserve.
Objective VPP2. Prior to take of any occurrence of Boggs Lake hedge-hyssop (*Gratiola heterosepala*), protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the	VPP2.1. Conduct surveys in modeled habitat (and suitable habitat identified by the approved biologist at the time of the survey) during the appropriate time of year when Boggs Lake hedge-hyssop are observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of Boggs Lake hedge-hyssop, identify one unprotected occurrence of the species and protect within a new minimum satellite-sized Preserve.

[1] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
TAC) occurrence of Boggs Lake hedge-hyssop within the Plan Area.	
Objective VPP3. Prior to take of any occurrence of dwarf downingia (*Downingia pusilla*), protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrence of dwarf downingia within the Plan Area.	VPP3.1. Conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when dwarf downingia are observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of dwarf downingia, identify one unprotected occurrence of the species and protect within a new minimum satellite-sized Preserve.
Objective VPP4. Protect and maintain in perpetuity a minimum of 15 occurrences of legenere (*Legenere limosa*) within the SSHCP Preserve System. Legenere occurrences will be preserved in accordance with the Conservation Actions described in this table. Prior to take of any occurrence of legenere, one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of legenere will be preserved and maintained within the Plan Area.	VPP4.1. Preserve and maintain in perpetuity at least 15 occurrences of legenere within the SSHCP Preserve System. The 15 occurrences will be preserved accordingly: (1) Conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when legenere are observable. (2) If detected in an area proposed to be disturbed by a Covered Activity, prior to take of legenere, identify one unprotected occurrence of the species and protect within a new minimum satellite-sized Preserve. By this process, at least 15 legenere occurrences will be protected in the SSHCP Preserves by the end of the Permit Term.
Objective VPP5. Prior to take of any occurrence of pincushion navarretia (*Navarretia myersii* ssp. *myersii*), protect one currently unpreserved[2] and "biologically equivalent or superior" (as defined by the TAC) occurrence of pincushion navarretia within the Plan Area.	VPP5.1. Conduct surveys in modeled habitat (and suitable habitat identified by the approved biologist at the time of the survey) during the appropriate time of year when pincushion navarretia are observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of pincushion navarretia, identify one unprotected occurrence of the species and protect within a new minimum satellite-sized Preserve.
Objective VPP6. Protect and maintain in perpetuity all known currently unprotected	VPP6.1. Preserve and maintain in perpetuity all known occurrences of Sacramento Orcutt grass in the Plan Area. Prior to proposed disturbance of a site associated with a Covered Activity, conduct surveys in modeled habitat (and suitable habitat

[2] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

AGENDA ITEM 11.1
1057

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
occurrences of Sacramento Orcutt grass (*Orcuttia viscida*) in the Plan Area to preserve existing distribution, and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.	identified by the approved project biologist at the time of the survey) during the appropriate time of year when Sacramento Orcutt grass are observable. Over the Permit Term, all plant surveys will comply with CDFW's most recent Survey Protocols for Sensitive Plants. If a species is found, the project proponent will protect the occurrence within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. Surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence.
Objective VPP7. Protect and maintain in perpetuity all known currently unprotected occurrences of slender Orcutt grass in the Plan Area to preserve existing distribution, and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.	VPP7.1. Preserve and maintain in perpetuity all known occurrences of slender Orcutt grass in the Plan Area. Prior to proposed disturbance of a site associated with a Covered Activity, conduct surveys in modeled habitat (and suitable habitat identified by the approved project biologist at the time of the survey) during the appropriate time of year when slender Orcutt grass are observable. Over the Permit Term, all plant surveys will comply with CDFW's most recent Survey Protocols for Sensitive Plants. If the species is found, the project proponent will protect the occurrence within a minimum satellite-sized Preserve that encloses the entire vernal pool micro-watershed. Surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence.
Objective SA1. Prior to take of an occurrence of Sanford's arrowhead (*Sagittaria sanfordii*), protect one currently unpreserved[3] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Sanford's arrowhead within the Plan Area.	SA1.1. Conduct surveys in modeled habitat (and suitable habitat identified by the approved biologist at the time of the survey) during the appropriate time of year when Sanford's arrowhead are observable. If detected in an area proposed to be disturbed by a Covered Activity, prior to take of Sanford's arrowhead, identify one unprotected occurrence of the species and protect within a new minimum satellite-sized Preserve.
Objective SA2. During re-establishment and/or establishment of Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek, translocate impacted Sanford's arrowhead from other sites.	SA1.2. The Implementing Entity will select translocation sites for Sanford's arrowhead in emergent marsh vegetation, including the margins of rivers, streams, ponds, reservoirs, irrigation and drainage canals, ditches, and stock-ponds Freshwater Marsh considering certain criteria, including the following: • Known to support Sanford's arrowhead. • Proposed for re-establishment/establishment. • Area can be re-established to support Sanford's arrowhead populations and natural ecosystem processes.
Aquatic Animal Covered Species	
Objective VPI1. Protect and maintain in perpetuity 1,270 acres of Vernal Pool	VPI1.1. The Implementing Entity will select Preserve sites containing modeled habitat for vernal pool invertebrates considering certain criteria, including the following:

[3] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

AGENDA ITEM 11.1
1058

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
tadpole shrimp modeled aquatic habitat within the Plan Area to preserve existing distribution.	• Vernal pool complexes with known occurrences of Covered vernal pool invertebrates. • Represents diversity of vernal pool depth, size, density, geologic formations, and soil types within the Plan Area. • Vernal Pool habitats embedded in Valley Grassland within Vernal Wetland Acre/Density Index (VWADI) Category 1–3 land analysis units (LAUs) that provide high-quality Vernal Pool habitat. • Adjacency of other suitable habitat. • Modeled habitat within the USFWS Recovery Areas and Critical Habitat for vernal pool invertebrate species.
	VPI1.2. Preserve a minimum of 90% of the watershed of each preserved vernal pool and maintain a minimum 50-foot setback outside the Preserve boundary.
Objective VPI2. Protect and maintain in perpetuity 1,270 acres of Vernal Pool fairy shrimp (*Branchinecta lynchi*) modeled aquatic habitat within the Plan Area to preserve existing distribution.	See Conservation Actions VPI1.1 and VPI1.2.
Objective VPI3. Protect and maintain in perpetuity 1,059 acres of mid-valley fairy shrimp (*Branchinecta mesovallensis*) modeled aquatic habitat within the Plan Area to preserve existing distribution.	See Conservation Actions VPI1.1 and VPI1.2.
Objective VPI4. Protect and maintain in perpetuity 1,245 acres of Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i) modeled aquatic habitat within the Plan Area to preserve existing distribution.	See Conservation Actions VPI1.1 and VPI1.2.
Objective VPI5. Ensure that during implementation of Objective VP2, re-established or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/ establishment in accordance with the Conservation Actions in this table.	Implement vernal pool re-establishment and establishment consistent with the requirements of AMM RE-ESTABLISHMENT/ ESTABLISHMENT-1 and -2.

AGENDA ITEM 11.1
1059

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective CTS1. Preserve at least five occupied California tiger salamander breeding ponds.	CTS1.1. The Implementing Entity will select breeding ponds for preservation considering certain criteria, including the following: • Located within USFWS Critical Habitat. • Surveys indicate active use of breeding pond within each of prior 3 years. • Breeding pond can sustain inundation for a minimum of 70 days during an average rainfall year. • Surrounding uplands no more than 0.5 mile away contain Blue Oak Savanna, Blue Oak Woodland, and Valley Grassland with adequate burrows and refugia sites. • Predatory fish and bullfrogs (*Rana catesbeiana*) are absent.
Objective CTS2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for California tiger salamander is preserved. Minimum preservation will total • 141 acres of aquatic habitat and • 1,677 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within California tiger salamander Critical Habitat occurs within California tiger salamander Critical Habitat (see Objectives BOW1, VP1, SW1, and VG1).	CTS2.1. Preserve California tiger salamander aquatic habitat (Vernal Pool and Seasonal Wetland). The Implementing Entity will select Preserve sites considering certain criteria, including the following: • Modeled habitat within USFWS Critical Habitat. • Contain modeled wetlands and surrounding uplands no more than 0.5 mile from aquatic habitat. • Wetlands must be able to sustain inundation for a minimum of 70 days during an average rainfall year. • Permanent impoundments are appropriate as long as predatory fish and bullfrogs are absent.
	CTS2.2. Preserve California tiger salamander upland habitat (Blue Oak Woodland, Blue Oak Savanna, and Valley Grassland). The Implementing Entity will select Preserve sites considering certain criteria, including the following: • Modeled habitat within USFWS Critical Habitat. • Contains Blue Oak Savanna, Blue Oak Woodland, and Valley Grassland no more than 0.5 mile from known breeding pond. • Contains burrows that are dry during the summer and fall months in Open Grassland or under isolated oaks. • Supports fossorial mammals to create upland burrows. • Within 1.5 miles of Vernal Pool and Seasonal Wetland that are considered Aquatic habitat.
	CTS2.3. Preserve California tiger salamander aquatic or upland habitat at a ratio of 1 acre for every 1 acre that is lost (1:1) within PPU 7. Conduct surveys after the first year and every 5 years thereafter to monitor occupancy of habitat.
Objective CTS3. Rural transportation project Covered Activities within California tiger salamander modeled habitat will be designed to allow California tiger salamander movement across the roadway area.	CTS3.1. The Implementing Entity will retain an approved biologist to prepare targeted species mobility studies to determine if California tiger salamander mobility between breeding ponds or between breeding ponds and upland refugia will be affected by rural transportation Covered Activities within California tiger salamander modeled habitat. Data relevant to determining California tiger salamander movement must be collected for at least 3 years, and the study will be updated through new data collection and consultation with USFWS and CDFW every 10 years. The mobility study methodology will be prepared in consultation with USFWS and CDFW, and will need approval from USFWS and CDFW prior to implementation. The data will be used by the project proponent to select the most appropriate design requirements to maintain and facilitate California tiger salamander movement. Modeled habitat near each of the following roadways will be the subject of targeted species mobility studies for California tiger

AGENDA ITEM 11.1
1060

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	salamander: • Twin Cities Road east of State Route 99 • Ione Road within PPU 7 • Clay Station Road from Dillard Road south to Sacramento County line with San Joaquin County (Plan Area boundary) After construction is complete, California tiger salamander movement across and along the road will be monitored to assess how their movement changed in response to the project, and if additional design considerations will be used as future projects are implemented along the roadway.
Objective WS1. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for western spadefoot (*Spea hammondii*) is preserved. Minimum preservation will total: • 1,531 acres of aquatic habitat and • 22,044 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within the Mather Core or Cosumnes/Rancho-Seco Core Recovery Areas occurs within the Core Recovery Areas (see Objectives BOW1, VP1, VP3, SW1, SC1, OW1, and VG1).	WS1.1. The Implementing Entity will select Preserve sites for aquatic and adjacent upland habitat considering certain criteria, including the following: • Habitat is located in the Mather Core or Cosumnes/Rancho-Seco Core Recovery Areas. • Aquatic habitat will include temporary pools and drainages. • Quiet streams that form following winter or spring rains. • Upland habitat surrounding aquatic breeding sites. • Friable soils suitable for burrow creation. • Soils maintain some degree of moisture. • Located away from areas that are subject to vibrations that simulate rainfall such as roadways with heavy traffic.
Objective WS2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic habitat for western spadefoot is re-established and/or established. Minimum re-establishment and/or establishment will total 906 acres of aquatic habitat. Ensure that mitigation for modeled high-value habitat impacted within the Mather Core or Cosumnes/Rancho-Seco Core Recovery Areas occurs within the Core	WS2.1. The Implementing Entity will select re-establishment and establishment sites considering certain criteria, including the following: • Habitat is located in the Mather Core or Cosumnes/Rancho-Seco Core Recovery Areas. • Aquatic habitat will include temporary pools and drainages. • Quiet streams that form following winter or spring rains. • Upland habitat available no more than 500 feet away from preserved aquatic habitat. • Friable soils suitable for burrow creation. • Soils maintain some degree of moisture. • Site links existing natural land covers that provide Covered Species modeled habitat.

AGENDA ITEM 11.1
1061

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Recovery Areas (see Objectives VP2, SW2, and OW2).	• Located away from areas that are subject to vibrations that simulate rainfall such as roadways with heavy traffic. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment/establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective GGS1. During assembly of the SSHCP Preserve System, ensure that modeled habitats for giant gartersnake are preserved along the following creeks (or other creeks that are determined by the TAC to provide similar giant gartersnake habitat value): • Lower Laguna Creek, mainly between Twin Cities Road (State Route 104) and Miess Road; • Skunk Creek, which flows into the Cosumnes River northwest of the City of Galt; • the short Willow Creek and tributaries of Badger Creek, which are to the north of the lower Laguna Creek and west of the Folsom South Canal; and • Badger Marsh. Mitigation for impacts to modeled habitats for giant gartersnake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum preservation will total • 170 acres of giant gartersnake high-value aquatic habitat and • 2,323 acres of giant gartersnake high-value upland habitat. (See Objectives AG1, FWM1, SW1, SC1, OW1, RIP1, RIP3, and VG1.)	GGS1.1. The Implementing Entity will select Preserve sites for aquatic modeled habitat considering certain criteria, including the following: • Stream/Creek, Freshwater Marsh, Open Water, and Seasonal Wetland located entirely inside or within 0.25 mile of the following reaches: ○ A prominent drainageway on the Elliot mitigation site, which links to Stone Lakes National Wildlife Refuge (NWR) and is wet year-round. ○ Drainage canals south of Elk Grove, which have a past occurrence and link to Stone Lakes NWR; the perennial segments of these canals are suitable habitat. ○ Badger Creek and all other creeks that drain into the marsh at the Cosumnes River Preserve, which are likely high-quality habitat due to proximity and connectivity to a significant population of giant gartersnakes; the perennial segments of these creeks are suitable habitat. ○ The perennial segments of Laguna Creek (south) and tributaries are suitable habitat due to presence of freshwater marsh habitat and proximity to known documented occurrences. ○ The perennial segments of drainages and canals leading from the Cosumnes River Preserve, including Deadman's Gulch, which provides suitable habitat. • Contains adequate water during the snake's active season (early spring through mid-fall) to provide food and cover. • Emergent, herbaceous wetland vegetation for escape cover and foraging habitat during the active season. • Grassy banks and openings in waterside vegetation for basking.
	GGS1.2. The Implementing Entity will select Preserve sites with stream reaches that contain upland modeled habitat within 200 feet of the stream, including Mixed Riparian Scrub and Valley Grassland, considering the following criteria: • A stream reach at least 600 feet in length. • Near foraging and breeding habitat. • Support higher-elevation uplands for cover. • Provide refuge from flood waters during the snake's dormant season in the winter. • Upland habitat can link isolated and disjunct giant gartersnake aquatic habitat. • A minimum 300-foot setback on at least one side of stream reaches.

AGENDA ITEM 11.1
1062

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective GGS2. During assembly of the SSHCP Preserve System, ensure that modeled habitats for giant gartersnake are re-established and/or established along the following creeks (or other creeks that are determined by the TAC to provide similar habitat value): • Lower Laguna Creek, mainly between Twin Cities Road (State Route 104) and Miess Road; • Skunk Creek: this creek flows into the Cosumnes River northwest of the City of Galt; • north of Lower Laguna Creek and west of the Folsom South Canal are several small creeks—the short Willow Creek and tributaries of Badger Creek; and • Badger Marsh. Mitigation for impacts to modeled habitats for giant gartersnake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum re-establishment and/or establishment will total • 170 acres of high-value aquatic habitat and • 134 acres of high-value upland habitat. (See Objectives SW2, OW2, RIP2, and RIP4.)	GGS2.1. The Implementing Entity will select re-establishment and establishment sites for aquatic habitat that include Freshwater Marsh, Open Water, Stream/Creek, and Seasonal Wetland considering the following criteria: • Contains a supply of perennial water that can maintain emergent vegetation. • Sites near (within 250 meters) the mouth of stream/creeks that are near potential upland habitat and adjacent to existing modeled upland habitat. • Sites can link isolated and disjunct giant gartersnake habitat. • Re-established sites located along those portions of a stream corridor that have been identified as Preserves for giant gartersnake that provide upland habitat modeled for aestivation and/or basking at intervals no greater than 600 feet. Giant gartersnake habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled habitat, defined by the following criteria: • Located in intervals along the stream channel that are no closer to one another than 300 feet. • At least 0.2 acre at any given location along the stream channel, but not to exceed 1 acre. • Provides perennial aquatic habitat. • Provides emergent vegetation (i.e., tules and/or cattails). • Provides grassy banks and openings in the waterside vegetation (e.g., bulrush, cattails, waterweed, or other floating vegetation). • Supports soils and topography modeled for re-establishing target habitat. • Designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat. • Provides a minimum 300-foot setback on at least one side of re-established stream reaches. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment or establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment/establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
	GGS2.2. The Implementing Entity will select re-establishment or establishment sites for aquatic habitat that include Mixed Riparian Scrub and Valley Grassland considering the following criteria: • Directly connected to (and within 0.25 mile of) aquatic habitat. • Higher elevation uplands to provide refuge from flood waters during the snake's dormant season in the winter. • Sites can link isolated and disjunct giant gartersnake habitat. • Re-established sites located along those portions of a stream corridor that have been identified as Preserves for giant gartersnake that provide upland habitat modeled for aestivation and/or nesting. Giant gartersnake habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled

AGENDA ITEM 11.1
1063

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	habitat, defined by the following criteria: • Supports soils and topography modeled for restoring target habitat. • Designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the re-established or established habitat is not meeting re-establishment or establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment or establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective GGS3. Plan Permittees will conduct a study to establish hydrologic baseline conditions along Badger Creek to identify what level of hydrology is necessary to support giant gartersnake and acquire a water source to maintain the minimum level of hydrology during the summer months when agricultural runoff may wane.	GGS3.1. Measure hydrologic parameters (e.g., flow rate, temperature) within Badger Creek in locations known to be occupied by giant gartersnake. Three monthly hydrologic measurements will be made during the dry season of an average or better rainfall year. Each recording will occur over a full week to identify any regular interruptions in flow or changes in conditions due to diversions or inflows.
	GGS3.2. Acquire water rights adequate to maintain baseline dry season flows within Badger Creek, as determined during measurements obtained pursuant to Conservation Action GGS3.1.
Objective WPT1. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for western pond turtle (*Actinemys marmorata*) is preserved. Minimum preservation will total • 315.35 acres of aquatic habitat and • 10,971 acres of upland habitat. (See Objectives FWM1, OW1, RIP1, RIP3, VG1, BOW1, and SC1.)	WPT1.1. The Implementing Entity will select Preserve sites for aquatic habitat, including Freshwater Marsh, Open Water, and Stream/Creek considering the following criteria: • Contains slow-moving or quiet water with emergent aquatic vegetation and deep pools with undercut banks for refugia. • Contains basking sites such as rocks, logs, matted floating vegetation, terrestrial islands within the aquatic habitat, and human-made debris. • Will allow a minimum 300-foot setback on at least one side of stream reaches that are preserved for western pond turtle. • Where a stream reach is at least 600 feet in length.
	WPT1.2. The Implementing Entity will select Preserve sites for upland habitat, including Blue Oak Savanna, Blue Oak Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland considering the following criteria: • Allows for a 400-foot setback along both sides of stream reaches identified for western pond turtle outside of the UDA. • Allows for a 300-foot corridor along each side of North Laguna Creek to the maximum extent feasible, as measured from the Ordinary High Water Mark (OHWM) of the creek, with a minimum stream corridor width of 600 feet plus the width of the creek, with additional setbacks as defined by local government ordinances. • In segments of Laguna Creek where a 300-foot corridor on one side of the creek is not possible due to existing development and constraints, 300 feet may be used as an average for a defined length of the creek. However, the corridor on either side of Laguna Creek will be a minimum of the mapped Federal Emergency Management Agency (FEMA) 100-year floodplain of 2014.

AGENDA ITEM 11.1
1064

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective WPT2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic habitat for western pond turtle is re-established and/or established. Minimum re-establishment and/or establishment will total 315 acres of aquatic habitat. (See Objectives RIP2, FWM2, and OW2.)	WPT2.1. The Implementing Entity will select re-establishment and/or establishment sites for foraging and breeding habitat that includes Freshwater Marsh, Open Water, and Stream/Creek considering the following criteria: • Contains slow-moving or quiet water with emergent aquatic vegetation and deep pools with undercut banks for refugia. • Contains or has high potential to create basking sites such as rocks, logs, matted floating vegetation, terrestrial islands within the aquatic habitat, and human-made debris. Western pond turtle aquatic habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled habitat, defined by the following criteria: • Located in intervals along the stream channel that are no closer to one another than 300 feet. • Establishment or re-establishment site within modeled habitat area at least 600 feet in length. • At least 0.2 acre at any given location along the stream channel but will not exceed 1 acre. • Provides perennial aquatic habitat. • Provides emergent vegetation (i.e., tules and/or cattails). • Provides grassy banks and openings in the waterside vegetation (e.g., bulrush, cattails, waterweed, or other floating vegetation). • Supports soils and topography modeled for restoring target habitat. • Designed and constructed to avoid or minimize direct or indirect impacts on existing functioning habitat. • Provides a minimum 300-foot setback on at least one side of restored stream reaches. • Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment/establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Terrestrial Invertebrate Covered Species	
Objective VELB1. Relocate or replace each impacted elderberry shrub (*Sambucus* spp.) according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999b). Mitigation will occur in locations that are not inundated for 2 continuous weeks, as determined by the TAC.	VELB1.1. Implement the following measures to avoid or minimize impacts to occupied valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) habitat: • Conduct protocol-level surveys for valley elderberry longhorn beetle if elderberry shrubs are located within 100 feet of construction activities. • Avoid direct impacts to occupied elderberry shrubs, defined as shrubs within 20 feet of construction. • Avoid indirect impacts of occupied elderberry shrubs, defined as shrubs between 20 and 100 feet of construction. • Compensate for direct loss of elderberry shrubs according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999b). • Conduct surveys after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	thereafter, the restored habitat is not meeting re-establishment criteria standards of 60% survivorship of occupied shrubs, the effort will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective VELB2. During implementation of Riparian habitat re-establishment and/or establishment, strategically include elderberry shrub in the planting palette (see Objectives RIP2 and RIP4).	VELB2.1. In Riparian habitat re-establishment and establishment sites that include modeled habitat for valley elderberry longhorn beetle (i.e., Mixed Riparian Woodland and Mixed Riparian Scrub or Valley Grassland with elderberry shrubs along a riparian corridor), include in plantings elderberry shrubs to create habitat characteristics associated with valley elderberry longhorn beetle occupancy. These characteristics include density of elderberry shrubs, shrub size, number of stems, and range of branch sizes (Talley et al. 2007).
Bird Covered Species	
Objective CH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 974 acres of modeled foraging and nesting habitat for Cooper's hawk (*Accipiter cooperii*) is preserved in accordance with the Conservation Actions described in this table (see Objectives RIP1, RIP3, and BOW1).	CH1.1. The Implementing Entity will select Preserve sites for nesting and foraging habitat considering certain criteria, including the following: • Blue oak woodland characterized by dense canopy closure (typically stands consisting of at least six trees with sparse ground cover). • Stands with trees approximately 26 to 49 feet high and 8 to 20 inches in diameter at breast height. • Proximity to foraging habitat with dense prey populations. • Located outside of the UDA.
Objective CH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 601 acres of modeled foraging and nesting habitat for Cooper's hawk is re-established and/or established (see Objectives RIP2 and RIP4).	CH2.1. Refer to Conservation Action RIP2.1. The Implementing Entity will select re-establishment or establishment sites for modeled foraging and nesting habitat considering certain criteria, including the following: • Near known nesting territories. • Connect disjunct segments of riparian habitats. • Proximity to modeled foraging areas with abundant prey populations. • Cooper's hawk Mixed Riparian Woodland and Mixed Riparian Scrub habitat establishment and re-establishment will occur only where a non-modeled land cover is converted to Mixed Riparian Woodland and Mixed Riparian Scrub. Establishment or re-establishment criteria for modeled Cooper's hawk habitat will also include the following: • Trees will be planted to encourage dense canopy closure of the mature stand. • Planting of 10 acorns for each tree to establish oak trees. • Survivorship of at least six trees pursuant to stand. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the established or re-established habitat is not meeting establishment or re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed establishment or re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective CH3. During assembly of the SSHCP Preserve System, ensure that a minimum of 38 acres of modeled foraging habitat for Cooper's hawk is preserved, in accordance with the Conservation Actions described in this table (see Objectives RIP1, RIP3, and BOW1).	CH3.1. The Implementing Entity will select Preserve sites for foraging habitat aquatic modeled habitat considering certain criteria, including the following: • Blue Oak Savannah containing trees approximately 26 to 49 feet high and 8 to 20 inches in diameter at breast height. • Presence of dense prey populations. • Located outside of the UDA.
Objective FH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 25,881 acres of modeled foraging habitat for ferruginous hawk is preserved, including 19,625 acres in PPUs 5 and/or 7 (see Objectives AG1, VG1, VP1, VP3, and SW1).	FH1.1. The Implementing Entity will select Preserve sites for foraging habitat considering certain criteria, including the following: • Known to already support populations of prey species, including rabbits, ground squirrels, and pocket gophers. • Moderate to dense vegetative cover (particularly grasses). • Topographic variation with shorter vegetation.
Objective FH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for ferruginous hawk is re-established and/or established (see Objectives VP2 and SW2).	FH2.1. The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Moderate to dense vegetative cover (particularly grasses). • Topographic variation with shorter vegetation.
Objective SH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 31,033 acres of modeled foraging habitat for Swainson's hawk is preserved (see Objectives AG1, AG2, SW1, VP1, VP3, and VG1). Ensure that mitigation for high-value modeled habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8.	SH1.1. The Implementing Entity will select Preserve sites that include foraging habitat considering certain criteria, including the following: • Presence of irrigation systems that are engineered to provide for alfalfa production. • Agricultural lands that have existing trees or could support plantings of additional trees for future use as Swainson's hawk nest trees. • Within 3 miles of active nest sites, where the record of the nest site is not older than 5 years, unless confirmed to be currently active by new surveys. • Proximity to large, contiguous area of open space that provides foraging habitat. • Proximity to stream riparian corridors containing large trees that potentially provide nesting habitat. • Preserves can include sites supporting vineyard and orchard as long as vines and trees are removed within 2 years of acquisition. • Preserves are not adjacent to wind energy facilities.
Objective SH2. At least 2,000 acres of cropland habitat within high-value habitat	SH2.1. Preserve 2,000 acres (1:1 ratio) of cropland habitat within 2 miles of at least two active nesting sites in fee title to ensure that intensive management actions can be taken that may be infeasible on Preserve easement lands. Land held in fee title will be

AGENDA ITEM 11.1
1067

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
within PPUs 4, 6, and 8 will be preserved in fee title to ensure that intensive management actions can be taken. Land held in fee title will be restricted to growing field or row crops. Fee title lands must maintain, at a minimum, an average of 50% of their crop cover-type in alfalfa. Other crop types or land covers may be substituted for alfalfa if the TAC determines that such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa.	restricted to growing fields or row crops. Fee title lands must maintain, at a minimum, an average of 50% of their crop cover-type in alfalfa over a period of 5 years. Other crop types or land covers may be substituted for alfalfa if a Swainson's hawk expert determines that such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa.
Objective SH3. During assembly of the SSHCP Preserve System, ensure a minimum of 746 acres of modeled nesting habitat for Swainson's hawk is preserved (see Objectives RIP1 and RIP3).	SH3.1. The Implementing Entity will select Preserve sites that contain modeled nesting habitat considering certain criteria, including the following: • Presently supports nesting activity. • Located within or near (preferably within 4.2 miles) productive foraging habitat such as Prime Farmland, Statewide Farmland (most productive), and current agriculture land cover types (i.e., alfalfa; other crop types or land covers may be substituted for alfalfa if the TAC determines that such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa). • Support large mature trees (e.g., taller than 50 feet) that are preferred nesting sites. • Located in rural areas unlikely to be affected by high levels of human activities. • Preserves are not adjacent to wind energy facilities.
Objective SH4. During assembly of the SSHCP Preserve System, ensure that a minimum of 373 acres of modeled riparian nesting habitat for Swainson's hawk is re-established and/or established. Ensure that mitigation for modeled nesting habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8 (see Objectives RIP2 and RIP4).	SH4.1. Re-establish or establish riparian habitat along stream or river channels near known nesting territories. Establishment and re-establishment will target areas that connect disjunct segments of riparian habitat to the maximum extent feasible. Surveys will be conducted periodically for 10 years to monitor success, including habitat quality and use by nesting Swainson's hawk. During the first year, established or re-established habitat will be monitored monthly, with more frequent monitoring during summer months or periods of drought to ensure that new plantings are kept moist. During the second and third years, habitat will be monitored quarterly. For the remainder of the monitoring period, restoration habitat will be monitored every 6 months. If there are extended periods of drought within the monitoring period, or if established or re-established habitat becomes flooded for an extended period during the monitoring period, the habitat will be monitored more frequently to assess the impacts of and remediate for these extreme weather conditions. If, after 10 years, the established or re-established habitat is not meeting establishment or re-establishment criteria standards in terms of modeled habitat quality, the efforts will be deemed to have failed. Absence of

AGENDA ITEM 11.1
1068

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	nesting Swainson's hawks over the 10-year period will not be a criterion for failure as long as the Riparian habitat has otherwise achieved the establishment or re-establishment standards. If, at any time during the monitoring period, restored habitat is declining beyond remediation, dying, or dead, efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective SH5. For each of the 36 known nesting trees within the UDA, plant 10 trees that are modeled for Swainson's hawk nesting within SSHCP Preserves. Plant nesting trees on properties protected by the SSHCP within PPUs 4, 6, and 8, and near protected foraging habitat. Tree species will be selected based on known suitability as nesting habitat for Swainson's hawk, and the planted trees must be maintained and/or replaced in perpetuity.	SH5.1. Plant nesting trees on properties protected by the SSHCP and within proximity to protected foraging habitat. Tree species will be selected based on known suitability as nesting habitat for Swainson's hawk. To minimize temporal loss, a mix of tree species will be planted at each site to include fast- and slow-growing species. Trees that are acceptable for planting include Fremont's cottonwood (*Populus fremontii*), valley oak (*Quercus lobata*), blue oak (*Q. douglasii*), interior live oak (*Q. wislizenii*), western sycamore (*Platanus racemosa*), red willow (*Salix laevigata*), and Northern California black walnut (*Juglans hindsii*). Clusters of five trees must be established and maintained for every 40 acres of agricultural cropland preserved, and must include at least two different species, one of which must be a fast-maturing tree such as Fremont's cottonwood or red willow. Trees will be placed at the edges of agricultural fields. To help ensure survivorship, acorns will be used to establish oak trees, and at least 10 acorns will be planted for each required tree (i.e., if a cluster is to be composed of two cottonwoods and three valley oaks, then 30 valley oak acorns must be planted).
Objective SH6. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for Swainson's hawk is re-established and/or established (see Objectives RIP2 and RIP4).	SH6.1. The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Presence of irrigation systems that are engineered to provide for alfalfa production. • Agricultural lands that could support plantings of additional trees for future use as Swainson's hawk nest trees. • Within 3 miles of active nest sites where the record of the nest site is not older than 5 years, unless confirmed to be currently active by new surveys. • Proximity to large, contiguous area of open space that provides foraging habitat. • Proximity to stream riparian corridors containing large trees that potentially provide nesting habitat. • Preserves are not adjacent to wind energy facilities.
Objective WK1. During assembly of the SSHCP Preserve System, ensure that a minimum of 31,205 acres of modeled foraging habitat for white-tailed kite is preserved (see Objectives VG1, AG1, RIP1, RIP3, SW1, VP1, VP3, and BOW1).	WK1.1. The Implementing Entity will select Preserve sites for foraging habitat considering certain criteria, including the following: • Agricultural lands that support perennial crops (e.g., alfalfa) rather than annual crops. • Known to be used by white-tailed kite for foraging. • On parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective WK2. During assembly of the SSHCP Preserve System, ensure that a minimum of 974 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is preserved (see Objectives RIP1, RIP3, and BOW1).	WK2.1. The Implementing Entity will select Preserve sites for nesting habitat, including Blue Oak Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub, considering certain criteria, including the following: • Large, unfragmented patches connected to Grassland and agriculture areas known to support high prey densities. • Closed canopy consisting of multiple vegetation layers, including mature trees. • Known to support nesting white-tailed kite. • On parcels 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective WK3. During assembly of the SSHCP Preserve System, ensure a minimum of 767 acres of modeled foraging habitat for white-tailed kite is re-established and/or established (see Objectives VP2, RIP2, RIP4, and SW2).	WK3.1. Implement Conservation Actions VP2, RIP2, RIP4, and SW2. Foraging habitat re-establishment or establishment will involve establishing habitat, including vegetation structure modeled for voles (*Microtus californicus*) where it historically occurred but no longer exists due to loss of or changes in ecological factors. White-tailed kite foraging habitat re-establishment or establishment will occur only where non-modeled habitat is converted to modeled habitat.
	WK3.2. Re-establish or establish nesting habitat in areas that have a range of riparian plant assemblages that include large trees such as cottonwood and valley oak, as well as an understory of Mixed Riparian Scrub. The Implementing Entity will select re-establishment/establishment sites for nesting habitat considering certain criteria, including the following: • Located along existing riparian corridors where nesting habitat likely existed in the past, such as along the Cosumnes River and Deer Creek. • Located within a new or existing preserve or habitat corridor. Created Riparian Woodland areas must be able to support a wide variety of species. • Located in areas within at least 0.5 mile of modeled foraging habitat. • Supports soil and topography modeled for restoring target habitat. • Located at least 500 feet from urban land uses, including structures and roads. • Avoidance of locations that historically did not support Riparian Woodland. • Avoidance of locations within the existing Vernal Pool landscape. Surveys will be conducted after 1 year and every 5 years thereafter to monitor prey abundance. If, after the first year or any 5-year interval thereafter, the re-established habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective WK4. During assembly of the SSHCP Preserve System, ensure that a minimum of 601 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is re-established and/or established (see Objectives RIP2 and RIP4).	See Conservation Action WK2.1.
Objective NH1. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,245 acres of modeled foraging habitat for northern harrier (*Circus cyaneus*) is preserved (see Objectives VG1, AG1, VP1, VP3, FWM1, and SW1).	NH1.1. The Implementing Entity will select Preserve sites for foraging habitat considering certain criteria, including the following: • Open habitats with dense, tall (12 to 38 inches) vegetation. • Known to support high prey densities (small mammals). • On parcels 20 acres or greater and/or occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially support other Covered Species. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective NH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 30,048 acres of modeled nesting/foraging habitat for northern harrier is preserved (see Objectives VG1 and AG1).	NH2.1. The Implementing Entity will select Preserve sites for nesting/foraging habitat considering the following criteria: • Open habitats with dense, tall (12 to 38 inches) vegetation. • Wet or moist sites for nesting. • Known to support high prey densities (small mammals). • On parcels 20 acres or greater and/or occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially support other Covered Species. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective NH3. During assembly of the SSHCP Preserve System, ensure that a minimum of 856 acres of modeled foraging habitat for northern harrier is re-established and/or established (see Objectives VP2, FWM2, and SW2).	NH3.1. The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Historically contained intact foraging habitat. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Could potentially support other Covered Species. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

AGENDA ITEM 11.1
1071

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective BO1. Preserve seven occupied western burrowing owl (*Athene cunicularia*) sites (commensurate with 20% of the estimated number of sites within the UDA as of 2014), preserve at least 200 acres of land surrounding each occupied burrow site, and maintain modeled habitat for western burrowing owl within 0.4 mile of breeding sites.	BO1.1. The Implementing Entity will select Preserve sites that include nesting habitat land cover types considering certain criteria, including the following: • Known to support breeding burrowing owls. • Located within 3 miles of a known nesting site or modeled nesting habitat. • Known to support high rodent populations during the breeding season. • Expand upon or link already preserved lands and will not be bisected by new roadways or incur impacts from any other infrastructure developments. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Potentially support other Covered Species. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
	BO1.2. Preserve modeled nesting habitat within PPUs 4, 6, and/or 8.

Objective BO2. For each burrowing owl or burrowing owl pair passively excluded, protect 200 acres of modeled habitat for western burrowing owl and establish a ground squirrel (*Spermophilus (Otospermophilus) beecheyi*) colony and augment with artificial burrows as appropriate (determined by TAC). Artificial burrows will be established at appropriate locations throughout the Preserve System pursuant to CDFW (CDFG 2012 guidelines) or as otherwise determined by the TAC.	BO2.1. Select Preserve sites in areas with known species occurrences and that contain modeled habitat. Manage these locations to maintain the following:
	• Open, well-drained terrain with low risk of flooding.
	• Short, sparse vegetation.
	• Underground burrows or burrow facsimiles.
	• Modeled foraging habitat within 0.4 mile of breeding sites.
	• Enhanced foraging habitat quality through
	  ○ Promoting fossorial mammal populations in areas that are modeled foraging habitat;
	  ○ Providing sentinel posts or mounds near burrows; and
	  ○ Creating rock piles near nest burrows.

Objective LS1. During assembly of the SSHCP Preserve System, ensure that a minimum of 9,152 acres of modeled foraging habitat for loggerhead shrike (*Lanius ludovicianus*) is preserved (see Objectives VG1, AG1, SW1, VP1, and VP3).	LS1.1. The Implementing Entity will select Preserve sites for foraging habitat considering certain criteria, including the following: • Lands that are open with sparse vegetation for foraging. • Available hunting perches with an open view. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Known to support loggerhead shrike and other Covered Species. • Linked or adjacent to currently preserved lands. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

AGENDA ITEM 11.1
1072

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective LS2. During assembly of the SSHCP Preserve System, ensure that a minimum of 22,014 acres of modeled nesting/foraging habitat for loggerhead shrike is preserved (see Objectives VG1, RIP1, and RIP3).	LS2.1. The Implementing Entity will select Preserve sites for nesting/foraging habitat considering certain criteria, including the following: • Lands that are open with sparse vegetation for foraging interspersed with scattered or isolated low trees or large shrubs for nest sites. • Available hunting perches with an open view. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Known to support loggerhead shrike and other Covered Species. • Linked or adjacent to currently preserved lands. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species.
Objective LS3. During assembly of the SSHCP Preserve System, ensure that a minimum of 592 acres of modeled nesting habitat for loggerhead shrike is re-established and/or established (see Objectives RIP2 and RIP4).	LS3.1. The Implementing Entity will select re-establishment/establishment sites for nesting habitat considering certain criteria, including the following: • Lands that possess or can be planted with scattered or isolated low trees or large shrubs for nest sites. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Potential to support loggerhead shrike and other Covered Species after re-establishment and/or establishment. • Linked or adjacent to currently preserved lands. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Loggerhead shrike habitat re-establishment will only occur where habitat historically occurred but no longer exists due to loss of or changes in ecological factors.
Objective LS4. During assembly of the SSHCP Preserve System, ensure that a minimum of 965 acres of modeled nesting habitat for loggerhead shrike is preserved (see Objectives RIP2 and RIP4).	See Conservation Action LS2.1.
Objective LS5. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for loggerhead shrike is re-established and/or established (see Objective SW2).	LS5.1. The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • On parcels 20 acres or greater and/or occur in larger, open space areas. • Potential to support loggerhead shrike and other Covered Species after re-establishment and/or establishment. • Linked or adjacent to currently preserved lands. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Loggerhead shrike habitat re-establishment will only occur where habitat historically occurred but no longer exists due to loss of or changes in ecological factors.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
Objective GS1. During assembly of the SSHCP Preserve System, ensure that a minimum of 257 acres of modeled roosting or roosting/foraging habitat for greater sandhill crane is preserved. Roosting habitat will be preserved and maintained within PPUs 4, 6, and 8, with a minimum of 75% within PPU 6 (see Objectives VP1, SW1, and FWM1).	GS1.1. The Implementing Entity will select Preserve sites for roosting habitat considering certain criteria, including the following: • Known roost sites. • Located within 2 miles of modeled foraging habitat outside the UDA. • 20 acres or greater and/or occurs in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially support other Covered Species or where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species. • At least 1,000 feet from disturbances such as roads or other operations that may disturb roosting. • Free of fences and power lines. • Seasonal wetland present from September to mid-March. • Supports natural drainage inflows, or water delivery mimics natural hydrologic cycles. The Implementing Entity will also coordinate with relevant conservation entities and the Wildlife Agencies to determine the most effective preserve acquisitions to account for potential geographic shifts in the greater sandhill crane population within the SSHCP Plan Area in anticipation of, and as a result of, sea-level rise.
Objective GS2. During assembly of the SSHCP Preserve System, ensure that a minimum of 7,751 acres of modeled foraging habitat for greater sandhill crane is preserved (see Objectives AG1, AG2, and VG1).	GS2.1. The Implementing Entity will select Preserve sites for foraging habitat considering certain criteria, including the following: • Modeled foraging habitat located within 2 miles of known roost sites or modeled roosting habitat outside the UDA. • On parcels 20 acres or greater and/or that occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Potentially support other Covered Species or where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species. • Free of fences and power lines. • Contain available sources of “grit,” including gravel and dirt roads or rocky uplands. The Implementing Entity will also coordinate with relevant conservation entities and the Wildlife Agencies to determine the most effective preserve acquisitions to account for potential geographic shifts in the greater sandhill crane population within the SSHCP Plan Area in anticipation of, and as a result of, sea-level rise.
Objective GS3. During assembly of the SSHCP Preserve System, ensure that a minimum of 184 acres of modeled roosting habitat or roosting/foraging habitat for greater sandhill crane is established and/or	GS3.1. Implement Conservation Actions for Objectives SW2 and FWM2. Select re-establishment or establishment sites outside the UDA based on the same criteria used for preservation sites in GS1.1 and GS2.1. Habitat re-establishment and establishment will only occur where it replaces low-quality foraging or roosting habitat, including the following features: • Replacement of unmodeled agriculture uses such as orchards and vineyards with habitats supporting high prey abundance (e.g., invertebrates), including Grassland, suitable Croplands, Irrigated Pasture, and Wet Meadow.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
re-established. Re-establish two new roost sites (minimum of 90 acres of Freshwater Marsh/Seasonal Wetland complex each) every 2 miles in the gap between the Cosumnes population and the Stone Lakes' population or other strategic locations if that gap is closed by another HCP or conservation project (see Objectives VP2, SW2, and FWM2).	• Removal of physical structures that can cause collisions during takeoff and flying, including fences, distribution lines, and other built structures. • Removal of human disturbances from otherwise modeled foraging and roosting habitat. • Establishment of suitable hydrologic regimes at roosting sites. • Grit sources near foraging areas.
Objective GS4. Create a visual screen of woody vegetation near human disturbances such as buildings, bridges, and paved roads from permanent roosting habitat within PPU 6. Screens should be located as appropriate to not interfere with habitat usage by greater sandhill crane.	GS4.1. Plant visual screens of woody vegetation in known and potential roosting sites within PPU 6 where there are nearby human disturbances, including roads, bridges, and dwellings.
Objective GS5. As part of the 2,000 acres preserved under Objective AG2, establish and maintain 10 food plots in strategic locations totaling a minimum of 200 acres within an agricultural setting for greater sandhill crane foraging habitat within PPU 6. Maintain the 200 acres among the 10 food plots as irrigated pasture or planted with crops preferred by greater sandhill crane as foraging habitat. Crops may include alfalfa, corn, wheat, or rice. Strategic placement of food plots will include locations for food plots in upland areas above the floodplain.	GS5.1. Maintain the 200 acres among the 10 food plots as irrigated pasture or planted with crops preferred by greater sandhill crane as foraging habitat. Crops may include alfalfa, corn, wheat, or rice. Preference shall be given to corn or rice. The 10 food plots will be distributed throughout PPU 6 at a minimum of five locations, each at least 20 acres. Food plots must be within 1.5 miles of irrigated pasture-grassland or other pasture, and within 2 miles of known roosting sites. Crops must not be harvested or removed until March. Crops such as corn should be knocked over at a height and as early as possible in the season to maximize the benefit and give access to greater sandhill cranes while still impeding geese from exploiting the resource.The Implementing Entity will also coordinate with relevant conservation entities and the Wildlife Agencies to determine the most effective preserve acquisitions to account for potential geographic shifts in the greater sandhill crane population within the SSHCP Plan Area in anticipation of, and as a result of, sea-level rise.
Objective GS6. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,000 acres of high-value	GS6.1. The Implementing Entity will select Preserve sites for high-value foraging habitat outside the 100-year floodplain considering certain criteria, including the following: • Modeled high-value foraging habitat that is located outside the 100-year floodplain.

AGENDA ITEM 11.1
1075

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
modeled foraging habitat for greater sandhill crane outside the 100-year floodplain is preserved (see Objectives VP1, SW1, and FWM1).	• Located within 2 miles of known roost sites or modeled roosting habitat outside the UDA. • On parcels 20 acres or greater and/or that occur in larger, open space areas. • Is recorded as supporting greater sandhill crane foraging during previous flood events. • Linked or adjacent to currently preserved lands. • Potentially support other Covered Species or where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species. • Free of fences and power lines. • Contain available sources of "grit," including gravel and dirt roads or rocky uplands. The Implementing Entity will also coordinate with relevant conservation entities and the Wildlife Agencies to determine the most effective preserve acquisitions to account for potential geographic shifts in the greater sandhill crane population within the SSHCP Plan Area in anticipation of, and as a result of, sea-level rise.
Objective TB1. During assembly of the SSHCP Preserve System, ensure that a minimum of 4,149 acres of modeled foraging habitat for tricolored blackbird is preserved (see Objectives AG1, AG2, FWM1, VG1, VP1, VP3, FWM1, OW1, and SW1).	TB1.1. The Implementing Entity will select Preserve sites for foraging habitat considering certain criteria, including the following: • Expand on or link already preserved lands and not bisected by new roadways or incur impacts from any other infrastructure developments. • Located within 1 mile of a known nesting site or modeled nesting habitat (note: intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat). • Contains vegetation with a potential for high insect populations during the breeding season (April through July). • On parcels 20 acres or greater and/or occur in larger, open space areas. • Where management can be used to enhance or re-establish natural ecosystem processes and attract tricolored blackbird.
Objective TB2. During assembly of the SSHCP Preserve System, ensure that a minimum of 27,532 acres of modeled nesting/foraging habitat for tricolored blackbird is preserved, including a minimum of 402 acres of Freshwater Marsh and Seasonal Wetland (see Objectives AG1, AG2, VG1, VG1, FWM1, and SW1).	TB2.1. The Implementing Entity will select Preserve sites for aquatic nesting/foraging habitat, including Seasonal Wetland and Freshwater Marsh land cover types considering certain criteria, including the following: • Has nesting substrate (e.g., tules, cattails) in an extensive area (minimum 2 acres) to accommodate large tricolored blackbird colonies. • Known to currently or historically support a tricolored blackbird colony. • Located within 3 miles of a known foraging site or modeled foraging habitat (note: intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat). • Open water (e.g., canal, lakeshore, or farm pond) within 1,640 feet of nesting substrate to provide a water source for nestlings. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Management for tricolored blackbird will include maintaining young, lush growth of emergent wetland (cattails or tules).

AGENDA ITEM 11.1
1076

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	TB2.2. The Implementing Entity will select Preserve sites for upland nesting/foraging habitat, including Cropland, Valley Seasonal Wetland, and Freshwater Marsh land cover types considering certain criteria, including the following: • Has upland nesting substrate (e.g., Himalayan blackberry thickets) in an extensive area (minimum 2 acres) to accommodate large tricolored blackbird colonies. • Known to currently or historically support a tricolored blackbird colony. • Located within 3 miles of a known foraging site or modeled foraging habitat (note: intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat). • Open water (e.g., canal, lakeshore, or farm pond) within 1,640 feet of nesting substrate to provide a water source for nestlings. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Management for tricolored blackbird will include maintaining young, lush growth of emergent wetland (cattails or tules).
Objective TB3. During assembly of the SSHCP Preserve System, ensure that a minimum of 917 acres of modeled foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2, SW2, OW2, and VP2).	TB3.1. Implement Conservation Actions FWM2.1, SW2.1, OW2.1, and VP2.1. The Implementing Entity will select re-establishment/establishment sites for aquatic modeled habitat considering certain criteria, including the following: • Occurs within 1,000 feet of a nesting colony, that is occupied at the time of re-establishment/establishment or that was recorded as an occupied nesting colony at any time since 2008. Sources for occupied nesting colonies are the California Natural Diversity Database (CNDDB), Tricolored Blackbird Portal, eBird, or other data sources approved by the Wildlife Agencies. • Includes all or a mix of Irrigated Pasture Grassland, Cropland, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, Open Water, and/or Valley Grassland, preferably situated within a mosaic of foraging habitat (as opposed to on the edge of foraging habitat) and providing adequate insect prey. • Tricolored blackbird habitat establishment/re-establishment will occur only where currently non-modeled habitat is converted to modeled habitat (e.g., conversion of a current non-wetland to a wetland). Modeled nesting substrate includes flooded, thorny, spiny, or "visually" but not actually spiny vegetation. Surveys will be conducted after the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the established or re-established habitat is not meeting establishment or re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed establishment or re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective TB4. During assembly of the SSHCP Preserve System, ensure that a minimum of 232 acres of modeled nesting/foraging habitat for tricolored blackbird is re-established and/or	TB4.1. The Implementing Entity will select re-establishment/establishment sites for nesting/foraging habitat, including Valley Grassland, Seasonal Wetland, and Freshwater Marsh land cover types considering certain criteria, including the following: • Known to historically support a tricolored blackbird colony. • Located within 1 mile of a known foraging site or SSHCP land cover type that provides modeled nesting and foraging habitat (Valley Grassland, Freshwater Marsh, Seasonal Wetland (Section 3.4.5)). Intensive row crops, vineyards, and orchards generally

AGENDA ITEM 11.1
1077

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
established (see Objectives FWM2 and SW2).	do not provide modeled foraging habitat. • Open water (e.g., canal, lakeshore, or stock pond) to provide water for nestlings within 1,640 feet of area where upland nesting substrate can be re-established and/or established. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. • Management for tricolored blackbird will include maintaining young, lush growth of emergent wetland (cattails or tules) or for upland sites, blackberry bushes or other suitable spiny bushes.
Objective TB5. Provide mitigation for loss of any tricolored blackbird nesting colony site that is occupied at the time of Covered Activity implementation or was recorded as an occupied nesting colony at any time since 2008. Sources for occupied nesting colonies are the California Natural Diversity Database, Tricolored Blackbird Portal, eBird, or other data sources approved by the Wildlife Agencies. Minimum mitigation is to protect one extant unprotected occurrence of a nesting colony prior to take of one nesting colony of tricolored blackbird. Ensure that at least five extant tricolored blackbird colonies that were occupied in recent years are maintained and managed within the SSHCP Preserve System.	TB5.1. Protect at least one extant unprotected occurrence of a nesting colony prior to take of one nesting colony of tricolored blackbird. Each of the extant occurrences preserved will meet the following criteria: • Has supported a minimum of 200 individual tricolored blackbirds during one or both of the survey years preceding the project application. • A protected nesting substrate (including wetlands that are flooded March to July, and thorny, spiny, or "visually" but not actually spiny vegetation). • Open accessible water within 1,640 feet of the nesting substrate. • Located within 1 mile of at least 500 acres of a known foraging site or SSHCP land cover type that provides modeled nesting and foraging habitat (Valley Grassland, some Cropland, Freshwater Marsh, Seasonal Wetland (Section 3.4.5)). This requirement targets lands with adequate insect forage. Intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat. One or more of the three elements (nesting substrate, access to open water as a water source for nestlings, and modeled foraging habitat) may be provided through establishment or re-establishment through Conservation Action TB3.1. If re-establishment is included, surveys will be conducted the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective TB6. Conduct an experimental study to identify management actions to protect tricolored blackbird colonies (e.g., coarse netting to reduce nest predation or impact of pesticides).	TB6.1. Select one or more existing tricolored blackbird colonies as experimental populations. If a large colony is available, test several potential feasible management actions within that one colony. If results of experimental treatments indicate a measurable and biologically significant decrease in nest predation or increased fledgling success and that treatments are feasible, include these management actions within Preserve Management Plans for Preserves that include historic or current tricolored blackbird colonies.
Objective TB7. Ensure that at least one large tricolored blackbird colony (i.e., one that has historically (from 1950 onward)	TB7.1 Each of the large colonies preserved will meet the following criteria: • Has supported a minimum of 1,500 individual tricolored blackbirds during a survey year since 1950.

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
supported a minimum of 1,500 individuals) is protected.	• A protected nesting substrate (including flooded, thorny, spiny, or "visually" but not actually spiny vegetation). • Open accessible water to provide a water source for nestlings within 1,640 feet of the nesting substrate. • At least 500 acres of modeled foraging habitat (that may include any combination of Irrigated Pasture Alfalfa, Vernal Pool, Valley Grassland, Seasonal Wetland, Swale, and Freshwater Marsh) providing adequate insect prey within a 1-mile radius of the nesting colony. One or more of the three elements (nesting substrate, access to open water, and modeled foraging habitat) may be provided through establishment or re-establishment through Conservation Action TB3.1. If re-establishment is included, surveys will be conducted the first year and every 5 years thereafter to monitor success. If, after the first year or any 5-year interval thereafter, the restored habitat is not meeting re-establishment criteria standards, the efforts will be deemed to have failed. Remediation of failed re-establishment efforts must occur within 1 year after efforts are deemed unsuccessful.
Objective TB8. For any tricolored blackbird nesting colony that is removed by a Covered Activity, re-establish and/or establish three new colonies within SSHCP Preserves. Re-established and/or established colonies can be in aquatic (freshwater marsh, seasonal wetland) or upland (annual grassland) habitat types, and must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands that provide adequate foraging opportunities.	TB8.1. When re-establishing and/or establishing aquatic nesting colony sites, the Implementing Entity will consider the following in their design: • Avoid management of properties for fall and winter waterfowl habitat. Maintain flooded marshes from spring into July through irrigation or impoundment (8–12 inches standing water through spring). As necessary, use graywater or recycled water sources for spring irrigation. • Plant mixture of cattails and tules (cattails more abundant) in seasonal wetlands and freshwater marshes if absent. Manage the wetlands for large patches of cattails (at least 100 feet in width), spaced away from the shoreline. Refresh cattails by mowing/disking or burning, not less than every 3 years in fall and winter. • Protect the colony site from encroachment by trees or high shrubs, to eliminate perching sites for avian nest predators. • Sites selected for re-establishment/establishment of aquatic nesting habitat must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands. Agricultural operations or grasslands should ideally be protected in SSHCP Preserves, but if not, must be free from pesticide use so that insect populations are not reduced. • Encourage cattle grazing near suitable breeding colony sites if possible. Grazing increases insect abundance and the short grass increases tricolored blackbird access to insects. As an alternative to cattle grazing, conduct prescribed burns every 5 years. The preferred grass height to maintain by grazing is less than 15 inches. • Near the aquatic nesting colony site, promote insect production in early spring through irrigation or other methods. Preferred insect prey include grasshoppers and caterpillars, but aquatic insect larvae can also provide food. • Tules or cattails will be cut down or removed after each season to allow for growth of new tules and cattails.
	TB8.2. When re-establishing and/or establishing upland nesting colony sites, the Implementing Entity will consider the following in their design: • Provide native spiny, thorny, thick substrate such as California blackberry (*Rubus ursinus*), prickly lettuce (*Lactuca serriola*),

AGENDA ITEM 11.1
1079

Table 7-1
Biological Goals, Measurable Objectives, and Conservation Actions

Measurable Objectives	Conservation Actions
	nettles (*Urtica dioica*), California rose (*Rosa californica*), sandbar willow (*Salix exigua*), and mugwort (*Artemisia douglasiana*). • Protect existing patches of non-native Himalayan blackberry (*Rubus armeniacus*) and milk thistle (*Silybum marianum*) patches and allow planting in select areas. These provide superior upland habitat compared to native species as they are more thick and spiny. • Protect the colony site from encroachment by trees or high shrubs to eliminate perching sites for avian nest predators. Patches should remain in the open to avoid predator access from trees and shrubs. • Target establishment of high-density patches with height of 4 to 10 feet in existing pastureland and rangeland. Irrigating in March–April can help increase the height and density of the plants if the winter has been dry. • Do not prune or mow patches until after the nesting season. • Sites selected for re-establishment/establishment of upland nesting habitat must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands. Agricultural operations or grasslands should ideally be protected in SSHCP Preserves, but if not, must be free from pesticide use so that insect populations are not reduced. • Ensure a water source is available within 1,500 feet of a target upland colony site throughout the breeding season. Water sources can include ponds, marshes, canals, stock ponds, and streams.
Mammal Covered Species	
Objective AB1. During assembly of the SSHCP Preserve System, ensure that a minimum of 23,171 acres of modeled habitat for American badger (*Taxidea taxus*) is preserved (see Objectives BOW1, VG1, VP1, VP3, and SW1).	AB1.1. The Implementing Entity will select Preserve sites for modeled habitat considering certain criteria, including the following: • Large areas (e.g., relatively undisturbed by human activity). • Supporting friable soils. • Known to support high prey densities, particularly ground squirrels and pocket gophers. • Where management can be used to enhance or re-establish natural ecosystem processes.
Objective AB2. During Preserve Assembly, ensure that a minimum of 767 acres of modeled habitat for American badger is re-established and/or established (see Objectives VP2 and SW2).	AB2.1. The Implementing Entity will select re-establishment/establishment sites for modeled habitat considering certain criteria, including the following: • Large areas (e.g., relatively undisturbed by human activity). • Supporting friable soils. • Known to support high prey densities, particularly ground squirrels and pocket gophers. • Where management can be used to enhance or re-establish natural ecosystem processes.
Objective WR1. During Preserve Assembly, ensure that a minimum of 23,910 acres of modeled foraging habitat for western red bat (*Lasiurus blossevillii*) is preserved (see	WR1.1. The Implementing Entity will select Preserve sites for foraging habitat considering certain criteria, including the following: • Foraging areas known to be used by western red bats. • Located within 2–3 miles of permanent water.

Measurable Objectives	Conservation Actions
Objectives BOW1, RIP1, RIP3, AG1, VG1, VP1, VP3, SW1, OW1, FWM1, and SC1).	• Areas known or having potential to support high insect prey densities. • Few or no human disturbances. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absence of or few habitat-fragmenting features, including roads and other infrastructure. • Where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.
Objective WR2. During assembly of the SSHCP Preserve System, ensure that a minimum of 841 acres of modeled roosting/foraging habitat for western red bat is preserved (see Objectives BOW1, RIP1, and RIP3).	WR2.1. The Implementing Entity will select Preserve sites for roosting/foraging habitat considering certain criteria, including the following: • Active roosting sites, especially maternity sites (note that buildings, bridges, and other built structures may be used for roosting). • Located within 2–3 miles of foraging habitat and permanent water. • Foraging areas known to be used by western red bat. • Areas known or having potential to support high insect prey densities. • Few or no human disturbances. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absence of or few habitat-fragmenting features, including roads and other infrastructure. • Where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.
Objective WR3. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,317 acres of modeled foraging habitat for western red bat is re-established and/or established (see Objectives VP2, SW2, OW2, FWM2, RIP2, and RIP4).	WR3.1. The Implementing Entity will select re-establishment/establishment sites for foraging habitat considering certain criteria, including the following: • Areas known or having potential to support high insect prey densities. • Located within 2–3 miles of permanent water. • Few or no human disturbances. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absence of or few habitat-fragmenting features, including roads and other infrastructure. • Where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.
Objective WR4. During assembly of the SSHCP Preserve System, ensure that a minimum of 450 acres of modeled	WR4.1. The Implementing Entity will select re-establishment/establishment sites for roosting/foraging habitat considering certain criteria, including the following: • Areas known or having potential to support high insect prey densities.

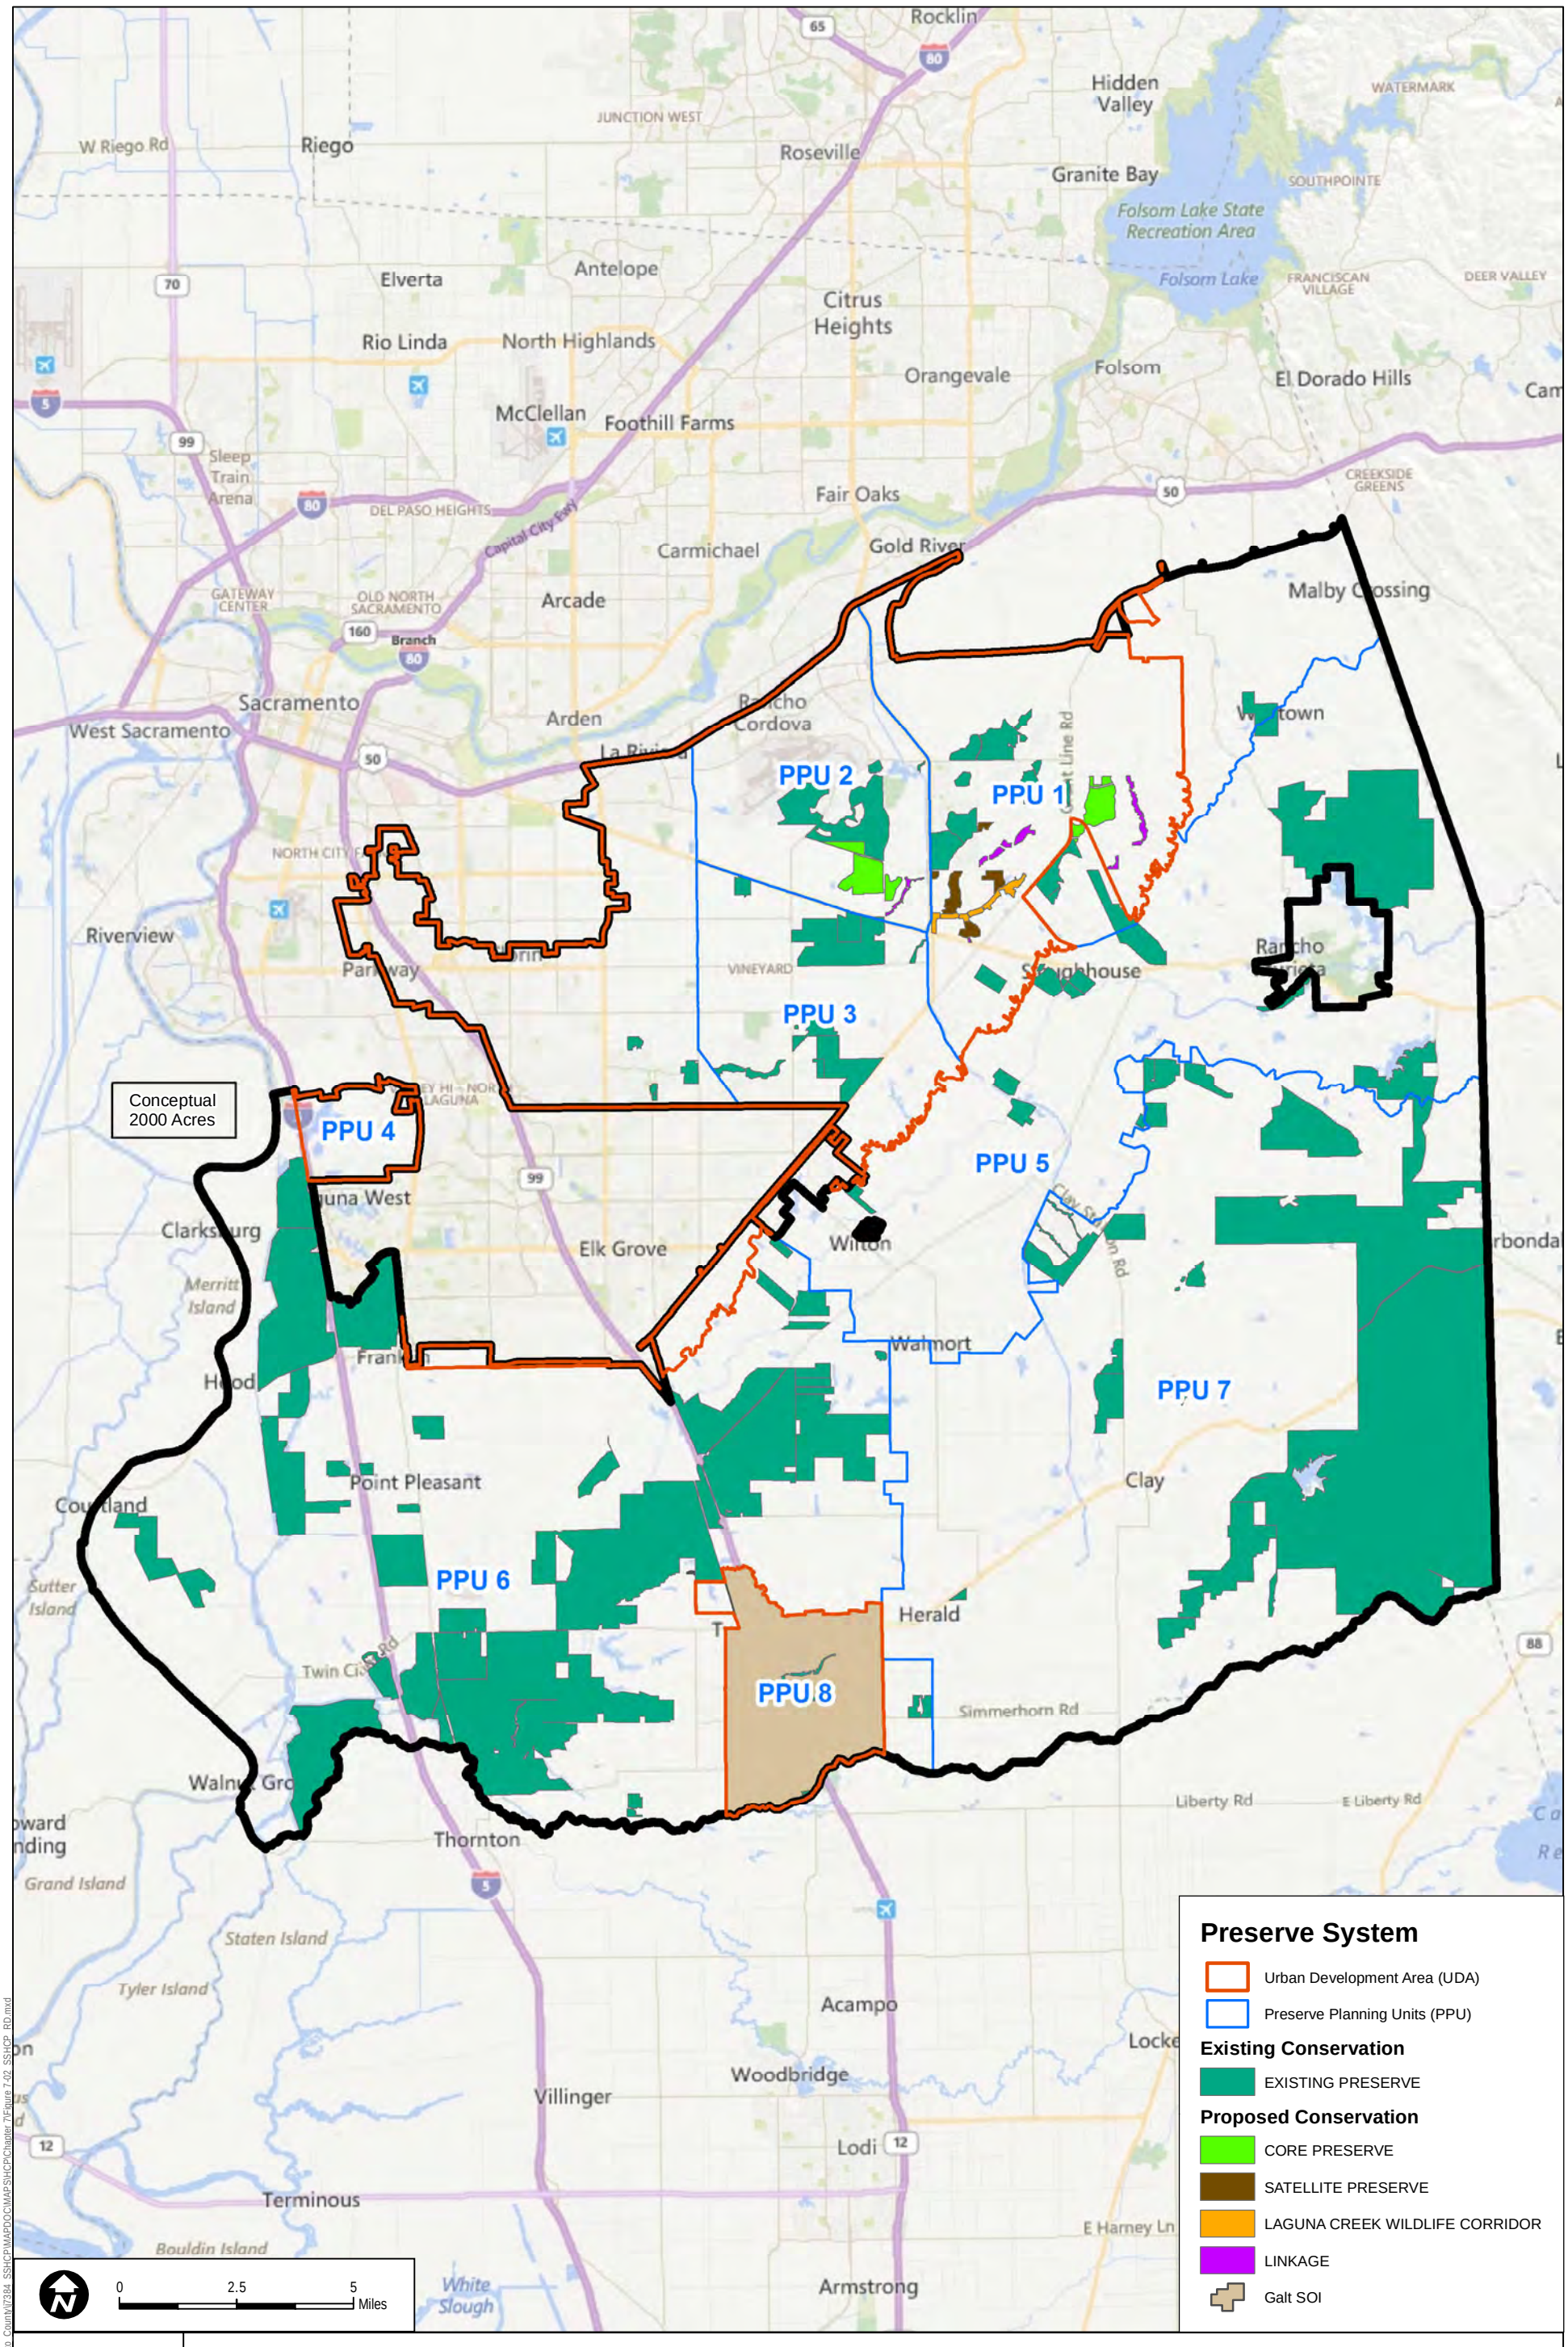
roosting/foraging habitat for western red bat is re-established and/or established (see Objectives RIP2 and RIP4).	• Located within 2–3 miles of foraging habitat and permanent water. • Few or no human disturbances. • On parcels 20 acres or greater and/or occur in larger, open space areas. • Linked or adjacent to currently preserved lands. • Absence of or few habitat-fragmenting features, including roads and other infrastructure. • Where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.

7.4 Development of the SSHCP Preserve System

The Plan Permittees will use the key conservation biology principles described in Section 7.1 and the Biological Goals and Measurable Objectives (Section 7.3) to develop the SSHCP Preserve System.

7.4.1 Preserve System Assembly Process



As described in Chapter 1, the Plan Area contains two regions: the UDA, where local jurisdictions anticipate urban growth, and lands outside the UDA, which are characterized by agricultural land uses and already include some large areas of conservation lands. Habitat preservation and management requirements in the UDA differ from those outside the UDA because these areas are subject to different land uses. Large SSHCP Preserves established outside of the UDA will occur in a matrix of open space and agricultural lands interspersed with agricultural residential communities; smaller SSHCP Preserves in the UDA will be surrounded by urban, suburban, industrial, and commercial land uses. Each Preserve in the SSHCP Preserve System will be established by one of two processes:

- **Hardline process**. This process is termed "hardline" because the exact locations and Preserve boundaries are known at the time of Plan preparation. Inside the UDA, some Preserves have already been proposed by willing landowners. These nine "hardline" Preserve locations are all within the UDA, and total approximately 1,800 acres (see Figures 7-2 through 7-5 and Section 7.5).
- **Criteria-based process.** These Preserves are "criteria-based," meaning the exact Preserve boundaries and locations are not known at the time of Plan preparation. Criteria-based Preserves will be located within the UDA and outside the UDA. The criteria-based Preserves will be located and established as described below (see Section 7.5).

The combined criteria-based and hardline preservation process will create an interconnected SSHCP Preserve System totaling 36,282 acres. All SSHCP Preserves will be preserved in perpetuity and would be acquired either as fee title or as conservation easements (see Chapter 9). As the SSHCP is implemented over the Permit Term, the new 36,282 acres SSHCP Preserve System will be established in a manner that supplements, complements, and links together many of the existing preserves[4] within the Plan Area (Section 3.5).

[4] Existing preserve acres are not included as part of the new 36,282 acre SSHCP Preserve System, and are not considered a part of the SSHCP Preserve System. Existing preserves do not count towards achieving any of the Biological Goals and Measurable Objectives described in this chapter or any other components of the SSHCP Conservation Strategy.

7.4.2 Benefits to Non-Covered Species

Although the SSHCP Preserve System is designed to provide benefits to Covered Species, establishing, managing, and monitoring the SSHCP Preserve System will also benefit non-covered native species within the Plan Area. For example, preserved Valley Grassland will provide foraging habitat for a range of bird species, and preserved Riparian Woodland will provide breeding habitat for many bird species. Establishment of large, well-linked Preserves and establishment of wildlife crossings as part of Urban Transportation and Rural Transportation Covered Activities will maintain habitat connectivity and provide movement corridors for mobile species such as deer (*Odocoileus hemionus* or *Odocoileus hemionus columbianus*), coyotes (*Canis latrans*), foxes (*Urocyon cinereoargenteus*), and others.

7.4.3 Existing Preserves in the Plan Area

The SSHCP Preserve System will be designed to link and to complement existing preserves, which are widely scattered within the Plan Area (see Section 3.5). The biological resources, aquatic resources, and Covered Species within the Plan Area will benefit from a network of new SSHCP Preserves that are interconnected to existing preserves (refer to Section 7.5.3 and Table 7-2). Existing preserve acres are not considered a part of the SSHCP Preserve System and do not count towards achieving any of the Biological Goals and Measurable Objectives described in this chapter or any other components of the SSHCP Conservation Strategy.

7.5 Description of the SSHCP Preserve System

This section describes the SSHCP Preserve System, including a description of preservation inside and outside of the UDA by PPU and by preserve category. As the Preserve System is assembled, the spatial configuration may be somewhat different than the Preserve System described in this section. The requirement to acquire a minimum 36,282-acre preserve system, to acquire 6,941 acres of preserve within the UDA, and to establish preserves by preserve category (e.g., Landscape Preserve, Core Preserve, Minor Preserve, etc.) within each PPU as described below are firm commitments. In addition, the SSHCP is committing to the preservation of at least 6,065 acres of Valley Grassland and 210 acres of vernal pool within the UDA. While it is the intent of the SSHCP to generally adhere to the amount of preservation by land cover type assumed within and outside of the UDA, some flexibility is needed to ensure that the SSHCP is acquiring the best habitat available. Therefore, up to 15% of proposed preserve acreage that is assumed to occur outside of the UDA can be shifted to locations within the UDA. All candidate Preserves will be reviewed as described in Section 9.4. Section 7.6 presents the conservation analysis of the operating Conservation Strategy.

The SSHCP Preserve System will include 36,282 acres of SSHCP Preserve, the majority of which would be preserved by conservation easements. Table 7-3 provides a breakdown of land cover types by acreage of existing habitat that will be preserved under the SSHCP Preserve System. Table 7-4 provides a breakdown of land covers by acreage of re-established/established habitat that will be preserved under the SSHCP Preserve System. The total amount of each land cover type presented in Tables 7-3 and 7-4 must be preserved within the SSHCP Plan Area. A minimum of 50 acres of vernal pool, a minimum of 30 acres of swales, and a minimum of 300 acres of Vernal Pool Ecosystem must be re-established or established within the Mather Core Recovery Area. A minimum of 50 acres of Freshwater Marsh must be re-established or established within the UDA. The conservation analysis for land covers is provided in Section 7.6.1.

Table 7-3

Total Preserve Area	**130**	**1,657**	**1,787**

* The acreage necessary to provide compensatory mitigation for impacts to Stream/Creek (VPIH) (22 acres) is assumed in the Swale land cover type category. However, compensatory mitigation for Swale and Stream/Creek (VPIH) land cover types can be achieved by re-establishing/establishing vernal pool land cover types.

** Compensatory Mitigation for Open Water can be achieved by re-establishing/establishing Open Water or an aquatic land cover type that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by TAC.

*** Compensatory Mitigation for Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland will be achieved by re-establishing/establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

**** Compensatory Mitigation for Blue Oak Woodland and Blue Oak Savanna will be achieved by re-establishing/establishing any combination of Blue Oak Woodland and Blue Oak Savanna.

7.5.1 Preserve System Inside the UDA by PPU

The following section summarizes the Preserve System inside the UDA in three ways:

- By PPU, broken out by SSHCP land cover types
- With regard to SSHCP Preserve categories (Landscape, Core, Minor, Satellite, Linkage, etc.)
- In relation to existing preserves

Subsections that follow provide more detailed commitments for SSHCP Preserves in each of the PPUs inside the UDA, as well as the portion of the Laguna Creek Wildlife Movement Corridor that is located outside the PPUs. Table 7-5 provides a summary of the acreage by SSHCP Land Cover Type in each PPU that is inside the UDA. SSHCP Preserves inside the UDA will account for approximately 20% of the Preserve System, most of which will be in PPUs 1, 3, and 4.

The following subsections also provide a general description for where criteria-based Preserves will be sited to meet Biological Goals and Measurable Objectives (Table 7-1). As described above, the final spatial configuration of the SSHCP Preserve System inside the UDA may differ somewhat from the details provided for each PPU below, but the assembled SSHCP Preserve System must meet the SSHCP Biological Goals and Measurable Objectives. While the exact preserve configuration may differ somewhat from the descriptions provided below, the preservation acreages to be acquired within each PPU (as illustrated in Table 7-5) and by preserve category (e.g., Landscape Preserve, Core Preserve, Minor Preserve, etc.) must be achieved. The following subsections also provide qualitative discussions of Covered Species preservation in each of the PPUs. The full conservation analysis for Covered Species is provided in Section 7.6.2.

7.5.1.1 PPU 1

That portion of PPU 1 that is inside the UDA[5] encompasses 17,574 acres and is bordered by U.S. Highway 50 to the north, Prairie City Road to the northeast, the Deer Creek floodplain boundary to the southeast, Sloughhouse to the south, and Sunrise Boulevard to the west. Land cover types in PPU 1 are summarized in Table 3-1. The dominant land cover in PPU 1 is Valley Grassland (within the Vernal Pool Ecosystem), which comprises 13,260 acres of the PPU. PPU 1 in the UDA also contains substantial amounts of Cropland (359 acres) and Mine Tailing Riparian Woodland (220 acres). PPU 1 also includes 389 acres of Vernal Pool that supports high-value vernal pool complexes, and 193 acres of Swale. Some urbanization has already occurred south of U.S. Highway 50 and east of Sunrise Boulevard, with High-Density Development comprising 1,158 acres of PPU 1 in the UDA. PPU 1 encompasses the City of Rancho Cordova in the Plan Area, and lands east of Rancho Cordova in unincorporated areas of the County. Because much of PPU 1 is located in Rancho Cordova's city limit and within the County's Urban Services Boundary, it is anticipated that much of PPU 1 within the UDA will eventually be urbanized.

PPU 1 contains documented occurrences for many SSHCP Covered Species (Figures 3-3 through 3-30), including 28 occurrences of Boggs Lake hedge-hyssop (*Gratiola heterosepala*) (89% of the total number of occurrences in the Plan Area) , 39 occurrences of Sacramento

[5] Note that a small portion of PPU 1 is also located outside of the UDA. The portion of PPU 1 that is located outside of the UDA is discussed in Section 7.5.2.

Orcutt grass (92% of the total number of occurrences in the Plan Area),53 occurrences of legenere (*Legenere limosa*) (30% of the total number of occurrences in the Plan Area), one of the four slender Orcutt grass occurrences that occur in the Plan Area, and 703 occurrences of vernal pool tadpole shrimp (34% of the total number of occurrences in the Plan Area). There are 53 occurrences of vernal pool fairy shrimp within PPU 1 out of a total of 533 occurrences Plan Area-wide, one occurrence of valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) (on the northern boundary of the PPU), six occurrences for western spadefoot (*Spea hammondii*), and scattered occurrences for all of the bird Covered Species except ferruginous hawk. PPU 1 also includes the eastern segment of the County's designated Laguna Creek Wildlife Movement Corridor, which generally provides riparian, wetland, and aquatic habitats for several Covered Species, including western pond turtle, Sanford's arrowhead (*Sagittaria sanfordii*), and dwarf Downingia (*Downingia pusilla*). The riparian habitat in PPU 1 also provides potential roosting and/or foraging habitat for western red bat (*Lasiurus blossevillii*), although there are no documented occurrences of this species.

Overview of Conservation Strategy for PPU 1

In PPU 1 inside the UDA, approximately 3,537 acres will be preserved by the SSHCP. The Preserve design focus in PPU 1 includes establishing a Core Preserve, several smaller minor and Satellite Preserves, and providing Linkage Preserves between both existing preserves and SSHCP Preserves.

Core Preserve

A new Core Preserve (Core Preserve C-1) will total 839 acres, of which, 350 acres will be hardline Preserve (see Figure 7-3) and the remaining 489 acres will be criteria-based Preserve. The following provides a general description of Core Preserve C-1.

The northern boundary of Core Preserve C-1 will generally be defined by existing mining operations, mine tailings, and agricultural uses. Most of the land cover north of Core Preserve C-1 lacks wetland resources as a result of mining and agricultural uses, and it is expected that this area will continue to operate as a processing plant for aggregate material in the foreseeable future.

The eastern boundary of Core Preserve C-1 will generally be defined by a ridgeline that defines the eastern watershed boundary of the Preserve and where the terrain drops precipitously to the east. There are some vernal pool resources east of the ridgeline, but these are in low-density complexes spread across a large area and, thus, probably could not be efficiently aggregated into a Preserve. At full buildout of the UDA (see Chapter 5, Covered Activities), it is expected that the area east of Core Preserve C-1 will ultimately be residential and commercial development.

Similar to the eastern boundary, the southern boundary of Core Preserve C-1 will generally be defined by a ridgeline. The area south of this general boundary contains few wetland

resources and does not provide hydrological connection to Core Preserve C-1. Future land uses south of Core Preserve C-1 will likely be residential, public, or quasi-public.

The western boundary of the southern portion of Core Preserve C-1, generally south of Glory Lane (a maintained gravel road), will generally be defined by an unnamed tributary drainage to Laguna Creek. This drainage is at the lowest elevation in the basin and is important for maintaining the integrity of the Core Preserve C-1 watershed to the east of Grant Line Road and ensuring that the sub-watersheds surrounding vernal pool complexes in Core Preserve C-1 remain intact. Water entering the basin flows from the northeast to the southwest, or from the ridgeline that generally defines the eastern boundary of Core Preserve C-1.

The western boundary of the northern portion of Core Preserve C-1, generally north of Glory Lane, will generally follow a ridgeline that defines the western watershed boundary for Core Preserve C-1 and its wetland features. The area west of this ridgeline will likely consist of commercial and residential development at full buildout of the UDA.

It is estimated that Core Preserve C-1 will comprise approximately 752 acres of Valley Grassland and approximately 54 acres of Vernal Pool that are located on the Laguna land formation.

Based on documented occurrences, several known Covered Species will be protected in Core Preserve C-1, including vernal pool tadpole shrimp, vernal pool fairy shrimp, legenere, pincushion Navarretia (*Navarretia myersii* ssp. *myersii*), and Sacramento Orcutt grass. Valley Grassland and Vernal Pool will also provide modeled habitat for several other Covered Species. The conservation analysis for Covered Species is provided in Section 7.6.2.

Minor Preserves

At least three Minor Preserves will be established in the UDA in PPU 1, totaling 785 acres within the UDA and ranging from approximately 247 to 271 acres each. They will be provisionally called Minor Preserves M-1, M-2, and M-3 (the name and number of Minor Preserves could change as the Preserve System is assembled, pursuant to review and approval by the Permitting Agencies). These three Minor Preserves will be entirely criteria-based.

Preserve M-1 will be approximately 271 acres. The eastern boundary of Preserve M-1 will generally be adjacent to Grant Line Road. Most of the land east of Preserve M-1 is in existing preserves or is in the Preserve System as the Laguna Creek Wildlife Movement Corridor (see Figure 7-3). It is anticipated that lands east and north of Preserve M-1 will be urbanized at full buildout of the UDA.

The southern boundary of Preserve M-1 will be adjacent to existing preserve outside the UDA. The boundary will be established to provide an adequate setback to a swale that drains Preserve

M-1, and an adjacent existing preserve into Laguna Creek. Protecting this drainage will maintain the subwatersheds located inside Preserve M-1 and the hydrological connectivity between Preserve M-1 and the existing preserve to the south.

Preserve M-1 will be dominated by Valley Grassland, but will also contain Vernal Pool. Although focused species surveys have not been conducted in this area, it is likely that Preserve M-1 will contain vernal pool tadpole shrimp and vernal pool fairy shrimp, and it may also contain Sacramento Orcutt grass based on documented occurrences in the adjacent existing preserve. There is also a documented occurrence of western spadefoot in the area. Several other Covered Species have potential to occur on Preserve M-1 based on the presence of modeled habitat and proximity to Laguna Creek.

Preserve M-2 will be approximately 247 acres and will generally be bordered on the north by Grant Line Road and the UDA boundary. Preserve M-2 is intended to be linked directly to an existing preserve. The eastern boundary of Preserve M-2 will be established to ensure that wetlands within Preserve M-2 are provided an adequate setback and that the slopes of Preserve M-2's principle drainage are protected. It is anticipated that areas east of Preserve M-2 will be developed for industrial and possibly some recreational uses with full buildout of the UDA. The southern boundary of Preserve M-2 will generally be defined by the existing agricultural and residential lots to the south, which have relatively little resource value. It is anticipated that the area south of Preserve M-2 will remain in agricultural and residential land use for the foreseeable future. The western boundary of Preserve M-2 will be established to ensure that wetlands in the Preserve are at a higher elevation than areas to the west that are anticipated to be developed for commercial, residential, and possibly industrial uses at full buildout of the UDA. Having the Preserve M-2 boundary at a lower elevation than wetland resources within Preserve M-2 will ensure that the sub-watersheds surrounding protected wetland resources remain intact. A majority of the rainfall that enters Preserve M-2 will exit via small drainages and swales that flow to the east or west.

Preserve M-2 will largely consist of Valley Grassland, Vernal Pools, and Swales. An additional 98 acres of Preserve M-2 will extend outside the UDA. The vernal pools are on the Laguna land formation. Although focused species surveys have not been conducted in this area, it is likely that Preserve M-2 will contain vernal pool tadpole shrimp and vernal pool fairy shrimp, and possibly Sacramento Orcutt grass based on several documented occurrences on nearby existing preserves. Several other Covered Species have potential to occur on Preserve M-2 based on the presence of modeled habitat and proximity to Laguna Creek.

Preserve M-3 will be approximately 267 acres and will be bordered on the north by Jackson Highway. At full buildout of the UDA, lands north of Preserve M-3 will likely be developed for residential or commercial uses. The southeastern boundary of Preserve M-3 will generally

be adjacent to Grant Line Road. At full buildout of the UDA, property southeast of Preserve M-3 will likely be developed for residential or commercial uses, or could become agricultural-residential. The western boundary of Preserve M-3 will generally be adjacent to Sunrise Boulevard. At full buildout of the UDA, property west of Preserve M-3 will likely be developed for commercial uses.

Preserve M-3 will consist largely of Valley Grassland, Vernal Pools, and Swales. The vernal pools in Preserve M-3 occur on the Laguna, Riverbank Undivided, and Surficial Alluvial Undifferentiated Deposits land formations. Although focused species surveys have not been conducted in this area, Preserve M-3 is likely to contain vernal pool tadpole shrimp and vernal pool fairy shrimp. Several other Covered Species have potential to occur in Preserve M-3 based on the presence of species modeled habitat and proximity to Laguna Creek.

Satellite Preserves

The Preserve System includes seven Satellite Preserves in PPU 1, totaling approximately 596 acres and ranging from approximately 11 to 160 acres each. These are provisionally called Satellite Preserves S-1 through S-6 and S-8 (Satellite Preserve S-7 in PPU 1 is outside the UDA and is discussed in Section 7.5.2.1).

Satellite Preserve S-1 will be a criteria-based Preserve and will generally be located west of Grant Line Road northeast of existing preserve and northwest of the new Core Preserve C-1 described above. Satellite Preserve S-1 will be connected to existing preserve and Core Preserve C-1 via Linkage Preserves, discussed below. It is anticipated that Satellite Preserve S-1 will eventually be surrounded by residential or commercial development at full buildout of the UDA.

Satellite Preserve S-1 will be approximately 118 acres in size and consist of Valley Grassland, Vernal Pools, and Swales. Satellite Preserve S-1 was primarily identified to protect an occurrence of Sacramento Orcutt grass (for which all known and future occurrences subject to a Covered Activity will be protected pursuant to Objective VPP6), but also to protect vernal pools and the upper reaches of Morrison Creek. The vernal pools that support Sacramento Orcutt grass are located above the upper reaches of Morrison Creek. These pools will be provided an adequate setback from the Preserve edge. Adjacent lands outside of Satellite Preserve S-1 slope and drain away from Satellite Preserve S-1, ensuring that the sub-watershed for the vernal pools in Satellite Preserve S-1 will remain intact. The vernal pools north of Morrison Creek drain south and southeast into Morrison Creek. A setback south of Morrison Creek that is adequate to protect the integrity of the creek will be established and will incorporate wetland features that border the creek. In addition to Sacramento Orcutt grass, several other Covered Species have potential to occur on Satellite Preserve S-1 based on the presence of species modeled habitat.

Satellite Preserve S-2 will be a hardline Preserve that will add acreage to an existing preserve to the west (Anatolia Preserve). It will also be adjacent to an existing preserve on the north. The eastern and southern boundaries of Satellite Preserve S-2 will likely be adjacent to residential or commercial development at full buildout of the UDA. Satellite Preserve S-2 will be approximately 22 acres and consist largely of Valley Grassland, Vernal Pools, and Swales. Satellite Preserve S-2 will preserve several vernal pools and drainages from the two adjacent existing preserves, including vernal pools known to contain vernal pool tadpole shrimp and Boggs Lake hedge-hyssop. Several other Covered Species have potential to occur in Preserve S-2 based on the presence of modeled habitat.

Satellite Preserve S-3 will be a hardline Preserve generally bordered on the north by Kiefer Boulevard (see Figure 7-3). Except where Satellite Preserve S-3 will connect directly to the existing Laguna Creek Wildlife Movement Corridor directly to the south, it is anticipated that Satellite Preserve S-3 will be bordered by residential or commercial development at full buildout of the UDA. Satellite Preserve S-3 will be approximately 79 acres largely consisting of Valley Grassland, Vernal Pools, and Swales. Satellite Preserve S-3 was identified primarily to protect an area of high-density vernal pools on a plateau that flows into Laguna Creek. Several Covered Species have potential to occur in Satellite Preserve S-3 based on the presence of modeled habitat and proximity to Laguna Creek.

Satellite Preserve S-4 will be a hardline Preserve generally bordered on the north by Kiefer Boulevard and will be located east of Sunrise Boulevard (Figure 7-3). Except where Satellite Preserve S-4 will connect directly to the Laguna Creek Wildlife Movement Corridor, it is anticipated that Satellite Preserve S-4 will be bordered by residential or commercial development at full buildout of the UDA. Satellite Preserve S-4 will be approximately 135 acres and largely consist of Valley Grassland, Vernal Pools, and Swales. Satellite Preserve S-4 was identified primarily to protect vernal pools. In addition, Sun Creek, which drains into Laguna Creek, runs north–south through the central portion of Satellite Preserve S-4 and is situated between shallow slopes on both sides. Satellite Preserve S-4 will encompass the relatively flat terrace adjacent to Sun Creek and will be large enough to provide adequate setbacks for the vernal pools located on the terrace. Satellite Preserve S-4 is expected to support vernal pool tadpole shrimp and vernal pool fairy shrimp based on documented occurrences on nearby existing preserves. Several other Covered Species have potential to occur on Satellite Preserve S-4 based on the presence of modeled habitat and proximity to Laguna Creek.

Satellite Preserve S-5 will be a hardline Preserve adjacent to an existing preserve (Anatolia Preserve) to the north and bordered by Sunrise Boulevard on the west (Figure 7-3). It is anticipated that lands east and south of Satellite Preserve S-5 will be residential or commercial development at full buildout of the UDA. Satellite Preserve S-5 will be approximately 11 acres consisting mostly of Valley Grassland, Vernal Pools, and Swales. Satellite Preserve S-5 will protect the on-site vernal pools and the hydrology of the existing preserve to the north, which

supports vernal pools known to contain vernal pool tadpole shrimp and Boggs Lake hedge-hyssop. It is expected that the vernal pools in Satellite Preserve S-5 contain vernal pool tadpole shrimp and Ahart's dwarf rush (*Juncus leiospermus*). Several other Covered Species have potential to occur on Satellite Preserve S-5 based on the presence of modeled habitat and proximity to Laguna Creek.

Satellite Preserve S-6 will be a hardline Preserve generally located north of Jackson Highway, east of Sunrise Boulevard, and west of Grant Line Road (Figure 7-3). Except where Satellite Preserve S-6 connects to Laguna Creek to the north, it is anticipated that Satellite Preserve S-6 will be bordered by residential or commercial development at full buildout of the UDA. Satellite Preserve S-6 will be approximately 71 acres and consist largely of Valley Grassland, Vernal Pools, and Swales. Satellite Preserve S-6 was identified primarily to protect vernal pools and is located on a plateau that drains north into Laguna Creek. Several Covered Species have potential to occur in Satellite Preserve S-6 based on the presence of modeled habitat and proximity to Laguna Creek.

Satellite Preserve S-8 will be a criteria-based Preserve located southeast of the intersection of Jackson Highway and Grant Line Road, and will be bordered on the south by existing preserve. Satellite Preserve S-8 will be approximately 160 acres and consist largely of Valley Grassland, Vernal Pools, Swales, and Open Water. Satellite Preserve S-8 was identified primarily to protect vernal pools and to connect with an existing preserve. Several Covered Species have potential to occur on Satellite Preserve S-8 based on the presence of modeled habitat.

Linkage Preserves

Seven Linkage Preserves totaling approximately 924 acres will be established in the UDA in PPU 1, not including the area in the Laguna Creek Wildlife Movement Corridor or the Cosumnes/Deer Creek Wildlife Movement Corridor, which are discussed separately below. Approximately 721 acres of the Linkage Preserves will be criteria-based, so their final design has not been established. The Linkage Preserves will be designed to maintain connectivity between existing preserves and SSHCP Preserves, providing for wildlife movement and, in many cases, hydrological connections between Preserves. Their ultimate size and dimensions (i.e., width and length of the linkage) will depend on several factors, including habitat types in the linkage, the ecological function(s) the linkage is designed to serve (e.g., overland wildlife movement, drainage), and adjacent land uses. The Linkage Preserves will need to be wide enough to support the suite of species expected to use the linkage, including movement habitat for more mobile species and "live-in" habitat for more sedentary species, and to provide adequate setbacks from adjacent land uses and potential edge effects, including invasive species, runoff, pollutants, lighting, and noise (see discussion of permanent indirect effects in Chapter 6). Pursuant to Objective L2, the Linkage Preserves inside the UDA will have minimum widths of approximately 600 feet, except where this minimum width is not possible due existing physical

constraints such as adjacent existing land uses or ownership constraints. See Chapter 5 for more details on linkage design criteria (e.g., setbacks) and Avoidance and Minimization Measures.

Seven Linkage Preserves have been identified for PPU 1, provisionally referred to as Linkage Preserves L-1 through L-4, L-7, L-8, and L-9.

Linkage Preserve L-1 (Carson Creek Linkage) will be a criteria-based linkage approximately 2 miles long and will connect Preserve C-1 to undeveloped lands east of the UDA. It is anticipated that Preserve L-1 will be bordered by urban development with full buildout of the UDA. Preserve L-1 will be approximately 231 acres and largely consist of Valley Grassland, Vernal Pools, and Swales. The primary purpose of Linkage Preserve L-1 will be to facilitate wildlife movement in the northeastern portion of the Plan Area and to maintain a hydrological connection of an unnamed stream between Core Preserve C-1 and undeveloped lands located east of the UDA. Although focused species surveys have not been conducted in Linkage Preserve L-1, it is likely to support vernal pool fairy shrimp and possibly vernal pool tadpole shrimp. Linkage Preserve L-1 will also be designed to support a vernal pool with a known occurrence of Sacramento Orcutt grass, and this vernal pool will be protected from adjacent future development by an adequate setback (see discussion in Chapter 5). Linkage Preserve L-1 will also be designed to maintain the hydrology of wetlands contained within Linkage Preserve L-1 by incorporating the Avoidance and Minimization Measures described in Chapter 5. Because Linkage Preserve L-1 will be crossed by roads, additional design features and Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained.

Linkage Preserve L-2 (Deer Creek Linkage) will be approximately 2.5 miles long and designed to connect to Core Preserve C-1 via Linkage Preserve L-1 to criteria-based Preserve to the south outside the UDA. In the north, Linkage Preserve L-2 will connect directly to Linkage Preserve L-1 just north of Glory Lane and just south of where Linkage Preserve L-1 will connect to Core Preserve C-1. It is anticipated that Linkage Preserve L-2 will be bordered by urban development with full buildout of the UDA. Linkage Preserve L-2 will be approximately 158 acres and will mostly consist of Valley Grassland, Stream/Creek VPIH, Vernal Pools, and Swales. The primary purpose of Linkage Preserve L-2 will be to facilitate wildlife movement in the northeastern portion of the Plan Area and to maintain a hydrological connection of an unnamed stream between Core Preserve C-1 and existing preserves and SSHCP Preserves located south of the UDA. Although focused species surveys have not been conducted in Linkage Preserve L-2, it is likely to support vernal pool fairy shrimp and possibly vernal pool tadpole shrimp. Linkage Preserve L-2 will also be designed to maintain the hydrology of wetlands contained within Linkage Preserve L-2 by incorporating the Avoidance and Minimization Measures described in Chapter 5. Because Linkage Preserve L-2 is expected to be crossed by roads, additional design features and Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained.

Linkage Preserve L-3 (Heritage Falls Linkage) will be a criteria-based linkage approximately 2 miles long, designed to connect the northern end of Core Preserve C-1 to the eastern portion of Satellite Preserve S-1. Linkage Preserve L-3 will run east approximately 1 mile from Satellite Preserve S-1, north of a mining operation, then trend south approximately 1 mile to Core Preserve C-1. It is anticipated that Linkage Preserve L-3 will be bordered by urban development at full buildout of the UDA. Linkage Preserve L-3 will be approximately 272 acres mostly consisting of Valley Grassland, Vernal Pools, and smaller areas of Swale. The primary purpose of Linkage Preserve L-3 is to facilitate wildlife movement between Core Preserve C-1 and Satellite Preserve S-1. Although focused surveys have not been conducted in Linkage Preserve L-3, it is likely to support vernal pool fairy shrimp and possibly vernal pool tadpole shrimp. At a minimum, Linkage Preserve L-3 will need to cross Grant Line Road, so Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained (see Chapter 5).

Linkage Preserve L-4 (Sunrise Douglas Linkage) will be a criteria-based linkage approximately 1 mile long designed to connect Core Preserve C-1 with an existing preserve located just south of Douglas Road. Linkage Preserve L-4 will generally be bordered on the west by existing development, and it is anticipated that Linkage Preserve L-4 will be bordered by additional urban development with full buildout of the UDA. Linkage Preserve L-4 will be approximately 102 acres largely consist of Valley Grassland, Vernal Pools, Swales, and Stream/Creek (VPIH). The primary purpose of Linkage Preserve L-4 is to facilitate wildlife movement and maintain the hydrological connection of an unnamed stream that runs between Core Preserve C-1 and an existing preserve south of Douglas Road. Linkage Preserve L-4 contains documented occurrences of vernal pool tadpole shrimp and possibly also supports vernal pool fairy shrimp. Because Linkage Preserve L-4 will connect to Core Preserve C-1 at Grant Line Road on the east and to an existing preserve at Douglas Road on the south, Avoidance and Minimization Measures will be employed at the unnamed stream to ensure that habitat linkage functions are maintained (see Chapter 5).

Linkage Preserve L-7 (Sun Creek Linkage) will be approximately 1.3 miles long and designed to connect Minor Preserve M-1 to Satellite Preserve S-4. Linkage Preserve L-7 will be bordered by urban development with full buildout of the UDA. Linkage Preserve L-7 will be approximately 92 acres mostly consisting of Valley Grassland, Vernal Pools, Swales, and Stream/Creek (VPIH). The primary purpose of Linkage Preserve L-7 is to facilitate wildlife movement and maintain a hydrological connection of an unnamed stream between Minor Preserve M-1 and Satellite Preserve S-4. Although focused surveys have not been conducted in this linkage area, it is likely to support vernal pool fairy shrimp, western spadefoot, and possibly vernal pool tadpole shrimp. Linkage Preserve L-7 will be crossed by several roads. Therefore, additional design features and Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained (see Chapter 5).

Linkage Preserve L-8 (Rio Del Oro Linkage) will be a criteria-based linkage approximately 0.4 mile long designed to connect Satellite Preserve S-1 to an existing preserve to the west. Linkage Preserve L-8 will be adjacent to existing development on the south and it is anticipated that Linkage Preserve L-8 will be bordered by additional urban development with full buildout of the UDA. Linkage Preserve L-8 will be approximately 27 acres largely consisting of Valley Grassland, Vernal Pools, Swales, Stream/Creek (VPIH), and Open Water. The primary purpose of Linkage Preserve L-8 is to facilitate wildlife movement and maintain a hydrological connection of an unnamed stream between Satellite Preserve S-1 and an existing preserve. Although focused surveys have not been conducted in the Linkage Preserve L-8 area, it is expected to support vernal pool fairy shrimp and possibly vernal pool tadpole shrimp. Linkage Preserve L-8 will likely be crossed by roadways. Therefore, additional design features and Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained (see Chapter 5).

Linkage Preserve L-9 will be approximately 1.5 miles long designed to connect Minor Preserve M-2 and Minor Preserve M-3. Linkage L-9 will be approximately 42 acres mostly consisting of Valley Grassland, Vernal Pools, Swales, and Stream/Creek (VPIH). Linkage Preserve L-9 will consist primarily of criteria-based Preserve, but will also include a small amount of Hardline Preserve. Linkage L-9 generally will be located in the west, north, and east corners of Jackson Road and Grant Line Road. The primary purpose of Linkage Preserve L-9 is to facilitate wildlife movement and maintain the hydrological connection of an unnamed stream between Minor Preserve M-2 and Minor Preserve M-3. Although focused surveys have not been conducted in the Linkage Preserve L-9 area, it is expected to support vernal pool fairy shrimp and possibly vernal pool tadpole shrimp. Linkage Preserve L-9 will be crossed by Grant Line Road and Jackson Road. Therefore, additional design features and Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained (see Chapter 5).

Laguna Creek Wildlife Movement Corridor

The Laguna Creek Wildlife Movement Corridor in PPU 1 will be designed to connect Minor Preserve M-1 in the east to Minor Preserve M-3 and existing preserve in PPU 3 to the west. The Laguna Creek Wildlife Movement Corridor extends approximately 3 miles through PPU 1 between the western boundary of PPU 1 to Minor Preserve M-1. The westernmost segment of the Laguna Creek Wildlife Movement Corridor will be located between the PPU 1 western boundary and Sunrise Boulevard, where it will connect to the northwest corner of Minor Preserve M-3. It will extend north of Jackson Road east of and parallel to Sunrise Boulevard approximately 0.4 mile, where it will then trend east and northeast for approximately 2.2 miles to connect with Minor Preserve M-1. Along the east-northeast segment, it will connect Satellite Preserves S-3, S-4, and S-5. The Laguna Creek Wildlife Movement Corridor in PPU 1 will comprise mostly Valley Grassland, Open Water, and Cropland, but will also include smaller areas of Stream/Creek, Freshwater Marsh, Vernal Pool, and Swale. The Laguna Creek Wildlife

Movement Corridor in PPU 1 supports documented occurrences of vernal pool tadpole shrimp and legenere, and provides modeled habitat for Covered Species such as vernal pool fairy shrimp and western pond turtle.

The Laguna Creek Wildlife Movement Corridor within PPU 1 is approximately 192 acres.

Cosumnes River/Deer Creek Wildlife Movement Corridor

Approximately 69 acres of the Cosumnes River/Deer Creek Wildlife Movement Corridor crosses through PPU 1 in the UDA. This is part of the broad 1-mile long Corridor in PPU 5 that borders the UDA. This part of the Corridor is composed of almost all Valley Grassland in the Vernal Pool Ecosystem.

7.5.1.2 PPU 2

PPU 2 encompasses approximately 9,271 acres located in the northern portion of the Plan Area (see Figure 7-3). PPU 2 is bordered on the north by U.S. Highway 50, on the east by Sunrise Boulevard, on the south by Jackson Highway, and on the west by Bradshaw Road. A substantial portion of PPU 2 is already developed, including Mather Field and urban development directly north and southeast of Mather Field Airport. PPU 2 supports 3,180 acres of High-Density Development, 239 acres of Low-Density Development, 181 acres of Major Roads, and 1,426 acres of Disturbed land covers, which together account for 54% of the total land cover in PPU 2. The co-dominant land cover in PPU 2 is Valley Grassland, comprising 3,589 acres of PPU 2. PPU 2 also contains 36 acres of Open Water, Stream/Creek, and Freshwater Marsh (combined), and 70 acres of Vernal Pool. It is anticipated that a majority of PPU 2 will eventually be urbanized.

PPU 2 contains documented occurrences for many of the Covered Species, notably the only Ahart's dwarf rush documented occurrence in the Plan Area (Figure 3-3) and occurrences for vernal pool invertebrates such as vernal pool fairy shrimp (34 occurrences) and vernal pool tadpole shrimp (97 occurrences), but the occurrence numbers are smaller than in PPUs 1 and 3. All of the bird Covered Species have been documented in PPU 2 except greater sandhill crane.

Overview of Conservation Strategy for PPU 2

Approximately 584 total acres in PPU 2 will be preserved in the SSHCP Preserve System (Table 7-5). All of the SSHCP Preserves in PPU 2 will be connected. Core Preserve C-2 will connect to the existing Mather Field Preserve to enhance Preserve value. SSHCP Preserves in PPU 2 will also be directly connected to existing preserves within PPU 2, and in PPU 3 (Vernal Pool Prairie Preserve) to the south by Linkage Preserve L-5 (Jackson Linkage). This Preserve System connectivity in PPU 2 will, therefore, contribute to achieving Objective L2 (Table 7-1).

Core Preserve

The Preserve System in PPU 2 includes a new Core Preserve (Core Preserve C-2) of approximately 522 acres (Figure 7-3). Although this Preserve is not large enough to be considered a Core Preserve by itself, the Conservation Strategy treats Core Preserve C-2 as a Core Preserve because it will connect with the existing 1,270-acre Mather Field Preserve along its southern boundary to form a single large Core Preserve.

The eastern boundary of Core Preserve C-2 will generally be at Eagles Nest Road, an existing obstacle to species movement and dispersal and that eliminates hydrological connections via overland surface flow from wetland resources to the east. Further, most of the wetland resources east of Eagles Nest Road are largely degraded by overburden that was deposited during construction of Folsom South Canal or from agricultural and urban land uses; therefore, they are not targeted for preservation in this Plan. However, one area east of Eagles Nest Road supports high-quality vernal pool resources that warrant protection. This area contains high-density vernal pool complexes and is considered likely to contain covered vernal pool species. The southeastern portion of Core Preserve C-2 will preserve these resources. At full buildout of the UDA, a majority of the land east of Core Preserve C-2 will likely be residential, commercial, and/or quasi-public land use.

The southern boundary of Core Preserve C-2 will be approximately 0.5 mile north of Jackson Highway. The area between the southern boundary of Core Preserve C-2 and Jackson Highway supports vernal pools, but these are disturbed, not abundant, and fragmented by existing small-lot agricultural-residential land uses. Although Core Preserve C-2 will protect the hydrology of vernal pool complexes within the Preserve, achieving a functional hydrological connection to the existing preserve south of Jackson Road via the agricultural-residential parcels will be difficult. Many of the drainages have been bermed, redirected, or developed, or simply do not drain to the existing preserve to the south. Such land uses typically have lower preservation value as core habitat and lower potential for cost-effective remediation because the landscape is disturbed and fragmented. Future land uses south of Core Preserve C-2 may remain agricultural-residential or could become residential or commercial development at full buildout of the UDA. However, as described below, a habitat linkage (Linkage 5) will be established to connect Core Preserve C-2 with the existing preserve south of Jackson Highway.

The western boundary of Core Preserve C-2 is generally bordered by currently undeveloped land and small-lot agricultural-residential land uses, but it is anticipated that land uses west of Core Preserve C-2 will eventually be residential and commercial development at full buildout of the UDA. Areas west of Core Preserve C-2 are at a lower elevation than the interior of Core Preserve C-2 where the vernal pools are located. This will ensure that the sub-watersheds and

hydrology of protected vernal pool complexes within Core Preserve C-2 remain undisturbed by any development-related changes in hydrology and drainage that may occur west of the Preserve edge (e.g., runoff from developed areas will naturally drain away from the wetland resources in Core Preserve C-2).

Core Preserve C-2 largely consists of vernal pool invertebrate habitat (Vernal Pool, Swale, Stream/Creek (VPIH), and Valley Grassland). Protected vernal pools occur on the Laguna landform, Modesto Upper Unit Formation, Riverbank Middle Unit Formation, and South Fork Gravel Formation (Chapter 4).

Documented occurrences of Covered Species at the existing Mather Field Preserve include vernal pool tadpole shrimp, vernal pool fairy shrimp, mid-valley fairy shrimp, legenere, and burrowing owl (*Athene cunicularia*). These and several other Covered Species also have potential to occur in the Core Preserve C-2, based on the presence of modeled habitat.

Kiefer Boulevard currently separates the existing Mather Field Preserve from Core Preserve C-2 to the south. To minimize fragmentation and maintain connectivity of Core Preserve C-2 with Mather Field Preserve, and to reduce the chance of road kill in the area, a grade separation and road crossing at Morrison Creek will be constructed to the specifications outlined in the Avoidance and Minimization Measures discussed in Chapter 5. These Avoidance and Minimization Measures will facilitate movement of wildlife and maintain hydrological connectivity between Mather Field Preserve and Core Preserve C-2.

Linkage Preserves

Two hardline Linkage Preserves totaling approximately 62 acres will be established in PPU 2. Linkage Preserve L-5 will consist of approximately 23.4 acres in a north–south linkage between Core Preserve C-2 and the existing Vernal Pool Prairie Preserve south of Jackson Road in PPU 3. Linkage Preserve L-10 will consist of approximately 38.6 acres connecting existing preserves in PPUs 1 and 3.

Linkage Preserve L-5 (Jackson Linkage) will be approximately 0.5 mile long and designed to connect Core Preserve C-2 in the north to the existing preserve in the south. It is anticipated that Linkage Preserve L-5 will be bordered by urban development on the east and west, but it is possible that the area could remain agricultural-residential. Linkage Preserve L-5 will be approximately 23 acres consisting of Valley Grassland, Vernal Pools, and smaller areas of Swale and Stream/Creek (VPIH). The primary purpose of Linkage Preserve L-5 is to facilitate wildlife movement between Core Preserve C-2 and the existing preserve in the north and the existing preserve in the south. Although focused surveys have not been conducted, Linkage Preserve L-5 is likely to support vernal pool fairy shrimp and possibly vernal pool tadpole shrimp. Linkage

Preserve L-5 will be designed to maintain the hydrology of wetlands contained within the linkage by incorporating the Avoidance and Minimization Measures described in Chapter 5. Linkage Preserve L-5 will be crossed by Jackson Highway where it connects to the existing preserve in PPU 3 and possibly crossed by other new roads. Because Linkage Preserve L-5 will be crossed by roads, additional design features and Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained.

Linkage Preserve L-10 will be an approximately 39-acre Linkage Preserve that will generally run along the Frye Creek tributary to Laguna Creek approximately 1.5 miles southwest from Sunrise Boulevard, where it will connect to Satellite Preserve S-5 and existing preserve at Eagles Nest Road at the extreme northeast corner of an existing preserve in PPU 2/PPU 3. Linkage Preserve L-10 will consist of Valley Grassland, Cropland, and small areas of Open Water, Stream/Creek (VPIH), Seasonal Wetland, and Swale.

7.5.1.3 PPU 3

PPU 3 encompasses 14,303 acres located in the northwestern portion of the Plan Area (see Figure 7-3). PPU 3 is bordered by Jackson Highway on the north, Sunrise Boulevard on the east, Deer Creek and the Cosumnes River floodplain boundary on the south, the Central California Traction railroad line on the southwest, and Bradshaw Road on the west. The dominant land cover in PPU 3 is Valley Grassland, which comprises 7,072 acres (49%). PPU 3 supports substantial urban development in the southwestern portion; High- and Low-Density Development together totals 2,168 acres, or 15% of PPU 3. PPU 3 also contains substantial agriculture (Cropland, Irrigated Pasture-Grassland, Orchard, and Vineyard) totaling 3,410 acres, or 24% of PPU 3. Other natural land covers with substantial acreage in PPU 3 are Open Water, Stream/Creek (VPIH), and Freshwater Marsh, which together total 246 acres, and Vernal Pool and Swale, which together total 508 acres.

PPU 3 contains documented occurrences for many of the Covered Species, notably three of the slender Orcutt grass documented occurrences in the Plan Area, a substantial number of occurrences for vernal pool tadpole shrimp and vernal pool fairy shrimp, and all of the bird Covered Species except ferruginous hawk and greater sandhill crane (Figures 3-20 through 3-28). Occurrences of tricolored blackbird (*Agelaius tricolor*) are especially numerous in PPU 3, with 49 occurrences (19% of the total occurrences in the Plan Area).

Overview of Conservation Strategy for PPU 3

Approximately 1,815 acres in PPU 3 will be preserved under the SSHCP (Table 7-5). The Preserve design focus for PPU 3 is to connect two large existing preserves: the 1,160 acres of existing preserve in the north portion of PPU 3 and the 560 acres of existing preserve in the

central portion. This is accomplished by establishing a new Core Preserve (Core Preserve C-3), which will total approximately 1,046 acres. By linking preserves within PPU 3 and linking to other preserves in PPUs 2 and 4, the Preserve System in PPU 3 is consistent with the principle of establishing habitat linkages among Preserves and will contribute to achieving Objective L2 (Table 7-1).

Core Preserve

In PPU 3, a new Core Preserve (Core Preserve C-3) will total approximately 1,046 acres, all which will be criteria-based Preserve. Core Preserve C-3 will consist of five discrete areas located adjacent to existing preserves in a spatial configuration to fill in gaps between existing preserves. An approximately 770-acre area of Core Preserve C-3 will connect two large existing preserves and will be located between Florin Road on the north, Gerber Road on the south, and between Excelsior Road on the west and Eagles Nest Road on the east. The southwestern portion of this 770-acre Core Preserve C-3 area will include Laguna Creek.

The eastern and southern boundaries of Core Preserve C-3 generally connect to an existing preserve. The boundaries of Core Preserve C-3 will generally follow property lines that capture whole parcels supporting high-density wetland resources. Most of the areas immediately east of the Core Preserve C-3 boundary support agricultural uses and completely lack wetland resources. At full buildout of the UDA, the entire eastern border of Core Preserve C-3 may be adjacent to residential and commercial development, but could also remain in agriculture or be restored, as noted below.

The western boundary of Core Preserve C-3 in PPU 3 is generally defined by Excelsior Road. Wetland resources west of Excelsior Road tend to be scattered on small agricultural-residential parcels ranging in size from several acres to 30 acres. The value of remaining wetlands west of Excelsior Road is compromised by patches of existing development, which usually results in altered wetland hydrology and fragmented habitats. The western boundary of Core Preserve C-3 will likely be bordered by commercial and residential development at full buildout of the UDA, except for the Laguna Creek Wildlife Movement Corridor that trends to the southwest from Core Preserve C-3.

The approximately 1,046 acres of Core Preserve C-3 will mostly consist of Valley Grassland, Vernal Pool, and Swales. Vernal Pools occur on the Laguna and Riverbank Undivided land formations. Smaller acreages (i.e., less than 20 acres each) of other land covers in Core Preserve C-3 will include Blue Oak Savanna, Freshwater Marsh, Riparian, Open Water, and Stream/Creek. Core Preserve C-3 supports documented occurrences and modeled habitat for a number of Covered Species, including documented occurrences for vernal pool fairy shrimp,

burrowing owl, loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), legenere, and slender Orcutt grass.

The hydrological flow across Core Preserve C-3 is generally from the northeast to the southwest. The area to the north of Core Preserve C-3 is hydrologically disconnected from the area to the south of Core Preserve C-3, except where Frye Creek and an unnamed drainage currently convey water from north to south via small pipe culverts. However, the wetland complexes within Core Preserve C-3 are largely intact and connected where pools at lower elevations receive water from pools at higher elevations. The Core Preserve C-3 boundaries will be established to ensure that sub-watersheds for preserved wetland resources are left intact and are capable of maintaining the natural hydrologic regime for those protected resources.

Water that enters Core Preserve C-3 from off-site areas primarily is collected via several drainages and swales that drain into Laguna Creek, which conveys water through the southern portion of Core Preserve C-3 from the northeast to the southwest.

Several properties adjacent to Core Preserve C-3 have habitat restoration potential. These properties are currently in agricultural production but, according to the property owners, have never been deep ripped (which will prevent vernal pool restoration because deep ripping disrupts the clay hardpan soil required to form vernal pools). Historical and current aerial photography reveal faint outlines of past vernal pool wetland signatures that could potentially be restored on these properties. If the vernal pool complexes on these properties are restored and added to Core Preserve C-3, they could add substantial suitable habitat for Covered Species and common species to the Preserve System.

Core Preserve C-3 will be bisected by Florin Road. A grade separation and road crossing where Frye Creek crosses Florin Road will be established to reduce habitat fragmentation, maintain connectivity within Core Preserve C-3, and minimize road kill (see Figure 5-10).

Satellite Preserves

Two Satellite Preserves will be established in PPU 3: Satellite Preserves S-7 and S-9.

Satellite Preserve S-7 will be a criteria-based Preserve adjacent to an existing preserve and generally located south of Florin Road and east of Eagles Nest Road. Satellite Preserve S-7 will be approximately 91 acres consisting mostly of Valley Grassland and Vernal Pool habitat. Satellite Preserve S-7 is primarily designed to protect a documented occurrence of tricolored blackbird and wetland resources. The site's hydrology currently is artificially impounded on the south by berms, creating large marsh areas that are suitable for tricolored blackbird nesting colonies. The eastern portion of Satellite Preserve S-7 connects directly to Laguna Creek, which

runs north–south in this area. Satellite Preserve S-7 is also adjacent to a potential vernal pool re-establishment/establishment site. If the re-establishment/establishment site is acceptable and the landowner agrees to protect the property as a vernal pool re-establishment/establishment site, that site will connect Satellite Preserve S-7 directly to Core Preserve C-3.

Satellite Preserve S-9 will be a criteria-based Preserve located southeast of the Laguna Creek Wildlife Movement Corridor and west of Excelsior Road. Satellite Preserve S-9 will be approximately 31 acres consisting mostly of Valley Grassland, Swale and Vernal Pool. The northwestern portion of Satellite Preserve S-9 will connect directly to Laguna Creek, which runs northeast–southwest in this area. The northeastern portion of Satellite Preserve S-9 will be diagonal from Core Preserve C-3, separated by Excelsior Road. Therefore, additional design features and Avoidance and Minimization Measures will be employed to ensure that habitat linkage functions are maintained (see AMM ROAD-2 and Figure 5-10).

Laguna Creek Wildlife Movement Corridor

Laguna Creek Wildlife Movement Corridor will connect south from Satellite Preserve S-7, trending due south approximately 0.75 mile to Gerber Road, where it will then trend due west for approximately 1 mile and connect to Core Preserve C-3 and an existing preserve. Within Core Preserve C-3 and the existing preserve, Laguna Creek trends southwest and exits an existing preserve at Excelsior Road, where it is again designated the Laguna Creek Wildlife Movement Corridor. It trends west–southwest approximately 2 miles as the Laguna Creek Wildlife Movement Corridor and existing preserve where it is bordered on both sides by the Wildhawk, Silver Springs, and Emerald Creek residential developments until it exits PPU 3 at the railroad line just east of Carmencita Avenue, where it continues southwest within the UDA but outside the PPUs. The minimum width of both the Laguna Creek Wildlife Movement Corridor and existing preserve between the residential developments is currently approximately 400 feet.

The Laguna Creek Wildlife Movement Corridor within PPU 3 is approximately 250 acres.

Linkage Preserves

An approximately 179-acre Linkage Preserve L-6 will connect to the Laguna Creek Wildlife Movement Corridor on the south where it exits Core Preserve C-3 at Excelsior Road. This parcel will add a setback between Laguna Creek and the Silver Springs and Dierks Ranch developments south of the creek.

7.5.1.4 PPU 4

PPU 4 encompasses 5,253 acres located in isolated areas in the northwestern portion of the Plan Area (see Figure 7-4). PPU 4 is generally bordered by the Sacramento City limits on the north,

Highway 99 on the east, Eschinger Road on the south, and Interstate 5 (I-5) on the west. Dominant land covers in PPU 4 are Cropland (1,817 acres), Valley Grassland (1,168 acres), and High- and Low-Density Development (1,122 acres combined). PPU 4 contains documented occurrences for many of the Covered Species, most notably two of the total 11 known occurrences for giant gartersnake (generally along Laguna Creek west of Highway 99), and occurrences for all of the covered bird species, including 17 occurrences for Swainson's hawk (Figure 3-25). Otherwise PPU 4 does not support large occurrence concentrations for any other particular species.

Overview of Conservation Strategy for PPU 4

Approximately 527 acres will be preserved in PPU 4 (Table 7-5).

Preserves in PPU 4 will focus primarily on preservation of Valley Grassland and Freshwater Marsh. These Preserves will connect to Preserves inside the UDA to the east of PPU 4, and will also connect to Cropland Preserve in PPU 6 to the south outside the UDA.

7.5.1.5 PPU 8

PPU 8 encompasses 7,133 acres located in the southern portion of the Plan Area, mostly within the city limits of Galt and Galt's sphere of influence (see Figures 7-4 and 7-5). PPU 8 is bordered by the northern boundary of Galt's sphere of influence on the north, Cherokee Lane on the east, Dry Creek on the south, and Sargent Avenue on the west. The dominant land cover in PPU 8 is Cropland, which occupies 1,773 acres (25%). PPU 8 also includes 986 acres of High-Density Development, 991 acres of Low-Density Development, 1,097 acres of Irrigated Pasture-Grassland, and 1,488 acres of Valley Grassland. Because the majority of PPU 8 is located within Galt's city limits or sphere of influence, it is anticipated that much of PPU 8 will eventually be urbanized.

PPU 8 contains documented occurrences of several Covered Species, including five occurrences of greater sandhill crane, 19 of Swainson's hawk, and a single occurrence of western red bat; otherwise, PPU 8 does not support occurrence concentrations of any particular species (Figures 3-3 through 3-30).

Overview of Conservation Strategy for PPU 8

The Preserve System in PPU 8 is limited to Cropland Preserve located in the northwest of the PPU and in the south of the PPU along Dry Creek. Preservation in PPU 8 focuses on high-value Swainson's hawk foraging habitat. This PPU also includes a greater sandhill crane roosting pond (Figure 3-22).

Cropland Preserve

PPU 8 will include 415 acres of Cropland Preserve composed mostly of Cropland and Irrigated Pasture-Grassland. Preservation will also include Valley Grassland, Seasonal Wetland, Swale, and Vernal Pool.

7.5.1.6 Outside PPUs

Laguna Creek Wildlife Movement Corridor Preserve

Laguna Creek runs west from PPU 3 southwest toward Elk Grove. Undeveloped lands and low-density residential occur along and immediately adjacent to the creek, but the area is urbanizing and beginning to develop the lands adjacent to the creek. An 82-acre portion of the Laguna Creek Wildlife Movement Corridor Preserve that is a criteria-based Preserve will extend southwest approximately 1.8 miles to Calvine Road.

7.5.2 Preserve System Outside the UDA by PPU

Table 7-6 provides a summary of the Preserve System outside the UDA by PPU, each of which is described in more detail in the following subsections. Preserve design outside the UDA is less constrained than in the UDA because it generally comprises rural land uses and large, undeveloped parcels. Therefore, the precise locations of SSHCP Preserves outside the UDA are less certain and are described with less detail than the Preserve System inside the UDA. Further, Covered Activities outside the UDA will have limited areas of effects because they are limited to linear road and infrastructure projects (Sections 5.2.3 and 5.2.4) and Preserve management activities (Section 5.2.7). Preserve design outside the UDA will also be guided by the Biological Goals and Measurable Objectives and the Conservation Actions in Table 7-1. As discussed in Chapter 9, SSHCP Preserve acquisitions proposed by the Implementing Entity will be reviewed and approved by the Permitting Agencies.

Table 7-6
Preservation of Natural Land Cover Types in the
Preserve System by PPU Outside the UDA

Land Cover Type	SSHCP Preserves (acres)					
	PPU 1	*PPU 5*	*PPU 6*	*PPU 7*	*Outside PPUs*	*Total*
Wetland Waters						
Freshwater Marsh	0	0	58	15	0	73
Seasonal Wetland	0	31	30	32	0	93
Swale	3	8	13	162	0	186
Vernal Pool	12	35	28	681	0	756

Table 7-6
Preservation of Natural Land Cover Types in the Preserve System by PPU Outside the UDA

Land Cover Type	SSHCP Preserves (acres)					
	PPU 1	*PPU 5*	*PPU 6*	*PPU 7*	*Outside PPUs*	*Total*
Non-Wetland Waters						
Open Water	0	6	45	33	0	84
Stream/Creek	0	33	41	14	0	88
Stream/Creek (VPIH)	0	0	0	0	0	0
Riparian

Terrestrial						
Blue Oak Woodland/Blue Oak Savanna	0	0	0	47	0	47
Cropland/ Irrigated Pasture-Grassland	0	388	8,465	533	0	9,386
Valley Grassland	204	750	623	14,372	0	15,949
Total	**219**	**1,691**	**9,750**	**15,894**	**0**	**27,554**

The following subsections provide more detail for the Preserve System in each of the PPUs outside the UDA. This additional detail includes general descriptions for where criteria-based Preserves should be sited in order to meet the Biological Goals and Measurable Objectives. However, as is the case for the criteria-based preservation inside the UDA, the final spatial configuration of the SSHCP Preserve System outside the UDA may vary somewhat from that described in this section. While the exact Preserve configuration may differ somewhat from the descriptions provided below, the preservation acreages by Preserve category (e.g., Landscape Preserve, Core Preserve, Minor Preserve, etc.) must be achieved. Some shifting of Preserve acreages across PPUs that are located outside of the UDA and shifting of Preserve acres outside of the UDA to area within the UDA are allowable. To ensure that Preserve heterogeneity is maintained throughout the Plan Area, not more that 15% of the total Preserve acreage identified within each PPU can be shifted outside of that PPU (see Table 7-6). In addition, no more than 15% of the total Preserve acreage identified outside of the UDA can be shifted to locations inside of the UDA. The following subsections also provide qualitative discussions of Covered Species preservation in each PPU, as appropriate. The full conservation analysis for Covered Species is provided in Section 7.6.2.

7.5.2.1 PPU 1

Although PPU1 is mostly within the UDA, PPU1 also contains 2,156 acres outside the UDA (see Figures 1-1 and 7-3), of which 1,468 acres are Valley Grassland and 531 acres are Disturbed land cover.

Within PPU 1 outside the UDA, approximately 219 acres will be preserved overall (Table 7-6). The focus of the Preserve design for PPU 1 outside the UDA is to maintain connectivity with Linkage Preserve L-2 (Deer Creek Linkage) inside the UDA and to provide connectivity to an existing preserve both within and south of the UDA. This will be accomplished by establishing a Preserve in PPU 1 outside the UDA, which primarily will include Valley Grassland, as well as Vernal Pool Land Covers. Preservation in PPU 1 outside the UDA will contribute to achieving Objective L2 of Goal 1.

7.5.2.2 PPU 5

PPU 5 encompasses approximately 52,534 acres in the central–eastern portion of the Plan Area (see Figures 1-1 and 7-5). PPU 5 is situated between PPU 7 to the south and the UDA to the north (PPUs 1 and 3), and is bordered by the County line to the east. The dominant land cover in PPU 5 is Valley Grassland (27,463 acres). Blue Oak Woodland and Savanna (6,556 acres), agriculture (Cropland, Irrigated Pasture–Grassland, Orchards, and Vineyards; 8,692 acres), and non-habitat land cover types (Aqueducts, Disturbed, High-Density Development, Low-Density Development, Major Roads, Mine Tailing, Recreation/Landscaped; 6,542 acres) also comprise substantial areas of PPU 5. PPU 5 also has substantial acres of riparian land cover (Mine Tailing Riparian Woodland, Mixed Riparian Scrub, and Mixed Riparian Woodland; 1,401 acres), Seasonal Wetland (446 acres), Stream/Creek (481 acres), Open Water (365 acres), Vernal Pool (339 acres), and Freshwater Marsh (159 acres).

PPU 5 contains documented occurrences for many of the Covered Species (Figures 3-3 through 3-30), most notably virtually all of the documented occurrences for valley elderberry longhorn beetle (154 of 156) clustered in a reach of the Cosumnes River extending approximately 1.6 miles west of Jackson Road. All of the covered bird species have been documented in PPU 5, except for greater sandhill crane.

Overview of Conservation Strategy for PPU 5

Approximately 1,691 acres in PPU 5 will be preserved by the SSHCP (Table 7-6). The Preserve design focus in PPU 5 is primarily to provide habitat linkages among Preserves both outside and inside the UDA, primarily along the Cosumnes River/Deer Creek Corridor. All Preserves in PPU 5 will be criteria-based Preserve. PPU 5 also includes the vast majority of documented occurrences for valley elderberry longhorn beetle in the Plan Area, which is sensitive to habitat fragmentation.

Cosumnes River/Deer Creek Wildlife Movement Corridor

Approximately 1,482 acres will be preserved in PPU 5 in the Cosumnes River/Deer Creek Wildlife Movement Corridor. Valley Grassland and Mixed Riparian Woodland are co-dominant in the portion of the corridor in PPU 5, with some Vernal Pool. Other land covers in the Cosumnes River/Deer Creek Corridor in PPU 5 include Stream/Creek, Cropland, and Mixed Riparian Scrub. Because it is outside the UDA, this corridor has no defined width, but will provide habitat connectivity and a movement corridor. The Permittees estimate that this corridor will be up to 17 miles in length within PPU 5.

Linkage Preserves

Linkage Preserve L-6 will connect the Laguna Creek Wildlife Movement Corridor Preserve from the northwest in PPU 3 to the Cosumnes River/Deer Creek Wildlife Movement Corridor Preserve in PPU 5. Linkage Preserve L-6 will be mostly Valley Grassland . Linkage Preserve L-11 will connect Cosumnes River/Deer Creek Wildlife Movement Corridor to the large Landscape Preserve in PPU 7 to the southeast. The majority of Linkage Preserve L-11 will also be Valley Grassland, but may also include substantial areas of Cropland and Seasonal Wetland.

7.5.2.3 PPU 6

PPU 6 encompasses 95,196 acres outside the UDA in the southwestern portion of the Plan Area. PPU 6 is bisected by I-5. It is bordered on the west by the Sacramento River, on the south by the Mokelumne River, and by Dry Creek (Figures 1-1 and 7-4). The dominant land covers in PPU 6 are Agriculture (58,458 acres) and Valley Grassland (17,633 acres). PPU 6 contains 3,436 acres of Low-Density Development. Notably, PPU 6 contains much of the aquatic and riparian resources in the Plan Area, including 5,048 acres of non-vernal pool aquatic land cover types (Freshwater Marsh, Open Water, and Stream/Creek), which is 69% of these aquatic land covers in the Plan Area outside the UDA and 60% of these aquatic land covers in the entire Plan Area. The 5,097 acres of riparian land covers (Mine Tailing Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland) in PPU 6 account for 70% of the riparian land cover in the Plan Area outside the UDA and 52% of the riparian land covers in the entire Plan Area. Finally, Vernal Pool and Swale cover 1,068 acres in PPU 6.

Reflecting its large size, substantial riparian, aquatic, valley grassland, and agricultural habitats, and relative lack of development, PPU 6 contains documented occurrences for many of the Covered Species (Figures 3-3 through 3-30). PPU 6 is the most important PPU for the covered bird species. All of the covered birds have been documented in PPU 6, including 281 (71%) occurrences for Swainson's hawk, 190 (92%) occurrences for greater sandhill crane, and 55% or more of the occurrences for northern harrier and white-tailed kite. In addition, PPU 6 includes 8

of the 10 occurrences of dwarf downingia in the Plan Area, 15 of the 53 occurrences of legenere, and 41 of the 62 occurrences of Sanford's arrowhead.

Overview of Conservation Strategy in PPU 6

Approximately 9,750 acres will be preserved in PPU 6 (Table 7-6). The Preserve design focus is preserving existing agricultural lands that provide habitat for several of the broad-ranging Covered Species, most notably Swainson's hawk (see Objectives SH1, SH2, SH5 in Table 7-1) and greater sandhill crane (see Objectives GS2, GS4, and GS6 in Table 7-1).

Cropland Preserve

The SSHCP will establish approximately 8,465 acres of Cropland Preserve in PPU 6, consisting mostly of Cropland and Irrigated Pasture–Grassland land cover types. Other natural land covers are also present in this Cropland Preserve, but these agricultural lands will be preserved and managed primarily for the benefit of Covered Species that forage in row crops, and will generally be adjacent to existing cropland preserve.

Cosumnes River/Deer Creek Wildlife Movement Corridor

Approximately 812 acres of the Cosumnes River/Deer Creek Wildlife Movement Corridor will be preserved within PPU 6, connecting to the Preserves within PPU 5. The corridor will connect where it exits PPU 3 on the northeast corner of PPU 6. The portion of the corridor in PPU 6 is composed mostly of Mixed Riparian Woodland and Agricultural lands.

Satellite Preserve

Satellite Preserve S-10, which is mostly located in PPU 4, may also have acreage located in PPU 6. Land covers in this portion of Satellite S-10 will be mostly Cropland, Mixed Riparian Woodland, and Freshwater Marsh.

7.5.2.4 PPU 7

PPU 7 encompasses 90,906 acres in the southeastern portion of the Plan Area (see Figure 7-5). PPU 7 is bordered by PPU 5 on the north, the Sacramento County line and Dry Creek on the south, the county line on the east, and the north–south alignments of Cherokee Lane and Davis Road on the west. The dominant land covers in PPU 7 are Valley Grassland, which comprises 52,278 acres of the PPU, and Agriculture which comprises 20,695 acres (much of it Vineyard in the southern and western portions). Low-Density Development also accounts for 5,306 acres of PPU 7. PPU 7 contains a large proportion of the Blue Oak Woodland and Savanna in the Plan Area, which together comprise 5,861 acres or 40% of the total Blue Oak Woodland and Savanna

in the Plan Area (second only to PPU 5, which contains 6,556 acres of Blue Oak Woodland/Savanna). PPU 7 also contains by far the largest area of Vernal Pool, with 2,221 acres, or 49% of the Vernal Pool in the Plan Area.

Reflecting its large size, substantial valley grassland and vernal pool habitats, and relative lack of development, PPU 7 contains documented occurrences for many of the Covered Species (Figures 3-3 through 3-30). With more than half of the vernal pool acreage in the Plan Area, PPU 7 is extremely important for preservation of vernal pool species and contains 315 of 533 documented occurrences for vernal pool fairy shrimp, all 48 occurrences for pincushion navarretia, all 28 occurrences for California tiger salamander, and 19 of 29 occurrences for western spadefoot in the Plan Area. Further, all of the covered birds except white-tailed kite have been documented in PPU 7.

Overview of Conservation Strategy for PPU 7

Approximately 15,894 acres of the Preserve System will be located in PPU 7. SSHCP Preserves in PPU 7 will include a large Landscape Preserve and Linkage Preserves that will connect to the Cosumnes River/Deer Creek Wildlife Movement Corridor in PPU 5. The Preserve design focus in PPU 7 is landscape-scale preservation of the Vernal Pool Ecosystem, in areas that are adjacent to or near existing preserves, including the 12,500-acre Chance Ranch and other mitigation sites and mitigation banks in the area.

Landscape Preserves

The Landscape Preserve in PPU 7 must be at least 10,500 acres in size and will be located strategically to connect with existing preserves. The vast majority of this Landscape Preserve will be Valley Grassland. This Landscape Preserve will also contain Vernal Pool, Swale, Stream/Creek, Seasonal Wetland, and other land covers.

Linkage Preserves

A 314-acre portion of Preserve Linkage L-11 will cross over from PPU 5 into PPU 7. This segment completes the connection between the Cosumnes River/Deer Creek Wildlife Movement Corridor in PPU 5 and the large Landscape Preserve in PPU 7. This segment of Linkage Preserve L-11 is composed almost entirely of Valley Grassland, with some Vernal Pool.

7.5.3 Preserve Connectivity

Core and Minor Preserves established by the SSHCP will be connected by Linkage Preserves to other SSHCP Preserves and existing preserves within the Plan Area. SSHCP Linkage Preserves will be designed to maintain connectivity among the preserves, providing for wildlife movement and, in many cases, hydrologic connections between preserves (see Objective L2 in Table 7-1). The ultimate

size and dimensions of the Linkage Preserves (i.e., width and length) will depend on several factors, including habitat types in the linkage, the ecological function (or functions) the linkage is designed to serve (e.g., overland wildlife movement, drainage), and adjacent land uses.

The three Core Preserves inside the UDA (Section 7.5.1) will be linked by minimum 600-foot-wide Linkage Preserves (see Objective L2 in Table 7-1). These Linkage Preserves will follow stream channels, where possible, to maintain hydrologic connectivity. In addition to linking the three Core Preserves within the UDA, smaller minor and Satellite Preserves will also be connected for a total of 10 Linkage Preserves in the UDA.

The Landscape Preserve located outside of the UDA in PPU 7 and some Cropland Preserve in PPU 6[6] will also be connected to preserves inside the UDA by linkages, including the Cosumnes River Wildlife Movement Corridor, Preserve L-5, and SSHCP Preserves and existing preserves connecting PPU 5 to PPU 1.

All Linkage Preserves will meet the Landscape Preserve selection criteria listed in Table 7-1. In limited circumstances, a Satellite Preserve may need to be established to protect a species occurrence, and that Preserve may not be able to be connected to other Preserves due to existing and planned development patterns.

Additional connectivity in the Plan Area will be provided by some streams with associated Stream Setbacks that are not part of the SSHCP Preserve System (see AMMs STREAM-1, STREAM-2, and STREAM-3 in Section 5.4). Protection of streams and Stream Setbacks, including those within Linkage Preserves, will help to achieve several Measurable Objectives, including Objectives W1 and W2 (Stream Setbacks) and Objective W3 (design and avoidance measures). These Stream Setbacks are intended to protect water quality but will also facilitate wildlife movement and dispersal of seeds and cysts via wildlife or water flows in the SSHCP Preserve System.

7.5.4 Studies Required by SSHCP Biological Goals and Measurable Objectives

Several of the measurable objectives listed in Table 7-1 require that the Implementing Entity conduct discrete studies to determine how AMMs should be implemented, or to better understand the ecology of Covered Species in the Plan Area (Table 7-7). These studies are different from the special studies that will help the Implementing Entity to monitor effectiveness of the Conservation Strategy (Section 8.3.3.5).

[6] Note that most SSHCP Covered Species that will use cropland preserves are avian species and are capable of flying from one Preserve to the next. Therefore, linkage of agricultural preserves is not essential and may not occur in many instances.

Table 7-7
Studies Required by SSHCP Measurable Objectives

Description of Required Study	Timing for Study
In accordance with Objective CTS3, prepare targeted species mobility studies to determine if California tiger salamander mobility between breeding ponds or between breeding ponds and upland refugia will be affected by Rural Transportation Project Covered Activities within California tiger salamander modeled habitat. Data relevant to determining California tiger salamander movement must be collected for at least 3 years, and the study will be updated through new data collection and consultation with USFWS and CDFW every 10 years. The mobility study methodology will be prepared in consultation with USFWS and CDFW, and will need approval from USFWS and CDFW prior to implementation. The data will be used by the project proponent to select the most appropriate design requirements to maintain and facilitate California tiger salamander movement. Modeled habitat near each of the following roadways will be the subject of targeted species mobility studies for California tiger salamander: • Twin Cities Road east of State Route 99 • Ione Road within PPU 7 • Clay Station Road from Dillard Road south to Sacramento County line with San Joaquin County (Plan Area boundary) After construction is complete, California tiger salamander movement across and along the road will be monitored to assess how their movement changed in response to the project, and if additional design considerations will be used as future projects are implemented along the roadway.	Study initiated within 18 months of SSHCP permit issuance. Study duration at least 3 years, and updated every 10 years.
In accordance with Objective GGS 3, measure hydrologic parameters (flow rate, temperature, timing of flows) within Badger Creek in locations known to be occupied by giant gartersnake. Three monthly hydrologic measurements will be made during the dry season of an average or better rainfall year. Each recording will occur over a full week to identify any regular interruptions in flow or changes in conditions due to diversions or inflows. After determining the baseline hydrologic parameters for occupied giant garter-snake habitat along Badger Creek, identify water sources that could be used to supplement natural and agricultural flows in the future to maintain that hydrology throughout Badger Creek during the summer months when agricultural runoff may wane.	Study initiated within 2 years of SSHCP permit issuance.
In accordance with Objective TB6, conduct study to identify management actions to protect tricolored blackbird colonies from environmental stressors. Stressors to be studied for reduction include nest predation (e.g., coarse netting to reduce nest predation, reducing trees and bushes around colonies to reduce perches for predators, mesopredator trapping). Select one or more existing tricolored blackbird colonies as experimental populations. If a large colony is available, test several potential feasible management actions within that one colony. Experimental treatments will be evaluated as to whether they indicate a measurable and biologically significant decrease in nest predation or increased fledgling success. Treatments will also be evaluated for feasibility,	Study initiated within 2 years of SSHCP permit issuance, and completed within 5 years of SSHCP permit issuance.

7.6 Conservation Analysis

This section describes the beneficial effects of the Conservation Strategy and compares those to the adverse effects described in Chapter 6 to make conclusions about the expected

effectiveness of the Conservation Strategy in achieving the Biological Goals and Measurable Objectives (see Table 7-1).

7.6.1 Natural Land Cover Analysis

This section analyzes the adverse effects of the Covered Activities and the benefits of the SSHCP Conservation Strategy for the SSHCP natural land cover types:

- **Aquatic Natural Land Covers**
  - Vernal Pool Ecosystem
    - Valley Grassland (inside the Vernal Pool Ecosystem)
    - Vernal Pool and Swale
    - Stream/Creek (VPIH)
  - Other Aquatic Natural Land Covers
    - Seasonal Wetland
    - Freshwater Marsh
    - Stream/Creek
    - Open Water
    - Riparian
- **Terrestrial Natural Land Covers**
  - Blue Oak Woodland/Savanna
  - Agriculture[7]

Detailed descriptions for SSHCP natural land covers are provided in Chapter 3.

As described in Section 6.5, indirect impacts to natural land covers were qualitatively analyzed collectively. Qualitatively, permanent indirect effects to natural land covers, including a decrease in habitat functionality and viability, will result from the following environmental stressors in the absence of AMMs: (1) permanent alterations to watershed hydrographs and degradation of water quality; (2) habitat fragmentation; (3) increased risk of wildfire, which can result in increased thatch, and the impacts from fire suppression (i.e., grading); (4) alterations of vernal pool hydrology; (5) increased human activity, which can result in trampling of natural land covers or increased trash and debris; (6) invasive weeds, which can alter the composition and structure of

[7] Agriculture includes Cropland and Irrigated Pasture–Grassland.

natural land covers; and (7) pesticides and fertilizers, which can reduce pollinators or exterminate or weaken species that comprise the habitat. Additionally, temporary construction-related indirect effects (see Section 6.3.2) will result from the following stressors in the absence of AMMs: (1) temporary alterations to hydrographs and degradation of water quality during construction; (2) laydown or trampling of vegetation during construction; (3) construction dust; (4) increased human presence during construction; and (5) construction trash and debris. Indirect permanent impacts to vernal pool, swale, and stream/creek (VPIH) were quantified and are discussed further in Section 7.6.1.1.1.

The conservation analysis for natural land covers is broken down into aquatic (Section 7.6.1.1) and terrestrial natural (Section 7.6.1.2) land covers.

7.6.1.1 Aquatic Natural Land Covers

The conservation analysis for aquatic natural land covers is broken down into those that make up the Vernal Pool Ecosystem (Section 7.6.1.1.1) and other aquatic land covers (Section 7.6.1.1.2).

The Vernal Pool Ecosystem considers the interconnectivity between Swale, Stream/Creek (VPIH), Vernal Pool, and Valley Grassland. Vernal pools cannot persist absent surrounding uplands, and, thus, an ecosystem approach will be used when establishing the SSHCP Preserve System to ensure a properly functioning Vernal Pool Ecosystem. Therefore, the Vernal Pool Ecosystem is discussed separately from other aquatic land covers.

7.6.1.1.1 Vernal Pool Ecosystem

As described in Chapter 3, the Vernal Pool Ecosystem includes the following natural land cover types: Vernal Pool, Swale, Stream/Creek (VPIH), and Valley Grassland that are hydrologically connected. The Vernal Pool Ecosystem in the Plan Area provides the primary constituent elements described in the Federal Critical Habitat (USFWS 2006c) identified for four of the vernal pool SSHCP Covered Species, including slender Orcutt grass, Sacramento Orcutt grass, vernal pool fairy shrimp, and vernal pool tadpole shrimp. The primary constituent elements of these Covered Species are described in Section 3.6. In short, these primary constituent elements include: (1) topographic features within a matrix of uplands that result in continuously, or intermittently, flowing surface water in the depressional features that provide for dispersal and promote hydroperiods of adequate length in the pools for each of four vernal pool SSHCP Covered Species; (2) depressional features that become inundated during winter rains and that continuously hold water for a period long enough to provide adequate water for incubation, maturation, and reproduction for the crustaceans and to promote germination, flowering, and seed production of predominantly annual native wetland species for the grasses; (3) sources of food for the crustaceans; and (4) organic and inorganic materials that provide shelter for the crustaceans.

Indirect impacts to the Vernal Pool Ecosystem were partially quantified; indirect impacts to Vernal Pool, Swale, and Stream/Creek (VPIH) were quantified, but indirect impacts to Valley Grassland were not quantified. In total, approximately 17,259 acres, or 16%, of the 103,210 acres of the Vernal Pool Ecosystem in the Plan Area would be removed or indirectly impacted over the proposed 50-year Permit Term; indirect impacts account for 142 acres of the total impact acreage (Table 7-8a). This includes the following impacts to the Vernal Pool Ecosystem: removal of 16,794 acres (64%) and indirect impacts to 132 acres (0.5%) of the 26,048 acres present inside the UDA; and removal of 322 acres (0.4%) and indirect impacts to 9.5 acres (0.01%) of 77,162 acres present outside the UDA. Permanent indirect effects to natural land covers, include the Vernal Pool Ecosystem, are collectively and qualitatively analyzed in Section 7.6.1.

In total, approximately 8,500 acres of the Vernal Pool Ecosystem in the Mather Core Recovery Area would be removed or indirectly impacted over the proposed 50-year Permit Term; indirect impacts account for 113 acres of the total impact acreage (Table 7-8b). This includes the following impacts to the Vernal Pool Ecosystem: removal of 8,118 acres of Valley Grassland, removal of 144 acres, and indirect impacts to 72 acres of Vernal Pool, removal of 112 acres and indirect impacts to 38 acres of Swale, and removal of 13 acres and indirect impacts of 3 acres of Stream/Creek (VPIH).

Table 7-8a
Permanent Effects and Conservation for the Vernal Pool Ecosystem

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Direct and Indirect Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Plan Area-Wide					
Vernal Pool Ecosystem	**17,117**	**142**	**17,259[a]**	**23,284**	**645**
Valley Grassland[b]	16,472	Qualitative	16,472	22,014	0[c]
Vernal Pool	389	94	483	966	389
Swale	234	44	278	278	256[d]
Stream/Creek (VPIH)	22	4	26	26	0

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[b] Refers to Valley Grassland hydrologically connected to the Vernal Pool Ecosystem.
[c] Valley Grassland may be re-established/established at the same time as re-establishment/establishment of Vernal Pool and Swale to form a complete Vernal Pool Ecosystem. However, much of the 645 acres of re-established/established modeled areas will occur on existing Valley Grassland; thus, it is not possible to identify the amount of Valley Grassland re-established/established under the SSHCP.
[d] Re-establishment/establishment to mitigate effects to Stream/Creek (VPIH) is assumed to be in the form of Swale, which has been added to the 234 acres necessary to mitigate effects to swale. Swale re-establishment/establishment may occur in the form of any combination of Swale or Vernal Pool.

Table 7-8b
Permanent Effects and Conservation for the Vernal Pool Ecosystem Within the Mather Core Recovery Area

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Direct and Indirect Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Plan Area-Wide					
Vernal Pool Ecosystem	**8,386**	**114**	**8,500[a]**	**5,493**	**50**
Valley Grassland[b]	8,118	Qualitative	8,118	5,155	0
Vernal Pool	144	72	216	213	50
Swale	112	38	150	90	0
Stream/Creek (VPIH)	13	3	16	26	0

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[b] Refers to Valley Grassland hydrologically connected to the Vernal Pool Ecosystem.

To mitigate 17,259 acres of Covered Activity impacts to the Vernal Pool Ecosystem, the SSHCP preserves 23,284 acres of Vernal Pool Ecosystem, including 966 acres of Vernal Pool, 278 acres of Swale, 26 acres of Stream/Creek (VPIH), and 22,014 acres of hydrologically connected Valley Grassland (Table 7-8a). Of the 23,284 acres of Vernal Pool Ecosystem to be preserved, 5,493 acres of Vernal Pool Ecosystem will be preserved within the Mather Core Recovery Area, including 213 acres of Vernal Pool, 90 acres of Swale, 26 acres of Stream/Creek (VPIH), and 5,155 acres of hydrologically connected Valley Grassland (Table 7-8b). The Conservation Strategy for the Vernal Pool Ecosystem is based on preservation of large assemblages of interconnected Vernal Pool, Swale, and Stream/Creek (VPIH) embedded in Valley Grassland, protecting perched aquifers and maintaining vernal pool hydrology, and maintaining water quality in vernal pool micro-watersheds. Finally, the SSHCP will also re-establish and/or establish components of the Vernal Pool Ecosystem including approximately 389 acres of Vernal Pool and 256 acres of Swale in the form of any combination of Swale or Vernal Pool. Valley Grassland may be re-established/established at the same time as re-establishment/establishment of vernal pools and swales to form a complete Vernal Pool Ecosystem.

Each component or natural land cover comprising the Vernal Pool Ecosystem is described separately below. The Biological Goals and Measurable Objectives applicable to the Vernal Pool Ecosystem are listed in Table 7-9.

Valley Grassland

As discussed in Section 6.5, effects on Valley Grassland hydrologically connected to the Vernal Pool Ecosystem within the Plan Area include direct impacts to 16,471 acres of 97,349 acres in the Plan Area, or 17%. This includes direct impacts to 16,185 acres (66%) of the 24,584 acres present inside the UDA and direct impacts to 286 acres (0.4%) of the 72,765 acres present

outside the UDA. Permanent indirect effects to natural land covers, including Valley Grassland in the Vernal Pool Ecosystem, are qualitatively analyzed in Section 7.6.1.

A total of 22,014 acres of Valley Grassland within the Vernal Pool Ecosystem will be preserved by the SSHCP, including approximately 6,065 acres inside the UDA (Table 7-5) and 15,949 acres outside the UDA (Table 7-6). Also see Section 7.6.1.2, Terrestrial Natural Land Covers, for additional discussion regarding Valley Grasslands.

Vernal Pool

As discussed in Section 6.5, approximately 483 acres, or 11%, of the 4,536 acres of the Vernal Pool in the Plan Area would be removed or indirectly impacted; indirect impacts account for 94 acres of the total impact acreage. More specifically, impacts to Vernal Pool include the removal of 355 acres (38%) and indirect impacts to 85 acres (9%) of the 935 acres present inside the UDA; and removal of 34 acres (0.9%) and indirect impacts to 9 acres (0.2%) of 3,601 acres present outside the UDA.

A total of 995 acres of Vernal Pool will be preserved by the SSHCP, including approximately 210 acres inside the UDA (Table 7-5) and 756 acres outside the UDA (Table 7-6). As discussed in Chapter 3, 1,983 acres of Vernal Pool are already protected in existing preserves in the Plan Area. The Conservation Strategy for the Vernal Pool Ecosystem is based on preservation of large assemblages of vernal pools within the UDA and outside the UDA (primarily in PPU 7),

protecting perched aquifers and maintaining vernal pool hydrology, and maintaining water quality in vernal pool micro-watersheds. Approximately 389 acres of Vernal Pool will be re-established and/or established under the SSHCP, with at least 50 acres within or adjacent to the Mather Core Recovery Area.

Swale

As discussed in Section 6.5, approximately 278 acres, or 22%, of the 1,252 acres of Swale in the Plan Area would be removed or indirectly impacted; indirect impacts account for 44 acres of the total impact acreage. More specifically, impacts to Swale include the removal of 232 acres (50%) and indirect impacts to 43 acres (9%) of the 461 acres present inside the UDA; and removal of 2 acres (0.2%) and indirect impacts to 1 acres (0.1%) of 791 acres present outside the UDA.

A total of 278 acres of Swale will be preserved by the SSHCP, including approximately 92 acres inside the UDA and 186 acres outside the UDA (see Tables 7-5 and 7-6). Approximately 256 acres of Swale will be re-established and/or established in the form of any combination of Swale or Vernal Pool.

Stream/Creek (VPIH)

Approximately 26 acres, or 36%, of the 73 acres of Stream/Creek (VPIH) in the Plan Area would be permanently removed or indirectly impacted; indirect impacts account for 4 acres of the total impact acreage. Of the 68 acres of Stream/Creek (VPIH) inside the UDA, 25 acres (37%) will be permanently impacted; of the 4.8 acres of stream/creek (VPIH) outside the UDA, 1 acre (1%) will be permanently impacted.

A total of 26 acres of Stream/Creek (VPIH) will be preserved by the SSHCP, including approximately 26 acres inside the UDA (see Tables 7-5). Re-establishment and/or establishment to mitigate effects on Stream/Creek (VPIH) will be in the form of any combination of Swale or Vernal Pool, which is included in the approximately 256 acres described above for swale.

Table 7-9
Biological Goals and Measurable Objectives Applicable to the Vernal Pool Ecosystem

Applicable Biological Goals	Related Measurable Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Objective L1. Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (Low-Impact Development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in this table (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50

Table 7-9
Biological Goals and Measurable Objectives Applicable to the Vernal Pool Ecosystem

Applicable Biological Goals	Related Measurable Objectives
	acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, and establish natural land covers, (including Cropland, and Irrigated Pasture–Grassland) that provide habitat for Covered Species.	**Objective VG1.** Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with Conservation Actions in Table 7-1 and in accordance with Section 7.5.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective VP5. Re-establish and/or establish a minimum of 256 acres of Swale or vernal pool for impacts to the Swale and Stream/Creek (VPIH) land covers. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.
	Objective VP6. Re-establish and/or establish a minimum of 300 acres of functional Vernal Pool Ecosystem within or adjacent to (within 1 mile of) the Mather Core Recovery Area.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture–Grassland) that are preserved within the Plan Area.	**Objective HAB3.** Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.

Analysis of Conservation of the Vernal Pool Ecosystem

The Biological Goals and Measurable Objectives that were developed in the SSHCP for Covered Species using the Vernal Pool Ecosystem land cover type will also ensure that the integrated hydrologic and ecological functions of the component land cover types are protected. To meet these Biological Goals and Measurable Objectives, the SSHCP Conservation Strategy will preserve and link approximately 23,284 acres of the highest-quality Vernal Pool Ecosystem in the Plan Area. This

will protect the hydrology and soil conditions necessary for persistence of Covered Species that use this ecosystem, including irreplaceable resources such as Sacramento Orcutt grass and a range of other Covered Species such as vernal pool fairy shrimp, mid-valley fairy shrimp, and California tiger salamander. In addition, the SSHCP Conservation Strategy will re-establish and/or establish approximately 645 acres of Swale and Vernal Pool to ensure adequate acreage remains for the persistence of Covered Species that rely on these land covers in the Plan Area. The SSHCP Preserve System targets preservation within the two vernal pool core recovery areas in the Plan Area. Most SSHCP Preserves containing the Vernal Pool Ecosystem will be entirely within or within 1 mile of the two core recovery areas. The Vernal Pool Ecosystem will be managed and monitored in perpetuity to ensure that the Vernal Pool Ecosystem remains functional over time.

To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves that are not part of the SSHCP Preserve System, thus making a larger-scale contiguous Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves. Large preserves will preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools. Large preserves will also protect subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer.

The SSHCP Preserve System will provide heterogeneity of the Vernal Pool Ecosystem by maintaining the existing ecosystem variability at three main spatial scales: (1) landscape heterogeneity (geologic formations, soils, location within the Plan Area) of preserved vernal pool complexes in the Plan Area; (2) heterogeneity of vernal pool types, spatial patterns, and connectivity within a Preserve; and (3) heterogeneity of individual pools, including sizes, water chemistry, and floristic components. A GIS exercise was conducted that analyzed one possible preserve scenario. From this exercise, Tables 7-10 and 7-11 were created that present the geologic formations and soil unit types that may compose the Preserve System, as compared to the composition of the Plan Area as a whole. These tables demonstrate that the Preserve System can comprise the full range and diversity of soil types and geologic formations associated with the Vernal Pool Ecosystem in the Plan Area. Table 7-12 similarly presents the variation in Vernal Wetland Acre/Density Index scores for the Preserve System, which demonstrates that the Preserve

System can generally maintain the diversity of vernal pool densities and pool sizes as compared to existing conditions in the Plan Area. The Preserve System would focus more on acquiring and preserving parcels with higher densities of pools or larger pools, as these tend to be more intact or more valuable as habitat for vernal pool species. However, large areas of less dense or smaller pools would also be acquired, retaining adequate distributions of these other Vernal Wetland Acre/Density Index (VWADI) categories for those species that preferentially occupy less dense or smaller pools. By preserving vernal pool heterogeneity at these three scales, the likelihood of capturing genetic diversity is increased, and preservation of biodiversity is better assured. By establishing Preserves on each of the geologic landforms throughout the Plan Area that currently support vernal pools, preserving the vernal pool heterogeneity as indicated by soil types and the VWADI index, and by ensuring connectivity among the existing and SSHCP Preserves in the Plan Area, the SSHCP will preserve a broad range of habitat types.

Table 7-10
Geologic Formations Supporting Vernal Pools in the SSHCP Preserve System

Geologic Formation	In Preserve System (acres)	% of Preserve System (acres)	In Plan Area (acres)	% of Plan Area
Laguna Formation	12,897	34.8%	61,282	19.3%

The SSHCP recognizes that removal of 17,117 acres of the existing 103,210 acres of the Vernal Pool Ecosystem will result in the loss of habitat and cause habitat fragmentation. However, habitat fragmentation is less likely in the Plan Area than in other regions as connectivity of the Vernal Pool Ecosystem in the Plan Area will be maintained by establishing large preserves that augment or connect to existing preserves that are not part of the SSHCP Preserve System. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. The SSHCP Preserve System will preserve the upland land cover types that are connected to the

vernal pools both biologically and hydrologically. Burrowing animals and pollinators, for example, while not Covered Species, are essential components of the Vernal Pool Ecosystem and will be protected within Valley Grassland land covers in SSHCP Preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and habitat linkages between SSHCP Preserves and existing preserves would be minimal or would not occur at all.

In the Mather Core Recovery Area, the SSHCP will preserve at least 5,494 acres of the Vernal Pool Ecosystem. Approximately 2,300 of those 5,494 acres will be located within three Core Preserves, which, combined with 3 Minor Preserves, 9 Satellite Preserves, and 10 Linkage Preserves, are designed to connect to existing preserves and fill in the habitat gaps between preserves in the UDA.

Of the 23,284 acres of the Vernal Pool Ecosystem that will be preserved in the Plan Area, 15,578 acres (68%) will be conserved in PPU 7. This will include a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. This Landscape Preserve will encompass the full range of heterogeneity of natural land covers and soil types associated with the Vernal Pool Ecosystem in the Cosumnes/Rancho-Seco Core Recovery Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves are generally established without setbacks in developed areas and sacrifice a portion of the preserved lands to these edge effects, which may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual watersheds based on LIDAR–Preserve boundaries that were established outside the defined watershed, so even without a buffer, the perched aquifer and overland surface flow will not be impacted by adjacent activities. Using a rigorous Preserve Setback strategy and watershed protection in conjunction with low-impact and compatible uses in land planning, the Preserve will maintain existing functions and values of the Vernal Pool Ecosystem in the Preserve System.

In addition to preservation of the Vernal Pool Ecosystem, the Implementing Entity will also establish or re-establish approximately 645 acres of Vernal Pool and Swale in the Plan Area, with a priority on re-establishment before establishment. The SSHCP will prioritize re-establishment within areas that historically had vernal pools, and will limit the densities at which pools can be placed, especially where pools are being added to already functional vernal pool complexes. All re-establishment and establishment sites will be inoculated with inoculum from

the impact or other representative sites, which will assist in maintaining or re-establishing the historical distribution of the species that use the Vernal Pool Ecosystem in the Plan Area. The effectiveness of inoculation will be monitored through a special study, as described in Section 8.3.3.5. Re-establishing pools in historical vernal pool areas will further help to conserve the Vernal Pool Ecosystem by ensuring no net loss of the total acreage in the SSHCP Plan Area.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of the Vernal Pool Ecosystem protected in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 Objectives will benefit the Vernal Pool Ecosystem by preparing and implementing Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). These actions will improve habitat value of the Vernal Pool Ecosystem.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 Objectives will directly benefit the Vernal Pool Ecosystem by requiring that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), that Stream Setbacks be established, and that Avoidance and Minimization Measures be implemented (Objective W2, W3). Goal 3 Objectives will directly benefit the Vernal Pool Ecosystem by outlining Preserve selection and re-establishment/establishment criteria for Valley Grassland, Vernal Pool, and Swale that ensure that adequate acreage of each SSHCP natural land cover remains in the Plan Area to provide necessary breeding, foraging, or sheltering habitat for Covered Species and other Plan Area native species (Objective VG1, VP1, VP2, VP3, VP4, VP5).

As Preserve Management Plans are implemented, grazing will be managed for the benefit of Covered Species habitat, including the Vernal Pool Ecosystem, by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the soil profile and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing condition.

7.6.1.1.2 Other Aquatic Land Covers

Other than the Vernal Pool Ecosystem, described in Section 7.6.1.1.1, which is categorized as an aquatic land cover, the remaining aquatic land covers include Seasonal Wetland; Freshwater Marsh; Stream/Creek; Open Water; and Riparian, which includes Mine Tailing Riparian Woodland, Mixed Riparian Scrub, and Mixed Riparian Woodland. These aquatic natural land covers are referred to in this section as "other" aquatic land covers, which excludes the Vernal

Pool Ecosystem; the use of the term is intended to differentiate these resources from all aquatic natural land covers, which does include the Vernal Pool Ecosystem.

In total, approximately 1,095 acres, or 6%, of the 18,628 acres of the other aquatic land covers in the Plan Area would be removed over the proposed 50-year Permit Term (Table 7-13). This includes the removal of 1, 017 acres (64%) of the 1,660 acres present inside the UDA and removal of 78 acres (0.4%) of 16,968 acres present outside the UDA. Permanent indirect effects to natural land covers are collectively and qualitatively analyzed in Section 7.6.1. The only indirect effect to natural land covers analyzed that does not directly apply to other aquatic land covers is the alteration of vernal pool hydrology, which specifically applies to the Vernal Pool Ecosystem.

Table 7-13
Permanent Effects and Conservation for Other Aquatic Land Covers

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Direct and Indirect Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Plan Area-Wide					
Other Aquatic Land Covers	**1,095**	**Qualitative**	**1,095**	**1,468**	**1,095**
Seasonal Wetlands	105	Qualitative	105	105	105
Freshwater Marsh	127	Qualitative	127	127	127
Stream/Creeks	117	Qualitative	117	117	117
Open Water	155	Qualitative	155	155	155
Riparian[a]	591	Qualitative	591	964	591

[a] Approximately 591 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub will be re-established and/or established; of the 591 acres, 218 acres of the re-establishment or establishment will be for impacts to Mine Tailing Riparian Woodland.

To mitigate 1,095 acres of impacts to the other aquatic land covers, the SSHCP preserves 1,468 acres of these land covers, including 105 acres of Seasonal Wetland, 127 acres of Freshwater Marsh, 117 acres of Stream/Creek, 155 acres of Open Water, and 964 acres of Riparian. The SSHCP will also re-establish and/or establish 1,095 acres of other aquatic land covers, including 105 acres of Seasonal Wetland, 127 acres of Freshwater Marsh, 117 acres of Stream/Creek, 155 acres of Open Water, and 591 acres of Riparian (Table 7-13).

Each component, or natural land cover, that comprises the other aquatic land covers is described separately below. The Biological Goals and Measurable Objectives applicable to these other aquatic land covers are listed in Table 7-14.

Seasonal Wetland

Approximately 105 acres, or 4%, of the 2,600 acres of Seasonal Wetland in the Plan Area would be removed. More specifically, of the 163 acres of Seasonal Wetland in the UDA, approximately

102 acres, or 63% will be removed, and of the 2,438 acres of Seasonal Wetland outside of the UDA, approximately 3 acres, or 0.2%, will be removed.

A total of 105 acres of Seasonal Wetland will be preserved by the SSHCP, including approximately 12 acres inside the UDA (Table 7-5) and approximately 93 acres outside the UDA (Table 7-6). Preserve sites for Seasonal Wetland will be selected in areas that are modeled habitat for Covered Species and, at a minimum, on parcels that are 20 acres or greater. Approximately 105 acres of Seasonal Wetland will be re-established and/or established under the SSHCP.

Freshwater Marsh

Approximately 127 acres, or 4%, of the 2,954 acres of freshwater marsh in the Plan Area would be removed. This direct permanent impact includes the removal of approximately 119 acres, or 30%, of the 392 acres of Freshwater Marsh in the UDA and the removal of approximately 8 acres, or 0.3%, of the 2,562 acres of Freshwater Marsh outside of the UDA.

A total of 127 acres of Freshwater Marsh will be preserved by the SSHCP, including approximately 54 acres inside the UDA (Table 7-5) and approximately 73 acres outside the UDA (Table 7-6). Preserve sites for Freshwater Marsh will be selected in areas that are modeled habitat for Covered Species and that currently support emergent vegetation and that exhibit hydrology that can support Freshwater Marsh. Approximately 127 acres of Freshwater Marsh will be re-established and/or established under the SSHCP.

Stream/Creek

Approximately 117 acres, or 4%, of the 2,778 acres of Stream/Creek in the Plan Area would be removed. More specifically, of the 163 acres of Stream/Creek in the UDA, approximately 92 acres, or 56%, will be removed; of the 2,615 acres of Stream/Creek outside of the UDA, approximately 25 acres, or 1.0%, will be removed.

A total of 117 acres of Stream/Creek will be preserved by the SSHCP, including approximately 29 acres inside the UDA (Table 7-5) and approximately 88 acres outside the UDA (Table 7-6). Preserve sites for Stream/Creek will be selected in areas that have the potential to support Covered Species, are in proximity to the mouth of the Stream/Creek, support water during early spring to mid-fall, are adjacent to existing preserves that are not part of the SSHCP Preserve System, and can be enhanced through management. Approximately, 117 acres of Stream/Creek will be re-established and/or established under the SSHCP.

Open Water

Approximately 155 acres, or 7%, of the 2,344 acres of Open Water in the Plan Area would be removed. This direct permanent impact includes the removal of approximately 154 acres, or 65%, of the 237 acres of Open Water in the UDA and the removal of approximately 1 acre, or 0.03%, of the 2,107 acres of open water outside of the UDA.

A total of 155 acres of Open Water will be preserved by the SSHCP, including approximately 71 acres inside the UDA (Table 7-5) and approximately 84 acres outside the UDA (Table 7-6). Preserve sites for Open Water will be selected in areas that are and link to modeled habitat for Covered Species and can be enhanced through management. Approximately 155 acres of Open Water will be re-established and/or established under the SSHCP.

Riparian

Riparian includes the following land covers: Mine Tailing Riparian Woodland, Mixed Riparian Scrub, and Mixed Riparian Woodland. Approximately 591 acres, or 7%, of the 7,952 acres of Riparian in the Plan Area would be removed. Of the 705 acres of Riparian in the UDA, approximately 551 acres, or 78% will be removed and of the 7,246 acres of Riparian outside of the UDA, approximately 40 acres, or 0.6%, will be removed.

A total of 964 acres of Riparian will be preserved by the SSHCP, including approximately 72 acres inside the UDA (Table 7-5) and approximately 892 acres outside the UDA (Table 7-6). Preserve sites for Riparian will be selected in areas that are modeled habitat for Covered Species; are located within 3 miles of foraging habitat for Covered Species that use riparian habitat for nesting and/or roosting; are multilayered and have a closed canopy structure; are large; and can be enhanced through management. Approximately 591 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub will be re-established and/or established; of the 591 acres, 218 acres of the re-establishment or establishment will be for impacts to Mine Tailing Riparian Woodland.

Table 7-14
Biological Goals and Measurable Objectives Applicable to the Other Aquatic Land Covers

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5.

Table 7-14
Biological Goals and Measurable Objectives Applicable to the Other Aquatic Land Covers

Applicable Biological Goals	Related Biological Objectives
	(minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W1**. Ensure that during implementation of Objective L2 (establishing a minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.
	Objective W2. Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (Low-Impact Development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W6. Covered Activities will avoid a minimum of 20% of first and second order tributaries to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek in the UDA.
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, and establish natural land covers, (including Cropland and Irrigated Pasture–Grassland) that provide habitat for Covered Species.	**Objective SW1.** Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.
	Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.

Table 7-14
Biological Goals and Measurable Objectives Applicable to the Other Aquatic Land Covers

Applicable Biological Goals	Related Biological Objectives
	Objective OW1. Preserve a minimum of acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by TAC). The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.
	Objective RIP1. Objective RIP1. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective RIP2. Re-establish and/or establish a minimum of 591 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture–Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.

Analysis of Conservation of Other Aquatic Land Covers

The SSHCP Conservation Strategy for other aquatic land covers is similar to that of the Vernal Pool Ecosystem, described in Section 7.6.1.1.1; refer to this section for additional details on the SSHCP Conservation Strategy. Preservation of these other aquatic land covers will be consistent with the Conservation Strategy guiding principles (Section 7.1) because it will protect watersheds and their ecosystem functions, and maintain Plan Area land cover heterogeneity between preserves. Protecting and re-establishing and/or establishing the other aquatic land covers in SSHCP Preserves will assist in achieving Goal 2 of the Conservation Strategy to avoid or minimize impacts of future Covered Activities on Plan Area aquatic resources and to ensure "no net loss" of

aquatic resources and aquatic functions within the Plan Area. The Conservation Strategy for aquatic land covers is closely tied to the Aquatic Resources Program (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report), which includes a process to assess and mitigate the effects of Covered Activities on watershed functions and conditions, and an alternatives analysis that would incentivize avoidance of on-site aquatic land covers.

Throughout the Plan Area, the SSHCP Conservation Strategy will preserve and link together the highest-quality aquatic resources, including approximately 1,468 acres of other aquatic land covers. The Preserve System will protect the hydrology and soil conditions necessary for persistence of Covered Species that use these aquatic resources, such as giant gartersnake and western pond turtle. In addition, the SSHCP Conservation Strategy will re-establish and/or establish approximately 1,095 acres of other aquatic land covers to ensure adequate acreage of these resources remain for the persistence of Covered Species that rely on them in the Plan Area. The aquatic land covers will be managed and monitored in perpetuity to ensure that they remain functional over time.

Preservation outside of the UDA will focus on the formation of large landscape-scale Preserves that connect to and augment existing preserve that is not part of the SSHCP Preserve System, which has direct ecological benefits to Covered Species, but also practical benefits, such as facilitation of land management, that result in ecological benefits. In the UDA, three Core Preserves, up to three Minor Preserves, and seven Satellite Preserves will be established and linked together within the UDA. Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves.

Another benefit of the SSHCP over project-by-project permitting is the strict requirements for the 50-foot Preserve Setbacks. The AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Stream and Preserve setbacks will be monitored by the Implementing Entity, easement held by the HCP Agency to ensure that they function as intended. Project-by-project permitting does not provide this level of guarantee for functionality of setbacks. Using a rigorous Preserve Setback strategy and watershed protection in conjunction with low-impact and compatible uses in land

planning, the Preserve will maintain existing functions and values of the other aquatic land cover types in the Preserve System.

While approximately 1,095 acres, or 6%, of the 18,628 acres of the other aquatic land covers in the Plan Area would be removed, resulting in habitat loss, the Implementing Entity will establish or re-establish 1,095 acres of other aquatic land covers ensuring that there would be no net loss of acreage (Table 7-13). Re-establishment and establishment sites will be selected based on the criteria outlined in the Conservation Actions for each Measurable Objective (Table 7-1) to maximize success. Species such as giant gartersnake, western pond turtle, and tricolored blackbird that are dependent on these other aquatic land cover types will benefit from these re-establishment/establishment efforts and this could assist in maintaining their distributions in the Plan Area. The Conservation Actions for each aquatic land cover type varies, but in general, re-establishment and/or establishment sites will be selected based on the following criteria: (1) the sites will link to aquatic land cover types that provide modeled Covered Species habitat or after re-establishment and/or establishment qualify as modeled Covered Species habitat; (2) there is sufficient hydrology on site or it can be re-established on site; (3) the site has appropriate soils and topography; and/or (4) management can be used to enhance or restore natural ecosystems. Additionally, Conservation Action SW2.1 ensures that sites for seasonal wetlands are re-established and/or established on parcels 20 acres or greater in size and/or occur in larger, open space areas, to the maximum extent feasible; Conservation Action FWM2.1 includes selecting sites that historically supported freshwater marsh; and Conservation Action SC2.1 includes selecting sites that are adjacent to an existing preserve and within proximity to the mouth of the stream/bank. Conservation Action RIP2.1 includes more detailed criteria for selecting re-establishment/establishment sites for Mixed Riparian Woodland and Mixed Riparian Scrub beyond those generally described for all other aquatic land cover types including selecting areas: (1) that are located within 3 miles of foraging habitat for Covered Species that use riparian habitat for nesting and/or roosting; (2) that have a multilayered and closed-canopy structure; (2) that are large, unfragmented, and connected to Valley Grassland and Agricultural areas; (3) that are located within a SSHCP Preserve; (4) that would avoid impacts to existing vernal pool landscapes, preserved or restored giant gartersnake habitat, and to existing functioning habitat; and (5) for establishment, did not historically support riparian vegetation, and for re-establishment, did historically support riparian vegetation.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of lands protected in the Preserve System will ensure that aquatic land covers are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 Objectives will benefit aquatic land covers by preparing and implementing Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4).

7.6.1.2 Terrestrial Natural Land Covers

The terrestrial natural land covers in the SSHCP Plan Area include: Valley Grassland that is not within the Vernal Pool Ecosystem; Blue Oak Woodland and Savanna; and Agriculture, which includes Cropland, Irrigated Pasture–Grassland, Orchard, and Vineyard.

In total, approximately 15,285 acres, or 10%, of the 150,758 acres of the terrestrial natural land covers in the Plan Area would be removed over the proposed 50-year Permit Term. This includes the removal of 14,244 acres (89%) of the 16,066 acres present inside the UDA and removal of 1,042 acres (0.8%) of 134,692 acres present outside the UDA. The only indirect effect to natural land covers analyzed that does not directly apply to terrestrial land covers is the alteration of vernal pool hydrology, which applies to the Vernal Pool Ecosystem. Additionally, while alterations to watershed hydrographs and degradation of water quality can indirectly impact terrestrial land covers, this particular stressor has a greater impact on aquatic natural land covers, including the Vernal Pool Ecosystem.

To mitigate impacts to terrestrial land covers, the SSHCP preserves 15,285 acres of these terrestrial land covers, including 5,542 acres of Valley Grassland that is not within the Vernal Pool Ecosystem, 47 acres of Blue Oak Woodland/Savanna, and 9,696 acres of Cropland and/or Irrigated Pasture–Grassland. The SSHCP will also re-establish and/ or establish 47 acres of Blue Oak Woodland/Savanna (Table 7-15).

Table 7-15
Permanent Effects and Conservation for Terrestrial Land Covers

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Direct and Indirect Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Plan Area-Wide					
Terrestrial Land Covers	**15,285**	**Qualitative**	**15,285**	**15,285**	**47**
Valley Grassland (Outside of Vernal Pool Ecosystem)	5,542	Qualitative	5,542	0[a]	—
Blue Oak Woodland/Savanna	47	Qualitative	47	47[b]	47[c]
Agriculture	9,696	Qualitative	9,696	9,696[d]	—

[a] Impacts to Valley Grasslsnds will be mitigated by preserving Valley Grasslsnds that are within the Vernal Pool Ecosystem.
[b] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by preserving any combination of Blue Oak Savanna and Blue Oak Woodland.
[c] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by re-establishing or establishing any combination of Blue Oak Woodland and Blue Oak Savanna.
[d] Impacts to Cropland, Irrigated Pasture-Grassland, orchards and vineyards can be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.

Each component, or natural land cover, that comprises the terrestrial natural land covers is described separately below. The Biological Goals and Measurable Objectives applicable to these terrestrial natural land covers are listed in Table 7-16.

Valley Grassland

Approximately 5,542 acres, or 4%, of the 150,758 acres of Valley Grassland that are not within the Vernal Pool Ecosystem in the Plan Area would be removed. More specifically, of the 5,716 acres present in the UDA, 5,159 acres, or 90%, will be removed, and of the 32,042 acres present outside of the UDA, 383 acres, or 1.2%, will be removed.

A total of 5,542 acres of Valley Grassland that are not within the Vernal Pool Ecosystem will be preserved by the SSHCP, including approximately 6,065 acres inside the UDA (Table 7-5) and 15,949 acres outside the UDA (Table 7-6).

Blue Oak Woodland/Savanna

Approximately 47 acres, or 0.3%, of the 14,769 acres of Blue Oak Woodland/Savanna in the Plan Area would be removed. This direct permanent impact includes the removal 3 acres, 14%, of the 18 acres of Blue Oak Woodland/Savanna in the UDA, and the removal of 45 acres, or 0.3%, of the 14,751 acres of Blue Oak/Savanna outside of the UDA.

A total of 47 acres of Blue Oak Woodland/Savanna will be preserved by the SSHCP, all located outside the of the UDA (Table 7-6). Preserve sites for Blue Oak Woodland/Savanna will be selected in areas that expand upon or link to the Deer Creek Hills Preserve to the maximum extent feasible, as the limited amount of Blue Oak Woodland/Savanna preservation in the SSHCP will be most effective when linked to that large existing expanse of Blue Oak Woodland/Savanna. Blue Oak Woodland/Savanna will be re-established and/or established under the SSHCP, including approximately 47 acres in areas that expand upon or link to the Deer Creek Hills Preserve, to the maximum extent feasible.

Agriculture

Agriculture includes the following land covers: Cropland, Irrigated Pasture–Grassland, Orchard, and Vineyard. Approximately 9,696 acres, or 10%, of the 98,187 acres of agriculture in the Plan Area would be removed. Of the 10,287 acres of agriculture in the UDA, 9,082 acres, or 88% will be removed and of the 87,899 acres of agriculture outside of the UDA, 614 acres, or 0.7%, will be removed.

A total of 9,696 acres of agriculture will be preserved by the SSHCP, all located outside of the UDA (Table 7-6). Of the 9,696 total acres of preservation, 1,000 acres will be outside the 100-

year floodplain to provide a refuge for giant gartersnakes from flood waters during the snake's dormant season in winter (see Table 7-1 for Objective GGS1.2). Preserve sites for Cropland and Irrigated Pasture–Grassland will be selected to maximize their benefit to foraging habitat for avian Covered Species and their value for agriculture production including sites: (1) containing soils that are highly productive for agricultural resources and that have irrigation systems for crop production; (2) supporting or capable of supporting high prey densities for avian Covered Species; (3) supporting or capable of supporting nesting or perching habitat for avian Covered Species; and (4) can be enhanced or restored through management.

Table 7-16
Biological Goals and Measurable Objectives Applicable to the Terrestrial Land Covers

Applicable Biological Goals	Related Measurable Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 3. Preserve, re-establish, and establish natural land covers, (including Cropland and Irrigated Pasture–Grassland) that provide habitat for Covered Species.	**Objective BOW1**. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this table.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture–Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).

Table 7-16
Biological Goals and Measurable Objectives Applicable to the Terrestrial Land Covers

Applicable Biological Goals	Related Measurable Objectives
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
	Objective AG2. Of the 9,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as corn, alfalfa, or wheat) preferred by tricolored blackbird (*Agelaius tricolor*), greater sandhill crane (*Grus canadensis*), and the Covered raptor species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective AG3. Maintain or increase raptor prey availability and improve raptor foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species.

Analysis of Conservation of Terrestrial Natural Land Covers

The focus of the Conservation Strategy for terrestrial natural land cover types is mostly outside the UDA, where a large landscape-scale Preserve will connect to and augment existing preserve that is not part of the SSHCP Preserve System. The large size of this preserve would be consistent with the guiding principle (Section 7.1) to minimize habitat fragmentation, protect watersheds and their ecosystem functions, and minimize edge effects. Establishing large preserves also benefits preserve management as a single PMP can guide management of a large area in a coordinated fashion and minimize environmental stressors such as habitat fragmentation. Also, there are practical benefits for Preserve management, such as grazing herds could be used across large landscapes and less perimeter fencing is required than on multiple smaller preserves. The Conservation Strategy for Valley Grassland Blue Oak Woodland/ Savanna, and Agriculture are described in more detail in the following paragraphs.

The Conservation Strategy for Valley Grassland was discussed in Section 7.6.1.1.1 and emphasizes establishment of Preserves in areas that are adjacent or in proximity to existing preserves and where Valley Grasslands can be located in areas that provide benefits to the Vernal Pool Ecosystem. By adding on to existing preserves, the Preserve System will maximize overall size of preserved areas and habitat connectivity, and minimize the amount of edge exposed to urban development and other environmental stressors.

Blue Oak Woodland/Savanna composes a relatively small portion (4%) of the Plan Area land cover, mostly along its eastern edge, and none of the Covered Species are entirely dependent on these communities for the species to persist within the Plan Area. Nonetheless, Blue Oak Woodland/Savanna in the Plan Area provide valuable wildlife habitat and serve other ecological

functions that will contribute to the preservation of Covered Species, particularly in the eastern portion of the Plan Area in PPUs 5 and 7 where they are dominant habitat types. Of the 47 acres of Blue Oak Woodland/Savanna that will be preserved, all will be conserved in PPU 7. PPU 7 contains a large proportion of the Blue Oak Woodland and Savanna in the Plan Area, which comprise 5,861 acres or 40% of the total Blue Oak Woodland and Savanna in the Plan Area.

Agricultural uses are cyclical in nature (e.g., crop rotation) and interact with the foraging and other life history needs of SSHCP Covered Species. Therefore, the Conservation Strategy is designed to maintain a mosaic of agricultural crop types distributed throughout the main agricultural area of the Plan Area and is considered an ecologically sound method of preserving agricultural habitats that benefit the Covered Species. PPU 6 Preserves are where the majority of agriculture (8,465 acres, 82%, of 9,462 acres) will be conserved. The Preserve design focus for PPU 6 is preserving existing agricultural lands that provide habitat for several of the broad-ranging Covered Species, most notably Swainson's hawk and greater sandhill crane, as well as several occurrences for burrowing owl and white-tailed kite. The Cropland Preserve will allow for variation in crop types from year to year in specific fields, but overall will maintain important habitat functions that benefit SSHCP Covered Species that depend on Agriculture land covers. The Cropland Preserves established in the western portion of PPU 6 will also provide connectivity between the Cosumnes River floodplain and Stone Lakes National Wildlife Refuge (NWR), where greater sandhill crane populations are regularly observed.

In the UDA, three Core Preserves, up to three Minor Preserves, and seven Satellite Preserves will be established and linked together within the UDA. Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves.

Another benefit of the SSHCP over project-by-project permitting is the strict requirements for the 50-foot Preserve Setbacks. The AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Using a rigorous Preserve Setback strategy and watershed protection in conjunction with low-impact and compatible uses in land planning, the Preserve will maintain existing functions and values of the terrestrial land cover types in the Preserve System.

While approximately 47 acres, or 0.3%, of the 14,769 acres of Blue Oak Woodland/Savanna in the Plan Area would be removed, resulting in habitat loss, the Implementing Entity will establish or re-establish 47 acres of Blue Oak Woodland/Savanna ensuring that there would be no net loss of acreage (Table 7-15). Re-establishment and/or establishment for Blue Oak Woodland/Savanna will be selected in areas that expand upon or link to the Deer Creek Hills Preserve, to the maximum extent feasible, and any potential re-establishment/ establishment sites would fill gaps in existing mixed Blue Oak Woodland or Blue Oak Savanna land covers, or would link existing Blue Oak Woodland or Blue Oak Savanna land covers. The Implementing Entity will also establish 300 acres of Vernal Pool Ecosystem, much of which will consist of Valley Grassland. This will be accomplished by converting agricultural land or disturbed areas within the UDA to Valley Grassland, Vernal Pools, and Swales. While there are no re-establishment/establishment objectives for Agriculture, the SSHCP Conservation Strategy minimizes habitat fragmentation by focusing on the establishment of large Preserves, and by linking SSHCP Preserves and existing preserves together. For example, PPU 7 encompasses 90,906 acres, and the dominant land covers in PPU 7 are Valley Grassland, which comprises 52,278 acres of the PPU, and Agriculture, which comprises 20,695 acres. Similarly, PPU 6 encompasses 95,196 acres the dominant land covers in PPU 6 are Agriculture (58,458 acres) and Valley Grassland (17,633 acres).

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of lands protected in the Preserve System will ensure that terrestrial natural land covers are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will benefit terrestrial natural land covers by preparing and implementing Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4).

7.6.2 Covered Species

This section provides the conservation analysis for the 28 Covered Species of the SSHCP. For each of the Covered Species, the following is provided:

- A summary of impacts to habitat and the proposed level of preservation of documented occurrences (as applicable) and modeled habitat;
- Analysis of the SSHCP Conservation Strategy for the species, including:
    - Analysis of how relevant Biological Goals and Measurable Objectives will directly or indirectly benefit the species, and quantitative or qualitative description of the benefits;
    - Summary of how any Avoidance and Minimization Measures (AMMs) will benefit this species, especially species-specific AMMs; and

- Summaries of conservation for each Core Recovery Area and for each separate CHU for every Covered Species that was included in any Recovery Plan.

7.6.2.1 Ahart's Dwarf Rush

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 7,403 acres of Ahart's dwarf rush modeled habitat in the Plan Area. All impacted modeled habitat for Ahart's dwarf rush is within the Vernal Pool Ecosystem, comprising approximately 310 acres of Ahart's dwarf rush modeled aquatic habitat and approximately 7,093 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-17).

To mitigate these impacts to Ahart's dwarf rush modeled habitats and the take of all Ahart's dwarf rush occupying that habitat, the SSHCP will preserve approximately 12,592 acres of Vernal Pool Ecosystem, including 478 acres of Vernal Pool, 165 acres of Swale, and 11,949 acres of Valley Grassland (Table 7-17). The SSHCP will also re-establish and/or establish approximately 239 acres of Ahart's dwarf rush modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-18).

Table 7-17
Permanent Effects and Conservation for Ahart's Dwarf Rush

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Direct and Indirect Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	7,093	Qualitative	7,093[a]	11,949	0
Vernal Pool	149	51	200	478	149
Swale	90	20	110	165	90[b]
Vernal Pool Ecosystem	**7,332**	**71**	**7,403**	**12,592**	**239**

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[b] Swale re-establishment/establishment may occur in the form of any combination of Swale or Vernal Pool

Table 7-18
Biological Goals and Measurable Objectives Applicable to Ahart's Dwarf Rush

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, and establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.

Table 7-18
Biological Goals and Measurable Objectives Applicable to Ahart's Dwarf Rush

Applicable Biological Goals	Related Biological Objectives
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPP1.** Protect the one currently documented unpreserved occurrence of Ahart's dwarf rush in the Plan Area. Prior to take of any occurrence of Ahart's dwarf rush (*Juncus leiospermus*), protect six currently unpreserved[8] and "biologically equivalent or superior" (as defined by the TAC) occurrences of Ahart's dwarf rush within the Plan Area. After six currently unpreserved occurrences are protected, prior to take of an occurrence of Ahart's dwarf rush, protect one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of Ahart's dwarf rush within the Plan Area.

Analysis of Species Conservation

There is one documented occurrence of Ahart's dwarf rush in the Plan Area, which will be preserved in a 15-acre Satellite Preserve in PPU 1. This occurrence will not be directly or indirectly impacted. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area. With implementation of the SSHCP under Objective VPP1, prior to take of any occurrence of Ahart's dwarf rush, six currently unpreserved[9] and "biologically equivalent or superior" (as defined by the Technical Advisory Committee (TAC)) occurrences of Ahart's dwarf rush within the Plan Area will be preserved. After six currently unpreserved occurrences

[8] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

[9] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

are protected, prior to take of an occurrence of Ahart's dwarf rush, one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of Ahart's dwarf rush within the Plan Area will be preserved. Preserved occurrences will be located within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for Ahart's dwarf rush is on preserving known occurrences, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur, or become established in the future. The SSHCP Conservation Strategy will preserve and link approximately 12,592 acres of modeled habitat for Ahart's dwarf rush in the Plan Area. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in or near these Core Recovery Areas, focusing conservation in the areas important for recovery of this species. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves, including spread of non-native plant species or degradation of water quality. Large preserves will protect the subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. Large preserves will also preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools.

By preserving existing populations and modeled habitat of Ahart's dwarf rush in large, interconnected Preserves that are protected from edge effects, the species will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow via interconnected systems of vernal pools and swales. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of Ahart's dwarf rush habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

Three Core Preserves, each including more than 300 acres of Ahart's dwarf rush modeled habitat (with a combined total of 1,867 acres), will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP

Preserves. For example, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

Although there are no known occurrences of Ahart's dwarf rush outside the UDA, modeled habitat in the Cosumnes/Rancho-Seco Core Recovery Area where the species might occur would be protected within the large landscape-scale Preserve (at least 10,500 acres) established in PPU 7. The Landscape Preserve will be established through land acquisitions that are targeted to (1) preserve modeled Ahart's dwarf rush habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase Preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other. The preservation of known occurrences and modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the SSHCP Conservation Strategy will also establish or re-establish approximately 239 acres of Ahart's dwarf rush modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. The re-established and/or established Ahart's dwarf rush modeled aquatic habitat will be provided appropriate management and monitoring of lands to ensure that habitat remains functional in perpetuity for Ahart's dwarf rush. This will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System.

The SSHCP Preserve System will link SSHCP Preserves and existing preserves that have modeled Ahart's dwarf rush modeled habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of seeds through surface flows, predator wastes, wind, and mud carried on the feet of animals). The SSHCP Preserve System will maintain the Ahart's dwarf rush at its current

distribution, and the re-establishment and establishment of additional habitat will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The SSHCP Preserve will establish Core Preserves and Linkage Preserves that will maintain connectivity between existing occurrences and modeled habitat in other SSHCP Preserves and existing preserves in the Plan Area. By establishing large Preserves, the SSHCP will also ensure that connectivity between vernal pools within SSHCP Preserves is maintained.

The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer. However, grazing is not always compatible with success of Ahart's dwarf rush; therefore, those preserved populations of Ahart's dwarf rush may need to be protected from grazing. Detailed prescriptions for grazing in these preserves would be included in Preserve Management Plans (see Section 8.3.4.2).

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 7,403 acres of the existing 25,136 acres of Ahart's dwarf rush modeled habitat (the Vernal Pool Ecosystem) may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated Ahart's dwarf rush populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area Vernal Pools remains relatively good. Those Vernal Pools in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve Ahart's dwarf rush modeled habitat with a range of vernal pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem. By preserving a range of Ahart's dwarf rush habitats in the Plan Area, the SSHCP will help Ahart's dwarf rush persist during expected climate change effects on precipitation and temperature.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of Ahart's dwarf rush modeled habitat in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit Ahart's dwarf rush habitat from the

preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing conditions. These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2 (SSHCP Biological Goals and Measurable Objectives), Goal 2 objectives will directly benefit Ahart's dwarf rush by requiring that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), establishing Stream Setbacks, and requiring implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit Ahart's dwarf rush by ensuring there are selection criteria and re-establishment/establishment criteria for Valley Grassland, Vernal Pool, and Swale (Objective VG1, VP1, VP2, VP3, VP4, VP5). Further, Objective VPP1 (Goal 5) will assure the preservation of Ahart's dwarf rush occurrences and distribution within the Plan Area.

Recovery Plan

As discussed in Section 7.6.3, the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (Recovery Plan), includes recovery criteria for Ahart's dwarf rush (USFWS 2005a). To conserve this species, the Recovery Plan prioritizes preservation of Vernal Pool Ecosystem within several core areas, including the Mather Core Recovery Area and the Cosumnes/Rancho Seco Core Recovery Area in the Plan Area. SSHCP Covered Activities are anticipated to impact up to approximately 5,045 acres of Ahart's dwarf rush modeled habitat in the Mather Core Recovery Area and 18 acres in the Cosumnes/Rancho Seco Core Recovery Area (Table 7-19). Total impacts to Core Recovery Areas within the Plan Area are 5,062 acres. The SSHCP Conservation Strategy will preserve and link approximately 3,530 acres of modeled habitat for Ahart's dwarf rush in the Mather Core Recovery Area and approximately 3,771 acres within the Cosumnes/Rancho Seco Core Recovery Area. Total preservation within Core Recovery Areas within the Plan Area is 7,301 acres.

Table 7-19
Ahart's Dwarf Rush Effects and Conservation in Core Recovery Areas

Habitat Model Land Cover Types	Total Core Recovery Areas (acres)		Mather Core Area (acres)		Cosumnes/Rancho Seco Core Area (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*
Valley Grassland	4,825	6,802	4,809	3,291	16	3,511
Vernal Pool	148	401	147	185	0.8	215
Swale	89	98	88	54	1	44
Vernal Pool Ecosystem	**5,062**	**7,301**	**5,045**	**3,530**	**18**	**3,771**

See Section 7.6.3 for a detailed description of how the SSHCP's Conservation Actions carried out to meet SSHCP Biological Goals and Measurable Objectives will incorporate, or be consistent with, many of the species-specific recovery criteria for the nine Covered Species addressed in the Recovery Plan. The SSHCP provides an alternative Conservation Strategy for preserving vernal pool species habitat and meeting the six recovery criteria listed (see Section 7.6.3).

Although less than 100% of Ahart's dwarf rush occurrences may be preserved within the Plan Area, the SSHCP Conservation Strategy is the equivalent of the Recovery Plan's Species-Specific Recovery Criteria for each Core Area located inside the Plan Area (USFWS 2005a), as described in Section 7.6.3.

7.6.2.2 Boggs Lake Hedge-Hyssop

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 8,724 acres of Boggs Lake hedge-hyssop modeled habitat in the Plan Area. Total impacts to modeled Boggs Lake hedge-hyssop Vernal Pool Ecosystem are 8,711 acres, comprising 292 acres of Boggs Lake hedge-hyssop modeled aquatic habitat and 8,419 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-20). In addition, the SSHCP will impact approximately 13 acres of Seasonal Wetland in the Plan Area. In all, 98% of impacts to the Vernal Pool Ecosystem and 91% to Seasonal Wetland will occur in the UDA.

To mitigate these impacts to Boggs Lake hedge-hyssop modeled habitats and the take of all Boggs Lake hedge-hyssop occupying that habitat, the SSHCP will preserve approximately 9,074 acres of modeled habitat, including 9,039 acres of Vernal Pool Ecosystem (i.e., 382 acres of Vernal Pool and 8,657 acres of Valley Grassland) and 35 acres of Seasonal Wetland (see Table 7-20). The SSHCP will also re-establish and/or establish approximately 252 acres of Boggs Lake

hedge-hyssop modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-21).

Table 7-20
Permanent Effects and Conservation for Boggs Lake Hedge-Hyssop

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	8,419	Qualitative	8,419[a]	8,657	0
Vernal Pool	240	52	292	382	239
Subtotal Vernal Pool Ecosystem	*8,659*	*52*	*8,711*	*9,039*	*239*
Seasonal Wetland	13	Qualitative	13[a]	35	13
GRAND TOTAL	**8,672**	**52**	**8,724**	**9,074**	**252**

[a] Total impacts to Valley Grassland and Seasonal Wetland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-21
Biological Goals and Measurable Objectives Applicable to Boggs Lake Hedge-Hyssop

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in

Table 7-21
Biological Goals and Measurable Objectives Applicable to Boggs Lake Hedge-Hyssop

Applicable Biological Goals	Related Biological Objectives
	Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, and establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPP2.** Prior to take of any occurrence of Boggs Lake hedge-hyssop (*Gratiola heterosepala*), preserve one currently unpreserved[10] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Boggs Lake hedge-hyssop within the Plan Area.

[10] Includes occurrences in the SSHCP geographic information system (GIS) database (January 2014) and any future occurrences found in the Plan Area.

Analysis of Species Conservation

Of the 30 known occurrences of Boggs Lake hedge-hyssop in the Plan Area, one falls within an SSHCP Preserve, and four will be impacted. With implementation of the SSHCP under Objective VPP2, prior to take of any occurrence of Boggs Lake hedge-hyssop, one currently unpreserved[11] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Boggs Lake hedge-hyssop within the Plan Area will be preserved. Therefore, if more than one occurrence is to be impacted the Implementing Entity will ensure that additional occurrences are protected in SSHCP Preserves. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area. Preserved occurrences will be located within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for Boggs Lake hedge hyssop is on preserving known occurrences, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur, established in the future. The SSHCP Conservation Strategy will preserve and link approximately 9,074 acres of the highest-quality Seasonal Wetland and Vernal Pool Ecosystem for Boggs Lake hedge-hyssop in the Plan Area. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in or near these Core Recovery Areas, focusing conservation in the areas important for recovery of this species. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves, including spread of non-native plant species or degradation of water quality. Large preserves will protect the subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. Large preserves will also preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools.

By preserving existing populations and modeled habitat of Boggs Lake hedge hyssop in large, interconnected Preserves that are protected from edge effects, the species will be less affected by

[11] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow via interconnected systems of vernal pools and swales. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of Boggs Lake hedge hyssop habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

As discussed in Section 7.5, the conservation focus for Boggs Lake hedge-hyssop is focused in PPU 1 and PPU 3 where documented occurrences occur. Three Core Preserves, each including more than 450 acres of Boggs Lake hedge-hyssop modeled habitat (with a combined total of approximately 2,058 acres), will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

The conservation focus outside the UDA is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. The Landscape Preserve will be established through land acquisitions that are targeted to (1) preserve modeled Boggs Lake hedge-hyssop habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase Preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish approximately 252 acres of Boggs Lake hedge-hyssop modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. Re-establishing pools in historical vernal pool areas will further help to conserve Boggs Lake hedge-hyssop by ensuring no net loss of the total acreage of Boggs Lake hedge-hyssop habitat in the SSHCP Plan Area. All re-establishment and/or established sites for seasonal wetlands will link existing areas of seasonal wetlands and support soils and topography modeled for re-establishing and/or establishing seasonal

wetlands. The SSHCP will also preserve a minimum of approximately 105 acres of seasonal wetlands on parcels 20 acres or greater in size and/or sites that occur in larger, open space areas, to the maximum extent feasible.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. The SSHCP Preserve System will link SSHCP Preserves and existing preserves that have modeled Boggs Lake hedge-hyssop modeled habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of seeds through surface flows, predator wastes, wind, and mud carried on the feet of animals). The SSHCP Preserve System will maintain the Boggs Lake hedge-hyssop at its current distribution, and the re-establishment and establishment of additional habitat will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The SSHCP Preserve will establish Core Preserves and Linkage Preserves that will maintain connectivity between existing occurrences and modeled habitat in other SSHCP Preserves and existing preserves in the Plan Area. By establishing large Preserves, the SSHCP will also ensure that connectivity between pools within SSHCP Preserves is maintained.

The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 8,724 acres of the existing 37,000 acres of Boggs Lake hedge-hyssop modeled habitat (i.e., seasonal wetlands and the Vernal Pool Ecosystem) may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated Boggs Lake hedge-hyssop populations that are not preserved under the SSHCP may contain genetic diversity of

conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area pools and seasonal wetlands remains relatively good. Those pools and seasonal wetlands in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve Boggs Lake hedge-hyssop modeled habitat with a range of vernal pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem. By preserving a range of Boggs Lake hedge-hyssop habitats in the Plan Area, the SSHCP will help Boggs Lake hedge-hyssop persist during expected climate change effects on precipitation and temperature.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of Boggs Lake hedge-hyssop modeled habitat in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit Boggs Lake hedge-hyssop habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing conditions. These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 objectives will directly benefit Boggs Lake hedge-hyssop from the requirement that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), Stream Setbacks and implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit Boggs Lake hedge-hyssop by ensuring there are selection criteria and re-establishment/establishment criteria for Valley Grassland, Vernal Pool, and Seasonal Wetland (Objective VG1, VP1, VP2, VP3, VP4, VP5, SW1, SW2). Further, Objective VPP2 (Goal 5) will assure the preservation of Boggs Lake hedge-hyssop occurrences and distribution within the Plan Area.

Recovery Plans

As discussed in Section 7.6.3, the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (Recovery Plan) includes recovery criteria for Bogg's Lake hedge-hyssop (USFWS 2005a). To conserve this species, the Recovery Plan prioritizes preservation of Vernal

Pool Ecosystem within several core areas, including the Mather Core Recovery Area and the Cosumnes/Rancho Seco Core Recovery Area in the Plan Area. SSHCP Covered Activities are anticipated to impact up to approximately 5,005 acres of Bogg's Lake hedge-hyssop modeled habitat in the Mather Core Recovery Area and 20 acres in the Cosumnes/Rancho Seco Core Recovery Area (Table 7-22). Total impacts to Core Recovery Areas within the Plan Area are 5,024 acres. The SSHCP Conservation Strategy will preserve and link approximately 3,853 acres of modeled habitat for Bogg's Lake hedge-hyssop in the Mather Core Recovery Area and approximately 4,450 acres within the Cosumnes/Rancho Seco Core Recovery Area. Total preservation within Core Recovery Areas within the Plan Area is 8,303 acres.

Table 7-22
Boggs Lake Hedge-Hyssop Permanent Effects and Conservation in Core Recovery Areas

Habitat Model Land Cover Types	Total Core Recovery Areas (acres)		Mather Core Area (acres)		Cosumnes/Rancho Seco Core Area (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*
Valley Grassland	4,867	7,931	4,848	3,686	19	4,245
Vernal Pool	155	357	154	167	1	191
Vernal Pool Ecosystem	**5,022**	**8,288**	**5,003**	**3,853**	**20**	**4,436**
Seasonal Wetland	1.9	14	1.9	**0**	0	14
Grand Total	**5,024**	**8,303**	**5,005**	**3,853**	**20**	**4,450**

See Section 7.6.3 for a detailed description of how the SSHCP's Conservation Actions carried out to meet SSHCP Biological Goals and Measurable Objectives will incorporate, or be consistent with, many of the species-specific recovery criteria for the nine Covered Species addressed in the Recovery Plan. The SSHCP provides an alternative Conservation Strategy for preserving vernal pool species habitat and meeting the six recovery criteria listed (see Section 7.6.3).

7.6.2.3 Dwarf Downingia

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 1,982 acres of dwarf downingia modeled habitat in the Plan Area. All impacted modeled habitat for dwarf downingia is within the Vernal Pool Ecosystem, comprising approximately 159 acres of dwarf downingia modeled aquatic habitat and 1,823 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-23). In all, 98% of impacts to the Vernal Pool Ecosystem will occur in the UDA.

To mitigate these impacts to dwarf downingia modeled habitats (i.e., the Vernal Pool Ecosystem) and the take of all dwarf downingia occupying that habitat, the SSHCP will preserve approximately 3,975 acres of Vernal Pool Ecosystem, including 186 acres of Vernal Pool, 56 acres of Swale, and 3,733 acres of Valley Grassland (Table 7-23). The SSHCP will also re-establish and/or establish approximately 141 acres of dwarf downingia modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-24).

Table 7-23
Permanent Effects and Conservation for Dwarf Downingia

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	1,823	Qualitative	1,823[a]	3,733	0
Vernal Pool	94	13	107	186	95
Swale	46	6	52	56	46[b]
Vernal Pool Ecosystem	**1,963**	**19**	**1,982**	**3,975**	**141**

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[b] Swale re-establishment/establishment may occur in the form of any combination of Swale or Vernal Pool.

Table 7-24
Biological Goals and Measurable Objectives Applicable to Dwarf Downingia

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.

Table 7-24
Biological Goals and Measurable Objectives Applicable to Dwarf Downingia

Applicable Biological Goals	Related Biological Objectives
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, and establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).

Table 7-24
Biological Goals and Measurable Objectives Applicable to Dwarf Downingia

Applicable Biological Goals	Related Biological Objectives
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPP3.** Prior to take of any occurrence of Dwarf downingia (*Downingia pusilla*), preserve one currently unpreserved[12] and "biologically equivalent or superior" (as defined by the TAC) occurrence of dwarf downingia within the Plan Area.

Analysis of Species Conservation

None of the 10 occurrences of dwarf downingia in the Plan Area will be enclosed within the Preserve System. However, Covered Activities are not projected to impact any documented occurrences of dwarf downingia. Exhaustive surveys for dwarf downingia have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area. Implementation of Objective VPP3 will require that, prior to take of any occurrence of dwarf downingia, one currently unpreserved[13] and "biologically equivalent or superior" (as defined by the TAC) occurrence of dwarf downingia within the Plan Area will be preserved. Preserved occurrences will be located within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for dwarf downingia is on preserving known occurrences, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur, or become established in the future. The SSHCP Conservation Strategy will preserve and link approximately 3,975 acres of modeled habitat for dwarf downingia in the Plan Area. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in or near these Core Recovery Areas, focusing conservation in the areas important for recovery of this species. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation

[12] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

[13] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

Strategy will minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves, including spread of non-native plant species or degradation of water quality. Large preserves will protect the subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. Large preserves will also preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools.

By preserving existing populations and modeled habitat of dwarf downingia in large, interconnected Preserves that are protected from edge effects, the species will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow via interconnected systems of vernal pools and swales. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of dwarf downingia habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

The habitat conservation focus for dwarf downingia is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. The Landscape Preserve will be established through land acquisitions that are targeted to (1) preserve modeled dwarf downingia habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase Preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish approximately 141 acres of dwarf downingia modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. Re-establishing pools in historical vernal pool areas will further help to conserve dwarf downingia by ensuring no net loss of the total acreage of dwarf downingia habitat in the SSHCP Plan Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. The SSHCP Preserve System will link SSHCP Preserves and existing preserves that have modeled dwarf downingia modeled habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of seeds through surface flows, predator wastes, wind, and mud carried on the feet of animals). The SSHCP Preserve System will maintain the dwarf downingia at its current distribution, and the re-establishment and establishment of additional habitat will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The SSHCP Preserve will establish Core Preserves and Linkage Preserves that will maintain connectivity between existing occurrences and modeled habitat in other SSHCP Preserves and existing preserves in the Plan Area. By establishing large Preserves, the SSHCP will also ensure that connectivity between pools within SSHCP Preserves is maintained.

The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 1,982 acres of the existing 24,261 acres of dwarf downingia modeled habitat (i.e., the Vernal Pool Ecosystem) may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated dwarf downingia populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area pools and seasonal wetlands remains relatively good. Those pools and seasonal wetlands in the

Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve dwarf downingia modeled habitat with a range of vernal pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem. By preserving a range of dwarf downingia habitats in the Plan Area, the SSHCP will help dwarf downingia persist during expected climate change effects on precipitation and temperature.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of dwarf downingia modeled habitat in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit dwarf downingia habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing conditions. These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 objectives will directly benefit dwarf downingia from the requirement that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), Stream Setbacks and implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit dwarf downingia by ensuring there are selection criteria and re-establishment/establishment criteria for Valley Grassland, Vernal Pool, and Swale (Objective VG1, VP1, VP2, VP3, VP4, VP5). Further, Objective VPP2 (Goal 5) will assure the preservation of dwarf downingia occurrences and distribution within the Plan Area.

7.6.2.4 Legenere

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 10,778 acres of legenere modeled habitat in the Plan Area. Total impacts to modeled legenere Vernal Pool Ecosystem are approximately 10,742 acres, comprising approximately 341 acres

of legenere modeled aquatic habitat and 10,401 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-25). In addition, the SSHCP will impact approximately 36 acres of Seasonal Wetland in the Plan Area. In all, 98% of impacts to the Vernal Pool Ecosystem and 95% to Seasonal Wetland will occur in the UDA.

To mitigate these impacts to legenere modeled habitats and the take of all legenere occupying that habitat, the SSHCP will preserve approximately 11,615 acres of modeled habitat including 11,573 acres of Vernal Pool Ecosystem (i.e., 512 acres of Vernal Pool and 11,061 acres of Valley Grassland) and 42 acres of Seasonal Wetland (Table 7-25). The SSHCP will also re-establish and/or establish approximately 130 acres of legenere modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-26).

Table 7-25
Permanent Effects and Conservation for Legenere

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	10,401	Qualitative	10,401[a]	11,061	0
Vernal Pool	276	65	341	512	95
Subtotal Vernal Pool Ecosystem	**10,677**	**65**	**10,742**	**11,573**	**95**
Seasonal Wetland	36	Qualitative	36[a]	42	35
GRAND TOTAL	**10,713**	**65**	**10,778**	**11,615**	**130**

[a] Total impacts to Valley Grassland and Seasonal Wetland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-26
Biological Goals and Measurable Objectives Applicable to Legenere

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in

Table 7-26
Biological Goals and Measurable Objectives Applicable to Legenere

Applicable Biological Goals	Related Biological Objectives
	accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, and establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are

Table 7-26
Biological Goals and Measurable Objectives Applicable to Legenere

Applicable Biological Goals	Related Biological Objectives
	obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPP4.** Protect and maintain in perpetuity a minimum of 14 occurrences of legenere (*Legenere limosa*) within the SSHCP Preserve System. Legenere occurrences will be preserved in accordance with the Conservation Actions in Table 7-1. Prior to take of any occurrence of legenere, one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of legenere will be preserved and maintained within the Plan Area.

Analysis of Species Conservation

Of the 56 occurrences of legenere, 15 will be preserved in SSHCP Preserves, with 14 inside the UDA (in PPU 1, PPU 2, PPU 3, PP 4) and 1 outside the UDA (PPU 7). Covered Activities will impact 5 documented occurrences, only within the UDA. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area. With implementation of the SSHCP, a minimum of seven occurrences of legenere within the hardline Preserve areas in the UDA (see Section 7.4) will be preserved and maintained in perpetuity; a minimum of seven additional occurrences within the criteria-based Preserve areas in the UDA (in accordance with the Conservation Actions described in Table 7-1) will be preserved and maintained in perpetuity; and prior to take of any occurrence of legenere, one currently unpreserved[14] and "biologically equivalent or superior" (as defined by the TAC) occurrence of legenere will be preserved and maintained within the Plan Area. Preserved occurrences will be located within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If

[14] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for legenere is on preserving known occurrences, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur, or become established in the future. The SSHCP Conservation Strategy will preserve and link approximately 11,615 acres of the highest-quality Seasonal Wetland and Vernal Pool Ecosystem habitat for legenere in the Plan Area. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in or near these Core Recovery Areas, focusing conservation in the areas important for recovery of this species. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves, including spread of non-native plant species or degradation of water quality. Large preserves will protect the subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. Large preserves will also preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools.

By preserving existing populations and modeled habitat of legenere in large, interconnected Preserves that are protected from edge effects, the species will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow via interconnected systems of vernal pools and swales. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of legenere habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

The conservation focus for legenere is focused in PPU 1 and PPU 3 where documented occurrences occur. Three Core Preserves, each including more than 500 acres of legenere modeled habitat (with a combined total of 2,203 acres), will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of

SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

The conservation focus outside the UDA is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. The Landscape Preserve will be established through land acquisitions that are targeted to (1) preserve modeled legenere habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase Preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish approximately 130 acres of legenere modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. Re-establishing pools in historical vernal pool areas will further help to conserve legenere by ensuring no net loss of the total acreage of legenere habitat in the SSHCP Plan Area. All re-establishment and/or established sites for seasonal wetlands will link existing areas of seasonal wetlands and support soils and topography modeled for re-establishing and/or establishing seasonal wetlands. The SSHCP will also preserve a minimum of approximately 105 acres of seasonal wetlands on parcels 20 acres or greater in size and/or sites that occur in larger, open space areas, to the maximum extent feasible.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. The SSHCP Preserve System will link SSHCP Preserves and existing preserves that have modeled legenere modeled habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of seeds through surface flows, predator wastes, wind, and mud carried on the feet of animals). The SSHCP Preserve System will maintain the legenere at its current distribution, and the re-establishment and establishment of additional habitat will assist in maintaining or re-establishing the historical distribution of the

species in the Plan Area. The SSHCP Preserve will establish Core Preserves and Linkage Preserves that will maintain connectivity between existing occurrences and modeled habitat in other SSHCP Preserves and existing preserves in the Plan Area. By establishing large Preserves, the SSHCP will also ensure that connectivity between pools within SSHCP Preserves is maintained.

The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 10,778 acres of the existing 50,973 acres of legenere modeled habitat (i.e., seasonal wetlands and the Vernal Pool Ecosystem) may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated legenere populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area pools and seasonal wetlands remains relatively good. Those pools and seasonal wetlands in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve legenere modeled habitat with a range of vernal pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem. By preserving a range of legenere habitats in the Plan Area, the SSHCP will help legenere persist during expected climate change effects on precipitation and temperature.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of legenere modeled habitat in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit legenere habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the

perched aquifer and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing conditions. These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 objectives will directly benefit legenere from the requirement that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), Stream Setbacks and implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit legenere by ensuring there are selection criteria and re-establishment/establishment criteria for Valley Grassland, Vernal Pool, and Seasonal Wetland (Objective VG1, VP1, VP2, VP3, VP4, VP5, SW1, SW2). Further, Objective VPP2 (Goal 5) will assure the preservation of Boggs Lake hedge-hyssop occurrences and distribution within the Plan Area.

Recovery Plan

As discussed in Section 7.6.3, the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (Recovery Plan) includes recovery criteria for Legenere (USFWS 2005a). To conserve this species, the Recovery Plan prioritizes preservation of Vernal Pool Ecosystem within several core areas, including the Mather Core Recovery Area and the Cosumnes/Rancho Seco Core Recovery Area in the Plan Area. SSHCP Covered Activities are anticipated to impact up to approximately 5,913 acres of legenere modeled habitat in the Mather Core Recovery Area and 23 acres in the Cosumnes/Rancho Seco Core Recovery Area (Table 7-27). Total impacts to Core Recovery Areas within the Plan Area are 5,936 acres. The SSHCP Conservation Strategy will preserve and link approximately 4,275 acres of modeled habitat for legenere in the Mather Core Recovery Area and approximately 6,503 acres within the Cosumnes/Rancho Seco Core Recovery Area. Total preservation within Core Recovery Areas within the Plan Area is 10,777 acres.

Table 7-27
Legenere Permanent Effects and Conservation in Core Recovery Areas

Habitat Model Land Cover Types	Total Core Recovery Areas (acres)		Mather Core Area (acres)		Cosumnes/Rancho Seco Core Area (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*
Valley Grassland	5,756	10,288	5,734	4,087	22	6,201
Vernal Pool	174	473	173	187	1.1	286
Vernal Pool Ecosystem	**5,930**	**10,761**	**5,930**	**4,274**	**23**	**6,487**
Seasonal Wetland	5.5	16	5.5	0.9	0	16
Grand Total	**5,936**	**10,777**	**5,913**	**4,275**	**23**	**6,503**

See Section 7.6.3 for a detailed description of how the SSHCP's Conservation Actions carried out to meet SSHCP Biological Goals and Measurable Objectives will incorporate, or be consistent with, many of the species-specific recovery criteria for the nine Covered Species addressed in the Recovery Plan. The SSHCP provides an alternative Conservation Strategy for preserving vernal pool species habitat and meeting the six recovery criteria listed (see Section 7.6.3).

7.6.2.5 Pincushion Navarretia

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 8,258 acres of pincushion navarretia modeled habitat in the Plan Area. All impacted modeled habitat for pincushion navarretia is within the Vernal Pool Ecosystem, comprising approximately 271 acres of pincushion navarretia modeled aquatic habitat and approximately 7,987 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-28). In all, 98% of impacts to the Vernal Pool Ecosystem will occur in the UDA.

To mitigate these impacts to pincushion navarretia modeled habitats (i.e., the Vernal Pool Ecosystem) and the take of all pincushion navarretia occupying that habitat, the SSHCP will preserve approximately 14,642 acres of Vernal Pool Ecosystem, including 514 acres of Vernal Pool, 183 acres of Swale, and 13,945 acres of Valley Grassland (Table 7-28). The SSHCP will also re-establish and/or establish approximately 141 acres of pincushion navarretia modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-29).

Table 7-28
Permanent Effects and Conservation for Pincushion Navarretia

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	7,987	Qualitative	7,987[a]	13,945	0
Vernal Pool	118	36	154	514	95

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[b] Swale re-establishment/establishment may occur in the form of any combination of Swale or Vernal Pool.

Table 7-29
Biological Goals and Measurable Objectives Applicable to Pincushion Navarretia

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, and establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.

Table 7-29
Biological Goals and Measurable Objectives Applicable to Pincushion Navarretia

Applicable Biological Goals	Related Biological Objectives
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPP5.** Prior to take of any occurrence of pincushion navarretia (*Navarretia myersii* ssp. *myersii*), preserve one currently unpreserved[15] and "biologically equivalent or superior" (as defined by the TAC) occurrence of pincushion navarretia within the Plan Area.

Analysis of Species Conservation

Of the 48 documented occurrences of pincushion navarretia in the Plan Area, all are located outside the UDA in PPU 7. No known occurrences of pincushion navarretia are enclosed in the Preserve System, but no known occurrences will be impacted by Covered Activities. Exhaustive surveys for pincushion navarretia have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area. With implementation of the SSHCP under Objective VPP5, prior to take of any

[15] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

occurrence of pincushion navarretia, one currently unpreserved[16] and "biologically equivalent or superior" (as defined by the TAC) occurrence of pincushion navarretia within the Plan Area will be preserved. Preserved occurrences will be located within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for pincushion navarretia is on preserving occurrences as they are discovered, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur, or become established in the future. The SSHCP Conservation Strategy will preserve and link approximately 14,642 acres of the highest-quality habitat for pincushion navarretia in the Plan Area. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in or near these Core Recovery Areas, focusing conservation in the areas important for recovery of this species. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves, including spread of non-native plant species or degradation of water quality. Large preserves will protect the subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. Large preserves will also preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools.

By preserving existing populations and modeled habitat of pincushion navarretia in large, interconnected Preserves that are protected from edge effects, the species will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow via interconnected systems of vernal pools and swales. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of pincushion navarretia habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

[16] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

Three Core Preserves that include a combined total of approximately 1,099 acres of pincushion navarretia modeled habitat will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked within the UDA. However, as discussed in Section 7.5, the conservation focus for pincushion navarretia is focused outside the UDA in PPU 7 where documented occurrences occur. A large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area will connect to and augment existing preserve that is not part of the SSHCP Preserve System. The Landscape Preserve will be established through land acquisitions that are targeted to (1) preserve modeled pincushion navarretia habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase Preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish approximately 141 acres pincushion navarretia modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. Re-establishing vernal pools and swales in historical vernal pool areas will further help to conserve pincushion navarretia by ensuring no net loss of the total acreage of pincushion navarretia habitat in the SSHCP Plan Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning,

the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System.

The SSHCP Preserve System will link SSHCP Preserves and existing preserves that have modeled pincushion navarretia modeled habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of seeds through surface flows, predator wastes, wind, and mud carried on the feet of animals). The SSHCP Preserve System will maintain the pincushion navarretia at its current distribution, and the re-establishment and establishment of additional habitat will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The SSHCP Preserve will establish Core Preserves and Linkage Preserves that will maintain connectivity between existing occurrences and modeled habitat in other SSHCP Preserves and existing preserves in the Plan Area. By establishing large Preserves, the SSHCP will also ensure that connectivity between pools within SSHCP Preserves is maintained.

The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 8,258 acres of the existing 57,438 acres of pincushion navarretia modeled habitat (i.e., the Vernal Pool Ecosystem) may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated pincushion navarretia populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area pools and seasonal wetlands remains relatively good. Those pools and seasonal wetlands in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve pincushion navarretia modeled habitat with a range of vernal pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem. By preserving a range of pincushion navarretia habitats in the Plan Area, the SSHCP will help pincushion navarretia persist during expected climate change effects on precipitation and temperature.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of pincushion navarretia modeled habitat in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit pincushion navarretia habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing conditions. These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 objectives will directly benefit pincushion navarretia from the requirement that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), Stream Setbacks and implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit pincushion navarretia by ensuring there are selection criteria and re-establishment/establishment criteria for Valley Grassland, Vernal Pool, and Swale (Objective VG1, VP1, VP2, VP3, VP4, VP5). Further, Objective VPP2 (Goal 5) will assure the preservation of pincushion navarretia occurrences and distribution within the Plan Area.

7.6.2.6 Sacramento Orcutt Grass

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 7,187 acres of Sacramento Orcutt grass modeled habitat in the Plan Area. All impacted modeled habitat for Sacramento Orcutt grass is within the Vernal Pool Ecosystem, comprising 196 acres of Sacramento Orcutt grass modeled aquatic habitat and 6,991 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-30). These impacts include direct and indirect effects to up to approximately 248 acres of Vernal Pool Ecosystem within Sacramento Orcutt grass Critical Habitat. In all, 98% of impacts to the Vernal Pool Ecosystem will occur in the UDA, including approximately 191 acres of impact to Sacramento Orcutt grass modeled habitat and 6,925 acres of impact to supporting uplands.

To mitigate these impacts to Sacramento Orcutt grass modeled habitats and the take of all Sacramento Orcutt grass occupying that habitat, the SSHCP will preserve approximately 14,459 acres of Vernal Pool Ecosystem, including 514 acres of Vernal Pool and 13,945 acres of Valley Grassland (Table 7-30). The approximately 14,459 acres of preserved Vernal Pool Ecosystem includes 4,001 acres of preservation of Vernal Pool Ecosystem within Sacramento Orcutt grass Critical Habitat (Table 7-31).

Finally, the SSHCP will also re-establish and/or establish approximately 148 acres of Sacramento Orcutt grass modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-32).

Table 7-30
Permanent Effects and Conservation for Sacramento Orcutt Grass

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)

Table 7-32
Biological Goals and Measurable Objectives Applicable to Sacramento Orcutt Grass

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will

Table 7-32
Biological Goals and Measurable Objectives Applicable to Sacramento Orcutt Grass

Applicable Biological Goals	Related Biological Objectives
	be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.

Table 7-32
Biological Goals and Measurable Objectives Applicable to Sacramento Orcutt Grass

Applicable Biological Goals	Related Biological Objectives
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPP6**. Preserve and maintain in perpetuity all known currently unpreserved occurrences of Sacramento Orcutt grass (*Orcuttia viscida*) in the Plan Area to preserve existing distribution, and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.

Analysis of Species Conservation

There are 40 documented occurrences of Sacramento Orcutt grass distributed in the Plan Area, 30 of which are outside the UDA. Of the 40 occurrences of Sacramento Orcutt grass, 6 will be protected in an SSHCP Preserve. Objective VPP6 requires that all occurrences be preserved; this is a species for which no take of occurrences is allowed so project proponents would be required to avoid occurrences and they would not be impacted. Exhaustive surveys for Sacramento Orcutt grass have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area; however, additional occurrences will be avoided. Before a site is disturbed by a Covered Activity, surveys will be conducted in modeled habitat during the appropriate time of year when Sacramento Orcutt grass is observable. Any occurrences will be preserved by the Project Proponent within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for Sacramento Orcutt grass is on preserving known occurrences, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur or become established in the future. The SSHCP Conservation Strategy will preserve and link approximately 14,459 acres of modeled habitat for

Sacramento Orcutt grass in the Plan Area. In particular, preservation of the Vernal Pool Ecosystem will protect the hydrology and soil conditions necessary for persistence of preserved Sacramento Orcutt grass aquatic habitat. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in or near these Core Recovery Areas, focusing conservation in the areas important for recovery of this species. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves, including spread of non-native plant species or degradation of water quality. Large preserves will protect the subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. Large preserves will also preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools.

By preserving existing populations and modeled habitat of Sacramento Orcutt grass in large, interconnected Preserves that are protected from edge effects, the species will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow via interconnected systems of vernal pools and swales. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of Sacramento Orcutt grass habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

As discussed in Section 7.5, the conservation focus for Sacramento Orcutt grass is focused inside PPU 1, PPU 3, and PPU 7 where documented occurrences occur. Three Core Preserves, each including more than 300 acres of Sacramento Orcutt grass modeled habitat (with a combined total of 1,733 acres), will be established in PPU 1 and PPU 3. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. For example, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

The conservation focus in PPU 7 is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserves that is not part of the SSHCP Preserve System. The Landscape Preserve will be established through land acquisitions that are targeted to (1) preserve occupied Sacramento Orcutt grass habitat, (2) capture desired vernal pool types and supporting uplands, (3) add parcels onto existing preserves that increase Preserve size and minimize habitat fragmentation and edge effects, and (4) provide connections to existing preserves that are currently isolated from each other.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 7,187 acres of the existing 34,492 acres of Sacramento Orcutt grass modeled habitat (i.e., Vernal Pool Ecosystem) may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated Sacramento Orcutt grass populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area pools remains relatively good. Those pools in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve Sacramento Orcutt grass modeled habitat with a range of pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem. By preserving a range of Sacramento Orcutt grass habitats in the Plan Area, the SSHCP will help Sacramento Orcutt grass persist during expected climate change effects on precipitation and temperature.

The preservation of known occurrences and modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish approximately 148 acres of

Sacramento Orcutt grass modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. The re-established and/or established Sacramento Orcutt grass modeled aquatic habitat will be provided appropriate management and monitoring of lands to ensure that habitat remains functional in perpetuity for Sacramento Orcutt grass. This will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area.

The SSHCP Preserve System will link SSHCP Preserves and existing preserves that have Sacramento Orcutt grass modeled habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of seeds through surface flows, predator wastes, wind, and mud carried on the feet of animals). The SSHCP Preserve System will maintain the Sacramento Orcutt grass at its current distribution, and the re-establishment and establishment of additional habitat will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The SSHCP Preserve will establish Core Preserves and Linkage Preserves that will maintain connectivity between these existing occurrences and modeled habitat in other SSHCP Preserves and existing preserves in the Plan Area. By establishing large Preserves, the SSHCP will also ensure that connectivity between vernal pools within SSHCP Preserves is maintained. The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of habitat for Sacramento Orcutt grass protected in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit Sacramento Orcutt grass habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing conditions. These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 objectives will directly benefit Sacramento Orcutt grass from the requirement that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), Stream Setbacks and implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit Sacramento Orcutt grass by ensuring there are selection criteria and re-establishment/establishment criteria for Valley Grassland, Vernal Pool, and Swale (Objective VG1, VP1, VP2, VP3, VP4, VP5). Further, Objective VPP6 (Goal 5) will assure the protection of Sacramento Orcutt grass occurrences and distribution within the Plan Area.

Critical Habitat

As defined in Section 3.6.1, the Vernal Pool Ecosystem includes Valley Grassland and Vernal Pool land cover types, each of which include one or more Primary Constituent Elements (PCEs) that have been defined for Sacramento Orcutt grass (USFWS 2006c). To compensate for impacts to 248 acres of Vernal Pool Ecosystem within Sacramento Orcutt grass Critical Habitat, the SSHCP Conservation Strategy will preserve a total of approximately 4,001 acres of Vernal Pool Ecosystem within Sacramento Orcutt grass Critical Habitat. Of this preservation, 287 acres of Vernal Pool Ecosystem will be preserved in CHU 2 and 3,714 acres in CHU 3. Monitoring and adaptive management under the SSHCP will ensure that the PCEs for Sacramento Orcutt grass are maintained within these CHUs and allow the PCEs to provide their intended conservation function for the species.

Recovery Plan

The SSHCP will be consistent with the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005a), which recommends preserving 100% of documented occurrences. And the SSHCP Conservation Strategy is the equivalent of the Recovery Plan's Species Specific Recovery Criteria for each Core Recovery Area located inside the Plan Area (USFWS 2005a), as described below. Where occurrences exist in locations still suitable for a functioning Core Preserve, these locations will be prioritized for preservation to achieve SSHCP and USFWS (2005a) Recovery Plan conservation goals.

SSHCP Covered Activities are anticipated to impact up to approximately 5,913 acres of Sacramento Orcutt grass modeled habitat in the Mather Core Recovery Area, and approximately 23 acres in the Cosumnes/Rancho Seco Core Recovery Area. To conserve this species, a total of approximately 6,503 acres of Vernal Pool Ecosystem will be preserved within the Cosumnes/Rancho Seco Core Recovery Area and a total of approximately 4,275 acres will be preserved within the Mather Core Recovery Area (Table 7-33). When combined with existing preserves, 80% of the modeled Sacramento Orcutt grass habitat in the Cosumnes/Rancho-Seco Core Recovery Area will be preserved. Although this is less than the 95% habitat preservation

target of the 2005 Recovery Plan, this large preservation area combined with the other elements of the SSHCP Conservation Strategy (e.g., monitoring and adaptive management, preservation of all occurrences) will allow consistency with the 2005 Recovery Plan. When combined with existing preserves, 50% of the modeled Sacramento Orcutt grass habitat in the Mather Core Recovery Area will be preserved.

Table 7-33
Sacramento Orcutt Grass Permanent Effects and Conservation in Core Recovery Areas

Habitat Model Land Cover Types	Total Core Recovery Areas (acres)		Mather Core Area (acres)		Cosumnes/Rancho Seco Core Area (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*
Valley Grassland	4,558	9,063	4,538	3,273	20	5,790
Vernal Pool	146	374	145	147	1	227
Vernal Pool Ecosystem	**4,704**	**9,437**	**4,683**	**3,420**	**21**	**6,017**

The SSHCP Conservation Strategy is equivalent to implementation of the 2005 Recovery Plan for the Plan Area because it provides an alternative Conservation Strategy for conserving Sacramento Orcutt grass and contains the six elements of recovery. The manner in which the SSHCP achieves this consistency for Sacramento Orcutt grass is discussed in detail in Section 7.6.3.

7.6.2.7 Slender Orcutt Grass

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 7,187 acres of slender Orcutt grass modeled habitat in the Plan Area. All impacted modeled habitat for slender Orcutt grass is within the Vernal Pool Ecosystem, comprising 196 acres of slender Orcutt grass modeled aquatic habitat and 6,991 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-34). These impacts include direct and indirect effects to up to approximately 235 acres of Vernal Pool Ecosystem within slender Orcutt grass Critical Habitat. In all, 98% of impacts to the Vernal Pool Ecosystem will occur in the UDA, including approximately 191 acres of impact to slender Orcutt grass modeled habitat and 6,925 acres of impact to supporting uplands.

To mitigate these impacts to slender Orcutt grass modeled habitats and the take of all slender Orcutt grass occupying that habitat, the SSHCP will preserve approximately 9,710 acres of Vernal Pool Ecosystem, including 378 acres of Vernal Pool and 9,332 acres of Valley Grassland

(Table 7-34). The 9,710 acres of preserved Vernal Pool Ecosystem includes 287 acres of preservation of Vernal Pool Ecosystem within slender Orcutt grass Critical Habitat (Table 7-35).

Finally, the SSHCP will also re-establish and/or establish approximately 148 acres of slender Orcutt grass modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-36).

Table 7-34
Permanent Effects and Conservation for Slender Orcutt Grass

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	6,991	Qualitative	6,991[a]	9,332	0
Vernal Pool	148	48	196	378	148
Vernal Pool Ecosystem	**7,139**	**48**	**7,187**	**9,710**	**148**

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-35
Slender Orcutt Grass Permanent Effects and Conservation in Critical Habitat

Habitat Model Land Cover Types	Total Critical Habitat (acres)		Critical Habitat Unit 6 (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*

Table 7-36
Biological Goals and Measurable Objectives Applicable to Slender Orcutt Grass

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).

Table 7-36
Biological Goals and Measurable Objectives Applicable to Slender Orcutt Grass

Applicable Biological Goals	Related Biological Objectives
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).

Table 7-36
Biological Goals and Measurable Objectives Applicable to Slender Orcutt Grass

Applicable Biological Goals	Related Biological Objectives
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPP7.** Preserve and maintain in perpetuity all known currently unpreserved occurrences of slender Orcutt grass in the Plan Area to preserve existing distribution, and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.

Analysis of Species Conservation

There are four documented occurrences of slender Orcutt grass distributed in the Plan Area, all within the UDA. Three (75%) of the four occurrences will be preserved in an SSHCP Preserve (all inside the UDA in PPU 3). No documented occurrences of slender Orcutt grass will be impacted by currently known Covered Activity project footprints. Further, Objective VPP7 requires that all occurrences of slender Orcutt grass be preserved; this is a species for which no take of occurrences is allowed. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area; however, additional occurrences will be avoided. Before a site is disturbed by a Covered Activity, surveys will be conducted in modeled habitat during the appropriate time of year when slender Orcutt grass is observable. Any occurrences will be preserved by the Project Proponent within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to monitor persistence. If monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for slender Orcutt grass is on preserving known occurrences, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur, or become established in the future. The SSHCP Conservation Strategy will preserve and link approximately 9,710 acres of modeled habitat for slender Orcutt grass in the Plan Area. In particular, preservation of the Vernal Pool Ecosystem will protect the hydrology and soil conditions necessary for persistence of preserved slender Orcutt grass aquatic habitat. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in or near these Core Recovery Areas, focusing conservation in the areas important for recovery of this species. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will

minimize indirect effects of urban development on the Vernal Pool Ecosystem within Preserves, including spread of non-native plant species or degradation of water quality. Large preserves will protect the subsurface hydrology that supports the Vernal Pool Ecosystem by protecting the perched aquifer from punctures or disruption related to grading and other surface-disturbing activities. Large preserves will also preserve vernal pool surface hydrology by maintaining the connections between swales and vernal pools.

By preserving existing populations and modeled habitat of slender Orcutt grass in large, interconnected Preserves that are protected from edge effects, the species will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow via interconnected systems of vernal pools and swales. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of slender Orcutt grass habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

As discussed in Section 7.5, the conservation focus for slender Orcutt grass is focused inside PPU 1, and PPU 3, where documented occurrences occur. Three Core Preserves, each including more than 300 acres of slender Orcutt grass modeled habitat (with a combined total of 1,733 acres), will be established in PPU 1 and PPU 3. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. For example, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

Although there are no known occurrences of slender Orcutt grass outside the UDA, modeled habitat in the Cosumnes/Rancho-Seco Core Recovery Area where the species might occur would be protected within the large landscape-scale Preserve (at least 10,500 acres) established in PPU 7. The Landscape Preserve will be established through land acquisitions that are targeted to (1) preserve modeled slender Orcutt grass habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase Preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 7,187 acres of the existing 34,492 acres of slender Orcutt grass modeled habitat (i.e., Vernal Pool Ecosystem) may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated slender Orcutt grass populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area pools remains relatively good. Those pools in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve slender Orcutt grass modeled habitat with a range of pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem. By preserving a range of slender Orcutt grass habitats in the Plan Area, the SSHCP will help slender Orcutt grass persist during expected climate change effects on precipitation and temperature.

The preservation of known occurrences and modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish approximately 148 acres of slender Orcutt grass modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. The re-established and/or established slender Orcutt grass modeled aquatic habitat will be provided appropriate management and monitoring of lands to ensure that habitat remains functional in perpetuity for slender Orcutt grass. This will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area.

The SSHCP Preserve System will link SSHCP Preserves and existing preserves that have slender Orcutt grass modeled habitat to help maintain dispersal between vernal pool complexes (e.g.,

dispersal of seeds through surface flows, predator wastes, wind, and mud carried on the feet of animals). The SSHCP Preserve System will maintain the slender Orcutt grass at its current distribution, and the re-establishment and establishment of additional habitat will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The SSHCP Preserve will establish Core Preserves and Linkage Preserves that will maintain connectivity between these existing occurrences and modeled habitat in other SSHCP Preserves and existing preserves in the Plan Area. By establishing large Preserves, the SSHCP will also ensure that connectivity between vernal pools within SSHCP Preserves is maintained. The larger Preserves (Core and Landscape) will facilitate appropriate vegetation management activities that improve functionality of the Vernal Pool Ecosystem as habitat, such as prescribed livestock grazing and prescribed burning. Large preserves make grazing more feasible by not requiring grazing operators to constantly shuttle livestock between disjunct preserve areas, and allow use of prescribed burning by establishing large separations between burn areas inside the preserve and developed areas outside the preserve. Grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' competition with native vernal pool plants and limit their use of water from the perched aquifer.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of habitat for slender Orcutt grass protected in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit slender Orcutt grass habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools and allow filling from surface flows if present. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing conditions. These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 objectives will directly benefit slender Orcutt grass from the requirement that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), Stream Setbacks, and implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit slender Orcutt grass by ensuring there are selection criteria and re-establishment/ establishment criteria for Valley Grassland, Vernal Pool, and Swale (Objective VG1, VP1, VP2, VP3, VP4, VP5).

Further, Objective VPP6 (Goal 5) will assure the protection of slender Orcutt grass occurrences and distribution within the Plan Area.

Critical Habitat

As defined in Section 3.6.1, the Vernal Pool Ecosystem includes Valley Grassland and Vernal Pool land cover types, each of which include one or more PCEs that have been defined for slender Orcutt grass (USFWS 2006c). To compensate for impacts to 235 acres of Vernal Pool Ecosystem within slender Orcutt grass Critical Habitat, the SSHCP Conservation Strategy will preserve a total of approximately 287 acres of Vernal Pool Ecosystem within slender Orcutt grass Critical Habitat, all of which will be preserved in CHU 6. Monitoring and adaptive management under the SSHCP will ensure that the PCEs for slender Orcutt grass are maintained within this CHU, and allow the PCEs to provide their intended conservation function for the species.

Recovery Plan

The SSHCP will be consistent with the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005a), which recommends preserving 100% of documented occurrences. The SSHCP Conservation Strategy is the equivalent of the Recovery Plan's Species-Specific Recovery Criteria for each Core Recovery Area located inside the Plan Area (USFWS 2005a), as described below. Where occurrences exist in locations still suitable for a functioning Core Preserve, these locations will be prioritized for preservation to achieve SSHCP and USFWS (2005a) Recovery Plan conservation goals.

SSHCP Covered Activities are anticipated to impact up to approximately 4,683 acres of slender Orcutt grass modeled habitat in the Mather Core Recovery Area, and approximately 21 acres in the Cosumnes/Rancho Seco Core Recovery Area. To conserve this species, a total of approximately 6,017 acres of Vernal Pool Ecosystem will be preserved within the Cosumnes/Rancho Seco Core Recovery Area and a total of approximately 3,420 acres will be preserved within the Mather Core Recovery Area (Table 7-37). When combined with existing preserves, 80% of the modeled slender Orcutt grass habitat in the Cosumnes/Rancho Seco Core Recovery Area will be preserved. Although this is less than the 95% habitat preservation target of the 2005 Recovery Plan, this large preservation area combined with the other elements of the SSHCP Conservation Strategy (e.g., monitoring and adaptive management, preservation of all occurrences) will allow consistency with the 2005 Recovery Plan. When combined with existing preserves, 50% of the modeled slender Orcutt grass habitat in the Mather Core Recovery Area will be preserved.

Table 7-37
Slender Orcutt Grass Permanent Effects and Conservation in Core Recovery Areas

Habitat Model Land Cover Types	Total Core Recovery Areas (acres)		Mather Core Area (acres)		Cosumnes/Rancho-Seco Core Area (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*
Valley Grassland	4,558	9,063	4,538	3,273	20	5,790
Vernal Pool	146	374	145	147	1	227
Vernal Pool Ecosystem	**4,704**	**9,437**	**4,683**	**3,420**	**21**	**6,017**

The SSHCP Conservation Strategy is equivalent to implementation of the 2005 Recovery Plan for the Plan Area because it provides an alternative Conservation Strategy for conserving slender Orcutt grass and contains the six elements of recovery. The manner in which the SSHCP achieves this consistency for slender Orcutt grass is discussed in detail in Section 7.6.2.1, Ahart's Dwarf Rush, Recovery Plans.

7.6.2.8 Sanford's Arrowhead

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 10,620 acres of the Sanford's arrowhead modeled habitat in the Plan Area, comprising 103 acres of Freshwater Marsh, 68 acres of Open Water, 72 acres of Seasonal Wetland, 83 acres of Stream/Creek, and 10,294 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-38). In all, 98% of impacts to Sanford's arrowhead modeled habitat will occur in the UDA.

To mitigate these impacts to Sanford's arrowhead modeled habitats and the take of all Sanford's arrowhead occupying that habitat, the SSHCP will preserve approximately 12,089 acres of modeled habitat, including 127 acres of Freshwater Marsh, 23 acres of Open Water, 87 acres of Seasonal Wetland, 117 acres of Stream/Creek, and 11,735 acres of Valley Grassland (Table 7-38). The SSHCP will also re-establish and/or establish approximately 326 acres of Sanford's arrowhead modeled habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-39).

Final South Sacramento Habitat Conservation Plan

Table 7-38
Permanent Habitat Impacts and Conservation for Sanford's Arrowhead

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Freshwater Marsh	103	Qualitative	103	127	103
Open Water	68	Qualitative	68	23[a]	68[b]
Seasonal Wetland	72	Qualitative	72	87	72
Streams/Creeks	83	Qualitative	83	117	83
Valley Grassland	10,294	Qualitative	10,294[c]	11,735	0
GRAND TOTAL	**10,620**	**Qualitative**	**10,620**	**12,089**	**326**

[a] Preservation of Open Water can be achieved by preserving any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

[b] Re-establishment and/or establishment of Open Water can be achieved by re-establishing and/or establishing any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-39
Biological Goals and Measurable Objectives Applicable to Sanford's Arrowhead

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (low-impact development (LID) and ROAD AMMs) • Ground disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).

Table 7-39
Biological Goals and Measurable Objectives Applicable to Sanford's Arrowhead

Applicable Biological Goals	Related Biological Objectives
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W6. Covered Activities will avoid a minimum of 20% of first and second order tributaries to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek in the UDA.
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by the Technical Advisory Committee (TAC)). The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.

Table 7-39
Biological Goals and Measurable Objectives Applicable to Sanford's Arrowhead

Applicable Biological Goals	Related Biological Objectives
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective SA1.** Prior to take of an occurrence of Sanford's arrowhead (*Sagittaria sanfordii*), protect one currently unpreserved[17] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Sanford's arrowhead within the Plan Area.
	Objective SA2. During re-establishment and/or establishment of Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek, translocate impacted Sanford's arrowhead (*Sagittaria sanfordii*) from other sites.

Analysis of Species Conservation

Of the 63 documented occurrences of Sanford's arrowhead within the Plan Area, 14 are located inside the UDA and 49 occurrences are located outside the UDA. One of the 63 occurrences of Sanford's arrowhead will be protected in an SSHCP Preserve, and 12 of the documented occurrences will be impacted by UDA Covered Activities. Implementation of Objective SA1 will require that, prior to take of any occurrence of Sanford's arrowhead, one currently unpreserved[18] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Sanford's arrowhead within the Plan Area will be preserved. Exhaustive surveys for this species have not been conducted in the Plan Area or region, and it is likely that additional occurrences will be found in the future in the Plan Area. Preserved occurrences will be located within a minimum satellite-sized Preserve that encloses the entire vernal pool watershed. In addition, surveys will be conducted after the first year of preservation and every 5 years thereafter to

[17] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

[18] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the Plan Area.

monitor persistence. If monitoring indicates that the preserved population is not persisting, the Implementing Entity will conduct remediation efforts.

Although the conservation focus for Sanford's arrowhead is on preserving known occurrences, the Preserve System could also benefit this species by preserving modeled habitat where previously unknown occurrences occur, or become established in the future. The SSHCP Conservation Strategy will preserve and link approximately 12,089 acres of modeled habitat for Sanford's arrowhead in the Plan Area. In particular, preservation of Valley Grassland will protect the hydrology and soil conditions necessary for persistence of preserved Sanford's arrowhead aquatic habitat. To the extent possible, SSHCP Preserves will be adjacent to and contiguous with existing preserves, increasing the effective size of the Preserve System. By ensuring SSHCP Preserves are large and/or connected to existing preserves, the Conservation Strategy will minimize indirect effects of urban development on the modeled habitat within Preserves, including spread of non-native plant species or degradation of water quality.

Sanford's arrowhead conservation will focus on preservation/re-establishment/establishment sites that will provide the necessary hydrologic parameters, seed, tuber/rhizome fragment dispersal, and colonization of available now-unoccupied emergent marsh sites. Sanford's arrowhead preservation inside the UDA will focus on areas along the Laguna Creek Wildlife Movement Corridor. Except where prevented by existing development, the Laguna Creek Wildlife Movement Corridor will have on average a minimum width of 600 feet. This stream riparian corridor will include preserved freshwater marsh as well as mixed riparian scrub and mixed riparian woodland. In addition to preserving existing Sanford's arrowhead populations, the stream riparian corridor will include re-establishment and/or establishment of these habitats at a 1:1 ratio along reaches with suitable soils and landforms. Areas targeted for re-establishment/establishment will include Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek that provide opportunities for establishing new occurrences of Sanford's arrowhead, as well as opportunities for dispersal and colonization of nearby modeled habitat.

Conservation of Sanford's arrowhead habitat outside the UDA will focus on areas in stream riparian corridors, marshes, and other areas that are modeled habitat for this species. Areas that will be the focus of habitat Preserves include Cosumnes River, Deer Creek, Badger Creek, Willow Creek, Laguna Creek south, Brown Creek, and Skunk Creek. Select portions of Bear Slough, Cosumnes Slough, Deadman's Gulch, Griffith Creek, Hadselville Creek, North Fork Badger Creek, Rolling Draw Creek, Windmill Creek, and unnamed creeks and drainage canals also will be considered. The goal within Sanford's arrowhead habitat will be to maintain, on average, a minimum stream riparian corridor width of 600 feet with, on average, 300 feet on both sides of the stream. A corridor width of this size is expected to protect streams and associated habitats from adverse effects by adjacent land uses. Stream reaches that currently support associated Freshwater Marsh or that could be restored to this habitat type will be the focus of

preservation efforts. Through management and monitoring, the Preserve will continue to provide existing functions and values and may exceed the existing condition.

By preserving existing populations and modeled habitat of Sanford's arrowhead in large, interconnected Preserves that are protected from edge effects, the species will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via pollinators and inadvertent tracking of seeds through water flow. The larger Preserves will also facilitate appropriate vegetation management activities that improve functionality of Sanford's arrowhead habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish approximately 326 acres of Sanford's arrowhead modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of approximately 10,620 acres of the existing 52,823 acres of Sanford's arrowhead modeled habitat may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated Sanford's arrowhead populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance. This is less likely in the Plan Area than in other regions because connectivity within Plan Area modeled habitat remains relatively good. Those areas in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic

diversity and species distribution, the SSHCP will preserve Sanford's arrowhead modeled habitat with a range of modeled habitat types within the Plan Area.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of habitat for Sanford's arrowhead protected in the Preserve System will ensure that modeled habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit Sanford's arrowhead habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3), monitoring objectives (HAB5, HAB7), and invasive species eradication on Preserves (Objective HAB4). These actions will result in higher overall reproductive success and productivity of the Plan Area population.

In addition, as discussed in Section 7.3.2, SSHCP Biological Goals and Measurable Objectives, Goal 2 objectives will directly benefit Sanford's arrowhead from the requirement that aquatic resources are re-established/established or preserved and managed in perpetuity (Objective W4, W5), Stream Setbacks and implementation of AMMs (Objective W2, W3). Goal 3 objectives will directly benefit Sanford's arrowhead by ensuring there are selection criteria and re-establishment/ establishment criteria for Valley Grassland, Freshwater Marsh, Seasonal Wetland, Open Water, and Stream/Creek (Objective VG1, FWM1, FWM2, SW1, SW2, OW1, OW2, SC1, SC2). Further, Objective SA1 (Goal 5) will assure the preservation of Sanford's arrowhead occurrences and distribution within the Plan Area.

7.6.2.9 Vernal Pool Fairy Shrimp

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 17,259 acres of vernal pool fairy shrimp modeled habitat in in the Plan Area. All impacted modeled habitat for vernal pool fairy shrimp is within the Vernal Pool Ecosystem, comprising 787 acres of vernal pool fairy shrimp modeled aquatic habitat and 16,472 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-40). These impacts include direct and indirect effects to up to 746 acres of Vernal Pool Ecosystem within vernal pool fairy shrimp Critical Habitat. The majority of impacts to the Vernal Pool Ecosystem (98%) occur in the UDA, including 741 acres of impact to vernal pool fairy shrimp modeled aquatic habitat and 16,186 acres of impact to supporting uplands. The SSHCP assumes that all modeled aquatic habitat is occupied by vernal pool fairy shrimp, and thus impacts to known occurrences are not analyzed.

To mitigate these impacts to vernal pool fairy shrimp modeled habitats and the take of all vernal pool fairy shrimp occupying that habitat, the SSHCP preserves 23,284 acres of Vernal Pool Ecosystem, including 966 acres of Vernal Pool, 278 acres of Swale, 26 acres of Stream/Creek

(VPIH) and 22,014 acres of Valley Grassland (Table 7-40). The 22,414 acres of preserved Vernal Pool Ecosystem includes 11,920 acres of preservation that will occur within the Vernal Pool Ecosystem that is within vernal pool fairy shrimp Critical Habitat (Table 7-41).

Finally, the SSHCP will also re-establish and/or establish 645 acres of vernal pool fairy shrimp modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-42).

Table 7-40

Biological Goals and Measurable Objectives Applicable to Vernal Pool Fairy Shrimp

Applicable Biological Goals	Related Biological Measurable Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of

Table 7-42
Biological Goals and Measurable Objectives Applicable to Vernal Pool Fairy Shrimp

Applicable Biological Goals	Related Biological Measurable Objectives
Covered Species within the Plan Area.	the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4 • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.

Table 7-42
Biological Goals and Measurable Objectives Applicable to Vernal Pool Fairy Shrimp

Applicable Biological Goals	Related Biological Measurable Objectives
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland, and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPI2.** Protect and maintain in perpetuity 1,270 acres of vernal pool fairy shrimp *(Branchinecta lynchi)* modeled aquatic habitat within the Plan Area to preserve existing distribution.
	Objective VPI5. Ensure that during implementation of Objective VP2, re-established and/or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/establishment, in accordance with Conservation Actions in Table 7-1.

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link 23,284 acres of the highest-quality habitat for vernal pool fairy shrimp in the Plan Area. In particular, preservation of the Vernal Pool Ecosystem will protect the hydrology and soil conditions necessary for persistence of preserved vernal pool fairy shrimp aquatic habitat.

The Conservation Strategy for vernal pool fairy shrimp targets preservation of vernal pool fairy shrimp habitat within Core Recovery Areas and Critical Habitat. These areas have been identified by the Wildlife Agencies as having the highest priority for preservation. Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho- Seco Core Recovery Area will be mitigated through preservation in these Core Recovery Areas. In addition, many impacts occurring outside the Core Recovery Areas will be mitigated within or near the Core Recovery Areas. This mitigation focus will provide improved conservation for the species as compared to the existing project-by-project permitting.

As discussed in Section 7.5, the conservation focus outside the UDA is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. This Landscape Preserve will encompass a heterogeneous range of natural land covers and soil types associated with the Vernal Pool Ecosystem in the Plan Area. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves. Required selection criteria for vernal pool fairy shrimp preserved habitat are listed in Conservation Action VPI1.1 and VPI1.2, and will assure that appropriate vernal pool densities, soil types, geology, adjacent modeled habitat, and other factors are included in the SSHCP Preserve System. By preserving a range of vernal pool fairy shrimp aquatic habitats in the Plan Area, the SSHCP will help vernal pool fairy shrimp persist during expected climate change effects on precipitation and temperature.

The Landscape Preserve will be established through land acquisitions that are targeted to (1) protect occupied vernal pool fairy shrimp habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

Three Core Preserves, each including more than 500 acres of modeled vernal pool fairy shrimp habitat, will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked together within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. Further, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from locating new SSHCP Preserves next to existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between SSHCP Preserves and existing preserves would be minimal or would not occur at all.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. By preserving existing populations of vernal pool fairy shrimp in large, interconnected Preserves that are protected from edge effects, the shrimp will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via inadvertent tracking of cysts and through water flow via interconnected systems of vernal pool, swale, and stream/creek (VPIH). The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of vernal pool fairy shrimp habitat, like prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of 17,259 acres of the existing 103,210 acres of vernal pool fairy shrimp modeled habitat (i.e., Vernal Pool Ecosystem), especially the removal or modification of 8,500 acres within the Mather Core Recovery Area, may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated vernal pool fairy shrimp populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance (Simovich 1998). This is less likely in the Plan Area than in other regions as connectivity within Plan Area pools remains relatively good. Those pools in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve vernal pool fairy shrimp modeled habitat with a range of pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish 645 acres of vernal pool fairy shrimp

modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. All re-establishment and establishment sites will be inoculated with inoculum from the impact or other representative sites, which will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The effectiveness of inoculation will be monitored through a special study, as described in Section 8.3.3.5. Re-establishing pools in historical vernal pool areas will further help to conserve vernal pool fairy shrimp by ensuring no net loss of the total acreage of vernal pool fairy shrimp aquatic habitat in the Plan Area.

The SSHCP Preserve System will link together SSHCP Preserves and existing preserves that have modeled vernal pool fairy shrimp habitat, to help maintain dispersal between vernal pool complexes (e.g., dispersal of cysts through surface flows, predator wastes, wind, and mud carried on the feet of animals). For example, 12 documented occurrences for vernal pool fairy shrimp are located in existing preserves in PPU 1, which would be linked together under the SSHCP by Core Preserves, Linkage Preserves, and Satellite Preserves to other existing preserves in PPUs 1, 2, and 3. By establishing large Preserves, the SSHCP will also ensure that connectivity between pools within Preserves is maintained.

As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for vernal pool fairy shrimp protected in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit vernal pool fairy shrimp habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3, HAB5) and invasive species eradication on Preserves (Objective HAB4). Further, effectiveness monitoring of the Conservation Strategy for vernal pool fairy shrimp will include a special study to investigate indirect effects of development on vernal pool crustaceans. The results of that study will inform adaptive management of SSHCP Condition 2 AMMs, as well as adaptive management of SSHCP Preserves. As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool fairy shrimp habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools, and allow filling from surface flows if present.

Critical Habitat

As defined in Section 3.2.3, the Vernal Pool Ecosystem includes Valley Grassland, Vernal Pool, Swale, and Stream/Creek (VPIH) land cover types, each of which include one or more PCEs that have been defined for vernal pool fairy shrimp (USFWS 2006c). The SSHCP Conservation Strategy will preserve a total of 11,920 acres of Vernal Pool Ecosystem within vernal pool fairy shrimp Critical Habitat. Of this preservation, 464 acres of Vernal Pool Ecosystem will be

preserved in CHU 13, 11,451 acres in CHU 14a, and 5 acres in CHU 14b. Monitoring and adaptive management under the SSHCP will ensure that the PCEs for vernal pool fairy shrimp are maintained within these CHUs, and allow the PCEs to provide their intended conservation function for the species.

Recovery Plan

SSHCP Covered Activities are anticipated to impact up to approximately 8,500 acres of vernal pool fairy shrimp modeled habitat in the Mather Core Recovery Area, and approximately 53 acres in the Cosumnes/Rancho Seco Core Recovery Area. To conserve this species, a total of approximately 15,294 acres of Vernal Pool Ecosystem will be preserved within the Cosumnes/Rancho Seco Core Recovery Area and a total of approximately 5,484 acres will be preserved within the Mather Core Recovery Area (Table 7-43). When combined with existing preserves that are not part of the SSHCP Preserve System, more than 99% of the modeled vernal pool fairy shrimp habitat in the Cosumnes/Rancho Seco Core Recovery Area will be preserved, consistent with the 80% target of the 2005 Recovery Plan. When combined with existing preserves that are not part of the SSHCP Preserve System, 48% of the modeled vernal pool fairy shrimp habitat in the Mather Core Recovery Area will be preserved.

The SSHCP Conservation Strategy is equivalent to implementation of the 2005 Recovery Plan for the Plan Area because it provides an alternative conservation strategy for conserving vernal pool fairy shrimp and contains the six elements of Recovery. The manner in which the SSHCP achieves this consistency for vernal pool fairy shrimp is discussed in detail in Section 7.6.3.

7.6.2.10 Mid-Valley Fairy Shrimp

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 12,639 acres of mid-valley fairy shrimp modeled habitat in the Plan Area. All impacted modeled habitat for mid-valley fairy shrimp is within the Vernal Pool Ecosystem, comprising 633 acres of mid-valley fairy shrimp modeled aquatic habitat and 12,006 acres of surrounding uplands (valley grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-44). The majority of impacts to the Vernal Pool Ecosystem (98%) occur in the UDA, including 625 acres of impact to mid-valley fairy shrimp modeled aquatic habitat and 11,799 acres of impact to supporting uplands. The SSHCP assumes that all modeled aquatic habitat is occupied by mid-valley fairy shrimp, and thus impacts to known occurrences are not analyzed.

To mitigate these impacts to mid-valley fairy shrimp modeled habitats and the take of all mid-valley fairy shrimp occupying that habitat, the SSHCP preserves 11,297 acres of Vernal Pool Ecosystem, including 603 acres of Vernal Pool, 201 acres of Swale, and 10,493 acres of Valley Grassland (Table 7-44).

Finally, the SSHCP will also re-establish and/or establish 546 acres of mid-valley fairy shrimp modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-45).

Table 7-44
Permanent Effects and Conservation for Mid-Valley Fairy Shrimp

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	12,006	Qualitative	12,006 [a]	10,493	0
Vernal Pool	337	71	408	603	336
Swale	190	35	225	201	210[b]
Vernal Pool Ecosystem	**12,533**	**106**	**12,639**	**11,297**	**546**

[a] Total impacts to Valley Grassland include an unknown but small amount of indirect impact that was analyzed qualitatively in Chapter 6.
[b] Swale re-establishment/establishment may occur in the form of any combination of Swale or Vernal Pool.
[c] Re-establishment/establishment to mitigate direct effects to 20 acres of Stream/Creek (VPIH) will be in the form of Swale, which has been added to the 190 acres necessary to mitigate direct effects to swale.

Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes

Table 7-45
Biological Goals and Measurable Objectives Applicable to Mid-Valley Fairy Shrimp

Applicable Biological Goals	Related Biological Objectives
Species within the Plan Area.	or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the

Table 7-45
Biological Goals and Measurable Objectives Applicable to Mid-Valley Fairy Shrimp

Applicable Biological Goals	Related Biological Objectives
	Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPI3.** Protect and maintain in perpetuity 1,059 acres of mid-valley fairy shrimp (*Branchinecta mesovallensis*) modeled aquatic habitat within the Plan Area to preserve existing distribution.
	Objective VPI5. Ensure that during implementation of Objective VP2, re-established and/or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/establishment, in accordance with Conservation Actions in Table 7-1.

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link 11,397 acres of the highest-quality habitat for mid-valley fairy shrimp in the Plan Area. In particular, preservation of the Vernal Pool Ecosystem will protect the hydrology and soil conditions necessary for persistence of preserved mid-valley fairy shrimp aquatic habitat.

The Conservation Strategy for mid-valley fairy shrimp targets preservation of mid-valley fairy shrimp habitat within Core Recovery Areas. These areas have been identified by the Wildlife Agencies as having the highest priority for preservation. Impacts to mid-valley fairy shrimp occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in these Core Recovery Areas, providing improved conservation for the species as compared to the existing project-by-project permitting.

As discussed in Section 7.5, the conservation focus outside the UDA is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. This Landscape Preserve will encompass a heterogeneous range of natural land covers and soil types associated with the Vernal Pool Ecosystem in the Plan Area. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves. Required selection criteria for mid-valley fairy shrimp preserved habitat are listed in Conservation Action VPI1.1, and will assure that appropriate vernal pool densities, soil types, geology, adjacent modeled habitat, and other factors are included in the SSHCP Preserve System. By preserving a range of mid-valley fairy shrimp aquatic habitats in the Plan Area, the SSHCP will help mid-valley fairy shrimp persist during expected climate change effects on precipitation and temperature.

The Landscape Preserve will be established through land acquisitions that are targeted to (1) protect occupied mid-valley fairy shrimp habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

Three Core Preserves, each including more than 500 acres of modeled mid-valley fairy shrimp habitat, will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked together within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. Further, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved

vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs, in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. By preserving existing populations of mid-valley fairy shrimp in large, interconnected Preserves that are protected from edge effects, the shrimp will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via inadvertent tracking of cysts and through water flow via interconnected systems of vernal pool, swale, and stream/creek (VPIH). The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of mid-valley fairy shrimp habitat, such as prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of 12,639 acres of the existing 53,698 acres of mid-valley fairy shrimp modeled habitat (i.e. Vernal Pool Ecosystem), especially the removal or modification of 6,280 acres within the Mather Core Recovery Area, may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated mid-valley fairy shrimp populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance (Simovich 1998). This is less likely in the Plan Area than in other regions as connectivity within Plan Area pools remains relatively good. Those pools in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve mid-valley fairy shrimp modeled habitat with a range of pool sizes, soil types, geologic landforms, and

locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish 546 acres of mid-valley fairy shrimp modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. All re-establishment and establishment sites will be inoculated with inoculum from the impact or other representative sites, which will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The effectiveness of inoculation will be monitored through a special study, as described in Section 8.3.3.5. Re-establishing pools in historical vernal pool areas will further help to conserve mid-valley fairy shrimp by ensuring no net loss of the total acreage of mid-valley fairy shrimp aquatic habitat in the Plan Area.

The SSHCP Preserve System will link together SSHCP Preserves and existing preserves that have modeled mid-valley fairy shrimp habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of cysts through surface flows, predator wastes, wind, and mud carried on the feet of animals). For example, seven documented occurrences for mid-valley fairy shrimp are located in existing preserves in PPU 3, which would be linked together under the SSHCP by Core Preserves and Linkage Preserves to other existing preserves in PPU 2. By establishing large Preserves, the SSHCP will also ensure that connectivity between pools within Preserves is maintained.

As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for mid-valley fairy shrimp protected in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit mid-valley fairy shrimp habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3, HAB5) and invasive species eradication on Preserves (Objective HAB4). Further, effectiveness monitoring of the Conservation Strategy for mid-valley fairy shrimp will include a special study to investigate indirect effects of development on vernal pool crustaceans. The results of that study will inform adaptive management of SSHCP Condition 2 AMMs, as well as adaptive management of SSHCP Preserves. As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools, and allow filling from surface flows if present.

Recovery Plan

SSHCP Covered Activities are anticipated to impact up to approximately 6,280 acres of mid-valley fairy shrimp modeled habitat in the Mather Core Recovery Area, and approximately 41 acres in the Cosumnes/Rancho Seco Core Recovery Area. To conserve this species, a total of approximately 5,392 acres of Vernal Pool Ecosystem will be preserved within the Cosumnes/Rancho Seco Core Recovery Area and a total of approximately 4,737 acres will be preserved within the Mather Core Recovery Area (Table 7-46). When combined with existing preserves that are not part of the SSHCP Preserve System, 77% of the modeled mid-valley fairy shrimp habitat in the Cosumnes/Rancho Seco Core Recovery Area will be preserved, nearly reaching the 80% target of the 2005 Recovery Plan. When combined with existing preserves that are not part of the SSHCP Preserve System, 52% of the modeled mid-valley fairy shrimp habitat in the Mather Core Recovery Area will be preserved.

Table 7-46
Permanent Effects and Conservation in Core Recovery Areas for Mid-Valley Fairy Shrimp

Habitat Model Land Cover Types	Total Core Recovery Areas (acres)		Mather Core Area (acres)		Cosumnes/Rancho Seco Core Area (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*

The SSHCP Conservation Strategy is equivalent to implementation of the 2005 Recovery Plan for the Plan Area because it provides an alternative conservation strategy for conserving mid-valley fairy shrimp and contains the six elements of recovery. The manner in which the SSHCP achieves this consistency for mid-valley fairy shrimp is discussed in detail in Section 7.6.3.

7.6.2.11 Vernal Pool Tadpole Shrimp

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 17,259 acres of vernal pool tadpole shrimp modeled habitat in the Plan Area. All impacted modeled habitat for vernal pool tadpole shrimp is within the Vernal Pool Ecosystem, comprising 787 acres of vernal pool tadpole shrimp modeled aquatic habitat and 16,472 acres of surrounding uplands (Valley Grassland) needed to support continued habitat

functions and values of the aquatic habitats (Table 7-47). These impacts include direct and indirect effects to approximately 746 acres of Vernal Pool Ecosystem within vernal pool tadpole shrimp Critical Habitat. The majority of impacts to the Vernal Pool Ecosystem (98%) occur in the UDA, including 741 acres of impact to vernal pool fairy shrimp modeled aquatic habitat and 16,186 acres of impact to supporting uplands. The SSHCP assumes that all modeled aquatic habitat is occupied by vernal pool tadpole shrimp, and thus impacts to known occurrences are not analyzed.

To mitigate these impacts to vernal pool tadpole shrimp modeled habitats and the take of all vernal pool tadpole shrimp occupying that habitat, the SSHCP preserves 23,284 acres of Vernal Pool Ecosystem, including 966 acres of Vernal Pool, 278 acres of Swale, 26 acres of Stream/Creek (VPIH), and 22,014 acres of Valley Grassland (Table 7-47). The 23,284 acres of preserved Vernal Pool Ecosystem includes 11,920 acres of preservation of Vernal Pool Ecosystem within vernal pool tadpole shrimp Critical Habitat (Table 7-48).

Finally, the SSHCP will also re-establish and/or establish 645 acres of vernal pool tadpole shrimp modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-49).

Table 7-47
Permanent Effects and Conservation for Vernal Pool Tadpole Shrimp

Table 7-49
Biological Goals and Measurable Objectives Applicable to Vernal Pool Tadpole Shrimp

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of

Table 7-49
Biological Goals and Measurable Objectives Applicable to Vernal Pool Tadpole Shrimp

Applicable Biological Goals	Related Biological Objectives
	freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland, and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPI1.** Protect and maintain in perpetuity 1,270 acres of vernal pool tadpole shrimp modeled aquatic habitat within the Plan Area to preserve existing distribution.
	Objective VPI5. Ensure that during implementation of Objective VP2, re-established and/or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/establishment, in accordance with Conservation Actions in Table 7-1.

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link 23,284 acres of the highest-quality habitat for vernal pool tadpole shrimp in the Plan Area. In particular, preservation of the Vernal Pool Ecosystem will protect the hydrology and soil conditions necessary for persistence of preserved vernal pool tadpole shrimp aquatic habitat.

The Conservation Strategy for vernal pool tadpole shrimp targets preservation of vernal pool tadpole shrimp habitat within Core Recovery Areas and Critical Habitat. These areas have been identified by the Wildlife Agencies as having the highest priority for preservation.

Objective VP1b requires that impacts occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in these Core Recovery Areas, providing improved conservation for the species as compared to the existing project-by-project permitting.

As discussed in Section 7.5, the conservation focus outside the UDA is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. This Landscape Preserve will encompass a heterogeneous range of natural land covers and soil types associated with the Vernal Pool Ecosystem in the Plan Area. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, thus making a larger-scale contiguous Preserve System. Required selection criteria for vernal pool tadpole shrimp preserved habitat are listed in Conservation Action VPI1.1, and will ensure that appropriate vernal pool densities, soil types, geology, adjacent modeled habitat, and other factors are included in the SSHCP Preserve System. By preserving a range of vernal pool tadpole shrimp aquatic habitats in the Plan Area, the SSHCP will help vernal pool tadpole shrimp persist during expected climate change effects on precipitation and temperature.

The Landscape Preserve will be established through land acquisitions that are targeted to (1) protect occupied vernal pool tadpole shrimp habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

Three Core Preserves, each including more than 500 acres of modeled vernal pool tadpole shrimp habitat, will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked together within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves will be

adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. Further, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. By preserving existing populations of vernal pool tadpole shrimp in large, interconnected Preserves that are protected from edge effects, the shrimp will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via inadvertent tracking of cysts and through water flow via interconnected systems of vernal pool, swale, and stream/creek (VPIH). The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of vernal pool tadpole shrimp habitat, such as prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of 17,259 acres of the existing 103,210 acres of vernal pool tadpole shrimp modeled habitat (i.e., Vernal Pool Ecosystem), especially the removal or modification of 8,500 acres within the Mather Core Recovery Area may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated vernal pool tadpole shrimp populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance (Simovich 1998). This is less likely in the Plan Area than in other regions as connectivity within Plan Area pools remains relatively good. Those pools in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve

vernal pool tadpole shrimp modeled habitat with a range of pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish 645 acres of vernal pool tadpole shrimp modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. All re-establishment and establishment sites will be inoculated with inoculum from the impact or other representative sites, which will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The effectiveness of inoculation will be monitored through a special study, as described in Section 8.3.3.5.

The SSHCP Preserve System will link together SSHCP Preserves and existing preserves that have modeled vernal pool tadpole shrimp habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of cysts through surface flows, predator wastes, wind, and mud carried on the feet of animals). For example, 21 known occurrences for vernal pool tadpole shrimp are located in existing preserves in PPU 2, which would be linked together under the SSHCP by Core Preserves and Linkage Preserves to other existing preserves in PPU 3. By establishing large Preserves, the SSHCP will also ensure that connectivity between vernal pools within SSHCP Preserves is maintained.

As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for vernal pool tadpole shrimp protected in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit vernal pool tadpole shrimp habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3, HAB5), and invasive species eradication on Preserves (Objective HAB4). Further, effectiveness monitoring of the Conservation Strategy for vernal pool tadpole shrimp will include a special study to investigate indirect effects of development on vernal pool crustaceans. The results of that study will inform adaptive management of SSHCP Condition 2 AMMs, as well as adaptive management of SSHCP Preserves. As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools, and allow filling from surface flows if present.

Critical Habitat

As defined in Section 3.2.3, the Vernal Pool Ecosystem includes Valley Grassland, Vernal Pool, Swale, and Stream/Creek (VPIH) land cover types, each of which include one or more PCEs that have been defined for vernal pool tadpole shrimp (USFWS 2006c). The SSHCP Conservation Strategy will preserve a total of 11,920 acres of Vernal Pool Ecosystem within vernal pool tadpole shrimp Critical Habitat. Of this preservation, 464 acres of Vernal Pool Ecosystem will be preserved in CHU 8, 5 acres in CHU 9a, and 11,451 acres in CHU 9b. Monitoring and adaptive management under the SSHCP will ensure that the PCEs for vernal pool tadpole shrimp are maintained within these CHUs, and allow the PCEs to provide their intended conservation function for the species.

Recovery Plan

SSHCP Covered Activities are anticipated to impact up to approximately 8,500 acres of vernal pool tadpole shrimp modeled habitat in the Mather Core Recovery Area, and approximately 53 acres in the Cosumnes/Rancho Seco Core Recovery Area. To conserve this species, a total of approximately 15,294 acres of Vernal Pool Ecosystem will be preserved within the Cosumnes/Rancho Seco Core Recovery Area and a total of approximately 5,484 acres will be preserved within the Mather Core Recovery Area (Table 7-50). When combined with existing preserves that are not part of the SSHCP Preserve System, 83% of the modeled vernal pool tadpole shrimp habitat in the Cosumnes/Rancho Seco Core Recovery Area will be preserved, consistent with the 80% target of the 2005 Recovery Plan. When combined with existing preserves that are not part of the SSHCP Preserve System, 46% of the modeled vernal pool tadpole shrimp habitat in the Mather Core Recovery Area will be preserved.

Table 7-50
Permanent Effects and Conservation in Core Recovery Areas for Vernal Pool Tadpole Shrimp

Habitat Model Land Cover Types	Total Core Recovery Areas (acres)		Mather Core Area (acres)		Cosumnes/Rancho-Seco Core Area (acres)	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*
Valley Grassland	8,164	19,557	8,118	5,155	46	14,402
Vernal Pool	222	916	216	213	6	703

Vernal Pool Ecosystem	**8,553**	**20,778**	**8,500**	**5,484**	**53**	**15,294**

The SSHCP Conservation Strategy is an acceptable alternative to implementation of the 2005 Recovery Plan (refer to Section 7.6.3).

7.6.2.12 Ricksecker's Water Scavenger Beetle

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 17, 233 acres of Ricksecker's water scavenger beetle modeled habitat in the Plan Area. All impacted modeled habitat for Ricksecker's water scavenger beetle is within the Vernal Pool Ecosystem, comprising 761 acres of Ricksecker's water scavenger beetle modeled aquatic habitat and 16,472 acres of surrounding uplands (Valley Grassland) needed to support continued habitat functions and values of the aquatic habitats (Table 7-51). The majority of impacts to the Vernal Pool Ecosystem (98%) occur in the UDA, including 715 acres of impact to Ricksecker's water scavenger beetle modeled aquatic habitat and 16,186 acres of impact to supporting uplands. The SSHCP assumes that all modeled aquatic habitat is occupied by Ricksecker's water scavenger beetle, and thus impacts to known occurrences are not analyzed.

To mitigate these impacts to Ricksecker's water scavenger beetle modeled habitats and the take of all Ricksecker's water scavenger beetle occupying that habitat, the SSHCP preserves approximately 23,258 acres of Vernal Pool Ecosystem, including 966 acres of Vernal Pool, 278 acres of Swale, and 22,014 acres of Valley Grassland (Table 7-51).

Finally, the SSHCP will also re-establish and/or establish 623 acres of Ricksecker's water scavenger beetle modeled aquatic habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-52).

Table 7-51
Permanent Effects and Conservation for Ricksecker's Water Scavenger Beetle

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Valley Grassland	16,472	Qualitative	16,472 [a]	22,014	0
Vernal Pool	389	94	483	966	389
Swale	234	44	278	278	234[b]
Vernal Pool Ecosystem	**17,095**	**138**	**17,233**	**23,258**	**623**

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[b] Swale re-establishment/establishment may occur in the form of any combination of Swale or Vernal Pool.

Table 7-52
Biological Goals and Measurable Objectives Applicable to Ricksecker's Water Scavenger Beetle

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the

Table 7-52
Biological Goals and Measurable Objectives Applicable to Ricksecker's Water Scavenger Beetle

Applicable Biological Goals	Related Biological Objectives
	Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VPI4.** Protect and maintain in perpetuity 1,245 acres of Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i) modeled aquatic habitat within the Plan Area to preserve existing distribution.
	Objective VPI5. Ensure that during implementation of Objective VP2, re-established and/or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/establishment, in accordance with Conservation Actions in Table 7-1.

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link 23,258 acres of the highest-quality habitat for Ricksecker's water scavenger beetle in the Plan Area. In particular, preservation of the Vernal Pool Ecosystem will protect the hydrology and soil conditions necessary for persistence of preserved Ricksecker's water scavenger beetle aquatic habitat.

Although the *Recovery Plan for Vernal Pool Ecosystems* does not include Ricksecker's water scavenger beetle, the Core Recovery Areas designated in the Recovery Plan represent the highest-quality intact habitat available in the Plan Area. Therefore, the Conservation Strategy for Ricksecker's water scavenger beetle targets preservation of Ricksecker's water scavenger beetle habitat within Core Recovery Areas. Impacts to Ricksecker's water scavenger beetle occurring within or near the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in these Core Recovery areas, providing improved conservation for the species as compared to the existing project-by-project permitting.

As discussed in Section 7.5, the conservation focus outside the UDA is on formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserve that is not part of the SSHCP Preserve System. This Landscape Preserve will encompass a heterogeneous range of natural land covers and soil types associated with the Vernal Pool Ecosystem in the Plan Area. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, thus making a larger-scale contiguous Preserve System. Required selection criteria for Ricksecker's water scavenger beetle preserved habitat (see Conservation Actions for Objective VPI4) will ensure that appropriate vernal pool densities, soil types, geology, adjacent modeled habitat, and other factors are included in the SSHCP Preserve System. By preserving a range of Ricksecker's water scavenger beetle aquatic habitats in the Plan Area, the SSHCP will help Ricksecker's water scavenger beetle persist during expected climate change effects on precipitation and temperature.

The Landscape Preserve will be established through land acquisitions that are targeted to (1) protect occupied Ricksecker's water scavenger beetle habitat; (2) capture desired vernal pool types, swales, and supporting uplands; (3) add parcels onto existing preserves that increase preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

Three Core Preserves, each including more than 500 acres of modeled Ricksecker's water scavenger beetle habitat, will be established in the UDA. In addition to the three Core Preserves, up to three Minor Preserves and seven Satellite Preserves will be established and linked together within the UDA. The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. Further, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land

preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and linkages between preserves would be minimal or would not occur at all.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. By preserving existing populations of Ricksecker's water scavenger beetle in large, interconnected Preserves that are protected from edge effects, the beetle will be less affected by future stochastic events and more likely to exchange genetic material among adjacent populations via inadvertent tracking of eggs and through water flow via interconnected systems of vernal pool and swale. The larger Preserves will also facilitate appropriate vernal pool vegetation management activities that improve functionality of Ricksecker's water scavenger beetle habitat, such as prescribed livestock grazing and prescribed burning. For example, grazing, fire, and other land management actions will reduce aboveground biomass and control non-native grasses' use of water from the perched aquifer.

Despite the establishment of the Preserve System, the SSHCP recognizes that removal or modification of 17,233 acres of the existing 102,676 acres of Ricksecker's water scavenger beetle modeled habitat (i.e., Vernal Pool Ecosystem), especially the removal or modification of 16,901 acres within the UDA, may result in some loss of species genetic diversity. The SSHCP further recognizes that small, isolated Ricksecker's water scavenger beetle populations that are not preserved under the SSHCP may contain genetic diversity of conservation importance (Simovich 1998). This is less likely in the Plan Area than in other regions as connectivity within Plan Area pools remains relatively good. Those pools in the Plan Area that are isolated have become so relatively recently, thus limiting the amount of genetic divergence from non-isolated populations. Nonetheless, to maximize preservation of genetic diversity and species distribution, the SSHCP will preserve Ricksecker's water scavenger beetle modeled habitat with a range of pool sizes, soil types, geologic landforms, and locations within the Plan Area. Refer to Section 7.6.1.1.1 for a discussion of how the Preserve System maintains the heterogeneity of the Vernal Pool Ecosystem.

The preservation of modeled habitat under the Conservation Strategy represents mitigation to the maximum extent possible. However, to maximize beneficial effects on the species, the Implementing Entity will also establish or re-establish 623 acres of Ricksecker's water scavenger beetle modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. All re-establishment and establishment sites will be inoculated with inoculum from the impact or other representative sites, which will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. The effectiveness of inoculation will be monitored through a special study, as described in Section 8.3.3.5. Re-establishing pools in historical vernal pool areas will further help to conserve Ricksecker's water scavenger beetle by ensuring no net loss of the total acreage of Ricksecker's water scavenger beetle aquatic habitat in the Plan Area.

The SSHCP Preserve System will link together SSHCP Preserves and existing preserves that have modeled Ricksecker's water scavenger beetle habitat to help maintain dispersal between vernal pool complexes (e.g., dispersal of eggs through surface flows, predator wastes, and mud carried on the feet of animals such as waterfowl). For example, four known occurrences for Ricksecker's water scavenger beetle are located in existing preserves in PPU 2. The SSHCP will establish Core Preserves and Linkage Preserves that will maintain connectivity between these existing occurrences and modeled habitat in other SSHCP Preserves or existing preserves. By establishing large Preserves, the SSHCP will also ensure that connectivity between vernal pools within SSHCP Preserves is maintained.

As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for Ricksecker's water scavenger beetle protected in the Preserve System will ensure that vernal pool hydrology, vegetation, and other vernal pool habitat characteristics within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives (Table 7-49) will directly benefit Ricksecker's water scavenger beetle habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, HAB3, HAB5) and invasive species eradication on Preserves (Objective HAB4). Further, effectiveness monitoring of the Conservation Strategy for Ricksecker's water scavenger beetle will include a special study to investigate indirect effects of development on vernal pool crustaceans. The results of that study will inform adaptive management of SSHCP Condition 2 AMMs, as well as adaptive management of SSHCP Preserves. As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species habitat by reducing residual dry matter in pools and density of non-native grasses in the surrounding uplands, which will reduce grasses' water consumption from the perched aquifer and pools and allow filling from surface flows if present.

7.6.2.13 Valley Elderberry Longhorn Beetle

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 591 acres of modeled habitat for valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) in the Plan Area, all of which is located in Riparian land cover types (Table 7-53). The majority of impacts (550 acres) to the modeled valley elderberry longhorn beetle habitat will occur in the UDA, including 218 acres of impact to Mine Tailing Riparian Woodland, 186 acres of impact to Mixed Riparian Scrub, and 146 acres of impact to Mixed Riparian Woodland. The SSHCP assumes that all modeled habitat is occupied by valley elderberry longhorn beetle, and thus impacts to known occurrences are not analyzed.

To mitigate these impacts to valley elderberry longhorn beetle modeled habitat and the take of all valley elderberry longhorn beetles occupying that habitat, the SSHCP preserves 964 acres of modeled habitat for valley elderberry longhorn beetle. Preservation of the 964 acres of valley elderberry longhorn beetle modeled habitat includes the preservation of any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.(Table 7-53). Most of the preserved land is likely to occur in the Cosumnes River and Deer Creek areas that provide excellent habitat for valley elderberry longhorn beetle. Conservation actions for the valley elderberry longhorn beetle are consistent with the Biological Goals and Measurable Objectives for this species (Table 7-54).

Table 7-53
Permanent Effects and Conservation for Valley Elderberry Longhorn Beetle

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Mine Tailing Riparian Woodland	218	Qualitative	218	218 [a]	218 [b]
Mixed Riparian Woodland	184	Qualitative	184	368 [c]	184 [d]
Mixed Riparian Scrub	189	Qualitative	189	378 [c]	189 [d]
GRAND TOTAL	**591**	Qualitative	**591**	**964**	**591**

[a] Impacts to Mine Tailing Riparian Woodland will be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[b] Impacts to Mine Tailing Riparian Woodland will be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[c] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[d] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

Table 7-54
Biological Goals and Measurable Objectives Applicable to Valley Elderberry Longhorn Beetle

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective RIP1**. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Re-establish and/or establish a minimum of 591 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species

Table 7-54
Biological Goals and Measurable Objectives Applicable to
Valley Elderberry Longhorn Beetle

Applicable Biological Goals	Related Biological Objectives
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective VELB1**. Relocate or replace each impacted elderberry shrub (*Sambucus* spp.) according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999b). Mitigation will occur in locations that are not inundated for 2 continuous weeks, as determined by the TAC.
	Objective VELB2. During implementation of riparian habitat re-establishment and/or establishment, strategically include elderberry shrub in the planting palette (see Objectives RIP2 and RIP4).

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link 964 acres of the highest-quality riparian habitat for valley elderberry longhorn beetle in the Plan Area. The SSHCP conservation focus for valley elderberry longhorn beetle is outside the UDA in PPU 5 and PPU 6, which encompass the Cosumnes River and Deer Creek areas. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, thus making a larger-scale contiguous Preserve System. By preserving a range of valley elderberry longhorn beetle habitats in the Plan Area, the SSHCP will help valley elderberry longhorn beetle persist during expected climate change effects on precipitation and temperature.

Preserves benefiting valley elderberry longhorn beetle will be established through land acquisitions that are targeted to (1) protect occupied valley elderberry longhorn beetle habitat; (2) capture long stretches of desired Riparian land cover types; (3) add parcels onto existing preserves that increase preserve size and minimize habitat fragmentation and edge effects; and (4) provide connections to existing preserves that are currently isolated from each other.

The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves that include riparian habitat

for valley elderberry longhorn beetle will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and preservation of long stretches of intact riparian habitat would not occur.

Another benefit of the SSHCP that would not occur on a project-by-project basis is the requirement for Preserve Setbacks, which will establish a minimum 50-foot buffer between Urban Development Covered Activities and SSHCP Preserves or existing preserves. Stream Setbacks will also protect riparian areas that are not part of Preserves. These setbacks will ensure that Preserves and avoided streams are protected from edge effects such as urban runoff, proliferation of non-native plants, light and noise exposure, and other environmental stressors. Under existing project-by-project mitigation, Preserves are generally established without setbacks in developed areas and sacrifice a portion of the preserved lands to these edge effects, reducing the effective preservation area. By preserving existing populations of valley elderberry longhorn beetle in long, interconnected riparian areas that are protected from edge effects, the beetle will be less affected by future stochastic events and more likely to exchange genetic material between more remote populations.

In addition to modeled habitat preservation, the Implementing Entity will also re-establish and/or establish 591 acres of valley elderberry longhorn beetle modeled habitat in the Plan Area, with a priority on re-establishment before establishment. Under Objective VELB-2, re-establishment/establishment of riparian habitat will include planting of elderberry, further ensuring no net loss of the total acreage of valley elderberry longhorn beetle habitat in the Plan Area.

Objective VELB-1 will also require that any elderberry shrubs impacted by Covered Activities will be relocated or replaced in a suitable location identified by the TAC. This, coupled with the above described re-establishment and/or establishment of modeled habitat, will ensure no net loss of habitat for valley elderberry longhorn beetle. Relocation or replacement of elderberry shrubs will be implemented according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999b).

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed

of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs, in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for valley elderberry longhorn beetle protected in the Preserve System will ensure that elderberry plants and other habitat requirements within the SSHCP Preserve System are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Measurable objectives (Table 7-51) that in particular will directly benefit valley elderberry longhorn beetle are those designed to maintain and enhance habitat, including Preserve Management Plans (Objectives HAB1 and HAB2), consideration of management history (Objective HAB3), invasive species eradication program (Objective HAB4), collecting weather data to develop status and trends (Objective HAB6), and monitoring the groundwater table as it relates to status and trends for riparian habitat (Objective RIP5). Permanent indirect effects on modeled habitat, such as weeds, litter, and hydrologic alterations will be addressed by Objective HAB5. These actions should result in higher overall reproductive success and productivity of the Plan Area population.

Covered Activities will directly affect one documented occurrence within the UDA (within PPU 1) and no documented occurrences outside the UDA, out of a total of 156 occurrences in the Plan Area. Covered activities are not expected to indirectly affect any occurrences. At least one of the 156 occurrences will be protected in an SSHCP preserve in PPU 5, and another 111 of the 156 occurrences are already protected in existing preserves.

Recovery Plans

The USFWS published the *Valley Elderberry Longhorn Beetle Recovery Plan* in 1984. The Recovery Plan states that in order to recover the beetle, habitat must be protected along the several rivers, including the American, Sacramento, Feather, Stanislaus, Mokelumne, Calavera, Cosumnes, and San Joaquin. The Mokelumne and Cosumnes Rivers are located in the central and southern portions of the Plan Area. The main components of the Recovery Plan include: surveys for presence of the valley elderberry longhorn beetle; development of habitat protection plans; restoration of preserved sites (including exotics removal); and management and maintenance, including minimizing the use of herbicides and insecticides, preventing removal of riparian vegetation, and preventing riprapping of habitat sites. The Recovery Plan includes narratives for the following objectives (USFWS 1984).

1. *Preserve and protect known habitat sites to provide adequate habitat conditions for valley elderberry longhorn beetle.*

   The Recovery Plan identified occupied sites along three specific rivers for habitat preservation through long-term administrative actions: American River, Merced River, and

Putah Creek (USFWS 1984, p. 22). The Mokelumne and Cosumnes Rivers within the Plan Area are not specifically identified for protection in the Recovery Plan. The Recovery Plan has a specific objective for developing management plans for protected sites.

2. *Survey riparian forests of the Sacramento and San Joaquin valleys for presence of valley elderberry longhorn beetle and incorporate findings into short-term and long-term management programs.*

   This objective includes surveys along the Mokelume River from Comanche Reservoir Dam and along the Cosumnes River from Bridgehouse downstream to their confluences with the San Joaquin River.

3. *Determine ecological requirements and management needs of valley elderberry longhorn beetle.*

   This objective includes field studies of the autecology of the species at known and newly discovered sites; laboratory studies on life history; field studies on potential management needs at certain sites (Goethe Park, Ancil Hoffman Park, American River Parkway, and Solano Lake Park); studies of habitat rehabilitation methods for riparian areas and incorporation of results into short- and long-term management programs; determination of population status and success of management; and determination of delisting criteria.

   With the exception of management needs at certain sites, these actions could be conducted throughout the Plan Area, and so including one or more of these studies as part of the SSHCP Monitoring and Management Program will be determined as the Monitoring and Management Program is developed in the early years of implementation (see Chapter 8).

4. *Preserve and protect newly discovered valley elderberry longhorn beetle habitat to provide suitable habitat conditions for the species.*

   This objective includes minimizing further degradation, development, or modification of habitat (41); protecting newly discovered populations; minimizing use of insecticides, herbicides, and other toxic substances; and minimizing other activities that are incompatible with habitat maintenance. These actions are all general conservation actions that will be incorporated into the SSHCP.

5. *Re-establish valley elderberry longhorn beetle at rehabilitated sites within the species' historical range.*

   This objective includes determining suitability of potential existing habitat and rehabilitation sites for reintroduction; protecting habitat sites; developing and implementing a management program for each site; and reintroducing valley elderberry

longhorn beetle at selected sites. These actions are all general conservation actions that will be incorporated into the SSHCP.

6. *Increase public awareness of valley elderberry longhorn beetle through education and information programs.*

   This objective includes signage at county parks; various audio-visual programs, publications, brochures, and press releases; and distribution of information to local parks, schools, newspapers, radio, and television. Specific site-specific actions for education are not identified in the Recovery Plan, but the Preserve System Monitoring and Management Program will include this action as appropriate (see Chapter 8). Also, because the Recovery Plan dates back to 1984, education actions will need to be updated to take advantage of current information technologies (e.g., websites, social media).

7. *Enforce law and regulation to protect valley elderberry longhorn beetle.*

   This objective includes informing local agencies about legal status of valley elderberry longhorn beetle, including applicable laws and regulations; eliminating illegal collecting; and examining the effectiveness of existing laws and regulations and proposing changes as necessary. The SSHCP itself is a means to inform local agencies about the species, and the other actions are addressed though implementation of the SSHCP, such as management of the Preserve System and any changes in local ordinances that relate to protection and management of the Preserve System.

Critical Habitat

Critical Habitat designated for the valley elderberry longhorn beetle does not occur within the Plan Area. Critical Habitat is located north of the Plan Area along the American River.

7.6.2.14 California Tiger Salamander

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 1,757 acres of modeled habitat for California tiger salamander within the Plan Area. The SSHCP will impact up to approximately 80 acres of modeled aquatic breeding and foraging habitat and up to approximately 1,677 acres of modeled upland habitat within the Plan Area (Table 7-55). The majority of impacts to modeled habitat (81%) occur inside the UDA, including 1,366 acres of modeled upland habitat and 55 acres of modeled aquatic habitat. Covered Activities outside the UDA will directly impact 311 acres of modeled upland habitat and 25 acres of modeled aquatic habitat. SSHCP Covered Activities will not impact aquatic or upland habitat within California tiger salamander Critical Habitat (Table 7-56).

To mitigate these impacts, the SSHCP will preserve a total of 17,062 acres of California tiger salamander modeled habitat, including 885 acres of modeled aquatic habitat (Vernal Pool and Seasonal Wetland) and 16,177 acres of modeled upland habitat (Blue Oak Savanna and Valley Grassland). Of the preserved habitat, 1,872 acres will be in Critical Habitat in PPU 7, including 61 acres of modeled aquatic habitat and 1,811 acres of modeled upland habitat. The SSHCP will also re-establish and/or establish 79 acres of modeled aquatic habitat within the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-57).

Table 7-55
Permanent Effects and Conservation for California Tiger Salamander

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)

Table 7-57
Biological Goals and Measurable Objectives Applicable to California Tiger Salamander

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1

Table 7-57
Biological Goals and Measurable Objectives Applicable to California Tiger Salamander

Applicable Biological Goals	Related Biological Objectives
	mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether preserves are being managed and maintained for the benefit of Covered Species
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective CTS1.** Preserve at least five occupied California tiger salamander breeding ponds.
	Objective CTS2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for California tiger salamander is preserved. Minimum preservation will total: • 141 acres of aquatic habitat • 1,677 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within California tiger salamander Critical Habitat occurs within California tiger salamander Critical Habitat (see Objectives BOW1, VP1, SW1, and VG1).
	Objective CTS3. Rural Transportation Project Covered Activities within California tiger salamander modeled habitat will be designed to allow California tiger salamander movement across the roadway area.

Table 7-57
Biological Goals and Measurable Objectives Applicable to California Tiger Salamander

Applicable Biological Goals	Related Biological Objectives
	Objective VPI5. Ensure that during implementation of Objective VP2, re-established and/or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/establishment, in accordance with Conservation Actions in Table 7-1.

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link a total of 17,062 acres of California tiger salamander modeled habitat Plan-wide, including 16,177 acres of modeled upland habitat and 885 acres of modeled aquatic habitat (Table 7-52). Additionally, the preservation of Vernal Pool Ecosystem (including pools that provide modeled breeding habitat for California tiger salamander) will protect the hydrology and soil conditions necessary for persistence of preserved California tiger salamander aquatic habitat.

Objective VP1b requires that impacts occurring within or near the Cosumnes/Rancho Seco Core Recovery Area will be mitigated through preservation in this Core Recovery Area, providing improved conservation for the species as compared to the existing project-by-project permitting.

As discussed in Section 7.5, the primary conservation focus for California tiger salamander in the Plan Area is on the formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserves that are not part of the SSHCP Preserve System. This Landscape Preserve will encompass a heterogeneous range of natural land covers and soil types associated with California tiger salamander modeled habitat and the Vernal Pool Ecosystem in the Plan Area. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, resulting in a larger-scale contiguous Preserve System.

Of the 17,062 acres of California tiger salamander modeled habitat to be preserved in the Plan Area, virtually all of this preservation will occur outside the UDA, and the majority of this preservation will occur in PPU 7. The preserve design focus in PPU 7 is primarily landscape-scale preservation of natural land covers, targeting Vernal Pool and Valley Grassland in areas that are adjacent, or in proximity, to existing preserves, including other mitigation sites and mitigation banks in the area. The SSHCP Preserves in PPU 7 will be consolidated with the 12,500-acre Chance Ranch, providing continuous aquatic and upland habitat that will meet the life history needs of the California tiger salamander.

Most of the SSHCP Preserve in PPU 7 will be located within the Cosumnes/Rancho-Seco Core Recovery Area, including 752 acres of modeled aquatic habitat and 14,434 acres of modeled upland habitat (Table 7-53). Since only approximately 52 acres of California tiger salamander modeled habitat will be affected within the Cosumnes/Rancho Seco Core Area, this preservation will more than compensate for the loss.

The SSHCP Preserve System will link together SSHCP Preserves and existing preserves that have modeled California tiger salamander habitat, to help maintain dispersal between breeding sites and modeled upland habitat. For example, there are 14 known occurrences for California tiger salamander in existing preserves and 6 known occurrences in SSHCP Preserves outside the UDA in PPU 7. The SSHCP Preserves in PPU 7 will, in most cases, directly abut existing preserves, providing seamless continuity of modeled habitat. The Preserve System also includes 312 acres of Linkage Preserve that will connect from the Landscape Preserve in PPU 7 to the Cosumnes River corridor located in PPU 5. By establishing large Preserves, the SSHCP will also ensure that connectivity between breeding pools within SSHCP Preserves is maintained.

To ensure that California tiger salamander populations are protected and continue to expand within the Plan Area, several species-specific objectives (CTS1 – CTS3) will be implemented as part of the Conservation Strategy (Table 7-54). Objective CTS1 will benefit California tiger salamander by preserving at least five occupied breeding ponds within the SSHCP Preserve System. The conservation actions for this objective also identify the necessary criteria for selecting the location and suitability of California tiger salamander breeding ponds, as well as associated upland habitats. As a result, both occupied breeding ponds and additional aquatic and upland habitat for California tiger salamander will be preserved and maintained within the Plan Area, which would not occur on a project-by-project basis. Improved management and monitoring under the SSHCP will also allow for expansion of California tiger salamander into areas not currently used by the species.

Objective CTS2 benefits California tiger salamander by requiring preservation of modeled aquatic and upland California tiger salamander habitat in SSHCP Preserves, as described above. This objective ensures that selected preserve sites contain both modeled aquatic (breeding) habitat and upland habitat (that supports fossorial mammals and occurs within 1.5 miles of aquatic habitat) for California tiger salamander. By preserving a range of California tiger salamander aquatic habitats in the Plan Area, the SSHCP will help California tiger salamander persist during expected climate change effects on precipitation and temperature.

Objective CTS3 will also benefit California tiger salamander occurring near rural transportation projects by requiring that these Covered Activities allow safe California tiger salamander movement across the roadway. This objective requires targeted species mobility studies to determine if movement between breeding ponds or between breeding ponds and upland refugia

will be affected by rural transportation Covered Activities within California tiger salamander modeled habitat. This information will be used to determine if culvert under-crossings are needed and the appropriate locations for these structures. This objective will minimize or eliminate ongoing take of California tiger salamander from vehicles traveling on the roadways.

In addition to modeled habitat preservation, the Implementing Entity will also re-establish and/or establish 79 acres of California tiger salamander modeled aquatic habitat in the Plan Area, with a priority on re-establishment before establishment. Re-established and/or established aquatic habitat will be located no more than 0.5 mile from preserved aquatic habitat to increase the likelihood that the re-established and/or established aquatic habitat will be occupied by California tiger salamander in the future, which will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. Re-establishing and/or establishing breeding pools will also ensure no net loss of the acreage of California tiger salamander aquatic habitat in the Plan Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for California tiger salamander protected in the Preserve System will ensure that vernal pool and seasonal wetland hydrology, vegetation, and other vernal pool and seasonal wetland habitat characteristics within the SSHCP Preserve System are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit California tiger salamander habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, and HAB4) designed to maintain and enhance aquatic habitat, including early detection and eradication of invasive species such as American bullfrogs (*Lithobates catesbeianus*) and crayfish (*Procambarus* sp.) in Preserves. Additionally, Objective HAB7 will include monitoring of vegetation height, management of which will benefit California tiger salamander since this species has difficulty migrating across areas with tall or dense vegetation. Monitoring and managing grazing practices in grassland habitats can

help to maintain migration pathways between upland sites and aquatic locations. These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population. Permanent indirect effects on aquatic habitats such as hydrologic alterations will be tracked through studies of edge effects at Preserve boundaries, as directed by Objective HAB5. This information will feed into adaptive management of vernal pools and will benefit the California tiger salamander using that habitat.

Further, effectiveness monitoring of the Conservation Strategy for California tiger salamander will include a special study to investigate indirect effects of development on the Vernal Pool Ecosystem. The results of that study will inform adaptive management of SSHCP Condition 2 AMMs, as well as adaptive management of SSHCP Preserves. As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species and California tiger salamander by reducing the density of non-native grasses in the surrounding uplands, which will not only improve the ability of California tiger salamander to move through upland habitat, but will also reduce water consumption from the perched aquifer and pools and allow filling from surface flows if present.

Critical Habitat

The California tiger salamander primary Critical Habitat constituent elements (USFWS 2005b) are described in a similar manner as the SSHCP aquatic (Vernal Pool and Seasonal Wetland) and terrestrial upland (Blue Oak Savanna, Blue Oak Woodland, and Valley Grassland) land cover types located anywhere within designated Critical Habitat.

The SSHCP Conservation Strategy will preserve a total of 1,872 acres of modeled aquatic and upland habitat within California tiger salamander CHU 3. SSHCP Covered Activities will not impact aquatic or upland habitat within California tiger salamander Critical Habitat. Monitoring and adaptive management under the SSHCP will ensure that the PCEs for California tiger salamander are maintained within the CHU, and allow the PCEs to provide their intended conservation function for the species.

Recovery Plan

USFWS has prepared a *Draft Recovery Plan for the Central California Distinct Population Segment of the California Tiger Salamande*r (Ambystoma californiense) (USFWS 2016). The Draft Recovery Plan includes three recovery objectives for the species:

1. Secure self-sustaining populations of Central California tiger salamander throughout the full range of the Distinct Population Segment, ensuring conservation of genetic variability and diverse habitat types (e.g., across elevation and precipitation gradients).

2. Ameliorate or eliminate the threats that caused the species to be listed, and any future threats.
3. Restore and conserve a healthy ecosystem supportive of Central California tiger salamander populations.

The Plan Area is located within the Central Valley Recovery Unit of the Draft Recovery Plan, and contains approximately 62,937 acres of the 207,100-acre Rancho Seco Management Unit. SSHCP Covered Activities would impact up to 45 acres of modeled upland habitat and 6 acres of modeled aquatic habitat in the Rancho Seco Management Unit of the Central Valley Recovery Unit (Table 7-58).

Table 7-58
Permanent Effects and Conservation in Recovery Area for California Tiger Salamander

Habitat Model Land Cover Types	Rancho Seco Management Unit	
	Total Effect	*Total Habitat Preservation*
Upland Habitat		
Blue Oak Savanna	0	33
Valley Grassland	45	14,530
Total Upland Habitat	*45*	*14,563*
Aquatic Habitat		
Vernal Pool	6	697
Seasonal Wetland	0	47
Total Aquatic Habitat	*6*	*744*
Total in Management Unit	**51**	**15,308**

The Draft Recovery Plan stipulates that preserves in the Central Valley Recovery Unit must be at least 3,398 acres in size to allow for sufficient upland and breeding habitat. The target number of preserves for the Rancho Seco Management Unit is 5, with a total area of 16,990. The SSHCP would create approximately 15,308 acres of preserve in the Rancho Seco Management Unit, including a Landscape Preserve of greater than 10,000 acres. Many of the recovery actions identified in the Draft Recovery Plan are included in the SSHCP, including locating preserves where fossorial mammals create adequate burrow habitat (Objective CTS2), removal of non-native invasive vegetation and invasive wildlife (Objective HAB4), maintaining linkages between preserves (Objective L2), design undercrossings to minimize road mortality of California tiger salamanders (Objective CTS3), and ensure long-term monitoring and management of preserve sites in perpetuity (refer to Chapter 8).

7.6.2.15 Western Spadefoot

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 23,207 acres of modeled habitat for western spadefoot within the Plan Area. The SSHCP will impact up to approximately 1,164 acres of modeled aquatic breeding and foraging habitat, which includes Vernal Pool, Swale, Seasonal Wetland, Open Water, Stream/Creek, and Stream/Creek (VPIH); and up to approximately 22,043 acres of modeled upland habitat, which includes Blue Oak Savanna, Blue Oak Woodland, and Valley Grassland within the Plan Area (Table 7-59). The majority of impacts to modeled habitat (97%) will occur inside the UDA, including 21,329 acres of modeled upland habitat and 1,089 acres of modeled aquatic habitat.

To mitigate these impacts, the SSHCP will preserve a total of approximately 23,708 acres of western spadefoot modeled habitat, including approximately 1,647 acres of modeled aquatic habitat (vernal pool, swale, seasonal wetland, open water, stream/creek, and stream/creek [VPIH]) and approximately 22,061 acres of modeled upland habitat (blue oak savanna and valley grassland). The SSHCP will also re-establish and/or establish 1,022 acres of modeled aquatic habitat and 47 acres of modeled upland habitat within the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-60).

[a] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by preserving any combination of Blue Oak Savanna and Blue Oak Woodland.
[b] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by re-establishing or establishing any combination of Blue Oak Woodland and Blue Oak Savanna.
[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[d] Re-establishment and/or establishment of Open Water can be achieved by re-establishing and/or establishing an aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.
[e] Re-establishment/establishment to mitigate effects to Stream/Creek (VPIH) will be in the form of Swale, which has been added to the 234 acres necessary to mitigate effects to Swale.

Table 7-60
Biological Goals and Measurable Objectives Applicable to Western Spadefoot

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).

Table 7-60
Biological Goals and Measurable Objectives Applicable to Western Spadefoot

Applicable Biological Goals	Related Biological Objectives
	Objective W5. Ensure that aquatic resources are re-established and/or established or during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W7. Ensure that when re-establishing/establishing vernal pools, swales, and freshwater marsh that a minimum of 50 acres of vernal pool, 30 acres of swale, and 50 acres of freshwater marsh re-establishment/establishment occur within the Morrison Creek Watershed.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.

Table 7-60
Biological Goals and Measurable Objectives Applicable to Western Spadefoot

Applicable Biological Goals	Related Biological Objectives
	Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by the Technical Advisory Committee (TAC)). The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective WS1.** During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for western spadefoot (*Spea hammondii*) is preserved. Minimum preservation will total: • 1,531 acres of aquatic habitat • 22,044 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within the Mather Core or Cosumnes/Rancho-Seco Core Recovery Areas occurs within the Core Recovery Areas (see Objectives BOW1, VP1, VP3, SW1, SC1, OW1, and VG1).
	Objective WS2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic habitat for western spadefoot is re-established and/or established. Minimum re-establishment and/or establishment will total 906 acres of aquatic habitat.

Table 7-60
Biological Goals and Measurable Objectives Applicable to Western Spadefoot

Applicable Biological Goals	Related Biological Objectives
	Ensure that mitigation for modeled high-value habitat impacted within the Mather Core or Cosumnes/Rancho-Seco Core Recovery Areas occurs within the Core Recovery Areas (see Objectives VP2, SW2, and OW2).

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link a minimum of 1,647 acres of modeled aquatic habitat in the Plan Area, including 1,534 acres of aquatic habitat in the Mather and Cosumnes/Rancho-Seco Core Recovery Areas, which will provide adequate aquatic habitat for western spadefoot in the Plan Area. In addition, through ensuring that a minimum of 22,061 acres of modeled upland habitat for western spadefoot is preserved in the Plan Area including 19,610 acres of upland habitat within the Mather and Cosumnes/Rancho-Seco Core Recovery Areas, western spadefoot will have adequate upland habitat in the Plan Area. Additionally, the preservation of Vernal Pool Ecosystem (including pools that provide modeled breeding habitat for western spadefoot) will protect the hydrology and soil conditions necessary for persistence of preserved western spadefoot aquatic habitat.

Objective VP1b requires that impacts occurring within the Mather and Cosumnes/Rancho Seco Core Recovery Areas will be mitigated through preservation in these Core Recovery Areas, providing improved conservation for the species as compared to the existing project-by-project permitting.

As discussed in Section 7.5, the primary conservation focus for western spadefoot in the Plan Area is on the formation of a large landscape-scale Preserve (at least 10,500 acres) in the Cosumnes/Rancho-Seco Core Recovery Area that connects to and augments existing preserves that are not part of the SSHCP Preserve System. This Landscape Preserve will encompass a heterogeneous range of natural land covers and soil types associated with western spadefoot modeled habitat and the Vernal Pool Ecosystem in the Plan Area. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, resulting in a larger-scale contiguous Preserve System.

The majority of the preservation will occur outside the UDA, and most of this preservation will occur in the Cosumnes/Rancho Seco Core Recovery Area (in PPU 7) and in a small portion of the Mather Core Recovery Area. The preserve design focus outside the UDA is primarily landscape-scale preservation of natural land covers, targeting Vernal Pool and Valley Grassland in areas that are adjacent, or in proximity, to existing preserves, including other mitigation sites and mitigation

banks in the area. The SSHCP Preserve in PPU 7 will be consolidated with the 12,500-acre Chance Ranch, providing continuous aquatic and upland habitat that will meet the life history needs of the western spadefoot. Inside the UDA, a total of 6,380 acres will be preserved. Even though a large landscape-scale Preserve was not possible inside the UDA due to development and numerous additional constraints, large connected Preserves is still a primary goal.

The SSHCP Preserve System will link together SSHCP Preserves and existing preserves that have modeled western spadefoot habitat to help maintain dispersal between breeding sites and modeled upland habitat. For example, there are three known occurrences for western spadefoot in existing preservation outside the UDA in PPUs 5 and 7, and seven known occurrences in SSHCP Preserves in PPU 7. The SSHCP Preserves in PPU 7 will in most cases directly abut existing preserves, providing seamless continuity of modeled habitat. The Preserve System also includes a Linkage Preserve that will connect from the Landscape Preserve in PPU 7 to the Cosumnes River/Deer Creek Wildlife Movement Corridor located in PPU 5. Inside the UDA, there are two known occurrences of western spadefoot in existing preserves in PPUs 1 and 3, and two occurrences in SSHCP Preserves in PPUs 1 and 2. The Preserve System also includes a Linkage Preserve that will connect SSHCP Preserves and existing preserves in PPU 1. As a result, aquatic and upland habitat for western spadefoot will be preserved and maintained within the Plan Area, which would not occur on a project-by-project basis. Improved management and monitoring under the SSHCP will also allow for expansion of western spadefoot into areas not currently used by the species.

To ensure that western spadefoot populations are protected and continue to expand within the Plan Area, two species-specific objectives (WS1 and WS2) will be implemented as part of the Conservation Strategy. Objective WS1 will benefit western spadefoot during assembly of the SSHCP Preserve System, by ensuring that modeled aquatic and upland habitat for western spadefoot is preserved. The conservation actions for this objective also identify minimum preservation acreages for both modeled aquatic and modeled upland habitats. By preserving a range of western spadefoot aquatic habitats in the Plan Area, the SSHCP will help western spadefoot persist during expected climate change effects on precipitation and temperature.

Objective WS2 will also benefit western spadefoot during assembly of the SSHCP Preserve System, by ensuring that modeled aquatic habitat for western spadefoot is re-established and/or established. The conservation action for this objective also identifies the minimum acreage for re-establishment and/or establishment of aquatic habitat. Additionally, this objective will ensure that any re-established or established aquatic habitat is located no more than 500 feet from preserved aquatic habitat. This requirement will increase the likelihood that the re-established or established aquatic habitat will be occupied by western spadefoot in the future, which will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. Re-establishing and/or establishing breeding pools will also ensure no net loss of western spadefoot aquatic habitat in the Plan Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries that would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for western spadefoot protected in the Preserve System will ensure that vernal pool and seasonal wetland hydrology, vegetation, and other vernal pool and seasonal wetland habitat characteristics within the SSHCP Preserve System are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit western spadefoot habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, and HAB4) designed to maintain and enhance aquatic habitat, including early detection and eradication of invasive species such as American bullfrogs and crayfish in Preserves (Table 7-57). Additionally, Objective HAB7 will include monitoring of vegetation height, management of which will benefit western spadefoot since this species has difficulty moving through areas with tall or dense vegetation. Monitoring and managing grazing practices in grassland habitats can help to maintain movement pathways between upland sites and aquatic locations. These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population. Permanent indirect effects on aquatic habitats such as hydrologic alterations will be tracked through studies of edge effects at Preserve boundaries, as directed by Objective HAB5. This information will feed into adaptive management of vernal pools and will benefit western spadefoot using that habitat.

Further, effectiveness monitoring of the Conservation Strategy for western spadefoot will include a special study to investigate indirect effects of development on the Vernal Pool Ecosystem. The results of that study will inform adaptive management of SSHCP Condition 2 AMMs, as well as adaptive management of SSHCP Preserves. As Preserve Management Plans are implemented, grazing will be managed for the benefit of vernal pool Covered Species and western spadefoot by reducing the density of non-native grasses in the surrounding uplands, which will not only improve the ability of western spadefoot to move through upland habitat, but also reduce water consumption from the perched aquifer and pools and allow filling from surface flows if present.

Recovery Plans

To conserve this species, the Recovery Plan prioritizes preservation of Vernal Pool Ecosystem within several core areas, including the Mather Core Recovery Area and the Cosumnes/Rancho Seco Core Recovery Area in the Plan Area. SSHCP Covered Activities are anticipated to impact up to approximately 8,600 acres of western spadefoot modeled habitat in the Recovery Areas (Table 7-61).

The SSHCP Conservation Strategy will preserve and link approximately 21,144 acres of modeled habitat for western spadefoot in the Recovery Areas. The SSHCP especially focuses conservation for the western spadefoot on the large areas of intact habitat present in the Cosumnes/Rancho Seco Core Recovery Area. A total of 15,299 acres of Vernal Pool Ecosystem will be preserved there, including 897 acres of aquatic habitat and 14,402 acres of valley grassland in hydrologically connected uplands (Table 7-61). When combined with existing preserves, 83% of the modeled western spadefoot habitat in the Cosumnes/Rancho Seco Core Recovery Area will be preserved, consistent with the 80% target of the 2005 Recovery Plan.

Within the Mather Core Recovery Area, existing and planned development constrains the inventory of western spadefoot habitat that is available for preservation. Therefore, the SSHCP preserves a total of 5,601 acres of Vernal Pool Ecosystem in the Mather Core Recovery Area, including 440 acres of aquatic habitat and 5,161 acres of valley grassland in hydrologically connected uplands. When combined with existing preserves, 46% of the modeled western spadefoot habitat in the Mather Core Recovery Area will be preserved.

The SSHCP Conservation Strategy is equivalent to implementation of the 2005 Recovery Plan for the Plan Area because it provides an alternative Conservation Strategy for conserving western spadefoot and contains the six elements of recovery. The manner in which the SSHCP achieves this consistency for western spadefoot is discussed in detail in Section 7.6.3.

7.6.2.16 Giant Gartersnake

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 2,358 acres of modeled habitat for giant gartersnake within the Plan Area (Table 7-62). The SSHCP will impact up to approximately 169 acres of modeled aquatic habitat (core and peripheral) and up to approximately 2,189 acres of modeled upland habitat within the Plan Area (Table 7-62). The majority of impacts to modeled habitat (89%) occur inside the UDA, including 144 acres of modeled aquatic habitat and 1,965 acres of modeled upland habitat. Covered Activities outside the UDA will directly impact approximately 25 acres of modeled aquatic habitat and 224 acres of modeled upland habitat.

To mitigate these impacts, the SSHCP will preserve a total of 5,524 acres of giant gartersnake modeled habitat within the Plan Area, including 406 acres of modeled aquatic habitat and 5,118 acres of modeled upland habitat (Table 7-58). Most of this preservation will occur outside the UDA in PPU 7. Of the preserved habitat, 996 acres will be in high-value habitat, including 325 acres of modeled aquatic habitat and 671 acres of modeled upland habitat (Table 6-63). High-value habitat is specifically limited to modeled habitat within the Badger Creek and Stone Lakes NWR areas where there are known subpopulations of giant gartersnake. The SSHCP will also re-establish and/or establish 303 acres of modeled habitat within the Plan Area, including 169 acres of modeled aquatic habitat and 134 acres of modeled upland habitat. Approximately 232 acres of the 303 acres to be re-established and/or established will be in high-value habitat (Table 6-63). All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-64).

Table 7-62
Permanent Effects and Conservation for Giant Gartersnake

Land Cover Types	Direct Effects (acres)	Indirect Effects (Acres)	Total Effects (Acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)

Total Plan-Wide Habitat	**2,358**	**Qualitative**	**2,358**	**5,524**	**303**

[a] High-value habitat is specifically limited to the Badger Creek and Stone Lakes NWR areas where there are known subpopulations of giant gartersnake. High-value habitat for giant gartersnake includes Freshwater Marsh, Stream/Creek, Open Water (excluding ski lakes), Seasonal Wetland, Mixed Riparian Scrub, and Valley Grassland land cover types in these areas.
[b] Preservation of Open Water can be achieved by preserving any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.
[c] Re-establishment and/or establishment of Open Water can be achieved by re-establishing and/or establishing any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.
[d] Impacts to Mixed Riparian Scrub can be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[e] Impacts to Mixed Riparian Scrub can be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub or any combination of the two.
[f] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-63

Table 7-64
Biological Goals and Measurable Objectives Applicable to Giant Gartersnake

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W1.** Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.
	Objective W2. Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP1. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed

Table 7-64
Biological Goals and Measurable Objectives Applicable to Giant Gartersnake

Applicable Biological Goals	Related Biological Objectives
	Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by the Technical Advisory Committee (TAC)). The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).

Table 7-64
Biological Goals and Measurable Objectives Applicable to Giant Gartersnake

Applicable Biological Goals	Related Biological Objectives
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective GGS1**. During assembly of the SSHCP Preserve System, ensure that modeled habitats for giant gartersnake are preserved along the following creeks (or other creeks that are determined by the TAC to provide similar giant gartersnake habitat value): • Lower Laguna Creek, mainly between Twin Cities Road (State Route 104) and Miess Road; • Skunk Creek, which flows into the Cosumnes River northwest of the City of Galt; • the short Willow Creek and tributaries of Badger Creek, which are to the north of the lower Laguna Creek and west of the Folsom South Canal; and • Badger Marsh. Mitigation for impacts to modeled habitats for giant gartersnake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum preservation will total • 170 acres of giant gartersnake high-value aquatic habitat and • 2,323 acres of giant gartersnake high-value upland habitat. (See Objectives AG1, FWM1, SW1, SC1, OW1, RIP1, RIP3, and VG1.)
	Objective GGS2. During assembly of the SSHCP Preserve System, ensure that modeled habitats for giant gartersnake are re-established and/or established along the following creeks (or other creeks that are determined by the TAC to provide similar habitat value): • Lower Laguna Creek, mainly between Twin Cities Road (State Route 104) and Miess Road; • Skunk Creek: this creek flows into the Cosumnes River northwest of the City of Galt; • north of Lower Laguna Creek and west of the Folsom South Canal are several small creeks—the short Willow Creek and tributaries of Badger Creek; and • Badger Marsh. Mitigation for impacts to modeled habitats for giant gartersnake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum re-establishment and/or establishment will total • 170 acres of high-value aquatic habitat and • 134 acres of high-value upland habitat. (See Objectives SW2, OW2, RIP2, and RIP4.)
	Objective GGS3. Plan Permittees will conduct a study to establish hydrologic baseline conditions along Badger Creek to identify what level of hydrology is necessary to support giant gartersnake and acquire a water source to maintain the minimum level of hydrology during the summer months when agricultural runoff may wane.

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link a minimum of 406 acres of modeled aquatic habitat in the Plan Area including 325 acres of high-value aquatic habitat in the Badger Creek and Stone Lakes NWR areas, which will provide adequate aquatic habitat for giant gartersnake in the Plan Area. In addition, through ensuring that a minimum of 5,118 acres of modeled upland habitat for giant gartersnake is preserved in the Plan Area, including 671 acres of high-value upland habitat within the Badger Creek and Stone Lakes NWR areas, giant gartersnake will have adequate upland habitat in the Plan Area. Plan Area streams and creeks will be protected from direct and indirect effects of urban development through Stream Setbacks, as described in AMM STREAM-1 and STREAM-2.

Objective GGS1 requires that impacts occurring within or near the Badger Creek and Stone Lakes NWR high-value habitat areas will be mitigated through preservation in these core aquatic habitat areas, providing improved conservation for the species as compared to the existing project-by-project permitting.

A total of 5,524 acres of giant gartersnake modeled habitat will be preserved Plan-wide, including 406 acres of modeled aquatic habitat and 5,118 acres of modeled upland habitat. Most of this preservation will occur outside the UDA.

The Preserve System will link together SSHCP Preserves and existing preserves that have modeled giant gartersnake habitat to help maintain dispersal between breeding sites and modeled upland habitat. For example, there are two known occurrences for giant gartersnake in existing preservation and two known occurrences in SSHCP Preserves outside the UDA in PPU 6. Most of the occurrences (8 of 11 occurrences) of giant gartersnake within the Plan Area are in PPU 6 in the Badger Creek and Stone Lakes NWR areas. As a result, both occupied habitat and additional modeled aquatic and upland habitat for giant gartersnake will be preserved and maintained within the Plan Area, which would not occur on a project-by-project basis. Improved management and monitoring under the SSHCP will also allow for expansion of giant gartersnake into areas not currently used by the species.

To ensure that giant gartersnake populations are protected and continue to expand within the Plan Area, three species-specific objectives (GGS1 – GGS3) will be implemented as part of the Conservation Strategy (Table 7-64). Objective GGS1 will benefit giant gartersnake during Preserve Assembly by ensuring that modeled habitats for giant gartersnake are preserved along specified creeks that provide giant gartersnake habitat value as identified in the Conservation Actions for this objective. By preserving a range of giant gartersnake aquatic and upland habitats in the Plan Area and providing Stream Setbacks which minimize impacts of urban development,

the SSHCP will help giant gartersnakes persist during expected climate change effects on precipitation and temperature.

Objective GGS2 will benefit giant gartersnake during Preserve Assembly by ensuring that modeled habitats for giant gartersnake are re-established and/or established along specified creeks that provide giant gartersnake habitat value as identified in the Conservation Actions for this objective. Objective GGS3 will also benefit giant gartersnake by establishing baseline hydrologic conditions along Badger Creek to identify the level of hydrology necessary to support giant gartersnake and by acquiring water sources to maintain the minimum level of hydrology during the summer months when agricultural runoff may diminish.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries that would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for giant gartersnake protected in the Preserve System will ensure that freshwater marsh, seasonal wetland, open water, and stream/creek hydrology, vegetation, and other wetland habitat characteristics within the SSHCP Preserve System are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit giant gartersnake habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, and HAB4) designed to maintain and enhance aquatic habitat, including early detection and eradication of invasive species such as American bullfrogs in Preserves. These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population. Permanent indirect effects on aquatic habitats such as hydrologic alterations will be tracked through studies of edge effects at Preserve boundaries, as directed by Objective HAB5.

Recovery Plan

The overall objective of the *Revised Draft Recovery Plan for the Giant Garter Snake* (Thamnophis gigas) (USFWS 2015a) is to delist the giant gartersnake, with the interim goals

being (1) stabilizing and protecting existing populations, and (2) conducting research necessary to further refine recovery criteria.

Recovery tasks emphasized in this plan are (1) habitat protection; (2) public participation, outreach, and education; (3) habitat management and restoration; (4) surveying and monitoring; and (5) research.

The Plan Area is located within the Cosumnes/Mokelumne Watershed Recovery Unit and the Delta Basin Recovery Unit of the Draft Recovery Plan. The Plan Area contains approximately 140,871 acres of the 235,002-acre Cosumnes-Mokelumne Watershed Recovery Unit, and 33,467 acres of the 699,859-acre Delta Basin Recovery Unit. SSHCP Covered Activities would impact up to 1,887 acres of modeled upland habitat and 131 acres of modeled aquatic habitat in the Cosumnes/Mokelumne Watershed Recovery Unit (Table 7-65). Covered Activities would also impact up to 60 acres of modeled upland habitat and 13 acres of modeled aquatic habitat in the Delta Basin Recovery Unit.

Table 7-65
Permanent Effects and Conservation in Recovery Area for Giant Gartersnake

Habitat Model Land Cover Types	Cosumnes-Mokelumne Watershed Recovery Unit		Delta Basin Recovery Unit		All Recovery Units	
	Total Effect	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*	*Total Effect*	*Total Habitat Preservation*
Aquatic Habitat						
Seasonal Wetland	38	94	2	5	40	99
Freshwater Marsh	66	127	3	26	69	153
Open Water	3	17	0	23	3	40
Stream/Creek	24	106	8	24	32	130
Total Aquatic Habitat	*131*	*344*	*13*	*78*	*144*	*422*
Upland Habitat						
Mixed Riparian Scrub	134	63	0	33	134	96
Valley Grassland	1,753	1,795	60	16	1,813	1,811
Total Upland Habitat	*1,887*	*1,858*	*60*	*49*	*1,947*	*1,907*
Total in Core Recovery Area	**2,018**	**2,202**	**73**	**127**	**2,091**	**2,329**

To offset these impacts, the SSHCP Conservation Strategy for giant gartersnake will preserve 49 acres of modeled upland habitat and 78 acres of modeled aquatic habitat in the Delta Basin Recovery Unit and will preserve 1,858 acres of modeled upland habitat and 344 acres of modeled aquatic habitat in the Cosumnes-Mokelumne Watershed Recovery Unit. The total impacts to giant gartersnake modeled habitat that is within recovery units that are within the

SSHCP Plan Area will be 2,901 acres. These impacts will be offset by preserving a total of 2,329 acres of giant gartersnake modeled habitat within recovery units that are within the SSHCP Plan Area.

The SSHCP Conservation Strategy will also help fulfill the objectives in the draft recovery plan by preserving and protecting the existing Cosumnes-Mokelumne Recovery Unit subpopulation in the Badger Creek/Willow Creek area and in the Delta Basin Recovery Unit, as well as monitoring and managing these habitats in perpetuity. By preserving habitat in these areas, the SSHCP will ensure that ample movement and dispersal habitat for giant gartersnake remains in these Recovery Units. The Preserve System will also include connections to adjacent large blocks of existing preserved habitat associated with the Stone Lakes NWR and the Cosumnes River Preserve that also provides habitat for giant gartersnake that is within giant gartersnake Recovery Units.

7.6.2.17 Western Pond Turtle

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 10,972 acres of modeled habitat for western pond turtle within the Plan Area (Table 7-66). The SSHCP will impact up to approximately 316 acres of modeled aquatic habitat, consisting of freshwater marsh, open water, and stream/creek and up to approximately 10,656 acres of modeled upland habitat which includes blue oak woodland, blue oak savanna, valley grassland, mine tailing riparian woodland, mixed riparian woodland, and mixed riparian scrub within the Plan Area. The majority of impacts to modeled habitat (94%) occur inside the UDA, including 282 acres of modeled aquatic habitat and 10,064 acres of modeled upland habitat. Covered Activities outside the UDA will directly impact approximately 34 acres of modeled aquatic habitat and 592 acres of modeled upland habitat.

To mitigate these impacts, the SSHCP will preserve a total of 13,102 acres of western pond turtle modeled habitat within the Plan Area, including 330 acres of modeled aquatic habitat and 12,772 acres of modeled upland habitat (Table 7-66). Most of this preservation will occur outside the UDA in PPU 7. The SSHCP will also re-establish and/or establish 716 acres of modeled habitat within the Plan Area, including 316 acres of modeled aquatic habitat and 400 acres of modeled upland habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-67).

[a] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by preserving any combination of Blue Oak Savanna and Blue Oak Woodland.

[b] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by re-establishing or establishing any combination of Blue Oak Woodland and Blue Oak Savanna.

[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

[d] Impacts to Mine Tailing Riparian Woodland will be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian.

[e] Impacts to Mine Tailing Riparian Woodland will be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[f] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[g] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[h] Preservation of Open Water can be achieved by preserving any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

[i] Re-establishment and/or establishment of Open Water can be achieved by re-establishing and/or establishing any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

Table 7-67
Biological Goals and Measurable Objectives Applicable to Western Pond Turtle

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.

Table 7-67
Biological Goals and Measurable Objectives Applicable to Western Pond Turtle

Applicable Biological Goals	Related Biological Objectives
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W1.** Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.
	Objective W2. Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design Avoidance and Minimization Measures (low-impact development (LID) and ROAD AMMs) • Ground disturbance Avoidance and Minimization Measures (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
	Objective W6. Covered Activities will avoid a minimum of 20% of first and second order tributaries to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek in the UDA.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective RIP1. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian

Table 7-67
Biological Goals and Measurable Objectives Applicable to Western Pond Turtle

Applicable Biological Goals	Related Biological Objectives
	Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by the Technical Advisory Committee (TAC)). The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether preserves are being managed and maintained for the benefit of Covered Species
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective WPT1**. During assembly of the SSHCP Preserve System, ensure that modeled aquatic and upland habitat for western pond turtle (*Actinemys marmorata*) is preserved. Minimum preservation will total • 315.35 acres of aquatic habitat and • 10,971 acres of upland habitat.

Table 7-67
Biological Goals and Measurable Objectives Applicable to Western Pond Turtle

Applicable Biological Goals	Related Biological Objectives
	(See Objectives FWM1, OW1, RIP1, RIP3, VG1, BOW1, and SC1.)
	Objective WPT2. During assembly of the SSHCP Preserve System, ensure that modeled aquatic habitat for western pond turtle is re-established and/or established. Minimum re-establishment and/or establishment will total 315 acres of aquatic habitat. (See Objectives RIP2, FWM2, and OW2.)

Analysis of Western Pond Turtle Conservation

The SSHCP Conservation Strategy will preserve and link a minimum of 330 acres of modeled aquatic habitat in the Plan Area, which will provide adequate aquatic habitat for western pond turtle in the Plan Area. In addition, through ensuring that a minimum of 12,772 acres of modeled upland habitat for western pond turtle is preserved in the Plan Area, western pond turtle will have adequate upland habitat in the Plan Area. Plan Area streams and creeks will be protected from direct and indirect effects of urban development through Stream Setbacks, as described in AMMs STREAM-1 and STREAM-2.

Objective VP1b requires that impacts occurring within or near the Cosumnes/Rancho-Seco Core Recovery Area will be mitigated through preservation in this Core Recovery Area, providing improved conservation for the species as compared to the existing project-by-project permitting.

As discussed in Section 7.5, the primary conservation focus for western pond turtle in the Plan Area is on the formation of a large landscape-scale Preserve (at least 10,500 acres) outside the UDA that connects to and augments existing preserves that are not part of the SSHCP Preserve System. This Landscape Preserve will encompass a heterogeneous range of natural land covers and soil types associated with western pond turtle modeled habitat in the Plan Area. Additionally, conservation is also focused on preservation of modeled habitat in the Cosumnes River/Deer Creek Corridor and the Laguna Creek Wildlife Movement Corridor. To the extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, resulting in a larger-scale contiguous Preserve System.

A total of 13,102 acres of western pond turtle modeled habitat will be preserved Plan-wide, including 330 acres of modeled aquatic habitat and 12,772 acres of modeled upland habitat (Table 7-66). Most of this preservation will occur outside the UDA, and the majority of this preservation will occur in PPU 7. The Preserve System in PPU 7 includes approximately 101 acres of modeled aquatic habitat and 8,879 acres of modeled upland habitat. The SSHCP Preserves in PPU 7 will be

consolidated with the 12,500-acre Chance Ranch, providing continuous aquatic and upland habitat that will meet the life history needs of the western pond turtle.

The Preserve System links together SSHCP Preserves and existing preserves that have modeled western pond turtle habitat to help maintain dispersal between breeding sites and modeled upland habitat. For example, there are four known occurrences for western pond turtle in existing preserves outside the UDA in PPU 6, and five known occurrences in SSHCP Preserves in PPU 7. Most of the occurrences of western pond turtle within the Plan Area (13 of 16) are outside the UDA in PPU 6 and in PPU 7 in the Cosumnes/Rancho-Seco Core Area. As a result, both occupied habitat and additional modeled aquatic and upland habitat for western pond turtle will be preserved and maintained within the Plan Area, which would not occur on a project-by-project basis. Improved management and monitoring under the SSHCP will also allow for expansion of western pond turtle into areas not currently used by the species.

To ensure that western pond turtle populations are protected and continue to expand within the Plan Area, two species-specific objectives (WPT1 and WPT2) will be implemented as part of the Conservation Strategy (Table 7-67). Objective WPT1 will benefit western pond turtle during assembly of the SSHCP Preserve System, by ensuring that modeled aquatic and upland habitat for western pond turtle is preserved. The conservation actions for this objective also identify minimum preservation acreages for both modeled aquatic and modeled upland habitats. By preserving a range of western pond turtle aquatic habitats in the Plan Area, the SSHCP will help western pond turtles persist during expected climate change effects on precipitation and temperature.

Objective WPT2 will also benefit western pond turtles during Preserve Assembly, by ensuring that modeled aquatic habitat for western pond turtle is re-established and/or established. The conservation action for this objective also identifies the minimum acreage for re-establishment and/or establishment of aquatic habitat. Additionally, this objective will ensure that any re-established and/or established aquatic habitat is located no more than 500 feet from preserved aquatic habitat. This requirement will increase the likelihood that the re-established or established aquatic habitat will be occupied by western pond turtle in the future, which will assist in maintaining or re-establishing the historical distribution of the species in the Plan Area. Re-establishing and/or establishing aquatic habitat will also ensure no net loss of western pond turtle aquatic habitat in the Plan Area.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow

for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. As discussed in Chapter 8, preserve land management techniques, monitoring, and adaptive management of habitat for western pond turtle protected in the Preserve System will ensure that freshwater marsh, open water, and stream/creek hydrology, vegetation, and other wetland habitat characteristics within the SSHCP Preserve System are not degraded, and will improve under SSHCP management as compared to existing habitat conditions. Goal 4 objectives will directly benefit western pond turtle habitat from the preparation and implementation of Preserve Management Plans (Objectives HAB1, HAB2, and HAB4) designed to maintain and enhance aquatic habitat, including early detection and eradication of invasive species such as American bullfrogs and introduced bass species (*Micropterus* spp. and *Morone saxatilis*) in Preserves. These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population. Permanent indirect effects on aquatic habitats such as hydrologic alterations will be tracked through studies of edge effects at Preserve boundaries, as directed by Objective HAB5.

7.6.2.18 Cooper's Hawk

Estimated Levels of Impact, Preservation, Re-Establishment and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 638 acres of modeled nesting/foraging habitat and modeled foraging habitat for Cooper's hawk (*Accipiter cooperii*) (Table 7-68). These impacts include direct effects to 600 acres of nesting/foraging habitat (including Blue Oak Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland) and 38 acres of foraging habitat (Blue Oak Savanna). The majority of impacts to Cooper's hawk nesting and foraging habitat (76%) will be inside the UDA.

To mitigate impacts to Cooper's hawk, the SSHCP will preserve approximately 1,011 acres of modeled habitat, including 964 acres of modeled nesting/foraging habitat and 47 acres of modeled foraging habitat throughout the Plan Area.

Additionally, the SSHCP will re-establish or establish 638 acres of modeled habitat, most of which will be Mixed Riparian Woodland and Mixed Riparian Scrub nesting/foraging habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-69).

Table 7-68
Permanent Effects and Conservation for Cooper's Hawk

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (Acres)	Total Habitat Preservation (acres)	Total Habitat Re-establishment and/or Establishment (acres)
Nesting/Foraging Habitat

[a] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by re-establishing or establishing any combination of Blue Oak Woodland and Blue Oak Savanna.
[b] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[c] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[d] Impacts to Mine Tailing Riparian Woodland will be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[e] Impacts to Mine Tailing Riparian Woodland will be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[f] Impacts to Blue Oak Savanna can be mitigated by preserving any combination of Blue Oak Savanna and Blue Oak Woodland.

Table 7-69
Biological Goals and Measurable Objectives Applicable to Cooper's Hawk

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and

Table 7-69
Biological Goals and Measurable Objectives Applicable to Cooper's Hawk

Applicable Biological Goals	Related Biological Objectives
	ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective RIP1**. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in

Table 7-69
Biological Goals and Measurable Objectives Applicable to Cooper's Hawk

Applicable Biological Goals	Related Biological Objectives
	developing status and trends and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective CH1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 974 acres of modeled foraging and nesting habitat for Cooper's hawk (*Accipiter cooperii*) is preserved in accordance with the Conservation Actions described Table 7-1 (see Objectives RIP1, RIP3, and BOW1).
	Objective CH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 601 acres of modeled foraging and nesting habitat for Cooper's hawk is re-established and/or established (see Objectives RIP2 and RIP4).
	Objective CH3. During assembly of the SSHCP Preserve System, ensure that a minimum of 38 acres of modeled foraging habitat for Cooper's hawk is preserved, in accordance with the Conservation Actions described in Table 7-1 (see Objectives RIP1, RIP3, and BOW1).

Analysis of Species Conservation

The SSHCP will preserve 1,011 acres of modeled nesting/foraging and foraging habitat for Cooper's hawk, which will ensure that the species has adequate nesting and foraging habitat in the Plan Area. In addition, the SSHCP will re-establish/establish 638 acres of modeled nesting/foraging habitat for Cooper's hawk in the Preserve System. Conservation of modeled nesting/foraging habitat will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized, and in combination with implementation of a comprehensive Monitoring and Management Program within the Preserve System, will continue to support Cooper's hawk.

Sites selected for preservation of nesting and foraging habitat will include Mixed Riparian Woodland, Mixed Riparian Scrub, and Blue Oak Woodland/Savanna. Pursuant to Conservation Action CH1.1, selection of Preserve sites supporting nesting and foraging habitat will be prioritized based on the availability of dense Blue Oak Woodland with trees approximately 26 to 49 feet high and in close proximity to foraging habitat with dense prey populations, all of which are located outside the UDA. The SSHCP will provide a well-designed system of large, interconnected Preserves to minimize the effects of habitat fragmentation. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to Cooper's hawk.

Establishment or re-establishment of areas for Cooper's hawk nesting and foraging habitat will be prioritized pursuant to Conservation Action CH2.1, which means they will be located near known nesting territories, connect disjunct segments or riparian habitat, and provide close proximity to modeled foraging areas with abundant prey populations. Cooper's hawk Mixed

Riparian Woodland and Mixed Riparian Scrub habitat establishment and re-establishment will occur only where a non-modeled land cover is converted to Mixed Riparian Woodland and Mixed Riparian Scrub. In addition, trees will be planted to encourage dense canopy closure of the mature stand, and survivorship of at least six trees pursuant to a stand is a success criterion.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Using a Stream Setback strategy in conjunction with low-impact and compatible uses in land planning, the Preserve System will maintain existing functions and values of Blue Oak Woodland and riparian nesting and foraging habitat in the Preserve System and minimize edge-effect disturbances to nesting Cooper's hawk (e.g., lighting, noise, human activity). Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

Additionally, improvements in nesting and foraging habitat quantity and quality with management and monitoring will support expansion of nesting and foraging activities into areas not currently used by Cooper's hawk. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Through proper land management techniques and continued monitoring of nesting and foraging habitat for Cooper's hawk preserved in the Preserve System, the SSHCP will ensure that habitat functions and values remain the same as the time of acquisition or improve with proper management. Management objectives that will, in particular, benefit Cooper's hawk are those designed to maintain and enhance nesting and foraging habitat, include monitoring the groundwater table as it relates to the health of riparian habitat (Objective RIP5) and ensuring that adverse edge effects, such as weeds, noise, hydrologic effects, trash, and litter, are avoided and minimized (Objectives HAB4 and HAB5). This careful management and monitoring, coupled with the extensive preservation of modeled habitat in large Preserves, ensures that the Conservation Strategy is consistent with Guiding Principle 7 to maintain or increase the number of Cooper's hawk present in the Plan Area. Similarly, the establishment of SSHCP Preserves in modeled Cooper's hawk habitat throughout the Plan Area means the Conservation Strategy is consistent with Guiding Principle 8, ensuring that Cooper's hawk are distributed throughout the Plan Area to limit the effects of stochastic disturbances to local subpopulations.

7.6.2.19 Ferruginous Hawk

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 25,491 acres of modeled foraging habitat for ferruginous hawk (*Buteo regalis*) (Table 7-70). These impacts include direct effects to 22,014 acres of Valley Grassland, 389 acres of Vernal Pool, 105 acres of Seasonal Wetland, 234 acres of Swale, and 2,749 acres of Irrigated Pasture Grassland. The majority of impacts to ferruginous hawk nesting and foraging habitat (70%) will be inside the UDA.

To mitigate impacts to ferruginous hawk, the SSHCP will preserve 26,112 acres of modeled foraging habitat, including 22, 014 acres of modeled Valley Grassland, 966 acres of Vernal Pool, 105 acres of Seasonal Wetland, 234 acres of Swale, and 2,749 acres of Irrigated Pasture-Grassland in the Plan Area. Most preservation will occur outside the UDA, largely in PPU 7.

Additionally, the SSHCP will re-establish or establish 728 acres of modeled habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-71).

Table 7-70
Permanent Effects and Conservation for Ferruginous Hawk

[a] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[b] Impacts to Irrigated Pasture-Grassland can be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.

Table 7-71
Biological Goals and Measurable Objectives Applicable to Ferruginous Hawk

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.

Table 7-71
Biological Goals and Measurable Objectives Applicable to Ferruginous Hawk

Applicable Biological Goals	Related Biological Objectives
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams, as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA, as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.

Table 7-71
Biological Goals and Measurable Objectives Applicable to Ferruginous Hawk

Applicable Biological Goals	Related Biological Objectives
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective FH1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 25,881 acres of modeled foraging habitat for ferruginous hawk is preserved, including 19,625 acres in PPUs 5 and/or 7 (see Objectives AG1, VG1, VP1, VP3, and SW1).
	Objective FH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for ferruginous hawk is re-established and/or established (see Objectives VP2 and SW2).

Analysis of Species Conservation

The SSHCP will preserve 26,112 acres of modeled foraging habitat for ferruginous hawk, which will ensure that the species has adequate foraging habitat in the Plan Area. In addition, the SSHCP will re-establish/establish 728 acres of modeled foraging habitat for ferruginous hawk in the Preserve System. Conservation of modeled foraging habitat will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized, and in combination with implementation

of a comprehensive Monitoring and Management Program within the Preserve System, will continue to support ferruginous hawk.

Sites selected for preservation of foraging habitat or re-establishment and/or establishment will be prioritized, pursuant to Conservation Action FH1.1, and will include sites that have moderate to dense short vegetative cover with topographic variation, and are known to already support populations of prey species. The SSHCP will provide a well-designed system of large-scale landscape-level Preserves to minimize the effects of habitat fragmentation. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to ferruginous hawk.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Using a Stream Setback strategy in conjunction with low-impact and compatible uses in land planning, the Preserves will maintain existing functions and values of Vernal Pool, Irrigated Pasture-Grassland, and Valley Grassland foraging habitat in the Preserve System and minimize edge-effect disturbances to foraging ferruginous hawk (e.g., lighting, noise, human activity). Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

Additionally, improvements in foraging habitat quantity and quality with management and monitoring will possibly contribute to expansion of foraging activities into areas not currently used by ferruginous hawk. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Through proper land management techniques and continued monitoring of foraging habitat for ferruginous hawk preserved in the Preserve System, the SSHCP will ensure that habitat functions and values remain the same as the time of acquisition or improve with proper management. Management objectives that will, in particular, benefit ferruginous hawk are those designed to maintain and enhance foraging habitat, including monitoring the vegetation biomass within grassland land covers (HAB 7) and ensuring that adverse edge effects, such as weeds, noise, hydrologic effects, trash, and litter, are avoided and minimized (Objectives HAB4 and HAB5). This careful management and monitoring, coupled with the extensive preservation of modeled habitat in large Preserves, ensures that the Conservation Strategy is consistent with Guiding Principle 7 to maintain or increase the number of ferruginous hawk present in Plan Area. Similarly, the establishment of SSHCP Preserves in modeled ferruginous hawk habitat throughout the Plan Area means the Conservation Strategy is consistent with Guiding Principle

8, ensuring that ferruginous hawks are distributed throughout the Plan Area to limit the effects of stochastic disturbances to local subpopulations.

7.6.2.20 Swainson's Hawk

Estimated Levels of Impact, Preservation, Re-Establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 31,112 acres of modeled nesting and modeled foraging habitat for Swainson's hawk (*Buteo swainsoni*) (Table 7-72). These impacts include direct effects to 373 acres of modeled nesting habitat (including Mixed Riparian Woodland and Mixed Riparian Scrub) and 30,739 acres of modeled foraging habitat (Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale). Of the 31,112 acres of impacts to modeled habitat, 7,413 acres are within an area designated as high-value habitat for Swainson's hawk (Table 7-73). The majority of impacts to Swainson's hawk nesting and foraging habitat (73%) will be inside the UDA.

To mitigate impacts to Swainson's hawk, the SSHCP will preserve 33,805 acres of modeled nesting and foraging habitat that includes 8,158 acres of modeled high-value habitat. A majority of Swainson's hawk modeled habitat will be preserved outside the UDA, within PPUs 5 and 7.

Additionally, the SSHCP will re-establish or establish 1,101 acres of modeled nesting and foraging habitat, including 118 acres of modeled high-value habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-74).

Table 7-72

Total High-Value Habitat	**7,413**	**0**	**7,413**	**8,158**	**118**

[a] High-value habitat for Swainson's hawk is modeled foraging habitat occurring in the western portion of the Plan Area (within PPUs 4, 6, and 8). Acreages presented for high-value habitat are a subset of modeled nesting and foraging habitat and are not in addition to modeled nesting and foraging habitat.
[b] Impacts to Cropland or Irrigated Pasture-Grassland can be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.
[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-74
Biological Goals and Measurable Objectives Applicable to Swainson's Hawk

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).

Table 7-74
Biological Goals and Measurable Objectives Applicable to Swainson's Hawk

Applicable Biological Goals	Related Biological Objectives
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W1.** Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.
	Objective W2. Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams, as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA, as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective RIP1**. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.

Table 7-74
Biological Goals and Measurable Objectives Applicable to Swainson's Hawk

Applicable Biological Goals	Related Biological Objectives
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective SH1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 31,033 acres of modeled foraging habitat for Swainson's hawk is preserved (see Objectives AG1, AG2, SW1, VP1, VP3, and VG1). Ensure that mitigation for high-value modeled habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8.
	Objective SH2. At least 2,000 acres of Cropland habitat within high-value habitat within PPUs 4, 6, and 8 will be preserved in fee title to ensure that intensive management actions can be taken. Land held in fee title will be restricted to growing field or row crops. Fee title lands must maintain, at a minimum, an average of 50% of their crop cover-type in alfalfa (*Medicago sativa*). Other crop types or land covers may be substituted for alfalfa if the TAC determines that

Table 7-74
Biological Goals and Measurable Objectives Applicable to Swainson's Hawk

Applicable Biological Goals	Related Biological Objectives
	such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa.
	Objective SH3. During assembly of the SSHCP Preserve System, ensure a minimum of 746 acres of modeled nesting habitat for Swainson's hawk is preserved (see Objectives RIP1 and RIP3).
	Objective SH4. During assembly of the SSHCP Preserve System, ensure that a minimum of 373 acres of modeled riparian nesting habitat for Swainson's hawk is re-established and/or established. Ensure that mitigation for modeled nesting habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8 (see Objectives RIP2 and RIP4).
	Objective SH5. For each of the 36 known nesting trees within the UDA, plant 10 trees that are modeled for Swainson's hawk nesting within SSHCP Preserves. Plant nesting trees on properties preserved by the SSHCP within PPUs 4, 6, and 8, and near preserved foraging habitat. Tree species will be selected based on known suitability as nesting habitat for Swainson's hawk, and the planted trees must be maintained and/or replaced in perpetuity.
	Objective SH6. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for Swainson's hawk is re-established and/or established (see Objectives RIP2 and RIP4).

Analysis of Species Conservation

The SSHCP will preserve 33,805 acres of modeled nesting and modeled foraging habitat that includes 8,158 acres of modeled high-value habitat for Swainson's hawk, which will ensure that the species has adequate nesting, foraging, and high value habitat in the Plan Area. In addition, the SSHCP will re-establish/establish 1,101 acres of modeled foraging habitat that includes 118 acres of high-value habitat for Swainson's hawk in the Preserve System (SH4 through SH6).

Sites selected for preservation of nesting, foraging, and high-value habitat will include sites that are set up for alfalfa or other suitable agricultural production within 3 miles of active nest sites that are in close proximity to large areas of open space to provide foraging habitat and with existing large mature trees that will provide nesting habitat. Re-establishment and/or establishment will focus on similar criteria but will establish riparian habitat along streams or river channels within known nesting territories and plant suitable nesting trees on SSHCP Preserves near preserved foraging habitat. The SSHCP will be consistent with Guiding Principle 1 (Section 7.1) by providing a well-designed system of large-scale landscape-level Preserves to minimize the effects of habitat fragmentation. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to Swainson's hawk.

Implementation of Goal 3 and its related measurable objectives for modeled nesting and foraging habitat (Objectives RIP1 through RIP4, VG1, VP1 through VP5, SW1 and SW2, and AG1) will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized and, in combination with implementation of a comprehensive Preserve System Monitoring and Management Program, will continue to support Swainson's hawk.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Using a Stream Setback strategy in conjunction with low-impact and compatible uses in land planning, the Preserves will maintain existing functions and values of Riparian, Vernal Pool, Irrigated Pasture-Grassland, Valley Grassland, and other modeled nesting and foraging habitat in the Preserve System, and minimize edge-effect disturbances to nesting and foraging Swainson's hawk (e.g., lighting, noise, human activity). Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

Additionally, improvements in nesting and foraging habitat quantity and quality with management and monitoring will possibly contribute to expansion of nesting and foraging activities into areas not currently used by Swainson's hawk. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Through proper land management techniques and continued monitoring of foraging habitat for Swainson's hawk preserved in the Preserve System, the SSHCP will ensure that habitat functions and values remain the same as the time of acquisition or improve with proper management. Management objectives that will, in particular, directly benefit Swainson's hawk are those designed to maintain and enhance foraging habitat. The Conservation Strategy for Swainson's hawk requires cultivation of alfalfa, rice, and dryland grains close to known Swainson's hawk nest sites and modeled nesting habitat; planting of trees in agricultural settings; and planting of hedgerows along the borders of agricultural fields. Alfalfa, rice, and dryland grains are modeled habitats for Swainson's hawk prey and provide high productivity foraging habitats. Cultivating these crops and managing them for the benefit of Swainson's hawk will increase prey availability and should improve foraging success for the hawk. Similarly, planting trees in agricultural settings should increase the number of suitable nest sites in Swainson's hawk preferred foraging habitats, and planting hedgerows should increase habitat for prey species and prey availability. The SSHCP will preserve large expanses of Valley Grassland and agricultural landscapes outside the UDA, many of which would contain existing or suitable Swainson's hawk nest trees. Although preservation of nest trees outside the UDA is not a measurable objective, many nest trees outside the UDA will be

preserved indirectly through this process.In addition, the mitigation for Swainson's hawk nesting tree removal in the UDA would be to plant replacement nesting trees outside the UDA in SSHCP Preserves. Monitoring vegetation height in grasslands (Objective HAB7) should help maintain foraging habitat quality by improving habitat suitability for prey and increasing prey detectability (i.e., by controlling dense thatch). This careful management and monitoring, coupled with the extensive preservation of modeled habitat in large Preserves, ensure that the Conservation Strategy is consistent with Guiding Principle 7 to maintain or increase the number of Swainson's hawk present in Plan Area. Similarly, the establishment of SSHCP Preserves in modeled Swainson's hawk habitat throughout the Plan Area means the Conservation Strategy is consistent with Guiding Principle 8, ensuring that Swainson's hawks are distributed throughout the Plan Area to limit the effects of stochastic disturbances to local subpopulations. The sum total of these efforts will ensure that impacts to Swainson's hawk from SSHCP Covered Activities are mitigated to the maximum extent practicable.

7.6.2.21 White-Tailed Kite

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 31,319 acres of modeled nesting, nesting/foraging and foraging habitat for white-tailed kite (*Elanus leucurus*) (Table 7-75). These impacts include direct effects to 376 acres of nesting habitat (including Blue Oak Woodland, Mixed Riparian Woodland, and Mine Tailing Riparian Woodland), 189 acres of nesting/foraging habitat (Mixed Riparian Scrub), and 31,319 acres of foraging habitat (Blue Oak Savanna, Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale). The majority of impacts to white-tailed kite nesting and foraging habitat (73%) will be inside the UDA.

To mitigate impacts to white-tailed kite, the SSHCP will preserve 32,175 acres of modeled habitat, including 586 acres of modeled nesting habitat, 189 acres of modeled nesting/foraging habitat, and 31,400 acres of modeled foraging habitat throughout the Plan Area. Most preservation will occur outside the UDA, with most of this preservation occurring in Valley Grassland habitat in PPU7.

Additionally, the SSHCP will re-establish or establish 1,365 acres of modeled habitat, of which approximately half will be foraging habitat and half will be nesting and nesting/foraging habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-76).

Table 7-75

Biological Goals and Measurable Objectives Applicable to White-Tailed Kite

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787

Table 7-76
Biological Goals and Measurable Objectives Applicable to White-Tailed Kite

Applicable Biological Goals	Related Biological Objectives
Covered Species within the Plan Area.	acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W1**. Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.
	Objective W2. Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams, as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA, as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective RIP1**. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.

Table 7-76
Biological Goals and Measurable Objectives Applicable to White-Tailed Kite

Applicable Biological Goals	Related Biological Objectives
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective AG2. Of the 9,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as corn (*Zea mays*), alfalfa, or wheat (*Triticum*)) preferred by tricolored blackbird, greater sandhill crane, and the covered raptor species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective AG3. Maintain or increase raptor prey availability and improve raptor foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak

Table 7-76
Biological Goals and Measurable Objectives Applicable to White-Tailed Kite

Applicable Biological Goals	Related Biological Objectives
	Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
	Objective AG3. Maintain or increase raptor prey availability and improve raptor foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective WK1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 31,205 acres of modeled foraging habitat for white-tailed kite is preserved (see Objectives VG1, AG1, RIP1, RIP3, SW1, VP1, VP3, and BOW1).
	Objective WK2. During assembly of the SSHCP Preserve System, ensure that a minimum of 974 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is preserved (see Objectives RIP1, RIP3, and BOW1).
	Objective WK3. During assembly of the SSHCP Preserve System, ensure a minimum of 767 acres of modeled foraging habitat for white-tailed kite is re-established and/or established (see Objectives VP2, RIP2, RIP4, and SW2).
	Objective WK4. During assembly of the SSHCP Preserve System, ensure that a minimum of 601 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is re-established and/or established (see Objectives RIP2 and RIP4).

Analysis of Species Conservation

The SSHCP will preserve 32,175 acres of modeled nesting, modeled nesting/foraging and modeled foraging habitat for white-tailed kite, which will ensure that the species has adequate nesting, nesting/foraging, and foraging habitat in the Plan Area. In addition, the SSHCP will re-establish/establish 1, 365 acres of modeled nesting, nesting/foraging and foraging habitat for white-tailed kite in the Preserve System.

Sites selected for preservation of nesting, nesting/foraging, and foraging habitat will include sites that are set up for agriculture that support perennial crops, that are known to be used by white-tailed kite for foraging, and that occur in larger open space areas. They will include large, unfragmented patches of land with dense canopy cover for nesting that are connected to grasslands and agricultural areas known to support high prey densities. Re-establishment and/or establishment will include sites located along existing riparian corridors where nesting habitat likely existed in the past and sites within a new or existing preserve or habitat corridor in areas within at least 0.5 mile of modeled foraging habitat at least 500 feet from urban land uses. Areas that did not historically support riparian woodlands or that are within the existing Vernal Pool Ecosystem will be avoided. The SSHCP will be consistent with Guiding Principles 1 and 4 (Section 7.1) by providing a well-designed system of large landscape-level Preserves to minimize the effects of habitat fragmentation and edge effects. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to white-tailed kite.

Implementation of Goal 3 and its related measurable objectives for modeled nesting and foraging habitat (Objectives RIP1 through RIP4, VG1, VP1 through VP5, SW1 and SW2, AG1, and BOW1 and BOW2) will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized, and in combination with implementation of a comprehensive Monitoring and Management Program within the Preserve System, will continue to support white-tailed kite. Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Using a Stream Setback strategy in conjunction with low-impact and compatible uses in land planning, the Preserves will maintain existing functions and values of Blue Oak Woodland, Mixed Riparian Woodland, Mine Tailing Riparian Woodland, Vernal Pool, Irrigated Pasture-Grassland, Cropland, Seasonal Wetland, Valley Grassland, and other modeled nesting and foraging habitat in the Preserve System, and minimize edge-effect disturbances to nesting and foraging white-tailed kite (e.g., lighting, noise, human activity). Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

Additionally, improvements in nesting and foraging habitat quantity and quality with management and monitoring will contribute to expansion of nesting and foraging activities into areas not currently used by white-tailed kite. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Through proper land management techniques and continued monitoring of foraging habitat for white-tailed kite preserved in the Preserve System,

the SSHCP will ensure that habitat functions and values remain the same as the time of acquisition or improve with proper management. Management objectives that will, in particular, directly benefit white-tailed kite are those designed to maintain and enhance foraging habitat, including ensuring Cropland and Irrigated Pasture-Grassland (Objective AG1). The Conservation Strategy for white-tailed kite requires cultivation of alfalfa, rice, and dryland grains close to modeled nesting habitat; planting of trees in agricultural settings; and planting of hedgerows along the borders of agricultural fields. Alfalfa, rice, and dryland grains are modeled habitats for white-tailed kite prey and provide high-productivity foraging habitats. Cultivating these crops and managing them for the benefit of white-tailed kite will increase prey availability and should improve foraging success for the white-tailed kite. Similarly, planting trees in agricultural settings should increase the number of suitable nest and perching sites near foraging habitats, and planting hedgerows should increase habitat for prey species and prey availability. Additionally, if large trees are planted in hedgerows, they will provide white-tailed kite nesting habitat in addition to increased prey habitat values. Monitoring vegetation height in grasslands (Objective HAB7) should help maintain foraging habitat quality by improving habitat suitability for prey and increasing prey detectability (e.g., by controlling dense thatch). These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population. This careful management and monitoring, coupled with the extensive preservation of modeled habitat in large Preserves, ensures that the Conservation Strategy is consistent with Guiding Principle 7 to maintain or increase the number of white-tailed kites present in Plan Area. Similarly, the establishment of SSHCP Preserves in modeled white-tailed kite habitat throughout the Plan Area means the Conservation Strategy is consistent with Guiding Principle 8, ensuring that white-tailed kites are distributed throughout the Plan Area to limit the effects of stochastic disturbances to local subpopulations.

7.6.2.22 Northern Harrier

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 30,903 acres of modeled nesting/foraging habitat and foraging habitat for northern harrier (*Circus cyaneus*) (Table 7-77). These impacts include direct effects to 30,048 acres of nesting/foraging habitat (including Cropland, Irrigated Pasture-Grassland, and Valley Grassland) and 855 acres of foraging habitat (including Vernal Pool, Seasonal Wetland, Swale, and Freshwater Marsh). The majority of impacts to northern harrier nesting and foraging habitat (72%) will be inside the UDA.

To mitigate impacts to northern harrier, the SSHCP will preserve 33,186 acres of modeled habitat, including 31,710 acres of modeled nesting/foraging habitat and 1,476 acres of modeled foraging habitat throughout the Plan Area. A majority of preservation will occur outside the UDA, with most of this preservation split between PPUs 6 and 7.

Additionally, the SSHCP will re-establish or establish 855 acres of modeled foraging habitat, most of which will be Vernal Pool habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-78).

Table 7-77
Permanent Effects and Conservation for Northern Harrier

Land Cover Types	Direct Effects (acres)	Indirect Effects	Total Effects (Acres)	Total Habitat Preservation (acres)	Total Habitat Re-Establishment and/or Establishment (acres)

[a] Impacts to Cropland or Irrigated Pasture-Grassland can be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.
[b] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-78
Biological Goals and Measurable Objectives Applicable to Northern Harrier

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).

Table 7-78
Biological Goals and Measurable Objectives Applicable to Northern Harrier

Applicable Biological Goals	Related Biological Objectives
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.

Table 7-78
Biological Goals and Measurable Objectives Applicable to Northern Harrier

Applicable Biological Goals	Related Biological Objectives
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective NH1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 1,245 acres of modeled foraging habitat for northern harrier (*Circus cyaneus*) is preserved (see Objectives VG1, AG1, VP1, VP3, FWM1, and SW1).
	Objective NH2. During assembly of the SSHCP Preserve System, ensure that a minimum of 30,048 acres of modeled nesting/foraging habitat for northern harrier is preserved (see Objectives VG1 and AG1).
	Objective NH3. During assembly of the SSHCP Preserve System, ensure that a minimum of 856 acres of modeled foraging habitat for northern harrier is re-established and/or established (see Objectives VP2, FWM2, and SW2).

Analysis of Species Conservation

The SSHCP will preserve 33,186 acres of modeled nesting/foraging and modeled foraging habitat for northern harrier (NH1 and NH2), which will ensure that the species has adequate nesting/foraging and foraging habitat in the Plan Area. In addition, the SSHCP will re-

establish/establish 855 acres of modeled nesting/foraging and foraging habitat for northern harrier in the Preserve System (NH3).

Sites selected for preservation of nesting/foraging and foraging habitat will include large, open sites with dense, tall vegetation known to support high prey densities linked or adjacent to currently preserved lands. Preserved sites will include wet or moist sites for nesting, in large open space areas that potentially support other Covered Species. Re-establishment and/or establishment will include sites with historically contained intact foraging habitat in large, open space areas where management can be used to enhance or re-establish natural ecosystem processes and attract other Covered Species. The SSHCP will be consistent with Guiding Principles 1 and 4 (Section 7.1) by providing a well-designed system of large-scale landscape-level Preserves to minimize the effects of habitat fragmentation and edge effects. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to northern harrier.

Implementation of Goal 3 and its related measurable objectives for modeled nesting and foraging habitat (Objectives VG1, VP1 through VP5, SW1 and SW2, FWM1 and FWM2, and AG1) will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized, and in combination with implementation of a comprehensive Monitoring and Management Program within the Preserve System, will continue to support northern harrier.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Using a Stream Setback strategy in conjunction with low-impact and compatible uses in land planning, the Preserves will maintain existing functions and values of Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Freshwater Marsh, and other modeled nesting and foraging habitat in the Preserve System, and minimize edge-effect disturbances to nesting and foraging northern harrier (e.g., lighting, noise, human activity). Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

Additionally, improvements in nesting and foraging habitat quantity and quality with management and monitoring will possibly contribute to expansion of nesting and foraging activities into areas not currently used by northern harrier. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Through proper land management

techniques and continued monitoring of foraging habitat for northern harrier preserved in the Preserve System, the SSHCP will ensure that habitat functions and values remain the same as the time of acquisition or improve with proper management. Management objectives that will, in particular, directly benefit northern harrier are those designed to maintain and enhance foraging habitat, including ensuring Cropland and Irrigated Pasture-Grassland are available for foraging (Objective AG1). The Conservation Strategy for northern harrier includes cultivation of alfalfa, rice, and dryland grains close to modeled nesting habitat; planting of trees in agricultural settings; and planting of hedgerows along the borders of agricultural fields. Monitoring vegetation height in grasslands (Objective HAB7) should help maintain foraging habitat quality by improving habitat suitability for prey and increasing prey detectability (e.g., by controlling dense thatch). These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population. This careful management and monitoring, coupled with the extensive preservation of modeled habitat in large Preserves, ensures that the Conservation Strategy is consistent with Guiding Principle 7 to maintain or increase the number of northern harriers present in Plan Area. Similarly, the establishment of SSHCP Preserves in modeled northern harrier habitat throughout the Plan Area means the Conservation Strategy is consistent with Guiding Principle 8, ensuring that northern harrier are distributed throughout the Plan Area to limit the effects of stochastic disturbances to local subpopulations.

7.6.2.23 Western Burrowing Owl

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 30,836 acres of modeled wintering/nesting habitat for western burrowing owl (*Athene cunicularia*) (Table 7-79). These impacts include direct effects to 22,014 acres of Valley Grassland, 5,285 acres of Cropland, 2,749 acres of Irrigated Pasture-Grassland, 38 acres of Blue Oak Savanna, 389 acres of Vernal Pool, 105 acres of Seasonal Wetlands, 234 acres of Swale, and 22 acres of Stream/Creek (VPIH). The majority of impacts to western burrowing owl nesting/foraging habitat (74%) will be inside the UDA.

To mitigate impacts to western burrowing owl, the SSHCP will preserve approximately 33,132 acres of modeled wintering/nesting habitat, including 22,014 acres of Valley Grassland, 6,947 acres of Cropland, 2,749 acres of Irrigated Pasture-Grassland, 47 acres of Blue Oak Savanna, 966 acres of Vernal Pool, 105 acres of Seasonal Wetlands, 278 acres of Swale, and 26 acres of Stream/Creek (VPIH) throughout the Plan Area. A majority of this preservation will occur outside the UDA.

Additionally, the SSHCP will re-establish or establish 38 acres of modeled Blue Oak Savanna wintering nesting habitat, which is the only re-establishment or establishment planned for

western burrowing owl. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-80).

Table 7-79
Permanent Effects and Conservation for Western Burrowing Owl

[a] Impacts to Blue Oak Savanna can be mitigated by preserving any combination of Blue Oak Savanna and Blue Oak Woodland.
[b] Impacts to Blue Savanna can be mitigated by re-establishing or establishing any combination of Blue Oak Woodland and Blue Oak Savanna.
[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[d] Impacts to Cropland or Irrigated Pasture-Grassland can be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.

Table 7-80
Biological Goals and Measurable Objectives Applicable to Western Burrowing Owl

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic	**Objective W2.** Covered Activities will implement the following, as outlined in Section 5.4.2:

Table 7-80
Biological Goals and Measurable Objectives Applicable to Western Burrowing Owl

Applicable Biological Goals	Related Biological Objectives
resources within the Plan Area.	• Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends and to track climate change.

Table 7-80
Biological Goals and Measurable Objectives Applicable to Western Burrowing Owl

Applicable Biological Goals	Related Biological Objectives
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective BO1.** Preserve seven occupied western burrowing owl (*Athene cunicularia*) sites (commensurate with 20% of the estimated number of sites within the UDA as of 2014), preserve at least 200 acres of land surrounding each occupied burrow site, and maintain modeled habitat for western burrowing owl within 0.4 mile of breeding sites.
	Objective BO2. For each western burrowing owl or western burrowing owl pair passively excluded, preserve 200 acres of modeled habitat for western burrowing owl, and establish a California ground squirrel (*Spermophilus (Otospermophilus) beecheyi*) colony, and augment with artificial burrows as appropriate (determined by TAC). Artificial burrows will be established at appropriate locations throughout the Preserve System pursuant to CDFW (CDFG 2012 guidelines) or as otherwise determined by the TAC.

Analysis of Species Conservation

The SSHCP will preserve 33,132 acres of modeled nesting/foraging habitat for western burrowing owl. Additionally, 7 occupied western burrowing owl sites and at least 200 acres of land surrounding each burrow site will be preserved under the SSHCP. Modeled habitat within 0.4 miles of breeding sites will be maintained under this objective and will ensure that the species has adequate nesting/foraging habitat in the Plan Area. Furthermore, the SSHCP will preserve 200 acres of modeled habitat for every western burrowing owl or western burrowing owl pair passively relocated, and establish a ground squirrel colony and augment with artificial burrows as appropriate.

Sites selected for preservation of nesting/foraging habitat and occupied western burrowing owl sites will include sites known to support breeding western burrowing owls, located within 3 miles of a known nesting site or modeled nesting habitat, that support high rodent populations during the breeding season and expand upon or link already preserved lands that will not be bisected by new roadways or incur impacts from any other infrastructure developments. Sites selected for preservation will include large (over 20 acres) sites that are open, with well-drained terrain and a low risk of flooding that has short, sparse vegetation with underground burrows that have modeled foraging habitat within 0.4 mile of breeding sites. Foraging habitat will be enhanced by promoting fossorial mammal populations in areas that are modeled foraging habitat and provide sentinel posts or mounds near burrows. The SSHCP will provide a well-designed system of large-scale landscape-level Preserves to minimize the effects of habitat fragmentation and edge effects. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to western burrowing owl.

Conservation of modeled nesting/foraging habitat will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized, and in combination with implementation of a comprehensive Preserve System Monitoring and Management Program, will continue to support western burrowing owl. Using a Stream Setback strategy in conjunction with low-impact and compatible uses in land planning, the Preserves will maintain existing functions and values of Cropland, Irrigated Pasture-Grassland, Valley Grassland, and Blue Oak Savanna in the Preserve System, and minimize edge-effect disturbances to nesting/foraging western burrowing owl (e.g., lighting, noise, human activity).

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

Additionally, improvements in nesting and foraging habitat quantity and quality with management and monitoring will possibly contribute to expansion of nesting and foraging activities into areas not currently used by western burrowing owl. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Through proper land management techniques and continued monitoring of foraging habitat for western burrowing owl preserved in the Preserve System, the SSHCP will ensure that habitat functions and values remain the same as the time of acquisition or improve with proper management. Management objectives that will, in particular, directly benefit western burrowing owl are those designed to maintain and enhance foraging habitat, include ensuring Cropland and Irrigated Pasture-Grassland is available for foraging. The Conservation Strategy that will benefit western burrowing owl includes managing large, open Preserves that contain small mammal burrows (such as California ground squirrel) with an active small mammal population. Areas with sentinel posts and/or mounds that are located within 0.4 mile of active breeding sites with well-drained soils will be prioritized for the benefit of western burrowing owl. These sites will increase prey availability and should improve nesting and foraging success for the owl. Monitoring vegetation height in grasslands (Objective HAB7) should help maintain foraging habitat quality by improving habitat suitability for prey and increasing prey detectability (e.g., by controlling dense thatch). These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population. Similarly, the establishment of SSHCP Preserves in modeled western burrowing owl habitat throughout the Plan Area means the Conservation Strategy is consistent with Guiding Principle 8, ensuring that western burrowing owls are distributed throughout the Plan Area to limit the effects of stochastic disturbances to local subpopulations.

7.6.2.24 Loggerhead Shrike

Estimated Levels of Impact, Preservation, Re-Establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 31,367 acres of modeled habitat for loggerhead shrike (*Lanius ludovicianus*) in the Plan Area (Table 7-81). This would include approximately 591 acres of nesting habitat (Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland), 22,014 acres of modeled nesting/foraging habitat (Valley Grassland), and 8,762 acres of modeled foraging habitat (Cropland, Irrigated Pasture-Grassland, Vernal Pool, Seasonal Wetland, Swale). (Table 7-81). The majority of the direct and indirect effects to loggerhead shrike nesting and foraging habitat will occur inside the UDA, although permanent effects on specific nest sites are not analyzed in Chapter 6 because the SSHCP database does not contain any confirmed loggerhead shrike nest sites for the Plan Area (Section 3.3.3).

To mitigate impacts to loggerhead shrike, the SSHCP will preserve approximately 34,023 acres of modeled habitat, including 964 acres of modeled nesting habitat, 22,014 acres of modeled nesting/foraging habitat and 11,045 acres of modeled foraging habitat throughout the Plan Area. A majority of preservation will occur outside the UDA, with most of this preservation occurring in PPUs 6 and 7 in Valley Grassland habitat.

Additionally, the SSHCP will re-establish or establish approximately 1,319 acres of modeled habitat, including 591 acres of modeled nesting habitat and 728 acres of modeled foraging habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-82).

[a] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[b] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[c] Impacts to Mine Tailing Riparian Woodland will be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[d] Impacts to Mine Tailing Riparian Woodland will be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.
[e] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[f] Impacts to Cropland or Irrigated Pasture-Grassland can be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.

Table 7-82
Biological Goals and Measurable Objectives Applicable to Loggerhead Shrike

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).

Table 7-82
Biological Goals and Measurable Objectives Applicable to Loggerhead Shrike

Applicable Biological Goals	Related Biological Objectives
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W1**. Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.
	Objective W2. Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish Irrigated Pasture-Grassland that provide habitat for Covered Species.	**Objective RIP1**. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will

Final South Sacramento Habitat Conservation Plan

Table 7-82
Biological Goals and Measurable Objectives Applicable to Loggerhead Shrike

Applicable Biological Goals	Related Biological Objectives
	be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends, and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
	Objective AG2. Of the 10,3779,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as corn (*Zea mays*), alfalfa, or wheat (*Triticum*)) preferred by tricolored blackbird, greater sandhill crane, and the covered raptor species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective LS1**. During assembly of the SSHCP Preserve System, ensure that a minimum of 9,152 acres of modeled foraging habitat for loggerhead shrike (*Lanius ludovicianus*) is preserved (see Objectives VG1, AG1, SW1, VP1, and VP3).
	Objective LS2. During assembly of the SSHCP Preserve System, ensure that a minimum of 22,014 acres of modeled nesting/foraging habitat for loggerhead shrike is preserved (see Objectives VG1, RIP1, and RIP3).

Table 7-82
Biological Goals and Measurable Objectives Applicable to Loggerhead Shrike

Applicable Biological Goals	Related Biological Objectives
	Objective LS3. During assembly of the SSHCP Preserve System, ensure that a minimum of 592 acres of modeled nesting habitat for loggerhead shrike is re-established and/or established (see Objectives RIP2 and RIP4).
	Objective LS4. During assembly of the SSHCP Preserve System, ensure that a minimum of 965 acres of modeled nesting habitat for loggerhead shrike is preserved (see Objectives RIP2 and RIP4).
	Objective LS5. During assembly of the SSHCP Preserve System, ensure that a minimum of 729 acres of modeled foraging habitat for loggerhead shrike is re-established and/or established (see Objective SW2).

Analysis of Species Conservation

The SSHCP will preserve approximately 34,023 acres of modeled habitat, including 964 acres of modeled nesting habitat, 22,014 acres of modeled nesting/foraging habitat, and 11,045 acres of modeled foraging habitat, throughout the Plan Area (Objectives LS1, LS2, and LS4). In addition, the SSHCP will re-establish or establish approximately 1,319 acres of modeled habitat for the loggerhead shrike in the Preserve System.

Sites selected for preservation of nesting, nesting/foraging, and foraging habitat will be prioritized pursuant to Conservation Actions LS1.1 and LS2.1, and will include sites that are Cropland, Irrigated Pasture-Grassland, Vernal Pool, Seasonal Wetland, Swale, Valley Grassland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland. The sites will include parcels that are greater than 20 acres in size and that are open with sparse vegetation for foraging, as these areas are known to support high prey densities. The sites would also be interspersed with scattered or isolated low trees or large shrubs that would be suitable for loggerhead shrike nest sites to enhance reproduction opportunities for this species. The areas would provide hunting perches with an open view to provide better foraging opportunities, and the areas would be either linked or adjacent to currently preserved lands to maintain and/or enhance connectivity between habitat patches. They would be in areas known to support loggerhead shrike and other Covered Species, and would be able to be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

Pursuant to Conservation Action LS3.1 and LS5.1, re-establishment and/or establishment will be prioritized on parcels that are 20 acres or greater in size and/or occur in larger, open space areas and that possess or can be planted with scattered or isolated low trees or large shrubs for nest sites. These sites would need to have the potential to support loggerhead shrike and other Covered Species after re-establishment and/or establishment, and would be linked or adjacent to

currently preserved lands to increase and ensure connectivity between Preserves and habitat patches. They would be located where management can be used to enhance or re-establish natural ecosystem processes and attract Covered Species. Loggerhead shrike habitat re-establishment will only occur where habitat historically occurred but no longer exists due to loss of or changes in ecological factors.

The SSHCP will provide a well-designed system of large Preserves that are linked and designed to minimize the effects of habitat fragmentation and edge effects. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to loggerhead shrike.

Conservation of modeled nesting/foraging habitat will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized, and in combination with implementation of a comprehensive Preserve System Monitoring and Management Program within the Preserve System, will continue to support loggerhead shrike nesting and foraging habitat. Although Goal 2 addresses aquatic resources, some of the land covers included in the objectives for this goal are modeled nesting habitat (i.e., Mixed Riparian Scrub) and modeled foraging habitat (Vernal Pool, Seasonal Wetland, and Swale) for loggerhead shrike.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Using a Stream Setback strategy in conjunction with low impact and compatible uses in land planning the Preserve System will maintain existing functions and values of nesting habitat and minimize edge-effect disturbances to nesting loggerhead shrike (e.g., lighting, noise, human activity) and functions and values of foraging habitat. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Additionally, improvements in nesting and foraging habitat quantity and quality with management and monitoring will possibly contribute to expansion of nesting and foraging activities into areas not currently used by loggerhead shrike. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Implementation of Goal 3 and Goal 4 will directly benefit loggerhead shrike by maintaining and enhancing foraging habitat. Measurable Objectives under Goals 3 and 4 will ensure planting of Croplands (Objective AG1 and AG2) and provide cover and refugia to attract prey species (Objective HAB1, HAB2 and HAB 7). The Conservation Strategy for loggerhead shrike includes cultivation of alfalfa, rice, and dryland grains close to modeled nesting and perching habitat; planting of trees in agricultural settings; and planting of hedgerows along the borders of agricultural fields. Alfalfa, rice, and dryland grains are modeled habitats for loggerhead shrike prey and provide high

productivity foraging habitats. Cultivating these crops and managing them for the benefit of loggerhead shrike will increase prey availability and should improve foraging success for the shrike. Similarly, planting trees in agricultural settings should increase the number of suitable hunting perches and potentially nesting sites near foraging habitats. Planting hedgerows should increase habitat for prey species and prey availability. Additionally, if trees are planted in hedgerows, they can provide loggerhead shrike hunting perches and potentially nesting habitat, in addition to increased prey habitat values. Monitoring vegetation height in grasslands (Objective HAB7) should help maintain foraging habitat quality by improving habitat suitability for prey and increasing prey detectability (e.g., by controlling dense thatch). These actions should result in higher overall reproductive success and productivity of the Plan Area breeding population, and ensure that the Conservation Strategy is consistent with Guiding Principle 7 to maintain or increase the number of loggerhead shrike present in Plan Area. Similarly, the establishment of SSHCP Preserves in modeled loggerhead shrike foraging and nesting habitat throughout the Plan Area means the Conservation Strategy is consistent with Guiding Principle 8 by ensuring that, should a localized population become extirpated from a particular habitat patch, individual loggerhead shrikes from nearby modeled habitat in other preserves would repopulate vacant habitat and thus limit the effects of stochastic disturbances to local subpopulations.

7.6.2.25 Greater Sandhill Crane

Estimated Levels of Impact, Preservation, Re-establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact approximately 7,942 acres of modeled greater sandhill crane (*Grus canadensis*) roosting and foraging habitat of the Plan, including 124 acres of modeled roosting/foraging habitat (Seasonal Wetland and Freshwater Marsh), 66 acres of modeled roosting habitat (Vernal Pool), and 7,752 acres of modeled foraging habitat (Cropland, Irrigated Pasture-Grassland, and Valley Grassland) (Table 7-83). This includes 820 acres of impact to modeled high-value habitat Seasonal Wetland, Freshwater Marsh, Vernal Pool, Cropland, Irrigated Pasture-Grassland, and Valley Grassland). The majority of the direct effects for greater sandhill crane will occur inside the UDA.

To mitigate impacts to greater sandhill crane, the SSHCP will preserve approximately 10,320 acres of modeled habitat, that includes 232 acres of modeled roosting/foraging habitat, 37 acres of modeled roosting habitat, and 10,051 acres of modeled foraging habitat throughout the Plan Area (Table 7-83). Of the preserved modeled habitat, 9,399 acres of high-value habitat will be preserved (Table 7-84). A majority of preserved modeled habitat will occur outside the UDA, most of which will be in PPU 6.

Additionally, the SSHCP will re-establish or establish 184 acres of modeled habitat of the Plan, including 125 acres of modeled roosting/foraging habitat and 59 acres of modeled roosting

habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-85).

Table 7-83
Permanent Effects and Conservation for Greater Sandhill Crane

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Re-Establishment and/or Establishment (acres)

Total High-Value Habitat	**819**	**1**	**820**	**9,399**	**19**

[a] High-value habitat is all modeled roosting and foraging habitat above sea level and outside the floodplain and outside the UDA.
[b] Impacts to Cropland or Irrigated Pasture-Grassland can be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.
[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-85
Biological Goals and Measurable Objectives Applicable to Greater Sandhill Crane

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs) • Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.

Table 7-85
Biological Goals and Measurable Objectives Applicable to Greater Sandhill Crane

Applicable Biological Goals	Related Biological Objectives
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
	Objective AG2. Of the 10,3779,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as corn, alfalfa, or wheat) preferred by tricolored blackbird, greater sandhill crane, and the covered raptor species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.

Table 7-85
Biological Goals and Measurable Objectives Applicable to Greater Sandhill Crane

Applicable Biological Goals	Related Biological Objectives
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective GS1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 257 acres of modeled roosting or roosting/foraging habitat for greater sandhill crane is preserved. Roosting habitat will be preserved and maintained within PPUs 4, 6, and 8, with a minimum of 75% within PPU 6 (see Objectives VP1, SW1, and FWM1).
	Objective GS2. During assembly of the SSHCP Preserve System, ensure that a minimum of 7,751 acres of modeled foraging habitat for greater sandhill crane is preserved (see Objectives AG1, AG2, and VG1).
	Objective GS3. During assembly of the SSHCP Preserve System, ensure that a minimum of 184 acres of modeled roosting habitat or roosting/foraging habitat for greater sandhill crane is established and/or re-established. Re-establish two new roost sites (minimum of 90 acres of Freshwater Marsh/Seasonal Wetland complex each) every 2 miles in the gap between the Cosumnes population and the Stone Lakes' population or other strategic locations if that gap is closed by another HCP or conservation project (see Objectives VP2, SW2, and FWM2).
	Objective GS4. Create a visual screen of woody vegetation near human disturbances such as buildings, bridges, and paved roads from permanent roosting habitat within PPU 6. Screens should be located as appropriate to not interfere with habitat usage by greater sandhill cranes.
	Objective GS5. As part of the 2,000 acres preserved under Objective AG2, establish and maintain 10 food plots in strategic locations totaling a minimum of 200 acres within an agricultural setting for greater sandhill crane foraging habitat within PPU 6. Maintain the 200 acres among the 10 food plots as irrigated pasture or planted with crops preferred by greater sandhill crane as foraging habitat. Crops may include alfalfa, corn, wheat, or rice. Strategic placement of food plots will include locations for food plots in upland areas above the floodplain.
	Objective GS6. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,000 acres of high-value modeled foraging habitat for greater sandhill crane outside the 100-year floodplain is preserved (see Objectives VP1, SW1, and FWM1).

Analysis of Species Conservation

The SSHCP will preserve approximately 10,320 acres of modeled roosting and foraging habitat, including 232 acres of modeled roosting/foraging habitat, 37 acres of modeled roosting habitat, and 10,051 acres of modeled foraging habitat throughout the Plan Area. In addition, the SSHCP will re-establish two new roost sites (minimum of 90 acres of Freshwater Marsh/Seasonal Wetland complex each) every 2 miles in the gap between the Cosumnes population and the Stone Lakes' population.

The SSHCP provides a well-designed system of large Preserves that are linked and designed to minimize the effects of habitat fragmentation and edge effects. To the maximum extent possible,

newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to greater sandhill crane. By preserving 10,051 acres of modeled foraging habitat, the SSHCP will ensure that greater sandhill crane will have adequate foraging habitat in the Plan Area. In addition, the SSHCP will establish and maintain 10 food plots in strategic locations totaling a minimum of 200 acres within an agricultural setting that will ensure that foraging habitat is provided near important roosting areas in the Cosumnes River floodplain. Further, providing visual screens between roosting sites and human disturbances in PPU 6 will increase the chance that viable roosting sites will be maintained in the Preserve System.

Sites selected for preservation of roosting/foraging and roosting habitat will be prioritized pursuant to Conservation Action GS1.1 and will include sites that are known roost sites that are 20 acres or greater in size and/or that occur in larger, open space areas. They would be open space areas that are free of fences and powerlines, located within 2 miles of modeled foraging habitat outside the UDA, and linked or adjacent to currently preserved lands that are least 1,000 feet from disturbances, such as roads or other operations that may disturb roosting. The areas would support natural drainage inflows or water delivery that mimics natural hydrologic cycles and have Seasonal Wetland present from September to mid-March. Lastly, they potentially support other Covered Species or where management will be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.

Sites selected for preservation of foraging habitat will be prioritized pursuant to Conservation Action GS2.1 and will include sites that are known roost sites that are 20 acres or greater in size and/or that occur in larger, open space areas. They would be modeled foraging habitat that are free of fences and powerlines, located within 2 miles of known roost sites or modeled roosting habitat outside the UDA. The areas would be linked or adjacent to currently preserved lands, contain available sources of “grit,” including gravel and dirt roads or rocky uplands, and potentially support other Covered Species or where management will be used to enhance or re-establish natural ecosystem processes and attract other Covered Species.

Re-establishment and/or establishment will be prioritized pursuant to Conservation Action GS3.1 in that it would select re-establishment or establishment sites outside the UDA, based on the same criteria used for preservation sites in GS1.1 and GS2.1, and will only occur where it replaces low-quality foraging or roosting habitat. Specifically, it will replace unmodeled agriculture uses, such as orchards and vineyards, with habitats supporting high prey abundance (e.g., invertebrates), removal of physical structures that can cause collisions during takeoff and flying, removal of human disturbances from otherwise modeled foraging and roosting habitat, and establishment of suitable hydrologic regimes at roosting sites. Also, it would contain grit sources near foraging areas.

The impacts on modeled roosting and foraging habitat loss and conversion and lack of habitat management may be significantly affecting the greater sandhill crane in the Plan Area. Conservation of modeled roosting and foraging habitat will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized. Although Goal 2 addresses aquatic resources, some of the land covers included in the objectives for this goal are modeled roosting/foraging habitat (i.e., Seasonal Wetland and Freshwater Marsh) and modeled roosting habitat (Vernal Pool) for greater sandhill crane. Using a Stream Setback strategy in conjunction with low impact and compatible uses in land planning the Preserve System will maintain existing functions and values of roosting and foraging habitat and minimize edge-effect disturbances to roosting and foraging greater sandhill crane (e.g., lighting, noise, human activity). Implementation of Goal 2 and its related measurable objectives for roosting/foraging habitat and roosting habitat will help ensure that the adverse effects of Covered Activities on these habitats will be minimized, and in combination with implementation of a comprehensive management and monitoring program within the Preserve System, will continue to support greater sandhill crane. Additionally, improvements in roosting and foraging habitat quantity and quality with management and monitoring will possibly contribute to expansion of roosting and foraging activities into areas not currently used by greater sandhill crane.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

Improvements in roosting and foraging habitat quantity and quality with management and monitoring will possibly contribute to expansion of roosting and foraging activities into areas not currently used by greater sandhill crane. Continued monitoring (Chapter 8) will track the amount of habitat lost and the amount preserved, and ensure the Plan is in overall compliance with get-ahead, stay-ahead requirements. Implementation of Goal 3 and Goal 4 will directly benefit greater sandhill crane by maintaining and enhancing foraging habitat. Measurable Objectives under Goals 3 and 4 will ensure planting of Croplands (Objectives AG1 and AG2) and provide cover and refugia to attract prey species (Objectives HAB1, HAB2, and HAB 7). The Conservation Strategy for greater sandhill crane includes cultivation of alfalfa, rice, and dryland grains close to roosting habitat. Alfalfa, rice, and dryland grains are modeled habitats for greater sandhill crane animal prey and other foods (e.g., waste grains) and provide high-productivity foraging habitats. Cultivating these crops and managing them for the benefit of greater sandhill crane will increase food availability and should improve foraging success for the crane.

Monitoring vegetation height in grasslands (Objective HAB7) should help maintain foraging habitat quality by improving access to waste grains, as well as habitat suitability for prey and increasing prey detectability (e.g., by controlling dense thatch). The effects of noise and hydrologic alterations will be addressed by Objective HAB5. This careful management and monitoring, coupled with the extensive preservation of modeled habitat in large Preserves, ensures that the Conservation Strategy is consistent with Guiding Principle 7 (Section 7.1) to maintain or increase the number of and carrying capacity for wintering greater sandhill cranes present in Plan Area. Similarly, the establishment of SSHCP Preserves in modeled greater sandhill crane foraging and roosting habitat throughout the Plan Area means the Conservation Strategy will ensure that, should a localized population become extirpated from a particular habitat patch, individual greater sandhill cranes from nearby modeled habitat in other preserves would repopulate vacant habitat and thus limit the effects of stochastic disturbances to local subpopulations.

7.6.2.26 Tricolored Blackbird

Estimated Levels of Impact, Preservation, Re-Establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to approximately 31,058 acres of modeled habitat for tricolored blackbird (*Agelaius tricolor*) in the Plan Area. As detailed in Table 7-78, this would include approximately 27,531 acres of nesting/foraging habitat (Cropland, Valley Grassland, Seasonal Wetland, and Freshwater Marsh) and 3,527 acres of modeled foraging habitat (Irrigated Pasture-Grassland, Vernal Pool, Swale and Open Water) (Table 7-86). The majority of the direct and indirect effects for tricolored blackbird (96%) will occur inside the UDA.

To mitigate impacts to tricolored blackbird, the SSHCP will preserve approximately 33,297 acres of modeled habitat (Table 7-86), including 29,193 acres of modeled nesting/foraging habitat and 4,104 acres of modeled foraging habitat throughout the Plan Area. A majority of preservation for this species will be in PPUs 6 and 7.

Additionally, the SSHCP will re-establish or establish approximately 1,010 acres of modeled habitat, including 232 acres of modeled nesting/foraging habitat and 778 acres of modeled foraging habitat. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-87).

Final South Sacramento Habitat Conservation Plan

Table 7-86
Permanent Effects and Conservation for Tricolored Blackbird

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (Acres)	Total Habitat Preservation (acres)	Total Habitat Establishment and/or Re-Establishment (acres)

[a] Impacts to Cropland or Irrigated Pasture-Grassland can be mitigated by preserving a combination of Cropland and Irrigated Pasture-Grassland.
[b] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.
[c] Preservation of Open Water can be achieved by preserving any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.
[d] Re-establishment and/or establishment of Open Water can be achieved by re-establishing and/or establishing any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

Table 7-87
Biological Goals and Measurable Objectives Applicable to Tricolored Blackbird

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design AMMs (Low-Impact Development (LID) and ROAD AMMs)

Table 7-87
Biological Goals and Measurable Objectives Applicable to Tricolored Blackbird

Applicable Biological Goals	Related Biological Objectives
	• Ground-disturbance AMMs (Best Management Practices (BMPs) and ROAD AMMs)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.

Table 7-87
Biological Goals and Measurable Objectives Applicable to Tricolored Blackbird

Applicable Biological Goals	Related Biological Objectives
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by the Technical Advisory Committee (TAC)). The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends and to track climate change.
	Objective HAB7. Monitor vegetation biomass within grassland land covers.
	Objective AG2. Of the 10,3779,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as corn, alfalfa, or wheat) preferred by tricolored blackbird, greater sandhill crane, and the covered raptor species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective TB1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 4,149 acres of modeled foraging habitat for tricolored blackbird is preserved (see Objectives AG1, AG2, FWM1, VG1, VP1, VP3, FWM1, OW1, and SW1).
	Objective TB2. During assembly of the SSHCP Preserve System, ensure that a minimum of 27,532 acres of modeled nesting/foraging habitat for tricolored

Table 7-87
Biological Goals and Measurable Objectives Applicable to Tricolored Blackbird

Applicable Biological Goals	Related Biological Objectives
	blackbird is preserved, including a minimum of 402 acres of Freshwater Marsh and Seasonal Wetland (see Objectives AG1, AG2, VG1, VG1, FWM1, and SW1).
	Objective TB3. During assembly of the SSHCP Preserve System, ensure that a minimum of 917 acres of modeled foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2, SW2, OW2, and VP2).
	Objective TB4. During assembly of the SSHCP Preserve System, ensure that a minimum of 232 acres of modeled nesting/foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2 and SW2).
	Objective TB5. Provide mitigation for loss of any tricolored blackbird nesting colony site that is occupied at the time of Covered Activity implementation or was recorded as an occupied nesting colony at any time since 2008. Sources for occupied nesting colonies are the CNDDB, Tricolored Blackbird Portal, eBird, or other data sources approved by the Wildlife Agencies. Minimum mitigation is to preserve one extant unpreserved occurrence of a nesting colony prior to take of one nesting colony of tricolored blackbirds. Ensure that at least five extant tricolored blackbird colonies that were occupied in recent years are maintained and managed within the SSHCP Preserve System.
	Objective TB6. Conduct an experimental study to identify management actions to preserve tricolored blackbird colonies (e.g., coarse netting to reduce nest predation or impact of pesticides).
	Objective TB7. Ensure that at least one large tricolored blackbird colony (i.e., one that has historically (from 1950 on) supported a minimum of 1,500 individuals) is preserved.
	Objective TB8. For any tricolored blackbird nesting colony that is removed by a Covered Activity, re-establish and/or establish three new colonies within SSHCP Preserves. Re-established and/or established colonies can be in aquatic (freshwater marsh, seasonal wetland) or upland (annual grassland) habitat types, and must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands that provide adequate foraging opportunities.

Analysis of Species Conservation

The SSHCP will preserve approximately 33,297 acres of modeled nesting and foraging habitat. This would include approximately 29,193 acres of modeled nesting/foraging habitat and 4,104 acres of modeled foraging habitat throughout the Plan Area. The SSHCP will provide a system of large-scale landscape-level Preserves that are linked and designed to minimize the effects of habitat fragmentation and edge effects. To the maximum extent possible, newly preserved lands acquired by the SSHCP will be adjacent to and contiguous with existing preserves, enhancing the ecological value of SSHCP Preserves to tricolored blackbird.

By ensuring that 4,104 acres of modeled foraging habitat and 29,193 acres of modeled nesting/foraging habitat is preserved, and a minimum of 778 acres of foraging habitat and 232

acres of modeled nesting/foraging habitat is established or re-established in the Plan Area, as well as managing the habitat value of Croplands in the Preserve System, tricolored blackbirds will have adequate foraging habitat in the Plan Area. In addition, the 1,010 acres of re-established and/or established modeled foraging habitat and 232 acres of re-established and/or established nesting/foraging habitat will ensure that tricolored blackbird have adequate quality nesting/foraging habitat in the Plan Area.

Sites selected for preservation of foraging habitat will be prioritized pursuant to Conservation Action TB1.1 and be within 3 miles of a known nesting site or modeled nesting/foraging habitat on parcels 20 acres or greater in size and/or occur in larger, open space areas. They will be known to support high insect populations during the breeding season (April through July), will expand on or link already preserved lands, and will not be bisected by new roadways or incur impacts from any other infrastructure developments. Lastly they will be located where management will be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

Sites selected for preservation of nesting/foraging habitat will be prioritized pursuant to Conservation Actions TB2.1 and TB2.2 and will be located where management will be used to enhance or re-establish natural ecosystem processes and attract Covered Species.

Preserve sites for aquatic nesting/foraging habitat will be within 3 miles of a known foraging site (intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat) or modeled nesting habitat on parcels 20 acres or greater in size and/or occur in larger, open space areas. They will be known to currently or historically support a tricolored blackbird colony, have nesting substrate (e.g., tules, cattails) in an extensive area (minimum 2 acres) to accommodate large tricolored blackbird colonies, and have Open Water (e.g., canal, lakeshore, or farm pond) within 1,640 feet (500 meters) of nesting substrate to provide a water source for nestlings. Management of this preserved aquatic nesting/foraging habitat will include periodic thinning or removal of tules or cattails after the nesting season to allow for growth of new tules and cattails, which are strongly preferred by nesting blackbirds. In addition, trees and other potential perching sites within 50 feet of this aquatic nesting/foraging habitat will be removed as necessary to prevent predators from taking eggs or nestlings from active colonies.

Preserve sites for upland nesting/foraging habitat will be within 3 miles of a known foraging site (intensive row crops, vineyards, and orchards generally do not provide modeled foraging habitat) or modeled nesting habitat on parcels 20 acres or greater in size and/or occur in larger, open space areas. They will be known to currently or historically support a tricolored blackbird colony, have nesting substrate (e.g., Himalayan blackberry) thickets in an extensive area (minimum 2 acres) to accommodate large tricolored blackbird colonies, and have Open Water

(e.g., canal, lakeshore, or farm pond) within 1,640 feet (500 meters) of nesting substrate to provide a water source for nestlings. Management of this upland nesting/foraging habitat will include maintaining these dense thickets of blackberry.

Sites for re-establishment and/or establishment of foraging habitat will be prioritized based on the criteria in Conservation Action TB3.1 (Table 7-1). Re-establishment and/or establishment will occur only where currently non-modeled habitat is converted to modeled habitat, and will be located where management will be used to enhance or re-establish natural ecosystem processes and attract Covered Species. The areas will occur within 3 miles of at least 1,000 acres of open space that includes all or a mix of Irrigated Pasture-Grassland, Cropland, Vernal Pool, Seasonal Wetlands, Swale, Freshwater Marsh, Open Water, and/or Valley Grassland that will provide adequate insect prey for nestlings. Surveys will be conducted in the re-establishment areas after the first year and every 5 years thereafter to monitor success and provide for remediation of failed re-establishment areas within 1 year after efforts are deemed unsuccessful.

Sites selected for re-establishment and/or establishment of nesting/foraging habitat will be prioritized pursuant to Conservation Action TB4.1, and will be known to historically support a tricolored black bird colony. They will be located on parcels 20 acres or greater in size and/or occur in larger, open space areas within 1 mile of a known foraging site or SSHCP land cover type that provides modeled nesting and foraging habitat. Lastly, it will have Open Water to provide water for nestlings within 1,640 feet (500 meters) of area where upland nesting substrate can be re-established and/or established.

Implementation of Objectives TB3 and TB4 and their accompanying Conservation Actions will ensure that tricolored blackbird will have new areas of preserved and managed quality nesting and nesting/foraging habitat in the Plan Area. Improvements in nesting and foraging habitat quantity and quality with management and monitoring will contribute to the potential expansion of nesting and foraging activities into areas not currently used by tricolored blackbird.

Ongoing impacts on modeled nesting and foraging habitat loss and conversion and lack of habitat management may already be significantly affecting the tricolored blackbird in the Plan Area. Implementation of Goal 2 and its related measurable objectives for modeled nesting and foraging habitat (Objectives W2 through W5) will help ensure that the adverse impacts of Covered Activities on these habitats will be minimized. Although Goal 2 addresses aquatic resources, some of the land covers included in the objectives for this goal are modeled nesting and foraging habitat (i.e., Seasonal Wetland, Freshwater Marsh, Vernal Pool, Open Water, and Swale) for tricolored blackbird. Using a Stream Setback strategy in conjunction with low-impact and compatible uses in land planning the Preserve System will maintain existing functions and values of nesting and foraging habitat and minimize edge-effect disturbances to tricolored blackbird colonies (e.g., lighting, noise, human activity).

The SSHCP Conservation Strategy ensures that the most current distribution of nesting colonies is considered during Plan implementation. Objective TB5 requires preservation and management of at least five nesting colonies that were recently active prior to the effective date of the permit (based on the last two statewide surveys). In addition, prior to take of a nesting colony, one extant and unprotected colony must be preserved. To meet Objective TB5, Conservation Action TB5.1 will be implemented and will provide a preserved nesting substrate (including flooded, thorny, spiny, or "visually" but not actually spiny vegetation) with open accessible water within 1,640 feet (500 meters) of the nesting substrate with at least 1,000 acres of modeled foraging habitat. Objective TB6 require a study of potential management actions to reduce permanent indirect effects to nest colonies, such as predation and pesticides. Objective TB7 requires that at least one large colony that has historically (since 1950) supported at least 1,500 individuals be preserved. According to Conservation Action TB7-1, that large colony must have preserved nesting habitat and at least 500 acres of modeled foraging habitat within a 1-mile radius of the colony.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands. Further, the SSHCP Conservation Strategy protects individual vernal pool watersheds–SSHCP Preserve boundaries would be established outside the micro-watershed of preserved vernal pools. Using rigorous Preserve Setback AMMs and watershed protection AMMs in conjunction with low-impact AMMs and compatible-use AMMs in project planning, the Preserve will maintain existing ecosystem functions and habitat values of the Vernal Pool Ecosystem within the Preserve System. Through proper land management techniques and continued monitoring of nesting and foraging habitat for tricolored blackbird preserved in the Preserve System, the SSHCP will ensure that habitat functions and values remain the same as the time of acquisition or improve with proper management (HAB1 through HAB7). Management objectives that will, in particular, directly benefit tricolored blackbird are those designed to maintain and enhance nesting and foraging habitat, such as those that ensure planting of Croplands (Objectives AG1 and AG2) and provision of cover and refugia that will attract prey species (Objectives AG1 and AG2). The Conservation Strategy for tricolored blackbird includes cultivation of alfalfa, rice, and dryland grains close to modeled nesting habitat and planting of hedgerows along the borders of agricultural fields. Alfalfa, rice, and dryland grains are modeled habitats for tricolored blackbird and provide high productivity foraging habitats that provide both insect prey that is important during the nesting season and plant matter that is important during the winter (Crase and DeHaven 1978). Cultivating these crops and managing them for the benefit

of tricolored blackbird will increase prey availability and should improve nesting and foraging success for the blackbird. This careful management and monitoring, coupled with the extensive preservation of modeled habitat in large Preserves throughout the Plan Area, means the Conservation Strategy is consistent with Guiding Principle 8 by ensuring that, should a localized population become extirpated from a particular habitat patch, individual tricolored blackbirds from nearby modeled habitat or colonies in other preserves would be able to recolonize vacant habitat and thus limit the effects of stochastic disturbances to local subpopulations.

7.6.2.27 American Badger

Estimated Levels of Impact, Preservation, Re-Establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 22,780 acres of American badger (*Taxidea taxus*) modeled habitat in the Plan Area (Table 7-88), including 389 acres of impacts to Vernal Pool, 234 acres of impacts to Swale, 105 acres of impacts to Seasonal Wetland, 38 acres of impacts to Blue Oak Savanna, and 22,014 acres of impacts to Valley Grassland. Occurrences of this highly mobile species have been documented in PPUs 1, 2, and 6 (Figure 3-29), but it is likely that the species is more widely distributed and will be affected by Covered Activities throughout the Plan Area.

To mitigate these impacts to American badger modeled habitat, the SSHCP will preserve 23,401 acres of American badger modeled habitat, including 966 acres of Vernal Pools, 278 acres of Swale, 105 acres of Seasonal Wetland, 38 acres of Blue Oak Savanna, and 22,014 acres of Valley Grassland (Table 7-88).

The SSHCP will also re-establish and/or establish 766 acres of American badger modeled habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-89).

Table 7-88
Habitat Impacts and Conservation for American Badger

Land Cover Types	Direct Effects (acres)	Indirect Effects (acres)	Total Effects (acres)	Total Habitat Preservation (acres)	Total Habitat Establishment/ Re-Establishment (acres)
Blue Oak Savanna	38	Qualitative	38	38[a]	38[b]
Valley Grassland	22,014	Qualitative	22,014[c]	22,014	0
Vernal Pool	389	0	389	966	389
Seasonal Wetlands	105	Qualitative	105	105	105
Swale	234	0	234	278	234
GRAND TOTAL	**22,780**	**0**	**22,780**	**23,401**	**766**

[a] Impacts to Blue Oak Savanna can be mitigated by preserving any combination of Blue Oak Savanna and Blue Oak Woodland.
[b] Impacts to Blue Oak Savanna can be mitigated by re-establishing or establishing any combination of Blue Oak Woodland and Blue Oak Savanna.
[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

Table 7-89
Biological Goals and Measurable Objectives Applicable to American Badger

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W2.** Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design avoidance and minimization measures (Low-Impact Development (LID) and ROAD Measures) • Ground disturbance avoidance and minimization measures (Best Management Practices (BMPs) and ROAD Measures)
	Objective W3. Covered Activities will implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish natural land covers (including cropland and irrigated pasture-grassland) that provide habitat for Covered Species.	**Objective VG1**. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.

Table 7-89
Biological Goals and Measurable Objectives Applicable to American Badger

Applicable Biological Goals	Related Biological Objectives
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including cropland and irrigated pasture-grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. Program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends, tracking climate change, and other related tasks.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective AB1.** During assembly of the SSHCP Preserve System, ensure that a minimum of 23,171 acres of modeled habitat for American badger (Taxidea taxus) is preserved (see Objectives BOW1, VG1, VP1, VP3, and SW1).
	Objective AB2. During Preserve assembly, ensure that a minimum of 767 acres of modeled habitat for American badger is re-established and/or established (see Objectives VP2 and SW2).

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link 23,401 acres of the highest-quality habitat for American badger in the Plan Area. Because the range of American badger in the Plan Area is not well understood and observations are generally older, the Conservation Strategy does not target the areas where occurrences have been recorded. Rather, the SSHCP targets preservation of large, connected Preserves that can best support this highly mobile species. In particular, American badger modeled habitat preserved by the SSHCP in PPU 7 could support several badger territory/home ranges, which can range from approximately 340 acres to more than 1,500 acres (Lindzey 1982; Messick 1987; Minta 1993).

Preserves benefiting American badger will be established through land acquisitions that are targeted to (1) capture large continuous areas of American badger modeled habitat, (2) include a diversity of land cover types that provide American badger modeled habitat, (3) add parcels onto existing preserves that increase preserve size and minimize habitat fragmentation and edge effects, and (4) provide connections to existing preserves that are currently isolated from each other.

The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves that include American badger modeled habitat will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. Further, under Conservation Action VPI1.2 at least 90% of the watershed for each preserved vernal pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In these ways, SSHCP Preserves protect riparian and wetland areas and will contribute to the persistence of American badger in the Plan Area. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and preservation of large areas of intact habitat would not occur.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

In addition to modeled habitat preservation, the Implementing Entity will establish or re-establish 766 acres of American badger modeled habitat in the Plan Area, with a priority on re-establishment before establishment.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of habitat for American badger protected in the Preserve System will ensure that American badger habitat requirements within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Management objectives that will directly benefit American badger are those designed to maintain and enhance habitat, including Preserve Management Plans (Objectives HAB1 and HAB2), consideration of management history (Objective HAB3), an invasive species eradication program (Objective HAB4), and monitoring vegetation height in grasslands (Objective HAB7) to improve habitat suitability for important prey and increase prey detectability. Permanent indirect effects on modeled habitat such as increased weeds, litter, and hydrological alterations will be addressed by Objective HAB5 (Table 7-89). These actions should result in higher overall reproductive success and productivity of the Plan Area population, and may allow expansion of American badger into areas not currently used by this species.

7.6.2.28 Western Red Bat

Estimated Levels of Impact, Preservation, Re-Establishment, and Establishment

As discussed in Chapter 6, SSHCP Covered Activities are anticipated to impact up to 23,986 acres of western red bat (*Lasiurus blossevillii*) modeled habitat in the Plan Area (Table 7-90). The majority of impacts to western red bat modeled habitat (97%) occur in the UDA.

The range for western red bat includes the entire Plan Area. There are eight documented occurrences for western red bat in the SSHCP GIS database, and several records from county rabies testing that were not able to be geo-referenced (refer to Section 3.4.6). In addition, a bat monitoring station at the Cosumnes River Preserve has detected western red bats. Due to the apparent widespread distribution of the species in the Plan Area, the conservation analysis is primarily based on modeled foraging and roosting habitat under the assumption that western red bat could use these modeled habitats throughout the Plan Area.

To mitigate impacts to western red bat modeled habitat and to preserve or improve the species' abundance and distribution in the Plan Area, the SSHCP will preserve 24,697 acres of western red bat modeled habitat, consisting of 839 acres of modeled roosting/foraging habitat (Blue Oak Woodland and Savanna, Mixed Riparian Woodland) and 23,858 acres of modeled foraging habitat (Valley Grassland, Mixed Riparian Scrub, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, Open Water, and Streams/Creek) (Table 7-90).

The SSHCP will also re-establish and/or establish 1,765 acres of western red bat modeled habitat in the Plan Area. All preservation, re-establishment, and/or establishment will be consistent with the Biological Goals and Measurable Objectives for this species (Table 7-91).

Table 7-90
Permanent Effects and Conservation for Western Red Bat

GRAND TOTAL	**23,986**	**0**	**23,986**	**24,980**	**1,765**

[a] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[b] Impacts to Mixed Riparian Woodland or Mixed Riparian Scrub can be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[c] Total impacts to Valley Grassland include an unknown but small amount of impact that was analyzed qualitatively in Chapter 6.

[d] Preservation of Open Water can be achieved by preserving any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

[e] Re-establishment and/or establishment of Open Water can be achieved by re-establishing and/or establishing any aquatic land cover type that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

[f] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by preserving any combination of Blue Oak Savanna and Blue Oak Woodland.

[g] Impacts to Blue Oak Woodland or Blue Oak Savanna can be mitigated by re-establishing or establishing any combination of Blue Oak Woodland and Blue Oak Savanna.

[h] Impacts to Mine Tailing Riparian Woodland will be mitigated by preserving any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[i] Impacts to Mine Tailing Riparian Woodland will be mitigated by re-establishing or establishing any combination of Mixed Riparian Woodland and Mixed Riparian Scrub.

[j] Impacts to Orchards will be mitigated by preserving any combination of Cropland and Irrigated Pasture-Grassland.

Table 7-91
Biological Goals and Measurable Objectives Applicable to Western Red Bat

Applicable Biological Goals	Related Biological Objectives
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.	**Objective L1.** Establish a minimum Preserve System of 36,282 acres of natural land covers that preserves 34,495 acres and re-establishes or established 1,787 acres of habitat for Covered Species and other native biota as a component of the Preserve System. Of the 34,495 acres of preservation, at least 6,941 acres will be within the UDA. Of the 1,787 acres of re-establishment or establishment at least 130 acres will be within the UDA. Preserves will be assembled in accordance with the Conservation Actions in this table.
	Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves or existing preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (minor variations on minimum width may be allowed where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10).
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.	**Objective W1.** Ensure that during implementation of Objective L2 (establishing a minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.
	Objective W2. Covered Activities will implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP design avoidance and minimization measures (Low-Impact Development (LID) and ROAD Measures) • Ground disturbance avoidance and minimization measures (Best Management Practices (BMPs) and ROAD Measures)
	Objective W3. Covered Activities will implement stream setback requirements in the UDA for creeks and streams, as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities will implement Preserve Setback requirements in the UDA, as described in AMM EDGE-3.
	Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VG1, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).
	Objective W5. Ensure that aquatic resources are re-established and/or established during assembly of the SSHCP Preserve System in compliance with Conservation Actions listed in Table 7-1 (see Objectives SW2, FWM2, OW2, RIP2, and RIP4).
Goal 3. Preserve, re-establish, or establish, natural land covers (including cropland and irrigated pasture-grassland) that provide habitat for Covered Species.	**Objective RIP1**. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective RIP2. Preserve a minimum of 964 acres of Mixed Riparian Woodland and/or Mixed Riparian Scrub for impacts to Mixed Riparian Woodland, Mixed Riparian Scrub and Mine Tailing Riparian Woodland land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW1. Preserve a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak

Table 7-91
Biological Goals and Measurable Objectives Applicable to Western Red Bat

Applicable Biological Goals	Related Biological Objectives
	Savanna. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective BOW2. Re-establish and/or establish a minimum of 47 acres of Blue Oak Woodland and/or Blue Oak Savanna for direct impacts to Blue Oak Woodland and Blue Oak Savanna. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP1a. Preserve a minimum of 966 acres of Vernal Pool in the Plan Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP1b. Impacts to Vernal Pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho-Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and/or Cosumnes/Rancho-Seco Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional Vernal Pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area in accordance with the Conservation Actions in Table 7-1.
	Objective VP3. Preserve a minimum of 278 acres of Swale. The Preserves will be assembled in accordance with the Conservation Actions in table 7-1.
	Objective VP4. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective VP5. Preserve a minimum of 26 acres of Swale or Stream/Creek (VPIH) land cover type for impacts to the Stream/Creek (VPIH) land cover type. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW1. Preserve a minimum of 105 acres of Seasonal Wetland. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SW2. Re-establish and/or establish a minimum of 105 acres of Seasonal Wetland. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in this Table 7-1.
	Objective FWM1. Preserve a minimum of 127 acres of Freshwater Marsh. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional Freshwater Marsh. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek land cover. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
	Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek land cover. Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.

Table 7-91
Biological Goals and Measurable Objectives Applicable to Western Red Bat

Applicable Biological Goals	Related Biological Objectives
	Objective OW1. Preserve a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of Open Water, as determined by the Technical Advisory Committee (TAC)). The Preserves will be assembled in accordance with the Conservation Actions in this table and in accordance with Section 7.5.
	Objective OW2. Re-establish and/or establish a minimum of 155 acres of Open Water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with the Conservation Actions in Table 7-1.
	Objective AG1. Preserve a minimum of 9,696 acres of Cropland and/or Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The Preserves will be assembled in accordance with the Conservation Actions in Table 7-1.
Goal 4. Maintain or improve habitat value of natural land covers (including cropland and irrigated pasture-grassland) that are preserved within the Plan Area.	**Objective HAB1.** Develop Preserve Management Plans for the benefit of Covered Species.
	Objective HAB2. Assess whether Preserves are being managed and maintained for the benefit of Covered Species.
	Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing the initial Preserve Management Plan (PMP).
	Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. The program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training road crews to identify and report weeds.
	Objective HAB5. Monitor Preserves for edge effects (e.g., weeds, noise, hydrology, litter).
	Objective HAB6. Collect weather data throughout the county to assist in developing status and trends, track climate change, and other actions.
	Objective HAB7. Monitor vegetation biomass within Grassland land covers.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.	**Objective WR1**. During Preserve assembly, ensure that a minimum of 23,910 acres of modeled foraging habitat for western red bat (*Lasiurus blossevillii*) is preserved (see Objectives BOW1, RIP1, RIP3, AG1, VG1, VP1, VP3, SW1, OW1, FWM1, and SC1).
	Objective WR2. During assembly of the SSHCP Preserve System, ensure that a minimum of 841 acres of modeled roosting/foraging habitat for western red bat is preserved (see Objectives BOW1, RIP1, and RIP3).
	Objective WR3. During assembly of the SSHCP Preserve System, ensure that a minimum of 1,317 acres of modeled foraging habitat for western red bat is re-established and/or established (see Objectives VP2, SW2, OW2, FWM2, RIP2, and RIP4).
	Objective WR4. During assembly of the SSHCP Preserve System, ensure that a minimum of 450 acres of modeled roosting/foraging habitat for western red bat is re-established and/or established (see Objectives RIP2 and RIP4).

Analysis of Species Conservation

The SSHCP Conservation Strategy will preserve and link 24,697 acres of the highest-quality habitat for western red bat in the Plan Area. Because the range of western red bat in the Plan Area is not well understood and observations have generally been based on vector control records, the Conservation Strategy does not target the areas where occurrences have been recorded; rather, the SSHCP targets preservation of large, connected Preserves that can best support this highly mobile species. In particular, the western red bat modeled habitat preserved by the SSHCP in PPU 7 will support extensive foraging habitat for the species. Preservation of riparian woodland roosting habitat and re-establishment/establishment of additional riparian woodland roosting habitat will potentially improve reproductive success of this species.

Most of the modeled foraging and roosting habitat preserved under the SSHCP will be outside the UDA and concentrated in PPUs 5, 6, and 7. PPUs 5 and 6 include the Cosumnes River and Deer Creek areas, which contain the riparian habitat known to support western red bat. The SSHCP also includes planned riparian re-establishment/establishment for the Cosumnes River in PPUs 5 and 6, which is expected to improve and expand roosting habitat for western red bat along the river.

Preserves benefiting western red bat will be established through land acquisitions that are targeted to capture large continuous areas of modeled habitat; include a diversity of land cover types; add parcels onto existing preserves that increase preserve size and minimize habitat fragmentation and edge effects; and provide connections to existing preserves that are currently isolated from each other.

The size and shape of all Preserves in the UDA are constrained by existing land use and zoning designations. However, to the extent possible, SSHCP Preserves that include western red bat modeled habitat will be adjacent to compatible land uses or existing preserves to reduce edge effects related to encroaching urban development. Further, under Conservation Action VPI1.2, at least 90% of the watershed for each preserved Vernal Pool will also be preserved. Refer to Section 7.4.3 for descriptions of the functional size of preserved areas that will result from the combination of SSHCP Preserves with existing preserves. In these ways, SSHCP Preserves will protect riparian and wetland areas, and will contribute to the persistence of western red bat in the Plan Area. In the absence of the SSHCP, land preservation for project-by-project mitigation would not be located in this coordinated and strategic way, and preservation of large areas of intact habitat would not occur.

Implementation of Conservation Actions (Table 7-1) and AMMs (Section 5.4) will avoid and minimize potential edge effects (Section 6.3) on SSHCP Preserves. For example, the AMMs established for Preserve Setbacks under the SSHCP would make setbacks as effective as possible to buffer preserves from edge effects and other environmental stressors associated with urban

development. Under existing project-by-project mitigation, setbacks around preserves may allow for activities and encroachments that reduce the effective preservation area and allow indirect effects to preserved lands.

In addition to modeled habitat preservation, the Implementing Entity will also establish or re-establish 1,765 acres of western red bat modeled habitat in the Plan Area, with a priority on re-establishment before establishment.

As discussed in Chapter 8, Preserve land management techniques, monitoring, and adaptive management of habitat for western red bat protected in the Preserve System will ensure that western red bat habitat requirements within the SSHCP Preserve System are not degraded and will improve under SSHCP management as compared to existing habitat conditions. Management objectives (Table 7-91) that will, in particular, directly benefit western red bat are those designed to maintain and enhance foraging habitat and monitor edge effects of noise. Excessive noise from surrounding developments could interfere with echolocation and reduce foraging success. Monitoring vegetation height in grasslands (Objective HAB7) should help maintain foraging habitat quality by improving habitat suitability for prey and increasing prey detectability for nocturnal predators (e.g., by controlling dense thatch). These actions should result in higher overall reproductive success and productivity of the Plan Area population, and may allow expansion of western red bat into areas not currently used by this species.

7.6.3 Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon

The USFWS published the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* in 2005 for 33 species (20 listed species and 13 species of concern). Generally, the Recovery Plan addresses 16 vernal pool regions, with a focus on species-specific recovery actions within important Core Recovery Areas in each region. The Plan Area is within the Southeastern Sacramento Valley Vernal Pool Region. The Plan Area includes two Core Recovery Areas: the Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area, discussed in more detail below. The Mather Core Recovery Area and the Cosumnes/Rancho-Seco Core Recovery Area were designated by USFWS (2005a) as Zone 1 Core Areas, the highest priority ranking for preservation.

The Recovery Plan includes four listed SSHCP Covered Species: Sacramento Orcutt grass, slender Orcutt grass, vernal pool fairy shrimp, and vernal pool tadpole shrimp (USFWS 2005a). The Recovery Plan also addresses five non-listed “species of concern” that are SSHCP Covered Species: Ahart’s dwarf rush, Boggs Lake hedge-hyssop, legenere, mid-valley fairy shrimp, and western spadefoot (USFWS 2005a).

The Recovery Plan identifies general and species-specific recovery criteria for five recovery and long-term conservation actions (USFWS 2005a, p. III-93 to III-120 and Table III-1). However, USFWS (2005a) also states that alternative strategies, such as development of HCPs or other site-specific planning methods, may present opportunities to conserve species habitat and meet the rationales for the species-specific recovery criteria. HCPs that cover species and vernal pool habitat may be deemed equivalent to implementation of the 2005 Recovery Plan for the covered area if they contain the six elements of the Recovery Plan discussed below.

The SSHCP will preserve large, interconnected blocks of habitat, and the Conservation Actions carried out to meet SSHCP Biological Goals and Measurable Objectives will incorporate, or be consistent with, many of the species-specific recovery criteria for nine Covered Species addressed in the Recovery Plan. Therefore, the SSHCP provides an alternative Conservation Strategy for preserving vernal pool species habitat and meeting the six recovery criteria listed on page III-120 of the 2005 Recovery Plan, as described below.

1. *Permanently protected vernal pool preserves within the area covered by an HCP in large contiguous blocks of suitable habitat.*

   The goals of the SSHCP include protecting the populations of 13 covered vernal pool species in Preserves large enough to maintain and enhance population viability and protect vernal pool and valley grassland landscape functions (Table 7-1). This will be accomplished by protecting approximately 22,907 acres of Vernal Pool Ecosystem, including 995 acres of existing Vernal Pool, 309 acres of Swale, 35.3 acres of Stream/Creek (VPIH), and 21,568 acres of hydrologically connected Valley Grassland. Finally, the SSHCP will also re-establish and/or establish components of the Vernal Pool Ecosystem, including approximately 389 acres of Vernal Pool and 256 acres of Swale. Valley Grassland may be re-established/established at the same time as re-establishment/establishment of vernal pools and swales to form a complete Vernal Pool Ecosystem.

   In the Mather Core Recovery Area, the SSHCP will preserve 5,494 acres of Vernal Pool Ecosystem, including 213 acres of Vernal Pool, 90 acres of Swale, and 5,155 acres of hydrologically connected Valley Grassland. In the Cosumnes/Rancho Seco Recovery Area, the SSHCP will preserve 15,293 acres of Vernal Pool Ecosystem, including 703 acres of Vernal Pool, 189 acres of Swale, and 14,402 acres of hydrologically connected Valley Grassland. Vernal Pools and Valley Grassland will be preserved in four types of vernal pool Preserves throughout the Plan Area:

   - Three Core Preserves will be established within the UDA. These Preserves are within the Mather Core Recovery Area and will provide protection of documented occurrences of Covered Species, protect adjacent suitable vernal pools, and protect the ecological functions of the vernal pool and valley grassland complexes.

- In addition to the Core Preserves, at least 3 Minor Preserves totaling approximately 813 acres and 10 Satellite Preserves totaling approximately 1,508 acres will also be established within the UDA. Within the UDA, the size and shape of minor and Satellite Preserves are substantially constrained by existing land use and zoning designations. However, these Preserves are necessary to provide protection for documented occurrences of Covered Species or areas with high-quality vernal pool habitat.
- A Landscape Preserve, including approximately 10,500 acres of land preservation, will be established outside the UDA within PPU 7. This Landscape Preserve is within the Cosumnes/Rancho-Seco Core Recovery Area and will encompass a wide variety of vernal pool types and Preserve habitat heterogeneity associated with vernal pools and valley grassland in the Plan Area. The Landscape Preserve will be established through land acquisitions that are targeted (1) to establish core areas, (2) to add parcels onto existing preserve lands (e.g., Chance [Howard] Ranch) to increase their size and avoid habitat fragmentation, and (3) to provide connections to existing preserves and/or Preserve areas.

2. *Protection of the entire genetic range of each listed species within the area covered by the HCP.*

The SSHCP Preserve System is designed to maintain or expand the existing distribution of each Covered Species within the Plan Area, pursuant to Goal 5. This will contribute toward preserving the genetic range of the covered vernal pool species throughout the Plan Area. In addition, the SSHCP will ensure that a broad range of habitat types and geographic locations are preserved in the Preserve System. Heterogeneous habitat types and areas generally support greater biodiversity, including genetic diversity within and among populations. They also are more likely to be ecologically complex, and at least some may be more resilient over time than homogeneous habitat areas.

Vernal pool heterogeneity is provided in the Preserve System at three spatial scales: (1) landscape heterogeneity (geologic formations, soils, location within the Plan Area) of preserved vernal pool complexes in the Plan Area; (2) heterogeneity of vernal pool types, spatial patterns, and connectivity within a Preserve; and (3) heterogeneity of individual pools, including sizes, water chemistry, and floristic components. Tables 7-10 and 7-11 in Section 7.6.1.1.1 present the geologic formations and soil types that compose the Preserve System, as compared to the composition of the Plan Area as a whole. Table 7-12 similarly presents the VWADI scores of the Preserve System as compared to the Plan Area. VWADI categorizes vernal pool complexes by the size and density of pools, which captures heterogeneity at both scale 2 and scale 3. By preserving vernal pool heterogeneity at these three scales, the likelihood of capturing genetic diversity is increased, and preservation of biodiversity is better assured.

For vernal pools in the SSHCP Preserve System, primary parameters used to define habitat heterogeneity include the number of different geological formations and soil associations encompassed, and the Vernal Wetland Acre/Density Index, which indicates the variance in the size and density of vernal pools present in different locations of the Plan Area. By establishing Preserves on each of the geologic landforms throughout the Plan Area that currently support vernal pools, preserving the vernal pool heterogeneity as defined above, and ensuring connectivity among the existing and SSHCP preserves in the Plan Area, the SSHCP will preserve a broad range of habitat types. The SSHCP Preserve System includes preservation and species-specific measures distributed within each PPU, rather than allowing conservation to be focused within limited portions of the Plan Area. In addition, the SSHCP targets preservation of occurrences of Sacramento Orcutt grass, slender Orcutt grass, Ahart's dwarf rush, and other endemic vernal pool plants. Preserves will be established to protect these very rare plant species where needed. This targeted preservation will help ensure that the Preserve System contributes to preserving the genetic range of these species, thus helping to preserve their genetic diversity within the Plan Area.

3. *Protection of all populations of species with 25 or fewer total occurrences addressed in this plan within the area covered by the HCP.*

   Three extremely endangered plant species (slender Orcutt grass, Sacramento Orcutt grass, and Ahart's dwarf rush) are present in the Plan Area. The SSHCP will protect all populations of these three species within the Plan Area. The SSHCP will also protect all newly discovered occurrences of slender Orcutt grass and Sacramento Orcutt grass that are found within the Plan Area. Furthermore, to protect these species from population declines and possible extirpation from the Plan Area, the USFWS, CDFW, and Partner Agency Permittees have determined it necessary to preserve occurrences within Minor or Satellite Preserves with minimum 300-foot setbacks around the plant populations. Many of these occurrences are already adversely indirectly affected by adjacent existing development, or could be indirectly affected by adjacent land use designations. These adjacent conditions restricted the ability of the SSHCP to protect these extremely endangered plant occurrences within a larger SSHCP Preserve type (e.g., Core Preserves or Landscape Preserves). Where the extremely endangered plant species are present in Plan Area locations that are suitable for a functioning Core Preserve, those locations will be prioritized for preservation to achieve SSHCP Biological Goals and the USFWS Recovery Plan (2005a) conservation goals for the species (see Conservation Actions for VPP1, VPP6, and VPP7).

4. *Connectivity with other preserves within the area covered by the HCP.*

   Core and Minor Preserves established by the SSHCP contain many of the vernal pool resources within the UDA, and will be connected by Linkage Preserves to other Preserves within the Plan Area. SSHCP Linkage Preserves will be designed to maintain

connectivity among the Preserves, providing for wildlife movement and, in many cases, hydrologic connections between Preserves (see Objective L2 in Table 7-1). Connectivity with other Preserves could allow for movement of cysts between different pools, facilitating genetic exchange. For vernal pool plants, maintaining a linkage of undeveloped habitat improves the chances that pollinators will locate the isolated and ephemeral flowers. Hydrologic connectivity will benefit vernal pools and any linkage or connection to other preserves reduces the chances for disruption of perched aquifers that support vernal pools. The ultimate size and dimensions of the Linkage Preserves will depend on several factors, including habitat types in the linkage, the ecological function(s) the linkage is designed to serve (e.g., overland wildlife movement, drainage), and adjacent land uses. Additional linkage function will be provided by some stream and riparian corridors not specifically identified as Linkage Preserves. Stream and riparian corridors are described in Section 7.6.1.1.2. While these corridors will preserve riparian, stream, and creek habitats, they may also serve to connect vernal pool and valley grassland resources in the SSHCP Preserve System (e.g., by facilitating dispersal of seeds and cysts via wildlife or water flows).

The three Core Preserves inside the UDA will be linked by minimum 600-foot-wide Linkage Preserves (with some minor allowable variation due to physical constraints; see Objective L2). These Linkage Preserves will follow stream channels, where possible, to maintain hydrologic connectivity. In addition to linking the three Core Preserves within the UDA, smaller Minor and Satellite Preserves (where possible considering existing development and infrastructure) will also be connected by Linkage Preserves.

The Landscape Preserves located outside of the UDA in PPU 7 will be connected to existing preserve within the Cosumnes/Rancho Seco Recovery Area.

5. *Adaptive management of the preserves within the area covered by the HCP to support the species addressed in the Recovery Plan*.

   Many of the SSHCP Biological Goals and Measurable Objectives presented in Table 7-1 include in objective language "protect and maintain in perpetuity" Covered Species and their habitats, as well as re-establishment and/or establishment of their habitat, in the Plan Area. These Conservation Actions also require an effectiveness monitoring component for management activities. Management, including adaptive management, for the SSHCP is discussed in Chapter 8.

6. *Sufficient funding for management, maintenance and monitoring of the preserves in perpetuity.*

   Funding for the SSHCP is discussed in Chapter 12.

8 SSHCP MONITORING AND MANAGEMENT PROGRAMS

8.1 Introduction

This chapter describes the framework of the South Sacramento Habitat Conservation Plan (SSHCP) Compliance and Avoidance and Minimization Measure (AMM) Monitoring Program (Section 8.2) and the framework of the SSHCP Preserve System Monitoring and Management Program (Section 8.3). The purposes of these programs are to ensure compliance with all requirements of the SSHCP, the Implementing Agreement (IA), and the Permits; to assess the status of the Covered Species, natural communities, and ecosystem processes within the SSHCP Preserve System; and to evaluate the effects of preserve management actions such that the SSHCP Conservation Strategy, including each of the SSHCP Biological Goals and Measurable Objectives (Table 7-1), is achieved. The SSHCP Preserve System Monitoring and Management Program will integrate monitoring and adaptive management into one cohesive program where monitoring will inform and change management actions to continually improve outcomes for Covered Species and natural land cover types.

As the framework for the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program, this chapter outlines the monitoring and management protocols and standards that the Implementing Entity will use to prepare Individual Preserve Management Plans (PMPs) and SSHCP Annual Reports. The technical details of the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program will be finalized by the Implementing Entity in the first 18 months after permit issuance, and two separate documents will be prepared for each of these programs based on the frameworks presented in Sections 8.2 and 8.3. Development of the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program during that 18-month period will involve coordination by the SSHCP Implementing Entity, Plan Permittees, the Permitting Agencies, and the future SSHCP Technical Advisory Committee (TAC) (see Section 9.3.4). This will be done in an open, public process with full engagement of the TAC, made up of Plan Permittees, agency representatives, and stakeholders, including the environmental, landowner, and development community. Further, the programs and procedures will undergo public disclosure and adoption by the Implementation Committee. All meetings of the Implementation Committee will be called, noticed, held, and conducted in compliance with the provisions of the Ralph M. Brown Act (California Government Code, Section 54950 et seq.).

8.1.1 Regulatory Context

By regulation, all incidental take permits (ITPs) require monitoring of mitigation measures and the response of Covered Species to these measures (50 CFR 17.22(b)(1)(iii)). The “Five-Point

Policy" established additional policy guidance for HCP monitoring (USFWS and NOAA 2000). The Five-Point Policy distinguishes between compliance and effectiveness monitoring.

Compliance monitoring (also known as implementation monitoring) tracks and verifies whether the Permittees are carrying out the terms of the SSHCP document, the ITPs, and the IA—including financial responsibilities and obligations, management responsibilities, and other aspects of the ITP, the HCP, and the IA; tracks the level of incidental take of Covered Species and confirms that the species effects of the permitted Covered Activities are consistent with the assumptions and predictions used when the HCP was developed and approved (see Section 8.2.1).

Effectiveness monitoring evaluates whether the effectiveness of the operating conservation program of the HCP is consistent with the assumptions and predictions made when the HCP was developed and approved; in other words, is the HCP achieving the Biological Goals and Measureable Objectives? Effectiveness monitoring measures the biological conditions resulting from the operating conservation program (e.g., change in species status, or change in habitat condition) (see Section 8.2.2).

The Five-Point Policy goes on to say:

- The scope of an HCP monitoring program should be commensurate with the scope and duration of the operating Conservation Strategy and the scope and duration of the Covered Activity effects.
- The HCP's Biological Goals and Measurable Objectives provide a framework for developing a monitoring program, and the monitoring program should measure progress toward meeting those goals and objectives. The monitoring program should reflect the Biological Goals and Measureable Objectives.
- The appropriate unit of measure in a monitoring program depends on the specific effects, the operating conservation program, and the units used in the biological objectives' measurable units (e.g., if the biological objective is for numbers of individuals, the monitoring program should measure the number of individuals).
- Any methodology and techniques involved in biological aspects of monitoring should be based on sound science. Standard survey or other previously-established monitoring protocols should be used.
- The monitoring program should provide the information needed to implement an adaptive management program.
- The monitoring program should be flexible so that it can be modified, if necessary, based on the need for additional information.

Adaptive Management

The Five-Point Policy defines adaptive management as "an integrated method for addressing uncertainty in natural resource management." While adaptive management is not always required in an HCP, the Five-Point Policy indicates that adaptive management is necessary for HCPs that would otherwise pose a significant risk to species at the time the ITP is issued, due to data or information gaps regarding factors such as the ecology of the species or its habitat, the effectiveness of the management methods, or the effects of the Covered Activities on the Covered Species. These criteria generally apply to the SSHCP. Identifying the uncertainty to be addressed is the foundation of an HCP adaptive management strategy. Whenever an adaptive management strategy is used, the approved HCP must outline the agreed-upon future changes to the operating conservation program.

The Five-Point Policy identified four main elements of an HCP adaptive management strategy as follows:

1. Identify the uncertainty and the questions that need to be addressed to resolve the uncertainty;
2. Develop alternative strategies and determine which experimental strategies to implement;
3. Integrate a monitoring program that is able to detect the necessary information for strategy evaluation; and
4. Incorporate feedback loops that link implementation and monitoring to a decision-making process (which may be similar to a dispute-resolution process) that result in appropriate changes in management.

Annual Reporting

Regulations at 50 CFR 13.45 provide the authority for the USFWS to require periodic reports of the activities conducted under the permit. The Five-Point Policy specified specific information needed in HCP annual monitoring reports.

The SSHCP Annual Reports will help the USFWS determine whether the Permittees are properly implementing the terms and conditions of the SSHCP, its ITP, and the IA, and will provide a long-term administrative record documenting progress made toward achieving each SSHCP Biological Goals and Measurable Objectives.

The SSHCP Compliance and AMM Monitoring Program, SSHCP Preserve System Monitoring and Management Program, and SSHCP Annual Reports will comply with the requirements of the Five-Point Policy.

8.2 SSHCP Compliance and AMM Monitoring Program

The SSHCP Compliance and AMM Monitoring Program tracks three requirements of the Five-Point Policy: (1) Are Measurable Objectives (Table 7-1) being implemented as required in the HCP, Permits, and IA; (2) are AMMs described in Section 5.4 being implemented as required in the HCP, Permits, and IA; and (3) are AMMs fully effective in reducing the effects of environmental stressors as was assumed in Chapter 6 of the HCP. The other Five-Point Policy requirement to track the effectiveness of the operating Conservation Strategy is monitored through the SSHCP Preserve System Monitoring and Management Program (Section 8.3). This section presents a framework for the SSHCP Compliance and AMM Monitoring Program.

8.2.1 SSHCP Compliance Monitoring

As discussed in Section 8.1, compliance monitoring tracks the status of the SSHCP implementation and documents that all requirements are being met. Compliance monitoring verifies that the Plan Permittees are carrying out the terms of the SSHCP, the ITPs, and the SSHCP IA.

Table 8-1 lists each SSHCP Measurable Objective or Conservation Strategy commitment, identifies what we need to know to determine compliance, specifies a monitoring approach to address each monitoring question, identifies the timing and frequency of the specified monitoring, and identifies what additional information will need to be provided in the full SSHCP Compliance and AMM Monitoring Program.

SSHCP compliance monitoring will include the components listed below:

- Track the type, number, and location of each Covered Activity implemented (see Chapter 5) that year, along with the acres of ground disturbance for each Covered Activity implemented that year.
- Track acres of permanent and temporary impacts to each SSHCP land cover type that year, track the total SSHCP permanent and temporary impacts to each land cover type (total since permit issuance), and compare to SSHCP impact analysis (Chapter 6).
- Track the number and locations of each SSHCP AMM (see Section 5.4) applied at each Covered Activity implemented that year, track total number of each AMM implemented (total since permit issuance), and report on the effectiveness of each AMM in avoiding effects to Covered Species (as compared to assumptions made during SSHCP development) (see Section 8.2.3).
- Track locations and quantify acres of direct impacts to each Covered Species modeled habitat and Critical Habitat (Table 3-2) that year, and track the total SSHCP direct

impacts to each Covered Species modeled habitat and Critical Habitat (total since permit issuance).

- Track the locations and quantify acres of indirect impacts to Vernal Pool, Swale, and Stream/Creek (VPIH) land cover types, and track the total SSHCP indirect impacts to Vernal Pool, Swale, and Stream/Creek (VPIH) land cover types (total since permit issuance).
- Track the number and acres of direct and indirect impacts to occurrences of plant Covered Species that year, and track the total SSHCP impacts to occurrences of plant Covered Species (total since permit issuance).
- Track the location and the acres of each SSHCP land cover type permanently preserved that year (by fee-title and by conservation easement), and track the total SSHCP preservation of that land cover type (total since permit issuance).
- Track location and acres of each Covered Species modeled habitat (Table 3-2) on the lands preserved that year (including breakdowns for Critical Habitat preserved and modeled habitat preserved in a Recovery Area or within 1 mile of Recovery Areas), and track the total SSHCP preservation of each Covered Species modeled habitat (total since permit issuance).
- Track location and acres of each SSHCP land cover type or Covered Species habitat that is re-established or established[1] that year, including breakdowns for within 1 mile of Recovery Areas, and track the total SSHCP acres of each re-established or established (total since permit issuance).
- Track the location and acres of direct and indirect impacts within each Critical Habitat Unit located in the Plan Area, and track the total since permit issuance of direct and indirect impacts to each Critical Habitat Unit located in the Plan Area.
- Track, describe, and provide copies of recorded conservation easements, titles of lands acquired in fee title, interagency memorandums of agreement, or any other agreements entered into by the Implementing Entity or other Plan Permittee for the purposes of protecting, establishing or re-establishing Covered Species habitat.
- Track acres of each habitat land cover type that is potentially available for preservation.[2]

The Implementing Entity will be responsible for collecting and compiling required compliance monitoring information for inclusion in the SSHCP Annual Report (see Section 8.4.1).

[1] Note that in the context of this Plan, the word "establish" is synonymous with "create."

[2] Land cover types that are potentially available for preservation are those lands that are not encumbered by some form of protection like a conservation easement, have not been used for mitigation, and are not planned for development.

The compliance monitoring approaches proposed in Table 8-1 are subject to change based on outcomes of adaptive management, as directed in the Five-Point Policy: "An effective monitoring program is flexible enough to allow modifications, if necessary, to obtain the appropriate information."

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
SSHCP Commitments in the Conservation Strategy (other than Measurable Objectives)				
The maximum acres of take of each SSHCP land cover type (Table 6-4).	How many acres of land cover types have been impacted by Covered Activities?	Map impacted areas and quantify acres of disturbance. Ensure that impacts do not exceed authorized take. Input impacts into tools such as the Project Tracking System in EcoAtlas.	Project-by-project tracking Annual reporting	Implementing Entity to specify in first 18 months external tracking system to input data into (e.g., EcoAtlas).
The maximum acres of take of modeled Covered Species habitat (Table 6-4).	How many acres of modeled Covered Species habitat have been impacted by Covered Activities?	Review project-level impact reports. Map impacted areas, intersect with maps of species habitat models, and quantify acres of disturbance. Track land cover conversion outside the Urban Development Area (UDA) separately. Ensure that impacts do not exceed authorized take.	Project-by-project tracking Annual reporting	Implementing Entity to develop an Annual Report format in first 12 months.
The maximum take of Covered Species (Table 6-4).	How many individuals, occurrences, colonies, or nests of Covered Species have been taken by Covered Activities?	Prepare annual reports that compile project-level impact reports and field-verify reports are consistent with conditions. Ensure that impacts do not exceed authorized take.	Annual reports	Implementing Entity to develop an Annual Report format in first 12 months.
Assembly of Preserve System in the UDA as described in Section 7.5.	How many acres of Core, Minor, Satellite, and Wildlife Corridor Preserves have been established by the SSHCP? Are the preserved acreages consistent with the locations	Track acquired Preserve lands and verify that the Preserve System is being designed according to Section 7.5.	As individual Preserves are acquired for the Preserve System Annual reporting	Implementing Entity to Identify in first 18 months triggers for when SSHCP preserve assembly is not following Section 7.5 (e.g., how to distinguish between normal variability in

	described in Section 7.5 of the SSHCP?			acquisition and a potential shortfall).
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.				
Objective L1. Establish a minimum Preserve System of 33,796 acres of natural land covers that preserves habitat for Covered Species and other native biota as a component of the Preserve System. Of the 33,796 acres, 7,560 acres will be within the UDA and 26,236 acres will be outside the UDA. Preserves will be assembled in accordance with Conservation Actions in Table 7-1.	Are the habitat acquisition requirements being met?	Map the preserves, mitigation areas, and natural land cover types. Map conversion of land cover inventory within the Plan Area.	Land cover mapping at time of preserve acquisition Maps and tables included with Annual Reports	Implementing Entity to develop format for maps and tables to be included in Annual Report in first 12 months.
Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves and existing Preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (Minor variations on minimum width may be allowed by the Plan where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10)	Are all the preserve linkages being established between larger preserves?	Map the preserves. Compare geographic information system (GIS) mapping against the Conceptual Preserve System design.	Maps and tables included with Annual Reports	Implementing Entity to develop format for maps and tables to be included in Annual Report in first 12 months.
	Do linkages include appropriate widths of natural or naturalized habitat between parcels?	Review current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Compare GIS mapping against minimum width of 600 feet.	Maps and tables included with Annual Reports	Implementing Entity to develop format for maps and tables to be included in Annual Report in first 12 months.

AGENDA ITEM 11.1

1348

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.				
Objective W1. Ensure that during implementation of Objective L2 (establishing minimum of 11 Linkage Preserves), the Linkage Preserves that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek.	Are linkage creeks and streams being adequately set back?	Map the preserves, (with particular attention to set back widths from streams and creeks). Compare GIS mapping against minimum setback width.	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective W2. Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP design avoidance and minimization measures (low-impact development (LID) and ROAD AMMs)	Are avoidance and minimization measures for design being incorporated in design?	Project design review and comparison with checklist of avoidance and minimization measures.	Checklist review whenever project design is submitted to a Land Use Authority Permittee (see Section 9.2.1).	Implementing Entity to develop in first 6 months a checklist for AMM compliance.
Ground disturbance avoidance and minimization measures (Best Management Practices (BMPs) and ROAD AMMs)	Are ground disturbance avoidance and minimization measures being implemented during construction?	Field verification by permit compliance staff of relevant jurisdiction.	Construction monitoring frequency consistent with Land Use Authority Permittee conditions of project approval	Implementing Entity to specify in first 6 months procedures for permit compliance staff to verify correct implementation of BMPs and ROAD AMMs.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement preserve setback requirements in the UDA as described in AMM EDGE-3.	Does design include appropriate setbacks?	Review project design and compare with Project Review checklist (see Section 10.5) to confirm that project meets setback requirements.	Review project design against checklist when a project is submitted to a Land Use Authority Permittee (see Section 9.2.1).	Implementing Entity to develop in first 6 months a checklist to be provided to Land Use Authority Permittees when evaluating project designs.
	Are required setbacks being established?	Compare aerial photography after project completion against minimum setback widths (Section 8.4.1).	Annual aerial photography review of land cover type conversion	Implementing Entity to develop in first 18 months GIS methodology for comparing aerials taken after project completion against Stream Setback requirements.
Objective W4. Ensure that aquatic resources are preserved during assembly of the SSHCP Preserve System and are managed in perpetuity (see Objectives VPG1, VPG2, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).	Are preserved acreage goals/requirements being met? Are aquatic resources abundance, diversity, and condition being maintained or improved within the Preserve System as the SSHCP is implemented?	Map preserves, mitigation areas, and natural land cover types. Mapping of conversion of land cover inventory within the Plan Area. Monitor and track overall aquatic resource abundance and diversity in perpetuity. Implement random or probabilistic sampling design at recommended intervals to track trends in condition; likely incorporating California Rapid Assessment Method (CRAM).	Mapping at time of acquisition Maps and tables of compensatory mitigation included with Annual Report. Sampling at intervals to be determined by Preserve System Monitoring and Management Program.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports. Implementing Entity to prepare a Preserve System Monitoring and Management Program in first 18 months that identifies intervals for random sampling of aquatic resources to determine condition, and specify methodology for sampling.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective W5. Ensure that aquatic resources are re-established or established within the Preserve System, in accordance with Conservation Actions in Table 7-1 (see Objectives VP2, SW2, FWM2, OW2, RIP2, and RIP4).	Are re-established and/or established aquatic resources acreage requirements being met? Are aquatic resources abundance and diversity (defined for the SSHCP as amount and type of aquatic land cover types) being maintained or improved within the Plan Area as the SSHCP is implemented?	Map the extent and distribution of re-established and/ or established aquatic resources. SSHCP Annual Reports prepared by Implementing Entity, specifying locations and amounts of compensatory mitigation implemented. Monitor and track the overall aquatic resource abundance and diversity (defined for the SSHCP as amount and type of aquatic land cover types). Implement random or probabilistic sampling design at recommended intervals to track trends in condition of re-established and established pools; likely incorporating CRAM.	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.				
Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of Valley Grassland within the Vernal Pool Ecosystem have we preserved?	Map Vernal Pool Ecosystem in preserves, mitigation areas, and natural land cover types. Map conversion of land cover inventory within the Plan Area. Break down acreage within and outside the UDA and evaluate consistency with Conservation Actions and	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
		descriptions of preserves by Preserve Planning Unit (PPU).		
Objective VP1. Preserve a minimum of 967 acres of vernal pool in the Plan Area. Impacts to vernal pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and Cosumnes/Rancho Seco Recovery Area.	How many acres of vernal pool have we preserved? Are the habitat acquisition and mitigation goals being met specific to protecting and restoring vernal pool resources in the Mather Core Recovery Area and the Cosumnes Rancho Seco Core Recovery Area?	Map Vernal Pool Ecosystem in preserves, mitigation areas, and natural land cover types. Map conversion of land cover inventory within the Plan Area. Break out mapping of Vernal Pool Ecosystem into Vernal Pool wetted surface acres, Valley Grassland, Swale, and Stream/Creek (VPIH).	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective VP2. Re-establish and/or establish a minimum of 389 acres of functional vernal pool, including at least 50 acres within or adjacent to (within 1 mile of) the Mather Core Recovery Area. Impacts to vernal pool within or adjacent to (within 1 mile of) the Mather Core Recovery Area and the Cosumnes/Rancho Seco Recovery Area will be mitigated within or adjacent to (within 1 mile of) the Mather Core Recovery Area and the Cosumnes/Rancho Seco Recovery Area.	How many acres of vernal pools have we re-established and/ or established in the Mather Core Recovery Area and the Cosumnes Rancho Seco Core Recovery Area?	Map re-established and established vernal pools in and within 1 mile of the Core Recovery Areas. Check re-established and/or established for consistency with success criteria, Conservation Actions in Table 7-1, and the conceptual preserve system design in Section 7.5.	Maps and tables included with Annual Reports	Implementing Entity to develop success criteria for re-established/established vernal pools in cooperation with the TAC in the first 18 months. Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective VP3. Preserve a minimum of 278 acres of Swale. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of Swale have we preserved?	Quantify acres and map the extent and distribution of preserved Swale; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve system design in Section 7.5.	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective VP4. Preserve a minimum of 25 acres of Swale or Stream/Creek (Vernal Pool Invertebrate Habitat (VPIH)) land cover type for impacts to the Stream/Creek (VPIH) land cover The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of Swale or Stream/Creek (VPIH) have we preserved?	Quantify acres and map the extent and distribution of preserved Swale or Stream/Creek (VPIH); cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve system design in Section 7.5.	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective VP5. Re-establish and/or establish a minimum of 256 acres of Swale for impacts to the Swale or the Stream/Creek (VPIH) land covers. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	How many acres of Swale have we re-established and/or established?	Quantify acres and map the extent of re-established and established swale in the Preserve System. Review of aerial photography and GIS mapping after construction. Check re-established and/or established for consistency with success criteria, Conservation Actions in Table 7-1, and the conceptual preserve system design in Section 7.5.	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective SW1. Preserve a minimum of 105 acres of seasonal wetlands. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of seasonal wetland have we preserved?	Quantify acres and map the extent of preserved seasonal wetland. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	What is the distribution of preserved seasonal wetland and does it correspond with the Conservation Actions in Table 7-1	Map distribution of preserved seasonal wetland; cross check for consistency with Conservation Actions in Table 7-1 and the	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual

Table 8-1

	and the conceptual preserve design in Section 7.5?	conceptual preserve system design in Section 7.5.		Reports.
Objective SW2. Re-establish and/or establish a minimum of 105 acres of seasonal wetlands. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	How many acres of seasonal wetland have we re-established and/or established?	Quantify acres and map the extent of re-established and established freshwater marsh in the Preserve System. Review of aerial photography and GIS mapping after construction.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective FWM1. Preserve a minimum of 127 acres of freshwater marsh. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of freshwater marsh have we preserved?	Quantify acres and map the extent of preserved freshwater marsh. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	What is the distribution of preserved freshwater marsh and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Map the distribution of preserved freshwater marsh; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional freshwater marsh. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	How many acres of freshwater marsh have we re-established and/ or established?	Quantify acres and map the extent of re-established and established freshwater marsh in the Preserve System. Review of aerial photography and GIS mapping after construction.	Mapping at time of establishment/re-establishment, Annual review of aerial photography. Include maps and tables with Annual Reports.	None.

AGENDA ITEM 11.1

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
	What is the distribution of re-established and/ or established freshwater marsh and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Map the distribution of re-established and established freshwater marsh; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports. Report	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek (VPIH) land cover. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of streams/creeks have we preserved?	Quantify acres and map the extent of preserved streams/creeks. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Maps and tables included with Annual Reports.	None.
	What is the distribution of preserved Stream/Creek (VPIH) and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Map the distribution of preserved Stream/Creek (VPIH); cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek (VPIH) land cover. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	How many acres of Stream/Creek (VPIH) have we re-established and/ or established?	Quantify acres and map the extent of re-established and established Stream/Creek (VPIH). Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Mapping at time of establishment/re-establishment, include maps and tables with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	What is the distribution of re-established and/ or established	Map the distribution of created and restored freshwater marsh; cross	Maps and tables included with	Implementing Entity to develop in first 12 months

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
	freshwater marsh and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Annual Reports.	format for maps and tables to be included in Annual Reports.
Objective OW1. Preserve a minimum of 311 acres of open water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of open water, as determined by the TAC). The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of open water or other habitat of equivalent or better ecological function have we preserved? What is the distribution of preserved open water and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Quantify acres and map the extent of preserved open water in the Preserve System. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types. Cross check preserved Open Water for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective OW2. Re-establish and/or establish a minimum of 155 acres of open water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of open water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	How many acres of open water or other habitat of equivalent or better ecological function have we re-established and/or established?	Quantify acres and map the extent of established and re-established open water in the Preserve System. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Mapping at time of establishment/re-establishment, include maps and tables with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	What is the distribution of re-established and/or established open water and does it correspond with the Conservation	Map the distribution of established and re-established open water; cross check for consistency with Conservation Actions in Table 7-1	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual

	Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	and the conceptual preserve design in Section 7.5.		Reports.
Objective RIP1. Preserve a minimum of 373 acres of mixed riparian woodland and/or mixed riparian scrub. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of mixed riparian woodland/mixed riparian scrub have we preserved?	Quantify acres and map the extent of preserved mixed riparian woodland/mixed riparian scrub. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	What is the distribution of preserved riparian woodland/mixed riparian scrub and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Map the distribution of preserved mixed riparian woodland/mixed riparian scrub; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective RIP2. Re-establish and/or establish a minimum of 373 acres of mixed riparian woodland and/or mixed riparian scrub. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	How many acres of mixed riparian woodland/mixed riparian scrub have we re-established and/ or established?	Quantify acres and map the extent of re-established and/ or established mixed riparian woodland/mixed riparian scrub in the Preserve System. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Mapping at time of establishment/re-establishment, include maps and tables with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
	What is the distribution of re-established and/ or established mixed riparian woodland/mixed riparian scrub and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Map the distribution of established and re-established mixed riparian woodland/mixed riparian scrub; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective BOW1. Preserve a minimum of 48 acres of blue oak woodland/savanna for direct impacts to blue oak woodland/savanna. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of blue oak woodland/savanna have we preserved?	Quantify acres and map the extent of preserved blue oak woodland/savanna. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	What is the distribution of preserved blue oak woodland/savanna and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Map the distribution of preserved blue oak woodland/savanna; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Map included with Annual Report	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective BOW2. Re-establish and/or establish a minimum of 48 acres of blue oak woodland/savanna for direct impacts to blue oak woodland/savanna. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1	How many acres of blue oak woodland/savanna have we re-established and/ or established?	Quantify acres and map the extent of established and re-established blue oak woodland/savanna in the preserve system Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Mapping at time of establishment/re-establishment, include maps and tables with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

AGENDA ITEM 11.1
1359

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
	What is the distribution of re-established and/ or established blue oak woodland/savanna and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5?	Map the distribution of established and re-established blue oak woodland/savanna; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective AG1. Preserve a minimum of 9,696 acres of Cropland and Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	How many acres of Cropland and Irrigated Pasture-Grassland have we preserved?	Quantify acres and map the extent of preserved Cropland and Irrigated Pasture-Grassland. Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	What is the distribution of preserved Cropland and Irrigated Pasture-Grassland and does it correspond with the Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Map the distribution of preserved Cropland and Irrigated Pasture-Grassland; cross check for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland, and Irrigated Pasture-Grassland) that are preserved within the Plan Area.				
Objective HAB1. Develop Preserve Management Plans (PMPs) for the benefit of Covered Species.	Are PMPs being prepared for each acquisition, according to timing and standards described in the HCP?	Agency and TAC review of PMPs prior to approval.	As plans are prepared	Implementing Entity to develop checklist for PMP requirements in first 18 months.
Objective HAB2. Assess whether SSHCP Preserves are being managed and	Are the physical conditions on the preserves meeting the needs of	Rapid monitoring (CRAM or similar) for subset of preserves, visited on	Quarterly	Implementing Entity to specify in first 18 months the

maintained for the benefit of Covered Species.	Covered Species?	regular basis, compared against reference sites		methodology by which management will be assessed for each Covered Species.
Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing initial preserve management approach.	Is existing management/ management history being recorded for each parcel or parcel group as they are obtained?	Implementing Entity confirmation that history is being recorded.	As parcels are acquired.	None.
	Are the management histories incorporated into the Initial and Individual PMPs? Does the management directed in the PMP account for past management actions?	Permitting Agency review of PMPs prior to approval.	As plans are prepared.	None.
Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. The program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.	Where are non-native weeds occurring, and what species? Has an early detection and eradication program been prepared and implemented?	Regular weed assessment and mapping within the UDA. Wildlife Agency review of Invasive Species Monitoring and Eradication Program.	Quarterly weed assessment on preserves, with other opportunistic assessment.	Implementing Entity to develop Invasive Species Monitoring and Eradication Program in first 18 months.
	Are we eradicating them in a timely fashion?	Annual review of weed assessments and eradication efforts by Implementing Entity. Summary of weed eradication efforts included in Annual Reports.	Annual	Implementing Entity to include in Invasive Species Monitoring and Eradication Program eradication or reduction targets; and a hierarchy of response methods to eradicate or reduce non-native plant populations.

AGENDA ITEM 11.1
1361

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
	Are we updating the Program to account for changed conditions?	TAC Review of the Program every 5 years.	Program review every 5 years.	None.
Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.)	Are preserves being monitored for edge effects?	Prepare summary of monitoring, include in Annual Reports.	Include in Annual Reports.	None.
Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.	What are the regional and local trends for temperature, rainfall and other weather parameters? How do they vary within the Plan Area?	Install weather stations within selected preserves, collect and periodically analyze data and use in multivariate analyses of species occurrence and abundance.	Ongoing, annual data analysis or as needed for other studies.	Implementing Entity to specify in the first 18 months methodology for weather data analysis and how to use it for monitoring and adaptive management.
Objective HAB7. Monitor vegetation biomass within grassland land covers.	What is the height of vegetation within Vernal Pool Grasslands, Valley Grasslands, Blue Oak Savanna, and other relevant land cover types?	Conduct monitoring using RDM or another rapid assessment technique.	After the growing season, annual.	Implementing Entity to identity in first 12 months acceptable rapid assessment techniques for vegetation biomass.
Objective VP4. Investigate indirect effects of development on vernal pool crustaceans over the short term and the long term.	Have vernal pool crustaceans been studied for indirect effects from development?	Review annual reports and study reports.	As determined by study designs.	None.
Objective AG2. Of the 9,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as, but not limited to, corn, alfalfa, or wheat) preferred by tricolored blackbird (*Agelaius tricolor*), greater sandhill crane (*Grus canadensis*), and the covered raptor species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6	What is the current inventory of Cropland that can be acquired?	Analyze extant inventory to ensure availability of suitable acreage for future mitigation and to determine actions for current Cropland preserve management.	Map extant inventory immediately, update annually.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	How many acres of Cropland have we preserved?	Quantify acres and map the extent and distribution of preserved Cropland. Annual (or some agreed upon time interval) review of current	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual

in plots of 20 acres or more. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.		aerial imagery and SSHCP GIS database of land cover types. Cross check preserved cropland for consistency with Conservation Actions in Table 7-1 and the conceptual preserve design in Section 7.5.		Reports.
Objective AG3. Maintain or increase prey availability and improve foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species.	How much hedgerow is being planted?	Quantify linear feet and map the extent of planted hedgerows in SSHCP preserves.	Maps and tables included with Annual Reports.	Implementing Entity to develop a list in first 12 months of acceptable plant species for planted hedgerows.
	Are plants still alive?	Field verification of plant condition.	Annual	Implementing Entity to develop in first 18 months methodology for evaluating plant condition and fossorial mammal habitat suitability.
Objective RIP5. Monitor groundwater table as it relates to status and trends for riparian habitat.	What is the groundwater table depth and how is it changing?	Annually measure depth to water table on Preserve parcels with existing wells.	Annual at a consistent time of year	Implementing Entity to develop in first 18 months methodology for groundwater study, how to establish trend for groundwater level, and thresholds for concern.
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.				
Objective VPP1. Prior to take of any occurrence of Ahart's dwarf rush (*Juncus*	Are we ensuring that any take of Ahart's dwarf rush is offset by	Conduct a population study of take and newly preserved Ahart's dwarf	Annual within study plots for 10 years,	Implementing Entity to describe in first 12 months a

leiospermus), protect one currently unpreserved[3] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Ahart's dwarf rush within the Plan Area.	protection of another unprotected Ahart's dwarf rush?	rush.	every 5 years after trend established	protocol for the Ahart's dwarf rush population study, and provide definition of take for this species.
Objective VPP2. Prior to take of any occurrence of Boggs Lake hedge-hyssop (*Gratiola heterosepala)*, protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Boggs Lake hedge-hyssop within the Plan Area.	Are we ensuring that any take of Boggs Lake hedge-hyssop is offset by protection of another unprotected Boggs Lake hedge-hyssop?	Conduct a population study of take and newly preserved Boggs Lake hedge-hyssop.	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the Bogg's lake hedge-hyssop population study, and provide definition of take for this species.
Objective VPP3. Prior to take of any occurrence of dwarf downingia (*Downingia pusilla*), protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrence of dwarf downingia within the Plan Area.	Are we ensuring that any take of currently unknown dwarf downingia is offset by protection of another currently unknown dwarf downingia?	Conduct a population study of take and newly preserved dwarf downingia.	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the dwarf downingia population study, and provide definition of take for this species.
Objective VPP4. Protect and maintain in perpetuity a minimum of 15 occurrences of legenere (*Legenere limosa*) within the SSHCP Preserve System. Legenere occurrences will be preserved in accordance with the Conservation Actions described in this table. Prior to take of any occurrence of legenere, one currently unpreserved and	Are we protecting the known occurrences of legenere? Are we ensuring that any take of currently unknown legenere is offset by protection of another currently unknown legenere?	Conduct a population study of take and newly preserved legenere.	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the legenere population study, and provide definition of take for this species.

[3] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
"biologically equivalent or superior" (as defined by the TAC) occurrence of legenere will be preserved and maintained within the Plan Area.				
Objective VPP5. Prior to take of any occurrence of pincushion navarretia (*Navarretia myersii* ssp. *myersii*), protect one currently unpreserved[4] and "biologically equivalent or superior" (as defined by the TAC) occurrence of pincushion navarretia within the Plan Area.	Are we ensuring that any take of pincushion navarretia is offset by protection of another currently unknown pincushion navarretia?	Conduct a population study of take and newly preserved pincushion navarretia.	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the pincushion navarretia population study, and provide definition of take for this species.
Objective VPP6. Protect and maintain in perpetuity all known currently unprotected occurrences of Sacramento Orcutt grass (*Orcuttia viscida*) in the Plan Area to preserve existing distribution, and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.	Are we protecting the known occurrences of Sacramento Orcutt grass? Are we ensuring that any take of currently unknown Sacramento Orcutt grass is offset by protection of another currently unknown Sacramento Orcutt grass?	Conduct a population study of take and newly preserved Sacramento Orcutt grass.	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the Sacramento Orcutt grass population study, and provide definition of take for this species.
Objective VPP7. Protect and maintain in perpetuity all known currently unprotected occurrences of slender Orcutt grass in the Plan Area to preserve existing distribution, and any currently unknown sites discovered	Are we protecting the known occurrences of slender Orcutt grass? Are we ensuring that any take of currently unknown slender Orcutt grass is offset by protection	Conduct a population study of take and newly preserved slender Orcutt grass.	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the slender Orcutt grass population study, and provide definition

in locations subject to an SSHCP Covered Activity.	of another currently unknown slender Orcutt grass?			of take for this species.
Objective SA1. During re-establishment and/or establishment of seasonal wetlands, freshwater marsh, open water, and stream/ creek, translocate impacted Sanford's arrowhead (*Sagittaria sanfordii*) from other sites. Prior to take of an occurrence of Sanford's arrowhead, protect one additional occurrence of Sanford's arrowhead within the Plan Area.	Are we protecting the known occurrences of Sanford's arrowhead? Are we ensuring that any take of currently unknown Sanford's arrowhead is offset by protection of another currently unknown Sanford's arrowhead?	Conduct a population study of take, newly preserved Sanford's arrowhead, and re-established/ established Sanford's arrowhead .	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the Sanford's arrowhead population study, and provide definition of take for this species.
Objective VPI1. Protect and maintain in perpetuity 1,270 acres of vernal pool tadpole shrimp modeled aquatic habitat within the Plan Area to preserve existing distribution.	Is existing vernal pool tadpole shrimp modeled habitat being preserved?	Review map of Vernal Pool, Swale, and Stream/Creek (VPIH) in the Plan Area. Use GIS to compare preserved Vernal Pool, Swale, and Stream/Creek (VPIH) against inventory.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective VPI2. Protect and maintain in perpetuity 1,270 acres of vernal pool fairy shrimp (*Branchinecta lynchi*) modeled aquatic habitat within the Plan Area to preserve existing distribution.	Is existing vernal pool fairy shrimp modeled habitat being preserved?	Review map of Vernal Pool, Swale, and Stream/Creek (VPIH) in the Plan Area. Use GIS to compare preserved Vernal Pool, Swale, and Stream/Creek (VPIH) against inventory.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective VPI3. Protect and maintain in perpetuity 1,059 acres of mid-valley fairy shrimp (*Branchinecta mesovallensis*) modeled aquatic habitat within the Plan Area to preserve existing distribution.	Is existing mid-valley fairy shrimp modeled habitat being preserved?	Review map of Vernal Pool, Swale, and Stream/Creek (VPIH) in the Plan Area. Use GIS to compare preserved Vernal Pool, Swale, and Stream/Creek (VPIH) against inventory.	Map and tables included with Annual Report	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective VPI4. Protect and maintain in perpetuity 1,245 acres of Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i) modeled aquatic habitat within the Plan Area to preserve existing distribution.	Is existing Ricksecker's water scavenger beetle modeled habitat being preserved?	Review map of Vernal Pool, Swale, and Stream/Creek (VPIH) in the Plan Area. Use GIS to compare preserved Vernal Pool, Swale, and Stream/Creek (VPIH) against inventory.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective VPI5. Ensure that during implementation of Objective VP2, re-established or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/ establishment, in accordance with Conservation Actions in Table 7-1.	Are re-established and/ or established vernal pools being inoculated with the appropriate soils?	Reporting by biologist conducting establishment/re-establishment to confirm origin of soils.	Biologist to confirm suitability of inocula before use in re-establishment/establishment. Reporting submitted within 1 month of inoculation	Implementing Entity to develop criteria for inoculation of vernal pool re-establishment/ creation within the first 12 months.
Objective CTS1. Preserve at least 5 occupied California tiger salamander breeding ponds.	Where are existing occupied breeding ponds within California tiger salamander critical habitat?	Conduct survey for occupied California tiger salamander breeding ponds in the Plan Area.	Survey for occupied ponds in first HCP year	Implementing Entity to develop in first 12 months the survey methodology to locate occupied California tiger salamander breeding ponds.
	Are the required number of existing occupied California tiger salamander breeding ponds being preserved?	Map extent and distribution of California tiger salamander breeding ponds and field verification of pond preservation.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

AGENDA ITEM 11.1

1367

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective CTS2. During preserve assembly, ensure that modeled aquatic and upland habitat for California tiger salamander is preserved. Minimum preservation will total: • 141 acres of aquatic habitat • 1,677 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within California tiger salamander Critical Habitat occurs within California tiger salamander Critical Habitat (see Objectives BOW1, VPG1, VP1, SW1, and VG1).	What is the current inventory of habitat for California tiger salamander?	Quantify acres and map the extent and distribution of California tiger salamander aquatic and upland habitat in the Plan Area.	Maps and tables included with Annual Reports.	None.
	Are necessary acres of aquatic and upland habitat preserved? Is mitigation for modeled high value habitat impacted within California tiger salamander Critical Habitat occurring within California tiger salamander Critical Habitat?	Review map of Vernal Pool, Swale, Blue Oak Woodland, and Valley Grassland in the Plan Area. Use GIS to compare preserved Vernal Pool, Swale, and Stream/Creek (VPIH) against inventory. Outputs are maps and tabular presentation of data showing acres of habitat preserved compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is preserved habitat being maintained/ managed for California tiger salamander?	Compliance monitoring summary included in Annual Reports submitted by implementing entity. Field verification of compliance by Implementing Entity or designee	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for California tiger salamander, and provide compliance checklist in first 18 months.
Objective CTS3. Rural transportation project Covered Activities within CTS modeled habitat will be designed to allow California tiger salamander movement across the roadway area.	Are required wildlife crossings included in designs for rural transportation Covered Activities implemented in CTS modeled habitat?	Design review by Wildlife Agencies and Implementing Entity, considering site-specific conditions and local CTS movement.	On project application	Implementing Entity to develop in first 12 months formal criteria to evaluate wildlife crossings for CTS use.
	Are required CTS crossings being constructed?	Compliance monitoring reports submitted by implementing entity. Field verification by implementing entity or designee	During project construction and at project completion	None.

AGENDA ITEM 11.1
1368

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective WS1. During preserve assembly, ensure that modeled aquatic and upland habitat for western spadefoot (*Spea hammondii*) is preserved. Minimum preservation will total: • 1,531 acres of aquatic habitat • 22,044 acres of upland habitat. Ensure that mitigation for modeled habitat impacted within the Mather Core or Cosumnes/Rancho Seco Core Recovery Areas occurs within the Core Recovery Areas (see Objectives BOW1, VP1, VP3, SW1, SC1, OW1, and VG1).	What is the current inventory of aquatic and upland habitat for western spadefoot in the Plan Area?	Quantify acres and map the extent and distribution of western spadefoot aquatic and upland habitat in the Plan Area.	Maps and tables included with Annual Report.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are required acres of aquatic and upland habitat preserved? Is mitigation for modeled habitat impacted within the Mather Core Recovery Area and/or Cosumnes/Rancho Seco Core Recovery Area occurring within the Mather Core Recovery Area and/or Cosumnes/Rancho Seco Core Recovery Area?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is preserved habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by implementing entity. Field verification of compliance by Implementing Entity or designee	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for western spadefoot, and provide compliance checklist in first 18 months.
Objective WS2. During preserve assembly, ensure that modeled aquatic habitat for western spadefoot is re-established and/or established. Minimum re-establishment and/or establishment will total: • 906 acres of aquatic habitat.	Are necessary acres of aquatic habitat being re-established and/ or established? Is compensatory mitigation for modeled habitat impacted within the Mather Core Recovery Area and/or Cosumnes/Rancho Seco Core	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Ensure that mitigation for modeled habitat impacted within the Mather Core or Cosumnes/Rancho Seco Core Recovery Areas occurs within the Core Recovery Areas (see Objectives VP2, SW2, and OW2).	Recovery Area being constructed within the Mather Core Recovery Area and/or Cosumnes/Rancho Seco Core Recovery Area?	to targets.		
	Is re-established and/ or established habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by implementing entity. Field verification of compliance by Implementing Entity or designee	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for western spadefoot, and provide compliance checklist in first 18 months.
Objective WPT1. During preserve assembly, ensure that modeled aquatic and upland habitat for western pond turtle (*Actinemys marmorata*) is preserved. Minimum preservation will total: • 315.35 acres of aquatic habitat • 10,971 acres of upland habitat. (See Objectives FWM1, OW1, VPG1, RIP1, RIP3, VG1, BOW1, and SC1).	What is the current inventory of habitat for western pond turtle in the Plan Area?	Map the extent and distribution of western pond turtle aquatic and upland habitat.	Map and tables included with Annual Report	None.
	Are necessary acres of aquatic and upland habitat being preserved?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is preserved habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by implementing entity. Field verification of compliance by Implementing Entity or designee	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for western pond turtle, and provide compliance checklist in first 18 months.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective WPT2. During preserve assembly, ensure that modeled aquatic habitat for western pond turtle is re-established and/or established. Minimum re-establishment and/or establishment will total: • 315 acres of aquatic habitat. (See Objectives RIP2, FWM2, and OW2.)	Are necessary acres of aquatic habitat being re-established and/or established?	Annual review of habitat re-establishment and establishment projects, including GIS mapping. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is re-established and/or established habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by implementing entity. Field verification of compliance by Implementing Entity or designee	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for western pond turtle, and provide compliance checklist in first 18 months.
Objective GGS1. During preserve assembly, ensure that modeled habitats for giant gartersnake are preserved along the following creeks (or other creeks that are determined by the TAC to provide similar GGS habitat value): • The lower Laguna Creek, mainly between Twin Cities Road (State Route (SR) 104) and Miess Road; • Skunk Creek, which flows into the Cosumnes River northwest of the City of Galt; • the short Willow Creek and tributaries of Badger Creek, which are to the north of the lower Laguna Creek and west of the	What is the current inventory of habitat for giant gartersnake in the Plan Area? tributaries of Badger Creek; and • Badger Marsh. Mitigation for impacts to modeled habitats for giant gartersnake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum re-establishment and/or establishment will total: • 170 acres of high-value aquatic habitat • 134 acres of high-value upland habitat. (See Objectives SW2, OW2, RIP2, and RIP4.)				
Objective GGS3. Plan Permittees will conduct a study to establish hydrologic baseline conditions along Badger Creek to identify what level of hydrology is necessary to support giant gartersnake and acquire a water source to maintain the minimum level of hydrology during the summer months when agricultural runoff may wane.	What is the hydrologic condition along Badger Creek? How much supplemental water would be required to maintain baseline conditions during summer?	Conduct hydrologic study for Badger Creek.	Within two years of HCP implementation	Implementing Entity to fully define in first 18 months what the hydrologic study will entail for inclusion in bid package.
Objective VELB1. Relocate or replace each impacted elderberry shrub (*Sambucus* spp.) according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999). Mitigation will occur in locations that are not inundated for 2 continuous weeks, as determined by the TAC.	How many shrubs are being impacted? Are impacted shrubs being relocated or replaced in appropriate locations?	Review mitigation proposed for each project, including location for replacement.	Project-by-project basis	Implementing Entity to develop methodology in first 18 months for determining inundation period of potential elderberry shrub mitigation sites.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective VELB2. During implementation of riparian habitat re-establishment and/or establishment, strategically include elderberry shrub in the planting palette (see Objectives RIP2 and RIP4).	Is elderberry shrub being used appropriately during riparian habitat re-establishment and/ or establishment?	Review of planting plans for proposed re-establishment/ establishment projects, comparison against Conservation Actions in Table 7-1, field inspection of in-progress and completed re-establishment/ establishment projects.	Project-by-project basis	Implementing Entity to develop in first 12 months a checklist for review of riparian re-establishment/ establishment planting plans.
Objective CH1. During preserve assembly, ensure that a minimum of 974 acres of modeled nesting/foraging habitat for Cooper's hawk (*Accipiter cooperii*) is preserved, in accordance with Conservation Actions described in Table 7-1 (see Objectives RIP1, RIP3, and BOW1).	What is the current inventory of nesting/foraging habitat for Cooper's hawks in the Plan Area?	Map the extent and distribution of Cooper's hawk nesting/foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are necessary acres of nesting/foraging habitat being preserved?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is preserved habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for Cooper's hawk, and provide compliance checklist in first 18 months.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective CH2. During preserve assembly, ensure that a minimum of 601 acres of modeled nesting/foraging habitat for Cooper's hawk is re-established and/or established (see Objectives RIP2 and RIP4).	Are necessary acres of nesting/foraging habitat being re-established and/ or established?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is re-established and/or established habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for Cooper's hawk, and provide compliance checklist in first 18 months.
Objective CH3. During preserve assembly, ensure that a minimum of 38 acres of modeled foraging habitat for Cooper's hawk is preserved, in accordance with Conservation Actions described in Table 7-1 (see Objectives RIP1, RIP3, and BOW1).	What is the current inventory of foraging habitat for Cooper's hawks in the Plan Area?	Map the extent and distribution of Cooper's hawk foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are necessary acres of foraging habitat being preserved?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports. Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective TB2. During preserve assembly, ensure that a minimum of 27,532 acres of modeled nesting/foraging habitat for tricolored blackbird is preserved, including a minimum of 402 acres of freshwater marsh and seasonal wetland (see Objectives AG1, AG2, VG1, VPG1, FWM1, and SW1).	What is the current inventory of habitat for tricolored blackbirds?	Map the extent and distribution of tricolored blackbirds nesting habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are necessary acres of nesting habitat being preserved?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is preserved habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for tricolored blackbird, and provide compliance checklist in first 18 months.
Objective TB3. During preserve assembly, ensure that a minimum of 917 acres of modeled foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2, SW2, OW2, and VP2).	Are necessary acres of foraging habitat being re-established and/or established?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
	Is re-established and/or established habitat being maintained/managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/management is for tricolored blackbird, and provide compliance checklist in first 18 months.
Objective TB4. During preserve assembly, ensure that a minimum of 232 acres of modeled nesting/foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2 and SW2).	Are necessary acres of nesting habitat being re-established and/or established?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is re-established and/or established habitat being maintained/managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/management is for tricolored blackbird, and provide compliance checklist in first 18 months.
Objective TB5. Provide mitigation for loss of any tricolored blackbird nesting colony site that is occupied at the time of Covered Activity implementation or was recorded as an occupied nesting colony at any time since 2008. Sources for occupied nesting colonies are the CNDDB, Tricolored Blackbird Portal, eBird, or other data sources approved by the Wildlife Agencies. Minimum mitigation is to	Where are colonies of tricolored blackbirds located, historically and at present?	Map historic and existing tricolored blackbird nesting colony sites.	Maps and tables included with Annual Report	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are sufficient colonies being preserved?	Annual (or some agreed upon time interval) review of current SSHCP GIS database of colony sites and modeled foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

AGENDA ITEM 11.1
1378

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
protect one extant unprotected occurrence of a nesting colony prior to take of one nesting colony of tricolored blackbirds. Ensure that at least five extant tricolored blackbird colonies that were occupied in recent years are maintained and managed within the SSHCP Preserve System.	Are preserved colonies being maintained/managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for tricolored blackbird, and provide compliance checklist in first 18 months.
Objective TB6. Conduct an experimental study to identify management actions to protect tricolored blackbird colonies (e.g., coarse netting to reduce nest predation or impact of pesticides).	How many birds successfully fledge?	Nest census to quantify successful fledging.	Once each season that study is ongoing, coordinated with study timing.	Implementing Entity to develop in the first 18 months a methodology for tricolored blackbird nest census.
	What techniques best exclude predators?	Conduct pilot study for exclusion techniques.	Study initiated within 2 years of HCP implementation; completed within 5 years of HCP implementation.	Implementing Entity to develop in first 18 months a pilot study design for management techniques to benefit tricolored blackbird, including exclusion techniques to be tested, how to determine success or failure of techniques.
Objective TB7. Ensure that at least one large tricolored blackbird colony (i.e., one that has historically [from 1950 onward] supported a minimum of 1,500 individuals) is protected.	Where are large colonies of tricolored blackbirds located, historically and at present?	Map historic and existing tricolored blackbird nesting colony sites.	Maps and tables included with Annual Report	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is the appropriately sized colony being preserved?	Annual (or some agreed upon time interval) review of current SSHCP GIS database of colony sites.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to

Table 8-1

				be included in Annual Reports.
	Is preserved colony being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for tricolored blackbird, and provide compliance checklist in first 18 months.
Objective TB8. For any tricolored blackbird nesting colony that is removed by a Covered Activity, re-establish and/or establish three new colonies within SSHCP Preserves. Re-established and/or established colonies can be in aquatic (freshwater marsh, seasonal wetland) or upland (annual grassland) habitat types, and must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands that provide adequate foraging opportunities.	For each impacted colony site, are three potential colony sites being re-established or established?	Annual (or some agreed upon time interval) review of current SSHCP GIS database of colony sites, and re-established/established colony sites.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are re-established/established colony sites being maintained and managed to encourage colonization?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for tricolored blackbird, and provide compliance checklist in first 18 months.
Objective BO1. Preserve 7 occupied western burrowing owl (*Athene cunicularia*) sites (commensurate with 20% of the estimated number of sites within the UDA as of 2014), preserve at least 200 acres of land surrounding each occupied burrow site, and maintain modeled habitat for western burrowing owl within 0.4 mile of breeding sites.	Where are occupied burrowing owl sites?	Map burrowing owl sites and modeled burrowing owl foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are the occupied burrowing owl sites and associated modeled foraging habitat being preserved?	Annual (or some agreed upon time interval) review of current SSHCP GIS database of colony sites.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Objective BO2. For each burrowing owl or burrowing owl pair passively excluded, protect 200 acres of modeled habitat for western burrowing owl, and establish a ground squirrel (*Spermophilus (Otospermophilus) beecheyi*) colony and augment with artificial burrows as appropriate (determined by TAC). Artificial burrows will be established at appropriate locations throughout the Preserve System pursuant to CDFW (CDFG 2012 guidelines) or as otherwise determined by the TAC.	How many burrowing owls are being passively excluded?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are requisite number of acres of modeled habitat for burrowing owl being preserved and augmented with ground squirrels and artificial burrows?	Map burrowing owl sites and modeled burrowing owl foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop format for annual summary maps in first 12 months.
	Are preserved sites being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for burrowing owl, and provide compliance checklist in first 18 months.
Objective FH1. During preserve assembly, ensure that a minimum of 25,881 acres of modeled foraging habitat for ferruginous hawk is preserved, including 19,625 acres in PPUs 5 and 7 (see Objectives AG1, VG1, VP1, VP3, VPG1, and SW1).	What is the current inventory of habitat for ferruginous hawks?	Map the extent and distribution of ferruginous hawk foraging habitat. Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective SH4. During preserve assembly, ensure that a minimum of 373 acres of modeled riparian nesting habitat for Swainson's hawk is re-established and/or established. Ensure that mitigation for modeled nesting habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8 (see Objectives RIP2 and RIP4).	Are necessary acres of modeled riparian nesting habitat being re-established and/or established? Is mitigation occurring in the correct PPUs according to the Objective?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is re-established and/or established habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for Swainson's hawk, and provide compliance checklist in first 18 months.
Objective SH5. For each of the 36 known nesting trees within the UDA, plant 10 trees that are modeled for Swainson's hawk nesting within SSHCP preserves. Plant nesting trees on properties protected by the SSHCP within PPUs 4, 6, and 8, and near protected foraging habitat. Tree species will be selected based on known suitability as nesting habitat for Swainson's hawk, and the planted trees must be maintained and/or replaced in perpetuity.	Which trees are to be impacted?	Map the locations of impacted trees.	Upon project application	None.
	Are we planting the appropriate number of trees, in the appropriate locations, with the appropriate timing?	Map the locations of planted trees and compare against Conservation Actions in Table 7-1. Field inspection by implementing entity or designee.	Annual mapping and field verification, compliance monitoring. Maps and tables included in Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
Objective SH6. During preserve assembly, ensure that a minimum of 729 acres of modeled foraging habitat for Swainson's hawk is re-established and/or established (see	Are necessary acres of modeled foraging habitat being re-established and/or established? AGENDA ITEM 11.1
1391

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective GS3. During preserve assembly, ensure that a minimum of 184 acres of modeled roosting habitat or roosting/foraging habitat for greater sandhill crane is re-established and/or established. Re-establish two new roost sites (minimum of 90 acres of freshwater marsh/seasonal wetland complex each) every 2 miles in the gap between the Cosumnes population and the Stone Lakes' population or other strategic locations if that gap is closed by another HCP or conservation project (see Objectives VP2, SW2 and FWM2).	Are necessary acres of modeled roosting and roosting/foraging habitat being re-established and/ or established? Are new roost sites located as directed in the objective?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types, modeled habitat, and roost sites. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is re-established and/ or established habitat or roost sites being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for greater sandhill crane, and provide compliance checklist in first 18 months.
Objective GS4. Create a visual screen of woody vegetation near human disturbances such as buildings, bridges, and paved roads from permanent roosting habitat within PPU 6. Screens should be located as appropriate to not interfere with habitat usage by greater sandhill cranes.	Where is permanent roosting habitat that would benefit from a visual screen?	Map the extent and distribution of roosting habitat that is near locations frequented by humans (e.g., roads, rivers, etc.).	Map habitat suitable for screening immediately	Implementing Entity to develop a method in the first 18 months to prioritize sites for visual screening to benefit greater sandhill crane.
	Are visual screens being planted appropriately?	Map planted screens and inspect height and condition in field to ensure no interference with habitat use by greater sandhill cranes.	Annual mapping and field verification of screen conditions	Implementing Entity, in consultation with the TAC, to identify in the first 18 months the ideal height and other parameters for screen function to benefit greater sandhill crane.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective GS5. As part of the 2,000 acres preserved under Objective AG2, establish and maintain 10 food plots in strategic locations totaling a minimum of 200 acres within an agricultural setting for greater sandhill crane foraging habitat within PPU 6. Maintain the 200 acres among the 10 food plots as irrigated pasture or planted with crops preferred by greater sandhill crane as foraging habitat. Crops may include, but are not limited to, alfalfa, corn, wheat, or rice. Strategic placement of food plots will include locations for food plots in upland areas above the floodplain.	How many acres of greater sandhill crane food plots have we established?	Map the extent and distribution of greater sandhill crane food plots.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are the food plots being acquired, planted, and managed according to the conservation strategy for greater sandhill crane?	Cross check for consistency with greater sandhill crane modeled species habitat.	Summary of consistency included with Annual Reports.	Implementing Entity to develop in first 12 months format for summary to be included in Annual Reports.
Objective GS6. During preserve assembly, ensure that a minimum of 1,000 acres of high-value modeled foraging habitat for greater sandhill crane outside the 100-year floodplain is preserved (see Objectives VP1, SW1, and FWM1).	Are the necessary acres of high-value modeled foraging habitat being preserved outside the 100-year floodplain?	Map the extent and distribution of greater sandhill crane foraging habitat. Ensure that an appropriate proportion of foraging habitat preservation is located outside the 100-year floodplain. Cross-check for consistency with greater sandhill crane modeled species habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is the high-value modeled foraging habitat outside the 100-year floodplain being managed for the benefit of greater sandhill crane according to the SSHCP Conservation Strategy?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports	Implementing Entity to define what appropriate maintenance/ management is for greater sandhill crane, and provide compliance checklist in first 18 months.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective LS1. During preserve assembly, ensure that a minimum of 9,152 acres of modeled foraging habitat for loggerhead shrike (*Lanius ludovicianus*) is preserved (see Objectives VG1, AG1, VPG1, SW1, VP1, and VP3).	What is the current inventory of habitat for loggerhead shrike?	Map the extent and distribution of loggerhead shrike modeled foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are necessary acres of modeled foraging habitat being preserved?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is preserved habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports.	Implementing Entity to define what appropriate maintenance/ management is for loggerhead shrike, and provide compliance checklist in first 18 months.
Objective LS2. During preserve assembly, ensure that a minimum of 22,014 acres of modeled nesting/foraging habitat for loggerhead shrike is preserved (see Objectives VG1, RIP1, and RIP3).	What is the current inventory of habitat for loggerhead shrike?	Map the extent and distribution of loggerhead shrike modeled nesting habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are necessary acres of modeled nesting/foraging habitat being preserved?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual

Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports	Implementing Entity to define what appropriate maintenance/ management is for loggerhead shrike, and provide compliance checklist in first 18 months.
Objective LS3. During preserve assembly, ensure that a minimum of 592 acres of modeled nesting habitat for loggerhead shrike is re-established and/or established (see Objectives RIP2 and RIP4).	Are necessary acres of modeled nesting habitat being re-established and/ or established?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is re-established and/ or established habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports	Implementing Entity to define what appropriate maintenance/ management is for loggerhead shrike, and provide compliance checklist in first 18 months.
Objective LS4. During preserve assembly, ensure that a minimum of 965 acres of modeled nesting habitat for loggerhead shrike is preserved (see Objectives RIP2 and RIP4).	What is the current inventory of habitat for loggerhead shrike?	Map the extent and distribution of loggerhead shrike modeled nesting habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.

Table 8-1
Framework for SSHCP Conservation Strategy Compliance Monitoring

Measurable Objective or SSHCP Commitment	What do we need to know to assess compliance?	How do we monitor what we need to know?	How often?	What needs to be developed in the first 18 months for the SSHCP Compliance and AMM Monitoring Program?
Objective WR1. During preserve assembly, ensure that a minimum of 23,910 acres of modeled foraging habitat for western red bat (*Lasiurus blossevillii*) is preserved (see Objectives BOW1, RIP1, RIP3, AG1, VPG1, VG1, VP1, VP3, SW1, OW1, FWM1, and SC1).	What is the current inventory of foraging habitat for western red bat?	Map the extent and distribution of western red bat modeled foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are necessary acres of modeled foraging habitat being preserved?	Annual (or some agreed upon time interval) review of current aerial imagery and SSHCP GIS database of land cover types and modeled habitat. Outputs are maps and tabular presentation of data in acres showing acres of habitat compared to targets.	Maps and tables included with Annual Reports	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Is preserved habitat being maintained/ managed?	Compliance monitoring summary included in Annual Reports submitted by Implementing Entity. Field verification of compliance by Implementing Entity or designee.	Summary included with Annual Reports	Implementing Entity to define what appropriate maintenance/ management is for western red bat, and provide compliance checklist in first 18 months.
Objective WR2. During preserve assembly, ensure that a minimum of 841 acres of modeled roosting/foraging habitat for western red bat is preserved (see Objectives BOW1, RIP1, and RIP3).	What is the current inventory of habitat for western red bat?	Map the extent and distribution of western red bat modeled roosting/foraging habitat.	Maps and tables included with Annual Reports.	Implementing Entity to develop in first 12 months format for maps and tables to be included in Annual Reports.
	Are necessary acres of modeled roosting/foraging habitat being preserved? 8.2.2 AMM Compliance Monitoring

The SSHCP Compliance and AMM Monitoring Program will ensure required AMMs are implemented at Covered Activity project sites, and are implemented correctly (Table 8-2).

The ways in which SSHCP AMM compliance will be assured by the Plan Permittees is provided in Table 8-2. For many Covered Activity projects, the Land Use Authority Permittees will include appropriate SSHCP AMMs in Mitigation Monitoring and Reporting Plans that they prepare under the California Environmental Quality Act for Covered Activities implemented by third-parties, prior to Land Use Authority Permittee approval. The AMM compliance monitoring approaches and timing included in Table 8-2 will be incorporated into these Mitigation Monitoring and Reporting Plans, implementation of which will be conditions of project approval.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
LID-1 (Stormwater Quality)	Are projects incorporating appropriate stormwater management into designs to satisfy the requirements outlined in the Stormwater Quality Design Manual for the Sacramento and South Placer Regions?	Design review by Land Use Authority Permittee.	During design review	None.
LID-2 (Groundwater Recharge)	Has the proponent identified areas in the project site that could be appropriate for groundwater recharge? Has the drainage design incorporated groundwater recharge to the maximum extent feasible?	Design review by Land Use Authority Permittee.	During design review	None.
LID-3 (Natural Site Features):	Has the proponent identified important natural site features within the project site? Has the project design avoided or preserved these natural site features to the maximum extent feasible?	Design review by Land Use Authority Permittee.	During design review and after project completion	Implementing Entity to define "natural site features" in first 12 months for use by Land Use Authority Permittee.
EDGE-1 (Compatible Land Uses)	Has the proponent located compatible land uses adjacent to preserves or preserve setbacks to the maximum extent feasible?	Design review by Land Use Authority Permittee. Field verification of land uses by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	Implementing Entity to develop final list of compatible land uses in first 12 months for use by Land Use Authority Permittee.
EDGE-2 (Single-Loaded Streets)	Has the proponent located single loaded streets adjacent to preserves or preserve setbacks to the maximum extent feasible?	Design review by Land Use Authority Permittee. Field verification of land uses by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	None.
EDGE-3 (Preserve Setbacks)	Has the required minimum width of each preserve setback been established?	Design review by Land Use Authority Permittee. Field verification of setback	During design review and after project completion.	Implementing Entity to develop checklist for design

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
		conditions by Land Use Authority Permittee or Implementing Entity.		and monitoring of each Covered Activity allowed in the Preserve Setbacks in first 12 months.
EDGE-3a (Setback Recreational Trails)	If trails or other allowed facilities are proposed in Preserve Setbacks, do they meet size and l placement requirements of EDGE-3a?	Design review by Land Use Authority Permittee. Field verification of setback conditions by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	Implementing Entity to develop checklist for design and monitoring of each Covered Activity allowed in the Preserve Setbacks in first 12 months.
EDGE-3b (Setback Firebreaks)	If firebreaks are proposed in Preserve Setbacks, do they meet size and l placement requirements of EDGE-3b?	Design review by Land Use Authority Permittee. Field verification of setback conditions by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	Implementing Entity to develop checklist for design and monitoring of each Covered Activity allowed in the Preserve Setbacks in first 12 months.
EDGE-3c (Setback Shade Trees and Landscaping)	If the landscaping planting Covered Activity is proposed in a Preserve Setback, are the plantings consistent with restrictions of EDGE-3c?	Design review by Land Use Authority Permittee. Monitoring of drip irrigation for maximum of 5 years after planting. Field verification of setback conditions by Land Use Authority Permittee or Implementing Entity. Periodic inspection of landscaping and other preserve setback conditions by Implementing Entity to ensure ongoing compliance in perpetuity. Annual monitoring of potential indirect effects from Setback landscaping (i.e., leaf	During design review and after project completion. Annual inspection in perpetuity.	Implementing Entity to develop checklist for acceptable planting methods, appropriate shade trees and landscaping species, and acceptable placement within the Preserve Setback in first 12 months, including landscaping.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
		litter accumulation, irrigation runoff, plant encroachment)		
EDGE-4 (Locate Stormwater Control Outside Preserves)	Are stormwater flows directed away from preserves and captured within the development?	Design review by Land Use Authority Permittee. Field verification of stormwater system functional compliance by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	Implementing Entity to develop checklist in first 12 months for use by Land Use Authority Permittees.
EDGE-5 (Stormwater Control in Preserve Setbacks)	If trails are established in a preserve setback, was the trail designed to slope away from the preserve, and will rain water leaving the trail collected in an adjacent a low-velocity bioswale?	Design review by Land Use Authority Permittee. Field verification of trail and bioswale design and placement in the Preserve Setback, by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	Implementing Entity to develop checklist for acceptable trail and bioswale designs and placement.
EDGE-6 (Detention Basins in Linkage Preserves)	Are detention basins proposed only in Linkage Preserves L1, L2, L4, L7, L8, L9, and L10? Are the detention basins designed to avoid soil excavation and associated effects to the soil's hardpan/duripan and perched aquifer?	Design review by Land Use Authority Permittee. Field inspection of completed detention basin by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	Implementing Entity to develop in first 18 months criteria and checklist for acceptable detention basin designs within Linkage Preserves.
EDGE-7 (Hardpan/Duripan Protection)	Are proponent s avoiding ground disturbing activities inside preserves and inside preserve setbacks that could cut into, disrupt, or remove the soil's restrictive layer (hardpan or duripan)? If a minor puncture of the soil restrictive layer (e.g., from installing a post) is approved by the Implementing Entity and	Design review by Land Use Authority Permittee to determine whether an activity could damage the duripan. Review of repair designs by the Implementing Entity and the TAC. Field inspection of repairs by Land Use Authority Permittee or Implementing Entity.	During design review and after project completion.	Implementing Entity to identify forbidden activities that could cut into, disrupt, or remove the soil's restrictive layer. Implementing Entity to develop list of potentially acceptable activities that might cause minor

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
	the TAC, was the puncture sealed using bentonite clay or other material?			punctures the duripan, and specify appropriate materials and methods for sealing punctures or minor disruptions to the soil restrictive layer, both in first 12 months.
EDGE-8 (Outdoor Lighting)	Is the project proponent using best information available at the time of project design to minimize effects of light pollution from new urban development on target species (e.g., western spadefoot, Ricksecker's water scavenger beetle)?	Land Use Authority Permittee review of proponent plans for AMM implementation; review field implementation and compare to current best practices.	During design review. Update best practices for lighting as new information is available.	Implementing Entity, in consultation with the TAC, to identify in first 18 months lighting best practices. Provide updates to Land Use Authority Permittees as new information is available.
EDGE-9 (Livestock Access to Preserves)	Has the project proponent provided adequate number of l access areas for livestock delivery to and pickup from on-site or adjacent preserves in their project design, if applicable?	Land Use Authority Permittee review of proponent plans for adequate livestock access areas, if applicable.	During design review.	Implementing Entity, in consultation with the TAC, to develop in first 18 months a checklist for livestock access to be used by Land Use Authority Permittees when reviewing projects.
EDGE-10 (Prevent Invasive Species Spread)	Is equipment cleaned of mud and plant material before entering a preserve setback or a preserve? Are mowing activities beginning in non-infested areas before moving on to infested areas? Do maintenance plans for preserve setbacks or preserves include	Implementing Entity review of maintenance plans for preserve setbacks and preserves. Periodic review of maintenance activities for compliance with maintenance plans	During design review. Annual inspection in perpetuity.	Implementing Entity to develop measures to be included in maintenance plans in first 6 months.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
	techniques to avoid spread of invasive plants? Are setback and preserve maintenance activities consistent with these plans?			
BMP-1 (Construction Fencing)	Is the project proponent installing and maintaining construction fencing at the outer boundary of any Preserve Setback or Stream Setback to reduce disturbance to the maximum extent feasible?	Review of construction fencing by Permit Compliance staff or by Biological Monitor, if present.	During construction, monthly inspection.	None.
BMP-2 (Erosion Control)	Are control measures for erosion installed according to project plans? Are the appropriate materials used in Covered Species habitat for giant gartersnake, western pond turtle, California tiger salamander, or western spadefoot to avoid entrapment?	Review of erosion control materials by Land Use Authority Permittee Permit Compliance staff and/or by Biological Monitor, if present.	During construction, monthly inspection.	Implementing Entity to develop list in first 6 months of appropriate erosion control materials for use in modeled habitat for giant gartersnake, western pond turtle, California tiger salamander, or western spadefoot to avoid entrapment.
BMP-3 (Equipment Storage and Fueling)	Has the proponent identified designated equipment storage and fueling locations on project plans? During project construction, is storage and fueling occurring in the designated location?	Review of project plans by Land Use Authority Permittee. Inspection of project site by Land Use Authority Permittee Permit Compliance staff to verify use of appropriate storage and fueling locations.	During design review. During construction, monthly inspection.	None.
BMP-4 (Erodible Materials)	Has the proponent clearly indicated requirements for placement of erodible materials on project plans? Are erodible	Review of project plans by Land Use Authority. Inspection of project site by Permit Compliance staff to confirm that	During design review. During construction, monthly inspection.	None.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
	materials being placed in the appropriate locations?	erodible materials are being placed properly.		
BMP-5 (Dust Control)	Are proponents watering active construction sites, if necessary, to reduce dust effects on adjacent vegetation and wildlife habitat? Is the water being sourced from municipal sources or existing groundwater wells?	Review of project plans by Land Use Authority Permittee to confirm that dust control notes are present. Land Use Authority Permittee Permit Compliance staff to confirm that dust is being controlled appropriately and that water is sourced from municipal supplies or existing groundwater wells.	During design review. During construction, monthly inspection.	None.
BMP-6 (Construction Lighting)	Is the proponent using best information available at the time to minimize effects of light pollution on target species (e.g., western spadefoot, Ricksecker's water scavenger beetle)?	Land Use Authority Permittee review of proponent plans for AMM implementation. Land Use Authority Permittee or Implementing Entity review of field implementation and compare to current best practices.	During design review. During construction, monthly inspection.	Implementing Entity, in consultation with the TAC, to compile in first 12 months guidance related to light pollution and minimization measures for use by Land Use Authority Permittee. Implementing Entity to update every 5 years as necessary.
BMP-7 (Biological Monitor)	Is an approved biological monitor present on the project site during the required times? Have work stoppages been reported to the Wildlife Agencies? Have observations of listed species been reported to CDFW?	Periodic inspection of the project site by Land Use Authority Permittee Permit Compliance staff or the Implementing Entity to confirm presence of biological monitor. Review of monitoring reports submitted by biological monitor.	Monthly during construction.	Implementing Entity to develop checklist of qualifications for Approved Biologist in first 6 months, in coordination with the Wildlife Agencies.
BMP-8 (Training of Construction Staff)	Are construction staff being trained by an Approved Biologist regarding all	Implementing Entity review of documentation submitted that confirms	Monthly during construction.	Implementing Entity to describe contents of required

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
	requirements listed in the AMM? Has required documentation been submitted to the Implementing Entity?	every member of the construction staff has received the required training.		training of construction staff by Approved Biologist in first 6 months, in coordination with the Wildlife Agencies.
BMP-9 (Soil Compaction)	Did the proponent treat compacted soils after construction to restore water infiltration and soil hydrology to pre-project conditions?	Post-construction inspection of the project site by Land Use Authority Permittee Permit Compliance staff or the Implementing Entity to confirm that soil compaction treatments were applied.	Within one month after finishing restoration work.	Implementing Entity to develop in first 6 months requirements for compaction treatments of temporarily disturbed sites.
BMP-10 (Revegetation)	Did the proponent revegetate cut and fill slopes as required?	Post-construction inspection of the project site by Land Use Authority Permittee Permit Compliance staff or the Implementing Entity to confirm revegetation was done, and that it persists.	Within one month after finishing restoration work.	Implementing Entity to develop in first 6 months requirements for revegetation or restoration of temporarily disturbed sites.
BMP-11 (Speed Limit)	Are project-related vehicles observing the appropriate speed limits in the Plan Area?	Land Use Authority Permittee coordination with any biological monitors to ensure speed limit is being followed.	Monthly during construction.	None.
ROAD-1 (Road Project Location)	Did the project proponent avoid environmentally sensitive area to the maximum extent possible when selecting the location for a road project?	Land Use Authority Permittee will review project plans to determine that road projects have avoided sensitive environmental resources to the maximum extent feasible.	During design review.	None.
ROAD-2 (Wildlife Crossing Structures)	Does the design of the road project include wildlife crossing structures at required locations, and does the design	Land Use Authority Permittee will review project plans to determine that road projects have included wildlife	During design review, and post-construction.	Implementing Entity to develop in first 12 months detailed requirements for dry

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
	of the wildlife crossing meet all requirements for the targeted species?	crossing structures at all required locations. Land Use Authority Permittee, Implementing Entity and the TAC will approve final wildlife crossing designs		wildlife crossings and wildlife crossing that also provide hydrologic connectivity.
ROAD-3 (Roadside Pesticide Use)	For entities conducting roadside pesticide use, are label requirements being followed and are signs identifying restricted areas (e.g., California tiger salamander breeding ponds) placed?	Land Use Authority Permittee will coordinate with Approved Biologist to confirm label requirements are being followed and will post signs on road shoulders. Implementing Entity will confirm placement of road signs in sensitive areas.	Monthly during construction.	Implementing Entity to determine sign wording and designs in first 18 months so that they are consistent within the Plan Area.
NATURE TRAIL-1 (Nature Trail Plan)	Has a nature trail plan been prepared for each preserve that allows public access on a nature trail in the PMP? Does the trail plan meet requirements listed in the AMM?	Implementing Entity and Wildlife Agency review of trail plans. Public access not allowed without an approved trail plan.	During preparation of PMPs.	Implementing Entity to develop in first 18 months an outline for trail plans and required contents.
NATURE TRAIL-2 (Nature Trail Protection of Duripan)	Are trails in preserves avoiding impacts to the soil hardpan/duripan? Are trails remaining unpaved?	Implementing Entity field verification of trail locations and unpaved status.	During construction of nature trails.	None.
NATURE TRAIL-3 (Nature Trail Location)	Are trails in preserve avoiding impacts to sensitive resources?	Implementing Entity field verification of trail locations as they relate to sensitive resources.	During construction of nature trails.	Implementing Entity to develop in first 18 months a list of sensitive resources to be avoided by nature trails on Preserves.
NATURE TRAIL-4 (Biological Studies Prior to	Have biological studies been conducted during preparation of the trail plan? Do	Implementing Entity review of the trail plan and supporting documentation.	During preparation of PMPs.	Implementing Entity to develop in first 18 months a

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
Nature Trail Design)	they identify appropriate avoidance and minimization measures for trail construction and operation?			listing of required biological studies for trail plans.
NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Are nature trail impacts being monitored according to the PMP for that preserve? If monitoring indicates impacts, has use of the trail been discontinued?	Implementing Entity review of trail effects monitoring and coordination with Preserve Manager.	Monthly.	Implementing Entity to develop in first 18 months examples of thresholds for closure of nature trail, to be included in trail plans.
RE-ESTABLISHMENT/ ESTABLISHMENT-1 (Vernal Pool)	Are entities conducting SSHCP vernal pool re-establishment/establishment following the requirements identified in the AMM?	Implementing Entity review of vernal pool re-establishment/establishment plans. Field verification by Implementing Entity of vernal pool conditions and consistency with stated guidelines and plans.	During planning and design of re-establishment/ establishment activities, and during construction.	Implementing Entity to develop in first 6 months the outline and required contents of vernal pool re-establishment/establishment plans.
RE-ESTABLISHMENT/ ESTABLISHMENT-2 (Vernal Pool Inocula Bank)	Are soils from converted vernal pools being excavated and stored using the appropriate protocols? Are inocula soils placed in re-established and/ or established pools being sourced from the appropriate geologic formation and soil type?	Land Use Authority Permittee review of plans for projects converting vernal pools to ensure that they clearly state the disposition of vernal pool soils. Implementing Entity coordination with staff or contractors re-establishing or establishing vernal pools on preserves to ensure that inocula are correct.	During design review, and during implementation of re-establishment/ establishment plans.	Implementing Entity to develop in first 6 months plans for inocula banking (e.g., how long will inocula be considered viable, how will viability be confirmed, how will inocula from different sources be organized).
STREAM-1 (Laguna Creek Wildlife Corridor)	Are proponents establishing the appropriate size setback on Laguna Creek? Are trails being placed in the correct location within the setbacks?	Review of project plans by Land Use Authority to confirm that Laguna Creek setbacks are designed according to requirements, including locations of trails. Field verification by Land Use	During design review, and after implementation.	None.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
		Authority Permittee or Implementing Entity to confirm that Stream Setbacks are correctly established.		
STREAM-2 (UDA Stream Setbacks)	Are proponents establishing appropriate setbacks on Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek? Are trails being placed in the correct location within the setbacks?	Review of project plans by Land Use Authority Permittee to confirm that Stream Setbacks are designed according to requirements, including locations of trails. Field verification by Land Use Authority Permittee or Implementing Entity to confirm that Stream Setbacks are correctly established.	During design review, and after implementation.	None.
STREAM-3 (Minor Tributaries to UDA Streams)	Are proponents establishing appropriate setbacks on first and second order tributaries that are credited as avoided? Are trails being placed in the setbacks?	Review of project plans by Land Use Authority Permittee to confirm that Stream Setbacks are designed according to requirements, including locations of trails. Field verification by Land Use Authority Permittee or Implementing Entity to confirm that Stream Setbacks are correctly established.	During design review, and after implementation.	None.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
STREAM-4 (Minimize Effects from Temporary Channel Re-routing)	If stream channels are being re-routed during construction, are the measures identified in the AMM being implemented to avoid hydrological impacts?	Local Land Use Authority Permittee or Implementing Entity review of plans for temporary stream channel re-routing. Periodic inspection of the project site by Land Use Authority Permittee Permit Compliance staff or the Implementing Entity to confirm required measures are being implemented and maintained.	During design review, and monthly inspection.	None.
STREAM-5 (Design for Stream Channel Re-Routing)	Do designs for stream channel re-routing include the considerations outlined in the AMM?	Local Land Use Authority Permittee or Implementing Entity review of plans for stream channel re-routing. Local Land Use Authority Permittee or Implementing Entity field verification of project implementation.	During design review, and after implementation.	None.
UTILITY-1 (Avian Collision Avoidance)	Are new or relocated utility poles, lines and cell towers being designed in conformance with APLIC standards, as required under the AMM?	Local Land Use Authority Permittee or Implementing Entity review of plans for new or relocated utility poles, lines and cell towers.	During design review.	None.
UTILITY-2 (Utility Maintenance on Preserves)	When utility maintenance must occur on preserves with vernal pools, are the utilities adhering to AMM requirements on timing?	Preserve Manager will report to Implementing Entity on utility maintenance access and timing.	Monthly.	None.
UTILITY-3 (Trenchless Construction Methods)	Are trenchless construction methods being used in the locations required in the AMM?	Local Land Use Authority Permittee or Implementing Entity review of pipeline or conduit projects to confirm that trenchless construction methods have been specified in the required locations.	During design review.	None.

AGENDA ITEM 11.1

1412

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
UTILITY-4 (Siting of Entry and Exit Location)	When trenchless construction methods are used, are the entry and exit locations being sited to avoid vernal pools and riparian woodland.	Local Land Use Authority Permittee or Implementing Entity review of pipeline or conduit projects to confirm that trenchless construction entry and exit locations avoid vernal pools and riparian woodland.	During design review.	None.
LEVEE-1 (Preparation of Hydrologic Analysis)	If a PMP includes modification or breaching of an existing levee, or impeding flows on the water side of an existing levee, has a hydrologic analysis been conducted? If so and the analysis indicates that the activity would substantially increase flood stage elevations or flood risk outside the Preserve, has the levee activity been not implemented?	Implementing Entity review and approval of Draft Individual PMPs. Implementing Entity annual reporting of Preserve System activities.	Reporting included in Annual Reports.	None.
SPECIES-1 (Litter Removal Program)	Has a Litter Removal Program been prepared for each Covered Activity that implements Covered Species AMMs?	Review of Litter Removal Program by the Land Use Authority Permittee or Implementing Entity. Periodic inspection of the project site by Land Use Authority Permittee Permit Compliance staff or the Implementing Entity to confirm required measures are being implemented and maintained.	During design review, and monthly inspection.	Implementing Entity to provide in first 6 months a checklist for required contents of a litter removal program for use by Land Use Authority Permittee.
SPECIES-2 (No Pets in Construction Areas)	Have construction workers been informed that pets are not allowed on construction sites if a Covered Activity must implement Covered Species	Land Use Authority Permittee or Implementing Entity review of documentation that workers have received notification. Periodic	Monthly inspection.	None.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
	AMMs? Are pets present on construction sites where they are not allowed?	inspection of the project site by Land Use Authority Permittee Permit Compliance staff or the Implementing Entity to confirm pets are not present.		
SPECIES-3 (Take Report)	Is required reporting of take of Covered Species occurring?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure take is not unreported.	Monthly	Implementing Entity to develop in first 6 months the required contents of take report.
SPECIES-4 (Post Construction Compliance Report)	Did a completed Covered Activity submit its post-construction compliance report as required?	Land Use Authority Permittee or Implementing Entity review of post-construction compliance report.	Post-construction	Implementing Entity to develop in first 12 months the required contents of post-construction compliance report.
PLANT-1 (Rare Plant Surveys)	Are required surveys being conducted?	Land Use Authority or Implementing Entity review of application packages.	During project design.	Implementing Entity to develop in first 12 months protocols for Orcutt grass surveys in consultation with the TAC.
PLANT-2 (Rare Plant Protection	Are occurrences being protected as required?	If surveys indicate occurrences are present, Implementing Entity to work with project proponent to establish preserve.	Prior to project construction.	None.
ORCUTT-1 (Orcutt Grass Surveys)	Are required surveys being conducted?	Land Use Authority or Implementing Entity review of application packages.	During project design.	Implementing Entity to develop in first 12 months protocols for Orcutt grass surveys, in consultation with the TAC.

AGENDA ITEM 11.1

1414

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
ORCUTT-2 (Orcutt Grass Protection)	Are occurrences of Sacramento or slender Orcutt grass being protected as required?	If surveys indicate occurrences are present, Implementing Entity to work with project proponent to establish preserve.	Prior to project construction.	None.
CTS-1 (California Tiger Salamander Daily Construction Schedule)	Are construction activities in California tiger salamander modeled habitat restricted as required in the AMM?	Implementing Entity coordination with any biological monitors to ensure daily construction schedule is being followed.	Monthly during construction.	None.
CTS-2 (California Tiger Salamander Exclusion Fencing)	If construction activities are occurring in modeled habitat between October 15 and July 15, is required exclusion fencing being installed, inspected, and maintained?	Implementing Entity coordination with Approved Biologist is on-site to confirm exclusion fencing is installed, maintained, and is being inspected by the Approved Biologist.	Monthly during construction.	None.
CTS-3 (California Tiger Salamander Monitoring)	If construction activities are occurring in modeled habitat between October 15 and July 15, is an Approved Biologist on-site?	Implementing Entity coordination with any biological monitors to ensure an Approved Biologist is on-site.	Monthly during construction.	Implementing Entity to develop checklist of qualifications for Approved Biologist in first 6 months, in coordination with the Wildlife Agencies.
CTS-4 (Avoid California Tiger Salamander Entrapment)	If construction activities are occurring in modeled habitat between October 15 and July 15, are required steps being taken to avoid California tiger salamander entrapment?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.
CTS-5 (California Tiger Salamander Encounter Protocol)	If construction activities are occurring in modeled habitat between October 15 and July 15, are required encounter protocols being followed?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat)	If erosion control is implemented in California tiger salamander modeled habitat, does it adhere to the requirements of the AMM?	Review of erosion control materials by Land Use Authority Permittee, Permit Compliance staff and/or by Biological Monitor, if present.	Monthly during construction.	None.
	Have the requirements been included in the bid solicitation package for the contractor?	Land Use Authority Permittee review of bid solicitation package.	Before project proponent issues bid solicitation package.	None.
CTS-7 (Rodent Control)	If rodent control is used on a Covered Activity project site, is it restricted to the developed portion of the project site	Implementing Entity coordination with any biological monitors to ensure rodent control use is appropriately restricted.	Monthly during construction.	Implementing Entity to define "developed portion of site" for use by biological monitors, and describe any additional restrictions on types of allowable rodent control, both in first 6 months.
WS-1 (Western Spadefoot Work Window)	Are Covered Activities within western spadefoot modeled habitat occurring between May 15 and October 15 only?	Land Use Authority Permittee review of construction plans, confirmation of construction timing by Permit Compliance staff.	During plan check and monthly during construction.	None.
WS-2 (Western Spadefoot Exclusion Fencing)	If construction activities are occurring in modeled habitat between October 15 and May 15, is required exclusion fencing being installed, inspected, and maintained?	Implementing Entity coordination with Approved Biologist is on-site to confirm exclusion fencing is installed, maintained, and is being inspected by the Approved Biologist.	Monthly during construction.	None.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
WS-3 (Western Spadefoot Monitoring)	If construction activities are occurring in modeled habitat between October 15 and May 15, is an Approved Biologist on-site?	Implementing Entity coordination with any biological monitors to ensure an Approved Biologist is on-site.	Monthly during construction.	Implementing Entity to develop checklist of qualifications for Approved Biologist in first 6 months, in coordination with the Wildlife Agencies.
WS-4 (Avoid Western Spadefoot Entrapment)	If construction activities are occurring in modeled habitat between October 15 and May 15, are required steps being taken to avoid western spadefoot entrapment?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.
WS-5 (Erosion Control Materials in Western Spadefoot Habitat)	If erosion control is implemented in western spadefoot modeled habitat, does it adhere to the requirements of the AMM?	Review of erosion control materials by Land Use Authority Permittee, Permit Compliance staff and/or by Biological Monitor, if present.	Monthly during construction.	None.
	Have the requirements been included in the bid solicitation package for the contractor?	Land Use Authority Permittee review of bid solicitation package.	Before project proponent issues bid solicitation package.	None.
WS-6 (Western Spadefoot Encounter Protocol)	If construction activities are occurring in modeled habitat between October 15 and May 15, are required encounter protocols being followed?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.
GGS-1 (Giant Garter Snake Surveys)	Are planning surveys being conducted for Covered Activities occurring in giant gartersnake modeled habitat? Are areas of giant gartersnake habitat on the project site delineated and avoided?	Land Use Authority Permittee review of planning surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months protocol for giant gartersnake planning surveys.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
GGS-2 (Giant Garter Snake Work Window)	Are Covered Activities within giant gartersnake modeled habitat occurring between May 1 and September 15 only?	Land Use Authority Permittee review of construction plans, confirmation of construction timing by Permit Compliance staff.	During plan check and monthly during construction.	None.
GGS-3 (Giant Gartersnake Monitoring)	If construction activities are occurring in modeled habitat between September 15 and May 1, is an Approved Biologist on-site?	Implementing Entity coordination with any biological monitors to ensure an Approved Biologist is on-site.	Monthly during construction.	Implementing Entity to develop checklist of qualifications for Approved Biologist in first 6 months, in coordination with the Wildlife Agencies.
GGS-4 (Giant Garter Snake Habitat Dewatering and Exclusion)	If construction activities are occurring in modeled habitat between September 15 and May 1, was the habitat dewatered and has required exclusion fencing being installed, inspected, and maintained?	Implementing Entity coordination with Approved Biologist is on-site to confirm dewatering has occurred and that exclusion fencing is installed, maintained, and is being inspected by the Approved Biologist.	Monthly during construction.	Implementing Entity to develop in first 12 months requirements for dewatering plans.
GGS-5 (Avoid Giant Gartersnake Entrapment)	If construction activities are occurring in modeled habitat between September 15 and May 1, are required steps being taken to avoid giant gartersnake entrapment?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.
GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat)	If erosion control is implemented in giant gartersnake modeled habitat, does it adhere to the requirements of the AMM?	Review of erosion control materials by Land Use Authority Permittee, Permit Compliance staff and/or by Biological Monitor, if present.	Monthly during construction.	None.
	Have the requirements been included in the bid solicitation package for the contractor?	Land Use Authority Permittee review of bid solicitation package.	Before project proponent issues bid solicitation package.	None.

AGENDA ITEM 11.1

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
GGS-7 (Giant Gartersnake Encounter Protocol)	If construction activities are occurring in modeled habitat between September 15 and May 1, are required encounter protocols being followed?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.
GGS-8 (Giant Gartersnake Post Construction Restoration)	Have temporarily disturbed areas been revegetated or otherwise restored to pre-project conditions?	Implementing Entity review of photodocumentation submitted by project proponent.	Photodocumentation submitted one month after finishing restoration work.	Implementing Entity to develop list of requirements for revegetation or restoration of temporarily disturbed sites.
WPT-1 (Western Pond Turtle Surveys)	Are planning surveys being conducted for Covered Activities occurring in western pond turtle modeled habitat? Are areas of western pond turtle habitat on the project site delineated and avoided?	Land Use Authority Permittee review of planning surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months a protocol for planning surveys for western pond turtle.
WPT-2 (Western Pond Turtle Work Window)	Are Covered Activities within giant gartersnake modeled habitat occurring between May 1 and September 15 only?	Land Use Authority Permittee review of construction plans, confirmation of construction timing by Permit Compliance staff.	During plan check and monthly during construction.	None.
WPT-3 (Western Pond Turtle Monitoring)	If construction activities are occurring in modeled habitat between September 15 and May 1, is an Approved Biologist on-site?	Implementing Entity coordination with any biological monitors to ensure an Approved Biologist is on-site.	Monthly during construction.	Implementing Entity to develop checklist of qualifications for Approved Biologist in first 6 months, in coordination with the Wildlife Agencies.
WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	If construction activities are occurring in modeled habitat between September 15 and May 1, was the habitat dewatered	Implementing Entity coordination with Approved Biologist is on-site to confirm dewatering has occurred and that	Monthly during construction.	Implementing Entity to develop in first 12 months requirements for dewatering

	and has required exclusion fencing being installed, inspected, and maintained?	exclusion fencing is installed, maintained, and is being inspected by the Approved Biologist.		plans.
WPT-5 (Avoid Western Pond Turtle Entrapment)	If construction activities are occurring in modeled habitat between September 15 and May 1, are required steps being taken to avoid giant gartersnake entrapment?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.
WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat)	If erosion control is implemented in western pond turtle modeled habitat, does it adhere to the requirements of the AMM?	Review of erosion control materials by Land Use Authority Permittee, Permit Compliance staff and/or by Biological Monitor, if present.	Monthly during construction.	None.
	Have the requirements been included in the bid solicitation package for the contractor?	Land Use Authority Permittee review of bid solicitation package.	Before project proponent issues bid solicitation package.	None.
WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit)	Is the project proponent complying with the required speed limit, if a Covered Activity is located in western pond turtle modeled habitat?	Land Use Authority Permittee coordination with any biological monitors to ensure speed limit is being followed.	Monthly during construction.	None.
WPT-8 (Western Pond Turtle Encounter Protocol)	If construction activities are occurring in modeled habitat between September 15 and May 1, are required encounter protocols being followed?	Implementing Entity review of Take Reports, and coordination with any biological monitors to ensure proper protocols are being used.	Monthly during construction.	None.
WPT-9 (Western Pond Turtle Post Construction Restoration)	Have temporarily disturbed areas been revegetated or otherwise restored to pre-project conditions?	Implementing Entity review of photodocumentation submitted by project proponent.	Photodocumentation submitted one month after finishing restoration work.	Implementing Entity to develop list of requirements for revegetation or restoration of temporarily disturbed sites.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
TCB-1 (Tricolored Blackbird Surveys)	Are planning surveys being conducted for Covered Activities occurring in tricolored blackbird modeled habitat? Are known tricolored blackbird nesting colonies on the project site delineated and avoided during nesting?	Land Use Authority Permittee review of design surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months a protocol for design surveys for tricolored blackbird.
TCB-2 (Tricolored Blackbird Pre-Construction Surveys)	Are pre-construction surveys being conducted?	Land Use Authority Permittee review of pre-construction surveys.	Prior to construction.	Implementing Entity to develop in first 6 months protocol for tricolored blackbird pre-construction surveys.
TCB-3 (Tricolored Blackbird Nest Setback)	If a nest is present on the Covered Activity Project site, has a 500-foot nest setback been established?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding setback. Confirmation of avoidance by Permit Compliance staff.	During construction, weekly contact with Approved Biologist.	None.
TCB-4 (Tricolored Blackbird Nest Setback Monitoring)	If a nest setback has been established, is the Approved Biologist monitoring behavior of the tricolored blackbirds to ensure they are not disturbed by the Covered Activities occurring within the setback?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding setback. Review of monitoring reports submitted by Approved Biologist.	Monthly.	Implementing Entity to develop in first 6 months a monitoring protocol for tricolored blackbird nest setbacks.
TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	Are the restrictions on harvest timing and pesticide use being complied with?	Implementing Entity periodic inspection of Cropland preserve to confirm compliance.	Monthly between January 1 and June 30.	Implementing Entity to develop in first 12 months, in coordination with the TAC details on pesticide use timing and harvest timing to avoid take of nesting tricolored blackbirds.

AGENDA ITEM 11.1

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
SWHA-1 (Swainson's Hawk Surveys)	Are planning surveys being conducted for Covered Activities occurring in Swainson's hawk modeled habitat? Are areas of Swainson's hawk habitat on the project site delineated and avoided?	Land Use Authority Permittee review of planning surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months a protocol for planning surveys for Swainson's hawk.
SWHA-2 (Swainson's Hawk Pre-Construction Surveys)	Are pre-construction surveys being conducted?	Land Use Authority Permittee review of pre-construction surveys.	Prior to construction.	Implementing Entity to develop in first 6 months a protocol for Swainson's hawk pre-construction surveys.
SWHA-3 (Swainson's Hawk Nest Buffer)	If a nest is present on the Covered Activity Project site, has a 0.25-mile nest buffer been established?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding nest buffer. Confirmation of avoidance by Permit Compliance staff.	During construction, weekly contact with Approved Biologist.	None.
SWHA-4 (Swainson's Hawk Nest Buffer Monitoring)	If a nest buffer has been established, is the Approved Biologist monitoring behavior of the Swainson's hawks within the nest buffer to ensure they are not disturbed by the Covered Activity?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding nest buffer. Review of monitoring reports submitted by Approved Biologist.	Monthly.	Implementing Entity to develop in first 6 months a monitoring protocol for Swainson's hawk nest buffer.
GSC-1 (Greater Sandhill Crane Surveys)	Are planning surveys being conducted for Covered Activities occurring in greater sandhill crane modeled habitat? Are areas of greater sandhill crane habitat on the project site delineated and avoided?	Land Use Authority Permittee review of planning surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months a protocol for planning surveys for greater sandhill crane.

AGENDA ITEM 11.1

1422

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
GSC-2 (Greater Sandhill Crane Pre-Construction Surveys)	Are pre-construction surveys being conducted?	Land Use Authority Permittee review of pre-construction surveys.	Prior to construction.	Implementing Entity to develop in first 6 months a protocol for greater sandhill crane pre-construction surveys.
GSC-3 (Greater Sandhill Crane Roost Buffer)	If a roost is present on the Covered Activity Project site, has a 0.5-mile roosting setback been established?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding roost buffer. Confirmation of avoidance by Permit Compliance staff.	During construction, weekly contact with Approved Biologist.	None.
GSC-4 (Greater Sandhill Crane Visual Barrier)	If project-related activities occur within the 0.5-mile roosting buffer, has a visual barrier been constructed according to requirements?	Land Use Authority Permittee review of construction plans to ensure visual barrier is included, confirmation of appropriate visual barrier by Permit Compliance staff.	Project-specific	Implementing Entity to develop in first 18 months specifications for visual barrier to protect greater sandhill crane.
GSC-5 (Greater Sandhill Crane Roost Buffer Monitoring)	If a roost buffer has been established and project activities are occurring within the roost buffer, is the Approved Biologist monitoring behavior of the greater sandhill crane to ensure they are not disturbed by the Covered Activity?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding roost buffer. Review of monitoring reports submitted by Approved Biologist.	Monthly.	Implementing Entity to develop in first 6 months a monitoring protocol for greater sandhill crane roost buffers.
WBO-1 (Western Burrowing Owl Surveys)	Are planning surveys being conducted for Covered Activities occurring in western burrowing owl modeled habitat? Are areas of western burrowing owl habitat on the project site delineated and avoided?	Land Use Authority Permittee review of planning surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months a protocol for planning surveys for western burrowing owl.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
WBO-2 (Western Burrowing Owl Preconstruction Surveys)	Are pre-construction surveys being conducted?	Land Use Authority Permittee review of pre-construction surveys.	Prior to construction.	Implementing Entity to develop in first 6 months a protocol for western burrowing owl pre-construction surveys.
WBO-3 (Burrowing Owl Avoidance)	If burrowing owls are present within the project site during the breeding season, are they being avoided? If construction must occur inside the 250-foot setback, has an avoidance and minimization plan been prepared and implemented? If during the non-breeding season, are owls being avoided, or have unoccupied burrows been excavated?	Land Use Authority Permittee and/or Implementing Entity and Wildlife Agency review of avoidance and minimization plan. Periodic inspection of project site to verify compliance with approved plan. Is behavior of burrowing owls being monitored by an Approved Biologist?	Prior to construction, monitoring during construction.	Implementing Entity to develop in first 6 months requirements for burrowing owl avoidance and minimization plans.
WBO-4 (Burrowing Owl Construction Monitoring)	If a setback has been established, is the Approved Biologist monitoring compliance with the setback and behavior of the western burrowing owls to ensure they are not disturbed by the Covered Activity?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding setback. Review of monitoring reports submitted by Approved Biologist.	Monthly.	Implementing Entity to develop in first 6 months a monitoring protocol for western burrowing owl nest setbacks.
WBO-5 (Burrowing Owl Passive Relocation)	Is passive relocation restricted to only instances where it is expressly approved by the Wildlife Agencies, and conducted according to the requirements of the measure?	Wildlife Agency review of passive relocation requests. Review of monitoring reports submitted by Approved Biologist.	Project-by-project	None.

AGENDA ITEM 11.1

1424

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
WBO-6 (Burrowing Owl Timing of Maintenance Activities)	Are activities near preserves, preserve setbacks, or Stream Setbacks timed to avoid effects on occupied burrows of western burrowing owls?	Case-by-case review by the Implementing Entity of activities occurring in preserves and setbacks.	Ongoing, as new activities are proposed	None
WBO-7 (Rodent Control)	If rodent control is used on a Covered Activity project site, is it restricted to the developed portion of the project site	Implementing Entity coordination with any biological monitors to ensure rodent control use is appropriately restricted.	Monthly during construction.	Implementing Entity to define "developed portion of site" for use by biological monitors, and describe any additional restrictions on types of allowable rodent control, both in first 6 months.
RAPTOR-1 (Raptor Surveys)	Are planning surveys being conducted for Covered Activities occurring in raptor Covered Species modeled habitat? Are areas of raptor habitat on the project site delineated and avoided?	Land Use Authority Permittee review of planning surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months a protocol for planning surveys for northern harrier, ferruginous hawk, white-tailed kite and Cooper's hawk.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
RAPTOR-2 (Raptor Pre-Construction Surveys)	Are pre-construction surveys being conducted?	Land Use Authority Permittee review of pre-construction surveys.	Prior to construction.	Implementing Entity to develop in first 6 months a protocol for pre-construction surveys for northern harrier, ferruginous hawk, white-tailed kite and Cooper's hawk.
RAPTOR-3 (Raptor Nest/Roost Buffer)	If a nest or roost is present on the Covered Activity project site, has a 0.25-mile nest/roost buffer been established?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding nest/roost buffer. Confirmation of avoidance by Permit Compliance staff.	During construction, weekly contact with Approved Biologist.	None.
RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring)	If a nest/roost buffer has been established, is the Approved Biologist monitoring behavior of raptor Covered Species within the setback to ensure they are not disturbed by the Covered Activity?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding nest/roost buffers. Review of monitoring reports submitted by Approved Biologist.	Monthly.	Implementing Entity to develop in first 6 months a monitoring protocol for nest/roost buffers for northern harrier, ferruginous hawk, white-tailed kite and Cooper's hawk.
BAT-1 (Winter Hibernaculum Surveys)	Are planning surveys being conducted for Covered Activities occurring in western red bat modeled habitat? Are winter hibernacula on the project site delineated and avoided?	Land Use Authority Permittee review of planning surveys and construction plans, confirmation of avoidance by Permit Compliance staff.	During plan check and monthly during construction.	Implementing Entity to develop in first 6 months a protocol for western red bat winter hibernaculum planning surveys.
BAT-2 (Winter Hibernaculum Pre-Construction Surveys)	Are pre-construction surveys being conducted?	Land Use Authority Permittee review of pre-construction surveys.	Prior to construction.	Implementing Entity to develop in first 6 months a protocol for western red bat pre-construction surveys.

Table 8-2
Framework for SSHCP AMM Compliance Monitoring

AMM	What do we need to know to assess compliance?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program
BAT-3 (Winter Hibernaculum Buffer)	If a winter hibernaculum is present on the Covered Activity Project site, has a 300-foot winter hibernaculum buffer been established?	Implementing Entity and/or Land Use Authority Permittee coordination with Approved Biologist regarding winter hibernaculum buffer. Confirmation of avoidance by Permit Compliance staff.	During construction, weekly contact with Approved Biologist.	None.
BAT-4 (Bat Eviction Methods)	If direct effects to a non-maternity roost cannot be avoided on a Covered Activity project site, is an Approved Biologist using safe eviction methods to remove bats?	Implementing Entity and Wildlife Agency coordination with Approved Biologist regarding non-maternity roosts and eviction techniques. Review of monitoring reports submitted by Approved Biologist.	During construction, as-needed contact with Approved Biologist	Implementing Entity to develop in first 12 months a protocol for safe eviction of western burrowing owl.

.

8.2.3 AMM Effectiveness Monitoring

In addition to monitoring compliance with SSHCP AMM requirements, the SSHCP Compliance and AMM Monitoring Program will monitor the effectiveness of each SSHCP AMM to assure that each AMM is avoiding or minimizing effects of Covered Activities on Covered Species and SSHCP natural land cover types to the extent assumed during the preparation of the SSHCP Conservation Strategy, and as assumed by the SSHCP impact analysis (Chapter 6). The results of AMM effectiveness monitoring will be used to adaptively modify an AMM, if that is necessary to reduce adverse effects to Covered Species and SSHCP natural land cover types. The effectiveness of the operational Conservation Strategy will be monitored through the SSHCP Preserve System Monitoring and Management Program, as described in Section 8.3.

The effectiveness of each SSHCP AMM will be monitored by the methods and processes summarized in Table 8-3.

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
LID-1 (Stormwater Quality)	Are stormwater quality measures preventing effects to Preserves?	Special study for pre- and post-project edge conditions on Preserves (Section 8.3.3.5).	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.
LID-2 (Groundwater Recharge)	Only compliance monitoring required (Table 8-2).			
LID-3 (Natural Site Features)	No effectiveness monitoring required.			
EDGE-1 (Compatible Land Uses):	Are compatible land uses minimizing indirect effects to Preserves and Covered Species on Preserves?	Special study for pre- and post-project edge conditions (e.g., noise, ground vibration, light, hydrology, non-native species) on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.
EDGE-2 (Single-Loaded Streets)	Are single-loaded streets minimizing indirect effects to Preserves and Covered Species on Preserves?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.

AGENDA ITEM 11.1
1429

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
EDGE-3 (Preserve Setbacks)	Are Preserve Setbacks minimizing indirect effects to Preserves and Covered Species on Preserves?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.
EDGE-3a (Setback Recreational Trails)	Are trails or other allowed facilities in Preserve Setbacks designed according to the requirements of EDGE-3a preventing direct and indirect effects to Covered Species and Covered Species modeled habitat on Preserves?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.
EDGE-3b (Setback Firebreaks)	Are firebreaks in Preserve Setbacks designed according to the requirements of EDGE-3b preventing direct and indirect effects to Covered Species and Covered Species modeled habitat on Preserves?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.

AGENDA ITEM 11.1

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
EDGE-3c (Setback Shade Trees and Landscaping)	Are shade trees and landscaping in Preserve Setbacks designed according to the requirements of EDGE-3c preventing direct and indirect effects to Covered Species and Covered Species modeled habitat on Preserves?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.
EDGE-4 (Locate Stormwater Control Outside Preserves)	Only compliance monitoring required (Table 8-2).			
EDGE-5 (Stormwater Control in Preserve Setbacks)	Is trail runoff within Preserve Setbacks being collected and prevented from entering Preserves?	Implementing Entity inspection of Preserve Setbacks during rain events.	Annually during rain events	Implementing Entity to develop methodology to be used to evaluate effectiveness of stormwater control in first 18 months after permit issuance.
EDGE-6 (Detention Basins in Linkage Preserves)	Is the detention basin causing adverse effects to the surrounding Preserve?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5.	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.
EDGE-7 (Hardpan/Duripan Protection)	If the hardpan/duripan has been repaired, did the repair restore the perched aquifer?	Periodic inspection of vernal pools around the repair area to	Annually after spring filling of pools.	Implementing Entity to develop within first 18

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
		determine whether subsurface hydrology is intact.		months the methods for assessing success of hardpan/duripan repairs.
EDGE-8 (Outdoor Lighting)	Is lighting being controlled so that it does not spill onto Preserves and affect Covered Species in the Preserves?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, periodic post-project studies beginning no less than 5 years after project completion, as described in Section 8.3.3.5	Implementing Entity to develop prior to SSHCP permit issuance a methodology for special study for pre-project edge conditions on Preserves. Same methodology will be used for post-project conditions.
EDGE-9 (Livestock Access to Preserves)	Is the designated livestock access point functioning to minimize effects to the preserve?	Implementing Entity inspection of the livestock access point for vegetation damage and area of effects.	Annually in spring.	None.
EDGE-10 (Prevent Invasive Species Spread)	Are invasive species being controlled before entering Preserves?	Implementing Entity implements Invasive Species Monitoring and Eradication Program.	Quarterly weed assessment on preserves, with other opportunistic assessment.	Implementing Entity to develop Invasive Species Monitoring and Eradication Program in first 18 months.
BMP-1 (Construction Fencing)	Are construction activities occurring only within the construction fencing?	Inspection of the project site by Implementing Entity or Land Use Authority Permittee.	Monthly during construction.	None.
BMP-2 (Erosion Control)	Are temporary erosion control measures working to prevent sediment, stormwater, and pollutant runoff?	Inspection of the project site by Implementing Entity or Land Use Authority Permittee.	Monthly during construction.	None.
BMP-3 (Equipment Storage and Fueling)	Is the designated storage and fueling area preventing ground disturbance and	Inspection of the project site by Implementing Entity or Land	Monthly during construction.	None.

AGENDA ITEM 11.1
1432

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
	discharge of hazardous materials outside the development footprint?	Use Authority Permittee.		
BMP-4 (Erodible Materials)	Are erodible materials from the project site entering waterways?	Inspection of the project site by Implementing Entity or Land Use Authority Permittee.	Monthly during construction.	None.
BMP-5 (Dust Control)	Is dust control effective in minimizing effects on Preserves?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
BMP-6 (Construction Lighting)	Are lighting restrictions minimizing effects on light-sensitive Covered Species?	Inspection of any night operations at the project site by Implementing Entity or Land Use Authority Permittee.	Project-by-project, depends on if night construction is occurring.	None.
BMP-7 (Biological Monitor)	Is the biological monitor responding appropriately when Covered Species are detected on the Project Site, or when they determine that Covered Species are being harmed/harassed by construction activities?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
BMP-8 (Training of Construction Staff)	Are construction staff demonstrating that they understand the required AMMs and are implementing them appropriately?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
BMP-9 (Soil Compaction)	Is the soil after compaction treatment allowing infiltration?	Inspection of the project site by Implementing Entity or Land Use Authority Permittee.	One post-construction inspection during a rain event.	None.
BMP-10 (Revegetation)	Is the revegetated slope preventing erosion and runoff into SSHCP Preserves, Preserve Setbacks, or Stream Setbacks?	Inspection of the project site by Implementing Entity or Land Use Authority Permittee.	Post-construction, annual inspection during a rain event.	None.

AGENDA ITEM 11.1

1433

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
BMP-11 (Speed Limit)	Is the speed limit in modeled habitat eliminating collisions with Covered Species?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
ROAD-1 (Road Project Location)	Are the selected road project locations minimizing edge effects on adjacent Preserves?	Special study for pre- and post-project edge conditions on Preserves, as described in Section 8.3.3.5.	Pre-project study before development occurs, post-project study no less than 5 years after project completion.	Implementing Entity to develop before SSHCP permit issuance a preliminary methodology for a special study on baseline edge effects from road projects.
ROAD-2 (Wildlife Crossing Structures)	Are wildlife using the wildlife crossing structures?	Special study for wildlife use of crossings, as described in Section 8.3.3.5.	Study conducted after at least half of crossings are constructed.	Implementing Entity to develop in first 18 months the preliminary methodology for special study to determine wildlife use of wildlife crossing structures, including deployment of cameras or survey for sign (e.g., tracks, scat).
ROAD-3 (Roadside Pesticide Use)	Is the weed removal protocol and signage along roadways effective in removing weed infestations and protecting Covered Species habitat?	Inspections for non-native plant infestations as directed under Objective HAB-4.	As directed by Objective HAB-4 and related Conservation Actions.	Implementing Entity to develop in first 18 months a protocol for determining whether control measures are working on non-native plant infestations.
NATURE TRAIL-1 (Nature Trail Plan)	Are the management techniques outlined in the Trail Plan preventing impacts from trail use?	Monitoring of persistent disturbance on and near nature trails, including vegetation loss, trash, soil disturbance.	Periodic observations by Preserve staff, summary of observations in Annual Reports.	None.

AGENDA ITEM 11.1
1434

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
NATURE TRAIL-2 (Nature Trail Protection of Duripan)	Only compliance monitoring required (Table 8-2).			
NATURE TRAIL-3 (Nature Trail Location)	Only compliance monitoring required (Table 8-2).			
NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design)	Only compliance monitoring required (Table 8-2).			
NATURE TRAIL-5 (Monitoring of Nature Trail Impacts)	Only compliance monitoring required (Table 8-2).			
RE-ESTABLISHMENT/ ESTABLISHMENT-1 (Vernal Pool)	Does the re-established and/ or established vernal pool meet success criteria, as approved by the Permitting Agencies in the SSHCP Preserve System Monitoring and Management Program?	Monitor attainment of success criteria as described in the SSHCP Preserve System Monitoring and Management Program.	Starting one year after re-establishment/establishment, repeated annually.	In first 18 months, Implementing Entity to develop success criteria for re-established/established vernal pool in consultation with the TAC and Permitting Agencies.
RE-ESTABLISHMENT/ ESTABLISHMENT-2 (Vernal Pool Inocula Bank)	Is the vernal pool inocula bank preserving viable inocula, and is it proving functional for vernal pool re-establishment/ establishment efforts?	Implementing Entity sampling of vernal pool inocula banks and sampling for cysts/seeds. Review of success criteria. Conduct a special study on long-term effectiveness of the inocula bank.	Annual inspection of inocula banks. Annual review of success criteria	Implementing Entity to develop in first 6 months plans for inocula banking (e.g., how long will inocula be considered viable, how will viability be confirmed, how will inocula from different sources be organized). Implementing Entity to develop in first 18 months a special study methodology to study the effectiveness of inoculation.

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
STREAM-1 (Laguna Creek Wildlife Corridor)	Are the setbacks adequate to minimize direct and indirect effects to Laguna Creek, and to allow wildlife movement through the Wildlife Corridor?	Periodic inspection of setbacks by Implementing Entity or Land Use Authority Permittee, using checklist. Special study to evaluate wildlife use of corridor.	Quarterly inspections, and special study as described in Section 8.3.3.5.	Implementing Entity to develop in first 18 months a checklist for evaluating condition of setback (e.g., trash, light pollution, non-native species, removal of land cover types). Implementing Entity to develop in first 18 months a preliminary design for a special study examining wildlife usage of the Laguna Creek Wildlife Corridor.
STREAM-2 (UDA Stream Setbacks)	Are the setbacks adequate to minimize direct and indirect effects to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Central Paseo, and Sun Creek?	Periodic inspection of setbacks by Implementing Entity or Land Use Authority Permittee, using checklist.	Quarterly	Implementing Entity to develop in first 18 months a checklist for evaluating condition of setback (e.g., trash, light pollution, non-native species, removal of land cover types).
STREAM-3 (Minor Tributaries to UDA Streams)	Are the 25-foot setbacks adequate to minimize direct and indirect effects to minor tributaries?	Periodic inspection of setback by Implementing Entity or Land Use Authority Permittee, using checklist.	Quarterly	Implementing Entity to develop in first 18 months a checklist for evaluating condition of setback (e.g., trash, light pollution, non-native species, removal of land cover types).

AGENDA ITEM 11.1

1436

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
STREAM-4 (Minimize Effects from Temporary Channel Re-routing)	Is implementation of the required measures avoiding adverse effects to water quality?	Implementing Entity visual inspection of the Project Site, Implementing Entity review of Post-Construction Compliance Report from Approved Biologist as directed by AMM SPECIES-4.	Monthly visual inspection, post-construction review of report.	None.
STREAM-5 (Design for Stream Channel Re-Routing)	Is the re-routed stream channel providing modeled habitat for aquatic Covered Species?	Implementing Entity inspection of the project site.	Every 5 years, starting 5 years after completion of re-establishment/establishment.	None.
UTILITY-1 (Avian Collision Avoidance)	How many Covered Species bird collisions or electrocutions are occurring on Plan Area utility lines?	Implementing Entity review of take reports submitted by Plan Area utility companies.	As reports are available.	None.
UTILITY-2 (Utility Maintenance on Preserves)	Is the restriction on timing for maintenance near vernal pools in SSHCP Preserves or Preserve Setbacks preventing effects to vernal pools?	Implementing Entity inspection of maintenance sites after utility work has been completed.	As needed	None.
UTILITY-3 (Trenchless Construction Methods)	Only compliance monitoring required (Table 8-2).			
UTILITY-4 (Siting of Entry and Exit Location)	Only compliance monitoring required (Table 8-2).			
LEVEE-1 (Preparation of Hydrologic Analysis)	Are activities allowed under an approved PMP resulting in increased flood stage elevations or flood risk outside the Preserves?			

AGENDA ITEM 11.1

1437

Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
SPECIES-1 (Litter Removal Program)	Is implementation of the Litter Removal Program preventing effects on Covered Species habitat?	Periodic inspection of the project site by Land Use Authority Permittee Permit Compliance staff or the Implementing Entity to determine effectiveness of the Program.	Monthly	None.
SPECIES-2 (No Pets in Construction Areas)	Only compliance monitoring required (Table 8-2).			
SPECIES-3 (Take Report)	Only compliance monitoring required (Table 8-2).			
SPECIES-4 (Post Construction Compliance Report)	Only compliance monitoring required (Table 8-2).			
PLANT-1 (Rare Plant Surveys)	Only compliance monitoring required (Table 8-2).			
PLANT-2 (Rare Plant Protection	Is the preserve established for the occurrence providing sufficient protection from direct and indirect effects?	Conduct a population study of preserved species. For study plots, also monitor hydrology and non-native species to correlate changes in environmental conditions with population data.	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the plant population study.
ORCUTT-1 (Orcutt Grass Surveys)	Only compliance monitoring required (Table 8-2).			
ORCUTT-2 (Orcutt Grass Protection)	Is the Preserve established for the Orcutt grass occurrence providing sufficient protection from direct and indirect effects?	Conduct a population study of preserved Orcutt grasses. For study plots, also monitor hydrology and non-native species to correlate changes in	Annual within study plots for 10 years, every 5 years after trend established	Implementing Entity to describe in first 12 months a protocol for the Sacramento Orcutt grass population study.

Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
		environmental conditions with population data.		
CTS-1 (California Tiger Salamander Daily Construction Schedule)	Is the daily construction schedule avoiding the California tiger salamander's active period of day?	Implementing Entity review of Post-Construction Compliance Report from Approved Biologist as directed by AMM SPECIES-4.	After construction.	None.
CTS-2 (California Tiger Salamander Exclusion Fencing)	Is exclusion fencing preventing California tiger salamander from entering the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
CTS-3 (California Tiger Salamander Monitoring)	Is the biological monitor responding appropriately when California tiger salamander are found in or near the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
CTS-4 (Avoid California Tiger Salamander Entrapment)	Are any California tiger salamanders being entrapped in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
CTS-5 (California Tiger Salamander Encounter Protocol)	Is the encounter protocol minimizing effects to California tiger salamanders found in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat)	Are any California tiger salamanders being entrapped in erosion control materials?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
CTS-7 (Rodent Control)	Only compliance monitoring required (Table 8-2).			
WS-1 (Western Spadefoot Work Window)	Is the work window fully avoiding the active season of western spadefoot?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.

AGENDA ITEM 11.1
1439

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
WS-2 (Western Spadefoot Exclusion Fencing)	Is exclusion fencing preventing western spadefoot from entering the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WS-3 (Western Spadefoot Monitoring)	Is the biological monitor responding appropriately when western spadefoot are found in or near the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WS-4 (Avoid Western Spadefoot Entrapment)	Are any western spadefoot being entrapped in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WS-5 (Erosion Control Materials in Western Spadefoot Habitat)	Are any western spadefoot being entrapped in erosion control materials?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WS-6 (Western Spadefoot Encounter Protocol)	Is the encounter protocol minimizing effects to western spadefoot found in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
GGS-1 (Giant Gartersnake Surveys)	No effectiveness monitoring required.			
GGS-2 (Giant Gartersnake Work Window)	Is the work window fully avoiding the active season of giant gartersnake?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
GGS-3 (Giant Gartersnake Monitoring)	Is the biological monitor responding appropriately when giant gartersnake are found in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion)	Is dewatering and exclusion preventing giant gartersnakes from entering the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.

AGENDA ITEM 11.1

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
GGS-5 (Avoid Giant Gartersnake Entrapment)	Are any giant gartersnakes being entrapped in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat)	Are any giant gartersnakes being entrapped in erosion control materials?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
GGS-7 (Giant Gartersnake Encounter Protocol)	Is the encounter protocol minimizing effects to giant gartersnakes found in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
GGS-8 (Giant Gartersnake Post Construction Restoration)	Is the specified restoration resulting in suitable habitat for giant gartersnake?	Implementing Entity or Land Use Authority Permittee inspection of restoration area.	Immediately post-restoration; repeat inspection after 1 year and 5 years.	Implementing Entity to develop in first 12 months a checklist to be used in the field when evaluating the restoration effort.
WPT-1 (Western Pond Turtle Surveys)	Only compliance monitoring required (Table 8-2).			
WPT-2 (Western Pond Turtle Work Window)	Is the work window fully avoiding the active season of western pond turtle?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WPT-3 (Western Pond Turtle Monitoring)	Is the biological monitor responding appropriately when western pond turtle are found in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion)	Is dewatering and exclusion fencing preventing western pond turtle from entering the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.

AGENDA ITEM 11.1

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
WPT-5 (Western Pond Turtle Entrapment)	Are any western pond turtle entrapped in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat)	Are any giant gartersnakes entrapped in erosion control materials?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit)	Is the speed limit in western pond turtle modeled habitat eliminating collisions with western pond turtle?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WPT-8 (Western Pond Turtle Encounter Protocol)	Is the encounter protocol minimizing effects to western pond turtle found in the construction footprint?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
WPT-9 (Western Pond Turtle Post Construction Restoration)	Is the specified restoration resulting in suitable habitat for giant gartersnake?	Implementing Entity or Land Use Authority Permittee inspection of restoration area.	Immediately post-restoration; repeat inspection after 1 year and 5 years.	Implementing Entity to develop in first 12 months a checklist to be used in the field when evaluating the restoration effort.
TCB-1 (Tricolored Blackbird Surveys)	Only compliance monitoring required (Table 8-2).			
TCB-2 (Tricolored Blackbird Pre-Construction Surveys)	Are pre-construction surveys detecting tricolored blackbird nests that are present on project sites?	Implementing Entity review of Post-Construction Compliance Report from Approved Biologist as directed by AMM SPECIES-4.	After construction.	None.

Table 8-3
Framework for SSHCP AMM Effectiveness Monitoring

AMM	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the SSHCP Compliance and AMM Monitoring Program?
TCB-3 (Tricolored Blackbird Nest Buffer)	Are the nest buffers adequate to avoid disturbance of nesting tricolored blackbird? Are construction activities avoiding the nest buffers?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
TCB-4 (Tricolored Blackbird Nest Buffer Monitoring)	Is the biological monitor responding appropriately when construction activities result in disturbance of nesting tricolored blackbird?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves)	Is the timing of pesticide use and harvest timing resulting in reduced effects to tricolored blackbird from these activities?	Implementing Entity review of Post-Construction Compliance Report from Approved Biologist as directed by AMM SPECIES-4.	After construction.	Implementing Entity to develop in first 12 months, in coordination with the TAC details on pesticide use timing and harvest timing to avoid take of nesting tricolored blackbirds.
SWHA-1 (Swainson's Hawk Surveys)	Only compliance monitoring required (Table 8-2).			
SWHA-2 (Swainson's Hawk Pre-Construction Surveys)	Are pre-construction surveys detecting Swainson's hawk nests that are present on project sites?	Implementing Entity review of Post-Construction Compliance Report from Approved Biologist as directed by AMM SPECIES-4.	After construction.	None.
SWHA-3 (Swainson's Hawk Nest Buffers)	Are the nest buffers adequate to avoid disturbance of nesting Swainson's hawk? Are construction activities avoiding the nest buffers?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
SWHA-4 (Swainson's Hawk Nest Buffer Monitoring)	Is the biological monitor responding appropriately when construction activities result in disturbance of nesting Swainson's hawk?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.

Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.
BAT-4 (Bat Eviction Methods)	Are eviction methods being applied only to non-maternity roosts, and in a way that does not result in injury to the animals?	Implementing Entity review of compliance reports submitted by Approved Biologist.	Monthly during construction.	None.

8.3 SSHCP Preserve System Monitoring and Management Program

The effectiveness of the Measureable Objectives and the rest of the Conservation Strategy in achieving each of the broad Biological Goals for this Plan Area is intrinsically difficult to quantify. The effectiveness will be qualitatively assessed over the Permit Term, and the effectiveness of the operational SSHCP Conservation Strategy will be considered and discussed periodically in the Annual Reports (Section 8.4.1).

8.3.1 Principles of SSHCP Preserve Monitoring and Management

The monitoring and management framework presented in this section is based on the professional knowledge and experience of the species experts, experienced habitat-management experts, the Permitting Agencies, and others who were involved in preparation of the SSHCP. The biological principles that guide the SSHCP Preserve System Monitoring and Management Program included the following:

1. **Preserve Management Changes (Adaptive Management) Must Have a Valid and Site-Specific Scientific Basis**

Before making any changes to management of a Preserve, preserve managers must have a comprehensive understanding of the resources available, the effects of past management practices, and any other site-specific constraints. The SSHCP is consistent with this principle in the following ways:

- An Initial PMP (Section 8.3.4.2) will be prepared by the Implementing Entity upon acquisition of each Preserve parcel or group of parcels. The Initial PMP will document the management history for each parcel (via records, interviews of ranch managers or landowners, etc.) as directed under Objective HAB1.
- Under the Initial PMP, a Preserve Manager (refer to Section 9.3.1) will continue the existing land management approach (on each parcel acquired, until an Individual PMP (Section 8.3.4.2) is prepared for the Preserve or Preserve parcel.
- Preserve Managers and Permitting Agencies will be very cautious about changing management on a Preserve or a Preserve parcel based on a study conducted in another location, because the other location may have different soils, geologic formations, vegetation, or different species.

2. Preserve Monitoring and Management is Most Effective and Efficient When it is More Intensive on Smaller Preserves, and Less Intensive on Larger Preserves

As explained in Chapter 6, permanent indirect effects of Covered Activities are especially relevant on smaller preserves because smaller preserves have more "edge" relative to acres of interior habitat. Conversely, larger preserves are more insulated from the effects of most environmental stressors (Section 6.3). Therefore, these different size classes call for different approaches for both monitoring and Preserve management. The SSHCP is consistent with this principle in the following ways:

- Monitoring of environmental stressors along edges (Section 6.3) as required under Objective HAB3 will be more intensive on smaller SSHCP preserves that border urban development (i.e., the UDA Satellite Preserves, Linkage Preserves, Minor Preserves), and well as on Core Preserves that are divided by roadways or community trails.
- Preserve Managers will consider how preserve size determines what land-management methods/techniques from the SSHCP Preserve Management and Monitoring Details (see Appendix G) should or should not be done, and tailor the Individual PMP to best track the benefits of conservation actions within each preserve.

3. Preserve Monitoring for Abundance of Annually Variable Species (i.e., Vernal Pool Plants and Invertebrates) Must Use Fine-Scale Temporal Analyses to Monitor Species Status and Trends

Use of a single-year baseline "snapshot in time" is not appropriate for plants and animals with an "annual" life cycle,[5] as the number of individuals in a population may change dramatically from year to year, in response to fluctuations in weather or other environmental conditions. Effective monitoring of annually variable species requires ongoing sampling and identification of trends across several years to separate out the effects of climatic effects or stochastic variables. The SSHCP is consistent with this principle in the following ways:

- SSCHP monitoring will include ongoing status monitoring and conduct trends analysis for annual plant and invertebrate Covered Species to track abundance within years and between years.
- Reference monitoring sites will be used as the "basis of comparison" when reporting status and trends for the "annual" Covered Species and habitats on individual SSHCP Preserves, or in the SSHCP Preserve System. The reference sites will include permanent and rotating plots.

[5] Plant or animal species that grow to maturity and reproduce within one growing season. Example is vernal pool crustaceans.

4. Preserve Monitoring and Management on Cropland or Irrigated-Pasture Preserves Must Be Integrated with the Agricultural Operations

On Cropland and Irrigated-Pasture Preserves (see Chapter 7), management for species habitat must be balanced with the agricultural land uses to achieve the Conservation Strategy for several Covered Species, (i.e., Swainson's hawk, greater sandhill crane, and giant gartersnake). In addition, most Preserves with Vernal Pool Ecosystem will use grazing animals to manage biomass within the Valley Grassland. These agricultural operations must be economically sustainable, but must also be compatible with the Conservation Strategy.

- The potential conflicts and synergies between agricultural land uses and the habitat needs of SSHCP Covered Species (e.g., harvest timing, pesticide use, crop rotations) will be identified in each Individual PMP, which will also specify actions to reduce or eliminate conflicts.
- The animals used in grazing and the timing or patterns of grazing on Preserves will be managed based on monitoring results. The requirements of the Conservation Strategy will be included in conservation easements and/or contracts with agricultural operators.

5. Preserve Monitoring and Management Must Account For the Land Uses Surrounding a Preserve

Because Preserves will be managed in perpetuity for the benefit of Covered Species, management must take into account the activities and land uses that are occurring on lands surrounding the Preserve. For instance, development of a sports field near a Preserve may result in additional light pollution, or agricultural operations near a Preserve could draw from groundwater supplies that sustain habitat on the Preserve. The SSHCP is consistent with this principle in the following ways:

- Individual PMPs must take into account existing land-use and future land use surrounding the Preserve, including effects to surface water availability or changes to the perched aquifer within vernal pool soils that might indirectly affect species habitats within the preserve boundaries. Changes in off-site land use near a SSHCP preserve will be documented in annual reports and considered when updating Individual PMPs. Edge effects of surrounding land uses will also be monitored.

6. Consider Beneficial and Adverse Effects on Non-Covered Species

Although the focus of the SSHCP is on Covered Species, management of Preserves must also take into account any beneficial or adverse effects of Preserve management on non-covered native species. Conferring benefits to non-covered species is one of the listed purposes and

benefits of the HCP as presented in Section 1.1.2. The SSHCP is consistent with this principle in the following ways:

- Where it is feasible and will not reduce the value of the Preserve's habitat for Covered Species, Individual PMPs will include management actions that also provide benefits for other native species. Beneficial and adverse effects of Preserve System Covered Activities to Plan Area non-covered native species will be monitored and tracked as information allows in Annual Reports, but separate monitoring on non-Covered Species is not proposed under the SSHCP.

8.3.2 Overview of the SSHCP Preserve System Monitoring and Management Program

As required by the Five-Point Policy, the Biological Goals and Measurable Objectives of the SSHCP (Table 7-1 in Chapter 7) provide a foundation for the SSHCP Preserve System Monitoring and Management Program. They indicate what species, land cover or community indicators need to be monitored (e.g., natural communities, species, and specify the monitoring units (quantity or state), and the location(s) of the monitoring (e.g., monitoring animal movement along the Laguna Creek Wildlife Corridor).

The Preserve System will comprise many individual parcels and groups of parcels that will function interrelatedly, but must be managed separately because of differences in soils, species present, historic land uses, and other factors. The SSHCP Preserve System Monitoring and Management Program will provide commonality for the management of these different Preserves by providing a single "framework" document, from which the Implementing Entity will develop Initial PMPs and Individual PMPs. The SSHCP Preserve System Monitoring and Management Program document will be fully developed by the Implementing Entity within 18 months of permit issuance.

The SSHCP Preserve System Monitoring and Management Program document will:

- Provide a template to be used by the Implementing Entity to prepare Initial PMP (Section 8.3.4.3, Appendix G) that must be approved by the TAC upon acquisition of a Preserve parcel to address immediate short-term management needs such as trash removal, fence repair, and invasive species control.
- Provide Preserve Managers a template for preparing Individual PMPs (Section 8.3.4.3). Each PMP will include a "decision tree" for using preserve monitoring data to adjust management actions on that individual preserve.
- Provide the comprehensive habitat monitoring and management "toolbox" for managing he different land covers and habitats in the Plan Area (Appendix G), to be used by the

Preserve Manager in preparing Individual PMPs. The toolbox includes adaptive management methods that can be employed (Section 8.3.4.2), and routine facility management actions and activities that could be required for any SSHCP preserves, including regular patrols, trash removal, fence/gate installation and repairs, and other maintenance activities (Sections 8.3.4.1 and 5.2.7).

- Describe the entity that makes management decisions for each SSHCP Preserve .
- Describe the mechanisms by which the Changed Circumstances provided for in the SSHCP (Chapter 11) are addressed.

8.3.3 Monitoring Effectiveness of the SSHCP Preserve System

Table 8-4 lists each SSHCP Measurable Objective, identifies what we need to know to determine effectiveness, specifies an approach to address each monitoring question, identifies the timing and frequency of the specified monitoring, and identifies what additional information will need to be provided in the full SSHCP Preserve System Monitoring and Management Program.

The approach to monitoring proposed in Table 8-4 is subject to change as directed in the Five-Point Policy: "An effective monitoring program is flexible enough to allow modifications, if necessary, to obtain the appropriate information."

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Goal 1. Preserve and link intact landscapes that include the highest-quality habitat for Covered Species within the Plan Area.				
Objective L1. Establish a minimum Preserve System of 33,796 acres of natural land covers that preserves habitat for Covered Species and other native biota as a component of the Preserve System. Of the 33,796 acres, 7,560 acres will be within the UDA and 26,236 acres will be outside the UDA. Preserves will be assembled in accordance with Conservation Actions in Table 7-1.	Refer to effectiveness monitoring presented below for each land cover type under Goal 3, and for each Covered Species under Goal 5.			
Objective L2. Establish a minimum of 11 Linkage Preserves that provide interconnections between the Landscape, Core, Minor, and Satellite Preserves and existing Preserves. Linkage Preserves will have a minimum width of 600 feet and will be located as described in Section 7.5. (Minor variations on minimum width may be allowed by the Plan where there are physical constraints in the environment, in accordance with the process outlined in Chapter 10)	Are mobile Covered Species using the Linkage Preserves to travel between SSHCP preserves and/or existing preserves?	Special study that sets up motion activated cameras at particular locations within each Linkage Preserve, as described in Section 8.3.3.5. Use results for mobile species as a proxy for non-mobile species.	Special study to commence within 5 years of establishment of at least 5 Linkage Preserves and intact Laguna Creek Wildlife Corridor. Repeat study every 5 years.	Implementing Entity to develop in first 18 months a preliminary design for the special study. One year before study commences Implementing Entity to work with special study investigator to Identify locations for camera placement, duration of camera deployment, procedures for deploying, maintaining, and processing the data from the cameras.
Goal 2. Maintain or improve physical, chemical, and biological functions of aquatic resources within the Plan Area.				
Objective W1. Ensure that during implementation of Objective L2 (establishing 11 Linkage Preserves), the Linkage Preserves	Are the Linkage Preserves surrounding creeks wide enough to allow function as linkages?	Monitor Linkage Preserves for edge effects, including noise and light intensity, frequency of trash,	At establishment of first Linkage Preserve, repeat	In first 18 months, Implementing Entity to compile list of edge effects to

that include creeks or streams will include the creek plus a minimum 300-foot setback on each side of the creek, in accordance with the process outlined in Section 5.4.		qualitative hydrology changes, etc. along a transect from the boundary toward interior of the Preserve parcel. Compile observations from Implementing Entity staff during Preserve management efforts. Compare annual reports over time.	annually.	be monitored, and specify protocols for consistently measuring the edge effects.
Objective W2. Covered Activities shall implement the following, as outlined in Section 5.4.2: • Incorporate the SSHCP Design avoidance and minimization measures (LID and ROAD AMMs) Ground disturbance avoidance and minimization measures (BMPs and ROAD AMMs)	Effectiveness of AMMs will be monitored as described in Table 8-3.			
Objective W3. Covered Activities shall implement Stream Setback requirements in the UDA for creeks and streams as described in AMM STREAM-1, STREAM-2, and STREAM-3. Covered Activities shall implement preserve setback requirements in the UDA as described in AMM EDGE-3.	Effectiveness of AMMs will be monitored as described in Table 8-3.			
Objective W4. Ensure that aquatic resources are preserved during preserve assembly and managed in perpetuity (see Objectives VPG1, VPG2, VP1, VP3, SW1, FWM1, ES1, SC1, OW1, RIP1, and RIP3).	What is the overall abundance and diversity of preserved aquatic resources in the Preserve System? Refer also to list of effectiveness monitoring listed for each aquatic land cover type under Goal 5.	Implement random or probabilistic sampling design for preserved aquatic resources throughout Preserve System at recommended intervals over the life of the SSHCP to track trends in condition; using	Annual	Implementing Entity to determine in first 18 months the necessary intervals for sampling.

Table 8-4

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
		Functional or Condition Assessment Methods (FCAM) and/or California Rapid Assessment Method (CRAM). Refer to the Aquatic Resources Program (ARP, Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report) for more details on these methods. FCAM should be rerun until enough CRAM data is available to assess the condition at a watershed scale with CRAM data. When enough CRAM data is available, a comparison should be made between FCAM and CRAM and any discrepancies should be explained. If FCAM varies significantly from CRAM then the watershed studies using FCAM analysis should be reexamined.		
Objective W5. Ensure that aquatic resources are re-established or established within the Preserve System, in accordance with Conservation Actions in Table 7-1 (see Objectives VP2, SW2, FWM2, OW2, RIP2, and RIP4).	What is the overall abundance and diversity of res-established and/or established aquatic resources in the Preserve System? Refer also to list of effectiveness monitoring listed for each aquatic land cover type under Goal 3.	Implement random or probabilistic sampling design for re-established/established aquatic resources throughout Preserve System at recommended intervals over the life of the SSHCP to track trends in condition; using Functional or Condition Assessment Methods	Annual	Implementing Entity to determine in first 18 months the necessary intervals for sampling.

		(FCAM) and/or California Rapid Assessment Method (CRAM). Refer to the Aquatic Resources Program (ARP, Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report) for more details on these methods. FCAM should be rerun until enough CRAM data is available to assess the condition at a watershed scale with CRAM data. When enough CRAM data is available, a comparison should be made between FCAM and CRAM and any discrepancies should be explained. If FCAM varies significantly from CRAM then the watershed studies using FCAM analysis should be reexamined.		
Goal 3. Preserve, re-establish, or establish, natural land covers (including Cropland and Irrigated Pasture-Grassland) that provide habitat for Covered Species.				
Objective VG1. Preserve a minimum of 22,014 acres of Valley Grassland land cover within the Vernal Pool Ecosystem. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			
Objective VP1. Preserve a minimum of 967 acres of vernal pool in the Plan Area. Impacts to vernal pool within or adjacent to (within 1	See effectiveness monitoring under Goal 5 for each species using this habitat.

Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective VP5. Re-establish and/or establish a minimum of 256 acres of Swale for impacts to the Swale or the Stream/Creek (VPIH) land covers. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	Does the re-established and/ or established Swale meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established swale, as described in the final SSHCP Preserve System Monitoring and Management Program.	Starting one year after re-establishment/establishment, repeated annually.	In first 18 months, Implementing Entity to develop success criteria for re-established/established Swale in consultation with the TAC and Permitting Agencies.
Objective SW1. Preserve a minimum of 105 acres of seasonal wetland. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			
Objective SW2. Re-establish and/or establish a minimum of 105 acres of seasonal wetland. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	Does the re-established and/ or established seasonal wetland meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established seasonal wetland, as described in the final SSHCP Preserve System Monitoring and Management Program.	Starting one year after re-establishment/establishment, repeated annually.	In first 18 months, Implementing Entity to develop success criteria for re-established/established seasonal wetland in consultation with the TAC and Permitting Agencies.
Objective FWM1. Preserve a minimum of 127 acres of freshwater marsh. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective FWM2. Re-establish and/or establish a minimum of 127 acres of functional freshwater marsh. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	Does the re-established and/ or established freshwater marsh meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established freshwater marsh, as described in the final SSHCP Preserve System Monitoring and Management Program.	Starting one year after re-establishment/establishment, repeated annually.	In first 18 months, Implementing Entity to develop success criteria for re-established/established freshwater marsh in consultation with the TAC and Permitting Agencies.
Objective SC1. Preserve a minimum of 117 acres of the Stream/Creek (VPIH) land cover. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			
Objective SC2. Re-establish and/or establish a minimum of 117 acres of the Stream/Creek (VPIH) land cover. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	Does the re-established and/ or established Stream/Creek (VPIH) meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established Stream/Creek (VPIH), as described in the final SSHCP Preserve System Monitoring and Management Program.	Starting one year after re-establishment/establishment, repeated annually.	In first 18 months, Implementing Entity to develop success criteria for re-established/established Stream/Creek (VPIH) in consultation with the TAC and Permitting Agencies.
Objective OW1. Preserve a minimum of 311 acres of open water (or a land cover that provides equivalent or better habitat for Covered Species affected by the loss of open water, as determined by the TAC). The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective OW2. Re-establish and/or establish a minimum of 155 acres of open water (or a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of open water, as determined by the TAC). Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	Does the re-established and/ or established Open Water (or equivalent land cover type) meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established open water area, as described in the final SSHCP Preserve System Monitoring and Management Program.	Annual	In first 18 months, Implementing Entity to develop success criteria for re-established/established open water (or other land cover type deemed equivalent) in consultation with the TAC and Permitting Agencies.
Objective RIP1. Preserve a minimum of 373 acres of mixed riparian woodland and/or mixed riparian scrub. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			
Objective RIP2. Re-establish and/or establish a minimum of 373 acres of mixed riparian woodland and/or mixed riparian scrub. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	Does the re-established and/ or established mixed riparian woodland and/or mixed riparian scrub meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established mixed riparian woodland/mixed riparian scrub area, as described in the final SSHCP Preserve System Monitoring and Management Program.	Annual	In first 18 months, Implementing Entity to develop success criteria for re-established/established mixed riparian woodland and/or mixed riparian scrub in consultation with the TAC and Permitting Agencies.
Objective RIP3. Preserve a minimum of 218 acres of mixed riparian woodland and/or mixed riparian scrub for impacts to mine tailings riparian woodland. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective RIP4. Re-establish and/or establish a minimum of 218 acres of mixed riparian woodland and/or mixed riparian scrub for impacts to mine tailings riparian woodland. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1.	Does the re-established and/ or established mixed riparian woodland and/or mixed riparian scrub meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established mixed riparian woodland/mixed riparian scrub, as described in the final SSHCP Preserve System Monitoring and Management Program.	Annual	In first 18 months, Implementing Entity to develop success criteria for re-established/established mixed riparian woodland and/or mixed riparian scrub in consultation with the TAC and Permitting Agencies.
Objective BOW1. Preserve a minimum of 48 acres of blue oak woodland/savanna for direct impacts to blue oak woodland/savanna. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.	See effectiveness monitoring under Goal 5 for each species using this habitat.			
Objective BOW2. Re-establish and/or establish a minimum of 48 acres of blue oak woodland/savanna for direct impacts to blue oak woodland/savanna. Re-establishment and/or establishment will occur in accordance with Conservation Actions in Table 7-1	Does the re-established and/ or established blue oak woodland/savanna meet success criteria approved by the Permitting Agencies and described in the final SSHCP Preserve System Monitoring and Management Program (Section 8.3.2)?	Monitor attainment of success criteria for each re-established and/or established blue oak woodland/savanna area, as described in the final SSHCP Preserve System Monitoring and Management Program.	Annual	In first 18 months, Implementing Entity to develop success criteria for re-established/established blue oak woodland/savanna in consultation with the TAC and Permitting Agencies.
Objective AG1. Preserve a minimum of 9,696 acres of Cropland and Irrigated Pasture-Grassland, including 1,000 acres outside the 100-year floodplain in accordance with Objective GS6. The preserves will be	See effectiveness monitoring under Goal 5 for each species using this habitat.			

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
assembled in accordance with Conservation Actions in Table 7-1.				
Goal 4. Maintain or improve habitat value of natural land covers (including Cropland, and Irrigated Pasture-Grassland) that are preserved within the Plan Area.				
Objective HAB1. Develop PMPs for the benefit of Covered Species.	Only compliance monitoring required (Table 8-1).			
Objective HAB2. Assess whether SSHCP Preserves are being managed and maintained for the benefit of Covered Species.	Are the physical conditions on the preserves meeting the needs of Covered Species?	Rapid monitoring of a range of physical variables, including vegetation types, thatch density, ponded water present, and other factors for subset of preserves, visited on regular basis, compared against reference sites.	Quarterly	In first 18 months, Implementing Entity will develop guidelines for which rapid monitoring techniques to use for different land cover types, how to use the rapid monitoring results to determine if conditions are appropriate to Covered Species modeled habitat, and what reference sites will be used.
Objective HAB3. Record management history for Preserve parcels as they are obtained. Consider management history when developing Initial Preserve Management Plan (PMP).	Only compliance monitoring required (Table 8-1).			
Objective HAB4. Develop and implement an early detection and eradication program for invasive species within the Plan Area. The program will include regular weed assessment and mapping within the UDA, and a comprehensive weed detection and abatement plan for the Plan Area, including training of road crews to identify and report weeds.	Are we eradicating invasive species in a timely fashion? Are we updating the Early Detection and Eradication Program to account for changed conditions?	Weed assessment on SSHCP Preserves. Reporting of weed eradication efforts. Recurring TAC Review of the invasive species monitoring and eradication program.	Quarterly weed assessment on preserves, with other opportunistic assessment. Annual reporting. Program review every 5 years.	Develop monitoring methods and schedule for invasive species.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective HAB5. Monitor preserves for edge effects (e.g., weeds, noise, hydrology, litter, etc.)	What are the levels of certain edge effects observed along a transect from the boundary of the parcel toward the middle? Are edge effects changing over time?	Measure noise and light intensity, frequency of trash, qualitative hydrology changes, etc. along a transect from the boundary toward interior of the Preserve parcel. Compare annual reports over time.	Annual	Compile list of edge effects to be monitored. Specify methodologies for consistently measuring the edge effects.
Objective HAB6. Collect weather data throughout the County to assist in developing status and trends, track climate change, etc.	Only compliance monitoring required (Table 8-1).			
Objective HAB7. Monitor vegetation biomass within grassland land covers.	Is vegetation biomass within Vernal Pool Grasslands, Valley Grasslands, Blue Oak Savanna, and other relevant land cover types being managed for the benefit of Covered Species?	Conduct monitoring using RDM or another rapid assessment technique.	After the growing season, Annual.	Identify the biomass levels or other indicators (e.g., thatch density, grass height, etc.) that predict habitat quality for Covered Species. Specify the monitoring techniques to be used for each indicator.
Objective VP4. Investigate indirect effects of development on vernal pool crustaceans over the short term and the long term.	Is there evidence for indirect effects of development on occupancy of vernal pools near development?	Special study on variation in occupancy of pools from zone of indirect effect along transect from edge toward interior, as described in Section 8.3.3.5.	Repeat study after development has been in place for long term (~15 years)	Develop study methodology, including number of vernal pools, reference sites, techniques to parse out different indirect effects.
Objective AG2. Of the 9,696 acres preserved under Objective AG1, maintain at least 2,000 of those acres of high-quality foraging crops (such as, but not limited to, corn, alfalfa, or wheat) preferred by tricolored blackbird (*Agelaius tricolor*), greater sandhill crane (*Grus canadensis*), and the covered raptor	Are the habitat goals for tricolored blackbirds, greater sandhill crane, and covered raptor species benefiting those species and meeting Goal 5?	Monitor performance criteria for habitat for tricolored blackbirds, greater sandhill crane, and covered raptor species as described in the final SSHCP Preserve System Monitoring and Management Program .	Annual	In first 18 months, Implementing Entity to develop success criteria for planted food plots as habitat for tricolored blackbirds, greater sandhill crane, and covered raptor species in

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
species. The 2,000 acres will be distributed in strategic locations throughout PPUs 4, 5, or 6 in plots of 20 acres or more. The preserves will be assembled in accordance with Conservation Actions in Table 7-1.				consultation with the TAC.
Objective AG3. Maintain or increase raptor prey availability and improve raptor foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species.	Are planted hedgerows providing fossorial mammal habitat?	Field evaluation of habitat value of hedgerows.	Annual	Develop methodology for determining habitat quality for fossorial mammals.
Objective RIP5. Monitor groundwater table as it relates to status and trends for riparian habitat.	Only compliance monitoring required (Table 8-1).			
Goal 5. Maintain or expand the existing distribution of each Covered Species within the Plan Area.				
Objective VPP1. Protect the one currently documented occurrence of Ahart's dwarf rush in the Plan Area. Prior to take of any occurrence of Ahart's dwarf rush (*Juncus leiospermus*), protect six currently unpreserved[6] and "biologically equivalent or superior" (as defined by the TAC) occurrences of Ahart's dwarf rush within the Plan Area. After six currently unpreserved occurrences are protected, prior to take of an occurrence of Ahart's dwarf rush, protect one	Are the preserved occurrences persisting at their existing distribution/abundance, or increasing in their distribution/abundance?	Conduct a population study of preserved Ahart's dwarf rush within the Preserve System.	Every 5 years during flowering.	Sampling methodology for vernal pool species, including identification of reference sites if appropriate.

[6] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrences of Ahart's dwarf rush within the Plan Area.				
Objective VPP2. Prior to take of any occurrence of Boggs Lake hedge-hyssop (*Gratiola heterosepala)*, protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrence of Boggs Lake hedge-hyssop within the Plan Area.	Are the preserved occurrences persisting at their existing distribution/abundance, or increasing in their distribution/abundance?	Conduct a population study of preserved Bogg's Lake hedge-hyssop within the Preserve System.	Every 5 years during flowering.	Sampling methodology for vernal pool species, including identification of reference sites if appropriate.
Objective VPP3. Prior to take of any occurrence of dwarf downingia (*Downingia pusilla*), protect one currently unpreserved[1] and "biologically equivalent or superior" (as defined by the TAC) occurrence of dwarf downingia within the Plan Area.	Are the preserved occurrences persisting at their existing distribution/abundance, or increasing in their distribution/abundance?	Conduct a population study of preserved dwarf downingia within the Preserve System.	Every 5 years during flowering.	Sampling methodology for vernal pool species, including identification of reference sites if appropriate.
Objective VPP4. Protect and maintain in perpetuity a minimum of fourteen occurrences of legenere (*Legenere limosa)* within the hardline preserve areas in the SSHCP Preserve System. Legenere occurrences will be preserved in accordance with the Conservation Actions described in Table 7-1. Prior to take of any occurrence of legenere, one currently unpreserved and "biologically equivalent or superior" (as defined by the TAC) occurrence of legenere will be preserved and maintained within the Plan Area.	Are the preserved occurrences persisting at their existing distribution/abundance, or increasing in their distribution/abundance?	Conduct a population study of preserved legenere within the Preserve System.	Every 5 years during flowering.	Sampling methodology for vernal pool species, including identification of reference sites if appropriate.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective VPP5. Prior to take of any occurrence of pincushion navarretia (*Navarretia myersii* ssp. *myersii*), protect one currently unpreserved[7] and "biologically equivalent or superior" (as defined by the TAC) occurrence of pincushion navarretia within the Plan Area.	Are the preserved occurrences persisting at their existing distribution/abundance, or increasing in their distribution/abundance?	Conduct a population study of preserved pincushion navarretia within the Preserve System.	Every 5 years during flowering.	Sampling methodology for vernal pool species, including identification of reference sites if appropriate.
Objective VPP6. Protect and maintain in perpetuity all known currently unprotected occurrences of Sacramento Orcutt grass (*Orcuttia viscida*) in the Plan Area to preserve existing distribution, and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.	Are the preserved occurrences persisting at their existing distribution/abundance, or increasing in their distribution/abundance?	Conduct a population study of preserved Sacramento Orcutt grass within the Preserve System.	Every 5 years during flowering.	Sampling methodology for vernal pool species, including identification of reference sites if appropriate.
Objective VPP7. Protect and maintain in perpetuity all known currently unprotected occurrences of slender Orcutt grass in the Plan Area to preserve existing distribution, and any currently unknown sites discovered in locations subject to an SSHCP Covered Activity.	Are the preserved occurrences persisting at their existing distribution/abundance, or increasing in their distribution/abundance?	Conduct a population study of preserved slender Orcutt grass within the Preserve System.	Every 5 years during flowering.	Sampling methodology for vernal pool species, including identification of reference sites if appropriate.
Objective SA1. During re-establishment and/or establishment of seasonal wetlands, freshwater marsh, open water, and stream/ creek, translocate impacted Sanford's arrowhead (*Sagittaria sanfordii*) from other	Are transplanted Sanford's arrowhead individuals persisting in the re-established/established habitat?	Field inspection of quantity and state of Sanford's arrowhead that have been transplanted.	Annual	Requirements for survey timing.

[7] Includes occurrences in the SSHCP GIS database (January 2014) and any future occurrences found in the SSHCP Plan Area.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
sites. Prior to take of an occurrence of Sanford's arrowhead, protect one additional occurrence of Sanford's arrowhead within the Plan Area.				
Objective VPI1. Protect and maintain in perpetuity 1,270 acres of vernal pool tadpole shrimp modeled aquatic habitat within the Plan Area to preserve existing distribution.	Are protected pools being occupied by vernal pool tadpole shrimp?	Statistically valid sampling of pools for occupancy.	Annual	Sampling methodology for vernal pool species, including identification of reference sites. Refer to Appendix G for draft survey methodology to be incorporated into Preserve System Monitoring and Management Program.
Objective VPI2. Protect and maintain in perpetuity 1,270 acres of vernal pool fairy shrimp (*Branchinecta lynchi*) modeled aquatic habitat within the Plan Area to preserve existing distribution.	Are protected pools being occupied by vernal pool fairy shrimp?	Statistically valid sampling of pools for occupancy.	Annual	Sampling methodology for vernal pool species, including identification of reference sites. Refer to Appendix G for draft survey methodology to be incorporated into Preserve System Monitoring and Management Program.
Objective VPI3. Protect and maintain in perpetuity 1,059 acres of mid-valley fairy shrimp (*Branchinecta mesovallensis*) modeled aquatic habitat within the Plan Area to preserve existing distribution.	Are protected pools being occupied by mid-valley fairy shrimp?	Statistically valid sampling of pools for occupancy.	Annual	Sampling methodology for vernal pool species, including identification of reference sites. Refer to Appendix G for draft survey methodology to be incorporated into Preserve System Monitoring and Management Program.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective VPI4. Protect and maintain in perpetuity 1,245 acres of Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i) modeled aquatic habitat within the Plan Area to preserve existing distribution.	Are protected pools being occupied by Ricksecker's water scavenger beetle?	Statistically valid sampling of pools for occupancy.	Annual	Sampling methodology for vernal pool species, including identification of reference sites. Refer to Appendix G for draft survey methodology to be incorporated into Preserve System Monitoring and Management Program.
Objective VPI5. Ensure that during implementation of Objective VP2, re-established or established vernal pools are inoculated with soils from impacted vernal pools within 1 mile of re-establishment/ establishment, in accordance with Conservation Actions in Table 7-1.	Is inoculation successful in increasing the pace of occupancy of re-established and/or established vernal pools?	Statistically valid sampling of pools for occupancy where inoculation has occurred; comparison to reference pools.	Annual after inoculation	Sampling methodology for vernal pool species, including identification of reference sites. Refer to Appendix G for draft survey methodology to be incorporated into Preserve System Monitoring and Management Program.
Objective CTS1. Preserve at least 5 occupied California tiger salamander breeding ponds.	Are preserved breeding ponds continuing to be used by California tiger salamander?	Occupancy survey of breeding pools (e.g., dip netting).	Every 2 years	Survey methodology for California tiger salamander, including identification of reference sites.
Objective CTS2. During preserve assembly, ensure that modeled aquatic and upland habitat for California tiger salamander is preserved. Minimum preservation will total: • 141 acres of aquatic habitat • 1,677 acres of upland habitat. Ensure that mitigation for modeled high-value habitat impacted within California tiger	Are California tiger salamander using the preserved habitat?	Occupancy survey of subset of breeding pools (e.g., dip netting) and upland habitat (e.g., drift fences and pitfall traps).	Every 5 years.	Survey methodology for California tiger salamander aquatic and upland habitats, including identification of reference sites and necessary subset for statistically valid results.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
salamander Critical Habitat occurs within California tiger salamander Critical Habitat (see Objectives BOW1, VPG1, VP1, SW1, and VG1).				
Objective CTS3. Rural transportation project Covered Activities within California tiger salamander modeled habitat will be designed to allow California tiger salamander movement across the roadway area.	Are California tiger salamanders using the crossings?	Drift fencing and pitfall traps deployed at each crossing. Review of any collisions reported with California tiger salamanders on rural transportation project Covered Activities.	Once, 5 years after crossing construction. Annual review of collisions.	Survey methodology for California tiger salamander at crossings.
Objective WS1. During preserve assembly, ensure that modeled aquatic and upland habitat for western spadefoot (*Spea hammondii*) is preserved. Minimum preservation will total: • 1,531 acres of aquatic habitat • 22,044 acres of upland habitat. Ensure that mitigation for modeled habitat impacted within the Mather Core or Cosumnes/Rancho Seco Core Recovery Areas occurs within the Core Recovery Areas (see Objectives BOW1, VP1, VP3, SW1, SC1, OW1, and VG1).	Are western spadefoot using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for western spadefoot, including identification of reference sites.
Objective WS2. During preserve assembly, ensure that modeled aquatic habitat for western spadefoot is re-established and/or established. Minimum re-establishment and/or establishment will total:	Are western spadefoot using the re-established and/ or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for western spadefoot, including identification of reference sites.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
• 906 acres of aquatic habitat. Ensure that mitigation for modeled habitat impacted within the Mather Core or Cosumnes/Rancho Seco Core Recovery Areas occurs within the Core Recovery Areas (see Objectives VP2, SW2, and OW2).				
Objective WPT1. During preserve assembly, ensure that modeled aquatic and upland habitat for western pond turtle (*Actinemys marmorata*) is preserved. Minimum preservation will total: • 315.35 acres of aquatic habitat • 10,971 acres of upland habitat. (See Objectives FWM1, OW1, VPG1, RIP1, RIP3, VG1, BOW1, and SC1).	Are western pond turtles using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for western pond turtle, including identification of reference sites.
Objective WPT2. During preserve assembly, ensure that modeled aquatic habitat for western pond turtle is re-established and/or established. Minimum re-establishment and/or establishment will total: • 315 acres of aquatic habitat. (See Objectives RIP2, FWM2, and OW2.)	Are western pond turtles using the re-established and/or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for western pond turtle, including identification of reference sites.
Objective GGS1. During preserve assembly, ensure that modeled habitats for giant gartersnake are preserved along the following creeks (or other creeks that are determined by the TAC to provide similar GGS habitat value):	Are giant gartersnakes using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for giant gartersnake, including identification of reference sites if appropriate.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
• The lower Laguna Creek, mainly between Twin Cities Road (State Route (SR) 104) and Miess Road; • Skunk Creek, which flows into the Cosumnes River northwest of the City of Galt; • the short Willow Creek and tributaries of Badger Creek, which are to the north of the lower Laguna Creek and west of the Folsom South Canal; and • Badger Marsh. Mitigation for impacts to modeled habitats for giant gartersnake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum preservation will total: • 170 acres of Giant Garter Snake high-value aquatic habitat • 2,323 acres of Giant Garter Snake high-value upland habitat. (See Objectives AG1, FWM1, SW1, SC1, OW1, VPG1, RIP1, RIP3, and VG1).				
Objective GGS2. During preserve assembly, ensure that modeled habitats for giant gartersnake are re-established and/or established along the following creeks (or other creeks that are determined by the TAC to provide similar habitat value):	Are giant gartersnakes using the re-established and/ or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for giant gartersnake, including identification of reference sites if appropriate.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
• The lower Laguna Creek, mainly between Twin Cities Road (SR 104) and Miess Road; • Skunk Creek: this creek flows into the Cosumnes River northwest of the City of Galt; • To the north of the lower Laguna Creek and west of the Folsom South Canal are several small creeks—the short Willow Creek and tributaries of Badger Creek; and • Badger Marsh. Mitigation for impacts to modeled habitats for giant gartersnake that occur along Badger Creek and Stone Lakes will occur along these drainages. Minimum re-establishment and/or establishment will total: • 170 acres of high-value aquatic habitat • 134 acres of high-value upland habitat. (See Objectives SW2, OW2, RIP2, and RIP4.)				
Objective GGS3. Plan Permittees will conduct a study to establish hydrologic baseline conditions along Badger Creek to identify what level of hydrology is necessary to support giant gartersnake and acquire a water source to maintain the minimum level of hydrology during the summer months when	What is the hydrologic condition along Badger Creek? How much supplemental water would be required to maintain baseline conditions during summer?	Conduct hydrologic study	Hydrologic study within two years of SSHCP implementation	Detail the methodology for the hydrologic study.
	Is the supplemental water maintaining appropriate hydrologic	Annually review aerial imagery of Badger Creek to observe the ratio of	Annual review of aerial imagery.	Establish appropriate monitoring protocol for

agricultural runoff may wane.	conditions in perpetuity?	open water and emergent vegetation. Investigate in the field hydrologic conditions every 5 years to ensure continued habitat suitability for giant gartersnake.	Field investigation of conditions every 5 years	hydrologic conditions along Badger Creek.
Objective VELB1. Relocate or replace each impacted elderberry shrub (*Sambucus* spp.) according to USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999). Mitigation will occur in locations that are not inundated for 2 continuous weeks, as determined by the TAC.	Are USFWS success criteria being met at mitigation sites?	Monitor attainment of success criteria as described in the SSHCP Preserve System Monitoring and Management Program.	Annual for first 5 years after planting. After 5 years post-planting, inspection every 5 years.	Define success criteria for relocation or replacement, based on USFWS Conservation Guidelines for the Valley Elderberry Longhorn Beetle.
Objective VELB2. During implementation of riparian habitat re-establishment and/or establishment, strategically include elderberry shrub in the planting palette (see Objectives RIP2 and RIP4).	Is elderberry shrub being used appropriately during riparian habitat re-establishment and/ or establishment?	Review of planting plans for proposed restoration projects, field inspection of in-progress and completed restoration projects	Project-by-project basis	Checklist for appropriate use of elderberry shrub to be used by Land Use Authority Permittee staff during project review.
Objective CH1. During preserve assembly, ensure that a minimum of 974 acres of modeled nesting/foraging habitat for Cooper's hawk (*Accipiter cooperii*) is preserved, in accordance with Conservation Actions described in Table 7-1 (see Objectives RIP1, RIP3, and BOW1).	Are Cooper's hawks using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for Cooper's hawk, including identification of reference sites if appropriate.
Objective CH2. During preserve assembly, ensure that a minimum of 601 acres of modeled nesting/foraging habitat for Cooper's	Are Cooper's hawks using the re-established and/ or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations	Survey methodology for Cooper's hawk, including identification of reference

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

hawk is re-established and/or established (see Objectives RIP2 and RIP4).			in Annual Report.	sites if appropriate.
Objective CH3. During preserve assembly, ensure that a minimum of 38 acres of modeled foraging habitat for Cooper's hawk is preserved, in accordance with Conservation Actions described in Table 7-1 (see Objectives RIP1, RIP3, and BOW1).	Are Cooper's hawks using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for Cooper's hawk, including identification of reference sites if appropriate.
Objective TB1. During preserve assembly, ensure that a minimum of 4,149 acres of modeled foraging habitat for tricolored blackbird is preserved (see Objectives AG1, AG2, FWM1, VG1, VPG1, VP1, VP3, FWM1, OW1, and SW1).	Are tricolored blackbirds using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for tricolored blackbird. Methodology should be coordinated with the Statewide survey.
Objective TB2. During preserve assembly, ensure that a minimum of 27,532 acres of modeled nesting/foraging habitat for tricolored blackbird is preserved, including a minimum of 402 acres of freshwater marsh and seasonal wetland (see Objectives AG1, AG2, VG1, VPG1, FWM1, and SW1).	Are tricolored blackbirds using the preserved habitat? Is there a positive correlation between use of conserved nesting and foraging sites?	Conduct occupancy surveys, review observations made by Implementing Entity staff. Compare survey results at preserved SSHCP nesting and foraging sites to sites that do not receive SSHCP management and monitoring efforts.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for tricolored blackbird. Methodology should be coordinated with the Statewide survey.
Objective TB3. During preserve assembly, ensure that a minimum of 917 acres of modeled foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2, SW2, OW2, and VP2).	Are tricolored blackbirds using the re-established and/or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for tricolored blackbird. Methodology should be coordinated with the Statewide survey.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective TB4. During preserve assembly, ensure that a minimum of 232 acres of modeled nesting/foraging habitat for tricolored blackbird is re-established and/or established (see Objectives FWM2 and SW2).	Are tricolored blackbirds using the re-established and/or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff. If colonies present, count number of individuals at each colony.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for tricolored blackbird. Methodology should be coordinated with the Statewide survey.
Objective TB5. Provide mitigation for loss of any tricolored blackbird nesting colony site that is occupied at the time of Covered Activity implementation or was recorded as an occupied nesting colony at any time since 2008. Sources for occupied nesting colonies are the CNDDB, Tricolored Blackbird Portal, eBird, or other data sources approved by the Wildlife Agencies. Minimum mitigation is to protect one extant unprotected occurrence of a nesting colony prior to take of one nesting colony of tricolored blackbirds. Ensure that at least five extant tricolored blackbird colonies that were occupied in recent years are maintained and managed within the SSHCP Preserve System.	Are tricolored blackbirds continuing to use the preserved colonies?	Colony occupancy survey to count number of individuals at each preserved colony.	Every 3 years. If regional count becomes more frequent, coordinate timing with regional program.	Survey methodology for tricolored blackbird. Methodology should be coordinated with the Statewide survey.
Objective TB6. Conduct an experimental study to identify management actions to protect tricolored blackbird colonies (e.g., coarse netting to reduce nest predation or impact of pesticides).	How many birds successfully fledge?	Nest census to quantify successful fledging.	Once each season that study is ongoing, coordinated with study timing.	Nest census methodology for tricolored blackbird.
	What techniques best exclude predators?	Conduct pilot study for exclusion techniques.	Study initiated within 2 years of	Pilot study design, including exclusion techniques to be

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
			HCP implementation; completed within 5 years of HCP implementation	tested, how to determine success or failure of techniques.
Objective TB7. Ensure that at least one large tricolored blackbird colony (i.e., one that has historically [from 1950 onward] supported a minimum of 1,500 individuals) is protected.	Are tricolored blackbirds continuing to use the colony?	Conduct occupancy surveys, review observations made by Implementing Entity staff. If colonies present, count number of individuals at each colony.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for tricolored blackbird. Methodology should be coordinated with the Statewide survey
Objective TB8. For any tricolored blackbird nesting colony that is removed by a Covered Activity, re-establish and/or establish three new colonies within SSHCP Preserves. Re-established and/or established colonies can be in aquatic (freshwater marsh, seasonal wetland) or upland (annual grassland) habitat types, and must be within 0.5 mile of appropriate agricultural forage crops (especially alfalfa) or annual grasslands that provide adequate foraging opportunities.	Are re-established and/or established colony sites being used by tricolored blackbird nesting colonies?	Conduct occupancy surveys, review observations made by Implementing Entity staff. If colonies present, count number of individuals at each colony.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for tricolored blackbird. Methodology should be coordinated with the Statewide survey
	Are nestlings within re-established and/or established colony sites fledging successfully? What is the fledgling success rate?	Nest census to quantify successful fledging.	Once each season that study is ongoing, coordinated with study timing.	Nest census methodology for tricolored blackbird.
Objective BO1. Preserve 7 occupied western burrowing owl (*Athene cunicularia*) sites (commensurate with 20% of the estimated number of sites within the UDA as of 2014), preserve at least 200 acres of land surrounding each occupied burrow site, and maintain modeled habitat for western	Are burrowing owls using the sites?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for burrowing owl, including identification of reference sites if appropriate.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
burrowing owl within 0.4 mile of breeding sites.				
Objective BO2. For each burrowing owl or burrowing owl pair passively excluded, protect 200 acres of modeled habitat for western burrowing owl, and establish a ground squirrel (*Spermophilus (Otospermophilus) beecheyi*) colony and augment with artificial burrows as appropriate (determined by TAC). Artificial burrows will be established at appropriate locations throughout the Preserve System pursuant to CDFW (CDFG 2012 guidelines) or as otherwise determined by the TAC.	Are ground squirrels occupying the site? Are burrowing owls using the squirrel burrows or the artificial burrows?	Conduct surveys for ground squirrels or other fossorial mammals. Review observations made by Implementing Entity staff. When recording occupancy survey data for burrowing owl under Objective BO1, note whether burrows are natural or artificial.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for ground squirrel, including identification of reference sites if appropriate.
Objective FH1. During preserve assembly, ensure that a minimum of 25,881 acres of modeled foraging habitat for ferruginous hawk is preserved, including 19,625 acres in PPUs 5 and 7 (see Objectives AG1, VG1, VP1, VP3, VPG1, and SW1).	Are ferruginous hawks using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for ferruginous hawk, including identification of reference sites if appropriate.
Objective FH2. During preserve assembly, ensure that a minimum of 729 acres of modeled foraging habitat for ferruginous hawk is re-established and/or established (see Objectives VP2 and SW2).	Are ferruginous hawks using the re-established and/or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for ferruginous hawk, including identification of reference sites if appropriate.
Objective SH1. During preserve assembly, ensure that a minimum of 31,033 acres of modeled foraging habitat for Swainson's	Are Swainson's hawks using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations	Survey methodology for Swainson's hawk, including identification of reference

hawk is preserved (see Objectives AG1, AG2, SW1, VP1, VP3, VG1). Ensure that mitigation for high-value modeled habitat impacted within PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8.			in Annual Report.	sites if appropriate.
Objective SH2. At least 2,000 acres of Cropland habitat within high-value habitat within PPUs 4, 6, and 8 will be preserved in fee title to ensure that intensive management actions can be taken. Land held in fee title will be restricted to growing field or row crops. Fee title lands must maintain, at a minimum, an average of 50% of their crop cover-type in alfalfa. Other crop types or land covers may be substituted for alfalfa if the TAC determines that such other crop types or land cover types are of the same or better quality foraging habitat as alfalfa.	Are Swainson's hawks using the preserved habitat? Which crops are they most commonly observed foraging in?	Conduct occupancy surveys, review observations made by Implementing Entity staff. Record crop types when conducting surveys or making observations. Include crop types in all survey reports or compilations of observations, to the extent possible.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for Swainson's hawk, including identification of reference sites if appropriate.
Objective SH3. During preserve assembly, ensure a minimum of 746 acres of modeled nesting habitat for Swainson's hawk is preserved (see Objectives RIP1 and RIP3).	Are Swainson's hawks using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for Swainson's hawk, including identification of reference sites if appropriate.
Objective SH4. During preserve assembly, ensure that a minimum of 373 acres of modeled riparian nesting habitat for Swainson's hawk is re-established and/or established. Ensure that mitigation for modeled nesting habitat impacted within	Are Swainson's hawks using the re-established and/or established habitat? Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
PPUs 4, 6, or 8 occurs within PPUs 4, 6, or 8 (see Objectives RIP2 and RIP4).				
Objective SH5. For each of the 36 known nesting trees within the UDA, plant 10 trees that are modeled for Swainson's hawk nesting within SSHCP preserves. Plant nesting trees on properties protected by the SSHCP within PPUs 4, 6, and 8, and near protected foraging habitat. Tree species will be selected based on known suitability as nesting habitat for Swainson's hawk, and the planted trees must be maintained and/or replaced in perpetuity.	Are the planted trees healthy?	Inspection of planted trees for size and health	Annual: Inspection of planted trees for size and health.	Checklist of factors to check on planted nest trees for health and condition.
	Are Swainson's hawks nesting in the planted trees?	Swainson's hawk nesting surveys	Annual starting at 10 years post-planting: Swainson's hawk presence/ absence surveys	Survey methodology for nesting Swainson's hawk, including identification of reference sites if appropriate.
Objective SH6. During preserve assembly, ensure that a minimum of 729 acres of modeled foraging habitat for Swainson's hawk is re-established and/or established (see Objectives RIP2 and RIP4).	Are Swainson's hawks using the re-established and/or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for Swainson's hawk, including identification of reference sites if appropriate.
Objective NH1. During preserve assembly, ensure that a minimum of 1,245 acres of modeled foraging habitat for northern harrier is preserved (see Objectives VG1, AG1, VPG1, VP1, VP3, FWM1, and SW1).	Are northern harriers using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for northern harrier, including identification of reference sites if appropriate.
Objective NH2. During preserve assembly, ensure that a minimum of 30,048 acres of modeled nesting/foraging habitat for northern harrier is preserved (see Objectives VG1 and AG1).	Are northern harriers nesting in the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for northern harrier, including identification of reference sites if appropriate.

AGENDA ITEM 11.1
1478

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective NH3. During preserve assembly, ensure that a minimum of 856 acres of modeled foraging habitat for northern harrier is re-established and/or established (see Objectives VP2, FWM2, and SW2).	Are northern harriers using the re-established and/ or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for northern harrier, including identification of reference sites if appropriate
Objective WK1. During preserve assembly, ensure that a minimum of 31,205 acres of modeled foraging habitat for white-tailed kite is preserved (see Objectives VG1, AG1, RIP1, RIP3, VPG1, SW1, VP1, VP3, and BOW1).	Are white-tailed kites using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for white-tailed kite, including identification of reference sites if appropriate.
Objective WK2. During preserve assembly, ensure that a minimum of 974 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is preserved (see Objectives RIP1, RIP3, and BOW1).	Are white-tailed kites using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for white-tailed kite, including identification of reference sites if appropriate.
Objective WK3. During preserve assembly, ensure a minimum of 767 acres of modeled foraging habitat for white-tailed kite is re-established and/or established (see Objectives VP2, RIP2, RIP4, and SW2).	Are white-tailed kites using the re-established and/ or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for white-tailed kite, including identification of reference sites if appropriate.
Objective WK4. During preserve assembly, ensure that a minimum of 601 acres of modeled nesting or nesting/foraging habitat for white-tailed kite is re-established and/or established (see Objectives RIP2 and RIP4).	Are white-tailed kites using the re-established and/ or established habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for white-tailed kite, including identification of reference sites if appropriate.
Objective GS1. During preserve assembly, ensure that a minimum of 257 acres of	Are greater sandhill cranes using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing	5 years for surveys, include	Survey methodology for roosting greater sandhill

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
modeled roosting or roosting/foraging habitat for greater sandhill crane is preserved. Roosting habitat will be preserved and maintained within PPUs 4, 6, and 8, with a minimum of 75% within PPU 6 (see Objectives VP1, SW1, and FWM1).		Entity staff.	staff observations in Annual Report.	crane, including identification of reference sites if appropriate.
Objective GS2. During preserve assembly, ensure that a minimum of 7,751 acres of modeled foraging habitat for greater sandhill crane is preserved (see Objectives AG1, AG2, and VG1).	Are greater sandhill cranes using the preserved habitat?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for greater sandhill crane, including identification of reference sites if appropriate.
Objective GS3. During preserve assembly, ensure that a minimum of 184 acres of modeled roosting habitat or roosting/foraging habitat for greater sandhill crane is re-established and/or established. Re-establish two new roost sites (minimum of 90 acres of freshwater marsh/seasonal wetland complex each) every 2 miles in the gap between the Cosumnes population and the Stone Lakes' population or other strategic locations if that gap is closed by another HCP or conservation project (see Objectives VP2, SW2 and FWM2).	Are greater sandhill cranes using the re-established and/ or established habitat or roost sites?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for roosting greater sandhill crane, including identification of reference sites if appropriate.
Objective GS4. Create a visual screen of woody vegetation near human disturbances such as buildings, bridges, and paved roads from permanent roosting habitat within PPU	Is roosting habitat located behind planted screens being occupied by greater sandhill cranes?	Conduct occupancy surveys, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for roosting greater sandhill crane, including identification of reference sites if

6. Screens should be located as appropriate to not interfere with habitat usage by greater sandhill cranes.				appropriate.
Objective GS5. As part of the 2,000 acres preserved under Objective AG2, establish and maintain 10 food plots in strategic locations totaling a minimum of 200 acres within an agricultural setting for greater sandhill crane foraging habitat within PPU 6. Maintain the 200 acres among the 10 food plots as irrigated pasture or planted with crops preferred by greater sandhill crane as foraging habitat. Crops may include, but are not limited to, alfalfa, corn, wheat, or rice. Strategic placement of food plots will include locations for food plots in upland areas above the floodplain.	Are food plots being used by greater sandhill cranes?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for greater sandhill crane, including identification of reference sites if appropriate.
Objective GS6. During preserve assembly, ensure that a minimum of 1,000 acres of high-value modeled foraging habitat for greater sandhill crane outside the 100-year floodplain is preserved (see Objectives VP1, SW1, and FWM1).	Are greater sandhill cranes using the preserved habitat? Is their usage of the habitat limited to periods of flooding?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff. Conduct special study of the habitat during and immediately following a 10-year flood or greater, as described in Section 8.3.3.5.	5 years: Occupancy surveys. Targeted surveys during flood events.	Survey methodology for greater sandhill crane, including identification of reference sites if appropriate.
Objective LS1. During preserve assembly, ensure that a minimum of 9,152 acres of modeled foraging habitat for loggerhead shrike (*Lanius ludovicianus*) is preserved (see	Are loggerhead shrikes using the preserved habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for loggerhead shrike, including identification of reference sites if appropriate.

Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objectives VG1, AG1, VPG1, SW1, VP1, and VP3).				
Objective LS2. During preserve assembly, ensure that a minimum of 22,014 acres of modeled nesting/foraging habitat for loggerhead shrike is preserved (see Objectives VG1, RIP1, and RIP3).	Are loggerhead shrikes using the preserved habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for loggerhead shrike, including identification of reference sites if appropriate.
Objective LS3. During preserve assembly, ensure that a minimum of 592 acres of modeled nesting habitat for loggerhead shrike is re-established and/or established (see Objectives RIP2 and RIP4).	Are loggerhead shrikes using the established and re-established habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for nesting loggerhead shrike, including identification of reference sites if appropriate.
Objective LS4. During preserve assembly, ensure that a minimum of 965 acres of modeled nesting habitat for loggerhead shrike is preserved (see Objectives RIP2 and RIP4).	Are loggerhead shrikes using the preserved habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for nesting loggerhead shrike, including identification of reference sites if appropriate.
Objective LS5. During preserve assembly, ensure that a minimum of 729 acres of modeled foraging habitat for loggerhead shrike is re-established and/or established (see Objective SW2).	Are loggerhead shrike using the preserved habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology for loggerhead shrike, including identification of reference sites if appropriate.
Objective WR1. During preserve assembly, ensure that a minimum of 23,910 acres of modeled foraging habitat for western red bat (*Lasiurus blossevillii*) is preserved (see Objectives BOW1, RIP1, RIP3, AG1, VPG1, VG1, VP1, VP3, SW1, OW1, FWM1, and SC1).	Are western red bat using the preserved habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology, potentially passive acoustic monitoring.

Table 8-4
Framework for Monitoring Effectiveness of the SSHCP Conservation Strategy

Measurable Objective	What do we need to know to assess effectiveness?	How do we monitor what we need to know?	When and how often?	What protocols and methods need to be developed in the Preserve System Monitoring and Management Program?
Objective WR2. During preserve assembly, ensure that a minimum of 841 acres of modeled roosting/foraging habitat for western red bat is preserved (see Objectives BOW1, RIP1, and RIP3).	Are western red bat using the preserved habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology, potentially passive acoustic monitoring.
Objective WR3. During preserve assembly, ensure that a minimum of 1,317 acres of modeled foraging habitat for western red bat is re-established and/or established (see Objectives VP2, SW2, OW2, FWM2, RIP2, and RIP4).	Are western red bat using the re-established and/ or established habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology, potentially passive acoustic monitoring.
Objective WR4. During preserve assembly, ensure that a minimum of 450 acres of modeled roosting/foraging habitat for western red bat is re-established and/or established (see Objectives RIP2 and RIP4).	Are western red bat using the re-established and/ or established habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology, potentially passive acoustic monitoring.
Objective AB1. During preserve assembly, ensure that a minimum of 23,171 acres of modeled habitat for American badger (*Taxidea taxus*) is preserved (see Objectives BOW1, VG1, VP1, VP3, VPG1, and SW1).	Are American badgers using the preserved habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology, potentially deployment of wildlife cameras.
Objective AB2. During preserve assembly, ensure that a minimum of 767 acres of modeled habitat for American badger is re-established and/or established (see Objectives VP2 and SW2).	Are American badgers using the re-established and/ or established habitat?	Conduct occupancy surveys at food plots, review observations made by Implementing Entity staff.	5 years for surveys, include staff observations in Annual Report.	Survey methodology, potentially deployment of wildlife cameras.

8.3.3.1 Phases of Monitoring

Preserve System management (see Section 8.3.4) will be conducted on all SSHCP Preserves during all three phases of the Permit Term. Preserve management decisions will be directed from the results of the Preserve monitoring.

Phase 1 – Develop and Test Monitoring Protocols

During Phase 1 – Develop and Test Monitoring Protocols, the proposed monitoring techniques for each land cover type and Covered Species will be further developed and tested in the field at least once. During this phase of refining the monitoring protocols, statistical methods to be used to analyze the monitoring data will also be developed and key statistical parameters, such as detection probabilities, will be identified and estimated.

Phase 2 – Intensive Monitoring Period

The second phase in the SSHCP Preserve System Monitoring and Management Program involves an intensive monitoring period in which Effectiveness Monitoring is conducted every year for the first 10 years. The purpose of a more intensive monitoring period is to further test and evaluate the effectiveness of survey protocols and to begin to establish statistically valid baseline data (e.g., population estimate or population index value) for the development of biologically meaningful significance thresholds. Since the Preserve System will continue to grow throughout Plan implementation, not all areas in the Preserve System will be included in this intensive monitoring phase. The intent of the data collected during this period is not designed to be Preserve-specific, but rather to inform the nature of variation within the biological system (e.g., population levels of Covered Species or composition of the natural community) intended to be preserved and managed. The 10-year time frame of intense monitoring should also allow sufficient time to experience a range of climatic conditions, typically one drought and one wet rainy season cycle, plus variations in timing and duration. This should provide a reasonable assessment of the annual population fluctuations for Covered Species and Natural Community-level variables to develop more biologically meaningful management thresholds and comparisons to interpret data during the long-term monitoring phase.

Phase 3 - Long-Term Monitoring

This phase involves implementation of the long-term monitoring program, which consists of a continuation of the monitoring protocols developed during Phase 1 and further refinement during Phase 2, only conducted at 3-year or 5-year intervals instead of every year as in Phase 2.

Programmatic Review of Monitoring and Adaptive Management Program

This additional component of the SSHCP Preserve System Monitoring and Management Program involves a programmatic review of the monitoring techniques, assessment of reserve management practices and an overall assessment of the effectiveness of the operating Conservation Program. Each review will assess the effectiveness of the Plan in achieving all of the Biological Goals and Measureable Objectives. These reviews are integral to the process of adaptive management. A programmatic review will occur every 5 years for the permit duration (i.e., 50 years) coinciding with the 5-year Annual Report (Section 8.4.1) and every 10 years after that in perpetuity. The first review will assess the results of the initial tests of the monitoring protocols, use these results to modify monitoring as necessary in Phase 2, and further define biologically meaningful performance criteria and significance thresholds. Data from the intensive monitoring during reviews in years 10 and 15 will be used to further refine performance criteria and significance thresholds. The final review in year 45 will assess the effectiveness of the Plan in achieving all of the Biological Goals and Measureable Objectives. After this review, review frequency will decrease to every 10 years in perpetuity. This frequency will allow for three monitoring cycles during the Long-Term Monitoring Phase. All reviews will summarize the results of special studies and incorporate results into the Preserve System Monitoring and Management Program.

8.3.3.2 Monitoring Status and Trends of Covered Species

Several of the Biological Measurable Objectives will require the Implementing Entity to monitor the status of the species in the Plan Area and identify trends in abundance and distribution on individual Preserves and across the Preserve System. Methods to monitor Covered Species status and trends to comply with the Covered Species objectives will be developed by the Implementing Entity with input from the TAC.

Potential ways to monitor status and trends include presence/absence data (CDFW 2009) or the Proportion of Area Occupied (PAO) (MacKenzie et al. 2003). Presence/absence surveys in a representative subset of vernal pools will be used for the vernal pool invertebrate species. This methodology is appropriate because determining abundance can be very damaging to the vernal pool community, and determining presence/absence in all vernal pools within the Preserve System would be extremely time consuming and costly.

The PAO may be appropriate for amphibian and reptile Covered Species and is becoming a widely used, useful, cost-effective metric for large-area monitoring programs. For example, PAO has been adopted by the Amphibian Research and Monitoring Initiative as the metric by which many amphibian populations nationwide will be measured. The PAO statistical approach evaluates the fraction of the landscape that is occupied by a species of interest, but not the actual

abundance of the population across the landscape. This is useful for more cryptic species, such as amphibians or reptiles, where actual abundance estimates are more difficult and costly to obtain. The PAO methodology

However, for certain Covered Species, such as plants, additional data may be collected on densities. In addition to presence/absence or PAO, data may also be collected to assess the overall health and status of these occurrences to see if their population levels and distribution are actually increasing throughout the Plan Area. There are two main methods for assessing population status and trends: (1) complete periodic censuses of the Covered Species in the Plan Area; and (2) sampling methods that allow for statistical estimates of some population parameter (e.g., population size, population density, occupancy rates, etc.).

Complete periodic censuses may have several advantages, including full information for the particular response variable and elimination of sampling error. Complete censuses provide more powerful data for assessing trends (i.e., an observed increase or decrease is real, although the difference may not be biologically significant). For example, if a 20% population decline (e.g., number of individuals, number of occupied sites) is the threshold for triggering management), a decline from 100 to 79 would trigger management. However, the census approach can be very costly, and the detection probability of any given survey has to be 1.0, or virtually 1.0, which is seldom the case for most species. For example, highly mobile birds or bats may simply be absent from a site at the time the survey is conducted even though they normally frequent the site, or nesting birds that are present may not be calling to advertise or defend their territories. Similarly, the reptiles and amphibians may be underground or otherwise cryptic and hard to detect during surveys. Studies that use trapping also seldom trap all individuals in a population due to factors such as limited encounter rates with traps and trap shyness (i.e., not all individuals are trappable).

For these reasons, the SSHCP will generally rely on the numerous sampling methods that have been developed for the Covered Species. Such methods generate population status information ranging from simple presence/absence or indices such as relative abundance (i.e., there is no population or other parameter estimate) to statistically-estimated occupancy rates or population sizes and/or densities using sophisticated mathematical formulations (see MacKenzie et al. 2006). The usual drawback of the statistical estimates is that minimum necessary samples sizes for making reasonably precise population estimates are often prohibitively large. In some cases, the minimum sample sizes (e.g., nest pairs of a species) may be larger than the entire population of a study area. In addition, determining adequate sample sizes and/or intensity of sampling at each site for species often requires substantial pilot testing because minimum sample size and sample effort is affected by factors such as rarity or commonness of the species, detection probabilities (e.g., samples sizes can be smaller or fewer sites need sampling with species that are reliably detected) and the inherent variability of a species population (which increases sampling error).

8.3.3.3 Success Criteria

The function of re-established or established habitat will be evaluated through monitoring of success criteria tailored to each particular site. The minimum success criteria will be developed during the 18-month preparation of the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program. The Implementing Entity will be advised by the TAC and the Permitting Agencies on the best available science regarding success criteria, and the Permitting Agencies must approve the success criteria as part of the two programs. Success criteria for new re-establishment/establishment sites may be updated over the duration of the permit to ensure that the best available science is being applied. The exact monitoring effort for each site will be site-specific. Monitoring of the success criteria must include, at a minimum, occupancy status and population trends of the target Covered Species at the habitat re-establishment/establishment site. If monitoring indicates that success criteria are not being met at any time in perpetuity, the Implementing Entity will take remedial action until success criteria are met and the re-established/established land cover type is providing the required Covered Species habitat.

8.3.3.4 Reference Sites

The Implementing Entity, in coordination with the Wildlife Agencies and TAC, will identify reference sites to compare with Covered Activity sites. This will allow the Implementing Entity to better separate regional effects from those caused by Preserve Management Covered Activities. Reference sites will include permanent and impermanent plots. Reference sites for vernal pools should be located as far away from human disturbance as feasible. Vernal pool reference sites for the SSHCP Preserve System must include plots both within and outside the UDA because of soils, geologic formations, vernal pool type, species distributions and weather patterns differ in the Plan Area between the UDA and the Plan Area south of the Cosumnes River (see Chapters 2, 3, and 4).

For plant monitoring, reference sites will be established (nearby accessible occurrences of the plants) and used to determine whether those species are identifiable at the time of the survey and to obtain a visual image of the target species, associated habitat, and associated natural community.

8.3.3.5 Special Studies to Evaluate Effectiveness

Monitoring effectiveness of AMMs and biological measurable objectives will require several in-depth investigations, which the SSHCP terms Special Studies. Special Studies differ from regular Preserve Monitoring because they will pose a hypothesis, and then test that hypothesis. The SSHCP will use the results of Special Studies for effectiveness monitoring and to inform Preserve adaptive management. Depending on the monitoring need, Special

Studies may be conducted once or regularly repeated throughout the Permit Term to inform preserve management decisions. Preserve Managers and the Implementing Entity will carry out Special Studies to gain insights into key questions identified in the SSHCP Preserve System Monitoring and Management Program (Table 8-5) and questions that arise during SSHCP implementation. The details of special studies, including methods and timing, will be developed by the Implementing Entity in coordination with the TAC.

Table 8-5
Special Studies Known at the Time of SSHCP Preparation

Special Study Topic	Preliminary Special Study Timing
Conduct a study on Ahart's dwarf rush and other vernal pool plants to determine population responses to SSHCP Preserve management methods.	Collect baseline data on Ahart's dwarf rush and other vernal pool plants in SSHCP Preserves as Preserves are acquired. Timing for experiments to test the effects of management methods to be determined through the TAC.
Conduct a special study on indirect effects on vernal pools in a SSHCP Preserve that abuts a development area. Measure vernal pool crustacean occupation of pools and other potential habitat covariates such as water chemistry and presence of invasive species from the zone of indirect effects along a transect from the edge toward the interior. Evaluate the effectiveness of EDGE AMMs in avoiding or reducing the edge effects of adjacent development on Preserves.	Special study to include a pre-project study and repeating post-project studies. Pre-project study to be conducted as soon as possible before one of the five master plan projects (Section 5.2.1.3) begins construction. First post-project study to be conducted no less than 5 years after completion of at least 25% of master plan project. Repeat study at several time intervals (e.g., 4 to 5 years) until development has been in place for the long term (approximately 15 years).
Special study on effectiveness of inoculation and inocula banking. Test different methods for storage of inocula soils and the storage method's effects on cyst and seed viability. Evaluate the success rate of vernal pools that have been inoculated compared with ones that have not been inoculated.	Evaluations of inocula banking techniques to begin with first deposition of vernal pool soils within the inocula bank. Schedule for sampling of inocula bank to be determined by the Implementing Entity in first 6 months after permit issuance, in collaboration with the TAC. Study ongoing for at least 10 years after commencement of inocula banking.
Investigate what types and abundances of wildlife travel through Linkage Preserves and Wildlife Corridors, and identify any seasonal differences in wildlife using the corridors.	Implementing Entity to develop in first 18 months a preliminary design for the special study. Special study to commence within 5 years of establishment of at least 5 Linkage Preserves and intact Laguna Creek Wildlife Corridor. 1 year before study commences Implementing Entity to work with directed study investigator to Identify locations for camera placement, duration of camera deployment, procedures for deploying, maintaining, and processing the data from the cameras. Repeat the study every 5 years.
Conduct a study of greater sandhill crane use of upland foraging habitat during and immediately following a 10-year flood or greater. This study would demonstrate the value of the upland foraging habitat that is required to be preserved under the Conservation Strategy and ensure that effects on this species are being mitigated to the maximum extent possible.	Design for special study developed within 18 months of SSHCP permit issuance; study conducted only after preservation of at least 500 acres of upland foraging habitat, and conducted during and immediately following 10-year flood or greater flood event.

Additional needs for Special Studies will be identified by the Preserve Managers, Implementing Entity, and TAC. The Permittees expect that many Special Studies will be

conducted by the Preserve Managers and Implementing Entity or by consulting scientists hired by the Implementing Entity. Special Studies that are identified as necessary during Plan implementation will likely be conducted by or in partnership with outside scientists from academic institutions, consulting firms, and nonprofit organizations.

As discussed in Chapter 12, Economics Analysis and Funding Program, the Permittees anticipate that funding provided by the Implementing Entity for Special Studies could be matched or supplemented by other entities. In addition to the Special Studies undertaken to answer Preserve management uncertainties (Table 8-5), the Permittees expect that the Implementing Entity will develop partnerships with academic institutions (e.g., undergraduate student projects, Masters theses, Ph.D. dissertations) to study the SSHCP Preserve System. These academic partnerships and studies will inform and improve SSHCP Preserve management and monitoring techniques.

8.3.4 SSHCP Preserve System Management

Typical Preserve System facility activities include controlling public access to sensitive areas, fencing construction and/or repairs of existing fences, signage placement and/or repairs, trash removal, and patrols would typically not require effectiveness monitoring or adaptive management. Where there is little uncertainty in a management outcome, an adaptive management approach usually is not necessary. For more information on Preserve management, refer to Appendix G-3 (Preserve Management Toolbox).

However, even common activities such as fencing may be part of a preserve habitat-restoration effort to preclude human or animal disturbance while the restored site is recovering, and monitoring the effectiveness of the fencing (or different kinds of fencing) may be of interest. Similarly, grazing to control thatch will be included in most Individual PMPs. Different methods of thatch control (e.g., grazing, weed-whacking, fire, or herbicides), or different timing of controls and/or intensity of controls will be monitored for effectiveness in meeting management goals defined by the Individual PMP and management may be adjusted accordingly.

8.3.4.1 Summary of SSHCP Preserve Adaptive Management Tasks

The following will be elements of the SSHCP Preserve System Monitoring and Management Program:

- Incorporate hypothesis testing and experimental land-management to address key uncertainties about response of natural resources to management methods, and to improve monitoring methods. The SSHCP may address uncertainties through the completion of special studies (Section 8.3.3.5)

- Evaluate monitoring protocols. For example, the frequency of vernal pool crustacean monitoring may need to be adjusted if it is not providing adequate information to gauge status and trends at an individual Preserve or across the Preserve System.
- Incorporate new and best available scientific information into the SSHCP Preserve System Monitoring and Management Program. The Implementing Entity will regularly review scientific literature and consult with the TAC and the Wildlife Agencies to ensure that new information about species and/or monitoring approaches is incorporated into the into the SSHCP Preserve System Management Program. For example, use of wildlife crossings and mobility across the landscape is not well known for SSHCP species. As the Preserves are studied, new information may indicate that linkages should be expanded and wildlife crossings relocated or enlarged.
- Refine existing Chapter 3 maps of each Covered Species habitat locations in the Plan Area. As more Preserve monitoring data becomes available (e.g., annual bird surveys) and as new scientific information results in changed assumptions, the maps should reflect new information to continue to provide guidance for prioritization of Preserve land acquisitions.
- Review all results of Preserve monitoring and directed studies. Examine unexpected results to understand the reason. Further adjust Preserve management actions and monitor the results of those adjustments.
- Refine success criteria for re-established and established land cover types during Phase 1 of monitoring. Minimum success criteria will be developed by the TAC and approved by the Permitting Agencies as part of the SSHCP Preserve System Monitoring and Management Program. As part of adaptive management, these minimum success criteria for re-established species habitat may be adjusted if monitoring demonstrates they are inappropriate indicators of functional habitat.

Proposed changes to Preserve monitoring and success criteria will not implemented by the Implementing Entity until approved by the Permitting Agencies.

8.3.4.2 Preserve Management Plans

As directed by measureable Objective HAB1, all lands preserved by the SSHCP shall have a PMP, which is prepared by the Implementing Entity and approved by the Wildlife Agencies. The following describes the process for PMP development and the minimum requirements for PMPs.

Initial PMP

The Implementing Entity will compile the history of management on each parcel or group of parcels (as appropriate) from available records and interviews with current and past land managers. These historical land use and management practices, combined with other information compiled in the

Preserve Documentation Report (PDR) (Chapter 9), will form the basis for an Initial PMP (refer to Conservation Action HAB 3.1). Pursuant to the principles described in Section 8.3.2, the Initial PMP will describe continuation of existing preserve land management until results of SSHCP Preserve System effectiveness monitoring (Section 8.3.3) demonstrate that land management type, intensity, or frequency should be changed by the Implementing Entity.

Individual PMP

After parcel acquisition, the Implementing Entity will prepare an Individual PMP for each preserve (or preserve-parcel) within 18 months of acquisition, using the Preserve Management "toolbox" that is outlined in Appendix G-3. The Individual PMP will identify necessary routine management and routine preserve monitoring, building on the Initial PMP as appropriate. If appropriate, Individual PMPs may include separate discussions for each Preserve unit – a parcel or group of parcels within a Preserve subject to the same management regime.

Each Individual PMP will clearly identify maintenance and repair responsibilities for infrastructure that borders Preserves, such as Preserve fencing that borders Preserve setbacks. The Individual PMP will also specify the mechanisms by which the Changed Circumstances provided for in the SSHCP (Chapter 11) are addressed

The Implementing Entity will ensure that the Individual PMPs are prepared by a qualified person(s) experienced in the monitoring and management of Plan Area natural communities, and qualified in planning and implementation of habitat restoration, if appropriate for the Preserve site. Draft Individual PMPs will be reviewed and approved by the Permitting Agencies (including Wildlife Agencies) prior to final Implementing Entity approval and implementation. Individual Preserve Management Plans will also be developed in coordination with the TAC.

SSHCP Individual PMPs will have this minimum framework:

- A prioritized list of environmental stressors (see Section 6.3) specific to the natural communities present in the Preserve or the Preserve parcel that must be addressed by PMP actions.
- Step-down each Biological Goal and Measureable Objective to Preserve unit level (i.e., Preserve-level goals and objectives)
- Prescribe necessary fire or grazing regimes, or other standard mechanisms of vegetation control
- All PMPs will include monitoring for invasive weeds, and prescribe measures for control of invasive weeds selected from the Preserve Management Toolbox (Appendix G-3). Preserve monitoring and management, including the weed-control programs shall be

conducted in perpetuity on each preserve. Each PMP shall include at least annual surveys to visually monitor extent of weed infestations and an IPM decision tree to select appropriate weed-control measures.

- When indicated by Preserve monitoring, Individual PMPs will be revised to include control measures for any destructive non-native animal species (e.g., bullfrogs). These measures shall be conducted in perpetuity on each SSHCP preserve, and shall include at least annual surveys to visually assess and identify new invasions.
- Identify and prioritize opportunities for habitat re-establishment and establishment
- Monitoring to document the status and continued persistence of Covered Species and presence of Covered Species modeled habitat.
- Facility maintenance schedules and requirements (e.g., fencing, trails)
- Responsibilities for implementation of the monitoring, PMP, interim and long-term ownership and/or management of the Preserve parcels.
- Process for annual monitoring of individual Preserves, management of the data, compilation and analysis of the monitoring data, and submittal to the Implementing Entity.

Individual PMPs for Cropland and Irrigated-Pasture Preserves

The primary purpose of the SSHCP Cropland and Irrigated-Pasture Preserves is to provide foraging habitat for certain bird Covered Species (e.g., greater sandhill crane, Swainson's hawk) while allowing viable agricultural operations to continue on the property (see Chapter 7). The Individual PMP will reflect the conditions required on the property by the conservation easement (Section 9.4.3). The Individual PMP for Cropland and Irrigated-Pasture Preserves will include at a minimum the following required components:

- Invasive species control;
- Pesticide/herbicide restrictions;
- Crop selection to enhance value of habitat or food plots for Covered Species;
- Erosion and runoff controls;
- Strategic planting or maintenance of existing trees and shrubs for perching, roosting, nesting, and refuge habitat; and
- If appropriate, planting of hedgerows (Objective AG3) to provide foraging habitat and/or screen food plots and other species-habitats from roads and other human travel corridors.

Additional management would be selected from the Preserve System Monitoring and Management Program for each individual Cropland or Irrigated-Pasture PMP depending on the conditions and conservation targets associated with each Preserve or Preserve parcel.

Habitat Re-Establishment/Establishment Plans

A stand-alone Habitat Re-Establishment/Establishment Plan will be developed by the Implementing Entity for a newly acquired parcel or an existing Preserve where habitat re-establishment and/or establishment is desired. The Habitat Re-Establishment/Establishment Plan will include detailed information on habitat design, including earthmoving, species inoculation, and planting palette, and will be consistent with the requirements of the ARP (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report). Individual PMPs will be updated by the Implementing Entity to include the monitoring and management requirements of the re-established/established habitat.

8.3.5 Monitoring and Management outside the Preserve System

The SSHCP Preserve System Monitoring and Management Program will include direction to Implementing Entity for any monitoring or management occurring outside individual Preserves. At the time of SSHCP preparation this is limited to two potential efforts: (1) monitoring and management of road shoulders, ditches, ROW areas, trails, Preserve Setbacks, and Stream Setbacks that border SSHCP Preserves for invasive weeds or other exotic plant species; and (2) monitoring of reference sites located outside the SSHCP Preserve System (Section 8.3.3.4). Invasive weed and exotic plant removal-protocols will be coordinated with those of other local entities to ensure consistency with these programs and facilitate the sharing of weed-removal monitoring results. This monitoring information will be used to determine the need to adapt management actions for controlling the spread of existing invasive plant infestations as well as potential future invasions. The monitoring results will be reviewed to assess the effectiveness of control method used. This weed removal monitoring information, along with all SSHCP monitoring results, will be shared with state and local land management agencies charged with the control of invasive plants, including the Sacramento River Watershed Program (www.sacriver.org) and the California Invasive Plant Council (www.cal-ipc.org), as well as with managers of other regional HCPs and adjacent public lands.

8.4 Data Management and Reporting

Proper data management, analysis, and reporting are critical to the success of the SSHCP Compliance and AMM Monitoring Program (Section 8.2) and the SSHCP Preserve System Monitoring and Management Program (Section 8.3). Data on monitoring methods, results, and analysis of results must be managed, stored, and made available to Implementing Entity staff,

decision makers, scientific advisors, the Permitting Agencies, and other appropriate persons. A database and clear reporting procedure are also required for permit compliance. Details regarding the scope and maintenance of the Data Repository, maintenance, and data reporting for monitoring are described in Section 9.8, Data Repository Development and Maintenance.

8.4.1 Annual Reports

This section describes the contents of the Annual Reports, which must be prepared by the Implementing Entity and submitted to the Permitting Agencies. Use of the Annual Reports in SSHCP implementation is described in Chapter 9.

At a minimum, all SSHCP Annual Reports will include the following information.

- Number and acreage of each Covered Activity implemented during the reporting period categorized by Covered Activity type (per Chapter 5). Reporting will include a map of Covered Activity locations.
- A year-to-date and cumulative summary (i.e., from the start of the Permit Term) of permanent and temporary impacts on all SSHCP land cover types. Impacts to riparian and wetland land cover types will also be reported by watersheds. Reporting will include a map of impacted locations.
- A year-to-date and cumulative summary of impacts to modeled habitat of Covered Species. Reporting will include a map of impacted areas.
- A year-to-date and cumulative summary of the total impacts to Critical Habitat of vernal pool fairy shrimp, vernal pool tadpole shrimp, Sacramento Orcutt grass, slender Orcutt grass, and California tiger salamander, and to Covered Species plant occurrences. Reporting will include a map of Critical Habitat impacts.
- A year-to-date and cumulative summary of impacts associated with projects exempt from fees and/or conditions of the SSHCP.
- An accounting of all conditions on Covered Activities applied to these activities (see Chapter 5).
- A list of all Stream Setback exceptions and any other exceptions granted each calendar year (Chapter 5).
- A description of all re-establishment and establishment implemented during the reporting period. Riparian and wetland re-establishment and establishment will also be reported by the watersheds shown in Figure 3-1 to facilitate regional coordination of wetland mitigation for the U.S. Army Corps of Engineers (USACE), State Water Resources

Control Board (SWRCB), and Regional Water Quality Control Board (RWQCB). Reporting will include a map of re-establishment/establishment project locations.

- A year-to-date and cumulative summary of the acreage of SSHCP land cover types preserved, re-established, and/or established. The success rate for re-establishment and establishment projects will also be documented. For each Preserve parcel acquired, document whether it was purchased in fee title or protected under a conservation easement. If conservation easements were used, the report will describe who holds the easements. Maps and GIS shapefiles will be provided identifying which parcels have been acquired and whether acquisition was via fee title or easement.
- A year-to-date and cumulative summary of the extent of modeled habitat for Covered Species preserved. This will be calculated by overlaying the most current species habitat models. Reporting will include a map of modeled habitat preservation for each Covered Species.
- A copy of all easements recorded during the reporting year. Reporting will include a map of easements.
- An assessment of the progress toward all preserve acquisition requirements, including SSHCP land cover types, Covered Species colony or breeding sites, plant Covered Species occurrences, and wetland protection. This assessment will include evaluation of compliance with the preserve designs in Chapter 7 (e.g., minimizing edge).
- An assessment of compliance with the Jump-Start and Stay-Ahead provisions (Section 9.4.6) to assure that some elements of the SSHCP Preserve System are in place before the permit is issued (Jump-Start) and that mitigation requirements of the Conservation Strategy stay ahead of Covered Activity impacts (Stay-Ahead).
- An accounting of all revenues received, by type (e.g., development fees, wetland fees, grants) and an assessment of progress towards total revenue goals. Funding from local, state, and federal sources must be tracked separately. Any fee adjustments must also be reported.
- A summary of monitoring results, including species status and trends.
- A description of the adaptive management process utilized during the reporting period.
- A summary of the recommendations or advice provided by the Wildlife Agencies and TAC regarding adaptive management and monitoring.

Every 5 years, the Annual Report will include more detailed analysis of progress and effectiveness of the Conservation Strategy. The following information will be provided in the 5-year Annual Report, in addition to the information required above for all Annual Reports:

- A summary of all land and water management activities undertaken on and off the preserves and a discussion of the management issues facing the Implementing Entity.
- An evaluation of the economic assumptions on which the SSHCP was based (e.g., SSHCP costs, revenue rates and grant funding projections).
- An assessment of progress toward a complete funding strategy for implementation after the Permit Term (Chapter 12).
- An assessment of the efficacy of the SSHCP Preserve System Monitoring and Management Program, including lessons learned from Individual PMPs and recommended changes to the SSHCP Preserve System Monitoring and Management Program based on interpretation of monitoring results and research findings.
- An assessment of the efficacy of habitat re-establishment and/or establishment methods in achieving performance objectives (if applicable) and recommended changes to improve the efficacy of the methods.
- A description of all SSHCP special studies undertaken during the reporting period; a summary of study results; and a description of integration with monitoring, assessment, and compliance elements.
- An assessment of the appropriateness of any performance indicators and objectives based on the results of effectiveness monitoring, and recommended changes to performance indicators and objectives.
- A description of any actions taken or expected regarding changed circumstances, including remedial actions.
- A description of any unforeseen circumstances that arose and responses taken.
- A summary of any administrative changes, minor modifications, or major amendments proposed or approved during the reporting year.

Electronic copies of the following data will be provided upon request to the Wildlife Agencies and to the public:

- Copies of all non-confidential, non-proprietary portions of the database that track Covered Activities and land acquisition in the possession and control of the Implementing Entity in its current state.
- Copies of all relevant GIS data in possession and control of the Implementing Entity in its current state, including land cover, the location of Covered Activities, and the boundaries of the current SSHCP Preserve System.

- Copies of all non-confidential, non-proprietary financial data in possession and control of the Implementing Entity in its current state.

8.4.2 SSHCP Implementing Entity will Share SSHCP Preserve Monitoring Data with Other Programs

The Implementing Entity will coordinate and share the results of monitoring and directed studies, as appropriate, with other regional restoration and management programs and the Wildlife Agencies. This sharing will enable the Implementing Entity and others to measure and evaluate change in resources and threats within individual preserves, across the entire Plan Area, and throughout the southern Sacramento Valley and northern San Joaquin Valley.

Environmental monitoring already occurs throughout the Plan Area to varying degrees on some of the existing public and private preserves (see Chapter 3 discussion of existing preserves). The SSHCP Preserve System Monitoring and Management Program will borrow methodologies from these existing preserve monitoring programs where appropriate. The Implementing Entity will confer with the existing Plans during the preparation of the SSHCP Preserve System Monitoring and Management Program to determine what aspects of their monitoring are compatible with SSHCP monitoring requirements. There may also be opportunities to conduct joint monitoring efforts to meet the needs of both entities.

Other opportunities for cooperation and collaboration are the other HCPs being implemented or are under preparation in the Sacramento region. Conservation plans approved or underway in the Southern Sacramento Valley and northern San Joaquin Valley include:

- Natomas Basin Habitat Conservation Plan (HCP)
  - Approved, applies to the 53,341-acre interior of the Natomas Basin, located in the northern portion of Sacramento County and the southern portion of Sutter County.
- Pacific Gas & Electric (PG&E) San Joaquin Valley Operations and Maintenance HCP
  - Approved, covers PG&E operations and maintenance within nine San Joaquin Valley counties.
- Sacramento Municipal Utilities District (SMUD) HCP (Limited Effect HCP)
  - In process, covers SMUD operations, maintenance, and minor construction actions on transmission and gas line corridors inside SMUD's 571,909-acre service area within Sacramento County and small portions of Placer and Yolo Counties.
- Butte Regional Conservation Plan (HCP/Natural Community Conservation Plan (NCCP))
  - In process, this plan covers regional development. Preliminary draft November 2012. Plan area includes approximately the western half of Butte County, and includes the entire extent of vernal pool landscapes within Butte County.

- Placer County Conservation Plan (HCP/NCCP)
  - In process, this plan covers regional development. Preliminary draft January 2011. Plan area includes approximately 201,000 acres of western Placer County.
- Yolo County (HCP/NCCP)
  - In process, this plan covers regional development. Preliminary draft May 2015. Plan area includes all of Yolo County, approximately 654,000 acres.
- Feather River HCP
  - In process, this plan covers flood control projects in a plan area along Feather River, Bear River, and other tributaries within five counties.
- Solano HCP
  - In process, preliminary draft published October 2012. Covers activities related to continued delivery of Solano project water, including delivery, operations, and maintenance within 585,000 acres mostly in Solano County.
- Yuba-Sutter NCCP/HCP
  - In process, this plan covers regional development. Plan area totals approximately 469,000 acres encompassing the valley floors of Yuba and Sutter Counties.
- San Joaquin County Multi-Species Habitat Conservation and Open Space Plan
  - Approved, this plan covers regional development. Plan area includes all lands in San Joaquin County except for federally owned lands and select project areas that are not covered by the plan.

In addition to coordination with the above-listed programs, the Implementing Entity will acquire data to the extent feasible and useful from other conservation monitoring programs within the Plan Area (e.g., existing preserves and established mitigation and conservation banks within the Plan Area) to improve the quality of the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring.

While the SSHCP will seek opportunities to establish and improve cross-compatibility of monitoring data sets between these various regional conservation plans, requiring such compatibility could impede SSHCP implementation because each program will have its own unique monitoring and data collection requirements. Therefore, as the various HCPs and NCCPs are approved and implemented, means to coordinate efforts will be investigated and implemented by the various implementing entities and agencies involved.

INTENTIONALLY LEFT BLANK

9 IMPLEMENTATION

9.1 Introduction

As summarized in Chapter 1, five local government entities developed the South Sacramento Habitat Conservation Plan (SSHCP or Plan) to apply for federal Endangered Species Act (ESA) and California Endangered Species Act (CESA) Incidental Take Permits from the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW). These five local government entities and the future SSHCP Implementing Entity are permit applicants and will become the Plan Permittees. One CESA and one federal ESA Incidental Take Permit will be issued to the six Plan Permittees. The ESA and CESA Incidental Take Permits are not severable, meaning that the six Plan Permittees will share a single state Incidental Take Permit and a single federal Incidental Take Permit. Upon issuance of the Incidental Take Permits, the Plan Permittees will be responsible for implementation of the SSHCP. Successful implementation will require participation and coordination among the Plan Permittees (both the Land Use Authority Permittees and the Plan Partner Permittees), the Implementing Entity, the Permitting Agencies (including the Wildlife Agencies [USFWS and CDFW]), the Technical Advisory Committee (TAC) and other advisory committees formed under this Plan, private-sector organizations, and the general public.

The SSHCP Plan Permittees also requested that the United States Army Corps of Engineers (USACE) develop a permitting process to expedite permits issued under Section 404 of the Clean Water Act (CWA), a process from the Regional Water Quality Control Board (RWQCB) for Water Quality Certification under Section 401 of the CWA, and a process to issue Reports of Waste Discharge under the California Porter-Cologne Water Quality Control Act (Porter-Cologne Act). The Plan Permittees also seek a process to obtain Streambed Alteration Agreements from CDFW under the California Fish and Game Code.

This chapter provides a detailed overview for how the SSHCP will be implemented, including descriptions of each entity involved with Plan implementation, a description of the duties and responsibilities for each of those entities, organizational structures, the administration and day-to-day operations required to implement the Plan, willing seller Preserve acquisition process and rules, and annual reporting responsibilities and reporting protocols.

9.2 Plan Permittees

The six Plan Permittees are the County of Sacramento, City of Galt, City of Rancho Cordova, Sacramento County Water Agency (SCWA), Capital Southeast Connector Joint Powers Authority (Connector JPA), and the Implementing Entity. Each of these agencies will be a Permittee on the ESA and CESA Incidental Take Permits that will provide authorization for

species take that results from Covered Activities that are implemented by the Plan Permittee, from Covered Activities implemented by third parties under the jurisdiction of a Land Use Authority Permittee (i.e., Sacramento County, City of Rancho Cordova, and City of Galt), or Covered Activities implemented by a Participating Special Entity under the jurisdiction of the SSHCP Implementing Entity.

As discussed below, each Plan Permittee will also be a signatory to the SSHCP Implementing Agreement (see Section 9.6), and will adopt an Implementation Ordinance or resolution (see Section 9.7.1). To implement the Plan, the Plan Permittees will form an Implementing Entity, as described in Section 9.3.1.

The six Plan Permittees are divided into three categories: Land Use Authority Permittees, Plan Partner Permittees, and the Implementing Entity. The roles and responsibilities for Land Use Authority Permittees and Plan Partner Permittees are defined in Sections 9.2.1 and 9.2.2, and the structure, roles, and responsibilities for the Implementing Entity are described in Section 9.3.1.

9.2.1 Land Use Authority Permittees

The three Land Use Authority Permittees are the County of Sacramento, City of Galt, and City of Rancho Cordova. Upon approval of the SSHCP by the Wildlife Permitting Agencies, the Plan Permittees will be issued ESA and CESA Incidental Take Permits for incidental take of Covered Species.

For Covered Activities conducted by a Land Use Authority Permittee, the Land Use Authority Permittee will be responsible for ensuring that the Covered Activity conforms to the requirements of the SSHCP and the ITPs, following the process for using take authorization as described in Chapter 10, SSHCP Permit Application Process).

The Land Use Authority Permittee will be responsible for determining when a Covered Activity that occurs within its jurisdiction, including one of its own projects, is eligible to use the SSHCP. If the Land Use Authority Permittee determines that a Covered Activity is eligible to use the SSHCP, the Land Use Authority Permittee can extend incidental take coverage provided by the Plan's ESA and CESA Incidental Take Permits to the Covered Activity within its jurisdiction, as part of the Land Use Authority Permittee's normal project-review process (e.g., grading permit issuance, California Environmental Quality Act (CEQA) certification).

Before extending Incidental Take Permit coverage to a Covered Activity, the Land Use Authority Permittee must receive confirmation in writing from the Implementing Entity that the project's proposed species and habitat take is consistent with the SSHCP "jump-start" and "stay-ahead" requirements (Section 9.4.6). Each Land Use Authority Permittee is also responsible for ensuring that the proposed project's design and construction is in compliance with all SSHCP requirements (see Chapter 10), and for ensuring that monitoring of required

SSHCP Avoidance and Minimization Measures (AMMs) (see Chapter 5, Covered Activities) occurs during project construction.

For each Covered Activity they approve, the Land Use Authority Permittee will be responsible for collecting all project information required for the SSHCP annual report (see Chapter 8, SSHCP Monitoring and Management Programs) and providing that information to the Implementing Entity.

Land Use Authority Permittees will be responsible for paying development fees related to their own projects and for approving Covered Activity projects and collecting development fees from Third-Party Project Proponents. As discussed in Section 1.1, Third-Party Project Proponents are private project applicants proposing to implement an SSHCP Covered Activity and seeking ministerial[1] or discretionary[2] project permits from one of the three Land Use Authority Permittees. See Chapter 12, Economics Analysis and Funding Program, for a description of the SSHCP development fee schedule.

Land Use Authority Permittees will provide the Implementing Entity copies of each approved project application package, whether it is their own application package or a Third-Party Project Proponent's application, for entry into the SSHCP Data Repository (see Section 9.8) and to provide information needed to prepare the required SSHCP annual report to the Permitting Agencies (Section 9.9).

Each Land Use Authority Permittee will adopt the SSHCP development fees as set by the SSHCP Implementing Entity (see Section 9.3.1). Each Land Use Authority Permittee will also be responsible for transferring to the Implementing Entity SSHCP development fees that are collected from Third-Party Project Proponents, and development fees will be collected for the Covered Activities they directly implement.

Land Use Authority Permittees will also have a special responsibility to assist with implementation of the SSHCP because of their authorities as land use agencies and as members of the Joint Exercise of Powers Authority (JPA) Governing Board (JPA Board) of the SSHCP Implementing Entity (see Section 9.3.1).

As discussed in Section 9.1 and described in detail in the Aquatic Resources Program (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report), the Land Use Authority Permittees have requested that USACE develop a multi-level CWA 404 permitting

[1] A ministerial permit is a permit that requires little to no judgment on behalf of the Land Use Authority Permittee. An example of a ministerial permit is a building permit where as long as a parcel is zoned to allow the building of a structure, the applicant only needs to follow building codes to construct their project.

[2] A discretionary permit is a permit that requires the use of judgment by a Land Use Permittee before the permit can be issued. An example of a discretionary permit is a permit for a general plan amendment.

process for Covered Activities. The Land Use Authority Permittees have also requested that RWQCB develop a process for Covered Activities to obtain Water Quality Certification under CWA 401 and to issue Reports of Waste Discharge under the California Porter-Cologne Act. In addition, the Land Use Authority Permittees have requested a master or a programmatic Streambed Alteration Agreement from CDFW for future Covered Activities that alter stream channels within the Plan Area.

The Land Use Authority Permittees will ensure that Covered Activities that they undertake and Covered Activities conducted by Third-Party Project Proponents are always consistent with the requirements of the SSHCP and the requirements of the Aquatic Resources Program. As discussed in the Aquatic Resources Program, the Land Use Authority Permittees will assist Third-Party Project Proponents in determining which CWA 404 permit vehicle can be used for each proposed Covered Activity.

Land Use Authority Permittees Responsibilities in Reviewing Third-Party Requests for Take Authorization

The Land Use Authority Permittees may extend Permit coverage to Third-Party Project Proponents who are proposing Covered Activities within their jurisdiction, provided that the projects or activities are designed and executed in accordance with all requirements of the SSHCP, the SSHCP Implementing Agreement, the terms and conditions of the Incidental Take Permits, the SSHCP Aquatic Resources Program, the proposed multi-level CWA 404 and CWA 401 permitting agreements for Covered Activities, and the Covered Activity Master Streambed Alteration Agreement proposed to CDFW. To use take authorization provided by the ESA and CESA Incidental Take Permits and the authorizations provided by the other SSHCP regulatory permits and agreements, a Third-Party Project Proponent must apply to the Land Use Authority Permittee with jurisdiction over the project (i.e., the City of Rancho Cordova, City of Galt, or County of Sacramento) as discussed in Chapter 10.

Each Land Use Authority Permittee will designate staff to assist Third-Party Project Proponents with questions regarding SSHCP requirements and the permit application process (see Chapter 10).

9.2.2 Plan Partner Permittees

The Sacramento County Water Agency and the Capital Southeast Connector Joint Powers Authority are the two "Plan Partner Permittees." The two Plan Partner Permittees are public agencies that participated in developing the SSHCP and will be permittees on the ESA and CESA Incidental Take Permits, but they do not have land use approval authority in the Plan Area. (The Incidental Take Permits will provide incidental take authorization directly to the Plan Partner Permittees. This means that these Plan Partner Permittees will not have to apply to the

County of Sacramento, the cities, or the Implementing Entity before they implement SSHCP Covered Activities.)

The Plan Partner Permittees cannot extend their take coverage to Third-Party Project Proponents or any other entity wishing to implement an SSHCP Covered Activity. Before implementing a Covered Activity, the Plan Partner Permittee must receive confirmation in writing from the Implementing Entity that the proposed species and habitat take is consistent with the SSHCP's jump-start and stay-ahead requirements (see Section 9.4.6). The Plan Partner Permittees will be responsible for transferring SSHCP fees for the Covered Activities they implement to the Implementing Entity.

Plan Partner Permittees will prepare and provide the Implementing Entity with copies of each project application package for projects that they implement for (1) review of species and habitat take amounts, (2) entry into the SSHCP Data Repository, and (3) preparing annual reports to the Permitting Agencies. Plan Partner Permittees will also be responsible for ensuring that the project design and construction fully complies with the Conservation Strategy (Chapter 7), monitoring all SSHCP avoidance and minimization requirements (see Chapter 5), and paying fees related to their own projects.

Plan Partner Permittees will also be eligible to use the proposed multi-level CWA 404 permitting process described in the Aquatic Resources Program to receive permit authorization to impact federal and state aquatic resources under Section 404 of the CWA and the CWA 401 permit strategy for Water Quality Certification, and to issue Reports of Waste Discharge under the California Porter-Cologne Act. In addition, Covered Activities implemented by a Plan Partner Permittee are eligible to use the proposed Master Streambed Alteration Agreement for SSHCP Covered Activities.

9.3 Implementation Structure

This section identifies all of the participants involved in implementation of the SSHCP, and provides an overview of each participant's responsibilities and duties.

9.3.1 Implementing Entity

The SSHCP Implementing Entity is a JPA called the South Sacramento Conservation Agency (Agency). The Joint Exercise of Powers Agreement that will form the Agency will be executed by the County of Sacramento, City of Galt, and City of Rancho Cordova (the Land Use Authority Permittees). The Agency is a distinct entity from its member authorities. See the Joint Exercise of Powers Agreement Creating the South Sacramento Conservation Agency.

The Implementing Entity oversees implementation of the SSHCP. The Implementing Entity will ensure that enough qualified staff is retained to accomplish all of the Implementing Entity's

responsibilities and duties. Staff for these positions may be hired by the Implementing Entity, or their functions can be contracted out to existing local agencies, nonprofit organizations, or private consultants. Staff or qualified consultants will be retained on an as-needed basis.

The Implementing Entity will hold title to Preserve lands or conservation easements it purchases, and will oversee any cooperative agreements with other entities that own and/or manage Preserves or conservation easements for the Implementing Entity as part of the SSHCP Preserve System. The Implementing Entity will provide funds for Preserve management and monitoring to those agencies and organizations with whom it contracts for such services.

The Implementing Entity will be a Permittee on the ESA and CESA Incidental Take Permits, and can use the Incidental Take Permits to implement its own Covered Activities. The Implementing Entity can also extend incidental take coverage to the Covered Activities proposed by Participating Special Entities. The Implementing Entity is the only Plan Permittee that can extend take coverage to Participating Special Entities. Participating Special Entities are defined in this section under the heading "Implementing Entity Responsibility in Reviewing Participating Special Entities Requests for Take Authorization."

The Implementing Entity cannot extend incidental take coverage to third-party projects that are under the jurisdiction of a Land Use Authority Permittee; all Third-Party Project Proponents seeking incidental take coverage must obtain approvals from the Land Use Authority Permittee with jurisdiction over that activity or project.

As with the other Plan Permittees, the Implementing Entity may use the proposed multi-level CWA 404 permitting process described in the Aquatic Resources Program (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report) to obtain CWA 404 permits authorizing impacts to federal and state aquatic resources and may use the agreement with RWQCB for Water Quality Certification under CWA 401 and issuance of Reports of Waste Discharge under the California Porter-Cologne Act, and may use the CDFW Master Streambed Alteration Agreement for future Covered Activities.

The Implementing Entity is composed of a JPA Board, an Implementation Committee, an Executive Director, and staff and/or outside consultants to help with day-to-day implementation of the Plan. The JPA Board is limited to the three Land Use Authority Permittees because only these three entities can exercise powers to levy land-use-related fees. The JPA Board will be subject to the requirements of the Ralph M. Brown Act and the Public Records Act.

The JPA Governing Board

The structure of the SSHCP Implementing Entity includes a JPA Board composed of three elected officials from the County of Sacramento, two elected officials from the City of Rancho Cordova, and one elected official from the City of Galt, for a total of six members. The JPA

Board may delegate its authority to administer the Plan to the Implementation Committee or to the Executive Director. However, the establishment or modification of development fees, hiring of the Executive Director, approval of the Implementing Entity's annual budget and annual report, approval of the purchase of easements or other interests in land to form the SSHCP Preserve System, and the resolution of disputes among Plan Permittees regarding implementation of the Plan or disputes with Third-Party Project Proponents must remain the responsibility of the JPA Board and cannot be delegated to others. The JPA Board will also act as the arbitrator should decisions made by the Implementation Committee or Executive Director be challenged.

The Implementation Committee

The Implementation Committee will assist the JPA Board with any implementation duties that the JPA Board sees fit to assign to it. Each Plan Permittee will select a member to represent them on the Implementation Committee. Members will include a single representative from each of the three Land Use Authority Permittees and the two Plan Partner Permittees, for a total of five members. The Implementation Committee will meet at least once every 2 months.

The Implementation Committee is responsible for, but not limited to, the following actions:

- Making recommendations to the JPA Board regarding the adoption or modification of SSHCP development fees
- Making recommendations to the JPA Board of annual operating and capital budgets of the Implementing Entity
- Making recommendations regarding hiring the Executive Director
- Approving, acquiring, selling, or exchanging interests in land or easements that are owned by the SSHCP Agency
- Approving modifications to the SSHCP Preserve Resource Management Plan
- Approving applications submitted by Participating Special Entities for coverage under the Plan Permits[3]
- Approving annual reports prior to submittal to the JPA Board
- Establishing committees or subcommittees to help implement the Plan

[3] The Implementing Entity will only approve applications submitted by Participating Special Entities. As described in more detail under the heading "Implementing Entity Responsibility in Reviewing Participating Special Entities Requests for Take Authorization," Participating Special Entities are organizations that do not require permits from Land Use Authority Permittees, such as school districts, reclamation districts, irrigation or water districts, sewer districts, utilities, other land use jurisdictions that are not local Land Use Authority Permittees (e.g. City of Elk Grove), etc. When a Land Use Authority Permittee has jurisdiction over a project, that project must be processed through the appropriate Land Use Authority Permittee.

The Implementation Committee will seek input from the TAC (see Section 9.3.4) through the Executive Director prior to approving SSHCP land management and monitoring plans.

The Executive Director and Plan Staff

An Executive Director and Plan staff will oversee day-to-day implementation of the SSHCP. However, many of the tasks necessary to implement the SSHCP can be contracted to outside parties such as consultants, nonprofit organizations, and contract agencies that specialize in certain functions that are required to be performed as part of Plan or permit requirements. Staff and/or contractors will be hired on an as-needed basis. The Executive Director will seek input from the TAC (see Section 9.3.4) prior to approving land or easement acquisitions.

The Implementing Entity will use specialists as needed to ensure proper implementation of the tasks listed below. It is anticipated that the Implementing Entity will employ staff or contract with consultants to fill the following Plan implementation roles:

- **An Executive Director** dedicated to Plan implementation and directs all the activities of the Implementing Entity. The Executive Director will ensure that all the tasks listed previously under "The Implementation Committee" are implemented, and will report to the JPA Board. The Executive Director will also oversee Plan Permittees to ensure compliance with the SSHCP requirements, the terms of the permits, and the Implementing Agreement on behalf of all Plan Permittees. Finally, the Executive Director will serve as the primary link between the JPA Board, the Implementing Committee, Implementing Entity staff, Plan Permittees, each Permitting Agency, and the general public.
- **A Program Manager** with biological resource expertise will help direct all natural resource aspects of Plan implementation, including land and aquatic resource management, monitoring, and the adaptive management program. The Program Manager or designees will collect and analyze species and environmental data as required by the Plan, stay informed of current scientific methods and concepts, and provide continuous oversight of the monitoring and adaptive management program (e.g., monitoring methods, study designs) to ensure that the Preserve System incorporates the most appropriate strategies with the latest technology and best management practices. The Program Manager will oversee the work products of consultants or outside entities that are employed to help with implementing the SSHCP. The Program Manager will oversee Preserve Managers and be responsible for communication with external scientists, including Wildlife Agency scientists and the larger conservation science community. The Program Manager will also encourage relationships with Wildlife Agency and academic scientists to facilitate collaborations that will contribute to implementation of the SSHCP

Conservation Strategy. During the early stages of SSHCP implementation, the Program Manager may also function as the Preserve Manager.

- **One or more Preserve Managers** may provide on-site management of individual SSHCP Preserves to implement individual Preserve Management Plans. Each Preserve Manager will be a qualified biologist with resource management experience. A Preserve Manager may be assigned to a region of the SSHCP Preserve System and may oversee multiple individual Preserves or Preserve parcels.
- **A real estate specialist** will be needed as the Implementing Entity conducts financial and legal analyses to guide selection of parcels for the Preserve System, and conducts or manages appraisals and transactions. The real estate specialist will have expertise in real estate law, zoning, and local regulations to fulfill the fiduciary duties of the Implementing Entity for its properties. The Implementing Entity may work with real estate specialists from other local organizations to acquire land to fulfill the Conservation Strategy. Also, Plan Permittees may already have staff with these skills; the Implementing Entity could partner with other Plan Permittees to obtain these real estate skills.
- **An accountant** will be responsible for developing and monitoring budgets, processing invoices, managing financial reserves, identifying cost savings, and managing administrative contracts (e.g., liability insurance). The Implementing Entity must also track expenditures and cash flow and establish and maintain an internal accounting system and procedures. Plan Permittees may already have staff with these skills and could partner with the Implementing Entity to manage the SSHCP budget.
- **A GIS specialist** will use GIS or other equivalent spatially explicit database systems to collect, store, and use relevant spatial data necessary for Plan implementation. The GIS specialist will also maintain the database to track compliance and guide Preserve design, monitoring, and adaptive management programs. For example, the Implementing Entity must be able to query the database to summarize take and conservation by year and cumulatively. The Implementing Entity will track all data related to the progress of meeting Plan goals and objectives.
- **A database specialist** will maintain the SSHCP Data Repository (Section 9.8 and Chapter 8). The database specialist will have a background in biometrics and statistics, and will participate in the development of the Preserve System Management Program and the SSHCP Monitoring Program.
- **Legal counsel** will provide guidance during Plan implementation on an as-needed basis for drafting and reviewing conservation easements, reviewing land purchases, assisting with land transaction negotiations, assisting with legal challenges, and assisting with easement violations if they occur. To the extent possible, in-house attorneys for the Plan Permittees may provide legal counsel to the Implementing Entity. However, certain

circumstances may require specialized third-party legal assistance. Financial analysis assistance will be required periodically to review the program's cost/revenue balance and ensure that SSHCP fees are adjusted with changing land costs and inflation.

Tasks associated with Plan implementation by the Executive Director and Plan staff will include the following:

- Identifying parcels suitable for SSHCP land acquisition or conservation easements
- Preparing SSHCP Preserve land or easement acquisition proposals
- With the approval of the JPA Board, executing acquisitions of SSHCP Preserve lands or easements
- Approving requests by permittees Third-Party Project Proponents, or Participating Special Entities to provide mitigation in lieu of fees[4]
- Approving re-establishment/establishment of wetland sites
- Monitoring and enforcing the conditions of SSHCP conservation easements established on private lands
- Preparing the Preserve Resource Management Program, including the land management toolbox described in Chapter 8, for approval by the Implementation Committee
- Preparing and implementing individual SSHCP Preserve Management Plans consistent with the Preserve Resource Management Program
- Implementing SSHCP Resource Management Programs that have been approved by the Implementation Committee
- Identifying needs for adaptive management actions and implementing as necessary, and monitoring the effects of adaptive management actions, as described in Chapter 8
- Preparing proposals for re-establishment and establishment of species habitat and aquatic resources for approval by the Permitting Agencies, and implementing re-establishment and establishment Covered Activities
- Tracking take of species, species habitat, and loss of aquatic resources caused by implementation of Covered Activities
- Tracking preservation of species occurrences, species habitat, and aquatic resources to establish the SSHCP Preserve System in the Plan Area

[4] There are five projects within the Urban Development Area (UDA) where hard line preserves have been identified and are assumed as part of the SSHCP conservation strategy. These preserves are considered pre-approved under the SSHCP (see Appendix K) and therefore do not require approval by the Implementing Entity other than to ensure that the preserve boundaries and other SSHCP requirements are consistent with the SSHCP.

- Maintaining a data repository of the monitoring data described in Chapter 8 and other relevant information
- Monitoring actions of Plan Permittees, Third-Party Project Proponents Covered Activities, and Participating Special Entities to ensure compliance with the SSHCP, Implementing Agreement, and permits, and notifying Plan Permittees if actions are not in compliance
- Collecting SSHCP development fees from Participating Special Entities and Plan Permittees
- Managing and tracking SSHCP development fees received from Participating Special Entities and Plan Permittees
- Managing the non-wasting SSHCP endowment or contract for management of the endowment (see Chapter 12)
- Managing and tracking Preserve monitoring and management costs and other Plan implementation costs
- Tracking impacts of all Covered Activities in a way that detects when any impact-cap or other Permit limit is being approached
- Tracking that the 2% "stay-ahead" requirement (see Section 9.4.6) is being met for all seven land cover type groupings and reviewing project application packages before approving take for each Covered Activity and Covered Activity project
- Managing and tracking information as required by the SSHCP's In-Lieu Fee Program (see Section 9.3.3)
- Preparing permit compliance, effects, and effectiveness monitoring reports that compile and analyze annual information from all Plan Permittees, and providing these to Permitting Agencies on schedule
- Developing agreements or contracts with parties for Implementation Committee approval to acquire Preserve land, conservation easements, or mitigation or conservation bank credits
- Developing agreements or contracts with parties for Implementation Committee approval to assist in SSHCP Preserve management
- Entering into contracts and agreements with owners and operators of existing mitigation banks or conservation banks
- Entering into contracts with consultants, non-profit organizations, and other entities to assist in implementation of the SSHCP
- Reviewing design surveys and pre-construction surveys of third-party projects by Plan Permittees (see Chapter 5 and Chapter 10)

- Assisting the other five Plan Permittees with questions regarding SSHCP requirements
- Creating tools for Plan Permittees to use in their application review and project assessment process (e.g., checklists, template planning survey report, fee calculator)
- Collaborating and exchanging information with the committees formed under this Plan

Implementing Entity Responsibilities in Reviewing Third-Party Requests for Take Authorization

The Implementing Entity's primary role for projects proposed by Third-Party Project Proponents under the jurisdiction of Land Use Authority Permittees will be to ensure that take availability remaining on the Incidental Take Permits is sufficient to permit that project, to review surveys that are required by the third-party project, and to approve dedications in lieu of paying SSHCP fees. The Implementing Entity will not be involved in processing third-party requests for take authorization. Requests for third-party take authorization will be the sole responsibility of the Land Use Authority Permittee that has jurisdiction over the project. The Implementing Entity will provide tools for Plan Permittees to use in their application review and project assessment process (e.g., checklists, template planning survey report, and fee calculator). However, when a Land Use Authority Permittee does not have land use authority over a Third-Party Project Proponent, the Implementing Entity will be responsible for reviewing SSHCP applications and approving third-party project proposals.

The Implementing Entity will also track the amount of take by land cover type resulting from all Covered Activities, including third-party Covered Activities approved by Land Use Authority Permittees. The Implementing Entity must track impacts of all Covered Activities in a way that detects when a permit impact cap is being approached. This includes permit caps on habitat impacts or take of species occurrences, as well as tracking the amount of impact relative to the amounts of jump-start and stay-ahead mitigation that is already established in the SSHCP Preserve System (see Section 9.4.6). The Implementing Entity will notify all Plan Permittees when any impact cap is imminent and what procedures should be followed to ensure that each cap is not exceeded. In addition, the Implementing Entity will provide advice, upon request, to the Land Use Authority Permittees (cities and the County of Sacramento) as they process third-party applications for take, and will promote coordination among Plan Permittees to ensure that the Plan is being implemented consistently and effectively.

Implementing Entity and Permitting Agency Coordination when Reviewing Third-Party Requests for Take Authorization

The Implementing Entity will coordinate with the Permitting Agencies concerning the following:

- Approval of Preserve land in lieu of paying SSHCP fees (Section 9.4.4, Land Dedication In Place of SSHCP Fees). The Land Use Authority Permittees must forward such offers

to the Implementing Entity. If the Implementing Entity approves, then the Implementing Entity will forward the offer to the Permitting Agencies for review and approval.

- Approval of re-establishment/establishment of wetlands in lieu of paying development fees. The Land Use Authority Permittees must forward such offers to the Implementing Entity for review and approval. If the Implementing Entity approves, then the Implementing Entity will forward the offer to the Permitting Agencies for review and approval.
- Review and approval, of all Stream and/or Preserve Setback modifications or exceptions. The Land Use Authority Permittees must request setback modifications or exceptions from the Permitting Agencies. Third-Party Project Proponents must request setback modifications or exceptions from a Land Use Authority Permittee.

Implementing Entity Responsibility in Reviewing Participating Special Entities Requests for Take Authorization

Entities that are not subject to the regulatory authority of a local Land Use Authority Permittee (e.g., school districts, reclamation districts, irrigation or water districts, sewer districts, utilities, other land use jurisdictions that are not local Land Use Authority Permittees) may wish to receive incidental take coverage under the Plan. The Implementing Entity may extend incidental take authorization to these Participating Special Entities if the proposed project or activity is an SSHCP Covered Activity defined in Section 5.2 or is an activity that meets the criteria for Covered Activities in Section 5.1, and the project or activity is consistent with all of the requirements of the SSHCP. Participating Special Entities will enter into an agreement with the Implementing Entity that conditions the project or activity to all terms and conditions of the SSHCP and the Implementing Agreement.

To use the SSHCP permits, a Participating Special Entity must file an application with the Implementing Entity in a form requested by the Implementing Entity (see Chapter 10). The Participating Special Entity applicant will be responsible for all costs associated with processing the application and any costs of the Implementing Entity in administering, monitoring, and enforcing the terms of the agreement.

9.3.2 Wildlife Agencies

As discussed in Chapter 1, USFWS and CDFW (collectively, the Wildlife Agencies) are responsible for issuing ESA and CESA Incidental Take Permits.

The role of the Wildlife Agencies is to monitor Plan compliance and notify the Implementing Entity as soon as possible if the Plan is not being implemented in compliance with the Incidental Take Permit, Implementing Agreement, or the SSHCP (Section 9.10.6).

The responsibilities and duties of the Wildlife Agencies include the following:

- Participating on the SSHCP TAC/Interagency Review Team (IRT) (see Sections 9.3.3 and 9.3.4)
- Reviewing and approving SSHCP monitoring protocols
- Reviewing and approving any modifications to SSHCP AMMs
- Reviewing and approving SSHCP habitat re-establishment/establishment plans
- Reviewing and approving SSHCP monitoring plans
- Reviewing and approving SSHCP Preserve Management Plans
- Reviewing and approving SSHCP adaptive land management actions
- Reviewing and approving SSHCP proposed land dedications[5]
- Reviewing SSHCP proposed land and easement acquisitions, land dedications,[6] and acquisition of mitigation or conservation bank credits

Ongoing communication and coordination between the Implementing Entity and the Wildlife Agencies will be essential to ensure proper implementation of the SSHCP. The Wildlife Agencies may attend meetings of the JPA Board or the Implementation Committee, and will be a sitting member on the TAC (see Section 9.3.4). Additional coordination meetings between Wildlife Agency staff and Implementing Entity staff and/or Plan Permittee staff may also be necessary to address any issues that may arise concerning implementation of the Plan, and to keep the Wildlife Agencies informed of progress related to various requirements of Plan implementation. These meetings will be held on an as-needed basis.

The Wildlife Agencies will review each SSHCP annual report prepared by the Implementing Entity to confirm compliance with all requirements of the SSHCP, Implementing Agreement, and the Incidental Take Permits or other agreements. During this review, the Wildlife Agencies will also evaluate and determine how to respond to activities or adaptive management proposed by the Implementing Entity for the next year (see discussion of SSHCP annual reports in Section 9.9).

Role of Wildlife Agencies in Reviewing Third-Party Requests for Take Authorization

The Wildlife Agencies will not be involved in approving individual Covered Activities, including Covered Activities proposed by Third-Party Project Proponents. The Plan Permittees are not required to transmit copies of third-party project application packages (Chapter 10) to the

[5] There are five projects within the UDA where hard line preserves have been identified and are assumed as part of the SSHCP conservation strategy. These preserves are considered pre-approved under the SSHCP (see Appendix K) and therefore do not require approval by the Wildlife Agencies other than to ensure that the preserve boundaries are consistent with the SSHCP Conservation Strategy.

[6] See preceding note.

Wildlife Agencies prior to approval of the project by Plan Permittees. However, individual project application packages will be provided to the Wildlife Agencies at their request.

In compliance with the Incidental Take Permit terms and conditions, the Plan Permittees and the Third-Party Project Proponents will ensure that Wildlife Agency personnel are given appropriate access to any Covered Activity project site, any mitigation site, or other areas where Covered Activities are conducted, and will allow Wildlife Agency staff to verify compliance with SSHCP requirements.

The Wildlife Agencies may want to review project application packages prior to Plan Permittee approvals for projects that border an existing Preserve or border an SSHCP planned Preserve, or projects that include a wildlife crossing structure. In addition, the Wildlife Agencies may wish to review master plan documents (see Section 5.5.1) for consistency with the SSHCP. The review can be conducted at TAC meetings or separately. The Wildlife Agencies will review these projects in accordance with time limits applicable to each Land Use Authority Permittee.

9.3.3 Other State and Federal Permitting Agencies

As discussed in Chapter 1, USACE is proposing a multi-level permitting process under CWA 404 for future SSHCP Covered Activities. RWQCB would also develop a process to issue a Water Quality Certification under CWA 401 and a program to issue a Report of Waste Discharge under the California Porter-Cologne Act for future SSHCP Covered Activities. The SSHCP will also seek a master Streambed Alteration Agreement from CDFW under the California Fish and Game Code, Section 1600 et seq., for future SSHCP Covered Activities.

The role of these state and federal Permitting Agencies is to monitor compliance with aspects of the SSHCP related to the Aquatic Resources Program (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report) and to notify the Implementing Entity as soon as possible if implementation is not in compliance with the aquatic resources permitting strategy prepared for the SSHCP (Section 9.10.6).

The responsibilities and duties of the aforementioned state and federal Permitting Agencies differ based on their permitting processes, but generally include the following:

- Participating on the TAC/IRT (see below)
- Reviewing and approving all SSHCP aquatic habitat re-establishment/establishment plans
- Reviewing and approving SSHCP monitoring protocols related to aquatic habitat re-establishment/establishment

- Reviewing and approving modifications to SSHCP AMMs related to aquatic habitat re-establishment/establishment
- Reviewing and approving SSHCP monitoring plans related to aquatic resources re-establishment/establishment
- Reviewing SSHCP adaptive land management actions related to aquatic resources re-establishment/establishment

Ongoing communication and coordination between the Implementing Entity and all Permitting Agencies will be essential to ensure proper implementation of the permitting process. The Permitting Agencies may attend meetings of the JPA Board or the Implementation Committee and will be a permanent member on the TAC (see Section 9.3.4).

Additional coordination meetings between Permitting Agency staff and Implementing Entity staff and/or Plan Permittee staff may also be necessary to address any issues that arise concerning implementation of the Aquatic Resources Program, and to keep the Permitting Agencies informed of progress related to various requirements of Plan implementation. These meetings will be held on an as-needed basis.

As discussed in Chapter 1, one of the benefits of the SSHCP is to provide "one stop shopping" that allows a Third-Party Project Proponent to pay one fee that will fund multiple permitting processes for their Covered Activity project (see Chapter 12 for a discussion of SSHCP fees). To allow the Land Use Authority Permittees to collect a fee to compensate for impacts to aquatic resources, the Plan Permittees elected to establish, as a component of the SSHCP fee structure, an In-Lieu Fee Program pursuant to the Federal Mitigation Rule (33 CFR 332). The In-Lieu Fee Program will ensure proper implementation, tracking, and reporting of fees collected to implement CWA 404 compensatory mitigation projects (i.e., aquatic resources re-establishment and establishment). Aquatic resource re-establishment and establishment projects will be paid for through development fees that the Land Use Authority Permittees Implementing Entity will collect from qualifying Third-Party Project Proponents that implement a Covered Activity. The Implementing Entity is responsible for ensuring that the compensatory mitigation requirements associated with Covered Activities are implemented.

Pursuant to the 2008 USACE Final Mitigation Rule, an Interagency Review Team (IRT) must be established to direct the implementation of compensatory mitigation projects, including compensatory mitigation site selection, project prioritization, and project execution. As discussed in Section 9.3.4, the TAC will function as the SSHCP IRT. The role of the TAC/IRT is to review and approve compensatory mitigation projects that re-establish or establish aquatic resources. The TAC/IRT includes standing members who participate in discussions about all compensatory mitigation projects. The Plan Permittees propose that the TAC function as the

IRT. As such, participation by USACE, U.S. Environmental Protection Agency, and RWQCB at the TAC is necessary when the meeting agenda includes discussion of compensatory mitigation projects.

Deadlines for Permitting Agencies to review compensatory mitigation projects are necessary to ensure that the process occurs in a timely manner; otherwise, significant delays could jeopardize these projects and ultimately the ability of the Implementing Entity to implement the Conservation Strategy. The Permitting Agencies will review compensatory mitigation projects and provide comments to the Implementing Entity within 30 days of their receipt. The Implementing Entity will incorporate changes to the proposals based on comments received by the Permitting Agencies and provide copies of the final proposal to the Permitting Agencies within 15 days.

The Permitting Agencies will review each SSHCP annual report prepared by the Implementing Entity and other Plan Permittees to confirm compliance with all requirements of the SSHCP, Implementing Agreement, and Incidental Take Permits or other agreements. During this review the Permitting Agencies will also evaluate and determine how to respond to activities or adaptive management proposed by the Implementing Entity for the next year (see discussion of SSHCP annual reports in Section 9.9).

Role of Permitting Agencies in Reviewing Third-Party Requests for Take Authorization

The Permitting Agencies will not be involved in approving individual Covered Activities, including most Covered Activities proposed by Third-Party Project Proponents. The Plan Permittees are not required to transmit copies of most third-party project application packages (Chapter 10) to the Permitting Agencies prior to approval of the project by Plan Permittees. However, individual project application packages will be provided to the Permitting Agencies at their request. In compliance with the Incidental Take Permit's terms and conditions, the Plan Permittees and the Third-Party Project Proponent will ensure that Permitting Agency personnel are given appropriate access to any Covered Activity project site or other areas where Covered Activities are conducted, and will allow Permitting Agency staff to verify compliance with SSHCP AMMs or other SSHCP requirements.

9.3.4 Technical Advisory Committee/Interagency Review Team

A TAC/IRT will be formed to provide a forum for the Plan Permittees, the Executive Director, and the Permitting Agencies to discuss and review specific components of Plan implementation.

The responsibilities and duties of the TAC/IRT include the following:

- Reviewing and approving SSHCP Preserve Monitoring Plans

- Reviewing and approving SSHCP Preserve Management Plans
- Reviewing and approving SSHCP property transactions for satisfying the Conservation Strategy such as land or easement acquisitions, purchase of conservation or mitigation bank credits, land dedications, and gifts of land
- Reviewing and approving SSHCP habitat re-establishment/establishment plans
- Reviewing and approving SSHCP success criteria for habitat and wetland re-establishment/ establishment projects
- Reviewing and approving SSHCP species monitoring protocols, including appropriate reference sites
- Reviewing and approving SSHCP adaptive land management actions
- Reviewing and approving modifications to SSHCP AMMs
- Ranking land or easement acquisitions for priority
- Reviewing relevant new scientific studies and reports for applicability in preserve management
- Advising on other scientific issues as identified by the Executive Director

As discussed previously in Section 9.3.1, the JPA Board or Implementation Committee is ultimately responsible for approving the aforementioned plans and actions, and the Permitting Agencies will have approval authority over those plans and actions. Plans or actions not approved by the Permitting Agencies will not be submitted by the Executive Director to the Implementation Committee or the JPA Board for approval.

The TAC will be composed of Implementing Entity staff, including the Executive Director, one member from each of the Plan Permittees, and one member from each of the Permitting Agencies. Other entities with expertise in any of the topics to be discussed by the TAC, including representatives of the building industry, the agricultural community, the scientific community, and the environmental community, will also be invited to participate in TAC meetings. In addition, there are several conservancies and resource protection agencies that operate within the Plan Area and are implementing plans with similar objectives to the SSHCP. Individuals from these organizations will likely be able to provide guidance and expertise based on their experiences monitoring and managing similar landscapes.

The Implementation Committee will form the TAC within 6 months of the SSHCP permit issuance. TAC meetings will be determined by the Executive Director based on the needs of the Plan.

9.3.5 Public Input

Successful implementation of the SSHCP depends on continued public support. It is the intent of the Plan Permittees to provide ample opportunities for public participation in and input on implementation of the SSHCP. Meetings of the JPA Board and the Implementation Committee will be open to the public, and comments will be solicited at these meetings. The public is also welcome to contact the Implementing Entity for information concerning implementation and operation of the SSHCP. In addition, the Implementing Entity will maintain a website to provide the public with information about SSHCP implementation. The SSHCP document and appendices, Implementing Agreement, Incidental Take Permits, and other permits and agreements will be available on the public website. In addition, each SSHCP annual report will be posted to the Implementing Entity's website.

Annual Public Workshops

The Implementing Entity will host an annual public workshop on the status of SSHCP implementation. That year's annual report will serve as the foundation for each public workshop. The workshop is an opportunity to examine how SSHCP implementation is functioning from various perspectives, including progress toward each SSHCP biological objective and goal and the financial status of the Plan. The workshop will provide the public with the opportunity to ask questions and to provide input to the Implementing Entity.

9.3.6 Dispute Resolution

All parties involved in implementation of the SSHCP are obligated to work together to ensure efficient and effective implementation of the SSHCP. However, should the Implementing Entity and the Permitting Agencies disagree on how to implement the SSHCP, the Implementing Entity will follow the dispute resolution process outlined in the Implementing Agreement (Appendix C).

9.4 Preserve Acquisition

This section describes the process that the Implementing Entity will use to acquire properties or easements to implement the SSHCP Preserve System described in Chapter 7. Many criteria will be considered when making land or easement acquisition decisions. Some of the key criteria for land or easement acquisitions, such as price and availability, will vary as the SSHCP Preserve System develops and as other circumstances change.

9.4.1 Willing Sellers

Land will only be acquired by the Implementing Entity for the SSHCP Preserve System from willing sellers. At no time will the Implementing Entity use condemnation or eminent domain to require landowners to sell their property to fulfill the SSHCP Conservation Strategy. In addition,

the Implementing Entity will not support or enter into any agreements or contracts where condemnation will be or has been used by another party to acquire land or easements.

It is possible that one or several landowners who own key resources of interest to the Implementing Entity will refuse to sell, or that negotiations to sell will fail. It is impossible to predict where this may occur and in what context it will occur (e.g., how much of the Preserve System has been acquired, the extent of resources remaining to protect). This situation, if it occurs, is only expected to occur near the end of the Permit Term, when most or all of the development impacts will likely have occurred; consequently, any delays in land acquisition associated with a lack of willing sellers will affect few Covered Activities. This situation can be avoided if the Implementing Entity begins negotiations with key landowners early in the SSHCP Permit Term. A review of progress toward land acquisition goals will take place at least annually with each annual report submitted to the Permitting Agencies.

9.4.2 Process for Acquisition of Preserve Land

The Implementing Entity will acquire properties within the Plan Area by fee title or by conservation easement to preserve species habitat consistent with the requirements in Chapter 7. Prior to the acceptance or purchase of Preserve land, the Implementing Entity will determine the land's suitability for meeting the biological goals and objectives of the SSHCP and for advancing the Conservation Strategy. Lands acquired must do the following:

- Contribute to meeting one or more Biological Goals and Measurable Objectives of the Plan and the overall Biological Goals of the SSHCP Conservation Strategy, as described in Chapter 7.
- Contain biological functions and values that when protected will contribute to meeting the Conservation Strategy of the SSHCP. Permanent protection must be ensured through a conservation easement consistent with the requirements of Section 9.4.3 by some other permanent dedication of land to the Preserve System.
- Be managed in perpetuity according to a Preserve Management Plan as described in Chapter 8. Land acquisitions may be counted toward meeting the obligations of the Plan before a Preserve Management Plan has been completed if the Implementing Entity owns the land, or if the property owner is bound by a conservation easement or other agreement that requires preparation of a land management plan consistent with the requirements described in Chapter 8. Management in perpetuity will be ensured through the conservation easement or title record.
- Not be below sea level.
- Not be an existing preservation site already being used for mitigation.

The Implementing Entity will take the following steps when reviewing and considering any fee title or conservation easement acquisition, in addition to any steps required to comply with applicable federal and state laws governing real estate transactions:

1. The Implementing Entity will determine landowner interest in selling an easement or selling in fee title and will approach the property owner with a proposal to acquire land through conservation easement or fee title.
2. The Implementing Entity will obtain a title report to determine if there are encumbrances that might exclude property from acquisition. Properties with encumbered water rights or surface mineral rights that cannot be subordinated to a conservation easement or habitat protection interest will be excluded from acquisition unless these encumbrances do not influence the integrity of the proposed Preserve. A Phase I survey with an environmental determination document for the presence of hazardous materials will be included with the title report.
3. The Implementing Entity will examine any existing leases on the property for compatibility with the land management and Biological Goals and Measurable Objectives of the SSHCP, including water and surface mining rights. Inconsistent leases must be terminated or modified to conform to the Plan.
4. The Implementing Entity will conduct an appraisal.
5. The Implementing Entity will prepare a Pre-Acquisition Preserve Documentation Report (PDR) (see Appendix G, Preserve Management and Monitoring Details) for the Pre-Acquisition PDR template. The Pre-Acquisition PDR will assess the baseline inventory of SSHCP land cover types (see Chapter 10), species known occurrences, availability of water for future Preserve maintenance, existing and historical management practices on the property, and general ecological health and functions of the property.
6. The Implementing Entity will identify and rank property acquisitions, via the TAC. Ranking will be based on the potential to achieve targeted SSHCP objectives and meet Preserve acquisition criteria (see Section 7.5, Description of the Conceptual SSHCP Preserve System), and based on cost relative to the parcel's ability to meet the SSHCP Biological Goals and Measurable Objectives. Properties that fulfill more difficult-to-achieve Biological Goals and Measurable Objectives will receive higher priority, such as a property that will provide Preserve linkages, has known occurrences of a plant Covered Species, or supports an important SSHCP land cover type with limited available inventory.
7. The Implementing Entity will prepare a land acquisition proposal.
8. The Implementing Entity will prepare an easement document (for conservation easements) or a deed (for acquisitions in fee title).

9. The Implementing Entity will prepare an offer for the landowner's consideration and negotiate the terms of the acquisition.
10. The Implementing Entity will record a conservation easement on the acquired property.
11. The Implementing Entity will prepare an Initial Preserve Management Plan (see Chapter 8). The Initial Preserve Management Plan will incorporate the existing management methods of the acquired property, ensuring that changes to preserve management are not made without cause.

As described in Chapter 7, it will be necessary for the Implementing Entity to purchase some lands in fee title. Fee title ownership allows more intensive habitat management than would otherwise be possible on lands held under a conservation easement. Fee title acquisition is preferred for SSHCP Preserves within the Urban Development Area (UDA) to allow for more intensive management of those Preserves, given their proximity to threats from existing and planned future development. As discussed below, all interests in land owned in fee title by the Implementing Entity and all conservation easements will be protected in perpetuity.

9.4.3 Conservation Easements

All lands acquired for the SSHCP Preserve System will need a conservation easement, even lands that are held in fee title by the Implementing Entity. Within the UDA, most of the SSHCP Preserve System is expected to be held in fee title by the Implementing Entity. Outside the UDA, the Implementing Entity intends to minimize the amount of fee title acquisition for the SSHCP Preserve System. Therefore, most of the SSHCP Preserve System outside the UDA will be in the form of conservation easements where the land is not owned by the Implementing Entity. Easement acquisition offers advantages over fee title acquisition in that it promotes partnerships between private landowners and the SSHCP, continues beneficial ranching and farming operations in the Plan Area, keeps land in private ownership, and generally costs less to acquire.

Conservation easements will be negotiated individually between willing sellers and the Implementing Entity. The terms of the easement and prices paid for easements will be variable depending on the purpose of the easement and the degree to which the easement restricts land uses.

The Implementing Entity will hold in perpetuity all conservation easements it purchases or accepts from a landowner. In addition, all conservation easements will have a third-party enforcement beneficiary (CDFW and/or USFWS). Conservation easements will contain provisions that allow the Implementing Entity to manage the encumbered property if it becomes necessary, such as if a property is abandoned by the owner. On lands owned in fee title by the Implementing Entity, conservation easements will be held by an SSHCP Permitting Agency such as CDFW or USFWS.

All conservation easements acquired by the SSHCP Implementing Entity will be in accordance with California Civil Code Sections 815 et seq. All conservation easements will follow the easement templates found in Appendix D, including restrictions on use. The SSHCP will include at least two types of conservation easements: one for Rangeland and one for Cropland/Irrigated Pasture. Reasonable variations from the template may be allowed to address site-specific constraints. CDFW and USFWS, along with the Implementing Entity, must review and approve any modifications to the template easement.

All conservation easements shall exclude the area already encumbered by right-of-way easements and public utility easements and the area necessary to implement future roadway widening or new roadways, along with all appurtenances consistent with the current General Plans of the Land Use Authority Permittees. The conservation easement should also consider the appropriate setbacks from the future right-of-way/public utility easement to maintain the integrity of a Preserve.

Reselling Acquired Lands after Establishing Conservation Easements

The Implementing Entity expects to purchase a maximum of 15% of the Preserve System located outside of the UDA in fee title and the remaining approximately 85% of the Preserve System located outside the UDA in easements. However, if conservation easements are not available, but fee title option are, the Implementing Entity may purchase more than 15% of the lands needed to establish the Preserve System outside the UDA in fee title. If more than 15% of the Preserve System is acquired in fee title, the Implementing Entity will eventually attempt to sell properties to private landowners until fee title holdings amount to no more than 15%. Properties sold to privative landowners will be encumbered with a conservation easement.

Easements on Public Lands

Several publicly owned parcels within the Plan Area offer the potential to contribute to implementation of the SSHCP Preserve System. Should a public entity decide to encumber all or a portion of its properties with an SSHCP conservation easement, land dedication credits will be granted to that public entity in accordance with Section 9.4.4. Land dedication credits will be granted once sites on existing public lands are placed under a conservation easement that is consistent with the easement requirements described in this chapter.

Agricultural Enhancements on Easements

Landowners who sell easements on lands that become part of the Preserve System and who engage in farming activities are eligible for monetary payments for the purpose of agricultural enhancement. These payments can only be used to improve the property that is under conservation easement and must be shown to provide a beneficial use to Covered Species.

Examples of what the payments can be used for include the installation or repair of wells, fences, barns, drainage/irrigation systems; demolition of structures, and clearing of land that does not impact wetland or riparian resources. To be eligible for the Agricultural Enhancement Program the easement must include the terms of using the monetary payments and will include a list of all improvements that are approved for the property. The list of improvements can be amended from time to time with the approval of all signatories to the easement.

9.4.4 Land Dedication in Place of SSHCP Fees

A Third-Party Project Proponent may wish to dedicate land to the Implementing Entity for inclusion in the SSHCP Preserve System to satisfy the land acquisition component or re-establishment/ establishment component of the project's SSHCP development fee requirements (see Chapter 12 regarding fees). If a Third-Party Project Proponent wishes to dedicate Preserve land (to meet either the land preservation or re-establishment/establishment measures of the Plan) and the Implementing Entity and the Permitting Agencies determine that the proposed land dedication is consistent with the SSHCP Conservation Strategy, then this land dedication can offset all or part of the SSHCP land acquisition or re-establishment/establishment fees required. SSHCP fees not associated with land acquisition (e.g., administration and land management fees) are still required and must be paid by the Third-Party Project Proponent. Likewise, if a Third-Party Project Proponent wishes to dedicate land to satisfy re-establishment/establishment measures, then the re-establishment/establishment fee component, with the exception of monitoring and management costs, will be waived.

Lands proposed for dedication must comply with the SSHCP Conservation Strategy. In addition, land cannot be integrated into the SSHCP Preserve System unless adequate water rights and all surface mining rights can be secured. Surface mining is not compatible with the objectives of the SSHCP, and sufficient water for conservation/natural preserve purposes is necessary to implement management actions required under the SSHCP. The Implementing Entity and the Permitting Agencies will evaluate each property proposed for dedication on a case-by-case basis, as follows:

- Third-Party Project Proponents will prepare a Pre-Acquisition PDR (see Chapter 10), including a biological letter report (see Chapter 10). Third-Party Project Proponents will pay the cost of preparing the Pre-Acquisition PDR, including a Phase I site assessment, appraisal, and title search. If the Third-Party Project Proponent wishes to use the property for re-establishment/establishment, it must prepare a re-establishment/establishment plan (Chapter 8) for review and approval by the Implementing Entity and Permitting Agencies.
- The Implementing Entity will determine whether the proposed land dedication and any re-establishment/establishment plan meets the SSHCP's Conservation Strategy described in Chapter 7. Third-Party Project Proponents must provide the Implementing Entity and

the Permitting Agencies access to the proposed dedication property to survey the site and verify its biological value to the SSHCP Conservation Strategy.

- The Implementing Entity will use the Pre-Acquisition PDR to determine the acreage of SSHCP land cover types present on the subject property, and the suitability of the land cover types and property for inclusion in the SSHCP Preserve System.
- The Implementing Entity will use the re-establishment/establishment plan to determine compliance with the SSHCP Conservation Strategy, including AMMs and conservation action selection criteria.
- The Implementing Entity will evaluate whether the acres of SSHCP land cover types present on the subject property is less than, equal to, or in excess of required mitigation (see SSHCP Land Cover Credits) for the Third-Party Project Proponent's Covered Activities.
- For re-establishment/establishment proposals, the Third-Party Project Proponent will monitor and manage the re-established/established site to ensure that the habitat meets minimum success criteria, as determined by the TAC (Chapter 8). The Implementing Entity and Permitting Agencies will evaluate the performance of the re-established/ established land cover type to determine if the property can be used to satisfy the SSHCP Conservation Strategy requirements.

SSHCP Land Cover Credits

SSHCP Land Cover Credits are acres of land dedicated by project proponents that are in excess of the land acquisition or re-establishment/establishment acres required for mitigation for project impacts. Land Cover Credits shall be generated only when the Implementing Entity makes a written determination that the land proposed to be dedicated is consistent with the SSHCP's Conservation Strategy and suitable for assembly into the Preserve System. Fee credits shall accrue on an acre-for-acre basis by land cover type, with one fee credit or fraction thereof allowed for each acre of land cover type that is dedicated to the Preserve System. Land Cover Credits will be counted toward the stay-ahead provision of the Conservation Strategy (Section 9.4.6).[7]

Before a property is dedicated by fee title or by conservation easement, the Implementing Entity will provide the project proponent with a statement of the acres and types of SSHCP land covers, if any, the Implementing Entity determines can be SSHCP Land Cover Credits. Within 10 business days after acceptance of the property and recordation of an easement to the satisfaction of the Implementing Entity, the Implementing Entity will issue a dated SSHCP Land Cover

[7] Re-established/established acreage can only be counted toward the "stay-ahead" provision after the re-established/established habitat has met SSHCP success criteria.

Credit Certificate to the project proponent that sets forth the acres of each SSHCP Land Cover Credit in the rest of the property.

Future Uses of Land Cover Credits

Project proponents can use SSHCP Land Cover Credits for their future Covered Activities in the Plan Area. Impacts to a specific SSHCP land cover type can only be offset using credits of the same SSHCP land cover type. Mitigation requirements for re-establishment/establishment of an SSHCP land cover type can only be offset with SSHCP Land Cover Credits for re-establishment/establishment of the impacted land cover type. If project proponents wish, they can sell their SSHCP Land Cover Credits to the Implementing Entity or another project proponent wishing to implement a Covered Activity in the Plan Area. However, SSHCP Land Cover Credits may only be used to offset the land acquisition component or re-establishment/establishment component of the SSHCP fee payment, and the project will still be required to pay all other applicable SSHCP fees (Chapter 12).

9.4.5 Early Enrollment Program

Under the Early Enrollment Program, the Implementing Entity will broker agreements with willing landowners to place a temporary easement to encumber properties needed for the SSHCP Preserve System. The Implementing Entity will pay landowners for the easement or fee-title acquisition at a future date as development fees are available. The process for evaluating properties for easements or future fee-title acquisition is described in Section 9.4.3. Early enrollment properties will be prioritized based first on the Implementing Entity's need for the property at the time (e.g., contains land cover types or modeled species habitat that is in short supply, is needed to create a linkage between other Preserve parcels), and second on the order in which the property was enrolled in the program. The temporary easements will become permanent easements when the property is added to the SSHCP Preserve System. The use of temporary easements to protect properties provides the landowner with assurances that, should the property not be needed by the SSHCP, the easement can be extinguished. The Plan Permittees anticipate that all properties enrolled in the Early Enrollment Program will become part of the Preserve System and will consist of permanent easements. Early enrollment properties can be used by the Implementing Entity to satisfy the stay-ahead provision (Section 9.4.6).

Properties that are brought into the Early Enrollment Program will continue to be managed by the landowner to maintain the habitat value of the property. The Implementing Entity will take responsibility for managing and monitoring these lands once the property is placed under a permanent conservation easement.

Basic components of the Early Enrollment Program are as follows:

1. ***Land Preserve.*** Property owners who enter the Early Enrollment Program must agree to land use restrictions that preserve the subject property's habitat values. The property owner will also agree to make the property available to the Implementing Entity in the future for acquisition in fee title or conservation easement.
2. ***Early Enrollment Program Documents.*** Three documents will be required to enroll properties in the program:
    a. ***Preserve Documentation Report.*** Because lands brought into the Early Enrollment Program are intended to become part of the Preserve System, the Implementing Entity will prepare a Pre-Acquisition PDR, including a Biological Letter Report (see Section 10.4.3, Components of the SSHCP Project Application Package), Phase I site assessment, appraisal, and title search. The Implementing Entity will evaluate each property to ensure that it is consistent with the Conservation Strategy described in Chapter 7.
    b. ***Option to Purchase or Use as Mitigation.*** The landowner will grant the Implementing Entity an option agreement on the land that will allow its acquisition in fee title or conservation easement.
    c. ***Temporary Easement.*** Land will be secured under a temporary easement that requires the landowner to maintain the habitat values of the property until the Implementing Entity has purchased a permanent easement on the property.
3. ***Purchase of Early Enrollment Properties by the Implementing Entity.*** The Implementing Entity will acquire the property (or buy a permanent easement) when SSHCP fees become available. The price paid for a property cannot exceed available SSHCP fees.
4. ***Final Disposition of Preserve Lands.*** Any lands that have not been purchased to fulfill mitigation requirements may be purchased by the Implementing Entity at the end of the option agreement term.

9.4.6 Jump-Start and Stay-Ahead Provisions

The SSHCP requires and the Implementing Entity will ensure that progress toward assembling the SSHCP Preserve System will always stay ahead of Covered Activity impacts. This will ensure that Preserve assembly will keep pace with development and that the Implementing Entity is making steady progress toward assembling the entire SSHCP Preserve System. This will satisfy California Fish and Game Code Section 2081(b), which requires that impacts to state-listed species be fully mitigated in advance of the impacts. This will also satisfy the federal ESA,

which requires that Habitat Conservation Plans (HCPs) minimize and mitigate the impacts of taking "to the maximum extent practicable," and requires that the taking "will not appreciably reduce the likelihood of the survival and recovery of any Covered Species in the wild" (ESA Section 10(a)(2)(B)(ii)). In preparing permit decision documents, USFWS will consider whether the mitigation proposed under the SSHCP is scientifically and rationally related to the impacts of the proposed taking, and will consider temporal losses resulting from the time of impacts relative to the time that the conservation benefits of the mitigation are in place.

HCPs that are also Natural Community Conservation Plans must follow the rough step requirement, which can allow land acquisition to fall behind the pace of impacts. The SSHCP improves upon that process by implementing two provisions: the "jump-start" and "stay ahead" provisions. Prior to implementation of SSHCP Covered Activities, the Implementing Entity will protect SSHCP land cover types and Covered Species habitat in advance of impacts, called the jump-start provision (Section 9.4.6.2). The jump-start provision will ensure that there is enough Preserve area and habitat benefits to fully offset the initial habitat loss and species take expected when the Plan is first implemented. The jump-start provision will apply to all SSHCP land cover types.

Over the term of the permit, the Implementing Entity will maintain a "cushion" of mitigation that is established in advance of impacts, called the stay-ahead provision (Section 9.4.6.3). The stay-ahead provision includes maintaining a cushion that provides species habitat and known occurrences and nest sites for certain species. The stay-ahead provision will avoid temporal impacts to Covered Species that occur when mitigation is delayed from the time that impacts occur to when the associated mitigation benefits are available to the species (e.g., environmental benefits resulting from Preserve management, habitat enhancement, and habitat re-establishment activities).

9.4.6.1 Land Cover Type Groupings for Jump-Start and Stay-Ahead Provisions

The jump-start and stay-ahead provisions will place the 17 SSHCP "natural" land cover types (see Chapter 3, Biological Resources Setting) into seven groups (Table 9-1). By grouping SSHCP land cover types, the Implementing Entity is afforded the flexibility to meet the stay-ahead provision based on the best easement/land acquisition opportunities available rather than being limited by separate acreage goals for each of the 17 land cover types. Land cover types were grouped based on species habitat needs.

Table 9-1
Land Cover Types by Land Cover Category

Land Cover Grouping	Land Cover Types in the Grouping	Land Cover Types Acceptable for Acquisition to Meet Jump-Start-Stay Ahead Provision
Valley Grassland	Valley Grassland	Valley Grassland Valley Grassland (Vernal Pool Ecosystem)
Vernal Pool	Vernal Pool	Vernal Pool
Other Vernal Pool Invertebrate Habitat	Swale Stream/Creek (Vernal Pool Invertebrate Habitat)	Swale Stream/Creek (Vernal Pool Invertebrate Habitat)
Other Wetland	Seasonal Wetland Freshwater Marsh Stream/Creek Open Water	Seasonal Wetland Freshwater Marsh Stream/Creek Open Water
Riparian	Mixed Riparian Woodland Mixed Riparian Scrub Mine Tailing Riparian Woodland	Mixed Riparian Woodland Mixed Riparian Scrub
Agricultural	Cropland Irrigated Pasture-Grassland Orchard Vineyard	Cropland Irrigated Pasture-Grassland
Oak Woodland	Blue Oak Woodland Blue Oak Savanna	Blue Oak Woodland Blue Oak Savanna

The acres of land cover mitigation and acres of species modeled habitat mitigation specified in the Conservation Strategy (Chapter 7) will not be affected by the groupings. All of the mitigation acres identified in Chapter 7 will eventually be obtained by the Implementing Entity before the end of the Permit Term and regardless of the stay-ahead provisions or use of these land cover groups to measure compliance with the SSHCP jump-start and stay-ahead provisions.

The jump-start and stay-ahead provisions of the SSHCP Conservation Strategy can be achieved in whole or in part by the dedication of land or acquisition of fee title or easements (Sections 9.4.2, 9.4.3, 9.4.4), or the acquisition of credits from a Permitting Agency–approved conservation bank or mitigation bank (Section 9.4.8).

Temporary easements can be counted toward the jump-start and stay-ahead provisions; however, in the event that the temporary easement expires, that land can no longer be counted toward satisfying these provisions.

9.4.6.2 The Jump-Start Provision

To eliminate the chances of mitigation falling behind impacts at the outset of Plan implementation, the Implementing Entity will acquire at least 5% of the preservation required for each land cover by the SSHCP Conservation Strategy before Incidental Take Permits are issued by the Wildlife Agencies. See Table 9-2 for the total acres that must be acquired per grouping before Incidental Take Permits are issued.

For example, the Conservation Strategy requires preservation of 22,014 acres of Valley Grassland land cover type over the term of the permits. Before the Incidental Take Permits are issued, the SSHCP Implementing Entity will preserve at least 5% of 22,014 acres, or 1,100 acres, of Vernal Pool Grassland land cover to meet the jump-start provision.

The Implementing Entity will acquire the minimum acreage of each land cover grouping as prescribed in Table 9-2.

Table 9-2
Jump-Start Provision Acreage Requirements (at Permit Issuance)

Land Cover Grouping	Total Acres of Required Preservation by Land Cover Grouping[a]	Initial Acreage Required (before Permit Issuance) to Meet Jump-Start Provision (i.e., 5% of Required Preservation)
Valley Grassland	22,014	1,100[b]
Vernal Pool	966	48
Other Vernal Pool Invertebrate Wetland Habitat[c]	304	15
Other Wetland[d]	504	25
Agricultural	9,696	484
Riparian	964	48
Oak Woodland	47	2

[a] Based on the sum of required preservation for each land cover type (refer to Table 7-2) that is comprised by the land cover grouping.
[b] This 1,100 acres must be preserved within the Vernal Pool Ecosystem (Chapter 3, Section 3.2.3).
[c] Includes all Swale and Stream/Creek (Vernal Pool Invertebrate Habitat) habitat that is considered invertebrate habitat.
[d] Includes Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water.

9.4.6.3 The Stay-Ahead Provision

Over the 50-year Permit Term, the stay-ahead provision will maintain a "cushion" of preserved Covered Species modeled habitat and re-established/established modeled habitat for the SSHCP vernal pool invertebrate Covered Species. The stay-ahead provision requires that the Implementing Entity maintain enough Preserve land to be at least 2% ahead of the remaining preservation required for each SSHCP land cover grouping by the SSHCP Conservation Strategy at all times. This means that each project proposing to use the SSHCP must be checked against the stay-ahead provision prior to issuing Incidental Take Permits to

ensure that the project does not result in stay-ahead preserve land dropping below the 2% threshold. The Early Enrollment Program will provide a mechanism for the Implementing Entity to implement the stay-ahead provision.

For example, if half of the Incidental Take Permit's 22,014-acre maximum impact cap on Valley Grassland cover type has been used by Covered Activities, 11,007 acres of impact to Valley Grassland can still occur. At this stage of implementation, 11,007 acres of Valley Grassland would be required to mitigate the remaining 11,007 acres of impact (1:1 ratio). In this case, 2% of 11,007 acres, or approximately 220 acres, of Valley Grassland habitat must be preserved in advance of impacts to maintain the stay-ahead provision before any additional impacts to Valley Grassland habitat is allowed.

The status of the stay-ahead requirements for each land cover grouping will be discussed in each SSHCP annual report (see Section 9.9, Reporting). On an ongoing basis, the Implementing Entity will determine if at least 2% of the remaining mitigation requirements for each of the seven habitat categories is preserved ahead of impacts.

The stay-ahead provision also applies to colonies of tricolored blackbird (*Agelaius tricolor*) occurrences and the five plant Covered Species: Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii*), and Sanford's arrowhead (*Sagittaria sanfordii* Green). As discussed in Chapter 7, prior to impact to an occurrence of a plant Covered Species, at least one occurrence of the same species must be preserved.

9.4.6.4 Process if the Stay-Ahead Provision Is Not Being Met

The Implementing Entity is responsible for monitoring compliance with the stay-ahead provision on an ongoing basis as take coverage is extended to Covered Activities. As discussed in Section 9.2.1, the Plan Permittees will provide the Implementing Entity with information from each project application package, including the projected acres of impacts that are expected to occur to each land cover type and species modeled habitat if a project were to be implemented.

Because the Implementing Entity will be monitoring compliance with the stay-ahead provision as information from each project application is submitted, it is unlikely that the Plan will ever drop below the 2% threshold for any land cover type group. However, if the Implementing Entity determines that the amount of impact that is anticipated to occur will exceed the stay-ahead provision's 2% threshold for any land cover group, then the Implementing Entity will notify the Plan Permittees that SSHCP fee payments cannot be accepted out of concern that the 2% threshold will be exceeded, and immediately notify the Permitting Agencies. The Implementing Entity will convene a meeting with Plan Permittees and Permitting Agencies to discuss strategies to stay in

compliance with the stay-ahead provision, including the acquisition of additional Preserve land. The fee suspension will be lifted as soon as the Implementing Entity and the Permitting Agencies agree that the SSHCP is no longer at risk of noncompliance with the stay-ahead provision.

While SSHCP fee payments are suspended, take coverage can still be extended to Covered Activities if the Plan Permittees or Third-Party Project Proponents dedicate land in lieu of fees, or show proof of acquisition of appropriate conservation or mitigation bank credits within the Plan Area (see Section 9.4.8).

The status of the stay-ahead provision will be addressed in each annual report (see Chapter 8). See Section 9.10.6 and the SSHCP Implementation Agreement for more information regarding the process to remedy potential noncompliance with the SSHCP and the permit terms and conditions.

9.4.7 Gifts of Land

In the event that property is donated or gifted to the SSHCP Implementing Entity by another entity or an estate, the Implementing Entity will determine if the land is consistent with the SSHCP Conservation Strategy. If it is consistent, the property will be added to the SSHCP Preserve System.

If the property is determined to not be consistent with the SSHCP Conservation Strategy, the Implementing Entity will discuss with the donor if the land can be sold and the proceeds used to implement the SSHCP Conservation Strategy. If the land does not meet the SSHCP Conservation Strategy and its sale is restricted or prohibited, then the Implementing Entity will not accept the property.

Gifted properties must be monitored and managed consistent with the SSHCP monitoring and management guidelines and protocols as discussed in Chapter 8 of this document. While gifted lands can be used to satisfy the SSHCP Conservation Strategy, they will not be used to satisfy the mitigation needs of any project. Gifted lands should also be considered in the context of Appendix J, Voluntary Additional Conservation. Prior to accepting gifts of land, the Implementing Entity must identify a source of funding to pay for the long-term endowment that is necessary to monitor and manage the property.

9.4.8 Private Conservation or Mitigation Banks

A conservation or mitigation bank is privately or publicly owned land that is permanently protected and managed for its natural resource values. The Implementing Entity may choose to purchase credits from a conservation or mitigation bank located within the Plan Area to satisfy the requirements of the SSHCP Conservation Strategy, including the jump-start and stay-ahead provisions. Conservation and mitigation banks used for the SSHCP must be approved by

USFWS and/or CDFW (and USACE if the bank is also selling jurisdictional wetland credits). The Implementing Entity will establish agreements with Plan Area conservation and mitigation banks to expedite use of the banks for SSHCP purposes. Banks that are physically located outside of the Plan Area, but where the bank's service area extends into the Plan Area, cannot be used to mitigate for Covered Activities under the Plan. Banks used for the SSHCP must meet all requirements of the SSHCP Conservation Strategy, Monitoring Plan, and Management Program as determined by the Implementing Entity and the Permitting Agencies.

Nothing within the SSHCP prohibits the creation of new conservation or mitigation banks in the Plan Area. The SSHCP also does not prohibit existing Plan Area conservation or mitigation banks from selling credits to projects located inside or outside the Plan Area.

9.4.9 Grazing Leases, Licenses, or Contracts within the Preserve System

As discussed in Chapter 8, livestock grazing will be used to help manage Covered Species habitat on several SSHCP land cover types in the Preserve System. Existing grazing leases or licenses on properties that are acquired as part of the Preserve System will remain in effect, and the current grazing regime will be continued until a Preserve Management Plan can be prepared and approved by the Implementing Entity and Wildlife Agencies (Chapter 8). Once a Preserve Management Plan has been approved, the Implementing Entity will review the terms of the existing grazing lease or license for consistency with the Preserve Management Plan. If deemed necessary by the Implementing Entity, the existing lease or license will be made consistent with the Preserve Management Plan until the end of the lease or license period to the extent feasible.

When properties are acquired without a preexisting grazing lease or license and an approved Preserve Management Plan calls for grazing, the Executive Director will enter into a lease agreement or license with a livestock operator that includes the requirements of the Preserve Management Plan. As discussed in Chapter 8, the Preserve Management Plan will specify the timing, stocking rates, duration of grazing, and residual dry matter standards. The Preserve Management Plan will be reviewed annually with the livestock operator. In some instances, a livestock operator may not realize an economic benefit from grazing on the land, and compensation to the livestock operator may be necessary.

The Preserve Management Plan will also identify the responsibilities of each party in terms of maintaining Preserve infrastructures (e.g., fences), controlling weeds and pests, and reporting. The Preserve Management Plan will include the following conditions of agricultural use and covenants to be incorporated by reference into contracts, leases, and licenses to protect resources:

- Grazing capacity and stocking rates
- Evaluation of fencing of riparian areas

- Residual dry matter guidelines
- Conditions under which the desired stocking rate can be changed or exceeded (e.g., seasonal adjustments to maintain habitat quality and annual adjustments in response to rainfall)
- Grazing and livestock practices
- Pest control restrictions
- Reporting requirements

9.5 Easements on Setbacks

9.5.1 Preserve Setbacks

As required by AMM EDGE-3, projects that occur adjacent to existing and planned Preserves in the UDA are required to establish minimum Preserve Setbacks to protect Covered Species habitat and occurrences. Preserve Setbacks will be established concurrent with issuance of development permits for projects adjacent to planned or existing Preserves (Section 9.5.1). Refer to Chapter 5, Section 5.2.5, for Covered Activities allowed in Preserve Setbacks.

Setback Requirements for Proposed Projects Adjacent to Existing or Planned Preserves

The following lists the land use requirements for projects adjacent to Preserve Setbacks. Compliance with each requirement will be enforced by the Land Use Authority Permittee with jurisdiction over the proposed project.

- Each Preserve Setback will be encumbered by a Preserve Setback easement that gives the Implementing Entity the ability to enforce restrictions on Covered Activities within the Preserve Setback in perpetuity (refer to Section 5.2.5 and Appendix D, Sample Easement). The Preserve Setback easement will require development of a Preserve Setback Management Plan by the Implementing Entity in cooperation with the project proponent and the TAC. The Preserve Setback Management Plan will be compatible with the Preserve Management Plan for the adjacent Preserve (Chapter 8).
- Any discretionary review of a proposed project by a Land Use Authority Permittee, including rezones, conditional use permits, variances, parcel and subdivision maps, boundary line adjustments, development plan review, and design review, will ensure that sufficient area exists outside of the minimum 50-foot-wide Preserve Setback to accommodate primary and accessory structures, paved areas, septic systems, and other uses or activities that might affect the Preserve Setback.
- Any new lot created that contains land within an existing Preserve Setback must be conditioned as follows: The portion of the lot within the Preserve Setback must be

permanently restricted by an easement (Appendix D) held by the SSHCP Implementing Entity or another approved public or private land conservation organization that has the ability to provide adequate protection and prevent adverse impacts within the Preserve Setback. The final map will not be recorded, and no activity, including issuance of grading permits for ground disturbance and/or construction, will be allowed prior to providing proof of an easement to the Land Use Authority. Easements will remain tied to the land, and will move from deed to deed as the land is transferred from one owner to another.

- For building lots that exist as of the date of the issuance of SSHCP Incidental Take Permits, but for which a building permit or a preliminary site plan approval has not been obtained or is no longer valid, the required minimum front, side, and rear structural setbacks may extend into the Preserve Setback, provided that an easement is applied that prohibits clearing or construction in the Preserve Setback.

Preserve Setback Fee Calculations

The area within a Preserve Setback will not be counted when calculating SSHCP fees for project impacts, except where allowed Preserve Setback Covered Activities (e.g., bike paths) occur. Preserve Setbacks will not be used to mitigate impacts to SSHCP Covered Species modeled habitat.

9.5.2 Stream Setbacks

As required by AMM STREAM-1, AMM STREAM-2, and AMM STREAM-3, projects that occur adjacent to certain stream corridors are required to establish minimum setbacks to protect riparian ecological functions and maintain water quality. Land that is set aside to satisfy these setbacks cannot be used to offset SSHCP fees, but will not be assessed fees (unless a Covered Activity is allowed to occur within the setback) (see Chapter 5, Section 5.2.6, for Covered Activities allowed in Stream Setbacks). Refer to AMM STREAM-1, AMM STREAM-2, and AMM STREAM-3 in Section 5.4.1 for minimum Stream Setback requirements.

Nonconforming Structures and Uses within Stream Setbacks

Legally existing but nonconforming structures and uses of land within Stream Setbacks may be continued. Encroachment into the setback will only be allowed where previous allowable (i.e., permitted or otherwise legal) development or disturbance exists. Existing impervious surfaces within the setbacks that resulted from previous allowable disturbances or developments will not be expanded. If a legally existing but nonconforming use has been discontinued for a period of more than 90 days, it will not thereafter be re-established, with the exception of agricultural uses that are following prescribed best management practices for crop rotation. However, resumption of agricultural uses must be strictly confined to the extent of disturbance existing at the time of adoption of the SSHCP.

Land Use Requirements for Covered Activities within Stream Setbacks

The following lists the land use requirement for Covered Activities within Stream Setbacks (Chapter 5, Section 5.2.6).

- Any discretionary review of a proposed project by a Land Use Authority Permittee, including rezones, conditional use permits, variances, parcel and subdivision maps, boundary line adjustments, development plan review, and design review, will ensure that sufficient area exists outside of the Stream Setback to accommodate primary and accessory structures, paved areas, septic systems, and other uses or activities that might interfere with the functioning of the stream.
- Any new lot created that contains land within a setback must be conditioned as follows: The portion of the lot within the setback must be permanently restricted by an easement (Appendix D) held by the SSHCP Implementing Entity or another approved public or private land conservation organization that has the ability to provide adequate protection and to prevent adverse impacts within the setback. The final map will not be recorded, and no activity, including issuance of grading permits for ground disturbance and/or construction, will be allowed prior to submittal of easement to the Land Use Authority. Easements will run with the land and be binding on the property owner and successors.
- Any lands proposed for development in the UDA that include all or a portion of a Stream Setback will, as a condition of any major subdivision or major site plan approval, provide for vegetation or re-vegetation of any portions of the setback that are not vegetated at the time of the application or that were disturbed by prior land uses. Vegetation will include native or natural tree and plant species for that SSHCP land cover type, consistent with the AMMs in Section 5.4.1 (e.g., trees will not be planted in Grassland land covers).
- For building lots that exist as of the date of adoption of the SSHCP, but for which a building permit or a preliminary site plan approval has not been obtained or is no longer valid, the required minimum front, side, and rear structural setbacks will extend into the Stream Setback, provided that an easement is applied that prohibits clearing or construction in the Stream Setback.
- Roads and road crossings that must run through the Stream Setback will be designed consistent with the road design AMMs found in Section 5.4.1. An analysis will be conducted by Third-Party Project Proponents and approved by the Implementing Entity or Land Use Authority Permittee to ensure that no economically feasible alternative to locating the road in the Stream Setback is available.

Small Lot Waivers for Stream Setbacks

Waivers are primarily intended to provide relief to property owners of small lots (10 acres or smaller) where setback conditions may constrain the use of their property to a point that it is not usable consistent with existing land use entitlements.

A waiver for the Stream Setback may be granted by the Land Use Authority Permittee and with the consent of the Implementing Entity under the following conditions:

- A preexisting lot (defined as existing as of the date the SSHCP is formally adopted) for which there is insufficient room outside the Stream Setback for uses permitted by the underlying zoning and for which there is no other reasonable or prudent alternative to placement in the setback, including obtaining variances from setback or other requirements that would allow conformance with the setback requirements
- An economic hardship whereby an applicant demonstrates to the Land Use Authority Permittee's satisfaction that the subject property is not capable of yielding a reasonable economic return as a result of unique circumstances specific to the subject property, as follows:
    - An economic hardship related to or arising from the characteristics of the property due to the particular physical surroundings, shape, or topographical conditions of the property involved, rather than the personal situations of the applicant or the result of any action or inaction by the applicant or the owner or predecessors in title
    - The necessity of acquiring additional land to locate development outside the Stream Setback will not be considered an economic hardship unless the applicant can demonstrate that there is no adjacent land that is reasonably available or could be obtained, used, expanded, or managed to fulfill the basic purpose of the proposed activity
- For reasons of public health and safety, if the following is demonstrated to the satisfaction of the Land Use Authority Permittee:
    - The proposed project will serve an essential public health or safety need or
    - The proposed use is required to serve an existing public health or safety need, and
    - There is no alternative available to meet the established public health or safety need
- Those developments that have had setbacks applied in conformance with previously issued requirements

A Stream Setback waiver will only be granted if it is shown that the activity is in conformance with all applicable local, state, and federal regulations, and that the waiver granted is the minimum relief necessary to relieve the hardship.

The Third-Party Project Proponent will submit a written request for a Stream Setback waiver to the Land Use Authority Permittee or Implementing Entity if a Land Use Authority Permittee does not have oversight of the project or if the project is to be implemented by one of the Plan Permittees. The written request will include specific reasons justifying the waiver and any other information necessary to evaluate the proposed waiver request. The Land Use Authority Permittee or Implementing Entity may require an alternative analysis that clearly demonstrates that no other feasible alternatives exist and that minimal impact would occur as a result of the project or development.

In granting a request for a Stream Setback waiver, the Land Use Authority Permittee or the Implementing Entity may require project design features in addition to the applicable AMMs, including site design, landscape planting, fencing, signs, and water quality best management practices to reduce adverse impacts on water quality, streams, vernal pools and other wetlands, floodplains, and other sensitive resources.

All Stream Setback waivers that have been approved by a Land Use Authority Permittee will be subject to review and comment by the Implementing Entity and Permitting Agencies. The Implementing Entity and Permitting Agencies will have 30 days to respond in writing to a complete request for a waiver. If the Implementing Entity or Permitting Agencies do not agree with the granting of a waiver by the Land Use Authority Permittee, a meeting will be convened to discuss options that are available to the Third-Party Project Proponent.

Fees for Impacts in Stream Setbacks

The area within a Stream Setback will not be counted as impacted when calculating SSHCP fees for project impacts, except where allowed Stream Setback Covered Activities (e.g., bike paths) occur. Stream Setbacks will not be used to mitigate impacts to SSHCP Covered Species modeled habitat.

9.6 SSHCP Implementing Agreement

Implementing Agreements are recommended by USFWS for large-scale HCPs that address significant portions of a species range, for HCPs with long-term mitigation and monitoring programs, and for HCPs that include complicated conservation programs.

The purpose of the SSHCP Implementing Agreement is to ensure that all parties understand their roles and responsibilities under the HCP, the Endangered Species Act Section 10(a)(1)(B) Incidental Take Permit, and the California Endangered Species Act Incidental Take Permit, and to provide remedies should any party fail to fulfill its obligations. Accordingly, an Implementing Agreement was prepared for the SSHCP (Appendix C). This Implementing Agreement specifies the responsibilities of each party, how the Plan Permittees will ensure that the SSHCP

Conservation Strategy will be implemented, how reporting and enforcement procedures will be implemented, and various other provisions agreed to by the parties.

The Implementing Agreement references material already presented in the SSHCP document. As a result, the SSHCP and the Implementing Agreement have been made as consistent as possible. In the unlikely event that there are questions on the requirements of the SSHCP during Plan implementation, the content of permits prevail first, then the content of the Implementing Agreement, and finally the content of SSHCP document, as described in the Implementing Agreement (Appendix C). The Implementing Agreement may have to be amended to accommodate amendments to the SSHCP. Modifications to the Implementing Agreement would be made by agreement of the signatories in accordance with the terms of the Implementing Agreement.

9.7 Ordinances and Resolutions

9.7.1 Implementing Ordinance or Resolution

Each Plan Permittee, including the Implementing Entity, must adopt an implementing ordinance or resolution to formally incorporate the SSHCP, Implementing Agreement, and ESA and CESA Incidental Take Permits into its project review and approval procedures (see Appendix H). The ordinance or resolution will help ensure consistent implementation of the SSHCP, Implementing Agreement, and permits, and will provide the primary legal mechanism through which the Plan Permittees will implement the SSHCP.

The implementing ordinance or resolution must be adopted by each Plan Permittee before any Covered Activities occur, or before take coverage can be extended to Covered Activities proposed by third parties. The format and adoption process for the implementing ordinance or resolution can conform to the needs of the individual jurisdictions, and there may be terms of the ordinance or resolution that reflect the jurisdiction-specific terms of the SSHCP and Implementing Agreement. However, the implementing ordinances or resolutions will contain common required language to ensure consistent implementation of the SSHCP. The ESA and CESA Incidental Take Permits will be contingent upon adoption of local implementing ordinances or resolutions by the Plan Permittees. The Implementing Agreement and the permit terms and conditions will specify that the Incidental Take Permits are contingent upon the adoption of these implementing ordinances or resolutions. This will allow the Permitting Agencies to make a finding that the SSHCP will be implemented as described in the SSHCP document, and will be adequately funded in perpetuity, contingent upon the adoption of the implementing ordinances or resolutions.

9.7.2 Aquatic Resources Protection Ordinance

Each Plan Permittee, including the Implementing Entity, must adopt a Wetland Protection Ordinance. The purpose of the ordinance is to ensure compliance with the Aquatic Resources Program (Appendix I of the SSHCP Environmental Impact Statement/Environmental Impact Report) prepared as part of the SSHCP. The ordinance will also assure, through its enforcement provisions, no-net-loss of aquatic function and services; streamline aquatic resource permitting in a coordinated fashion; and satisfy the requirements of the federal CWA (Sections 404 and 401), California Fish and Game Code Section 1600, and the Porter-Cologne Act.

This Wetland Protection Ordinance will regulate all aquatic resources within the SSHCP Plan Area as defined by the Aquatic Resources Program for the SSHCP. The ordinance must be adopted by each Plan Permittee before any Covered Activities or fill of wetlands occur. The format and adoption process for the Wetland Protection Ordinance can conform to the needs of the individual jurisdictions. However, the ordinances will contain common required language to ensure consistent implementation of the Aquatic Resources Program prepared as part of the SSHCP.

9.7.3 "Catch-Up Fee" Ordinance

Each Land Use Authority Permittee will adopt a catch-up-fee ordinance that addresses the unusual circumstance when a Third-Party Project Proponent pays required SSHCP development fees prior to Land Use Authority Permittee issuance of an SSHCP permit, and the SSHCP development fee is thereafter increased. If this occurs, the Third-Party Project Proponent will be required to pay a "catch-up" fee to ensure that the fee paid is consistent with the fee structure at the time of SSHCP permit issuance.

Third-Party Project Proponents will be notified of the need to pay the catch-up fee by the appropriate Land Use Authority Permittee, or by the Implementing Entity when a Land Use Authority Permittee does not have jurisdiction over the project. It is the Implementing Entity's responsibility to notify Land Use Authorities of pending fee increases.

9.8 Data Repository Development and Maintenance

The Implementing Entity will develop and maintain a comprehensive SSHCP data repository to track permit compliance and all other aspects of the SSHCP, including results of land management and monitoring. The data repository will group and search separate SSHCP databases that contain all monitoring data (Chapter 8) and project-specific data. It will allow the Implementing Entity to query data from different databases from a central interface and more easily prepare SSHCP annual reports (Chapter 8). The initial data repository will be operating within 12 months to track permit compliance after all local implementing ordinances or resolutions take effect. The data repository will be structured by the Implementing Entity

Database Specialist (Section 9.3.1) to be "user friendly," such that a trained staffer (as opposed to a technician or programmer) can enter data. Additionally, the data repository will allow for future expansion and integration with an external database (e.g., linkage to agency or other GIS map libraries). Outside users may contact the Implementing Entity with data requests. The Implementing Entity expects to develop a simple form that can be completed for each request and sent electronically to the Implementing Entity. Depending on the request, access could be granted to the data repository, or data from a specific time period could be provided. The data repository will be structured to facilitate the following requirements:

- Data documentation such that future users can determine why, how, and where data were collected (documentation standards (i.e., metadata about the data) should be consistent for all types of monitoring and over time; adequate documentation will facilitate the future use of monitoring data)
- Quality assurance and quality control of the data
- Access and use of the most current information in assessment and decision making (the database will allow repeated access to current and past information over time)
- Storage of spatial information in a GIS-linked or similar database
- Data queries and reports

The types of information for which the data repository will be developed and maintained include the following:

- Status of Covered Activities, including implementation and impacts on Covered Species
- Status of SSHCP preservation/establishment/re-establishment measures
- SSHCP funding and expenditures
- SSHCP Baseline Land Cover Map
- Inventory of available SSHCP land cover types
- AMM implementation and monitoring
- Preserve monitoring, including species surveys and monitoring the results of adaptive management decisions
- Compliance with the stay-ahead provision (Section 9.4.6.3)
- Adopted changes to the SSHCP document, including administrative changes, minor amendments, and major amendments
- All reports and documents generated by the Implementing Entity or the Plan Permittees related to the SSHCP

After the first year of implementation, the data repository will support as many of the components listed above as will be needed to prepare the initial SSHCP annual report. For example, funding and expenditures will begin in the first year, but the results of some monitoring will not be available for several more years.

The Implementing Entity will comply with the data-sharing requirements of the Implementing Agreement. If the Implementing Entity allows additional access to the data repository, such access will require strict controls and monitoring to ensure that the integrity of the data repository is maintained (e.g., use of passwords to limit access of a particular entity to selected data repository functions, and sampling data entry forms to ensure that entered information is complete, compatible, and accurate).

9.9 Reporting

9.9.1 Annual and 5-Year Implementation Reports

The Implementing Entity will prepare an annual report summarizing the previous year's activities and a summary of all activities that have been implemented since permit issuance, including the acreage of habitat impacted (effects) from each SSHCP Covered Activity, information on direct harm or harassment of individuals of each Covered Species, acreage of modeled habitat protected under the SSHCP, Preserve land management actions implemented, monitoring results, adaptive management protocols implemented that year, habitat re-establishment/establishment, and status toward fulfillment of each Biological Goal and Measurable Objective presented in Chapter 7. Details regarding the content of the annual report are provided in Section 8.4.1, Annual Reports.

Final reports are due to the Permitting Agencies by January 31 following the end of the previous year's reporting cycle. The reporting cycle is October 1 of one year through September 30 of the following year. No annual report will be required for the first partial fiscal year. A due date of January 31 will allow time for the data from the previous fiscal year to be assembled, analyzed, and presented.

The purpose of the annual report is to provide each Permitting Agency, each Plan Permittee, the TAC, and other stakeholders with an accounting of actions taken by all permittees and to provide verification that the SSHCP permits and the Implementing Agreement are being implemented properly. The annual report will also identify areas where implementation has been ineffective and needs to be modified. The goals of the annual report are as follows:

- Provide the information and data necessary for the Plan Permittees to demonstrate to the Permitting Agencies and the public that the Plan is being implemented properly and as anticipated.
- Disclose any problems with Plan implementation so they can be corrected.

- Document issues with Plan implementation that may require coordination with the Permitting Agencies.
- Identify administrative or minor changes to Plan components required to increase the success of the Plan.

Every fifth year after initial implementation, the SSHCP annual report will also contain an audit of Plan implementation. The audit will be conducted by a panel of experts approved by the Wildlife Agencies. The panel will include persons with expertise in fields related to habitat management and monitoring.

Reports will be reviewed by the Implementation Committee and JPA Board prior to submittal to designated representatives of the Permitting Agencies, Plan Permittees, and the TAC. Annual reports will be made available to the public via posting on the SSHCP website. The Permitting Agencies and the TAC will use results presented in the annual reports and other available information to assess success of the SSHCP in meeting the Biological Goals and Measurable Objectives, and to formulate recommendations to the Implementing Entity for Plan implementation in the next year.

Each year, no more than 30 days after receiving the annual report, the TAC will convene to review report results to assess success of the SSHCP and to formulate recommendations to the Implementing Entity for Plan implementation in the next year.

9.9.2 20-Year Review

Twenty years after permit issuance, the Plan Permittees and Permitting Agencies will conduct a comprehensive review of progress toward achieving the SSHCP Conservation Strategy. The Implementing Entity will prepare a summary progress report and provide the report to the Permitting Agencies for review and comment.

9.10 SSHCP Modifications and Amendments

A modification to the SSHCP can be requested by a Plan Permittee or a Permitting Agency at any time. Requests for Plan modification must be made in accordance with the Implementation Agreement. SSHCP modifications are not anticipated to occur on a regular basis. Three categories of modifications will be recognized. In order of significance, they are as follows: administrative revisions, minor modifications, and permit amendments. This section defines the categories and provides examples for each.

9.10.1 Administrative Revisions

Administrative revisions are non-substantive changes or corrections to the Plan that do not require approval from the Permitting Agencies. These changes are clerical (e.g., correcting

obvious errors in text) or other non-substantive changes that clarify inconsistencies or ambiguities in the SSHCP (e.g., reconciling slightly different descriptions of the same monitoring protocol). Administrative changes will not result in any changes to the impacts analysis, conservation strategy, or decision documents. Administrative changes will be made in writing, documented by the Executive Director, and summarized in each annual report. The Implementation Committee will make the final decision on administrative revisions. The following are examples of administrative revisions:

- Making corrections of typographical, grammatical, and similar editing errors that do not change intended meanings or obligations
- Making corrections of any maps or exhibits to correct insignificant errors
- Making day-to-day implementation decisions such as modifying irrigation schedules for created/restored habitats on the basis of observed water needs of planted vegetation
- Conducting additional monitoring surveys
- Modifying SSHCP monitoring protocols to align with Permitting Agency monitoring protocols that may be modified
- Adopting new monitoring protocols that may be promulgated by the Permitting Agencies in the future
- Making annual adjustments to the SSHCP fees to keep pace with the inflation of land values, consistent with the SSHCP fee ordinance
- Making changes to the membership of the JPA Board, Implementation Committee, TAC, or any advisory committees to the JPA Board without changing the representation of the permittees, agencies, or organizations

9.10.2 Minor Modifications

Minor modifications to the Plan are changes that do not adversely affect the impact assessments or conservation strategy described in the SSHCP, and do not adversely affect the ability of the Implementing Entity to achieve the Conservation Strategy commitments of the SSHCP. In addition, minor modifications will not change the scope or nature of the Covered Activities, and will not trigger new National Environmental Policy Act (NEPA) analysis. Therefore, minor modifications are changes to the SSHCP that will not require amendments to the permits or Implementing Agreement. The following are examples of minor modifications:

- Updates to the land cover map or to species occurrence data that are consistent with the predictions and expectations of the SSHCP

- Minor changes to the Biological Goals and Measurable Objectives in response to monitoring results or adaptive management
- Minor changes to survey or monitoring protocols that are not proposed in response to adaptive management
- Modification of monitoring protocols for SSHCP effectiveness not in response to changes in standardized monitoring protocols from the Permitting Agencies
- Modification of existing or adoption of additional Preserve assembly requirements that improve the likelihood of achieving a Covered Species Biological Goal or Measurable Objective
- Revisions to the Preserve Management Program
- Discontinuation of ineffective Preserve assembly requirements and adoption of new Preserve assembly requirements that improve the likelihood of achieving the Conservation Strategy
- Modification of existing or adoption of new habitat re-establishment/establishment success criteria if results of monitoring and research or new information indicate that the initial success criteria need revision
- Modification of existing or adoption of additional Measurable Objectives where such changes more effectively achieve an SSHCP Biological Goal
- Modification of conditions on Covered Activities in response to AMM monitoring results or new technology
- Minor changes to the annual reporting protocols
- Other changes that do not result in adverse effects on Covered Species beyond those analyzed in the SSHCP (Chapter 6, Effects Assessment and Level of Take), the associated biological opinion, or the associated NEPA and CEQA document, and do not limit the ability of the Implementing Entity to achieve the Biological Goals and Measurable Objectives of the SSHCP

Minor modifications may be proposed by any Plan Permittee or the Permitting Agencies. The modification proposal must detail the nature of the proposed modification, provide a rationale for why it would not change the impact analysis, and describe how it would be consistent with the SSHCP Conservation Strategy. The other parties will use reasonable efforts to respond to proposed modifications within 30 days of receipt of such notice. Proposed modifications will become effective upon the other parties' written approval or shall be deemed approved by a party if no response is received within 30 days of receipt of such notice. If the Permitting Agencies feel that the proposal lacks specific information, the Permitting Agencies may request additional

information to authorize or deny the modification. If the Permitting Agencies deny the modification, they will provide an explanation for the denial.

The Permitting Agencies will not approve minor modifications to the Plan if they determine that the modifications would result in adverse effects on Covered Species or natural communities that are substantially different from those analyzed in the SSHCP. If any Permitting Agency denies a proposed modification, it may be proposed as a permit amendment as described below.

9.10.3 Amendments

Amendments are revisions to the SSHCP or the Implementing Agreement that may affect an impact analysis and so would require a corresponding amendment to one or all of the SSHCP permits. Amendments to the SSHCP and the Incidental Take Permits would follow the same formal review process as the original Plan and permits, including a NEPA/CEQA review, Federal Register notices, a new internal Section 7 consultation with USFWS, and new findings prepared by CDFW and USFWS.

Amendments must be approved by all Plan Permittees according to processes established in their regulations. Amendments may be proposed by any of the Plan Permittees. The proposal must detail the nature of the proposed amendment, its rationale, and any documentation needed to process it, including any required environmental studies. The Implementing Entity's Implementation Committee will submit a proposed amendment to the Permitting Agencies in a report that includes a description of the need for the amendment, an assessment of its impacts, and any alternatives by which the objectives of the proposal might be achieved.

The following are examples of changes that would require an amendment:

- Adjustment to the Plan Area or permit area boundary that could allow or could result in additional incidental take of a Covered Species or habitat, or that could exceed permitted take amounts
- The addition of a Covered Species
- The addition of a Covered Activity that could result in additional significant impacts not considered in the previous impact analysis or not already covered by the SSHCP permits
- An increase in the allowable take limit of existing Covered Activities or addition of new Covered Activities to the Plan
- Modifications of any important action or component of the SSHCP Conservation Strategy, including funding, that may substantially affect levels of covered take, effects of the Covered Activities, or the nature or scope of the Conservation Strategy—this

includes a reduction in the Conservation Strategy in the event that Covered Activities and fee funding do not occur as expected (see below for additional explanation)

- A major change in a Biological Goal or Biological Measurable Objective if monitoring or research indicates that they are not attainable because technologies to attain them are either unavailable or infeasible
- An increase in land acquisition requirements in excess of 5% of the original acreage requirements
- Addition of a new Plan Permittee

It is possible that, even over the full 50-year term of the Incidental Take Permits, Covered Activities and covered take might not occur to the extent projected in Chapter 6. If this occurs, fee revenues would likely fall short of projections. A shortfall of fee revenues could make it difficult or impossible for the Implementing Entity to complete the Preserve System and other components of the Conservation Strategy. If this situation appears likely, the Plan Permittees and the Permitting Agencies will develop mutually agreeable terms, which could include the following:

- Extending the term of the permits to allow completion of the Conservation Strategy
- Reducing the amount of take covered and accordingly reducing the conservation obligations of the Plan Permittees

Amendment Process for Endangered Species Act Section 10(a)(1)(B) Permit

To amend the Section 10(a)(1)(B) permit, the JPA Board will submit a formal application to USFWS. This application must include a revised HCP, a permit application form, any required fees, a revised Implementing Agreement, and the required compliance document under NEPA. The appropriate NEPA compliance process and document will depend on the nature of the amendment being proposed. A new scoping process may be required, dependent on the nature of the amendment. If additional scoping is deemed appropriate and necessary, USFWS will publish a Notice of Intent in the Federal Register to initiate the scoping process. Upon submission of a completed application package, USFWS will publish a notice of the application in the Federal Register, initiating the NEPA and HCP amendment review process. After public comment, USFWS may approve or deny the permit amendment application.

9.10.4 Future Land Use Planning Changes

The Plan Permittees acknowledge that the adoption and amendment of general plans, specific plans, community plans, zoning ordinances, and similar land use regulations; the granting of land use entitlements by the Land Use Authority Permittees (the County of Sacramento and the cities); and

annexations by the cities are matters within the sole discretion of the applicable land use jurisdiction. Changes in land use designations or regulations would not trigger preparation of a minor modification or an amendment to the SSHCP if the changes would not result in additional impacts to SSHCP Covered Species or affect completion of the SSHCP Conservation Strategy. The TAC will be responsible for deciding when changes in land use designations or regulations would result in additional impacts to SSHCP Covered Species or when changes in land use designations or regulations would affect completion of the SSHCP Conservation Strategy.

9.10.5 Permit Renewal

A Plan Permittee may apply for renewal of Incidental Take Permits no less than 120 days prior to the expiration of the Incidental Take Permits.

If a request for renewal is filed 120 days prior to expiration of the Incidental Take Permits, the Incidental Take Permits will remain valid through the renewal period. However, no additional take of Covered Species, beyond the level specified in the Incidental Take Permits, may occur.

9.10.6 Permit Suspension or Revocation

The Permitting Agencies have the ability, in accordance with applicable state and federal law, to suspend or revoke all or part of the permits in the event that any of the Plan Permittees are out of compliance with the Plan, the Implementing Agreement, or the permits. USFWS has the ability to suspend or revoke Incidental Take Permits if continuation of Covered Activities appreciably reduces the likelihood of the survival and recovery of the species in the wild (USFWS and NMFS 1998). CDFW has the ability to suspend or terminate all or part of an Incidental Take Permit if revocation or termination is required to avoid jeopardizing the continued existence of that portion of a Covered Species' range that occurs within the Plan Area and to fulfill a legal obligation of CDFW.

As discussed in Section 9.3.6, Dispute Resolution, and in the Implementation Agreement, the Permitting Agencies and the Plan Permittees will meet to remedy non-compliance with stated SSHCP goals and objectives or to resolve differences. If the Permitting Agencies should determine that permit revocation or suspension is necessary, they will notify the Implementing Entity and other Plan Permittees. The notification will explain the rationale for the suspension or revocation, and, where applicable, will provide any additional actions that the Plan Permittees can take to maintain the permits.

If one or more of the permits are revoked, the Plan Permittees have the obligation to fulfill all outstanding mitigation requirements, including management and monitoring of the Preserve System in perpetuity, for any take that occurred prior to the revocation. For example, if the Plan Permittees are behind on compliance with the stay-ahead provision for land acquisition or

restoration, they will be required to meet this obligation. See the Implementing Agreement (Appendix C) for additional details.

9.11 Implementation Schedule and Deadlines

To ensure that the SSHCP is successful, the Implementing Entity will make progress on a variety of tasks simultaneously. Tasks during the first several years of implementation will be particularly important to ensure positive momentum and early compliance with SSHCP terms and conditions. Schedule guidelines and major deadlines for Plan implementation are presented in Table 9-3. The Implementing Agreement will establish deadlines for certain tasks.

Table 9-3 lists those key implementation tasks with deadlines that are tied to permit compliance. As described in the table, these deadlines have various levels of flexibility depending on the circumstances. Implementation deadlines are important to establish a mutual understanding among the Plan Permittees and the Permitting Agencies about how the Plan will be implemented over time and to ensure that the Plan will be implemented in a timely manner. However, the Plan Permittees and the Permit Agencies recognize that, under certain circumstances, modifications to the deadlines beyond the flexibility provided in Table 9-3 could be reasonable and appropriate. The Implementing Entity may modify the deadlines through minor modifications to the Plan.

Before permits are issued, the Plan Permittees will set the groundwork for Plan implementation by establishing an implementation organization. Land acquisition and training of Plan Permittee staff may also commence before permit issuance. Prior to issuance of ESA and CESA Permits, the SSHCP Land Cover Baseline Map and local ordinances or resolutions required to fund and implement the Plan will be finalized. During the first 6 months of the Permit Term, emphasis will be placed on hiring key staff for the Implementing Entity (or contracting out their functions), establishing the TAC, and developing implementation tools (Table 9-3). Within the first year, the Implementation Entity will secure necessary staff and contract resources; create a Plan implementation website; establish the required data repository; and investigate habitat preservation, establishment, and re-establishment opportunities.

Over the next 5 years, additional Preserve staff will be hired or contracted, and more specific Preserve Management Plans will be created to guide management and monitoring of the expanding Preserve System. Environmental compliance and design for wetland re-establishment and establishment will be initiated. Beginning with this period and extending throughout the remaining Permit Term, SSHCP fees will be updated and adjusted on a regular basis. In addition, hiring and contracting staff will be completed to manage the Preserve System and implement the SSHCP. Habitat preservation, establishment and re-establishment, and design will continue, as will adaptive management and monitoring of biological resources.

Between Years 6 and 50, the Implementing Entity will continue to implement the Conservation Strategy, implement monitoring and adaptive management, and refine these programs as monitoring and other data are collected. Land acquisition must be completed by Year 50, and construction of all restoration and creation projects must be completed by Year 45 of the Permit Term (see Chapter 12 for a discussion of funding adequacy to meet these deadlines).

Before the end of the Permit Term, the Implementing Entity will determine the administrative structure necessary to continue management of the Preserve System in perpetuity. For example, management responsibility may be delegated to one of the Plan Permittees to oversee in perpetuity. Alternatively, the JPA may extend its term to continue to oversee implementation of the SSHCP.

Table 9-3
Schedule for Major Implementation Tasks

Time Period	Tasks and Milestones	Responsible Party
Prior to Permit		
Prior to Permit	Complete final versions of Implementing Agreement, Joint Exercise of Powers Agreement, and Plan Permittee ordinances in preparation for permit issuance and Implementing Entity formation.	Plan Permittees
Prior to Permit	Establish Implementing Entity through execution of the Joint Exercise of Powers Agreement. File with state Secretary of State within 30 days of its effective date.	Plan Permittees
Prior to Permit	In accordance with the Implementing Agreement and Joint Exercise of Powers Agreement, establish SSHCP implementation organizational structure (i.e., JPA Board and Implementation Committee).	Plan Permittees
Prior to Permit	Conduct fee nexus study and establish the SSHCP fee structure.	Plan Permittees
Prior to Permit	Establish separate accounts to isolate SSHCP fees from all other fees.	Plan Permittees
Prior to Permit	Determine schedule for transfer of development fees collected by the Plan Permittees to the Implementing Entity.	Plan Permittees
Prior to Permit	Finalize the SSHCP Land Cover Baseline Map.	Implementing Entity
Prior to Permit	Develop template SSHCP project application package for use by Third-Party Project Proponents and Plan Permittees that includes all items required in Chapter 10.	Plan Permittees
Prior to Permit	Develop a checklist prior to the first ordinance taking effect for local planners to evaluate the SSHCP project application package (Chapter 10). The checklist must include a statement of certification that Third-Party Project Proponents meet the relevant terms of the SSHCP.	Plan Permittees
Prior to Permit	Provide additional tools for Plan Permittees to use in their application review and project assessment process (e.g., template planning survey report, fee calculator).	Implementing Entity
Prior to Permit	Establish the process by which Land Use Authority Permittees will notify the Implementing Entity of any proposed incidental take and the process to receive confirmation in writing from the Implementing Entity that the proposed take is consistent with the SSHCP's permits, and that an adequate amount of jump-start and stay-ahead mitigation is in place to address that amount of incidental take proposed by the project.	Plan Permittees

Table 9-3
Schedule for Major Implementation Tasks

Time Period	Tasks and Milestones	Responsible Party
Prior to Permit	Provide each Plan Permittee with SSHCP maps (e.g., SSHCP Baseline Land Cover Map, Covered Species modeled habitat maps) to allow Land Use Authority Permittee staff to process and evaluate applications for SSHCP coverage or evaluate their own projects under the Plan.	Plan Permittees
Prior to Permit	Train Land Use Authority Permittee staff to prepare, review, and process SSHCP applications. This task will be ongoing through the 50-year permit term.	Plan Permittees, with ongoing assistance from Implementing Entity
Prior to Permit	Commence the recruitment process for the Implementing Entity Executive Director and key staff (if possible, to allow early implementation).	Plan Permittees
Prior to Permit	Prepare initial budget for Implementing Entity.	Plan Permittees
Prior to Permit	Acquire lands and commence re-establishment/establishment projects to comply with the jump-start provision.	Pre-Acquisition
0 to 6 Months After Permit		
Begin 0–6 Months after Permit	Hire Implementing Entity Executive Director and key staff (if not completed prior to permit issuance).	Implementing Entity
Begin 0–6 Months after Permit	Hire key staff of Implementing Entity or secure agreements or contracts with other organizations to fulfill these roles. Continue to hire or contract out Implementing Entity technical and operational staff as Preserve System expands (Chapter 9).	Implementing Entity, Plan Permittees
Begin 0–6 Months after Permit	Develop the SSHCP data repository. Develop processes for tracking collected fees, land acquisition, and SSHCP impacts. This task will be ongoing.	Implementing Entity, Plan Permittees
Begin 0–6 Months after Permit	Establish SSHCP implementation website.	Implementing Entity
Begin 0–6 Months after Permit	Develop a set of biologist qualifications and establish a pre-approved list of biologists for Covered Activity construction monitoring, Preserve monitoring, and Preserve management. This task will be ongoing.	Implementing Entity
Begin 0–6 Months after Permit	Develop a template for pre-acquisition assessment and protocols prior to the first land acquisition.	Implementing Entity
Begin 0–6 Months after Permit	Establish the Technical Advisory Committee.	Implementing Entity
Begin 0–6 Months after Permit	Determine the date by which the annual automatic update of SSHCP fees will occur (Chapter 12).	Implementing Entity
Begin 0–6 Months after Permit	Prepare the Preserve System Monitoring and Management Program, including the management toolbox described in Chapter 8. Complete within 18 months of Incidental Take Permit issuance.	Implementing Entity

Table 9-3
Schedule for Major Implementation Tasks

Time Period	Tasks and Milestones	Responsible Party
6 Months and Beyond After Permit		
Begin 6 Months to 1 Year after Permit	Investigate establishment and re-establishment opportunities on existing open space and SSHCP Preserve land. This task will be ongoing (Chapter 7).	Implementing Entity, Plan Permittees
Begin 1 year after Permit	Update SSHCP fees annually. Provide new fee schedule to Permittees. This task will be ongoing (Chapter 12).	Implementing Entity, Land Use Authority Permittees
During lifespan of Permit	At intervals specified in Chapter 12, perform financial assessment. This task will be ongoing.	Implementing Entity
Begin 1 year after Permit	Prepare and submit annual report to the Permitting Agencies. This task will be performed on an annual basis by March 15 of every year for the previous fiscal year (July 1 through June 30).	Implementing Entity
Begin 1 year after Permit	Conduct an annual public workshop to report on implementation progress of the SSHCP. This task will be ongoing.	Implementing Entity
Years 0–45 after Permit	Implement establishment and re-establishment projects. This task will be ongoing; however, construction of all habitat re-establishment/establishment projects must be completed by Year 45.	Implementing Entity
Begin 3 Years after Permit	A comprehensive development fee audit will be completed at least every 3 years for the first 15 years of the Plan (i.e., years 3, 6, 9, 12, and 15) and at least every 5 years thereafter (i.e., years 20, 25, 30, 35, 40, and 45), where year 1 is the first full calendar year of SSHCP implementation.	
Begin 5 Years after Permit	Use recent aerial photographs (at least every 5 years) to track and map land cover conversions, especially conversion of vernal pools. This task will be ongoing.	Implementing Entity
20 Years after Permit	In Year 20 of implementation, work with the Permitting Agencies to conduct a formal and complete review of progress toward building the Preserve System and achieving each Biological Goal and Measurable Objective.	Implementing Entity
Prior to Permit Expiration	Finalize an implementation structure for continued monitoring and management of the Preserve System after permit expiration.	Implementing Entity
After Permit Expiration in Perpetuity	Continue adaptive management and limited monitoring of Preserve System biological resources to ensure that management actions are working (Chapter 8).	Implementing Entity

10 SSHCP PERMIT APPLICATION PROCESS

10.1 Introduction

This chapter explains the South Sacramento Habitat Conservation Plan (SSHCP or Plan) permit application process and provides an overview of how Land Use Authority Permittees can extend Incidental Take Permit (ITP) coverage to Third-Party Project Proponents and how the Implementing Entity can extend ITP coverage to Participating Special Entities (each of these project proponents is explained in more detail in Chapter 9, Implementation).

This chapter also describes the SSHCP permit application process for Plan Permittees, an explanation of specific requirements that must be satisfied by a project proponent prior to receiving permit coverage under the SSHCP, and SSHCP development fee or land dedication requirements.

10.2 Submittal of SSHCP Permit Applications

This section describes the process for submitting SSHCP permit applications by Third-Party Project Proponents, by Plan Permittees for their own Covered Activities, and by Participating Special Entities.

10.2.1 SSHCP Permit Applications for Third-Party Project Proponents

Third-Party Project Proponents are private project applicants proposing to implement an SSHCP Covered Activity and seeking local land use approval permits (ministerial[1] or discretionary[2] permits) from a Land Use Authority Permittee. The Land Use Authority Permittees have the ability to extend incidental take coverage provided by their SSHCP ITP to a Covered Activity implemented within their jurisdictions by a third party. Third-Party Project Proponents shall submit their SSHCP permit application package to the Land Use Authority Permittee that has land use jurisdiction over their proposed project. Only the Land Use Authority Permittee with land use jurisdiction over a proposed project may extend ITP coverage to that project. For example, a project proposed by a Third-Party Project Proponent within the city limits of Rancho Cordova may only be extended ITP coverage by the City of Rancho Cordova. The Land Use Authority Permittee will review the SSHCP permit application for consistency with all of the SSHCP requirements that are described in this chapter and will provide the Implementing Entity with a copy of the SSHCP requirements for tracking purposes, as discussed in Chapter 9. Should a Third-Party Project Proponent propose to provide land in fee title or provide a conservation easement in lieu of paying all or part of the required SSHCP development fees, then the

[1] A ministerial permit is a permit that requires little to no judgment on behalf of the Land Use Authority Permittee. An example of a ministerial permit is a building permit where as long as a parcel is zoned to allow the building of a structure, the applicant only needs to follow building codes to construct their project.

[2] A discretionary permit is a permit that requires the use of judgment by a Land Use Permittee before the permit can be issued. An example of a discretionary permit is a permit for a general plan amendment.

Implementing Entity must also review the proposed land dedication or the easement to ensure that it is consistent with the SSHCP Conservation Strategy (Chapter 7, Conservation Strategy).

Land Use Authority Permittees issue land use approval permits for a wide range of projects, not all of which are SSHCP Covered Activities (Chapter 5, Covered Activities). Customers typically approach the information desk of the local jurisdiction (Land Use Authority Permittee) to inquire about land use approval permit requirements for their activity and the Land Use Authority Permittee will direct the customer to prepare the appropriate application. The Land Use Authority Permittee will review all applications to determine whether an activity is a Covered Activity eligible to use the SSHCP.

The Land Use Authority Permittee granting land use approval is not responsible for ensuring that a Third-Party Project Proponent complies with federal Endangered Species Act (ESA) or California Endangered Species Act (CESA) regulations. Instead, it is the responsibility of the Third-Party Project Proponent that is undertaking the Covered Activity to ensure that they have satisfied all legal requirements associated with the ESA and CESA. Many Third-Party Project Proponents implementing a covered activity may be unaware of the need to comply with ESA and CESA regulations. To ensure that Third-Party Project Proponents understand their legal obligations to comply with the ESA and CESA, each Land Use Authority Permittee will provide literature to a Third-Party Project Proponent that explains ESA and CESA regulations and how to satisfy those regulations. To use the SSHCP, the Third-Party Project Proponent must follow the SSHCP permit application process as explained in this chapter (Section 10.4, SSHCP Permit Application Processing).

CEQA Review

Many private Third-Party Project Proponent Covered Activities will require a land use approval and be subject to the California Environmental Quality Act (CEQA).[3] For such Covered Activities, review of SSHCP permit applications should generally be undertaken concurrently with the CEQA environmental review. To facilitate this approach, the Land Use Authority Permittee should generally request that Third-Party Project Proponents submit an SSHCP permit application package as part of the land use approval application and CEQA process.

There are many benefits to preparing the SSHCP permit application package early in the planning process. First, submitting an SSHCP permit application package during the land use approval/CEQA process will illustrate the various requirements of the SSHCP on the proposed project, and provide time for the project proponent to change the project description or to identify alternatives for CEQA analysis. Second, it will enable the CEQA document to refer to the project-specific requirements as identified in the SSHCP permit application. Finally, it will enable the local jurisdiction to provide early review of the SSHCP permit application for

[3] Some projects may also be subject to consistency with the Delta Plan if they fall within the Delta Plan area. Their consistency with the Delta Plan would be determined during CEQA review.

completeness. Based on a review of this initial information and a determination of SSHCP requirements, the Land Use Authority Permittee can establish conditions of approval specifying SSHCP conditions and SSHCP development fee requirements.

Each Land Use Authority Permittee is responsible for ensuring that Covered Activities, upon issuance of a take permit, fully comply with the terms of the Plan.

10.2.2 Pre-Application Procedures

Prior to submitting an SSHCP permit application package, Third-Party Project Proponents are encouraged to meet with their appropriate Land Use Authority Permittee or, if the applicant is a Participating Special Entity, the Implementing Entity. The purpose of the pre-submittal meeting is to allow the Land Use Authority Permittees to explain what information must be assembled for a specific project in support of the SSHCP permit application.

Pre-application meetings are also recommended if an applicant is proposing land dedication to offset all or a portion of their mitigation requirements. The SSHCP has strict criteria for siting Preserves, and not all land within the SSHCP Plan Area is suitable for establishing SSHCP Preserves. In addition, SSHCP Preserves must be designed so that they comply with SSHCP Avoidance and Minimization Measures (AMMs). Meeting early in the application process to discuss these criteria is strongly recommended to avoid delays in project approvals should land dedications not meet the criteria set forth in the SSHCP. A Land Use Authority Permittee or the Implementing Entity may require a fee for these pre-submittal meetings and/or pre-submitted project proposal review.

10.2.3 SSHCP Permit Applications for Plan Permittees

As discussed in Chapter 1, Introduction, and Chapter 9, the Plan Permittees are the County of Sacramento, City of Galt, City of Rancho Cordova, Sacramento County Water Agency, the Capital Southeast Connector Joint Powers Authority, and the Implementing Entity. The Plan Permittees can use SSHCP ITPs for Covered Activity public projects that they implement. A Plan Permittee is responsible for ensuring compliance with all elements of the Plan and will complete an SSHCP permit application package following the SSHCP permit application process explained in this chapter (Section 10.4). Each Plan Permittee will need to establish an internal process for ensuring that their projects are in compliance with the elements of the Plan.[4] Because each Plan Permittee conducts project design and review differently, the SSHCP does not propose a single process that must be followed by all Plan Permittees. The completed SSHCP permit application package will be submitted to the Implementing Entity so that the project can be tracked for compliance monitoring purposes. Because each Plan Permittee is a signatory to the

[4] Plan Permittee projects will also have to comply with CEQA, which could include individual project-level environmental documents and determinations of consistency with regional plans, such as the Delta Plan.

SSHCP ITP, they have incidental take coverage for their own Covered Activity projects and do not need to request ITP coverage from the Implementing Entity. However, the Implementing Entity will review Plan Permittee SSHCP permit application packages for consistency with the Plan and may provide comments if necessary.

10.2.4 SSHCP Permit Applications for Participating Special Entitles

Incidental take coverage may be extended to Participating Special Entities as defined in Chapter 9. Participating Special Entities include but are not limited to special districts, utilities, and land use jurisdictions that are not Plan Permittees. Participating Special Entities that desire incidental take coverage under the SSHCP ITPs must submit an SSHCP permit application package to the Implementing Entity for processing and approval following the SSHCP permit application process explained in this chapter (Section 10.4).

10.3 Determining Master Plan Consistency with the SSHCP

Due to the large area that a master plan[5] encompasses, Third-Party Project Proponents initiating master plans are required to consult with their respective Land Use Authority Permittee about SSHCP requirements early in the master plan process. Ensuring that the master plan complies with the requirements and provisions of the SSHCP will reduce the likelihood of project delays. In order for a master plan to use the local Land Use Authority's SSHCP ITPs to satisfy ESA and CESA requirements, a master plan must be designed to comply with the requirements of the SSHCP.

Early consultation with the Land Use Authority Permittee and Implementing Entity will:

- Ensure that all SSHCP AMMs are addressed by the master plan.
- Ensure that on-site avoidance areas and Preserves are planned in appropriate locations to satisfy SSHCP Conservation Strategy requirements.

Master Plan Area Specific Avoidance and Minimization Measures

Third-Party Project Proponents undertaking a Covered Activity that occurs within a proposed master planned area will follow the same SSHCP permit application process outlined in this chapter for Third-Party Project Proponents. It should be noted that some master plans have specific avoidance and minimization measures that apply only to that master plan area (see Appendix K). These avoidance and minimization measures must be addressed in the SSHCP permit application.

[5] A master plan is a document that broadly defines land use, circulation, and infrastructure for a specific area (master plan area) and includes implementation measures that guide how development within the master plan area will occur. The requirements for master plans can be fulfilled by a variety of planning tools, including specific plans, comprehensive plans, special planning areas, or any combination thereof.

10.4 SSHCP Permit Application Processing

The applicant will submit an SSHCP permit application package for review and approval by the Land Use Authority Permittee or Implementing Entity, depending on what type of applicant is submitting the application, following the process described in this section.

10.4.1 Timing of SSHCP Permit Application Submittal

All applicants seeking ITP coverage under the SSHCP must obtain that coverage prior to any ground-disturbing activity; however, they can also obtain coverage earlier by the following means:

a. In conjunction with any Plan Permittee discretionary review

b. For ministerial projects, prior to the issuance of any building or grading permit

c. In the absence of building or grading permits, prior to the Covered Activity being performed

10.4.2 Components of the SSHCP Permit Application Package

Applicants must include the data, documentation, and/or exhibits as described in this section as part of the SSHCP permit application package. Land Use Authority Permittees designate, and may amend, the form and timing in which the following information must be provided; however, the required content of the SSHCP permit application package will remain the same for all Land Use Authority Permittees. Land Use Authority Permittees may charge a fee to recover costs associated with review and processing of the SSHCP permit application. Applicants are responsible for the costs associated with preparation of the SSHCP permit application, including surveys. Forms for the SSHCP permit application package will be made available by the Land Use Authority Permittees or the Implementing Entity. The SSHCP permit application includes the components specified in the following subsections.

10.4.2.1 Applicant Information

This part of the application should include the applicant's name and contact information, property owner's name and contact information, and names and contact information for any consultants preparing materials in support of the SSHCP permit application.

10.4.2.2 Project Description and Map

The project description must include a written description of the location of the project site, including Assessor's Parcel Number(s), as well as a written description of all activities proposed within the project site, specifying which of the activities are thought to be Covered Activities under the SSHCP. Include a map illustrating the exact location of the project site, location of

proposed Covered Activities, and location of avoidance areas or on-site Preserves, if applicable, within the project site.

10.4.2.3 Land Cover Type Map, Wetlands Delineation, and Modeled Species Habitat Map

Applicants will submit an SSHCP land cover type map, wetland delineation (if applicable; see Step 2), and a map depicting modeled species habitat found on the project site (if applicable; see Step 3). Applicants may request that the SSHCP Land Cover Type and modeled species habitat maps be prepared by the Land Use Authority Permittee or the Implementing Entity for the project site using the SSHCP Land Cover Baseline Map and the modeled species habitat maps. The Land Use Authority Permittee or the Implementing Entity may require a fee for this service. Wetland delineations must be prepared by an individual or firm qualified to prepare them. All maps will be prepared using geographic information system (GIS) technology and all shapefiles will be provided to the Land Use Authority Permittee or the Implementing Entity for tracking purposes. These maps will be prepared according to the following steps:

- **Step 1** – A map of SSHCP land cover types for the project site will be generated using the SSHCP Land Cover Baseline Map. This is accomplished by placing the project boundary over the SSHCP Land Cover Baseline Map. If the SSHCP Baseline Land Cover Map shows an SSHCP aquatic land cover type (see Chapter 3, Biological Resources Setting, Table 3-1, SSHCP Land Cover Types within the Plan Area) present on the project site, the process proceeds to Step 2. If the SSHCP Baseline Land Cover Map does not show an SSHCP aquatic land cover type present on the project site, then the process proceeds to Step 3.
- **Step 2** – If SSHCP aquatic land cover types are present on the project site, then a wetland delineation and report will be prepared. When a U.S. Army Corps of Engineers (USACE)-verified and valid (i.e., non-expired) delineation for a project site already exists, that delineation can be used. Waters[6] (including wetlands) found to be present on site must be classified using the nomenclature system developed for the SSHCP (see Appendix E). The wetland delineation will follow the minimum standards set forth by the Sacramento District USACE and State Water Quality Control Board at the time of the delineation. The wetland delineation and report will map and quantify all SSHCP aquatic land cover types on the project site, which will then be used to help prepare a biological letter report (see paragraphs following Step 4).
- **Step 3** – A map of modeled species habitat for the project site will be generated using the modeled species habitat maps found in Chapter 3, Section 3.4, Covered Species Habitat Models. This is accomplished by placing the project boundary over each of the modeled

[6] As defined in 33 CFR 328 or 40 CFR 230.2(s).

species habitat maps. If modeled species habitat is present on the project site, the process proceeds to Step 4.

Maps of modeled species habitat will need to be prepared only for the following species:

- Giant gartersnake (*Thamnophis gigas*)
- Western pond turtle (*Actinemys marmorata*)
- California tiger salamander (*Ambystoma californiense*)
- Western spadefoot (*Spea hammondii*)
- Tricolored blackbird (*Agelaius tricolor)*
- Swainson's hawk (*Buteo swainsoni*)
- Greater sandhill crane (*Grus canadensis*)
- Western burrowing owl (*Athene cunicularia*)
- Cooper's hawk (*Accipiter cooperii*)
- Loggerhead shrike (*Lanius ludovicianus*)
- Northern harrier (*Circus cyaneus*)
- White-tailed kite (*Elanus leucurus*)
- Western red bat (*Lasiurus blossevillii*)

- **Step 4 –** Provide results of species surveys. If modeled species habitat is found on the project site for any of the species listed in Step 3, then species surveys must be conducted consistent with the procedures described in Chapter 5, Section 5.4.2, Covered Species Take Avoidance and Minimization Measures, unless that section does not require surveys for the species. Species surveys are also required for all SSHCP covered plant species as described in Chapter 5, Section 5.4.2, if wetlands are present on the project site.

The Land Use Authority Permittee or Implementing Entity will prepare a biological letter report that quantifies the current terrestrial and aquatic SSHCP land cover acreages and compares them to the SSHCP Land Cover Baseline Map. The biological letter report will also document acreage of modeled species habitat for each species and will document the results of species surveys.

The Land Use Authority Permittee or the Implementing Entity will use these reports to finalize the site-specific land cover type map to be used for calculating impacts to SSHCP land cover types and for calculating SSHCP development fees (refer to Section 10.7, SSHCP Development Fees and Land Dedication). Note that USACE wetland delineations may not map some aquatic habitat features that are considered aquatic habitat for endangered species (i.e., swales). Aquatic features

not delineated on wetland delineations but present on the project site as verified by aerial photos or on-the-ground surveys will be included in the final site-specific land cover type maps that will be used when calculating impacts and preservation. Any aquatic habitat features not identified by the USACE wetland delineation will not be subject to compensatory mitigation (e.g., re-establishment/ establishment) objectives or measures of this Plan.

The Local Land Use Authority Permittee or the Implementing Entity will also determine whether anthropogenic[7] land cover type conversion has occurred since baseline[8] conditions were established. If anthropogenic land cover type conversion has occurred, SSHCP development fees shall be based on impacts to the land covers described on the SSHCP Land Cover Baseline Map. This step will also include a determination of whether reclamation of a disturbed site (e.g., mine site reclamation) has occurred since the SSHCP Land Cover Baseline Map was documented. In that case, SSHCP development fees will be based on impacts to the reclaimed land cover.

10.4.2.4 Proposed Land Dedication Map and Report

If an applicant is proposing land dedication to offset all or a portion of their development fees, the Implementing Entity must determine whether the proposed land dedication is consistent with SSHCP AMMs described in Chapter 5, Section 5.4, Conditions on Covered Activities, and with the biological goals and objectives described in Chapter 7 (Table 7-1, Biological Goals, Measurable Objectives, and Conservation Actions). It should be noted that the SSHCP has fairly strict criteria that must be adhered to when siting Preserves, and it is possible that a site proposed for land dedication will not meet the criteria for an SSHCP Preserve. If it is determined that a land dedication proposal is not consistent with the requirements of the SSHCP, the applicant may wish to work with the Implementing Entity to find alternative sites that will support the SSHCP conservation strategy.

An applicant must provide the following information in support of a land dedication proposal:

1. An exhibit(s) showing the proposed location of the Preserve(s) as well as existing and potential Preserves on adjacent parcels (the Implementing Entity or Land Use Authority Permittee can provide information concerning existing and potential Preserves);
2. A report describing each land cover type using the nomenclature system developed for the SSHCP (see Appendix E) and the acres of each land cover type; and

[7] Of, relating to, or resulting from the influence of human beings on nature.

[8] To establish baseline conditions, acreages will be calculated using that version of the SSHCP Land Cover Type Map in existence as of the date the SSHCP permit was issued to the Plan Permittees by the U.S. Fish and Wildlife Service. See Chapter 3 for a description of the SSHCP Land Cover Type Map.

3. A written explanation as to how the proposed Preserve is consistent with SSHCP AMMs described in Chapter 5, Section 5.4, and the biological goals and objectives described in Chapter 7 (Table 7-1).

In addition, the applicant must execute an agreement with the Implementing Entity that gives the Implementing Entity or its contractors permission to access the site and to conduct any additional fieldwork necessary to evaluate the site for its suitability as a Preserve. The Implementing Entity may charge a fee to conduct any fieldwork necessary to evaluate the site.

10.4.2.5 Description of How the Project Complies with SSHCP Avoidance and Minimization Measures

The project proponent shall document how the proposed project will comply with SSHCP AMMs described in Chapter 5, Section 5.4. See the SSHCP AMMs worksheet attached to the SSHCP permit application package.

10.4.2.6 Proposed Mitigation

The project proponent will state how they intend to mitigate for impacts that result from their project (i.e., on-site preservation, off-site land dedication, payment of an SSHCP development fee, proof of mitigation bank credits, or some combination thereof).

10.4.2.7 Description of How the Project Complies with Requirements for Protection of Cultural Resources and Tribal Consultation

USACE, SHPO, and ACHP may potentially develop a cultural resources management plan as a basis for establishing a programmatic memorandum of agreement for compliance with the requirements of the NHPA Section 106 process. Compliance with such a plan would ensure that no NRHP-listed eligible or potentially eligible resources would be affected by Covered Activities subject to CWA Section 404 permits. If that plan is not developed, or for Covered Activities that are not subject to CWA 404 permitting requirements, a project proponent of a ground-disturbing activity, including habitat re-establishment or establishment in the Preserve System, must ensure that cultural resources potentially occurring in these areas are properly evaluated and protected. In consultation with the Implementing Entity, the project proponent will prepare a Cultural Resources Management Plan to ensure that implementation of the Covered Activity would not result in significant impacts to historic properties, cultural resources, or tribal resources. This plan could be prepared as part of the CEQA review for a Covered Activity, or as a separate plan for Covered Activities that are not subject to CEQA review. The plan would consist of the following:

1. Establishment of an Area of Potential Effect for the proposed Covered Activity.

2. A summary of known resources in the Area of Potential Effect that are currently listed in the National Register of Historic Places, California Register of Historic Places, or local historic registries.
3. Identification of areas of cultural sensitivity in the Area of Potential Effect based on consultation with the Native American Heritage Commission (Sacred Lands file check) and potentially affected tribes (identified by the Native American Heritage Commission).

10.5 Review for Completeness

The Land Use Authority Permittee will compare the Project Application Package against a Project Review Checklist, to confirm that all SSHCP requirements have been met, including requirements such as setbacks and other AMMs. The Land Use Authority Permittee's review process may be subject to the processing time and requirements of the Permit Streamlining Act (Government Code Section 65920 et seq.). For most projects, the Land Use Authority Permittee or Implementing Entity will review the SSHCP permit application package for completeness within 30 days of receipt of a complete SSHCP permit application package. The Land Use Authority Permittee or Implementing Entity may extend the review period for large or potentially complex projects up to an additional 30 days by providing written notice to the applicant. The Land Use Authority Permittee or Implementing Entity may continue to extend the review period after written notice until the Land Use Authority Permittee or Implementing Entity deems that an SSHCP permit application package is complete.

The Land Use Authority Permittee or Implementing Entity is also authorized to close SSHCP permit applications when they determine that the applicant has failed to provide requested information within a reasonable period. In such an event, the Land Use Authority Permittee or Implementing Entity shall provide written notice that the SSHCP permit application will be closed within 30 days unless all required materials are submitted.

10.6 Assessment of Impacts on SSHCP Land Cover Types

After a complete SSHCP permit application has been submitted, the involved Land Use Authority Permittee or the Implementing Entity shall prepare an assessment of SSHCP natural land cover type impacts that would result from the project.

10.6.1 Method for Calculating Impacted Acreage

The Land Use Authority Permittee or Implementing Entity will prepare an impact assessment that identifies the location and amount of each SSHCP natural land cover type that will be directly or indirectly impacted as a result of implementing a Covered Activity. Direct impacts will be calculated by overlaying the Covered Activities map generated as described in Section 10.4.2.2, Project Description and Map, onto the finalized site-specific land cover type map

generated as described in Section 10.4.2.3, Land Cover Type Map, Wetlands Delineation, and Modeled Species Habitat Map.

Indirect impacts are only calculated for three SSHCP land cover types: Vernal Pool, Swale, and Stream/Creek Vernal Pool Invertebrate Habitat (VPIH) (see Chapter 6, Effects Assessment and Level of Take, Section 6.5, Effects of Covered Activities on Land Cover Types). A Vernal Pool is considered indirectly impacted if more than 10% of its watershed is removed. Swales and Streams/Creeks (VPIH) are considered indirectly impacted when a Swale or Stream/Creek (VPIH) land cover type feature intersects a vernal pool that is directly impacted. Note that if any portion of a wetland land cover type is directly impacted, then the entire feature is considered to be directly impacted. Vernal Pool watershed maps prepared by the SSHCP will be used to determine when an indirect impact has occurred. Indirect impacts will be calculated by overlaying the map of Covered Activities onto the SSHCP watershed map.

The impact assessment will include both a map depicting the area of impact and table(s) quantifying the acres of impact to each land cover type. The results will be used to determine the required mitigation to offset impacts.

10.6.2 Appealing the Impact Assessment

An applicant has the right to appeal the impacts assessment made by a Land Use Authority Permittee or the Implementing Entity. Written objections must be filed with the Land Use Authority Permittee or the Implementing Entity within 30 calendar days of receiving the initial impact assessment, and must be accompanied by data supporting the appeal, such as surveys, aerial photos, maps, or resource agency-verified delineations. The Land Use Authority Permittee or the Implementing Entity has 30 calendar days from the receipt of the appeal to respond. Disagreements that cannot be resolved between the Land Use Authority Permittee staff or the Implementing Entity staff and applicants will be decided by the Land Use Authority Permittee's planning director or the executive director of the Implementing Entity.

10.7 SSHCP Development Fees and Land Dedication

Once a project receives a draft compliance determination letter, the Plan Permittee (or, if the applicant is a Participating Special Entity, the Implementing Entity) will calculate SSHCP development fees based on the project impacts (see Section 10.6, Assessment of Impacts on SSHCP Land Cover Types). Once impacts are calculated they must be reported to the Implementing Entity so they can be tracked for compliance with the Plan's stay-ahead provision (see Chapter 9, Section 9.4.6.1, Land Cover Type Groupings for Jump-Start and Stay-Ahead Provisions). SSHCP development fees are subject to automatic adjustments (see Chapter 12, Economics Analysis and Funding Program, Section 12.4.3.2, Development Fee Adjustment Program) to allow for fluctuating land values and other mitigation-related costs. Annual adjustments will be made on or before March 15 of each calendar year, and other adjustments

may be made during periodic audits. Table 12-5, Development Fees Used in the SSHCP Economic Model, in Chapter 12 sets forth the initial SSHCP development fee structure.

10.7.1 SSHCP Development Fees

SSHCP Development Fee Payment Timing

Mitigation for Covered Activity project impacts, whether through payment of the SSHCP development fee or land dedication, must occur prior to land disturbance. For master planned projects, an applicant can chose to pay SSHCP development fees for a unit of land to be impacted (a phase or portion of a larger project) rather than paying SSHCP development fees for the full project area at one time. Project proponents that pay SSHCP development fees in advance of issuance of SSHCP permits are subject to provisions of the "catch-up fee ordinance" as described in Chapter 9, Section 9.7.3, "Catch-Up Fee" Ordinance. This ordinance states that if a project proponent pays SSHCP development fees prior to issuance of an SSHCP permit and SSHCP development fees increase before the SSHCP permit is issued, the project proponent will pay the difference between what was originally paid and the amount of the SSHCP development fee increase. Fee payments are final and nonrefundable and remove any need for land dedication in lieu of SSHCP development fees.

10.7.2 Land Dedication in Lieu of SSHCP Development Fees

As described in Chapter 9, Section 9.4.4, Land Dedication in Place of SSHCP Fees, applicants will be allowed to dedicate land or easements instead of paying SSHCP development fees. If an applicant proposes to dedicate land or an easement and the Implement Entity determines that a proposed land dedication is acceptable for incorporation into the Preserve System, then the "land purchase" component of the SSHCP development fee can be reduced at a 1:1 ratio (see Chapter 12 for a complete breakdown of SSHCP development fee components). The remaining components of the SSHCP development fee will remain unchanged, as they are used to fund management and monitoring, Plan administration, and other features of the Plan. Land dedication in lieu of paying the land purchase component of the SSHCP development fee is only awarded after the Implementing Entity has approved of the land dedication and recordation of a conservation easement or transfer of fee title to the Implementing Entity has occurred.

The Implementing Entity will calculate the amount of habitat land cover type that can be used to reduce the SSHCP development fee commensurate with the land cover types found on the proposed dedication site. Applicants must follow the process for land dedication as described in Section 10.4.2.4, Proposed Land Dedication Map and Report.

Dedication of Land in Excess of Required Mitigation

If more land is dedicated than is required to offset impacts, an SSHCP Land Cover Credit can be generated. For a description of how SSHCP Land Cover Credits are generated, see Chapter 9, Section 9.4.4.

10.8 SSHCP Permit Authorization Issuance

Depending on the type of applicant, the Land Use Authority Permittee or the Implementing Entity will issue written authorization allowing them to engage in Covered Activities once all required SSHCP development fees have been paid, land dedications or easements have been received (if applicable), and conditions or mitigation terms have been satisfied. The Land Use Authority Permittee shall provide a copy of the project material for all projects it approves to the Implementing Entity for entry into the SSHCP database.

INTENTIONALLY LEFT BLANK

11 CHANGED AND UNFORESEEN CIRCUMSTANCES – ASSURANCES

This chapter discusses the assurances requested by the Permittees that will accompany the federal Endangered Species Act (ESA) Section 10(a)(1)(B) permits issued by the U.S. Fish and Wildlife Service (USFWS) and assurances that will be provided to private landowners within the Plan Area. This chapter also provides a discussion of projected effects of climate change in California, qualitatively assesses the relative vulnerability of the South Sacramento Habitat Conservation Plan (SSHCP) Covered Species to climate change in the Plan Area, and discusses how climate change was considered in the Conservation Strategy.

11.1 Assurances for Private Landowners

11.1.1 Willing Sellers

As discussed in Chapter 9, land will only be acquired by the Implementing Entity for the SSHCP Preserve System from willing sellers. The SSHCP Preserve System has enough flexibility that any one parcel of land is not required to satisfy the SSHCP Conservation Strategy.

The SSHCP Plan Permittees may enter into option agreements with key landowners to ensure that large tracts of land can be acquired that fulfil the SSHCP Conservation Strategy, including Preserve acquisitions for the "jump-start" and "stay-ahead" provisions. In the unlikely event that there are no willing sellers, the SSHCP Implementing Entity will consider amending the SSHCP, adjusting the development fees, or modifying other aspects of the SSHCP, as described in Chapter 9. The SSHCP cannot be amended to eliminate this willing sellers' clause or do anything that would force or otherwise require a landowner to sell land or easements to the SSHCP Implementing Entity.

11.1.2 Land or Easement Acquisition Pricing

The acquisition costs for land of a particular cover type will reflect the going market rate based on comparable lands. The SSHCP development fees that are collected will reflect the current market rate for land with similar habitat values needed for mitigation. Covered Activity development fees will be sufficient to purchase the needed Preserve land at the market rate. It is recognized, however, that development fees may not always be adequate at the time land is available for purchase. The SSHCP has provisions to address this issue, should it arise, including the jump-start and stay-ahead provisions (Chapter 10). In the unlikely event that there are no willing sellers, the SSHCP Implementing Entity will consider amending the SSHCP, adjusting the development fees, or modifying other aspects of the SSHCP, as described in Chapter 9.

11.1.3 No Use of Eminent Domain

As discussed in Chapter 9, the Implementing Entity will not use condemnation or eminent domain to acquire property.

11.1.4 No Change of Land Use or Zoning Designations

The SSHCP cannot require the local Land Use Authority Permittees to change land use or zoning designations to accommodate the SSHCP Conservation Strategy. Under the SSHCP, all landowners retain the right to apply for permits, rezones, or any other entitlements allowed under the local jurisdiction's policies and regulations.

11.1.5 Good Neighbor Program

The SSHCP requires the acquisition, preservation, re-establishment/establishment, and management of species habitat. Such actions may result in the expansion (colonization or increased numbers) of some Covered Species populations on private property adjacent to Preserves, potentially restricting the activities or increasing management costs for adjacent landowners. In recognition of this potential effect, the SSHCP offers a Good Neighbor Program that allows the SSHCP Implementing Entity to extend incidental take coverage to landowners that are adjacent to SSHCP Preserves and meet certain conditions as described in this section.

The SSHCP Good Neighbor Program extends Incidental Take Permit (ITP) coverage for willing participants on an "opt-in" basis for all agricultural lands within 0.5 mile of any land or property acquired as part of the SSHCP Preserve System. This opt-in approach allows for landowners to willingly participate in the Good Neighbor Program. Landowners that do not seek to participate in the program will not be required to do so. Incidental take coverage can only be extended to eligible parcels or portions of parcels within the Plan Area. The program does not provide for incidental take of existing populations of Covered Species prior to the establishment of a Preserve.

The Good Neighbor Program is described as follows:

- Agricultural lands within 0.5 mile of SSHCP Preserve boundaries can apply to the Implementing Entity for incidental take of federally listed Covered Species under the SSHCP's Section 10(a)(1)(B) ITP if such lands become inhabited by SSHCP Covered Species as a result of implementing the SSHCP, the land owner has applied for inclusion in the Good Neighbor Program, and the incidental take is in compliance with other applicable state and federal regulations (e.g., Migratory Bird Treaty Act, Clean Water Act, California Fish and Game Code).

- Incidental take coverage will be offered to neighboring land owners that are in active agricultural production, including ranching, at the time that an SSHCP Preserve is established and only on lands that are within the Plan Area. Incidental take coverage will not be offered to lands devoted to non-farmland or ranching purposes at the time the nearby Preserve is established.
- For purposes of the SSHCP, agricultural activities include crop production, animal production, forage production, and ranching activities in which usual and customary agricultural practices are occurring at the time the neighboring SSHCP Preserve is established. If agricultural lands used for crop production lie fallow in accordance with normal crop rotation practices at the time the neighboring Preserve is established, those lands will be considered to be actively used for agricultural purposes. Incidental take coverage shall continue, subject to the terms and conditions of the SSHCP, the Implementing Agreement, and the ITPs, for as long as the neighboring lands are actively used for agricultural purposes as defined here and the SSHCP ITPs remain in effect. Take coverage does not include conversion of agriculture to other land uses.
- Upon establishment of an SSHCP Preserve, the Implementing Entity will send a letter to each neighboring landowner with property that is located within 0.5 mile of the Preserve boundary and are actively used for agricultural purposes as defined in this section. The letter will explain the SSHCP Good Neighbor Program, including the landowner's potential eligibility for incidental take coverage under the program. Landowners who are interested in receiving incidental take coverage shall respond to the Implementing Entity and request coverage within 30 days of confirmed receipt of the notification.
- Prior to extending incidental take coverage, the Implementing Entity will determine the baseline conditions of the property by conducting a survey of the property. Upon completion of the surveys, a biological report will be prepared that documents the areas and resources of the property that are eligible for incidental take coverage under the program. Costs to prepare surveys and the biological report are the responsibility of the landowner. Biological reports will be reviewed by the Implementing Entity and the USFWS for adequacy.
- A change of ownership of land enrolled in the Good Neighbor Program requires the new landowner to notify the Implementing Entity and to sign a Certificate of Inclusion in order to continue coverage. No new surveys are required as long as the original agricultural practices described in the original Certificate of Inclusion are maintained by the new landowner.

Incidental take coverage ends when the SSHCP Permit Term expires. The Implementing Entity will maintain a record of all correspondence and Certificates of Inclusion sent to neighboring landowners under this policy, as well as signed Certificates of Inclusion returned by landowners.

On an annual schedule, the Implementing Entity will notify the USFWS of the number, location, and size of neighboring lands entered into the Good Neighbor Program. Copies of the Certificates of Inclusion will be provided to the Wildlife Agencies upon request.

Process for Entering Into the Good Neighbor Program

Generally, the steps are as follows:

1. The landowner contacts the Implementing Entity to express interest.
2. The Implementing Entity, with the aid of the property owner, collects information, including but not limited to a map of the property, proposed activities on the property, a description of the possible incidental take that may be caused by the landowners activities, and any other pertinent information.
3. The Implementing Entity conducts species surveys and land cover type surveys for the property.
4. The Implementing Entity prepares a biological report that describes the baseline conditions for the property to be enrolled in the Good Neighbor Program. Baseline conditions include a description of habitat for Covered Species (extent and quality), records of Covered Species on the subject property, and observations of Covered Species on the property.
5. Based on the information provided by the property owner and information gathered during site visits, the Implementing Entity develops a draft Good Neighbor Agreement.
6. Once the Good Neighbor Agreement is finalized, the property owner is issued a Certificate of Inclusion, and incidental take coverage will be extended to the qualifying landowner.

11.1.6 Public Notification of Land Acquisitions

All landowners within 0.5 miles of a property that is being proposed for preservation by the SSHCP must be notified of the impeding action to preserve the property. The notice must be sent at least 15 days prior to the Implementing Entity's Board meeting at which the proposal to preserve the property is being heard. At a minimum, the notice must include the date, time, and location of the Implementing Entity's Board hearing and a map that shows the proposed Preserve in relation to properties that are within 0.5 miles of the proposed Preserve property.

SSHCP Preserve acquisitions in fee title and easement are privately negotiated between landowners and the SSHCP Implementing Entity. The parties will privately settle on appropriate terms of a fee title or conservation easement acquisition, continued management of the property, possible improvements to the property, and any potential issues associated with the property title

among other procedural steps necessary for a transaction. Once terms have been agreed to between the parties, the Technical Advisory Committee must approve the transaction (see Chapter 9, Section 9.3.4).

11.1.7 Easement Acquisitions

The acquisition of easements is the preferred method for establishing the SSHCP Preserve system outside of the Urban Development Area (UDA). As described in Chapter 9, 85% of the Preserve system outside of the UDA will be established via easement acquisitions. Easement acquisitions are preferred by the Implementing Entity because easements maintain private ownership of lands and generally cost less to acquire. Fee title acquisitions will be allowed if there are no willing sellers of an easement. However, property purchased in fee title due to the unavailability of easement options may be sold back to a private landowner after an easement is established.

11.1.8 No Public Access to Conservation Easements Held by Private Landowners

It is not the intent of the Implementing Entity to allow general public access on conservation easements that are part of the SSHCP Preserve System. Public access to private lands managed under the SSHCP could conflict with ongoing agricultural or other operations and could pose a safety risk to the public. Public access to lands under conservation easements could also pose a risk of unwanted trespass onto adjacent privately held lands. Generally, the Implementing Entity will leave decisions regarding public access up to the landowner but will restrict access through the conservation easement where that access may conflict with the conservation goals of the site. All conservation easements will provide access for the Wildlife Agencies' and Implementing Entity's biologists to conduct management and biological monitoring necessary for compliance with the SSHCP's Monitoring Program and Preserve System Management Program.

11.2 Assurances to the Permittees – The No Surprises Rule

The federal No Surprises Regulation was established by the Secretary of the Interior on March 25, 1998. It provides assurances to Section 10 permit holders that no additional money, commitments, or restrictions of land or water will be required should unforeseen circumstances requiring additional mitigation arise once the permit is in place. The No Surprises Regulation states that if a Permittee is properly implementing an HCP that has been approved by USFWS, no additional commitment of resources, beyond that already specified in the plan, will be required. The Permittees request regulatory assurances (No Surprises) for all Covered Species in the Plan.

The federal No Surprises Rule (63 FR 8859) and associated amendments to federal regulations (50 CFR 17.3, 17.22, and 17.32) refined the concepts of "changed and unforeseen

circumstances" in HCPs, and describe potential future responsibilities based on whether changes in circumstances could have reasonably been foreseen and addressed by an HCP.

11.2.1 Changed Circumstances

Changed circumstances are defined under the federal "No Surprises" Rule (63 FR 8859) and at 50 CFR 17.3 as:

> "Changed circumstances means changes in circumstances affecting a species or geographic area covered by a conservation plan that can reasonably be anticipated by plan developers and the USFWS and that can be planned for (e.g., the listing of a new species, fire, flood, or other natural catastrophic event in areas prone to such events)."

Accordingly, these regulations require that potential changed circumstances be identified in the Plan along with remedial measures that would be taken to address these changes. The changed circumstances that could arise in the Plan Area have been identified and are described below.

A changed circumstance is a change in the circumstances affecting a Covered Species or their habitats that can be reasonably anticipated and that allows a plan to be developed in advance to accommodate the change. Changed circumstances are identified and planned for by the Plan Permittees. Anticipating and addressing these changed circumstances adds to the conservation value of the SSHCP by reducing the potential risks associated with the changed circumstance and will ensure that the Plan's Biological Goals and Measurable Objectives will be met (Chapter 7). It also provides the Permitting Agencies with assurance that the Implementing Entity is prepared to take certain remedial actions to address a changed circumstance if such an event occurs, and provides assurances to the Permitting Agencies that the SSHCP economic analysis and funding program (Chapter 12) includes adequate funding to deal with the identified changed circumstances.

If a changed circumstance occurs within the Plan Area as defined by these sections, the Implementing Entity will convene the Technical Advisory Committee (TAC) to discuss the changed circumstance if necessary. The Implementing Entity will remediate the effects of the changed circumstances, as described for each changed circumstance in Sections 11.2.2 to 11.2.9, and will report to the TAC on its actions. As necessary, the Implementing Entity will begin implementing a remediation action without awaiting notice from the TAC.

Pursuant to the No Surprises Rule, if such changed circumstances were provided for in the SSHCP and they occur during the Permit Term, implementation of their remedial measures is required. If additional conservation and mitigation measures are deemed necessary to

respond to changed circumstances and were provided for in the Plan's operating conservation program,[1] the Permittees will implement the measures specified in the SSHCP (50 CFR 17.22 and 17.32). The Implementing Entity will maintain sufficient financial reserves to fund all remedial actions as they arise.

If additional conservation and mitigation measures are deemed necessary to respond to changed circumstances and such measures were not provided for in the Plan's operating conservation program, the USFWS will not require any conservation and mitigation measures in addition to those provided for in the Plan, without the consent of the Permittees, as long as the Plan is found to be properly implemented[2] (50 CFR 17.22 and 17.32).

11.2.2 Unforeseen Circumstances

Unforeseen circumstances are also defined under the federal "No Surprises" Rule (63 FR 8859) and at 50 CFR 17.3 as follows:

> "Unforeseen circumstances means changes in circumstances affecting a species or geographic area covered by a conservation plan that could not reasonably have been anticipated by plan developers and the Service at the time of the conservation plan's negotiation and development, and that result in a substantial and adverse change in the status of the covered species."

Unforeseen circumstances are events affecting a species or geographic area covered by the SSHCP that could not reasonably have been anticipated by the participants during the development of the SSHCP and that result in a substantial and adverse change in the status of a Covered Species.

If unforeseen circumstances do arise during the SSHCP Permit Term, and if additional conservation and mitigation measures are deemed necessary to respond to the unforeseen circumstance, the USFWS and the Implementing Entity would work together to identify opportunities to address the unforeseen circumstance. The USFWS "may require additional measures of the Permittees where the Plan is being properly implemented, but only if such measures are limited to modifications within conserved habitat areas, or to the Plan's operating conservation program[3] for the affected species, and the additional measures maintain the original terms of the conservation plan to the maximum extent possible. However, any additional conservation and mitigation measures required by the

[1] Operating Conservation Program means any conservation plan, Implementing Agreement, and permit whose commitments and provisions have been or are being fully implemented by the Permittee (50 CFR 17.3)

[2] A "*properly implemented conservation plan"* means all SSHCP, Implementing Agreement, and permit commitments and provisions have been and are being fully implemented by the Permittees (50 CFR 17.3).

[3] An "*operating conservation program"* means those conservation management activities that are expressly agreed upon and described in the Plan or its Implementing Agreement, if any, and which are to be undertaken for the affected species when implementing an approved conservation plan, including measures to respond to changed circumstances.

USFWS to address unforeseen circumstances will not involve the commitment of additional land, water, or financial compensation, and will not require additional restrictions on the use of land, water, or other natural resources otherwise available for development or use under the original terms of the Plan unless the Implementing Entity consents" (see the No Surprises Rule and permit regulations 50 CFR 17.22(b)(5) and 17.32(b)(5).

The USFWS will "have the burden of demonstrating that unforeseen circumstances exist, using the best scientific and commercial data available." A finding of unforeseen circumstances must be clearly documented and based upon reliable technical information regarding the status and habitat requirements of species affected by the unforeseen circumstances. The USFWS will consider, but not be limited to, the following factors:

- Size of the current range of the affected covered species;
- Percentage of range adversely affected by the Plan;
- Percentage of range conserved by the Plan;
- Ecological significance of that portion of the range affected by the Plan;
- Level of knowledge about the affected covered species and the degree of specificity of the species' conservation program under the Plan; and
- Whether failure to adopt additional conservation measures would appreciably reduce the likelihood of survival and recovery of the affected species in the wild.

If a finding of unforeseen circumstances is made by the USFWS and additional conservation and mitigation measures are required, the Implementing Entity will work with the TAC to appropriately redirect SSHCP resources to address the unforeseen circumstances, consistent with 50 CFR 17.22(b)(5)(iii)(B) and with 50 CFR 17.22(b)(5)(iii)(B).

The No Surprises Rule "does not limit or constrain the USFWS, or any other Federal, State, local, or Tribal government agency, or any private entity, from taking additional actions at its own expense to protect or conserve a SSHCP Covered Species." This means the USFWS or other entities can intervene on behalf of a species at their own expense at any time and be consistent with the assurances provided to the Permittees under the No Surprises Rule.

Also, "nothing in the No Surprises Rule prevents the USFWS from asking the Permittees to voluntarily undertake additional mitigation on behalf of the affected species." If unforeseen circumstances do arise during the SSHCP Permit Term and the Permittees would like to undertake additional conservation and mitigation measures to respond to the unforeseen circumstance (e.g., human zombie apocalypse destroys Implementing Entity staff), the Permittees may request an amendment to the Plan (see Chapter 9).

11.3 Climate Change

Effective HCPs must anticipate and mitigate a wide range of current and potential threats to species. A growing body of research describes the potential effects of climate change on species and ecosystems. Because HCPs are tasked with the conservation of U.S. endangered species over significant time horizons (often in perpetuity), the effectiveness of HCPs may be reduced if plans do not account for climate change. The No Surprises clause that precludes the retroactive adjustment of HCP conservation commitments (USFWS and NOAA 1998) makes the consideration of climate change in HCP development critical (Bernazzani et al. 2012).

11.3.1 Projected Climate Change and Effects in California

The SSHCP Conservation Strategy was developed with consideration of projected future effects of climate change as identified in the *2009 California Climate Adaptation Strategy* (CAS) (California Natural Resources Agency 2009), Our Changing Climate (California Energy Commission and California Natural Resources Agency 2012), Safeguarding California: Reducing Climate Risk (California Natural Resources Agency 2014), the U.S. Bureau of Reclamation (2014), and the Capital Region Climate Readiness Collaborative (2014). The physical effects of climate change identified in these resources include the following, which are assumed as changed circumstances in the SSHCP:

- Temperature rise:
  - 2.1 degrees Fahrenheit (°F) to 4.5°F by 2050; 3.6°F to 7.8°F by 2100
  - More pronounced warming in summer than winter
  - More pronounced warming inland than in coastal areas
  - All models predict increased temperatures, with level of greenhouse gas emissions the biggest uncertainty.
- Extreme weather events:
  - More frequent and longer heat waves
  - More frequent and more intense wildfires
  - Prolonged drought
  - Increased winter and spring flooding due to more rain relative to snow, and earlier snowmelt.

- Precipitation changes:
  - 12% to 35% reduction by 2050
  - High uncertainty due to different models of where and how much snowfall and rain patterns will change
    - 11 of 12 precipitation models show overall decreases in rainfall in Northern California (12% to 35%)
    - More water will fall as rain than as snow, affecting runoff patterns (earlier snowmelt).
- Earlier spring and summer seasons, later fall and winter seasons
- Sea level rise:
  - 12 to 18 inches by 2050; 21 to 55 inches by 2100
- Generally hotter and drier conditions.

Potential future climate change impacts in the Plan Area include warmer temperatures, altered precipitation (changes in the timing, intensity, location, amount, and variability of precipitation); reduction of average annual snowpack and changes in the timing of snowmelt; seasonal shifts and lengthening of the growing season; and long-term changes in watershed vegetation. The potential effects of such changes, both directly from climate change and indirectly from more frequent and intense wildfires, include alterations in runoff patterns, hydrology, vegetation communities, microclimates, and microhabitats. Although these types of impacts are expected to occur, the existing climate change models require further calibration to estimate local impacts, determine variability of precipitation, and predict timing of extreme events. The changing patterns of rain and snowfall, however, are difficult to predict at a local or regional level due to natural variability and complex climatic and non-climatic interactions of temperature, wind, evapotranspiration rates, and other factors. However, the present state of knowledge can inform that future temperatures and precipitation may look very different from the past, even with little change in total annual precipitation levels in the six-county Sacramento region. It is important to note that yearly temperature and precipitation estimates conceal precipitation events that will vary throughout the year (Phurisamban 2014).

11.3.2 Climate Change and SSHCP Covered Species

The SSHCP Conservation Strategy and Preserve System Management and Monitoring Program were designed to provide assurances that Biological Goals and Measurable Objectives for Covered Species will be achieved under climate change changed circumstances (Section 11.4.4). To accomplish this, the Permittees first identified the Covered Species most at risk from climate change. Information compiled in the species accounts (Appendix B), as well as the best available climate change literature for the Sacramento Valley, was evaluated in the context of several

factors to assess the relative sensitivity of the Covered Species to climate change in the SSHCP. Factors considered generally following Gardali et al. (2012) and include the following:

- Habitat specialization and changes in habitat suitability: Species with generalized habitat requirements are more likely to tolerate a greater degree of climate change-induced habitat alterations than habitat specialists, and especially specialists occupying habitats most likely to be affected by climate change (e.g., riparian and wetland systems).
- Physiological tolerances: Species with high sensitivity to temperature, precipitation, moisture, or other climatic variables are more likely to be affected by climate change.
- Migratory status: Migratory species that depend on seasonally appropriate environmental conditions (e.g., environmental cues or triggers) are sensitive to factors that can affect survival and reproduction, such as food availability and temperature regimes.
- Dispersal ability: Species with limited dispersal capabilities, such as speed and distance of dispersal movements, are less likely to adapt to rapidly changing environmental changes.
- Changes in food availability: Species that depend heavily on seasonally or environmentally determined food resources or predator–prey relations (e.g., insect blooms tied to temperature) are more likely to be affected by climate change.
- Changes in extreme weather: Species sensitive to weather extremes such as prolonged drought or unusually high temperatures that affect both habitat and/or individuals directly (i.e., physiological tolerances) are more likely to be affected by climate change.

The results of this evaluation are summarized in Table 11-1. For each of the factors in the table, a general sensitivity ranking of Low, Medium, or High is assigned, or NA (not applicable) is assigned if the factor does not apply to the species. Available information for the species to support the rankings is provided. A general conclusion about the species' likely overall sensitivity to climate change in the Plan Area is also provided. The context of the Table 11-1 analysis is primarily the Plan Area and not the species' range-wide distributions.

For example, species that use oak woodlands, such as Cooper's hawk (*Accipiter cooperii*), may be considered vulnerable to climate change if wildfires become more frequent and intense and degrade or eliminate woodlands in the Plan Area. However, some climate models predict overall increases in oak woodlands in other areas of California, so at a statewide level, woodland species would not be as vulnerable to climate change, even though species distributions may change. So while a species such as Cooper's hawk may not be considered vulnerable statewide, its occurrence and distribution in the Plan Area could be adversely affected by consequences of future climate change. Consequently, some of the sensitivity conclusions for certain avian species in the Plan Area may not agree with statewide vulnerability assessments for birds made by Gardali et al. (2012). For example, of the 128 avian taxa Gardali et al. (2012) identified as vulnerable to climate

change in California, the only SSHCP avian Covered Species on the list is Swainson's hawk (*Buteo swainsoni*)—a Climate Priority 2 species according to Gardali et al. (2012). This species was ranked as having low–medium sensitivity in Table 11-1. Overall, six of the nine avian Covered Species in the Plan Area were ranked by the Permittees as having at least a low–medium sensitivity to climate change. Also, Gardali et al. (2012) note that their assessment was scaled to California and may not identify vulnerable taxa at a smaller scale.

More complex interactions or indirect relationships between climate change and other threats and stressors generally are not considered in the Table 11-1 analysis because they are often speculative. For example, severe drought may reduce the need for mosquito controls, which may reduce the proliferation of mosquitofish, which is a predator of fairy and tadpole shrimp (*Branchinecta lynchi* and *Lepidurus packardi)*, western spadefoot (*Spea hammondii*), and California tiger salamander (*Ambystoma californiense*), or the use of insecticides, which can adversely impact water quality, prey, or have direct toxic effects on wildlife.

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
Ahart's dwarf rush	High Sensitivity: Vernal pools and swales. Habitat could be hydrologically altered by climate change.	Medium Sensitivity: as annual it can tolerate periods of drought. Environmental conditions for germination (e.g., water temperature) unknown.	NA	Medium Sensitivity: natural seed dispersal likely via flowing water, waterfowl, hooves and legs of livestock but also found to colonize artificial features including created vernal pools, stock pond and reservoir margins, ditches, and other excavated or scraped depressions. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	High Sensitivity: sensitive to prolonged drought or altered precipitation patterns that could affect hydrology.	Medium-High
Boggs Lake hedge-hyssop	Medium Sensitivity: Vernal pools and seasonal wetlands. Could be hydrologically altered by climate change.	Medium Sensitivity: as annual it can tolerate periods of drought. Environmental conditions for germination (e.g., water temperature) unknown.	NA	Medium Sensitivity: natural seed dispersal likely via flowing water, waterfowl, hooves and legs of livestock but also found to colonize artificial features including created vernal pools, stock pond and reservoir margins, ditches, and other excavated or scraped depressions. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	Medium Sensitivity: may be sensitive to prolonged drought but also occurs in artificial habitats including created vernal pools, stock pond and reservoir margins, ditches, and other excavated or scraped depressions.	Medium
Dwarf downingia	Medium Sensitivity: Vernal pools and swales. Margins of larger or deeper vernal pools and the seasonally fluctuating vernal pool-like edges of more severely inundated systems. Habitat could be hydrologically altered by climate change.	Medium Sensitivity: as annual it can tolerate periods of drought. Environmental conditions for germination (e.g., water temperature) unknown.	NA	Medium Sensitivity: natural seed dispersal likely via flowing water, waterfowl, hooves and legs of livestock. Evidence of long distance dispersal in the species. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	Medium Sensitivity: may be sensitive to prolonged drought but also occurs in artificial habitats such as stock ponds and more severely inundated systems.	Medium
Legenere	Medium Sensitivity: Vernal pool and seasonal wetlands. Strict endemic of the vernal pool hydrologic cycle in well-developed vernal pools.. Habitat could be hydrologically altered by climate change.	Medium Sensitivity: as annual it can tolerate periods of drought. Environmental conditions for germination (e.g., water temperature) unknown.	NA	Medium Sensitivity: natural seed dispersal likely via flowing water, waterfowl, hooves and legs of livestock. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	Medium Sensitivity: may be sensitive to prolonged drought but also occurs in artificial habitats such as stock ponds and along margins of more permanent water bodies.	Medium
Pincushion navarretia	High Sensitivity: Vernal pools and swales. Habitat could be hydrologically altered by climate change.	Medium Sensitivity: as annual it can tolerate periods of drought. Environmental conditions for germination (e.g., water temperature) unknown.	NA	Medium Sensitivity: natural seed dispersal likely via flowing water, waterfowl, hooves and legs of livestock. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	High Sensitivity: sensitive to prolonged drought or altered precipitation patterns that could affect hydrology.	Medium-High
Sacramento Orcutt grass	Medium Sensitivity: Vernal pools; larger, deeper pools with more extreme inundation regimes. May germinate in years of marginal precipitation. Habitat could be hydrologically altered by climate change.	Medium Sensitivity: sensitive to temperature regime. Germination requires cold stratification followed by increasingly warm fluctuating diurnal temperatures and the presence of symbiotic aquatic fungi (*Alternaria* sp., *Curvilaria* sp.). However, matures in hotter and drier late spring and summer and possesses the C4 photosynthetic pathway and Krantz Anatomy which allows it to exchange atmospheric gasses with increased efficiency and concomitant reduction in water loss to evaporative transpiration.	NA	Medium Sensitivity: low natural dispersal capability but may be transported by livestock. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	High Sensitivity: one of the more specifically adapted Orcutt species, inhabiting the more well-developed of vernal pools, and one of the least likely to germinate during years with marginal precipitation.	Medium-High

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
Slender Orcutt grass	Medium Sensitivity: Vernal pools; larger, deeper pools with more extreme inundation regimes. May germinate in years of marginal precipitation. Habitat could be hydrologically altered by climate change.	Medium Sensitivity: sensitive to temperature regime. Germination requires cold stratification followed by increasingly warm fluctuating diurnal temperatures and the presence of symbiotic aquatic fungi (*Alternaria* sp., *Curvilaria* sp.). However, matures in hotter and drier late spring and summer and possesses the C4 photosynthetic pathway and Krantz Anatomy which allows it to exchange atmospheric gasses with increased efficiency and concomitant reduction in water loss to evaporative transpiration.	NA	Medium Sensitivity: low natural dispersal capability but may be transported by livestock. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	Medium Sensitivity: adapted to more extreme inundation regimes and may germinate in years with marginal precipitation.	Medium
Ricksecker's water scavenger beetle	High Sensitivity: Vernal pool and swale with sufficient hydroperiod to support lifecycle (minimum 18 days). Habitat could be hydrologically altered by climate change.	Medium Sensitivity: late instar larvae leave pool when temperatures increase and construct burrows in moist habitat for 2-4 day pupation period, depending on temperature. Then fly to different vernal pool for mating.	NA	High Sensitivity: adults fly to different vernal pools for mating and likely sensitive to habitat fragmentation. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	Medium Sensitivity: predatory as larvae and omnivorous as adults, with larvae indiscriminately attack anything their size or smaller. Adults feed on common frog-fruit (*Phyla nodiflora*), and dead insects and tadpoles.	Medium Sensitivity: eggs may be desiccation-resistant and lay dormant in the pool bottom. Need at least 18-day hydroperiod, but may be able to withstand drought periods.	Medium-High
Mid-valley fairy shrimp	Medium Sensitivity: Vernal pool and swale. Require cold winter waters for hatching and growth, typically appearing after the first frosts; optimal habitat includes abbreviated hydroperiod. Habitat could be hydrologically altered by climate change.	High Sensitivity: requires cold winter waters for hatching and growth; maturity rate related to temperature. May be sensitive to shifting/rising temperature patterns; e.g., warmer temperatures in late winter/early spring.	NA	Medium Sensitivity: cysts may be dispersed through predator wastes, wind, and mud carried on feet of animals, including livestock. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	Low Sensitivity: omnivorous, indiscriminately filters particles from the water column, including bacteria, unicellular algae, and micrometazoa. Also rasps periphyton from sticks, stems and slender leaves.	Medium Sensitivity: survive as cysts during dry periods and droughts. Can reach maturity in as little has 4 days, indicating relatively less sensitivity to drought conditions.	Medium
Vernal pool fairy shrimp	Medium Sensitivity: Vernal pool and swale vernal swale. Require cold winter waters for hatching and growth. Habitat could be hydrologically altered by climate change.	High Sensitivity: requires cold winter waters for hatching and growth; maturity rate related to temperature. May be sensitive to shifting/rising temperature patterns; e.g., warmer temperatures in late winter/early spring.	NA	Medium Sensitivity: cysts may be dispersed through predator wastes, wind, and mud carried on feet of animals, including livestock. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	Low Sensitivity: omnivorous, indiscriminately filters particles from the water column, including bacteria, unicellular algae, and micrometazoa. Also rasps periphyton from sticks, stems and slender leaves.	Medium Sensitivity: survive as cysts during dry periods and droughts. Can reach maturity in as little has 6 days under high temperatures, indicating relatively less sensitivity to drought conditions.	Medium
Vernal pool tadpole shrimp	High Sensitivity Vernal pool and swale; typically larger, deeper pools. Habitat could be hydrologically altered by climate change.	High Sensitivity: requires cold winter waters for hatching and growth; maturity rate related to temperature. May be sensitive to shifting/rising temperature patterns; e.g., warmer temperatures in late winter/early spring.	NA	Medium Sensitivity: cysts may be dispersed through predator wastes, wind, and mud carried on feet of animals, including livestock. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	Low Sensitivity: omnivorous, consuming live invertebrates, amphibian larvae, or carrion. Also filter detritus for micrometazoa.	High Sensitivity: survive as cysts during dry periods and droughts. Require at least 19 days to reach maturity so may be more vulnerable to shortened hydroperiods resulting from less rainfall and/or increased temperatures.	Medium-High

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
Sanford's arrowhead	Medium Sensitivity: Seasonal wetlands, freshwater marsh, open water, streams and creeks; includes man-made marsh habitats; observed water depths of 4 inches to 2 feet; potential preference for relatively shallow margins of deeper marsh systems. Habitat could be hydrologically altered by climate change.	Medium Sensitivity: dormant rhizome and associated tubers/corms allow it to persist within the submersed substrate through the dormant winter season; seed ecology, germination or seedling growth and vegetation growth unknown.	NA	Medium Sensitivity: have a wide distribution and capable of long-distance dispersal via water courses (e.g., floodwaters carrying tubers, rhizomes, fruits and seeds), migratory waterfowl, muskrats, and beavers. Ability to disperse could be limited by loss and fragmentation of suitable habitat.	NA	Low Sensitivity: occurs in relatively broad range of wetland habitats and is able withstand drought periods and occurs in seasonal and perennial wetlands and artificial or otherwise maintained irrigation, drainage, or flood control conveyances. Can be an aggressive spreader under good growing conditions.	Medium
Valley elderberry longhorn beetle	Medium Sensitivity: Depends on host plant elderberry (*Sambucus* spp.) for life cycle. General habitats include mine tailing riparian woodland, valley oak riparian woodland, mixed riparian woodland, and mixed riparian scrub where elderberry occurs. Although associated with moist habitats, elderberry is not an obligate wetland species and can tolerate drier conditions. However, suitable beetle habitat still requires that host plants are within matrix of other continuous to semi-continuous riparian vegetation. Habitat therefore could be hydrologically altered by climate change.	Unknown.	NA	High Sensitivity: very limited dispersal capability. Adults move less than 164 feet (50 meters) from emergence sites. Limited ability to shift range in response to climate change, particularly if suitable elderberry patches were reduced in size and amount and separated by longer distances.	High Sensitivity: timing of adult emergence closely to elderberry flowering between March and mid-May. Adults live only for a few days to a few weeks, mating and feeding on elderberry leaves, flowers, and nectar. Tight coupling between adult emergence and flowering of elderberry indicates that any asynchrony of this relationship due to climate change could adversely affect reproduction by species.	High Sensitivity: extreme weather conditions may disrupt synchrony of emergence and flowering of host plant.	High
California tiger salamander	High Sensitivity: Foraging – Vernal pool, seasonal wetlands and streams/creeks. Breeding – vernal pool and seasonal wetlands, that require inundation of 60–94 days after eggs hatch to complete metamorphosis; larvae develop faster in smaller, more rapidly drying pools. However, strong positive correlation between inundation period and total number of metamorphosing juveniles. Larvae die if pool dries before completion of metamorphosis. Generally reproductive output for species is low. Breeding habitat therefore could be hydrologically altered by climate change. Aestivation – blue oak woodland and savanna, and valley grassland that is less likely to be affected by climate change.	Medium Sensitivity: no specific information for species, but eggs subject to desiccation.	Low Sensitivity: short-distance breeding migrations occur between breeding sites and adjacent upland areas. These short-distance migrations are unlikely to be affected by climate change.	Medium Sensitivity: post-metamorphic dispersers may move to different ponds and may be sensitive to habitat fragmentation and isolation exacerbated by climate change.	Low Sensitivity: larvae omnivorous, feeding feed on zooplankton, small crustaceans, and aquatic insects. Post-metamorphs and adults prey on earthworms, snails, insects, fish, and even small mammals.	High Sensitivity: adults may forego breeding in drought years. During drier years males and female spend less time at breeding sites. Also, reproductive output and juvenile recruitment is naturally low, so likely sensitive to environmental stochasticity and potential extirpations at isolated sites.	Medium-High
Western spadefoot	High Sensitivity: Breeding – Vernal pool, swale, seasonal wetlands, open water, and streams/creeks that require at least 21 days of inundation for metamorphosis; reduced	High Sensitivity: reproduction strongly tied to water temperature. Water temperatures must be 48-86 degrees F before oviposition occurs. Eggs hatch 0.6-6 days	Low Sensitivity: short-distance breeding migrations occur	Medium Sensitivity: post-metamorphic dispersers may move to different breeding sites and may be sensitive to habitat fragmentation and isolation exacerbated by climate change. However,	Medium Sensitivity: rate of larval maturity related to food sources. Feed on a variety of insects, worms, and other	High Sensitivity: precipitation levels positively correlated with annual reproductive success. Forego reproduction in drought	Medium-High

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
	water volume and hotter temperatures may reduce reproductive output. Longer persisting pools allow longer larval development, and larger juveniles with greater fat reserves at metamorphosis. Foraging – Blue oak savanna, blue oak woodland, valley grassland, vernal pool, swale, seasonal wetlands, open water, and streams/creeks. Aestivation – valley grasslands and blue oak woodland and savanna. Foraging and aestivation habitat less likely to be affected by climate change.	depending on water temperature. At water temperatures greater than 70 degrees F egg failure may occur. Larval develop in 3 to 11 weeks depending on food resources and water temperature, but must be complete before pools dry. High mortality rates in prematurely drying pools (e.g., pools lasting less than 5 weeks).	between breeding sites and adjacent upland areas. These short-distance migrations are unlikely to be affected by climate change.	dispersal movements between breeding sites unknown. Species has broad geographic range in California, suggesting some capacity to disperse over relatively long distances.	invertebrates. Large juveniles have greater fat reserves, greater survival and greater reproductive fitness.	years and remain dormant in burrows.	
Western pond turtle	Medium Sensitivity: Breeding and foraging – Streams/creeks, open water, and freshwater marshes that contain slow-moving, deep water habitat and emergent woody debris, rocks, or other similar features used for basking. Perennial water sources at breeding and foraging sites are probably less prone to fluctuations related to climate change than ephemeral wetlands. However, sites with fluctuating water levels are less suitable and turtles may abandon sites that dry out. Nesting and aestivation – Blue oak woodland and savanna, valley grassland, mine tailing riparian woodland, valley oak riparian woodland, mixed riparian woodland, and mixed riparian scrub. Nesting and aestivation habitat less likely to be affected by climate change.	High Sensitivity: reproduction related to climate conditions. Have temperature-related sex determination, with males produced at lower incubation temperatures and females at high temperatures; temperature threshold is about 86 degrees F. Although eggs are laid in dry soils, may have greater risk of desiccation with hotter and drier conditions. Hatchlings may not leave the eggs when temperature exceeds 81 degrees F to avoid dehydration. Occupied aquatic habitats have water temperature range of about 34-102 degrees F, but appear to be more active in waters at least 60 degrees F. Bask to regulate body temperature between 75-90 degrees F.	Low Sensitivity: short-distance migrations occur between aquatic sites and adjacent upland nesting/aestivation areas; usually upland nesting/aestivation sites are within several hundred feet of aquatic sites, but females may move along streams more than 1 mile to find suitable nesting sites. These short-distance migrations are unlikely to be affected by climate change.	Medium Sensitivity: capable of long distance within-stream and overland movements (at least 8 miles). Climate change, however, may increase isolation and fragmentation of suitable aquatic sites.	Low Sensitivity: opportunistic predators and scavengers, feeding on crustaceans, arthropods, and sometimes carrion. Also feed on submergent vegetation mats, as well as willow, alder, and other plant types. Young feed on mosquito larvae and other aquatic invertebrates, and nekton (aggregates of actively swimming organisms.). Food sources are unlikely to be limited by climate change.	Medium Sensitivity: inhabit perennial aquatic sites, but may abandon sites that have fluctuating water levels or that dry out, suggesting sensitivity to prolonged drought or high seasonal variability in water levels.	Medium
Giant gartersnake	Medium Sensitivity: Breeding – Seasonal wetlands, freshwater marsh, open water, and streams/creeks. Foraging – Breeding habitats and croplands (restricted to rice fields). Hotter and drier climate may adversely affect breeding and foraging habitat because adequate water during the active season (early spring through mid-fall) is important. Nesting and aestivation – Mixed riparian scrub and valley grassland less likely to be affected by climate change.	Medium Sensitivity: early winter foraging and other activities are temperature dependent, but unclear that climate change would substantially affect these activities. May be active on surface in winter when temperature is and least 59 degrees F but timing of spring emergence is variable. Use burrows to escape summer heat and become less active. Bask to bring body temperature up to activity levels. May shift daily activity patterns in response to temperature (e.g., more nocturnal in hotter months).	Low Sensitivity: short-distance migrations between wetlands and adjacent upland areas up to several hundred feet from wetlands. These short-distance migrations are unlikely to be affected by	Medium Sensitivity: capable of long distance movements over short time periods (up to 5 miles in 2 days), suggesting ability to respond to climate-related changes in habitat availability. However, due to its restricted and fragmented geographic range and distribution, it's unlikely it could make substantial latitudinal or elevational shifts in its range in response to climate change.	Medium Sensitivity: prey on aquatic species including small fish and amphibians. Reduction in perennial water sources related to climate change could affect prey availability.	High Sensitivity: inhabit perennial aquatic sites, but capable of relocating to more suitable sites if a site is temporarily degraded by extreme weather events, including drought or floods. Main requirement is that suitable alternative habitat is available. However, water management during drought periods (e.g., less water for rice fields) may reduce suitable	Medium

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
			climate change.			alternative wetlands. Also excessive flood events could be adverse due to loss of upland refuge habitat combined with inherently small, fragmented populations, thus increasing chances of extirpations.	
Cooper's hawk	Medium Sensitivity: Nesting – Blue oak woodland, mine tailing riparian woodlands, valley oak riparian woodlands, mixed riparian woodland, and mixed riparian scrub; dense canopy structure for nesting; nest sites usually in trees groves (often highest tree), but also in solitary trees. Foraging – Blue oak woodland, blue oak savanna, mine tailing riparian woodlands, valley oak riparian woodlands, mixed riparian woodland, mixed riparian scrub, and valley grasslands. Climate change, including increased fire frequency and intensity, could reduce or degrade suitable nesting and foraging habitat.	Low Sensitivity: eggs and nestlings could be adversely affected by increased temperatures, but thermoregulation likely more under behavioral control of adults than ambient conditions. Species also nests in a wide variety of climatic conditions in North America from southern Canada to northern Mexico so local temperature changes likely would have small effect.	Low Sensitivity: most Cooper's hawks in California are non-migratory breeding residents, but seasonal movements by montane individuals to lower elevations may occur. No substantial adverse effects on seasonal movements by climate change are expected.	Medium Sensitivity: strong adult fidelity to nesting areas, so loss or degradation of nesting site could reduce reproductive success. Juveniles are capable of long distance dispersal from natal nest sites (at least several miles). Dispersal limited by available nest sites/territories, which could be affected by climate change.	Low Sensitivity: prey on a variety of avian and mammal prey that are available year round in a broad range of climatic conditions, including ubiquitous mourning doves, pigeons, crows, starlings, house sparrows, ground squirrels, and deer mice. Climate change is unlikely to substantially affect food availability.	Low Sensitivity: as relatively long-lived species (9 years for breeding birds) unlikely to be substantially affected by extreme weather events (e.g., disruption of a breeding season) as long as nesting habitat integrity is maintained.	Low-Medium
Tricolored blackbird	Medium Sensitivity: Nesting – Cropland, valley grassland, seasonal wetlands, and freshwater marsh, typically supporting tules and cattails, but also more recently in Himalayan blackberries, thistle, silage and grain fields. Nesting habitat typically supporting tules and cattails may be altered as a result of climate change. Available breeding habitat may be reduced and result in fewer and smaller nesting colonies, exacerbating the current declining population trend. Foraging – Cropland, irrigated pasture-grassland, valley grassland, vernal pool, swale, seasonal wetlands, freshwater marsh, and open water; most foraging is within 3 miles of their colony sites, but may commute up to 8 miles. Climate change could affect suitability of foraging sites, forcing birds to commute farther distances to productive foraging sites.	Low Sensitivity: eggs and nestlings could be adversely affected by increased temperatures, but thermoregulation likely more under behavioral control of adults than ambient conditions. Species also nests in a wide variety of climatic conditions in California, including the Mojave Desert.	Low Sensitivity: not migratory, but nomadic, with an unpredictable, but apparently flexible pattern. No substantial adverse effects on nomadic movements by climate change are expected.	Medium Sensitivity: due to its restricted range, it is unlikely that it could significantly shift its range in response to climate change, and it is possible that its range could contract with the loss of suitable nesting habitat.	Medium Sensitivity: rely on concentrations of insects and seeds within commuting distance (typically less than 3 miles) from nesting colonies. Could be adversely affected if climate change resulting in reduced food availability in areas near nesting colonies.	Medium Sensitivity: breeding sites may be affected by extreme weather conditions, including drought and flooding.	Low-Medium

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
Western burrowing owl	Low Sensitivity: Wintering – Blue oak savanna, cropland, irrigated pasture-grassland, valley grassland, vernal pool, seasonal wetlands, swale, streams/creeks. Nesting – Cropland, irrigated pasture-grassland, stream/creeks; nest substrates include excavated burrows (primarily ground squirrel) or similar cavities, such as pipes, culverts, rubble piles, and other debris. These habitats unlikely to be substantially affected by climate change and may actually be increased by hotter and drier conditions and associated increases in fire frequency and intensity.	Low Sensitivity: broods are raised in underground burrows where microclimate conditions are affected by site-specific physical factors such as soil type, entrance aspect, slope, burrow depth, and convection. Nests in a broad range of climate regions (including Imperial Valley in California), suggesting that surface temperatures and other climate factors are not particularly critical limits on nesting activities.	Low Sensitivity: California supports both year-round resident burrowing owls (especially in central and Southern California) and over-wintering migrants. Climate change in California should not affect migratory and other seasonal movement patterns because there would be relatively little impact on suitable habitat and prey.	Low Sensitivity: climate change itself unlikely to affect habitat availability so dispersal ability not directly related to climate change; e.g., the need to shift range in response to climate change.	Low Sensitivity: prey includes insects, small mammals, reptiles, birds, and carrion. Any climate-related changes to a prey type (e.g., altered timing of insect blooms) could be compensated for by switching to alternate prey.	Low Sensitivity: as relatively long-lived species (at least 8 years) unlikely to be substantially affected by extreme weather events (e.g., disruption of a breeding season) as long as long-term habitat values are maintained.	Low
Ferruginous hawk	Low Sensitivity: Foraging (winter) – valley grassland, vernal pool, swale, seasonal wetland, and irrigated-pasture where rodents such as ground squirrels, gophers, and rabbits are abundant. Habitat quality, as defined by openness and prey availability likely has little sensitivity to climate change.	Low Sensitivity: as related to wintering activities, there are no evident consequences of climate change. It can be assumed that individuals would use behavioral responses to respond to climate effects.	Medium Sensitivity: Spring migration and initiation and support of breeding activity may be affected by climate change if predator-prey relations at nesting sites are altered (e.g., timing and or abundance of prey).	NA	Low Sensitivity: opportunistic selection of available prey, including ground squirrels, gophers, and rabbits that are unlikely to be substantially affected by climate change, although short-term temporal losses of prey may occur in some areas due to intense fires.	Low Sensitivity: no apparent substantial effects of extreme weather on prey or wintering habitat. Prey are available year round in the Plan Area regardless of weather conditions, although abundance may vary from year to year in relation to local weather conditions.	Low
Swainson's hawk	Medium Sensitivity: Nesting – Blue oak savanna, blue oak woodland, mine tailing riparian woodland, valley oak riparian woodland, mixed riparian woodland, and mixed riparian scrub. May nest in isolated trees and nest site selection may relate more to territory quality than tree characteristic. Foraging (year-round) – Blue oak savanna, cropland, irrigated pasture-grassland, valley grassland, vernal pool, swale, and seasonal wetlands. High quality	Low Sensitivity: eggs and nestlings could be adversely affected by increased temperatures, but thermoregulation likely more under behavioral control of adults than ambient conditions. Species nest in hot climates in California, including the western Mojave Desert.	Medium Sensitivity: arrival and departure times for migration could be disrupted by climate change, especially if timing of predator-prey relations are altered, including insect prey. Birds	Low Sensitivity: species is highly mobile and no impacts of climate change related to dispersal ability are anticipated.	Medium Sensitivity: depend on abundant food sources near nest sites. Forages for both insects and vertebrates (e.g., during breeding season) and may be sensitive to disruptions of predator-prey timing related to climate change.	Low Sensitivity: as a long-lived species (more than 20 years) unlikely to be substantially affected by extreme weather events (e.g., disruption of a breeding season) as long as long-term habitat values are maintained.	Low-Medium

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
	foraging habitats support vertebrate prey (e.g., California voles, ground squirrels, gophers) during breeding season. Voles tend to occur in areas of high grass cover and wet meadows. Drier and hotter conditions and/or water management during drought reducing irrigation in agriculture could adversely affect foraging habitat quality and therefore reduce territory quality.		may fast during migration, reaching destinations undernourished and therefore adequate prey at destination important.				
Northern harrier	Medium Sensitivity: Nesting – Cropland, irrigated pasture-grassland, and valley grassland; Nesting habitat at ground level at the margin of wetlands, but also grassland and agriculture in dense, tall vegetation. Foraging - Cropland, irrigated pasture-grassland, valley grassland, vernal pool, swale, seasonal wetlands, and freshwater marsh. High quality foraging habitat for males supports high California vole densities which occur in areas with high grass cover and wet meadows. Drier and hotter conditions and/or water management during drought could reduce nesting and foraging habitat availability and quality.	Low Sensitivity: eggs and nestlings could be adversely affected by increased temperatures, but thermoregulation likely more under behavioral control of adults than ambient conditions	Low Sensitivity: most breeders in California are non-migratory, but rather nomadic in response to prey availability. Nomadic behavior unlikely to be substantially affected by climate change.	Low Sensitivity: species is highly mobile with low fidelity to nest sites. No anticipated impact of climate change related to dispersal ability are anticipated because individuals should be able to respond to changing habitat conditions.	Medium Sensitivity: California voles are a primary prey that occur in dense grasses and wet meadows. Vole habitat quality could be affected directly by climate change and/or water management during drought. Also, voles exhibit population cycles that may be affected by climate change. However, harriers can switch prey in relation to availability. Foraging also tied to small passerine nesting periods, which could be altered by climate change.	Low Sensitivity: as a long-lived species (more than 16 years) unlikely to be substantially affected by extreme weather events (e.g., disruption of a breeding season) as long as long-term habitat values are maintained.	Low-Medium
White-tailed kite	Medium Sensitivity: Nesting – Blue oak woodland, mine tailing riparian woodland, valley oak riparian woodland, mixed riparian woodland, and mixed riparian scrub that may be sensitive to extended drought conditions and lack of regeneration/recruitment, as well as more frequent and intense wildfires. Foraging – Blue oak savanna, mixed riparian scrub, cropland, irrigated pasture-grassland, valley grassland, vernal pool, swale, and seasonal wetlands; foraging habitat includes grasslands, lightly grazed pasture, wet meadows, and agricultural areas. Most foraging during breeding season is within about 0.5 mile of nest site. Drier and hotter conditions and/or water management during drought could reduce foraging habitat availability and quality.	Low Sensitivity: eggs and nestlings could be adversely affected by increased temperatures, but thermoregulation likely more under behavioral control of adults than ambient conditions. Nest failures related to weather conditions have been observed, but capable of two broods when prey are abundant.	Low Sensitivity: most breeders in California are non-migratory, but exhibit rather nomadic behavior in response to prey availability. Nomadic behavior not expected to be substantially affected by climate change.	Low Sensitivity: species is highly mobile with apparent low fidelity to nest sites. No anticipated impact of climate change related to dispersal ability because individuals should be able to respond to changing habitat conditions.	High Sensitivity: reproduction highly related to prey availability. As a small mammal specialist, sensitive to fluctuations in prey density (e.g., voles). Several years of poor prey availability (potentially exceeding its life span of less than 6 years) could substantially affect this species' productivity and recruitment. Also most foraging during breeding season is within 0.5 mile of nest, so sensitive to distribution of prey in relation to suitable nesting habitat that could be affected by climate change.	High Sensitivity: a relatively short-lived raptor (less than 6 years) and mortality has been attributed to inclement weather. Also sensitive to prey fluctuations that could be affected by weather extremes.	Medium-High
Greater sandhill crane	High Sensitivity: Roosting (winter only) – Vernal pool, seasonal wetlands, and freshwater marsh; use rocky uplands and dirt and gravel roads to obtain "grit," which	Unknown. Does not nest in Plan Area so local climate change should not directly affect reproductive success.	Medium Sensitivity: individuals likely would be sensitive	Medium Sensitivity: species is highly mobile but extremely philopatric to its roosting and foraging habitat. Climate change would not affect their dispersal ability, but they may not be able to	Low Sensitivity: omnivorous, feeding on cultivated grains, berries, small mammals, insects, snails, reptiles,	Low Sensitivity: as a long-lived species (more than 20 years) with high annual survival rates, unlikely to be substantially	High

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
	is important when diet is seeds. Foraging (winter only) - Cropland, irrigated pasture-grassland, valley grassland, freshwater marsh, and seasonal wetlands. Drier and hotter conditions and/or water management September-March could reduce both roosting and foraging habitat availability and quality. Reduced availability of suitable roosting areas could also increase distances between roosting and foraging sites, resulting in greater energy expenditure and greater chance of collisions with structures. Limited roost areas also may increase bird densities and increase susceptibility to epizootic events such as cholera, avian botulism, aspergillosis, salmonella, and avian tuberculosis.		to roosting and foraging habitat conditions upon arrival on winter grounds in the fall, which may be adversely affected by hotter and drier climate and water management.	locate suitable alternative habitat to which they can disperse.	amphibians, nestling birds, and seeds. Foraging for invertebrates in grassland and pastures occurs at onset of winter rains by probing soils in and overturning cattle dung. Altered precipitation may affect access to this food source. Has become accustomed to abundant waste grains from agriculture, which could become more limited with loss of agricultural lands from sea-level rise.	affected by extreme weather events (e.g., disruption of a breeding season) as long as long as long-term habitat values are maintained. However, collisions with transmission lines are increased during windy and foggy conditions.	
Loggerhead shrike	Low Sensitivity: Nesting – Mine tailing riparian woodlands, mixed riparian scrub, and valley grassland. habitat generally include grasslands, pastures with fence rows, agricultural fields, woodland savannas, scrub, and riparian. Foraging – Cropland, irrigated pasture-grassland, valley grassland, vernal pool, seasonal wetlands, and swale; important habitat features include short, sparse vegetation, scattered or isolated low trees or large shrubs for nest sites, available hunting perches with an open view. Except for riparian, these habitats likely are not highly sensitive to climate change.	Low Sensitivity: eggs and nestlings could be adversely affected by increased temperatures, but thermoregulation likely more under behavioral control of adults than ambient conditions.	Low Sensitivity: while some northern populations of shrikes are migratory, it is assumed that shrikes in the Plan Area are breeding residents and non-migratory.	Low Sensitivity: species is mobile and widely distributed in arid portions of the western North America. Juveniles capable of long dispersal movements (typically several miles and documented as far 43 miles). Should be capable of any necessary dispersal and range shift in response to climate change.	Low Sensitivity: forage primarily on large ground-dwelling insects that require little to no water. Also opportunistic predator on birds, amphibians, reptiles, and small mammals. Also eat road kill and carrion. Climate change unlikely to substantially availability of food sources.	Low Sensitivity: There is no information for shrike suggesting that it might be sensitive to changes in extreme weather.	Low
Western red bat	Medium Sensitivity: Roosting – Blue oak woodland, blue oak savanna, mine tailing riparian woodlands, valley oak riparian woodlands, mixed riparian woodland, and orchards; roosting habitat is primarily low and middle elevation broadleaf tree communities, including cottonwood, sycamore and orchards (often walnut); generally roosts solitarily in the foliage of trees or shrubs, but reproductive females may roost together in small groups; roosts commonly in edge habitats adjacent to streams or open fields, in orchards, and sometimes in urban areas with mature trees; generally forages in same areas as roosts. Roosting habitat could be degraded	High Sensitivity: has high energy requirements and enters torpor during the day to conserve energy during colder, inactive periods. Increased temperatures, along with habitat effects, could disrupt thermoregulation and energy budgets. Become active at temperatures of about 68 degrees F, but have been observed flying at temperatures as low as 45 degrees F. Reduced free water available for lactating females could affect reproductive success.	High Sensitivity: makes seasonal north-south migrations which could be disrupted by phenological changes from climate change, including disruptions in predator-prey relationships.	Low Sensitivity: species is highly mobile and roosts in suitable tree habitats; therefore should have the ability to disperse and respond to climate change through range shifts if necessary.	Medium Sensitivity: has high energetic demands. Sensitive to a potential disruption in predator-prey relations by climate change, especially during reproductive season. However, takes a variety of prey, including moths, cicadas, leaf hoppers, beetles, wasps, flies, crickets, and grasshoppers so a particular type of available prey probably not critical.	Medium Sensitivity: as a tree rooster, this species is more exposed to ambient weather conditions than crevice/cave roosting bats. However, red bat has adaptations to cold weather, including thicker fur and rounder ears to prevent heat loss. Longevity in the wild is unknown and may be sensitive to extreme weather events that reduce reproductive success and recruitment.	Medium-High

Table 11-1
Evaluation and Ranking of Covered Species Sensitivity to Climate Change

Covered Species	Habitat Specialization/Habitat Changes	Physiological Tolerance	Migratory Status	Dispersal Ability	Changes in Food Availability	Changes in Extreme Weather	Overall Sensitivity Ranking
	by hotter and drier conditions, as well as increased frequency and intensity of wildfires that affect habitat structure. Foraging – Blue oak woodland, blue oak savanna, mine tailing riparian woodlands, valley oak riparian woodlands, mixed riparian woodland, mixed riparian scrub, orchards, valley grassland, vernal pool, swale, seasonal wetlands, freshwater marsh, open water, and streams/creeks. Climate change may affect predator-prey relations by altering the abundance or distribution of insect prey.						
American badger	Low Sensitivity: Open habitats, including blue oak savanna, valley grassland, vernal pool, swale, and seasonal wetlands; habitat with friable soils and available of prey such as ground squirrel. Generally found in arid, open habitats that likely are not highly sensitive to climate change. These kinds of habitats may increase in California with a hotter drier climate.	Low Sensitivity: badgers are adapted to a broad range of climate conditions in North America and likely responds to local climate conditions behaviorally and physiologically. Can reduce activity and metabolism in response to severe cold and reduced food availability characteristic of northern latitudes within its range. Could be some effect of climate change on patterns of torpor and reproductive activity, but unlikely to be substantial.	NA	Low Sensitivity: capable of making long dispersal movements (females more than 30 miles and males more than 60 miles) and its range includes a broad range of habitat conditions. Should be able to shift range both latitudinally and in elevation in response to climate change if necessary.	Low Sensitivity: opportunistic predator and adapted to conditions with seasonally low prey availability.	Low Sensitivity: its range includes regions subject to extreme weather events. Can respond both behaviorally (denning and reduced activity) and physiologically (reduced metabolism). Also long-lived (up to 15 years) and able to withstand years with poor conditions for reproduction.	Low

INTENTIONALLY LEFT BLANK

The climate change sensitivities identified in Table 11-1 were used to refine the SSHCP Covered Species list (Chapter 3), Biological Goals and Measurable Objectives (Chapter 7), Preserve System design (Chapter 7), Preserve System Monitoring and Management Program framework (Chapter 8), and Changed Circumstances (Section 11.4).

Implementing the Conservation Strategy will protect and enhance a range of Plan Area natural communities, species habitat types, and water sources; and conserving environmental gradients (e.g., altitude, aspect, slope) that will be important to species as climate change affects timing and availability of resources and habitat types in the Plan Area. This will allow many Covered Species to emigrate and disperse to the portions of the Plan Area that continue to provide suitable habitat. The SSHCP Preserve System will provide habitat connectivity for northward and upslope movement of Covered Species, by conserving and restoring habitat linkages (Section 7.5), and reducing habitat fragmentation. The Conservation Strategy also requires redundant habitat linkages to ensure effective connectivity (Section 7.5). As a result of this habitat preservation and connectivity, the distribution of Covered Species and natural land cover types in the Plan Area will be able to shift response to climate change and maintain or expand their distributions as required under Biological Goal 5. As described in Chapter 7, habitat re-establishment and establishment are included in the SSHCP Conservation Strategy to increase the resilience of Covered Species by improving quality and quantity of modeled habitat.

At the species level, the Plan Permittees developed biological goals, measurable objectives, Conservation Actions, and monitoring to ensure the life history needs of Covered Species are provided for in the SSHCP Preserve System. These species-specific measurable objectives and Conservation Actions will ensure shifts of species range, distribution, and abundance driven by climate change do not affect the species' persistence in the Plan Area, by protecting and enhancing individuals, populations, and groups of populations. The SSHCP Covered Species list includes all species with a possibility of being listed during the Permit Term, using the best information available at the time of Plan preparation. This information included the climate change sensitivities in Table 11-1, which emphasizes coverage of unlisted species with restricted distributions, small population sizes, habitat specialization, and those that depend on habitat most likely to be affected by climate change.

The climate change sensitivities of Covered Species identified in Table 11-1 were considered when developing the Conservation Strategy, including the Biological Goals and Measurable Objectives. Examples of ways in which the Conservation Strategy ensures that the species-level goal can be achieved, even with projected climate change, include the following:

- Measurable Objective GS-6 preserves upland forage areas for greater sandhill crane that can be used during flood events.

- Measurable Objective GGS1 and GGS2 for giant gartersnake targets Preserve lands in the Badger Creek watershed, which based on its elevation and position within the watershed, the Permittees assume is not vulnerable to sea level rise-related flooding. Therefore, the Permittees assume that suitable upland habitat will remain available to support overwintering giant gartersnakes in these Preserves, even during flood events.
- The SSHCP provides several dry crossings (AMM ROAD-2) where roadways cross a SSHCP Preserve or directly abut a SSHCP Preserve. These dry crossings will be sized to accommodate a minimum of medium-sized mammals (e.g., coyote) and will provide overland connectivity between Preserve lands during flooding events.
- Vernal pool species also have a limited potential to shift upslope in response to climate change because the vernal pool habitat is restricted to particular soil types that are only present in valley floors and limited portions of foothills. Therefore, the Preserve System will protect more than 23,000 acres of the Vernal Pool Ecosystem across a range of soil types, hydrologies, and locations within the Plan Area. This will provide the best feasible scenario for persistence of the vernal pool species with the effects of climate change.

The relative potential sensitivities of the Covered Species to climate change presented in Table 11-1 will help the Permittees to develop the SSHCP Preserve Monitoring and Management Program. Examples of how the SSHCP Preserve System Management and Monitoring Program framework accounts for future climate change include the following:

- The vernal pool Covered Species are considered to have a medium to medium-high sensitivity to climate change and therefore climate change effects will be closely tracked for the vernal pool Covered Species (see Section 8.3.4.4).
- During drought periods, the Implementing Entity will use adaptive management of Preserves to reduce biomass of annual grasses in the Vernal Pool Ecosystem, to help extend vernal pool ponding by reducing water uptake (Chapter 8). The Implementing Entity will also increase monitoring and management of invasive plant species that may have competitive advantages in drought.
- The effects of wildfire on Covered Species and the Preserve System will be minimized through adaptive management. Changed circumstances for wildfire (Section 11.4.6) will be addressed through the SSHCP Preserve System Monitoring and Management Program.
- The Implementing Entity will provide supplemental water at re-establishment/ establishment sites if needed.
- Preserve monitoring will track the status of Covered Species and allow for early identification of Preserve System occupancy trends, which will serve as an early warning

for the possible effects of climate change and will allow for adaptive management within the Preserve System to ensure species persistence in the Plan Area.

Collectively, these and other monitoring and management efforts will allow the Implementing Entity to detect and respond to the effects of climate change on Covered Species to ensure effective implementation of the SSHCP Conservation Strategy.

11.4 SSHCP Changed and Unforeseen Circumstances

The Plan Permittees have identified nine changed circumstances likely in this Plan Area during the Permit Term that can reasonably be anticipated by the Permittees and the USFWS, and that can be planned for. Specific remedial measures or procedures within the SSHCP to address nine changed circumstances are described. In addition, the Plan Permittees identify at what level or extent each of the nine circumstances would be addressed as unforeseen circumstances under the No Surprises Rule.

11.4.1 Listing of Covered Species

Changed Circumstances: The 28 SSHCP Covered Species (Table 1-2) include 21 plants and animal species that are not currently listed as threatened or endangered under the federal ESA:

- Mid-valley fairy shrimp
- Ricksecker's water scavenger beetle
- Western spadefoot
- Western pond turtle
- Cooper's hawk
- Tricolored blackbird
- Western burrowing owl
- Ferruginous hawk
- Swainson's hawk
- Northern harrier
- White-tailed kite
- Greater sandhill crane
- Loggerhead shrike
- Western red bat
- American badger
- Dwarf downingia
- Boggs Lake hedge-hyssop
- Ahart's dwarf rush
- Legenere
- Pincushion navarretia
- Sanford's arrowhead

However, non-listed SSHCP Covered Species are addressed in the SSHCP impact analysis and the SSHCP Conservation Strategy as if they are listed species. All SSHCP Covered Species, including the plant species and federally unlisted species, will receive No Surprises assurances under USFWS' No Surprises Rule (USFWS and NOAA 1998).

Therefore, if any of the non-listed Covered Species become listed during the 50-year SSHCP Permit Term, the federal ITP will immediately become effective for that species, once the USFWS' Conference Opinion for that species is converted to a Biological Opinion. The Permittees will not be required to change SSHCP Conservation Strategy, the Implementing Agreement, or the terms and conditions of the permit.

Unforeseen Circumstances: There are no unforeseen circumstances associated with the listing of Covered Species.

11.4.2 Listing of New Species

As described in Chapter 1, the SSHCP Covered Species list includes all species with a possibility of being listed during the Permit Term, using the best information available at the time of Plan preparation. However, the possibility remains that a new species could be listed in the Plan Area during the Permit Term and this possibility can be planned for.

Changed Circumstances: If a species not covered by the SSHCP becomes listed, or is proposed for listing as endangered or threatened under the federal ESA or California Endangered Species Act (CESA) during the Permit Term, and Plan implementation could adversely affect the newly listed species, a changed circumstance will have occurred. The USFWS and California Department of Fish and Wildlife (CDFW) will notify the Implementing Entity of any findings that a species is warranted for listing under the ESA or is a candidate for listing under the CESA. This notification will ensure that the Permittees can begin planning changes to the Plan or Plan implementation to conserve the species, and to ensure that the operating Conservation Strategy does not foreclose opportunities for species conservation. As a first step after notification, the Implementing Entity will map and quantify species suitable habitat present in the Plan Area to determine conservation needs of the newly listed species.

If the new species does become listed and the SSHCP has not been amended to address the newly listed species, the Plan Permittees will implement the following remedial measures:

- Plan Permittees will work with the Wildlife Agencies to develop measures to avoid take during implementation of Covered Activities. Permittees and Third-Party Project Proponents will implement the avoidance measures.
- Any parts of a Covered Activity that cannot fully avoid effects to the newly listed species or its habitat shall not proceed until the species is added to the SSHCP ITPs.
- The Implementing Entity will use SSHCP impact methodology to quantify Covered Activity impacts to the species modeled habitat.

- The Plan Permittees will work with the Wildlife Agencies to address the newly listed species in an SSHCP amendment. The Plan Permittees will submit application packages to amend the existing ITPs to add the newly listed species as a Covered Species (see Chapter 9 for Plan amendment process).
- Alternatively, the Plan Permittees or Third-Party Project Proponents could apply for individual take coverage under the ESA and CESA for the project and activities.

Unforeseen Circumstances: There are no unforeseen circumstances associated with the listing of new species.

11.4.3 Climate Change

Changed Circumstance: As discussed in Section 11.3.1**,** several physical climate change effects are currently occurring in California, including shifts in precipitation patterns (changes in the timing, location, amount, and variability of precipitation), reduction of average annual snowpack and changes in the timing of snowmelt and runoff patterns, and increased average temperature and seasonal shifts that lengthen the growing season. Potential physical and biological effects of those changes include increased number and intensity of winter floods; increased number and length of droughts; more frequent and intense wildfires; changes to natural community composition; more invasive species; and increases in wildlife disease.

Although climate change is reasonably foreseeable over the SSHCP 50-year Permit Term, it is not within the scope of the Plan to respond directly to air temperature increases or changes in regional precipitation patterns. Additionally, it will not be possible to determine when a Plan Area change over the 50-year Permit Term is the result of climate change or other non-climate factors. Because of the high level of uncertainty of how natural communities and species will respond to changes in temperature, precipitation patterns, or other climate factors, SSHCP remedial actions to address future climate change would be implemented primarily through the SSHCP Preserve Monitoring and Management Program, as described and provided for in SSHCP Chapter 8.

The SSHCP response to climate change, and therefore the delineation of Changed Circumstances for climate change, is most appropriately gauged by the character and magnitude of the physical and biological changes that may occur within the Plan Area and can reasonably be anticipated and planned for, including floods, wildfires, drought, invasive species, and disease.

Unforeseen Circumstances: The following sections for flood, wildfire, drought, invasive plant species, invasive animal species, and disease address unforeseen circumstances related to climate change.

11.4.3.1 Floods

Changed Circumstances: A flood event occurs when a waterway's capacity to hold water is exceeded by high-water flows and results in water overtopping the stream bank and entering the floodplain. The term *flood* can also apply to localized flooding events caused by levee breaks, pipeline breaks, dam breaks, drainage blockages, and equipment failure.

Flooding is common in some portions of the Plan Area. The primary reason for this history of flooding is the Plan Area's natural topographic position in the Central Valley, including flatness in the valley and high tributary mountain watersheds (Lund 2012). Within the Sacramento Valley, major flooding has occurred from rainstorms or snowmelt that quickly inundate slow-draining populated and agricultural areas (Lund 2012). Low-lying parts of the Plan Area, including the portion in the Sacramento-San Joaquin Delta are flood-prone because they are below sea level and protected only by relatively weak levees (Lund 2012).

Some SSHCP land cover types support plant and animal species with adaptations to periodic flood disturbances, and those land covers and species (e.g., vernal pool invertebrates) may actually benefit from flooding. Generally, flooding can deposit soils rich in nutrients and biological materials, which can enhance habitat, temporarily expand an aquatic species' range, and even increase stream and riparian biological functions over time. Most flood events that occur in the Plan Area) (i.e., excluding major or catastrophic events) are expected to have minimal negative impacts, and in many cases positive effects, on Covered Species or their habitats. For example, flooding increases use by waterbirds such as greater sandhill cranes that forage and roost in shallow flooded habitat (Silveira 1998). Moderate seasonal flooding in broad, shallow flood basins provides expansive areas of giant gartersnake habitat (Hinds 1952). Flooding will not adversely affect the Vernal Pool Ecosystem (Vernal Pool, Swale, Stream/Creek (VPIH) and hydrologically connected valley grassland). Flooding that temporarily connects normally isolated vernal pools can facilitate dispersal by vernal pool invertebrates.

However, extreme or extended flooding could impact Preserves and destroy newly established habitat re-establishment and/or establishment sites by depositing debris or sedimentation, downing trees, and scouring vegetation from stream banks. Plant and animal communities, which may benefit by moderate flooding, may also shift or be eliminated in response to extended flooding, including fairy shrimp (Silveira 1998). According to the USFWS (1993), most or all giant gartersnake populations are vulnerable to adverse effects from extensive flooding, and a 100-year flood event has the potential of extirpating all remaining populations of giant gartersnake due to loss of winter refugia over the species' range. The severity of impacts caused by flooding will vary depending on several factors, including flood duration, intensity, the type of habitat that is affected, and the amount of upland habitat available in the vicinity.

Based on flood flow forecast models, Willis et al. (2011) identified some main effects of future temperature increase scenarios as a result of climate change on river hydrologic regimes and flood control operations in the Sacramento Basin. In particular, flows will change even with small temperature increases causing more rainfall runoff. Willis et al. (2011) found that with either increased or reduced precipitation intensities, temperature increases are expected to increase runoff volumes and flood risks in the Sacramento Basin. In contrast, the U.S. Bureau of Reclamation (2014) found that projected increases in early season runoff will contribute to flood control releases earlier in the year, providing more flood storage capacity. For example, they estimate that storage volumes at Folsom Lake will decrease by up to 12% by the year 2070. However, that study did not consider the effects of peak flows that could contribute to a higher risk of flooding due to climate change.

The SSHCP assumes that climate change will result in sea level rise and lands in the Plan Area located below sea level have a reasonable chance of being inundated. The SSHCP Conservation Strategy accounts for projected sea level rise in its acquisition of Preserve lands to meet the measurable objectives for greater sandhill crane by excluding lands from modeled habitat that are located below sea level. If sea level rise and flooding exceeds SSHCP projections such that preserved lands acquired for benefit of greater sandhill crane can no longer provide suitable roosting habitat for greater sandhill cranes, that sea-level rise or flooding would constitute an unforeseen circumstance. The SSHCP accounts for this changed circumstance by providing suitable refuge foraging habitat for greater sandhill cranes outside the Cosumnes floodplain for use when flooding precludes use of typical foraging habitat.

The Conservation Strategy for giant gartersnake targets Preserve lands in the Badger Creek watershed, which based on its elevation and position within the watershed, the Permittees assume is not vulnerable to sea level rise-related flooding. Therefore, the Permittees assume that suitable upland habitat will remain available to support overwintering giant gartersnakes in these Preserves, even during flood events. However, if a massive flood event occurs in the Badger Creek watershed that results in the drowning of a large proportion of the overwintering giant gartersnake population, that would be an unforeseen circumstance.

For other Covered Species, the SSHCP provides several dry crossings (AMM ROAD-2) where roadways cross a SSHCP Preserve or directly abut a SSHCP Preserve. These dry crossings will be sized to accommodate a minimum of medium-sized mammals (e.g., coyote) and will provide overland connectivity between Preserve lands during flooding events.

Should flooding occur that potentially damages or destroys SSHCP Preserves, re-establishment/establishment sites, or enhancement sites, the following actions shall be taken by the Implementing Entity to deal with the changed circumstance:

- Within 48 hours of determining that a flood event has caused damage, the Preserve Manager will begin inspections of the Preserve to determine if adverse effects occurred

to Covered Species or their habitats within the Preserve. The Preserve Manager will conduct site reconnaissance, sampling, or surveying, as deemed appropriate, and prepare a brief disturbance assessment report that will be provided to the Implementing Entity. Specific issues to be considered in the disturbance assessment report will include, but not be limited to:

  - Damage to Preserve irrigation, pumping, or security equipment;
  - Direct mortality of species;
  - Damage to re-established/established riparian sites, including loss of plantings, damage to irrigation equipment, and erosion of graded banks;
  - Long-term flooding of land cover types that result in conversion of the land cover type to open water or freshwater marsh;
  - Erosive forces and materials deposition including sand, gravel, or invasive species (especially floating-type seeds or plants); and
  - Non-organic debris (e.g., shopping carts, clothing, vehicles, building materials, etc.).

- The Preserve Manager will initiate protective measures where appropriate and repair structures necessary to secure and maintain the affected site, such as fences and irrigation facilities.
- If necessary, the Implementing Entity will convene the TAC to develop measures that address immediate recovery of the affected site(s). Actions that could be recommended by the TAC include additional remediation measures (e.g., erosion control) or reseeding the area to prevent the establishment of invasive species.
- Within 1 year after the changed circumstance occurs, the Preserve Manager will prepare a disturbance assessment report to determine if natural processes at the affected site(s) are acting to resolve the problem. If not, the Preserve Manager will develop appropriate response measures to remediate the disturbance.
- After reviewing the disturbance assessment report, the Implementing Entity will determine whether habitat re-establishment is necessary. A re-establishment plan and a reasonable timeframe shall be established in coordination with the TAC (Chapter 9).
- The Implementing Entity will set up proper monitoring protocols for the affected site(s) in accordance with the SSHCP Preserve System Monitoring and Management Program described in Chapter 8, if re-establishment is necessary.

Unforeseen Circumstances: Flooding will be considered a changed circumstance until such time as two 100-year flood events occur within a 5-year period. According to the Federal Emergency Management Agency (FEMA), a "100-year flood" is the flood elevation that has a 1% chance of being equaled or exceeded each year. Two 100-year floods within a 5-year period

are not expected based in the historical data of five 100-year floods over 46 years and would be considered an unforeseen event.

11.4.3.2 Wildfire

Wildfire was a common historical occurrence within the Plan Area. Native vegetation communities that evolved in a setting with periodic natural fires typically are well adapted to such fire events. Fire presence and absence at varying cycles or regimes affects vegetation community composition and succession, or the natural sequential replacement of vegetation types over time. For California's valley grasslands, which dominate the Plan Area, native species are tolerant of fire within its natural regime of frequency and season (Brooks et al. 2004) and occasional fires have little permanent effect (Bartolome et al. 2007). However, altered fire regimes, in combination with naturalized non-native grasses and livestock grazing, have complex effects on grassland structure and composition (D'Antonio et al 2000) and have contributed significantly to the conversion of native valley grasslands to non-native annual grasslands (Brooks et al. 2004). Since the introduction of non-native Mediterranean grasses and other exotic weeds by European settlers, wildfire has helped control the buildup of non-native grass thatch (Brooks et al. 2004; Bartolome et al. 2007).

Wildfires, especially grassland fires, occur frequently in the Plan Area. Fires in the Plan Area since 2000 generally were nearer urban areas or along other highly traveled roadways (which facilitated quick reporting and response), were constrained by barriers to fire spread (e.g., roads, irrigated agricultural land), or burned early in the year when fuel moisture levels typically are higher. However, fire suppression can allow thatch and woody materials to build up over time, thereby increasing fuel loads. Because the fuel loads in the Plan Area are limited mostly to grasses, the Permittees assume that these large fires will not burn at the temperatures that would cause irreversible effects to grassland or woodland ecosystems in the Plan Area. Fire frequency will also be limited by re-growth of grasses, as several years will have to pass before grassland fuel loads recover from a fire.

A total of 32 fires were recorded in the Plan Area between 1950 and 2011 with sizes ranging from 10.9 to 14,125.6 acres (FRAP 2012). Of these, 27 burned at least 100 acres, 16 burned at least 500 acres, and 6 burned at least 1,000 acres. Only two fires (the 1981 Meiss Fire and the 1996 Scott Fire) burned in excess of 5,000 acres, considered Class G Fires (NWCG 2014). As presented in Table 11-2, the trend over the past decade (2000–2009) is a higher number of smaller fires, although the capacity of Plan Area vegetation to fuel large (Class G 5,000 acre) fires does exist. Over a 60-year period from 1950 through 2009 the average number of fires in the Plan Area per year is 0.516 and the average fire size is 1,255 acres. Increased average temperatures related to climate change will increase fire frequency and fire size, and are forecast to have a greater influence on fire frequency and fire size than any increased population or urbanization in the Plan Area (Baltar et al. 2014; Hurteau et al. 2014).

Table 11-2
Plan Area Wildfire Burn Acreage and Fire Quantity, by Decade

Decade	Total Acreage Burned	Number of Fires by Decade
1950–1959	1,217	2
1960–1969	4,532	3
1970–1979	2,016	4
1980–1989	18,982	10
1990–1999	10,006	2
2000–2009	3,415	11

Wildfire will damage SSHCP Preserve System infrastructure such as fences, buildings, and water supply pipelines. Damage to any SSHCP Preserve System infrastructure will be covered by insurance and will be repaired by the Implementing Entity. Any fires in the SSHCP Preserve System substantially affecting enhancement, re-establishment or establishment sites, regardless of the number of burned acres, will be remediated by the Implementing Entity as a changed circumstance. Prescribed fires were not included in the definition of changed circumstances, unless the prescribed fire accidentally escapes the planned perimeter. Based on historical fire data and weather patterns for the Plan Area and the expected climate change discussed in Section 11.3, wildfire occurrence is most likely during the warm, dry summer months (June through September). However, given the high ignition potential for grasslands and the proximity of potential ignition sources (roadways), wildfires may occur outside of this period under appropriate weather conditions.

Individual Preserve Management Plans will identify fire prevention and habitat protection actions consistent with the California Board of Forestry and Fire Protection 1994 Joint Policy on Pre, During, and Post Fire Activities and Wildlife Habitat.[4] Such actions may include identification and installation/maintenance of fuel breaks, prescribed fire, pre-incident planning, and public education campaigns. Prescribed burning to control buildup of thatch and woody debris, plus control invasive species, is an important tool for ecosystem management, including reducing the chances of fires, and will be considered in the individual management plans. In addition, preventive measures such as fuel breaks will be included as best management practices (BMPs).

Preventative actions include, but are not limited to:

- Each Preserve Manager will create or redesign fuel breaks as appropriate to limit fire spread.
- As allowed and consistent with the Preserve Management Plan, the Preserve Manager will use low-intensity prescribed fires to encourage growth of fire-adapted native plants and discourage growth of non-fire-adapted invasive plants.

[4] http://www.bof.fire.ca.gov/board_joint_policies/joint_policies/pre.pdf

- The Implementing Entity will develop Memoranda of Understanding with all applicable fire agencies to be included with each Preserve Management Plan that identifies appropriate response and fire suppression techniques, including access points, priority locations for fire camps, firebreak construction, water uptake, use of chemical retardants, heavy equipment operation, and post-fire cleanup.
- The Implementing Entity will incorporate public-awareness programs into Preserve Management Plans. This includes public outreach to neighboring lands to minimize fire risk.

Should a wildfire occur in a SSHCP Preserve, the following remedial actions shall be undertaken:

- Each Preserve Manager will work closely with responding fire agencies to ensure fire response and suppression is consistent with the Memorandum of Understanding described above to minimize impacts to sensitive ecological areas;
- Within 48 hours of learning of a Preserve wildfire, the Preserve Manager will begin inspections of the Preserve to determine adverse effects occurred to Covered Species or their habitats within the Preserve. The Preserve Manager will conduct site reconnaissance, sampling, or surveying, as deemed appropriate, and prepare a brief disturbance assessment report that will be provided to the Implementing Entity. Specific issues to be considered in the disturbance assessment report will include, but not be limited to:
    - GPS mapping of boundaries and calculation of acreages of SSHCP land covers burned or disturbed;
    - Qualitative description of ground disturbances specifically created during fire-fighting effort (e.g., access points, fire lines);
    - Damage to irrigation, pumping, fencing or other Preserve facilities;
    - Direct mortality of species;
    - Responses to control erosion, invasive plants, and identify needs for repair or replacement of Preserve facilities; and
    - Analysis of effectiveness of AMMs and consistency with the fire agencies MOU listed in the Preserve Management Plan.
- If necessary, Preserve Staff will initiate erosion control measures where appropriate consistent with Section 5.4, and repair structures necessary to secure and maintain the Preserve such as fences and irrigation facilities.
- The Implementing Entity will set up proper post-fire monitoring protocols for the site in accordance with the SSHCP Monitoring Program and Preserve System Management Program approach described Chapter 8.

- After reviewing the disturbance assessment report, the Implementing Entity will determine whether habitat re-establishment is necessary. A re-establishment plan and a reasonable timeframe shall be established in coordination with the TAC (Chapter 9).

Unforeseen Circumstances: The Permittees assume that wildfire will not cause permanent conversion of land cover types within the Preserve System. If wildfire in the Preserve System is sufficiently intense to fully remove a land cover type and damage soils so that they no longer support the pre-existing land cover type that represents an unforeseen circumstance. Further, if a wildfire occurs in the Preserve System of such a size or intensity that aerial application of chemical fire retardants is used, that is also an unforeseen circumstance.

11.4.3.3 Drought

Changed Circumstances: Drought is a natural, cyclical weather phenomenon that generally occurs over a period of several years. There is no universal definition of when a drought begins or ends. A drought is declared by a statewide drought emergency proclamation. Droughts lasting more than 3 years are relatively rare in Northern California (DWR 2015). Over the past century there have been eight multi-year drought events, five of which lasted 3 to 5 years and two of which lasted 6 years (DWR 2015).

Given that drought is a naturally recurring environmental condition in California, many plants and animals are adapted to natural drought cycles. However, the negative effects of natural drought cycles have been exacerbated by anthropogenic factors, including climate change, that have disturbed the native California landscape, including increased competition from invasive plant and animal species, habitat conversion, intensive water uses for agriculture and urban development, air and water pollution, and climate change. The natural adaptations and resiliency to drought by the Covered Species and their habitats in the Plan Area may not be adequate to respond to drought in the future.

If adverse effects related to drought are observed but vernal pools still support vernal pool species, the following actions shall be taken:

- The Implementing Entity will use adaptive management of Preserves to reduce biomass of annual grasses in the Vernal Pool Ecosystem, to help extend vernal pool ponding by reducing water uptake.
- The Implementing Entity will increase monitoring and management of invasive plant species that may have competitive advantages in drought.
- The Implementing Entity will provide supplemental water at re-establishment/ establishment sites if needed.

- The Implementing Entity will implement other measures through the Monitoring Program and Preserve System Management Program (Chapter 8) in ways consistent with permit obligations and with the consent of the Implementing Entity.

Unforeseen Circumstances: If drought occurs in the Plan Area over enough years that the wetted area of vernal pools no longer support vernal pool species and converts to a terrestrial land cover type, that will be an unforeseen circumstance. In that circumstance, the USFWS will extend the No Surprises assurances to the Plan Permittees for all SSHCP aquatic Covered Species. If drought occurs in the Plan Area over enough years that farmers on SSHCP conservation easements have no irrigation water sources, the USFWS will extend the No Surprises assurances to the Plan Permittees for all SSHCP Covered Species that require Cropland, Irrigated-Pasture Grassland, Orchard, or Vineyard.

11.4.3.4 Invasive Plant Species

Changed Circumstances: A number of plant invasive species are already present and common within the Plan Area (see Section 6.6.1), and it is unlikely that many of these species can be wholly eradicated in the future. As several invasive plant species are likely to be present in SSHCP Preserves now or in the future, the SSHCP requires an invasive species management component for each Preserve Management Plan. The SSHCP Conservation Strategy also includes roadside monitoring and removal of invasive plants in the Plan Area (Measurable Objective HAB 4). New invasive plant species or expanded invasive plant species distributions are considered a changed circumstance from baseline conditions. Invasive plant species baseline conditions in the SSHCP Preserve System will be established for each SSHCP Preserve parcel as it is acquired for the Preserve System.

In the event that a new invasive plant species becomes established or an existing invasive species exhibits substantial or unexpected expansion in the SSHCP Preserve System, the following actions shall be taken:

- Within 30 days of discovery or notification of a new invasive species or substantial or unexpected expansion of an existing invasive species, the Implementing Entity will meet with the TAC to determine appropriate eradication efforts consistent with the PMP and Measurable Objective HAB4.
- The Implementing Entity will conduct expedited monitoring for invasive plant species according to the SSHCP Preserve System Monitoring and Management Program on all SSHCP Preserves. If the invasive plant species is found on additional SSHCP Preserves, eradication efforts will be implemented consistent with each PMP to control or eliminate the invasive plant species threat.

- If eradication efforts result in a need to re-establish habitat in a Preserve, the re-establishment will be completed within 2 years of the eradication.
- The Implementing Entity will set up proper long-term monitoring protocols for the site in accordance with the SSHCP Preserve System Monitoring and Management Program described in Chapter 8 if restoration is necessary.

Unforeseen Circumstances: There is no unforeseen circumstance for invasive plant species; the Plan Permittees will treat any invasive plant species establishment or expansion with adaptive management.

11.4.3.5 Invasive Animal Species

Changed Circumstances: A number of animal invasive species are already present and common within the Plan Area (see Section 6.6.1), and it is unlikely that many of these species can be wholly eradicated in the future. As several invasive animal species are likely to be present in SSHCP Preserves now or in the future, the SSHCP requires an invasive species management component for each Preserve Management Plan. New invasive species or expanded invasive species distributions are considered a changed circumstance from baseline conditions. Invasive species baseline conditions in the SSHCP Preserve System will be established for each SSHCP Preserve parcel as it is acquired.

Examples of invasive animal species that are harmful to Covered Species and could become established or expand their range in the Plan Area include bullfrogs, which could invade California tiger salamander breeding ponds and prey on tadpoles; and hybrid California tiger salamander, which interbreed with native California tiger salamander and dilute the genetic diversity of the native species.

General

In the event that a new invasive species becomes established or an existing invasive species exhibits substantial or unexpected expansion in the SSHCP Preserve System, the following actions shall be taken:

- Within 30 days of discovery or notification of a new invasive animal species or substantial or unexpected expansion of an existing invasive animal species, the Implementing Entity will meet with the TAC to determine appropriate eradication efforts consistent with the PMP.
- Monitoring protocols for the invasive animal species will be implemented on all SSHCP Preserves. If the invasive animal species is found on additional preserves, eradication efforts will be implemented consistent with each PMP to control or eliminate the invasive species threat.

Hybrid California Tiger Salamander

In the event that hybrid California tiger salamanders are found in SSHCP Preserves, the following actions will be taken:

- The Implementing Entity will contract with species experts to help identify potential remediation measures for the hybrid California tiger salamander. The Implementing Entity will meet with Wildlife Agencies, the TAC, and the contracted species experts to develop a plan for selection and implementation of the remediation measures in the Preserve System.
- The Implementing Entity will work with the Wildlife Agencies to develop a plan to eradicate hybrid California tiger salamander, or take other actions, up to the limits described under the No Surprises Rule.

Unforeseen Circumstance: If hybrid California tiger salamanders eliminate the native California tiger salamanders in the Plan Area that will constitute an unforeseen circumstance.

11.4.3.6 Disease

Changed Circumstances

Under historical circumstances, Covered Species populations in the Plan Area probably either occurred in equilibrium with disease (i.e., the population was maintained by balance of births and deaths of immigration and emigration) and/or had the resiliency to recover from severe outbreaks. Even if some populations historically experienced local, and occasionally severe, disease-related reductions in numbers or local extirpations, over the long term these impacts probably were not substantial enough to result in extinctions due to adequate suitable habitat and movement corridors to allow repopulations. However, given the current level of habitat fragmentation due to agricultural and urban development in the region (i.e., including the Central Valley), and environmental stressors related to climate change in the Plan Area, unusual outbreaks or introductions of new diseases could adversely, and potentially irreversibly, affect the populations of some Covered Species.

Should a disease or vector organism adversely impact a Covered Species, the following actions shall be taken:

- The Implementing Entity will contract with species experts to help identify potential remediation measures for the Covered Species disease infestation. The Implementing Entity will meet with Wildlife Agencies, the TAC, and the contracted species experts to

develop a plan for selection and implementation of the remediation measures in the Preserve System.

- The Implementing Entity will set up proper disease monitoring protocols in the Preserve System, and potentially outside the Preserve System, in accordance with the SSHCP Monitoring Program and Preserve System Management Program described in Chapter 8.

Unforeseen Circumstances: If a disease results in the extirpation of a Covered Species from the Plan Area, that will constitute an unforeseen circumstance. In that event, the Implementing Entity may work with the Wildlife Agencies to develop a translocation plan to repopulate the Preserve System with the affected Covered Species, or take other actions, up to the limits described under the No Surprises Rule.

12 ECONOMICS ANALYSIS AND FUNDING PROGRAM

12.1 Overview

The federal Endangered Species Act (ESA) requires that the Plan Permittees provide assurances that the South Sacramento Habitat Conservation Plan (SSHCP or Plan) will be adequately funded over the proposed 50-year Permit Term. The Biological Goals and Measurable Objectives of the SSHCP cannot be attained without adequate funding. The SSHCP funding program is critical to the successful development, implementation, and viability of the SSHCP. Estimating the full costs of the operating SSHCP is an essential step to demonstrate adequate funding to meet regulatory requirements.

This chapter presents the SSHCP economic analysis (including the SSHCP cost analysis and SSHCP funding program). The economic analysis evaluates the costs associated with implementation of the SSHCP and identifies the funding mechanism(s) that will be used to pay for the SSHCP. In order to ensure enough funding, all costs associated with the Conservation Actions necessary to implement the SSHCP had to be identified. Because of the geographic scale of the Plan, the complexity of the Conservation Actions, and the long time frame over which these actions will occur, the cost-estimating process involves many assumptions. The costs are identified for planning purposes only to estimate funding levels needed to implement the Plan. This chapter is organized as follows:

Section 12.2 describes the approach to the cost analysis, including an overview of the methodology used, and data sources.

Section 12.3 presents planning-level cost estimates for the various actions and activities associated with implementation of the SSHCP.

Section 12.4 describes the funding program and quantifies the primary funding mechanism (development fees). This section also presents a mechanism to address cost changes over time.

12.2 Cost Analysis Methodology and Data

The SSHCP economic analysis and associated cost estimates are based on the best information available. Information used in this cost analysis includes, but is not limited to, the estimated acres of impact of future Covered Activities (Chapter 6), estimated costs of the SSHCP habitat preservation and implementing re-establishment/establishment requirements, costs of land by location of the proposed SSHCP Preserve System (Chapter 7), estimated costs of anticipated Preserve System management and monitoring activities (Chapter 8), the staffing and overhead costs of the proposed SSHCP implementation structure (Chapter 9), and estimated costs of addressing any future changed circumstances (Chapter 11). Estimated costs associated with

operating the SSHCP are organized into the following eight categories, which are further explained in Section 12.3:

- Land or Easement Acquisition for the Preserve System
- Habitat Re-establishment/Establishment Activities in the Preserve System
- Habitat Management, Monitoring, and Adaptive Management in the Preserve System
- Changed Circumstances
- Agricultural Enhancement in the Preserve System
- Plan Administration
- Endowment
- SSHCP Plan Development.

The SSHCP cost analysis relies on a detailed financial spreadsheet model (see Appendix I) to track costs and funding requirements associated with SSHCP implementation. The model assesses SSHCP conservation requirements and generates a set of cost estimates, organized by SSHCP land cover type categories. Based on the anticipated cost to acquire necessary land and to implement the Plan, the model estimates funding requirements and the required level of the development fees that will be imposed on Covered Activities to meet these funding requirements.

The SSHCP cost analysis relies on many data sources. Key steps taken were as follows:

1. The analysis of SSHCP costs considered a hypothetical "Preferred SSHCP Preserve System" that indicated the approximate location and SSHCP land cover type that could be acquired by the SSHCP.
2. A land valuation exercise identified estimated per-acre land costs based on the location and SSHCP land cover type anticipated for acquisition.
3. A review of cost assumptions for habitat re-establishment/establishment, management, monitoring, and other costs yielded additional cost estimates by SSHCP land cover type.
4. Costs were aggregated to identify the total funding needed for implementation of the SSHCP Preserve System.
5. Development fees were derived by determining the total cost of mitigation per acre impacted by Covered Activities for each SSHCP land cover type.

Generally, estimates are informed by literature reviews, independent research, and input from land managers experienced with habitat preservation and re-establishment/establishment in Northern California, as well as a review of cost models in similar "regional" habitat conservation

plans (HCPs) that have already been permitted by the U.S. Fish and Wildlife Service (USFWS).[1] The values presented in this chapter represent the best available cost estimates based on the information currently available to the Plan Permittees. All costs are presented in 2015 dollars. Shortly after Plan implementation begins and actual cost data are available, the Implementing Entity will compare the cost assumptions made in this economic analysis with the cost of implementing the SSHCP. If actual costs of Plan implementation are inconsistent with the economic analysis, development fees will be adjusted to bring the development fees in line with the observed cost of implementing the SSHCP.

12.3 Costs Associated with Implementation of the SSHCP

This section discusses the assumptions that are made to estimate the cost associated with operating the SSHCP.

12.3.1 Land and Easement Acquisition Costs

Meeting the Plan's Biological Goals and Measurable Objectives for preservation of SSHCP land cover types requires acquisition of land or conservation easements on properties with suitable ecological characteristics (see Chapter 7). As discussed in the following paragraph, costs associated with the acquisition of land or conservation easements include the cost of the land itself, costs associated with a preliminary biological assessment of the land's habitat values, transaction-related expenses such as title and escrow fees and commissions, and initial site improvements.

The total cost of land to be acquired by fee tile and conservation easement under the SSHCP is estimated to be $487 million over the 50-year Permit Term, including the actual cost of the land or the easement as well as the transaction costs, Preserve Documentation Report (PDR) costs, and initial site improvement costs, as well as an overall 10% contingency, as discussed below. This estimate relies on the assumption that 31% of newly acquired lands will be acquired in fee title (as opposed to conservation easement), and that the cost of a conservation easement ranges from 70% to 80% of the cost of a fee title acquisition. Furthermore, it is assumed that 43% of fee title acquisitions will occur within the Urban Development Area (UDA) where land is more expensive.

12.3.1.1 Fee Title Land Value

Fee title land values are based on a review of comparable private market sales of lands in the Plan Area, data from the California Chapter of the American Society of Farm Managers and

[1] Cost models from the East Contra Costa County HCP/Natural Community Conservation Plan, the Natomas Basin HCP, the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan, the Sacramento Valley Open Space Conservancy, and the Central Valley Farmland Trust were used to inform the SSHCP cost model.

Rural Appraisers, and interviews with local land appraisers.[2] Values are distinguished by parcel size and parcel location within Preserve Planning Units. Land acquisition costs used in this cost estimate range from $9,000 per acre to $35,000 per acre for parcels located outside of the UDA and from $25,000 per acre to $150,000 per acre for parcels located inside of the UDA. Planning-level average fee title land value assumptions range from about $26,000 to $53,000 per acre in the UDA and $9,000 to $13,000 per acre outside the UDA, as shown in Table 12-1.

The price differences shown in Table 12-1 reflect the development potential of properties within and outside of the UDA and variation in parcel sizes. Assumptions concerning development potential in the Plan Area reflect land use policy from the existing General Plans of the three land use jurisdictions (the County of Sacramento, City of Rancho Cordova, and City of Galt) that are within the Plan Area. The UDA boundary roughly corresponds with the County's Urban Services Boundary that marks the anticipated extent of infrastructure (sewer and water supply) needed to support future urban development and corresponds with City of Galt's Sphere of Influence and city limit and the City of Rancho Cordova's city limit. Parcels of land that are within the UDA tend to have higher average per-acre values compared to parcels found outside of the UDA due to the potential for urban development. Parcels located outside of the UDA are generally characterized by a real estate market in which value is driven by agricultural and rural residential uses (and in some cases, mitigation bank uses) which have lower per-acre values compared to urban real estate markets.

Smaller parcels of land are typically more highly valued than larger parcels. This is due to the fact that smaller parcels are typically already entitled for some urban use where larger parcels are typically entitled for agricultural uses. Also, there is a smaller pool of buyers for large parcels of land and as a result, the cost analysis assumes that prices for large parcels will be lower on a per-acre basis.

Table 12-1
Average Per-Acre Fee Title Land Value Assumptions

PPU	UDA Relationship	2 to 10 acres	10 to 20 acres	20 acres +	Weighted Average
PPU 1	Inside UDA	$150,000	$50,000	$27,500	$28,000
PPU 2	Inside UDA	*No Acquisitions in PPU 2*			
PPU 3	Inside UDA	$150,000	$50,000	$27,500	$32,000
PPU 4	Inside UDA	$100,000	$40,000	$25,000	$26,000
PPU 5	Outside UDA	$35,000	$15,000	$10,000	$11,000
PPU 6	Outside UDA	$35,000	$15,000	$12,800	$13,000

[2] Sacramento County Assessor data and Trends in Agricultural Land & Lease Values (2014).

Table 12-1
Average Per-Acre Fee Title Land Value Assumptions

PPU	UDA Relationship	2 to 10 acres	10 to 20 acres	20 acres +	Weighted Average
PPU 7	Outside UDA	$25,000	$15,000	$9,000	$9,000
PPU 8	Inside UDA	$150,000	$50,000	$50,000	$53,000

Notes:
PPU = Preserve Planning Unit
UDA = Urban Development Area

12.3.1.2 Conservation Easement Values

Conservation easements generally cost less than fee title acquisition because the grantee of the easement is only acquiring an interest in the real property while the grantor of the easement retains ownership and control of the property consistent with the terms of the easement.

The scope of a conservation easement, and the restrictions it imposes on land use, determines the cost of the easement. For the SSHCP economic analysis, easement costs were developed based on assumptions related to the scope of the proposed easements and restrictions on land use that will be used by the Implementing Entity in acquiring preserve lands, with inputs from an appraiser experienced in easement valuation[3] (see Appendix D, Sample Easements). Generally, conservation easement values within the Plan Area, on average, are 70% to 85% of fee title value. For the SSHCP economic analysis, a weighted average of about 77% of fee title value was applied to land cover type values, with resulting per-acre easement costs shown in Table 12-2.

Table 12-2
Average Per-Acre Conservation Easement Costs

PPU	UDA Relationship	2 to 10 acres	10 to 20 acres	20 acres +	Weighted Average
PPU 1	Inside UDA	$120,000	$40,000	$22,000	$23,000
PPU 2	Inside UDA	*No Acquisitions in PPU 2*			
PPU 3	Inside UDA	$120,000	$40,000	$22,000	$25,000
PPU 4	Inside UDA	$80,000	$32,000	$20,000	$21,000
PPU 5	Outside UDA	$28,000	$12,000	$8,000	$8,000
PPU 6	Outside UDA	$25,000	$11,000	$9,000	$9,000
PPU 7	Outside UDA	$20,000	$12,000	$7,000	$7,000
PPU 8	Inside UDA	$120,000	$40,000	$40,000	$43,000

Notes:
PPU = Preserve Planning Unit
UDA = Urban Development Area

[3] Gregory A. House (House Agricultural Consultants), Accredited Farm Manager, Accredited Rural Appraiser, and Certified Professional Agronomist.

12.3.1.3 Land Transaction Costs

A number of transaction costs are associated with the land acquisition process, whether it be fee title or conservation easement. Typically, these costs are part of the due-diligence process and include commissions and legal fees, title searches and insurance, appraisals, legal boundary surveys, and Phase 1 Environmental Assessment costs. Because the results of the due-diligence process may cause the Implementing Entity to decide not to acquire certain properties, the economic model assumes that some transaction costs will be incurred on properties that are not acquired. The economic model assumes that transaction costs are 5% of the land or easement purchase price. This percentage is generally consistent with the transaction costs assumed in other HCP economic analyses. Assuming that the average property acquisition is 100 acres, it will require about 350 transactions to assemble the SSHCP Preserve System. It is likely that roughly 25% more properties will be investigated than will be acquired. The land acquisition process is discussed in detail in Chapter 9.

Preserve Documentation Report

A PDR (Appendix F) will be prepared by the Implementing Entity for all properties proposed for acquisition by the SSHCP and will identify existing physical and biological conditions on properties being considered for acquisition. As specified in Appendix F, each PDR will include information on the property location, physical condition of facilities such as fences, and biological setting, including documentation of special-status and other species on the property. The habitat assessment conducted as part of a PDR will require limited biological surveys, and the completed PDR will be a brief report with accompanying maps. Costs assumptions for completion of an average PDR are based on the estimate that it will require 22 hours at $150 per hour for contracted biological staff to complete required tasks. Also included in the PDR cost is a post-acquisition biological assessment, which is estimated to require 1 hour of biologist time per acre. Assuming there will be five PDRs for every four property acquisitions and that the average acquisition is 100 acres, PDR cost is estimated to be about $189 per acre.

Recordation of Easements

All lands acquired for the SSHCP Preserve System will need a conservation easement, even lands that are held in fee title by the Implementing Entity. Conservation easements will be negotiated individually between willing sellers and the Implementing Entity. The terms of the easement and prices paid for easements will be variable depending on the purpose of the easement and the degree to which the easement restricts land uses. Easements will be recorded for Stream Setbacks and Preserve Setbacks to provide the Implementing Entity with the ability to enforce the Avoidance and Minimization Measures that are expected to occur within the area of the setback (see Chapter 5). Costs for the preparation of a conservation easement are estimated as

part of total transaction costs, which are assumed to be 5% of the transaction value (including some costs attributable to parcels for which due diligence occurs but are not acquired).

Initial Site Improvements

The economic analysis assumes that most lands preserved in fee title will require varying levels of site improvements upon acquisition, such as removal of degraded facilities, repair and replacement of gates, and installation of signage and new fencing. The cost analysis assumes that conservation easements will require the same level of site improvements as properties acquired in fee title. Although the extent of the improvements needed is dependent on the condition of the property at the time it is acquired, the SSHCP's economic analysis assumes each preserved property will require initial site improvements averaging $257 per acre preserved, which reflects estimates of demolition, safety improvement, fencing, and signage for a typical property.

12.3.2 Habitat Re-establishment/Establishment

Habitat re-establishment/establishment costs are estimated to be approximately $183 million over the 50-year Permit Term. Estimates of re-establishment/establishment costs were developed for each of the land cover types that require re-establishment/establishment (i.e., Vernal Pool, Seasonal Wetland, Freshwater Marsh, Swale, Stream/Creek, Stream/Creek (Vernal Pool Invertebrate Habitat [VPIH]), Open Water, Riparian (including Mixed Riparian Woodland and Mixed Riparian Scrub), Mine Tailing Riparian Woodland, Blue Oak Woodland, and Blue Oak Savanna). Only costs associated with the re-establishment/establishment activities are addressed here. Cost to acquire land where re-establishment or establishment will occur is discussed in Section 12.3.1. It is important to note that re-establishment/establishment will, in most cases, take place within Preserve System lands that are acquired for purposes of meeting conservation requirements. Accordingly, it is not anticipated that additional lands will be needed to accommodate all the re-establishment/establishment required under this Plan. It should also be noted that the portion of the re-establishment/establishment fee to acquire land is to replace the upland land cover type that will be lost as a result of constructing re-established or established wetlands.

Cost estimates to re-establish/establish habitat are based on interviews with land management agencies active in the region that have engaged in habitat re-establishment/establishment; interviews with conservation banks; and cost estimates prepared for potential habitat re-establishment/establishment sites located within the Plan Area.[4]

[4] Interviews were conducted with staff from Westervelt Environmental Services, the Sacramento Valley Conservancy, and the Stone Lakes National Wildlife Refuge. Cost estimates to design, build, and monitor 50 acres of Vernal Pool re-establishment within the Plan Area were prepared by Dudek restoration experts for purposes of estimating potential re-establishment costs. Current bids to construct vernal pools within the Plan Area were used to estimate potential establishment costs.

Costs associated with habitat re-establishment/establishment include, but are not limited to, site reconnaissance, soil testing and other site feasibility studies as necessary, engineering design and preparation of construction drawings and specifications, land acquisition, staking, earthwork, plant and seed procurement, planting/seeding, and installation of irrigation system. Additionally, re-establishment/establishment projects are subject to additional costs associated with intensive short-term monitoring and maintenance activities for the first 5 years after re-establishment/ establishment is complete. Finally, estimates of habitat re-establishment/establishment costs assume that some portion of habitat re-establishment/establishment projects may not be successful. In particular, re-established/established vernal pool habitat projects have historically been challenging relative to other wetland projects (see Table 12-3 for assumed success rates).[5] In addition, a 10% contingency is applied to guard against shortfalls in planning and design costs, construction costs, and short-term monitoring and maintenance costs. Contingency funds can also be used to remediate re-establishment/establishment sites if the site is not functioning properly. Note that long-term monitoring and management costs for remediation sites are addressed in Section 12.3.7, Endowment.

It is anticipated that contractors will be hired by the Implementing Entity to design, build, and monitor habitat re-establishment/establishment projects. These projects require specialized equipment and technical knowledge to successfully implement habitat re-establishment/ establishment. It also is possible that the Plan will acquire credits from mitigation banks that are within the Plan Area. Staff time, equipment, and vehicles for the Implementing Entity to account for the time needed to hire and oversee contractor designs, specification, and construction are included in SSHCP Administration Cost, discussed in Section 12.3.6.

Table 12-3
Habitat Re-establishment/Establishment Costs

Re-establishment/ Establishment Type	Estimated Per-Acre Cost	Success Rate	Expected Per-Acre Cost	Per-Acre Cost with Contingency
Vernal Pool	$68,834	65%	$105,898	$116,488
Blue Oak	$30,000	50%	$60,000	$66,000
Riparian	$54,511	80%	$68,139	$74,953
Mine Tailing Riparian Woodland	$54,511	65%	$83,863	$92,249
Seasonal Wetland	$59,294	80%	$74,118	$81,529
Freshwater Marsh	$56,388	80%	$70,485	$77,533
Swale	$53,130	75%	$70,840	$77,924

[5] John Zanzi of Dudek has 30 years' experience with design, implementation and long-term monitoring of mitigation projects in California. Mr. Zanzi's professional experience informs the success rates used in this Plan by virtue of his firsthand experience that spans numerous similar mitigation projects including construction implementation and performance of 5-year monitoring programs that collect quantitative data to analyze the interim trajectory and final mitigation project performance.

Table 12-3
Habitat Re-establishment/Establishment Costs

Re-establishment/ Establishment Type	Estimated Per-Acre Cost	Success Rate	Expected Per-Acre Cost	Per-Acre Cost with Contingency
Stream/Creek (VPIH)	$53,130	80%	$66,412	$73,053
Open Water	$50,650	90%	$56,278	$61,906
Stream/Creek	$54,511	85%	$64,131	$70,544

12.3.2.1 Cost of Regulatory Compliance

Implementation of habitat re-establishment/establishment activities may require additional regulatory compliance. Costs of regulatory compliance for habitat re-establishment/ establishment are estimated to be about $31 million over the 50-year Permit Term.

The SSHCP economic analysis assumes that CEQA, NEPA, Sections 401 and 404 of the Clean Water Act, Section 106 of the National Historic Preservation Act, Sections 1600–1607 of the California Fish and Game Code, and other miscellaneous requirements (e.g., county grading permits, road encroachment permits, stormwater pollution prevention plans) will be required for SSHCP habitat re-establishment/establishment activities. Estimated costs reflect the costs for contracting the preparation and submittal of compliance documents and permit applications.

All regulatory compliance costs are expected to be incurred during the Permit Term and will not be required for ongoing management and monitoring activities. Based on input from consultant firms familiar with projects in the region and based on expert opinion from the Plan Permittees local jurisdictions, it is estimated that regulatory compliance will add about 20% to the cost of the re-establishment/establishment activities, with the additional costs attributed to preparing regulatory compliance documents for habitat re-establishment/establishment actions.

12.3.3 Habitat Management, Monitoring, and Adaptive Management Costs

12.3.3.1 Habitat Management Costs

All land that is part of the SSHCP Preserve System must be managed according to the Preserve System Monitoring and Management Program and SSHCP Conservation Strategy. As discussed in Section 8.2, all Preserve lands acquired in fee title will be subject to active land management by the Implementing Entity. Preserve lands acquired by conservation easement will primarily be managed by individual landowners according to a Preserve Management Plan prepared by the Implementing Entity. Habitat management costs are estimated to be approximately $15 million over the 50-year Permit Term.

Costs associated with management of the SSHCP Preserve System include upfront capital expenditures on equipment, materials, and infrastructure improvements; construction of field facilities; and installation of water wells and pumping equipment. Ongoing management costs include invasive species control and other maintenance activities during the Permit Term. An overall average cost per acre of $500 was applied for the upfront management costs, while $15 per acre per year is assumed for ongoing management activities.[6] Management costs were assumed to apply to all Preserve land owned in fee title as well as to 5% of the conservation easement lands. As mentioned earlier, all of the land that makes up the SSHCP Preserve System will be managed, and property that is encumbered by an easement will primarily be managed by the landowner. However, up to 5% of properties encumbered by an easement will require specialized management that will be conducted and paid for by the SSHCP Implementing Entity. Specialized management may include management techniques that are designed to enhance habitat for individual species such as, but not limited to, unconventional crop rotations or fallowing of fields.

The cost to manage the Preserve System is largely based on the size of the Preserve System. Costs are expected to increase as the Preserve System grows. However, costs will not increase in proportion to the size of the Preserve System because per acre management costs are expected to eventually decrease due to efficiencies of scale. Post-permit management costs are expected to stabilize at a lower cost level. At the end of the 50-year Permit Term, management costs are expected to decline to about 50% of the annual cost in year 50, since the Preserve System will be fully assembled and re-establishment/establishment will be at or near completion.

Cost of Preparing Preserve Management Plans

In addition to basic management activities described above, the SSHCP Preserve System Monitoring and Management Program will include direction on how each land cover type will be managed to ensure that its biological value as habitat is maintained and/or re-established. The SSHCP Preserve System Monitoring and Management Program will address topics such as agricultural production, grazing regimes, weed control, prescribed fire measures, and wetland management issues. The SSHCP Preserve System Monitoring and Management Program will be updated periodically, and the costs associated with those updates have also been included in the cost analysis. Focused property-specific or Preserve-specific Preserve Management Plans will be developed from the SSHCP Preserve System Monitoring and Management Program. It is

[6] The analysis assumes that all management requirements would be satisfied by the per-acre fixed and annual cost estimates, either directly by the Implementing Entity or through vendor/contractors hired by the Implementing Entity. If management activities are executed by the Implementing Entity, a variety of facility, vehicle, and other equipment costs would be incurred, consistent with the per-acre management cost estimate.

estimated that about 3% ($400,000 before contingency) of the overall cost of habitat management can be attributed to the preparation of Preserve Management Plans.

Species Enhancement Measures

In addition to basic management activities, as part of the proposed Conservation Strategy the SSHCP includes Measurable Objectives that will benefit target species (see Chapter 7), rather than the more general species benefits provided by the Preserve System as a whole. These include planting hedgerows to benefit Swainson's hawk (*Buteo swainsoni*) and greater sandhill crane (*Grus canadensis;* Objective AG3), preparation of targeted species mobility studies for California tiger salamander (*Ambystoma californiense;* Objective CTS3), and others. Cost estimates were developed for each measure and distributed across land cover types. It is estimated that about 11% ($1.7 million before contingency) of the overall cost of habitat management can be attributed to habitat assessment and planning.

12.3.3.2 Habitat Monitoring Costs

As discussed in Section 8.3, all Preserve lands acquired in fee title or by conservation easement will be monitored by the Implementing Entity or consultants that are hired to complete monitoring tasks. Costs associated with monitoring of the SSHCP Preserve System include planning, conducting, analyzing, and reporting on presence/absence or status and trends of Covered Species and SSHCP land cover types within the Preserve System; and planning, conducting, analyzing, and reporting on compliance and effectiveness of AMMs and measurable objectives. Refer to Chapter 8 for details on monitoring requirements.

An overall average cost per acre of $50 was applied for the upfront monitoring costs. Ongoing monitoring is assumed to be $13 to $50 per acre per year, with agricultural lands assumed to require significantly less monitoring work than other land cover types. Lower levels of monitoring are required for row crop and irrigated pasture so monitoring of row crop and irrigated pastures was set at 25% of the annual per-acre cost of monitoring for all other land cover types.

Habitat monitoring costs (including Adaptive Management, discussed in Section 12.3.3.3) are estimated to be about $45 million over the 50-year Permit Term. While all SSHCP Preserves are monitored as part of implementation, the intensive monitoring of re-establishment/establishment projects during the post construction period are not included in this cost category, but are included in the re-establishment/establishment cost category in Section 12.3.2. At the end of the 50-year Permit Term, monitoring costs are expected to decline to about 50% relative to the annual cost in year 50.

12.3.3.3 Adaptive Management Costs

Costs associated with adaptive management are included in habitat management costs category. Adaptive management activities within the Preserve System will include any change in the management of the Preserve System necessary to meet the Biological Goals and Measurable Objectives described in Chapter 7. These changes will be informed by monitoring described in Chapter 8. Adaptive management tasks are described in Section 8.3.4.2.

12.3.4 Cost of Remediating Changed Circumstances

The SSHCP funding program is required to account for costs associated with the Plan's defined changed circumstances (see Chapter 11). Costs of remediating changed circumstances are estimated to be about $8 million over the 50-year Permit Term. Due to the uncertainty inherent in changed circumstances, it is not possible to forecast the prevalence and extent of these events in the Plan Area with precision. It was assumed that the cost of remedial measures to address changed circumstances will add 10% to management costs and 15% to monitoring costs of the total management budget. Contingency funds can also be used to remediate changed circumstances if necessary.

The Implementing Entity will maintain sufficient financial reserves to fund remedial actions described in Chapter 11 when they arise. As discussed in Section 12.4, the Implementing Entity will annually assess its funding reserves and supplement those reserves if necessary to fund implementation of the most expensive remedial actions that might occur. Funds used to supplement these financial reserves could come from outside the Implementing Entity or from within the Implementing Entity budget (i.e., funds shifted from other SSHCP uses). This approach will ensure that adequate funds are available immediately in the event of a changed circumstance occurring.

Annual funding for remedial measures will accrue each year, and annual funding for remedial measures will grow each year in proportion of the size of the Preserve System. The combination of these two factors will lead to substantial remedial measures funding reserves generated later in the Permit Term. Changed circumstances described in Chapter 11 are more likely to occur on a larger scale later in the Permit Term due to the greater size of the Preserve System and the expected effects of climate change.

As described in Chapter 11, the Implementing Entity is required to implement remedial action if any of the changed circumstances occur. The cost assumptions are made for planning purposes and will not limit the Implementing Entity's obligation to respond to these changed circumstances. Remedial measures for the Preserve System are not required after the Permit Term so these costs are assumed to apply only during the Permit Term.

12.3.5 Agricultural Enhancement Funding

Landowners who sell easements on lands that become part of the Preserve System and who engage in farming activities are eligible for monetary payments for the purpose of agricultural enhancement. These payments can only be used to improve the property that is under conservation easement. Examples of what the payments can be used for include the installation or repair of wells, fences, barns, drainage/irrigation systems; demolition of structures, and clearing and leveling of land that does not impact wetland or riparian resources. The SSHCP Implementing Entity must approve all expenditures. The SSHCP economic analysis assumes that payments under the agricultural enhancement program will be $10 per acre per year. Agricultural enhancement costs are estimated to be approximately $6 million over the 50-year Permit Term. Agricultural enhancement activities that are included in the conservation easement agreement are assumed to occur in perpetuity.

12.3.6 SSHCP Administration Cost

Plan administration costs represent operating costs that will be incurred by the Implementing Entity, including staffing, supplies, facilities, equipment, outside professional services, and other miscellaneous expenses. Based on descriptions of the SSHCP Implementing Entity provided in Chapter 9, staffing costs are needed for 7.0 full-time equivalent (FTE) positions (and associated salary and benefit and tax costs). Office expenses include, but are not limited to, computers, other IT equipment and software, office furniture, supplies, communications, copying and printing, and postage. Office space is assumed to be provided by Sacramento County for $8,000 per FTE. General office costs including utilities, office equipment including copy and fax machines, an office telephone system, printers, scanners, publications, and digital cameras are included in the office charge. Additional costs included in the economic model include liability insurance, accounting, legal review, travel, and public outreach.

Including a 10% contingency, the SSHCP administration costs are estimated at an average of about $1.3 million per year or $66 million over the 50-year Permit Term. At the end of the Permit Term, the Implementing Entity will continue to manage the SSHCP Preserve System, though the level of annual cost is assumed to decrease by about 50% given the loss of certain needs/functions (e.g., land acquisitions). Estimates of Plan administration costs were based on a review of budget information from other regional conservation organizations/HCPs.

It is important to note that labor and equipment costs associated with many SSHCP implementation activities are not included under the SSHCP administration cost category. For example, labor and other costs associated with most habitat establishment and re-establishment, management, and monitoring activities are excluded from staffing costs, as

these activities are likely to be undertaken primarily by outside contractors and are captured in the separate cost estimates for these categories.

In addition, administrative costs incurred by Plan Permittees other than the Implementing Entity to fulfill their own responsibilities under the Plan are not included in the cost estimates. For example, each Plan Partner will incur costs when reviewing applications for take authorization from various project proponents (see Chapter 10). The participating cities and the County might recover these costs from applicants according to the policies in place at each local jurisdiction. The development fee amounts specified in the Plan do not reflect the costs of application review by the local jurisdictions, and revenues from the development fees will not be used to cover these costs. Similarly, the cost of all conditions on Covered Activities described in Chapter 5 will be borne by the project proponents, either public agencies or private developers.

Staff

It is assumed that the Implementing Entity will employ an executive director dedicated to Plan implementation that directs all the activities of the Implementing Entity; a program manager who directs all natural resource aspects of Plan implementation; up to two Preserve Managers who provide on-site management of individual SSHCP Preserves; and an administrative assistant who handles day-to-day administrative tasks (some staff are part-time). The Implementing Entity also will employ a budget analyst. It is assumed that data management and analysis (including geographic information system (GIS)), accounting, legal and real-estate services will be contracted to one of the Plan Partners or will be provided by consultants. Staff-specific costs include employee salaries and benefits (estimated using a salary multiplier of 50% to include the costs such as health insurance, payroll taxes, retirement plan payments, worker's compensation, disability, and life insurance).

Up to three positions (2.5 FTE) to staff the Implementing Entity are identified in the cost model for year 1, increasing to four from year 2 to year 4. Seven FTEs are identified in the cost model after year 5 of implementation. Staffing levels at the Implementing Entity will increase slowly over time as the Preserve System grows and responsibilities increase.

Other staffing mixes could be used by the Implementing Entity to fulfill the obligations of the Plan; but for the purposes of the cost analysis, the staffing mix described in the preceding paragraphs was used. Costs for personnel to monitor and manage the Preserve System and to re-establish/establish habitat are included in the monitoring, management, and habitat re-establishment/establishment cost categories. It is assumed that habitat re-establishment/establishment, management and monitoring will mainly be provided by consultants. Costs to staff the Implementing Entity are estimated to be about $44 million over the 50-year Permit Term.

Governing Board

Implementation of the SSHCP is overseen by a Governing Board composed of members from the County of Sacramento, City of Galt and City of Rancho Cordova. For purposes of the economic analysis it is assumed that there will be a total of six board members each receiving a stipend of $100 per meeting. It is anticipated that the board will meet up to twice a year. Board stipends are estimated to total $60,000 over the 50-year Permit Term.

Insurance

Insurance costs are an important part of program administration. Insurance costs were included for professional insurance for the Governing Board members (often known as "directors' and officers' insurance"), general liability insurance to cover public recreational use within SSHCP Preserves, and professional liability insurance for Implementing Entity staff. Insurance is estimated to be $1 million over the 50-year Permit Term.

12.3.7 Endowment

The development fees include a contribution to a non-wasting endowment fund designed to generate sufficient interest to cover the ongoing annual costs beyond the 50-year Permit Term. The endowment needs are based on estimates of the long-term average real interest rate. The periodic audits of the funding program will review the accrual of the endowment and the long-term interest rates and determine if any adjustments are required.

As noted in the preceding sections, only a few activities including management and monitoring, agricultural enhancement, and plan administration will continue in perpetuity beyond the end of the 50-year Permit Term. Due to the reduced levels of activity at the end of the land-acquisition process and the completion of habitat re-establishment construction, costs are assumed to be reduced by 50% during the post-Permit Term, except for Agricultural Enhancement which continues at the same level as during the Permit Term. The post-permit SSHCP budget provides an additional allowance for legal defense equal to 7.5% of other post-permit costs. The annual cost of ongoing activities is about $1.9 million.

The SSHCP cost analysis includes a non-wasting endowment from which the real interest earned is sufficient to cover average annual post-permit costs. Based on Plan Permittee research of real interest rates as well as a review of interest rate assumptions in other regional HCPs, a real interest rate of 3% is assumed (i.e., net interest over-and-above inflation). This assumption is consistent with the endowment requirements maintained by the California Department of Fish and Wildlife and on the endowment program operated by the National Fish and Wildlife Foundation.

A non-wasting endowment of about $62 million is required at the end of the Permit Term. This includes the additional cost (7.5% of the base endowment), about $4.3 million, as a legal endowment. Assuming an even distribution of development and development fee payment over the 50-year Permit Term, interest revenues accruing to the endowment during the Permit Term are estimated to cover about 42 percent of the endowment need.

12.3.8 SSHCP Development and Preparation Cost Recovery

The development and preparation of the SSHCP documents entailed a significant amount of Permittee and consultant time and costs. Taking into account labor costs and expenditures, the Plan Permittees estimate that their direct contributions total about $6 million. These are contributions that were paid using City and County General Funds and from contributions provided by the Sacramento County Water Agency, Sacramento Regional County Sanitation District, and the Southeast Connector Joint Powers Authority. These contributions do not include grant awards. The costs of Plan development have already been incurred. In addition, the Plan Partners will fund the Implementing Entity operations, including the executive director, program manager, administrative assistant, and other staff, as well as legal, real estate, accounting, and other functions for the first 2 years of implementation. This is necessary as the Plan will not have collected enough development fees within the first 2 years to be self-sustaining. Recovery of plan development costs are spread over the 50-year Permit Term, which with interest brings total plan development cost to about $10 million. The Plan Partners will not pay the Plan preparation cost recovery component of the development fee for their Covered Activities.

12.3.9 Summary of HCP Costs and Funding Requirements

A summary of SSHCP implementation costs is presented in Table 12-4. The costs presented in Table 12-4 also represent the total funding requirements for implementation of the SSHCP. The cost estimates include all costs associated with SSHCP implementation during the Permit Term as well as establishing the non-wasting endowment (including legal endowment) required at the end of the Permit Term to cover costs that extend beyond the Permit Term in perpetuity.

Table 12-4
Summary of Plan Costs

Cost Category	Cost Estimate	Average Annual Cost	Distribution of Costs
Land and Easement Acquisition Costs	$487,238,000	$9,745,000	57.0%
Habitat Re-establishment/Establishment	$183,098,000	$3,662,000	21.4%
Habitat Management, Monitoring, and Adaptive Management	$59,995,000	$1,200,000	7.0%
Changed Circumstances	$8,231,000	$165,000	1.0%
Agricultural Enhancement	$6,015,000	$120,000	0.7%
Plan Administration	$66,009,000	$1,320,000	7.7%
Endowment	$35,301,000	$712,000	4.1%
SSHCP Development	$9,547,000	$191,000	1.1%
Total	**$855,432,000**	**$17,115,000**	**100.0%**

12.3.9.1 Contingency Cost

The Plan costs presented in this section are planning-level estimates. To account for uncertainties in costs, contingencies have been added to the costs to help protect against short-term cost overruns. A general contingency of 10% is included in the cost model for land and easement acquisition, habitat re-establishment/establishment, habitat management, and plan administration. The contingency for monitoring activities is set at 15% to account for easement enforcement actions. Contingency costs are reported in the total cost estimate for each SSHCP cost element. A contingency fund will be used to offset any program costs that are higher than predicted by this Plan. Contingency funds have been set at modest levels because the SSHCP has a development fee adjustment program that allows for adjustments to cover changing economic conditions (see Automatic Adjustment of Development Fees to Account for Inflation in Section 12.4.3.2). In total, about 8% of the total plan cost ($71 million) is a direct contingency cost.

12.4 SSHCP Funding Program (Sources and Assurances)

Long-term viability of the SSHCP requires adequate funding to cover the Plan's implementation costs. Funding to implement the SSHCP is expected to come predominantly from development fees charged on future development.

This section outlines the key parameters of the SSHCP funding program, which include:

- SSHCP Development Fee Concept
- SSHCP Development Fee Structure
- SSHCP Development Fee Program and Schedule
- Funding Adequacy and Assurances.

12.4.1 SSHCP Development Fee Concept

The SSHCP development fees are set at levels that fully offset the cost of compensating for the species take and habitat loss authorized by the SSHCP Incidental Take Permits and the loss of aquatic features protected under the Clean Water Act.

The SSHCP includes a development fee structure that is based on the land cover types impacted by a SSHCP Covered Activity. This approach accounts for variations in costs that are associated with conservation requirements for each different land cover type. Each new development project will pay development fees based on the land cover types affected by the development. The SSHCP development fees were estimated on a per-acre-of-development basis.

The per-acre development fee is calculated by summing the total HCP implementation costs associated with mitigating the impacts of each SSHCP natural land cover type and then dividing that total cost by the number of acres of impact (direct and indirect).

Because the SSHCP implementation cost includes both costs during the Permit Term and the cost of establishing the required endowment to cover costs of managing the SSHCP Preserve System after the end of the 50-year Permit Term, a project's one-time development fee must be adequate to cover all SSHCP implementation costs for each land cover type preserved.

As discussed in Chapters 7 and 9 and in the following sections, some urban development projects will be required to dedicate SSHCP Preserve System lands on site. For these developers and potentially others who agree to on-site dedications with the SSHCP Implementing Entity, these on-site land dedications will act to reduce the number of acres on which the land component of the development fee will need to be paid. As also indicated in the development fee schedule, all new developments/impacts will be required to make contributions towards a range of other costs, though the re-establishment/establishment component of the development fee only applies to the land cover types where such mitigation actions are required.

12.4.2 SSHCP Development Fee Structure

The SSHCP employs a development fee structure, where covered projects and activities incur different development fees based on the types of habitat and amount of habitat impacted. The underlying principle for the development fee structure is that land preservation and conservation requirements, and therefore costs, vary by habitat type. For example, per-acre land costs will vary by land cover type depending on the need to mitigate the loss of land covers inside the UDA where land is more expensive. Similarly, annual monitoring costs are assumed to differ by land cover, while land management costs apply to fee title acquisitions. Re-establishment/ establishment mitigation requirements only apply to certain types of land covers.

More specifically, the SSHCP development fees are separated into twelve land cover groupings, including: (1) Agriculture, (2) Valley Grassland, (3) Vernal Pool, (4) Blue Oak Savanna and Woodland, (5) Riparian, (6) Mine Tailing Riparian Woodland, (7) Seasonal Wetland, (8) Freshwater Marsh, (9) Swale, (10) Stream/Creek (VPIH), (11) Open Water, and (12) Stream/Creek. The SSHCP Conservation Strategy (Chapter 7) includes re-establishment/ establishment objectives for all but two of these land cover types: Agriculture and Valley Grassland.

This Plan uses development impact fees to fund mitigation that will offset losses of land cover types, Covered Species habitat, and other biological values. These one-time development fees pay for the full cost of mitigating project effects on the Covered Species. Once paid, applicants do not need to find their own mitigation to satisfy state and federal endangered species or Clean Water Act laws. In addition, these development fees should also satisfy all or most of the CEQA mitigation needs for biological resources, as discussed in Chapter 1.

Methods for calculating development fees are explained in Chapter 10. As described in Chapter 10, applicants must submit an SSHCP land cover type map, wetland delineation (if applicable), and a map depicting modeled species habitat found on the project site (if applicable). The Land Use Authority Permittee or the Implementing Entity will use these reports to finalize the site-specific land cover type map to be used for calculating impacts to SSHCP land cover types and for calculating SSHCP development fees. The underlying analysis for the development fee calculations is provided in the *SSHCP Nexus Study*.

12.4.3 SSHCP Development Fee Program and Schedule

The development fees used in the SSHCP economic model are presented in Table 12-5. Development fees are shown by land cover, with the preservation component of the fee distinguished from the re-establishment/establishment fee. Appendix I includes additional detail concerning the cost components that compose the fee.

Table 12-5
Development Fees Used in the SSHCP Economic Model

Land Cover	Preservation Fees		Re-Establishment/Establishment Fees		Total
	Land	*Other*	*Re-Establishment/ Establishment and Land*	*Other*	
Agriculture	$13,511	$3,752	$0	$0	$17,263
Valley Grassland	$14,545	$5,548	$0	$0	$20,093
Vernal Pool – Direct	$26,675	$11,317	$152,844	$5,940	$196,776
Vernal Pool – Indirect	$26,675	$11,317	$0	$0	$37,992
Blue Oak	$16,285	$5,896	$92,258	$5,940	$120,379
Riparian	$25,238	$11,156	$103,001	$5,940	$145,336
Mine Tailing Riparian Woodland	$9,398	$5,716	$123,757	$5,940	$144,811
Seasonal Wetland	$17,723	$5,921	$110,893	$5,940	$140,477
Freshwater Marsh	$23,233	$6,156	$106,098	$5,940	$141,428
Swale – Direct	$17,451	$5,945	$106,566	$5,940	$135,902
Swale – Indirect	$17,451	$5,945	$0	$0	$23,396
Streams/Creeks (VPIH) – Direct	$33,592	$6,389	$100,722	$5,940	$146,643
Streams/Creeks (VPIH) – Indirect	$33,592	$6,389	$0	$0	$39,981
Open Water	$17,424	$5,944	$87,345	$5,940	$116,653
Streams/Creeks	$12,132	$5,746	$97,710	$5,940	$121,529

12.4.3.1 Land Dedication in Lieu of Development Fees

The implementation strategy outlined in Chapter 9 describes a land dedication process where project proponents can dedicate land towards satisfying their mitigation requirements and thereby reduce their development fees. When the dedication of land (or a re-establishment/establishment site) is accepted into the SSHCP Preserve System, development fees will be adjusted by reducing the appropriate portion of the development fee (e.g., the "land" component of the SSHCP development fee) at a 1:1 ratio. It should be noted that some components of the proposed SSHCP development fees (i.e., "other" fees shown in Table 12-5) will remain unchanged because these fee revenues are used to fund SSCHP requirements for management and monitoring, changed circumstances, plan administration, plan development, and endowment. Land dedication in lieu of paying the land purchase component of the SSHCP development fee is only awarded after the Implementing Entity

has approved the land dedication and recordation of a conservation easement or transfer of fee title to the Implementing Entity has occurred.

As described in Chapter 10, if an applicant proposes to dedicate land or an easement in lieu of paying part of the required SSHCP development fees, then the Implementing Entity must review the proposed land dedication or the easement to ensure that it is consistent with the SSHCP Conservation Strategy. The SSHCP has strict criteria for siting Preserves, and not all land within the SSHCP Plan Area is suitable for establishing SSHCP Preserves. The Implementing Entity must determine whether the proposed land dedication is consistent with SSHCP AMMs described in Chapter 5, Section 5.4, Conditions on Covered Activities, and with the Biological Goals and Measurable Objectives described in Chapter 7 (Table 7-1, Biological Goals, Measurable Objectives, and Conservation Actions). An applicant must provide information in support of a land dedication proposal as detailed in Chapter 10. Mitigation fee implementation will be covered in more detail in the Mitigation Fee Ordinances.

12.4.3.2 Development Fee Adjustment Program

The funding program must ensure that the SSHCP remains solvent in perpetuity. SSHCP funding will never lag behind increasing costs, and Plan implementation will never be compromised. Therefore, the SSHCP funding program is able to respond to changing economic conditions, including inflation and a dynamic real estate market. It is able to respond to any unexpected funding shortfalls over the Permit Term.

The SSHCP economic model predicts future changes in costs and revenues using the best available information. To ensure that SSHCP funding never lags behind increasing costs, the SSHCP includes automatic development fee adjustments and periodic development fee audits.

Automatic Adjustment of Development Fees to Account for Inflation

The proposed SSHCP development fees will be automatically adjusted annually for inflation. For purposes of development fee adjustments, the SSHCP development fees are organized into two categories: (1) land acquisition and (2) all other costs of implementing the SSHCP. These two categories are subject to differing rates of inflation. Therefore, an inflation index that is appropriate to each category has been selected.

The SSHCP cost analysis assumes that the cost of land acquisition is tied directly to real estate values in the Plan Area. All other costs are tied more generally to changes in the cost of labor/personnel, services, and goods and materials. Therefore, it is anticipated that different rates of inflation could apply to land acquisition and other costs over time and require different inflation indices.

For land acquisition costs, the index to adjust the land acquisition cost portion of development fees will be the annual Home Price Index for the Sacramento–Arden–Arcade–Roseville, California Metropolitan Statistical Area from the Office of Federal Housing Enterprise Oversight. This index is selected because it is a well-regarded public data source with relevant geographic coverage. The development fee adjustment index will be based on the change in the average annual Home Price Index (Quarter 1 through Quarter 4) for the prior calendar year. The "other costs" will be indexed using the California Construction Cost Index (CCCI). The CCCI is the most applicable index as it tracks labor and materials costs that are relevant to other SSHCP costs.

Periodic Audit and Adjustment of SSHCP Development Fees

In addition to annual development fee adjustments, the SSHCP will conduct periodic comprehensive reviews of the SSHCP funding program and development fees to ensure that the development fees generated by Covered Activities are adequately covering Plan implementation costs. A comprehensive development fee audit will be completed at least every 3 years for the first 15 years of the Plan (i.e., years 3, 6, 9, 12, and 15) and at least every 5 years thereafter (i.e., years 20, 25, 30, 35, 40, and 45), where year 1 is the first full calendar year of SSHCP implementation. This minimum frequency of development fee audits was established to avoid cost-related uncertainties in early years of Plan implementation and to allow time to accumulate sufficient data to analyze the relationship between costs and development fee revenues. The audit process will include a detailed review of implementation costs and how actual costs compare to the cost assumptions in the original economic model (see Appendix I). Following completion of the independent development fee audits, SSHCP development fees may be adjusted to reflect refined cost estimates.

12.4.4 Funding Adequacy and Assurances

The SSHCP funding program is designed so that mitigation-based funding sources will meet all expected costs of the Plan. It is acknowledged that future costs of conservation are difficult to predict. Therefore, the SSHCP development fee adjustment program will be used to address any funding shortfalls, which help ensure funding adequacy over the Permit Term and in perpetuity. As discussed in Section 12.3.4, a contingency fund will be maintained to address any unexpected funding shortfalls, associated primarily with higher-than-expected land management and monitoring costs. Contingency funding is included in the economic model.

12.4.4.1 Catch-Up Fee Ordinance

As discussed in Chapter 9, each Land Use Authority Permittee will adopt a catch-up-fee ordinance. This ordinance requires third-party project applicants to pay a catch-up-fee in the

unusual circumstance that a third-party project proponent pays required SSHCP development fees prior to receiving Land Use Authority Permittee issuance of a local permit and the SSHCP development fee is thereafter increased.

12.4.4.2 Short-Term Funding Shortfalls

As described in Chapter 9, the SSHCP has a robust Jump-Start Stay-Ahead program that ensures that progress toward assembling the SSHCP Preserve System will always stay ahead of Covered Activity impacts. This is accomplished by requiring that the SSHCP maintain enough Preserve land to be at least 2% ahead of the remaining preservation needed for each SSHCP land cover type as required by the SSHCP Conservation Strategy. To ensure that the 2% stay-ahead requirement is always maintained, the Plan Partners must first check with the Implementing Entity prior to extending take coverage to Third-Party Project Proponents or prior to using take coverage for their own projects to ensure that there is enough habitat available to mitigate project impacts and to maintain a 2% cushion. If the Implementing Entity determines that the amount of impact that is anticipated to occur will exceed the stay-ahead provision's 2% threshold for any land cover group, then fees cannot be used to satisfy mitigation requirements (see Chapter 9 for alternatives to paying a fee).

Over the entire Permit Term, fee revenue may fall short of expectations if fewer Covered Activities occur than assumed under the Plan. Although unlikely, this shortfall will make it difficult for the Permittees to meet their conservation obligations. If it appears that take authorized under the permits will fall short of expectations, substantially reducing fee revenue, the Implementing Entity and other Permittees will work with the Wildlife Agencies to extend the term of the permits to allow the use of the authorized take and allow full implementation of the Plan. As described above, the Local Partners are not expected to, nor are they required to, utilize local general funds for Habitat Plan implementation in the event of funding shortfalls as a result of less fee revenue than expected, either in the short term or the long term.

Alternatively, if revenues fall far short of expectations and it is unlikely that the Permittees will meet their permit obligations, they may apply to reduce the authorized take and reduce the permit obligations. Any Permit Term extension or request for reductions in Plan obligations will follow the requirements for a major amendment described in Chapter 9.

12.4.4.3 Post-Permit Management and Monitoring

The Plan Permittees are obligated to continue to protect, manage, and maintain the Preserve System after the end of the 50-year permit period. As noted in Section 12.3.8, only a few activities including management and monitoring, agricultural enhancement, and plan administration will continue in perpetuity beyond the end of the 50-year Permit Term. Funding

obligations such as land acquisition, habitat re-establishment/establishment, remedial measures and contingency, will not continue post-permit.

Due to the reduced levels of activity at the end of the land acquisition process, the completion of habitat re-establishment construction and the absence of the need to fund contingency and remedial measures, costs are assumed to be reduced by 50% during the post-Permit Term.

Funding provided by interest on the endowment is expected to fully fund post-permit costs. Any shortfalls in the endowment during the Permit Term will be identified by the comprehensive development fee audit to be completed at least every 3 years for the first 15 years and at least every 5 years thereafter. If the endowment is not growing fast enough to reach its target size, then the endowment fee portion of the development fees will be increased to make up the shortfall. With these built-in safeguards in the endowment, post-permit funding is expected to be adequate to fully offset post-permit costs of management and monitoring.

Five years prior to the termination of the permit, the Plan Permittees will determine how to handle the continuing obligations of the Implementing Entity with the approval of the Wildlife Agencies. Cost assumptions regarding post-permit costs are presented in Section 12.3.8.

13 ALTERNATIVES TO AVOID OR REDUCE TAKE

The federal Endangered Species Act (ESA) requires that Habitat Conservation Plan (HCP) applicants identify alternative actions that were considered to reduce the level of take to federally listed species and to provide a rationale for why those alternatives were not chosen. The Endangered Species Consultation Handbook (USFWS and NMFS 1998) identifies two alternatives commonly used in HCPs: (1) an alternative that would reduce take below levels anticipated for the proposed project, and (2) an alternative that would avoid take and hence not require a permit from the U.S. Fish and Wildlife Service (USFWS). Because the ESA only requires that alternative approaches be based on take of federally listed wildlife species covered by an HCP, this chapter provides a description of alternative take scenarios that were considered to avoid or reduce take of federally listed species covered under the South Sacramento Habitat Conservation Plan (SSHCP or Plan). Because take of federally listed plant species are not prohibited under the ESA and because this Plan requires Covered Activities fully avoid take of Sacramento Orcutt grass (*Orcuttia viscida*) and slender Orcutt grass (*Orcuttia tenuis*), this chapter does not address these plants. The identification and discussion of project alternatives required by the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) are presented in the Environmental Impact Statement/Environmental Impact Report (EIS/EIR) that has been prepared for the SSHCP.

13.1 Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

As discussed in Chapter 3, vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*) spend their entire life cycles within ephemeral wetlands, including vernal pools and swales. However, adjacent upland habitats such as valley grasslands are also considered essential habitat for the two shrimp species because vernal pools and swales require supporting hydrology (e.g., adequate runoff to supply the pools, intact perched aquifer). As discussed in Chapter 6, surveys suggest that vernal pool fairy shrimp and vernal pool tadpole shrimp are relatively well distributed throughout the Plan Area. They are considered to be potentially present in any area that contains vernal pools and swales with adjacent upland habitat adequate to supply runoff to the pools and swales.

Take of vernal pool fairy shrimp and vernal pool tadpole shrimp could be avoided if Covered Activities do not cause direct or indirect effects to the vernal pool ecosystem. A "no take" alternative for vernal pool fairy shrimp and vernal pool tadpole shrimp would therefore need to include avoidance of modeled habitat in the vernal pool ecosystem.

This "no take" alternative for vernal pool fairy shrimp and vernal pool tadpole shrimp was considered but deemed infeasible by the Plan Permittees. Complete avoidance of the vernal pool ecosystem would preclude implementation of city and County of Sacramento (County)

General Plans by disallowing much of the planned development within the Urban Development Area (UDA). The UDA is defined as that portion of the Plan Area that is also within the County's Urban Service Boundary (USB), city spheres of influence, and city boundaries. The UDA is where most Covered Activities will be permitted and where most new growth is planned to occur. The "no take" alternative was rejected as it is inconsistent with the purposes of the SSHCP (Chapter 1) in that it would preclude implementation of Land Use Authority Permittee General Plans.

Another alternative that was considered is to reduce take by requiring that all development projects within vernal pool recovery areas (i.e., Mather Core Recovery Area and Cosumnes/Rancho Seco Core Recovery Area) avoid impacts to vernal pools and swales. While this "reduced take" alternative would allow for some additional development to occur within the UDA over the "no take" alternative, it would still preclude a significant amount of development from occurring within a majority of the area identified within city and County General Plans for urbanization. Similar to the "no take" alternative, this "reduced take" alternative was also rejected as it would be inconsistent with the purpose and need of the SSHCP. It would preclude implementation of Land Use Authority Permittee General Plans.

In addition, both the "no take" and "reduced take" alternatives are biologically inferior to the Preserve System approach proposed under the SSHCP. Both of these alternatives likely would require on-site avoidance and minimization only of occupied vernal pools and swales (as documented by protocol-level presence/absence surveys) and immediately adjacent upland habitat. This piecemeal type of avoidance of spatially discrete resources typically results in small, isolated preserves that become degraded over time due to various adverse indirect edge effects (e.g., non-native species, pollutants). Such habitat fragmentation and isolation also disrupts dispersal of individuals within and among vernal pool complexes via natural dispersal mechanisms (e.g., wind, overland flows, and animals), potentially resulting in reduced genetic exchange and various related effects such as genetic drift, reduced genetic diversity, reduced likelihood of colonizations (i.e., the "rescue" effect), and, thus, higher likelihood of local extirpations. The ecosystem value of these small, fragmented preserves will also be reduced because management will be more difficult and expensive, sometimes even impossible.

Under the SSHCP, preserves established for vernal pool fairy shrimp and vernal pool tadpole shrimp will be large and interconnected by habitat linkages, and thus will maintain the ecosystem processes necessary for conserving these species that would be more difficult under the "no take" and "reduced take" alternatives (see Sections 7.6.2.9 and 7.6.2.11). In addition to providing biologically superior preserves and habitat linkages, the SSHCP requires implementation of fully funded monitoring and management programs in perpetuity. An advantage of the SSHCP is that monitoring and management will be comprehensive and backed by local government entities implementing the Plan, thus providing a greater level of certainty that management and monitoring

will continue in perpetuity and will occur consistently on all SSHCP established preserves and habitat linkages within the Plan Area (see Chapter 8, Monitoring and Management Programs, and Chapter 10, Project Application Process). While the "no take" and "reduced take" alternatives would avoid a greater acreage of vernal pools and swales, both alternatives would lack key components that the SSHCP offers to enhance and manage the vernal pool fairy shrimp and vernal pool tadpole shrimp in perpetuity.

13.2 Valley Elderberry Longhorn Beetle

As discussed in Chapter 3, the valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) occurs in several land cover types in the Plan Area that support its host plant (elderberry), including mine tailing riparian woodland, mixed riparian woodland, and mixed riparian scrub. It has been documented along the Cosumnes River/Deer Creek riparian corridor and along Dry Creek east of the City of Galt. Exit holes have also been documented within the Mine Tailing Riparian Woodland in Rancho Cordova on the Aerojet property (Talley et al. 2007) just outside the Plan Area and along the Cosumnes River near Rancho Murieta (Talley 2003).

Many factors have contributed to the decline of this species, although the effects of many potential environmental stressors are poorly understood (USFWS 1984). Over the past 150 years, approximately 90% of the riparian habitat in California has been lost to development or other human activities (USFWS 1984, 2006).Levees, dams, and other structures or activities that alter the hydrology of riparian areas may directly destroy riparian habitat or indirectly cause loss of riparian forests and elderberry shrubs. Habitat fragmentation also may threaten valley elderberry longhorn beetle because isolation of small patches of riparian forest may prevent genetic flow among occupied patches, thus effectively isolating metapopulations (Collinge et al. 2001). Furthermore, small habitat patches bordered by development may not be adequately protected from adverse edge effects such as urban runoff, pollutants, and invasive species, including Himalayan blackberry (*Rubus discolor*). Also, fogging of riparian areas by mosquito abatement districts or the California Department of Public Health to control mosquitoes may adversely affect the valley elderberry longhorn beetle.

Take of valley elderberry longhorn beetle could be avoided if Covered Activities do not directly impact riparian habitats that support occupied elderberry shrubs (as determined by focused surveys for beetles or exit holes). A "no take" alternative for valley elderberry longhorn beetle would therefore need to include avoidance of all riparian sites supporting occupied elderberry shrubs.

This "no take" alternative for valley elderberry longhorn beetle was considered but deemed infeasible by the Plan Permittees. Although focused surveys for valley elderberry longhorn beetle have not been conducted throughout the Plan Area, the SSHCP assumes that habitat

patches supporting elderberry shrubs that have characteristics predictive of beetle occupancy (i.e., certain shrub densities and shrub sizes, number of stems, and range of branch sizes (Talley et al. 2007)), are widespread in riparian portions of the Plan Area. While most urban development Covered Activities would occur outside of the riparian areas that provide suitable habitat for the valley elderberry longhorn beetle, complete avoidance of occupied habitat patches would preclude implementation of several Covered Activities. Covered Activities that could directly permanently or temporarily impact habitat for the valley elderberry longhorn beetle include major transportation projects and other infrastructure projects (e.g., recycled and wastewater pipelines) that cross riparian zones at stream crossings, operation and maintenance of transportation and flood control facilities and water delivery systems, and construction and operation and maintenance of recreational facilities (e.g., trails). The "no take" alternative could preclude or severely restrict one or more of these Covered Activities. The "no take" alternative was therefore rejected as it is inconsistent with the purposes of the SSHCP and would conflict with mandates for human health and safety (e.g., flood control).

In addition, the "no take" alternative is biologically inferior to the Preserve System approach proposed under the SSHCP. The "no take" alternative would require on-site avoidance and minimization only of riparian habitat patches supporting host plants occupied by the valley elderberry longhorn beetle. This piecemeal type of avoidance of spatially discrete resources typically results in small, isolated preserves that become degraded over time due to various adverse indirect edge effects (e.g., non-native species, dust, pollutants). Such habitat fragmentation and isolation also disrupts dispersal of individuals between disjunct riparian patches, potentially resulting in reduced genetic exchange and various related effects such as genetic drift, reduced genetic diversity, reduced likelihood of colonizations, and, thus, higher likelihood of local extirpations.

Under the SSHCP, there would be no net loss of riparian habitat from Covered Activities, preserves supporting riparian habitat with elderberry shrubs would be established, stream setbacks would be established in select riparian areas, and additional acreage of suitable habitat for the valley elderberry longhorn beetle would be re-established or established per USFWS Conservation Guidelines for the Valley Elderberry Longhorn Beetle (USFWS 1999), thus resulting in a net increase in suitable habitat for the species. The re-establishment and establishment strategy, in concert with no net loss of existing riparian acreage and established preserves, will help protect the ecosystem processes necessary for conserving valley elderberry longhorn beetle in the Plan Area. Assembly of preserves and habitat re-establishment/ establishment beyond the existing compensatory mitigation required by the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) under existing Section 404 and Section 1600 regulations, respectively, likely would not occur under a "no take" alternative. Therefore, a "no take" alternative would make it more difficult to protect ecosystem processes.

In addition to providing biologically superior mitigation for riparian habitat impacts resulting from Covered Activities, the SSHCP requires implementation of fully funded monitoring and management programs in perpetuity. An advantage of the SSHCP is that monitoring and management will be comprehensive and backed by local government entities implementing the Plan, thus providing a greater level of certainty that management and monitoring will continue in perpetuity and will occur consistently on all SSHCP established preserves within the Plan Area (see Chapter 8, Monitoring and Management Programs, and Chapter 10, Project Application Process). While the "no take" alternative could avoid a greater number of currently occupied habitat patches, this alternative would lack key components that the SSHCP offers to enhance and manage the valley elderberry longhorn beetle in perpetuity.

13.3 California Tiger Salamander

California tiger salamander (*Ambystoma californiense*) uses seasonal wetlands such as vernal pools for breeding and nearby upland habitats such as valley grassland, blue oak savanna, and blue oak woodland for refugia and dispersal. Based on existing occurrence data for the SSHCP, California tiger salamanders are limited to the southeastern portion of the Plan Area outside of the UDA. Their distribution generally extends north from the San Joaquin/Sacramento County boundary to just south of the Cosumnes River and from the Amador/Sacramento County boundary east to the City of Galt.

Impacts to California tiger salamander have largely occurred from agricultural conversion of habitat and low-density development associated with rural agricultural residential developments. More recently, this species has also become increasingly threatened by higher-density urban development within its range. Direct impacts include the fill of breeding or refugia habitat that is near or contiguous with breeding locations. Some road expansion and maintenance projects also likely directly and indirectly impact California tiger salamander by creating barriers to movement and causing direct mortality by vehicle strikes.

Take of California tiger salamander could be avoided if Covered Activities do not directly impact breeding sites and adjacent and nearby upland habitat used for refugia and/or dispersal. A "no take" alternative for California tiger salamander would therefore need to include avoidance of all occupied breeding sites and sufficient upland habitat adjacent to and near occupied sites to maintain both the hydrology of the breeding sites and provide for refugia and dispersal. Avoidance of California tiger salamander habitat would include eliminating impacts to all breeding sites located in the southeastern portion of the County and a minimum 1.5-mile buffer around those wetland resources. Because the species' distribution in the Plan Area is entirely outside of the UDA on agriculturally zoned land, avoidance of take could only be achieved by prohibiting agricultural activities on suitable habitat. The SSHCP only covers agricultural activities on SSHCP preserves for the benefit of Covered Species. Therefore, there

is no mechanism available to the SSHCP to implement this alternative. In addition, the County has identified this area for agricultural use within its General Plan and has adopted a Right-To-Farm Ordinance. Prohibition on all agriculture activities in this area would thus require legislative action, making a "no take" alternative infeasible. Therefore, this "no take" alternative was rejected.

Another "no take" alternative considered for California tiger salamander is to eliminate rural transportation projects in California tiger salamander modeled habitat. Rural transportation project Covered Activities in California tiger salamander modeled habitat primarily consist of shoulder widening undertaken to improve roadway safety. Because these Covered Activities involve improvements of existing roadways, it is not possible to realign these projects to avoid California tiger salamander habitat. Although direct impacts to California tiger salamander habitat from road widening likely would be small and not substantially reduce available upland habitat, these roadway improvements may increase the risk of mortality from vehicle strikes that result from expanding roadway widths and increased traffic volumes. This "no take" alternative was rejected because roadway improvements are considered important safety measures and eliminating them as Covered Activities is not consistent with the purposes of the SSHCP, could jeopardize human health and safety, and precludes implementation of locally adopted General Plans.

The two "no take" alternatives are biologically inferior to the approach proposed under the SSHCP. The "no take" alternatives would require on-site avoidance only of occupied breeding sites and adjacent and nearby upland habitats for California tiger salamander. This avoidance would not result in establishment of preserves. The SSHCP establishes a large, landscape-level preserve in the southeastern portion of the Plan Area to provide adequate habitat to support the California tiger salamander's full life cycle, including breeding sites and upland refugia and dispersal habitat (see Section 7.6.2.14).

In addition, the SSHCP requires implementation of fully funded monitoring and management programs in perpetuity. An advantage of the SSHCP is that monitoring and management will be comprehensive and backed by local government entities implementing the Plan, thus providing a greater level of certainty that management and monitoring will continue in perpetuity and will occur consistently on all SSHCP established preserves and habitat linkages within the Plan Area (see Chapter 8, Monitoring and Management Programs, and Chapter 10, Project Application Process). While the "no take" alternative could avoid a greater number of currently occupied habitat patches, this alternative would lack key components that the SSHCP offers to enhance and manage the California tiger salamander in perpetuity.

13.4 Giant Gartersnake

Giant gartersnake (*Thamnophis gigas*) uses several land cover types for foraging, including seasonal wetlands, freshwater marsh, open water, and streams/creeks and uses mixed riparian scrub and valley grassland for aestivation. Giant gartersnake uses upland habitat for breeding, aestivation, dispersal, and refugia in close proximity to aquatic habitat for foraging. Occurrence records for giant gartersnake in the Plan Area are concentrated in the southern and southwestern portions of the Plan Area (Figure 3-18), indicating it is absent from the northwestern, northern, and eastern portions of the Plan Area. The distribution of giant gartersnake in the southern and southwestern portions of the Plan Area is limited by the extent of perennial waters.

Giant gartersnake is threatened by habitat loss and degradation, including urban development, conversion of habitat to agricultural uses, and in-stream capital improvement projects and associated ongoing operations and maintenance. Although some giant gartersnake populations have persisted at low population levels in artificial wetlands associated with agricultural and flood-control activities, many of these altered wetlands are now threatened by urban development. Impacts from these activities could result in a loss of breeding, aestivation, and foraging habitat and/or result in habitat fragmentation, causing populations to become increasingly isolated.

Take of giant gartersnake could be avoided if Covered Activities do not directly impact occupied breeding, foraging, refugia, and dispersal areas in the southwestern and southern portions of the Plan Area. Avoidance of giant gartersnake habitat therefore likely would require eliminating impacts to all streams within the southwestern and southern portions of the Plan Area, plus a minimum 0.25-mile buffer on either side of streams to preserve adjacent upland and seasonal wetland resources. Like California tiger salamander, a vast majority of the giant gartersnake occurrences in the Plan Area are outside of the UDA on agriculturally zoned land. And as with California tiger salamander, avoidance of upland habitat could only be achieved by prohibiting agricultural activities on modeled habitat. Any prohibition on agriculture activities would be extremely difficult to implement and would conflict with General Plan policy, making a "no take" alternative outside of the UDA infeasible.

Within the UDA, a small portion of the giant gartersnake's range includes Laguna Creek and its tributaries. Take of giant gartersnake habitat inside the UDA could be avoided or reduced by eliminating or restricting capital improvement projects within Laguna Creek's floodplain, including flood control projects, water supply, drainage, sewer, roadway improvements, and related operations and management. This "no take" or "reduced take" alternative is infeasible because not undertaking some of these projects would put human health and safety at risk and would preclude implementation of locally adopted General Plans. The "no take" and

"reduced take" alternatives both within and outside of the UDA therefore were rejected because they are infeasible.

The "no take" and "reduced take" alternatives for giant gartersnake are biologically inferior to the Preserve System approach proposed under the SSHCP. Both alternatives would require on-site avoidance only of occupied habitats. This on-site avoidance would not involve establishment of preserves. The SSHCP helps to establish and consolidate large preserves in the southwestern and southern portions of the Plan Area near Badger Creek and will connect to the Stone Lakes National Wildlife Refuge, providing preserve areas large enough to support the gartersnake's full life cycle, including foraging, breeding, refugia, and dispersal habitat (see Section 7.6.2.16).

In addition, the SSHCP requires implementation of fully funded monitoring and management programs in perpetuity. An advantage of the SSHCP is that monitoring and management will be comprehensive and backed by local government entities implementing the Plan, thus providing a greater level of certainty that management and monitoring will continue in perpetuity and will occur consistently on all SSHCP preserves (see Chapter 8, Monitoring and Management Programs, and Chapter 10, Project Application Process). While the "no take" and "reduced take" alternatives could avoid a greater number of currently occupied habitat patches, these alternatives would lack key components that the SSHCP offers to maintain giant gartersnake in the Plan Area in perpetuity.

APPENDIX A

Glossary and Acronyms

APPENDIX A1

Glossary of Terms

APPENDIX A1
Glossary of Terms

A

Adaptive management: A scientific approach to resource management that combines management, monitoring and research to effectively manage complex ecosystems in the face of uncertainty. Adaptive management addresses uncertainty about the system by identifying clear objectives, identifying areas of uncertainty and alternative hypotheses, testing critical assumptions, monitoring to provide feedback about the ecosystem and actions, learning from the ecosystem as actions are taken to manage it, and incorporating what is learned into future actions. Often includes development of conceptual models of the ecosystem or species. As described in the Five-Point Policy, adaptive management is "an integrated method for addressing uncertainty in natural resource management."[1] See Chapter 8 of the SSHCP.

Agencies: See definitions for "Wildlife Agencies" and "Permitting Agencies."

Agricultural-residential development: In the 2010 Sacramento County General Plan (County of Sacramento 2011), low-density, single-family residential is defined as a land use area meant to allow the keeping of animals and the raising of crops for personal or income supplementation purposes.[2]

Applicant: See "Plan Permittees."

Aquatic land cover: Aquatic land covers are a subset of the SSHCP land cover types defined in Chapter 3. There are 11 aquatic land cover types: (1) vernal pool grassland, (2) vernal pool, (3) swale, (4) seasonal wetland, (5) freshwater marsh, (6) streams/creeks (vernal pool invertebrate habitat), (7) streams/creeks, (8) open water, (9) mixed riparian woodland, (10) mixed riparian scrub, and (11) mine tailing riparian woodland.

Aquatic resource: Aquatic resources are defined as waters including wetlands, rivers, streams, lakes, marine, and estuarine systems. Also see definition of Waters of U.S.

Arterial roads: In Sacramento County, these are roads that provide linkages between thoroughfares and collectors. Arterials can also provide for mobility and direct access within commercial and retail corridors through two-way left-turn lanes.[3] As described in Chapter 5,

APPENDIX A1 (Continued)

Covered Activities, arterial roads are typically developed as four-lane roadways with a center two-way left-turn lane or a raised center median with adjacent Class I, Class II, or Class III bikeway facilities.

Authorized incidental take (authorized take): The amount of incidental take of covered species and amount of habitat modification or degradation in the Incidental Take Permits (ITPs) issued to Permittees pursuant to Section 10(a)(1)(B) of the federal Endangered Species Act (ESA), and the amount of take of covered species requested by the SSHCP Permittees for inclusion in the California Department of Fish and Wildlife (CDFW) ITP issued under the California Endangered Species Act (CESA) pursuant to California Fish and Game Code Section 2081. Also see definition of "Incidental Take."

Avoidance and Minimization Measures: Measures to avoid and minimize adverse effects resulting from covered activities described in Chapter 5 of the SSHCP. See Section 5.6. Includes the following AMM types:

- ***Best management practice (BMP):*** Measures to avoid and minimize impacts resulting from covered activities during and after construction. An approach to pollution control that is based on adopting methods that have been determined to be the most effective, practical means of preventing or reducing water pollution from non-point sources.[4]
- ***Low-impact development (LID):*** An approach to land development (or re-development) that employs principles such as preserving and establishing natural landscape features and minimizing effective imperviousness to manage water in a way that reduces the impact of built areas and promotes the natural movement of water within an ecosystem or watershed.

B

Biological Resources Letter Report: Documents the biological resources present within a site that is proposed for development Covered Activities. Each report includes at a minimum 1) a map of SSHCP Land Cover Types based on a field investigation of the site, 2) descriptions of Covered Species habitat present on the site, 3) any observations of Covered Species and other species observed on the site during a general biological resources survey, 4) results of any required species-specific surveys, and 5) any site-specific conditions that should be applied to the proposed project to avoid or minimize take of Covered Species and habitat. Prepared as a part of the Project Application Package.

[4] A Dictionary of Environment and Conservation (2 ed.). Oxford University Press. 2013.

APPENDIX A1 (Continued)

Biological opinion (BO): A document which includes: (1) the opinion of the USFWS or the National Marine Fisheries Service as to whether or not a Federal action is likely to jeopardize the continued existence of listed species, or result in the destruction or adverse modification of designated critical habitat; (2) a summary of the information on which the opinion is based; and (3) a detailed discussion of the effects of the action on listed species or designated critical habitat. [50 CFR §402.02, 50 CFR §402.14(h)].[5]

Bio-swale: Vegetated, mulched, or xeriscaped channels that provide treatment and retention as they move stormwater from one place to another. Vegetated swales slow, infiltrate, and filter stormwater flows. As linear features, vegetated swales are particularly suitable along streets and parking lots.

Buffer: A zone around a sensitive environmental feature (e.g., nest site) where human activity is restricted to minimize direct and indirect effects to the feature. For example, a buffer will be required between a nesting bird and construction activities.

Buffering: In GIS analysis, a polygon enclosing a point, line, or polygon at a specified distance. In the SSHCP, buffering was used to identify zones of avoidance such as stream or preserve setbacks where a waterway or preserve boundary was buffered by a given distance to create the area of avoidance.

C

California Natural Diversity Database (CNDDB): A CDFW program that inventories the locations and status of rare plants and animal occurrences within California.[6]

Changed circumstance: Changes in the circumstances affecting a species or geographic area covered by a conservation plan that can reasonably be anticipated by the plan developers and the Service and can be planned for (e.g., the listing of a new species, or a fire, flood, drought, or other natural catastrophic event in areas prone to such events (50 CFR 17.3). (Also see definitions for "Unforeseen Circumstance" and "No Surprises Policy/Assurances").

Claypan: Dense, compact, slowly permeable layer with a high clay content.

Community plan: In Sacramento County, this is a development plan proposed by a land developer and approved by one of the SSHCP Permittees that sets forth policy and

[5] USFWS. 1998 . Endangered Species Consultation Handbook.

APPENDIX A1 (Continued)

implementation strategies for such items as land use, transportation, urban design, parks, schools, and public services, in a defined development community.[7]

Compensatory mitigation: The restoration (re-establishment or rehabilitation), establishment (creation), enhancement, and/or in certain circumstances preservation of aquatic resources for the purposes of offsetting unavoidable adverse impacts which remain after all appropriate and practicable avoidance and minimization has been achieved (33 CFR 332).

Conservation action(s): Specific SSHCP activities that will be carried out to meet the conservation needs of the covered species and natural communities in order to achieve the SSHCP biological goals and biological objectives.

Conservation Strategy: The SSHCP's overall and unified approach for achieving the SSHCP biological goals and biological objectives. Elements of the Conservation Strategy include preserve assembly guidelines, conditions on Covered Activities, avoidance and minimization measures (AMMs), habitat preservation, habitat re-establishment/establishment, habitat monitoring and management, and species monitoring and management. The SSHCP Conservation Strategy provides for conservation of 29 covered species and their habitats; avoids or minimizes impacts of covered activities; mitigates for the impacts of covered activities on the covered species and their habitats on the basis of species and habitat needs; provides a regional approach to the avoidance, minimization, and mitigation of impacts to the maximum extent practicable; provides protection to wetlands and waters of the Plan Area; and contributes to recovery of some listed Covered Species.

Conserve, Conservation: Under the federal ESA, "conservation," "conserve," and "conserving" means to use, and the use of all methods and procedures that are necessary to bring any listed species to the point at which the protection measures provided by the ESA are no longer necessary (also see definition of "Recovery" below). Such conservation methods and procedures may include, but are not limited to, all activities associated with scientific resources management such as species research, census, law enforcement, habitat acquisition, maintenance, propagation, live trapping, transplantation, and the regulated taking of individuals in extraordinary cases where population pressures within a given ecosystem cannot be otherwise relieved (ESA Section 3.(3)).[8]. The SSHCP, especially Chapters 5, 7, 8, 9, and 10, describes the methods and procedures by which the Permittees will conserve each SSHCP covered species within the boundaries of the Plan Area

APPENDIX A1 (Continued)

Conservation bank: See also definition of "mitigation bank."

Conservation Easement: A legally enforceable land preservation agreement that transfers certain use rights on a property from a landowner to a qualified third-party land protection organization, typically restricting future urban development, as well as several other activities and/or land uses on the property, and "running with" the property in perpetuity.

Construction monitoring: Monitoring by approved biologists of all ground-disturbing Covered Activities to ensure that required SSHCP Avoidance and Minimization Measures are implemented correctly, and to collect information on the effectiveness of the implemented SSHCP Avoidance and Minimization Measure.

Core preserve: A SSHCP habitat preserve that is at least 800 acres in size and contains extensive areas of contiguous habitat, including substantial areas of habitats that are representative of habitats found in the geographic region, and include populations of Covered Species considering the specific ecological needs of SSHCP Covered Species. Most SSHCP Core preserves are located in the UDA. See Section 7.4.1. See also definitions for "landscape preserve," "minor preserve," "linkage preserve," "satellite preserve," and "cropland preserve."

Covered Activity (Activities): The otherwise lawful activities and projects described in Chapter 5 of the SSHCP that are implemented in the Plan Area by the Plan Permittees, or implemented by third parties (e.g., project proponents or private developers) that are subject to the jurisdiction of a Plan Permittee. Species incidental take resulting from Covered Activities is covered under the ESA and CESA Incidental Take Permits (see definition for Incidental Take Permit [ITP]).

Covered Species: The species that will be listed on the CESA and federal ESA ITPs issued by the two Wildlife Agencies (USFWS and CDFW). The Plan addresses 29 species (21 wildlife and 8 plants), of which, 10 are currently listed as threatened or endangered under CESA or the federal ESA (see Table 1-2 for a complete list of species covered under this Plan).[9]

Critical Habitat : For federally-listed species Critical Habitat consists of: (1) the specific areas within the geographical area occupied by the species, at the time it is listed in accordance with the provisions of section 4 of the Act, on which are found those physical or biological features (constituent elements) (a) essential to the conservation of the species and (b) which may require special management considerations or protection; and (2) specific areas outside the geographical area occupied by the species at the time it is listed in accordance with the provisions of section 4 of the Act, upon a determination by the Secretary that such areas are

[9] Chapter 1.

APPENDIX A1 (Continued)

essential for the conservation of the species.[10] [ESA §3 (5)(A)] Designated critical habitats are described in 50 CFR §17.

Constituent Elements: Also referred to as primary constituent elements. The physical and biological features of designated or proposed critical habitat essential to the conservation of the species, including, but not limited to: (1) space for individual and population growth, and for normal behavior; (2) food, water, air, light, minerals, or other nutritional or physiological requirements; (3) cover or shelter; (4) sites for breeding, reproduction, rearing of offspring, germination, or seed dispersal; and (5) habitats that are protected from disturbance or are representative of the historic geographic and ecological distributions of a species. [ESA §3(5)(A)(i), 50 CFR §424.12(b)][11]

Core Recovery Area: Core recovery areas are the specific sites identified by the USFWS as necessary to recover endangered or threatened species[12]. As discussed in Chapter 3, there are two Core Recovery Areas in the SSHCP Plan Area.

Cropland preserve: SSHCP Preserves consisting of existing croplands or irrigated pasture-grasslands that have been identified as uniquely important foraging, roosting, and nesting habitat in the Plan Area for some Covered Species, including Swainson's hawk, white-tailed kite, northern harrier, tricolored blackbird, and greater sandhill crane. See Chapter 7 of the SSHCP.

D

Depressional wetland: Depressional wetlands are confined to topographic basins or hollows that are either too small or too shallow to form lakes or reservoirs. This is a very large category of wetlands that includes vernal pools and natural as well as artificial ponds. There is no minimum or maximum size for depressional wetlands. They often depend on multiple water sources, including local runoff, groundwater, and direct precipitation. Their waters can be saline, alkaline, or fresh.[13] See definition of vernal pool crustacean habitat.

Detention: Water management practice or system that delays the downstream progress of stormwater by the use of temporary storage or metered outlets.[14]

14 Corps. 2014. "Glossary." Accessed September 18, 2014. http://chl.erdc.usace.army.mil/glossary.

APPENDIX A1 (Continued)

Detention basin: An excavated area along waterways that collects stormwater runoff and gradually releases it in a controlled manner to prevent downstream areas from flooding or being eroded.

Development: See "Urban Development."

Discharge: The volume of stormwater that passes a given location within a given period of time, usually expressed in cubic feet per second.[15]

Distribution: The geographic area within which a species or other taxon of organisms occurs; the spatial pattern or arrangement of the members of a species, population, or other group of organisms.[16] See also "species range."

Duripan: Soil that is cemented by alluvial silica in a subsurface hardpan (see the definition of "hardpan."

E

Ecosystem/Ecological System: The natural interacting biotic and abiotic system in a given area, which includes all of the organisms (plants, animals, fungi, and micro-organisms) that live in particular habitat, along with their immediate physical environment. Examples include a lake, forest, or drainage basin. The term was first used by British ecologist Arthur Tansley in 1935, who visualized ecosystems as being composed of two parts, the biome and the habitat. In Tansley's view 'all parts of such an ecosystem—organic and inorganic, biome and habitat—may be regarded as interacting factors which, in a mature ecosystem, are in approximate equilibrium; it is through their interactions that the whole system is maintained'. Many ecologists regard ecosystems as the basic units of ecology because they are complex, interdependent, and highly organized, and because they are the basic building blocks of the biosphere.[17]

Edge effect: These are foreseeable permanent indirect effects to natural communities and species habitat resulting from development and increased human populations along the boundaries of open space areas, which result in chronic habitat degradation and decline or loss of species.

APPENDIX A1 (Continued)

Effect(s): Covered Activities cause environmental stressors (see definition below) that result in direct, indirect or cumulative effects on covered species and species habitats. Effects are primarily discussed in Chapter 6 of the SSHCP.

- ***Direct effects*** result from removal, modification, or degradation of a land cover type that provides habitat for a SSHCP covered species; removes a species population, or a species occurrence (or portions of thereof); or directly harms, harasses, kills or injures an individual of any covered species. Direct effects occur at the time and place of the covered activity implementation (e.g., ground disturbance, vegetation removal, inundation). Direct effects can be either permanent or temporary (see definitions of permanent and temporary impacts immediately below).
- ***Indirect effects*** result from modification or degradation of species habitat over time, eventually partially or fully removing the value of the habitat for breeding, feeding, or sheltering. Indirect effects are defined by USFWS as "those that are caused by the proposed action and are later in time, but are still reasonably certain to occur" (50 CFR 402.02).
- ***Permanent effects*** are direct or indirect effects that result from permanent removal, modification, or degradation of covered-species habitat, or that affect habitat for more than one year during covered activity implementation and/or more than one year after completion of the covered activity (e.g., creating a new road through grassland). Permanent effects also include indirect impacts to land covers that result in a permanent (i.e., more than one year after completion of the covered activity) change to species habitat or habitat functions (e.g., development around a wetland that reduces the water supply to a wetland that subsequently results in a reduction in the size, hydrologic regime, or water quality of the wetland). Effects that result in reduction of long-term viability of a plant or animal occurrence are also considered permanent.
- ***Temporary effects*** are direct effects that alter land cover for less than one year and the disturbed area recovers or is restored to pre-project conditions within one year (e.g., prescribed burning, construction staging areas) of completing ground disturbance. For the purposes of this Plan, all effects associated with covered activities that have a duration exceeding one year or that take more than one year to restore immediately following construction will be considered permanent. For purposes of the SSHCP, all temporary effects associated with covered activities are assumed to occur within the permanent effect footprint and therefore separate acreages have not been calculated for temporary effects. It is also assumed that AMMs will avoid to the maximum extent feasible temporary effects to covered species.

APPENDIX A1 (Continued)

- ***Cumulative effects*:** Under the federal ESA, the effects of future state or private activities (non-federal activities) that are reasonably certain to occur within the action area of an action subject to consultation.

Emergent vegetation: Aquatic plants that grow with their roots under water but their leaves and stems above the surface of the water.[18]

Endemic species: A species whose distribution is restricted to a certain area or environmental feature (e.g., soil types, natural community). A native species found only within a given area.19

Enhance, Enhancement: The manipulation of the physical, chemical, or biological characteristics of a land cover or ecosystem to heighten, intensify, or improve a specific resource function, such as species habitat quality. "Enhancement" does not result in a gain in resource area.

- ***Habitat enhancement:*** The manipulation of an existing habitat for Covered Species that improves its value to one or more Covered Species for breeding, feeding, or sheltering.

Ephemeral stream (as a jurisdictional aquatic resource): A stream that has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow.[20] (See also "intermittent stream" and "perennial stream.")

Environmental Stressor: The component(s) or action(s) of a Covered Activity that results in adverse effects to Covered Species.

Establishment (creation):[21] The manipulation of the physical, chemical, or biological characteristics present to develop a resource that did not previously exist. Establishment results in a gain in resource area and functions.

Eutrophication: A common form of water pollution which involves the enrichment of a body of freshwater with nutrients such as nitrate fertilizers (washed from the soil by rain) and phosphates (from fertilizers and detergents in municipal sewage). The pollution enriches the waterbody, and this encourages the rapid growth of aquatic plants and can cause excessive growth of algae

[18] A Dictionary of Environment and Conservation (2 ed.). Oxford University Press. 2013.
[19] A Dictionary of Environment and Conservation. Oxford University Press. 2013.
[20] This definition is consistent with that found in the 2012 NWPs (Federal Register, Vol. 77(34), February 21, 2012).
[21] Note that in the context of this Plan and per 40 CFR 230, the word "establish" is synonymous with "create." See 73 FR 19594, "Compensatory Mitigation for Losses of Aquatic Resources."

(bloom) and vascular plants. This in turn reduces the availability of light and the aerobic decomposition of dead algae reduces dissolved oxygen, making the water uninhabitable for some species. Some of the algae and bacteria produce relatively large amounts of toxins, which further disrupt the aquatic ecosystem. Since the early 20th century such blooms have been a regular occurrence in the most heavily polluted parts of the Great Lakes in North America, but they have declined as water quality has improved as a result of improved pollution control and water quality management strategies. Lakes can be classified according to their nutrient content as oligotrophic (nutrient poor), mesotrophic (moderately productive), or eutrophic (very productive and fertile).[22]

Extirpated: Locally extinct, for example, a species that no longer survives in regions that were once part of its range, but that still exists elsewhere in the wild or in captivity.[23]

F

Fallow lands: Cropland and agricultural fields that are abandoned or deliberately rested for one full growing season.

Fee-title: Private ownership of real estate in which the owner has the right to control, use, and transfer the property at will. In the SSHCP, preserves could be established through acquisition of land in fee-title (also see "conservation easement").

Five-Point Policy: An addendum to the HCP Handbook, published by the USFWS and NMFS (2000), that provides additional requirements for preparing HCPs, including (1) biological goals and objectives, (2) adaptive management, (3) monitoring, (4) shorter permit duration, and (5) increased public participation.[24]

Flexible preserve: In the SSHCP, 500 acres of "flexible" preserve will be included in the SSHCP Preserve System inside the UDA to mitigate for anticipated take of vernal pool land covers. Flexible preserves must be located inside or within 1 mile of the Mather Core Recovery Area (MCRA) and contain vernal pool resources, and must be established in PPUs 1, 2, or 3. Flexible preserve could be of any combination of minor or satellite-sized SSHCP preserve (see Chapter 7). Also see "core preserve, minor preserve, satellite preserve, linkage preserve, landscape preserve, cropland preserve."

APPENDIX A1 (Continued)

Flood: A flow beyond the carrying capacity of a waterway channel (e.g., drainage, creek, stream, river).[25]

Floodplain: Normally dry land adjacent to a body of water such as a river or stream that is susceptible to inundation by floodwaters.[26]

Fossorial: Adapted for digging or burrowing into the ground.[27]

Fully protected species: Any species identified in California Fish and Game Code Sections 3511, 4700, 4800, 5050, or 5515. (See discussion of fully protected SSHCP covered species in Section 1.2.4).

G

General plan: A comprehensive policy document required for local land use authorities, usually a county or a city, for the purpose of providing guidance as to the location and type of land use that will be permitted to occur at any given location.[28]

Geographic information system (GIS): Computer-based mapping technology that manipulates geographic data in digital layers and enables one to conduct a wide array of environmental analyses.

Geomorphic provinces (regions): Areas in which distinct land forms and processes shaping such forms are present.[29]

Governing Authority (GA): In the SSHCP, Implementing Entity is a body of elected officials representing each of the Plan Permittees that is responsible for proper implementation of the HCP, ensuring compliance with the Implementing Agreement, monitoring the actions of the Plan Participants, managing fees collected by the Plan Participants, and informing the Plan Participants of changes in status of the HCP. See definition of Implementing Entity.

Governing Board: The Implementing Entity is overseen by a Governing Board that is ultimately responsible for ensuring implementation of the SSHCP. The Governing Board will make all decisions related to the governance and administration of the SSHCP, except where otherwise delegated to other commissions, committees or entities as the Governing Board sees fit.

APPENDIX A1 (Continued)

The JPA Governing Board is limited to the three Land Use Authority Permittees because the Joint Exercise of Powers Act requires that a JPA can only exercise powers held by all the participating agencies.

Greenfield: Undeveloped land, usually either open space or agricultural land cover.

H

Habitat: The place or environment where a plant or animal naturally lives and grows (a group of particular environmental conditions).[30] Habitat may be occupied (i.e., individuals or a population of the species are or have recently been present) or unoccupied. See "Critical Habitat" definition.

Habitat connectivity: The degree to which a landscape facilitates or impedes movement of organisms, eggs, cysts, seeds, or pollen among different resource patches.

Habitat degradation: A notable reduction in the amount and/or quality of habitat.

Habitat fragmentation: Habitat fragmentation is the process by which habitat loss results in the division of large, continuous habitats into smaller, more isolated remnants (see "habitat patches" below). Habitat fragmentation is a landscape-level phenomenon, and patch-level processes (patch area, edge effects and patch shape complexity) can only be understood within a landscape context. A dominant effect of increasing habitat loss is a reduction in patch area, with resulting declines in population density and species richness, and significant alterations to community composition, species interactions and ecosystem functioning.[31]

Habitat patches (islands): Habitat areas that are physically or spatially isolated from other areas of similar habitat type.

Habitat preservation: A process that involves bringing land with Covered Species habitat under protective status through fee title (see "fee title") or conservation easement (see "conservation easement").

Hardline preservation process: This process is termed "hardline" because the exact locations and preserve boundaries are known at this time. Inside the Urban Development Area (UDA), some preserves have already been proposed by willing landowners, but the preserves have not

[30] USFWS. 2008. Endangered Species: Glossary. Endangered Species Glossary. Last updated July 16, 2014. Accessed September 17, 2014. http://www.fws.gov/midwest/endangered/glossary/index.html.

APPENDIX A1 (Continued)

been formally put under conservation easement by the SSHCP. These nine "hardline" preserve locations are in PPUs 1 and 2, and total approximately 1,740 acres (see Figures 7-2 to 7-5).

Hardpan: A hardened, impervious layer of soil, such as clay.

I

Implementation Commission: An Implementation Commission will be formed by the Governing Board. This commission will assume some of the duties of the Governing Board including, but not limited to, land or easement acquisition approval and approval of management and monitoring plans for the preserve system.

Implementing Agreement: An agreement that legally binds the permittee to the requirements and responsibilities of a conservation plan and section 10 permit. It may assign the responsibility for planning, approving, and implementing the mitigation measures under the HCP.[32]

Implementing Entity: The body that is responsible for implementation of a permitted HCP. The SSHCP Implementing Entity is composed of a Governing Board, Implementation Commission, various committees and staff who oversee management and administration of the Plan. See definition of "Implementing Agreement."

Implementing ordinance: The primary legal document that the SSHCP Permittees will develop, approve, and execute to formalize consistent and transparent implementation of the SSHCP, Implementing Agreement, and Permits.

Incidental take: Take that results from, but is not the purpose of, carrying out an otherwise lawful activity.[33] See definition of "take" below.

Incidental Take Permit(s) (ITP): A permit that exempts a permittee from the prohibition of take under 9 of the ESA and is issued by the USFWS pursuant to Section 10(a)(1)(B) (also called a Section 10 permit). CDFW may also authorize the incidental take of state-listed species under CESA through issuance of an Incidental Take Permit pursuant to Fish and Game Code Section 2081, subdivisions (b) and (c).

Infiltration: The flow of water downward from the land surface into and through the upper soil layers.[34]

33 USFWS. 2008. Endangered Species: Glossary. Endangered Species Glossary. Last updated July 16, 2014. Accessed September 17, 2014. http://www.fws.gov/midwest/endangered/glossary/index.html.

34 Corps. 2014. "Glossary." Accessed September 18, 2014. http://chl.erdc.usace.army.mil/glossary.

APPENDIX A1 (Continued)

Infiltration basin: A shallow earthen basin constructed in naturally pervious soils, designed for infiltrating stormwater by retaining runoff from development and allowing it to percolate into the underlying soils and into groundwater over a specified drawdown period.

Infiltration trench: A long, narrow trench constructed in naturally pervious soils and filled with gravel, designed for storing runoff until it infiltrates into the soil over a specified drawdown period.

Intermittent stream: A stream that has flowing water during certain times of the year, when groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. Runoff from rainfall is a supplemental source of water for stream flow (see also "ephemeral stream" and "perennial stream").

Invasive species: Animals, plants or other organisms introduced by man into places out of their natural range of distribution, where they become established and disperse, generating a negative impact on the local ecosystem and species.[35][36]

J

Jeopardize the continued existence of: Under the federal ESA, an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species.[37]

Jump-Start and Stay-Ahead: Provisions included in the SSHCP implementation schedule to ensure mitigation occurs prior to implementation of covered activities. See Chapter 9.

L

Laguna Creek Wildlife Corridor: An SSHCP-planned preserve along Laguna Creek in the northern portion of the Plan Area that is at least 300 feet wide except where existing constraints limit this width. This corridor is designed to maintain species movement, provide resident habitat for wildlife, preserving riparian habitat, and maintaining hydrologic connections between planned preserves inside the UDA. See definition for "SSHCP Preserves," "Wildlife Corridor," and "Stream Corridor."

APPENDIX A1 (Continued)

Land cover type(s): The dominant feature of the land surface discernible from aerial photographs and defined by vegetation, water, or human uses. The SSHCP Land Cover types are described in Chapter 3.

Land dedication: Land that is donated by the owner to a qualified land protection organization, generally for open space or conservation use.

Land use: A general characterization of type(s) of uses allowable within a geographic area as determined by a local jurisdiction (e.g., City or County) general plan or zoning ordinance such as housing, business, industry, open space, agriculture, natural resources, recreation, education, public buildings and grounds, and other categories of public and private uses of land. Land use in the Plan Area is described in Chapter 4.

Land Use Authority Permittee(s): These entities have regulatory authority over zoning and entitlements within the Plan Area. Land Use Authority Permittees can extend incidental take coverage provided by the SSHCP ITPs to covered activities implemented by third-party project proponents that are under the jurisdiction of that Land Use Authority Permittee. Land Use Authority Permittees under the SSHCP are the County of Sacramento and the Cities of Galt and Rancho Cordova.

Landscape ecology: Principles and theories for understanding the structure, functioning, and change of landscapes and ecosystems over time.[38]

Landscape preserve: A SSHCP preserve that is at least 10,000 acres in size and containing extensive areas of contiguous natural land covers where natural ecological functions can continue to operate, typically without extensive land management activities. One Landscape preserve will be located outside the UDA. See Section 7.4.1.

LiDAR: Stands for **"**light detection and ranging." A remote sensing method used to measure ranges to the earth. Used in geographic information system (GIS) processes to create maps and models.[39] In the SSHCP LiDAR was used to developed detailed topographic maps of portions of the Plan Area containing vernal pools; analysis of that topography allowed for identification of microwatersheds.

Linkage Preserve: SSHCP preserves that are generally more linear-shaped landscape features that connect large habitat blocks (e.g., core and minor preserves) and are designed to provide for hydrological connectivity or dispersal and movement of species between preserve areas. See Section 7.4.1.

---

APPENDIX A1 (Continued)

Listed species: A species (including a subspecies or a distinct population segment of a vertebrate species) that is listed as endangered or threatened under the federal ESA or CESA.

Loss of waters: Waters of the U.S. that are permanently adversely affected by filling, flooding, excavation, or drainage because of the regulated activity. Permanent adverse effects include permanent discharges of dredged or fill material that change an aquatic area to dry land, increase the bottom elevation of a waterbody, or change the use of a waterbody. Refer to "Waters of the U.S."

Low-Impact Compatible Land Use: Passive or active open space land uses that have limited indirect effects on wetlands and vernal pool species habitats within adjacent existing and planned preserves. Examples of these compatible adjacent land uses are parks, athletic fields, detention basins, and schools with athletic fields adjacent to preserves. The design and construction of these land uses does not impact the soil hardpan and perched aquifer of the open space area or the adjacent preserve, and does not allow increased runoff into the adjacent preserves. See "open space" below.

M

Mesic: A moderately moist habitat.[40]

Metapopulation: A set of partially isolated populations that belong to the same species, between which individuals can freely migrate.[41]

Microhabitat: The immediate environment in which an organism lives, where factors such as moisture and light may be different from those in the surrounding area.[42]

Minor preserve: SSHCP preserves that are between 250 and 800 acres in size that support populations that are important to the viability of a covered species, have unusually high biological diversity, and/or have a high concentration of sensitive biological resources. Most minor preserves are located in the UDA. See Section 7.4.1.

Mitigation: Any actions that are taken to avoid or minimize negative environmental impacts. This can take various forms, including avoiding the impact by not taking a certain action; minimizing impacts by limiting the scale of the action; rectifying the impact by repairing or

[40] A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.
[41] A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.
[42] A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.

APPENDIX A1 (Continued)

restoring the affected environment; reducing the impact by taking protective steps; and compensating for the impact by replacing or providing substitute resources.[43]

Mitigation bank: A site, or suite of sites, where aquatic resources (e.g., wetlands, streams, riparian areas) are restored, established, enhanced, and/or preserved for the purpose of providing compensatory mitigation for impacts authorized by USACE permits. In general, a mitigation bank sells compensatory mitigation credits to a USACE permittee whose obligation to provide compensatory mitigation is then transferred to the mitigation bank sponsor. The operation and use of a mitigation bank are governed by a banking enabling instrument[44]. Also see definition of conservation bank above.

Mitigation fee: The proposed fee for any Covered Activities that affect Covered Species or species habitat. These fees will fund the cost of implementing of the SSHCP including (1) land acquisition, (2) habitat establishment, re-establishment and enhancement, (3) monitoring and long-term management, and (4) plan administration components of the SSHCP.[45]

N

Native species: A species that is within its historical natural range, and occurs naturally in a given area or habitat, as opposed to an introduced species or invasive species.[46]

Natural Communities Conservation Plan (NCCP): A CDFW program designed to use an ecosystem approach to conserve natural communities at the ecosystem scale while accommodating compatible land use.

Naturalized habitats or vegetation: Result when non-native species establish new self-perpetuating populations within native habitats or vegetation communities, and undergo widespread dispersal and become permanently incorporated within the resident native habitat or vegetation community.

Navigable waters of the United States: Navigable waters of the United States are those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. A determination

[43] A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.
[44] 33 CFR Part 332.
[45] CEQA Guidelines, Section 15126.4(a)(1).
[46] A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.

of navigability, once made, applies laterally over the entire surface of the waterbody, and is not extinguished by later actions or events that impede or destroy navigable capacity. [47]

Non-listed species: Means a species or subspecies that is not listed as endangered or threatened under the federal ESA or CESA.

No surprises policy/assurances: Assurances to Permit holders that if unforeseen circumstances arise, the USFWS will not require more land, water, or money or additional restrictions on the use of land, water, or other natural resources beyond the level stated in the Habitat Plan without the consent of the Permittee (63 FR 35, February 23, 1998). Applies as long as Permittee is implementing terms and conditions of the Habitat Plan properly. [48]

O

Occurrence: Plant taxa, animal taxa, and natural communities in the CDFW California Natural Diversity Database (CNDDB) are referred to as "elements." An "element occurrence" or "occurrence" is a location record for a site which contains an individual, population, nest site, den, or stand of a special status element. Populations, individuals, or colonies located within 1/4 mile of each other generally constitute a single occurrence, sometimes with multiple "parts. An occurrence from a source other than the CNDDB is generally defined as a spatially discrete point location or database record for any particular resource (e.g., special-status plant or animal).

Open space land (rural and urban): The County of Sacramento General Plan (2011) defines rural and urban open space as follows:

- ***Rural open space:*** Open space areas are largely un-fragmented areas of undeveloped land that are set aside primarily to preserve and/or enhance the County's wildlife habitat, agricultural productivity and recreational opportunities**.**
- ***Urban open space:*** Urban open space areas are typically undeveloped land within urbanized areas that are set aside to provide public recreational opportunities as well as the chance to experience natural areas and wildlife habitat. They may also be developed areas that are available to the public to provide a feeling of openness.

Ordinary High Water Mark (OHWM): A line on the shore or stream channel established by the fluctuations of water and indicated by physical characteristics or by other appropriate means that consider the characteristics of the surrounding area (see 33 CFR 328.3(e)).

[47] 33 C.F.R. § 329.4.
[48] Santa Clara Valley Habitat Plan. August 2012.

APPENDIX A1 (Continued)

P

Participating Special Entity: In the SSHCP defined as a public agency such as a water, school, irrigation, transportation, or other special district that is not subject to the jurisdiction of Plan Permittees but that requests and receives coverage under the SSHCP during implementation according to the terms of the SSHCP.[49]

Perched aquifer: Groundwater that is separated from the underlying main body of groundwater (aquifer) by a layer of impermeable clay, silica/iron complex or bedrock (aquiclude).[50] Perched water tables supporting vernal pools can exist for several months during the winter/spring months (drying out by late summer).

Perennial stream: A stream that normally contains flowing water at all times.[51] (see also "intermittent stream" and "ephemeral stream").

Performance standards: Under Section 404 of the CWA defined as observable or measurable physical (including hydrologic), chemical and/or biological attributes that are used to determine if a compensatory mitigation project meets its objectives.

Permit amendment: A change to the incidental take permit(s) issued by the USFWS or CDFW that necessitate a renegotiating and reissuing of the permit(s). Modifications and amendments are defined as follows.

- ***Administrative revisions:*** non-substantive changes or corrections to the Plan that do not require approval from the Permitting Agencies.
- ***Minor Modifications:*** changes that do not adversely affect the impact assessments or conservation strategy described in the Habitat Plan and do not adversely affect the ability of the Implementing Entity to achieve the conservation strategy commitments of the SSHCP.
- ***Amendments:*** revisions to the SSHCP, Aquatic Resources Program, or the Implementing Agreement that may affect an impact analysis, so would require a corresponding amendment to one or all of the SSHCP Permits.

Permitting Agencies: Agencies that are issuing permits for the SSHCP or developing programmatic agreements for the SSHCP. In the SSHCP the permitting agencies are: California Department of Fish & Wildlife (CDFW), U.S. Fish and Wildlife Service (USFWS), U.S. Army

APPENDIX A1 (Continued)

Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and U.S. Environmental Protection Agency (EPA).

Plan Area: The area encompassed by the SSHCP permits within which the Plan Permittees have authorization from the Wildlife Agencies for the take of Covered Species and species habitat resulting from Covered Activities. See Chapter 1.

Plan Permittees: The SSHCP was prepared by six local jurisdictions, including the County of Sacramento, City of Galt, City of Rancho Cordova, Sacramento County Water Agency, Sacramento Regional County Sanitation District, and the Southeast Connector Joint Powers Authority. These six permit applicants and a (to be formed) SSHCP Implementing Entity are collectively referred to as the Plan Permittees.

Population: A group of individuals of the same species who are living in the same area at the same time and share a common gene pool, which makes it possible for them to interbreed.[52] Also see definition of "Occurrence."

Population size: The number of individuals in a given population.

Pre-Acquisition Preserve Documentation Report (PDR): A report that assesses the baseline inventory of SSHCP land cover types, species occurrences, and general ecological health and function of a property prior to the inclusion of the property in the SSHCP Preserve System and the acceptance of a land dedication, a fee title purchase, or an easement purchase.

Pre-construction survey: A survey that is conducted to identify Covered Species and/or their habitats on a given property or land area prior to the initiation of a ground-disturbing covered activity, to ensure that species and habitat avoidance and minimization measures can be effectively implemented during that activity. Specifics for pre-construction surveys are dictated by relevant species protocols.

Pre-design survey: Surveys that are required during preparation of the Project Application Package These surveys assess the location and quantity of modeled habitat and the potential for select Covered Species to be present at the project site. The surveys require land cover type mapping and wetland delineations. Based on land cover type mapping, the Land Use Authority Permittee or Implementing Entity will assess the potential for each covered species to be present on the project site and to be affected by the proposed action. The potential for presence is based on the presence of modeled habitat for a species. Depending on the land

[52] A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.

APPENDIX A1 (Continued)

covers present, specific Covered Species surveys may be required as directed by Species AMMs (Section 5.2). See Chapter 10.

Preservation/Preserve (verb): For purposes of the SSHCP Conservation Strategy, preventing changes in land use from a natural state by, for example, purchasing land in fee title or establishing a conservation easement. For purposes of the ARP, the removal of a threat to, or preventing the decline of, aquatic resources by an action in or near those aquatic resources. This term includes activities commonly associated with the protection and maintenance of aquatic resources through the implementation of appropriate legal and physical mechanisms. Preservation does not result in a gain of aquatic resource area and functions.

Preserve (noun): A SSHCP Preserve is a discrete area of habitat acquired and managed for the benefit of Covered Species.

Preserve Assembly Guideline: The SSHCP preserve assembly guidelines (see Section 7.3.1) will be applied by the Implementing Entity in a manner that will assemble the SSHCP Preserve System described in Section 7.5, and will assure that all SSHCP Biological Goals and Measurable Objectives specifying preserve acquisition objectives are achieved. Because the exact locations and boundaries of the softline criteria-based preserves are unknown, the SSHCP Conservation Strategy presents and analyzes a conceptual Preserve System based on reasonable assumptions regarding potential acquisition areas.

Preserve Management Plan (PMP): A document prepared for individual SSHCP preserves that tiers from the Preserve System Management Plan (see below) . Each PMP will set forth the management actions to be employed on the property to benefit Covered Species and habitats to provide for meeting the SSHCP biological goals and objectives, identify habitat and species monitoring requirements on that preserve, and include criteria for implementing adaptive monitoring and management of the preserve.

Preserve Planning Unit (PPU): PPUs are geographic subdivisions of the Plan Area delineated to capture specific habitat or agricultural land cover types or areas identified as being important for a specific Covered Species. There are eight PPUs. See Chapter 1.

Preserve Setback: A setback of at least 50-feet established outward from the boundary of any existing and planned preserve within the UDA to reduce impacts that may result from adjacent urban development Covered Activities. The minimum 50-foot setback will remain in its natural state and function as a transition area between intensive development and preserves. See Section 5.2.7, Covered Activities in Preserve Setbacks,

Preserve System: The SSHCP Preserve System is composed of individual SSHCP Preserves (see "Preserve" above). The SSHCP Preserve System will connect with existing preserves to

best conserve the natural/naturalized land covers, cropland, and irrigated pasture-grassland in the Plan Area.

Project: See Covered Activities above.

Project proponent: Means a person or entity (third-party) that has requested use of the SSHCP permits held by the one of the Land Use Authority Permittee or Implementing Entity for a proposed project or activity that is a SSHCP Covered Activity and that is subject to the land use or other regulatory authority of that Land Use Authority Permittee or Implementing Entity.

R

Range: The limits of the geographical distribution of a species; the entire geographical area over which a species occurs.

- ***Historic Range:*** The natural range or geographical areas that a particular species was known or believed to occupy in the past.[53]
- ***Known Range:*** The geographical area over which a species has lived naturally in recent times or is known to occur.[54]

Recharge: The flow to groundwater from the infiltration of surface water.

Recovery: Improvement in the status of a listed species to the point at which listing is no longer appropriate under the federal ESA listing criteria.[55] Also see definition of "Listed Species."

Recovery plan: A document authored by USFWS or NOAA Fisheries that serves as a guide for activities to be undertaken by federal, state, or private entities in helping to recover and conserve endangered or threatened species.[56]

Re-establishment: For the SSHCP Conservation Strategy, re-establishment means the act of replacing, restoring, or renovating habitat to close to its historical condition, such as the physical and vegetation structure and ecosystem functions of a damaged habitat. For the ARP, a form of restoration in which there is manipulation of the physical, chemical, or biological characteristics of a site with the goal of returning natural/historical functions to a former aquatic resource or land cover type. Re-establishment results in rebuilding a former aquatic resource/land cover type,

53 A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.

56 USFWS. 2008. Endangered Species: Glossary. Endangered Species Glossary. Last updated July 16, 2014. Accessed September 17, 2014. http://www.fws.gov/midwest/endangered/glossary/index.html.

and results in a gain in aquatic resource area/land cover type and functions. Also see SSHCP definition of establishment (creation).

Restrictive Layer (e.g., duripan, hardpan, claypan): A layer of impermeable clay, silica/iron complex or bedrock within the soil horizon that precludes infiltration to the groundwater aquifer. Also see "Perched Aquifer."

Right-of-way: A legal right of passage over private property, usually for roadways, railroads, or public utilities.

Rural collector roadways: Two-lane roads in rural areas of Sacramento County.[57] Also see definition for "Arterial Roadways."

S

Satellite preserve: SSHCP Preserves that are smaller than core and minor preserves (i.e., less than 250 acres), but that support populations that are important to the viability of a covered species in the Plan Area, or have a particularly high concentration of sensitive biological resources. Satellite preserves are inside the UDA. See Section 7.4.1.

Softline criteria-based preserve design: A strategy used to create future habitat preserves based on a set of guidelines and parameters for preserve system design, including a system of zones and sub-zones, to guide the process of land acquisition for the Preserve System over time. Also see definition for "hardline preserve design."

Species modeled habitat: Covered species suitable habitat was "modeled" based on the best available information on the life history and biology of each covered species, the species habitats needed for breeding and for feeding or sheltering at each life history stage, known occurrences within the Plan Area, associations between covered species and the SSHCP land cover types in the Plan Area, and when available information on range, soil type associations and elevation limits. Each species model was reviewed by local species-experts. This information was compiled using GIS to generate a map-based model of species suitable habitat within the Plan Area for each SSHCP covered species. See Chapter 3 of the SSHCP.

Species range: See "range."

Sacramento, California: Sacramento County Community Planning and Development Department. Accessed September 12, 2014. http://www.per.saccounty.net/PlansandProjectsIn-Progress/Pages/GeneralPlan.aspx.

APPENDIX A1 (Continued)

Specific plan: A plan developed by a Land Use Authority that sets forth policy and implementation strategies for such items as land use, transportation, urban design, parks, schools, and public services, in a defined geographic area, for the purpose of implementing a General Plan on an area-specific basis.[58]

Sphere of influence (SOI): A plan for the probable ultimate physical boundaries and service area of a city as determined by the local agency formation commission of each county.[59]

State-listed species: Species that are listed as threatened or endangered species, or a candidate for such status, under CESA.

Stay-Ahead and Jump-Start: Provisions included in the SSHCP implementation schedule (see Chapter 10) to ensure mitigation occurs prior to implementation of covered activities.

Stream Setback: Designated areas adjacent to streams within which only specified activities could occur in order to prevent or reduce impacts. See Section 5.2.6 Covered Activities in Stream Setbacks, See also "Preserve Setback" and "buffer."

Submergent vegetation: Vegetation that is inundated by water.

Substrate: The surface on which a plant or animal lives and grows; for example a rocky or sandy substrate.[60]

Suitable habitat: Specific SSHCP land cover types where the environmental and geographic conditions (i.e., biotic and abiotic conditions) are present for a given species to persist and survive. Essential habitat elements are present. Suitable habitat can be represented by specific areas on a geographic map when the distribution of environmental factors are known and/ or defined through criteria based upon the environmental conditions the species requires. Suitable habitat may be occupied (i.e., individuals or a population of the species are or have recently been present) or unoccupied. See "species modeled habitat."

Swale: Drainages typically found in flat to gently rolling valley grassland in association with vernal pool complexes on shallow soils with an impermeable clay or hardpan layer. They convey runoff through broad gently sloping ephemeral drainages during, and for short periods after, rainstorms. Soils may remain saturated during the early part of the growing season, but dry up by summer. Swales support several of the native plants commonly found in vernal pools. Swales

associated with vernal pools may provide conduits for movement of covered plant and animal propagules (seeds, cysts, eggs, and spores) and adult California tiger salamanders and western spadefoots among vernal pools.

T

Take: Under the CESA and the California Fish and Game Code (Section 86), "take" is defined as "hunt, pursue, catch, capture, or kill," or an attempt to do any such act, and violations of CESA's take prohibition are criminal misdemeanors under State of California law (Fish and Game Code, Section 86, 12000)

Under the federal ESA, "Take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct; may include significant habitat modification or degradation if it kills or injures wildlife by significantly impairing essential behavioral patterns including breeding, feeding, or sheltering (16 U.S.C. 1532).

- ***Harass:*** Harass in the definition of "take" in the ESA means an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering (50 CFR 17.3).
- ***Harm:*** Harm in the definition of "take" in the ESA means an act which actually kills or injures wildlife. Such act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering (50 CFR 17.3).

Technical Advisory Committee (TAC): Part of the SSHCP Implementing Entity. The committee formed to inform the scientific decisions made by the Implementing Entity in implementing the SSHCP, as provided in Section 10.2.4 and as further described in Chapter 10.

Terrace: A relatively flat, natural surface along a river valley, above the level of the floodplain.[61]

Third-party project proponents: Individuals, landowners, other private parties, or Participating Special Entities P that are not Plan Permittees and that receive coverage under a Plan Permittees ITPs in accordance with Chapter 9.

Turbidity: The degree of cloudiness in water (or air) that is caused by the presence of suspended solids.[62]

[61] A Dictionary of Environment and Conservation (2nd); Park and Allaby 2013; Oxford University Press.

APPENDIX A1 (Continued)

U

Unforeseen circumstance: Changes in circumstances surrounding an HCP that were not or could not be anticipated by HCP participants and the USFWS that result in a substantial and adverse change in the status of a covered species.[63] Also see definitions of "changed circumstance" and "no surprises rule."

Unincorporated county: The area of Sacramento County not within the boundaries of an incorporated city.[64]

Upland habitat: Covered Species habitat for generally aquatic species that occurs within a terrestrial land cover type. The SSHCP identifies upland habitat for California tiger salamander, western spadefoot, giant gartersnake, and western pond turtle.

Urban Development Area (UDA): As defined in the SSHCP, an area that shows the potential extent of future development based on the anticipated expansion of infrastructure and areas designated for development by local jurisdictions, which may extend beyond the Urban Services Boundary (USB); those locations within the Plan Area that are also within the Sacramento County USB, and the incorporated Cities of Rancho Cordova, Galt, and Galt's sphere of influence (a.k.a. Urban Development Area).

Urban Policy Area (UPA): As identified in the County of Sacramento General Plan (2011), an area of Sacramento County capable of supplying a 20-year supply of developable land sufficient to accommodate projected growth; intended to direct growth in a logical manner and to identify areas where infrastructure, requiring large capital investments, will be needed in the near future.[65]

Urban Services Boundary (USB): As identified in the County of Sacramento General Plan (2011), the boundary demarcating the area within which long-range urbanization will occur in Sacramento County, and urban services, such as water and sewer, will be provided; attempts to limit urban sprawl, thereby protecting open space and agricultural areas outside the USB boundary.[66]

APPENDIX A1 (Continued)

V

Vernal pool: Vernal pools are a type of depressional seasonal wetland that is characterized by an annual cycle of winter inundation and summer drought which result in a specific set of physical parameters and a unique assemblage of highly specialized endemic plants and animals. Vernal pools retain water seasonally due to a shallow, impermeable soil layer beneath the surface and the absence of a drainage outlet.[67] See "restrictive layer" and "perched aquifer" and "microwatershed." See definition of SSHCP Vernal Pool land cover type in Chapter 3.

Vernal pool crustacean habitat: Typified by vernal pools, vernal pool crustacean habitat is a class of depressional wetlands ranging from well vegetated vernal pools and seasonal wetlands to sparsely to non-vegetated playa/alkali lakes and rock pools. Species have also been found in roadside ditches, tire ruts and other non-natural depressional areas. The most prominent feature of vernal pool crustacean habitat is the presence of a pronounced wet/dry hydrologic regime. The wet/dry cycle begins with a wet phase in which the pools inundate during the rainy season and a dry phase beginning in late spring or early summer. Vernal pool crustacean habitat may inundate and dry down more than once in a season. Vernal pools have highly specialized endemic wetland vegetative communities that are adapted to the distinct wet/dry hydrologic regime. The vegetative community can consist of both obligate (occur in inundated portion of wetland only) and facultative (may occur along saturated fringe and transition to upland) wetland species, but is predominantly endemic wetland obligate species. However, vernal pool crustacean habitat may include shallow depressional wetlands characterized by non-native plant species and wetland facultative plant species. Vernal pool crustacean habitat is strongly related to the hydrologic regime of the wetlands which can also be a function of the soils and underlying substrate. Most vernal pool crustacean habitat falls into one of two categories with regards to hydrology, a surface flow system or a perched aquifer/surface water system. Each system has characteristic hydrologic patterns and water quality characteristics. Vernal pool crustacean habitat is not currently identified as a SSHCP land cover type, however for the purposes of analysis and impact assessment all vernal pool land cover types are considered vernal pool crustacean habitat.

Vernal Pool Landscape: Vernal pool landscape is an aggregation of SSHCP land cover types consisting of vernal pools, swales, streams/creeks (vernal pool invertebrate habitat), and valley grassland. This aggregation was developed as a GIS overlay for the purposes of conducting impact analysis and developing the SSHCP Conservation Strategy based on conservation of vernal pool landscapes, including all the components of the vernal pool landscape ecosystem.

[67] USFWS. 2005. Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon.

APPENDIX A1 (Continued)

W

Water quality: The chemical, physical, and biological characteristics of a water body, usually in respect to its suitability for habitat or another particular purpose.[68]

Waters of the U.S. The term waters of the United States means:

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters including interstate wetlands;
3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:
    a. Which are or could be used by interstate or foreign travelers for recreational or other purposes; or
    b. (From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    c. Which are used or could be used for industrial purposes by industries in interstate commerce;
4. All impoundments of waters otherwise defined as waters of the United States under this definition;
5. Tributaries of waters identified in paragraphs (s)(1) through (4) of this section;
6. The territorial sea;
7. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (s)(1) through (6) of this section; waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not waters of the United States.

Watershed: In the ARP, a land area that drains to a common waterway, such as a stream, lake, estuary, wetland, or ultimately the ocean.[69]

APPENDIX A1 (Continued)

Wildlife Agencies: In the SSHCP, the Wildlife Agencies are the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW) in combination. Also see definition for "Permitting Agency."

Wildlife corridor: A linear landscape feature that facilitates the movement of plants and animals between two or more habitat patches. Sacramento County's Laguna Creek Wildlife Corridor is an important landscape feature in the Plan Area and will be an important component of the Plan-wide Preserve System for maintaining movement and resident habitat for wildlife, preserving riparian habitat, and maintaining hydrologic connections between preserves inside the UDA. Outside the UDA, the Cosumnes River/Deer Creek Corridor serves a similar function. See Section 7.4.1 and the definition for "stream corridor."

X

Xeric: Having very little moisture, tolerant of or adapted to dry conditions.[70]

Species Accounts

APPENDIX B
Species Accounts

1 DWARF DOWNINGIA (DWDO)

Prepared by Dittes and Guardino Consulting (John Dittes and Josephine Guardino)

Dwarf Downingia (DWDO)

(Downingia pusilla)

Status USFWS: None

Status CDFG: None

Status CNPS:2.2

© 2004 Carol W. Witham

1.1 Legal Status

Dwarf downingia (*Downingia pusilla*) is considered to be rare, threatened or endangered in California, but more common elsewhere, thus qualifying its designation as a list 2.2 species by the California Native Plant Society (CNPS), meaning it is fairly threatened in California with a moderate degree/immediacy of threat, but it is more common outside of California (CNPS 2010). It has been assigned an R-E-D Code of 1-2-1, meaning it is rare, but found in sufficient numbers and distributed widely enough that the potential for extinction is low at this time, it is endangered in a portion of its range, and it is more or less widespread outside of California.

Being a CNPS List 2 plant species, dwarf downingia meets the California Department of Fish and Game (CDFG) definition of a special plant though it has no formal protection status by the CDFG or United States Fish and Wildlife Service (USFWS).

1.2 Life History and Ecology

1.2.1 Species Description and Life History

1.2.1.1 Morphology

Dwarf downingia, a strict endemic of the vernal pool hydrologic regime, is an annual member of the Bellflower family (Campanulaceae). This inconspicuous species is variable with regard to stem length (Mason 1957). Single small-stature plants can be erect and less than three centimeters in

height at maturity, or longer branched stems (up to 15 cm) can sprawl horizontally, forming relatively dense colonies, or mix with the other sprawling vernal pool species (Dittes pers. obs.). Small (five to ten millimeter-long) narrowly linear leaves are alternately arranged on the stems. Single flowers are borne in the leaf axils towards the tips of the stems.

Dwarf downingia possesses atypical flowers within the genus with regard to size and symmetry. Typical *Downingia* flowers, ranging from five to 19 millimeters in length, are bilaterally symmetrical, with two narrow "upper petals" and a broad, three-lobed "lower petal." These five corolla lobes, mostly blue or blue-purple with varying combinations of white and yellow, are united into a tube below their bases. The flower is borne at the apex of a long narrow stalk-like ovary (inferior ovary).

In comparison to characteristically showy *Downingia* flowers, the flowers of dwarf downingia are very small, ranging from only 2.5 to 5.4 millimeters in length. In addition, they lack the strong bilateral symmetry characteristic of other *Downingia* species; dwarf downingia flowers appear almost radial or star-like, with five narrow, triangular lobes that barely exceed the green calyx lobes. Dwarf downingia flowers can be white or blue, with two small yellow spots near the throat (Hickman 1993). This is a very inconspicuous plant and must be surveyed for while in flower, as there is no other way to identify this species.

1.2.1.2 Ecological Life Cycle

Other than field observations recorded in the California Natural Diversity Data Base (CNDDB) (CDFG 2010), basic taxonomy and biogeographic treatments, dwarf downingia remains mostly unstudied. Since all vernal pool plant species share similar environmental selective pressures, they likely also share similar adaptive traits. For this reason, studies addressing the life history and ecology of other more common vernal pool plant may species provide some insight into the life history and ecology of dwarf downingia.

Dwarf downingia shares the annual growth habit with the vast majority of other endemic vernal pool plants. This adaptive trait allows populations to persist through the regular and extreme summer drought that characterizes vernal pools and the Mediterranean Climate (Griggs and Jain 1983; Holland 1987; Stone et al. 1988; Zedler 1990).

1.2.1.3 Seed Germination

The specific timing of the germination of dwarf downingia seeds relative to the timing of the vernal pool inundation cycle has not been studied or described in detail. In general, *Downingia* seeds germinate during the early stages of vernal pool inundation (Zedler 1987). Studies involving germination of *Downingia cuspidata* have demonstrated a required pretreatment for germination at high percentages, although complete submersion was not required (Myers 1975).

APPENDIX B (Continued)

Studies involving *D. concolor* have had erratic to poor germination results (Hoover 1937; Linhart 1972 as reported in Zedler 1987). Seeds of other more common *Downingia* spp. occurring in the Sacramento Valley (*D. bicornuta, D. ornatissima, D. cuspidata, D. bella*) germinate under water in pool basins or in inundated soil at shallow edges of filled pools (Dittes pers. obs.). Germination requirements and optima for dwarf downingia have not been investigated. Seed dormancy and required environmental cues for in-situ germination may exist, but are presently unknown.

1.2.1.4 Vegetative Growth

One of the challenges posed to many vernal pool plant species is optimization of photosynthesis and other metabolic processes in both the early season aquatic and later season terrestrial phases of the vernal pool cycle. *Downingia* and many other vernal pool species, being amphibious, possess differing aquatic and terrestrial growth forms. After germination, seedlings and young plants growing under water produce thickened, elongate, spongy stems with large air chambers, and narrowly linear leaves that lack waxy cuticle (Weiler 1962). Stems produced in the terrestrial phase are thinner with denser tissue, and leaves are somewhat wider, thicker and posses waxy cuticle. The air-filled aquatic stems hold the plant vertical in the water column and with the thinner leaves, facilitate light exposure and gas exchange. This in effect lengthens the growing season by maximizing growth while vernal pools are still inundated.

1.2.1.5 Reproduction

Dwarf downingia and other species in the genus flower and set seeds during the dry-down and terrestrial phase of the vernal pool hydrologic cycle, typically during March through May (CNPS 2010). The very small, reduced flowers and included anthers and stigma reflect a self-fertilizing breeding system for dwarf downingia, in contrast to the outcrossing strategy for almost all other Downingias (Weiler 1962; Zedler 1987; Thorp 1990). Once fertilized, the inferior ovary elongates into a narrow stalk like capsule that can reach two to three centimeters in length. The mature capsules produce numerous minute dust-like seeds that are released as the capsule disintegrates through the late spring, summer and fall months. Fecundity and variation in seed production have not been investigated in dwarf downingia.

1.2.1.6 Dispersal

In many other vernal pool species, seed dispersal is naturally limited, although this has not been stated specifically for *Downingia*. Limited seed dispersal in vernal pool species is thought to represent an adaptation to spatially unpredictable and limited vernal pool habitat (Griggs 1974, 1980). Natural dispersal of dwarf downingia seeds likely occurs via flowing water, transport on feet and feathers of waterfowl, and in mud on hooves and legs of livestock.

APPENDIX B (Continued)

Evidence of dwarf downingia dispersal and colonization exists in occupancy of man-made topo-hydrologic features within occupied vernal pool landscapes (stock pond margins, roadside ditches, rutted tire tracks, gravel pits and scraped depressions (Witham 1991; CDFG 2010). As with all other vernal pool species, natural dispersal of seeds was likely a more frequent event when there were many more vernal pools, more pool interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming ungulates (Griggs 1980). Dwarf downingia, and about 10-15 other vernal pool species occur both in Californian and South American vernal pool habitats (amphitropical); a distribution most likely resulting in historic long-distance dispersal by migratory waterfowl (Zedler 1987).

1.2.1.7 Seed Dormancy

The existence of a dormant soil seed bank is unknown for dwarf downingia. The presence of a persistent soil seed bank provides insurance against localized extirpation resulting from the unpredictable occurrence and duration of appropriate growing conditions. If total seed crop failure occurs in a given year or set of years (failure to germinate, loss to late season flooding or fire, excessive grazing by livestock or grasshopper herbivory), additional stored seeds are available for another year's effort.

1.2.1.8 Population Genetics

The population biology and genetics of dwarf downingia have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. Elam (1998) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon. Given the limited number of occurrences and the scattered geographical distribution, all intra-pool dwarf downingia populations should be considered unique, and for the purposes of conservation, important genetic entities.

1.2.2 Habitat Requirements and Ecology

1.2.2.1 Biogeography and Landform Relations

It is generally held that many of the endemic vernal pool plant species, including downingias, are relatively recent evolutionary derivations of more common and widespread upland progenitors (Stebbins 1976; Stone 1990; Raven and Axlerod 1978; Thorne 1984). These neoendemic vernal pool species are thought to have evolved from terrestrial habitat into seasonally aquatic vernal pool habitat made available as the Mediterranean Climate developed and the inland Tertiary-age Sea dried.

Dwarf downingia occurrences are associated mainly with northern claypan vernal pools in central Sacramento County, with northern hardpan vernal pools in the foothills of the Sierra Nevada, and with vernal pools of the Interior Valleys of the Coast Range in Napa and Sonoma Counties (CDFG

APPENDIX B (Continued)

2010). Throughout this area, the species occurs on a variety of landforms and soil associations. In Sacramento County, dwarf downingia occurs primarily on the Laguna and Riverbank.

1.2.2.2 Hydrology Relations

Dwarf downingia is a strict endemic of the vernal pool hydrologic cycle. It is of importance to conservation however, that in contrast to the "deeply-adapted" vernal pool grasses of the Orcuttiae Tribe, and legenere (*Legenere limosa*), dwarf downingia occupies more commonly occurring, smaller and/or shallower vernal pools with comparatively more "flashy" hydrology (CDFG 2010; Dittes pers. obs.). In a survey of eight dwarf downingia-occupied vernal pools at Beale Air Force Base, the mean vernal pool area was found to be 299 square meters (357.6 square yards) and the mean vernal pool depth was 20.8 centimeters (8.2 inches). These are reported as being of average area and depth among the pools measured in that study (Platenkamp 1998). Vernal pool dimensions or reference to size are not given for any of the other CDFG occurrences. Dwarf downingia is also known to occupy the margins of larger or deeper vernal pools, and the seasonally fluctuating vernal pool-like edges of more severely inundated systems, including seasonal marsh, slough and stock pond habitats.

1.2.2.3 Biological Community Relations

Floristic associations provide further indication of preference for less extreme (more typical) vernal pool hydrological cycles. Dwarf downingia grows in the same hydro-topographical position as more commonly occurring vernal pool associates, including Fremont's goldfields (*Lasthenia fremontii*), smooth goldfields (*L. glaberrima*), dwarf wooly marbles (*Psilocarphus brevissimus*), Oregon wooly marbles (*P. oregonus*), annual hairgrass (*Deschampsia danthonoides*), popcorn-flowers (*Plagiobothrys stipitatus* var. *micranthus, P. bracteatus),* double-horned downingia (*Downingia bicornuta*), mousetail (*Myosurus minimus*), American pillwort (*Pilularia americana*), quillwort (*Isoetes howellii*), coyote thistle (*Eryngium* spp.), and others. All species reported as associates of dwarf downingia in Sacramento County (CDFG 2010). Most of these are commonly occurring vernal pool species that inhabit small to medium size vernal pools and swales, and the slopes and margins of larger and/or deeper pools. It is interesting to note that at least one population has been reported as growing among deeper pool associations [e.g., smooth goldfields, common spikerush (*Eleocharis macrostachya*), and water starwort (*Callitriche marginata)]*.

1.2.2.4 Non-Native Weed Relations

Hydrological stresses associated with vernal pools exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian wild rye (*Lolium multiflorum*) and Mediterranean barley (*Hordeum marinum* ssp,

APPENDIX B (Continued)

gussoneanum), two non-native facultative wetland species typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types. Some suggest that built-up thatch from Italian wild rye, Mediterranean barley, Medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species as well by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2002).

Since dwarf downingia occupies the smaller to medium size, "more typical" vernal pool types and the margins of larger or deeper pools, it may be more susceptible to the effects of excessive growth of Italian wild rye and Mediterranean barley and thatch buildup than the Orcuttiae grasses, or the more deeply-adapted legenere.

Other weedy hydrophytic species reported as growing with dwarf downingia include lippia (*Phyla nodiflora*), and swamp pricklegrass (*Crypsis schoenoides*). Although none of the following are specifically reported to co-inhabit vernal pools with dwarf downingia, other non-native weedy hydrophytes may present future problems, including European mannagrass (*Glyceria declinata*), field bindweed (*Convolvulus arvensis*), Common unicorn plant (*Probiscidea louisianica*), Bermuda-grass (*Cynodon dactylon*) and paradox canary-grass (*Phalaris paradoxa*). Cocklebur (*Xanthium strumarium*), another native species, can also dominate vernal pools (Schlising, Unger pers. comms.).

1.2.2.5 Livestock Grazing Relations

Specific interactions between livestock grazing and dwarf downingia are largely unknown. In general, appropriately timed dry-pasture livestock grazing regimes are thought to be compatible with the development and persistence of vernal pool vegetation. Robins and Vollmer (2002) provide a review of information pertaining to livestock grazing in vernal pool ecosystems.

Many extant populations of dwarf downingia inhabit long-operating cattle ranches, so persistence indicates tolerance for at least some level of grazing. Timing of livestock grazing is likely more important than stocking rates in affecting persistence of dwarf downingia. During the period when pools are inundated and upland forage is still green and attractive, cattle tend to not congregate in pools and trampling and grazing pressures to vernal pool plant species in their seedling or juvenile aquatic phase are minimized. Once the upland forage cures and the vernal pools are in their flowering and seed-producing terrestrial phase, moist pools become more attractive to livestock and grazing and trampling pressures are increased. It should be noted however, as with many other vernal pool annuals, small stature and high plant densities ensure that in all but extreme cases, a portion of every year's cohort escapes destruction, matures and sets seed. Grazing in the summer and fall months, after seeds have set and plants have died likely has little negative effect on dwarf downingia.

APPENDIX B (Continued)

1.2.2.6 Disturbance Response

Observations of field workers provide some evidence of the potential response of dwarf downingia populations to particular disturbance regimes. Several dwarf downingia populations persist despite periodic disking of the vernal pool substrates over decades (Kelsey pers. comm.; Dittes pers. obs.; CDFG 2010). It is very important to note that in these cases, disking is not so deep as to significantly affect the subtending impermeable layer or the vernal pool hydrological cycle. In addition, the disking is performed in the late summer or fall months in preparation for dryland winter grain crops, so vernal pool plants have set seed and dried. Persistence of populations in fall-disked and planted dryland winter wheat fields has also been noted for several of the Orcuttiae grasses (Hoover 1941; Crampton 1959; Stone et al. 1988). This has been observed for other more common vernal pool species as well (Ahart pers. comm. 2003).

If this disking occurs earlier in the growing season, before seeds are mature, over consecutive years, population extirpation is probable through exhaustion of soil seed bank. These are outstanding examples of the overriding selective force of the vernal pool hydrologic cycle in affecting floristic composition, and the importance of timing of management-related disturbances relative to specific life-history stages.

1.2.2.7 Essential Habitat Elements

Essential habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The essential habitat elements for dwarf downingia are identified in Table DWDO-1 and have been derived from input from local species experts.

Table DWDO-1
Essential Habitat Elements for Dwarf Downingia

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, vernal pool, and vernal swale.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

APPENDIX B (Continued)

1.3 Species Distribution and Population Trends

1.3.1 Species Distribution

Presently, dwarf downingia is recorded from 117 CNDDB occurrences in California (CDFG 2010). These are distributed primarily in the Great Central Valley from Fresno County in the south, to Tehama County in the north. Dwarf downingia also occurs at scattered sites in the interior valleys of the southern North Coast Ranges, in Napa and Sonoma Counties. These occurrences are all situated at sites ranging from 10 to 1,600 feet elevation above mean sea level (CNPS 2010), and lie within the California Floristic Province (Sacramento Valley and San Joaquin Valley Sub-regions of the Great Valley Region; Sierra Nevada Foothill Subregion of the Sierra Nevada Region; North Coast Range Subregion of the Northwest Region; Hickman 1993). At least two additional occurrences, not yet registered in the CNDDB, occur in Sacramento County (Gibson and Skordal 1994; TNC *date unknown*).

Throughout its range, dwarf downingia occupies a variety of landforms and numerous soil associations.

1.3.2 Central Valley Distribution

Dwarf downingia is known from three geographically defined population centers in the Central Valley. The northernmost is located in Tehama County, between the vicinity of Red Bluff in the north and Black Butte Lake in the south. The southernmost population center occupies a narrow band in the San Joaquin Valley along the eastern edge of Merced County and a single occurrence on the northern edge of Fresno County. The central population center, located in the southern Sacramento Valley, is comprised of occurrences within Solano, Placer, Sacramento, and Yuba Counties.

1.3.3 Range within the Plan Area

Of the 10 occurrences of dwarf downingia recorded from Sacramento County (eight CNDDB occurrences and two occurrences not-yet registered), five are located outside of the Plan Area (CNDDB occurrence #32, #56, #57, #58, and #59). Of the remaining five occurrences, three are located within the UDA in the City of Elk Grove (CNDDB occurrence #54, #55, and an occurrence not yet registered); and two occurrences are located outside of the UDA within the Plan Area. One of these is encompassed within the 16,420-acre The Nature Conservancy (TNC) Cosumnes River Preserve (CNDDB occurrence #53) and the other is located within the Howard Ranch preserve and is not yet registered with the CNDDB.

It is important to note that owing to its small stature, preference for small to medium-sized vernal pools and the area of remaining unsurveyed or partially surveyed habitat, moderate to high potential exists for discovery of additional populations within the Plan Area.

APPENDIX B (Continued)

Table DWDO-2 shows the soil series, geological formation and landform associations for each known occurrence in Sacramento County. Generally, dwarf downingia is associated with Lower Unit Riverbank and old terrace remnant alluvial deposits of the Laguna Formation. For the purposes of the SSHCP, the range of dwarf downingia is considered to include all vernal habitats.

Table DWDO-2
Extant CNDDB Occurrence Numbers, Distribution, Associated Soil Series and Landform Formations for Dwarf downingia In Sacramento County

Occurrence #	Quadrangle	Soil Series	Geological Formation and Landform
32	Rio Linda	San Joaquin Fine Sandy Loam (0-3% slopes and 3-8% slopes)	Lower Unit Riverbank Formation
53	Galt	Adjacent to Clear Lake Clay, Partially Drained, 0-2% Slopes	Adjacent to Qfa
54	Elk Grove	Redding Gravelly Loam, 0-8% Slopes	Laguna
55	Elk Grove	Redding Gravelly Loam, 0-8% Slopes	Laguna
56	Florin	San Joaquin-Galt Complex, 0-3% Slopes	Lower Unit Riverbank Formation
57	Rio Linda	San Joaquin Fine Sandy Loam (0-3% Slopes and 3-8% Slopes)	Lower Unit Riverbank Formation
58	Rio Linda	San Joaquin Fine Sandy Loam (0-3% Slopes and 3-8% Slopes)	Lower Unit Riverbank Formation
59	Rio Linda	San Joaquin Fine Sandy Loam (0-3% Slopes and 3-8% Slopes)	Lower Unit Riverbank Formation

1.3.4 Population Levels and Trends

Dwarf downingia is known from a total of 117 CNDDB occurrences. Of the 117 CNDDB occurrences recorded, two are extirpated and one possibly extirpated from Sonoma County, one is extirpated from Napa County, one is extirpated and another possibly extirpated from Placer County, and one is extirpated from Sacramento County. Of the remaining 110 CNDDB occurrences presumed extant, 26 have not been revisited since before 1983 (CDFG 2010). Of the 84 CNDDB occurrences reported since 1983 and presumed extant, one is listed as experiencing a decreasing trend, and the rest are listed as trend "unknown" (CDFG 2010). It should be noted though, that the vast majority of these 84 occurrences are located on private lands and most are reported as being subject to one or more threats.

It is impossible to determine the number of historically occurring dwarf downingia populations or the acreage of suitable habitat lost to historic agricultural and urban land-use conversions, since so much had happened before these species first received attention. Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978).

APPENDIX B (Continued)

Since dwarf downingia is adapted to the smaller, more "flashy" types of vernal pools, as well as to the margins of larger or deeper pools, estimates of vernal pool habitat lost may reflect loss of potentially suitable dwarf downingia habitat as well. Effects of historic livestock grazing combined with drought cycles and habitat alterations relating to development of non-native annual grassland are not quantifiable.

Table DWDO-3
Dwarf downingia Population Estimates Recorded For Sacramento County

CNDDB Occurrence #	# of Pools Observed	Range of Population Estimates
32	unknown	1994: 100 plants
53	Large vernal marsh	1991: 1000 plants
54	1	1991: 200 plants
55	6 vernal pools and 2 scraped areas	1991: 300
56	2 vernal pools	1990: varied from 100's to 1000's
57	Created depression	1991:50 plants
58	Vernal pool	1993: 50 plants
59	Vernal pool	1993: 150 plants

Between-year variation in population numbers has been documented for several of the dwarf downingia occurrences outside of Sacramento County, although none have been studied in detail. One occurrence is reported as supporting 300 plants in 1988, and 10,000 in 1989 (CNDDB occurrence #29). Another occurrence (CNDDB occurrence #60) was reported as supporting more than 1,000 plants in 1989 and 237 plants in 1990. CNDDB occurrence #62 was found to support 200-400 plants in 1989 and 36 plants in 1990 (CDFG 2010).

Studies involving other vernal pool plant rarities, including Orcuttiae grasses and Hoover's spurge (*Chamaesyce hooveri*) have demonstrated marked fluctuation in numbers of individuals within populations between years (Griggs 1983; Holland 1987; Alexander and Schlising 1997). This extreme population variability is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). It is not known however, to what degree dwarf downingia exhibits a similar between-year pattern.

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given dwarf downingia population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another critical aspect of population demography is the presence and nature of the soil seed bank, which is unknown for dwarf downingia.

APPENDIX B (Continued)

1.4 Threats to the Species

Potential direct threats to dwarf downingia include: loss of vernal pool habitat to agricultural or urban/industrial land-use conversions; construction and maintenance of firebreaks, roads, and utility corridors; inappropriate livestock grazing regimes (later spring/summer rotations, sheep versus cattle); grassland fires; recreational vehicles; equestrian and pedestrian traffic, and refuse dumping.

Potential Indirect threats to dwarf downingia include hydrological alteration of sub-watersheds by surrounding developments and land uses, shifts in competitive interactions (hydrology-mediated or invasive weeds), windblown refuse accumulation, point and non-point source water pollution, air pollution, and global climate change.

1.5 Data Gaps and Conservation Implications

Despite its distinctive appearance and relative rarity, dwarf downingia has received little research attention from botanists or ecologists. Aside from general observations of field workers provided in the CNDDB, detailed studies have not been conducted regarding the biology, ecology, pollinators, breeding system, population genetics, habitat relationships, population levels, trends or threats associated with this species. Pertinent data gaps, implications for conservation, and operating assumptions include:

1.5.1 Unknown Number of Undiscovered Populations

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Plan Area and elsewhere within the range of the species. In the Plan Area, discovery of new populations may occur on the large dry-land ranchlands, public quasi-public lands and vernal pool-grassland preserves already established in the eastern portion of the County.

1.5.2 Unknown Relationship between Landform/Soil Chemistry and Bio-Geographic Distribution

Throughout its range, dwarf downingia is associated with a variety of geological formations and associated soil types. In Sacramento County, this species is occurs on the Lower Unit Riverbank Formation (five occurrences) and on the Laguna Formation (two occurrences) (CDFG 2010). The exact nature of relationship to landform is however, unknown. It is unknown if soil pH or other edaphic factors influence dwarf downingia distribution and population vigor. It is possible that the presence of functioning vernal pools, regardless of landform, soil series and soil pH indicates suitable habitat.

APPENDIX B (Continued)

1.5.3 Unknown Pollination Ecology

Dwarf downingia possesses the smallest flowers of any of the species in the genus, and is thought to be a self-pollinator; however, without knowing specific breeding abilities and pollinator relationships, it is difficult to ascertain habitat needs for potentially co-evolved insect pollinators.

1.5.4 What Constitutes Population Vigor, and How to Measure?

Population vigor will need to be monitored during the life of the SSHCP, yet population dynamics, including year-to-year variability in abundance, have not been studied for dwarf downingia. The existence of a dormant soil seed bank, a critical contributor to population stability in some other vernal pool species, is unknown for dwarf downingia as well. Other rare vernal pool species have been shown to be highly variable in abundance from year-to-year (Holland 1987; Griggs pers. comm. 2003), and causative factors contributing to year-to-year population fluctuations may be difficult to identify (Alexander and Schlising 1997).

Trends may occur that are not discernable and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

1.5.5 Specific Hydrological Requirements of Dwarf downingia

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting dwarf downingia populations (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate).

The general lack of numerical hydrological data limits the ability to precisely monitor and/or assess hydrological suitability of dwarf downingia-vernal pool habitat within established preserves. Similarly, assessment of potentially suitable dwarf downingia habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing dwarf downingia populations are established, assessed and monitored over time, a more quantifiable definition of suitable dwarf downingia -vernal pool hydrology may be developed.

1.5.6 Baseline Hydrological Trend of Pools and Existing Indirect Effects

Extant dwarf downingia populations may have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

APPENDIX B (Continued)

Baseline dwarf downingia conditions for the SSHCP may not be pristine, so if trends in vigor or habitat quality become apparent during the 50-year period or at some time beyond, it may be difficult to attribute trend to any specific management activity.

1.5.7 Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by geography (Holland and Dains 1990).

Proposed preserve designs may not afford complete protection to the hydrological systems that support dwarf downingia and other species assemblages dependant on them.

1.5.8 Definition of Appropriate Scale Dwarf Downingia-Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective dwarf downingia-vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale vernal pool preserve that includes dwarf downingia at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et al. 1998).

1.5.9 Determination of Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the dwarf downingia-vernal pool preserves, primarily for purposes of upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with dwarf downingia-occupied pools, although grazing and monitoring in similar systems have been addressed (Barry 1998; TNC 2000; Griggs 2000; Robins and Vollmar 2002). It is important to note that dwarf downingia does persist though, in historically and contemporary operating livestock ranches. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems. Since dwarf downingia occupied small to medium size vernal pools, management of Italian wild rye and Mediterranean barley around the margins of vernal pools, and Medusa-Head Grass in uplands should be of particular management concern.

Presently, Witham et al. are formulating site-specific livestock grazing regimes for annual grassland-vernal pool systems in an area of Sacramento County (Witham pers. comm.). Livestock grazing regimes in dwarf downingia -vernal pool preserves covered under the SSHCP will tier towards the results of this work, as well as to the specific needs of dwarf downingia. Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

APPENDIX B (Continued)

1.5.10 Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in vernal pools include European mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, field bindweed, lippia, paradox canary grass, hairy hawkbit, cocklebur and cattails. None of these are reported to co-inhabit dwarf downingia-occupied vernal pools in Sacramento County. Any of these and others now unknown may appear or change in abundance in dwarf downingia-occupied pools over time. Italian wild rye and Mediterranean barley, two common non-native inhabitants of shallow vernal pools and vernal pool margins, might be of management concern to dwarf downingia, owing to the latter's preference for small to medium size vernal pools.

Potential competitive interactions with these species may affect the vigor of dwarf downingia populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect dwarf downingia populations.

1.5.11 Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to design preserves for multi-species conservation. Suitability of dwarf downingia habitat for supporting other rare plant species has not been specifically addressed, although in Sacramento County natural populations of legenere and Sanford's arrowhead (*Sagittaria sanfordi*) are documented as sharing habitat with it. Many of these pool complexes also may provide habitat for rare invertebrates, amphibians, mammals, and bird species as well.

Management for multiple species maximizes the effectiveness of habitat conservation and requires coordinated monitoring and actions. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime between November 1st and April 15th may be compatible with or even benefit some dwarf downingia-associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

1.5.12 Genetic Considerations (Spatial and Temporal Variation, Seed Bank, Drift, Bottlenecks)

Population genetics for dwarf downingia are completely unknown. For an overview of genetic considerations of vernal pool plant species see Elam (1998).

Current limitations in our understanding of dwarf downingia population genetics have little immediate conservation implication, given the extreme rarity of dwarf downingia.

APPENDIX B (Continued)

If experimental inoculation of pools is proposed as part of the SSHCP, appropriate measures will be developed to ensure that seed collection, seed treatment and pool inoculation methods are consistent with what we know and do not know about dwarf downingia ecology and population genetics.

1.5.13 Critical Population Size

Critical population size is a statistical estimate of the minimum number of individuals required for a population to maintain itself over generations, through time. This population parameter has been determined for assorted wildlife and some perennial plant species. The most simplistic estimations take into account recruitment rates of individuals into the population via reproduction and immigration, and removal rates of individuals from that same population via death and emigration.

Since dwarf downingia is an annual species, its population sizes are known to be highly variable from year to year, and the soil seed bank constitutes an important demographic component of the population, definition and assessment of a critical population size is impracticable and lacks ecological meaning.

Knowledge of critical population size provides an ecologically meaningful and quantifiable benchmark for adaptive management purposes (e.g., if monitored populations drop to within 30 percent of critical population size, site-specific analysis, appropriate management changes and additional monitoring will occur). This is not possible for annual species, so other measurable benchmarks are needed.

1.5.14 Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, the existence and potential role of a dormant soil seed bank in population dynamics is completely unknown for dwarf downingia. There have been no studies addressing the presence of a soil seed bank, seed dormancy or longevity.

From the perspective of conservation, knowledge of site-specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

1.5.15 Unknown Aspects of Experimental Inoculation

Since there are so few natural populations of dwarf downingia in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied dwarf downingia

habitat, create meta-population structure at extant occurrences where single pools may support the species, and ensure existence should any natural populations become compromised.

Uncertainties regarding the political ramifications and ecological effectiveness of experimental inoculation lead the conservation community and Agencies to not consider experimental inoculation as an appropriate conservation goal. Given the extreme rarity of this species though, this option may need reconsideration at some point in time.

1.5.16 Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter, ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant dwarf downingia occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of dwarf downingia, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and effectively, these pollutants may negatively affect dwarf downingia and other native plant species.

1.5.17 Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology.

It is likely that given the expected global climate trends, a vigor response of some kind could be expected for dwarf downingia populations within the implementation period of this HCP, or at some time beyond.

2 BOGG'S LAKE HEDGE-HYSSOP (BLHH)

Prepared by Dittes and Guardino Consulting (John Dittes and Josephine Guardino)

Bogg's Lake hedge-hyssop (BLHH)
(Gratiola heteropepala)
Status USFWS: None
Status CDFG: Endangered
Status CNPS: List 1B.2

© 2005 Robert E. Preston, Ph.D.

2.1 Legal Status

Bogg's Lake hedge-hyssop (*Gratiola heterosepala*) was listed by the California Department of Fish and Game (CDFG), as State Endangered under the California Endangered Species Act (CESA) in 1978. The California Native Plant Society (CNPS) includes Bogg's Lake hedge-hyssop as a CNPS List 1B.2 species which means it is a plant species that is fairly threatened in California with moderate degree or immediacy of threat (CNPS 2010). CNPS has also assigned an R-E-D Code of 1-2-2, meaning it is rare but found in sufficient numbers and distributed widely enough that the potential for extinction is low at this time, it is endangered in a portion of its range, and it is rare outside of California (CNPS 2010).

2.2 Life History and Ecology

2.2.1 Species Description and Life History

Bogg's Lake hedge-hyssop is a small-stature annual in the figwort family (Scrophulariaceae). This diminutive species has an erect, un-branched stem that can reach from two to 10 cm in height. Small one to two centimeter-long leaves are arranged oppositely on the stem; the lower ones are linear-lanceolate and the upper ones are shorter, proportionally wider and more blunt (obtuse) at the tip. The inflorescence is comprised of one to several six to eight millimeter-long flowers arranged in a terminal raceme. Individual pale-yellow and white, tubular flowers are born on 10 to 20 millimeter-long stalks (pedicels). The pedicels and upper stem are glandular puberulent. The calyx is comprised of five round-tipped sepals, three of which are united about 1/3 the distance from their base, and two that are more–or-less separate. Of the three united

sepals, the central one is wider and longer. Numerous small seeds are produced in pear-shaped (pyriform) capsules that usually equal the mature calyx in length (four to six millimeter).

The more common and potentially co-occurring bractless hedge-hyssop (*Gratiola ebracteata*) is distinguished from its rare relative on the basis of having more elongate and sharply pointed sepals that are mostly separate to their bases, and white, versus mostly yellow flowers (Mason and Bacigalupi 1954; Hickman 1993). A third species, clammy hedge-hyssop (*Gratiola neglecta*), is distinguished from *G. bracteata,* and *G. heterosepala* on the basis of having two small bracts subtending the flowers, and flowers that are at least two to three times as long as the calyx.

Bogg's Lake hedge-hyssop, and the genus *Gratiola* in general, has received little attention from biologists or ecologists. Other than basic taxonomic and biogeographic treatments, and a single study of pollinator ecology (Kaye et al. 1990), Bogg's Lake hedge-hyssop remains mostly unstudied. Ecological information, mostly from observations of field workers, exists mostly as a result of land management and agency-mandated resource management activities (Corbin 2000; Corbin et al. 1994; Schoolcraft 2000; Plantenkamp 1998; Jones and Stokes 1994).

2.2.1.1 Ecological Life Cycle

Bogg's Lake hedge-hyssop shares the annual growth habit with the vast majority of other endemic vernal pool plants. This adaptive trait confers to the populations avoidance of the regular and extreme seasonal drought that characterizes vernal pool habitat and the Mediterranean Climate (Griggs and Jain 1983; Holland 1987; Stone et al. 1988; Zedler 1990).

2.2.1.2 Seed Germination

The specific timing of germination of Bogg's Lake hedge-hyssop seeds relative to the timing of the vernal pool inundation cycle has not been described in detail. Observations indicate that Bogg's Lake hedge-hyssop seeds germinate and begin juvenile growth under water (Kaye et al. 1990; Corbin et al. 1994). Seed longevity, germination requirements and germination optima for Bogg's Lake hedge-hyssop have not been investigated.

2.2.1.3 Vegetative Growth

One of the challenges to many vernal pool plant species is optimization of physiological processes in both the early season aquatic and later season terrestrial phases of the vernal pool cycle. For Bogg's Lake hedge-hyssop, the hollow (fistulous) stem is the principal structural adaptation to growth in the aquatic habitat. The air-filled stems hold the plant vertical in the water column, thus facilitating light exposure and gas exchange. This in effect lengthens the growing season by maximizing growth while vernal pools are still inundated. It is interesting to note that, although the species inhabits the basins and slopes of deeper/larger vernal pools, it

lacks distinctly different juvenile aquatic morphology, an adaptation that is shared by many other deep pool annual species with which it occurs (e.g., *Orcuttia* spp., *Downingia* spp., *Navarretia* spp., *Eryngium* spp., *Callitriche* spp.).

2.2.1.4 Reproduction

Bogg's Lake hedge-hyssop flowers and sets seeds during the dry-down phase of the vernal pool hydrologic cycle, typically while shallow water up to two inches (five centimeters) deep remains in the pool basin (Corbin et al. 1994). Flowering occurs in the Central Valley from April to June (CNPS 2010), and at higher elevations as late as August (Corbin et al. 1994; CNPS 2010; CDFG 2010). Bogg's Lake hedge-hyssop is completely self-compatible as indicated by pollinator exclusion experiments (Kaye et al. 1990). Fruits mature quickly, usually within one to two weeks after the flowers appear (Corbin et al. 1994). The mature capsules produce numerous minute seeds that are released as the 4-valved capsule opens, and as the parent plant disintegrates. Fecundity and variation in seed production have not been investigated in Bogg's Lake hedge-hyssop .

2.2.1.5 Dispersal

In many other vernal pool species, seed dispersal is naturally limited, although this has not been stated specifically for *Gratiola*. Limited seed dispersal in vernal pool species is thought to represent an adaptation to spatially unpredictable and limited vernal pool habitat (Griggs 1974, 1980, 1990). Bogg's Lake hedge-hyssop does not appear to have dispersal-limiting traits (e.g., fruit adherent to parent plant, fruit not opening).

Evidence of natural Bogg's Lake hedge-hyssop dispersal and colonization exists in occupancy of man-made topo-hydrologic features located within or near occupied vernal pool landscapes (artificially created vernal pools, stock pond and reservoir margins, ditches, and other excavated or scraped depressions (CDFG 2010). Further evidence of long-range dispersal exists in the relatively widespread range of this species in northern California. Natural dispersal of Bogg's Lake hedge-hyssop seeds likely occurs via flowing water, transport on feet and feathers of waterfowl, and in mud on hooves and legs of livestock. As with all other vernal pool species, natural dispersal of seeds was likely a more frequent event when there were many more vernal pools, more pool interconnectivity, exceedingly larger waterfowl migrations and unfenced roaming native ungulates (Griggs 1980).

2.2.1.6 Seed Dormancy

Seed dormancy is indicated by observation of a three-year period where Bogg's Lake hedge-hyssop plants were absent, followed by reappearance during the favorable growing season of the fourth year (Corbin et al. 1994). Seed longevity and seed abundance in the soil has not been investigated. The presence of a persistent soil seed bank provides insurance against localized

extirpation resulting from the unpredictable occurrence and duration of appropriate growing conditions. If total seed crop failure occurs in a given year or set of years (failure to germinate, loss to late season flooding or fire, excessive grazing by livestock or grasshopper herbivory), additional stored seeds are available for another year's effort.

2.2.1.7 Population Genetics

Population genetics of Bogg's Lake hedge-hyssop have not been investigated, so intra- and inter-population patterns of genetic variability are unknown. Elam (1996) provides a good overview of the myriad considerations in assessing the population genetics of vernal pool plants in the absence of empirical data for a given taxon. Given the limited number of occurrences in the Plan Area and the scattered geographical distribution, all intra-pool Bogg's Lake hedge-hyssop populations should be considered unique, and for the purposes of conservation, important genetic entities.

2.2.2 Habitat Requirements and Ecology

2.2.2.1 Biogeography and Landform Relations

Bogg's Lake hedge-hyssop is strictly associated with the vernal pool-type hydrologic cycle. Over its geographic range, this species is found in a number of distinct physiographic/edaphic settings. In Sacramento County, Bogg's Lake hedge-hyssop is associated with vernal pools located on ancient weathered alluvial terraces of the Laguna Geologic formation, with soils of the Redding, Red Bluff and related Series. Soils of the Redding Series tend to be strongly acidic (indication of age and weathering) and are generally gravelly with cobble. These soils also typically possess a shallow, water-impermeable iron-silica hardpan that favors the development of vernal pools (SCS 1993). In Tehama County, Bogg's Lake hedge-hyssop occurs in vernal pools associated with cemented hardpan of the Tuscan, Toomes and related series, as well as in more shallow volcanic soils (CDFG 2010). The montane occurrences of Lassen, Shasta and Modoc Counties are also associated with volcanic soils, but in addition to volcanic mudflow and basalt substrates, wetlands formed on large hydric clay flats also support the species. Similarly, in Lake County, and Solano County, Bogg's Lake hedge-hyssop is associated with large seasonal Playa Lake-type pools formed on clay substrates.

2.2.2.2 Hydrology Relations

Bogg's Lake hedge-hyssop is a strict endemic of the vernal pool hydrologic cycle. This species is reported to grow in well-developed vernal pools, and playa lakes, as well as along the seasonally fluctuating margins of more permanent water bodies (small lakes, reservoirs, stock ponds, seasonally saturated clay flats in meadows). It is significant to note that most of the other rare species with which Bogg's Lake hedge-hyssop grows are also associated with well-developed large or deep vernal pools that exhibit more extreme, longer duration inundation such as slender

APPENDIX B (Continued)

Orcutt grass (*Orcuttia tenuis*), San Joaquin Valley Orcutt grass (*O. ineaequalis*), Sacramento Orcutt grass (*O. viscida*), Greene's tuctoria (*Tuctoria greenei*), hairy Orcutt grass (*Orcuttia pilosa*), legenere (*Legenere limosa*), and Hoover's spurge (*Chamaesyce hooveri)* (CDFG 2010). Specific pool area, pool depth, or other measures of pool hydrology are not reported for any of the Bogg's Lake hedge-hyssop occurrences. It has been observed that the species germinates and grows underwater, and quickly flowers and sets seed as the pool dries, while two to five inches of water remain in the pool basin.

2.2.2.3 Biological Community Relations

Floristic associations provide further indication of preference for more extreme vernal pool hydrological cycles. Like the Orcuttiae grasses, Bogg's Lake hedge-hyssop often grows in comparatively barren areas within deeper portions of vernal pools, sometimes in barren openings with commom spikerush (*Eleocharis macrostachya*). In addition to the fore-mentioned rarities, other associated species indicative of well-developed vernal pool hydrology, including hairy pepperwort (*Marsilea vestida*), coyote thistle (*Eryngium castrense, E. vaseyi*), Alisma-leaved coyote thistle (*E. alismifolium),* bee-thistle (*E. arictulatum*), Mathia's thistle (*E. mathiasae),* bractless hedge-hyssop, downingias (*Downingia bicornuta, D. bacigalupi, D. cuspidata, D. ornatissima*), quillwort (*Isoetes howellii, I. orcuttii and I. nuttallii*), flowering quillwort (*Lilaea scilloides*), smooth goldfields (*Lasthenia glaberrima*), California elatine (*Elatine californica*), and winged water starwort (*Callitriche marginata*),

Other vernal pool endemics reported as occurring with Bogg's Lake hedge-hyssop include common inhabitants of shallower or smaller to medium-size vernal pools with shorter duration ponding, or the slopes and edges of larger or deeper pools. These species include Fremont's goldfields (*Lasthenia fremontii*), white-headed navarretia (*Navarretia leucocephala*), stalked popcorn-flower (*Plagiobothrys stipitatus*), bracted popcorn-flower (*P. bracteatus*), dwarf wooly marbles (*Psilocarphus brevissimus*), dwarf downingia (*Downingia pusilla*), annual hairgrass (*Deschampsia danthonioides*), Douglas' meadowfoam (*Limnanthes douglasii*), tricolored monkey-flower (*Mimulus tricolor*).

2.2.2.4 Non-Native Weed Relations

Hydrological stresses associated with vernal pools exclude the majority of non-native weedy species that characterize the present-day valley annual grassland, agricultural fields, and ruderal habitats. Italian Rye and Mediterranean Barley, two non-native facultative wetland species typically dominate disturbed wetlands and can be invasive in smaller, more ephemeral vernal pool types. Some suggest that built-up thatch from Italian wild rye (*Lolium multiflorum*), Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), Medusa-head grass (*Taeniatherum caput-medusae*), and other non-native upland species may indirectly affect vernal pool species as

well by lessening the amount of water entering the system through surface and subsurface flow (Robins and Vollmar 2001).

Since Bogg's Lake hedge-hyssop occupies medium to larger or deeper vernal pools, it may not be particularly susceptible to the effects of excessive growth of Italian wild rye and Mediterranean barley and thatch buildup, as with the more deeply-adapted legenere and Orcuttiae grasses.

No weedy hydrophytic species are presently reported as growing with Bogg's Lake hedge-hyssop. Although none of the following are specifically reported to co-inhabit vernal pools with Bogg's Lake hedge-hyssop, other non-native weedy hydrophytes may present future problems, including mannagrass (*Glyceria declinata*), lippia (*Phyla nodiflora*), swamp pricklegrass (*Crypsis schoenoides*), field bindweed (*Convolvulus arvensis*), common unicorn plant (*Probiscidea louisianica*), Bermuda grass (*Cynodon dactylon*) and paradox canary grass (*Phalaris paradoxa*). Cocklebur (*Xanthium strumarium*), a native species, can also dominate vernal pools (Schlising pers. comm.; Unger pers. comm.).

2.2.2.5 Livestock Grazing Relations

In general, appropriately timed dry-pasture livestock grazing regimes are thought to be compatible with the persistence of vernal pool vegetation. Robins and Vollmer (2002) provide a review of information pertaining to livestock grazing in vernal pool ecosystems. Observations made on (U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS) grazing allotments indicate that Bogg's Lake hedge-hyssop populations are somewhat resistant to grazing and trampling pressures, with abundant and vigorous flowering and fruiting plants present despite hoof-pocked surfaces. Others have indicated livestock grazing as a threat (CDFG 2010).

Many extant populations of Bogg's Lake hedge-hyssop inhabit long-operating cattle ranches and USFS and BLM grazing allotments. Persistence in un-irrigated pasture systems indicates tolerance for at least some level of grazing. In most cases, timing of livestock grazing is likely more important than stocking rates in affecting persistence of Bogg's Lake hedge-hyssop , as it is for the Orcuttiae grasses (Stone et al. 1988). During the period when pools are inundated and upland forage is still green and attractive, cattle tend to not congregate in pools and trampling and grazing pressures to vernal pool plant species in their seedling or juvenile aquatic phase are minimized. As the upland forage cures and the vernal pools are in their flowering and seed-producing terrestrial phase, moist pools become more attractive to livestock and grazing and trampling pressures are increased. Excessive trampling and grazing during this period may negatively affect Bogg's Lake hedge-hyssop, and other vernal pool species. Grazing in the summer and fall months, after seeds have set and plants have died likely has little negative effect

APPENDIX B (Continued)

on Bogg's Lake hedge-hyssop (Mason and Bacigalupi 1954; CDFG 1987) especially since the plant usually disintegrates rapidly once pools have dried (Corbin et al. 1994).

It should be noted however, as with many other vernal pool annuals, small stature and high plant densities ensure that in all but extreme cases, a portion of every year's cohort escapes destruction, matures and sets seed.

2.2.2.6 Disturbance Response

Observations of field workers provide some evidence of the potential response of Bogg's Lake hedge-hyssop populations to particular disturbance regimes. One occurrence has been extirpated as a result of disking and harrowing. It is interesting to note that several rare and common vernal pool species, including Bogg's Lake hedge-hyssop and Orcuttiae grasses are recorded to persist despite periodic disking of the vernal pool substrates over decades (Hoover 1941; Crampton 1959; Stone et al. 1988; CDFG 2010; Ahart pers. comm.; Kelsey pers. comm.; Dittes pers. obs.). It is very important to note that in these cases, disking is not so deep as to significantly affect the subtending impermeable layer or the vernal pool hydrological cycle. In addition, the disking is performed in the late summer or fall months in preparation for dry land winter grain crops, so vernal pool plants have set seed and dried. If this disking occurs earlier in the growing season, before seeds are mature, over consecutive years, population extirpation is probable through exhaustion of soil seed bank.

2.2.2.7 Essential Habitat Elements

Essential habitat elements are those basic aspects of the environment, which are needed for survival and propagation of the species. The essential habitat elements for Bogg's Lake hedge-hyssop are identified in Table BLHH-1 and have been derived from input from local species experts.

Table BLHH-1
Essential Habitat Elements for Bogg's Lake Hedge Hyssop

Essential Activities	Land Cover Types	Habitat Elements
Entire life cycle	Vernal impoundment, and vernal pool.	Topographic features characterized by isolated mound and intermound complex within a matrix of surrounding uplands that result in continuously, or intermittently, flowing surface water in the depressional features including swales connecting the pools, providing for dispersal and promoting hydroperiods of adequate length in the pools. Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water or whose soils are saturated for a period long enough to promote germination, flowering, and seed production of predominantly annual native wetland species and typically exclude both native and non-native upland plant species in all but the driest years. As these features are inundated on a seasonal basis, they do not promote the

APPENDIX B (Continued)

Table BLHH-1
Essential Habitat Elements for Bogg's Lake Hedge Hyssop

Essential Activities	Land Cover Types	Habitat Elements
		development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.

2.3 Species Distribution and Population Trends

2.3.1 Species Distribution

Bogg's Lake hedge-hyssop was first collected from Bogg's Lake in Lake County, California in 1954. Since that time, 90 total occurrences have been recorded (CDFG 2010), ranging from Fresno County in the south to northern Modoc County in northeast California. Bogg's Lake hedge-hyssop occurrences are distributed among five of the Geographic Sub-regions of the California Floristic Province, as described by Hickman (1993); the San Joaquin Valley, Sacramento Valley, Inner Coast Range, Cascade Range Foothill, High Cascade Range, and the non-Warner Mountain and Warner Mountain Sub-regions of the Modoc Plateau Region. Bogg's Lake hedge-hyssop is among the most widespread of the rare vernal pool species addressed in the SSHCP and exhibits the widest range in elevations (25 to 7,900 feet elevation) (CNPS 2010).

Tehama and Modoc Counties together support 40 percent of the 90 presently known Bogg's Lake hedge-hyssop occurrences, with 17 and 19 occurrences for each county, respectively. Shasta County supports 14 occurrences (16 percent of total), while Sacramento County supports 11 occurrences (12 percent of total) and Solano County supports six occurrences (seven percent of total). San Joaquin, Fresno, Lake, Placer, Lassen, Madera, Siskiyou, Merced, and Fresno Counties each support five or fewer occurrences (CDFG 2010).

This comparatively wide geographic and elevation distribution of Bogg's Lake hedge-hyssop may partially reflect comparatively broad habitat requirements relative to some of the other vernal pool rarities (e.g., Sacramento Orcutt Grass). It may also reflect a different propensity for seed dispersal by waterfowl, or perhaps even a different "biogeographic legacy" (e.g., timeline of evolution and geographic distribution of ancestral taxon).

2.3.2 Central Valley Distribution

In the Central Valley, Bogg's Lake hedge-hyssop occurs among five roughly defined population centers. The southernmost of these, comprising four CNNDB occurrences, is located along the eastern edge of the Great Central Valley near the Fresno and Madera County lines. The next population center to the northwest, comprised of a single occurrence, is located approximately 45 miles away in eastern Merced County. A third population center is located 75 miles to the north

and is comprised of 18 occurrences. These occurrences extend approximately 45 miles north-to-south along the eastern edge of the Great Central Valley from northern San Joaquin County north through Sacramento County, to western Placer County. A fourth population center, comprised of six occurrences, is located approximately 30 miles to the west near the Sacramento-San Joaquin River Delta in Solano County. The northernmost Great Central Valley population center, comprised of four occurrences, is located in southern Tehama County, approximately 75 miles north of the northernmost Placer County occurrence. Another Tehama County population center, comprised of 13 additional occurrences, is located approximately 20 miles further northeast at higher elevations on the volcanic mudflow formations of the Cascade Range Foothills, east of the Great Central Valley.

2.3.3 Range within the Plan Area

Currently, there are ten CNDDB occurrences of Bogg's Lake hedge-hyssop within the Plan Area (Figure BLHH-1), all of which are located within the Urban Development Area (UDA). Within the UDA, the northeastern-most occurrence (CNDDB occurrence #48) is located northwest of the intersection of White Rock and Prairie City Roads. This occurrence is located on private land and is comprised of an unrecorded number of occupied pools. The next occurrence to the southwest is located approximately seven mi away (CNDDB occurrence #57) at the proposed Sunrise-Douglas Subdivision development. With 12 occupied pools, this is the largest Bogg's Lake hedge-hyssop occurrence in Sacramento County (CDFG 2010).

The next occurrence to the west (CNDDB occurrence #84) is located approximately two miles from the Sunrise Douglas site, just north of Morrison Creek and west of Eagles Nest Road near the southern edge of Mather Field. This occurrence is comprised of an unrecorded number of occupied vernal pools.

Another occurrence (CNDDB occurrence #30), associated with the 138-acre Sheldon Mitigation Site, is located approximately 2.5 miles south of the Sunrise-Douglas occurrence, just north of the Cosumnes River Floodplain. The number of occupied pools at this site is not recorded. CNDDB occurrence #81, comprised of a single occupied pool, is located on private land near Laguna Creek east of Excelsior Road, approximately 4.5 miles west by southwest of CNDDB occurrence #30.

The three westernmost occurrences (CNDDB occurrence #33, #34, and #35) are distributed along a north-south oriented axis with Elk Grove-Florin Road on the west, and Gerber Road and Elk Grove Boulevard on the north and south, respectively. The southernmost of these three occurrences (CNDDB occurrence #33) is located on private land, and is comprised of one occupied vernal pool. CNDDB occurrence #34, located on private land approximately 1.8 miles to the north, is comprised of an unrecorded number pools. The northernmost of these three

APPENDIX B (Continued)

occurrences (CNDDB occurrence #35) is located approximately one mile north of the central occurrence, and is also comprised of an unrecorded number of occupied pools.

Two additional occurrences are associated with the Kiefer Landfill development (CNDDB occurrence #18 and #82). Occurrence #18 is composed of seven occupied vernal pools, and occurrence #82 is reported to support one occupied vernal pool (Jones and Stokes 1998; CDFG 2010).

In Sacramento County, eight of the nine (89 percent) extant Bogg's Lake hedge-hyssop occurrences are associated with the Laguna Formation. Associated soils include those of the Redding and Red Bluff/Redding Series. This geological landform is comprised of remnant old-terrace alluvial deposits of ancestral river channels and pediment gravels, which were deposited during the early Pleistocene, between 600,000 and 1,500,000 years ago. Laguna Formation and associated soils are strongly associated with the distribution of vernal pools. Table BLHH-2 shows the soil series, geological formation and landform associations for each known occurrence in Sacramento County. It is significant to note that owing to the diminutive size of the species, its ability to inter-mingle with the more common species bractless hedge-hyssop, and the area of unsurveyed or partially surveyed area of Laguna Formation, other occurrences are likely to be present in Sacramento County. In addition, well-developed vernal pools on landforms other than Laguna could provide suitable habitat. For the purposes of the SSHCP, the range of Bogg's Lake hedge-hyssop is considered to be all vernal habitats as well as other seasonal wetlands and impoundments.

Table BLHH-2
CNDDB Occurrence Numbers, Distribution, Associated Soil Series and Landform Formations for Bogg's Lake hedge-hyssop in Sacramento County

CNDDB Occurrence #	Quadrangle	Soil Series	Geological Formation and Landform
3 (possibly extirpated)	Rio Linda	San Joaquin Fine Sandy Loam, 3-8% Slopes	Lower Unit, Riverbank Formation
18	Buffalo Creek	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
30	Sloughhouse	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
33	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
34	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	North Merced Gravel (Arroyo Seco gravel)
35	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
48	Buffalo Creek	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.

CNDDB Occurrence Numbers, Distribution, Associated Soil Series and Landform Formations for Bogg's Lake hedge-hyssop in Sacramento County

CNDDB Occurrence #	Quadrangle	Soil Series	Geological Formation and Landform
57	Buffalo Creek	Red Bluff-Redding Complex, 0-5% Slopes	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
81 (extirpated)	Elk Grove	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
82	Buffalo Creek	Redding gravelly loam, 0-8% slopes, Claypan and hardpan +/- 20 inches	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.
84	Carmichael	Red Bluff-Redding Complex, 0-5% Slopes	Laguna Formation, remnant, high-terrace deposits of Pleistocene river channels.

2.3.4 Population Levels and Trends

Of the 90 documented CNDDB occurrences, all but two are presumed extant. One occurrence in Sacramento County is listed as "possibly extirpated" after the vernal pools were plowed, harrowed, and leveled for a housing development in 1977 (CNNDB occurrence #3) (CDFG 2010). The extirpated occurrence is located in the City of Elk Grove where the site had been disked and partially leveled and is slated for development (CDFG 2010).

Downward population trends have been reported for five populations (two in Sacramento County and one each in Placer, Lake, and Tehama Counties); while three occurrences from Shasta County are classified as "fluctuating" and one Shasta County occurrence is classified as "increasing." The population trends for the remaining occurrences are listed as "unknown."

It should be noted that Bogg's Lake hedge-hyssop is a diminutive and a relatively ephemeral species that easily escapes the notice of botanists, particularly since the taxonomic features used to circumscribe it are subtle, and it often grows intermingled with the more common and superficially similar species. Given these considerations and the amount of unsurveyed or partially surveyed potentially suitable habitat, additional occurrences will likely be discovered.

It is impossible to determine the number of historically occurring Bogg's Lake hedge-hyssop populations lost or the acreage of suitable habitat lost to historic agricultural land-use conversions, since so much had happened before these species first received attention (Stone et al. 1988). Investigators have made estimates as to the acreage of vernal pool habitat lost since historic times (Holland 1978; Jones and Stokes 1990), however owing to habitat specificity (restriction to), only a subset of the vernal pool habitat lost within the natural range of the species likely provided suitable habitat for Bogg's Lake hedge-hyssop.

APPENDIX B (Continued)

There has been no comprehensive effort to monitor all populations of Bogg's Lake hedge-hyssop although various monitoring projects have been conducted by the BLM and USFS. However, the population estimates for some of the occurrences in Sacramento County occurrences have been made (Table BLHH-3).

Table BLHH-3
Bogg's Lake Hedge-hyssop Population Estimates for Sacramento County (CNDDB)

CNDDB Occurrence #	Occurrence # of pools observed	Range of population estimates
3	Reported from "several vernal pools:	Possibly extirpated
18	7	10,000 + plants
30	1	1990: 0 plants 1993: 1,000 + plants
33	1	1991: 20 plants
34	1	1991: 200 plants
35	3	?
48	Ponds	?
57	12	Several thousand to several hundred thousand
81	1	1998: 1 plant
82	1	?
84	1	2000: 1,000's of plants

Observations of Bogg's Lake hedge-hyssop indicate that abundance of individuals in a population can vary greatly from year-to year, depending at least in part on precipitation of the season. Abundance estimates made at several occurrences range from a complete lack of plants to thousands in subsequent years (CDFG 2010). Population variability in some vernal pools species is attributable to interactions of seed dormancy, early seedling survivorship, and average seed set per plant, as principally determined by seasonal and between-year limitations in available moisture (Griggs and Jain 1983; Holland 1987). Fluctuations of similar magnitude are also recorded for Hoover's spurge, hairy Orcutt grass, and Greene's tuctoria at the Vina Plains Preserve in Tehama County (Alexander and Schlising 1997).

Observations made over a decade or so may provide a reasonable indication of the short-term vigor of a given Bogg's Lake hedge-hyssop population. It is important to consider however, that in order to assess the trend of the species, long-term monitoring of both habitat and populations conducted over multiple cycles of wet and dry years is needed. Another aspect of population demography is the quantity and age of stored seed in the soil profile. Undoubtedly, the number of stored seeds in the soil profile has bearing on how many plants can be produced in a given favorable year.

2.4 Threats to the Species

Potential direct threats to Bogg's Lake hedge-hyssop include loss of vernal pool habitat to agricultural or urban/industrial land-use conversions; construction and maintenance of firebreaks, roads, and utility corridors; timber harvest activities (in montane Occurrences); inappropriate livestock grazing regimes (later spring/summer rotations); grassland fires; recreational vehicles; equestrian and pedestrian traffic; and refuse dumping (CDFG 1992, 1998; CDFG 2010; Corbin et al. 1994; Kaye et al. 1990).

Potential Indirect threats to Bogg's Lake hedge-hyssop include hydrological alteration of sub-watersheds by surrounding developments and land uses; shifts in competitive interactions (hydrology-mediated or invasive weeds); windblown refuse accumulation; point and non-point source water pollution; air pollution, and global climate change.

2.5 Data Gaps and Conservation Implications

With exception to an investigation into the breeding system (Kaye et al. 1990), various monitoring projects, and the visual observations of field workers (Corbin et al. 1994; Schoolcraft 2000; CDFG 2010; Witham pers. comm.), Bogg's Lake hedge-hyssop has received limited research attention. Detailed studies have not been conducted regarding the biology, ecology, potential for cross pollination, population genetics, habitat relationships, population dynamics, trends or threats. Pertinent data gaps, implications for conservation, and operating assumptions include the following.

2.5.1 Unknown Number of Undiscovered Populations

Additional unsurveyed and partially surveyed potentially suitable habitat exists within the Plan Area and elsewhere within the range of the species. In the Plan Area, discovery of new populations of Bogg's Lake hedge-hyssop may occur on the large dry-land ranchlands, public/quasi-public lands and vernal pool-grassland preserves already established in Sacramento County.

2.5.2 Unknown Relationship Between Landform/Soil Chemistry and Bio-Geographic Distribution

In Sacramento County, Bogg's Lake hedge-hyssop has a geographic association with old alluvial terraces possessing acidic soils, primarily of the Redding and Red Bluff Families (Laguna Geological Formation). The exact nature of this relationship is, however, unknown. It is unknown if soil pH or other edaphic factors influence the species distribution and population vigor. It is possible that functioning vernal pools with well-developed hydrology, regardless of landform, soil series and soil pH may provide suitable habitat for this species. This is supported by the occurrence of this species in vernal pools and wetlands with vernal pool-type hydrology

on other landforms, with different soil types, at varying locations. In the Plan Area, vernal pools are most frequent and best developed on the Laguna Formation.

2.5.3 Unknown Pollination Ecology

In a study conducted in Oregon, Bogg's Lake hedge-hyssop has been shown to be completely self-compatible, and insects were never observed visiting its flowers (Kaye et al. 1990). It is not known though whether or not out-crossing ability exists, and if so, whether or not insect pollinators are associated with the species anywhere in its range.

2.5.4 What Constitutes Population Vigor, and How to Measure?

Population vigor will need to be monitored during the life of the SSHCP, yet population dynamics, including year-to-year variability in abundance, has not been described in detail for any of the occurrences in Sacramento County. In other areas, Bogg's Lake hedge-hyssop population estimates have been made over varying periods of time. Populations estimates range from 1,000,000 plants at CNDDB occurrence #36, to a single individual at CNDDB occurrence #64. Observations made over time also indicate that Bogg's Lake hedge-hyssop populations can vary by several orders of magnitude between years, with low numbers present during years with sub-optimal hydrology (CDFG 2010; Corbin et al. 1994). Other rare vernal pool species have been shown to be variable in population abundance from year-to-year (Holland 1987; Griggs pers. comm.), and causative factors contributing to year-to-year population fluctuations in rare species may be difficult to identify (Alexander and Schlising 1997).

Population vigor will be difficult to assess based on number of individuals present over short intervals of time. Trends occurring over longer periods may occur that are not discernable, and trends that are discerned may be unexplainable. These factors will complicate attempts to change management for benefit of the species if measured vigor shows decline.

2.5.5 Specific Hydrological Requirements of Bogg's Lake hedge-hyssop

Numerical data do not exist regarding specific parameters of the annual hydrological cycle of vernal pools supporting Bogg's Lake hedge-hyssop populations in the Plan Area (e.g., timing of rainfall, depth of ponding, duration of ponding and soil dry down rate).

The general lack of numerical hydrological data limits the ability to precisely monitor or assess hydrological suitability of Bogg's Lake hedge-hyssop -vernal pool habitat within established preserves. Similarly, assessment of potentially suitable Bogg's Lake hedge-hyssop habitat for preserve establishment or for detection of the species at this time must rely on generalities. Once preserves for existing Bogg's Lake hedge-hyssop populations are established, assessed and

monitored over time, a more quantifiable definition of suitable Bogg's Lake hedge-hyssop - vernal pool hydrology will emerge based on learned information.

2.5.6 Baseline Hydrological Trend of Pools and Existing Indirect Effects

Extant Bogg's Lake hedge-hyssop populations in the Plan Area may have already experienced some degree of hydrological modification resulting from development-related alterations to sub-watersheds (CDFG 2010). Without complete protection of entire vernal pool watersheds, or precise hydrological monitoring and accurate modeling on a pool complex-scale, long-term indirect effects resulting from existing alterations to sub-watershed hydrology are unknown.

Baseline Bogg's Lake hedge-hyssop habitat conditions for the SSHCP may not be pristine, so if trends in vigor or habitat quality become apparent during the 50-year period or at some time beyond, it may be difficult to attribute trend to any specific management activity.

2.5.7 Definition of Appropriate Hydrology Buffer

There is no standard for appropriate scale of effective hydrologic buffers for vernal pool-annual grassland ecosystems, since the nature of vernal pool complexes and their geo-hydrological relations may vary substantially by geography (Holland and Dains 1990).

Proposed preserve designs may not afford complete protection to the hydrological systems that support Bogg's Lake hedge-hyssop and other species assemblages dependant on them.

2.5.8 Definition of Appropriate Scale Bogg's Lake hedge-hyssop -Vernal Pool-Annual Grassland Preserve

There is no standard for appropriate scale of effective Bogg's Lake hedge-hyssop -vernal pool preserves. It is a paradigm of conservation biology that "bigger is better" for a variety of well-documented reasons. Conservation challenges associated with the relatively small-scale vernal pool preserve that includes rare plant populations at Phoenix Field and Phoenix Park are well documented and reflect consequences of increase edge effect associated with smaller preserves (Clark et al. 1998).

2.5.9 Determination of an Appropriate Livestock Grazing Regime

Livestock grazing will occur in at least some of the Bogg's Lake hedge-hyssop -vernal pool preserves, primarily for purposes of upland annual grassland vegetation management. Specific grazing regimes have not been formulated for annual grassland pasture systems with Bogg's Lake hedge-hyssop -occupied pools, although grazing and monitoring in similar systems have been addressed (Barry 1998; TNC 2000; Griggs 2000; Robins and Vollmar 2002). It is important

to note that Bogg's Lake hedge-hyssop does persist though, in historically and contemporary operating livestock ranches and USFS and BLM grazing allotments. At a minimum, compatibility with some level of grazing is evidenced by persistence of the species in these systems. Since Bogg's Lake hedge-hyssop occupies medium to large-size vernal pools, management of Italian wild rye and Mediterranean barley around the margins of vernal pools, and Medusa-head grass in uplands should be monitored and managed but not primarily for the needs of Bogg's Lake hedge-hyssop specifically.

Presently, Witham et al. are formulating site-specific livestock grazing regimes for annual grassland-vernal pool systems in an area of Sacramento County. Livestock grazing regimes in Bogg's Lake hedge-hyssop -vernal pool preserves covered under this HCP will tier towards the results of this work, as well as to the specific needs of Bogg's Lake hedge-hyssop . Specific livestock grazing regimes cannot be formulated until preserve size, configuration, and soil and vegetation conditions and vegetation management goals are determined.

2.5.10 Interactions with Non-Native Weeds and Weed Management Activities

Non-native weeds, or weedy native species reported as occurring in vernal pools include western mannagrass, swamp pricklegrass, Bermuda grass, common spikerush, filed bindweed, lippia, paradox canary-grass, hairy hawkbit, Cocklebur and cattails. None of these are reported to co-inhabit Bogg's Lake hedge-hyssop -occupied vernal pools in Sacramento County. Any of these and others now unknown may appear and/or change in abundance in Bogg's Lake hedge-hyssop -occupied pools over time. Italian wild rye and Mediterranean barley, two common non-native inhabitants of shallow vernal pools and vernal pool margins, might be of management concern to Bogg's Lake hedge-hyssop if they are allowed to completely dominate the vernal pool margins and adjacent uplands. Potential competitive interactions with these species may affect the vigor of Bogg's Lake hedge-hyssop populations. In addition, any eradication or control methods implemented for these species may in turn potentially affect Bogg's Lake hedge-hyssop populations.

2.5.11 Potential Association and Compatibility with Other Rare Vernal Pool Species

It is desirable to combine to design preserves for multi-species conservation. Bogg's Lake hedge-hyssop has been reported as sharing vernal pools with other rare plant species, including Sacramento Orcutt grass, hairy Orcutt grass, slender Orcutt grass, Greene's tuctoria, San Joaquin Valley Orcutt grass, Bogg's Lake hedge-hyssop , Hoover's spurge, legenere, succulent owl's-clover. Many of these pool complexes supporting rare species also provide habitat for rare invertebrates, amphibians, mammals, and bird species as well.

APPENDIX B (Continued)

Management for multiple species maximizes the effectiveness of habitat conservation and requires coordinated monitoring and actions. Management for the benefit of one species may conflict with management needs of other rare species. For instance, livestock grazing anytime between July 1 and April 1 may be compatible with or even benefit some Bogg's Lake hedge-hyssop -associated pool complexes, but may be detrimental to ground-dwelling amphibians depending on those complexes (e.g., California tiger salamander).

2.5.12 Genetic Variation (Spatial and Temporal [Seed Bank], Genetic Drift, Genetic Bottlenecks)

Population genetics for Bogg's Lake hedge-hyssop are completely unknown. For an overview of genetic considerations of vernal pool plant species, see Elam 1998). Current limitations in our understanding of Bogg's Lake hedge-hyssop population genetics have little immediate conservation implication, given the relatively few number of Bogg's Lake hedge-hyssop occurrences in the Plan Area.

If experimental inoculation of pools is proposed as part of the SSHCP, appropriate measures will be developed to ensure that seed collection, seed treatment and pool inoculation methods are consistent with what we know and do not know about Bogg's Lake hedge-hyssop ecology and population genetics.

2.5.13 Critical Population Size

Critical population size is a statistical estimate that defines the minimum number of individuals required for a population to maintain itself over generations, through time. This population parameter has been determined for assorted wildlife and some perennial plant species. The most simplistic estimations take into account recruitment rates of individuals into the population via reproduction and immigration, and removal rates of individuals from that same population via death and emigration.

Since Bogg's Lake hedge-hyssop is an annual species, its population sizes may be highly variable from year to year, and the soil seed bank constitutes an unknown demographic component of the population, definition and assessment of a critical population size is impracticable and lacks ecological meaning for the purposes of the SSHCP.

Knowledge of critical population size provides an ecologically meaningful and quantifiable benchmark for adaptive management purposes (e.g., if monitored populations drop to within 30 percent of critical population size, site-specific analysis, appropriate management changes and additional monitoring will occur). This is not possible for annual species, so other measurable benchmarks are needed.

APPENDIX B (Continued)

2.5.14 Seed Longevity and Dynamics of Stored Soil Seed Bank

As previously mentioned, the existence and potential role of a dormant soil seed bank in population dynamics is indicated by the observation of a three-year period during which plants were absent, followed by abundant plants the following favorable hydrologic season. Beyond this observation though, there have been no empirical studies addressing the presence of a soil seed bank, seed dormancy or longevity for Bogg's Lake hedge-hyssop.

From the perspective of conservation, knowledge of site specific soil seed bank characteristics would allow more accurate assessment of population size and stability (vigor). This is particularly true of populations that typically support the fewest standing individuals through time.

2.5.15 Unknown Aspects of Experimental Inoculation

Since there are so few natural populations of Bogg's Lake hedge-hyssop in Sacramento County, species viability may be significantly enhanced by inoculating unoccupied, apparently suitable pools and increasing the number of naturally self-sustaining populations. These additional populations would increase the likelihood of natural dispersal events into preserved but unoccupied Bogg's Lake hedge-hyssop habitat, create meta-population structure at extant occurrences where single pools may support the species, and help ensure existence should any natural populations become compromised. Dispersal into, and colonization of artificially created or enhanced vernal pools, stock-ponds, reservoirs and even rutted tire tracks in occupied vernal pool landscapes has been documented (CDFG 2010; Sanger pers. comm. 2003). Bogg's Lake hedge-hyssop is a fully self-compatible species, which is a pre-adaptation for colonization.

Uncertainties regarding the political ramifications and ecological effectiveness of experimental inoculation lead the conservation community and Agencies to not consider experimental inoculation as an appropriate conservation goal. Given the rarity of this species in the Plan Area though, this option may need reconsideration at some point in time.

2.5.16 Air Pollution (Dust/Ozone/Nitric Oxide, Sulphur Dioxide)

Portions of the Central Valley of California frequently exceed State and Federal safety levels for a variety of air pollutants, including particulate matter, ozone, and others. Some of these pollutants are known to negatively affect plant physiology and health, although none have been investigated as they relate to vernal pool vegetation. Assuming that extant Bogg's Lake hedge-hyssop occurrences are maintaining their vigor at existing ambient pollution levels, air pollution will probably not present a major threat to the viability of Bogg's Lake hedge-hyssop, if existing air quality can be maintained. If however, California's human population increases as projected and air pollution control measures are not developed and implemented concomitantly and

effectively, these pollutants may negatively affect Bogg's Lake hedge-hyssop and other native plant species in the future.

2.5.17 Effects of Global Climate Change

The scientific community commonly accepts as valid the phenomenon of increasingly rapid global climate change. Specific climatic models for California predict an average increase in temperature over the coming decades, with concomitant unpredictability in annual rainfall patterns. There is uncertainty regarding the exact nature and extent of these changes, as well as the consequences these changes pose to conservation biology.

It is likely that given the expected global climate trends, a vigor response of some kind could be expected for Bogg's Lake hedge-hyssop populations within the implementation period of this HCP, or at some time beyond.
