Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area, including urban development in Elk Grove and Rancho Murieta, further rural residential development, continued development of cultivated agricultural lands, and development of infrastructure projects such as California High-Speed Rail and California WaterFix. Although not every reasonably foreseeable future action would affect valley elderberry longhorn beetle, as a whole these actions would result in the continued loss of valley elderberry longhorn beetle habitat, as well as indirect impacts (e.g., habitat fragmentation, changes in hydrology) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation would occur at a no net loss of acreage, due to combined ESA requirements and Sacramento County General Plan policies protecting riparian land cover types. In addition to these mitigation requirements for replacement of land covers that are modeled habitat, valley elderberry longhorn beetle is listed under ESA, and additional avoidance, minimization, and mitigation requirements for suitable and occupied habitat would be applied.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (554 acres) and indirect impacts to modeled valley elderberry longhorn beetle habitat. The modeled habitat preserved (554 acres) and re-established/established (554 acres) under the No Action/No Project Alternative would equal the acreage of modeled habitat lost. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on valley elderberry longhorn beetle, when considered together with the significant impacts to valley elderberry longhorn beetle from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.3 Effects on California Tiger Salamander (Central Valley Population) and Its Habitat

As discussed in Appendix G, upland underground refugia habitats for this species within the Planning Area are Valley Grassland, Blue Oak Woodland, and Blue Oak Savanna, where the

California tiger salamander inhabits ground squirrel and other burrows or soil cracks and crevices, up to 1.3 miles from aquatic breeding habitat. Breeding habitat within the Planning Area is the Vernal Pool and Seasonal Wetland land covers located south of the Cosumnes River and east of Highway 99.

Direct and Indirect Effects of the Alternative

The implementation of the No Action/No Project Alternative would result in the direct loss of approximately 1,772 acres of modeled upland habitat and the direct loss of approximately 71 acres of modeled aquatic breeding habitat for California tiger salamander (Table 9-6). These impacts would be both within the UDA in Galt and outside the UDA, including impacts from shifted or displaced development (see Section 9.1.2).

Table 9-6. Direct Effects and Modeled Habitat Conservation for California Tiger Salamander under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing Modeled Habitat	*Direct Effect*	*Indirect Effect*	*Total Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Upland Habitat							
Blue Oak Savanna	3,322	48	Qualitative	48	1.4%	24	24
Blue Oak Woodland	3,774	45	Qualitative	45	1.2%	23	22
Valley Grassland	78,274	1,679	Qualitative	1,679	2.1%	9,492	0
Total Upland Habitat	*85,369*	*1,772*	*Qualitative*	*1,772*	*2.1%*	*9,539*	*46*
Aquatic Habitat							
Vernal Pool	3,033	67	4	71	2.3%	142	67
Seasonal Wetland	1,391	4	Qualitative	4	2.4%	8	4
Total Aquatic Habitat	*4,425*	*71*	*4*	*75*	*2.3%*	*150*	*71*
Total Modeled Habitat	**89,794**	**1,843**	**4**	**1,847**	**2.1%**	**9,689**	**117**

The No Action/No Project would result in impacts to approximately 53 acres of upland habitat and 7 acres of aquatic breeding habitat within the C/RS.

The No Action/No Project Alternative would also result in indirect impacts of 4 acres of California tiger salamander Vernal Pool modeled habitat. Indirect effects for the remaining land cover types of modeled habitat are analyzed qualitatively below. As with the direct impacts discussed previously, these indirect impacts would be within the UDA in Galt and outside the UDA. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on

those stressors that may result in indirect impacts to California tiger salamander and modeled habitat for the species.

Altered hydrology of vernal pools as a result of impacts to the duripan and other factors (see Appendix G) may reduce the hydroperiod of vernal pools which could make the habitat unsuitable for California tiger salamander breeding. Sedimentation as a result of urban and road runoff can also deposit sediment into seasonal wetlands and decrease depth and hydroperiod, with the same effects on breeding habitat as described for vernal pools.

Impacts to California tiger salamander may also occur due to increased ground vibration from transportation projects (e.g., causing abandonment of burrows), and lighting from urban development (e.g., disruption of nightly movement patterns).

Increased human activity resulting from nearby development could impact remaining modeled habitat use due to factors such as increased trash, soil compaction, and trampling of vegetation.

Adjacent development could also increase the presence of invasive plants and animals in modeled aquatic habitat. Invasive plants can increase water use in the ecosystem, shortening the hydroperiod of vernal pools and interfering with reproduction of California tiger salamander. Introductions of invasive animals such as bullfrogs (*Lithobates catesbeianus*) could increase predation on California tiger salamander eggs, larvae and juveniles. Increased medium sized predators that are associated with urban development could also increase predation risk to juveniles and adults during overland migration.

The use of pesticides and fertilizers in and adjacent to new development in the Planning Area would degrade breeding habitat by decreasing water quality, causing impacts on the vernal pool ecosystem and possibly result in mortality of eggs and larval California tiger salamander.

Development may result in an increased wildfire frequency due to increased ignition sources. Wildfire is a natural part of the ecosystem, and low intensity fires would not adversely impact California tiger salamander modeled habitat. However, increased fire frequency would require more fire-suppression activities around developed areas that would result in ground disturbance, which would result in habitat removal and additional changes in vernal pool hydrology that would impact California tiger salamander modeled breeding habitat.

Increases in the number of roads and traffic associated with development can cause mortality of California tiger salamander from vehicle collisions as adults migrate between upland habitat and aquatic breeding sites, and when juveniles disperse from breeding ponds to upland habitat.

Fragmentation of upland modeled habitat by new development could inhibit access to other areas of modeled habitat by restricting adult movement to suitable breeding habitat and by restricting dispersal of juveniles out of breeding ponds. Habitat fragmentation can also increase the impact of other indirect environmental stressors listed here (e.g., altered hydrology, invasive animals) on California tiger salamander by increasing the area of impact from these stressors relative to the area of the intact habitat patch.

Temporary effects (Section 3.6.5 and Section 9.2.1) that result from ground-disturbing construction activities under the No Action/No Project Alternative may result from stressors (Appendix G) such as temporary construction lighting, temporary construction noise, and temporary ground vibration that could result in take of individual California tiger salamanders under the No Action/No Project Alternative.

The Planning Area includes 10,193 acres of designated Critical Habitat (USFWS 2005) for California tiger salamander. None of the 10,193 acres of designated Critical Habitat within the Planning Area for the species would be removed under the No Action/No Project Alternative.

The No Action/No Project Alternative is not expected to remove any of the 31 occurrences California tiger salamander in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to California tiger salamander for projects that undergo environmental review under NEPA and CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in 9,689 acres of preservation and 117 acres of re-establishment/establishment of California tiger salamander modeled habitat.

Cumulative Effect of the Alternative

California tiger salamander habitat has been lost, degraded, and fragmented by past and present urban and suburban development, associated infrastructure, agriculture, development of agricultural–residential neighborhoods, and other rural development within the Planning Area, as described in Section 3.7.1. The effects of these past and present projects on California tiger salamander and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area, including further rural residential development, continued development of cultivated agricultural lands, and development of infrastructure projects such as California High-Speed Rail and California WaterFix. Although not every reasonably foreseeable future action would affect California tiger salamander, as a whole these actions would result in the continued loss of California tiger

salamander habitat and in indirect impacts (e.g., habitat fragmentation, change in vernal pool hydrology, increased human disturbance) to remaining modeled habitat. For future projects and activities subject to CEQA or NEPA, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for California tiger salamander. Mitigation for impacts on Blue Oak Woodland and Blue Oak Savanna land cover types that are modeled habitat would also typically occur due to policies protecting these land cover types in the Sacramento County General Plan. In addition to these mitigation requirements for replacement of land covers that are modeled habitat, California tiger salamander is listed under ESA and CESA, and additional avoidance, minimization, and mitigation requirements for suitable and occupied habitat would be applied.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 1,843 acres) and indirect (approximately 4 acres) of impacts to modeled California tiger salamander habitat. The modeled habitat preserved (approximately 9,689 acres) under the No Action/No Project Alternative would exceed the acreage of modeled habitat lost, and the aquatic habitat re-established/established would equal the aquatic habitat lost. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to California tiger salamander, when considered together with the significant impacts to California tiger salamander from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

9.2.2.4 Effects on Western Spadefoot Toad and Its Habitat

Modeled habitat for western spadefoot in the Planning Area includes portions of the Valley Grassland, Blue Oak Woodland, Blue Oak Savanna, Vernal Pool, Seasonal Wetland, Swale, Open Water, and Stream/Creek land covers above sea level. The terrestrial habitats within 1 mile of aquatic habitat are included in the habitat model as they are used by western spadefoot for foraging and estivation (similar to hibernation), during the dry season.

Direct and Indirect Effects of the Alternative

Direct loss of western spadefoot modeled habitat under the No Action/No Project Alternative would be approximately 1,036 acres of aquatic habitat, and 23,550 acres of upland habitat, which would impact approximately 15.7% and 7.7% of the existing modeled upland and aquatic habitat in the Planning Area respectively (Table 9-7).

Of the western spadefoot modeled habitat loss, approximately 9,336 acres would occur within the MCRA, which would affect approximately 50.3% modeled habitat within the MCRA. There would also be approximately 56 acres lost within the C/RS, which would affect approximately 0.1% of modeled habitat within the C/RS.

Table 9-7. Direct Effects and Preservation of Western Spadefoot Modeled Habitat Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing Modeled Habitat	*Direct Effect*	*Indirect Effect*	*Total Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Upland Habitat							
Blue Oak Savanna	5,637	86	Qualitative	86	1.5%	43	43
Blue Oak Woodland	9,132	54	Qualitative	54	0.6%	27	27
Valley Grassland	135,094	23,410	Qualitative	23,410	17.3%	11,806	0
Total Upland Habitat	*149,863*	*23,550*	*Qualitative*	*23,550*	*15.7%*	*11,876*	*70*
Aquatic Habitat							
Vernal Pool	4,536	322	193	515	11.4%	1,030	322
Swale	1,252	240	61	301	24.0%	673	240
Seasonal Wetland	2,600	115	Qualitative	115	4.4%	8	57
Open Water	2,344	175	Qualitative	175	7.5%	0	87
Streams/Creeks	2,674	149	Qualitative	149	5.6%	0	75
Streams/Creeks (VPIH)	73	35	7	42	57.5%	13	17
Total Aquatic Habitat	*13,479*	*1,036*	*261*	*1,297*	*9.6%*	*1,724*	*798*
Total Modeled Habitat	**163,342**	**24,586**	**261**	**24,847**	**15.2%**	**13,600**	**868**

The No Action/No Project Alternative would also result in approximately 261 acres of indirect effects to western spadefoot modeled aquatic habitat, as well as indirect effects to modeled upland habitat. These indirect effects are analyzed qualitatively below. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to western spadefoot and modeled habitat for the species.

Altered hydrology of vernal pools as a result of impacts to the duripan and other factors (see Appendix G) may reduce the hydroperiod of vernal pools, which could make the habitat unsuitable for western spadefoot breeding. Sedimentation as a result of urban and road runoff can also deposit sediment into seasonal wetlands and decrease depth and hydroperiod, with the same effects on breeding habitat as described for vernal pools.

Impacts to western spadefoot may also occur due to increased ground vibration from transportation projects (e.g., causing abandonment of burrows) and lighting from urban development (e.g., disruption of nightly movement patterns).

Increased human activity resulting from nearby development could impact remaining modeled habitat use due to factors such as increased trash, soil compaction, and trampling of vegetation.

Adjacent development could also increase the presence of invasive plants and animals in modeled aquatic habitat. Invasive plants can increase water use in the ecosystem, shortening the hydroperiod of vernal pools and interfering with reproduction of western spadefoot. Introductions of invasive animals such as bullfrogs could increase predation on all life stages of western spadefoot in and around breeding habitat. Increased abundance of medium-sized predators that are associated with urban development could also increase predation risk to juveniles and adults during overland migration.

The use of pesticides and fertilizers in adjacent new development would degrade breeding habitat by decreasing water quality causing impacts on the vernal pool ecosystem and possibly result in mortality of eggs and larval western spadefoot.

Development may result in an increased wildfire frequency due to increased ignition sources. Wildfire is a natural part of the ecosystem, and low-intensity fires would not adversely impact western spadefoot modeled habitat. However, increased fire frequency would require more fire suppression activities around developed areas that would result in ground disturbance, which would result in habitat removal and additional changes in vernal pool hydrology that would impact western spadefoot modeled breeding habitat.

Increases in the number of roads and traffic associated with development can cause mortality of western spadefoot from vehicle collisions as adults migrate between upland habitat and aquatic breeding sites, and when juveniles disperse from breeding ponds to upland habitat.

Fragmentation of upland modeled habitat by new development could inhibit access to other areas of modeled habitat by restricting adult movement to suitable breeding habitat and by restricting dispersal of juveniles out of breeding ponds. Habitat fragmentation can also increase the impact of other indirect environmental stressors listed here (e.g., altered hydrology,

invasive animals) on western spadefoot by increasing the area of impact from these stressors relative to the area of the intact habitat patch.

Temporary environmental stressors that result from ground-disturbing construction activities under the No Action/No Project Alternative may result in temporary impacts (Section 3.6.5 and Section 9.1.2) to western spadefoot. These stressors (Appendix G) can include, but are not limited to, temporary construction lighting, temporary construction noise, and temporary ground vibration that could result in impacts to individual western spadefoot.

The No Action/No Project Alternative is expected to remove 5 of the 41 occurrences of western spadefoot in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to western spadefoot modeled habitat for projects that undergo environmental review under NEPA or CEQA, or that require some other authorization. The anticipated mitigation would be required on a project-by-project basis and would result in preservation of approximately 11,876 acres of upland habitat and 1,724 acres of aquatic habitat, which would exceed the aquatic habitat lost. The No Action/No Project Alternative would also result in re-establishment/establishment of 868 acres of modeled habitat, which would be less than the aquatic habitat lost.

Cumulative Effect of the Alternative

Western spadefoot toad habitat has been lost, degraded, and fragmented by past and present urban and suburban development, associated infrastructure, agriculture, development of agricultural–residential neighborhoods, and other rural development within the Planning Area, as described in Section 3.7.1. The effects of these past and present projects on western spadefoot and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area, including urban development in Elk Grove and Rancho Murieta, further rural residential development, continued development of cultivated agricultural lands, and development of infrastructure projects such as California High-Speed Rail and California WaterFix. Although not every reasonably foreseeable future action would affect western spadefoot, as a whole these actions would contribute to the ongoing habitat loss. However, for future projects and activities subject to CEQA and NEPA review, these impacts would typically be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for western spadefoot.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would have direct and indirect impacts resulting in impacts to 24,586 acres of modeled western spadefoot habitat. The No Action/No Project Alternative would include the preservation (13,600 acres) of total modeled habitat, which would be less than the estimated loss of habitat, and re-establishment/establishment of aquatic habitat, which would also be less than the loss of that habitat type. Additionally, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on western spadefoot, when considered together with the significant impacts to western spadefoot from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.5 Effects on Giant Garter Snake and Its Habitat

The life history, acres of existing modeled habitat, and documented occurrences of giant garter snake in the Planning Area are described in Appendix G. All giant garter snake modeled habitat in this Planning Area is located between sea level and an elevation of 230 feet. Aquatic modeled habitats for foraging and movement, and aquatic modeled habitat for winter refugia habitat is identified within and adjacent to the following specific Planning Area drainages, of which only Laguna Creek is within the UDA:

- The prominent drainageway (Stream/Creek) on the Elliot mitigation site, which links to Stone Lakes National Wildlife Refuge and is wet year-round.
- All drainage canals (Stream/Creek) south of Elk Grove, which have a past documented occurrence of giant garter snake and link to Stone Lakes National Wildlife Refuge; the perennial segments of these canals are suitable habitat.
- All parts of Badger Creek (Stream/Creek) and all other creeks that drain into the marsh at the Cosumnes River Preserve; the perennial segments of these creeks are suitable habitat.
- The perennial segments of Laguna Creek (south) and tributaries (Stream/Creek), which are suitable habitat due to presence of Freshwater Marsh habitat and proximity to documented occurrences.
- The perennial segments of drainages and canals (Stream/Creek) leading from the Cosumnes River Preserve including Deadman's Gulch, which provides suitable habitat.

In addition to these specific Stream/Creek drainages, the habitat model includes all Stream/Creek, Freshwater Marsh, Open Water, and Seasonal Wetland land covers that are within 0.25 mile of these drainages that have the potential for supporting giant garter snake. Upland winter refugia habitat within the Planning Area consists of mixed riparian scrub and valley grassland, within a distance of 0.25 mile from modeled aquatic habitat.

Direct and Indirect Effects of the Alternative

Loss of modeled giant garter snake habitat due to implementation of projects and activities under the No Action/No Project Alternative would be approximately 2,314 acres of modeled upland habitat (8.3% of existing) and approximately 187 acres of modeled aquatic habitat (2.6 % of existing) (Table 9-8). Of this habitat loss, approximately 1,600 acres would occur within the UDA, and approximately 901 acres would occur outside of the UDA, including impacts from shifted or displaced development (see Section 9.1.2).

Table 9-8. Direct Effects and Conservation of Giant Garter Snake Modeled Habitat Under the No Action/No Project Alternative

Habitat Model	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Upland Habitat					
Mixed Riparian Scrub	1,044	134	12.8%	0	134
Valley Grassland	26,825	2,180	8.1%	3,253	0
Total Upland Habitat	*27,869*	*2,314*	*8.3%*	*3,253*	*134*
Aquatic Habitat					
Seasonal Wetland	1,625	41	2.5%	8	21
Freshwater Marsh	2,589	80	3.1%	16	40
Open Water	1,282	28	2.2%	0	14
Streams/Creeks	1,794	38	2.1%	0	38
Total Aquatic Habitat	*7,290*	*187*	*2.6%*	*24*	*81*
Total Modeled Habitat	**35,159**	**2,501**	**7.1%**	**3,277**	**215**

The No Action/No Project Alternative would also result in indirect effects to giant garter snake and its habitat. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to giant garter snake and modeled habitat for the species.

Increased urban runoff from impervious surfaces under the No Action/No Project Alternative could increase water depth in waterways that support giant garter snake, flooding the small mammal burrows used for winter shelter by giant garter snake. In addition, the pesticides and fertilizers that may be contained in this runoff may reduce prey populations.

Ongoing vibration and noise from urban development and associated transportation infrastructure can disturb movement patterns and cause abandonment of burrows, basking sites, and cover habitat.

Introductions of invasive animals such as bullfrogs in occupied giant garter snake habitat could increase predation on young giant garter snake. Increased numbers of medium-sized predators that are associated with urban development could also increase predation risk to juveniles and adults in upland habitats.

Increased wildfire as a result of the increased ignition sources associated with urban development could result in loss of cover habitat, as well as reduce potential prey in upland habitats until such time as the habitat returns to its pre-fire state.

Fragmentation of upland modeled habitat by new development could inhibit access to other areas of modeled habitat by restricting adult movement between aquatic habitats and upland burrows. Habitat fragmentation can also increase the impact of other indirect environmental stressors listed here (e.g., water quality, invasive animals) on giant garter snake by increasing the area of impact from these stressors relative to the area of the intact habitat patch.

The No Action/No Project Alternative is not expected to remove any of the 14 documented occurrences of giant garter snake in the Planning Area.

Temporary effects (Section 3.6.5 and Section 9.1.2) that result from ground-disturbing construction activities under the No Action/No Project Alternative may result from stressors (Appendix G) such as temporary construction lighting, temporary construction noise, and temporary ground vibration that could result in disturbance of individual giant garter snakes under the No Action/No Project Alternative.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for giant garter snake for projects that undergo environmental review under NEPA and CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in preservation of modeled habitat of approximately 3,253 acres of upland habitat and 24 acres of aquatic habitat. In addition, there is estimated to be 134 acres of re-establishment/establishment of modeled upland habitat and 81 acres of aquatic habitat.

Cumulative Effect of the Alternative

Giant garter snake habitat has been lost and fragmented by past urban and suburban development, associated infrastructure, and farming within the Planning Area, as described in Section 3.7.1. The effects of these past and present projects on giant garter snake and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect giant garter snake, as a whole these actions would result in the continued loss of giant garter snake habitat and in indirect impacts (e.g., habitat fragmentation, increased urban runoff, increased human disturbance) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA review, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for giant garter snake. Mitigation for impacts on Mixed Riparian Scrub land cover that is modeled habitat would typically occur at a no net loss of acreage due to policies in the Sacramento County General Plan protecting riparian land cover types. In addition to these mitigation requirements for replacement of land covers that are modeled habitat, giant garter snake is listed under ESA and CESA, and additional avoidance, minimization, and mitigation requirements for suitable and occupied habitat would be applied.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (2,501 acres) and indirect impacts to modeled giant garter snake habitat. The modeled habitat re-established/established (215 acres) under the No Action/No Project Alternative would be less than the modeled riparian and aquatic habitat lost. The No Action/No Project Alternative would also result in approximately 3,277 acres of modeled habitat preserved, which exceeds the modeled habitat lost. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on giant garter snake, when considered together with the significant impacts to giant garter snake from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.6 Effects on Western Pond Turtle and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of western pond turtle in the Planning Area are described in Appendix G.

The aquatic land cover types that are considered suitable habitat for western pond turtle are Streams/Creeks above sea level, and Freshwater Marsh and Open Water within 0.25 mile of a modeled Stream/Creek. Land cover types that provide suitable upland habitat are Blue Oak Woodland, Blue Oak Savanna, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland above sea level and within 0.25 mile of suitable aquatic habitat.

Direct and Indirect Effects of the Alternative

The estimated loss of habitat under the No Action/No Project Alternative is approximately 11,783 acres of upland and approximately 377 acres of aquatic habitat. This habitat loss would remove approximately 10.6% of the upland and approximately 5.9% of aquatic habitat for western pond turtle remaining in the Planning Area (Table 9-9). Of this habitat loss, approximately 10,432 acres occurs within the UDA, and approximately 1,728 acres occurs outside of the UDA, including impacts from shifted or displaced development (see Section 9.1.2).

Table 9-9. Direct Effects and of Modeled Habitat for Western Pond Turtle Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Upland Habitat					
Blue Oak Woodland	7,610	54	0.7%	27	27
Blue Oak Savanna	4,825	83	1.7%	42	42
Valley Grassland	91,580	11,328	12.4%	8,000	0
Mine Tailing Riparian Woodland	306	41	13.4%	0	0
Mixed Riparian Woodland	5,347	144	2.7%	0	164
Mixed Riparian Scrub	1,178	133	11.3%	0	154
Total Upland Habitat	*110,846*	*11,783*	*10.6%*	*8,069*	*387*
Aquatic Habitat					
Freshwater Marsh	2,240	111	5.0%	16	56
Open Water	1,441	117	8.1%	0	59
Stream/Creek	2,674	149	5.6%	0	75
Total Aquatic Habitat	*6,355*	*377*	*5.9%*	*16*	*190*
Total Modeled Habitat	**117,201**	**12,160**	**10.4%**	**8,085**	**577**

The No Action/No Project Alternative would also result in indirect effects to western pond turtle and its habitat. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to western pond turtle and modeled habitat for the species.

Altered hydrology and water quality degradation will adversely affect the suitability of aquatic habitats to support foraging and movement pathways. Altered hydrology will adversely affect western pond turtle by affecting water levels and movement through aquatic pathways to other aquatic habitats and dispersal of juvenile turtles to other habitats.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, which is likely to contain petroleum products, pesticides, and other toxins that may reduce water quality within modeled aquatic habitat and may injure or kill western pond turtle when exposed to toxins either through direct contact or by ingesting contaminated prey items.

Increased human activity (including trash, debris, pets, off-highway vehicles, trampling, and just the presence of humans) in the vicinity of suitable aquatic habitats (Stream/Creek, Freshwater Marsh, and Open Water) and adjacent upland (estivation) habitats will adversely affect western pond turtle. Since western pond turtle is very shy and cryptic, just the presence of humans and other activities near aquatic habitats can adversely affect western pond turtle foraging and basking activities. Increased human activity will also indirectly affect overwintering sites (where they bury themselves in loose soil until the weather warms) and nest sites (where hatchlings may reside for several months following emergence).

As with many amphibians and reptiles, western pond turtle is sensitive to vibration and noise. Vibration and noise issues will indirectly affect the use of aquatic and upland habitats by western pond turtle (e.g., disruption of movement patterns and basking and foraging activities, disturbance of nest sites where hatchlings may reside for several months following emergence or abandonment of nest sites, and disturbance of upland overwintering sites where they bury themselves in loose soil until the weather warms). Depending on the proximity of the vibration source, western pond turtle may abandon sites and move further away from the vibration source, which can make them more susceptible to predation. Since western pond turtle is sensitive to disturbance, noise can disturb basking sites and potentially overwintering sites.

Increased numbers of medium-sized predators associated with increased development could increase predation risk and mortality of western pond turtle.

Habitat fragmentation and isolation will have several adverse effects on western pond turtle although this species will move short distances through upland habitats to reach other suitable aquatic habitats, even though they prefer to move along aquatic pathways. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of foraging and nesting habitat within the UDA exposed to edge effects from adjacent land uses.

The No Action/No Project Alternative is not expected to remove any of the 19 documented occurrences of western pond turtle in the Planning Area.

Temporary effects (Section 3.6.5 and Section 9.1.2) that result from ground-disturbing construction activities under the No Action/No Project Alternative may result from stressors (Appendix G) such as temporary construction lighting, temporary construction noise, and temporary ground vibration that could result in disturbance of individual western pond turtle.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to western pond turtle habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in approximately 577 acres of modeled habitat re-establishment/establishment and approximately 8,085 acres of modeled habitat preservation for western pond turtle (approximately 8,069 acres of upland habitat and approximately 16 acres of aquatic habitat). As discussed in Section 2.2.4, this habitat conservation would be implemented on a project-by-project basis and would often not be part of a coordinated and linked Preserve System.

Cumulative Effect of the Alternative

Western pond turtle habitat has been lost, degraded, and fragmented by past and present urban and suburban development, associated infrastructure, agriculture, development of agricultural–residential neighborhoods and other rural development, and mining operations within the Planning Area, as described in Section 3.7.1. The effects of these past and present projects on western pond turtle and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect western pond turtle, as a whole these actions would contribute to the ongoing habitat loss. However, for future projects and activities subject to CEQA and NEPA review, these impacts would typically be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under CWA requirements would ensure that there would be no

net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for western pond turtle.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would have direct and indirect impacts resulting in the loss of 12,160 acres of modeled western pond turtle habitat. The No Action/No Project Alternative would include the preservation (approximately 8,085 acres) and re-establishment/establishment (approximately 577 acres) of modeled habitat, both of which are less than the acres lost. Additionally, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on western pond turtle, when considered together with the significant impacts to western pond turtle from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.7 Effects on Cooper's Hawk and Its Habitat

The life history, habitat requirements, documented occurrences and existing acres of modeled habitat of Cooper's hawk (*Accipiter cooperii*) in the Planning Area are described in Appendix G.

Cooper's hawk modeled habitat within the Planning Area includes Blue Oak Woodland, Blue Oak Savanna, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub above sea level. Modeled nesting habitat within the Planning Area is Blue Oak Woodland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub above sea level. The species also has been known to nest in urban areas.

Direct and Indirect Effects of the Alternative

Permanent loss of Cooper's hawk modeled habitat would occur under the No Action/No Project Alternative from new urban development and related infrastructure including approximately 607 acres of combined nesting/foraging habitat and 86 acres of foraging habitat for total loss of approximately 693 acres (Table 9-10). Of this habitat loss, approximately 521 acres would occur within the UDA and approximately 172 acres would occur outside of the UDA, including impacts from shifted or displaced development (see Section 9.1.2).

Table 9-10. Direct Effects and Conservation of Cooper's Hawk Modeled Habitat under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Nesting/Foraging Habitat					
Blue Oak Woodland	9,132	54	0.6%	27	27
Mine Tailing Riparian Woodland	641	218	34.0%	0	0
Mixed Riparian Woodland	5,785	146	2.5%	0	255
Mixed Riparian Scrub	1,451	189	13.0%	0	298
Total Nesting/Foraging Habitat	*17,009*	*607*	*3.6%*	*27*	*580*
Foraging Habitat					
Blue Oak Savanna	5,637	86	1.5%	43	43
Total Foraging Habitat	*5,637*	*86*	*1.5%*	*43*	*43*
Total Modeled Habitat	**22,646**	**693**	**3.1%**	**70**	**623**

The No Action/No Project Alternative would also result in indirect effects to Cooper's hawk and its habitat which are analyzed qualitatively below. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to Cooper's hawk and modeled habitat for the species.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, especially during storm events. Such increases can result in stream bank erosion, increased sediment loads downstream, and alterations of downstream hydrology which can remove or physically damage the surrounding riparian habitat that is modeled nesting habitat for Cooper's hawk.

Development may result in an increased wildfire frequency due to increased potential for ignitions associated with greater human presence and activities. Wildfire is a natural part of the ecosystem, and riparian and blue oak modeled Cooper's hawk habitat can recover quickly from low intensity fires. However with decades of fire suppression, the amount of fuel may have built up to levels that would increase the intensity of wildfires. Should wildfires be of sufficient intensity to result in high levels of mortality to riparian trees and oaks, this would result in a removal of nesting and foraging habitat for Cooper's hawk until sufficient regrowth occurs.

Noise, lighting, and human activity associated with urban development could degrade remaining modeled habitat by disturbing nesting activity of Cooper's hawk adjacent to development.

Increased numbers of medium-sized predators associated with increased development could reduce the numbers of each prey species. The increased use of pesticides (e.g., rodenticides) in adjacent developed parcels could also decrease prey availability.

New aboveground powerlines would pose a risk of electrocution to all raptors. However, the relatively small size of a Cooper's hawk, when compared to other raptors, may decrease this risk. Also, where new and improved transportation routes intersect with remaining modeled habitat, the increases in traffic and roads could cause a subsequent increase in mortality of Cooper's hawk.

Habitat fragmentation by new urban development may increase the distance required for Cooper's hawk to move between remaining modeled nesting and foraging habitat, increasing the time away from the nest, which can result in reduced nest success. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of foraging and nesting habitat within the UDA exposed to edge effects from adjacent land uses.

In addition, construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on Cooper's hawk primarily during nesting. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in nest disturbance or failure, and injure or kill individual Cooper's hawks. These temporary stressors can also result in disturbance of foraging behavior that can result in reduced nest success and result in injury to, or death of, individual Cooper's hawks.

The No Action/No Project Alternative is expected to remove two of the 20 documented occurrences of Cooper's hawk in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to Cooper's hawk for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would re-establish/establish approximately 623 acres of modeled habitat, and preserve an additional approximately 70 acres of Cooper's hawk modeled habitat, 27 acres of the combined nesting/foraging habitat, and 43 acres of foraging habitat.

Cumulative Effect of the Alternative

The land cover types that make up Cooper's hawk habitat within the Planning Area have been lost, degraded, and fragmented by past and present urban and suburban development and

associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on Cooper's hawk and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect Cooper's hawk, as a whole these actions would contribute to ongoing habitat loss and indirect impacts (e.g. habitat fragmentation, increased human disturbance) to remaining modeled habitat. However, for future projects and activities subject to CEQA and NEPA review, these impacts would typically be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 693 acres) and indirect impacts to modeled Cooper's hawk habitat. The modeled habitat preserved (approximately 70 acres) and re-established/established (approximately 623 acres) under the No Action/No Project Alternative would be less than the acreage of modeled habitat lost. Additionally, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on Cooper's hawk, when considered together with the significant impacts to Cooper's hawk from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.8 Effects on Tricolored Blackbird and Its Habitat

The natural history, occurrences, and habitat use in the Planning Area for tricolored blackbird (*Agelaius tricolor*) is described in Appendix G. Modeled foraging habitat within the Planning Area is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, and Open Water above sea level. Modeled nesting habitat within the Planning Area is Cropland, Valley Grassland, Seasonal Wetland, and Freshwater Marsh above sea level.

Direct and Indirect Effects of the Alternative

Permanent loss of tricolored blackbird modeled habitat under the No Action/No Project Alternative through development and related infrastructure would remove approximately 29,389 acres of existing modeled nesting/foraging habitat (15.6% of existing) and

approximately 3,518 acres of foraging habitat (14.6% of existing) (Table 9-11). Total loss of species modeled habitats would be approximately 32,907 acres (15.5% of existing). Of this habitat loss, approximately 30,219 acres would occur within the UDA, and approximately 2,688 acres would occur outside of the UDA, including impacts from shifted or displaced development (Section 9.1.2).

Table 9-11. Direct Effects and Conservation of Tricolored Blackbird Modeled Habitat Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-established/Established*
Nesting/Foraging Habitat					
Valley Grassland	135,112	23,428	17.3%	11,806	0
Cropland	47,905	5,703	11.9%	5,119	0
Seasonal Wetland	2,600	115	4.4%	8	57
Freshwater Marsh	2,922	143	4.9%	16	72
Total Nesting/ Foraging Habitat	*188,539*	*29,389*	*15.6%*	*16,949*	*129*
Foraging Habitat					
Irrigated Pasture-Grassland	15,991	2,781	17.4%	2,496	0
Vernal Pool	4,536	322	7.1%	1,030	322
Swale	1,222	240	19.6%	602	240
Open Water	2,344	175	7.4%	0	87
Total Foraging Habitat	*24,093*	*3,518*	*14.6%*	*4,199*	*649*
Total Modeled Habitat	**212,632**	**32,907**	**15.5%**	**21,148**	**778**

The No Action/No Project Alternative would also result in indirect effects to tricolored blackbird and its habitat, which are analyzed qualitatively below. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to tricolored blackbird and modeled habitat for the species.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, which is likely to contain petroleum products, pesticides, and other toxins that may reduce water quality within modeled nesting and foraging habitat and may injure or kill tricolor blackbird when the birds are exposed to toxins either through direct contact or by ingesting contaminated prey items.

Human activity associated with urban development could degrade remaining modeled nesting habitat by disturbing nesting activity of tricolored blackbird adjacent to development.

The increased use of pesticides in adjacent developed parcels could decrease prey availability in remaining modeled foraging habitat, reduce nesting success and in some cases injury and death of individuals.

Changes to the wildlife community included an increase in medium-sized predators that are often associated with development could increase predation on tricolored blackbird nesting colonies and result in the injury and death of individuals.

Habitat fragmentation by new urban development may increase the distance required for tricolored blackbird to move between nesting colonies and remaining modeled foraging habitat, which can result in reduced nest success and abandonment of nest colonies. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of modeled habitat within the UDA exposed to edge effects from adjacent land uses.

Construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on tricolored blackbird, primarily during nesting, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in disturbance or abandonment of nesting colonies and injury or death of individual tricolored blackbirds.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to tricolored blackbird habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in approximately 778 acres of re-establishment/establishment of modeled habitat, approximately 21,148 acres of preservation of modeled habitat, approximately 16,949 acres of nesting and foraging land covers, and approximately 4,199 of foraging only land covers for tricolored blackbird.

Cumulative Effect of the Alternative

The land cover types that make up modeled tricolored blackbird habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1.

In addition to past and current development effects, reasonably foreseeable future activities within the Planning Area (Section 3.7.2) would result in continued loss of tricolored blackbird modeled habitat, as well as indirect impacts (e.g. habitat fragmentation, increased urban runoff, increased human disturbance) to remaining modeled habitat, although for projects

subject to CEQA and NEPA review these impacts would likely be mitigated under the future regulatory environment Section 2.2.2.

The expected impacts of the No Action/No Project Alternative on tricolored blackbird modeled habitat total approximately 32,907 acres. It is expected that due to the regulatory environment under the No Action/No Project Alternative approximately 778 acres of modeled habitat would be re-established/ established. In addition under the No Action/No Project Alternative, approximately 21,148 acres of modeled habitat would be preserved, although this preservation and the aforementioned re-establishment/establishment would occur on a project-by-project basis and would often not be part of a coordinated Preserve System.

Therefore, the incremental impacts of the No Action/No Project Alternative on tricolored blackbird, when considered together with the significant impacts to tricolored blackbird from past and current human activities and the reasonably foreseeable future project within the study area, would result in a significant cumulative effect.

9.2.2.9 Effects on Western Burrowing Owl and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat within the Planning Area for western burrowing owl (*Athene cunicularia hypugaea*) are described in Appendix G. Modeled foraging habitat within the Planning Area is Blue Oak Savanna, Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, and Stream/Creek (VPIH) above sea level. Modeled nesting habitat within the Planning Area is Valley Grassland, Blue Oak Savanna, Cropland, and Irrigated Pasture-Grassland above sea level. Western burrowing owl may also occur in disturbed land covers when there are open areas with sufficient suitable burrow structures for nesting; however, these land covers were not included in the western burrowing owl species model because these burrow features are often removed with development activities.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would result in permanent loss of western burrowing owl habitat from new development and related infrastructure. These activities and projects would remove approximately 31,999 acres of existing modeled nesting/foraging habitat (15.6 % of existing) (Table 9-12). Of this habitat loss, approximately 29,310 acres would occur within the UDA, and approximately 2,689 acres would occur outside of the UDA, including impacts from shifted or displaced development (Section 9.1.2). Approximately 712 acres of wintering habitat would also be directly impacted under the No Action/No Project Alternative, for a total loss of approximately 32,711 acres.

Table 9-12. Direct Loss and Conservation of Western Burrowing Owl Modeled Habitat under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Wintering Habitat					
Vernal Pool	4,536	322	7.1%	1,030	322
Seasonal Wetland	2,600	115	4.4%	8	57
Swale	1,252	240	19.2%	673	240
Stream/Creek (VPIH)	73	35	47.9%	13	17
Total Wintering Habitat	*8,461*	*712*	*8.4%*	*1,724*	*636*
Nesting/Foraging Habitat					
Cropland	47,905	5,703	11.9%	5,119	0
Irrigated Pasture-Grassland	15,991	2,781	17.4%	2,496	0
Valley Grassland	135,112	23,429	17.3%	11,806	0
Blue Oak Savanna	5,637	86	1.5%	43	43
Total Nesting/ Foraging Habitat	*204,645*	*31,999*	*15.6%*	*19,464*	*43*
Total Modeled Habitat	**213,106**	**32,711**	**15.3%**	**21,188**	**679**

The No Action/No Project Alternative would also result in indirect impacts to modeled western burrowing owl habitat, which is analyzed here qualitatively. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The discussion below focuses on those stressors that may result in indirect impacts to western burrowing owl and modeled habitat for the species.

Human activity associated with urban development could degrade remaining modeled nesting/foraging habitat by increasing interactions between domestic dogs and western burrowing owl, which can result disturbance of burrows and harassment of owls adjacent to development.

Changes to the wildlife community included an increase in medium-sized predators that are often associated with urban development, such as raccoons, which could increase predation on burrowing owl and result in the injury and death of individuals. Increases of prey species associated with urban development such as pigeons may result in increased transmission of disease to western burrowing owl, leading to injury or death.

The increased use of pesticides in adjacent developed parcels could decrease prey availability in remaining modeled nesting/foraging habitat, reduce nesting success, and in some cases cause injury and death of individuals.

The increase in traffic associated with new development may result in increased mortality of western burrowing owl as a result of a greater number of vehicle collisions.

While habitat fragmentation may increase the distance required for western burrowing owl to move between nest burrows and remaining modeled foraging habitat, western burrowing owl often forage in the areas surrounding the nesting burrow reducing this impact. Habitat fragmentation would increase the influence of other stressors by increasing the amount of modeled habitat within the UDA exposed to edge effects from adjacent land uses.

Ground-disturbing construction activities under the No Action/No project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on nesting western burrowing owl, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction ground vibration and increased human presence may result in disturbance or abandonment of burrows and injury or death of individual western burrowing owl.

There are 97 documented occurrences of western burrowing owl within the Planning Area. Projects and activities implemented as a result of the No Action/No Project Alternative would remove 10 of these occurrences.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to western burrowing owl for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in re-establishment/establishment of approximately 679 acres of modeled habitat (consisting of approximately 43 acres of nesting/foraging habitat and 636 acres of wintering habitat), and preservation of approximately 21,188 acres of modeled habitat (consisting of approximately 19,464 acres of nesting/foraging habitat and 1,724 acres of wintering habitat) for western burrowing owl.

Cumulative Effect of the Alternative

The land cover types that make up western burrowing owl modeled habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on western burrowing owl and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect western burrowing owl, as a whole these actions would contribute to the ongoing habitat loss. However, for future projects and activities subject to NEPA or CEQA, these impacts would typically be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would have direct and indirect impacts resulting in the loss of 32,711 acres of western burrowing owl modeled habitat. The regulatory environment under the No Action/No Project Alternative is anticipated to result in the re-establishment/establishment approximately 43 acres of modeled Blue Oak Savanna modeled habitat and an additional 636 acres of western burrowing owl wintering habitat. In addition under the No Action/No Project Alternative, approximately 21,188 acres of modeled habitat would be preserved, although this preservation and the aforementioned re-establishment/establishment would occur on a project-by-project basis and would often not be part of a coordinated Preserve System.

Therefore, the incremental impacts of the No Action/No Project Alternative on western burrowing owl, when considered together with the significant impacts to western burrowing owl from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.10 Effects on Ferruginous Hawk and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of ferruginous hawk (*Buteo regalis*) are discussed in Appendix G. Ferruginous hawk is not known to nest in the Planning Area and do not regularly breed in California, but utilize open grasslands and agricultural areas for winter foraging. Suitable habitat within the Planning Area is represented by Valley Grassland, Irrigated Pasture-Grassland, Vernal Pool, Seasonal Wetland, and Swale land cover types located above sea level.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would result in permanent direct loss of approximately 26,887 acres of ferruginous hawk habitat through loss of habitat to development and related infrastructure (16.9% of existing removed) (Table 9-13). Of this habitat loss, approximately 24,918 acres would occur within the UDA, and approximately 1,969 acres would occur outside of the UDA.

Table 9-13. Direct Effects and Preservation of Ferruginous Hawk Modeled Habitat Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Foraging Habitat					
Valley Grassland	135,112	23,429	17.3%	11,806	0
Irrigated Pasture-Grassland	15,991	2,781	17.4%	2,496	0
Seasonal Wetland	2,600	115	4.4%	8	57
Vernal Pool	4,536	322	7.1%	1,030	322
Swale	1,252	240	19.2%	602	240
Total Modeled Habitat	**159,491**	**26,887**	**16.9%**	**15,942**	**619**

In addition to direct effects, the No Action/No Project Alternative would also result in indirect impacts to modeled ferruginous hawk foraging habitat, which is analyzed here qualitatively. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to ferruginous hawk and modeled foraging habitat.

Stressors such as changes to hydrology and water quality due to urban runoff, increased use of pesticides, and increases in abundance of medium-sized predators associated with urban areas may impact modeled foraging habitat by adversely affecting aquatic vegetation and prey availability.

New development would likely result in increased traffic and vehicle collisions, and the use of aboveground electrical lines that pose an electrocution risk. Both of these stressors both may increase mortality of ferruginous hawk.

Increased human activity resulting from nearby development could degrade habitat suitability in remaining habitat by disturbing foraging behavior.

Habitat fragmentation by new urban development may increase the distance required for ferruginous hawk to move between remaining patches of modeled foraging habitat, which can result in increased energy use and decreased health. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of modeled habitat within the UDA exposed to edge effects from adjacent land uses.

Temporary effects (Section 3.6.5 and Section 9.1.2) on foraging habitat quality from construction activities under the No Action/No Project are expected to occur due to environmental stressors (Appendix G); temporary trampling of vegetation, construction noise and lighting, increased human presence during construction, and construction debris.

Of 26 documented occurrences of ferruginous hawks in the Planning Area, none are expected to be removed by implementation of the No Action/No Project Alternative.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to ferruginous hawk modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in the re-establishment/establishment of approximately 619 acres of modeled habitat and the preservation of approximately 15,942 acres of modeled habitat for ferruginous hawk.

Cumulative Effect of the Alternative

Ferruginous hawk habitat has been lost, degraded, and fragmented by past and present urban and suburban development, associated infrastructure, agriculture, development of agricultural–residential neighborhoods and other rural development, and mining operations within the Planning Area, as described in Section 3.7.1. The effects of these past and present projects on ferruginous hawk and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect ferruginous hawk, as a whole these actions would contribute to the ongoing habitat loss. However, for future projects and activities subject to CEQA and NEPA review, these impacts would typically be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for ferruginous hawk.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would have direct and indirect impacts resulting in the loss of 26,887 acres of modeled ferruginous hawk habitat. The No Action/No Project Alternative would include the preservation of modeled habitat (approximately 15,942 acres), which would be less than the anticipated loss of habitat, and re-establishment/establishment of modeled habitat (approximately 619 acres). Under the

No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on ferruginous hawk, when considered together with the significant impacts to ferruginous hawk from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.11 Effects on Swainson's Hawk and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of Swainson's hawk are discussed in Appendix G. Modeled foraging habitat within the Planning Area is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale above sea level and below 500 feet. Modeled nesting habitat is mixed Riparian Woodland and Mixed Riparian Scrub above sea level and below 500 feet.

High-value habitat for Swainson's hawk is defined by the SSHCP as modeled foraging habitat occurring in the western portion of the Planning Area. The majority of documented occurrences of Swainson's hawk in the Planning Area are located outside of the UDA in the western portion of the Planning Area, where the foraging habitat is of high quality due to the relative abundance of prey species in that area. While nesting of Swainson's hawk has occurred in urbanized areas, it is very uncommon, and developed land covers are not included in the Swainson's hawk nesting habitat model.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would remove approximately 336 acres of nesting habitat (4.6% of existing) and approximately 32,888 acres of foraging habitat (15.4% of existing) in the Planning Area (Table 9-14). Of this habitat loss, approximately 30,212 acres would occur within the UDA, and approximately 2,676 acres would occur outside of the UDA.

Table 9-14. Direct Effects and Conservation of Swainson's Hawk Modeled Habitat under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Nesting Habitat					
Mixed Riparian Woodland	5,785	147	2.5%	0	147
Mixed Riparian Scrub	1,449	189	13.0%	0	189
Total Nesting Habitat	*7,234*	*336*	*4.6%*	*0*	*336*
Foraging Habitat					
Valley Grassland	133,705	23,391	17.5%	11,806	0
Cropland	47,905	5,703	11.9%	5,119	0
Irrigated Pasture-Grassland	15,991	2,781	17.4%	2,496	0
Vernal Pool	4,536	322	7.1%	1,030	322
Seasonal Wetland	2,600	115	4.4%	8	57
Swale	1,252	240	19.1%	602	240
Total Foraging Habitat	*205,989*	*32,552*	*15.8%*	*21,061*	*619*
Total Modeled Habitat	**213,223**	**32,888**	**15.4%**	**21,061**	**955**

In addition to direct effects, the No Action/No Project Alternative would also result in indirect impacts to modeled Swainson's hawk nesting and foraging habitat, which is analyzed here qualitatively. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to Swainson's hawk and modeled nesting and foraging habitat.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, especially during storm events. Such increases can result in stream bank erosion, increased sediment loads downstream, and alterations of downstream hydrology, which can remove or physically damage the surrounding riparian habitat that is modeled nesting habitat for Swainson's hawk.

Development may result in an increased wildfire frequency due to increased potential for ignitions associated with greater human presence and activities. Wildfire is a natural part of the ecosystem, and riparian modeled Swainson's hawk habitat can recover quickly from low-intensity fires. However, with decades of fire suppression the amount of fuel may have built up to levels that would increase the intensity of wildfires. Should wildfires be of sufficient intensity

to result in high levels of mortality to riparian trees, this would result in a removal of nesting habitat for Swainson's hawk until sufficient regrowth occurs.

Noise, lighting, and human activity associated with urban development could degrade remaining modeled nesting habitat by disturbing nesting activity of Swainson's hawk adjacent to development, potentially causing nest abandonment.

Increased numbers of medium-sized predators associated with increased development could reduce the numbers of each prey species. The increased use of pesticides (e.g., rodenticides) in adjacent developed parcels could also decrease prey availability.

New aboveground powerlines would pose a risk of electrocution to Swainson's hawk. Also, where new and improved transportation routes intersect with remaining modeled habitat, the increases in traffic and roads could cause a subsequent increase in mortality of Swainson's hawk from vehicle collisions.

Habitat fragmentation by new urban development may increase the distance required for Swainson's hawk to move between remaining modeled nesting and foraging habitat, increasing the time away from the nest, which can result in reduced nest success. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of foraging and nesting habitat within the UDA exposed to edge effects from adjacent land uses.

In addition, construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on Swainson's hawk, primarily during nesting, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in nest disturbance or failure and injure or kill individual Swainson's hawks. These temporary stressors can also result in disturbance of foraging behavior that can result in reduced nest success and result in the injury to, or death of, individual Swainson's hawks.

The No Action/No Project Alternative is expected to remove 35 of the 410 documented occurrences of Swainson's hawks in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to Swainson's hawk modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in approximately 955 acres of modeled habitat re-establishment/establishment (approximately 336 acres of nesting habitat and approximately 619 acres of foraging habitat), and approximately 21,061 acres of modeled habitat preservation for Swainson's hawk (consisting entirely of foraging habitat). As discussed in Section 2.2.4, this

habitat conservation would be implemented on a project-by-project basis and would often not be part of a coordinated and linked Preserve System.

Cumulative Effect of the Alternative

The land cover types that make up Swainson's hawk modeled habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on Swainson's hawk and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect Swainson's hawk, as a whole these actions would contribute to ongoing habitat loss and indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining modeled habitat, although for projects subject to CEQA and NEPA review these impacts would likely be mitigated under the future regulatory environment described in Section 2.2.2, which would include protection for the species under CESA and the mitigation guidelines of the CWA, Sacramento County Swainson's Hawk Ordinance, and Sacramento County General Plan.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would have direct and indirect impacts resulting in the loss of 32,888 acres of modeled Swainson's hawk habitat. The No Action/No Project Alternative would include the preservation of modeled habitat (approximately 21,061 acres), which would be less than the estimated loss of habitat, and re-establishment/establishment of modeled habitat (approximately 955 acres). Under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on Swainson's hawk, when considered together with the significant impacts to Swainson's hawk from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.12 Effects on Northern Harrier and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of northern harrier (*Circus cyaneus*) are discussed in Appendix G. Modeled foraging habitat within the Planning Area is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, Swale, and Freshwater Marsh above sea level. Modeled nesting habitat is Cropland, Irrigated Pasture-Grassland, and Valley Grassland above sea level.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would remove approximately 31,913 acres of nesting/foraging habitat for northern harrier (16.0% of existing) and approximately 821 acres of foraging habitat (7.6% of existing) (Table 9-15). Of this habitat loss, approximately 30,054 acres would occur within the UDA and approximately 1,859 acres would occur outside of the UDA.

Table 9-15. Direct Effects and Conservation for Northern Harrier Modeled Habitat Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Nesting/Foraging Habitat					
Valley Grassland	135,112	23,429	17.3%	11,806	0
Cropland	47,905	5,703	11.9%	5,119	0
Irrigated Pasture-Grassland	15,991	2,781	17.4%	2,496	0
Total Nesting/Foraging Habitat	*199,008*	*31,913*	*16.0%*	*19,421*	*0*
Foraging Habitat					
Vernal Pool	4,536	322	8.0%	1,030	322
Seasonal Wetland	2,600	115	4.4%	8	57
Freshwater Marsh	2,922	144	4.9%	16	72
Swale	1,252	240	19.1%	602	240
Total Foraging Habitat	*11,310*	*821*	*7.6%*	*1,656*	*691*
Total Modeled Habitat	**210,318**	**32,734**	**15.6%**	**21,077**	**691**

In addition to direct effects, the No Action/No Project Alternative would also result in indirect impacts to modeled northern harrier nesting and foraging habitat, which is analyzed here qualitatively. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion

focuses on those stressors that may result in indirect impacts to northern harrier and modeled nesting and foraging habitat.

Noise, lighting, and human activity associated with urban development could degrade remaining modeled nesting habitat by disturbing nesting activity of northern harrier adjacent to development, potentially causing nest abandonment.

Increased numbers of medium-sized predators associated with increased development could reduce the numbers of each prey species. The increased use of pesticides (e.g., rodenticides) in adjacent developed parcels could also decrease prey availability.

New aboveground powerlines would pose a risk of electrocution to northern harrier. Also, where new and improved transportation routes intersect with remaining modeled habitat, the increases in traffic and roads could cause a subsequent increase in mortality of northern harrier from vehicle collisions.

Habitat fragmentation by new urban development may increase the distance required for northern harrier to move between remaining modeled nesting and foraging habitat, increasing the time away from the nest, which can result in reduced nest success. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of foraging and nesting habitat within the UDA exposed to edge effects from adjacent land uses.

In addition, construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on northern harrier, primarily during nesting, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in nest disturbance or failure, and may injure or kill individual northern harrier. These temporary stressors can also result in disturbance of foraging behavior that can result in reduced nest success and result in the injury or death of individual northern harriers.

The No Action/No Project Alternative is expected to remove two of the 70 documented occurrences of northern harrier in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to northern harrier modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in approximately 691 acres of modeled habitat re-established/established, approximately 21,077 acres of preservation of modeled habitat preserved:, approximately 19,421 acres of nesting/foraging habitat, and approximately 1,656 acres of foraging habitat.

Cumulative Effect of the Alternative

The land cover types that make up northern harrier modeled habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on northern harrier and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect northern harrier, as a whole these actions would result in the continued loss of northern harrier habitat, as well as indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA review, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2, which would include protection for the species under Section 3503 of the California Fish and Game Code. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for northern harrier.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 32,734 acres) and indirect impacts to modeled northern harrier habitat. The modeled habitat preserved (21,077 acres) under the No Action/No Project Alternative would be less than the acreage of modeled habitat lost. In addition, the No Action/No Project Alternative would result in approximately 691 acres of modeled habitat re-established/established. Under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on northern harrier, when considered together with the significant impacts to northern harrier from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.13 Effects on White-Tailed Kite and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of white-tailed kite (*Elanus leucurus*) are discussed in Appendix G. Modeled foraging habitat within the Planning Area is Blue Oak Savanna, Cropland, Irrigated Pasture-Grassland, Valley

Grassland, Mixed Riparian Scrub, Vernal Pool, Seasonal Wetland, and Swale above sea level. Modeled nesting habitat within the Planning Area is Blue Oak Woodland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, and Mixed Riparian Scrub above sea level. The majority of the 62 documented occurrences of this species within the Planning Area are outside the UDA, and the majority of those are located in the western portion of the Planning Area (Appendix G).

Direct and Indirect Effects of the Alternative

Thee No Action/No Project Alternative would remove approximately 419 acres of white-tailed kite nesting habitat (2.9% of existing), approximately 189 acres of nesting/foraging habitat (13.0% of existing), and approximately 32,676 acres of foraging habitat (15.3% of existing) for a total of approximately 33,284 acres lost (Table 9-16). Of this habitat loss, approximately 30,407 acres would occur within the UDA, and approximately 2,877 acres would occur outside of the UDA.

Table 9-16. Direct Effects and Conservation of White-Tailed Kite Modeled Habitat Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/Establishment*
Nesting Habitat					
Blue Oak Woodland	9,132	54	0.6%	27	27
Mixed Riparian Woodland	5,785	147	2.5%	0	256

Nesting/Foraging Habitat					
Mixed Riparian Scrub	1,451	189	13.0%	0	298
Total Nesting/Foraging Habitat	*1,451*	*189*	*13.0%*	*190*	*298*
Foraging Habitat					
Valley Grassland	135,112	23,429	17.3%	11,806	0
Cropland	47,905	5,703	11.9%	5,119	0
Irrigated Pasture-Grassland	15,991	2,781	17.4%	2,496	0
Blue Oak Savanna	5,637	86	1.5%	43	43
Vernal Pool	4,536	322	6.9%	1,030	322
Seasonal Wetland	2,600	115	4.4%	8	57
Swale	1,252	240	19.1%	602	240
Total Foraging Habitat	*213,033*	*32,676*	*15.3%*	*21,104*	*662*
Total Modeled Habitat	**230,042**	**33,284**	**14.5%**	**21,321**	**1,243**

In addition to direct effects, the No Action/No Project Alternative would also result in indirect impacts to modeled white-tailed kite nesting and foraging habitat, which is analyzed here qualitatively. As with the direct impacts discussed previously, the greatest impact of these

indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on stressors that may result in indirect impacts to white-tailed kite and modeled nesting and foraging habitat where it is adjacent to urban development and transportation projects.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, especially during storm events. Such increases can result in stream bank erosion, increased sediment loads downstream, and alterations of downstream hydrology, which can remove or physically damage the surrounding riparian habitat that is modeled nesting habitat for white-tailed kite.

Development may result in an increased wildfire frequency due to increased potential for ignitions associated with greater human presence and activities. Wildfire is a natural part of the ecosystem and riparian and blue oak woodland modeled white-tailed kite habitat can recover quickly from low-intensity fires. However, with decades of fire suppression, the amount of fuel may have built up to levels that would increase the intensity of wildfires. Should wildfires be of sufficient intensity to result in high levels of mortality to riparian trees and oaks, this would result in a removal of nesting and foraging habitat for white-tailed kite until sufficient regrowth occurs.

Noise, lighting, and human activity associated with urban development could degrade remaining modeled nesting habitat by disturbing nesting activity of white-tailed kite adjacent to development, potentially causing nest abandonment.

Increased numbers of medium sized predators associated with increased development could reduce the numbers of each prey species. The increased use of pesticides (e.g., rodenticides) in adjacent developed parcels could also decrease prey availability.

New aboveground powerlines would pose a risk of electrocution to white-tailed kite. Also, where new and improved transportation routes intersect with remaining modeled habitat, the increases in traffic and roads could cause a subsequent increase in mortality of white-tailed kite from vehicle collisions.

Habitat fragmentation by new urban development may increase the distance required for white-tailed kite to move between remaining modeled nesting and foraging habitat, increasing the time away from the nest, which can result in reduced nest success. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of foraging and nesting habitat within the UDA exposed to edge effects from adjacent land uses.

In addition, construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on white-tailed kite primarily during

nesting, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in nest disturbance or failure, and may injure or kill individual white-tailed kite. These temporary stressors can also result in disturbance of foraging behavior that can result in reduced nest success and result in the injury or death of individual white-tailed kite. While nest failure may be caused by construction activities, it is expected that any activity under CEQA would include protection measures for this fully protected species as there is no mechanism within the Fish and Game Code to authorize take of individuals of fully protected species under these circumstances (Section 9.1.1).

The No Action/No Project Alternative is expected to remove 8 of the 62 documented occurrences of white-tailed kite in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to white-tailed kite modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in approximately 1,243 acres of modeled habitat re-established/established, and approximately 21,321 acres of modeled habitat preservation for white-tailed kite, consisting of approximately 27 acres of nesting habitat, approximately 190 acres of nesting/foraging habitat, and approximately 21,104 acres of foraging habitat. As described in Section 2.2.4, this modeled habitat conservation would be implemented on a project-by-project basis and would often not be part of a coordinated and linked Preserve System.

Cumulative Effect of the Alternative

White-tailed kite modeled habitat within the Planning Area has been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described for Section 3.7.1. The effects of these past and present projects on white-tailed kite and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect white-tailed kite, as a whole these actions would result in the continued loss of white-tailed kite habitat and indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining modeled habitat, although for projects subject to CEQA and NEPA review these impacts would likely be mitigated under the future regulatory environment Section 2.2.2, which would include protection for the species as a fully protected species under the California Fish and Game Code. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would

be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for white-tailed kite.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 33,284 acres) and indirect impacts to modeled white-tailed kite habitat. The modeled habitat preserved (approximately 21,321 acres) under the No Action/No Project Alternative would be less than the acreage of modeled habitat lost. In addition, the No Action/No Project Alternative would re-establish/establish approximately 1,243 acres of modeled habitat. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on white-tailed kite, when considered together with the significant impacts to white-tailed kite from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.14 Effects on Greater Sandhill Crane and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of greater sandhill crane (*Grus canadensis tabida*) are discussed in Appendix G. Greater sandhill crane is listed as threatened under CESA and is a fully protected species under the California Fish and Game Code. Modeled roosting habitat is Vernal Pool, Seasonal Wetland, and Freshwater Marsh above sea level and within 2 miles of documented greater sandhill crane occurrences. Modeled foraging habitat within the Planning Area is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Seasonal Wetland, and Freshwater Marsh within 1.75 miles of modeled roosting habitat and above sea level.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative project and activities would remove a total of approximately 9,499 acres of modeled habitat for greater sandhill crane, of which approximately 76 acres is roosting habitat, approximately 138 acres is roosting/foraging habitat, and approximately 9,285 acres is foraging habitat (Table 9-17). Of this modeled habitat loss, approximately 7,210 acres would occur within the UDA, and approximately 2,289 acres would occur outside of the UDA.

Table 9-17. Direct Effects and of Modeled Habitat for Greater Sandhill Crane Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing Modeled Habitat	*Direct Effect*	*Indirect Effect*	*Total Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment /Establishment*
Roosting/Foraging Habitat							
Seasonal Wetland	1,877	63	Qualitative	63	3.4%	8	32
Freshwater Marsh	2,610	75	Qualitative	75	2.9%	16	38
Total Roosting/Foraging Habitat	*4,487*	*138*	*Qualitative*	*138*	*3.1%*	*24*	*70*
Roosting Habitat							
Vernal Pool	1,156	76	117	193	6.6%	386	76
Total Roosting Habitat	*1,156*	*76*	*117*	*193*	*6.6%*	*386*	*76*
Foraging Habitat							
Cropland	42,628	4,080	Qualitative	4,080	9.6%	3,662	0
Valley Grassland	30,585	3,444	Qualitative	3,444	11.3%	2,671	0
Irrigated Pasture-Grassland	10,908	1,761	Qualitative	1,761	16.1%	1,580	0
Total Foraging Habitat	*84,121*	*9,285*	*Qualitative*	*9,285*	*11.0%*	*7,913*	*0*
Total Modeled Habitat	**89,764**	**9,499**	**117**	**9,616**	**10.6%**	**8,323**	**146**

In addition to direct effects, the No Action/No Project Alternative would also result in indirect impacts to modeled greater sandhill crane roosting habitat (117 acres) and foraging habitat, which is analyzed here qualitatively. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to greater sandhill crane roosting and foraging habitat.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, which could cause alterations of downstream hydrology and could modify water depths around roosting habitat causing abandonment of roost sites. Urban runoff also can contain petroleum products, pesticides, and other chemicals that can degrade water quality and potentially harm greater sandhill crane directly or by contaminating food sources.

Chronic noise from new development and transportation infrastructure can cause abandonment of roost sites and avoidance of foraging habitat by greater sandhill crane. New development may also increase human activities, including recreational activities within

roosting and foraging habitat for greater sandhill crane that can result in the abandonment of roosts and avoidance of foraging habitat.

New development can also have the potential to spread disease to greater sandhill crane as a result of the increased presence of humans and pets within roosting and foraging habitat.

Where new and improved transportation routes intersect with modeled habitat, the increases in traffic and roads could cause a subsequent increase in mortality of greater sandhill crane from vehicle collisions.

Habitat fragmentation by new urban development may limit suitability of remaining modeled greater sandhill crane roosting habitat in small habitat patches. Habitat fragmentation can also increase the distance required for greater sandhill crane to move between remaining modeled roosting and foraging habitat, increasing the energy demands required to forage. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of modeled foraging and roosting habitat exposed to edge effects from adjacent land uses.

In addition, construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on greater sandhill crane and are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence in the vicinity of roost sites may result in roost abandonment and disturbance of foraging, which would be a disruption of normal behavior that could result in injury to greater sandhill crane. While roost abandonment may be caused by construction activities, it is expected that any activity under CEQA would include protection measures for this fully protected species as there is no mechanism within the Fish and Game Code to authorize take of individuals of fully protected species under these circumstances (Section 9.1.1).

The majority of documented occurrences of greater sandhill crane in the Planning Area are outside the UDA in the western portion of the Planning Area (Appendix G). The No Action/No Project Alternative is expected to remove 62 of the 70 documented occurrences of greater sandhill cranes in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to greater sandhilll crane modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in approximately 146 acres of modeled habitat re-establishment/establishment, and approximately 8,323 total acres of modeled habitat preservation for greater sandhill crane, including approximately 24 acres of

roosting/foraging habitat, approximately 386 acres of roosting habitat, and approximately 7,913 acres of foraging habitat.

Cumulative Effect of the Alternative

Greater sandhill crane modeled habitat within the Planning Area has been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure described in Section 3.7.1. The effects of these past and present projects on greater sandhill crane and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect greater sandhill crane, as a whole these actions would result in the continued loss of greater sandhill crane habitat, as well as indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining modeled habitat, although for projects subject to CEQA and NEPA review, these impacts would likely be mitigated under the future regulatory environment described Section 2.2.2, which would include protection for the species as a fully protected species under the California Fish and Game Code.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (9,499 acres) and indirect (117 acres) impacts to modeled greater sandhill crane habitat for a total impact of 9,616 acres. The modeled habitat preserved (8,323 acres) would be less than the acreage of modeled habitat lost. In addition, the No Action/No Project Alternative would result in 146 acres of modeled habitat re-established/established. Under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on greater sandhill crane, when considered together with the significant impacts to greater sandhill crane from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.15 Effects on Lesser Sandhill Crane and Its Habitat

Basic habitat information for lesser sandhill crane (*Grus canadensis canadensis*) within the Planning Area is found in Appendix G. The land cover types in the Planning Area that are utilized by lesser sandhill crane are the same as those for greater sandhill crane above.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would result in the same acres of habitat loss as discussed previously for greater sandhill crane (see Table 9-17). New development and transportation infrastructure would have indirect effects on lesser sandhill crane that would also be the same as those discussed for greater sandhill crane. In addition, construction activities under the No Action/No Project Alternative may result in temporary effects as discussed for greater sandhill crane.

The habitat preserved under the No Action/No Project Alternative for lesser sandhill crane would be the same as that for greater sandhill crane.

Cumulative Effect of the Alternative

The cumulative effects on lesser sand hill crane would be similar to those described previously for greater sandhill crane; that is, there would be a ***Significant Adverse Cumulative*** effect when considering the No Action/No Project Alternative with past, present, and reasonably foreseeable future projects.

9.2.2.16 Effects on Loggerhead Shrike and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of loggerhead shrike (*Lanius ludovicianus*) are discussed in Appendix G. The SSHCP modeled foraging habitat within the Planning Area is Cropland, Irrigated Pasture-Grassland, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale above sea level. Modeled nesting habitat within the Planning Area is Mine Tailing Riparian Woodland, Mixed Riparian Scrub, and Valley Grassland above sea level.

Direct and Indirect Effects of the Alternative

Activities under the No Action/No Project Alternative are anticipated to result in loss of loggerhead shrike habitat to development and related infrastructure. Activities would remove approximately 554 acres of nesting habitat, approximately 23,429 acres of nesting/foraging habitat, and approximately 9,161 acres of foraging habitat (Table 9-18). Of this habitat loss, approximately 30,431 acres would occur within the UDA, and approximately 2,713 acres would occur outside of the UDA.

Table 9-18. Direct Effects and Conservation of Modeled Habitat for Loggerhead Shrike Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing Modeled Habitat	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Nesting Habitat					
Mixed Riparian Woodland	5,785	147	2.5%	0	256
Mixed Riparian Scrub	1,424	189	13.0%	0	298
Mine Tailing Riparian Woodland	641	218	34.0%	0	0
Total Nesting Habitat	*7,850*	*554*	*7.0%*	*0*	*554*
Nesting/Foraging Habitat					
Valley Grassland	135,112	23,429	17.3%	11,806	0
Total Nesting/Foraging Habitat	*135,112*	*23,429*	*17.3%*	*11,806*	*0*
Foraging Habitat					
Cropland	47,905	5,703	11.9%	5,119	0
Irrigated Pasture-Grassland	15,991	2,781	17.4%	2,496	0
Vernal Pool	4,536	322	6.9%	1,030	322
Seasonal Wetland	2,600	115	4.4%	8	57
Swale	1,252	240	19.1%	602	240
Total Foraging Habitat	*72,284*	*9,161*	*12.7%*	*9,255*	*619*
Total Modeled Habitat	**215,246**	**33,144**	**15.4%**	**21,061**	**1,173**

The No Action/No Project Alternative would also result in indirect effects to loggerhead shrike and its habitat which are analyzed qualitatively below. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The discussion below focuses on those stressors that may result in indirect impacts to loggerhead shrike and modeled habitat for the species.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, especially during storm events. Such increases can result in stream bank erosion, increased sediment loads downstream, and alterations of downstream hydrology, which can remove or physically damage the surrounding riparian habitat that is modeled nesting habitat for loggerhead shrike.

Development may result in an increased wildfire frequency due to increased potential for ignitions associated with greater human presence and activities. Wildfire is a natural part of the ecosystem, and riparian loggerhead shrike habitat can recover quickly from low-intensity fires. However, with decades of fire suppression, the amount of fuel may have built up to levels that

would increase the intensity of wildfires. Should wildfires be of sufficient intensity to result in high levels of mortality to riparian vegetation, this would result in a removal of nesting habitat for loggerhead shrike until sufficient regrowth occurs.

The increased use of pesticides (e.g., rodenticides, insecticides) that may occur within adjacent developed parcels could also decrease prey availability within remaining foraging habitat for loggerhead shrike.

Habitat fragmentation by new urban development within the UDA may reduce the patch size of remaining modeled habitat to the point where the habitat is no longer suitable for loggerhead shrike. Also, habitat fragmentation can result in an increase in the distance required for loggerhead shrike to move between remaining modeled nesting and foraging habitat, increasing the time away from the nest, which can result in reduced nest success. Also, habitat fragmentation would increase the influence of other stressors by increasing the amount of foraging and nesting habitat within the UDA exposed to edge effects from adjacent land uses.

In addition, construction activities under the No Action/No project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on loggerhead shrike, primarily during nesting, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in nest disturbance or failure and may injure or kill individual loggerhead shrike. These temporary stressors can also result in disturbance of foraging behavior that can result in reduced nest success and in the injury or death of individual loggerhead shrikes.

The No Action/No Project Alternative is not expected to remove any of the 34 documented occurrences of loggerhead shrike in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to loggerhead shrike modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in re-establishment/establishment of approximately 1,173 acres of modeled habitat and approximately 21,061 acres of modeled habitat preservation for loggerhead shrike. The acres preserved under the No Action/No Project Alternative would often not be part of a coordinated and linked Preserve System, but rather preserved on a project-by-project basis as described in Section 2.2.4.

Cumulative Effect of the Alternative

The land cover types that make up loggerhead shrike modeled habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these

past and present projects on loggerhead shrike and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect loggerhead shrike, as a whole these actions would result in the continued loss of loggerhead shrike habitat, as well as indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA review, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for loggerhead shrike.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 33,144 acres) and indirect impacts to modeled loggerhead shrike habitat. The modeled habitat preserved (approximately 21,061 acres) would be less than the acreage of modeled habitat lost. In addition the No Action/No Project Alternative would result in approximately 1,173 acres of modeled habitat re-established/established. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental impacts of the No Action/No Project Alternative on loggerhead shrike, when considered together with the significant impacts to loggerhead shrike from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.17 Effects on Grasshopper Sparrow and Its Habitat

Basic habitat information and documented occurrence in the Planning Area for grasshopper sparrow (*Ammodramus savannarum*) are described in Appendix G. The EIS/EIR considers potentially suitable habitat within the Planning Area to be Irrigated Pasture-Grassland and Valley Grassland above sea-level.

Direct and Indirect Effects of the Alternative

Estimated losses of habitat potentially suitable for grasshopper sparrow under the No Action/No Project Alternative consist of approximately 2,781 acres of Irrigated Pasture and approximately 23,429 acres of Valley Grassland for a total land cover loss of approximately 26,210 acres. Of this habitat loss, approximately 24,301 acres would occur within the UDA, and approximately 1,909 acres would occur outside of the UDA.

The No Action/No Project Alternative is also expected to result in permanent indirect effects on grasshopper sparrow and potentially suitable habitat, which may result in degradation of remaining habitat and disturbance or loss of individuals. These impacts are analyzed qualitatively here. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The following discussion focuses on those stressors that may result in indirect impacts to grasshopper sparrow and potentially suitable habitat for the species.

Noise, lighting, and human activity associated with urban development could degrade remaining modeled nesting habitat by disturbing nesting activity of grasshopper sparrow adjacent to development, potentially causing nest abandonment. Increased human activity can also increase the numbers of pests and medium-sized predators in modeled habitat which could result in increased nest predation on the ground-nesting grasshopper sparrow.

Habitat fragmentation would increase the influence of other stressors by increasing the amount of potentially suitable habitat within the UDA exposed to edge effects from adjacent land uses.

In addition, construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on grasshopper sparrow, primarily during nesting, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in nest disturbance or failure and injure or kill individual grasshopper sparrow. These temporary stressors can also result in disturbance of foraging behavior that can result in reduced nest success and result in the injury or death of individual grasshopper sparrows.

The No Action/No Project Alternative would result in approximately 14,302 acres of preservation of land covers that provide suitable habitat for grasshopper sparrow through project mitigation. This habitat preservation would be implemented on a project-by-project basis and would often not be part of a coordinated and linked Preserve System.

Cumulative Effect of the Alternative

The Valley Grassland and Irrigated Pasture Grassland that make up potentially suitable habitat for grasshopper sparrow within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1.

In addition to past and current development effects, reasonably foreseeable future activities within the Planning Area (Section 3.7.2) would result in continued loss of grasshopper sparrow habitat, as well as indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining habitat. Neither of the land cover types that make up grasshopper sparrow habitat are subject to stringent mitigation requirements that would substantially avoid, minimize, or compensate for losses, though grasshopper sparrow is a California Species of Concern and additional mitigation may be required as a result of CEQA review of individual projects.

The expected impacts of the No Action/No Project Alternative on grasshopper sparrow potentially suitable habitat total approximately 26,210 acres. The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) may require mitigation for impacts on grasshopper sparrow suitable habitat for projects that undergo environmental review under NEPA and CEQA, which is estimated to result in the preservation of approximately 14,302 acres of potentially suitable habitat, although this preservation would occur on a project-by-project basis and would often not be part of a coordinated Preserve System.

Therefore, the incremental impacts of the No Action/No Project Alternative on grasshopper sparrow, when considered together with the significant impacts to grasshopper sparrow from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect.

9.2.2.18 Effects on Song Sparrow (Modesto Population) and Its Habitat

Basic habitat information for song sparrow (*Melospiza melodia*) within the Planning Area is found in Table 9-3 and Appendix G. The land cover types in the Planning Area that are utilized by song sparrow are Seasonal Wetland, Freshwater Marsh, and Mixed Riparian Scrub above sea level.

Direct and Indirect Effects of the Alternative

The estimated potentially suitable song sparrow habitat loss due to loss of these land cover types under the No Action/No Project Alternative would total approximately 448 acres.

The No Action/No Project Alternative would also result in indirect effects to song sparrow and its habitat, which are analyzed qualitatively below. As with the direct impacts discussed

previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The discussion below focuses on those stressors that may result in indirect impacts to song sparrow and potentially suitable habitat for the species.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, which is likely to contain petroleum products, pesticides, and other toxins that may reduce water quality within modeled nesting and foraging habitat and may injure or kill song sparrow when the birds are exposed to toxins either through direct contact or by ingesting contaminated prey items.

Human activity associated with urban development could degrade remaining modeled nesting habitat by disturbing nesting activity of song sparrow adjacent to development.

The increased use of pesticides in adjacent developed parcels could decrease prey availability in remaining modeled foraging habitat, reduce nesting success, and in some cases cause injury and death of individuals.

Changes to the wildlife community, including an increase in abundance of medium-sized predators that are often associated with development, could increase predation on song sparrow resulting in the injury and death of individuals.

Habitat fragmentation by new urban development may increase the distance required for song sparrow to move between remaining suitable nesting and foraging habitat, which can result in reduced nest success. In addition, habitat fragmentation would increase the influence of other stressors by increasing the amount of suitable habitat within the UDA exposed to edge effects from adjacent land uses.

Construction activities under the No Action/No Project Alternative are expected to have temporary effects (Section 3.6.5 and Section 9.1.2) on song sparrow, primarily during nesting, which are analyzed qualitatively here. Temporary environmental stressors (Appendix G) such as construction noise, construction lighting, and increased human presence may result in disturbance, injury, or death of individual song sparrow.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to song sparrow modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in re-establishment/establishment of 318 acres of modeled habitat and 24 total acres of preservation of song sparrow habitat, which equals the habitat loss under this alternative.

Cumulative Effect of the Alternative

The land cover types that make up song sparrow potentially suitable habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1.

In addition to past and current development effects, reasonably foreseeable future activities within the Planning Area (Section 3.7.2) would result in continued loss of song sparrow potentially suitable habitat, as well as indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining potentially suitable habitat, although for projects subject to CEQA and NEPA review these impacts would likely be mitigated under the future regulatory environment described Section 2.2.2.

The expected impacts of the No Action/No Project Alternative on song sparrow potentially suitable habitat total approximately 448 acres. The regulatory environment under the No Action/No Project Alternative is anticipated to result in the re-establishment/establishment approximately 318 acres of potentially suitable habitat. In addition, under the No Action/No Project Alternative, approximately 24 acres of potentially suitable habitat would be preserved, although this preservation and the aforementioned re-establishment/establishment would occur on a project-by-project basis and often not be part of a coordinated Preserve System.

Therefore, the incremental impacts of the No Action/No Project Alternative on song sparrow, when considered together with the significant impacts to song sparrow from past and current human activities and the reasonably foreseeable future projects within the study area, would result in a ***Significant Cumulative*** effect

9.2.2.19 Effects on Bank Swallow and Its Habitat

Basic habitat information and occurrence within the Planning Area of bank swallow (*Riparia riparia*) are described in Appendix G. Bank swallow is associated with large cut banks in riverine habitats and sand bluffs where it builds nest burrows, and with surrounding areas that it uses for foraging habitat.

Direct and Indirect Effects of the Alternative

Documented occurrences within the Planning Area are along the Cosumnes River between Rancho Murieta and Sloughhouse. The expected loss of bank swallow nesting habitat under the No Action/No Project Alternative is analyzed qualitatively, because the land cover definition does not specifically consider exposed stream banks and other features required by this species for nesting colonies. However, there are no activities under the No Action/No Project

Alternative expected to result in the loss of exposed stream banks along the Cosumnes River or in the loss of foraging habitat within close proximity to known nest colonies.

Activities under the No Action/No Project Alternative are not likely to result in permanent indirect and temporary effects on bank swallow or the preservation of habitat through mitigation.

Cumulative Effect of the Alternative

Past flood control and bank stabilization projects in the Planning Area discussed in Section 3.7.1 have reduced nesting habitat for bank swallow, and foraging habitat has been lost, degraded, and fragmented by urban and suburban development and associated infrastructure.

Reasonably foreseeable future activities within the Planning Area under the No Action/No Project Alternative are not expected to result in the loss of exposed stream banks along the Cosumnes River or in the loss of foraging habitat within close proximity to known nest colonies.

Therefore, the incremental impact of the No Action/No Project Alternative on bank swallow, when considered together with the impacts of past, current, and reasonably foreseeable projects, would result in a ***Less Than Significant Cumulative*** effect.

9.2.2.20 Effects on Western Red Bat and Its Habitat

Habitat use, natural history, and documented occurrences of western red bat (*Lasiurus blossevillii*) within the Planning Area are described in Appendix G. Modeled foraging habitat within the Planning Area is Valley Grassland, Blue Oak Woodland, Blue Oak Savanna, Orchard, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, Mixed Riparian Scrub, Vernal Pool, Seasonal Wetland, Swale, Freshwater Marsh, Open Water, and Stream/Creek above sea level. Modeled roosting habitat within the Planning Area is Blue Oak Woodland, Blue Oak Savanna, Orchard, Mine Tailing Riparian Woodland, and Mixed Riparian Woodland above sea level.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would result in the removal of approximately 24,763 acres of foraging habitat and approximately 725 acres of roosting/foraging habitat for western red bat (Table 9-19), the majority of this loss (approximately 23,535 acres) would be within the UDA. The habitat shown (Table 9-19) are only those natural land covers that may be used by the species and is an underestimation of total habitat remaining, as western red bat is known to roost and forage in developed areas with sufficient mature tree cover, and those acres are not included in the analysis. While newly developed acres under the No Action/No Project Alternative may contain trees that could provide habitat for western red bat in the future, given

the time for newly planted trees to mature, newly developed acres are considered habitat loss in this analysis.

Table 9-19. Direct Effects and Conservation of Modeled Habitat for Western Red Bat Under the No Action/No Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Modeled Habitat Lost*	*Habitat Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Foraging Habitat					
Valley Grassland	135,112	23,429	17.3%	11,806	0
Vernal Pool	4,536	322	7.1%	1,030	322
Seasonal Wetlands	2,600	115	4.4%	8	57
Freshwater Marsh	2,922	144	4.9%	16	72
Stream/Creek	2,674	149	5.6%	0	75
Open Water	2,344	175	7.5%	0	87
Mixed Riparian Scrub	1,451	189	13.0%	0	298
Swale	1,252	240	19.1%	602	240
Total Foraging Habitat	*152,891*	*24,763*	*16.2%*	*13,462*	*1,151*
Roosting/Foraging Habitat					
Blue Oak Woodland	9,132	54	0.9%	27	27
Mixed Riparian Woodland	5,785	147	2.5%	0	256
Blue Oak Savanna	5,637	86	1.5%	43	43
Orchards	3,646	220	6.0%	197	0
Mine Tailing Riparian Woodland	641	218	34.0%	0	0
Total Roosting/Foraging Habitat	*24,841*	*725*	*3.0%*	*267*	*326*
Total Modeled Habitat	**177,732**	**25,488**	**14.3%**	**13,729**	**1,477**

The No Action/No Project Alternative would also result in indirect effects to western red bat and its habitat, which are analyzed qualitatively below. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The discussion below focuses on those stressors that may result in indirect impacts to western red bat and modeled habitat for the species.

By permanently increasing the extent of impermeable surfaces, urban development may result in increased runoff, which is likely to contain petroleum products, pesticides, and other toxins that may reduce water quality within modeled foraging habitat and may injure or kill western red bat that are exposed to toxins either through direct contact or by ingesting contaminated prey items. The increased use of pesticides (e.g., insecticides) that may occur within adjacent

developed parcels could also decrease prey availability within remaining foraging habitat for western red bat.

Development may result in an increased wildfire frequency due to increased potential for ignitions associated with greater human presence and activities. Wildfire is a natural part of the riparian and oak woodland ecosystem, and western red bat habitat can recover quickly from low-intensity fires. However, with decades of fire suppression, the amount of fuel may have built up to levels that would increase the intensity of wildfires. Should wildfires be of sufficient intensity to result in high levels of mortality to riparian vegetation or oaks, this would result in a removal of roosting and foraging habitat for western red bat until sufficient regrowth occurs.

Changes to the wildlife community included an increase in medium sized predators that are often associated with development as well as pets that could increase predation on western red bats.

Habitat fragmentation by new urban development within the UDA may increase the distance required for western red bat to move between remaining modeled roosting and foraging habitat, increasing energy demands. Also, habitat fragmentation would increase the influence of other stressors by increasing the amount of foraging and roosting habitat within the UDA exposed to edge effects from adjacent land uses.

Construction activities under the No Action/No Project Alternative may also result environmental stressors (Appendix G) that can temporarily reduce habitat quality and impact individual western red bats. These stressors include vegetation and tree removal, which can result in the abandonment of roost sites.

The No Action/No Project Alternative is expected to remove three of the seven documented occurrences of western red bats in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to western red bat modeled habitat for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in the re-establishment/establishment of approximately 1,477 acres of modeled habitat, approximately 13,729 total acres of modeled habitat preservation for western red bat, approximately 13,462 acres of foraging habitat, and approximately 267 acres of roosting/foraging habitat. The acres conserved under the No Action/No Project Alternative would often not be part of a coordinated and linked Preserve System, but rather would be conserved on a project-by-project basis as described in Section 2.2.4.

Cumulative Effect of the Alternative

The land cover types that make up western red bat modeled habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on western red bat and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect western red bat, as a whole these actions would result in the continued loss of western red bat habitat, as well as indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA, review these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2. Mitigation for impacts of future projects and activities under ESA and CWA requirements would ensure that there would be no net loss of acreage, function, and/or value for aquatic land covers that are modeled habitat for western red bat.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 25,488 acres) and indirect impacts to modeled western red bat habitat. The modeled habitat preserved (approximately 13,729 acres) would be less than the acreage of modeled habitat lost. In addition, the No Action/No Project Alternative would result in approximately 1,477 acres of modeled habitat re-established/established. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to western red bat, when considered together with the significant impacts to western red bat from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

9.2.2.21 Effects on American Badger and Its Habitat

Habitat use, natural history, known occurrences, and existing acres of modeled habitat in the Planning Area of American badger are described in Appendix G. Modeled habitat is Blue Oak Savanna, Valley Grassland, Vernal Pool, Seasonal Wetland, and Swale above sea level.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would result in the loss of approximately 24,192 acres of American badger modeled habitat to development and related infrastructure (Table 9-20). The majority of this loss of modeled habitat would occur within the UDA (23,134 acres) due to the intersection of urban development with modeled habitat in this area.

Table 9-20. Direct Effects and Conservation of Modeled Habitat for American Badger Under the No Action/No Project Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing*	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/ Establishment*
Valley Grassland	135,112	23,429	17.34%	11,806	0
Blue Oak Savanna	5,637	86	1.53%	43	43
Vernal Pool	4,536	322	7.12%	1,030	322
Seasonal Wetland	2,600	115	4.42%	8	57
Swale	1,252	240	19.09%	602	240
Total Modeled Habitat	**149,137**	**24,192**	**16.22%**	**13,489**	**662**

The No Action/No Project Alternative would also result in indirect effects to American badger and its habitat, which are analyzed qualitatively below. As with the direct impacts discussed previously, the greatest impact of these indirect effects would be within the UDA due to the intersection of development and suitable habitat in that area. The various environmental stressors that may result from activities under the No Action/No Project Alternative are described in Appendix G. The discussion below focuses on those stressors that may result in indirect impacts to American badger and modeled habitat for the species.

Alterations to hydrology can reduce prey availability in aquatic habitats areas by impacting aquatic vegetation. The increased use of pesticides in adjacent developed parcels (i.e., rodenticides) along with an increase in medium-sized predators that are often associated with urban settings could also reduce prey availability.

Chronic ground vibration, noise, lighting, and increased human activity resulting from nearby development could disturb foraging activity and result in abandonment of burrows. New development would also increase traffic, which could result in increased vehicle collisions and injury and death of American badger.

Habitat fragmentation due to loss of habitat to development would increase the influence of other stressors (e.g., human activity) by increasing the amount of habitat exposed to edge effects from adjacent urban development within the UDA.

Construction activities under the No Action/No Project Alternative may also result in temporary reduction in foraging habitat quality and disturbance of individual American badger, which could lead to reproductive failure. These effects would be caused by stressors (Appendix G) including trampling of vegetation, construction vibration, construction noise and lighting, increased human presence, and trash and debris.

The No Action/No Project Alternative is not expected to remove any of the nine documented occurrences of American badger in the Planning Area.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to American badger for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in the re-establishment/establishment of approximately 662 acres of modeled habitat and approximately 13,489 acres of preservation of modeled habitat for American badger through project mitigation requirements for the project-by-project regulatory compliance. As discussed in Section 2.2.4, the acres conserved under the No Action/No Project Alternative would often not be part of a coordinated and linked Preserve System, but rather would be conserved on a project-by-project basis.

Cumulative Effect of the Alternative

The land cover types that make up American badger modeled habitat within the Planning Area have been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on American badger and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect American badger, as a whole these actions would result in the continued loss of American badger habitat, as well as indirect impacts (e.g., habitat fragmentation, increased human disturbance) to remaining modeled habitat. For future

projects and activities subject to CEQA and NEPA review, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 24,192 acres) and indirect impacts to modeled American badger habitat. The modeled habitat preserved (approximately 13,489 acres) would be less than the acreage of modeled habitat lost. In addition the No Action/No Project Alternative would result in approximately 662 acres of modeled habitat re-established/established. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to American badger, when considered together with the significant impacts to American badger from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

9.2.2.22 Effects on Sanford's Arrowhead and Its Habitat

Documented occurrences within the Planning Area of Sanford's arrowhead (*Sagittaria sanfordii*) are provided in Appendix G. Modeled habitat for Sanford's arrowhead is all Seasonal Wetland, Freshwater Marsh, Open Water, and Stream/Creek above sea level that coincides with specific slopes and soils.

Direct and Indirect Effects of the Alternative

The No Action/No Project Alternative would result in the permanent loss of approximately 12,065 acres of Sanford's arrowhead modeled habitat due to development and related infrastructure (Table 9-21). Of this loss approximately 10,844 acres would occur within the UDA.

Table 9-21. Direct Effects and Modeled Habitat Conservation for Sanford's Arrowhead Under the No Action/No Project Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing*	*Direct Effect*	*% of Existing Habitat Lost*	*Modeled Habitat Preservation*	*Modeled Habitat Re-establishment/Establishment*
Freshwater Marsh	2,044	119	5.8%	16	60
Open Water	1,086	80	7.4%	0	40
Seasonal Wetlands	1,425	81	5.7%	8	41
Streams/Creeks	893	109	12.2%	0	55
Valley Grassland	47,375	11,676	24.6%	5,883	0
Total Modeled Habitat	**52,823**	**12,065**	**22.8%**	**5,907**	**196**

As discussed previously for direct impacts, the majority of indirect impacts to Sanford's arrowhead under the No Action/No Project Alternative would occur within the UDA as a result of urban development. The various environmental stressors that may result from activities under the No Action/No Project Alternative and that would result in indirect effects on Sanford's arrowhead and its habitat described here and in Appendix G.

By permanently increasing the extent of impermeable surfaces, urban development and roads may result in increased runoff, especially during storm events. Such increases can result in increased inundation periods for seasonal wetlands and alterations of downstream hydrology in streams and creeks. Also, addition of new development may permanently increase the potential for ongoing discharge of pollutants such as grease, oil, fertilizers, and lawn pesticides within habitat for Sanford's arrowhead, which could degrade modeled habitat.

Development could also impact Sanford's arrowhead by increasing the presence of invasive plants through species escaping from landscaping, which could outcompete Sanford's arrowhead.

Development may result in an increased wildfire frequency due to increased ignition sources. Wildfire is a natural part of the ecosystem, and low-intensity fires would not adversely impact Sanford's arrowhead. However, increased fire frequency would require more fire suppression activities around developed areas that would result in ground disturbance, which would result in habitat removal.

Development under the No Action/No Project Alternative would likely result in habitat fragmentation that would inhibit seed dispersal and movement of pollinators for Sanford's arrowhead. Habitat fragmentation can also increase the impact of other indirect environmental stressors listed here (e.g., urban runoff, invasive plants) on Sanford's arrowhead by increasing the area of impact from these stressors relative to the area of the intact habitat patch.

There are 64 documented occurrences in the Planning Area, most of which occur outside the UDA. Of these occurrences, six would be lost to development under the No Action/No Project Alternative.

The regulatory environment under the No Action/No Project Alternative (Section 2.2.2) would require mitigation for impacts to Sanford's arrowhead for projects that undergo environmental review under NEPA or CEQA. The anticipated mitigation would be required on a project-by-project basis and would result in the re-establishment/establishment of approximately 196 acres of modeled habitat and approximately 5,907 acres of preservation of modeled habitat for Sanford's arrowhead though project mitigation requirements for the project-by-project regulatory compliance.

Cumulative Effect of the Alternative

Sanford's arrowhead modeled habitat within the Planning Area has been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on American badger and its habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect Sanford's arrowhead, as a whole these actions would result in the continued loss of American badger habitat, as well as indirect impacts (e.g., habitat fragmentation, increased urban runoff) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA review these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct (approximately 12,065 acres) and indirect impacts to modeled Sanford's arrowhead habitat. The modeled habitat preserved (approximately 5,907 acres) under the No Action/No Project Alternative would be less than the acreage of modeled habitat lost. In addition the No Action/No Project Alternative would result in approximately 196 acres of modeled habitat re-established/established. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to Sanford's arrowhead, when considered together with the significant impacts to Sanford's arrowhead from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

9.2.2.23 Effects on Other Special-Status Plant Species and Their Habitat

There are 18 special-status plant species with potential to occur in the Planning Area that are not covered by the SSHCP and are analyzed here (Table 9-2). Information on the process to select these species, their habitat associations, and occurrence in the Planning Area is provided in Appendix G. These plant species are predominately associated with five SSHCP land cover categories: Vernal Wetlands, Non-vernal Wetlands, Riparian Habitats, Blue Oak Woodland and

Savanna, and Valley Grassland. The No Action/No Project Alternative is expected to result in loss of land covers that provide suitable habitat for these species as shown in Table 9-22.

Direct and Indirect Effects of the Alternative

New development and transportation infrastructure would have indirect effects on special-status plant species not covered by the SSHCP that would be the same type and character as those discussed for Sanford's arrowhead previously. Effects may include increased exposure to pollutants and increased presence of invasive plant species, with the addition of specific environmental stressors on vernal pool hydrology (see the analysis of vernal pool invertebrates and plants in Section 9.2.2.1) that would indirectly adversely impact those special-status plant species analyzed here that are modeled to occur within the vernal pool ecosystem (e.g., bristly sedge (*Carex comosa*), Bolander's water-hemlock (*Cicuta maculata* var. *bolanderi*), Tuolumne button-celery (*Eryngium pinnatisectum*), and saline clover (*Trifolium hydrophilum*)). In addition, construction activities under the No Action/No Project Alternative may result in temporary effects as discussed for Sanford's arrowhead in Section 9.2.2.23.

Table 9-22. Total Loss of Potentially Suitable Habitat for Other Special-status Plants Under the No Action/No Project Alternative

Plant Name (status)*	Total Planning Area (acres)								
	Loss of Potentially Suitable Habitat (direct and indirect)					*Total Habitat Loss*	*% of Existing Potentially Suitable Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment/ Establishment*
	Vernal Wetlands	*Non-vernal Wetlands*	*Riparian*	*Blue Oak Woodland /Savanna*	*Valley Grassland*				
Watershield (State S2)	—	259	—	—	—	259	4.6%	24	129
Bristly sedge (State S2)	562	259	—	—	—	821	7.2%	1,656	691
Fleshy owl's clover (Federal - T; State - E)	—	259	—	—	—	259	4.6%	24	129
Brandegee's clarkia (State S2)	—	—	—	140	—	140	0.9%	70	70
Bolander's water-hemlock (State S2)	562	259	554	—	—	1,375	7.1%	1,656	1,245
Peruvian dodder (CRPR 2B.2)	—	259	—	—	—	259	4.6%	24	129
Tuolumne button-celery (State S2)	562	—	—	140	—	702	3.4%	1,702	632
Stinkbells (State S3)	—	—	—	140	23,429	23,569	15.7%	11,876	70
Woolly rose-mallow (State S2)	—	259	—	—	—	259	4.6%	24	129
Northern California black walnut (State S1)	—	—	554	—	—	554	7.0%	0	554
Delta tule pea (State S2)	—	259		—	—	259	4.6%	24	129
Heckard's pepper-grass (State S2)	—	—	—	—	23,429	23,429	17.3%	11,806	0
Mason's lilaeopsis (State S2)	—	259	554	—	—	813	6.0%	24	683
Delta mudwort (State S2)	—	259	554	—	—	813	6.0%	24	683
Marsh skullcap (State S1)	—	259		—	—	259	4.6%	24	129

Table 9-22. Total Loss of Potentially Suitable Habitat for Other Special-status Plants Under the No Action/No Project Alternative

Plant Name (status)*	Total Planning Area (acres)								
	Loss of Potentially Suitable Habitat (direct and indirect)					*Total Habitat Loss*	*% of Existing Potentially Suitable Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment/ Establishment*
	Vernal Wetlands	*Non-vernal Wetlands*	*Riparian*	*Blue Oak Woodland /Savanna*	*Valley Grassland*				
Side-flowering skullcap (State S1)	—	259	—	—	—	259	4.6%	24	129
Suisun marsh aster (State S2)	—	259	—	—	—	259	4.6%	24	129
Saline clover (State S2)	562	259	—	—	23,429	24,250	16.6%	13,462	691

Modeled Habitat Definitions:
Vernal Wetlands: Vernal Pool, Swale
Non-vernal Wetlands: Freshwater Marsh, Seasonal Wetland
Riparian: Mine Tailing Riparian Woodland, Mixed Riparian Scrub, Mixed Riparian Woodland

For species with state or federal status no CRPR listing used.
Status Definitions
Federal:
E = listed as endangered under the ESA
T = listed as threatened under the ESA

State:
E = listed as endangered under CESA
T = listed as threatened under CESA
S1 = Critically Imperiled by the State
S2 = Imperiled by the State
S3 = Vulnerable by the State

California Rare Plant Rank (CRPR)
1A = Presumed extirpated in California and either rare or extinct elsewhere
1B = Rare, threatened, or endangered in California and elsewhere
2A = Presumed extirpated in California, but more common elsewhere
2B = Rare, threatened, or endangered in California, but more common elsewhere
3 = Plants which need more information and on the Review list
4 = Plants of limited Distribution – Watch List

CRPR Threat Ranks
0.1 = Seriously threatened in California (high degree/immediacy of threat)
0.2 = Moderately threatened in California (moderate degree/immediacy of threat)
0.3 = Not very threatened in California (low degree/immediacy of threats or no current threats known)

The No Action/No Project Alternative is expected to result in conservation of habitat for these special-status plants through project-by-project mitigation required by existing policies and regulations (Section 9.1.1), and would often not be part of a coordinated and linked Preserve System (Section 2.2.4). The acres of estimated habitat conservation for each species are shown in Table 9-22.

Critical habitat has been designated for fleshy owl's clover (*Castilleja campestris* var. *succulenta)* south of Dry Creek at the extreme southern edge of the Planning Area. The No Action/No Project Alternative is not expected to impact any of this designated Critical Habitat for fleshy owl's clover.

Cumulative Effect of the Alternative

Potentially suitable habitat within the Planning Area for special-status plants not covered by the SSHCP has been lost, degraded, and fragmented by other past and present urban and suburban development and associated infrastructure as described in Section 3.7.1. The effects of these past and present projects on special-status plants and their habitat are reflected in the current conditions for the species as discussed in Appendix G.

Reasonably foreseeable future actions, as described in Section 3.7.2, consist of actions that are similar in nature to the past and present actions in the Planning Area. Although not every reasonably foreseeable future action would affect special-status plants, as a whole these actions would result in the continued loss of special-status plant habitat, as well as indirect impacts (e.g., habitat fragmentation, increased urban runoff) to remaining modeled habitat. For future projects and activities subject to CEQA and NEPA review, these impacts would be mitigated under the regulatory environment described in Sections 9.1.1 and 2.2.2.

As discussed previously in this impact section, the development and related infrastructure under the No Action/No Project Alternative would result in direct and indirect impacts to modeled special-status plant species habitat (Table 9-22). The modeled habitat preserved under the No Action/No Project Alternative would, in most cases, be less than the acreage of modeled habitat lost. In addition for species other than Heckard's pepper-grass (*Lepidium latipes* var. *heckardii*), the No Action/No Project Alternative would also re-establish/establish modeled habitat. However, under the No Action/No Project Alternative, preserved and re-established/established habitat would often be geographically fragmented and not adaptively managed to provide conservation at a landscape scale due to the project-by-project nature of the mitigation. This mitigation scenario would increase indirect effects such as habitat fragmentation and would result in a decrease in the value of modeled habitat for the species.

Therefore, the incremental direct and indirect impacts of No Action/No Project Alternative to other special-status plants, when considered together with the significant impacts to other special-status plants from past, current, and foreseeable future projects and activities in the study area, would be a ***Significant Cumulative*** effect.

9.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3.

9.2.3.1 Effects on Vernal Pool Invertebrate/Plant Species and Habitat

As was the case for the No Action/ No Project Alternative above, the following 11 vernal pool invertebrate and plant species are considered together in the analysis of the Proposed Action/Proposed Project due to their dependence on the vernal pool ecosystem: vernal pool tadpole shrimp, vernal pool fairy shrimp, mid-valley fairy shrimp, Ricksecker's water scavenger beetle, dwarf downingia, Ahart's dwarf rush, pincushion navarretia, slender Orcutt grass, Sacramento Orcutt grass, Boggs Lake hedge-hyssop, and legenere.

While the individual natural history, habitat requirements, modeled habitat, and documented occurrences in the Planning Area differ for these species (Appendix G), the direct impact mechanisms (environmental stressors) that cause temporary impacts are the same.

Direct and Indirect Effects of the Alternative

Projects and activities under the Proposed Action/Proposed Project (Section 2.3.3) would permanently remove modeled habitat for vernal pool invertebrate and plant species through development and related infrastructure resulting in direct impacts to vernal pool invertebrate and plant species. While the majority of the urban development and direct impacts would occur within the UDA, transportation and other infrastructure projects resulting in direct impacts would occur outside the UDA. The direct impact acres that would occur under the Proposed Action/Proposed Project Alternative for each species are shown in Table 9-23 and discussed below.

Vernal pool invertebrate and plant species near proposed construction activities under the Proposed Action/Proposed Project Alternative will be adversely affected by several temporary construction-related effects (Appendix G) that will result in disturbance to habitat or harm to vernal pool invertebrate plant and animal species. Generally, these temporary effects will occur within the project boundary or road right-of-way area, which is quantified in the direct effects and the area of indirect impacts to each species in the impact tables below.

As discussed previously for direct impacts, the majority of indirect impacts to vernal pool invertebrate and plant species under the Proposed Action/Proposed Project Alternative would

occur within the UDA, as a result of urban development, although there would be indirect impacts as a result of transportation and other infrastructure projects occurring outside the UDA. The environmental stressors that would trigger indirect impacts under the Proposed Action/Proposed Project Alternative are the same in type and character as those discussed in the impact discussion for vernal pool invertebrate and plant species under the No Action/No Project Alternative in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires covered activities to implement the following AMMs relevant to vernal pool invertebrate and plant species; LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-7 (Hardpan/Duripan Protection), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use), RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool), UTILITY-2 (Utility Maintenance), UTILITY-3 (Trenchless Construction Methods), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Compared to the project avoidance and minimization measures of the No Action/Project Alternative, these SSHCP AMMs would reduce indirect impacts on vernal pool invertebrate and plant species. For example, EDGE-3 establishes a 50-foot setback from the edge of established preserves to minimize indirect effects on Preserve lands, while EDGE-7 would not allow covered activities that could damage duripan within the Preserve Setback to protect the perched aquifer that maintains hydrologic conditions in the vernal pool ecosystem. The indirect impact acres that would occur under the Proposed Action/Proposed Project for each species are shown in Table 9-23 and discussed below.

The maximum anticipated loss of species modeled habitat for vernal pool tadpole shrimp and vernal pool fairy shrimp modeled habitat due to direct impacts would be approximately 17,117 acres (Table 9-23). Indirect effects on vernal pool tadpole shrimp and vernal pool fairy shrimp modeled aquatic habitat are anticipated to result in additional approximately 142 acres of impacts. The total impact, including direct and indirect impacts, of the Proposed Action/Proposed Project Alternative on vernal pool tadpole shrimp and vernal pool fairy shrimp modeled habitat is expected to be approximately 17,259 acres.

Of the modeled vernal pool tadpole shrimp and vernal pool fairy shrimp habitat loss, approximately 8,500 acres would occur within the MCRA, which would affect approximately 46.9% of the modeled habitat within the MCRA. There would also be approximately 53 acres lost within the C/RS, which would affect approximately 0.1% of modeled habitat within the

C/RS. This is a smaller area lost within the MCRA and an approximately equal area lost within the C/RS when compared to the No Action/No Project Alternative.

The total impact of approximately 17,259 acres under the Proposed Action/Proposed Project Alternative on vernal pool tadpole and vernal pool fairy shrimp habitat is approximately 690 acres less than the approximately 17,949 acres of total impact estimated for the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is also expected to remove approximately 695 acres of Critical Habitat for vernal pool tadpole shrimp and vernal pool fairy shrimp in Critical Habitat Unit 13 and approximately 51 acres in Critical Habitat Unit 14a for a total of approximately 746 acres of Critical Habitat lost. This loss is approximately 220 acres less than the approximately 966 acres of designated Critical Habitat that would be removed under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is expected to remove 112 of the 851 documented occurrences of vernal pool tadpole shrimp in the Planning Area, which would be 22 more occurrences than would be removed under the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative is also expected to remove 49 of the 581 documented occurrences of vernal pool fairy shrimp in the Planning Area, which would be 18 more occurrences than would be removed under the No Action/No Project Alternative.

The maximum anticipated direct loss of species modeled habitat for mid-valley fairy shrimp under the Proposed Action/Proposed Project would be approximately 12,553 acres, primarily within the UDA. In addition, indirect impacts on modeled habitat would be approximately 106 acres. The total impacts on modeled habitat, including direct and indirect impacts, would be approximately 12,639 acres within the Planning Area (Table 9-23). Of this habitat loss, approximately 6,280 acres would occur within the MCRA, which would affect approximately 43% of modeled habitat within the MCRA. There would also be approximately 41 acres lost within the C/RS, which would affect approximately 0.4% of modeled habitat within the C/RS. This is a smaller area lost within the MCRA and an approximately equal area lost within the C/RS when compared to the No Action/No Project Alternative.

The total impact area of 12,639 acres for mid-valley fairy shrimp under the Proposed Action/Proposed Project is approximately 581 acres less than the estimated 13,220 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project Alternative is expected to remove 10 of the 37 occurrences of mid-valley fairy shrimp in the Planning Area, which would be 5 more occurrences than would be removed under the No Action/No Project Alternative.

Activities under the Proposed Action/Proposed Project Alternative would cause direct impacts to approximately 17,095 acres of Ricksecker's water scavenger beetle modeled habitat to development and related infrastructure. In addition to this direct impact, approximately 138 acres of indirect impact would also occur for a total impact, direct and indirect combined, of 17,233 acres on Ricksecker's water scavenger beetle modeled habitat. The total impact to Ricksecker's water scavenger beetle modeled habitat would be approximately 16.6% of the existing modeled habitat in the Planning Area (Table 9-23).

The total impact area of 17,233 acres for Ricksecker's water scavenger beetle modeled habitat under the Proposed Action/Proposed Project is approximately 674 acres less than the estimated 17,907 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project Alternative is not expected to remove any of the eight occurrences of Ricksecker's water scavenger beetle in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative future urban development and related infrastructure would cause direct impacts through the loss of approximately 1,963 acres of modeled habitat for dwarf downingia. In addition to this direct impact, approximately 19 acres of indirect impact would also occur for a total impact of approximately 1,982 acres on dwarf downingia modeled habitat. The total impact, including direct and indirect impacts, to dwarf downingia modeled habitat would be approximately 8.1% of the existing modeled habitat in the Planning Area (Table 9-23).

The total impact area of 1,982 acres for dwarf downingia modeled habitat under the Proposed Action/Proposed Project is approximately 56 acres less than the estimated 2,038 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project Alternative is not expected to remove any of the 10 documented occurrences of dwarf downingia in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative would cause permanent loss of approximately 7,332 acres land cover types suitable for Ahart's dwarf rush due to development and related infrastructure. In addition to this direct impact, approximately 71 acres of indirect impact would also occur for a total impact (direct and indirect impacts combined) of approximately 7,403 acres on Ahart's dwarf rush modeled habitat. The total impact to Ahart's dwarf rush modeled habitat would be approximately 29.2% of the existing modeled habitat in the Planning Area (Table 9-23).

The total impact area of 7,403 acres for Ahart's dwarf rush modeled habitat under the Proposed Action/Proposed Project is approximately 658 acres less than the estimated 8,061 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project Alternative is not expected to remove either of the two occurrences of Ahart's dwarf rush in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative would cause loss of approximately 8,201 acres of modeled habitat for pincushion navarretia resulting from development and related infrastructure. In addition to this direct impact, approximately 57 acres of indirect impact would also occur for a total impact (direct and indirect impacts combined) of approximately 8,258 acres on pincushion navarretia modeled habitat. The total impact to pincushion navarretia modeled habitat would be approximately 14.3% of the existing modeled habitat in the Planning Area (Table 9-23).

The total impact area of 8,258 acres for pincushion navarretia modeled habitat under the Proposed Action/Proposed Project is approximately 179 acres less than the estimated 8,437 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project Alternative is not expected to remove any of the 48 occurrences of pincushion navarretia in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative would result in an estimated permanent loss of approximately 7,139 acres of land cover types suitable for slender Orcutt grass and Sacramento Orcutt grass resulting from development and related infrastructure. In addition to this direct impact, approximately 48 acres of indirect impact would also occur for a total impact, including both direct and indirect impacts, of approximately 7,187 acres on slender Orcutt grass and Sacramento Orcutt grass modeled habitat. This total impact would be approximately 20.7% of the total modeled habitat within the Planning Area (Table 9-23). Of this habitat loss, approximately 4,683 acres would occur within the MCRA, which would affect approximately 44.8% of modeled habitat within the MCRA. There would also be approximately 21 acres lost within the C/RS, which would affect approximately 0.1% of modeled habitat within the C/RS. This is a smaller area lost within the MCRA and an approximately equal area lost within the C/RS when compared to the No Action/No Project Alternative.

The total impact area of 7,187 acres for slender Orcutt grass and Sacramento Orcutt grass modeled habitat under the Proposed Action/Proposed Project is approximately 575 acres less than the estimated 7,762 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project alternative is also expected to impact approximately 235 acres of Critical Habitat for Sacramento Orcutt grass in Critical Habitat Unit 2 and approximately 13 acres in Critical Habitat Unit 3, for a total of approximately 248 acres of Critical Habitat lost. This loss of Critical Habitat would be approximately 526 acres less than the 774 acres that is estimated to occur under the No Action/No Project Alternative.

Approximately 235 acres of Critical Habitat for slender Orcutt grass would also be lost in Critical Habitat Unit 6, which would be approximately 475 acres less than the 710 acres of Critical Habitat estimated to be lost under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is expected to remove 1 of the 40 occurrences of Sacramento Orcutt grass and none of the 4 occurrences of slender Orcutt grass in the Planning Area, which would be one fewer occurrence than would be removed under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative would result in loss of approximately 8,672 acres of modeled habitat for Boggs Lake hedge-hyssop resulting from development and related infrastructure. In addition to this direct impact, approximately 52 acres of indirect impact would also occur for a total impact (direct and indirect impacts combined) of approximately 8,724 acres on Boggs Lake hedge-hyssop modeled habitat. The total impact to Boggs Lake hedge-hyssop modeled habitat would be approximately 23.8% of the existing modeled habitat in the Planning Area (Table 9-23).

The total impact area of 8,724 acres for Boggs Lake hedge-hyssop modeled habitat under the Proposed Action/Proposed Project is approximately 524 acres less than the estimated 9,248 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project Alternative is expected to remove four of the existing 31 occurrences of Boggs Lake hedge-hyssop in the Planning Area, which would be two more occurrences than would be removed under the No Action/No Project Alternative.

The No Action/No Project Alternative would result in loss of approximately 10,713 acres of modeled habitat for legenere resulting from development and related infrastructure. In addition to this direct impact, approximately 65 acres of indirect impact would also occur for a total impact (direct and indirect impacts combined) of approximately 10,778 acres on legenere modeled habitat. The total impact to legenere modeled habitat would be approximately 21.1% of the existing modeled habitat in the Planning Area (Table 9-23).

The total impact area of 10,778 acres for legenere modeled habitat under the Proposed Action/Proposed Project is approximately 505 acres less than the estimated 11,283 acres of total loss under the No Action/No Project Alternative (Table 9-4).

The Proposed Action/Proposed Project Alternative is expected to remove 2 of the existing 62 occurrences of legenere in the Planning Area, which would be 1 more occurrence than would be removed under the No Action/No Project Alternative.

Table 9-23. Direct/Indirect Impacts and Conservation of Vernal Pool Invertebrate and Plant Modeled Habitat under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)

* Under SSHCP Objective VP5, re-establishment/establishment to mitigate effects to Stream/Creek (VPIH) will be in the form of Swale, which has been added to the acres necessary to mitigate effects to Swale.

The Conservation Strategy that would be implemented under the Proposed Action/Proposed Project Alternative would result in the acres of modeled habitat preserved and re-established/established for vernal pool invertebrates and plants shown in Table 9-23.

The modeled habitat re-established/established under the Proposed Action/Proposed Project Alterative for pincushion navarretia (approximately 141 acres) and legenere (approximately 130

acres) is smaller than under the No Action/No Project Alternative (approximately 204 acres and 262 acres respectively), although the acres preserved under the Proposed Action/Proposed Project are larger for both species.

For all other vernal pool invertebrates and plants covered by the SSHCP, the acres preserved and acres re-established/established under the Proposed Action/Proposed Project Alternative would exceed the acres preserved and acres re-established/established under the No Action/No Project Alternative.

The Conservation Strategy also includes Biological Goals and Measurable Objectives that would direct the modeled habitat preservation associated with Covered Activities for vernal pool invertebrates and plants within the Planning Area. These biological objectives would include maintenance or improvement of habitat value for vernal pool invertebrates and plants by minimizing indirect effects on modeled habitat within preserves (e.g., development of Preserve management plans and requirements for developments to include setback widths to limit edge effects). The No Action/No Project Alternative would preserve and re-establish/establish vernal pool invertebrate and plant habitat listed in Table 9-4; however, this habitat preservation would not be in an as effectively linked Preserve System, nor would it follow the objectives of the Conservation Strategy as would be implemented under the Proposed Action/Proposed Project Alternative.

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would result in the loss of a smaller area of habitat for vernal pool invertebrate and plant species within the Planning Area when compared to the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve and re-establish/establish more habitat than what is estimated for the No Action/No Project Alternative. The Proposed Action/Proposed Project would also impact a smaller area within the MCRA, compared to the No Action/No Project Alternative, and an equal area within the C/RS, although preservation within the MCRA would also be less than the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative would impact a smaller area of Critical Habitat for vernal pool tadpole shrimp, vernal pool fairy shrimp, slender Orcutt grass, and Sacramento Orcutt grass than the No Action/ No Project Alternative.

The Proposed Action/Project Preserve System would provide some larger vernal pool ecosystem preserves, and increased Preserve connectivity, over the project-by-project mitigation under the No Action/No Project Alternative, maintaining existing vernal pool ecosystem function, which benefits vernal pool invertebrate and plant species.

Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would result in the avoidance or minimization of indirect and temporary effects on vernal pool invertebrate and plant modeled habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative's impact to 11 vernal pool invertebrate and plant species is a ***Significant Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/ No Project baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of a smaller area of habitat for vernal pool invertebrate and plant species within the Planning Area when compared to the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of vernal pool invertebrate and plant species and would preserve additional acres of modeled habitat that exceed the preservation under the No Action/No Project Alternative within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Proposed Action/Proposed Project Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to vernal pool invertebrate and plant species and be operated under a comprehensive preserve management program.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for 11 vernal pool invertebrates and plant species than would occur under the No Action/No Project Alternative. However, at the scale of vernal pool invertebrate and plant species impacts

throughout the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to these species. The Proposed Action/Proposed Project Alternative would result in ***No Cumulative Effect*** to these 11 vernal pool invertebrate and plant species compared to the No Action/No Project Alternative baseline condition.

9.2.3.2 Effects on Valley Elderberry Longhorn Beetle and Its Habitat

The description of valley elderberry longhorn beetle along with modeled species habitat and documented occurrences within the Planning Area can be found in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of species modeled habitats for valley elderberry longhorn beetle is approximately 591 acres, primarily within the UDA due to the intersection of urban development and modeled habitat in this area. This would result in the loss of approximately 7.5% of the existing habitat within the Planning Area (Table 9-24). This would be greater than the anticipated 554 acres removed by activities under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is expected to remove one of the existing 156 occurrences of valley elderberry longhorn beetle in the Planning Area, whereas no occurrences would be removed under the No Action/No Project Alternative.

Table 9-24. Direct Effects and Modeled Habitat Conservation for Valley Elderberry Longhorn Beetle Under the Proposed Action/Proposed Project Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing Modeled Habitat*	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Mine Tailing Riparian Woodland	641	218	34%	218	218*
Mixed Riparian Woodland	5,785	184	3.2%	368	184
Mixed Riparian Scrub	1,452	189	13.0%	378	189
Total Modeled Habitat	**7,878**	**591**	**7.5%**	**1,170**	**591**

* All of the required mitigation acreage to offset losses of Mine Tailing Riparian Woodlands would occur within either Mixed Riparian Scrub or Mixed Riparian Woodland (Table 2-7).

Indirect impacts to valley elderberry longhorn beetle would also occur from the environmental stressors that result from the Proposed Action/Proposed Project Alternative. The indirect effects of these environmental stressors on valley elderberry longhorn beetle are described and

analyzed qualitatively in the valley elderberry longhorn beetle impact discussion for the No Action/No Project Alternative in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires Covered Activities to implement the following AMMs that are relative to valley elderberry longhorn beetle habitat; LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use), STREAM-1 (Laguna Creek Wildlife Corridor), STREAM-2 (UDA Stream Setbacks), STREAM-3 (Minor Tributaries to UDA Streams), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), and NATURE TRAIL-5 (Monitoring of Trail Impacts) (Table 2-6). Relative to the project avoidance and minimization measures of the No Action/Project Alternative, these SSHCP AMMs would further avoid and minimize indirect impacts on valley elderberry longhorn beetle. For example, STREAM-1 though STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled habitat.

There are no species AMMs for valley elderberry longhorn beetle; however, AMMs required of Covered Activities would avoid or minimize temporary direct effects on valley elderberry longhorn beetle and modeled habitat. For example, STREAM-1 through STREAM-3 would require greater setbacks than under the No/Action Alternative thereby increasing protection of riparian modeled habitat, and reducing temporary effects under the Proposed Action/Proposed Project Alternative to be less than under the No Action/No Project.

The Proposed Action/Proposed Project Alternative would include the re-establishment/ establishment of approximately 591 acres of modeled habitat for valley elderberry longhorn beetle (Table 9-24), which would equal the loss under the alternative. This is approximately 37 acres more re-establishment/establishment than would be expected under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative would also preserve approximately 1,170 acres within the Preserve System, while no modeled habitat preservation is anticipated under the No Action/No Project Alternative. The Conservation Strategy also provides two specific objectives for valley elderberry longhorn beetle: the relocation and replacement of damaged or lost elderberry shrubs, and the inclusion of elderberry shrubs in general riparian re-establishment/establishment projects. These objectives would mitigate impacts to individual elderberry shrubs on which this species depends.

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would directly impact approximately 38 acres more modeled habitat for valley elderberry longhorn beetle within the Planning Area than would the No Action/No Project Alternative. Both alternatives would achieve no net loss of acreage of modeled habitat through mitigation; however, the Proposed Action/Proposed Project Alternative would preserve considerably more habitat (approximately 1,170 acres) than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would result in avoidance of indirect and temporary effects on valley elderberry longhorn beetle individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

The Proposed Action/Proposed Project Alternative's impact would be similar to that of the No Action/No Project Alternative but would provide more benefit to the species when considering the additional 1,170 acres of habitat preserved. Therefore, based on the significance criteria in Section 9.2.1, there would be a ***Minor Beneficial*** effect on valley elderberry longhorn beetle when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of 591 acres of modeled valley elderberry longhorn beetle habitat within the Planning Area, which is 38 acres greater than the loss than under the No Action/No Project Alternative. However, as discussed previously, both alternatives are anticipated to mitigate these losses to a no net loss of acreage. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of valley elderberry longhorn beetle and would preserve additional acres of valley elderberry longhorn beetle habitat that exceed the preservation under the No Action/No Project Alternative by 1,170 acres within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous

and more connected preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual preserves in the Preserve System under the Proposed Action/Proposed Project Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to valley elderberry longhorn beetle and be operated under a comprehensive preserve management program.

The incremental effects of the Proposed Action/Proposed Project Alternative would not be significantly different than the incremental effects that would be occur under the No Action/No Project Alternative for valley elderberry longhorn beetle. The Proposed Action/Proposed Project Alternative would result in a ***No Cumulative Effect*** to valley elderberry longhorn beetle compared to the No Action/No Project Alternative baseline condition.

9.2.3.3 Effects on California Tiger Salamander (Central Valley Population) and Its Habitat

The life history, habitat requirements, known occurrences, and existing acres of modeled California tiger salamander (Central Valley population) habitat in the Planning Area are described in detail in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated direct loss of species modeled habitats for California tiger salamander is approximately 1,677 acres of upland habitat and approximately 80 acres of aquatic breeding habitat for the species (Table 9-25). These losses would be 2.0% of the existing modeled upland and 1.8% of the existing modeled aquatic habitat in the Planning Area. Impacts to upland habitat acres are approximately 95 acres less, while impacts to aquatic habitat are approximately 5 acres more than the acres of expected direct impact from the No Action/No Project Alternative of approximately 1,772 acres of upland and approximately 75 acres of aquatic habitat (Table 9-6). This may be due to the majority of California tiger salamander habitat occurring within the UDA in Galt and outside of the UDA in locations where the anticipated development under the two alternatives are very similar in size and scope.

The Proposed Action/Proposed Project Alternative is not expected to remove any of the existing 31 occurrences of California tiger salamanders in the Planning Area; there would also be no occurrences removed under the No Action/No Project Alternative.

Table 9-25. Direct Effects and Conservation of California Tiger Salamander Modeled Habitat Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing	*Direct Effect*	*Indirect Effect*	*Total Effect*	*% of Existing Modeled Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Upland Habitat							
Blue Oak Savanna	3,322	0	Qualitative	0	0.0%	33	0
Blue Oak Woodland	3,774	0	Qualitative	0	0.0%	0	0
Valley Grassland	78,274	1,677	Qualitative	1,677	2.1%	16,144	0
Total Upland Habitat	*85,369*	*1,677*	*Qualitative*	*1,677*	*2.0%*	*16,177*	*0*
Aquatic Habitat							
Vernal Pool	3,033	57	2	59	1.9%	762	58
Seasonal Wetland	1,391	21	Qualitative	21	1.5%	105	21
Total Aquatic Habitat	*4,425*	*79*	*2*	*80*	*1.8%*	*867*	*79*
Total Modeled Habitat	**89,794**	**1,756**	**2**	**1,757**	**2.0%**	**17,062**	**79**

The loss of modeled habitat within the C/RS would be approximately 52 acres, including 46 acres of upland habitat and 6 acres of aquatic habitat. This loss of modeled habitat is approximately equal to the estimated 60 acres of habitat loss within the C/RS under the No Action/No Project Alternative.

None of the 10,193 acres of Critical Habitat for the species in the Planning Area would be lost under the Proposed Action/Proposed Project Alternative. As discussed in Section 9.2.3, the No Action/No project Alternative also would not remove designated Critical Habitat for California tiger salamander.

Indirect effects on modeled California tiger salamander habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects would be the same in type and character as those discussed and analyzed qualitatively for the No Action/No Project in Section 9.2.2. The total quantified indirect effects under the Proposed Action/Proposed Project Alternative would be approximately 4 acres. This would be approximately equal to the quantified indirect impact of 4acres under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs by Covered Activities that are relative to California tiger salamander; LID-1 (Stormwater Quality), LID-3(Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside

Preserves),EDGE-5 Stormwater Control in Preserve Setbacks), EDGE-7 (Hardpan/Duripan Protection), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design) NATURE TRAIL-5 (Monitoring of Trail Impacts), ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3(Roadside Pesticide Use), RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool), RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank), UTILITY-2 (Utility Maintenance), UTILITY-3 (Trenchless Construction Methods), UTILITY-4 (Siting of Entry and Exit Location), and CTS-7 (Rodent control) (Table 2-6). Relative to the project avoidance and minimization measures of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on California tiger salamander. For example, ROAD-2 would require wildlife crossing structures and maintain connectivity between modeled habitats, while CTS-7 would limit rodent control to developed portions of project sites allowing for burrow creation that provides habitat for California tiger salamander. While both of these AMMs may be applied to projects under the No Action/No Project Alternative, they would likely be applied less frequently and not within all modeled habitat.

There are general AMMs that would avoid or minimize temporary effects to California tiger salamander, and species-specific AMMs that would further avoid or minimize temporary impacts on this species: CTS-1(California Tiger Salamander Daily Construction Schedule), CTS-2 (California Tiger Salamander Monitoring), CTS-3 (California Tiger Salamander Exclusion Fencing), CTS-4 (trench protection), CTS-5 (Encounter Protocol), and CTS-6 (erosion control materials) (Table 2-6). Temporary effects under the Proposed Action/Proposed Project Alternative are expected to be less than under the No Action/No Project Alternative as discussed at the beginning of Section 9.2.3.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 17,062 acres of modeled habitat for California tiger salamander. This is greater than the estimated 9,689 acres of modeled habitat preservation under the No Action/No Project Alternative. Of this preserved habitat, approximately 14,435 acres of upland habitat and approximately 752 acres of aquatic habitat are located within the C/RS.

The Conservation Strategy also includes the re-establishment/establishment of approximately 79 acres of modeled California tiger salamander aquatic habitat, which would be fewer acres of re-establishment/establishment than the approximately 117 acres estimated for the No Action/No Project Alternative.

The Conservation Strategy includes the implementation of biological objectives related to California tiger salamander habitat and the species itself within the Planning Area. In addition to the preservation and re-establishment of habitat, the Conservation Strategy would

implement biological objectives related to California tiger salamander that would guide the modeled habitat preservation of habitat for the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 90 fewer acres of habitat for California tiger salamander within the Planning Area than are estimated for the No Action/No Project Alternative, as well as slightly fewer acres in the C/RS. In addition, the Proposed Action/Proposed Project Alternative would preserve considerably more habitat than what is estimated for the No Action/No Project Alternative overall, as well as within the C/RS. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on California tiger salamander individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on California tiger salamander when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative described in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 1,757 acres of modeled California tiger salamander habitat within the Planning Area, which is approximately 90 acres less than the loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as limitations on rodent control, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of California tiger salamander and would preserve additional acres

of California tiger salamander habitat that exceed the preservation under the No Action/No Project Alternative by approximately 7,373 acres within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area on California tiger salamander than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse impacts on this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect on California tiger salamander compared to the No Action/No Project Alternative baseline condition.

9.2.3.4 Effects on Western Spadefoot and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of western spadefoot in the Planning Area are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitats for western spadefoot is approximately 22,043 acres of upland habitat and approximately 1,022 acres of aquatic breeding habitat for the species (Table 9-26). These habitat losses would equal approximately 14.7% of the upland and 7.6% of aquatic habitat for western spadefoot in the Planning Area. This loss is less than the estimated 1,036 acres of aquatic habitat loss and less than the estimated 23,550 acres of upland habitat loss under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is expected to remove 4 of the existing 41 occurrences of western spadefoot in the Planning Area, which would be 3 fewer occurrences than would be removed under the No Action/No Project Alternative.

Table 9-26. Direct Effects and Modeled Habitat Conservation for Western Spadefoot Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing	*Direct Effect*	*Indirect Effect*	*Total Habitat Lost*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Upland Habitat

* Under SSHCP Objective VP5, re-establishment/establishment to mitigate effects to Stream/Creek (VPIH) will be in the form of Swale, which has been added to the acres necessary to mitigate effects to Swale.

** Acres of Open Water Habitat re-established/established will occur as either Freshwater Marsh or Seasonal Wetland

Indirect effects on modeled western spadefoot habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs by Covered Activities that are relative to western spadefoot: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-7 (Hardpan/Duripan Protection), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), NATURE TRAIL-1(Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design) NATURE TRAIL-5 (Monitoring of Trail Impacts),

ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use), RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool), RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank), UTILITY-2 (Utility Maintenance), UTILITY-3 (Trenchless Construction Methods), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project avoidance and minimization measures of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on western spadefoot. For example, ROAD-2 would require wildlife crossing structures and maintain connectivity between modeled habitats, and EDGE-4 would require that stormwater runoff be directed away from Preserves which would limit exposure of western spadefoot within Preserves to urban runoff that may contain pesticides and petroleum products. While both of these AMMs may be applied to projects under the No Action/No Project Alternative, they would likely be applied less frequently.

There are general construction AMMs that would be required of Covered Activities that would avoid or minimize temporary effects to western spadefoot (Table 2.6), along with species-specific AMMs that would further avoid or minimize temporary impacts on this species: WS-1 (Western Spadefoot Design Surveys), WS-2 (Western Spadefoot Work Window), WS-3 (Western Spadefoot Monitoring), WS-4 (Trench Protection), WS-5 (Erosion Control Materials), and WS-6 (Encounter Protocol) (Table 2-5). These construction and species-specific AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary effects under the Proposed Action/Proposed Project Alternative on western spadefoot are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 23,708 acres of modeled habitat for western spadefoot. This modeled habitat preservation would be more than the 13,600 acres of western spadefoot modeled habitat estimated to be conserved under the No Action/No Project Alternative. This acreage preserved under the No Action/No Project Alternative would not be part of an organized Preserve System.

The Conservation Strategy would also establish/re-establish approximately 47 acres of upland habitat and 1,022 acres of aquatic habitat for western spadefoot. The Conservation Strategy would implement biological objectives that support modeled habitat conservation for the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed above, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

The Proposed Action/Proposed Project Alternative is also estimated to preserve 5,176 acres of upland habitat and 520 acres of aquatic habitat located within the MCRA, and approximately

14,436 acres of upland habitat and 1,013 acres of aquatic habitat located within the C/RS for western spadefoot.

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would directly and indirectly adversely affect approximately 1,640 fewer acres of habitat for western spadefoot within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Proposed Action/Proposed Project Alternative would preserve approximately 10,108 more acres of modeled habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would result in reduce avoid or minimized indirect and temporary effects on western spadefoot individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on western spadefoot when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative in Section 9.2.2.

The Proposed Action/Proposed Project Alternative would result in the loss of 23,065 acres of modeled western spadefoot habitat within the Planning Area, which is 1,379 acres less than the loss than under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as limitations on stormwater runoff to Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of western spadefoot. Although the Conservation Strategy would preserve 10,108 more acres of western spadefoot habitat than under the No Action/No Project Alternative, those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for western spadefoot than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect to the western spadefoot compared to the No Action/No Project Alternative baseline condition.

9.2.3.5 Effects on Giant Garter Snake and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat for giant garter snake in the Planning Area are described in detail in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for giant garter snake under the Proposed Action/Proposed Project Alternative total approximately 2,358 acres, including approximately 2,189 acres of upland habitat and 169 acres of aquatic habitat for the species (Table 9-27). These would equal the loss of approximately 7.9% of the upland and 2.3% of aquatic habitat in the Planning Area. The loss of modeled habitat under the Proposed Action/Proposed Project Alternative is less than the approximately 2,501 acres lost under the No Action/No Project Alternative.

Table 9-27. Direct Effects and Modeled Habitat Conservation for Giant Garter Snake Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Upland Habitat					
Mixed Riparian Scrub	1,044	135	12.9%	105	134
Valley Grassland	26,825	2,054	7.7%	5,013	0
Total Upland Habitat	*27,869*	*2,189*	*7.9%*	*5,118*	*134*
Aquatic Habitat					
Seasonal Wetland	1,625	39	2.4%	100	39
Freshwater Marsh	2,589	71	2.7%	127	71
Open Water	1,282	25	2.0%	62	25*
Stream/Creek	1,794	34	1.9%	117	34
Total Aquatic Habitat	*7,290*	*169*	*2.3%*	*406*	*169*
Total Modeled Habitat	**35,159**	**2,358**	**6.7%**	**5,524**	**303**

* Acres of Open Water habitat re-establishment/establishment will occur as a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of open water, as determined by the Technical Advisory Committee (TAC).

The Proposed Action/Proposed Project Alternative is not expected to remove any of the existing 14 occurrences of giant garter snakes in the Planning Area; there would also be no occurrences removed under the No Action/No Project Alternative.

Indirect effects to giant garter snake and its habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs by Covered Activities that are relative to giant garter snake: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 Stormwater Control in Preserve Setbacks), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design) NATURE TRAIL-5 (Monitoring of Trail Impacts), ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use), STREAM-2 (UDA Stream Setbacks), STREAM-3 (Minor tributaries to UDA Streams), UTILITY-2 (Utility Maintenance), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project avoidance and minimization measures of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on giant garter snake. For example, STREAM-2 and STREAM-3 would increase setback distances on UDA streams and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled habitat.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative. These stressors and impacts would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). Covered activities would be required to implement general construction AMMs as well as species-specific AMMs that would avoid or minimize temporary effects to giant garter snake: GGS-1 (Giant Garter snake Design Surveys), GGS-2 (Giant Garter snake Work Window), GGS-3 (Giant Garter snake Monitoring), GGS-4 (Giant Garter snake Habitat Dewatering and Exclusion), GGS-5 (Trench Protection), GGS-6 (Erosion Control Materials), GGS-7 (Encounter Protocol), and GGS-8 (Giant Garter Snake Post-Construction Restoration) (Table 2-6). These construction and species-specific AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary effects under the Proposed Action/Proposed Project Alternative on giant garter snake are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 5,524 acres of giant garter snake modeled habitat, including approximately 5,118 acres of upland habitat and approximately 406 acres of aquatic habitat. This modeled habitat conservation would exceed the estimated total of approximately 3,253 acres of modeled upland and 24 acres of modeled aquatic habitat preservation under the No Action/No Project Alternative. The Conservation Strategy also would establish/re-establish a total of approximately 303 acres of giant garter snake upland and aquatic habitat, compared to 215 acres under the No Action/No Project Alternative, and would implement specific biological objectives for modeled habitat conservation of the species in the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed above, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would adversely affect approximately 143 fewer acres of modeled habitat for giant garter snake within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 2,247 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on giant garter snake individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on giant garter snake when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 2,358 acres of modeled giant garter snake habitat within the Planning Area, which is approximately 143 fewer acres than the loss than

under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy would also include Biological Goals and Measureable Objectives specific to the conservation of giant garter snake. In addition, the Conservation Strategy would preserve approximately 2,247 more acres of giant garter snake habitat than under the No Action/No Project Alternative, and those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for giant garter snake than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect to giant garter snake compared to the No Action/No Project Alternative baseline condition.

9.2.3.6 Effects on Western Pond Turtle and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of western pond turtle in the Planning Area are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for the western pond turtle is approximately 10,972 acres, including approximately 10,656 acres of upland habitat and approximately 316 acres of aquatic habitat (Table 9-28). This would equal approximately 9.6% of the upland and 5.0% of aquatic habitat for the species in the Planning Area. This is less than the expected loss under the No Action/No Project Alternative of approximately 12,160 acres, including approximately 11,783 of upland and approximately 377 acres of aquatic habitat.

The Proposed Action/Proposed Project Alternative is expected to remove 1 of the existing 19 occurrences of western pond turtle in the Planning Area, which would be the same number of occurrences as would be removed under the No Action/No Project Alternative.

Indirect effects to western pond turtle and its habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project in Section 9.2.2 above.

Table 9-28. Direct Effects and Modeled Habitat Conservation for Western Pond Turtle Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area(acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Upland Habitat					
Blue Oak Woodland	7,610	9	0.1%	0	9
Blue Oak Savanna	4,825	35	0.7%	34	35
Valley Grassland	91,580	10,256	11.2%	12,319	0
Mine Tailing Riparian Woodland	306	41	13.4%	37	41*
Mixed Riparian Woodland	5,347	170	3.2%	368	170
Mixed Riparian Scrub	1,178	145	12.3%	14	145
Total Upland Habitat	*110,846*	*10,656*	*9.6%*	*12,772*	*400*
Aquatic Habitat					
Freshwater Marsh	2,240	95	4.2%	127	95
Open Water	1,441	104	7.2%	86	104**
Stream/Creek	2,674	117	4.4%	117	117
Total Aquatic Habitat	*6,355*	*316*	*5.0%*	*330*	*316*
Total Modeled Habitat	**117,201**	**10,972**	**9.4%**	**13,102**	**716**

* Acres of Mine Tailing Riparian habitat re-establishment/establishment will occur as either Mixed Riparian Woodland and/or Mixed Riparian Scrub.

** Acres of Open Water habitat re-establishment/establishment will occur as a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of open water, as determined by the TAC.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs by Covered Activities that are relative to western pond turtle: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design) NATURE TRAIL-5 (Monitoring of Trail Impacts), ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use), STREAM-1 (Laguna Creek Setback), STREAM-2 (UDA Stream Setbacks), STREAM-3 (Minor tributaries to UDA Streams) UTILITY-2 (Utility Maintenance), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project avoidance and minimization measures of the No Action/Project Alternative, these SSHCP AMMs would avoid and minimize indirect

impacts on western pond turtle. For example, STREAM-1, STREAM-2, and STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative. These stressors and impacts would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). Covered activities would be required to implement general construction AMMs, and species-specific AMMs that would avoid or minimize temporary effects to western pond turtle: WPT-1 (Western Pond Turtle Design Surveys), WPT-2 (Western Pond Turtle Work Window), WPT-3 (Western Pond Turtle Monitoring), WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion), WPT-5 (Trench Protection), WPT-6 (Erosion Control Materials) and WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit), WPT-8 (Western Pond Turtle Encounter Protocol), and WPT-9 (Post-Construction Restoration (Table 2-6). These construction and species-specific AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary effects under the Proposed Action/Proposed Project Alternative on western pond turtle are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 13,102 acres of habitat for western pond turtle, including approximately 12,772 acres of upland habitat and approximately 330 acres of aquatic habitat. This modeled habitat conservation would exceed the estimated 8,085 acres of western pond turtle habitat, including approximately 8,069 of upland and approximately 16 acres of aquatic habitat conserved under the No Action/No Project Alternative, which would be the result of project-by-project mitigation. In addition, the Conservation Strategy under the Proposed Action/Proposed Project would establish/re-establish approximately 716 acres of upland and aquatic habitat for western pond turtle, compared to approximately 577 acres under the No Action/No Project Alternative, and includes specific biological objectives for the conservation of the species in the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,188 fewer acres of habitat for western pond turtle within the Planning Area than is estimated for the No

Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 5,017 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on western pond turtle individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Beneficial*** effect on western pond turtle comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 10,972 acres of modeled western pond turtle habitat within the Planning Area, which is approximately 1,188 fewer acres than the loss than under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of western pond turtle. Although the Conservation Strategy would preserve approximately 5,017 more acres of western pond turtle habitat than under the No Action/No Project Alternative, those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for western pond turtle than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to

significant adverse cumulative impacts on this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect to western pond turtle compared to the No Action/No Project Alternative baseline condition.

9.2.3.7 Effects on Cooper's Hawk and Its Habitat

Appendix G describes the life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of Cooper's hawk in the Planning Area.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for Cooper's hawk is approximately 638 acres, including approximately 600 acres of nesting/foraging habitat (approximately 3.5% of existing), and approximately 38 acres of foraging habitat (approximately 0.7% of existing) (Table 9-29). These percentages do not take into account the use of developed areas for nesting by Cooper's hawk, which if taken into account would increase the percentage of remaining existing habitat. This is smaller than the estimated loss of 693 acres under the No Action/No Project Alternative. The difference in habitat loss between the two alternatives consists of additional impact to mixed riparian and mixed riparian nesting/foraging habitat under the Proposed Action/Proposed Project Alternative.

The Proposed Action/Proposed Project Alternative is expected to remove 4 of the existing 20 occurrences of Cooper's hawk in the Planning Area, which would be two more occurrences than would be removed under the No Action/No Project Alternative.

Table 9-29. Direct Effects and Modeled Habitat Conservation for Cooper's Hawk Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Nesting/Foraging Habitat					
Blue Oak Woodland	9,132	9	0.1%	0	9
Mixed Riparian Woodland	5,785	184	3.2%	368	184
Mixed Riparian Scrub	1,451	189	13.0%	378	189
Mine Tailing Riparian Woodland	641	218	34.0%	218	218*
Total Nesting/Foraging Habitat	*17,009*	*600*	*3.5%*	*964*	*600*
Foraging Habitat					
Blue Oak Savanna	5,637	38	0.7%	47	38
Total Foraging Habitat	*5,637*	*38*	*0.7%*	*47*	*38*
Total Modeled Habitat	**22,646**	**638**	**2.8%**	**1,011**	**638**

* Habitat Re-establishment/establishment for Mine Tailing Riparian Woodland can be either Mixed Riparian Woodland or Mixed Riparian Scrub.

Indirect impacts on Cooper's hawk modeled habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects and the environmental stressors that cause them are the same in type and character as those discussed and analyzed qualitatively for Cooper's hawk under the No Action/No Project Alternative (Section 9.2.2).

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to Cooper's hawk: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Stormwater Basins in Preserves), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), and UTILITY-1 (Avian Collision Avoidance). Relative to the project avoidance and minimization measures of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on Cooper's hawk. For example, STREAM-1, STREAM-2, and STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled nesting/foraging habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require general construction AMMs and AMMs specific to covered raptor species: RAPTOR-1 (Raptor Design Surveys), RAPTOR-2 (Raptor Pre-Construction Surveys), RAPTOR-3 (Raptor Nest/Roost Buffer), and RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring) (Table 2-6). These construction and raptor-specific AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on Cooper's hawk are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 1,011 acres of modeled Cooper's hawk habitat, including approximately 964 acres of nesting/foraging habitat and approximately 47 acres of foraging habitat. This modeled habitat preservation would exceed the estimated 70 acres of preservation under the No Action/No Project Alternative, which would occur as a result of project-by-project mitigation. The Conservation Strategy also would establish/re-establish a total of approximately 638 acres of habitat for Cooper's

hawk, as compared to approximately 623 acres under the No Action/No Project Alternative, and implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 55 fewer acres of habitat for Cooper's hawk within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve 924 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on Cooper's hawk individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on Cooper's hawk when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 638 acres of modeled Cooper's hawk habitat within the Planning Area, which is approximately 55 fewer acres than the loss than under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives that would benefit Cooper's hawk. In addition, the Conservation Strategy would preserve approximately 924 more acres of Cooper's hawk habitat than under the No Action/No Project Alternative, and

those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for Cooper's hawk than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Proposed Action/Proposed Project Alternative would result in ***No Cumulative Effect*** to Cooper's hawk compared to the No Action/No Project Alternative baseline condition.

9.2.3.8 Effects on Tricolored Blackbird and Its Habitat

The natural history, habitat use, and documented occurrences in the Planning Area for tricolored blackbird are given in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for tricolored blackbird is approximately 31,058 acres, including approximately 27,531 acres of nesting/foraging habitat (approximately 14.6% of existing), approximately 3,527 acres of foraging habitat (approximately 14.6% of existing) (Table 9-30). This is a smaller area than the estimated habitat loss under the No Action/No Project Alternative of 32,907 acres, including 29,389 acres of nesting/foraging and 3,518 acres of foraging habitat.

Table 9-30. Effects and Modeled Habitat Conservation for Tricolored Blackbird Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Nesting/Foraging Habitat					
Valley Grassland	135,112	22,014	16.3%	22,014	0
Cropland	47,905	5,285	11.0%	6,947	0
Seasonal Wetland	2,600	105	4.0%	105	105
Freshwater Marsh	2,922	127	4.3%	127	127
Total Nesting/Foraging Habitat	*188,539*	*27,531*	*14.6%*	*29,193*	*232*
Foraging Habitat					
Irrigated Pasture-Grassland	15,991	2,749	17.2%	2,749	0
Vernal Pool	4,536	389	8.6%	966	389
Swale	1,222	234	19.1%	278	234
Open Water	2,344	155	6.6%	155	155*
Total Foraging Habitat	*24,093*	*3,527*	*14.6%*	*4,148*	*778*
Total Modeled Habitat	**212,632**	**31,058**	**14.6%**	**33,341**	**1,010**

* Acres of Open Water habitat re-establishment/establishment will occur as a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of open water, as determined by the TAC.

Indirect impacts to tricolored blackbird modeled habitat would occur under the Proposed Action/Proposed Project Alternative, which would be the same type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to tricolored blackbird: LID-1(Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), BMP-2 (Erosion Control), BMP-9 (Soil Compaction), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), RE-ESTABLISHMENT/ ESTABLISHMENT-1 (Vernal Pool), UTILITY-1 (Avian Collision Avoidance), UTILITY-4 (Siting of Entry and Exit Location), and TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves) (Table 2-6). Relative to the project AMMs of the No Action/Project Alternative, these SSHCP AMMs would avoid and minimize indirect impacts on tricolored blackbird. For example, EDGE-4 would require that stormwater runoff be directed away from Preserves, which would

limit exposure of tricolor blackbird within Preserves to urban runoff that may contain pesticides and petroleum products. TCB-5 would restrict the use of pesticides on Preserves between January 1 and July 15, further reducing exposure of tricolored blackbird to pesticides. While these AMMs may be applied to projects under the No Action/No Project Alternative, they would likely be applied less frequently.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require general construction AMMs and species-specific AMMs: TCB-1 (Tricolored Blackbird Design Surveys), TCB-2 (Tricolored Blackbird Pre-Construction Surveys), TCB-3 (Tricolored Blackbird Nest Buffer), and TCB-4 (Tricolored Blackbird Nest Buffer Monitoring) (Table 2-6). These construction and raptor-specific AMMs may also be applied under the No Action/No Project Alternative. However, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on tricolored blackbird are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 33,341 acres of habitat for tricolored blackbird, including approximately 29,193 acres of nesting/foraging habitat and approximately 4,148 acres of foraging habitat. This modeled habitat conservation would be greater than the estimated 21,148 acres under the No Action/No Project Alternative, which would occur as a result of project-by-project mitigation. The Conservation Strategy also would establish/re-establish a total of approximately 1,010 acres of habitat for tricolored blackbird and implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously, and objectives to maintain or improve habitat value and preserve high-quality habitat (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,849 fewer acres of habitat for tricolored blackbird within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 12,193 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize

indirect and temporary effects on tricolored blackbird individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on tricolored blackbird when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 31,058 acres of modeled tricolored blackbird habitat within the Planning Area, which is approximately 1,849 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as limitations on stormwater runoff, to Preserves that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of tricolored blackbird. In addition, the Conservation Strategy would preserve approximately 12,193 more acres of tricolored blackbird habitat than under the No Action/No Project Alternative, those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for tricolored blackbird than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Significant Beneficial Cumulative Effect*** for tricolored blackbird compared to the No Action/No Project Alternative baseline condition.

9.2.3.9 Effects on Western Burrowing Owl and Its Habitat

Habitat use, natural history, and occurrence within the Planning Area for western burrowing owl are found in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat under the Proposed Action/Proposed Project is approximately 30,836 acres (14.7% of existing) (Table 9-31). This is smaller than the estimated modeled habitat loss under the No Action/No Project Alternative of 32,711 acres.

The Proposed Action/Proposed Project Alternative is expected to remove 19 of the existing 97 occurrences of western burrowing owls in the Planning Area, which would be 9 more occurrences than would be removed under the No Action/No Project Alternative.

Table 9-31. Direct Effects and Modeled Habitat Conservation for Western Burrowing Owl Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Wintering Habitat					
Vernal Pool	4,536	389	8.6%	966	389
Seasonal Wetland	2,600	105	4.0%	105	105
Swale	1,252	234	18.7%	278	256
Stream/Creek (VPIH)	73	22	30.1%	26	0

Nesting/Foraging Habitat					
Cropland	47,905	5,285	11.0%	6,947	0
Irrigated Pasture-Grassland	15,991	2,749	17.2%	2,749	0
Valley Grassland	135,112	22,014	16.3%	22,014	0
Blue Oak Savanna	5,637	38	0.7%	47	38
Total Nesting/Foraging Habitat	*204,645*	*30,086*	*14.7%*	*31,757*	*38*
Total Modeled Habitat	**213,106**	**30,836**	**—**	**33,132**	**788**

Indirect impacts on western burrowing owl modeled habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects and the environmental stressors that cause them are the same in type and character as those discussed and analyzed qualitatively for western burrowing owl under the No Action/No Project Alternative (Section 9.2.2).

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant western burrowing owl: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Stormwater Basins in Preserves), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), RE-ESTABLISHMENT/ ESTABLISHMENT-1 (Vernal Pool), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), and UTILITY-1 (Avian Collision Avoidance) (Table 2-6). Relative to the project AMMs of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on western burrowing owl. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled burrowing owl habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require general construction AMMs, and AMMs specific to western burrowing owl that would also be required: WBO-1 (Burrowing Owl Design Surveys), WBO-2 (Burrowing Owl Pre-Construction Survey), WBO-3 (Burrowing Owl Avoidance), WBO-4 (Burrowing Owl Construction Monitoring), WBO-5 (Burrowing Owl Passive Relocation), and WBO-6 (Burrowing Owl Timing of Maintenance) (Table 2-6). These construction and species-specific AMMs may also be applied under the No Action/No Project Alternative. However, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on western burrowing owl are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include a total of approximately 33,132 acres of modeled habitat for western burrowing owl. This modeled habitat preservation would exceed the approximately 21,188 acres estimated under the No Action/No Project Alternative. The Conservation Strategy would also establish/re-establish a total of approximately 788 acres of habitat for western burrowing owl, and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed

previously, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for P Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,875 fewer acres of modeled habitat for western burrowing owl within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 11,944 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on western burrowing owl individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on western burrowing owl when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 30,836 acres of modeled western burrowing owl habitat within the Planning Area, which is approximately 1,875 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of western burrowing owl. In addition, the Conservation Strategy would preserve approximately 11,944 more acres of western burrowing owl habitat than under the No Action/No Project Alternative, and those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would

result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for western burrowing owl than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for western burrowing owl compared to the No Action/No Project Alternative baseline condition.

9.2.3.10 Effects on Ferruginous Hawk and Its Habitat

The life history, suitable habitat, and documented occurrences in the Planning Area of ferruginous hawk are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for ferruginous hawk under the Proposed Action/Proposed Project is approximately 25,491 acres of foraging habitat (16% of existing) (Table 9-32). This is less than the expected loss under the No Action/No Project Alternative of approximately 26,887 acres.

The Proposed Action/Proposed Project Alternative is expected to remove 1 of the existing 26 occurrences of ferruginous hawk in the Planning Area, whereas no occurrences would be removed under the No Action/No Project Alternative.

Table 9-32. Direct Effects and Modeled Habitat Conservation for Ferruginous Hawk Under the Proposed Action/Proposed Project Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing*	*Direct Effect*	*% of Existing Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Foraging Habitat					
Valley Grassland	135,112	22,014	16.3%	22,014	0
Irrigated Pasture-Grassland	15,991	2,749	17.2%	2,749	0
Seasonal Wetland	2,600	105	4.0%	105	105
Vernal Pool	4,536	389	8.6%	966	389
Swale	1,252	234	18.7%	278	234
Total Modeled Habitat	**159,491**	**25,491**	**16.0%**	**26,112**	**728**

Indirect impacts on modeled foraging habitat for ferruginous hawk would also occur under the Proposed Action/Proposed Project Alternative. These indirect impacts and the stressors that cause them are the same type and character as the impacts and stressors discussed and analyzed qualitatively in the species impact discussion in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs by Covered Activities that are relevant to ferruginous hawk: LID-1 (Stormwater Quality) LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Detention Basins in Linkage Preserves), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), RE-ESTABLISHMENT/ ESTABLISHMENT-1 (Vernal Pool), UTILITY-1 (Avian Collision Avoidance), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project AMMs of the No Action/Project Alternative, these SSHCP AMMs would avoid and minimize indirect impacts on ferruginous hawk. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled ferruginous hawk foraging habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require general construction AMMs (Table 2.6). These construction AMMs may also be applied under the No Action/No Project Alternative. However, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on ferruginous hawk are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 26,112 acres of habitat for ferruginous hawk. This modeled habitat conservation would be greater than the approximately 15,942 acres estimated under the No Action/No Project Alternative, which would be the result of project-by-project mitigation. The Conservation Strategy would also establish/re-establish a total of approximately 728 acres of habitat for ferruginous hawk, and would also implement biological objectives to conserve the

species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,396 fewer acres of habitat for ferruginous hawk within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Proposed Action/Proposed Project Alternative would preserve 10,168 more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on ferruginous hawk individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on ferruginous hawk when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 25,491 acres of modeled ferruginous hawk habitat within the Planning Area, which is approximately 1,396 acres less than the loss than under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as Preserve Setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of ferruginous hawk and would preserve additional acres of ferruginous hawk habitat that would be approximately 10,168 acres greater than the preservation under the No Action/No Project Alternative. Additionally, the preservation under the Proposed Action/Proposed Project Alternative would be within a systematic, coordinated

Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Proposed Action/Proposed Project Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to ferruginous hawk and be operated under a comprehensive preserve management program.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for ferruginous hawk than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for ferruginous hawk compared to the No Action/No Project Alternative baseline condition.

9.2.3.11 Effects on Swainson's Hawk and Its Habitat

The life history, suitable habitat, and documented occurrences in the Planning Area of Swainson's hawk are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of Swainson's hawk modeled habitat under the Proposed Action/Proposed Project would be approximately 31,112 acres; including 373 acres of nesting habitat (approximately 5.2% of existing) and 30,739 acres of foraging habitat (approximately 14.9% of existing) (Table 9-33). This is less than the estimated loss under the No Action/No Project Alternative totaling approximately 32,888 acres, including 336 acres of nesting and 32,552 acres of foraging habitat.

The Proposed Action/Proposed Project Alternative is expected to remove 53 of the existing 410 occurrences of Swainson's hawk in the Planning Area, which would be 13 more occurrences than would be removed under the No Action/No Project Alternative.

Indirect reductions in habitat quality for Swainson's hawk would also occur under the Proposed Action/Proposed Project Alternative. These indirect impacts and the stressors that cause them are the same type and character as the impacts and stressors discussed and analyzed qualitatively in the species impact discussion in Section 9.2.2.

Table 9-33. Direct Effects and Modeled Habitat Conservation for Swainson's Hawk Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Nesting Habitat					
Mixed Riparian Woodland	5,785	184	3.2%	368	184
Mixed Riparian Scrub	1,449	189	13.0%	378	189
Total Nesting Habitat	*7,234*	*373*	*5.2%*	*746*	*373*
Foraging Habitat					
Valley Grassland	133,705	21,977	16.4%	22,014	0
Cropland	47,905	5,285	11.0%	6,947	0
Irrigated Pasture-Grassland	15,991	2,749	17.2%	2,749	0
Vernal Pool	4,536	389	8.6%	966	389
Seasonal Wetland	2,600	105	4.0%	105	105
Swale	1,252	234	18.7%	278	234
Total Foraging Habitat	*205,989*	*30,739*	*14.9%*	*33,059*	*728*
Total Modeled Habitat	**213,223**	**31,112**	**14.6%**	**33,805**	**1,101**

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs; LID-1 (Stormwater Quality) LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Detention Basins in Linkage Preserves), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool), and UTILITY-1 (Avian Collision Avoidance) (Table 2-6). For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled Swainson's hawk habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require the application of general construction and species-specific AMMs: SWHA-1 (Swainson's Hawk

Design Surveys), SWHA-2 (Swainson's Hawk Pre-Construction), SWHA-3 (Swainson's Hawk Nest Buffer), and SWHA-4 (Swainson's Hawk Nest Buffer Monitoring) (Table 2-6). These construction and Swainson's hawk AMMs may also be applied under the No Action/No Project Alternative. However, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on Swainson's hawk are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include a total of approximately 33,805 acres of habitat for Swainson's hawk, including approximately 746 acres of nesting and 33,059 acres of foraging habitat. This modeled habitat preservation would exceed the estimated 21,061 acres of conservation under the No Action/No Project Alternative that would result from project-by-project mitigation. The Conservation Strategy would also establish/re-establish approximately 373 acres of nesting and 728 acres of foraging habitat, and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,776 fewer acres of habitat for Swainson's hawk within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 12,744 more acres of modeled habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on Swainson's hawk individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on Swainson's hawk when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 31,112 acres of modeled Swainson's hawk habitat within the Planning Area, which is approximately 1,776 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of Swainson's hawk. In addition, the Conservation Strategy would preserve approximately 12,744 more acres of Swainson's hawk habitat than under the No Action/No Project Alternative, those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for Swainson's hawk than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for Swainson's hawk compared to the No Action/No Project Alternative baseline condition.

9.2.3.12 Effects on Northern Harrier and Its Habitat

The life history, suitable habitat, and documented occurrences in the Planning Area of northern harrier are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for northern harrier under the Proposed Action/Proposed Project would be approximately 30,903 acres, including approximately 30,048 acres of nesting/foraging habitat (approximately 15.1% of existing) and approximately 855 acres of foraging habitat (approximately 7.6% of existing) (Table 9-34). This is greater than the

estimated total loss of 32,734 acres of northern harrier habitat, including 31,913 acres of nesting/foraging and 821 acres of foraging habitat under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is expected to remove 8 of the existing 70 occurrences of northern harrier in the Planning Area, which would be 3 more occurrences than would be removed under the No Action/No Project Alternative.

Table 9-34. Direct Effects and Modeled Habitat Conservation for Northern Harrier Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Nesting/Foraging Habitat					
Valley Grassland	135,112	22,014	16.3%	22,014	0
Cropland	47,905	5,285	11.0%	6,947	0
Irrigated Pasture-Grassland	15,991	2,749	17.2%	2,749	0
Total Nesting/Foraging Habitat	*199,008*	*30,048*	*15.1%*	*31,710*	*0*
Foraging Habitat					
Vernal Pool	4,536	389	8.6%	966	389
Seasonal Wetland	2,600	105	4.0%	105	105
Freshwater Marsh	2,922	127	4.3%	127	127
Swale	1,252	234	18.7%	278	234
Total Foraging Habitat	*11,310*	*855*	*7.6%*	*1,476*	*855*
Total Modeled Habitat	**210,318**	**30,903**	**14.7%**	**33,186**	**855**

Indirect impacts on northern harrier modeled habitat and individuals would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects and the environmental stressors that cause them are the same in type and character as those discussed and analyzed qualitatively for northern harrier under the No Action/No Project Alternative (Section 9.2.2).

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to northern harrier: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Stormwater Basins in Preserves), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), and UTILITY-1 (Avian Collision Avoidance) (Table 2-6). Relative to the project AMMs of the No Action/Project

alternative, these SSHCP AMMs would avoid and minimize indirect impacts on northern harrier. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled northern harrier habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require general construction AMMs and AMMs specific to covered raptor species: RAPTOR-1 (Raptor Design Surveys), RAPTOR-2 (Raptor Pre-Construction Surveys), RAPTOR-3 (Raptor Nest/Roost Buffer), and RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring) (Table 2-6). These construction and raptor-specific AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on northern harrier are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include a total of approximately 33,186 acres of habitat for northern harrier, including 31,710 acres of nesting/foraging and 1,476 acres of foraging habitat. This modeled habitat preservation would exceed the estimated 21,077 acres of modeled habitat preservation under the No Action/No Project Alternative, which would be the result of project-by-project mitigation. The Conservation Strategy would also establish/re-establish approximately 855 acres of foraging habitat for northern harrier and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,831 fewer acres of habitat for northern harrier within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 12,109 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on northern harrier individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided above, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on northern harrier when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 30,903 acres of modeled northern harrier habitat within the Planning Area, which is approximately 1,831 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of northern harrier. In addition, the Conservation Strategy would preserve approximately 12,109 more acres of northern harrier habitat than under the No Action/No Project Alternative, those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for northern harrier than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for northern harrier compared to the No Action/No Project Alternative baseline condition.

9.2.3.13 Effects on White-Tailed Kite and Its Habitat

The life history, suitable habitat, and documented occurrences in the Planning Area of white-tailed kite are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated total loss of white-tailed kite modeled habitat under the Proposed Action/Proposed Project would be approximately 31,319 acres, including approximately 376 acres of nesting habitat (approximately 2.4% of existing), approximately 189 acres of nesting/foraging habitat (approximately 13.0% of existing), and approximately 30,754 acres of foraging habitat (approximately 14.4% of existing) (Table 9-35). This would be less than the estimated total loss under the No Action/No Project Alternative of approximately 33,284 acres, including 419 acres of nesting, 189 acres of nesting/foraging, and 32,676 acres of foraging habitat.

The Proposed Action/Proposed Project Alternative is expected to remove 12 of the existing 62 occurrences of white-tailed kite in the Planning Area, which would be one more occurrence than would be removed under the No Action/No Project Alternative.

Table 9-35. Direct Effects and Modeled Habitat Conservation for White-Tailed Kite Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Nesting Habitat					
Blue Oak Woodland	9,132	9	0.1%	0	9

Total Modeled Habitat	**230,042**	**31,319**	**13.6%**	**32,319**	**1,365**

* Habitat re-establishment/establishment for Mine Tailing Riparian Woodland can be either Mixed Riparian Woodland or Mixed Riparian Scrub.

Indirect impacts on white-tailed kite modeled habitat and individuals would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects and the environmental stressors that cause them are the same in type and character as those discussed

and analyzed qualitatively for white-tailed kite under the No Action/No Project Alternative (Section 9.2.2).

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to white-tailed kite: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Stormwater Basins in Preserves), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), and UTILITY-1 (Avian Collision Avoidance) (Table 2-6). Relative to the project AMMs of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on white-tailed kite. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled white-tailed kite habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require general construction AMMs, and AMMs specific to covered raptor species would also be required: RAPTOR-1 (Raptor Design Surveys), RAPTOR-2 (Raptor Pre-Construction Surveys), RAPTOR-3 (Raptor Nest/Roost Buffer), and RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring) (Table 2-6). These construction and raptor-specific AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on white-tailed kite are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include a total of approximately 32,319 acres of habitat for white-tailed kite, including approximately 586 acres of nesting habitat, approximately 169 acres of nesting/foraging habitat, and approximately 31,444 acres of foraging habitat. This modeled habitat preservation is greater than estimated for the No Action/No Project Alternative of a combined 21,321 acres of habitat types, which would occur as a result of project-by-project mitigation.

The Conservation Strategy would also establish/re-establish approximately 1,365 acres of habitat for white-tailed kite, and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed above, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,965 fewer acres of habitat for white-tailed kite within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 10,998 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on white-tailed kite individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on white-tailed kite when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described previously for the No Action/No Project Alternative (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 31,319 acres of modeled white-tailed kite habitat within the Planning Area, which is approximately 1,965 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of white-tailed kite. In addition, the Conservation Strategy would

preserve approximately 10,998 more acres of white-tailed kite than under the No Action/No Project Alternative, and those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for white-tailed kite than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for white-tailed kite compared to the No Action/No Project Alternative baseline condition.

9.2.3.14 Effects on Greater Sandhill Crane and Its Habitat

The life history, suitable habitat, and documented occurrences in the Planning Area of greater sandhill crane are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of greater sandhill crane modeled habitat under the Proposed Action/Proposed Project would be approximately 7,942 acres, including 66 acres of roosting, 124 acres of roosting/foraging, and 7,752 acres of foraging habitat (Table 9-36). Of this total, approximately 7,116 acres are within the UDA and only approximately 826 acres are outside of the UDA where high-quality habitat is located. The total loss of modeled habitat is less than the estimated total loss of 9,616 acres under the No Action/No Project Alternative, of which 2,289 acres would occur outside of the UDA where high-quality habitat is located.

The Proposed Action/Proposed Project Alternative is expected to remove 63 of the existing 70 occurrences of greater sandhill crane in the Planning Area, which is 1 more occurrence that would be removed under the No Action/No Project Alternative.

Table 9-36. Direct Effects and Modeled Habitat Conservation for Greater Sandhill Crane Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing	*Direct Effect*	*Indirect Effect*	*Total Habitat Lost*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Roosting/Foraging Habitat[1]							
Seasonal Wetland	1,877	51	Qualitative	51	2.7%	105	52
Freshwater Marsh	2,610	73	Qualitative	73	2.8%	127	73
Total Roosting/Foraging Habitat	*4,487*	*124*	*Qualitative*	*124*	*2.8%*	*232*	*125*
Roosting Habitat							
Vernal Pool	1,156	59	7	66	5.7%	37	59
Total Roosting Habitat	*1,156*	*59*	*7*	*66*	*5.7%*	*37*	*59*
Foraging Habitat[2]							
Cropland	42,628	3,764	Qualitative	3,764	8.8%	6,700	0
Valley Grassland	30,585	2,469	Qualitative	2,469	8.1%	1,671	0
Irrigated Pasture-Grassland	10,908	1,519	Qualitative	1,519	13.9%	1,680	0
Total Foraging Habitat	*84,121*	*7,752*	*Qualitative*	*7,752*	*9.2%*	*10,051*	*0*
Grand Total	**89,764**	**7,935**	**7**	**7,942**	**8.8%**	**10,320**	**184**

1 Modeled roosting habitat includes these communities within 2 miles of greater sandhill crane occurrences in the Planning Area.
2 Modeled foraging habitat includes these communities within 1.75 miles of modeled roosting habitat.

The Proposed Action/Proposed Project Alternative would have approximately 7 acres of indirect effects on greater sandhill crane roosting habitat, as compared to approximately 117 acres of indirect effects on roosting habitat under the No Action/No Project Alternative. Indirect effects to other habitat types and individuals would also occur under the Proposed Action/Proposed Project Alternative; these indirect effects and the environmental stressors that cause them are the same in type and character as those discussed and analyzed qualitatively for greater sandhill crane under the No Action/No Project Alternative (Section 9.2.2).

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to greater sandhill crane; LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3(Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), BMP-2 (Erosion Control), BMP-9 (Soil Compaction), ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education),

RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool), UTILITY-1 (Avian Collision Avoidance), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project AMMs of the No Action/Project Alternative, these SSHCP AMMs would avoid and minimize indirect impacts on greater sandhill crane. For example, EDGE-4 would require that stormwater runoff be directed away from Preserves, which would limit exposure of greater sandhill crane within Preserves to urban runoff that may contain pesticides and petroleum products and that can adversely affect the hydrology of vernal pool roosting habitat.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative will require general construction AMMs and species-specific AMMs: GSC-1 (Greater Sandhill Crane Design Surveys), GSC-2 (Greater Sandhill Crane Pre-Construction Surveys), GSC-3 (Greater Sandhill Crane Roosting Buffer), GSC-4 (Greater Sandhill Crane Visual Barrier), and GSC-5 (Greater Sandhill Crane Roost Buffer Monitoring) (Table 2-6). These construction and species-specific AMMs may also be applied under the No Action/No Project Alternative. However, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on tricolored blackbird are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 10,320 acres of modeled habitat for greater sandhill crane. This modeled habitat preservation exceeds the 8,323 acres estimated under the No Action/No Project Alternative. The Conservation Strategy would also establish/re-establish approximately 184 acres of habitat for greater sandhill crane. Furthermore, the Conservation Strategy would also implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed above, and objectives to maintain or improve habitat value and preserve high-quality habitat (at least 2,000 acres of preserved foraging habitat would be high-quality foraging habitat).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,557 fewer acres of habitat for greater sandhill crane within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 1,997 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also

included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on greater sandhill crane individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on greater sandhill crane when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative previously (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 7,942 acres of modeled greater sandhill crane habitat within the Planning Area, which is approximately 1,557 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of greater sandhill crane. In addition, the Conservation Strategy would preserve 1,997 more acres of greater sandhill crane modeled habitat than under the No Action/No Project Alternative; those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for greater sandhill crane than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Proposed Action/Proposed Project Alternative would result in ***No Cumulative Effect*** for greater sandhill crane compared to the No Action/No Project Alternative baseline condition.

9.2.3.15 Effects on Lesser Sandhill Crane and Its Habitat

Basic Habitat use and occurrence within the Planning Area for lesser sandhill crane are described in Appendix G.

Direct and Indirect Effects of the Alternative

The land cover types in the Planning Area that are utilized by lesser sandhill crane are the same as those for greater sandhill crane (Table 9-36) described in Section 9.2.3.14, as is the expected acres of habitat loss under the Proposed Action/Proposed Project Alternative. New development and transportation infrastructure would have indirect effects on lesser sandhill crane that would be the same as those discussed previously for greater sandhill crane . In addition, construction activities under the Proposed Action/Proposed Project Alternative may result in temporary effects as discussed previously for greater sandhill crane.

The Proposed Action/Proposed Project Alternative would include the implementation of the AMMs discussed for greater sandhill crane that would also avoid or minimize indirect impacts lesser sandhill crane. Temporary impacts would also be avoided or minimized by the construction and species AMMs discussed in Section 9.2.3.14 for greater sandhill crane. Although the greater sandhill crane species-specific AMMs would not apply to projects where only lesser sandhill crane is present, due to the habitat overlap of the two species, both would benefit from the application of these species-specific AMMs.

The lesser sandhill crane modeled habitat preserved under the Proposed Action/Proposed Project Alternative and the relation of that modeled habitat preservation to the No Action/No Project Alternative would be the same as that for greater sandhill crane.

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,557 fewer acres of habitat for lesser sandhill crane within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 1,997 more acres of habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on lesser sandhill crane individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously,

the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on lesser sandhill crane when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 7,942 acres of modeled lesser sandhill crane habitat within the Planning Area, which is approximately 1,557 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of greater sandhill crane, which would also benefit lesser sandhill crane. In addition, the Conservation Strategy would preserve 1,997 more acres of lesser sandhill crane modeled habitat than under the No Action/No Project Alternative, and those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for lesser sandhill crane than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. The Proposed Action/Proposed Project Alternative would result in ***No Cumulative Effect*** for lesser sandhill crane compared to the No Action/No Project Alternative baseline condition.

9.2.3.16 Effects on Loggerhead Shrike and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of loggerhead shrike are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for loggerhead shrike would be approximately 31,367 acres, including approximately 591 acres of nesting (approximately 7.5% of existing), approximately 22,014 acres of nesting/foraging (approximately 16.3% of existing), and approximately 8,762 acres of foraging habitat (approximately 12.1% of existing) (Table 9-37). This is less than the estimated total loss under the No Action/No Project Alternative of approximately 33,144 acres.

The Proposed Action/Proposed Project Alternative is not expected to remove any of the existing 34 occurrences of loggerhead shrike in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

Table 9-37. Direct Effects and Modeled Habitat Conservation for Loggerhead Shrike Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Nesting Habitat					
Mixed Riparian Woodland	5,785	184	3.2%	368	184
Mixed Riparian Scrub	1,424	189	13.3%	378	189
Mine Tailing Riparian Woodland	641	218	34.0%	218	218
Total Nesting Habitat	*7,850*	*591*	*7.5%*	*964*	*591*
Nesting/Foraging Habitat					
Valley Grassland	135,112	22,014	16.3%	21,014	0
Total Nesting/Foraging Habitat	*135,112*	*22,014*	*16.3%*	*21,014*	*0*
Foraging Habitat					
Cropland	47,905	5,285	11.0%	6,947	0
Irrigated Pasture-Grassland	15,991	2,749	17.2%	2,749	0
Vernal Pool	4,536	389	8.6%	966	389
Seasonal Wetland	2,600	105	4.0%	105	105
Swale	1,252	234	18.7%	278	234
Total Foraging Habitat	*72,284*	*8,762*	*12.1%*	*11,045*	*728*
Grand Total	**215,246**	**31,367**	**14.6%**	**34,023**	**1,319**

Indirect impacts on loggerhead shrike modeled habitat and individuals would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects and the environmental stressors that cause them are the same in type and character as those discussed and analyzed qualitatively for loggerhead shrike under the No Action/No Project Alternative (Section 9.2.2).

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to loggerhead shrike: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Stormwater Basins in Preserves), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), STREAM-1 (Laguna Creek Setback), STREAM-2 (UDA Stream Setbacks), and UTILITY-1 (Avian Collision Avoidance) (Table 2-6). Relative to the project avoidance and minimization measures of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on loggerhead shrike. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled loggerhead shrike habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative would require general construction AMMs and AMMs specific to covered raptor species: RAPTOR-1 (Raptor Design Surveys), RAPTOR-2 (Raptor Pre-Construction Surveys), RAPTOR-3 (Raptor Nest/Roost Buffer), and RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring) (Table 2-6). These construction and raptor-specific AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on loggerhead shrike are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include a total of approximately 34,023 acres of habitat for loggerhead shrike. This modeled habitat preservation would exceed the estimated 21,061 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy would also establish/re-establish a total of approximately 1,319 acres of habitat for loggerhead shrike and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed above, and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,777 fewer acres of habitat for loggerhead shrike within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 12,962 more acres of habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on loggerhead shrike individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided above, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on loggerhead shrike when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 31,367 acres of modeled loggerhead shrike habitat within the Planning Area, which is approximately 1,777 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives beneficial to the conservation of loggerhead shrike. In addition, the Conservation Strategy would preserve approximately 12,962 more acres of loggerhead shrike modeled habitat than under the No Action/No Project Alternative; those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for loggerhead shrike than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for loggerhead shrike compared to the No Action/No Project Alternative baseline condition.

9.2.3.17 Effects on Grasshopper Sparrow and Its Habitat

Basic habitat information for grasshopper sparrow within the Planning Area is found in Appendix G.

Direct and Indirect Effects of the Alternative

Estimated losses of potentially suitable grasshopper sparrow habitat under the Proposed Action/Proposed Project Alternative would consist of approximately 2,749 acres of Irrigated Pasture and approximately 22,014 acres of Valley Grassland for a total land cover loss of approximately 24,763 acres. Of this habitat loss, approximately 23,938 acres would occur within the UDA, and 825 acres would occur outside of the UDA. This is less than the estimated loss of potentially suitable grasshopper sparrow habitat under the No Action/No Project Alternative of approximately 26,210 acres.

Indirect impacts on potentially suitable grasshopper sparrow habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects and the environmental stressors that cause them are the same in type and character as those discussed and analyzed qualitatively for grasshopper sparrow under the No Action/No Project Alternative (Section 9.2.2).

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to grasshopper sparrow: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3(Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5(Stormwater Control in Preserve Setbacks), EDGE-6 (Stormwater Basins in Preserves), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), and UTILITY-1 (Avian Collision Avoidance) (Table 2-6). Relative to the project AMMs of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on grasshopper sparrow. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project

Alternative, thereby increasing protection of modeled grasshopper sparrow habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative will require general construction AMMs be applied to Covered Activities (Table 2-6). These construction AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on grasshopper sparrow are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 24,763 acres of potentially suitable grasshopper sparrow habitat. This would be a greater amount of preserved potentially suitable habitat than the estimated 14,302 acres preserved under the No Action/No Project Alternative that would result from project-by-project mitigation.

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,447 fewer acres of potentially suitable habitat for grasshopper sparrow within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Proposed Action/Proposed Project Alternative would preserve approximately 10,461 more acres of potentially suitable habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on grasshopper sparrow individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on grasshopper sparrow when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 24,763 acres of potentially suitable grasshopper sparrow habitat within the Planning Area, which is approximately 1,447 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining potentially suitable habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives beneficial to the conservation of grasshopper sparrow. The Conservation Strategy would preserve approximately 10,461 more acres of grasshopper sparrow potentially suitable habitat than under the No Action/No Project Alternative. Additionally, those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for grasshopper sparrow than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for grasshopper sparrow compared to the No Action/No Project Alternative baseline condition.

9.2.3.18 Effects on Song Sparrow (Modesto Population) and Its Habitat

Basic habitat information for song sparrow within the Planning Area is found in Appendix G.

Direct and Indirect Effects of the Alternative

The anticipated loss of potentially suitable habitat for song sparrow would be approximately 105 acres of Seasonal Wetland, 127 acres of Freshwater Marsh, and 189 acres of Mixed Riparian Scrub, which totals approximately 421 acres and is less than the 448 acres estimated under the No Action/No Project Alternative.

Indirect impacts to song sparrow potentially suitable habitat would occur under the Proposed Action/Proposed Project Alternative which would be the same type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to song sparrow: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), BMP-2 (Erosion Control), BMP-9 (Soil Compaction), ROAD-1(Road Project Location), ROAD-3(Roadside Pesticide Use), NATURE TRAIL-1(Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool), UTILITY-1 (Avian Collision Avoidance), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project AMMs of the No Action/Project Alternative, these SSHCP AMMs would avoid and minimize indirect impacts on song sparrow. For example, EDGE-4 would require that stormwater runoff be directed away from Preserves, which would limit exposure of song sparrow within Preserves to urban runoff that may contain pesticides and petroleum products. While this AMM may be applied to projects under the No Action/No Project Alternative it would likely be applied less frequently.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative will require general construction AMMs be applied to Covered Activities (Table 2-6). These construction AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on song sparrow are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include a total of approximately 421 acres of potentially suitable song sparrow habitat. This exceeds the estimated 24 acres under the No Action/No Project Alternative that would occur on a project-by-project basis.

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 27 fewer acres of potentially suitable habitat for song sparrow within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 397 acres more potentially suitable habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on song sparrow individuals and potentially suitable habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on song sparrow when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 421 acres of potentially suitable song sparrow habitat within the Planning Area, which is approximately 27 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining potentially suitable habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives beneficial to the conservation of song sparrow. The Conservation Strategy would preserve approximately 397 more acres of song sparrow potentially suitable habitat than under the No Action/No Project Alternative, and those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for song sparrow than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. The Proposed Action/Proposed Project Alternative would result in ***No Cumulative Effect*** for song sparrow compared to the No Action/No Project Alternative baseline condition.

9.2.3.19 Effects on Bank Swallow and Its Habitat

Basic habitat information for bank swallow within the Planning Area is found in Appendix G.

Direct and Indirect Effects of the Alternative

Bank swallow is associated with large cut banks in riverine habitats and sand bluffs where it builds nest burrows, and with surrounding areas that it uses for foraging. The two documented occurrences within the Planning Area are along the Cosumnes River between Rancho Murieta and Sloughhouse. The potential loss of bank swallow nesting habitat from Preserve Covered Activities within the Cosumnes River/Deer Creek Corridor where it occurs is analyzed qualitatively, as the land cover level analysis performed does not include the specific features required by this species for nesting colonies. Preserve Covered Activities under the Proposed Action/Proposed Project Alternative that remove cut banks through use of bank stabilization techniques to restore historical hydrologic conditions or activities that remove foraging habitat within proximity to nest colonies would result in impacts to bank swallow.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to bank swallow: LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), BMP-2 (Erosion Control), BMP-9 (Soil Compaction), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool), UTILITY-1 (Avian Collision Avoidance), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project AMMs of the No Action/Project Alternative, these SSHCP AMMs would avoid and minimize indirect impacts on song sparrow. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of bank swallow foraging habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative will require general construction AMMs be applied to Covered Activities (Table 2-6). These construction AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on bank swallow are expected to be less than under the No Action/No Project Alternative.

The majority of nesting and foraging habitat in the Planning Area would likely be preserved within the Cosumnes River/Deer Creek Corridor under the Proposed Action/Proposed Project Alternative.

Significance of Direct and Indirect Effects

Preserve Covered Activities within the Cosumnes River/Deer Creek Corridor implemented under the Proposed Action/Proposed Project Alternative would potentially impact known nesting colonies of bank swallow within the Planning Area in contrast to the No Action/No Project Alternative. However, the Proposed Action/Proposed Project Alternative would preserve considerably more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on bank swallow individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Proposed Action/Proposed Project Alternative on bank swallow would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Proposed Action/Proposed Project Alternative would have a ***Less Than Significant Adverse*** effect on bank swallow when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, Preserve Covered Activities may occur within the Cosumnes River/Deer Creek Corridor, such as the use of bank stabilization techniques to restore

historical hydrologic conditions, or Preserve Covered Activities may remove foraging habitat near nest colonies in the area. There are no proposed activities under the No Action/No Project Alternative in that area that would likely adversely affect these nest colonies. However, the AMMs that would be required by the SSHCP would likely reduce impacts from Preserve Covered Activities.

The Conservation Strategy would include Biological Goals and Measureable Objectives that would benefit bank sparrow foraging habitat and would preserve a greater area of bank swallow habitat than the preservation under the No Action/No Project Alternative. In addition the preservation under the Proposed Action/Proposed Project Alternative would be within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative. The individual preserves in the Preserve System under the Proposed Action/Proposed Project Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to bank swallow and be operated under a comprehensive preserve management program.

The incremental effects of the Proposed Action/Proposed Project Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative would result in ***No Cumulative Effect*** to bank swallow compared to the No Action/No Project Alternative baseline condition.

9.2.3.20 Effects on Western Red Bat and Its Habitat

The habitat requirements, documented occurrences, and existing acres of modeled habitat of western red bat in the Planning Area are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of western red bat modeled habitat would be approximately 23,986 acres, including 23,330 acres of foraging (approximately 15.3% of existing) and approximately 656 acres of roosting/foraging habitat (approximately 2.6% of existing). This is less than the estimated loss under the No Action/No Project Alternative of approximately 25,488 acres. The percentage of habitat remaining shown in Table 9-38 only applies to those natural land covers listed and is an underestimation of total habitat remaining. Western red bat is known to roost and forage in developed areas with mature trees and those acres are not included in the analysis.

The Proposed Action/Proposed Project Alternative is expected to remove six of the existing seven occurrences of western red bat in the Planning Area, which would be three more occurrences than would be removed under the No Action/No Project Alternative.

Table 9-38. Direct Effects and Modeled Habitat Conservation for Western Red Bat Under the Proposed Action/Proposed Project Alternative

Modeled Habitat	Total (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Foraging Habitat					
Valley Grassland	135,112	22,014	16.3%	22,014	0
Vernal Pool	4,536	389	8.6%	966	389
Seasonal Wetlands	2,600	105	4.0%	105	105
Freshwater Marsh	2,922	127	4.3%	127	127
Stream/Creek	2,674	117	4.4%	117	117
Open Water	2,344	155	6.6%	155	155*
Mixed Riparian Scrub	1,451	189	13.0%	378	189
Swale	1,252	234	18.7%	278	234
Total Foraging Habitat	*152,891*	*23,330*	*15.3%*	*24,140*	*1,316*
Roosting/Foraging Habitat					
Blue Oak Woodland	9,132	9	0.1%	0	9
Mixed Riparian Woodland	5,785	184	3.2%	368	184
Blue Oak Savanna	5,637	38	0.7%	47	38
Orchards	3,646	207	5.7%	207	0
Mine Tailing Riparian Woodland	641	218	34.0%	218	218**
Total Roosting/Foraging Habitat	*24,841*	*656*	*2.6%*	*840*	*449*
Grand Total	**177,732**	**23,986**	**13.5%**	**24,980**	**1,765**

* Acres of Open Water habitat re-establishment/establishment will occur as a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

** Habitat re-establishment/establishment for Mine Tailing Riparian Woodland can be either Mixed Riparian Woodland or Mixed Riparian Scrub.

Indirect impacts to western red bat modeled habitat would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects are the same in type and character as those discussed and analyzed qualitatively in the species impact discussion in Section 9.2.2 above.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs that are relevant to western red bat: LID-1 (Stormwater Quality) LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Detention Basins in Linkage Preserves), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location),

NATURE TRAIL-4 (Biological Studies Prior to Trail Design) NATURE TRAIL-5 (Monitoring of Trail Impacts), NATURE TRAIL-6 (Trail Public Education), and UTILITY-1 (Avian Collision Avoidance) (Table 2-6). Relative to the project AMMs of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on western red bat. For example, STREAM-1, STREAM-2, and STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled roosting habitat from indirect impacts.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative will require covered activities implement general AMMs and species-specific AMMs: BAT-1 (Maternity Roost Design Surveys), BAT-2 (Maternity Roost Pre-Construction Surveys, BAT-3 (Maternity Roost Buffer), and BAT-4 (Bat Eviction Methods) (Table 2-6). These construction AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on western red bat are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 24,980 acres of modeled habitat for western red bat. This modeled habitat preservation would be greater than the estimated 13,729 acres under the No Action/No Project Alternative. The Conservation Strategy would also establish/ re-establish a total of approximately 1,765 acres of habitat for western red bat, and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed above, and objectives to maintain or improve habitat value (e.g., development of preserve management plans, and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,502 fewer acres of modeled habitat for western red bat within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 11,251 acres more modeled western red bat habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or

minimize indirect and temporary effects on western red bat individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on western red bat when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 23,986 acres of modeled western red bat habitat within the Planning Area, which is approximately 1,502 fewer acres than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives beneficial to the conservation of western red bat. The Conservation Strategy would preserve approximately 11,251 more acres of western red bat modeled habitat than under the No Action/No Project Alternative, and those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for western red bat than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for western red bat compared to the No Action/No Project Alternative baseline condition.

9.2.3.21 Effects on American Badger and Its Habitat

The species description of American badger within the Planning Area is provided in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for American badger would be approximately 22,780 acres, or approximately 15.3% of the existing modeled habitat in the Planning Area (Table 9-39). This is less than the 24,192 acres estimated under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is not expected to remove any of the existing nine occurrences of American badger in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

Table 9-39. Direct Effects and Modeled Habitat Conservation for American Badger Under the Proposed Action/Proposed Project Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing*	*Direct Effect*	*% of Existing Habitat Lost*	Total Habitat Preservation	Total Habitat Re-establishment and/or Establishment
Valley Grassland	135,112	22,014	16.3%	22,014	0
Blue Oak Savanna	5,637	38	0.7%	38	38
Vernal Pool	4,536	389	8.6%	966	389
Seasonal Wetland	2,600	105	4.0%	105	105
Swale	1,252	234	18.7%	278	234
Grand Total	**149,137**	**22,780**	**15.3%**	**23,401**	**766**

Indirect effects on American badger would also occur under the Proposed Action/Proposed Project Alternative. These indirect effects are the same in type and character as those discussed for the species in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs relevant to American badger: LID-1 (Stormwater Quality) LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves), EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-6 (Stormwater Basins in Preserves), EDGE-8 (Outdoor Lighting), EDGE-9 (Livestock Access to Preserves), EDGE-10 (Prevent Invasive Species Spread), ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use), BMP-9 (Soil Compaction), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design), NATURE TRAIL-5 (Monitoring of Trail Impacts), and NATURE TRAIL-6 (Trail Public Education) (Table 2-6). Relative to the project

AMMs of the No Action/Project alternative, these SSHCP AMMs would avoid and minimize indirect impacts on American badger. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled American badger habitat from indirect impacts.

The Proposed Action/Proposed Project Alternative will also have temporary impacts on American badger, which would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). The Proposed Action/Proposed Project Alternative will require general construction AMMs be applied to Covered Activities (Table 2-6). These construction AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on American badger are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include approximately 23,401 acres of habitat for American badger. This modeled habitat preservation would be more than the estimated 13,489 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy would also establish/re-establish a total of approximately 766 acres of habitat and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously and objectives to maintain or improve habitat value (e.g., development of preserve management plans and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact 1,412 fewer acres of habitat for American badger within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Proposed Action/Proposed Project Alternative would preserve 9,912 more acres of habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on American badger individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously,

the Proposed Action/Proposed Project Alternative would have a ***Significant Beneficial*** effect on American badger when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 22,780 acres of modeled American badger habitat within the Planning Area, which is approximately 1,412 acres less than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as setbacks from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives beneficial to the conservation of American badger. The Conservation Strategy would preserve approximately 9,912 more acres of American badger modeled habitat than under the No Action/No Project Alternative. Additionally, those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for American badger than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for American badger compared to the No Action/No Project Alternative baseline condition.

9.2.3.22 Effects on Sanford's Arrowhead and Its Habitat

The habitat requirements of Sanford's arrowhead and information on documented occurrences in the Planning Area are provided in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of Sanford's arrowhead modeled habitat would be approximately 10,620 acres, or 20.1% of existing modeled habitat in the Planning Area (Table 9-40). The majority of that effect would be on Valley Grassland within the UDA. This is less than the estimated loss of 12,065 acres under the No Action/No Project Alternative.

The Proposed Action/Proposed Project Alternative is expected to remove 12 of the existing 64 occurrences of Sanford's arrowhead in the Planning Area, which would be 6 more occurrences than would be removed under the No Action/No Project Alternative.

Table 9-40. Direct Effects and Modeled Habitat Conservation for Sanford's Arrowhead Under the Proposed Action/Proposed Project Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing*	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Freshwater Marsh	2,044	103	5.0%	127	103
Open Water	1,086	68	6.3%	23	68*
Seasonal Wetlands	1,425	72	5.1%	87	72
Streams/Creeks	893	83	9.3%	117	83
Valley Grassland	47,375	10,294	21.7%	11,735	0
Grand Total	**52,823**	**10,620**	**20.1%**	**12,089**	**326**

* Acres of Open Water habitat re-establishment/establishment will occur as a land cover that provides equivalent or better habitat value for Covered Species affected by the loss of Open Water, as determined by the TAC.

Indirect effects on Sanford's arrowhead would occur under the Proposed Action/Proposed Project Alternative. These indirect effects are the same in type and character as those discussed for the species in Section 9.2.2.

The Proposed Action/Proposed Project Alternative requires implementation of the following AMMs by Covered Activities that are relative to Sanford's arrowhead: LID-1 (Stormwater Quality), LID-3 (Natural Site Features), EDGE-1 (Compatible Land Uses), EDGE-2 (Single Loaded Streets), EDGE-3 (Preserve Setbacks), EDGE-4 (Locate Stormwater Control Outside Preserves),EDGE-5 (Stormwater Control in Preserve Setbacks), EDGE-10 (Prevent Invasive Species Spread), BMP-9 (Soil Compaction), NATURE TRAIL-1 (Trail Plan), NATURE TRAIL-2 (Hardpan/Duripan Protection), NATURE TRAIL-3 (Trail Location), NATURE TRAIL-4 (Biological Studies Prior to Trail Design) NATURE TRAIL-5 (Monitoring of Trail Impacts), ROAD-1 (Road Project Location), ROAD-3 (Roadside Pesticide Use), STREAM-1 (Laguna Creek Setback), STREAM-2 (UDA Stream Setbacks), STREAM-3 (Minor tributaries to UDA Streams), UTILITY-2 (Utility Maintenance), and UTILITY-4 (Siting of Entry and Exit Location) (Table 2-6). Relative to the project AMMs of the No Action/Project alternative, these SSHCP AMMs would avoid

and minimize indirect impacts on Sanford's arrowhead. For example, STREAM-1, STREAM-2, and STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative. These setbacks would minimize the indirect impact to stream and creek modeled habitat for Sanford's arrowhead.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative. These stressors and impacts would be the same in type and character as those discussed and analyzed qualitatively for the species under the No Action/No Project Alternative (Section 9.2.2). Covered Activities would be required to implement general construction AMMs that would avoid or minimize temporary effects to Sanford's arrowhead (Table 2-6). These construction AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on Sanford's arrowhead are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would include a total of approximately 12,089 acres of habitat for Sanford's arrowhead. This modeled habitat preservation would exceed the estimated 5,907 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy would also establish/re-establish a total of approximately 326 acres of habitat, and would implement biological objectives to conserve the species within the Planning Area. These objectives would include the implementation of the AMMs and the Preserve System discussed previously, and objectives to maintain or improve habitat value (e.g., development of preserve management plans, and requirements for Preserve width to limit edge effects).

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact approximately 1,445 fewer acres of habitat for Sanford's arrowhead within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would preserve approximately 6,182 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid or minimize indirect and temporary effects on Sanford's arrowhead individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Proposed Action/Proposed Project Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on Sanford's arrowhead when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would result in the loss of approximately 10,620 acres of modeled Sanford's arrowhead habitat within the Planning Area, which is approximately 1,445 fewer acres than the estimated loss under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Proposed Action/Proposed Project Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives beneficial to the conservation of Sanford's arrowhead. The Conservation Strategy would preserve approximately 6,182 more acres of Sanford's arrowhead modeled habitat than under the No Action/No Project Alternative, and those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

The incremental effects of the Proposed Action/Proposed Project Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for Sanford's arrowhead than would occur under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect for Sanford's arrowhead compared to the No Action/No Project Alternative baseline condition.

9.2.3.23 Effects on Special-Status Plant Species Not Covered by the SSHCP and Their Habitat

There are 18 special-status plant species with potential to occur in the Planning Area that are not covered by the SSHCP (Table 9-2) and are analyzed here. Information on the process to select these species, their habitat associations, and occurrence in the Planning Area is provided

in Appendix G. These plant species are predominately associated with five SSHCP land cover categories: Vernal Wetlands, Non-vernal Wetlands, Riparian Habitats, Blue Oak Woodland and Savanna, and Valley Grassland.

Direct and Indirect Effects of the Alternative

The maximum modeled habitat loss under Proposed Action/Proposed Project Alternative is expected to be less than the loss under the No Action/No Project Alternative for 12 species (watershield (*Brasenia schreberi*), fleshy owl's clover, Brandegee's clarkia (*Clarkia biloba* ssp. *brandegeeae*), Peruvian dodder (*Cuscuta obtusiflora* var. *glandulos*a), stinkbells, woolly rose-mallow (*Hibiscus lasiocarpos* var. *occidentalis*), Delta tule pea (*Lathyrus jepsonii* var. *jepsonii*), Heckard's pepper-grass, marsh skullcap (*Scutellaria galericulata*), side-flowering skullcap (*Scutellaria lateriflora*), Suisun Marsh aster (*Symphyotrichum lentum*), and saline clover) and greater for the remaining 6 species (Table 9-41).

Table 9-41. Total Loss of Potentially Suitable Habitat for Other Special-Status Plants Under the Proposed Action/Proposed Project Alternative

Total Planning Area (acres)									
	Loss of Potentially Suitable Habitat (direct and indirect)						*% of Existing Potentially Suitable Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment/ Establishment*

Mason's lilaeopsis (State S2)	—	232	591	—	—	823	6.1%	1,196	823

Table 9-41. Total Loss of Potentially Suitable Habitat for Other Special-Status Plants Under the Proposed Action/Proposed Project Alternative

Total Planning Area (acres)									
	Loss of Potentially Suitable Habitat (direct and indirect)						*% of Existing Potentially Suitable Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment/ Establishment*
*Plant Name (status)**	*Vernal Wetlands*	*Non-vernal Wetlands*	*Riparian*	*Blue Oak Woodland/ Savanna*	*Valley Grassland*	*Total Habitat Loss*			
Delta mudwort (State S2)	—	232	591	—	—	823	6.1%	1,196	823
Marsh skullcap (State S1)	—	232	—	—	—	232	4.2%	232	232
Side-flowering skullcap (State S1)	—	232	—	—	—	232	4.2%	232	232
Suisun marsh aster (State S2)	—	232	—	—	—	232	4.2%	232	232
Saline clover (State S2)	761	232	—	—	22,014	23,007	15.7%	23,490	855

For species with state or federal status, no CRPR listing used.

* **Status Definitions**

Federal

E = listed as endangered under the ESA

T = listed as threatened under the ESA

State

E = listed as endangered under CESA

T = listed as threatened under CESA

S1 = Critically Imperiled by the State

S2 = Imperiled by the State

S3 =Vulnerable by the State

California Rare Plant Rank (CRPR)

2B = Rare, threatened, or endangered in California, but more common elsewhere

CRPR Threat Ranks

0.2 = Moderately threatened in California (moderate degree/immediacy of threat)

Indirect and temporary effects on these special-status plant species would be similar to those listed for Sanford's arrowhead in Section 9.2.2, such as increased exposure to pollutants and increased presence of invasive plant species, and are analyzed qualitatively for the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative would include the implementation of the AMMs discussed previously for Sanford's arrowhead that would also avoid or minimize indirect impacts to the special-status plants analyzed here.

Temporary construction stressors and impacts would occur under the Proposed Action/Proposed Project Alternative. These stressors and impacts would be the same in type and character as those discussed and analyzed qualitatively for Sanford's arrowhead under the No Action/No Project Alternative (Section 9.2.2), with the addition of specific environmental stressors on vernal pool hydrology (see the analysis of vernal pool invertebrates and plants in Section 9.2.2.1) that would indirectly adversely impact those special-status plant species analyzed here that are modeled to occur within the vernal pool ecosystem (e.g., bristly sedge, Bolander's water-hemlock, Tuolumne button-celery, and saline clover). Covered activities would be required to implement general construction AMMs that would avoid or minimize temporary effects to special-status plant species. These construction AMMs may also be applied under the No Action/No Project Alternative; however, oversight of AMM implementation and monitoring of AMM effectiveness by the Implementing Entity for the SSHCP would increase the avoidance and minimization of impacts. For this reason, temporary impacts under the Proposed Action/Proposed Project Alternative on the special-status plants analyzed here are expected to be less than under the No Action/No Project Alternative.

The Preserve System under the Proposed Action/Proposed Project Alternative would preserve and establish/re-establish habitat for special-status plants not covered by the SSHCP. In addition, the Conservation Strategy would implement biological objectives for Covered Species that would benefit non-covered plant species. The acres preserved under the Proposed Action/Proposed Project Alternative exceed the acres preserved under the No Action/No Project Alternative for all but three species (bristly sedge, Brandagee's clarkia, and Tuolumne button-celery).

Critical Habitat has been designated for fleshy owl's clover south of Dry Creek at the extreme southern edge of the Planning Area. The Proposed Action/Proposed Project Alternative is not expected to impact any of this designated Critical Habitat for fleshy owl's clover.

Significance of Direct and Indirect Effects

The Proposed Action/Proposed Project Alternative would impact a greater number of acres of habitat for 6 special-status plant species within the Planning Area than is estimated for the No Action/No Project Alternative and fewer acres for the remaining 12 species. However, the Proposed

Action/Proposed Project Alternative would preserve more habitat than what is estimated for the No Action/No Project Alternative for four of the six species with a greater impact and fewer for only one that has a smaller impact. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Proposed Action/Proposed Project Alternative that would avoid and minimize indirect and temporary effects on special-status plant species individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Proposed Action/Proposed Project Alternative on these special-status plant species would not be substantially different to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Proposed Action/Proposed Project Alternative would have a ***Less Than Significant Adverse*** effect on the special-status plant species not covered by the SSHCP when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Proposed Action/Proposed Project Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Proposed Action/Proposed Project Alternative would impact a greater number of acres of habitat for 6 special-status plant species within the Planning Area than is estimated for the No Action/No Project Alternative, and fewer acres for the remaining 12 species.

The Conservation Strategy would include Biological Goals and Measureable Objectives that would benefit special-status plant species habitat and would preserve more habitat than what is estimated for the No Action/No Project Alternative for four of the six species with a greater impact and fewer for only one that has a smaller impact. In addition the preservation under the Proposed Action/Proposed Project Alternative would be within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual preserves in the Preserve System under the Proposed Action/Proposed Project Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to special-status plant species and be operated under a comprehensive preserve management program.

The incremental effects of the Proposed Action/Proposed Project Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project

Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. The Proposed Action/Proposed Project Alternative would result in ***No Cumulative Effect*** to the special-status plant species not covered by the SSHCP compared to the No Action/No Project Alternative baseline condition.

9.2.4 Reduced Permit Term Alternative

As described in Section 2.4.3, the Reduced Permit Term Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative.

Under the Reduced Permit Term Alternative, the core of the Preserve System established inside the UDA would be associated with the development of five large Master Plans, as discussed in Section 2.3.4 for the Reduced Permit Term Alternative, and as discussed in Section 2.3.3 for the Proposed Action/Proposed Project Alternative. Because the core of the Preserve System inside the UDA under both EIS/EIR action alternatives is associated with the same five large Master Plans, approximately 70% of the UDA Preserves established under the Reduced Permit Term Alternative would have similar sizes, boundaries, and locations as the UDA Preserves established under the Proposed Action/Proposed Project Alternative. However, the shorter duration of the Reduced Permit Term Alternative—and the smaller amount of urban development and associated development fees collected by the Reduced Permit Term Alternative—would not allow the HCP's Implementing Entity to establish as many acres of new Preserves in the Planning Area as would occur under the Proposed Action/Proposed Project's 50-year permit term. Therefore, fewer new Preserves would be established under the Conservation Strategy of the Reduced Permit Term Alternative. This difference would be especially pronounced outside the UDA.

As described in Section 2.4, the ESA and CESA incidental take permits and the CWA permit strategy for HCP Covered Activities would be valid only during the 30-year permit term of the Reduced Permit Term Alternative, and the Reduced Permit Term Alternative's Conservation Strategy would be implemented only during this 30-year term. The urban development Covered Activities and conservation strategies associated with the five Master Plans would be implemented inside the UDA during this 30-year period. However, the EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3), so the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, as described in Section 3.6.7.2, the EIS/EIR analysis of the Reduced Permit Term Alternative also considers future urban development that is not part of the project description of the Reduced Permit Term Alternative, but is still expected to occur within the Planning Area after the end of the permit term (i.e., in years 31–50 of the EIS/EIR study period).

As described in Section 3.6.7.2, project mitigation Preserves established after the end of the 30-year Reduced Permit Term Alternative would be established under a project-by-project process for obtaining individual authorizations under CWA, ESA, CESA, and Section 1600 of the California Fish and Game Code. Consequently, mitigation Preserves established in years 31–50 of the EIS/EIR study period would not be established using a regional, landscape-based approach that balances new urban development with the need for conservation, as would be provided by an HCP. Therefore, much of the Preserve System inside the UDA would be very similar under the two action alternatives, but the Preserve System outside the UDA would be substantially different between the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, it is unlikely that mitigation Preserves established outside the UDA would be contiguous or would be interconnected, and it is unlikely that a large, contiguous 10,500-acre landscape-size vernal pool Preserve would be established in the southwestern portion of the Planning Area. Likewise, the No Action/No Project Alternative also would not result in contiguous, interconnected Preserves outside the UDA and would not establish a 10,500-acre vernal-pool preserve in the Planning Area. In these ways, the new mitigation Preserves established outside the UDA under the Reduced Permit Term Alternative and the No Action/No Project Alternative would be similar.

9.2.4.1 Effects on Vernal Pool Invertebrate/Plant Species and Habitat

As was the case for the No Action/No Project Alternative discussed previously, the following 11 vernal pool invertebrate and plant species are considered together in the analysis of the Reduced Permit Term Alternative due to their dependence on the vernal pool ecosystem: vernal pool tadpole shrimp, vernal pool fairy shrimp, mid-valley fairy shrimp, Ricksecker's water scavenger beetle, dwarf downingia, Ahart's dwarf rush, pincushion navarretia, slender Orcutt grass, Sacramento Orcutt grass, Boggs Lake hedge-hyssop, and legenere. While the individual natural history, habitat requirements, modeled habitat, and documented occurrences in the Planning Area differ for these species (and are found in Appendix G), the direct impact mechanisms and environmental stressors that cause temporary impacts are the same.

Direct and Indirect Effects of the Alternative

Projects and activities under the Reduced Permit Term Alternative (Section 2.4.3) would permanently remove modeled habitat for vernal pool invertebrate and plant species through development and related infrastructure resulting in direct impacts to vernal pool invertebrate and plant species. While the majority of the urban development would occur within the UDA, transportation and other infrastructure projects would occur outside the UDA. The direct impact acres that would occur under the Reduced Permit Term Alternative for each species are shown in Table 9-42 and discussed below.

Vernal pool invertebrate and plant species near proposed construction activities under the Reduced Permit Term Alternative will be adversely affected by several temporary construction-related effects (Appendix G) that will result in additional disturbance to habitat or additional harm to vernal pool invertebrate plant and animal species. Generally, these temporary effects will occur within the project boundary or road right-of-way area (quantified in the direct effects and the area of indirect impacts to each species in the impact tables below).

As discussed above for direct impacts, the majority of indirect impacts to vernal pool invertebrate and plant species under the Reduced Permit Term Alternative would occur within the UDA as a result of urban development, although there would be indirect impacts as a result of transportation and other infrastructure projects outside the UDA. The environmental stressors that would trigger indirect impacts under the Reduced Permit Term Alternative are the same in type and character as those discussed in the impact discussion for vernal pool invertebrate and plant species under the No Action/No Project Alternative in Section 9.2.2 above.

The Reduced Permit Term Alternative requires Covered Activities to implement the AMMs that would be applied during the permit term and are listed in the vernal pool invertebrate and plant species analysis in Section 9.2.3.

Relative to the project AMMs of the No Action/No Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on vernal pool invertebrate and plant species. For example, EDGE-3 establishes a 50-foot setback from the edge of established Preserves to minimize indirect effects on Preserve lands, while EDGE-7 would not allow Covered Activities that could damage duripan within the Preserve Setback to protect the perched aquifer that maintains hydrologic conditions in the vernal pool ecosystem. The indirect impact acres that would occur under the Reduced Permit Term Alternative for each species are shown in Table 9-42 and discussed below.

Some of the elements of the AMMs described previously would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The maximum anticipated loss of species modeled habitat for vernal pool tadpole shrimp and vernal pool fairy shrimp due to direct impacts would be approximately 18,825 acres (Table 9-42). Indirect effects on vernal pool tadpole shrimp and vernal pool fairy shrimp modeled aquatic habitat are anticipated to result in additional approximately 271 acres of impacts. The total impact, including direct and indirect impacts, of the Reduced Permit Term Alternative on

vernal pool tadpole shrimp and vernal pool fairy shrimp modeled habitat is expected to be approximately 19,096 acres. This total impact exceeds the 17,949 acres of total impact estimated for the No Action/No Project Alternative by approximately 1,147 acres (Table 9-4).

Of the direct habitat loss, approximately 9,800 acres would occur within the MCRA, which would affect approximately 53% of the modeled habitat within the MCRA. There would also be approximately 53 acres lost within the C/RS, which would affect approximately 0.1% of modeled habitat within the C/RS. This is greater than the habitat loss estimated within the MCRA and equal to the loss within the C/RS estimated for the No Action/No Project Alternative.

The Reduced Permit Term Alternative is also expected to remove approximately 725 acres of Critical Habitat for vernal pool tadpole shrimp and vernal pool fairy shrimp in Critical Habitat Unit 13 and approximately 80 acres in Critical Habitat Unit 14a for a total of approximately 805 acres of Critical Habitat lost. This loss is 161 acres less than the approximately 966 acres of designated Critical Habitat that would be removed under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to remove 94 of the 851 documented occurrences of vernal pool tadpole shrimp in the Planning Area, which would be 4 more occurrences than would be removed under the No Action/No Project Alternative. The Reduced Permit Term Alternative is also expected to remove 39 of the 581 documented occurrences of vernal pool fairy shrimp in the Planning Area, which would be 8 more occurrences than would be removed under the No Action/No Project Alternative.

The maximum anticipated direct loss of species modeled habitat for mid-valley fairy shrimp under the Reduced Permit Term Alternative would be approximately 13,774 acres, primarily within the UDA. In addition, indirect impacts on modeled habitat would be approximately 148 acres. The total impact to modeled habitat, including direct and indirect impacts, would be 13,921 acres (Table 9-42). This exceeds the approximately 13,220 acres of total impact estimated for the No Action/No Project Alternative (Table 9-4) by approximately 701 acres.

Of the direct habitat loss, approximately 7,252 acres would occur within the MCRA, which would affect approximately 40.0% of modeled habitat within the MCRA. There would also be approximately 41 acres lost within the C/RS, which would affect approximately 0.1% of modeled habitat within the C/RS. This is less than the 48% of habitat loss estimated within the MCRA and 0.4% of habitat loss within the C/RS estimated for the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to remove 4 of the 37 occurrences of mid-valley fairy shrimp in the Planning Area, which would be 1 fewer occurrence than would be removed under the No Action/No Project Alternative.

Activities under the Reduced Permit Term Alternative would cause direct impacts to approximately 18,797 acres of Ricksecker's water scavenger beetle modeled habitat to development and related infrastructure. In addition to this direct impact, approximately 263 acres of indirect impact would also occur for a total impact (direct and indirect combined) of approximately 19,060 acres on Ricksecker's water scavenger beetle modeled habitat. The total impact to Ricksecker's water scavenger beetle modeled habitat would be approximately 18.5% of the existing modeled habitat in the Planning Area (Table 9-42). The total impact to Ricksecker's water scavenger beetle modeled habitat under the Reduced Permit Term Alternative would be approximately 1,153 acres greater than the approximately 17,907 acres that is estimated to occur under the No Action/No Project Alternative (Table 9-4).

The Reduced Permit Term Alternative is not expected to remove any of the eight occurrences of Ricksecker's water scavenger beetle in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The Reduced Permit Term Alternative future urban development and related infrastructure would cause direct impacts through the loss of approximately 2,139 acres of modeled habitat for dwarf downingia. In addition to this direct impact, approximately 30 acres of indirect impact would also occur for a total impact of approximately 2,167 acres on dwarf downingia modeled habitat. The total impact, including direct and indirect impacts, to dwarf downingia modeled habitat would be approximately 9% of the existing modeled habitat in the Planning Area (Table 9-42). The total impact to dwarf downingia modeled habitat under the Reduced Permit Term Alternative would be approximately 129 acres greater than the approximately 2,038 acres of impact estimated to occur under the No Action/No Project Alternative (Table 9-4).

The Reduced Permit Term Alternative is not expected to remove any of the 10 documented occurrences of dwarf downingia in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The Reduced Permit Term Alternative would cause permanent loss of approximately 8,031 acres land cover types suitable for Ahart's dwarf rush due to development and related infrastructure. In addition to this direct impact, approximately 98 acres of indirect impact would also occur for a total impact (direct and indirect impacts combined) of approximately 8,130 acres on Ahart's dwarf rush modeled habitat. The total impact to Ahart's dwarf rush modeled habitat would be approximately 32.3% of the existing modeled habitat in the Planning Area (Table 9-42). The total impact to Ahart's dwarf rush modeled habitat under the Reduced Permit Term Alternative would be approximately 69 acres greater than the approximately 8,061 acres estimated to occur under the No Action/No Project Alternative (Table 9-4).

The Reduced Permit Term Alternative is not expected to remove the two occurrences of Ahart's dwarf rush in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The Reduced Permit Term Alternative would cause loss of approximately 8,854 acres of modeled habitat for pincushion navarretia resulting from development and related infrastructure. In addition to this direct impact, approximately 96 acres of indirect impact would also occur, for a total impact (direct and indirect impacts combined) of approximately 8,950 acres on pincushion navarretia modeled habitat. The total impact to pincushion navarretia modeled habitat would be approximately 15.6% of the existing modeled habitat in the Planning Area (Table 9-42). The total impact to pincushion navarretia modeled habitat under the Reduced Permit Term would be approximately 513 acres greater than the approximately 8,437 acres estimated to occur under the No Action/No Project Alternative (Table 9-4).

The Reduced Permit Term Alternative is not expected to remove any of the 48 occurrences of pincushion navarretia in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

The No Action/No Project Alternative would result in an estimated permanent loss of approximately 7,858 acres of modeled habitat for slender Orcutt grass and Sacramento Orcutt grass resulting from development and related infrastructure. In addition to this direct impact, approximately 80 acres of indirect impact would also occur for a total impact, including both direct and indirect impacts, of approximately 7,938 acres on for slender Orcutt grass and Sacramento Orcutt grass modeled habitat. This total impact would be approximately 23% of the total modeled habitat within the Planning Area (Table 9-42). The total impact to slender Orcutt grass and Sacramento Orcutt grass modeled habitat under the Reduced Permit Term Alternative would be approximately 176 acres greater than the approximately 7,762 acres under the No Action/No Project Alternative (Table 9-4).

Of this modeled habitat loss, approximately 5,295 acres would occur within the MCRA, which would affect approximately 50.6% of modeled habitat within the MCRA. There would also be approximately 21 acres lost within the C/RS, which would affect approximately 0.1% of modeled habitat within the C/RS. This is greater than the habitat loss estimated within the MCRA and equal to the loss within the C/RS estimated for the No Action/No Project Alternative.

The Reduced Permit Term Alternative is also expected to impact approximately 553 acres of Critical Habitat for Sacramento Orcutt grass in Critical Habitat Unit 2 and approximately 64 acres in Critical Habitat Unit 3 for a total of approximately 618 acres of Critical Habitat lost. This loss of Critical Habitat would be approximately 156 acres less than the approximately 774 acres estimated to occur under the No Action/No Project Alternative.

Approximately 553 acres of Critical Habitat for slender Orcutt grass would also be lost in Critical Habitat Unit 6, which would be approximately 157 acres less than the approximately 710 acres of Critical Habitat lost by the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to remove 2 of the 40 occurrences of Sacramento Orcutt grass and none of the 4 occurrences of slender Orcutt grass in the Planning Area, which is equal to the occurrences that would be removed under the No Action/No Project Alternative.

The Reduced Permit Term Alternative would result in loss of approximately 9,618 acres of modeled habitat for Boggs Lake hedge-hyssop resulting from development and related infrastructure. In addition to this direct impact, approximately 105 acres of indirect impact would also occur for a total impact (direct and indirect impacts combined) of approximately 9,723 acres on Boggs Lake hedge-hyssop modeled habitat. The total impact to Boggs Lake hedge-hyssop modeled habitat would be approximately 26% of the existing modeled habitat in the Planning Area (Table 9-42). This total impact under the Reduced Permit Term would be approximately 475 acres greater than the approximately 9,248 acres estimated to occur under the No Action/No Project Alternative (Table 9-4).

The Reduced Permit Term Alternative is expected to remove 3 of the existing 31 occurrences of Boggs Lake hedge-hyssop in the Planning Area, which would be 1 more occurrence than would be removed under the No Action/No Project Alternative.

The No Action/No Project Alternative would result in loss of approximately 11,680 acres of modeled habitat for legenere resulting from development and related infrastructure. In addition to this direct impact, 110 acres of indirect impact would also occur for a total impact (direct and indirect impacts combined) of 11,790 acres on legenere modeled habitat. The total impact to legenere modeled habitat would be approximately 23.1% of the existing modeled habitat in the Planning Area (Table 9-42). This total impact under the Reduced Permit Term would be 507 acres greater than the 11,283 acres estimated to occur under the No Action/No Project Alternative (Table 9-4).

The Reduced Permit Term Alternative is expected to remove 2 of the existing 62 occurrences of legenere in the Planning Area, which would be 1 more occurrence than would be removed under the No Action/No Project Alternative.

Table 9-42. Direct/Indirect Impacts and Conservation of Vernal Pool Invertebrate and Plant Modeled Habitat Under the Reduced Permit Term Alternative.

Modeled Habitat	Total Planning Area (acres)

Legenere							
Valley Grassland	47,526	11,356	Qualitative	11,356	23.9%	9,075	0
Vernal Pool	2,559	286	110	396	15.5%	792	286
Seasonal Wetland	886	38	Qualitative	38	4.3%	24	31
Total Modeled Habitat	**50,971**	**11,680**	**110**	**11,790**	**23.1%**	**9,891**	**317**

The Reduced Permit Term Alternative would result in the acres of modeled habitat preserved and re-established/established for vernal pool invertebrates and plants shown in Table 9-42 above. The modeled habitat preservation for all vernal pool invertebrate and plant species under the Reduced Permit Term Alternative would exceed that estimated under the No Action/No Project Alternative.

The Conservation Strategy also includes Biological Goals and Measurable Objectives that would direct the modeled habitat preservation associated with Covered Activities for vernal pool invertebrates and plants within the Planning Area. These Biological Goals and Measurable Objectives would include maintenance or improvement of habitat value for vernal pool invertebrates and plants by minimizing indirect effects on modeled habitat within preserves (e.g., development of preserve management plans and requirements for developments to include setback widths to limit edge effects). The No Action/No Project Alternative would

preserve vernal pool invertebrate and plant habitat listed previously; this habitat preservation would not be in a linked Preserve System, nor would it follow the objectives of the Conservation Strategy as would be implemented under the Reduced Permit Term Alternative.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would result in loss of a larger area of habitat for all 11 vernal pool invertebrate and plant species within the Planning Area when compared to the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve more habitat than what is estimated for the No Action/No Project Alternative for these vernal pool invertebrate and plant species.

Multiple AMMs are also included in the Reduced Permit Term Alternative that would result in the avoidance or minimization of indirect and temporary effects on vernal pool invertebrate and plant modeled habitat and provide an additional mechanism for impact avoidance and oversight.

The Reduced Permit Term Alternative would impact a smaller area of Critical Habitat for vernal pool tadpole shrimp, vernal pool fairy shrimp, slender Orcutt grass, and Sacramento Orcutt grass than the No Action/ No Project Alternative.

The Reduced Permit Term Alternative would also impact a greater area within the MCRA and an equal area within the C/RS compared to the No Action/No Project Alternative.

The Reduced Permit Term Alternative Preserve System would provide some larger vernal pool ecosystem Preserves and increased Preserve connectivity over the project-by-project mitigation under the No Action/No Project Alternative, maintaining existing vernal pool ecosystem function, which benefits vernal pool invertebrate and plant species.

Therefore, the Reduced Permit Term Alternative's impact to all vernal pool invertebrate and plant species would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, effects from the Reduced Permit Term Alternative on vernal pool invertebrates and plant species would be a ***Less Than Significant Adverse*** effect when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

The Reduced Permit Term Alternative would result in loss of a larger area of habitat for all 11 vernal pool invertebrate and plant species within the Planning Area when compared to the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve considerably more habitat than what is estimated for the No Action/No Project Alternative for these species.

In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

During the 30-year permit term of the Reduced Permit Term Alternative, modeled habitat preservation would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual preserves established in the Preserve System during the 30-year permit term of the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to vernal pool invertebrate and plant species and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** on the vernal pool invertebrate and plant species compared to the No Action/No Project Alternative baseline condition.

9.2.4.2 Effects on Valley Elderberry Longhorn Beetle and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of valley elderberry longhorn beetle are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of valley elderberry longhorn beetle modeled habitat would be approximately 610 acres, primarily within the UDA or 7.7% of the existing modeled habitat in the Planning Area (Table 9-43). This would be greater than the estimated direct impact of 554 acres for the No Action/No Project Alternative.

The Reduced Permit Term Alternative is not expected to remove any of the existing 156 occurrences of valley elderberry longhorn beetle in the Planning Area; there would also be no occurrences removed under the No Action/No Project Alternative.

Table 9-43. Effects and Modeled Habitat Conservation for Valley Elderberry Longhorn Beetle Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Total Habitat Re-establishment and/or Establishment*
Mine Tailing Riparian Woodland	641	219	34.2%	5	0
Mixed Riparian Woodland	5,785	197	3.41	338	306
Mixed Riparian Scrub	1,452	194	13.4%	350	303
TOTAL	**7,878**	**610**	**7.7%**	**693**	**609**

Indirect and temporary impacts to valley elderberry longhorn beetle would also occur under the Reduced Permit Term Alternative. These effects are listed in the species impact discussion in Section 9.2.2. The Reduced Permit Term Alternative requires Covered Activities implement the AMMs that would be applied during the permit term are listed in the valley elderberry longhorn beetle analysis in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on valley elderberry longhorn beetle. For example, STREAM-1 though STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled habitat.

Some of the elements of the AMMs described above and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The Reduced Permit Term Alternative would result in approximately 598 acres of preservation, which is greater than the zero acres estimated for the No Action/No Project Alternative. The Conservation Strategy also would re-establish/establish 609 acres of valley elderberry longhorn beetle habitat and provides for two specific objectives for valley elderberry longhorn beetle that would be implemented during the permit term: the relocation and replacement of damaged or lost elderberry shrubs and the inclusion of elderberry shrubs in riparian re-establishment/establishment projects as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 56 more acres of habitat for valley elderberry longhorn beetle within the Planning Area than is estimated for the No Action/No Project Alternative; however, the Reduced Permit Term and the No Action/No Project Alternative would both re-establish/establish an equal number of acres to result in a no net loss of acreage for the species. Also, the Reduced Permit Term Alternative would preserve approximately 598 more of modeled habitat, while the No Action/No Project Alternative is estimated to preserve none. Additionally, the Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs, such as increased stream setbacks, are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on valley elderberry longhorn beetle individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on valley elderberry longhorn beetle would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, the Reduced Permit Term Alternative would have ***No Effect*** on valley elderberry longhorn beetle when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in the loss of approximately 610 acres of modeled valley elderberry longhorn beetle habitat within the Planning Area, which is approximately 56 acres greater than the loss than under the No Action/No Project Alternative. However, as discussed previously, both alternatives are anticipated to mitigate these losses to a no net loss of acreage. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30-years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of valley elderberry longhorn beetle. The Reduced Permit Term Alternative would

result in the preservation of 598 more acres of valley elderberry longhorn beetle habitat than under the No Action/No Project Alternative. In addition, this modeled habitat preservation would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to valley elderberry longhorn beetle and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to valley elderberry longhorn beetle compared to the No Action/No Project Alternative baseline condition.

9.2.4.3 Effects on California Tiger Salamander (Central Valley Population) and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of California tiger salamander (Central Valley population) in the Planning Area are described in detail in Appendix G.

The maximum anticipated direct loss of modeled habitats for California tiger salamander would be approximately 1,761 acres of upland (2.2% of existing) and approximately 85 acres of aquatic habitat (1.9% of existing), for a total of 1,846 acres of direct loss to modeled habitat (Table 9-44). These impacts would be very similar to the estimated direct impact from the No Action/No Project Alternative of approximately 1,847 acres.

The Reduced Permit Term Alternative is not expected to remove any of the existing 31 occurrences of California Tiger salamander in the Planning Area; there would also be no occurrences removed under the No Action/No Project Alternative.

Table 9-44. Direct Effects and Modeled Habitat Conservation for California Tiger Salamander Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing	*Direct Effect*	*Indirect Effect*	*Total Habitat Lost*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Upland Habitat							
Blue Oak Savanna	3,322	0	Qualitative	0	0.0%	0	0
Blue Oak Woodland	3,774	0	Qualitative	0	0.0%	0	0
Valley Grassland	78,274	1,761	Qualitative	1,761	*2.2%*	14,946	0
Total Upland Habitat	*85,369*	*1,761*	*Qualitative*	*1,761*	*2.1%*	*14,946*	*0*
Aquatic Habitat							
Vernal Pool	3,033	58	0	58	*1.9%*	116	58
Seasonal Wetland	1,391	27	Qualitative	27	*1.9%*	17	22
Total Aquatic Habitat	*4,425*	*85*	*0*	*85*	*1.9%*	*133*	*80*
Grand Total	**89,794**	**1,846**	**0**	**1,846**	***2.1%***	**15,079**	**80**

The Reduced Permit Term Alternative is expected to result in the loss of approximately 46 acres of upland habitat and 6 acres of aquatic habitat within the C/RS. This is 7 acres less than the expected habitat loss under the No Action/No Project Alternative.

None of the 10,193 acres of designated Critical Habitat for the species is expected to be removed under the Reduced Permit Term Alternative or the No Action/No Project Alternative.

Indirect effects on modeled California tiger salamander habitat would also occur under the Reduced Permit Term Alternative. These indirect effects would be the same in type and character as those discussed and analyzed qualitatively for the No Action/No Project in Section 9.2.2. There would be no quantified indirect effects under the Reduced Permit Term Alternative, which would be approximately 4 acres less than the quantified indirect impact under the No Action/No Project Alternative.

The Reduced Permit Term Alternative requires Covered Activities during the permit term to implement the AMMs listed in the California tiger salamander analysis in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on valley elderberry longhorn beetle. For example, ROAD-2 would require wildlife crossing structures and maintain connectivity between modeled habitats, while CTS-7 would limit rodent control to developed portions of project sites, allowing for burrow creation that provides habitat for California tiger salamander. While both of

these AMMs may be applied to projects under the No Action/No Project Alternative, they would likely be applied less frequently and not within all modeled habitat.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on California tiger salamander modeled habitat that would occur under the Reduced Permit Term Alternative are the same in type and character as those analyzed for the species under the No Action/No Project Alternative in Section 9.2.2. The AMMs that would be applied during the permit term to avoid or minimize these temporary effects are listed in the species analysis for the Proposed Action in Section 9.2.3. This would result in reduced temporary impacts to California tiger salamander when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would include preservation of approximately 15,079 acres of habitat for California tiger salamander. This is greater than the estimated 9,689 acres of modeled habitat preservation under the No Action/No Project Alternative. The Reduced Permit Term Alternative would also re-establish/establish 80 acres of modeled habitat for California tiger salamander.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately the same number of acres of habitat for California tiger salamander within the Planning Area as is estimated for the No Action/No Project Alternative, and an equal number of acres within the C/RS. However, the Reduced Permit Term Alternative would result in preservation of approximately 5,390 acres more modeled habitat for California tiger salamander than is estimated to result from the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid or minimize indirect and temporary effects on California tiger salamander individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the

Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on California tiger salamander when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described above for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in the loss of approximately 1,846 acres of modeled California tiger salamander beetle habitat within the Planning Area, which is approximately 1 acre smaller than the loss than under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 year of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of California tiger salamander. The Reduced Permit Term Alternative would result in preservation of additional acres of California tiger salamander habitat that exceed the preservation under the No Action/No Project Alternative by approximately 5,390 acres. During the 30-year permit term of the Reduced Permit Term Alternative, this preservation would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to California tiger salamander and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for California tiger salamander than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** for California tiger salamander compared to the No Action/No Project Alternative baseline condition.

9.2.4.4 Effects on Western Spadefoot and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of western spadefoot in the Planning Area are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated direct loss of modeled habitats for western spadefoot would be approximately 23,719 acres of upland habitat (approximately 15.8% of existing) and approximately 1,107 acres of aquatic breeding habitat (approximately 9.5% of existing) for the species, for a total direct loss of 24,826 acres of modeled habitat (Table 9-45). This exceeds the estimated loss of 24,586 acres of modeled habitat under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to remove 3 of the existing 41 occurrences of western spadefoot in the Planning Area, which would be 4 fewer occurrences than would be removed under the No Action/No Project Alternative.

Indirect effects on modeled western spadefoot habitat would also occur under the Reduced Permit Term Alternative. These indirect effects would be the same in type and character as those discussed and analyzed qualitatively for the No Action/No Project in Section 9.2.2. There would be approximately 177 acres of quantified indirect effects under the Reduced Permit Term Alternative, which would be approximately 84 acres less than the quantified indirect impact under the No Action/No Project Alternative. The total impact, direct impact and indirect impact combined, to western spadefoot under the Reduced Permit Term Alternative would be approximately 25,003 acres, which is greater than the estimated total impact under the No Action/No Project Alternative of 24,847 acres (Table 9-7).

Table 9-45. Direct Effects and Modeled Habitat Conservation for Western Spadefoot Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing	*Direct Effect*	*Indirect Effect*	*Total Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Upland Habitat							
Blue Oak Savanna	5,637	38	Qualitative	38	0.7%	37	37
Blue Oak Woodland	9,132	9	Qualitative	9	0.1%	9	9
Valley Grassland	135,094	23,671	Qualitative	23,671	17.5%	18,589	0
Total Upland Habitat	*149,863*	*23,719*	*Qualitative*	*23,719*	*15.8%*	*18,635*	*46*
Aquatic Habitat							
Vernal Pool	4,536	413	130	543	12.0%	1,086	413
Swale	1,252	269	40	309	24.7%	503	227
Seasonal Wetland	2,600	110	Qualitative	110	4.2%	70	91
Open Water	2,344	165	Qualitative	165	7.0%	43	104
Stream/Creek	2,674	122	Qualitative	122	4.6%	122	105
Stream/Creek (VPIH)	73	28	7	35	47.9%	16	8
Total Aquatic Habitat	*13,479*	*1,107*	*177*	*1,284*	*9.5%*	*1,840*	*948*
Grand Total	**163,342**	**24,826**	**177**	**25,003**	**15.3%**	**20,475**	**994**

The Reduced Permit Term Alternative requires Covered Activities implement the AMMs that would be applied during the permit term; they are listed in the western spadefoot analysis in Section 9.2.3.

Relative to the project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on western spadefoot. For example, ROAD-2 would require wildlife crossing structures and maintain connectivity between modeled habitats, and EDGE-4 would require that stormwater runoff be directed away from Preserves, which would limit exposure of western spadefoot within Preserves to urban runoff that may contain pesticides and petroleum products. While both of these AMMs may be applied to projects under the No Action/No Project Alternative, they would likely be applied less frequently.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP

would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on western spadefoot and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2, The AMMs that would be required during the permit term that would reduce these temporary effects on western spadefoot during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to western spadefoot when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would include preservation of approximately 20,475 acres of modeled habitat for western spadefoot, which would be greater than the 13,600 acres of modeled habitat estimated to be conserved under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would establish/re-establish approximately 994 acres of modeled habitat for western spadefoot, along with Biological Goals and Measurable Objectives that support modeled habitat preservation for the species within the Planning Area as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 156 more acres of habitat for western spadefoot within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 6,875 acres more habitat than what is estimated for the No Action/No Project Alternative. In addition, the Preserve System implemented during the permit term would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid or minimize indirect and temporary effects on western spadefoot modeled habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on western spadefoot would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have ***No Effect*** on western spadefoot when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described previously for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 25,001 acres of western spadefoot modeled habitat within the Planning Area, which is approximately 156 acres greater than the total impact under the No Action/No Project Alternative. However, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as increased stream setbacks and setbacks to avoid impacts to vernal pool hydrology, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of western spadefoot, and the Reduced Permit Term Alternative would result in approximately 6,875 more acres of western spadefoot habitat preserved than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to western spadefoot and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Impact*** to western spadefoot compared to the No Action/No Project Alternative baseline condition.

9.2.4.5 Effects on Giant Garter Snake and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of giant garter snake in the Planning Area are described in detail in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitats for giant garter snake would be approximately 2,506 acres, including approximately 2,319 acres of upland habitat (approximately 8.3% of existing) and approximately 187 acres of aquatic habitat (approximately 2.6% of existing) (Table 9-46). This is approximately 5 acres greater than the estimated 2,501 total acres lost under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is not expected to remove any of the existing 14 occurrences of giant garter snake in the Planning Area; there would also be no occurrences removed under the No Action/No Project Alternative.

Table 9-46. Direct Effects and Modeled Habitat Conservation for Giant Garter Snake Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Upland Habitat					
Mixed Riparian Scrub	1,044	134	12.8%	167	167
Valley Grassland	26,825	2,185	8.1%	5,122	0
Total Upland Habitat	*27,869*	*2,319*	*8.3%*	*5,289*	*167*
Aquatic Habitat					
Seasonal Wetland	1,625	41	2.5%	27	34
Freshwater Marsh	2,589	80	3.1%	58	69
Open Water	1,282	28	2.2%	7	18
Streams/Creeks	1,794	38	2.1%	38	33
Total Aquatic Habitat	*7,290*	*187*	*2.6%*	*130*	*154*
Grand Total	**35,159**	**2,506**	**7.1%**	**5,419**	**321**

Indirect effects on giant garter snake modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of HCP AMMs during the permit term would reduce indirect impacts on giant garter snake. For example, STREAM-2 and STREAM-3 would increase setback distances on UDA streams and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled habitat.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on giant garter snake and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on giant garter snake during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to giant garter snake when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would include preservation of approximately 5,419 acres of modeled habitat for giant garter snake. This modeled habitat preservation is 2,142 acres greater than that estimated for the No Action/No Project Alternative of 3,277 acres. The Conservation Strategy implemented during the permit term would establish/re-establish approximately 321 acres of upland and aquatic habitat for giant garter snake, and implement specific biological objectives for the modeled habitat preservation of the species in the Planning Area as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact 5 acres more habitat for giant garter snake within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Reduced Permit Term Alternative would preserve approximately 2,142 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System established during the permit term would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid or minimize indirect and temporary effects on giant garter snake individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact on giant garter snake would be similar to that of the No Action/No Project Alternative, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Reduced Permit Term Alternative would have ***No Effect*** on giant

garter snake when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in the loss of approximately 2,506 acres of modeled giant garter snake habitat within the Planning Area, which is 5 acres greater than the loss than under the No Action/No Project Alternative. In addition, the HCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy also would include Biological Goals and Measureable Objectives specific to the conservation of giant garter snake. The Reduced Permit Term Alternative would result in preservation of approximately 2,142 more acres of giant garter snake habitat than under the No Action/No Project Alternative; those acres would be preserved within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative.

The incremental effects of the Reduced Permit Term Alternative on giant garter snake would be similar to the effects that would occur under the No Action/No Project Alternative. Therefore, the Reduced Permit Term Alternative would result in ***No Effect*** for giant garter snake compared to the No Action/No Project Alternative baseline condition.

9.2.4.6 Effects on Western Pond Turtle and Its Habitat

The life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of western pond turtle in the Planning Area are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated direct loss of modeled habitats for the species would be approximately 11,356 acres, including approximately 11,022 acres of upland habitat (9.9% of existing) and approximately 334 acres of aquatic habitat(5.3% of existing) (Table 9-47). This is

less than the total estimated loss under the No Action/No Project Alternative of 12,160 acres, including 11,783 of upland and 377 acres of aquatic habitat.

The Reduced Permit Term Alternative is not expected to remove any of the existing 19 occurrences of western pond turtle in the Planning Area, which would be the 1 fewer occurrence than would be removed under the No Action/No Project Alternative.

Table 9-47. Direct Effects and Modeled Habitat Conservation for Western Pond Turtle Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Upland Habitat					
Blue Oak Woodland	7,610	9	0.1%	9	9
Blue Oak Savanna	4,825	35	0.7%	35	35
Valley Grassland	91,580	10,605	11.6%	12,596	0
Mine Tailing Riparian Woodland	306	41	13.4%	5	0
Mixed Riparian Woodland	5,347	183	3.4%	230	241
Mixed Riparian Scrub	1,178	149	12.6%	204	195
Total Upland Habitat	*110,846*	*11,022*	*9.9%*	*13,079*	*480*
Aquatic Habitat					
Freshwater Marsh	2,240	104	4.6%	76	90
Open Water	1,441	108	7.5%	28	68
Stream/Creek	2,674	122	4.6%	122	105
Total Aquatic Habitat	*6,355*	*334*	*5.3%*	*226*	*263*
Grand Total	**117,201**	**11,356**	**9.7%**	**13,239**	**679**

Indirect effects on western pond turtle modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/No Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on western pond turtle. For example, STREAM-2 and STREAM-3 would increase setback distances on UDA streams and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled habitat.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices

and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on western pond turtle and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on western pond turtle during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to western pond turtle when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in the preservation of approximately 13,079 acres of upland habitat and 226 acres of aquatic habitat. This 13,239 acres total modeled habitat preservation would be greater than the estimated modeled habitat preservation under the No Action/No Project Alternative of 8,085 acres. The Conservation Strategy implemented during the permit term would establish/re-establish approximately 679 acres of upland and aquatic habitat for western pond turtle, and implement specific biological objectives for the modeled habitat preservation of the species in the Planning Area as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 804 fewer acres of habitat for western pond turtle within the Planning Area than is estimated for the No Action/No Project Alternative. In addition, the Reduced Permit Term Alternative would preserve approximately 5,154 more acres of western pond turtle modeled habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid or minimize indirect and temporary effects on western pond turtle individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided above, the Reduced Permit Term Alternative would have a ***Significant Beneficial*** effect on western pond turtle when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in the loss of 11,356 acres of modeled western pond turtle habitat within the Planning Area, which is 804 acres less than the loss than under the No Action/No Project Alternative. In addition, the HCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the permit term also would include Biological Goals and Measureable Objectives specific to the conservation of western pond turtle. The Reduced Permit Term Alternative would result in the preservation of approximately 5,154 more acres of western pond turtle habitat than under the No Action/No Project Alternative. In addition, preservation that occurs during the 30-year permit term of the Reduced Permit Term Alternative would be within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives similar to those of the SSHCP applicable to western pond turtle and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for western pond turtle than would occur under the No Action/No Project Alternative. Therefore, the Reduced Permit Term Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect for western pond turtle compared to the No Action/No Project Alternative baseline condition.

9.2.4.7 Effects on Cooper's Hawk and Its Habitat

Appendix G describes the life history, habitat requirements, documented occurrences, and existing acres of modeled habitat of Cooper's hawk in the Planning Area.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of species modeled habitat for Cooper's hawk would be approximately 657 acres, including approximately 619 acres of nesting/foraging habitat (3.6% of existing), and approximately 38 acres of foraging habitat (0.7% of existing) (Table 9-48). These percentages do not take into account the use of developed areas for nesting by Cooper's hawk, which if taken into account would increase the percentage of remaining existing habitat. This loss of modeled habitat is less than the estimated loss of 693 acres under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to remove 2 of the existing 20 occurrences of Cooper's hawk in the Planning Area, which would be the same number of occurrences as would be removed under the No Action/No Project Alternative.

Table 9-48. Direct Effects and Modeled Habitat Conservation for Cooper's Hawk Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Habitat Re-establishment and/ or Establishment*
Nesting/Foraging Habitat					
Blue Oak Woodland	9,132	9	0.1%	9	9
Mine Tailing Riparian Woodland*	641	219	34.2%	5	0
Mixed Riparian Woodland	5,785	197	3.4%	338	306
Mixed Riparian Scrub	1,451	194	13.4%	350	303
Total Nesting/Foraging Habitat	*17,009*	*619*	*3.6%*	*702*	*618*
Foraging Habitat					
Blue Oak Savanna	5,637	38	0.7%	37	37
Total Foraging Habitat	*5,637*	*38*	*0.7%*	*37*	*37*
Grand Total	**22,646**	**657**	**2.9%**	**739**	**655**

* Habitat re-establishment/establishment for Mine Tailing Riparian Woodland can be either Mixed Riparian Woodland or Mixed Riparian Scrub.

Indirect effects on Cooper's hawk modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on Cooper's hawk. For example, STREAM-2 and STREAM-3 would increase setback distances on UDA streams and minor tributaries over what would be required under the No Action/No Project Alternative, increasing protection of riparian modeled habitat.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on Cooper's hawk and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on Cooper's hawk during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to Cooper's hawk when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in preservation of approximately 702 acres of nesting/foraging habitat and 37 acres of foraging habitat, which would be more than the 70 acres estimated for the No Action/No Project Alternative. Additionally, the Conservation Strategy implemented during the permit term would also, establish/re-establish a total of approximately 655 acres of habitat for Cooper's hawk and would implement biological objectives to conserve the species within the Planning Area as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 36 fewer acres of habitat for Cooper's hawk within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Reduced Permit Term Alternative would preserve approximately 632 more acres of modeled habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid or minimize indirect and temporary effects on Cooper's hawk individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided above, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on Cooper's hawk when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described above for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to 657 acres of Cooper's hawk modeled habitat within the Planning Area, which is 36 acres less than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as increased stream setbacks, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of Cooper's hawk. The Reduced Permit Term Alternative would result in preservation of 632 more acres of Cooper's hawk habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to Cooper's hawk and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for Cooper's hawk than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in a ***Significant Beneficial Cumulative Effect*** for Cooper's hawk compared to the No Action/No Project Alternative baseline condition.

9.2.4.8 Effects on Tricolored Blackbird and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area for tricolored blackbird are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitats for tricolored blackbird would be approximately 33,206 acres, including approximately 29,694 acres of nesting/foraging habitat (15.8% of existing) and approximately 3,512 acres of foraging habitat (14.5% of existing) (Table 9-49). This is greater than the estimated habitat loss under the No Action/No Project Alternative of 32,907 acres, including 29,389 acres of nesting/foraging and 3,518 acres of foraging habitat.

Indirect effects on tricolored blackbird modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Table 9-49. Direct Effects and Modeled Habitat Conservation for Tricolored Blackbird Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/ or Establishment*
Nesting/Foraging Habitat					
Valley Grassland	135,112	23,671	17.5%	18,589	0
Cropland	47,905	5,465	11.4%	5,299	0
Seasonal Wetland	2,600	110	4.2%	70	91
Freshwater Marsh	2,922	137	4.7%	100	119
Total Nesting/Foraging Habitat	*188,539*	*29,694*	*15.8%*	*24,058*	*210*
Foraging Habitat					
Irrigated Pasture-Grassland	15,991	2,665	16.7%	2,642	0
Vernal Pool	4,536	413	9.1%	1,199	413
Swale	1,222	269	22.0%	495	216
Open Water	2,344	165	7.0%	43	104
Total Foraging Habitat	*24,093*	*3,512*	*14.5%*	*4,379*	*733*
Grand Total	**212,632**	**33,206**	**15.6%**	**28,437**	**943**

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on tricolored blackbird. For example, EDGE-4 would require that stormwater runoff be directed away from Preserves, which would limit exposure of tricolor blackbird within Preserves to urban runoff that may contain pesticides and petroleum products. TCB-5 would restrict the use of pesticides on Preserves between January 1 and July 15, further reducing exposure of tricolored blackbird to

pesticides. While these AMMs may be applied to projects under the No Action/No Project Alternative, they would likely be applied less frequently.

Some of the elements of the AMMs described above and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on tricolored blackbird and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on tricolored blackbird during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to tricolored blackbird when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in preservation of approximately 24,058 acres of nesting/foraging habitat and approximately 4,739 acres of foraging habitat. This modeled habitat preservation exceeds the estimated 21,148 total acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would also establish/ re-establish approximately 943 acres of habitat for tricolored blackbird and implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 299 acres more modeled habitat for tricolored blackbird within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 2,910 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid or minimize indirect and temporary effects on tricolored blackbird individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on tricolored blackbird would be similar to that of the No Action/No Project Alternative, and based on the significance

criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on tricolored blackbird when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described above for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 33,206 acres of tricolored blackbird modeled habitat within the Planning Area, which is approximately 299 acres greater than the total impact under the No Action/No Project Alternative. However, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of tricolored blackbird. The Reduced Permit Term would result in the preservation of approximately 2,910 more acres of tricolored blackbird habitat than the preservation under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to tricolored blackbird and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to tricolored blackbird compared to the No Action/No Project Alternative baseline condition.

9.2.4.9 Effects on Western Burrowing Owl and Its Habitat

Habitat use, natural history, and documented occurrences within the Planning Area for western burrowing owl are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitat for western burrowing owl would be approximately 32,972 acres (15.5% of existing) (Table 9-50). This is greater than the expected habitat loss under the No Action/No Project Alternative of 32,711 acres.

The Reduced Permit Term Alternative is expected to remove 11 of the existing 97 occurrences of western burrowing owl in the Planning Area, which would be 1 more occurrence than would be removed under the No Action/No Project Alternative.

Indirect effects on western burrowing owl modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Table 9-50. Direct Effects and Modeled Habitat Conservation for Western Burrowing Owl Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Wintering Habitat					
Vernal Pool	4,536	413	9.1%	1,199	413
Seasonal Wetland	2,600	111	4.3%	70	91
Swale	1,252	270	21.6%	535	228
Stream/Creek (VPIH)	73	28	38.4%	16	8
Total Wintering Habitat	*8,461*	*822*	*9.7%*	*1,820*	*740*
Nesting/Foraging Habitat					
Cropland	47,905	5,465	11.4%	5,299	0
Irrigated Pasture-Grassland	15,991	2,665	16.7%	2,642	0
Valley Grassland	135,112	23,671	17.5%	18,589	0
Blue Oak Savanna	5,637	38	0.7%	37	37
Total Nesting/Foraging Habitat	*204,645*	*32,150*	*15.7%*	*26,567*	*37*
Total Modeled Habitat	**213,106**	**32,972**	**15.5%**	**28,387**	**777**

Relative to the typical project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on western burrowing owl. For

example, EDGE-3 would require 50-foot setback distances between urban development and Preserves which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled burrowing owl habitat from indirect impacts.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on western burrowing owl and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on western burrowing owl during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to western burrowing owl when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in the preservation of approximately 28,387 acres of modeled habitat. This exceeds the estimated 21,188 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would establish/re-establish a total of approximately 777 acres of habitat for western burrowing owl and would implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 261 acres more modeled habitat for western burrowing owl within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 7,199 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on western burrowing owl individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on western burrowing owl would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on western burrowing owl when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to 32,972 acres of western burrowing owl modeled habitat within the Planning Area, which is 261 acres greater than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of western burrowing owl. The Reduced Permit Term Alternative would result in the preservation of approximately 7,199 more acres of western burrowing owl habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to western burrowing owl and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to western burrowing owl compared to the No Action/No Project Alternative baseline condition.

9.2.4.10 Effects on Ferruginous Hawk and Its Habitat

The life history, suitable habitat in the Planning Area, and documented occurrences of ferruginous hawk are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of species modeled habitat for ferruginous hawk would be approximately 27,130 acres of foraging habitat (17.2% of existing) (Table 9-51). This is greater than the expected loss under the No Action/No Project Alternative of 26,887 acres.

The Reduced Permit Term Alternative is not expected to remove any of the existing 26 occurrences of ferruginous hawk in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

Table 9-51. Direct Effects and Modeled Habitat Conservation for Ferruginous Hawk Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Remaining*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Foraging Habitat					
Valley Grassland	135,112	23,671	17.5%	18,589	0
Irrigated Pasture-Grassland	15,991	2,665	16.7%	2,642	0
Seasonal Wetland	2,600	111	4.3%	70	91
Vernal Pool	4,536	413	9.1%	846	413
Swale	1,252	270	21.6%	495	216
Total Foraging Habitat	**159,491**	**27,130**	**17.0%**	**22,642**	**720**

Indirect effects on ferruginous hawk modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on ferruginous hawk. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled ferruginous hawk habitat from indirect impacts.

Some of the elements of the AMMs described above and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on ferruginous hawk and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on ferruginous hawk during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to ferruginous hawk when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in the preservation of approximately 22,642 acres of nesting/foraging habitat. This exceeds the estimated 15,942 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would establish/re-establish a total of approximately 720 acres of habitat for ferruginous hawk and implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 243 acres more modeled habitat for ferruginous hawk within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 6,700 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on ferruginous hawk individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on ferruginous hawk would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on ferruginous hawk when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 27,439 acres of ferruginous hawk modeled habitat within the Planning Area, which is approximately 553 acres greater than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of ferruginous hawk. The Reduced Permit Term Alternative would result in the preservation of approximately 389 more acres of ferruginous hawk habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to ferruginous hawk and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to ferruginous hawk compared to the No Action/No Project Alternative baseline condition.

9.2.4.11 Effects on Swainson's Hawk and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of Swainson's hawk are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of modeled habitats for Swainson's hawk would be approximately 32,986 acres, including approximately 391 acres of nesting habitat (5.4% of

existing) and approximately 32,595 acres of foraging habitat (15.8% of existing) (Table 9-52). This exceeds the estimated loss under the No Action/No Project Alternative, which totals approximately 32,888 acres, including 336 acres of nesting and 32,552 acres of foraging habitat.

The Reduced Permit Term Alternative is expected to remove 37 of the existing 410 occurrences of Swainson's hawk in the Planning Area, which would be 2 more occurrences than would be removed under the No Action/No Project Alternative.

Table 9-52. Direct Effects and Modeled Habitat Conservation for Swainson's Hawk Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Total Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Nesting Habitat					
Mixed Riparian Woodland	5,785	197	3.4%	229	250
Mixed Riparian Scrub	1,449	194	13.4%	241	242
Total Nesting Habitat	*7,234*	*391*	*5.4%*	*470*	*492*
Foraging Habitat					
Valley Grassland	133,705	23,671	17.7%	18,589	0
Cropland	47,905	5,465	11.4%	5,299	0
Irrigated Pasture-Grassland	15,991	2,665	16.7%	2,642	0
Vernal Pool	4,536	413	9.1%	1,199	413
Seasonal Wetland	2,600	111	4.2%	70	91
Swale	1,252	270	21.6%	495	216
Total Foraging Habitat	*205,989*	*32,595*	*15.8%*	*28,294*	*720*
Grand Total	**213,223**	**32,986**	**15.5%**	**28,764**	**1,212**

Indirect effects on Swainson's hawk modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on Swainson's hawk. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled Swainson's hawk habitat from indirect impacts.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements

implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on Swainson's hawk and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on Swainson's hawk during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to Swainson's hawk when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in the preservation of approximately 28,764 acres of modeled habitat, which exceeds the estimated 21,061 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would establish/re-establish a total of approximately 1,212 acres of habitat for Swainson's hawk, and implement biological objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 1,098 acres more modeled habitat for Swainson's hawk within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 7,703 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on Swainson's hawk individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on Swainson's hawk would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse Impact*** on Swainson's hawk when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described previously for the No Action/No Project Alternative above (Section 9.2.2).

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to 32,986 acres of Swainson's hawk modeled habitat within the Planning Area, which is 1,098 acres greater than the total impact estimated under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of Swainson's hawk. The Reduced Permit Term Alternative would result in the preservation of approximately 7,703 more acres of Swainson's hawk habitat than the preservation under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to Swainson's hawk and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to Swainson's hawk compared to the No Action/No Project Alternative baseline condition.

9.2.4.12 Effects on Northern Harrier and Its Habitat

Habitat use, natural history, and documented occurrences within the Planning Area for northern harrier are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of species modeled habitats totals approximately 32,732 acres, including approximately 31,801 acres of nesting/foraging habitat (16.1% of existing) and approximately 931 acres of foraging habitat (8.2% of existing) (Table 9-53). This is slightly less than the estimated total loss of approximately 32,734 acres of northern harrier habitat, including approximately 31,913 acres of nesting/foraging and approximately 821 acres of foraging habitat under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is expected to remove 4 of the existing 70 occurrences of northern harrier in the Planning Area, which would be two more occurrences than would be removed under the No Action/No Project Alternative.

Table 9-53. Direct Effects and Modeled Habitat Conservation for Northern Harrier Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Nesting/Foraging Habitat					
Valley Grassland	135,112	23,671	17.5%	18,589	0
Cropland	47,905	5,465	11.4%	5,299	0
Irrigated Pasture-Grassland	15,991	2,665	16.7%	2,642	0
Total Nesting/Foraging Habitat	*199,008*	*31,801*	*16.0%*	*26,530*	*0*
Foraging Habitat					
Vernal Pool	4,536	413	9.1%	1,199	413
Seasonal Wetland	2,600	111	4.3%	70	91
Freshwater Marsh	2,922	137	4.7%	100	119
Swale	1,252	270	21.6%	495	216
Total Foraging Habitat	*11,310*	*931*	*8.2%*	*1,864*	*839*
Grand Total	**210,318**	**32,732**	**15.6%**	**28,394**	**839**

Indirect effects on northern harrier modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on northern harrier. For example, EDGE-3 would require 50-foot setback distances between urban development and

Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled northern harrier habitat from indirect impacts.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on northern harrier and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on northern harrier during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to northern harrier when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in preservation of approximately 28,394 acres of modeled habitat. This exceeds the estimated 21,077 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would establish/re-establish a total of approximately 839 acres of habitat for northern harrier and would implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 2 acres less modeled habitat for northern harrier within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Reduced Permit Term Alternative would preserve approximately 7,317 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on northern harrier individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on Cooper's hawk

when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct impacts to 32,732 acres of northern harrier modeled habitat within the Planning Area, which is 2 acres less than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of northern harrier. The Reduced Permit Term Alternative would result in the preservation of approximately 7,317 more acres of northern harrier habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative. The individual preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to northern harrier and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for northern harrier than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** for northern harrier compared to the No Action/No Project Alternative baseline condition.

9.2.4.13 Effects on White-Tailed Kite and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of white-tailed kite are discussed in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated total loss of modeled habitats for white-tailed kite would be approximately 33,252 acres, including approximately 425 acres of nesting habitat (2.7% of existing), 194 acres of nesting/foraging habitat (13.4% of existing), and approximately 32,633 acres of foraging habitat (15.3% of existing) (Table 9-54). This is less than the estimated total loss under the No Action/No Project Alternative of approximately 33,284 acres.

Table 9-54. Direct Effects and Modeled Habitat Conservation for White-Tailed Kite Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Nesting Habitat

Total Nesting/Foraging Habitat	*1,451*	*194*	*13.4%*	*350*	*303*
Foraging Habitat					
Valley Grassland	135,112	23,671	17.5%	18,589	0
Cropland	47,905	5,465	11.4%	5,299	0
Irrigated Pasture-Grassland	15,991	2,665	16.7%	2,642	0
Blue Oak Savanna	5,637	38	0.7%	37	37
Vernal Pool	4,536	413	9.1%	1,199	413
Seasonal Wetland	2,600	111	4.3%	70	91
Swale	1,252	270	21.6%	495	216
Total Foraging Habitat	*213,033*	*32,633*	*15.3%*	*28,331*	*757*
Grand Total	**230,042**	**33,252**	**14.5%**	**29,033**	**1,375**

Indirect effects on white-tailed kite modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the

species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on white-tailed kite. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled white-tailed kite habitat from indirect impacts.

Some of the elements of the AMMs described above and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on white-tailed kite and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on white-tailed kite during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to white-tailed kite when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in the preservation of approximately 29,033 acres of modeled habitat. This exceeds the estimated 21,321 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would establish/re-establish a total of approximately 1,375 acres of habitat for white-tailed kite and would implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 32 fewer acres of modeled habitat for white-tailed kite within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Reduced Permit Term Alternative would preserve 7,712 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on white-tailed kite individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on Cooper's hawk when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 33,252 acres of white-tailed kite modeled habitat within the Planning Area, which is approximately 32 fewer acres than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of white-tailed kite. The Reduced Permit Term Alternative would result in the preservation of approximately 7,712 more acres of white-tailed kite habitat than the preservation under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to white-tailed kite and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for white-tailed kite than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** for white-tailed kite compared to the No Action/No Project Alternative baseline condition.

9.2.4.14 Effects on Greater Sandhill Crane and Its Habitat

Appendix G discusses the habitat use, natural history, and documented occurrences of greater sandhill crane in the Planning Area.

Direct and Indirect Effects of the Alternative

The maximum anticipated direct loss of species modeled habitats for greater sandhill crane would be approximately 8,271 acres (9.7% of existing), including approximately 59 acres of roosting, approximately 131 acres of roosting/foraging, and approximately 8,081 acres of foraging habitat (Table 9-55). This is less than the estimated total loss of 9,499 acres under the No Action/No Project Alternative.

Table 9-55. Direct Effects and Modeled Habitat Conservation for Greater Sandhill Crane Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)						
	Total Existing	*Direct Effect*	*Indirect Effect*	*Total Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Roosting/Foraging Habitat[1]							
Seasonal Wetland	1,877	58	Qualitative	58	3.2%	80	58
Freshwater Marsh	2,610	73	Qualitative	73	2.8%	53	64
Total Roosting/ Foraging Habitat	*4,487*	*131*	*Qualitative*	*131*	*3.0%*	*133*	*122*
Roosting Habitat							
Vernal Pool	1,156	59	83	142	12.3%	284	59
Total Roosting Habitat	*1,156*	*59*	*83*	*142*	*12.3%*	*284*	*59*
Foraging Habitat[2]							
Cropland	42,628	3,876	Qualitative	3,876	9.1%	3,758	0
Valley Grassland	30,585	2,534	Qualitative	2,534	8.3%	4,206	0
Irrigated Pasture-Grassland	10,908	1,671	Qualitative	1,671	15.3%	1,654	0
Total Foraging Habitat	*84,121*	*8,081*	*Qualitative*	*8,081*	*9.6%*	*9,618*	*0*
Grand Total	**85,277**	**8,271**	**83**	**8,354**	**9.6%**	**10,035**	**181**

1 Modeled roosting habitat includes these communities within 2 miles of greater sandhill crane occurrences in the Planning Area.
2 Modeled foraging habitat includes these communities within 1.75 miles of modeled roosting habitat.

Indirect effects on modeled greater sandhill crane habitat would also occur under the Reduced Permit Term Alternative. These indirect effects would be the same in type and character as those discussed and analyzed qualitatively for the No Action/No Project in Section 9.2.2. There would be 83 acres of quantified indirect effects under the Reduced Permit Term Alternative, which would be approximately 34 acres less than the quantified indirect impact under the No Action/No Project Alternative.

The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3. Relative to the project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on greater sandhill crane. For example, EDGE-4 would require that stormwater runoff be directed away from Preserves, which would limit exposure of greater sandhill crane within Preserves to urban runoff that may contain pesticides and petroleum products and that can adversely affect the hydrology of vernal pool roosting habitat.

Some of the elements of the AMMs described above and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on greater sandhill crane modeled habitat that would occur under the Reduced Permit Term Alternative are the same in type and character as those analyzed for the species under the No Action/No Project Alternative in Section 9.2.2. The AMMs that would be applied during the permit term to avoid or minimize these temporary effects are listed in the species analysis for the Proposed Action in Section 9.2.3. This would result in reduced temporary impacts to greater sandhill crane when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in preservation of approximately 10,035 acres of modeled habitat, which would be more than the estimated 8,323 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would also establish/re-establish approximately 181 acres of habitat for greater sandhill crane and would implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact 1,262 fewer acres of modeled habitat for greater sandhill crane within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Reduced Permit Term Alternative would preserve 1,712 more acres of habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would also provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and

temporary effects on greater sandhill crane individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on greater sandhill crane when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct (approximately 8,271 acres) and indirect (approximately 83 acres) impacts for a total impact of approximately 8,354 acres to greater sandhill crane modeled habitat within the Planning Area, which is approximately 1,262 acres less than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of greater sandhill crane. The Reduced Permit Term Alternative would result in the preservation of approximately 1,712 more acres of greater sandhill crane habitat than the preservation under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to greater sandhill crane and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for greater sandhill

crane than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** for greater sandhill crane compared to the No Action/No Project Alternative baseline condition.

9.2.4.15 Effects on Lesser Sandhill Crane and Its Habitat

Habitat associations and occurrence information for lesser sandhill crane in the Planning Area is provided in Appendix G.

Direct and Indirect Effects of the Alternative

The land cover types in the Planning Area that are utilized by lesser sandhill crane are the same as those previously identified for greater sandhill crane, as is the expected acres of potentially suitable habitat loss under the Reduced Permit Term Alternative.

New development and transportation infrastructure would have indirect effects on lesser sandhill crane that would be the same as those discussed previously for greater sandhill cranee. In addition, construction activities under the Reduced Permit Term Alternative may result in temporary effects as discussed for greater sandhill crane.

The Reduced Permit Term Alternative would include the implementation of the AMMs discussed previously for greater sandhill crane that would also avoid or minimize indirect impacts lesser sandhill crane during the permit term. Temporary impacts would also be avoided or minimized by the construction and species AMMs discussed for greater sandhill crane during the permit term. Although the greater sandhill crane species-specific AMMs would not apply to projects where only lesser sandhill crane is present, due to the habitat overlap of the two species both would benefit from the application of these species-specific AMMs.

The potentially suitable lesser sandhill crane habitat preserved under the Reduced Permit Term Alternative and the relation of that habitat preservation to the No Action/No Project Alternative would be the same as that for greater sandhill crane.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 1,262 fewer acres of potentially suitable habitat for lesser sandhill crane within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Reduced Permit Term Alternative would preserve approximately 1,712 more acres of habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would also provide some larger Preserves and increased

Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on lesser sandhill crane individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided above, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on lesser sandhill crane when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct (approximately 8,271 acres) and indirect (approximately 83 acres) impacts for a total impact of approximately 8,534 acres to lesser sandhill crane potentially suitable habitat within the Planning Area, which is approximately 1,262 acres less than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of greater sandhill crane that would also benefit lesser sandhill crane. The Reduced Permit Term Alternative would also result in the preservation of approximately 1,712 more acres of lesser sandhill crane habitat than the preservation under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to lesser sandhill crane and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for lesser sandhill crane than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** for lesser sandhill crane compared to the No Action/No Project Alternative baseline condition.

9.2.4.16 Effects on Loggerhead Shrike and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of loggerhead shrike are described Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated total loss of loggerhead shrike modeled habitat is approximately 33,516 acres of modeled habitat (Table 9-56). This is greater than the estimated loss under the No Action/No Project Alternative of approximately 33,144 acres.

Table 9-56. Direct Effects and Modeled Habitat Conservation for Loggerhead Shrike Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Nesting Habitat					
Mixed Riparian Woodland	5,785	197	3.4%	338	306
Mixed Riparian Scrub	1,424	194	13.6%	350	303
Mine Tailing Riparian Woodland	641	219	34.2%	5	0
Total Nesting Habitat	*7,850*	*610*	*7.8%*	*693*	*609*
Nesting/Foraging Habitat					
Valley Grassland	135,112	23,982	17.7%	24,096	0
Total Nesting/Foraging Habitat	*135,112*	*23,982*	*17.7%*	*24,096*	*0*
Foraging Habitat					
Cropland	47,905	5,465	11.4%	18,589	0
Irrigated Pasture-Grassland	15,991	2,665	16.7%	2,642	0
Vernal Pool	4,536	413	9.1%	1,199	413
Seasonal Wetland	2,600	111	4.3%	70	91
Swale	1,252	270	21.6%	495	216
Total Foraging Habitat	*72,284*	*8,924*	*12.3%*	*22,995*	*720*
Grand Total	**215,246**	**33,516**	**15.6%**	**47,784**	**1,329**

The Reduced Permit Term Alternative is not expected to remove any of the existing 34 occurrences of loggerhead shrike in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

Indirect effects on loggerhead shrike modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project avoidance and minimization measures of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on loggerhead shrike. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled loggerhead shrike habitat from indirect impacts.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on loggerhead shrike and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on loggerhead shrike during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to loggerhead shrike when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would include preservation of approximately 47,784 acres of modeled habitat. This exceeds the estimated 21,061 acres of modeled habitat preservation under the No Action/No Project Alternative. The Conservation Strategy implemented during the permit term would establish/re-establish a total of approximately 1,329 acres of habitat for loggerhead shrike, and implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 372 acres more modeled habitat for loggerhead shrike within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve 26,723 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on loggerhead shrike individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on loggerhead shrike would be slightly more than that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on loggerhead shrike when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 33,516 acres of loggerhead shrike modeled habitat within the Planning Area, which is approximately 372 acres greater than the total impact under the No Action/No Project Alternative. However, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of loggerhead shrike. The Reduced Permit Term Alternative includes preservation of approximately 26,723 more acres of loggerhead shrike habitat than the preservation under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is

anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to loggerhead shrike and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to loggerhead shrike compared to the No Action/No Project Alternative baseline condition.

9.2.4.17 Effects on Grasshopper Sparrow and Its Habitat

Habitat associations and occurrence information for grasshopper sparrow within the Planning Area is provided in Appendix G.

Direct and Indirect Effects of the Alternative

Estimated losses of potentially suitable habitat under the Reduced Permit Term Alternative would consist of approximately 2,665 acres of Irrigated Pasture-Grassland and approximately 23,671 acres of Valley Grassland for a total land cover loss of approximately 26,336 acres. Of this habitat loss, approximately 25,511 acres would occur within the UDA, and approximately 825 acres would occur outside of the UDA. This is greater than the loss of potentially suitable grasshopper sparrow habitat under the No Action/No Project Alternative of 26,210 acres.

Indirect effects on potentially suitable grasshopper sparrow habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on grasshopper sparrow. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of potentially suitable grasshopper sparrow habitat from indirect impacts.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP

would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on grasshopper sparrow and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on grasshopper sparrow during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to grasshopper sparrow when compared with the No Action/No Project Alternative under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would include preservation of approximately 21,231 acres of potentially suitable grasshopper sparrow habitat, and implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3. This exceeds the estimated 14,302 acres of potentially suitable habitat preservation under the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 126 acres more potentially suitable habitat for grasshopper sparrow within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 6,929 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on grasshopper sparrow individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on grasshopper sparrow would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on grasshopper sparrow when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct impacts to approximately 26,336 acres of potentially suitable grasshopper sparrow habitat within the Planning Area, which is approximately 126 acres greater than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives that would benefit conservation of grasshopper sparrow. The Reduced Permit Term Alternative would result in the preservation of approximately 6,929 more acres of potentially suitable grasshopper sparrow habitat than the preservation under the No Action/No Project Alternative. In addition, the habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to grasshopper sparrow and be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to grasshopper sparrow compared to the No Action/No Project Alternative baseline condition.

9.2.4.18 Effects on Song Sparrow (Modesto Population) and Its Habitat

Habitat associations and occurrence information for song sparrow in the Planning Area is provided in Appendix G. The land cover types in the Planning Area that are utilized by song sparrow are Seasonal Wetland, Freshwater Marsh, and Riparian Scrub.

Direct and Indirect Effects of the Alternative

The anticipated loss of potentially suitable habitat for song sparrow would be approximately 111 acres of Seasonal Wetland, approximately 137 acres of Freshwater Marsh, and approximately 194 acres of Mixed Riparian Scrub, which totals approximately 442 acres and is less than the approximately 448 acres estimated under the No Action/No Project Alternative.

Indirect effects on potentially suitable song sparrow habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on song sparrow. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of potentially suitable song sparrow habitat from indirect impacts.

Some of the elements of the AMMs described above and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on song sparrow and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on song sparrow during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to song sparrow when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in approximately 520 acres of modeled habitat preservation and would implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3. This exceeds the estimated 24 acres of modeled habitat preservation under the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact 6 fewer acres of potentially suitable habitat for song sparrow within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 496 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and

temporary effects on song sparrow individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on song sparrow when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 442 acres of potentially suitable song sparrow habitat within the Planning Area, which is approximately 6 fewer acres than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives that would benefit conservation of song sparrow. The Reduced Permit Term Alternative would result in preservation of approximately 496 more acres of song sparrow habitat than the preservation under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative. The individual preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to song sparrow and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for song sparrow than would occur under the No Action/No Project Alternative. However, at the scale of the

study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** for song sparrow compared to the No Action/No Project Alternative baseline condition.

9.2.4.19 Effects on Bank Swallow and Its Habitat

Habitat associations and occurrence information for bank swallow in the Planning Area is provided in Appendix G. Bank swallow is associated with large cut banks in riverine habitats and sand bluffs, where it builds nest burrows, and with surrounding areas that it uses for foraging. The two documented occurrences of nesting colonies within the Planning Area are along the Cosumnes River between Rancho Murieta and Sloughhouse.

Direct and Indirect Effects of the Alternative

The potential loss of bank swallow nesting habitat from Preserve Covered Activities and other activities under the Reduced Permit Term Alternative are analyzed qualitatively. Under this alternative, the entire Cosumnes River/Deer Creek Corridor would not be part of the Preserve System, and it is uncertain if these nesting colonies would be part of a Preserve. Should the nesting colonies be part of a Preserve, Preserve Covered Activities that remove cut banks though use of bank stabilization techniques, or that remove potential foraging habitat within proximity to nest colonies, would result in impacts to bank swallow. If the nesting colonies are not part of a Preserve, then no other Covered Activities under the Reduced Permit Term are likely to adversely affect these nesting colonies. Projects and activities under the No Action/No Project Alternative would not likely remove cut banks though use of bank stabilization techniques, or remove foraging habitat within proximity to nest colonies or result in impacts to bank swallow.

Indirect effects on potentially suitable bank swallow habitat may occur under the Reduced Permit Term Alternative, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on bank swallow. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of potentially suitable bank swallow habitat from indirect impacts.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements

implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on bank swallow habitat and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.. The AMMs that would be required during the permit term that would reduce these temporary effects on bank swallow during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to bank swallow when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period. The total acreage of potentially suitable bank swallow habitat preserved under the Reduced Permit Term Alternative is analyzed qualitatively. However, the majority of nesting and foraging habitat in the Planning Area is likely within the Cosumnes River/Deer Creek Corridor, and it is uncertain where the acres that would be preserved as part of the corridor would be located under this alternative.

Significance of Direct and Indirect Effects

Preserve Covered Activities within the Cosumnes River/Deer Creek Corridor implemented under the Reduced Permit Term Alternative would potentially impact known nesting colonies of bank swallow within the Planning Area in contrast to the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve more potentially suitable habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid or minimize indirect and temporary effects on bank swallow individuals and habitat, and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on bank swallow would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on bank swallow when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, if Preserve covered activities occur near known nest colonies, the Reduced Permit Term Alternative would result in greater direct and indirect impacts to potentially suitable bank swallow habitat within the Planning Area than under the No Action/No Project Alternative. However, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as stream and Preserve Setbacks, that would reduce indirect impacts to remaining potentially suitable habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives that would benefit conservation of bank swallow. The Reduced Permit Term Alternative would preserve more acres of bank swallow habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to bank swallow and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to bank swallow compared to the No Action/No Project Alternative baseline condition.

9.2.4.20 Effects on Western Red Bat and Its Habitat

Habitat use, natural history, documented occurrences, and existing acres of modeled habitat in the Planning Area of western red bat are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated direct loss of western red bat modeled habitat totals approximately 25,771 acres of modeled habitat. This exceeds the estimated loss under the No Action/No

Project Alternative of approximately 25,488 acres. The percentage of habitat remaining shown in Table 9-57 only applies to those natural land covers listed and is an underestimation of total habitat remaining. Western red bat is known to roost and forage in developed areas and those acres are not included in the analysis.

The Reduced Permit Term Alternative is expected to remove three of the existing seven occurrences of western red bat in the Planning Area, which would be equal to the occurrences that would be removed under the No Action/No Project Alternative.

Table 9-57. Direct Effects and Modeled Habitat Conservation for Western Red Bat Under the Reduced Permit Term Alternative

Modeled Habitat	Total Planning Area (acres)				
	Total Existing	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Foraging Habitat					
Valley Grassland	135,112	23,671	17.5%	18,589	0
Vernal Pool	4,536	413	9.1%	1,199	413
Seasonal Wetlands	2,600	111	4.3%	70	91

Open Water	2,344	165	7.0%	43	104
Mixed Riparian Scrub	1,451	194	13.4%	350	303
Swale	1,252	270	21.6%	495	216
Total Foraging Habitat	*152,891*	*25,083*	*16.4%*	*20,968*	*1,351*
Roosting/Foraging Habitat					
Blue Oak Woodland	9,132	9	0.1%	9	9
Mixed Riparian Woodland	5,785	197	3.4%	338	306
Blue Oak Savanna	5,637	38	0.7%	37	37
Orchards	3,646	225	6.2%	10	0
Mine Tailing Riparian Woodland	641	219	34.2%	5	0
Total Roosting/Foraging Habitat	*24,841*	*688*	*2.8%*	*399*	*352*
Grand Total	**177,732**	**25,771**	**14.5%**	**21,367**	**1,703**

Indirect effects on western red bat modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on western red bat. For

example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled western red bat habitat from indirect impacts.

Some of the elements of the AMMs described above and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on western red bat and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on western red bat during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to western red bat when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would result in the preservation of approximately 21,367 acres of modeled habitat. This exceeds the estimated 13,729 total acres of modeled habitat preservation under the No Action/No Project Alternative. During the permit term, the Conservation Strategy would establish/re-establish a total of approximately 1,703 acres of habitat for western red bat and would implement Biological Goals and Measurable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 283 acres more modeled habitat for western red bat within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 7,638 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on western red bat individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on western red bat would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less than Significant Adverse*** effect on western red bat when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct impacts to approximately 25,771 acres of western red bat modeled habitat within the Planning Area, which is approximately 283 acres greater than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of western red bat. The Reduced Permit Term Alternative would Preserve approximately 7,638 more acres of western red bat habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to western red bat and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to western red bat compared to the No Action/No Project Alternative baseline condition.

9.2.4.21 Effects on American Badger and Its Habitat

Habitat use, natural history, known occurrences, and existing acres of modeled habitat in the Planning Area of American badger are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated direct loss of American badger modeled habitat totals approximately 24,503 acres (Table 9-58). This exceeds the 24,192 acres estimated under the No Action/No Project Alternative.

The Reduced Permit Term Alternative is not expected to remove any of the existing nine occurrences of American badger in the Planning Area; no occurrences would be removed under the No Action/No Project Alternative.

Table 9-58. Direct Effects and Modeled Habitat Conservation for American Badger Under the Reduced Permit Term Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing*	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/or Establishment*
Valley Grassland	135,112	23,671	17.5%	18,589	0
Blue Oak Savanna	5,637	38	0.7%	37	37
Vernal Pool	4,536	413	9.1%	1,199	413
Seasonal Wetland	2,600	111	4.3%	70	91
Swale	1,252	270	21.6%	495	216
GRAND TOTAL	**149,137**	**24,503**	**16.4%**	**20,390**	**757**

Indirect effects on American badger modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project Alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on American badger. For example, EDGE-3 would require 50-foot setback distances between urban development and Preserves, which would not be required under the No Action/No Project Alternative, thereby increasing protection of modeled American badger habitat from indirect impacts.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices

and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on American badger and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on American badger during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to American badger when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would include the preservation of approximately 20,390 acres of habitat. This modeled habitat preservation is greater than the estimated 13,489 total acres of modeled habitat preservation under the No Action/No Project Alternative. During the permit term, the Conservation Strategy would establish/re-establish a total of approximately 757 acres of habitat and would implement biological objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 311 acres more modeled habitat for American badger within the Planning Area than is estimated for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would preserve approximately 6,901 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on American badger individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on American badger would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on American badger when compared to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 24,503 acres of American badger modeled habitat within the Planning Area, which is approximately 311 acres greater than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of American badger. The Reduced Permit Term Alternative would Preserve approximately 6,901 acres more American badger habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to American badger and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Impact*** to American badger compared to the No Action/No Project Alternative baseline condition.

9.2.4.22 Effects on Sanford's Arrowhead and Its Habitat

The habitat requirements and known occurrences of Sanford's arrowhead in the Planning Area are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum anticipated loss of Sanford's arrowhead modeled habitat totals approximately 11,835 acres (Table 9-59). The majority of that effect would be on valley grasslands within the UDA. This loss of modeled habitat is less than the estimated loss of 12,065 acres under the No Action/No Project Alternative.

Table 9-59. Direct Effects and Modeled Habitat Conservation for Sanford's Arrowhead Under the Reduced Permit Term Alternative

	Total Planning Area (acres)				
Modeled Habitat	*Total Existing*	*Direct Effect*	*% of Existing Habitat Lost*	*Habitat Preservation*	*Habitat Re-establishment and/ or Establishment*
Freshwater Marsh	2,044	113	5.5%	82	98
Open Water	1,086	72	6.6%	19	45
Seasonal Wetlands	1,425	75	5.3%	47	62
Stream/Creek	893	87	9.7%	87	75
Valley Grassland	47,375	11,488	24.2%	6,516	0
Grand Total	**52,823**	**11,835**	**22.4%**	**6,751**	**280**

The Reduced Permit Term Alternative is expected to remove 4 of the existing 64 occurrences of Sanford's arrowhead in the Planning Area, which would be 2 fewer occurrences than would be removed under the No Action/No Project Alternative.

Indirect effects on Sanford's arrowhead modeled habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on Sanford's arrowhead. For example, STREAM-1, STREAM-2, and STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative. These setbacks would minimize the indirect impact to stream and creek modeled habitat for Sanford's arrowhead.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP

would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on Sanford's arrowhead and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on Sanford's arrowhead during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to Sanford's arrowhead when compared with the No Action/No Project Alternative, under which AMMs would not be required of development projects for the full 50-year analysis period.

The Reduced Permit Term Alternative would include preservation of approximately 6,751 acres of habitat. This modeled habitat preservation is more than the estimated 5,907 acres of modeled habitat preservation under the No Action/No Project Alternative. During the permit term, the Conservation Strategy would establish/re-establish a total of approximately 280 acres of habitat for Sanford's arrowhead and would implement Biological Goals and Measureable Objectives as discussed in Section 9.2.3.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact approximately 230 acres less modeled habitat for Sanford's arrowhead within the Planning Area than is estimated for the No Action/No Project Alternative. Additionally, the Reduced Permit Term Alternative would preserve approximately 844 acres more habitat than what is estimated for the No Action/No Project Alternative. The Preserve System would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included during the 30-year permit term of the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on Sanford's arrowhead individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the Reduced Permit Term Alternative would have less impact, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on Sanford's arrowhead when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would result in direct and indirect impacts to approximately 11,835 acres of Sanford's arrowhead modeled habitat within the Planning Area, which is approximately 230 acres less than the total impact under the No Action/No Project Alternative. In addition, the SSHCP Conservation Strategy implemented under the Reduced Permit Term Alternative would include AMMs, such as requirements to direct stormwater away from Preserves, that would reduce indirect impacts to remaining modeled habitat compared to what is anticipated from the No Action/No Project Alternative.

The Conservation Strategy implemented during the first 30 years of the Reduced Permit Term Alternative also would include Biological Goals and Measureable Objectives specific to the conservation of Sanford's arrowhead. However, the Reduced Permit Term Alternative would preserve approximately 844 acres more Sanford's arrowhead habitat than under the No Action/No Project Alternative. In addition, the modeled habitat preservation that would occur during the 30-year permit term of the Reduced Permit Term Alternative would occur within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to Sanford's arrowhead and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for Sanford's arrowhead than would occur under the No Action/No Project Alternative. Therefore, the Reduced Permit Term Alternative does not result in a cumulatively considerable contribution to significant adverse cumulative impacts to this species. The Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect for Sanford's arrowhead compared to the No Action/No Project Alternative baseline condition.

9.2.4.23 Effects on Special-Status Plant Species Not Covered by the SSHCP and Their Habitat

The habitat requirements, documented occurrences, and existing acres of potentially suitable habitat in the Planning Area for the 18 special-status plant species that are not covered by the SSHCP are described in Appendix G.

Direct and Indirect Effects of the Alternative

The maximum habitat loss under Reduced Permit Term Alternative is expected to be less than under the No Action/No Project Alternative for nine species (watershield, fleshy owl's clover, Brandegee's clarkia, Peruvian dodder, woolly rose-mallow, Delta tule pea, marsh skullcap, side-flowering skullcap, and Suisun Marsh aster) and greater for the remaining nine species (bristly sedge, Bolander's water hemlock, Tuolomne button-celery, stinkbells, Northern California black walnut, Heckard's pepper-grass, Mason's lilaeopsis, Delta mudwort, and saline clover) (Table 9-60).

Indirect effects on potentially suitable special-status plant species habitat may occur under the Reduced Permit Term, which would be the same in type and character as the indirect effects analyzed for the species in Section 9.2.2. The AMMs that would be required during the permit term are discussed for the species in Section 9.2.3.

Relative to the project AMMs of the No Action/Project alternative, the implementation of SSHCP AMMs during the permit term would reduce indirect impacts on special-status plant species. For example, STREAM-1, STREAM-2, and STREAM-3 would increase setback distances on Laguna Creek, UDA streams, and minor tributaries over what would be required under the No Action/No Project Alternative. These setbacks would minimize the indirect impact to stream and creek modeled habitat for special-status plant species.

Some of the elements of the AMMs described previously and in Section 9.2.3 would also be implemented under the No Action/No Project Alternative as part of standard best practices and/or regulatory requirements (see Table 2-6). However, for those AMM elements implemented across alternatives, the additional oversight and guidance provided by the SSHCP would result in the requirements of these AMMs being implemented more frequently and consistently across the Planning Area.

The temporary effects on special-status plant species and potential loss of individuals that may occur under the Reduced Permit Term would be the same in type and character as those analyzed qualitatively in the species impact discussion in Section 9.2.2. The AMMs that would be required during the permit term that would reduce these temporary effects on special-status plant species during the permit term are listed for the species in Section 9.2.3. This would result in reduced temporary impacts to special-status plant species when compared with the No Action/No Project Alternative under which AMMs would not be required of development projects for the full 50-year analysis period.

Table 9-60. Direct Effects for Special-Status Plant Species Not Covered by the SSHCP Under the Reduced Permit Term Alternative

Total Planning Area (acres)								
	Potentially Suitable Habitat loss (direct and indirect) Reduced Permit Term Alternative							
*Plant Name (status)**	*Vernal Wetlands*	*Non-vernal Wetlands*	*Riparian*	*Blue Oak Woodland/ Savanna*	*Valley Grassland*	*Total Loss*	*Potentially Suitable Habitat Preservation*	*Potentially Suitable Habitat Re-establishment/ Establishment*
Watershield (State S2)	—	248	—	—	—	248	170	210
Bristly sedge (State S2)	683	248	—	—	—	931	1,864	839
Fleshy owl's clover (Federal - T; State - E)	—	248	—	—	—	248	170	210
Brandegee's clarkia (State S2)	—	—	—	47	—	47	46	46
Bolander's water-hemlock (State S2)	683	248	610		—	1,541	2,557	1,448
Peruvian dodder (CRPR 2B.2)	—	248	—		—	248	170	210

Stinkbells (State S3)	—	—	—	47	23,671	23,718	18,635	46
Woolly rose-mallow (State S2)	—	248	—	—	—	248	170	210
Northern California black walnut (State S1)	—		610	—	—	610	693	609
Delta tule pea (State S2)	—	248	—	—	—	248	170	210
Heckard's pepper-grass (State S2)	—		—	—	23,671	23,671	18,589	0
Mason's lilaeopsis (State S2)	—	248	610	—	—	858	863	819
Delta mudwort (State S2)	—	248	610	—	—	858	863	819
Marsh skullcap (State S1)	—	248	—	—	—	248	170	210
Side-flowering skullcap (State S1)	—	248	—	—	—	248	170	210
Suisun marsh aster (State S2)	—	248	—	—	—	248	170	210
Saline clover (State S2)	683	248	—	—	23,671	24,602	20,453	839

For species with state or federal status no CRPR listing used.

* **Status Definitions**

Federal
E = listed as endangered under the ESA
T = listed as threatened under the ESA

State
E = listed as endangered under CESA
T = listed as threatened under CESA
S1 = Critically Imperiled by the State
S2 = Imperiled by the State
S3 = Vulnerable by the State

California Rare Plant Rank (CRPR)
2B = Rare, threatened, or endangered in California, but more common elsewhere

CRPR Threat Ranks
0.2 = Moderately threatened in California (moderate degree/immediacy of threat)

The Reduced Permit Term Alternative would preserve and establish/re-establish habitat for special-status plants not covered by the SSHCP. In addition, during the permit term, the Conservation Strategy would implement Biological Goals and Measurable Objectives for covered species that would benefit non-covered plant species as discussed in Section 9.2.3. The acres of modeled habitat preservation under the Reduced Permit Term Alternative are greater than the acres preserved under the No Action/No Project Alternative for 17 species. Only for Brandegee's clarkia would the Reduced Permit Term Alternative result in fewer acres preserved than under the No Action/No Project Alternative.

Critical habitat has been designated for fleshy owl's clover south of Dry Creek at the extreme southern edge of the Planning Area. The Reduced Permit Term Alternative is not expected to impact any of this designated Critical Habitat for fleshy owl's clover.

Significance of Direct and Indirect Effects

The Reduced Permit Term Alternative would impact a greater number of acres of habitat for nine species-status plant species (bristly sedge, Bolander's water hemlock, Tuolomne button-celery, stinkbells, Northern California black walnut, Heckard's pepper-grass, Mason's lilaeopsis, Delta mudwort, and saline clover) within the Planning Area than is estimated for the No Action/No Project Alternative, and fewer acres for the remaining nine species (watershield, fleshy owl's clover, Brandegee's clarkia, Peruvian dodder, woolly rose-mallow, Delta tule pea, marsh skullcap, side-flowering skullcap, and Suisun Marsh aster).

However, the Reduced Permit Term Alternative would preserve more habitat than what is estimated for the No Action/No Project Alternative for all special-status plant species, with the exception of Brandegee's clarkia. The Preserve System implemented during the permit term would provide some larger Preserves and increased Preserve connectivity, improving ecosystem function. Multiple AMMs are also included in the Reduced Permit Term Alternative that would avoid and minimize indirect and temporary effects on special-status plant species individuals and habitat and provide an additional mechanism for impact avoidance and oversight.

Therefore, the overall impact of the Reduced Permit Term Alternative on bristly sedge, Brandegee's clarkia, Bolander's water hemlock, Tuolomne button-celery, stinkbells, Northern California black walnut, Heckard's pepper-grass, Mason's lilaeopsis, Delta mudwort, and saline clove would be similar to that of the No Action/No Project Alternative, and based on the significance criteria in Section 9.2.1, impacts from the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on these species when compared to the No Action/No Project Alternative baseline condition.

Therefore, the Reduced Permit Term Alternative would have less impact on watershield, fleshy owl's clover, Peruvian dodder, woolly rose-mallow, Delta tule pea, marsh skullcap, side-flowering skullcap, and Suisun Marsh aster, and using the significance criteria presented in Section 9.2.1 and the impact analysis provided previously, the Reduced Permit Term Alternative would have a ***Significant Beneficial*** effect on these species when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Cumulative Effect of the Alternative

The contribution of past, present, and reasonably foreseeable future projects to cumulative effects under the Reduced Permit Term Alternative would generally be the same as described for the No Action/No Project Alternative in Section 9.2.2.

As discussed previously in this impact section, the Reduced Permit Term Alternative would impact a greater number of acres of habitat for 9 species-status plant species (bristly sedge, Bolander's water hemlock, Tuolomne button-celery, stinkbells, Northern California black walnut, Heckard's pepper-grass, Mason's lilaeopsis, Delta mudwort, and saline clover) within the Planning Area than is estimated for the No Action/No Project Alternative and fewer acres for the remaining 9 species (watershield, fleshy owl's clover, Brandegee's clarkia, Peruvian dodder, woolly rose-mallow, Delta tule pea, marsh skullcap, side-flowering skullcap, and Suisun Marsh aster).

The Conservation Strategy implemented during the 30-year permit term of the Reduced Permit Term Alternative would include Biological Goals and Measureable Objectives that would benefit special-status plant species habitat. The Reduced Permit Term Alternative would preserve more habitat than what is estimated for the No Action/No Project Alternative for all special-status species with the exception of Brandegee's clarkia. In addition, the preservation under the Reduced Permit Term Alternative would be within a systematic, coordinated Preserve System implemented at the watershed scale. The Preserve System would result in more contiguous and more connected Preserves than is anticipated from the project-by-project mitigation under the No Action /No Project Alternative. The individual Preserves in the Preserve System under the Reduced Permit Term Alternative would also be subject to the Biological Goals and Measurable Objectives of the SSHCP applicable to special-status plant species and would be operated under a comprehensive preserve management program.

The incremental effects of the Reduced Permit Term Alternative on bristly sedge, Brandegee's clarkia, stinkbells, Northern California black walnut, Heckard's pepper-grass, Mason's lilaeopsis, Delta mudwort, and saline clover would not be significantly different than the incremental effects that would occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in ***No Cumulative Effect*** to these species compared to the No Action/No Project Alternative baseline condition. The incremental effects of the Reduced

Permit Term Alternative would result in less of an incremental contribution to the cumulative impact within the Planning Area for watershield, fleshy owl's clover, Bolander's water-hemlock, Peruvian dodder, Tuolumne button-celery, Woolly rose-mallow, Delta tule pea, marsh skullcap, side-flowering skullcap, and Suisun Marsh aster than would occur under the No Action/No Project Alternative. However, at the scale of the study area, the incremental difference in impacts under the Proposed Action/Proposed Project Alternative compared to impacts under the No Action/No Project Alternative is not discernibly different. Therefore, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** for these species compared to the No Action/No Project Alternative baseline condition.

INTENTIONALLY LEFT BLANK

CHAPTER 10 – AQUATIC RESOURCES

Chapter 8 discussed the Planning Area's Aquatic land cover types as natural communities that provide habitat for native species, and Chapter 9 discussed the Planning Area's Aquatic land cover types as modeled habitat for special-status species. However, Chapter 10 will discuss and analyze the Aquatic land cover types within the context of the statutes, regulations, and local policies that regulate aquatic resources.

As discussed in Chapter 8, the Planning Area includes 10 Aquatic land cover types that are composed of, or contain, aquatic features (Table 8-1). For the purposes of the Chapter 10 analysis, these 10 land cover types are considered potentially jurisdictional aquatic resources under the Clean Water Act (CWA). Chapter 10 will analyze these 10 land covers within 3 aquatic resource categories: (1) Wetlands, (2) Other Waters, and (3) Riparian. As discussed in Section 10.1.1, Regulatory Framework, the Wetlands and the Other Waters land covers include **potentially jurisdictional** waters of the United States ~~that are~~ regulated under CWA Section 404 (CWA 404) and CWA Section 401 (CWA 401). The 10 Aquatic land covers also include waters of the state that are regulated under the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) and include riparian areas, waterways, streambeds, lakes, and other aquatic resources that are regulated under the California Fish and Game Code.

Chapter 10 describes the existing conditions and presents the environmental effects of each Environmental Impact Statement/Environmental Impact Report (EIS/EIR) alternative on the Planning Area's Aquatic land covers and on their functions and their services. "Functions" are the physical, chemical, and biological processes that occur in ecosystems. "Services" are the benefits that human populations receive from aquatic ecosystem functions (33 CFR 332.2).

Information and analysis of aquatic resources is provided in this chapter to assist the U.S. Army Corps of Engineers (USACE), the Central Valley Regional Water Quality Control Board (RWQCB), and the California Department of Fish and Wildlife (CDFW) in the decisions to be made (see Sections 1.5 and 1.6).

10.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

10.1.1 Regulatory Framework

To determine the scope of analysis needed in this chapter and to identify permits and other authorizations that must be obtained in implementing the EIS/EIR alternatives (40 CFR 1502.25), the lead agencies reviewed existing laws, regulations, plans, and policies. This section includes a summary of federal, state, and local statues, regulations, and policies that apply to aquatic resources, including wetlands and other waters of the United States and state and riparian land covers that are present within the Planning Area.

Federal Statues and Regulation

Clean Water Act Section 404 Implementation in the Planning Area

CWA 404 regulates the discharge of dredged and fill materials into the waters of the United States as defined in the Code of Federal Regulations (Title 33, Section 328.3 and Title 40, Section 230.3). Permits are issued under CWA 404 by USACE to projects and activities that discharge dredge or fill material into wetlands and other waters of the United States**.** USACE delineates and verifies waters of the United States, including wetlands at each project or activity site, through jurisdictional determinations (33 CFR 328.3, 40 CFR 230.3).

USACE evaluates the following two types of permits under CWA 404: (1) general permits (nationwide, regional, and programmatic), and (2) individual permits (letters of permission and standard permits). General permits are issued by USACE on a nationwide or regional basis for a category or categories of activities when (1) those activities are substantially similar in nature and cause only minimal individual and cumulative environmental impact; or (2) the general permit would result in avoiding unnecessary duplication of the regulatory control exercised by another federal, state, or local agency provided it has been determined that the environmental consequences of the action are individually and cumulatively minimal (33 CFR 322.2[f]). Individual permits are evaluated on a case-by-case basis for activities that do not qualify for a general permit (i.e., that may have more than a minimal adverse environmental impact).

For discharge of dredged or fill material authorized under CWA 404, adverse impacts to waters of the United States must be avoided and minimized to the extent practicable. For unavoidable impacts, compensatory mitigation ~~is~~ **may be** required to replace the loss of waters of the United States functions. In 2008, USACE and the U.S. Environmental Protection Agency jointly issued regulations for compensatory mitigation titled *Compensatory Mitigation for Losses of Aquatic Resources: Final Rule, 33 CFR Parts 325 and 332* (2008 Compensatory Mitigation Rule) (73 FR 19594–19705). The term "compensatory mitigation" refers to the restoration, establishment,[1] enhancement, and/or preservation of wetlands, streams, or other aquatic resources specifically for the purpose of offsetting losses to these aquatic resources caused by authorized discharges of dredged or fill material into waters of the United States. The 2008 Compensatory Mitigation Rule seeks to improve the planning, implementation, and management of wetland and stream compensatory mitigation projects by emphasizing a watershed approach in selecting compensatory mitigation project locations, requiring measurable and enforceable ecological performance standards with regular monitoring, and specifying the components of a complete compensatory mitigation plan.

[1] Note that in the context of this Plan, the word "establish" is synonymous with "create."

If compensatory mitigation is required to offset unavoidable impacts to aquatic resources, the amount of compensatory mitigation must be sufficient **to the extent practicable** to replace lost aquatic resource functions and services~~, to the extent practicable~~ **(33 CFR 332.3[f][1])**. In cases where functional or condition assessments or other suitable metrics are not used, a minimum one-to-one acreage or one-to-one linear foot compensation ratio must be used.

~~In addition to setting minimum compensatory mitigation amounts,~~ ~~t~~**The** 2008 Compensatory Mitigation Rule establishes equivalent standards for **types of** aquatic resource compensatory mitigation ~~projects~~ regardless of whether they are conducted by mitigation banks, in-lieu fee programs, or permittees **(33 CFR 332.2[b])**. There are the following three ~~forms~~ **general options** for compensatory mitigation:

1. **Mitigation Bank:** A site or suite of sites where resources (e.g., wetlands, streams, riparian areas) are restored, established, enhanced, and/or preserved for to provide compensatory mitigation for impacts authorized by U.S. Department of the Army permits. In general, a mitigation bank sells compensatory mitigation credits to permittees whose obligation to provide compensatory mitigation is then transferred to the mitigation bank sponsor. The operation and use of a mitigation bank are governed by a mitigation banking instrument.
2. **In-Lieu Fee Program:** A program that conducts the restoration, establishment, enhancement, and/or preservation of aquatic resources through funds paid to a governmental agencies or non-profit natural resources management entity by permittees to satisfy compensatory mitigation requirements for their USACE permits. Similar to a mitigation bank, an in-lieu fee program sells compensatory mitigation credits to permittees whose obligation to provide compensatory mitigation is then transferred to the in-lieu program sponsor. The operation and use of an in-lieu fee program are governed by an in-lieu fee program instrument.
3. ~~**CWA**~~ **Permittee-Responsible Mitigation:** An aquatic resource restoration, establishment, enhancement, and/or preservation activity undertaken by the permittee (or an authorized agent or contractor) to provide compensatory mitigation for which the permittee retains full responsibility.

Use of mitigation banks and in-lieu fee programs is the preferred form of compensatory mitigation under the 2008 Compensatory Mitigation Rule since they usually involve the consolidation of compensatory mitigation projects where ecologically appropriate and the use of a watershed approach, consolidation of resources, ~~provide financial planning and scientific expertise (which often is not practical for permittee-responsible mitigation projects),~~ reduction of temporal losses of functions, and reduction of uncertainty over mitigation project success. The 2008 Compensatory Mitigation Rule requires the district engineer to consider compensatory

mitigation options in the following order: (1) Credits from a mitigation bank; (2) credits from an in-lieu fee program; (3) permittee-responsible mitigation under a watershed approach; (4) permittee-responsible mitigation through on-site and in-kind mitigation; and (5) permittee-responsible mitigation through off-site and/or out of kind mitigation. However, this preference hierarchy may be overridden in cases where forms of mitigation lower on the preference hierarchy are determined to better serve the aquatic resource needs of a watershed and are documented in the administrative record.

Clean Water Act Section 401

To comply with CWA 401, any project or activity that may result in a discharge of a pollutant into waters of the United States under CWA 404 must obtain a certification that the discharge will comply with the state's applicable effluent limitations and water quality standards. In California, the U.S. Environmental Protection Agency has delegated the authority to grant water quality certifications to the State Water Resources Control Board, which are typically processed by RWQCBs with local jurisdiction. The Planning Area is located within the jurisdiction of the Central Valley RWQCB. A water quality certification requires the project or activity to evaluate its potential impacts, implement appropriate measures to protect water quality, and comply with regulatory water quality standards. The issuance of CWA 404 authorizations by USACE for the discharge of dredged and fill materials into waters of the United States is a typical federal action that requires CWA 401 water quality certification.

Clean Water Act Section 402

The National Pollutant Discharge Elimination System (NPDES) program under CWA Section 402 (CWA 402) regulates the discharge of waste into waters of the United States. NPDES permit regulations apply to broad categories of discharges, including point-source municipal wastewater discharges and nonpoint-source stormwater runoff. NPDES permits typically identify the following:

- Effluent and receiving-water limits on allowable concentrations and/or mass emissions of pollutants contained in the discharge
- Prohibitions on discharges not specifically allowed under the permit
- Provisions that describe required actions by the discharger, including industrial pretreatment, pollution prevention, self-monitoring, and other activities

The California State Water Resources Control Board administers the NPDES permit program in California. Projects that disturb 1 or more acres of soil must obtain coverage under the state's NPDES General Permit for Discharges of Storm Water Associated with Construction Activity. A stormwater pollution prevention plan must be developed and implemented to provide specific construction-related best management practices (BMPs) to prevent soil erosion and loss of

topsoil. The required components and BMPs commonly included in a stormwater pollution prevention plan are described in Chapter 7.

Executive Order 11990, Protection of Wetlands

Executive Order 11990 (President Carter 1977), Protection of Wetlands, states that measures should be taken to "avoid to the extent possible the long- and short-term adverse impacts associated with the destruction or modification of wetlands and to avoid direct or indirect support of new construction in wetlands wherever there is a practicable alternative."

State Statutes and Regulations

Porter-Cologne Water Quality Control Act

The Porter-Cologne Act is California's primary statute governing water quality and water pollution issues with respect to both surface waters and groundwater. The Porter-Cologne Act grants the State Water Resources Control Board and RWQCBs power to protect water quality. The Porter-Cologne Act grants the State Water Resources Control Board and RWQCBs authority to adopt plans and policies, regulate discharges of waste to surface and groundwater, regulate waste disposal sites, and require cleanup of discharges of hazardous materials and other pollutants.

The RWQCBs' jurisdiction includes areas that meet the definition of "waters of the state," which includes areas that are also waters of the United States. The waters of the state are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. The RWQCBs have the discretion to take jurisdiction over areas not under the jurisdiction of CWA 404, provided the areas meet the definition of "waters of the state."

California Fish and Game Code, Section 1602 (Lake or Streambed Alteration Agreements)

The California Fish and Game Code (Section 1602) requires any entity to notify CDFW before beginning any project or activity that may substantially divert or obstruct the natural flow of or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake. If CDFW determines that the activity may substantially adversely affect fish and wildlife resources, a Lake or Streambed Alteration Agreement will be prepared.

Local Policies and Regulations

Sacramento County General Plan of 2005–2030

The Sacramento County General Plan of 2005–2030 (Sacramento County General Plan) provides a broad framework and direction for land use planning in Sacramento County. The Sacramento County General Plan contains a set of goals, policies, and programs that address important

community issues and natural resource protection. It is the basis for land use and public policy decisions made by the Board of Supervisors and other policy makers. As a long-term guide for future growth, the Sacramento County General Plan helps both Sacramento County leaders and residents make decisions about development projects.

The Sacramento County General Plan Conservation Element (Sacramento County 2011) includes goals and policies related to wetlands, waters of the United States and state, and riparian habitat. Applicable policies include the following (Sacramento County 2011):

> **Policy CO-58:** Ensure no net loss of wetlands, riparian woodlands, and oak woodlands.
>
> **Policy CO-59:** Ensure mitigation occurs for any loss of or modification to the following types of acreage and habitat function:
>
> - vernal pools,
> - wetlands,
> - riparian,
> - native vegetative habitat, and
> - special status species habitat.
>
> **Policy CO-63:** Vernal pools, wetlands, and streams within identified preserves shall not be drained, excavated, or filled for the purpose of converting the land to another use. If fill or modification is required for Drainage Master Plans, stormwater quality or levee maintenance, creation or restoration of an equal amount must occur within the boundaries of the preserve to achieve no net loss consistent with policy CO-58.
>
> **Policy CO-83:** Preserve a representative portion of vernal pool resources across their range by protecting vernal pools on various geologic landforms, vernal pools that vary in depth and size, and vernal pool complexes of varying densities, in order to maintain the ecological integrity of a vernal pool ecosystem.
>
> **Policy CO-84:** Ensure that vernal pool preserves are large enough to protect vernal pool ecosystems that provide intact watersheds and an adequate buffer, have sufficient number and extent of pools to support adequate species populations and a range of vernal pool types.
>
> **Policy CO-85:** Utilize proper vernal pool restoration techniques as approved by USFWS [U.S. Fish and Wildlife Service], CDFW, and USACE.

Policy CO-86: Limit land uses within established preserves to activities deemed compatible with maintenance of the vernal pool resource, which may include ranching, grazing, scientific study, and education.

Policy CO-89: Protect, enhance and maintain riparian habitat in Sacramento County.

Policy CO-111: Channel modifications shall retain wetland and riparian vegetation whenever possible or otherwise recreate the natural channel consistent with the historical ecological integrity of the stream or river.

Policy CO-115: Provide setbacks along stream corridors and stream channels to protect riparian habitat functions:

- A functional setback of at least 100 feet and measured from the outside edge of the stream bank should be retained on each side of a stream corridor that prohibits development or agricultural activity. This buffer is necessary to protect riparian functions by allowing for the filtering of sediment, pesticides, phosphorus and nitrogen, organic matter and other contaminates that are known to degrade water quality. This buffer also provides for the protection of vegetation along the stream bank which provides bank stability, erosion control and flood attenuation.
- A transitional setback of at least 50 feet in width beyond the functional buffer should be retained along all stream corridors. This buffer is necessary to protect hydrogeomorphic functions that regulate water temperature, regulate micro-climate, maintain channel complexity and retain hydrologic flow regimes. This buffer also provides corridors to facilitate the movement of wildlife.
- An extended setback of at least 50 feet in width beyond the transitional setback should be retained along all stream corridors. This setback will allow for recreational uses such as bike, pedestrian and/or equestrian trails and will allow for the placement of infrastructure such as water and sewer lines.

Policy CO-124: Maintain and manage rivers and streams to encourage special status species.

2030 Galt General Plan: Policy Document

Galt's *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009a) contains goals and policies in the Conservation and Open Space Element regarding protection and management of wetlands, waters of the United States and state, and riparian habitat. Applicable policies include the following:

Policy COS-1.10: Ecological Features Retention: The City shall retain to the extent feasible the ecological features of the creeks, sloughs, and rivers in their natural state.

Policy COS-1.11: Riparian Corridor Protection: The City shall endeavor to protect, preserve, and improve riparian corridors.

Policy COS-1.13: No Net Loss of Wetlands: The City shall review development proposals in accordance with applicable local, state, and federal statutes protecting jurisdictional wetlands (Section 404 of CWA) and require that new developments have no net loss of existing wetland habitats.

Policy COS-2.2: Wetland and Riparian Communities Management: The City shall support the protection, restoration, expansion, and management of wetland and riparian plant communities for passive recreation, groundwater recharge, and wildlife habitat.

Policy COS-2.4: Federal, State, and Local Statutes Compliance: The City shall review development proposals in accordance with applicable federal, state, and local statutes protecting special-status species and jurisdictional wetlands.

Policy COS-3.1: Riparian Protection: The City should require the protection of existing riparian vegetation along stream courses in the city.

Policy COS-4.4: Open Space Protection: The City shall, where appropriate, permanently protect as open space areas of natural resource value, including wetlands preserves, riparian corridors, woodlands, and floodplains.

City of Rancho Cordova General Plan

The *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2023) contains goals and policies in the Natural Resources Element to address protection of wetlands, waters of the United States and state, and riparian habitat. Applicable policies include the following:

Policy NR.1.9: The City shall require that impacts to riparian habitats be mitigated at a no net loss of existing function and value based on field survey and analysis of the riparian habitat to be impacted. No net loss may be accomplished by avoidance of the habitat, restoration of existing habitat, or creation of new habitat, or through some combination of the above.

Policy NR.2.1: Require mitigation that provides for “no net loss” of wetlands consistent with current state and federal policies.

Policy NR.2.2: Ensure that direct and indirect effects to wetland habitats are minimized by environmentally sensitive project siting and design, to the maximum extent feasible.

Policy NR.2.3: Work with private and non-profit conservation organizations to ensure competitive pricing for mitigation bank credits by allowing government agencies, non-profit organizations, and private landowners to establish vernal pool preserves, designate mitigation areas, create and restore vernal pools, and sell credits to developers for off-site mitigation.

Policy NR.3.4: Encourage projects that contain wetland preserves or creeks, or are located adjacent to wetland preserves or creeks, to be designed for visibility and, as appropriate, access.

10.1.2 Existing Conditions of Aquatic Resources

Section 10.1.2, Existing Conditions of Aquatic Resources, describes the existing conditions of each aquatic resource land cover type present in the Planning Area, including existing functions and existing services of the aquatic resource.

The Planning Area's 10 Aquatic land cover types have been placed in the following 3 aquatic resource categories: (1) Wetlands, (2) Other Waters, and (3) Riparian (Table 10-1, Aquatic Land Covers within the Planning Area). Because the *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1992) is the wetland classification system used by USACE and the U.S. Environmental Protection Agency, this chapter also classifies the 10 South Sacramento Habitat Conservation Plan (SSHCP) Aquatic land cover types in terms of the Cowardin wetland classification system. Existing locations of the Planning Area Aquatic land covers are shown on Figure 10-1, Aquatic Resources in the Planning Area.

Wetlands in the Planning Area

Wetlands are defined in the Code of Federal Regulations (Title 33, Part 328.3) as areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation adapted for life in saturated soil conditions. Areas that meet three wetland delineation criteria (hydrophytic vegetation, hydric soil types, and wetland hydrology) may be under the authority of CWA 404 pending USACE verification of wetland boundaries and jurisdictional analysis. The following three SSHCP Aquatic land cover types support the vegetation, soil types, and hydrology conditions that typically meet the CWA definition of a wetland: (1) Vernal Pool, (2) Seasonal Wetland, and (3) Freshwater Marsh. In addition, some Swale land covers in the Planning Area sometimes meet the three wetland delineation criteria, as discussed below.

Table 10-1. Aquatic Land Covers within the Planning Area

Land Cover Type	Existing Acres in Planning Area	Percentage of the 317,655-Acre Planning Area
Wetland Waters		
Vernal Pool	4,536	1.4%
Swale	1,252	0.4%
Seasonal Wetland	2,600	0.8%
Freshwater Marsh	2,954	0.9%
Total Wetland Waters	*11,342*	***3.50%*** ~~*3.6%*~~
Other Waters		
Stream/Creek (VPIH) (Ephemeral)	73	0.02%
Stream/Creek (Intermittent and Perennial)	2,778	0.9%
Open Water	2,341	0.7%
Total Other Waters	*5,192*	***1.62%*** ~~*1.6%*~~
Riparian		
Mixed Riparian Woodland	5,805	1.8%
Mixed Riparian Scrub	1,274	0.4%
Mine Tailing Riparian Woodland	641	0.2%
Total Riparian	*7,720*	*2.4%*
Total	**24,254**	**4.80%** ~~**7.7%**~~

Note: VPIH = vernal pool invertebrate habitat

Vernal Pool Wetlands

Approximately 4,536 acres of vernal pools remain within the Planning Area (Table 10-1). Vernal pool locations are associated with specific types of landforms, geologic formations, and soils. Therefore, vernal pools tend to be clustered at the landscape scale (Smith and Verrill 1998). As discussed in Section 5.1.2 and Section 8.1.2, Planning Area vernal pools are found on four different landforms and associated geologic formations. The characteristics of the landforms and the geologic formation and soil conditions determined how the vernal pools developed, the general density and sizes of vernal pools in a vernal pool complex, and ultimately the water chemistry and hydrologic regime of each vernal pool. Consequently, different geological formations in the Planning Area support vernal pools that may look similar after filling with water but differ physically and biologically. Vernal pools are a type of seasonal wetland, and the closest Cowardin classification for Planning Area vernal pools is "Palustrine, Emergent Wetland, Nonpersistent."

Seasonal Wetlands

Approximately 2,600 acres of Seasonal Wetland land cover is present within the Planning Area (Table 10-1). As discussed in Section 8.1.2, seasonal wetlands are defined in this EIS/EIR as wetlands that pond water for an extended period during a portion of the year, generally

filling during the rainy winter season, then dry relatively slowly, typically in the summer or early fall. Seasonal wetlands in the Planning Area tend to ~~be isolated features that~~ occur within moderate to large depressional features along streams, creeks, and rivers; along the edges of open water; or scattered within the Valley Grassland land cover. In addition, some impounded drainages; excavated stock ponds; and graded ~~or,~~ excavated, **or otherwise disturbed** former vernal pools within the Planning Area may also be Seasonal Wetland. The Seasonal Wetland land cover is often characterized by herbaceous annual and perennial species such as curly dock (*Rumex crispus*), sedges (*Carex* spp.), nutsedges (*Cyperus* spp.), spikerushes (*Eleocharis* spp.), and occasionally cattail (*Typha* spp.). The Cowardin classification for Seasonal Wetland is "Palustrine, Emergent Wetland, Nonpersistent."

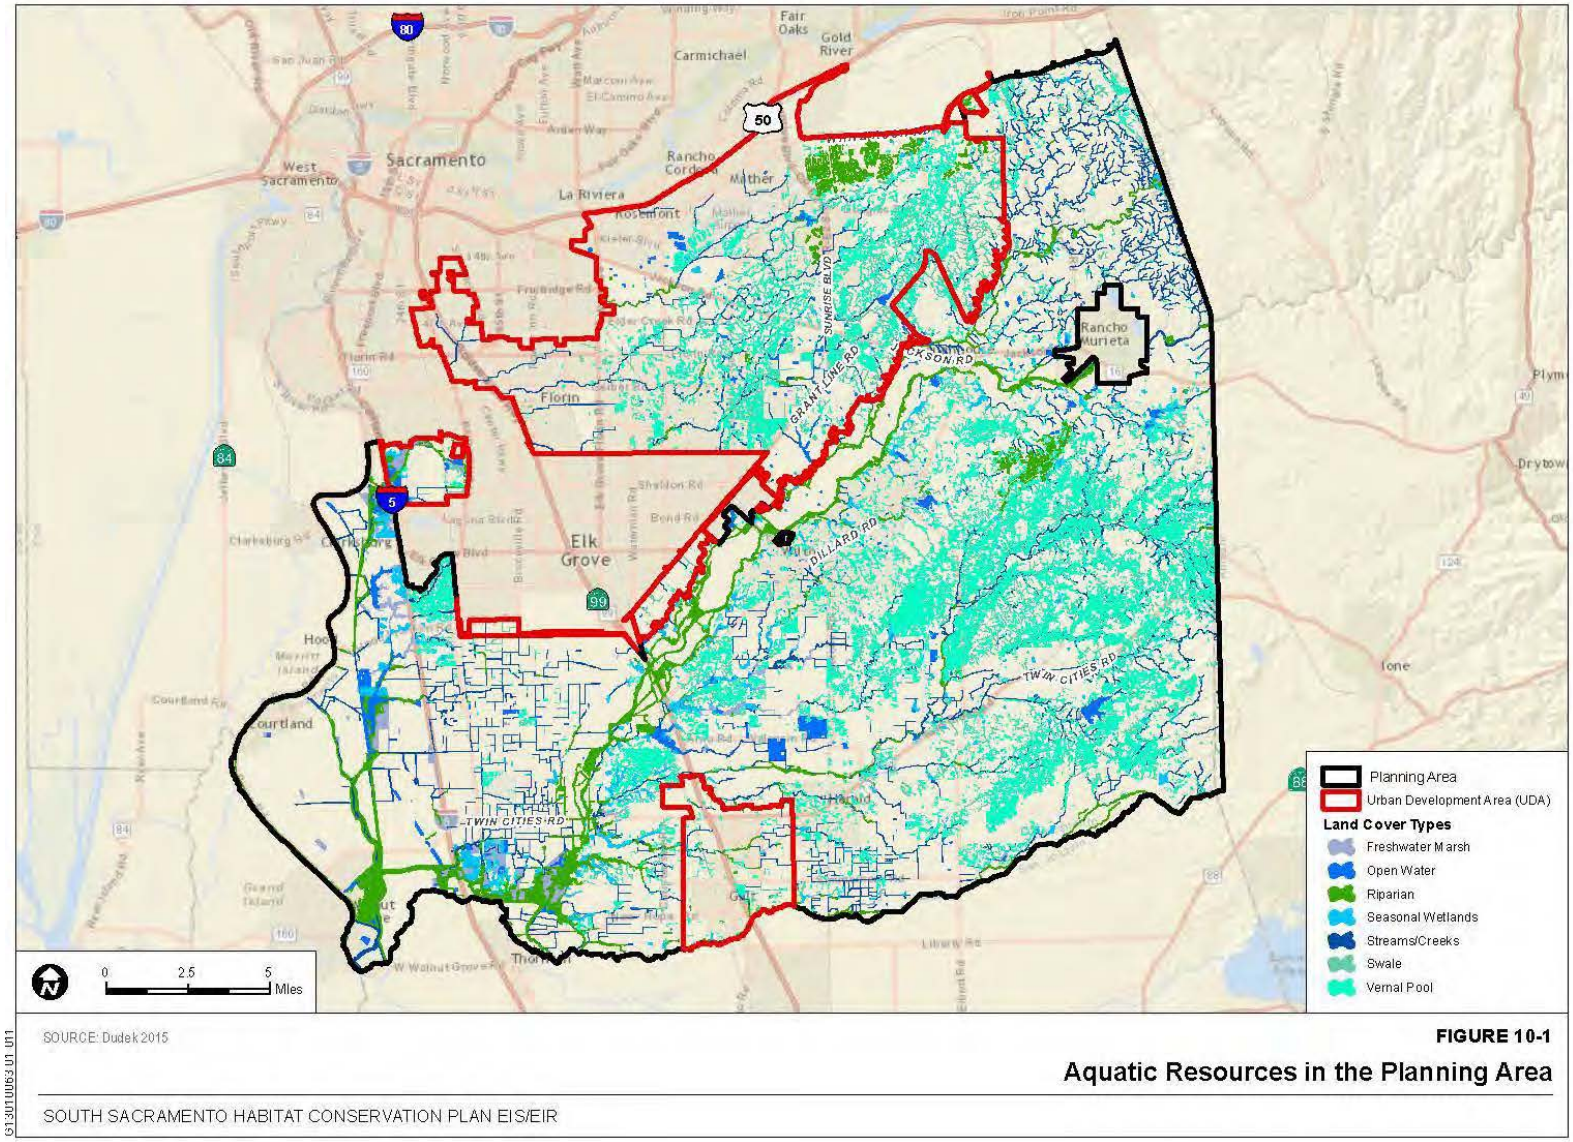
Freshwater Marsh Wetlands

Approximately 2,954 acres of Freshwater Marsh is present within the Planning Area (Table 10-1). As discussed in Section 8.1.1, Freshwater Marsh is dominated by perennial emergent herbaceous plant species such as cattail, tule (*Schoenoplectus acutus* var. *occidentalis*), and other emergent hydrophytic (water-loving) plant species. The Freshwater Marsh land cover is generally found at the edges of other Planning Area aquatic resources such as ponds, lakes, and rivers. Freshwater marshes are perennial wetlands but will periodically drawdown to expose moist soil in some dry years.

The majority of Freshwater Marsh in the Planning Area occurs along the Cosumnes River and Deer Creek, located in the southern portion of the Planning Area. However, areas of Freshwater Marsh are also found along other perennial creeks and streams and on the margins of the Open Water land cover throughout the Planning Area (Figure 10-1). Freshwater Marsh is a type of wetland, and the Cowardin classification for Freshwater Marsh is "Palustrine, Emergent Wetland, Persistent."

Swales

The Planning Area includes approximately 1,252 acres of Swale (Table 10-1). Swales are shallow ephemeral surface drainages found in association with vernal pools and vernal pool complexes.



The movement of surface water between vernal pools can occur in a network of narrow and intermittent surface "swales" (Solomeshch et al. 2007). In many vernal pool landscapes, including those in the Planning Area, surface water flows through integrated ephemeral swales to other vernal pools, and ultimately **may flow in**to a seasonal stream. Consequently, vernal pool landscapes comprise the upper watershed position of many stream systems (Rains et al. 2006). Due to the integrated hydrologic nature of vernal pool landscapes, disturbance of

upgradient vernal pools may have appreciable impacts on hydrologic and biogeochemical processes in ~~all~~ downgradient vernal pools and streams (Rains et al. 2008).

In a study of Mather Regional Park vernal pools, Rains et al. (2006) found that vernal pools filled only after soil layers above the claypan/duripan became saturated by seasonal rainfall in mid-December. During subsequent storm events, outflows to surface swales occurred, and lower vernal pools received ephemeral flows through interconnecting swales from upgradient vernal pools. Surface swale connections between vernal pools were maintained for approximately 10% to 60% of the days during which vernal pool water was present, with the longer periods of connectivity occurring between vernal pools located lower on the landscape. At no time was overland flow of rainwater observed delivering water from uplands directly to vernal pools (Rains et al. 2006, 2008).

All Swale land cover acres are directly associated with Planning Area vernal pools. Any Planning Area shallow surface drainages not directly connected or associated with a vernal pool or vernal pool complex were not mapped as “Swale” land cover under the SSHCP land cover classification system (see Chapter 3 of the SSHCP document). Some Swale land covers mapped in the Planning Area might include small shallow depressional features that pond water for longer periods during rainy seasons. Therefore, sections of some swales may be considered “vernal pool wetland” for CWA 404 purposes. The closest Cowardin classification for the Swale land covers in the Planning Area is “Riverine, Intermittent, Nontidal.”

Figure 10-1 Aquatic Resources in the Planning Area

INTENTIONALLY LEFT BLANK

Other Waters in the Planning Area

Three of the SSHCP land cover types (Stream/Creek, Stream/Creek Vernal Pool Invertebrate Habitat [VPIH] and Open Water) are generally defined as "other waters" in the CWA 404 definition of waters of the United States (33 CFR 328.3).

Stream and Creek (Stream/Creek)

The Planning Area includes approximately 2,778 acres of Stream/Creek land cover (Table 10-1). As discussed in Section 8.1.2, the Stream/Creek land cover in the Planning Area includes the Cosumnes River, the large streams located in the Urban Development Area (UDA)[2] such as Laguna Creek, and the many smaller intermittent and perennial creeks located throughout the Planning Area (Figure 10-1). Consequently, the Stream/Creek land cover can occur adjacent to riparian aquatic resources or may occur within any of the Terrestrial land cover types, including Valley Grassland, Blue Oak Woodland, Blue Oak Savanna, the Farming land cover types, and the Developed land cover types (see Table 8-1a, Figure 8-2, and Figure 10-1). The Cowardin classification for the Stream/Creek land cover in the Planning Area is "Riverine, Perennial or Intermittent, Nontidal."

As discussed in Section 7.1.2, some sections of the streams and creeks inside the UDA now have perennial flow in most years because of summer runoff from urban irrigation, discharges of treated groundwater existing groundwater-contamination cleanup activities~~)~~, and other ~~unseasonal~~ human-caused water sources.

Most streams in the Planning Area are valley floor streams characterized by slow-moving water, except after rain events, and often carry substantial sediment loads as a result of land disturbances. Some reaches of tributaries in the eastern portion of the Planning Area flow over gently sloping terrain and have more of a pool and riffle structure.

Due to relatively small size and location among urban and farming or rangeland uses, the functions and services of most creeks in the Planning Area have been substantially affected from adverse water quality, invasive species, vegetation removal, or other indirect impacts of urban development. However, Planning Area creeks still provide habitat for many native

[2] As discussed in Section 1.1.1, the term "UDA" is used by the EIS/EIR to discuss all lands where new urban development projects or activities could occur under the No Action/No Project Alternative, or where new urban development Covered Activities could occur under the two action alternatives. Therefore, the term "UDA" means all lands within the Sacramento County USB boundary that are also within the Planning Area (this includes lands within the Rancho Cordova city limits that are within the Planning Area); and all lands within Galt's city limits and within the City of Galt's sphere of influence (see Section1.1.1 and Figure 1-1).

species and important ecological functions, especially where the streams and creeks are associated with other riparian and wetland communities.

As discussed in Section 3.7.1, over the last 150 years, there have been substantial human-caused alterations of streams and creeks in the Planning Area, including straightening and deepening of creek channels; construction of levees, dams, and other impoundments; installation of riprap and concrete walls; and vegetation clearing. These changes have adversely affected many stream and creek area functions by separating active channels from their natural floodplains, altering natural flow patterns, and disrupting many other dynamic physical processes that maintain stream and creek functions. In addition to adverse effects on hydrologic functions of Planning Area streams and creeks, these watershed modifications have also reduced overall habitat functions in these areas since negative impacts from disturbances such as urban development and vegetation clearing lead to decreased abundances and altered distributions of plant and animal species.

Stream and Creek Vernal Pool Invertebrate Habitat (Stream/Creek [VPIH])

The Planning Area includes approximately 73 acres of Stream/Creek (VPIH) land cover (Table 10-1). As discussed in Section 8.1.2, the Stream/Creek (VPIH) land cover type is defined in the SSHCP document as an intermittent drainage that conveys water after rain events (i.e., is ephemeral), is dominated by grassland plant species, and can provide habitat for vernal pool crustaceans. The Stream/Creek (VPIH) land cover type occurs within the Mather Core Area in association with the Vernal Pool and Swale land covers. Unlike the Swale land cover type, the Stream/Creek (VPIH) land cover is less likely to support plant species also found in vernal pools. However, the Stream/Creek (VPIH) land cover is known to provide movement and dispersal habitat for plant seeds/propagules and movement and dispersal habitat for vernal pool crustaceans, including mid-valley fairy shrimp (*Branchinecta mesovallensis*), vernal pool fairy shrimp (*Branchinecta lynchi*), and the vernal pool tadpole shrimp (*Lepidurus packardi*). The Stream/Creek (VPIH) land cover can also provide intermittent breeding habitat for some vernal pool crustaceans in depressional features of the drainage that pond water between storm events. The Cowardin classification for all Stream/Creeks land covers in the Planning Area is "Riverine, Intermittent, Nontidal."

Although Stream/Creek (VPIH) is typically vegetated, it is included in the Other Waters land covers because it may not support conditions that meet the three-part definition of a wetland. However, it may still be considered a water of the United States**, or it may not be considered a water of the United States (e.g., neither a stream nor a wetland).**

Open Water

The SSHCP Open Water land cover type is scattered throughout the Planning Area and covers a total of 2,341 acres (Table 10-1) (Figure 10-1). The Open Water land cover type consists of perennial aquatic features, such as natural or constructed ponds, lakes, and reservoirs. Open water may contain no vegetation or non-rooted aquatic vegetation, such as algae, floating pondweeds, and other plants. Along shorelines, rooted, emergent vegetation may occur, forming Freshwater Marsh. The Cowardin classification is "Riverine and Limnetic, Unconsolidated Bottom, Nontidal." The largest open water features within the Planning Area are found on or near the Cosumnes River and Deer Creek. These open water features are largely unnamed with the exception of Blodgett Reservoir inside the UDA and Rancho Seco Lake outside the UDA.

Riparian Areas

CWA regulations define "riparian areas" as lands adjacent to streams, lakes, estuarine, and marine shorelines. Riparian areas are transitional between terrestrial and aquatic ecosystems through which surface and sub-surface hydrology connects riverine, lacustrine, estuarine, and marine waters with their adjacent wetlands, other waters, or uplands. Riparian areas provide a variety of ecological functions and services and help improve or maintain local water quality (33 CFR 330.1–330.6). Riparian areas are distinguished by gradients in biophysical conditions, ecological processes, and biota and include those portions of terrestrial ecosystems that significantly influence exchanges of energy and matter with aquatic ecosystems (i.e., a zone of influence) (NRC 2002). Riparian areas in the Planning Area ~~are including~~ **include** Mixed Riparian Woodland, Mixed Riparian Shrub, and the Minetailing Riparian land covers. The Cowardin classification for Mixed Riparian Woodland land cover and Mixed Riparian Shrub land cover is "Palustrine, Forested or Scrub/Shrub Wetland."

Over the last 150 years, there have been substantial anthropogenic alterations of the riparian areas along streams and creeks that support riparian plant and animal communities in the Central Valley. Anthropogenic alterations have resulted from by agriculture activities, rangeland use, and urban development (Katibah 1984), including the straightening and deepening of channels; construction of levees, dams, and other impoundments; installation of riprap and concrete walls; vegetation clearing; and other alterations. In the Planning Area, these alterations have often resulted in riparian vegetation occurring as small intermittent patches, usually as small clusters of trees and shrubs, or a thin strip of riparian vegetation that is only one or two trees wide.

In the eastern portion of the Planning Area, there are cottonwoods in some streamside locations. Along other streams, there is little or no woody riparian vegetation because streams

and creeks located in the Valley Grassland and Vernal Pool land covers are dominated by non-woody vegetation that exhibits little vegetation structure in the riparian zone along the stream and the adjacent uplands. In valley grassland riparian areas, there may be patchy distribution of mixed riparian scrub. Some streams in the urbanized UDA portions of the Planning Area are currently lined by concrete or bounded by concrete walls and support little or no riparian plant species, while others support narrow, relatively young, riparian vegetation with a mix of trees, shrubs, grasses, and sometimes seasonal wetlands.

As described in Section 8.1.2.1, there are three Riparian land cover types identified by the Permit Applicants within the Planning Area: Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodlands (Figure 10-1). These three woody Riparian land cover types currently total approximately 7,720 acres (Table 10-1).

The Mixed Riparian Woodland land cover type in the Planning Area is dominated by Fremont cottonwood trees (*Populus fremontii* ssp. *fremontii*) and may include Oregon ash (*Fraxinus latifolia*), Goodding's willow (*Salix gooddingii*), California black walnut (*Juglans californica* var. *hindsii*), or valley oak (*Quercus lobata*). In some areas, an understory of box elder (*Acer negundo*) or willow species, including arroyo willow (*Salix lasiolepis*) and sandbar willow (*Salix exigua*), may be present. A shrub layer may also present in the Mixed Riparian Woodland land cover type, particularly along the northern boundary of the Planning Area, and include species such as blue elderberry (*Sambucus mexicana*), Himalayan blackberry (*Rubus discolor*), coyote-brush (*Baccharis pilularis*), wild rose briar (*Rosa californica*), and California wild grape (*Vitis californica*). The ground layer is sparsely to densely vegetated with herbaceous species. Invasive weeds have colonized portions of the mixed riparian woodland in the Planning Area and giant reed (*Arundo donax*). Approximately 5,805 acres of the Planning Area is Mixed Riparian Woodland land cover (Table 10-1).

The Mixed Riparian Scrub land cover type is interspersed in riparian areas between Mixed Riparian Woodland and Annual Grassland land covers in the floodplains of waterways throughout Sacramento County. Approximately 1,274 acres of the Mixed Riparian Scrub land cover type is present in the Planning Area (Table 10-1). In the Planning Area, this land cover type consists of open-to-dense shrubby thickets dominated by a mixture of sandbar willow, arroyo willow, red willow (*Salix laevigata*), and immature stands of mixed riparian woodland tree species. Stands of riparian scrub in the Planning Area also support native and non-native species, including wild rose briar, California wild grape, perennial pepper weed (*Lepidium latifolium*), Himalayan blackberry, curly dock, and various non-native grasses. The highest-quality existing riparian areas in the Planning Area are outside the UDA along the Cosumnes River and Deer Creek (Figure 10-1). The Mixed Riparian Woodland present along the lower Cosumnes River is relatively wide and characterized by a multilayered vegetation structure, including an overstory of cottonwood, California sycamore (*Platanus racemosa*), and valley oak; an understory of narrow-leaf willow (*Salix*

exigua var. *exigua*), California and Himalayan blackberry, and California wild grape; and a patchy herbaceous layer of grasses, forbs, and sedges.

As discussed in Section 8.1.1, the Mine Tailing Riparian Woodland land cover type occurs as relatively narrow strips distributed among older mine tailings (Figure 8-1), and covers approximately 641 acres within the Planning Area (Table 10-1). This land cover type contains some of the plant species commonly found in the Mixed Riparian Woodlands and the Mixed Riparian Scrub land covers, such as Fremont cottonwood, blue elderberry, willow (*Salix* spp.), and coyote-brush. There are large areas of Mine Tailing Riparian Woodland land cover in the Planning Area, including approximately 219 acres of Mine Tailing Riparian Woodland in the northern portion of the Planning Area and approximately 345 acres of Mine Tailing Riparian Woodland just south of the Cosumnes River in the eastern portion of the Planning Area.

Existing Amounts (Abundance) of Each Aquatic Resource

As of 2015, there are approximately 24,254 acres of Aquatic land covers in the Planning Area (Table 10-2, Aquatic Resources by Watershed within the Planning Area). These 24,254 acres of aquatic resources are located within 1 or more of the Planning Area's 10 watersheds (see Section 7.1.2). Watersheds in the United States are delineated using a hierarchical system, which divides the United States into 21 regions, 221 subregions, 378 hydrologic accounting units, and 2,264 cataloging units (USGS 2013). Each hydrologic unit is identified by a unique Hydrologic Unit Code (HUC) consisting of 2 to 12 digits to define successively smaller units within the classification system (USGS 2013; USGS and NRCS 2013).

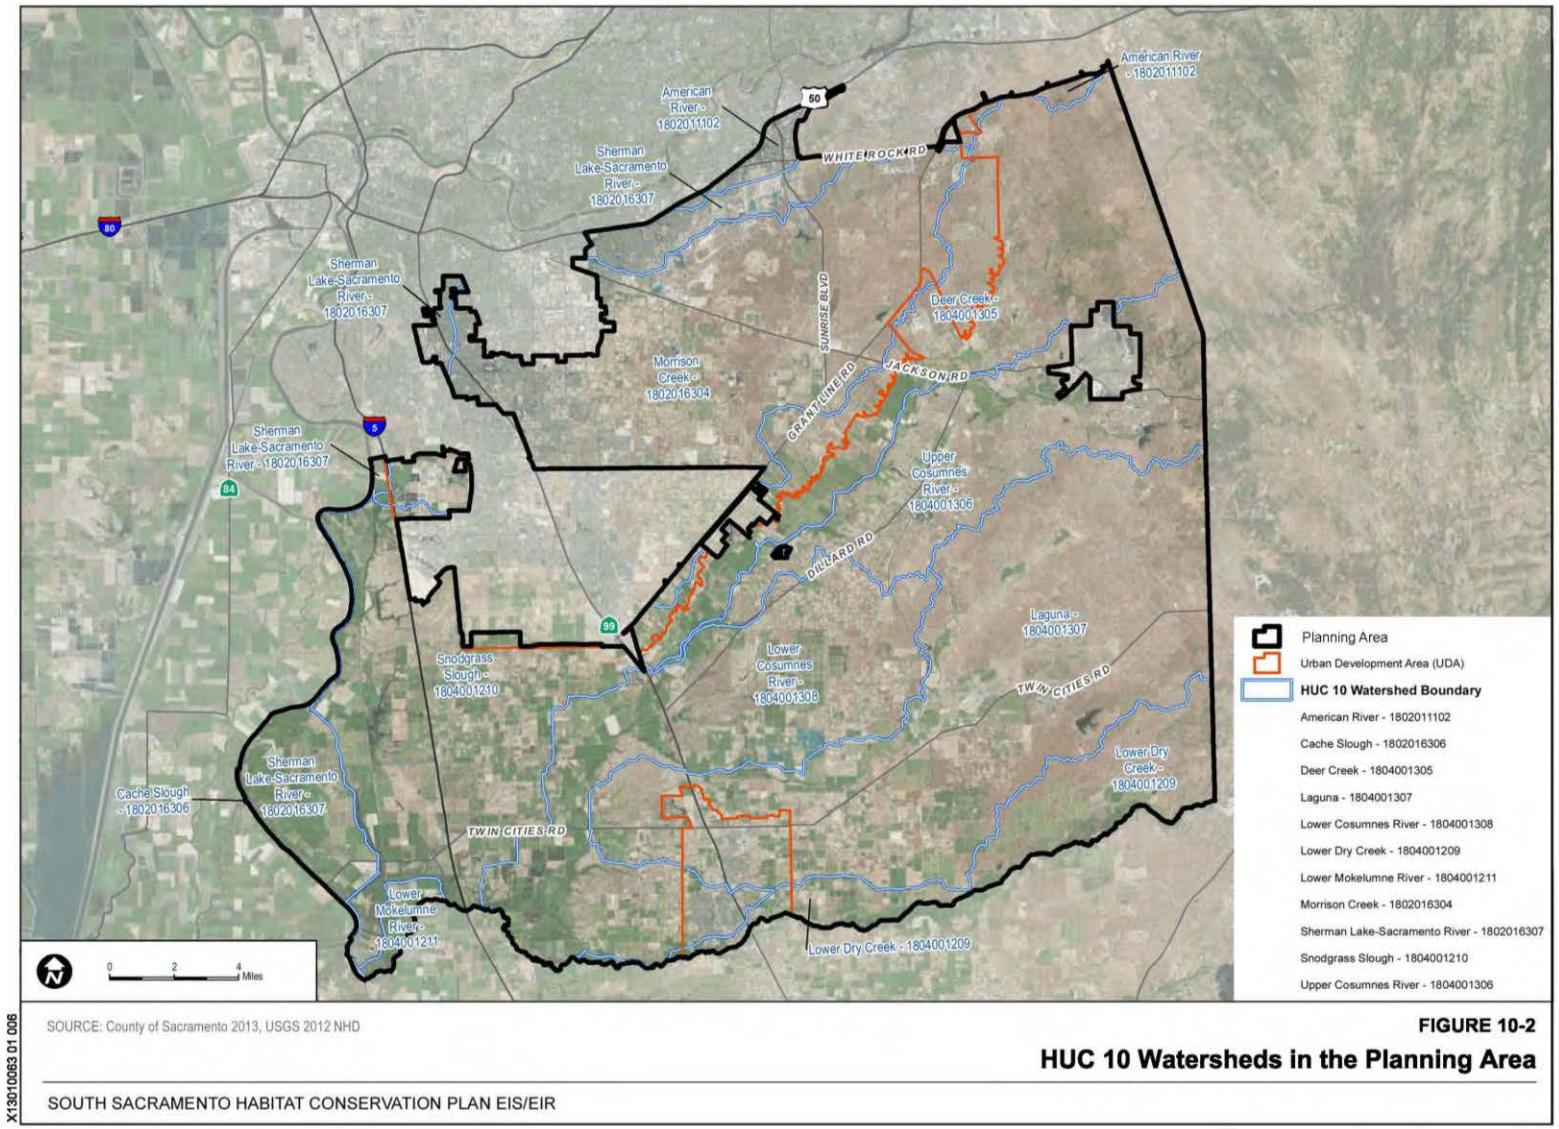
At the 10-digit HUC level, the Planning Area includes a portion or the entirety of 10 different watersheds (Figure 7-3). As also discussed in Section 7.1.2, the 10 Planning Area watersheds are American River (HUC 1802011102), Deer Creek (HUC 1804001305), Laguna Creek (HUC 1804001307), Lower Cosumnes River (HUC 1804001308), Lower Dry Creek (HUC 1804001209), Lower Mokelumne River (HUC 1804001211), Morrison Creek (HUC 1802016304), Sherman Lake–Sacramento River (HUC 1802016307), Snodgrass Slough (HUC 1804001210), and Upper Cosumnes River (HUC 1804001306) (Figure 10-2, HUC 10 Watersheds in the Planning Area). One additional watershed, Cache Slough, intersects the Planning Area but only comprises 6 acres in the Planning Area and, therefore, is not discussed in this chapter.

The Morrison Creek (located inside the UDA) and the Laguna Creek watershed (located in the south-southeastern parts of the Planning Area) cover approximately 37% of the Planning Area. The next three largest watersheds (Deer Creek, Lower Cosumnes River, and Snodgrass Slough) cover 41% of the Planning Area, resulting in the five largest watersheds draining approximately 78% of the Planning Area.

The watersheds containing the greatest abundance of aquatic resources are Snodgrass Slough and Lower Cosumnes River. The watersheds containing the least amounts of aquatic resources are the American River, Sherman Lake–Sacramento River, and Lower Mokelumne River.

The most abundant Aquatic Resources land covers within the Planning Area are Mixed Riparian Woodland and Vernal Pool (Table 10-2). The least abundant are Stream/Creek (VPIH) (likely due to the narrow width of these ephemeral creeks) and Mine Tailing Riparian Woodland.

Table 10-2. Aquatic Resources by Watershed within the Planning Area



Land Cover Type	Acres per Watershed										Total
	American River	*Deer Creek*	*Laguna Creek*	*Lower Cosumnes River*	*Lower Dry Creek*	*Lower Mokelumne River*	*Morrison Creek*	*Sherman Lake–Sacramento River*	*Snodgrass Slough*	*Upper Cosumnes*

AGENDA ITEM 11.1

4858

INTENTIONALLY LEFT BLANK

Figure 10-2 HUC 10 Watersheds in the Planning Area

INTENTIONALLY LEFT BLANK

The total acreage of aquatic resources reported in the Aquatic Resources Program (ARP) is approximately 232 acres less than the total acreage of aquatic resources reported in the SSHCP (SSHCP Plan Partners 2017). This is due to the following three factors: (1) the use of different geographic information system (GIS) processes that result in fractional differences in acreage totals; (2) rounding; and 3) some of the acreage of Riparian land cover types reported in the SSHCP are considered non-jurisdictional because they are mitigation sites composed of created or restored riparian habitat. Non-jurisdiction aquatic resources are not discussed in the ARP. It is this last factor that accounts for the majority of the difference in reported aquatic resources acreage between the ARP and the SSHCP.

Of the 10 watersheds in the Planning Area, the Snodgrass Slough and the Lower Cosumnes River watersheds have the most acres of aquatic resources, and the American River, Sherman Lake–Sacramento River, and Lower Mokelumne River watersheds contain the least acreage of aquatic resources.

The Mixed Riparian Woodland and Vernal Pool land covers are the most abundant aquatic resources in the Planning Area. The Stream/Creek (VPIH) and Mine Tailing Riparian Woodland land covers are the least abundant aquatic resource in the Planning Area (Table 10-1).

Existing Quality of Aquatic Resources (Functions and Services)

Modification of natural landscapes (i.e., vegetation, topography, and hydrology) is one of the prime human impacts on waters and watersheds. Altering natural landscapes for development purposes, resource extraction, or recreation can affect collection, storage, and discharge functions of a watershed. Changes in the landscape resulting from these human activities can increase sedimentation and erosion, increase or redirect natural runoff, and alter hydrologic regimes, including timing of flows and groundwater recharge. In addition, land use modification or conversion can change the way a watershed is used by individual species or species communities, including their distribution and abundance within a watershed (i.e., habitat function) and can directly or indirectly affect the chemical reactions required for the watershed to sustain itself. Introduction of pollutants into the watershed can happen directly through agricultural activities and runoff from impervious surfaces in more urbanized areas. As discussed in Chapter 7, an increase of impervious surfaces has caused significant changes to the quality and quantity of the stormwater runoff, leading to degraded stream and watershed systems; an increased quantity of stormwater for stream process to absorb sedimentation; and an increased pollutant load carried by the stormwater. Land development threatens the remaining vernal pool ecosystem directly through destruction and fragmentation of habitat. However, loss of habitat may also indirectly affect the remaining areas by increasing the likelihood of other threats (e.g., habitat fragmentation, hydrologic alteration, invasion by noxious species, changes in land management options/practices,

pollution, inadequate mitigation measures). Non-native annual grasses of Mediterranean origin now dominate the uplands associated with vernal pool complexes in California. The transition from native vegetation to exotics began with European settlement and was hastened by years of drought and overgrazing during the late 1800s. Some suggest that rapid evapo-transpiration of water and built-up thatch from non-native grass species (e.g., foxtail chess [*Bromus madritensis*], Italian ryegrass (*Lolium multiflorum*), Mediterranean barley [*Hordeum marinum* ssp. *gussoneanum*], medusahead [*Elymus caput-medusae*], soft brome [*Bromus hordeaceus*]) may indirectly affect vernal pool species by lessening the amount of water entering the system through surface and sub-surface flow (Marty 2005; Robins and Vollmar 2002). The effects of thatch buildup in uplands may negatively affect obligate vernal pool bee pollinators as well. Thick stands of mulch may also impede juvenile California tiger salamander (*Ambystoma californiense*) and western spadefoot (*Spea hammondii*) during their migrations from their aquatic pool habitat to the upland areas and burrows used for summer activity and aestivation. Barbed awns and seed coats on non-native grasses can also injure or kill mammals by becoming lodged in their ears, eyes, throats, and fur.

An assessment of the existing functions and services of each Planning Area Aquatic land cover was prepared by the Permit Applicants (Dudek 2016a). The existing quality of the aquatic resources within in the Planning Area was assessed based on the following factors: acres of the aquatic resource, primary adjacent land cover, secondary adjacent land cover, and aquatic resource type. For each Aquatic land cover type, a functional score was assigned to each of these factors based on ability to maintain or improve the following aquatic functions: (1) provide habitat for special-status aquatic species; (2) improve or maintain water quality through such processes as filtration and/or trapping of contaminants, such as sediment or toxicants, and prevention of soil erosions; and (3) improve hydrology through storing floodwaters or flood flow modifications, or by facilitating groundwater recharge. Habitat was evaluated based on the existing ability of a Planning Area Aquatic Resources land cover to support aquatic wildlife and plant species, especially special-status aquatic species. Water quality was evaluated based on the existing ability to improve or maintain water quality through processes such as filtration and/or trapping of contaminants, such as sediment or toxics, and prevention of erosion. Hydrology was evaluated based on the existing ability of the aquatic resource to facilitate groundwater recharge and store floodwaters through beneficial flood storage and flood flow modifications (Dudek 2016a). The Functional Assessment of the Planning Area provided an overall functional score of (1) very low, (2) low, (3) moderate, or (4) high for each wetland, other waters, and riparian aquatic resource. Table 10-3 summarizes the current acreages of each Functional/Condition Assessment Method score for each Wetlands, Other Waters, and Riparian Aquatic Resources land cover type in the Planning Area.

Table 10-3. Functional Analysis Of Aquatic Resources in the Planning Area

Land Cover Type	(4) High *Acres*	(3) Moderate *Acres*	(2) Low *Acres*	(1) Very Low *Acres*	Total
Wetland					
Vernal Pools	3,067	1,312	157	0	4536
Seasonal Wetland	1,396	1,019	185	0	2,600
Swales	945	302	5	0	1,252
Freshwater Marsh	988	1,697	269	0	2,954
Total Wetland	*6,396*	*4,330*	*616*	*0*	*11,342*
Other Waters					
Open Water	298	1,206	821	16	2,341
Stream/Creek (Intermittent and Perennial)	841	1,759	177	1	2,778
Stream/Creek (VPIH) (Ephemeral)	44	27	2	0	73
Total Other Waters	*1,183*	*2,992*	*1,000*	*17*	*5,192*
Riparian					
Mine Tailing Riparian Woodland	68	364	183	26	641
Mixed Riparian Scrub	112	820	298	44	1,274
Mixed Riparian Woodland	521	3,710	1,555	19	5,805
Total Riparian	*701*	*4,894*	*2,036*	*89*	*7,720*
Grand Total	**8,280**	**12,216**	**3,652**	**106**	**24,254**

Of the four wetland land cover types, the existing vernal pools have the greatest acreage of high function features (approximately 3,067 high function acres out of 4,536 total Vernal Pool acres). Seasonal Wetlands, Swales, and Freshwater Marsh land covers also have a relatively large number of high function acreages (approximately 1,396 acres, 945 acres, and 988 acres, respectively). The mixed riparian woodland and the open water aquatic resources have the most acres of low function score features (approximately 1,555 acres and 821 acres, respectively) in the Planning Area. However, the Planning Area overall does not have large acreages of very low functional condition aquatic resources (approximately 106 acres total across all 10 Aquatic Resources land cover types).

Current conditions of the aquatic resources can be further examined at the watershed (HUC-10) level. The existing habitat, water quality, and hydrology functions of each Planning Area watershed (Dudek 2016a) were based on the results of a watershed study (Dudek 2016b). The watershed study results were used to develop appropriate functional scores for wetlands and other waters occurring in each HUC-10 watershed based on special-status species occurrences within each HUC-10 (habitat function score), the percentage of natural land cover within each HUC-10 (water quality function score), and the percentage of impervious surface within each HUC-10 (hydrology functional score).

The Deer Creek, Laguna Creek, Lower Cosumnes River, Lower Dry Creek, Morrison Creek, and Upper Cosumnes River watersheds were found to contain a majority of moderate to high condition aquatic resources. Of these, the watersheds with the greatest proportion of high function aquatic resources are the Laguna Creek and Morrison Creek watersheds. The American River, Lower Mokelumne River, Sherman Lake–Sacramento River, and Snodgrass Slough watersheds currently contain no high function aquatic resources, and the resources are mostly low to moderate in condition (Figure 10-2). The Sherman Lake–Sacramento River watershed contains the greatest acreage of very low condition aquatic resources and has the highest proportion of low condition resources. The following discussion summarizes aquatic resources existing condition acreages by watershed.

American River Watershed

Approximately 12,060 acres, or approximately 23%, of the 53,360-acre American River watershed is located within the Planning Area (Figure 10-2). This watershed makes up 3.2% of the entire Planning Area and is located in the northern portion of the Planning Area. A little more than half of the watershed contains non-habitat land cover types, which primarily include High-Density Development and Mine Tailings. The remaining undeveloped land consists of Valley Grassland, Mine Tailing Riparian Woodland, Mixed Riparian Woodland, Blue Oak Woodland, Blue Oak Savanna, and Mixed Riparian Scrub land covers. Aquatic resources account for approximately 130 acres, or approximately 1%, of the American River watershed. Impervious surfaces cover approximately 3,080 acres, or 26%, of the watershed within the Planning Area.

The American River watershed includes documented occurrences for 10 of the 28 Covered Species, including Boggs Lake hedge-hyssop (*Gratiola heterosepala*), tricolored blackbird (*Agelaius tricolor*), Cooper's hawk (*Accipiter cooperii*), Swainson's hawk (*Buteo swainsoni*), valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), vernal pool fairy shrimp, vernal pool tadpole shrimp, white-tailed kite (*Elanus leucurus*), burrowing owl (*Athene cunicularia*), and northern harrier (*Circus cyaneus*). However, approximately 58% of the American River watershed has been influenced by human activities, with over half of the watershed dominated by the aforementioned non-habitat land covers. Subsequently, in combination with making up only 3% of the Planning Area, the portions of the American River watershed within the Planning Area do not support a high overall percentage of the Covered Species occurrences (2%) in the Planning Area.

Current Conditions – Due to the low percentage of Covered Species occurrences, the American River watershed has a score of −3 for its habitat function. It has a moderate percentage of natural land cover, resulting in a water quality score of +1. It has a relatively large amount of impervious surface, resulting in a hydrology function score of −2 (Dudek 2016a).

Deer Creek Watershed

The Deer Creek watershed bisects the Planning Area, extending from the northeastern edge to halfway into the Planning Area (Figure 10-2). Of the 82,980 acres of the watershed, 46,810 acres (56%) are within the Planning Area. A majority (93%) of the watershed contains "habitat" land covers, which includes agriculture. Terrestrial land covers (32,980 acres and 70% of the watershed), consisting primary of Valley Grassland (25,450 acres and 54% of the watershed), account for the majority of the watershed. Other Terrestrial land covers include Blue Oak Savanna and Blue Oak Woodland (14% of the watershed), Mixed Riparian Woodland, Mixed Riparian Scrub, Mine Tailing Riparian Woodland, and Valley Oak Riparian (0.02% of the watershed). Approximately 20% (9,940 acres) of the watershed consists of lands used for agricultural purposes, and 7% (3,300 acres) qualify for the non-habitat land cover type. The remaining 2% of the watershed (1,070 acres) consists of aquatic resources such as streams and creeks, open water, and vernal pools. Impervious surfaces cover approximately 370 acres, or only 1%, of the watershed within the Planning Area.

The Deer Creek watershed includes documented occurrences for 16 of the 28 Covered Species, including Boggs Lake hedge-hyssop, Sacramento Orcutt grass (*Orcuttia viscida*), Sanford's arrowhead (*Sagittaria sanfordii*), burrowing owl, Cooper's hawk, ferruginous hawk, loggerhead shrike (*Lanius ludovicianus*), northern harrier, Swainson's hawk, tricolored blackbird, valley elderberry longhorn beetle, vernal pool fairy shrimp, vernal pool tadpole shrimp, western pond turtle (*Actinemys marmorata*), western spadefoot, and white-tailed kite. This watershed contains 6% of the known occurrences for these 16 Covered Species and a substantial percentage of occurrences for 2 of the Covered Species, including 49% of the Sacramento Orcutt grass records and 20% of the ferruginous hawk records. Covered Species have been recorded throughout the watershed, with the majority occurring along hydrologic features and within aquatic or terrestrial habitat. A cluster of vernal pool species records occurs along the border of the Deer Creek and Morrison watersheds east of the intersection of Grant Line Road and Keifer Boulevard.

Current Conditions – The Deer Creek watershed has a relatively low percentage of Covered Species occurrences and, therefore, had a score of -2 for its habitat function. However, it has a high percentage of natural land cover, resulting in a water quality score of +3. It also has a low percentage of impervious surface, resulting in a hydrology function score of +3 (Dudek 2016a).

Laguna Creek Watershed

The Laguna Creek watershed is approximately 98,150 acres, of which 75,350 acres are within the Planning Area, and makes up 20% of the Planning Area (Figure 10-2). It is located in the southeastern portion of the Planning Area and contains virtually all of the mapped land cover

types in the Planning Area. The majority (91%) of the Laguna Creek watershed is undeveloped. Combined, Valley Grassland, Blue Oak Savanna, and Blue Oak Woodland account for 61% (approximately 46,310 acres) of the land covers in the watershed and 68% of the "natural" land covers, including agriculture. Agriculture accounts for 24% (approximately 17,730 acres) of the land covers in the Planning Area. The Laguna Creek watershed also supports all of the Aquatic land cover types except wetland restoration, including approximately 2,820 acres of Vernal Pool, Seasonal Wetland, and Swale; approximately 420 acres of Stream/Creek; and almost 300 acres of Open Water. Non-habitat land cover types compose only 9% of the watershed, with Low-Density Development accounting for 61% of the non-habitat land cover types. Impervious surfaces cover approximately 2,010 acres, or 3%, of the watershed within the Planning Area.

The Laguna Creek watershed includes documented occurrences for 22 of the 28 Covered Species, reflecting both its large size and diversity of land cover types. Covered Species documented in the watershed include dwarf downingia (*Downingia pusilla*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii* ssp. *myersii*), Sacramento Orcutt grass, vernal pool fairy shrimp, Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*), vernal pool tadpole shrimp, mid-valley fairy shrimp, California tiger salamander, western spadefoot, western pond turtle, giant garter snake (*Thamnophis gigas*), Cooper's hawk, burrowing owl, loggerhead shrike, northern harrier, ferruginous hawk, greater sandhill crane (*Grus canadensis tabida*), Swainson's hawk, tricolored blackbird, white-tailed kite, and western red bat (*Lasiurus blossevillii*). This watershed has the highest percentage (26%) of known occurrences for Covered Species after the Morrison Creek watershed, including 17% of the vernal pool covered plant occurrences and 40% of the vernal pool invertebrate occurrences.

Current Conditions – The Laguna Creek watershed has a relatively high percentage of Covered Species occurrence, yielding a habitat function score of +2. It also has a high percentage of natural land cover, resulting in a water quality score of +3, and a low percentage of impervious surface, resulting in a hydrology function score of +3 (Dudek 2016a).

Lower Cosumnes River Watershed

The Lower Cosumnes River watershed is 47,310 acres and entirely located within the south-central portion of the Planning Area (Figure 10-2). This watershed consists primarily of Terrestrial and Agricultural land covers, accounting for 81% of the land covers in the watershed. The Terrestrial category is dominated by valley grasslands (14,610 acres), which accounts for approximately 31% of the total Terrestrial land cover in the watershed. Agricultural areas total 21,220 acres and are the largest land covers in the Lower Cosumnes River watershed. Approximately 7% (3,510 acres) of the watershed is Aquatic land covers, including Seasonal Wetlands, Open Water, Freshwater Marsh, Vernal Pools, Wetland Restoration, Streams and Creeks and Swales. Approximately 12% (5,710 acres) of the watershed is non-habitat land cover

dominated by Low-Density Development (3,990 acres) and High-Density Development (1,260 acres). Impervious surfaces cover approximately 1,650 acres, or only 3%, of the watershed.

The Lower Cosumnes River watershed includes documented occurrences for 19 of the 28 Covered Species, including dwarf downingia, legenere, Sanford's arrowhead, vernal pool fairy shrimp, mid-valley fairy shrimp, Ricksecker's water scavenger beetle, valley elderberry longhorn beetle, California tiger salamander, giant garter snake, western pond turtle, burrowing owl, Cooper's hawk, ferruginous hawk, loggerhead shrike, northern harrier, greater sandhill crane, Swainson's hawk, tricolored blackbird, and white-tailed kite. This watershed contains 10% of the Planning Area's known occurrences of Covered Species.

Current Conditions – The Lower Cosumnes River watershed has a relatively low percentage of Covered Species occurrence, which gives it a habitat function score of -2. It has a mid-range percentage of natural land cover, resulting in a water quality score of 0. It has a low percentage of impervious surface, yielding a hydrology function score of +3 (Dudek 2016a).

Lower Dry Creek Watershed

The Lower Dry Creek watershed is located along the southern edge of the Planning Area. Approximately 50% of the watershed is located within the Planning Area (Figure 10-2). The watershed has very little non-agricultural development. Of the 18,570 acres in the watershed, approximately 56% are Terrestrial land covers and 38% are Agricultural land covers. Valley grasslands dominate the Terrestrial land cover in the watershed, comprising 14,610 of the 16,880 acres mapped as terrestrial. The majority (92%) of agricultural areas are cropland and vineyards. Aquatic and non-habitat land covers each make up approximately 3% of the remaining acreage within the watershed. Impervious surfaces cover approximately 140 acres, or 1%, of the watershed within the Planning Area.

The Lower Dry Creek watershed includes documented occurrences for 9 of the 28 Covered Species, including legenere, pincushion navarretia, vernal pool fairy shrimp, vernal pool tadpole shrimp, California tiger salamander, western spadefoot, northern harrier, Swainson's hawk, and tricolored blackbird. Overall, the watershed only contains 2% of the Covered Species occurrences, but it does contain 33% of the pincushion navarretia occurrences (16 of 49) and 19% of the California tiger salamander occurrences (6 of 29).

Current Conditions – Due to the low percentage of Covered Species occurrence, the Lower Dry Creek watershed has a habitat function score of -3. However, it has a relatively high percentage of natural land cover, which gives it a water quality score of +2. Its low percentage of impervious surface gives it a hydrology function score of +3 (Dudek 2016a).

Lower Mokelumne River Watershed

Although the Lower Mokelumne River watershed is more than 66,200 acres in size, only 3% of the watershed is located in the far southwestern corner of the southern Planning Area, and the watershed accounts for only 0.5% of the Planning Area (Figure 10-2). The small portion of this watershed located within the Planning Area is primarily made up of Agricultural land covers, specifically Cropland. The remaining acreage includes Mixed Riparian Scrub and Mixed Riparian Woodland, Aquatic land covers, and some residential areas. Impervious surfaces cover approximately 30 acres, or 1%, of the watershed within the Planning Area.

The Lower Mokelumne River watershed only contains three documented occurrences of one Covered Species: Sanford's arrowhead. This species is located on the boundary of the Planning Area within the Mokelumne River. Similar to the Lower Dry Creek watershed, the lack of occurrences of Covered Species within this watershed may be attributed to large amounts of land that have been converted for agricultural purposes. In addition, only a small portion of the watershed is actually located within the Planning Area. Due to its small size within the Planning Area, the Lower Mokelumne River watershed includes less than 1% of the modeled habitat for Covered Species.

Current Conditions – The Lower Mokelumne River watershed has a habitat function score of -3 due to its low percentage of species occurrence. It has a relatively low percentage of natural land cover, resulting in a water quality function score of -2. However, its low percentage of impervious surface yields a hydrologic function score of +3 (Dudek 2016a).

Morrison Creek Watershed

The Morrison Creek watershed is located within the northern half of the Planning Area and inside the UDA (Figure 10-2). Of the 82,790 acres that compose this watershed, 70,320 acres, or 85%, are located within the Planning Area and almost entirely inside the UDA. This is the second largest watershed in the Planning Area (second to the Laguna Creek watershed). Because it is located in the urbanizing portion of Sacramento County, approximately 45% of the watershed has already been developed and contains non-habitat land covers, primarily High-Density Development. Agriculture accounts for approximately 7% of the watershed. Terrestrial (44%) and Aquatic (4%) land covers account for the remaining land covers in the Morrison Creek watershed. Valley Grassland accounts for about 96% of the Terrestrial land cover. This watershed also supports all of the Aquatic land cover types, including approximately 890 acres of Vernal Pool, 430 acres of Swale, and 230 acres of Seasonal Wetland, which is embedded in Valley Grassland. Laguna Creek (north) is a significant east–west landscape feature that plays a prominent role in conservation. Impervious surfaces cover approximately 18,260 acres, or 26%, of the watershed. Along with the American River (26% impervious surfaces) and Sherman Lake–

Sacramento River (31% impervious surfaces) watersheds, the Morrison Creek watershed has one of the three highest percentages of impervious surfaces in the Planning Area. Reflecting both its large size and more urbanized character, it also has the highest amount of impervious surface acreage in the Planning Area, with Snodgrass Slough having the second highest amount at approximately 7,670 acres.

The Morrison Creek watershed includes documented occurrences for 26 of the 28 Covered Species despite substantial urbanization. Covered Species documented in the watershed include Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass (*Orcuttia tenuis*), Sanford's arrowhead, vernal pool fairy shrimp, vernal pool tadpole shrimp, mid-valley fairy shrimp, Ricksecker's water scavenger beetle, burrowing owl, Cooper's hawk, ferruginous hawk, loggerhead shrike, northern harrier, greater sandhill crane, Swainson's hawk, tricolored blackbird, white-tailed kite, western spadefoot, giant garter snake, western pond turtle, American badger (*Taxidea taxus*), and western red bat. This watershed has the highest percentage (33%) of known occurrences for Covered Species in the Planning Area, including 50% of both the covered vernal pool plants and vernal pool invertebrate occurrences. Due to the large area of vernal pools (almost 900 acres and second only to the Laguna Creek watershed), swale, and seasonal wetlands, vernal pool flora and fauna are the most important biological resources in the watershed.

Current Conditions – Because the Morrison Creek watershed contains the highest percentage of Covered Species occurrences, it has a habitat function score of +3. It has a moderate percentage of natural land cover, yielding a water quality function score of +1. It has a relatively large amount of impervious surface, giving it a hydrologic function score of -2 (Dudek 2016a).

Sherman Lake–Sacramento River Watershed

The Sherman Lake–Sacramento River watershed is located in the extreme western portion of the Planning Area, with approximately 29% located within the Planning Area (Figure 10-2). The watershed intersects the Planning Area in four separate locations that together compose approximately 5% of the Planning Area, including a large area along the northern portion of the Planning Area, a small area in the northwestern corner of the Planning Area, and two areas along the western portion of the Planning Area. The Sherman Lake–Sacramento River watershed in the Planning Area is dominated by human activities. Together, non-habitat and Agricultural land cover types account for 91% of the land covers in the watershed. Of these two land cover types, High-Density Development and Cropland contain the largest acreages at 5,360 and 5,440 acres, respectively, accounting for 58% of the total land covers in the watershed within the Planning Area. The Sherman Lake–Sacramento River watershed contains the Aquatic land cover types mapped within the Planning Area but in small amounts ranging from 2 to 40

acres and totaling 110 acres. Terrestrial land covers, primarily Valley Grassland, compose the remaining acreage, totaling 1,450 acres, or 8%, in the watershed within the Planning Area. Impervious surfaces cover approximately 5,690 acres, or 31%, of the watershed, which is the highest percentage of the watersheds in the Planning Area.

The Sherman Lake–Sacramento River watershed includes documented occurrences for 9 of the 28 Covered Species, including Sanford's arrowhead, vernal pool fairy shrimp, burrowing owl, northern harrier, greater sandhill crane, Swainson's hawk, tricolored blackbird, white-tailed kite, and western red bat. Overall, the watershed accounts for only 1% of the Covered Species occurrences in the Planning Area. The majority (91%) of the Sherman Lake–Sacramento River watershed is developed or agriculture, which is reflected in the relatively small number of Covered Species with occurrences in the watershed compared to several of the other watersheds.

Current Conditions – The Sherman Lake–Sacramento River watershed has the lowest scores (-3) for all three functions as a result of its low percentage of Covered Species occurrence, its low percentage of natural land cover, and its high percentage of impervious surface (Dudek 2016a).

Snodgrass Slough Watershed

The Snodgrass Slough watershed is the third largest watershed in the Planning Area behind the Laguna Creek and Morrison Creek watersheds and is entirely contained within the western portion of the Planning Area (Figure 10-2). Approximately 54% of the watershed is agriculture, of which approximately 66% are croplands; croplands cover approximately 35% of the entire watershed. Non-habitat land cover types, dominated by High-Density Development, account for 22% of the watershed. Terrestrial habitat, dominated by Valley Grassland (78%), Mixed Riparian Scrub, Mixed Riparian Woodland, and woodland restoration, covers approximately 16% of the watershed. The Snodgrass Slough watershed accounts for the highest acreage of Aquatic land cover within the Planning Area. Approximately 4,220 acres of the watershed supports the Aquatic land cover types mapped within the Planning Area, and represents 24% of the aquatic habitat in the Planning Area. Impervious surfaces cover approximately 7,670 acres, or 15%, of the watershed. Although this watershed has a relatively smaller proportion of impervious surfaces compared to the American River and Morrison Creek watersheds at 26% and Sherman Lake–Sacramento River watershed at 31%, it has a substantially higher level of impervious surfaces than the remaining watersheds, which range from 1% to 3%.

The Snodgrass Slough watershed includes documented occurrences for 19 of the 28 Covered Species, including dwarf downingia, legenere, Sanford's arrowhead, vernal pool fairy shrimp, vernal pool tadpole shrimp, mid-valley fairy shrimp, giant garter snake, western pond turtle, burrowing owl, Cooper's hawk, ferruginous hawk, loggerhead shrike, northern harrier, greater

sandhill crane, Swainson's hawk, tricolored blackbird, white-tailed kite, American badger, and Yuma myotis. This watershed contains 13% of known occurrences for Covered Species in the Planning Area, third only to the Morrison Creek (35%) and Laguna Creek (26%) watersheds.

Current Conditions – The Snodgrass Slough watershed has a moderate to low percentage of Covered Species occurrences, resulting in a habitat function score of -1. It has a relatively low percentage of natural land cover, which gives it a water quality score of -2. It has a mid-range percentage of impervious surface, yielding a hydrologic function score of 0 (Dudek 2016a).

Upper Cosumnes River Watershed

The Upper Cosumnes River watershed is located in the east-central portion of the Planning Area, which encompasses approximately 51% (32,000 acres) of the watershed (Figure 10-2). The majority of the watershed in the Planning Area (21,220 acres, or 66%), consists of terrestrial habitat dominated by valley grassland. Agricultural areas compose approximately 11%, and aquatic areas compose approximately 5% of the watershed in the Planning Area. Non-habitat land cover, primarily Low-Density Development, covers the remaining 18% of the watershed. Impervious surfaces cover approximately 340 acres, or 1%, of the watershed.

The Upper Cosumnes River watershed includes documented occurrences for 14 of the 28 Covered Species, including legenere, Sanford's arrowhead, vernal pool fairy shrimp, vernal pool tadpole shrimp, valley elderberry longhorn beetle, western spadefoot, Cooper's hawk, ferruginous hawk, loggerhead shrike, northern harrier, Swainson's hawk, tricolored blackbird, white-tailed kite, and western red bat. This watershed contains 9% of documented occurrences of Covered Species within the Planning Area. Most notably, the watershed contains 153 of the 156 known occurrences (98%) of valley elderberry longhorn beetle, with the largest concentration of occurrences along the Cosumnes River just south of Rancho Murieta.

Current Conditions – The Upper Cosumnes watershed has a relatively low percentage of Covered Species occurrences, which gives it a habitat function score of -2. However, it has a high percentage of natural land cover and a low percentage of impervious surface, yielding respective water quality and hydrologic function scores of +3 (Dudek 2016a).

10.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

10.2.1 Methodology for Assessing Impacts of Each Alternative on Aquatic Resources

This section describes the potential impacts of the projects and activities associated with each EIS/EIR alternative on the 10 Planning Area land covers that are potential jurisdictional aquatic

resources. Chapter 10 will analyze these 10 land covers within three aquatic resource categories: (1) Wetlands, (2) Other Waters, and (3) Riparian (see Table 10-1).

The future projects and activities expected under each EIS/EIR alternative are described in Chapter 2. As discussed in Section 3.6.5, the EIS/EIR impact methodology uses GIS datasets that were prepared using the best available information on the amounts and locations of ground disturbance from the future projects and activities expected under each alternative.

As discussed in Sections 3.6.5 and 3.6.6, direct impacts are effects caused by an action or project and occur at the same time and place as the action or project (40 CFR 1508.8; 14 CCR 15358). Indirect impacts are caused by an action or project but occur later in time or are farther removed in distance from the project site but are still reasonably foreseeable (40 CFR 1508.8; 14 CCR 15064(d)). Chapters 8 and 9 previously quantified indirect effects for the Vernal Pool, Swale, and Stream/Creek (VPIH) land covers as natural communities and species habitat, but Chapter 10 focuses on effects to these Aquatic land covers in the context of the CWA and Section 1600 of the California Fish and Game Code. Both statutes consider direct alteration, fill, or removal of aquatic resources, as well as the indirect impacts to the functions and services of each aquatic resource.

Activities and projects implemented under each EIS/EIR alternative could directly impact Planning Area aquatic resources by (1) removing an Aquatic land cover type by excavating, filling,[3] draining, or flooding the Aquatic land cover; or (2) converting an Aquatic land cover type to a Terrestrial or a Developed land cover type (see Table 8-1a). The direct impacts to aquatic resources discussed in Chapter 10 are a permanent loss of the acres of the impacted aquatic resource, including loss of the existing functions and services of those impacted acres.

Indirect impacts to aquatic resources would occur when activities or projects implemented under an EIS/EIR alternative adversely alter the existing physical, biological, or ecological characteristics of an aquatic resource, either later in time or farther removed in distance from the project site. Indirect impacts to aquatic resources may become evident over a period of time (weeks, months, or years) and/or occur in aquatic resources located outside the project site or located downstream from the project site. Activities and actions implemented under each EIS/EIR alternative could indirectly impact Planning Area aquatic resources by (1) altering the surface hydrology or sub-surface hydrology in the watershed of the aquatic resource; (2) introducing particulate matter, sediments, pollutants, or toxins to the aquatic resource or the watershed of the aquatic resource; or (3) increasing other threats (e.g., colonization by weedy and noxious species, habitat fragmentation, changes in land management options/practices,

[3] Direct adverse effects include permanent discharges of dredged or fill material that change an aquatic area to dry land, increase the bottom elevation of a waterbody, or change the use of a waterbody.

thatch buildup, inadequate mitigation measures). The indirect impacts discussed in Chapter 10 are permanent impacts to the physical, biological, or the ecological characteristics of an aquatic resource that provide habitat elements for aquatic species. However, those indirect impacts might not decrease the acres of the impacted aquatic resource or remove the functions and services of the impacted aquatic resource.

As discussed in Section 3.6.4, GIS methodology was used to quantitatively estimate the direct impacts (losses) of aquatic resources from each EIS/EIR alternative; GIS datasets of future projects and activities expected under each EIS/EIR alternative were digitally overlaid (compared) with separate GIS datasets of each Aquatic land cover type (Table 10-1). In addition, the potential indirect impacts of each action alternative on the Vernal Pool, Swale, and Stream/Creek (VPIH) land covers were quantified and provided in this chapter using the GIS methodology described in Section 3.6.5 and 3.6.6. However, the potential indirect impacts of each alternative on the other Aquatic Resources land covers (i.e., Seasonal Wetland, Freshwater Marsh, Stream/Creek, Open Water, Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland) are described and analyzed qualitatively, as discussed in Section 3.6.6.

As discussed in Section 3.6.2, it is appropriate to consider impacts to some environmental resources within the context of other impacts occurring to the resource within the surrounding landscape, community, or region. Several of the HUC 10 watershed boundaries discussed in Section 10.1.2 extend beyond the EIS/EIR Planning Area boundary (Figure 10-2). Accordingly, the lead agencies determined that an appropriate geographic scale for evaluating the impacts of each EIS/EIR alternative on aquatic resources should include the Planning Area and all areas of each HUC 10 watershed discussed above in Section 10.1.2, including the areas located outside the Planning Area boundary.

As discussed in Sections 3.4 and 10.1.1, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006) analyzed direct and cumulative impacts of urban growth planned within their jurisdictions, including impacts to aquatic resources. When the impact analysis or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief description of the incorporated information or analysis is provided in Sections 10.2.2, 10.2.3, and 10.2.4. However, as discussed in Section 3.4, the three General Plan EIRs used different study periods ending in 2030 (Galt 2009b), 2050 (Rancho Cordova 2006), and 2030 (Sacramento County 2010), respectively, and the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). As discussed in Section 3.4, the EIRs for the Rancho Cordova General Plan and the Galt General Plan analyzed full buildout of those jurisdictions. However, additional urban development is expected to occur within Sacramento County during the 35 years after the General Plan EIR study period ends in 2030 and before this EIS/EIR's study

period ends in 2065. Consequently, the impact analyses and conclusions incorporated from the *Sacramento County General Plan Update Final EIR* (Sacramento County General Plan EIR) may not have considered all of the future urban development that is included in the description of each EIS/EIR alternative (refer to Chapter 2). Therefore, the lead agencies considered the impact analysis and conclusions incorporated by reference from the three General Plan EIRs and the effects of all urban development activities and projects that are included in the description of each EIS/EIR alternative.

As discussed in Section 3.7, the cumulative analyses of impacts to aquatic resources in this chapter will consider (1) the effects of past and present (current) urban development within in the Planning Area (see the existing conditions in Section 10.1.2) and within the larger study area, and (2) future impacts expected from reasonably foreseeable other projects in the Planning Area (see Section 3.7) and foreseeable other projects within the larger study area. The cumulative analysis of each EIS/EIR alternative will then consider whether the incremental impacts of the alternative on aquatic resources would be significant (i.e., would be cumulatively considerable). ~~t~~**T**he cumulative analyses of each alternative in this chapter incorporates information about the past**, present, and reasonably foreseeable** impacts to wetlands and other waters from projects and activities within the SSHCP Planning Area that have been authorized under CWA 404 between 1979 and January 2013 by the USACE Sacramento District Regulatory Division (USACE 2014) (EIS/EIR Appendix A). The USACE 2014 report quantifies the total acres of direct loss of wetlands and other waters ~~from individual discharges of dredged or fill material~~ from past CWA 404 actions within the Planning Area~~, to the extent reasonable and practical~~. The USACE 2014 report also quantifies acres of preservation, re-establishment, and establishment of wetlands and other waters ~~undertaken~~ **provided** as compensatory mitigation for ~~authorized CWA 404 fill discharges~~ **loss of waters** between 1979 and January 2013. The USACE 2014 report also quantifies acres of wetlands and other waters that have been permanently preserved by the establishment of USACE-approved mitigation banks between 1979 and January 2013. The USACE 2014 report also considered ~~the progress of currently proposed projects in the CWA 404 permitting process, and the likelihood of a proposed project ultimately being implemented, to help identify~~ reasonably foreseeable ~~future~~ CWA 404 actions and ~~their foreseeable~~ **associated** **estimated** impacts to ~~the wetlands and the other water land covers~~ **waters of the United States**.

10.2.1.1 Determination of Impact Significance

As discussed in Section 3.8.1, the criteria used to evaluate the significance of impacts expected from each EIS/EIR alternative on ~~hydrology and water quality~~ **aquatic resources** are based on the California Environmental Quality Act Guidelines (14 CCR 15000 et seq.) and on typical thresholds used to evaluate impacts to aquatic resources in recent EIRs prepared by

Sacramento County. Based on these sources, a significant impact to the Planning Area's aquatic resources would occur if the alternative would:

- Have a substantial adverse effect on any riparian or other sensitive natural community identified in local or regional plans, local policies, or by state or federal regulations.
- Have a substantial adverse direct or indirect effect on aquatic resources.

The California Environmental Quality Act Guidelines (Appendix G) does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial impact could occur if the alternative would:

- Discernibly reduce adverse effects on riparian or other sensitive natural communities identified in local or regional plans, policies, or regulations or by CDFW or the U.S. Fish and Wildlife Service.
- Discernibly reduce adverse direct or indirect effects to aquatic resources.

The impact analysis for the three EIS/EIR alternatives considers the context, intensity, and severity of potential impacts to each of these impact criteria and presents separate determinations of significance addressing each of these criteria.

10.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2.1 of Chapter 2.

10.2.2.1 Direct and Indirect Effects of the No Action/No Project Alternative

As discussed in Section 10.2.1, much of the estimated total 35,532 acres of future urban development expected under the No Action/No Project Alternative (Section 2.2) is also described and analyzed in the Sacramento County General Plan, Galt General Plan, and Rancho Cordova General Plan (see Sections 3.4 and 10.2.1).

The Sacramento County General Plan EIR (Sacramento County 2010) determined that impacts of planned future development on ~~wetland and riparian~~ **aquatic** resources would be less than significant (Sacramento County 2010, pp. 8-31 through 8-34) because future projects would continue to comply with the existing regulations and policies discussed in Section 10.1.1. **In the Sacramento County General Plan EIR, the term "wetland" is used to encompass a variety of aquatic habitats, including both jurisdictional and non-jurisdictional wetlands and streams (i.e., aquatic habitats that could be affected through alteration of the bed and bank) (County of Sacramento 2010, p. 8-32).**

The *City of Rancho Cordova General Plan EIR* (Rancho Cordova General Plan EIR) (Rancho Cordova 2006) determined that impacts of future development to aquatic resources would be significant and unavoidable (Rancho Cordova 2006, "Biological Resources," pp. 4.10-48 through 4.10-56).

The *City of Galt General Plan Update: 2030 Final EIR* (Galt General Plan EIR) (Galt 2009b) found that impacts from future development to aquatic resources within Galt would be significant and unavoidable (Galt 2008, pp. 8-16 through 8-20 in the Draft EIR [Galt 2008], the Final EIR did not reprint these conclusions).

The adverse impacts of planned urban development on aquatic resources identified in the Sacramento County, Rancho Cordova, and Galt General Plan EIRs and summarized above would also occur under the No Action/No Project Alternative, and the information, analyses, and conclusions from the three General Plan EIRs are incorporated here by reference.

As discussed in Sections 3.4 and 10.2.1, the Galt and the Rancho Cordova General Plan EIRs analyzed buildout of their jurisdictions. However, additional urban development would occur within Sacramento County during the 35-year period after the end of the General Plan EIR study period (2030) and the buildout of the UDA expected at end of this EIS/EIR's study period in 2065. Consequently, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs and the effects of the additional urban development activities and projects included in the description of the No Action/No Project Alternative. The lead agencies extrapolated from the impacts of the urban development implemented in the early part of the EIS/EIR study period (the period analyzed in the General Plan EIRs) the estimated impacts from the additional urban development that will occur in the remaining years of the 50-year EIS/EIR study period. The lead agencies assumed that impacts to aquatic resources from new urban development constructed in the latter part of the EIS/EIR study period would continue to result in significant and unavoidable impacts to wetlands, other waters, and riparian areas.

As discussed in Section 2.2.3, new urban development would occur on approximately 32,426 acres of existing natural land covers under the No Action/No Project Alternative. This new urban development would **be assumed to** directly impact (i.e., ~~be~~ permanently impact~~ed~~, according to the assumptions stated for direct impacts in Section 10.2.1) **aquatic resources**. Of the currently existing 24,254 acres of aquatic resources mapped in the Planning Area, implementation of the No Action/No Project Alternative would result in an estimated direct loss of approximately of 1,607 (6.6%) of **the** ~~its~~ current amount of aquatic resources (Table 10-3~~ and Table 10-5~~). The 1,607 acres of direct loss of aquatic resources within the Planning Area under the No Action/No Project Alternative includes all three categories of aquatic

resources (see Table 10-4, Estimated Direct Loss of Aquatic Resources Under the No Action/No Project Alternative).

In addition, as described in Section 2.2.2, up to 1,900 acres of future planned urban development could be shifted or displaced from inside the Mather Core Recovery Area (located primarily within the Morrison Creek watershed) to one or more locations outside the current Sacramento County Urban Service Boundary (USB) (possibly to areas near Rancho Murieta in the Deer Creek watershed or south of the Elk Grove sphere of influence in the Upper Cosumnes River or the Snodgrass Slough watersheds), which could directly impact up to 50 acres of aquatic resources located outside the current USB boundary.

AGENDA ITEM 11.1

4879

As discussed in Sections 2.2.1 and 3.4, the No Action/No Project Alternative includes the full development, or "full buildout," of all lands presently zoned or ultimately planned/contemplated for urban development. These lands are discussed in Section 1.1.1 and on Figure 1-1 as the UDA. Most of the UDA area is within the Morrison Creek watershed (Figure 10-2); therefore, most future aquatic resource impacts from planned urban development (1,008 acres of the expected total 1,607 acres of impacts) would occur in the Morrison Creek watershed (Table 10-4). Smaller portions of the northern UDA area are within the Deer Creek and Sherman Lake–Sacramento River watersheds, where 254 acres and 19 acres of aquatic resources would be impacted, respectively. The southern UDA area is located in and around the Galt (Figure 1-1) and includes relatively small portions of the Laguna Creek, the Lower Cosumnes River, and the Dry Creek watersheds (Figure 10-2). Approximately 90 acres of aquatic resources would be directly impacted in the Laguna Creek watershed, 46 acres would be directly impacted in the Lower Cosumnes River watershed, and 29 acres would be directly impacted in the Lower Dry Creek watershed (Table 10-4).

As defined in Section 3.4.2, "full buildout" of the UDA will include some open space lands and some mitigation or conservation lands within the area planned for future urban development. The aquatic resources remaining within those open space, mitigation, or conservation lands would not be directly impacted (e.g., filled, removed, or changed to another Aquatic land cover type) by the expected "full buildout," but those aquatic resources could become indirectly impacted by adjacent development or by development anywhere within the same landscape or watershed.

In addition to direct losses of aquatic resources, planned urban development under the No Action/No Project Alternative would also indirectly impact existing aquatic resources. Section 3.6.6 and Appendix G summarize the different types of indirect impact mechanisms (environmental stressors) that can result from the construction and the operation of urban development projects and activities. Urban development projects can cause indirect impacts to aquatic resources present in nearby open spaces and conservation lands by increasing the presence of invasive plant species that escape from urban landscaping and by disturbing areas that become colonized by weedy and invasive plants. These invasive plants are known to adversely affect the natural hydrology and the habitat quality of aquatic resources by outcompeting native species, by blocking infiltration of rainwater in vernal pool soils, by changing the hydrology of vernal pools and other wetlands, and by using more water than native grassland species, which shortens the ponding period of vernal pools. The functions and services of vernal pool wetlands are especially vulnerable to indirect changes to the natural hydrologic regime of the vernal pool ecosystem because both the timing of vernal pool fill and period of vernal pool inundation dictate whether vernal pool plants and crustaceans are able to germinate or hatch, survive, and reproduce in the relatively short winter wet season (see

discussion of vernal pool hydrology and ecology in Appendix G). As discussed in Appendix G, an impervious soil layer in Planning Area vernal pool landscapes results in the formation of a seasonal "perched aquifer," which hydrologically connects vernal pools, swales, and stream/creek aquatic features within a landscape. New urban development projects and activities under the No Action/No Project Alternative implemented in vernal pool landscapes are expected to indirectly impact the functions and services of the vernal landscape in the following ways: by permanently damaging or interrupting the hydrologic connections of the perched aquifer; by interrupting or altering the formation of the perched aquifer, which allows soil to saturate, pools to fill, and swales to connect and flow to downgradient vernal pools; and by puncturing the impermeable soil hardpan (duripan) layer in a portion of a vernal pool landscape, permanently disrupting the existing hydrology of some or all of that landscape (see discussion of vernal pool hydrology and ecology **in** Appendix G). As discussed in Section 3.6.6, the EIS/EIR qualitatively describes and analyzes indirect impacts to most aquatic resources. However, three of the Planning Area aquatic resources (vernal pools, swales, and stream/creek [VPIH]) also provide habitat for federally listed vernal pool crustaceans and are analyzed in greater detail. As discussed in Sections 8.2.1 and 9.2.1, the Permit Applicants used LIDAR technology and GIS methodology to quantify acres of Vernal Pool, Swale, and Stream/Creeks (VPIH) land covers that could be indirectly impacted by changes to surface or sub-surface hydrology within their watersheds.

The project-by-project compensatory mitigation process expected under the No Action/No Project Alternative is described in Section 2.2.4. As discussed in Section 10.1.1, new development projects and activities implemented under the No Action/No Project Alternative that require authorizations from USACE under CWA 404 would comply with the 2008 Compensatory Mitigation Rule (73 FR 19594–19705), including appropriate mitigation ratios for unavoidable impacts to aquatic resources. Compensatory mitigation ratios ~~and amounts~~ to offset unavoidable impacts to aquatic resources would be determined by considering the factors used in the USACE South Pacific Division *Regulatory Program Standard Operating Procedure for Determination of Mitigation Ratios* (Mitigation Ratios Procedure) **or other policy guidance in effect at the time**, as discussed in Section 10.1.1. New urban development projects and activities could establish on-site or off-site mitigation preserves, purchase credits at an approved mitigation bank, or purchase mitigation credits through an established in-lieu fee program.

Table 10-5, Estimated Acres of Aquatic Resources Preserved Under the No Action/No Project Alternative, provides the estimated acreages of Aquatic Resources land cover types that would be preserved under the No Action/No Project Alternative inside the UDA and outside the UDA. As discussed in Section ~~2, 2.2.4~~**2.2.3**, the lead agencies described the future No Action/No Project Alternative by estimating the minimum and maximum amounts of new urban development that could occur over a 50-year period inside the UDA under various mitigation

scenarios. Under the scenario with the largest feasible acres of new development and the smallest feasible acres of aquatic resource mitigation feasible, an estimated 1,740 acres of aquatic resources would be preserved in the Planning Area as project mitigation under the No Action/No Project Alternative (Table 10-5). **Table 10-5 identifies 0 acres of riparian land cover preservation under the No Action/No Project Alternative. This is because it is assumed that under the No Action/No Project Alternative all mitigation for unavoidable losses of riparian land covers would be achieved through re-establishment/establishment of mixed riparian scrub and mixed riparian woodland and not through preservation of existing riparian land covers (see Table 10-6, Estimated Acres of Aquatic Resources Re-Established/Established Under the No Action/No Project Alternative).**

Table 10-5. Estimated Acres of Aquatic Resources Preserved Under the No Action/No Project Alternative

Land Cover Type	Preserved Land (acres)		
	Inside UDA	*Outside UDA*	*Total*
Wetland Waters

Mixed Riparian Woodland	0	0	0
Total Riparian	*0*	*0*	*0*
Total Preserved	**258**	**1,482**	**1,740**

Notes: UDA = Urban Development Area; VPIH = vernal pool invertebrate habitat

Mitigation preserves (permittee-responsible mitigation) could occur within a project/activity site or occur outside a project/activity site. These preserves would include aquatic resources that have been avoided in accordance with regulatory requirements to first avoid and minimize direct and/or indirect impacts to aquatic resources. Smaller, on-site preserves located in proximity to new development tend to be more isolated from other natural lands and more susceptible to indirect effect mechanisms identified previously.

Individual on-site project preserves located in proximity to new development are expected to become surrounded by new urban development and isolated from other natural lands, and the existing functions and services of aquatic resources on those preserves would be **more likely to be** adversely impacted by the urban development indirect effect mechanisms discussed in Chapter 8 and Appendix G.

Table 10-6. Estimated Acres of Aquatic Resources Re-Established/Established Under the No Action/No Project Alternative

Land Cover Type	Re-Establishment/Establishment Mitigation (acres)

Riparian	
Mine Tailing Riparian Woodland	0
Mixed Riparian Scrub	298
Mixed Riparian Woodland	256
Total Riparian	*554*
Total Preserved	**1,424**

Note: VPIH = vernal pool invertebrate habitat

The action of preserving existing aquatic resources would have no direct effect on the existing aquatic resources that are present inside or outside of the preserve. However, ground-disturbing actions necessary to re-establish/establish aquatic resources, especially vernal pools, on preserved land could result in indirect effects on existing natural aquatic resources. For example, some established (created) vernal pools have changed the existing hydrology of vernal pool landscapes in which they were created, impacting natural vernal pools within the same watershed. Construction activities associated with the re-establishment/establishment of aquatic resources generally include but are not limited to regrading or re-contouring of a site, typically up to 3 feet in depth for vernal pools, and seeding.

As discussed in Sections 2.2.2, 2.2.4, and 8.2.2, the No Action/No Project Alternative would also result in an estimated 1,424 acres of re-establishment or establishment of aquatic resources

(Table 10-6). **As described in Section 8.2.2, the re-establishment/establishment acres of aquatic resources presented in Table 10-6 reflect the lead agencies' assumption that the requirements of the 2008 Compensatory Mitigation Rule to be re-established/established to replace lost aquatic resource functions and services at a minimum one-to-one acreage or one-to-one linear foot compensation ratio would continue under the No Action/No Project Alternative. It is assumed in Table 10-6 that compensatory mitigation for direct impact to Vernal Pools and Swales would occur within the Planning Area. However, compensatory mitigation for the other Aquatic land covers (Stream/Creek [VPIH], Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water) is assumed to continue to occur primarily by purchasing credits at an approved mitigation banks or through an in-lieu fee program. However, several mitigation banks and in-lieu fee programs with service areas that overlap the Planning Area actually re-establish, establish, or enhance wetlands or other waters at locations outside the Planning Area. Therefore, Table 8-5 assumes that only half of the necessary compensatory mitigation for direct impacts to Stream/Creek (VPIH), Seasonal Wetland, Freshwater Marsh, Stream/Creek, and Open Water would occur inside the Planning Area.**

10.2.2.2 Cumulative Analysis of the No Action/No Project Alternative

As discussed in Sections 8.1.2 and 8.2.2, riparian woodlands, vernal pool wetlands, freshwater marsh wetlands, and other waters were once widespread across the Central Valley and in the Planning Area. Past human activities and projects, including farming operations; urban development inside the UDA; development of agricultural-residential neighborhoods in some areas outside the UDA; past mining operations; and the construction of associated energy, water conveyance, and transportation infrastructure projects (see Sections 3.7.1 and 10.1.2), have removed aquatic resources from the Planning Area and adversely altered the natural physical and biological processes of other aquatic resources, especially within the UDA portions of the Planning Area. The effects of past and of present (current) activities on Planning Area aquatic resources have resulted in the existing conditions described above in Section 10.1.2. These conditions represent an existing significant impact on aquatic resources within the EIS/EIR Planning Area and the larger resource study area.

The types of future foreseeable (probable) other projects, activities, and actions described in Section 3.7.2 are similar to the types of past activities and projects that have occurred in the study area. These foreseeable other projects and activities include new urban development projects within the City of Elk Grove and within the community of Rancho Murieta; proposed master planned developments within the UDA named "Rio Del Oro" (3,828 acres) and "Mather South" (885 acres); further rural residential development outside the UDA; continued urban development on currently cultivated agricultural lands; expansion of existing nature preserves, including the Stone Lakes National Wildlife Refuge and the Cosumnes River Preserve; and

construction of major infrastructure projects such as California High-Speed Rail and the California WaterFix.

A review of the USACE's CWA 404 project authorizations within the Planning Area between 1979 and 2013 indicated a small net gain of waters of the United States within individual project sites authorized under CWA 404 (USACE 2014). The foreseeable other projects that are subject to CWA 404 authorizations would also comply with existing regulatory requirements to avoid and minimize impacts to aquatic resources and provide compensatory mitigation for unavoidable impacts (see Section 10.1.1). Therefore, many of the foreseeable other actions discussed in Section 3.7.2 would not result in a loss of wetlands or other waters. Other existing regulations and policies described in Section 10.1.1, including Section 1602 of the California Fish and Game Code and policies of the three General Plans, would require the reasonably foreseeable other projects that are subject to the California Environmental Quality Act or local entitlements to avoid and minimize impacts to Riparian land covers and provide no net loss of riparian acres (see Section 10.1.1). Consequently, many of the foreseeable other projects and actions discussed in Section 3.7.2 would not result in additional losses of aquatics resource functions and services from the study area. However, the foreseeable rural residential developments, the agricultural activities on private lands, and **certain** other future activities **may not always trigger the regulations and policies listed above, and in those** cases, are likely to result in additional losses and adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period.

As described previously, ~~implantation~~**implementation** of the No Action/No Project Alternative is assumed to meet **the requirements of the 2008 Compensatory Mitigation Rule, and aquatic resources would be re-established/established to replace lost aquatic resource functions and services at a minimum one-to-one acreage or one-to-one linear foot compensation ratio. Compensatory mitigation under this alternative could occur inside and outside the Planning Area. With the resulting no net loss of aquatic resource functions and services, ~~W~~w**hen the incremental direct and indirect effects of the No Action/No Project Alternative are viewed in connection with the effects of the past, present, and reasonably foreseeable future other projects and actions, the incremental effects of the No Action/No Project Alternative would not make a considerable contribution to the existing significant cumulative impact on aquatic resources within the study area.

10.2.3 Proposed Action/Proposed Project Alternative

As described in Section 2.3.3, the Proposed Action/Proposed Project Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative. However, the locations of new urban development in the UDA under the Proposed Action/Proposed Project Alternative are expected to differ slightly from the No Action/No

Project Alternative, primarily because the Proposed Action/Proposed Project Alternative would consolidate the federal Endangered Species Act (ESA), California Endangered Species Act, and CWA 404 mitigation requirements of future projects and activities (Covered Activities) to form a managed and interconnected SSHCP Preserve System (see Section 2.3.5). The SSHCP and ARP would establish a network of Preserve Planning Units in the Planning Area that would preserve special-status species and their natural communities in perpetuity. Preservation of these natural communities includes many types of waters of the United States and waters of the state, riparian buffer areas, and adjacent upland areas. In addition, the Proposed Action/Proposed Project Alternative would allow urban development Covered Activities within the Mather Core Recovery Area portion of the UDA to be implemented consistent with planned urban development described in the approved Sacramento County and Rancho Cordova General Plans without urban development shifting or being displaced to locations outside the current USB boundary. Therefore, the Proposed Action/Proposed Project Alternative would allow for more urban development within the Mather Core Recovery Area than the No Action/No Project Alternative because approximately 1,900 acres of new urban development would not shift or be displaced to locations outside of the current Sacramento County USB boundary. Consequently, both the No Action/No Project Alternative and the Proposed Action/Proposed Project Alternative assume a full buildout of the UDA,[4] but new urban developments would not occur outside the current USB boundary under the Proposed Action/Proposed Project Alternative.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative's Conservation Strategy also includes landscape-level and project-level SSHCP Avoidance and Minimization Measures (SSHCP AMMs), which would be incorporated into the design or the implementation of each Covered Activity to avoid and minimize impacts to aquatic resources to the greatest extent practicable. The SSHCP AMMs include siting requirements, incorporation of low-impact development measure (LID) elements in project designs, incorporation of Stream Setbacks and Preserve Setbacks in project design, species-specific avoidance measures, and use of BMPs during ground disturbing Covered Activities (see Appendix D for details on each AMM).

10.2.3.1 Direct and Indirect Effects of the Alternative

As discussed in Section 10.1.2, approximately 24,254 acres of aquatic resources is present in the Planning Area (Table 10-1). Implementation of the Proposed Action/Proposed Project Alternative would directly impact (direct loss of) approximately 1,613 acres of aquatic resources, leaving approximately 22,611 acres (92.2% of existing condition) of aquatic

[4] "Full buildout" means all currently undeveloped lands that are zoned for or ultimately planned/contemplated for future urban development (in the adopted General Plans of the Permit Applicants) would become developed. Full buildout would include some open space and mitigation preserves or other conservation lands within the areas planned for urban development.

resources in the Planning Area (Table 10-7, Estimated Loss of Aquatic Resources Under the Proposed Action/Proposed Project Alternative).

The total 1,613 acres of direct loss of aquatic resources within the Planning Area includes all three categories of aquatic resources (see Table 10-7), including the direct loss of 855 acres of the Wetland Waters land cover types. This direct loss of wetland waters is approximately 34 acres greater than the 821 acres of direct loss of wetland waters anticipated under the No Action/No Project Alternative (Tables 10-4 and 10-7). In addition, the Proposed Action/Proposed Project Alternative would result in the direct loss of 294 acres of other waters, which would be 65 acres less than the 359 acres that is anticipated to be lost under the No Action/No Project Alternative (Tables 10-4 and 10-7). Also, the Proposed Action/Proposed Project Alternative would result in the total direct loss of 464 acres of Riparian land cover types, which would be 37 acres greater than the 427 acres of loss estimated for the No Action/No Project Alternative (Tables 10-4 and 10-7).

The Morrison Creek watershed (see Section 7.1.2 and Figure 10-2) is within the UDA, where future urban development Covered Activities would occur. Therefore, the Morrison Creek watershed would lose the most acres of aquatic resources compared to other Planning Area watersheds. Approximately 994 (619 acres of Wetland Waters, 156 acres of Other Waters, and 219 acres of Riparian land covers) acres of Morrison Creek aquatic resources would be lost under the Proposed Action/Proposed Project Alternative (Table 10-7).

Because the types of urban development implemented under the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative are similar, the sources of indirect impacts (e.g., impact mechanisms or environmental stressors) that result from the construction and operation of urban development would be similar in type to those described previously for the No Action/No Project Alternative (e.g., altered surface or sub-surface hydrology, contaminated surface runoff, invasive species) (see Section 10.2.2.1).

AGENDA ITEM 11.1

4888

The Proposed Action/Proposed Project Alternative's Conservation Strategy (Section 2.3.5) included~~d~~**s** required impact AMMs that would reduce or eliminate many of the impact mechanisms (environmental stressors) that indirectly impact aquatic resources functions and services. The Proposed Action/Proposed Project Alternative would require the following SSHCP AMMs to be applied to Covered Activities (these AMMs are also included in the ARP; details on the AMMs are provided in Appendix D of this EIS/EIR): BMP-1, BMP-2, BMP-3, BMP-4, BMP-5, BMP-9, Road-1, LID-1 through LID-3, EDGE-1 through EDGE-7, EDGE-9, EDGE-10, ROAD-1 through ROAD-3, NATURE TRAIL-1, NATURE TRAIL-2, NATURE TRAIL-4, STREAM-1 through STREAM-5, and UTILITY-2 through UTILITY-4 (see Table 2-6 and Appendix D for a description of all SSHCP AMMs). Relative to the AMMs of individual projects and activities implemented under the No Action/No Project Alternative, these SSHCP AMMs would better reduce indirect impacts on aquatic resources. For example, STREAM-1 through STREAM-3 would require wider Stream Setbacks between streams and new development than those required under the No Action/No Project Alternative regulatory environment, thereby providing greater protection of existing water quality and species habitats in stream/creek and other aquatic resources downstream. On-site project requirements to maintain hydrologic conditions, minimize effects on downstream hydrology through stormwater retention and other measures (LID), perform mandatory construction monitoring near Covered Species aquatic habitat, and perform mandatory implementation of erosion-control measures during project construction "scale up" such that the overall Planning Area would have reduced indirect impacts compared to the No Action/No Project Alternative.

BMP-1 through BMP-11 of the Proposed Action/Proposed Project Alternative are similar to the construction BMPs that would be implemented with projects under the No Action/No Project Alternative (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM. The Proposed Action/Proposed Project Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM and a process to make adaptive changes to any AMM that was not effective at avoiding impacts to water quality and aquatic habitats. This additional oversight and guidance provided by the SSHCP would result in the BMP AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to surface-water quality compared to the effects of the No Action/No Project Alternative.

Biological Goals and Measurable Objectives provide the broad guiding principles of a habitat conservation plan's (HCP's) operating Conservation Strategy and are required in all HCPs. The

stated Measureable Objectives of each Biological Goal are included as conditions in an HCP's permit. The primary components of the SSHCP Conservation Strategy are six Biological Goals for the operational SSHCP and the specific Measurable Objectives that would achieve each of the six SSHCP Biological Goals. As discussed in Section 7.3.2 of the Draft SSHCP document, SSHCP Biological Goal #2 is to "maintain or improve the existing physical, chemical, and biological functions of the aquatic resources located within the Planning Area." The stated intent of SSHCP Biological Goal #2 is to avoid or minimize impacts of future Covered Activities on Planning Area aquatic resources and to ensure no net loss of aquatic resources and aquatic functions by preserving existing aquatic resources and by re-establishing or establishing aquatic resources within the Planning Area.

SSHCP Biological Goal #2 and its Measurable Objectives prescribe a number of requirements that would benefit streams and creeks within the Planning Area. It requires increased avoidance of creeks in the UDA compared to the No Action/No Project Alternative (avoidance of a minimum of 20% of first and second order tributaries to Elder Creek, Frye Creek, Gerber Creek, Morrison Creek, Paseo Central, and Sun Creek in the UDA). It also requires establishment of Stream Setbacks, which are not currently a requirement within the Planning Area. Avoided creeks (including ephemeral streams) would have minimum setback requirements based on specific objectives of the overall ~~mitigation~~ **Conservation** ~~s~~**S**trategy. Additionally, aquatic resources preserved within the SSHCP Preserve System would be managed into perpetuity.

The SSHCP Conservation Strategy would create a Preserve System that would preserve and link the highest-quality natural land covers, cropland, and irrigated pasture-grassland within the Planning Area (described in detail in the SSHCP in Chapter 7, Section 7.2.2.1), with a Preserve System 32,426 acres in size, ~~and~~ 26,236 acres of which would be located outside the UDA. Avoidance and minimization of aquatic resources would be accomplished through preserve design and assembly, which includes protecting the rarest types and highest-functioning aquatic resources (e.g., vernal pools, streams, certain seasonal wetlands) and implementing inter-preserve connectivity. The SSHCP Preserve System would be designed to protect watershed functions, maintaining existing hydrologic regimes through linked preserves and setback requirements. This preserve design would be important to aquatic resources and their existing and potential beneficial uses and to the maintenance of aquatic-resource-dependent/associated plants and wildlife. It would also be designed to preserve natural upland landscapes associated with streams and wetland features for maintaining aquatic resource dependent/associated species.

The Proposed Action/Proposed Project Alternative would establish a coordinated and interconnected 33,426-acre SSHCP Preserve System in the Planning Area (see Section 2.3.5). The SSHCP Preserve System would contain at least 2,738 acres of Aquatic Resources land cover types (Table 10-8). The Proposed Action/Proposed Project Alternative would result in the preservation of

1,476 acres of Wetland Waters land cover types. This preservation of wetland waters would be 251 acres less than the 1,727 acres that are anticipated **to be preserved** under the No Action/No Project Alternative (Table 10-5). The Proposed Action/Proposed Project Alternative would result in the preservation of 298 acres of Other Water land cover types. This preservation of other waters would be 285 acres more than the 13 acres of other waters that are anticipated to be preserved under the No Action/No Project Alternative (Table 10-5).

Table 10-8. Estimated Acres of Aquatic Resources Preserved Under the Proposed Action/Proposed Project Alternative

Land Cover Type	Preserved Land (acres)		
	Inside UDA	*Outside UDA*	*Total*

Mine Tailing Riparian Woodland	0[a]	0[a]	0[a]
Combined Mixed Riparian Scrub and Mixed Riparian Woodland	74[a]	890[a]	964[a]
Total Riparian	*74*	*890*	*964*
Total Preserved	**679**	**2,059**	**2,738**

Note: UDA = Urban Development Area

[a] Impacts to Mixed Riparian Woodland, Mixed Riparian Scrub, and Mine Tailing Riparian Woodland would be mitigated by preserving any combination of Mixed Riparian Scrub and/or Mixed Riparian Woodland.

The Conservation Strategy of the Proposed Action/Proposed Project Alternative would preserve 964 acres of Riparian land cover types. Preservation of Riparian land cover under the No Action/No Project Alternative is not expected (Table 10-5).

The SSHCP's Conservation Strategy includes the re-establishment/establishment of 1,740 acres of Aquatic Resources land covers to compensate for unavoidable impacts (see Table 10-9, Estimated Acres of Aquatic Resources Re-established/Established Under the Proposed Action/Proposed Project Alternative). Section 7.3.2 of the SSHCP identifies the SSHCP Goals and Objectives, which establish minimum compensatory mitigation requirements for aquatic resources. For example, SSHCP Biological Goal #2's Measurable Objective W5 includes a

minimum 1:1 ratio, including land-cover-specific re-establishment/establishment ratios. As required by SSHCP Biological Goal #2, a minimum 1:1 re-establishment/establishment ratio would be required for all Covered Activities directly impacting wetlands, other waters, and riparian, and the re-establishment/establishment would occur within the SSHCP Preserve System. The Proposed Action/Proposed Project Alternative would result in the re-establishment/establishment of each of the three categories of aquatic resources (Table 10-9). These re-establishment/establishment amounts would ensure that the minimum one-to-one acreage and linear foot compensation ratios required per the 2008 Compensatory Mitigation Rule (33 CFR 332.3[f]) are met.

The compensatory mitigation ratios listed in the ARP are based on a landscape-level assessment of the diversity, abundance, and condition of aquatic resources types that occur in the Planning Area. The compensatory mitigation ratios are also designed to be consistent with USACE's 2008 Compensatory Mitigation Rule and to consider the factors used for determining compensatory mitigation requirements as required for processing Department of the Army permits under Section 404 of the CWA (Mitigation Ratios Procedure).

~~The ARP compensatory mitigation ratios are based upon factors consistent with the federal mitigation rule. The purpose of the ARP compensatory mitigation ratios strategy is to proactively offset unavoidable impacts to aquatic resources and maintain or improve physical, chemical, and biological functions of aquatic resources within the Planning Area.~~

As previously mentioned, two key components of the SSHCP Conservation Strategy are the Jump-Start and Stay-Ahead provisions (described in detail in Chapter 9, Section 9.5.5, of the SSHCP). These components of the SSHCP Conservation Strategy were developed to address the temporal loss consideration described in the Mitigation Ratios Procedure. Jump-Start and Stay-Ahead provisions require impacts to be mitigated in advance of Covered Activity project implementation and ensure that SSHCP Preserve System assembly would keep pace with urban development and make steady progress toward assembling the entire conceptual SSHCP Preserve System. Implementation of these provisions would ensure that lost aquatic resource functions are replaced ahead of Covered Activity project impacts, avoiding temporal loss.

Table 10-9. Estimated Acres of Aquatic Resources Re-Established/Established Under the Proposed Action/Proposed Project Alternative

Land Cover Type	Re-Establishment/Establishment Mitigation (acres)
Wetland Waters	
Vernal Pool	389
Seasonal Wetland	105
Swale	256
Freshwater Marsh	127
Total Wetland Waters	*877*
Other Waters	
Open Water	155
Stream/Creek (Intermittent and Perennial)	117
Stream/Creek (VPIH) (Ephemeral)	0[a]
Total Other Waters	*272*
Riparian	
Mine Tailing Riparian Woodland	0[b]
Combined Mixed Riparian Scrub and Mixed Riparian Woodland	591
Total Riparian	*591*
Total Re-Established/Established	**1,740**

Notes:

[a] Re-establishment and/or establishment to mitigate effects on Stream/Creeks (VPIH) would be Swale, which is included in the approximately 256 acres shown for Swale.

[b] Mine Tailing Riparian Woodland would be mitigated re-establishing or establishing Mixed Riparian Scrub or Mixed Riparian Woodland.

Because the Proposed Action/Proposed Project Alternative would result in greater impacts to aquatic resources, the ~~a~~ total acreage of re-established/established aquatic resources would be greater under the Proposed Action/Proposed Project Alternative (Table 10-9) than the No Action/No Project Alternative (Table 10-6). The No Action/No Project Alternative results in 1,424 acres of re-establishment/establishment mitigation **in the Planning Area (see Section 10.2.2 for an explanation of the use of mitigation banks and in-lieu fee programs and potential for some compensatory mitigation to be located outside the Planning Area)**, and the Proposed Action/Proposed Project Alternative results in 1,740 acres of re-establishment/establishment mitigation **in the Planning Area**. For both alternatives, the amount of re-establishment/establishment is directly tied to the amount of impact, with each acre of land cover loss resulting in **at least** 1 acre of establishment**/**re-establishment. For the No Action/No Project Alternative, this minimum one-to-one acreage is assumed based on the requirements of the 2008 Compensatory Mitigation Rule (33 CFR 332.3[f]). For the Proposed Project Alternative, it is a direct requirement of SSHCP Biological Goal #2, which would also provide compliance with the minimum standards of the 2008 Compensatory Mitigation Rule. Therefore, both alternatives result in no net loss of acreage of aquatic resources.

Mitigation for direct loss of Mine Tailing Riparian Woodland land cover would re-establish/establish Mixed Riparian Woodland or Mixed Riparian Scrub land covers. This mitigation strategy would replace Mine Tailing Riparian, a constructed land cover (see Section 8.1.2), with the natural Mixed Riparian Woodland or Mixed Riparian Scrub land covers. In addition, impacts to the Open Water land cover (which in the Planning Area consists largely of stock ponds, impoundments, and other constructed features ~~([~~[see Section 8.1.2~~)~~]]), would be mitigated though the preservation and re-establishment/establishment of either Freshwater Marsh or Seasonal Wetlands land covers. Impacts to the Stream/Creek (VPIH) land cover would be mitigated though the preservation or re-establishment/establishment of the Vernal Pool land cover. Because compensatory mitigation for impact to Mine Tailing Riparian Woodland, Open Water, and the Stream/Creek (VPIH) land cover would not be in kind, these land covers would decrease relative impacts expected under the No Action/No Project Alternative. However, the re-establishment/establishment of total riparian communities and total wetland and other waters would result in a no net loss of acreage.

As discussed previously, implementation of the SSHCP Conservation Strategy, including the Preserve System and AMMs, the ARP, and ~~a~~ proposed state and federal aquatic resource permitting approaches for future Covered Activities (described in Section 1.5), would result in a comprehensive regional approach to avoidance, minimization, and compensation of adverse impacts to aquatic resources (Section 2.3.5).

Similar to the No Action/No Project Alternative, aquatic resources directly and indirectly ~~lost~~ **impacted** under the Proposed Action/Proposed Project Alternative would be mitigated to achieve no net loss of aquatic resources acreage, functions, and services.

The SSHCP Conservation Strategy also includes the goal to "maintain or improve physical, chemical, and biological functions of aquatic resources within the Planning Area." The SSHCP Preserve System would result in larger individual preserves, and greater connectivity of preserves than is anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

Also, the Conservation Strategy and ARP include goals and objectives to re-establish/establish aquatic resources to compensate for unavoidable adverse impacts, including direct loss of aquatic resources, that remain after AMMs (e.g., watershed-scale planning, project-scale AMMs) have been applied. The Conservation Strategy and ARP would preserve 81 less acres of aquatic resources than the anticipated amount of preservation under the No Action/No Project Alternative; however, the preservation under the Conservation Strategy and ARP would be implemented with a systematically coordinated Preserve System that also considers watersheds. The Preserve System would result in larger individual preserves and greater connectivity of preserves than anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

In addition, as discussed previously, the SSHCP Conservation Strategy and ARP implemented under the Proposed Action/Proposed Project Alternative would include re-establishment/establishment, preservation, and AMMs, such as Stream Setbacks, that would reduce direct and indirect adverse impacts of project to aquatic resources compared to effects of the No Action/No Project Alternative.

Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would include the following:

- Result in the loss of 855 acres of wetland waters, which is 34 acres more than the 821-acre loss anticipated under the No Action/No Project Alternative
- Result in the loss of 294 acres of other waters, which is 65 acres less than the 359-acre loss anticipated under the No Action/No Project Alternative
- Result in the loss of 464 acres of Riparian land cover types, which is 37 acres more than the 427 acres expected under the No Action/No Project Alternative
- In total, result in the loss of 1,613 acres of aquatic resources, which is a 6-acre greater loss of aquatic resources compared to the 1,607-acre loss of the No Action/No Project Alternative (Table 10-4)
- Preserve 2,738 acres of aquatic resources, which is greater by 998 acres compared to 1,740 acres under the No Action/No Project Alternative
- Require AMMs, such as increased Stream Setbacks, that would be more protective to aquatic resources relative to the No Action/No Project Alternative
- Implement the SSHCP and ARP and result in a greater area of aquatic resources protections and management than the No Action/No Project Alternative
- Improve aquatic resources abundance, diversity, and condition within the Planning Area over that expected under the No Action/No Project Alternative

Therefore, after considering the impacts from the Proposed Action/Proposed Alternative on each of the impact criteria for aquatic resources (Section 10.2.1.1), the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects to aquatic resources compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

10.2.3.2 Cumulative Effects of the Proposed Action/Proposed Project Alternative

The effects of past~~,~~ **and** present~~, and reasonably foreseeable other~~ projects on aquatic resources in the Planning Area were described in Section 10.2.2.2 and represent a significant adverse cumulative impact on the aquatic resources within the study area. **A subset of the reasonably foreseeable other projects (e.g., foreseeable rural residential developments, agricultural activities on private lands) is likely to result in additional losses and additional adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period. However,** ~~A~~as discussed in Section 10.2.2.2, when the incremental direct and indirect effects of the No Action/No Project Alternative are viewed in connection with the significant adverse effects of the past, present, and reasonably foreseeable future other projects and actions, the incremental effects of the No Action/No Project Alternative would not make a considerable contribution to the existing significant cumulative impact on aquatic resources within the study area. Therefore, the No Action/No Project Alternative would result in a ***Less Than Significant Adverse*** effect.

As discussed previously, the implementation of the SSHCP Conservation Strategy, including the SSHCP AMMs, SSHCP ARP, and interconnected SSHCP Preserve System, is expected to result in more consistent and frequent conservation of aquatic resources compared to the No Action/No Project Alternative. Consequently, the incremental effects of the Proposed Action/Proposed Project Alternative would have a minor beneficial impact to aquatic resources compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of the Proposed Action/Proposed Project Alternative are individually limited and would not make a cumulatively considerable contribution to the significant adverse cumulative impacts of the past, present, and reasonably foreseeable future other projects on aquatic resources. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect to aquatic resources compared to the No Action/No Project Alternative baseline condition.

10.2.4 Reduced Permit Term Alternative

As described in Section 2.3.3, the Reduced Permit Term Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative.

Under the Reduced Permit Term Alternative, the core of the Preserve System established inside the UDA would be associated with the development of five large Master Plans (discussed in Section 2.3.4 for the Reduced Permit Term Alternative and Section 2.3.3 for the Proposed Action/Proposed Project Alternative). Because the Preserve System inside the UDA under both EIS/EIR action alternatives is associated with the same five large Master Plans, approximately 70% of the UDA preserves established under the Reduced Permit Term

Alternative would have similar sizes, boundaries, and locations as the UDA preserves established under the Proposed Action/Proposed Project Alternative. However, the shorter duration of the Reduced Permit Term Alternative—and the smaller amount of urban development and associated development fees collected by the Reduced Permit Term Alternative—would not allow the Reduced Permit Term Alternative to establish as many acres of new preserves in the Planning Area as would occur under the Proposed Action/Proposed Project Alternative's 50-year permit term. Therefore, fewer new preserves would be established under the ~~c~~**C**onservation ~~s~~**S**trategy of the Reduced Permit Term Alternative. This difference would be especially pronounced outside the UDA.

As described in Section 2.4, the ESA and California Endangered Species Act Incidental Take Permits and the CWA permit strategy for HCP Covered Activities would be valid only during the 30-year permit term of the Reduced Permit Term Alternative, and the Reduced Permit Term Alternative's ~~c~~**C**onservation ~~s~~**S**trategy would be implemented only during this 30-year term. The urban development Covered Activities and Conservation Strategies associated with the five Master Plans would be implemented inside the UDA during this 30-year period. However, the EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3), and the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, as described in Section 3.6.7.2, the EIS/EIR analysis of the Reduced Permit Term Alternative also considers future urban development that is not part of the project description of the Reduced Permit Term Alternative but is still expected to occur within the Planning Area after the end of the permit term (i.e., in Years 31–50 of the EIS/EIR study period).

As described in Section 3.6.7.2, project mitigation preserves established after the end of the 30-year Reduced Permit Term Alternative would be established under a project-by-project process for obtaining individual authorizations under CWA, ESA, California Endangered Species Act, and Section 1600 of the California Fish and Game Code. Consequently, mitigation preserves established in Years 31–50 of the EIS/EIR study period would not be established using a regional, landscape-based approach that balances new urban development with the need for conservation, which would be provided by an HCP. Therefore, much of the Preserve System inside the UDA would be very similar under the two action alternatives, but the Preserve System outside the UDA would be substantially different between the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, it is unlikely that mitigation preserves established outside the UDA would be contiguous or interconnected, and it is unlikely that a large, contiguous, 10,500-acre, landscape-size Vernal Pool Preserve would be established in the southwestern portion of the Planning Area. Likewise, the No Action/No Project Alterative also would not result in contiguous, interconnected preserves outside the UDA and would not establish a 10,500-acre Vernal Pool Preserve in the Planning Area. In these ways, the new mitigation

preserves established outside the UDA under the Reduced Permit Term Alternative and the No Action/No Project Alternative would be similar.

Direct and Indirect Effects of the Reduced Permit Term Alternative

As discussed in Section 2.4.3, the Covered Activities implemented under the 30-year Reduced Permit Term Alternative would include similar types of urban development expected under the No Action/No Project Alternative. Similar to the Proposed Action/Proposed Project Alternative, the displacement of planned urban development to areas outside of the County's existing USB expected under the No Action/No Project Alternative would not occur under the Reduced Permit Term Alternative. Therefore, the potential changes in location of aquatic resources identified for the No Action/No Project Alternative would not occur under the Reduced Permit Term Alternative. However, no significant changes in aquatic resources use associated with the displaced development were identified for the No Action/No Project Alternative.

~~The Reduced Permit Term Alternative would directly impact approximately 1,097 acres of aquatic resources during the 30 year permit term (Table 10-10). In the remaining 20 years of the 50-year EIS/EIR Study Period (Section 3.6.3) an estimated additional 758 acres of aquatic resources would be lost. Over the EIS/EIR 50-year study period, the Reduced Permit Term Alternative would result in the direct loss of approximately 1,856 acres of aquatic resources in the Planning Area (Table 10-8). This direct loss of aquatic resources is 124 acres greater than the direct loss of approximately 1,732 acres of aquatic resources under the No Action/No Project Alternative (Table 10-2).~~

The Reduced Permit Term Alternative would ~~also~~ result in the direct loss of 931 acres of Wetland Waters land cover types (Table 10-10, Estimated Loss of Aquatic Resources Under the Reduced Permit Term Alternative). This direct loss of wetland waters would be 110 acres greater than the 821 acres that is anticipated to be lost under the No Action/No Project Alternative (Table 10-4). The Reduced Permit Term Alternative would result in the direct loss of 315 acres of other waters. This direct loss of other waters would be 44 acres less than the 359 acres that is anticipated to be lost under the No Action/No Project Alternative (Table 10-4). The Reduced Permit Term Alternative would result in the direct loss of 482 acres of Riparian land cover types. This direct loss of Riparian land cover types would be 55 acres greater than the 427 acres that is anticipated to be lost under the No Action/No Project Alternative (Table 10-4).

Because most of the HCP Preserve System in the UDA would be established during the 30-year permit term, the locations of aquatic resources preservation by watershed would be similar under the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, the watershed with the largest direct loss of aquatic resources would continue to be the Morrison Creek watershed, with a total of 1,088 acres of direct loss (Table 10-10), which is 80 acres more than the Morrison Creek watershed direct losses of 1,008 acres under the No Action/No Project Alternative (Table 10-4).

AGENDA ITEM 11.1

4899

~~The Reduced Permit Term Alternative would result in the loss of 931 acres of wetland waters, which is 110 more acres than the 821-acre loss anticipated under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in the loss of 315 other waters, which is 44 acres less than the 359-acre loss anticipated under the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in the loss of 485 acres of Riparian land cover types, which is 55 acres more than the 427 acres expected under the No Action/No Project Alternative. In total, the Reduced Permit Term Alternative would result in the loss of 1,728 acres of aquatic resources, which is 121 acres more than the loss of aquatic resources under the No Action/No Project Alternative (Table 10-4); however, preservation of aquatic resources under the Reduced Permit Term Alternative, as discussed below, is greater by 1,038 acres compared to the No Action/No Project Alternative.~~

During the 30-year permit term, the SSHCP Conservation Strategy and ARP would implement aquatic resources preservation under the same Biological Goal and Measureable Objectives discussed previously for the Proposed Action/Proposed Project Alternative. Following the reduced permit term (Years 31–50 of the 50-year EIS/EIR study period), the preservation of aquatic resources would be expected to occur under the regulatory ~~guidelines~~ **framework** described for the No Action/No Project Alternative (Section 2.2.4). The acres preserved under the 30-year Reduced Permit Term Alternative are shown in Table 10-11.

Table 10-11. Estimated Preservation of Aquatic Resources Under the Reduced Permit Term Alternative

Grand Total	**500**	**2,278**	**2,778**

Notes: UDA = Urban Development Area; VPIH = vernal pool invertebrate habitat

The Reduced Permit Term Alternative would preserve 2,778 acres of aquatic resources in the Planning Area, which is 1,038 acres more than anticipated to be preserved under the No Action/No Project Alternative (1,740 acres) (Table 10-4).

The Reduced Permit Term Alternative would result in the preservation of 1,904 acres of Wetland Water land cover. This preservation of wetland waters would be 177 acres greater than the 1,727 acres that are anticipated under the No Action/No Project Alternative (Table 10-5).

The Reduced Permit Term Alternative would result in the preservation of 181 acres of Other Water land cover types. This preservation of waters would be 168 acres greater than the 13 acres that are anticipated under the No Action/No Project Alternative (Table 10-5).

The Reduced Permit Term Alternative would result in the preservation of 693 acres of Riparian land cover types. This preservation of Riparian land cover types are not anticipated under the No Action/No Project Alternative (Table 10-5).

During the permit term, as discussed for the Proposed Action/Proposed Project Alternative, re-establishment/establishment to compensate for unavoidable impacts to aquatic resources would be considered from a watershed approach and systematically prioritize re-establishment/establishment mitigation projects based on anticipated benefits to aquatic resources, considering both watershed- and function-based factors. The Conservation Strategy implemented during the 30-year permit term of the Reduced Permit Term Alternative would result in the re-establishment/establishment of 1,677 acres of aquatic resources in the Planning Area (Table 10-12, Estimated Re-Establishment/Establishment of Aquatic Resources Under the Reduced Permit Term Alternative).

Comparing Table 10-12 to Table 10-6, the Reduced Permit Term Alternative results in the following re-establishment/establishment: 160 acres more of Wetland Waters; 38 acres more of Other Waters; and 55 acres more Riparian land covers than that estimated for the No Action/No Project Alternative. The differences would likely be greater because the acreages are for a 30-year permit compared to a 50-year period under the No Action/No Project Alternative.

The Conservation Strategy implemented during the permit term would require AMMs, such as increased Stream Setbacks, that would be more protective to aquatic resources relative to the No Action/No project Alternative. Once the permit term has expired (Years 31–50) projects would be subject to the AMMs of the No Action/No Project Alternative.

In addition to direct losses of aquatic resources, planned urban development under the Reduced Permit Term No Action/No Project Alternative would also indirectly impact existing

aquatic resources. Section 3.6.6 and Appendix G summarize the different types of indirect impact mechanisms (environmental stressors) that can result from the construction and operation of urban development projects and activities.

As described previously in the analysis of the No Action/No Project Alternative, the functions and services of aquatic resources may be indirectly impacted by these stressors. During the 30-year permit term, the AMMs discussed in Table 2-6 and Appendix D would be applied to all HCP Covered Activities~~.~~. The AMMs applied during the permit term would better reduce direct and indirect impacts to aquatic resources compared to the AMMs implanted on a project-by-project basis under the No Action/No Project Alternative. Once the ~~5~~3**0**-year permit term has expired (Years 31–50 of the 50-year EIS/EIR study period)**,** individual urban development projects would comply with ESA, California Endangered Species Act, and CWA 404 on a project-by-project basis.

BMP-1 through BMP-11 of the Reduced Permit Term Alternative would be similar to the construction BMPs for projects implemented under the No Action/No Project Alternative (see Table 2-6). However, the Reduced Permit Term Alternative includes 30 years of additional on-site monitoring and measurement of the effectiveness of each AMM implemented and annual reporting of the effectiveness of each AMM. The Reduced Permit Term Alternative also includes a process for annual review of the effectiveness of each SSHCP AMM for a 30-year period and a process to make adaptive changes to any AMM that was not effective at avoiding impacts to water quality and aquatic resources. This additional oversight and guidance provided by the SSHCP would result in BMP AMMs being implemented more frequently and consistently at all ground-disturbing activities than would occur under the No Action/No Project Alternative. The SSHCP AMMs also provide new AMMs that would not occur under the No Action/No Project Alternative (Table 2-6), and these new measures are expected to lessen the potential adverse effects to surface-water quality and groundwater quality compared to the effects of the No Action/No Project Alternative.

During the permit term, the Reduced Permit Term Alternative would implement the SSHCP Conservation Strategy and ARP, which would work synergistically to preserve and re-establish/establish aquatic resources to provide compensatory mitigation for the direct loss of these resources at a 1:1 ratio as a result of implementing Covered Activities. Once the permit term has expired, preservation and re-establishment/establishment to mitigate for direct loss of aquatic resources as a result of project implementation would still be required to meet regulatory requirements in place at that time, which are expected to be mitigated at least at a 1:1 ratio but would occur on a project-by-project basis as discussed in Section 2.4.5. The Reduced Permit Term would achieve a no net loss of acres of aquatic resources function and value. The No Action/No Project Alternative would also be anticipated to result in no net loss of aquatic resources function and value (Section 10.2.2).

The ARP and SSHCP Conservation Strategy under the Reduced Permit Term Alternative contains the same Biological Goal #2 and associated Measureable Objectives, which would benefit aquatic resources and result in the preservation of 2,778 acres of aquatic resources in the Planning Area, which is a 1,038-acre larger area than the 1,740 acres that is expected to be preserved under the No Action/No Project Alternative. As discussed previously for expected re-establishment/establishment of aquatic resources, the preservation of aquatic resources that would be expected to occur during the permit term would be guided by the SSHCP Conservation Strategy and ARP. After the 30-year permit term concludes, preservation of aquatic resources would be accomplished on an individual project-by-project basis as discussed in Section 2.4.5.

The SSHCP Conservation Strategy and associated ARP that would be implemented during the first 30 years of the Reduced Permit Term Alternative would include re-establishment/establishment, preservation, and AMMs, such as increased Stream Setbacks, that would reduce direct and indirect adverse impacts to aquatic resources compared to what is anticipated from the No Action/No Project Alternative. In addition, the Conservation Strategy and the ARP implemented during the permit term also include goals and objectives to re-establish/establish aquatic resources to compensate for loss of aquatic resources at a no net loss level. During the permit term, the Conservation Strategy and ARP would preserve additional acres of aquatic resources that exceed the preservation acres under the No Action/No Project Alternative within a systematically coordinated Preserve System implemented at the watershed scale. The Preserve System implemented during the permit term would result in larger individual preserves and greater connectivity of preserves than anticipated from the project-by-project mitigation under the No Action/No Project Alternative.

Table 10-12. Estimated Re-Establishment/Establishment of Aquatic Resources Under the Reduced Permit Term Alternative

Mixed Riparian Scrub	303
Mixed Riparian Woodland	306
Total Riparian	*609*
Grand Total	**1,677**

Note: VPIH = vernal pool invertebrate habitat

Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would include the following:

- Result in the loss of 931 acres of wetland waters, which is 110 acres more than the 821-acre loss anticipated under the No Action/No Project Alternative.
- Result in the loss of 315 acres of other waters, which is 44 acres less than the 359-acre loss anticipated under the No Action/No Project Alternative.
- Result in the loss of 482 acres of Riparian land cover types, which is 55 acres more than the 427 acres expected under the No Action/No Project Alternative.
- In total, result in the loss of 1,728 acres of aquatic resources, which is 121 acres greater loss of aquatic resources compared to the No Action/No Project Alternative (Table 10-4).
- Preserve 2,778 acres of aquatic resources, which is greater by 1,038 acres compared 1,740 acres under No Action/No Project Alternative.
- Require AMMs, such as increased Stream Setbacks, that would be more protective to aquatic resources relative to the No Action/No Project Alternative. However, once the permit term has expired (Years 31–50 of the 50-year EIS/EIR study period),

projects would be subject to the AMMs of the No Action/No Project Alternative (which do not include, for example, the expectation of required Stream Setbacks).

- Implement the SSHCP and ARP for the first 30 years of the study period and result in a greater area of aquatic resources preserved than the No Action/No Project Alternative.
- Improve aquatic resource abundance, diversity, and condition within the Planning Area over that expected under the No Action/No Project Alternative.

Therefore, after considering the impacts from the Reduced Permit Term Alternative on each of the impact criteria for aquatic resources (Section 10.2.4), the Reduced Permit Term Alternative would result in a ***Minor Beneficial*** effect to aquatic resources compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Analysis of the Alternative

The effects of past~~,~~ **and** present~~, and reasonably foreseeable other~~ projects on aquatic resources in the Planning Area were described in Section 10.2.2.2 and represent a significant adverse cumulative impact on the aquatic resources within the study area. **A subset of the reasonably foreseeable other projects (e.g., foreseeable rural residential developments, agricultural activities on private lands) are likely to result in additional losses and additional adverse impacts to existing aquatic resources within the resource study area over the 50-year EIS/EIR study period. However,** ~~A~~**a**s discussed in Section 10.2.2.2, when the incremental direct and indirect effects of the No Action/No Project Alternative are viewed in connection with the significant adverse effects of the past, present, and reasonably foreseeable future other projects and actions, the incremental effects of the No Action/No Project Alternative would not make a considerable contribution to the existing significant cumulative impact on aquatic resources within the study area. Therefore, the No Action/No Project Alternative would result in a ***Less Than Significant Adverse*** effect.

As discussed in this section, the 30-year implementation of the HCP ~~c~~**C**onservation ~~s~~**S**trategy, including the HCP AMMs, the HCP ARP, and the interconnected HCP Preserve System, is expected to result in more consistent and frequent conservation of aquatic resources compared to the No Action/No Project Alternative. Consequently, the incremental effects of Reduced Permit Term Alternative would have a minor beneficial impact to aquatic resources compared to the incremental effects of the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of Reduced Permit Term Alternative are also individually limited and would not make a cumulatively considerable contribution to the significant adverse cumulative impacts of the past, present, and reasonably foreseeable future other projects on aquatic resources. The Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect to aquatic resources compared to the No Action/No Project Alternative baseline condition.

CHAPTER 11 – PALEONTOLOGICAL, CULTURAL, AND HISTORICAL RESOURCES

This chapter presents the environmental effects of each Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) alternative on paleontological resources and on cultural and historical resources. Paleontological resources are fossilized remains of plants and animals and may include bones, teeth, shells, and leaves found in geologic (rock) formations.

Historical resources are defined by the State of California as "any object, building, structure, site, area, or place, which is historically significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (Public Resource Code (PRC) section 5021.1(b)). Similarly, the term "historic property" is defined under the National Historic Preservation Act (NHPA) to include any prehistoric or historic district, site, building, structure, or object included in or eligible for inclusion in the National Register of Historic Places (NRHP) maintained by the Secretary of the Interior. The term "historic property" includes artifacts, records, and material remains that are related to and located within such properties. Properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization may also be historic properties eligible for inclusion in the NRHP (36 CFR 800.16(l)(1)).

The term "cultural resources" covers a wider range of resources than "historical resources" and "historic properties," such as sacred sites, archeological collections, or archaeological sites not eligible for the federal NRHP or not eligible for the California Register of Historical Resources (CRHR). Cultural resources can include prehistoric archaeological sites, prehistoric artifacts, and tribal cultural resources.[1]

11.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

This section describes the regulatory and physical environmental setting for paleontological, cultural, and historical resources within the Planning Area.

11.1.1 Regulatory Framework

Several federal, state, and local agency requirements apply to the identification, avoidance, and treatment of paleontological, cultural, and historical resources within the Planning Area. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, permitting, or implementation of the alternatives analyzed in this EIS/EIR. This section also identifies any relevant federal permits or other entitlements that must

[1] Under the California Environmental Quality Act (CEQA), a tribal cultural resource is defined as a site feature, place, cultural landscape, sacred place, or object, which is of cultural value to a tribe and is either: (1) on or eligible for the CRHR or a local historic register, or (2) the CEQA lead agency, at its discretion, chooses to treat the resource as a tribal cultural resource.

be obtained prior to implementing the alternatives. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 11.2 (40 CFR 1502.25).

11.1.1.1 Federal

National Environmental Policy Act

The definition of "effects" in the National Environmental Policy Act (NEPA) regulations includes adverse and beneficial effects on historic and cultural resources (40 CFR 1508.8). Therefore, the "Environmental Consequences" section of an EIS (see 40 CFR 1502.16(f)) must analyze potential effects to historic or cultural resources that could result from the proposed action and each alternative. As discussed in Section 3.8, in considering whether an alternative may "significantly affect the quality of the human environment," a federal agency must consider, among other things:

- Unique characteristics of the geographic area such as proximity to historic or cultural resources (40 CFR 1508.27(b)(3)), and
- The degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places (40 CFR 1508.27(b)(8)).

Therefore, because historic properties are a subset of "cultural resources," they are one aspect of the "human environment" defined by NEPA regulations. The NEPA regulations also require that "To the fullest extent possible, agencies shall prepare draft environmental impact statements concurrently with and integrated with environmental impact analyses and related surveys and studies required by the National Historic Preservation Act (40 CFR 1502.25(a))."

The federal government has a unique relationship with Indian tribes derived from the Constitution of the United States, treaties, Supreme Court decisions, and federal statutes. Consultation with an Indian tribe must recognize the government-to-government relationship between the federal government and Indian tribes, and should be conducted in a sensitive manner respectful of tribal sovereignty (36 CFR 800.2(c)(2)(ii)(B) and (C)). Under NEPA, federal agencies are encouraged to consult with Indian tribes early in the NEPA planning process, and to invite Indian tribes to be cooperating agencies in preparation of an EIS, when potential effects are on a reservation or affect tribal interests. Tribal consultations under NEPA can include effects to treaty, trust, and other natural resource issues, as well as to cultural resources in general, whether or not they meet the specific definition of historic property under the NHPA. The NEPA review of an action may also include the federal government's responsibilities under Executive Order (EO) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations; EO 13175, Consultation and

Coordination with Indian Tribal Governments; the American Indian Religious Freedom Act; and related statutes and policies that have a consultation component.

National Historic Preservation Act

The NHPA (16 U.S.C. 470 et seq.) establishes the nation's policy for historic preservation and sets in place a program for the preservation of historic properties. Pursuant to the NHPA, the State Historic Preservation Officer (SHPO) advises and assists, as appropriate, federal agencies in carrying out their historic preservation responsibilities. Section 106 of the NHPA (NHPA 106) requires federal agencies to take into account the effects of their undertakings on cultural resources that are, or may be, eligible for inclusion in the NRHP. An undertaking is a project, activity, or program under the direct or indirect jurisdiction of a federal agency. Such jurisdiction includes funding an action in whole or in part; carrying out an action by or on behalf of a federal agency; issuance of a federal permit, license, or approval; and state or local regulation administered under a delegation or approval by a federal agency. As such, implementation of a habitat conservation plan (HCP) and issuance of an Endangered Species Act (ESA) Incidental Take Permit are an undertaking and subject to compliance with NHPA 106. Other federal actions, including issuing authorizations or permits or under the Clean Water Act (CWA), must also fulfill the requirements of NHPA 106.

NHPA 106 also requires federal agencies to afford the SHPO, tribal historic preservation officers, and the public a reasonable opportunity to comment on their undertakings. The U.S. Fish and Wildlife Service (USFWS) may use the public involvement procedures under NEPA or under other program requirements to satisfy NHPA public involvement requirements. The USFWS is also responsible for providing a project description as well as an effects analysis and determination to the SHPO and to any affected Tribes. Cultural resources are a relevant factor in a NEPA analysis, and both NHPA and NEPA regulations encourage coordination and incorporation of NHPA consultation with the NEPA process. There is overlap, but there are also differences, in the implementing regulations for NHPA 106 (36 CFR 800) and implementing regulations for NEPA (40 CFR 1500–1508; 43 CFR 46) with regard to conducting an effects analysis. Section 6 of the NHPA addresses potential effects to historic properties associated with the federal undertaking (36 CFR 800.16(y)), while NEPA considers a broader categories of resources that includes historic properties and other aspects of the human environment (40 CFR 1508.14; 40 CFR 1508.8(b)).

The USFWS's responsibilities under NHPA 106 are to identify historic properties that may be affected, and to take into account the effect of issuance of an Incidental Take Permit and implementing the HCP conservation program on these properties. The implementing regulations for NHPA 106 (at 36 CFR Part 800), define how the USFWS can meet these requirements through a consultation process. The goal of consultation is to identify historic

properties potentially affected by the federal undertaking, assess its effects, and seek ways to avoid, minimize, or mitigate any adverse effects on historic properties. The regulations implementing NHPA 106 require federal agencies to consult the SHPO, and these stakeholders:

- Tribal Historic Preservation Officers, if applicable;
- Federally recognized Indian tribes, including Native villages and Native Hawaiian organizations, if applicable;
- Local governments, if the action may affect historic properties within their jurisdiction;
- Applicants for federal permits, licenses, or assistance;
- Representatives from interested organizations, private citizens, and the public; and
- The Advisory Council on Historic Properties (ACHP) when circumstances warrant its participation.

Federal agencies and these consulting parties strive to reach agreement on measures to avoid, minimize, and mitigate adverse effects on historic properties and to find a balance between project goals and preservation objectives. Because NHPA regulations allow the federal agencies to coordinate with other programs, in states with cultural resource requirements that meet NHPA goals, the state consultations can be incorporated into USFWS reviews to minimize duplicative effort by the USFWS and HCP permit applicants. In California, the Office of Historic Preservation reviews projects and programs to ensure that they comply with federal and state historic preservation laws, and that projects are planned in ways that avoid, minimize or mitigate adverse effects to cultural or historical resources.

Compliance with the NHPA 106 process involves the following steps (see 36 CFR 800 Subpart B):

- Initiate consultation and public involvement, including with Tribal Historic Preservation Officer(s) if applicable.
- Identify the area of potential effect (APE).
- Identify historic properties.
- Evaluate historic properties.
- Assess effects on historic properties.
- Resolution of Adverse Effects Consult with the SHPO regarding adverse effects on historic properties, resulting in a memorandum of agreement (MOA).
- Coordinate with requirements of NEPA review.
- Submit the MOA to the federal ACHP.
- Proceed in accordance with the MOA.

A key step in the process is determination of the "area of potential effects" associated with a potential undertaking (i.e., a proposed HCP). 36 CFR 800.16(d) defines the APE as "the geographic area or areas within which an undertaking may directly or indirectly cause changes in the character or use of historic properties, if any such properties exist. The APE is influenced by the scale and nature of the undertaking and may be different for different kinds of effects caused by the undertaking." The APE includes the areas where the USFWS would authorize take; areas where the USFWS influenced the project through negotiation of the avoidance, minimization, and mitigation measures; and activities associated with their implementation.

The regulations for implementing NHPA 106 directs the USFWS to make a "reasonable and good faith effort" to identify historic properties in consultation with the SHPO, the Tribal Historic Preservation Officers, and tribes, taking into consideration the magnitude and nature of the undertaking and degree of Federal involvement"(36 CFR 800.4(b)(1)). The identification effort includes, but is not limited to, a scientific literature review of the previous archaeological, historical, and historic structural resource information for a given APE.

The NHPA 106 process normally concludes with an agency finding of "no historic properties affected," "no adverse effect," or "adverse effects" that are resolved through avoidance, minimization, or mitigation." For undertakings with adverse effects, the federal agency usually executes a legally binding document, an MOA or Programmatic Agreement, that stipulates the resolution of adverse effects agreed to by the signatories. In the rare circumstances where there is a failure to reach an agreed-upon solution, the ACHP issues formal advisory comments to the head of the federal agency, and the head of the agency must then take into account and respond to those comments.

NHPA under CWA 404 Actions: The permitting or authorization of projects by the U.S. Army Corps of Engineers (USACE) under CWA 404 is a federal undertaking that is subject to compliance with NHPA 106. The USACE follows procedures contained in 33 CFR 325, Appendix C (*Procedures for the Protection of Historic Properties*) to fulfill the requirements set forth in the NHPA, in other applicable historic preservation laws, and in presidential directives as they relate to the regulatory program of the USACE (33 CFR Parts 320-334). In addition to the requirements of the NHPA, all historic properties are also subject to consideration under the USACE's NEPA processes (33 CFR Part 325, Appendix B), and the USACE's public interest review requirements contained in 33 CFR 320.4. Therefore, historic properties are included as a factor in the district engineer's decision on each CWA 404 permit application.

If the project or activity is found to have an "adverse effect" on NRHP-designated historic properties, the district engineer will coordinate with the SHPO to seek ways to avoid or reduce effects on designated historic properties. At any time during CWA 404 permit processing, the district engineer may consult with the involved parties to discuss and consider

possible alternatives or measures to avoid or minimize adverse effects of a proposed activity in accordance with the procedures described in 33 CFR Part 325, Appendix C. If the consultation results in a mutual agreement among the SHPO, the permit applicant, and the district engineer regarding the treatment of designated historic properties, then the district engineer may formalize that agreement either through special conditions added to the CWA 404 permit and/or by signing an MOA with these parties. Such MOA will constitute the comments of the SHPO and the ACHP. The criteria involved in making an adverse effect determination are described fully in 33 CFR Part 325, Appendix C.

In making the decision about a permit application, in accordance with 33 CFR 320.4, the USACE district engineer shall weigh all factors, including the effects of the undertaking on historic properties and any comments of the ACHP and the SHPO, and any views of other interested parties. The district engineer will add permit conditions to avoid or reduce effects on historic properties that he determines are necessary in accordance with 33 CFR 325.4. In reaching his determination, the district engineer will consider the Secretary of the Interior's *Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716). If the district engineer concludes that permitting the project would result in the irrevocable loss of important scientific, prehistoric, historical, or archeological data, the district engineer, in accordance with the Archeological and Historic Preservation Act, will advise the Secretary of the Interior of the extent to which the data may be lost if the undertaking is permitted, any plans to mitigate such loss that will be implemented, and the permit conditions that will be included to ensure that any required mitigation occurs.

NHPA and Tribes. Under the NHPA, consultation with Indian tribes and Native Hawaiian organizations is mandatory. These consultations focus on identifying and evaluating historic properties, assessing effects, and, where appropriate, resolving adverse effects to those properties. Consultation is required with any Indian tribe or Native Hawaiian organization that may attach religious and cultural significance to historic properties that may be affected by a proposed undertaking, regardless of whether the property is located on or off tribal lands. Tribal consultation under NEPA can include effects to treaty, trust, and other natural resource issues, as well as to cultural resources in general, whether or not they meet the specific definition of a historic property under the NHPA.

Federal Land Policy Management Act

The Federal Land Policy Management Act (43 U.S.C. 1701 et seq.) requires the Secretary of the Interior to manage public lands in such a way that will protect the quality of scientific, scenic, historical, and archaeological values.

Antiquities Act

The Antiquities Act (16 U.S.C. 431 et seq.) establishes criminal penalties for unauthorized destruction or appropriation of "any historic or prehistoric ruin or monument, or any object of antiquity" on federal lands.

Executive Order 11593, Protection and Enhancement of the Cultural Environment

Executive Order 11593 (President Nixon 1971) requires federal agencies to administer cultural properties under their control and to initiate measures necessary to direct federal agency policies, plans, and programs in such a way that federally owned sites are preserved and maintained. In addition, this Executive Order also required federal agencies, in consultation with the ACHP (16 U.S.C. 4701), to institute procedures to ensure that federal plans and programs contribute to the preservation and enhancement of non-federally owned sites, structures, and objects of historical, architectural, or archaeological significance.

Executive Order 13007, Indian Sacred Sites

Executive Order 13007 (President Clinton 1996) requires federal land-managing agencies to the extent practicable, permitted by law, and not clearly inconsistent with essential agency functions, to: (1) accommodate access to and ceremonial use of Native American sacred sites by Native American religious practitioners, and (2) avoid adversely affecting the physical integrity of such sacred sites. It also requires federal agencies to maintain confidentiality of sacred sites where appropriate.

American Indian Religious Freedom Act

The American Indian Religious Freedom Act (16 U.S.C. 1996) establishes a national policy to protect and preserve the inherent right of Native Americans and other indigenous groups to exercise their freedom to believe, express, and exercise their traditional religions, including, but not limited to, access to religious sites, use and possession of sacred objects, and freedom to worship through ceremonial and traditional rites. Federal agencies must obtain the views of Indian leaders and consider when a proposed land use might conflict with traditional Native American religious beliefs or practices and seek to avoid unnecessary interference with Native American religious practices during the implementation of an action. Potential conflict between an action and Native American religious practices does not bar federal agencies from approving a proposed land use or carrying out a proposed action.

Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act (Public Law 101–601; 25 U.S.C. 3001 et seq.) describes the rights of Native American lineal descendants and Native American

tribes with respect to the treatment, repatriation, and disposition of Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony, with which they can show a relationship of lineal descent or cultural affiliation. One major purpose of this act (Sections 5–7) is to require that federal agencies and museums receiving federal funds inventory holdings of Native American human remains and funerary objects and provide written summaries of other cultural items. Once lineal descent or cultural affiliation has been established, lineal descendants normally make the final determination about the disposition of cultural items. Disposition may take many forms from reburial to long-term curation, according to the wishes of the lineal descendent(s) or culturally affiliated tribe(s).

The second major purpose of the act is to provide greater protection for Native American burial sites and more careful control over the removal of Native American human remains, funerary objects, sacred objects, and items of cultural patrimony on federal and tribal lands. The act requires that Native American tribes be consulted whenever archaeological investigations encounter, or are expected to encounter, Native American cultural items or when such items are unexpectedly discovered on federal or tribal lands (Section 3). Excavation or removal of any such items also must be done under procedures required by the Archaeological Resources Protection Act (Section 3(c)(1)).

Archaeological and Historic Preservation Act

The Archaeological and Historic Preservation Act (16 U.S.C. 469–469c2) "specifically provides for the preservation of historical and archeological data (including relics and specimens) which might otherwise be irreparably lost or destroyed as the result of …any alteration of the terrain caused as a result of any federal construction project or federally licensed activity or program." Because the project includes issuance of federal permits under the ESA and CWA, this act would apply to the action alternatives. Under this act, a federal agency may request the Secretary of the Interior to undertake the recovery, protection, and preservation of historical and archeological data (including preliminary survey, or other investigation as needed, and analysis and publication of the reports resulting from such investigation), or it may, with funds appropriated for such project, program, or activity, undertake such activities.

Archaeological Resources Protection Act

The Archaeological Resources Protection Act (16 U.S.C. 470a et seq.) provides civil and criminal penalties for the unauthorized excavation, removal, damage, alteration, or defacement of any archaeological resource located on public lands or Indian lands unless permitted in accordance with Section 4 of the Archaeological Resources Protection Act.

11.1.1.2 State

California Environmental Quality Act

The California Environmental Quality Act (CEQA) of 1970, as amended, (PRC Section 21000), requires state and local agencies to identify and reduce, if feasible, significant effects of land use decisions, including those to cultural resources.

CEQA Guidelines (Sections 1427, 15064.4(b), 15064.5, 15064.7, 15126.4, and Appendix G, Section V) collectively recognize the potential effects of development to resources and the need for preservation. Under CEQA, public agencies must consider the effects of their actions on both "historical resources" and "unique archaeological resources." Pursuant to CEQA, Section 21084.1, a "project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment." CEQA, Section 21083.2, requires agencies to determine whether proposed projects would have effects on "unique archaeological resources."

"Historical resource" is a CEQA term with a defined statutory meaning (PRC Section 21084.1 and CEQA Guidelines, Sections 15064.5(a) and 15064.5(b)). The definition includes any resource listed in or determined to be eligible for listing in the CRHR (see below).

The CEQA Guidelines, Section 15064.5(c), also provide specific guidance on the treatment of archaeological resources, depending on whether they meet the definition of a historical resource or the definition of a unique archaeological resource. If the site meets the definition of a unique archaeological resource, it must be treated in accordance with the provisions of PRC Section 21083.2.

CEQA Guidelines, Section 15064.5(e), requires that excavation activities be stopped whenever human remains are uncovered and that the County coroner be called in to assess the remains. If the County coroner determines that the remains are those of Native Americans, the Native American Heritage Commission (NAHC) must be contacted within 24 hours. At that time, the lead agency must consult with the appropriate Native Americans, if any, as identified in a timely manner by the NAHC. CEQA Guidelines, Section 15064.5, directs the lead agency (or applicant), under certain circumstances, to develop an agreement with the Native Americans for the treatment and disposition of the remains.

Discretionary projects would be subject to environmental review consistent with CEQA. As part of the CEQA review process, the local land use authority (e.g., Sacramento County, Galt, or Rancho Cordova) would make a determination as to whether a project-level cultural resource analysis is warranted. The project-level analysis could include, for example, a cultural records and literature search, pedestrian surveys, architectural analysis, extended phase one

evaluations, including subsurface testing programs, and/or data recovery operations. During future CEQA review of projects, any potential site-specific effects on cultural resources would be identified, and any necessary avoidance or mitigation measures to reduce potential effects would be recommended, as appropriate.

The EIS/EIR cultural resources study follows the basic guidelines presented in PRC Section 5024.1; CEQA Guidelines Section 15064.5, and Sections 21083.2 and 21084.1 of the CEQA statute (described below).

California Public Resources Code Section 5024.1

PRC Section 5024.1 authorizes the establishment of the CRHR. The purpose of the register is to maintain listings of the state's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources on the California Register were expressly developed to be in accordance with previously established criteria developed for listing on the NRHP. See NRHP eligibility criteria at 40 CFR 60.4.

In order to be determined eligible for listing in the CRHR, a property must be significant at the local, state, or national level under one or more of four significance criteria:

- Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
- Associated with the lives of persons important to local, California, or national history.
- Embodies the distinctive characteristics of a type, period, region, or method of construction or represents the work of a master or possesses high artistic values.
- Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

The CRHR includes resources listed in or formally determined eligible for listing in the NRHP, as well as some California State Landmarks and Points of Historical Interest.

California Public Resources Code, Section 5021.1

PRC Section 5021.1 provides a definition for such things as a "historical resource" and "substantial adverse change" (to such resources). Historical resources are defined as "any object, building, structure, site, area, or place, which is historically significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC 5021.1(b)).

California Public Resources Code, Section 5097.5

PRC Section 5097.5 provides that unlawful removal or destruction of archaeological or paleontological resources from sites on public land is a misdemeanor, except with the express permission of the public agency having jurisdiction over the lands. As used in this section, "public lands" is defined as "lands owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or agency thereof."

California Public Resources Code, Section 5097.98

PRC Section 5097.98 discusses the procedures to be followed upon the discovery of human remains, including immediately securing the site of the remains and establishing a safe distance around them to allow for negotiation between the land owner and consulting tribal parties.

California Public Resources Code, Sections 5097.99 and 5097.991

PRC Sections 5097.99 and 5097.991 establish that unlawful removal of Native American items of cultural patrimony or human remains is a felony, and that it is the policy of the state to repatriate Native American human remains and grave goods.

Senate Bill 297

Senate Bill 297 addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction; and establishes the NAHC to resolve disputes regarding the disposition of such remains. This bill has been incorporated into the CEQA Guidelines (Section 15064.5(e)).

Assembly Bill 52

Assembly Bill 52 expands the provisions CEQA (PRC Section 21000) to provide California Native American tribes, including those that are not federally recognized, an opportunity to engage in formal consultation with public agencies considering approval of projects that could result in impacts to "tribal cultural resources." Assembly Bill 52 applies to projects with a Notice of Preparation of an EIR, or a Negative Declaration or Mitigated Negative Declaration issued on or after July 1, 2015 (note, because the Notice of Preparation associated with this EIS/EIR was released prior to July 1, 2015, the lead agency is not required to comply with this new regulation).

Health and Safety Code

Section 7050.5 of the Health and Safety Code establishes that any person who "knowingly mutilates, disinters, wantonly disturbs, or willfully removes any human remains in or from any

location" without authority of the law is guilty of a misdemeanor. In the event of discovery of any human remains outside of a cemetery, there shall be no further excavation or disturbance until the County coroner is notified. If the coroner determines the remains are Native American, or believes they may be Native American, the NAHC shall be notified within 24 hours.

11.1.1.3 Local

Sacramento County General Plan

The *Sacramento County General Plan Conservation Element* (Sacramento County 2011) states under Section VI, Cultural Resources, the following goal and six objectives that address the protection of cultural resources within the County:

> **Goal:** Promote the inventory, protection, and interpretation of the cultural heritage of Sacramento County, including historical and archaeological settings, sites, buildings, features, artifacts and/or areas of ethnic historical, religious or socio-economic importance.
>
> **Objectives:**
>
> 1. Comprehensive knowledge of archaeological and historic site locations.
> 2. Attention and care during project review and construction to ensure that cultural resource sites, either previously known or discovered on the project site, are properly protected with sensitivity to Native American values.
> 3. Structures with architectural or historical importance preserved to maintain contributing design elements.
> 4. Known cultural resources protected from vandalism, unauthorized excavation, or accidental destruction.
> 5. Properly stored and classified artifacts for ongoing study.
> 6. Public awareness and appreciation of both visible and intangible historic and cultural resources.

The Conservation Element contains the following policies that help implement the goal and objectives, as well as address paleontological resources:

> **CO-150:** Utilize local, state and national resources, such as the North Central Information Center (NCIC), to assist in determining the need for a cultural resources survey during project review.
>
> **CO-153:** Refer projects with identified archaeological and cultural resources to the Cultural Resources Committee to determine significance of resource and recommend

appropriate means of protection and mitigation. The Committee shall coordinate with the Native American Heritage Commission in developing recommendations.

CO-154: Protection of significant prehistoric, ethnohistoric, and historic sites within open space easements to ensure that these resources are preserved in situ for perpetuity.

CO-155: Native American burial sites encountered during preapproved survey or during construction shall, whenever possible, remain in situ. Excavation and reburial shall occur when in situ preservation is not possible or when the archaeological significance of the site merits excavation and recording procedure. On-site reinterment shall have priority. The project developer shall provide the burden of proof that off-site reinterment is the only feasible alternative. Reinterment shall be the responsibility of local tribal representatives.

CO-157: Monitor projects during construction to ensure crews follow proper reporting, safeguards, and procedures.

CO-158: As a condition of approval of discretionary permits, a procedure shall be included to cover the potential discovery of archaeological resources during development or construction.

CO-159: Request a Native American Statement as part of the environmental review process on development projects with identified cultural resources.

CO-161: As a condition of approval for discretionary projects, require appropriate mitigation to reduce potential impacts where development could adversely affect paleontological resources.

CO-162: Projects located within areas known to be sensitive for paleontological resources should be monitored to ensure proper treatment of resources and to ensure crews follow proper reporting, safeguards, and procedures.

CO-163: Require that a certified geologist or paleoresources consultant determine appropriate protection measures when resources are discovered during the course of development and land altering activities.

CO-169: Restrict the circulation of cultural resource location information to prevent potential site vandalism. This information is exempt from the "Freedom of Information Act."

Galt General Plan

The *Galt General Plan Policy Document* (Galt General Plan) (Galt 2009) includes two goals and the following policies that address the protection of cultural and paleontological resources within the City.

Goal HRE-1: To preserve and maintain sites and structures that serve as significant, visible connections to Galt's social, cultural, economic, and architectural history.

Goal HRE-4: To encourage the identification, protection, and enhancement of Galt's archaeological resources for their cultural values.

HRE-4.1: Archaeological Resource Surveys. For future development projects on previously unsurveyed lands, the City requires that a project applicant have a qualified archaeologist conduct the following activities: (1) conduct a record search at the North Central Information Center located at California State University, Sacramento and other appropriate historical repositories, (2) conduct field surveys where appropriate, and (3) prepare technical reports, where appropriate, meeting California Office of Historic Preservation Standards (Archaeological Resource Management Reports). These requirements shall be completed prior to the approval of the specific project.

HRE-4.2: Native American Resources. The City shall consult with Native American representatives regarding cultural resources to identify locations of importance to Native Americans, including archaeological sites and traditional cultural properties. Consistent with State requirements, consultation shall occur at the onset of an amendment to the City's General Plan or a specific plan.

HRE-4.3: Discovery of Archaeological Resources. In the event that archaeological/ paleontological resources are discovered during site excavation, the City shall require that grading and construction work on the project site be suspended until the significance of the features can be determined by a qualified archaeologist/paleontologist. The City will require that a qualified archaeologist/paleontologist make recommendations for measures necessary to protect a site or to undertake data recovery, excavation, analysis, and curation of archaeological/paleontological materials.

HRE-4.4: Discovery of Human Remains. Consistent with CEQA Guidelines (Section 15064.5), if human remains of Native American origin are discovered during development project construction, it is necessary to comply with state laws relating to the disposition of Native American burials, which fall within the jurisdiction of the Native American Heritage Commission (Public Resources Code Sec. 5097). If any human remains are discovered or recognized in any location on the project site, there shall be no further excavation or

disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

a. The Sacramento County Coroner/Sheriff has been informed and has determined that no investigation of the cause of death is required; and
b. If the remains are of Native American origin,
    1. The descendants of the deceased Native Americans have made a timely recommendation to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or
    2. The Native American Heritage Commission was unable to identify a descendant or the descendant failed to make a recommendation within 24 hours after being notified by the commission.

Rancho Cordova General Plan

The *Rancho Cordova General Plan* (Rancho Cordova 2006a) includes one goal, one policy, and two actions that address the protection of cultural and paleontological resources within Rancho Cordova.

Goal CHR.1: Identify and preserve the history of Rancho Cordova for future generations.

CHR.1.3: Establish review procedures for development projects that recognize the history of the area in conjunction with state and federal laws.

Action CHR.1.3.1. Require historic resources and paleontological studies (e.g., archaeological and historical investigations) for all applicable discretionary projects, in accordance with CEQA regulations. The studies should identify paleontological, historic, or cultural resources in the project area, determine their eligibility for inclusion in the California Register of Historical Resources, and provide mitigation measures for any resources in the project area that cannot be avoided.

Action CHR.1.3.2. Incorporate the following two conditions in applicable permits for all discretionary projects:

The Planning Department shall be notified immediately if any cultural resources (e.g., prehistoric or historic artifacts) or paleontological resources (e.g., fossils) are uncovered during construction. All construction must stop in vicinity of the find and an archaeologist that meets the Secretary of the Interior's Professional Qualifications

Standards in prehistoric or historical archaeology or a paleontologist shall be retained to evaluate the finds and recommend appropriate action.

The Planning Department shall be notified immediately if any human remains are uncovered and all construction must stop in vicinity of the find. The Planning Division shall notify the County Coroner according to Section 7050.5 of California's Health and Safety Code. If the remains are determined to be Native American, the procedures outlined in CEQA Section 15064.5 (d) and (e) shall be followed.

Paleontological Resources

Consideration of paleontological resources is required by CEQA, as described above. However, no state or local agencies have specific jurisdiction over paleontological resources. No state or local agency requires a paleontological collecting permit to allow for the recovery of fossil remains discovered as a result of construction-related earth moving on state or private land. However, Sacramento County, Galt, and Rancho Cordova each have General Plan policies/actions that address the protection of paleontological resources.

11.1.2 Existing Conditions of Paleontological, Cultural, and Historical Resources

This section provides a brief cultural history of the general region, including a description of prehistoric trends, ethnographic populations (i.e., Native Americans), and the historical context (Euro-American settlement and development). These descriptions provide context to understand the type, existing conditions, and general areas where cultural resources may be present in the Planning Area.

The existing "affected environment" that is reviewed under NEPA includes aesthetic, historic, and cultural resources, as these terms are commonly understood. As stated earlier, the "cultural resources" that are part of the existing affected environment of a study area include a broader array of properties than just the "historic properties" defined by Section 106. Section 106 is concerned exclusively with impacts to historic properties (prehistoric or historic districts, sites, buildings, structures, objects, and properties of traditional religious and cultural importance to an Indian tribe) that meet the NRHP criteria (40 CFR 60.4). Therefore, cultural resources that are not eligible for listing in the NRHP must also be included and considered in a NEPA review. These could include resources such as cultural institutions, resources that embody cultural practices, or sacred sites that do not otherwise meet the federal definition of a historic property.

11.1.2.1 Paleontological Resources

There are at least five recorded sites in Sacramento County that have revealed fossil vertebrate remains dating back to 100,000 years ago, including one location within the Planning Area at the Teichert aggregate plant on Kiefer Boulevard (Sacramento County 2011). A search of the University of California, Berkeley, Museum of Paleontology collections database conducted for the Rancho Cordova General Plan EIR (Rancho Cordova 2006b) did not identify any evidence of the existence of paleontological resources or potential resources in Rancho Cordova or in the Rancho Cordova sphere of influence (Rancho Cordova SOI).

As discussed in Section 5.1.2, most of the Planning Area is directly underlain by alluvial and sedimentary deposits that have been eroded from the adjacent mountain ranges and that make up the Sacramento Valley floor. While many of these deposits are too young to support paleontological resources, the soils below these deposits may be older and more sensitive for paleontological resources. Older Quaternary deposits of the Pleistocene age, such as the Modesto–Riverbank Formation, are widespread in the County and have been known to include paleontological resources.

11.1.2.2 Regional Prehistoric Context

The earliest known occupants of the Planning Area are from the Pre-Archaic Period (10,000–8,500 BC) based on fossil remains found in deep alluvial sediments. These fossils indicated the presence of large game animals that were likely hunted for food (Connector JPA 2012). Few archaeological sites from this period have been found in California, suggesting a small, widely dispersed population. These population conditions are likely influenced by the fact that the final Ice Age of the Pleistocene (1.8 million to about 10,000 years ago) was just ending; however, glaciers still existed in the Sierra Nevada, and conditions in general were much cooler and wetter than today, making the mountains an inhospitable habitat for humans (Chartkoff and Chartkoff 1984, as cited in Sacramento County 2012).

With the end of the Pleistocene, during the Early to Middle Archaic Period (8,500–4,000 BC), the climate began a warming and drying trend that lasted for several thousand years. People adapted to these changes by shifting their foraging emphasis away from hunting and increasing their use of plant resources, as evidenced by a marked increase in the presence of plant processing tools on archaeological sites dated to this time period. Another major change in subsistence came in the Late Archaic Period (4,000–2,000 BC) with the discovery of a method to remove the tannins from acorns, allowing this nearly ubiquitous nut to become a staple food for the indigenous people of California. It allowed people to gather and store large surpluses of food, which led to an increase in group size and population densities along with a less nomadic lifestyle. Sophisticated cultures developed in the Planning Area,

comparable to those found in farming areas in other parts of North America (Chartkoff and Chartkoff 1984, as cited in Sacramento County 2012).

Prehistoric sites, some of which are known to contain human remains, are located in the Planning Area along the American River, as well as elsewhere in the County (Rancho Cordova 2006b).

11.1.2.3 Local Prehistoric Context

The earliest evidence of the prehistoric inhabitants of the Planning Area comes from a single, deeply buried site in the bank of Arcade Creek (located just north of the Planning Area boundary), which contained grinding tools and large, stemmed projectile points. The points and grinding implements suggest an occupation date of sometime between 6,000 and 3,000 BC (Wallace 1978, as cited in Sacramento County 2012). However, it was not until after about 3,500 BC, in the late Archaic Period, that people began to move into the San Joaquin and Sacramento Valleys in any significant numbers (Chartkoff and Chartkoff 1984, as cited in Sacramento County 2012).

The earliest permanent settlement of the Delta region of the Sacramento River is called the Windmiller Tradition and is known primarily from burial sites containing relatively elaborate grave goods (Chartkoff and Chartkoff 1984, Ragir 1972, Wallace 1978, as cited in Sacramento County 2012). The Windmiller Tradition reflects the amplification of cultural trends begun in the Middle Archaic, as seen in the proliferation of finished artifacts, such as projectile points, shell beads, and pendants. Stone mortars and pestles, milling stones, and bone tools such as fishhooks, awls, and pins are also present. Based on linguistic evidence, it has been suggested that the Windmiller culture was ancestral to several historic tribes in the Central Valley, including the Penutian-speaking Nisenan. The Windmiller Tradition lasted until about 1,000 BC. Around 1,000 BC, subsistence strategies in the Planning Area changed to reliance on acorns and salmon (Chartkoff and Chartkoff 1984, Elsasser 1978, as cited in Sacramento County 2012). Culturally, this has been dubbed the Cosumnes Tradition (1,700 BC–AD 500), and appears to be an outgrowth of the Windmiller Tradition (Ragir 1972, as cited in Sacramento County 2012).

11.1.2.4 Tribal Presence in the Planning Area

The Planning Area is located within the territory that could have been occupied by the ethnographic Nisenan or Plains Miwok (Sacramento County 2012).

Nisenan. The Planning Area is in the southwestern portion of the territory occupied by the Nisenan. The Nisenan lived along the Sacramento River, primarily in large villages with populations of several hundred each. Between the Sacramento River and the foothills, the grassy plains were largely unsettled, used mainly as a foraging ground. Residence was generally centered around the residence of the husband's family or tribe, but couples had choice in the matter (Wilson and Towne 1978, as cited in Sacramento County 2012). Politically, the Nisenan

were divided into "tribelets," made up of a primary village and a series of outlying hamlets, presided over by a more-or-less hereditary chief (Kroeber 1976, Wilson and Towne 1978, as cited in Sacramento County 2012).

Plains Miwok. At the time of European contact, the Eastern (Plains) Miwok tribe occupied the Planning Area and vicinity. Archaeological investigations at sites on South Stone Lake (CA-SAC-65 and CA-SAC-145) indicate a considerable reliance on fishing for subsistence among the prehistoric populations. Each Plains Miwok tribelet was an independent political entity and functioned primarily within recognized tribelet boundaries. Large, multilineal villages were concentrated on rises along watercourses. In addition to gathering resources, the Plains Miwok obtained wild tobacco, planted tobacco seeds, and cultivated the plants (Schulz and Simons 1973, Schulz et al. 1979, as cited in Sacramento County 2010).

The only federally recognized tribe in the Planning Area is the Wilton Rancheria, which are descendants of the Plains Miwok. The Wilton Rancheria became federally recognized in 2009. The tribe's indigenous territory encompasses Sacramento County. The Wilton Rancheria occupies approximately 39 acres near the community of Wilton, and the 39acre area is excluded from the Planning Area because it is sovereign tribal land. Four other tribes located outside the Planning Area could have an interest in cultural resources located within the Planning Area. These are the United Auburn Indian Community (Nisenan and Miwok), the Ione Band of Miwok Indians (Miwok), the Buena Vista Rancheria (Miwok), and the Shingle Springs Band of Miwok Indians (Nisenan and Miwok).

11.1.2.5 European Settlement History and Context

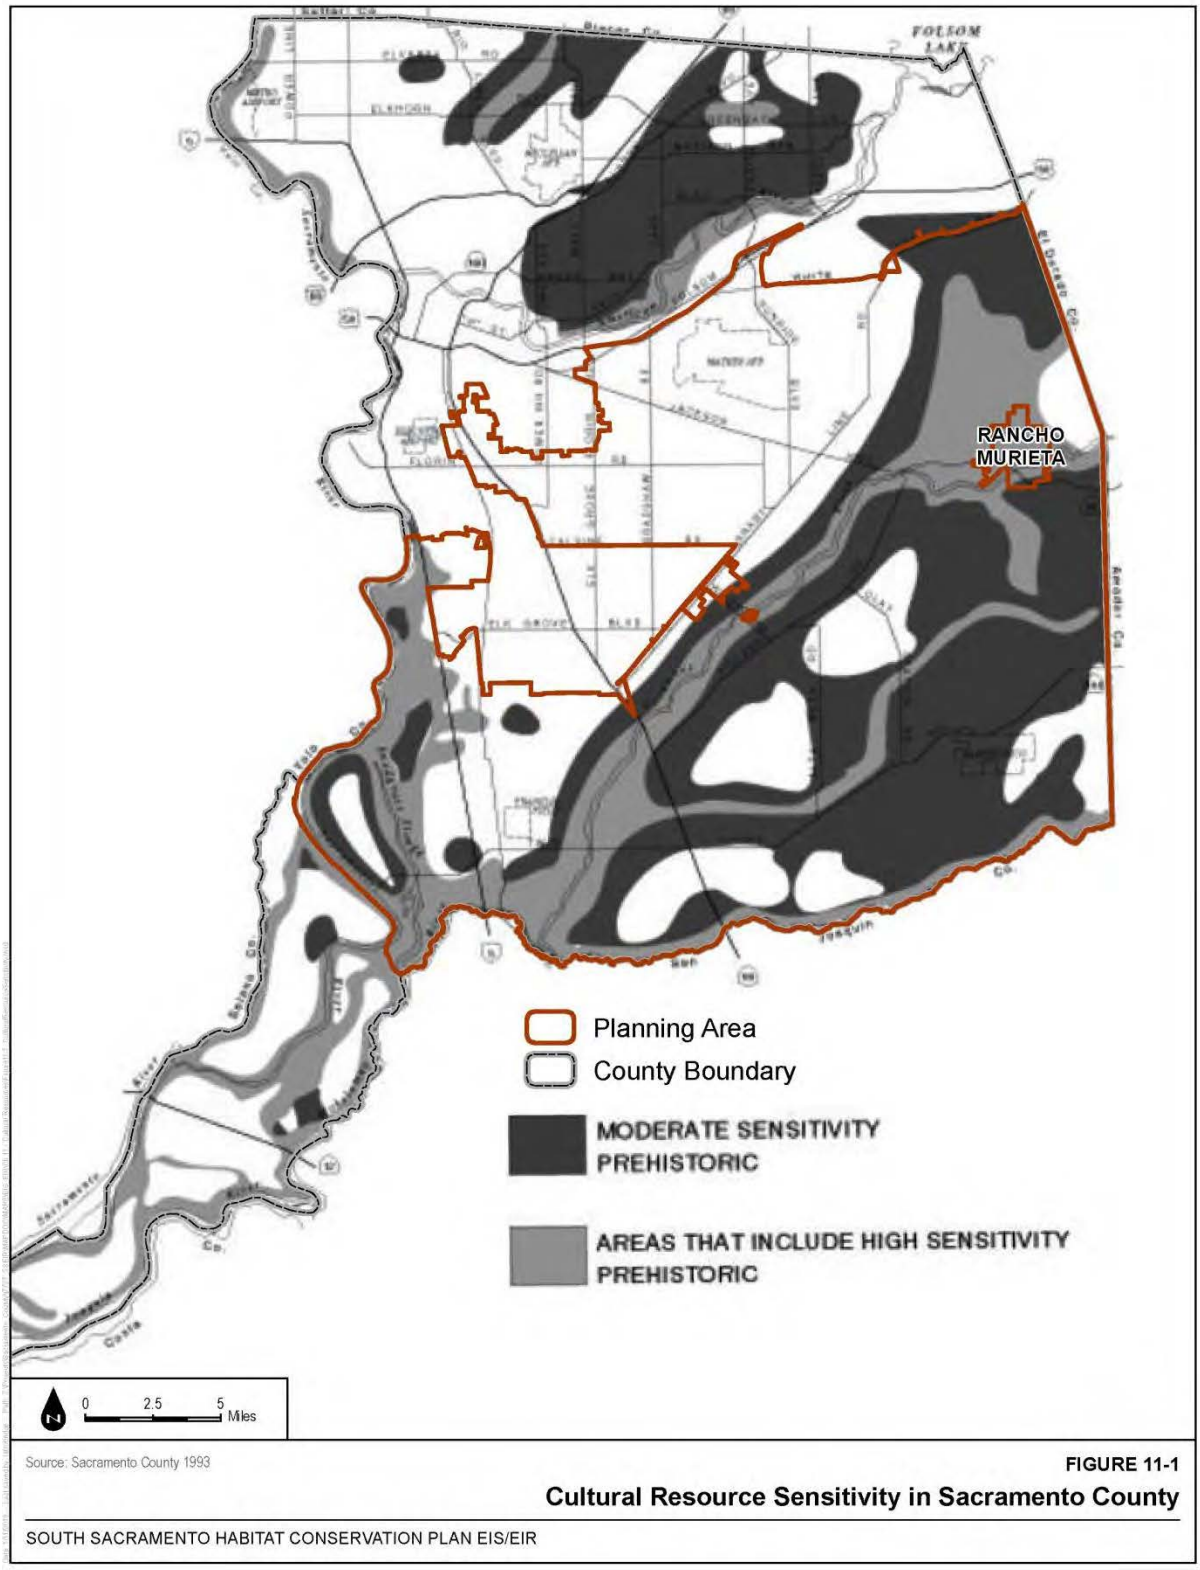
The Spanish arrived on the central California coast in 1769, and by 1776, the Miwok territory bordering the Nisenan on the south had been explored by Jose Canizares. In 1808, Gabriel Moraga crossed Nisenan territory, and in 1813, a major battle was fought between the Miwok and the Spaniards near the mouth of the Cosumnes River. Though the Nisenan appear to have escaped being removed to missions by the Spanish, they were not spared the ravages of European diseases. California became part of Mexico in 1821, when Mexico achieved its independence from Spain. In 1827, American trapper Jedediah Smith traveled along the Sacramento River and into the San Joaquin Valley to meet other trappers of his company who were camped there, but no permanent settlements were established by these fur trappers (Thompson & West 1880, as cited in Sacramento County 2012). In 1833, an epidemic (probably malaria) raged through the Sacramento Valley, killing an estimated 75% of the native population. When John Sutter erected his fort at the future site of Sacramento in 1839, he had little difficulty getting the few Nisenan survivors to settle nearby. As discussed in Section 1.3.1, the discovery of gold in 1848 at Sutter's Mill, near the Nisenan village of Colluma (now Coloma) on the south fork of the American River in El Dorado County, drew thousands of miners to the region, and led to widespread killing of Nisenan tribal members and the virtual destruction of traditional Nisenan culture. By the 1930s, no Nisenan remained who could

remember the days before the arrival of the Euro-Americans (Wilson and Towne 1978, as cited in Sacramento County 2012).

The town of Sacramento was laid out by John Sutter in the fall of 1848, and developed as a supply center for gold miners (Gudde 1969, as cited in Sacramento County 2012). California became a state in 1850, as a result of the major increase in population that resulted from the gold rush of 1849 (Old Sacramento Foundation Inc. 2001, Lawson 2002, as cited in Sacramento County 2012). The Sacramento Valley Railroad was completed from Sacramento to Folsom in 1856 (FEDSHRA 2007, as cited in Sacramento County 2012). It facilitated shipment of goods from Sacramento to the mining areas to the east.

As discussed in Section 1.3.1, as the population in California continued to increase after the Gold Rush, so did the expansion of agricultural lands (both grazing and croplands) in the Planning Area, both to feed California residents and as a profitable export industry. During the early part of the twentieth century, agricultural and grazing lands dominated the landscape of Sacramento County interrupted only by small pockets of urbanization. By the 1940s and 1950s after World War II, Sacramento County experienced a rapid increase in population relative to before the war, with a majority of new urban and suburban development occurring within the Planning Area near the City of Sacramento and in smaller cities such as Folsom and Galt.

11.1.2.6 Potential for Cultural Resources to be Discovered in the Planning Area



Based on the brief review presented above, the lead agencies expect that various types of cultural resources, including historic properties, may be encountered within the Planning Area.

According to the Sacramento County General Plan, the portions of the Planning Area that are likely or extremely likely to contain high sensitivity and moderate sensitivity[2] for existing prehistoric sites are located near the larger water courses (see Figure 7-4), such as the Cosumnes River and Laguna Creek, Snodgrass Slough, Beach and Stone Lakes, and in the legal Delta area[3] (Figure 11-1) (Sacramento County 2010). Therefore, land cover types with high sensitivity for prehistoric cultural resources include the stream/creek land cover type, the natural riparian land cover types (mixed riparian woodland and mixed riparian scrub), and the valley grassland uplands near these larger waterways. These are consistent with the areas identified by Sacramento County as being moderate or high sensitivity for cultural resources (Figure 11-1) (Sacramento County 1993). Out of the 627 previously recorded prehistoric resources in the unincorporated areas of the County, 7 are currently listed on the NRHP and/or the CRHR.

[2] A copy of a 1993 map was included in the *Sacramento County General Plan of 2005–2030* (Sacramento County 2011), with no changes. Cultural resources sensitivity is another way to describe the likelihood of cultural resources being present within a particular area.

[3] As defined in the Delta Protection Act (Section 12220 of the State Water Code), and shown on Figure 4-1.

Figure 11-1 Cultural Resource Sensitivity in Sacramento County

INTENTIONALLY LEFT BLANK

A records search conducted for the Rancho Cordova General Plan EIR (Rancho Cordova 2006b) identified eight prehistoric sites and one prehistoric/historic site within Rancho Cordova and its SOI. Most of the prehistoric sites in Rancho Cordova and its SOI are located along the American River outside the Planning Area and along creeks both inside and outside the Planning Area. Some of the sites in Rancho Cordova or its SOI are known to contain human remains, and several of the prehistoric sites in Rancho Cordova or its SOI are eligible for inclusion in the NRHP and the CRHR. Archival research conducted for the Galt General Plan EIR indicates that most prehistoric settlement in Galt and the Galt SOI was focused within 1,000 feet of major waterways, especially the Cosumnes River, and along the Dry Creek corridor (Galt 2008a).

Known historical sites in the Planning Area, including historic properties listed on or known to be eligible for the NRHP, tend to be concentrated in developed areas. These include areas along old travel routes such as the Jackson Highway, the Central California Traction Railroad, and the Southern Pacific Railroad routes, and along rivers and in streambeds. The Planning Area, including Galt, Rancho Cordova, and the unincorporated areas of Sacramento County, has 18 historical sites listed on the NRHP and/or the CRHR (Table 11-1). Although there are only 15 historical resources currently listed on the NRHP and 3 on the CRHR, several other sites that have been determined eligible for listing but have never gone through the formal process of officially listing the resource in the NRHP and/or the CRHR. The 18 resources that are currently listed consist of historical structures, such as the Brewster Building in Galt, historic ranches, and large multi-component historic districts, such as the Walnut Grove Chinese-American Historical District.

Table 11-1. Planning Area Historical Sites that are Currently Listed on the National Register of Historic Places or on the California Register of Historical Resources

Name on NRHP or CRHR	Listing	Location	Date Listed/Notes
Alta Mesa Farm Bureau Hall	NRHP #86003577	10195 Alta Mesa Road, Wilton	January 7, 1987 The hall was destroyed by fire in 1987, although the detached restroom building still stood
American River Grange Hall No. 172	NRHP #96001079	2720 Kilgore Road, Rancho Cordova	October 10, 1996
Brewster Building	NRHP #00000981	201 Fourth St., Galt	August 16, 2000
Brewster House	NRHP #78000740	206 Fifth St., Galt	June 23, 1978
John Stanford Brown House	NRHP #04000733	13950 CA 160, Walnut Grove	July 28, 2004
Delta Meadows Site	NRHP #71000175	Locke	November 5, 1971
Fifteen Mile House–Overland Pony Express Route	CRHR #698	White Rock & Gold Valley Roads, Rancho Cordova	September 11, 1959
Grave of Alexander Hamilton Willard	CRHR #657	Franklin Cemetery, Franklin	September 26, 1958
Imperial Theatre	NRHP #82000980	Market St., Walnut Grove	October 29, 1982
Isleton Chinese and Japanese Commercial Districts	NRHP #91000297	Bounded by River Road and Union, E, and H Sts., Isleton	March 14, 1991
Locke Historic District	NRHP #71000174	Bounded on the west by the Sacramento River, on the north by Locke Road, on the east by Alley St., and on the south by Levee St., Isleton	May 6, 1971
Rosebud Ranch	NRHP #79000521	North of Hood	December 31, 1979
Runyon House	NRHP #00001270	12865 River Road, Courtland	October 27, 2000
Sheldon Grist Mill	CRHR #439	Meiss Road and Hwy 16, Sloughhouse	June 2, 1949
Walnut Grove Chinese–American Historic District	NRHP #90000484	Bounded by C, Tyler, and Bridge Sts., and River Road, Walnut Grove	March 22, 1990
Walnut Grove Commercial/Residential Historic District	NRHP #90000551	Browns Alley and River Road., Walnut Grove	April 12, 1990
Walnut Grove Gakuen Hall	NRHP #80000837	Pine and C Sts., Walnut Grove	June 17, 1980
Walnut Grove Japanese–American Historic District	NRHP #90000483	Bounded by Winnie St., Tyler St., C St., and River Road, Walnut Grove	March 22, 1990

Some prehistoric and historical cultural resources are buried and would only be discovered by activities and projects that include earth-moving activities. As discussed in Section 11.2.1, prior environmental documents prepared for projects proposed in the Planning Area, including the Cordova Hills EIR (Sacramento County 2012) and the Capital SouthEast Connector Project EIR (Connector JPA 2012), identified prehistoric and historic-era cultural

resources within their proposed project footprints that were not listed on the NRHP or CRHR. Therefore, it is likely that other unknown cultural resources are present within the undeveloped areas of the Planning Area. Table 11-2 includes types of cultural resources expected to be present within the currently undeveloped portions of the Planning Area. Considering the long and complex history of human settlement in the Planning Area, historical resources that may be encountered are diverse, including buildings, structures, and objects, as well as historical and archaeological sites and artifacts. Descriptions of these general types of cultural resources are provided in Table 11-2.

Table 11-2. Types of Cultural Resources Potentially Occurring in the Planning Area

Resource Type	Description	Example
Building	Structures created principally to shelter or assist in carrying out any form of human activity. May also refer to a historically and functionally related unit (e.g., courthouse and jail).*	Houses, barns, churches, factories, and hotels.
Structure	The term "structure" is used to describe a construction made for a functional purpose rather than creating human shelter.	Mines, bridges, and tunnels.
Object	The term "object" is used to describe those constructions that are primarily artistic in nature or are relatively small in scale and simply constructed, as opposed to a building or a structure. Although it may be moveable by nature or design, an object is associated with a specific setting or environment. Objects should be in a setting appropriate to their significant historic use, role, or character. Objects that are relocated to a museum are not eligible for listing in the CRHR.	Fountains, monuments, maritime resources, sculptures, and boundary markers.
Site	A site is the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historical, cultural, or archaeological value regardless of the value of any existing building, structure, or object. A site need not be marked by physical remains if it is the location of a prehistoric event, and if no buildings, structures, or objects marked it at that time.	Trails, designed landscapes, battlefields, habitation sites, Native American ceremonial areas, rock art, historic period refuse deposits, and archaeological remains of historic period settlement.
Isolates	An isolate is a cultural item (typically found in archaeological contexts), that does not meet the criteria used to define a site.	Isolates may include prehistoric artifacts such as arrow points or milling stones, historic items such as bottle glass, and even certain ranching features such as cattle troughs if they are designated by the study as isolated features.

Note: * It is common to consider buildings over 50 years in age as potentially eligible as a historic resource; however, regulations do not restrict younger buildings from being designated as historic resources.

11.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

11.2.1 Methodology for Assessing Impacts of Each Alternative on Paleontological, Cultural, and Historical Resources

The Environmental Consequences/Environmental Impact section identifies and describes the potential impacts of the actions and projects associated with each EIS/EIR alternative on the paleontological, cultural, or historical resources in the Planning Area. Potential ways that the EIS/EIR alternatives could directly impact cultural resources would be through ground-disturbing activities (e.g., construction of new urban development or associated infrastructure), which could disturb unknown subsurface cultural resources. The projects and activities expected under each alternative are described in Chapter 2.

No systematic archaeological survey of Sacramento County has been conducted, including the 317,655-acre EIS/EIR Planning Area (Figure 1-1). However, records searches were conducted to prepare the Sacramento County, Rancho Cordova, and Galt General Plans and to prepare the impact analysis in the General Plan EIRs (see Section 3.4); to prepare the other EIRs described in Section 3.4; and to prepare EIRs for the five large Master Plans (see Sections 2.3.3 and 2.3.4). In addition, cultural resource studies conducted for individual projects within the Planning Area were reviewed, and the Sacramento County planning staff was consulted.

The Sacramento County General Plan EIR analyzed impacts of urban development within approximately 307,142 acres of the Planning Area; the Rancho Cordova General Plan EIR analyzed impacts of urban development within approximately 42,944 acres of the Planning Area; and the Galt General Plan EIR analyzed impacts of urban development within approximately 7,354 acres of the Planning Area.[4] The Sacramento County General Plan mapped general locations of cultural resource sensitivity within the Planning Area (Figure 11-1). Similarly, the Rancho Cordova General Plan EIR (Rancho Cordova 2006b) mapped areas of cultural sensitivity in zones around each creek and stream in that study area. The Galt General Plan EIR (Galt 2008a) noted that riparian areas were especially sensitive for cultural resources, but did not attempt to map areas of cultural sensitivity.

Two approaches were used to estimate the effects of each EIS/EIR alternatives on cultural resources. First, the map from the Sacramento County General Plan (Figure 11-1) was used to estimate the potential for urban development to disturb cultural resources in the Planning Area. To do that, the expected locations of planned and expected future urban development

[4] Because the Sacramento County General Plan EIR analyzed impacts within the Galt SOI and a portion of Rancho Cordova, there is approximately 33,000 acres of overlap between the area analyzed in the Sacramento General Plan EIR and the Galt and Rancho Cordova General Plan EIRs.

for each alternative (Chapter 2) were compared to the map from the Sacramento County General Plan (Figure 11-1), and areas where planned and expected future urban development overlapped with areas of moderate or high cultural resource sensitivity were noted. In addition, geographic information system (GIS) methodology (Section 3.6.5), which was used to quantitatively estimate the direct impacts of each EIS/EIR alternative on land cover types with higher cultural resource sensitivity (Section 11.1.2.6). To do this, GIS datasets of future projects and activities expected under each EIS/EIR alternative were digitally overlaid (compared) to GIS datasets of stream/creek and riparian land covers land cover types.

However, these analyses only quantify or describe the potential impacts to areas previously determined by the County to have high cultural resource sensitivity. Although these analyses are useful to identify differences between the alternatives, additional cultural resources can be "unknown" or undiscovered because the Planning Area has been inhabited or used by Native American peoples for many thousands of years. Therefore, it is possible or even likely that all of the areas historically inhabited or used by the Plains Miwok or Nisenan tribes have not been discovered. In addition, artifacts or human remains also could have also been transported to future development sites from outside the areas of known habitation by natural forces such as floods or animals, or included in fill material that was excavated from one area and deposited in another during construction activities. Accordingly, site-specific studies must be conducted to increase confidence about the cultural resources present a future urban development project sites; however, even after a site-specific study is done, unknown resources could still be unearthed during ground-disturbing construction activities. Therefore, although the EIS/EIR analysis of each alternative notes when an alternative would result in less disturbance to culturally sensitive areas, the EIS/EIR cannot conclude that the alternative would necessarily result in less impact to cultural resources.

In addition, as discussed in Section 3.4 and earlier in Section 11.1.1.3, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006b) analyzed direct and cumulative impacts of urban growth planned within their jurisdictions, including impacts to paleontological, cultural, and historical resources. When the impact analysis or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief summary or description of the incorporated information or analysis is provided in Sections 11.2.1, 11.2.2, or 11.2.3.

It is appropriate to consider impacts to some environmental resources within the context of other impacts occurring in the surrounding landscape, community, or region (see Section 3.6.2). The lead agencies determined that an appropriate geographic scale for evaluating the impacts of each EIS/EIR alternative on cultural and historic resources should include the Sacramento Area Council of Government's six-county region (SACOG 2016), which includes Sacramento,

Placer, El Dorado, Sacramento, Sutter, Yolo, and Yuba Counties. This cumulative study area was selected to capture the combined historic territories of the Plains Miwok and the Nisenan Native American tribes (refer to Section 11.1.2.4).

As discussed in Section 3.7, the Chapter 11 cumulative analyses of impacts to paleontological and cultural resources will consider: (1) the effects of past and present urban development within the Planning Area (see Existing Conditions in Section 11.1.2) and within the larger six-county study area, and (2) future impacts expected from reasonably foreseeable "other" projects in the Planning Area (see Section 3.7) and reasonably foreseeable "other" projects within the larger six-county study area. The cumulative analysis of each EIS/EIR alternative will then consider whether the incremental impacts of the alternative on paleontological and cultural resources would be significant (i.e., cumulatively considerable).

As discussed previously in Sections 1.6.4 and 3.6.1, the description and scope of each EIS/EIR alternative (Chapter 2) does not include local approvals or entitlements for individual, site-specific, urban development projects or activities. Accordingly, the analysis presented in this EIS/EIR does not provide project-level CEQA or NEPA coverage for the impacts of future Covered Activities on paleontological, cultural, or historical resources, and this EIS/EIR does not function as a programmatic or umbrella CEQA or NEPA document for regional development and infrastructure projects. This EIS/EIR evaluates only the adverse and beneficial environmental effects associated with the decisions of the lead agencies that are described in Section 1.5.

11.2.1.1 Determination of Impact Significance

As discussed in Section 3.8.1, the criteria used to evaluate the significance of each alternative's impacts on paleontological, cultural, and historical resources are based on Appendix G of the CEQA Guidelines, the definition of adverse impact under NHPA 106 (see 36 CFR 800.5(a)(1)), and on typical thresholds used to evaluate impacts in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse impact could occur if the alternative would:

1. Result in a substantial adverse change in the significance of a historical or archaeological resource, as defined as defined in CEQA Guidelines Section 15064.5.
2. Directly or indirectly alter any of the characteristics of a historic property that qualifies the property for listing in the NRHP, in a manner that would diminish the integrity of the historic property's location, design, setting, materials, workmanship, feeling, or association.
3. Disturb any human remains, including those interred outside of formal cemeteries.
4. Directly or indirectly destroy a unique paleontological resource or site.

Appendix G of the CEQA Guidelines does not provide suggested criteria for determining a beneficial effect. The following criteria were developed by the lead agencies. A beneficial impact could occur if the alternative would:

1. Discernibly reduce adverse changes in the significance of a historical or archaeological resource, as defined as defined in CEQA Guidelines Section 15064.5.
2. Discernibly reduce alteration of the characteristics and integrity of a property that may qualify it for listing in the NRHP, as defined in 40 CFR 60.4.
3. Discernibly reduce disturbance of any human remains, including those interred outside of formal cemeteries.
4. Discernibly reduce direct or indirect destruction of a unique paleontological resource or site.

The impact analysis for the three EIS/EIR alternatives will consider the context, intensity, and severity of potential impacts to each of these paleontological and cultural resources impact criteria, and will present a separate determination of significance for each of these criteria.

11.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2.

11.2.2.1 Direct and Indirect Effects of the Alternative

Much of the estimated total 35,532 acres of future urban development expected under the No Action/No Project Alternative (Section 2.2) is also described and analyzed in the Sacramento County General Plan, the Galt General Plan, and the Rancho Cordova General Plan (see Section 3.4 and Section 11.2.1). Therefore, many of the cumulative effects on paleontological and cultural resources from future urban development within the Chapter 11 study area, including the Planning Area, were evaluated in the General Plan EIRs and the other EIRs listed in Section 3.4.

As discussed in Section 3.4 and in Section 11.2.1, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b), in 2050 (Rancho Cordova 2006b), and 2030 (Sacramento County 2010), and the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). The Galt and Rancho Cordova General Plan EIRs analyzed buildout of their jurisdictions. However, additional urban development would occur within Sacramento County after the 2030 end of the General Plan EIR study period, until the expected buildout of the Urban

Development Area (UDA)[5] at end of this EIS/EIR's study period in 2065. Consequently, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of the additional urban development activities and projects included in the description of each EIS/EIR alternative. The lead agencies extrapolated that the impacts of the additional urban development in the latter part of the 50-year EIS/EIR study period, including potential impacts to paleontological and cultural resources, would be similar to the impacts of urban development implemented in the early part of the EIS/EIR study period, which was analyzed in the General Plan EIRs.

The impact analysis presented in the *City of Galt General Plan Update: 2030 Final EIR* (Galt General Plan EIR)(Galt 2009b), determined that within the City of Galt and the Galt SOI:

- Historic resources, including structures and sites in the City's downtown area, may be vulnerable to urban development projects and activities associated with the planned buildout described in the Galt General Plan. The General Plan policies establish a framework for the preservation of Galt's historic resources and promote historic preservation, which will help avoid, minimize, and mitigate project impacts to historical resources. However, even with project implementation of the Galt General Plan policies, the Galt General Plan EIR determined that impacts of planned urban development are significant and unavoidable;
- Cultural resources, paleontological resources, and/or human remains could be damaged or inadvertently unearthed during ground-disturbing activities associated with the planned buildout described in the Galt General Plan. However, future project compliance with state laws and with the Galt General Plan policies that promote the protection of these resources (see Section 11.1.1) would ensure impacts to existing cultural resources, paleontological resources, or human remains would be less than significant (Galt 2008, pp. 9-1 to 9-8).

The Galt General Plan EIR assumed full buildout of the existing Galt city limits and the Galt SOI by the end of the General Plan EIR's study period.

[5] As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, the term "UDA" means all lands within the County's Urban Service Boundary (USB) that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within the City of Galt's SOI (see Figure 1-1).

The *City of Rancho Cordova General Plan Final EIR* (Rancho Cordova General Plan EIR) (Rancho Cordova 2006b), determined that within Rancho Cordova and its SOI:

- Existing historic resources and cultural resources may be vulnerable to urban development projects and activities associated with the planned buildout described in the Rancho Cordova General Plan. Compliance with Rancho Cordova General Plan policies that promote the protection of these resources (see Section 11.1.1) would help to reduce impacts to historic resources and cultural resources. However, even with project implementation of the Rancho Cordova General Plan policies, the Rancho Cordova General Plan EIR determined that impacts to prehistoric and historic cultural resources, and human remains would be significant and unavoidable (Rancho Cordova 2006c, pp. 4.11-5 to 4.11-19).
- Paleontological resources could be damaged or inadvertently unearthed during ground-disturbing activities associated with the planned buildout described in the Rancho Cordova General Plan. Future project compliance with Rancho Cordova General Plan policies that promote the protection of these resources (see Section 11.1.1) would ensure impacts to paleontological resources would be reduced to less than significant (Rancho Cordova 2006c, pp. 4.11-5 to 4.11-19).

The Rancho Cordova General Plan EIR assumed full buildout of Rancho Cordova and the Rancho Cordova SOI by the end of the General Plan EIR's study period.

The impact analysis presented in the *Capital SouthEast Connector Project Final Program Environmental Impact Report* (Connector EIR) (Connector JPA 2012), determined that construction and operation of the Capital Southeast Connector:

- Could result in significant impacts to cultural resources from construction in areas where cultural resources are present. Project-level mitigation measures identified in the Connector EIR would reduce these impacts to less than significant; however, in areas of the Capital Southeast Connector right-of-way footprint where avoidance of cultural resources is not possible, impacts would remain significant and unavoidable (Connector JPA 2012, pp. 6-13 to 6-15).
- Could result in significant impacts to human remains due to ground disturbance during construction. A mitigation measure requiring construction to stop if human remains are encountered would reduce this potential impact to less than significant (Connector JPA 2012, pp. 6-15 to 6-16).

The impact analysis presented in the *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR) (Sacramento County 2010), determined that within Sacramento County:

- Historic resources and cultural resources may be vulnerable to planned urban development projects and activities associated with buildout of the Sacramento County General Plan. Compliance with Sacramento County General Plan policies would avoid or minimize impacts to cultural resources associated with future planned development in unincorporated Sacramento County. However, direct and indirect impacts would still occur to existing cultural and historic resources, resulting in a significant and unavoidable impact.
- Impacts to important cultural resources existing in areas identified in the Sacramento County General Plan EIR as "new growth areas," (includes the Jackson Highway Corridor[6] and Grant Line East area), would also result in significant and unavoidable impacts.
- Paleontological resources may be at risk for unintentional destruction during construction of planned urban development (residential, commercial, and industrial), during construction of associated infrastructure; and during the expansion of existing mining operations, resulting in significant and unavoidable impacts (Sacramento County 2010, pp. 15-22 to 15-34).

The Sacramento County General Plan EIR analyzed the effects of ground-disturbing projects and activities resulting from infill development of all acreage within the current 223,193-acre Urban Policy Area, combined with development in two "New Growth Areas" that total approximately 20,000 acres.[7] Approximately 43,719 acres of the current Urban Policy Area overlaps with the EIS/EIR Planning Area. However, the Sacramento County General Plan EIR did not address the potential to disturb human remains.

As discussed earlier, additional urban development would occur within Sacramento County after the 2030 end of the Sacramento County General Plan EIR study period, until the expected full buildout of the UDA at end of this EIS/EIR's study period in 2065. This additional urban development within the UDA would result in additional effects on existing cultural, historical,

[6] The Sacramento County General Plan EIR's proposed project (Sacramento County 2010) included development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by Sacramento County. However, Sacramento County is currently processing proposed Master Plans in the Jackson Highway Corridor, so the conclusions of the Sacramento County General Plan EIR's analysis of this proposed project are applicable to the EIS/EIR No Action/No Project Alternative.

[7] The two "New Growth Areas" were Jackson Highway Corridor (approximately 12,000 acres) and Grant Line East (approximately 8,000 acres). The Jackson Highway Corridor encompasses land on the northern and southern sides of Highway 16, beginning at South Watt Avenue and ending at Sunrise Boulevard. Grant Line East begins on the eastern side of Grant Line Road and ends at the Sacramento County USB.

and paleontological resources present in the Planning Area, especially inside the UDA where all new urban development would occur. The areas of highest cultural sensitivity in Sacramento County are generally along the larger waterways, which are located outside the UDA (Figure 11-1)(Sacramento County 1993). However, as described in Section 11.1.2.6, unknown cultural resources have potential to be present anywhere in the Planning Area. Therefore, the additional urban development (which would occur after the 2030 end of the Sacramento County General Plan EIR study period, until the buildout of the UDA at end of this EIS/EIR's study period in 2065) would add to the already significant and unavoidable effects on cultural resources previously identified in the Sacramento County General Plan EIR, described earlier.

Additionally, as explained above and in Section 2.2.2, approximately 1,900 acres of planned urban development would be shifted or displaced from inside the Mather Core Recovery Area (MCRA) to one or more locations outside the current Sacramento County USB boundary under the No Action/No Project Alternative. Based on the map of prehistoric cultural resource sensitivity in Sacramento County (Figure 11-1):

- The potential displacement areas in the northeast of the Planning Area and east of Galt have moderate prehistoric cultural resource sensitivity.
- The area surrounding Rancho Murieta and the area near Wilton have high prehistoric cultural resources sensitivity.
- The area south of Elk Grove has low prehistoric cultural resource sensitivity.

By shifting or displacing development from the MCRA (an area of low prehistoric cultural resource sensitivity), to areas with moderate or high prehistoric cultural sensitivity, the No Action/No Project Alternative could result in more impact to prehistoric cultural resources than was analyzed in the Sacramento County General Plan EIR. However, this impact analysis of the No Action/No Project Alternative assumes that all future development projects would comply with applicable policies and regulations identified in the General Plans for Rancho Cordova and Sacramento County (see Section 11.1.1.3).

All future projects and activities that require local permits, approvals, or entitlements (e.g., planning entitlements such as rezones, lot line splits, and subdivision maps) over the 50-year EIS/EIR study period would be required to comply with the Sacramento County, Galt, or Rancho Cordova policies for paleontological and cultural resources (see Section 11.1.1.3). These local policies require future projects to avoid or minimize impacts to cultural, paleontological, or historical resources. If full avoidance of cultural, paleontological, or historical resources is not feasible, Sacramento County, Galt, or Rancho Cordova policies require projects to incorporate additional mitigation measures before permits or entitlements. Examples of project-level mitigation measures to address unavoidable impacts to paleontological and cultural resources include data recovery, curation of recovered materials, repatriation of human remains and/or grave goods, and documentation of

results. In some cases, these mitigation measures would fully mitigate for the effects of a project. However, for many individual projects, the effects on cultural resources would remain significantly adverse after mitigation. Therefore, the No Action /No Project Alternative, including the 1,900 acres of displaced development outside the UDA and the expected buildout of the UDA over the 50-year EIS/EIR study period, would add to the already significant impacts to paleontological, cultural, and historic resources that were identified in the Sacramento County, Galt, and Rancho Cordova General Plan EIRs presented earlier.

As discussed in Section 2.2.2 and 2.2.4, individual projects and activities implemented under the No Action/No Project Alternative would continue to establish new mitigation preserves to meet requirements of ESA, California Endangered Species Act, CWA, and local environmental policies. A total of 23,430 acres of existing natural land covers would be permanently preserved under the No Action/No Project Alternative (Table 2-2). The establishment of new on-site or off-site mitigation preserves alone would not adversely impact paleontological or cultural resources present at the new preserve sites. Likewise, the purchase of credits at an approved mitigation bank, or through an established in-lieu fee program, would not adversely impact paleontological or cultural resources.

As discussed in Section 2.2.4, and Section 8.2.2, approximately 380 acres of stream/creek, freshwater marsh, and riparian land cover types would be preserved under the No Action/No Project Alternative. These aquatic resource land cover types generally have high sensitivity for prehistoric cultural resources (Section 11.1.2.6), and preserving them would prevent adverse effects of constructing new urban development and on the cultural and historic resources that might be present. Approximately 554 acres of riparian land covers would be re-established or established in Planning Area riparian areas under the No Action/No Project alternative (Table 8-5). The re-establishment of a riparian plant community is primarily by planting of tree, shrub, and herbaceous species, and results in minimal ground disturbance.

However, the establishment or re-establishment of 562 acres of vernal pools and swales as compensatory mitigation for projects and activities implemented under the No Action/No Project Alternative (Table 8-5) would require use of heavy equipment, and may require grading or excavation of soil to depths up to 3 feet, which has potential to impact existing paleontological or cultural resources. However, the re-establishment/establishment of vernal pools and swales would occur only on the specific soil types that form seasonal perched aquifers (see Chapter 8), and these soil types are typically not located in floodplains, where cultural resource sensitivity is highest. In addition, these small areas of shallow grading are less likely to disturb unknown cultural resources than the deeper grading that occurs with new urban development projects. Furthermore, future urban development projects and activities would comply with the regulations and local policies and regulations discussed in Section 11.1.1.3 and in the General Plan EIRs, and these existing regulations and policies would

continue to ensure that re-establishment or establishment of wetlands and other waters would not adversely affect cultural resources. Therefore, habitat re-establishment and establishment of vernal pools and swales on mitigation preserves is expected to have a ***Less Than Significant Adverse*** effect on existing cultural, paleontological, or historical resources.

In summary, the additional urban development from buildout of the UDA during the 50-year EIS/EIR study period and the effects of the approximately 1,900 acres of urban development that would be displaced to areas outside the UDA, would result in significant and unavoidable impacts to paleontological, cultural and historic resources. Therefore, the ***Significant and Unavoidable Adverse*** effects to paleontological, cultural, and historic resources identified in the Sacramento County, Galt, and the Rancho Cordova General Plan EIRs would continue under the No Action/No Project Alternative.

11.2.2.2 Cumulative Effects of the Alternative

The past and present urban development and associated infrastructure projects and human activities discussed in Section 3.7.1 and in Section 11.1.2 have damaged or destroyed paleontological and cultural resources within the EIS/EIR Planning Area, especially within the UDA. These past and present alterations have resulted in the existing conditions of the Planning Area (see Section 5.1.2), and represent a significant adverse impact on cultural resources from past and present development. Historical, cultural, and paleontological resources in other parts of the cumulative study area such as Yolo County and Sutter County have also been damaged by ground-disturbing activities of urban development.

The types of reasonably foreseeable "other" projects, activities, and actions described in Section 3.7.2, are similar to the types of past and present actions that occurred in the study area. The foreseeable other actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in the Elk Grove SOI and in Rancho Murieta, development of the Wilton Rancheria Casino, master planned developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued urban development of cultivated agricultural lands, major infrastructure projects such as California High-Speed Rail and the California WaterFix, and expansion of the existing National Wild Refuge and the Cosumnes River Preserve (see Section 3.7.2) These reasonably foreseeable other projects in the study area are expected to further impact paleontological and cultural resources. The combined impacts of the past, present, and reasonably foreseeable future projects are a significant cumulative impact to paleontological and cultural resources in the study area.

As discussed in the Section 11.2.2.1 direct and indirect analysis of the No Action/No Project, future projects and activities under the No Action/No Project Alternative would continue to implement applicable regulations and policies discussed in Section 11.1.1. However, although the policies in the Sacramento County General Plan (Sacramento County 2011) and Rancho Cordova General Plan (Rancho Cordova 2006a) are designed to minimize protect impacts to paleontological and cultural resources, additional losses of paleontological and cultural resources would result from the new urban development projects, activities, and actions included in the No Action/No Project Alternative. Therefore, the direct and indirect impacts of the No Action/No Project Alternative would further increase the significant loss of cultural and paleontological resources that already exists in the study area. Therefore, the incremental impacts to cultural and paleontological resources from the No Action/No Project Alternative are significant and cumulatively considerable, and would make a considerable contribution to the previously identified significant cumulative impacts on cultural and paleontological resources from the past, present, and reasonably foreseeable other projects.

11.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3.

11.2.3.1 Direct and Indirect Effects of the Alternative

As discussed in Section 2.3, Covered Activities under the Proposed Action/Proposed Project Alternative include the same types of urban development that are anticipated under the No Action/No Project Alternative. Covered Activities implemented under the Proposed Action/Proposed Project would result in new urban development projects and activities on approximately 33,500 acres of existing natural landscapes in the Planning Area (see Section 2.3.3), which is approximately 2,000 fewer acres of new urban development projects on natural landscapes than the No Action/No Project Alternative.

As discussed in Section 2.3.1, the Proposed Action/Proposed Project Alternative would allow urban development Covered Activities within the MCRA portion of the UDA to be implemented consistent with the approved Sacramento County and Rancho Cordova General Plans, without urban development shifting or being displaced to up to four locations outside the current USB boundary. Therefore, the Proposed Action/Proposed Project Alternative does not assume that approximately 1,900 acres of new urban development would be shifted or "displaced" to locations outside of the current USB boundary for Sacramento County. As discussed in Section 11.2.2.2, the four areas where urban development might be displaced under the No Action/No Project are areas of moderate or high sensitivity for cultural resources (Figure 11-1). Therefore, the Proposed Action/Proposed Project may result in fewer disturbances to cultural resources relative to the impact of the No Action/No Project Alternative baseline condition. However,

unknown cultural resources could be present anywhere in the Planning Area (Section 11.2.1), so the EIS/EIR does not assume that effects on cultural resources would be less under the Proposed Action/Proposed Project than under the No Action/No Project Alternative.

As discussed in Section 11.1.1, existing regulations and policies that apply to paleontological and cultural resources, including historic properties and human remains, will continue to be required of urban development Covered Activities over the 50-year permit term.

As discussed in Section 1.5.4, the USACE is developing a multilevel CWA Section 404 permitting program for future SSHCP Covered Activity projects and activities that discharge dredged or fill material to waters of the United States, which would be a federal undertaking under the NHPA. To meet the NHPA 106 requirements, the USACE may develop a Programmatic Agreement with the SHPO specifically to address NHPA 106 compliance for future SSHCP Covered Activities authorized under CWA 404. If this were to occur, as part of developing a Programmatic Agreement, the USACE would also consult with regional Native American tribal contacts, and may consider establishing a MOU with Native American tribes concerning future coordination on the protection of cultural resources. Compared to the impacts expected under the No Action/No Project baseline condition, the MOU developed as part of this process would provide equal or better protection for cultural resources and human remains. The other existing federal, state, and local regulatory requirements would provide protection for paleontological resources and historical resources.

As discussed in Section 2.3.5, the conservation strategy of the Proposed Action/Proposed Project Alternative would include a 36,027-acre interconnected and coordinated SSHCP Preserve System, with 7,162 acres preserved inside the UDA, and 36,027 acres preserved outside the UDA. Any paleontological and cultural resources located within the SSHCP Preserve System would be protected from urban development and associated infrastructure projects. As noted in Section 11.2.2, individual mitigation preserves established under the No Action/No Project Alternative would also protect paleontological and cultural resources. However, under the Proposed Action/Proposed Project, approximately 2,740 acres of stream/creek and riparian habitat would also be protected in preserves, which is approximately three times the acreage of these culturally sensitive areas preserved under the No Action/No Project Alternative.

In addition, under the Proposed Action/Proposed Project, additional stream setback areas would be established between new urban development and UDA streams, creeks, and first and second order tributaries to those streams and creeks. Avoidance and Minimization Measure (AMM) AMM STREAM-2 would require new urban development to be at least 100 feet from the top of each bank of several creeks in the Planning Area, even for creek reaches that are not within preserves. AMM STREAM-1 would require minimum 150-foot setbacks from the top of each bank along Laguna Creek in the UDA. Although the project-by-project approvals and

project mitigation that would occur under the No Action/No Project Alternative (Section 2.2.4) may include some setbacks from creeks and streams, the setbacks required under the Proposed Action/Proposed Project would be larger and would apply to more streams and creeks than the setbacks under the No Action/No Project Alternative. The greater setbacks under the Proposed Action/Proposed Project would limit disturbance of soils in floodplains and riparian areas, which are the areas with the greatest potential for cultural resource presence in the Planning Area (Sacramento County 1993, 2011; Rancho Cordova 2006a; Galt 2008b). The establishment of the Preserve System and requirements for larger stream setbacks would be a ***Minor Beneficial*** effect as compared to the No Action/No Project Alternative baseline condition,

As described for the No Action/No Project Alternative in Section 11.2.2, vernal pool and swale re-establishment/establishment activities on preserves would include land disturbances up to 3 feet depth. However, the acreage of re-established/established wetlands and other waters, and re-established/established riparian land covers under the Proposed Action/Proposed Project would total approximately 1,740-acres, approximately 50% more acres of re-established/established aquatic resources than under the No Action/No Project Alternative. The additional acreage of re-establishment/establishment under the Proposed Action/Proposed Project would increase the risk of disturbance of unknown cultural resources on preserves, as compared to the No Action/No Project Alternative. However, the re-establishment/ establishment of vernal pools and swales would continue to occur only on the specific soil types that form seasonal perched aquifers (see Chapter 8), and these soil types are typically not located in floodplains or riparian areas, where cultural resource sensitivity is highest. In addition, these small areas of shallow grading are less likely to disturb unknown cultural resources than the deeper grading that occurs with new urban development projects. Furthermore, future urban development projects and activities would continue to comply with the regulations and local policies and regulations discussed in Section 11.1.1.3 and in the General Plan EIRs, and these existing regulations and policies would continue to ensure that re-establishment or establishment of aquatic resources would not significantly affect known or unknown cultural resources in the SSHCP Preserve System. In addition, the amount of ground disturbance associated with re-establishment/establishment projects on preserves would remain minimal compared to the ground disturbance from urban development. Therefore, aquatic resource re-establishment/establishment under the Proposed Action/Proposed Project would continue to have a ***Less than Significant Adverse*** effect on paleontological, cultural, and historical resources, when compared to the impacts of the No Action/No Project Alternative baseline condition.

11.2.3.2 Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- Not result in disturbance of up to 1,900 acres outside the UDA identified as "moderate" or "high" cultural resource sensitivity by Sacramento County;
- Provide additional setback preserves along stream, creeks, and riparian areas, which generally have the highest sensitivity for cultural resources in the Planning Area;
- Result in similar effects to existing historical resources and paleontological resources.

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative on all of the impact criteria for paleontological, cultural, and historical resources listed above in Section 11.2.1.1, the Proposed Action/Proposed Project overall would result in a ***Minor Beneficial*** effect to Planning Area paleontological, cultural, and historical resources, when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

11.2.3.3 Cumulative Effects of the Proposed Action/Proposed Project

The effects of past, present, and the reasonably foreseeable other projects on paleontological, cultural, and historical resources in the Planning Area were described above in Section 11.2.2.2, and represent a significant adverse cumulative impact on the paleontological, cultural, and historical resources within the study area. As discussed in Section 11.2.2.1, the incremental direct and indirect effects of the No Action/No Project Alternative were determined to be significant and to be cumulatively considerable, when viewed in connection with the effects of the past, present, and reasonably foreseeable other projects in the study area.

As discussed here, the implementation of the Proposed Action/Proposed Project SSHCP conservation strategy, including the SSHCP AMMs, the SSHCP Aquatics Resources Plan, and the interconnected SSHCP Preserve System is expected to reduce the potential for impacts to cultural resources as compared to the No Action/No Project Alternative. Compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would include less development outside the current Sacramento County USB boundary, where cultural resource sensitivity is higher. The Proposed Action/Proposed Project would also include stream setbacks on streams, creeks, and first and second order tributaries to those streams and creeks. Because stream/creek and riparian areas have greater cultural resource sensitivity, these setbacks would reduce the potential for impacts to cultural resources. Consequently, the incremental effects of the Proposed Action/Proposed Project would have a minor beneficial impact to paleontological, cultural and historical resources when compared to the incremental effects of the No Action/No

Project Alternative baseline condition; therefore, the Proposed Action/Proposed Project does not result in a cumulatively considerable contribution to the significant adverse cumulative impacts on paleontological, cultural, and historical resources. The Proposed Action/Proposed Project would result in a ***Minor Beneficial Cumulative*** effect to paleontological, cultural, and historical resources compared to the No Action/No Project baseline condition.

11.2.4 Reduced Permit Term Alternative

The Reduced Permit Term Alternative is described in Section 2.4.

11.2.4.1 Direct and Indirect Effects of the Alternative

As described in Section 2.4.3 and Section 3.6.3, the Reduced Permit Term Alternative would include similar types of development in the UDA as the No Action/No Project Alternative. Over the 50-year EIS/EIR study period, the Reduced Permit Term Alternative would result in new urban development projects and activities on approximately 35,358 acres of existing natural land covers in the Planning Area (Table 8-12).

As discussed in Section 2.4.1, the Reduced Permit Term Alternative would allow urban development within the MCRA portion of the UDA to be consistent with the approved Sacramento County and Rancho Cordova General Plans, without urban development shifting or being displaced to up to four locations outside the current USB boundary. Therefore, the Reduced Permit Term Alternative does not assume that approximately 1,900 acres of new urban development would be shifted or "displaced" to locations outside of the current USB boundary for Sacramento County. As discussed above in section 11.2.2, the four areas where urban development might be displaced under the No Action/No Project Alternative are areas of moderate or high sensitivity for cultural resources (Figure 11-1). By not resulting in shifting or displacement of 1,900 acres of urban development to areas outside the UDA, the Reduced Permit Term Alternative would result in fewer disturbances of the areas identified by the County as having moderate or high cultural sensitivity (Figure 11-1) as compared to the No Action/No Project Alternative. However, as explained above in Section 11.2.1, unknown cultural resources could be present anywhere in the Planning Area, so the EIS/EIR does not assume that effects on cultural resources would necessarily be less under the Reduced Permit Term Alternative than under the No Action/No Project Alternative.

The existing regulations and local policy requirements discussed in Section 11.1.1 for cultural resources and human remains, if encountered during ground disturbance, would continue under the Reduced Permit Term Alternative. To meet the requirements of Section 106 for CWA permits, the USACE and the local jurisdictions could develop a Programmatic Agreement for Section 106 consultations with the SHPO in effect during the 30-year permit term of the

Reduced Permit Term Alternative. As part of developing a Programmatic Agreement, the USACE would consult with the local Native American tribes, which may include establishing an MOU with Native American tribes concerning future coordination and the protection of cultural resources. The MOU developed as part of this process would provide equal or better protection for cultural resources and human remains during the 30-year permit term than currently occurs. The other existing federal, state, and local regulatory requirements would provide protections for paleontological resources and historical resources.

As discussed in Section 2.4.5, the Reduced Permit Term Alternative would include an interconnected and coordinated preserve system, established during the 30-year permit term. Any paleontological, cultural, or historical resources present within the SSHCP Preserve System would not be disturbed or destroyed by future urban development. Relative to the No Action/No Project Alternative baseline condition, the 30-year Preserve System would result in a ***Minor Beneficial*** effect to paleontological, cultural, or historical resources.

However, during years 31–50 of the EIS/EIR study period, project ESA, California Endangered Species Act, and CWA mitigation preserves would be established under the uncoordinated, project-by-project process that currently occurs under the existing conditions and under the No Action/No Project Alternative. Any cultural, paleontological, or historical resources located within these on-site or off-site mitigation preserves would not be directly disturbed by new urban development. In addition, approximately 1,512 acres of stream/creek and riparian land covers would be preserved over the 50-year EIS/EIR study period, approximately double the acreage of these culturally sensitive areas that would be preserved under the No Action/No Project Alternative over the 50-year EIS/EIR study period. As in the No Action Alternative's expected regulatory environment (Section 2.2.2), project use of mitigation and conservation banks to meet CWA404 requirements has become common since 2008, and is expected to continue during years 31–50 of the Reduced Permit Term's 50 year study period)

In addition, during the 30-year permit term of the Reduced Permit Term Alternative, stream setbacks would be established that would require new urban development inside the UDA to be at least 50 feet from the top of the bank of many creeks in the Planning Area, even for creeks that are not within preserves. For the Laguna Creek in the UDA, development setbacks would be a minimum of 150 feet from the top of each bank during the 30-year permit term. Although project-by-project ESA and CWA authorizations under the existing conditions and under the No Action/No Project Alternative may requires small setbacks from creeks, the setbacks required under the Reduced Permit Term Alternative during the 30-year permit term would be larger, and would occur on more streams and creeks than under the No Action/No Project Alternative. The larger stream and creek setbacks established during the 30-year permit of the Reduced Permit Term Alternative would reduce disturbance of soils in riparian areas, which have the greatest cultural resource sensitivity (Sacramento County 1993, 2011; Rancho

Cordova 2006a; Galt 2008b). The Preserve System and requirements for stream setbacks during the 30-year permit term would be a ***Minor Beneficial*** effect as compared to the No Action/No Project Alternative baseline condition.

As for the No Action/No Project Alternative, aquatic resource re-establishment/establishment activities on preserves could involve land disturbance up to 3 feet deep to construct re-established/established vernal pool wetlands and swales, or for re-establishment/ establishment of other waters. However, the acreage of re-establishment/establishment of aquatic resources and riparian land covers under the Reduced Permit Term Alternative would be approximately 40% more than that under the No Action/No Project Alternative. The additional acreage of re-establishment/establishment under the Reduced Permit Term Alternative would increase the risk of disturbance of unknown cultural resources as compared to the No Action/No Project Alternative. However, Covered Activity projects and activities implemented during the 30-year permit term, and during the 50-year EIS/EIR study period, would continue to be required to comply with the existing cultural resource regulations and local policies described above in Section 11.1.1. Therefore, habitat re-establishment/ establishment under the Reduced Permit Term Alternative would continue to have ***Less Than Significant Adverse*** effects on paleontological, cultural, and historical resources when compared to the No Action/No Project Alternative baseline condition.

11.2.4.2 Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Not result in disturbance of up to 1,900 acres outside the UDA identified as “moderate” or “high” cultural resource sensitivity by Sacramento County;
- Provide 30-years of additional protections for stream, creeks, and riparian areas, which generally have the highest sensitivity for cultural resources in the Planning Area;
- Result in similar effects on historical resources and paleontological resources.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on all of the impact criteria for paleontological, cultural, and historical resources listed in Section 11.2.1, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to paleontological, cultural, and historical resources when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

11.2.4.3 Cumulative Effects of the Alternative

The effects of past, present, and reasonably foreseeable other projects on paleontological, cultural, and historical resources in the Planning Area are described in Section 11.2.2.1, and represent a significant adverse cumulative impact on the paleontological, cultural, and historical resources within the Study Area. As discussed in Section 11.2.2.1, the direct and indirect incremental effects of the No Action/No Project were determined to be significant and cumulatively considerable, when viewed in connection with the effects of the past, present, and foreseeable other projects in the Study Area.

As discussed here, the implementation of the Reduced Permit Term Alternative's conservation strategy, including the SSHCP AMMs, the SSHCP Aquatics Resources Plan, and the interconnected SSHCP Preserve System is expected to reduce the impacts to cultural resources when compared to the No Action/No Project Alternative. Compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would not displace or shift urban development outside the current Sacramento County USB boundary where cultural resource sensitivity is moderate or high (Figure 11-1). The Reduced Permit Term Alternative would also include 30 years of additional setbacks between new urban development and UDA streams, creeks, and first and second order tributaries to those streams and creeks. Because stream/creek and riparian areas have greater cultural resource sensitivity, the 30 years of larger and more numerous setbacks are expected to reduce impacts to cultural resources. Consequently, the direct and indirect incremental effects of the Reduced Permit Term Alternative would have a minor beneficial impact to paleontological, cultural, and historical resources when compared to the incremental effects of the No Action/No Project Alternative baseline condition; therefore, the Reduced Permit Term Alternative would not result in a cumulatively considerable contribution to the significant adverse cumulative impacts on paleontological, cultural, and historical resources. The Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect to paleontological, cultural, and historical resources, when compared to the No Action/No Project Alternative baseline condition.

INTENTIONALLY LEFT BLANK

CHAPTER 12 – PUBLIC SERVICES AND FACILITIES

This chapter presents the environmental effects of each Environmental Impact Statement (EIS)/ Environmental Impact Report (EIR) alternative on public services and facilities within the Planning Area. Services and facilities assessed include fire protection, law enforcement, water supply, wastewater treatment, solid waste (landfill capacity), parks and recreation, energy services (natural gas and electricity), and mosquito abatement.

12.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

This section describes the regulatory and physical environmental setting for traffic and circulation within the Planning Area.

12.1.1 Regulatory Framework

Several federal, state, and local agency requirements apply to public services and facilities within the Planning Area. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, issuance of permits, or implementation for the alternatives analyzed in this EIS/EIR. This section also identifies any relevant federal permits or other entitlements that must be obtained prior to implementing the alternatives. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 12.2, Environmental Consequences/Environmental Impacts (40 CFR 1502.25). The statutes, regulations, policies, and agency planning documents pertaining to each public service or facility are presented separately.

12.1.1.1 Fire Protection and Emergency Services

State

Petroleum Safety Orders. In accordance with 8 CCR 6773, "Fire Protection and Fire Equipment," the California Occupational Safety and Health Administration has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials; fire hose sizing requirements; restrictions on the use of compressed air; access roads; and the testing, maintenance, and use of all firefighting and emergency medical equipment.

Emergency Response/Evacuation Plans. The State of California passed legislation authorizing the Office of Emergency Services to prepare a Standard Emergency Management System program, which sets forth measures by which a jurisdiction should handle emergency disasters. Noncompliance with the Standard Emergency Management System program could result in the state withholding disaster relief from the noncomplying jurisdiction in the event of an emergency disaster.

Local

Sacramento County General Plan. Applicable goals and policies from the Public Facilities Element of the *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) that address fire protection services include the following:

Fire Protection and Emergency Services

Goal: Efficient and effective fire protection and emergency response serving existing and new development.

Fire Hazards

Goal: Minimize the loss of life, injury, and property damage due to fire hazards.

Policy SA-24: The County shall require, unless it is deemed infeasible to do so, the use of both natural and mechanical vegetation control in lieu of burning or the use of chemicals in areas where hazards from natural cover must be eliminated, such as levees and vacant lots (Sacramento County 2011).

Galt General Plan. Applicable goals and policies from the Public Facilities Element of the *Galt General Plan: Policy Document* (Galt General Plan) that address fire protection services include the following:

Fire Protection and Emergency Medical Services

Policy PFS-7.1: Fire Protection. The City shall continue to support the Cosumnes Community Services District Fire Department for fire protection and emergency medical service capable of meeting the needs of the community based on the benefit received. In addition, the City shall work with the Cosumnes Community Services District regarding necessary public fire facilities, equipment, and operational costs for the provision of fire prevention, fire protection, and emergency medical services to Galt residents (Galt 2009a).

Rancho Cordova General Plan. The Safety Element of the *Rancho Cordova General Plan* (Rancho Cordova General Plan) includes policies for fire protection. The applicable policy is as follows:

Policy S.9.1: Cooperate with the Sacramento Metropolitan Fire District (SMFD) to reduce fire hazards, assist in fire suppression, and ensure efficient emergency medical response (Rancho Cordova 2006a).

12.1.1.2 Law Enforcement

Local

Sacramento County General Plan. The applicable goal from the Public Facilities Element of the Sacramento County General Plan that addresses law enforcement is shown below:

Law Enforcement

> **Goal**: Adequate Sheriff Services and Facilities for the Unincorporated Areas of Sacramento County (Sacramento County 2011).

Galt General Plan. Law enforcement is addressed in the Galt General Plan Public Facilities and Services Element. The applicable policy is as follows:

> **Policy PFS-6.2:** Police Protection. The City should continue to provide adequate police protection and law enforcement by maintaining a police department capable of meeting the needs of the community (Galt 2009a, p. PFS-8).

Rancho Cordova General Plan. The Rancho Cordova General Plan Safety Element includes policies for law enforcement. The applicable policy is as follows.

> **Policy S.8.1:** Monitor and review the level of police staffing provided in the City to ensure that sufficient staffing and resources are available to serve local needs (Rancho Cordova 2006a).

12.1.1.3 Water Supply

Federal

Safe Drinking Water Act. The Safe Drinking Water Act gives the U.S. Environmental Protection Agency (EPA) the authority to set standards for contaminants in drinking water supplies. The EPA establishes primary regulations for the control of contaminants that affected public health and secondary regulations for compounds that affect the taste, odor, and aesthetics of drinking water. Under the provisions of the Safe Drinking Water Act, the California Department of Health Services has the primary enforcement responsibility. Title 22 of the California Administrative Code establishes Department of Health Services authority, and stipulates state drinking water quality and monitoring standards.

State

California Department of Water Resources. The Department of Water Resources is responsible for the preparation of the California Water Plan, management of the State Water Project, protection and restoration of the Sacramento–San Joaquin River Delta, regulation of dams, and provision of flood protection and other functions related to surface water and groundwater resources. The California Water Plan evaluates different combinations of regional and statewide resource management strategies to reduce water demand, increase water supply, reduce flood risk, improve water quality, and enhance environmental and resource stewardship. The California Water Plan is updated every 5 years; the latest version was updated in 2013.

California Department of Public Health. Recycled water regulations are administered by both San Francisco Bay Regional Water Quality Control Board (RWQCB) and the California Department of Public Health (CDPH). The regulations governing recycled water are found in a combination of sources, including the Health and Safety Code, Water Code, and Titles 22 and 17 of the California Code of Regulations (CCR). Issues related to the treatment and distribution of recycled water are generally under the permitting authority of RWQCB, while issues related to use and quality of recycled water are the responsibility of CDPH.

Title 22 of the CCR, Division 4, Environmental Health, Chapters 1 through 3, outline California's health laws related to recycled water. The intent of these regulations is to ensure protection of public health associated with the use of recycled water. The regulations establish acceptable levels of constituents in recycled water for a range of uses and assurance of reliability in the production of recycled water. The State Water Resources Control Board (SWRCB) has jurisdiction over the distribution of recycled wastewater and the enforcement of Title 22 regulations. Chapter 3, Article 3, of Title 22 indicates that disinfected tertiary-recycled water can be used for surface irrigation of food crops (including edible root crops, where the recycled water comes into contact with the edible portion of the crop), parks and playgrounds, school yards, residential landscaping, and unrestricted-access golf courses. Orchards and vineyards where the recycled water does not come into contact with the edible portion of the crop must be treated at least to un-disinfected secondary level for surface irrigation (CCR Section 60304).

State Water Resources Control Board. The SWRCB administers state water rights and water quality functions. The SWRCB and its nine RWQCBs administer water rights and enforce pollution control standards. The SWRCB is responsible for the granting of water rights permits and licenses through an appropriation process following public hearings and appropriate environmental review by applicants and responsible agencies. In granting water right permits and licenses, the SWRCB must consider all beneficial uses, including water for downstream human and environmental uses.

Central Valley Regional Water Quality Control Board. The Central Valley RWQCB is responsible for preparation and implementation of basin water quality plans consistent with the Clean Water Act and enforcement of those plans to ensure that local water quality is protected. The Central Valley RWQCB may become involved in water services programs as a responsible agency with respect to project impacts on downstream beneficial uses.

Local

Sacramento County General Plan. Applicable goals and policies from the Public Facilities Element of the Sacramento County General Plan that address water service include the following:

Water Facilities

Goal: Water facilities developed in an environmentally sound, economically efficient, and financially equitable manner.

Policy PF-1: New water facilities shall be planned to minimize impacts to in-stream water flow in the Sacramento and American Rivers.

Policy PF-2: Municipal and industrial development within the Urban Service Boundary but outside of existing water purveyors' service areas shall be served by either annexation to an existing public agency providing water service or by creation or extension of a benefit zone of the SCWA (Sacramento County 2011).

Galt General Plan. Water service is addressed in the Galt General Plan Public Facilities and Services Element. The applicable policy is as follows:

Water Services, Treatment, and Delivery

Policy PFS-2.9: Water services. The City shall monitor water demand growth trends to anticipate water service needs (Galt 2009a).

Rancho Cordova General Plan. The Rancho Cordova General Plan Infrastructure, Services, and Finance Element includes policies for water services, including the following:

Policy ISF.2.4: Ensure that water services and delivery systems are available in time to meet the demand created by new development, or are guaranteed to be built by bonds or securities.

Policy ISF.2.5: Ensure that water flow and pressure are provided at sufficient levels to meet domestic, commercial, industrial, and firefighting needs (Rancho Cordova 2006a).

12.1.1.4 Wastewater

Federal

Clean Water Act. The federal Clean Water Act (CWA) prohibits the discharge of pollutants to navigable waters from a point source unless the discharge is authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Discharge of treated wastewater to surface water of the United States, including wetlands, requires an NPDES permit. In California, the RWQCBs administer the issuance of these federal permits. Obtaining an NPDES permit requires preparation of detailed information, including characterization of wastewater sources, treatment processes, and effluent quality.

State

Porter–Cologne Water Quality Control Act. The Porter–Cologne Water Quality Control Act requires the SWRCB to adopt water quality control plans and set waste discharge requirements for discharges into surface and groundwater. The Central Valley RWQCB is responsible for administering and enforcing waste discharge requirements, permits, and water quality control plans.

Local

~~**Sacramento Regional Wastewater Treatment Plant Master Plan 2020.** The *Sacramento Regional Wastewater Treatment Plant Master Plan 2020* (2020 SRWTP Master Plan; Regional San 2008) identifies wastewater treatment facility needs for a 20-year planning period through the year 2020. The 2020 SRWTP Master Plan provides a phased program of recommended facilities to accommodate planned growth while at the same time maintaining treatment reliability, meeting future regulatory requirements, and optimizing costs. To meet this goal, the 2020 SRWTP Master Plan integrates overall strategies for wastewater treatment, effluent management, and biosolids disposal into an effective wastewater treatment management program. The 2020 SRWTP Master Plan proposes that treatment facility expansion occur in stages or phases as the sewage generated by the population increases (Regional San 2008).~~

~~**Interceptor System Master Plan 2000.** The *Interceptor System Master Plan 2000* (Interceptor System Master Plan; Regional San 2000) identifies existing and future capacity needs in the regional interceptor system and provide a strategic approach to plan for near-term and long-term improvements needed for the regional wastewater conveyance system. The Interceptor System Master Plan updates and refines regional conveyance facilities, service area, growth projections, and the existing system's response to rainfall; provides dynamic modeling; estimates the cost of facilities; identifies right-of-way acquisition needs; and identifies near- and long-term improvements required for regional wastewater conveyance. The Interceptor~~

~~System Master Plan uses land use and population projections based on the Sacramento Area Council of Governments Blueprint criteria and the land use plans of the member jurisdictions. The Interceptor System Master Plan also provides wastewater flow estimates, information on hydraulic modeling, and interceptor design criteria, and identifies conveyance systems and policies to accommodate planned growth (Regional San 2000).~~

Sacramento Regional County Sanitation District EchoWater Project. As a result of permit requirements adopted by the Central Valley RWQCB in 2010, as amended by orders of the Central Valley RWQCB and the SWRCB in 2011, 2012, 2013, and 2014, Sacramento Regional County Sanitation District (Regional San) is required to reduce total nitrogen and ammonia levels in its effluent substantially below existing concentrations. Biological nutrient removal is in progress to meet ammonia and nitrate effluent limitations. Regional San is also required to install tertiary filtration treatment for pathogen removal. Full compliance with the adopted and amended permit is required by May 2021 for ammonia and nitrate removal and May 2023 for filtration-related requirements.

Regional San Interceptor Sequencing Study. The Interceptor Sequencing Study (ISS) was prepared to determine Regional San's long-term needs to provide sanitary sewer service to a growing Sacramento region. The ISS evaluated proposed interceptor facilities identified in Regional San's previous planning document, the *Interceptor System Master Plan 2000* (Regional San 2000), to determine if there were other alternatives including delaying, realigning, or eliminating proposed interceptors. The ISS performed the following six tasks: 1) re-evaluated planning area growth predictions; 2) identified alternative flow-generation criteria based on projected population densities and anticipated future flow per household; 3) developed additional modeling capabilities to evaluate conservative and realistic flow conditions; 4) prepared multiple interceptor sewer service alternatives; 5) evaluated recycled water alternatives, including satellite treatment and scalping facilities; 6) prepared a cost analysis for the top interceptor alternatives.

The ISS provides a high-level evaluation of interceptor alternatives and identifies interceptor alignment corridors as well as anticipated capacity needs and interceptor pipe sizes. Proposed projects will be further evaluated through Regional San's asset management program and must be approved by the Project Authorization Committee before requesting approval from the Regional San Board of Directors to begin environmental review and project implementation. The Regional San Board of Directors adopted the ISS in February 2013.

Sacramento Area Sewer District Sewer System Management Plan. The Sacramento Area Sewer District (SASD) Sewer System Management Plan is a system-wide living management plan for the operation, maintenance, expansion, repair, and replacement of SASD's sewer collection system. The intent of this document is to be a day-to-day working management plan that also

meets the requirements of the Statewide General Waste Discharge Requirements Water Quality Order No. 2006-0003 approved on May 2, 2006, D: Provisions, no. 13 (D13).

Sacramento Area Sewer District Sewer System Capacity Plan 2010 Update. This is a high-level planning and dynamic sewer capacity plan that addresses existing, mid-range, and buildout sewer capacity needs. Existing capacity needs are based on SASD's current sewer system conditions. The mid-range capacity needs are based on plans to provide sewer service to SASD's service area within the next 10 years. The buildout capacity needs are based on providing sewer service to the entire SASD service area, which corresponds to Sacramento County's Urban Service Boundary (USB) with the exception of the areas served by the City of Sacramento, the City of Folsom, and the Rancho Murieta Community Services District.

Sacramento County General Plan. Applicable goals and policies from the Public Facilities Element of the Sacramento County General Plan that address wastewater are as follows:

Wastewater Collection and Treatment

Goal: Treatment plant, regional interceptors and trunk system expansion completed prior to construction in urban expansion areas and/or flows reaching critical capacity limits.

Policy PF-9: Design trunk and interceptor systems to accommodate flows generated by full urban development at urban densities within the ultimate service area. System design may take into consideration land that cannot be developed for urban uses due to long-term circumstances including but not limited to conservation easements, floodplains, public recreation areas etc. This could include phased construction where deferred capital costs are appropriate.

Goal: Establish limits on extension of public sewer service in the unincorporated area to ensure long-term availability of conveyance and treatment capacity, cost-effective use of revenues and support open space preservation objectives (Sacramento County 2011).

Galt General Plan. Sewer services are addressed in the Galt General Plan Public Facilities and Services Element. Applicable goals and policies are as follows:

Wastewater Collection, Treatment, Disposal, and Reuse

Policy PFS-3.7: Compliance with the Clean Water Act. The City shall comply with the requirements of the Clean Water Act with the intent of minimizing the discharge of pollutants to surface waters.

Policy PFS-3.9: Expand use of Reclaimed Water. The City shall encourage the use of tertiary treated wastewater for irrigation of agricultural lands, large landscaped areas,

and recreation/open space areas within close proximity to the City's WWTP to help ensure ongoing compliance with RWQCB requirements (Galt 2009a).

Rancho Cordova General Plan. The Rancho Cordova General Plan Infrastructure, Services, and Finance Element applicable policy for sewer services is as follows:

> **Policy ISF.2.4:** Ensure that sewage conveyance and treatment capacity are available in time to meet the demand created by new development, or are guaranteed to be built by bonds or other sureties (Galt 2009a).

12.1.1.5 Solid Waste

Federal

Resource Conservation and Recovery Act. The Resource Conservation and Recovery Act (RCRA) was enacted to protect human health and the environment from potential hazards of waste disposal, to conserve energy and natural resources, to reduce the amount of waste generated, and to ensure that wastes are managed in an environmentally sound manner. Under RCRA, the EPA has the authority to control hazardous wastes from "cradle to grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous wastes. RCRA also sets a framework for the management of nonhazardous solid wastes. RCRA enables the EPA to address underground storage tanks storing petroleum and other hazardous substances. RCRA authorizes states to develop and enforce their own waste management programs; the state programs must be approved and authorized by the EPA.

State

California Integrated Waste Management Act. The California Integrated Waste Management Act mandates a focus on the conservation of natural resources. Cities and counties are required to create comprehensive source reduction, recycling, and composting programs. The goal of these programs is to reduce the amount of waste sent to landfills by 50%. The act also requires counties to prepare an Integrated Waste Management Plan. The California Integrated Waste Management Act shifts the emphasis from landfill disposal toward waste reduction, recycling, and composting whenever possible. This approach conserves natural resources, saves energy, decreases pollution, and provides new jobs in the waste industry.

The California Integrated Waste Management Act established the following priorities for waste management: waste reduction, recycling and composting, controlled combustion of waste to generate electricity, and landfilling.

Public Resources Code Division 30/California Code of Regulations Title 14. These regulations establish minimum standards for solid waste handling and disposal, and clarify local responsibilities for enforcement of these standards. Local enforcement agencies have the primary responsibility for ensuring the correct operation and closure of solid waste facilities in the state. They also have responsibilities for guaranteeing the proper storage and transportation of solid wastes. The Sacramento County Environmental Management Department is authorized as the local enforcement agency under Division 30 of the Public Resources Code and Title 14 of the California Code of Regulations.

Local

Sacramento County General Plan. Applicable goals and policies from the Public Facilities Element of the Sacramento County General Plan that address solid waste are as follows:

Solid Waste Services and Facilities

Goal: Land use compatibility with all solid waste facilities.

> **Policy PF-21:** Property buffering the County landfill shall remain in agricultural, recreational or other open space uses and extend at least 2,000 feet in all directions, measured from the landfill's permitted boundary, unless the Department of Waste Management and Recycling determines that the use is compatible with landfill operations and the Board of Supervisors makes the finding that the uses are compatible with the existing or future operations of the landfill (Sacramento County 2011).

Galt General Plan. Solid waste is addressed in the Galt General Plan Public Facilities and Services Element. The applicable policy is as follows.

Solid Waste Collection and Disposal

> **Policy PFS-5.3:** Solid Waste Facilities. The City shall require that all solid waste facilities be located in areas free of incompatible land uses and prohibit future incompatible land uses on surrounding lands (Galt 2009a).

Rancho Cordova General Plan. The policy in the Rancho Cordova General Plan Natural Resources Element applicable to solid waste is as follows.

> **Policy NR.8.1:** Support recycling efforts by developing a set of programs to educate residents on recycling and provide recycling services (Rancho Cordova 2006a).

12.1.1.6 Parks and Recreation

State

Quimby Act. The Quimby Act states that the legislative body of a city or county may, by ordinance, require the dedication of land or impose a requirement of the payment of fees in lieu thereof, or a combination of both, for park or recreational purposes as a condition to the approval of a tentative or parcel map. The Quimby Act only applies to the acquisition of new parkland and does not apply to the physical development of new park facilities or associated operations and maintenance costs. The Quimby Act effectively preserves open space needed to develop parkland and recreational facilities; however, the designation of parks and other recreational facilities is subject to discretionary approval and is evaluated on a case-by-case basis with new residential development. The Quimby Act also finds that a minimum of 3 acres, up to a maximum of 5 acres, of park area is required per 1,000 persons.

Local

Sacramento County General Plan. Applicable goals and policies from the Public Facilities Element of the Sacramento County General Plan that address parks and recreation are as follows:

Local and Regional Park Acquisition, Development, and Maintenance

Goal: Adequate and well-funded local and regional park facilities serving existing and newly developing neighborhoods.

Policy PF-122: To help assure that local recreation and park district Master Plan standards for levels of service may be achieved and maintained, the County may require new development to dedicate land, pay in-lieu fees, development impact fees, or otherwise contribute a fair share to the acquisition and development of parks and recreation facilities. For development in infill areas where land dedication may not be practical, the County in cooperation with the affected park district may explore creative alternatives for providing park and recreation facilities.

Policy PF-123: At a minimum, new residential developments approved by the County shall provide sites for local parks for their prospective residents consistent with the Quimby Act and the land dedication standards for each local recreation and park district adopted by Sacramento County in Chapter 22.40 of the Sacramento County Code. These requirements may be satisfied by land dedication, payment of fees in lieu of dedication, or on-site improvements per the provisions of Chapter 22.40, which will be regularly updated to reflect changing demography. These include the baseline standard of three

acres of land for parks per 1,000 residents or in cases where existing parklands within a park district exceed three acres per 1,000 population, that higher ratio shall be the standard for new developments up to a maximum of five acres of land for parks per 1,000 residents based on calculations specified in SCC Chapter 22.40.

Policy PF-124: Consistent with its infill development standards and mixed use Commercial Corridor plans, the County in consultation with the local recreation and park districts shall encourage new infill and Corridor development projects to provide small plazas, pocket parks, civic spaces, and other gathering places that are available to the public to help encourage pedestrian activity, meet recreational needs and service standards consistent with Smart Growth principles.

Policy PF-125: The County shall promote the provision of on-site recreational amenities and gathering places that are available to the public by large scale development projects and may consider providing incentives such as density bonuses or increases in building coverage for that purpose.

Policy PF-126: Encourage local park districts to develop user fee supporting recreation programs for those activities that go beyond providing for basic recreation needs. Examples include sports leagues, tennis and other court complexes, leisure enrichment classes for all ages, aquatic centers and splash parks, and community centers.

Policy PF-127: Require new residential developments to participate in park O & M financing mechanisms where established by local park districts or the County.

Policy PF-128: Encourage park development adjacent to school sites and the formation of joint use agreements between school and park districts.

Policy PF-129: In cooperation with local park districts and County Regional Parks, the County shall assist in establishing permanent financing systems for the purpose of supporting an adequate level of park services and maintenance (Sacramento County 2011).

Sacramento County Pedestrian Master Plan. The Sacramento County Pedestrian Master Plan (SACDOT 2007) was conceived to improve pedestrian safety and access on public streets within the unincorporated portions of Sacramento County. The goal is to optimize the pedestrian experience, to provide safe and usable pedestrian facilities for all pedestrians, and to assure compliance with all federal, state, and local regulations and standards. The Pedestrian Master Plan identifies a number of pedestrian projects within the Planning Area, including sidewalks/ asphalt walkways along Dillard Road, Twin Cities Road, and Latrobe Road. The Pedestrian Master Plan focuses only on public streets and not on off-road trails.

Galt General Plan. Parks and recreation are addressed in the Galt General Plan Public Facilities and Services Element. Applicable goals and policies are as follows:

Parks and Recreational Open Space

Policy PFS-8.1: Parks/Resident Ratio. The City shall require new development to provide for park acreages at a minimum of 5 acres/1,000 acres and make land acquisition for parks and open space a recreation priority.

Policy PFS-8.11: Park Linkages. The City shall encourage pedestrian and bicycle trail linkages between parks, open space areas, wildlife habitat, and significant community activity centers.

Policy PFS-8.12: Natural Resource Protection in Park and Open Space Design. The City shall incorporate natural resource protection, wildlife habitat, and stormwater quality techniques into parks and open space design to encourage sustainability (Galt 2009a).

Rancho Cordova General Plan. The Rancho Cordova General Plan Open Space, Parks, and Trails Element includes policies for parks and recreation. Applicable goals and policies are as follows:

Goal OSPT.3: Create a system of pedestrian and bicycle trails that maximize usage while providing places for walking and bicycling without conflicts with motor vehicles.

Policy OSPT.2.3: Maximize the potential benefits of natural resource mitigation lands within urban development.

Policy OSPT.3.1: Develop a trails system that provides for maximum connectivity, so that all trails are linked for greater use as recreational and travel routes (Rancho Cordova 2006a).

12.1.1.7 Energy

Local

Sacramento County General Plan. Applicable objectives and policies from the Public Facilities Element of the Sacramento County General Plan that address energy are as follows:

General Energy Facility Policy

Objective: Minimize the health, safety, aesthetic, cultural, agricultural and biological impacts of energy facilities in Sacramento County.

Policy PF-69: Cooperate with the serving utility to minimize the potential adverse impacts of energy production and distribution facilities to environmentally sensitive areas by, when possible, avoiding siting in the following areas:

- Wetlands.
- Permanent marshes.
- Riparian habitat.
- Vernal pools.
- Oak woodlands.
- Historic and/or archaeological sites and/or districts

Electric Distribution Policy

Objective: Ensure the provision or safe, reliable, efficient and economical electric service while minimizing potential land use conflicts, and health, safety, environmental, and aesthetic impacts of transmission facilities.

Policy PF-83. New transmission corridors should be identified in all master plans created for new growth areas.

Policy PF-84. New transmission lines constructed within existing and planned urban areas should utilize existing transmission corridors whenever practical. Secondary preferred locations are adjacent to railway and freeway corridors when feasible.

Policy PF-85. To minimize visual impacts and protect the county's visual and aesthetic resources new bulk substations should be located in industrial and non-retail commercial areas when possible. To further minimize visual intrusion and potential land use conflicts, substations shall be enclosed with site-appropriate security fence in concert with a landscaped setback along all public street frontages.

Policy PF-89. Wherever feasible, utilize existing transmission poles to accommodate new overhead transmission lines. If practical, existing and future transmission corridors should be shared by more than one utility company subject to the Northern California Joint Pole Agreement.

Policy PF-90. Transmission rights-of-way should avoid bisecting parcels wherever possible.

Policy PF-91. Careful consideration shall be taken when transmission lines cross farmland. The crossing of prime or statewide importance farmland with

transmission lines should be avoided whenever possible. In those cases when crossing farmland in these categories is unavoidable, the County should recommend routing of the lines along the periphery of the site as the preferred alternative.

Policy PF-92. Transmission lines should avoid to the greatest extent possible, cultural resources and biological resources such as wetlands, permanent marshes, riparian habitats, vernal pools, and oak woodlands. When routed through such areas, transmission lines should have maximum line spans and cross at the narrowest points which involve minimal cutting and cropping of vegetation, maintaining the drainage regime of wetland basins. Additionally, when feasible, such routes should be maintained to serve as biological dispersion corridors between areas of high biodiversity.

Policy PF-95. Transmission lines should avoid paralleling recreation areas, historic areas, rural scenic highways, landscaped corridors, drainage basins, wetland mitigation, tree planting, and designated federal or state wild and scenic river systems, although these areas may be considered as options if facilities already exist there.

Policy PF-101. Route new overhead sub-transmission lines within existing transmission line corridors, along railroad tracks, or major roadways. In an effort to reduce the visual impact of new lines combine circuits on existing 69 kV power poles, wherever feasible.

Natural Gas Production and Distribution Facility Policy

Objective: Distribute natural gas safely and efficiently, and withdraw underground gas reserves in an environmentally sensitive manner.

Policy PF-113. Route new high pressure gas mains within railway and electric transmission corridors, along collector roads, and wherever possible, within existing easements. If not feasible these gas mains shall be placed as close to the easement as possible.

Coordination With Energy Providers

Objective: Well-planned and timely siting of efficiently operating energy delivery facilities.

Policy PF-117. All Community Plans shall include an Energy Facility Siting Element which indicates the location of existing and planned energy facilities. Community Plan Siting Elements and SMUD's Electric Study Plans for the corresponding area shall be consistent.

Policy PF-118. All tentative subdivision maps should identify the location of all utility easements sufficient to accommodate existing and future needs as determined by SMUD and PG&E (Sacramento County 2011).

Galt General Plan. Gas and electric services are addressed in the Galt General Plan Public Facilities and Services Element. The applicable policy is as follows:

> **Policy PFS-11.4:** Coordination with Utility Providers. The City should coordinate with gas and electricity service providers to locate and design gas and electric systems to minimize environmental and other impacts to existing and future residents (Galt 2009a).

Rancho Cordova General Plan. The Rancho Cordova General Plan Infrastructure, Services, and Finance Element includes no applicable goals or objectives.

12.1.1.8 Mosquito Abatement

Federal

Mosquito Abatement for Safety and Health Act. The Mosquito Abatement for Safety and Health Act authorizes grants through the Centers for Disease Control and Prevention for mosquito programs to prevent mosquito-borne diseases. It also requires the National Institute of Environmental Health Sciences to conduct or support research into methods for controlling the populations of insects and vermin that transmit deadly diseases to humans.

State

Mosquito Abatement and Vector Control District Law Act (California Health and Safety Code, Section 2000–2007). The Mosquito Abatement and Vector Control District Law Act was adopted to help protect people from health risks associated with mosquitos. The act provides the basis for creating Mosquito Abatement Districts throughout the state, including the Sacramento–Yolo Mosquito and Vector Control District that covers the Planning Area.

California Mosquito-Borne Virus Surveillance and Response Plan. This plan describes an enhanced surveillance and response program for mosquito-borne viruses in the State of California. Implementation obligations are shared across the California Department of Public Health, the Mosquito and Vector Control Association of California, and the University of California at Davis.

Local

Sacramento County General Plan. The applicable policy from the Conservation Element of the Sacramento County General Plan that addresses mosquito abatement is as follows:

> **Policy CO-71:** Development design shall help protect natural resources by:
>
> - Minimizing total built development in the floodplain, while designing areas of less frequent use that can support inundation to be permitted in the floodplain,

- Ensuring development adjacent to stream corridors and vernal pools provide, where physically reasonable, a public street paralleling at least one side of the corridor with vertical curbs, gutters, foot path, street lighting, and post and cable barriers to prevent vehicular entry.
- Projects adjacent to rivers and streams shall integrate amenities, such as trail connectivity, that will serve as benefits to the community and ecological function.
- Siting of wetlands near residential and commercial areas should consider appropriate measures to minimize potential for mosquito habitation.
- Development adjacent to steam corridors and vernal pools shall be designed in such a manner as to prevent unauthorized vehicular entry into protected areas (Sacramento County 2011).

Galt General Plan. The Galt General Plan does not contain any policies related to mosquito abatement.

Rancho Cordova General Plan. The Rancho Cordova General Plan Natural Resources Element includes the following policy applicable to mosquito abatement:

> **Policy NR.5.6:** Incorporate Storm Water, Urban Runoff, and Wetland Mosquito Management Guidelines and Best Management Practices into the design of water retention structures, drainage ditches, swales, and the construction of mitigated wetlands in order to reduce the potential for mosquito-borne disease transmission (Rancho Cordova 2006a).

12.1.2 Planning Area Public Services and Facilities

This section describes the existing fire and law enforcement, parks and recreational facilities, and water and wastewater infrastructure that serve the Planning Area. Solid waste disposal, energy facilities, and existing mosquito abatement activities are also described.

12.1.2.1 Fire Protection and Emergency Services

Fire protection service in the Planning Area is provided by the following independent districts: the Sacramento Metropolitan Fire District, Cosumnes Community Services District, Wilton Fire District, Herald Fire District Walnut Grove Fire Protection District, and Courtland Fire District. All fire districts provide emergency medical rescue and fire protection services. Some districts also provide advanced life support via fire department ambulances, paramedic squads, and/or by assigning firefighter/paramedics to fire engines. Most of the calls fire districts receive are for medical-related aid; a minor portion of the calls are for fire suppression (Sacramento County

2011). The California Department of Forestry and Fire Protection (CAL FIRE) provides fire protection and other emergency services for the easternmost portion of the Planning Area.

12.1.2.2 Law Enforcement

Law enforcement in the Planning Area is provided by the Sacramento County Sheriff's Department in the unincorporated areas, and within city limits, by the Galt Police Department and Rancho Cordova Police Department. In the Prairie City State Vehicular Recreation Area (described below under Parks and Recreation), California State Park Rangers who are fully sworn peace officers provide law enforcement.

12.1.2.3 Water Supply

The Sacramento County Water Agency (SCWA) is the largest water purveyor for the Planning Area. The SCWA is currently divided into eight zones. Within the Planning Area, Zones 40 and 41 overlap each other and provide water service to the portions of the Planning Area within the USB. Water for both urban land uses and non-urban demand (i.e., agriculture) is taken from surface water and local groundwater aquifers. Recycled water makes up a small percentage of the total supply within Sacramento County (Sacramento County 2010). Groundwater serving SCWA Zone 40 is provided from the Central Groundwater Basin and South Groundwater Basin. The County's Water Forum Agreement allocates a long-term supply of up to 40,900 acre-feet of groundwater per year (AFY) for Zone 40 (Sacramento County 2000). Surface water is supplied from three sources: a water rights permit issued by the SWRCB (21,700 AFY), Central Valley Project water services contracts (39,551 AFY), and wholesale water via an agreement between SCWA and Sacramento County (9,300 AFY).

SCWA has adopted a Water System Infrastructure Plan for Zone 40 (SCWA 2006), which describes the infrastructure needed to meet current and future demand as described in the Water Services Master Plan for Zone 40 (SCWA 2005). The purpose of the Water System Infrastructure Plan is to describe and quantify the facilities necessary to extract, treat, convey, and retail/wholesale groundwater; purchase wholesale water from the City of Sacramento for retail to Zone 40 customers; and treat, convey, and retail/wholesale surface water at the Vineyard Surface Water Treatment Plant (SCWA 2006). Connections between the Vineyard Surface Water Treatment Plant and customers throughout the Planning Area make up the majority of the infrastructure proposed in the infrastructure plan. Future water treatment plants, storage tanks, and pipelines are also proposed in the southeastern portion of the Planning Area (SCWA 2006).

Other water service districts located in the Planning Area include Galt and Folsom, California American Water Company, Golden State Water Company, Florin County Water District,

Fruitvale Vista Water Company, Tokay Park Water District, Omochumne–Hartnell Water District, Galt Irrigation District, Clay Water District, and Sacramento Municipal Utilities District (SMUD) Rancho Seco. These water districts and SCWA operate distribution infrastructure throughout the Planning Area. Improvements to pipelines and other underlying infrastructure are generally tied to specific development projects.

The U.S. Bureau of Reclamation operates Folsom Dam, Nimbus Dam, and the Folsom South Canal. Although the Bureau of Reclamation's original purpose was to provide for the reclamation of arid and semiarid lands in the west, its current mission covers a wider range of interrelated functions. These functions include providing municipal and industrial water supplies through the Central Valley Project: generating hydroelectric power; providing irrigation water for agriculture; improving water quality, flood control, and river navigation; providing river regulation and control and fish/wildlife enhancement; offering water-based recreation opportunities; and conducting research on a variety of water-related topics.

Regional San currently owns and operates a 5-million-gallon-per-day (mgd) water reclamation facility that has been producing Title 22 tertiary-recycled water since 2003. The water reclamation facility is located within the Sacramento Regional Wastewater Treatment Plant (SRWTP) property in Elk Grove. Regional San uses a portion of the recycled water at the SRWTP and the rest is wholesaled to the SCWA. SCWA retails the recycled water, primarily for landscape irrigation use, to select customers in Elk Grove outside the Planning Area. Regional San is not a water purveyor and any potential use of recycled water in the Planning Area must be coordinated between the key stakeholders, e.g., land use jurisdictions, water purveyors, users, and the recycled water producers.

12.1.2.4 Wastewater

The SASD and Regional San provide sewer service within the portions of unincorporated County in the USB and Rancho Cordova. Some locations within the Planning Area rely on on-site septic systems for wastewater treatment. The SASD is responsible for the construction and maintenance of sewer trunk lines, which convey wastewater to Regional San's system of interceptor lines. Regional San operates the SRWTP. ~~The SRWTP is a high-purity oxygen-activated sludge facility; it is permitted to treat an average dry weather flow of 181 million gallons per day (mgd) and a daily peak wet weather flow of 392 mgd (Sacramento County 2010). The majority of the treated wastewater is dechlorinated and discharged into the Sacramento River.~~ ~~The SRWTP is located in the westernmost portion of the Planning Area, just south of the community of Freeport.~~ **The SRWTP provides secondary treatment using an activated sludge process. The design of the SRWTP and interceptor system was balanced to have SRWTP facilities accommodate some of the wet weather flows while minimizing idle SRWTP facilities during dry weather. Regional San designed the SRWTP to accommodate**

some wet weather flows with the storage basins and interceptors designed to accommodate the remaining wet weather flows. The SRWTP is located in the westernmost portion of the Planning Area, just south of the community of Freeport. The Central Valley RWQCB issued an NPDES permit to Regional San in December 2010. In adopting the new discharge permit, the RWQCB required Regional San to meet significantly more restrictive treatment levels over its current levels. Regional San began the necessary activities, studies, and projects to meet the permit conditions in August of 2014. Regional San must complete construction of the new treatment facilities to achieve the permit and settlement requirements by May 2021 for ammonia and nitrate and May 2023 to meet these pathogen requirements. The main SASD collection system includes over 2,800 miles of sewer pipelines ranging in size from 4 to 75 inches in diameter. Regional San interceptors are a large system of pipes up to 10 feet in diameter, which carry wastewater directly to the SRWTP (Sacramento County 2010).

~~Regional San adopted the 2020 SRWTP Master Plan to identify wastewater treatment and facility needs. The Master Plan identifies treatment facilities, conveyance, and storage facilities necessary to serve anticipated population growth within the Sacramento metropolitan area and meet regulatory requirements related to discharge quality (Regional San 2008).~~ Regional San has also adopted the Interceptor Master Plan 2000, which specifies regional conveyance facility improvements (Regional San 2000) **that were further investigated in the Regional San ISS adopted in 2013**.

~~In October 2008, SASD adopted the Sewerage Facilities Expansion Master Plan Update (SASD 2008), which operates as a companion document to the SASD's Sewerage Facilities Expansion Master Plan (SASD 2004).~~ **The *2010 SASD System Capacity Plan Update* (SASD 2010) also contains** ~~I~~**i**mprovements ~~are proposed in these documents~~ to meet the demand of development anticipated within the USB (Sacramento County 2011).

The Galt Public Works Department operates Galt's sanitary sewer collection system and the wastewater treatment plant (WWTP). Galt's collection system consists of collection lines and trunk lines ranging in size from 4 to 24 inches in diameter. Sewage is lifted by sanitary sewer lift stations and placed in a 2-mile-long, 16-inch-diameter force main where it is transported to Galt's WWTP, located north of the City (Galt 2008). The WWTP has a design capacity of 3.0 mgd; however, the location and design of the plant would allow expansion to 6.0 mgd (Galt 2008). Treated water is discharged to Laguna Creek during the winter and to ponds used to irrigate land surrounding the WWTP during the summer.

Improvements to the sewer collection and treatment system are presented in Galt's Adopted Capital Improvement Program 2010–2015 (Galt 2010). These improvements include regular collection infrastructure replacement and upgrades to the City's WWTP. Galt requires new

development projects to include constructing the sanitary sewer collection system associated with the projects.

12.1.2.5 Solid Waste

The Sacramento County Department of Waste Management and Recycling provides solid waste services to the unincorporated portions of Sacramento County. The County owns and operates the 1,084-acre Kiefer Landfill, which is located in the northern portion of the Planning Area, north of the community of Sloughhouse (Sacramento County 2015). Kiefer Landfill is classified as a Class III municipal solid waste landfill facility and is permitted to accept general residential, commercial, and industrial refuse for disposal, including municipal solid waste, construction and demolition debris, green materials, agricultural debris, dead animals, and other designated debris (Sacramento County 2010). The Sacramento Regional Solid Waste Authority has certified three construction and demolition debris sorting facilities to meet the construction waste diversion rates required under the California Green Building Code: Florin-Perkins Public Disposal, L&D Landfill, and Sierra Waste (Sacramento Regional Solid Waste Authority 2015). Rancho Cordova also disposes of municipal solid waste at Kiefer Landfill.

Residential and commercial solid waste in Galt is collected by California Waste Recovery Systems and delivered to the Materials Recovery Facility in Galt to capture recyclable material. All material that is not recyclable is disposed of at a number of different landfills, including Arvin Sanitary Landfill (Kern County); Foothill Sanitary Landfill, Forward Landfill Inc., and North County Landfill (all in San Joaquin County); and L&D Landfill and Kiefer Landfill (both in Sacramento County).

12.1.2.6 Parks and Recreational Facilities

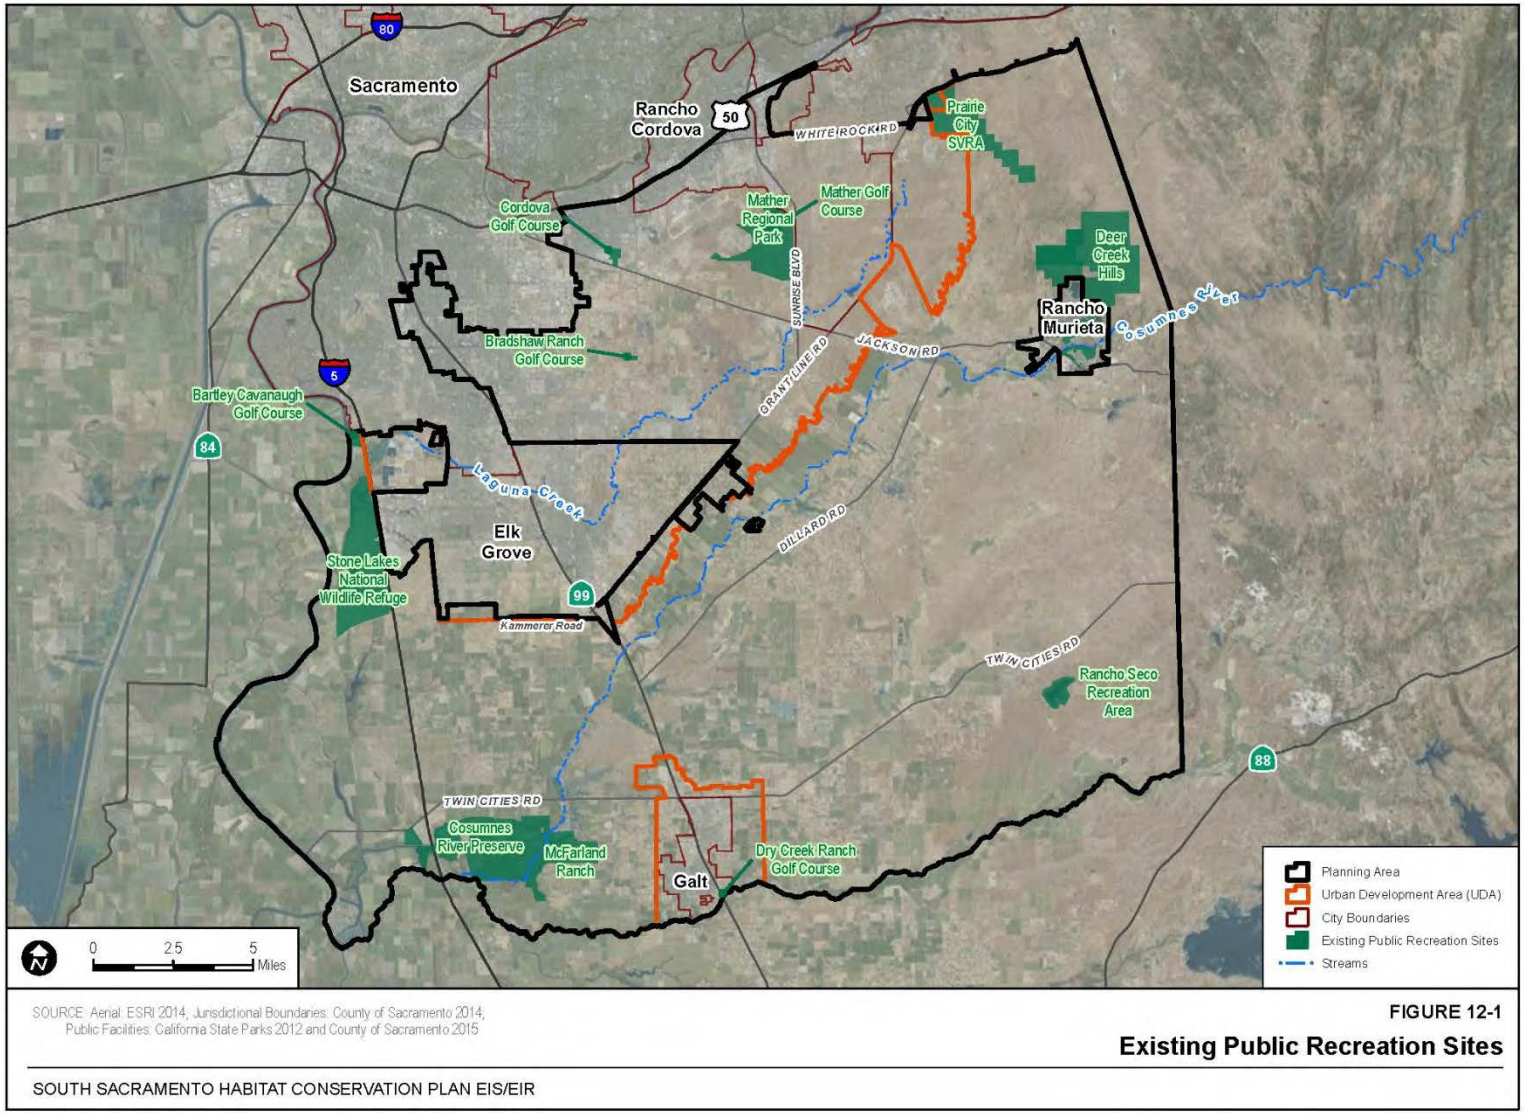
In the Planning Area, recreation services are provided by a mix of park districts, Sacramento County service areas, the County's regional park system, and the California Department of Parks and Recreation. Services within Galt are provided by Galt's Parks and Recreation Department. County Service Areas 4B (Wilton–Cosumnes) and 4D (Galt–Herald) provide park and recreation services in the eastern section of the Planning Area. The Cordova and Southgate Recreation and Park Districts provide service in the northern section of the Planning Area. County Service Area 4C (Delta) provides facilities and service in the southwestern portion of the Planning Area.

State and Regional Parks

Figure 12-1 indicates the location of the larger parks, recreation areas, and public golf courses within the Planning Area. The characteristics of these facilities are summarized in Table 12-1.

Table 12-1. Existing Regional Parks and Recreational Facilities

Facility Name	Acreage	Inside or Outside the UDA?	Owners/Managers	Activities
Cosumnes River Preserve[a]	±50,000	Outside	The Nature Conservancy, BLM, CDFW, Sacramento County, DWR, Ducks Unlimited, CSLC	Habitat preservation, agriculture, recreation, limited hunting and fishing
Deer Creek Hills[a]	±4,060	Outside	Sacramento Valley Conservancy, Sacramento County, CDFW, DPR	Habitat preservation, cattle grazing, recreation
Mather Regional Park	±1,600	Inside	Sacramento County	Vernal pool habitat, recreation
McFarland Ranch	±35	Outside	Sacramento County, Galt Area Historical Society	Recreation, education
Prairie City State Vehicular Recreation Area	±836	Outside	DPR Off-Highway Motor Vehicular Recreation Division	Recreation (off-highway vehicle use)
Rancho Seco Recreational Area[a]	±400	Outside	SMUD	Recreation
Stone Lakes National Wildlife Refuge[a,c]	±18,000	Outside	Sacramento County, USFWS	Habitat preservation, limited wildlife viewing
Mather Golf Course	±212	Inside	Sacramento County	Golf course
Cordova Golf Course	±81	Inside	Cordova Recreation and Park District	Golf course
Bradshaw Ranch Golf Course	±20	Inside	Privately owned	Golf course
Bartley Cavanaugh Golf Course	±95	Outside	Privately owned	Golf course
Dry Creek Ranch Golf Course	±5.5[b]	Outside	Privately owned	Golf course



UDA = Urban Development Area; BLM = Bureau of Land Management; CDFW = California Department of Fish and Wildlife; DWR = California Department of Water Resources; CSLC = California State Lands Commission; DPR = California Department of Parks and Recreation; SMUD = Sacramento Metropolitan Utilities District; USFWS – U.S. Fish and Wildlife Service.

[a] Facilities that are considered part of the existing Preserve System.

[b] Acreage within the Planning Area (remaining acreage is outside the Planning Area).

[c] **Stone Lakes National Wildlife Refuge has an approved boundary of approximately 18,000 acres within the Planning Area. At the time of EIS/EIR preparation, approximately 6,420 acres within that boundary have been acquired for the National Wildlife Refuge.**

Figure 12-1 Existing Public Recreation Sites

INTENTIONALLY LEFT BLANK

Cosumnes River Preserve. This more than 50,000-acre preserve is centered on the Cosumnes River outside the USB. The property consists of wildlife habitat and agricultural lands owned by The Nature Conservancy, Bureau of Land Management, California Department of Fish and Wildlife, the County, California Department of Water Resources, Ducks Unlimited, and the California State Lands Commission (Cosumnes River Preserve 2015). The Cosumnes River Preserve allows hiking, kayaking, hunting, and fishing.

Deer Creek Hills. This oak woodlands preserve area is located outside the USB, north of Rancho Murieta. The 4,062-acre preserve is owned by the Sacramento Valley Conservancy, the County, California Department of Fish and Wildlife, and the California Department of Parks and Recreation. Preserve uses include habitat preservation, cattle grazing, and public use including hiking and mountain biking (Sacramento County and Sacramento Valley Conservancy 2011).

Mather Regional Park. This regional park, located within the USB and owned by Sacramento County, consists of approximately 1,600 acres. The park contains recreational uses, including picnic areas and trails, and also provides vernal pool habitat. The park is adjacent to the 169-acre Mather Golf Course.

McFarland Ranch. This historical "living history" ranch is owned by the County and managed by the Galt Area Historical Society. The park contains the former home of John McFarland, a prominent rancher who gave Galt its name, as well as the surrounding 35 acres of land. The ranch currently serves to educate regional schools and families about pioneer life at the turn of the century (Galt Area Historical Society 2015).

Prairie City State Vehicular Recreation Area. The 836-acre state facility is located outside the USB, but within the Planning Area. This state recreation area allows the use of off-highway vehicles and other passive recreational resources (DPR 2015).

Rancho Seco Recreational Area. This 400-acre recreational area surrounding Rancho Seco Lake is owned by SMUD and is open to the public for recreational activities, including camping and hiking (SMUD 2015a).

Stone Lakes National Wildlife Refuge. The purpose of this 18,000-acre refuge, owned and operated by the U.S. Fish and Wildlife Service, is to preserve and protect two rare natural Central Valley lakes and their surrounding riparian habitat and grassland areas. The property lies within the Sacramento–San Joaquin Delta as well as within the Pacific Flyway, thereby providing wintering grounds for a variety of waterfowl and other migratory birds, as well as habitat for indigenous species such as Swainson's hawk (*Buteo swainsoni*), giant garter snake (*Thamnophis gigas*), and the valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*). The

property also contains a number of cultural resource sites. Stone Lakes National Wildlife Refuge also provides recreational trails and guided hiking and kayaking tours.

Local Parks

Numerous neighborhood and community parks exist within the Planning Area, primarily within developed residential communities. These facilities are operated by the park districts and County service areas described previously.

Golf Courses

There are numerous golf courses within the Planning Area. A description of these recreational amenities is provided below.

Mather Golf Course. This County-owned 212-acre golf course is located adjacent to Mather Regional Park, inside the USB. Like Mather Regional Park, Mather Golf Course is located on the former Mather Air Force Base. Mather Golf Course was one of the first golf courses in California to become fully designated as a Certified Audubon Cooperative Sanctuary.

Bradshaw Ranch Golf Course. This 20-acre golf course is located south of Jackson Highway and north of Gerber Road within the Planning Area. This golf course is privately owned and operated.

Bartley Cavanaugh Golf Course. This 95-acre golf course is located in the community of Freeport, west of Interstate 5, within the Planning Area. This golf course is privately owned and managed.

Dry Creek Ranch Golf Course. Located in Galt, a portion of this golf course is located just south of the Planning Area. The course is privately owned and operated.

12.1.2.7 Energy

SMUD and Pacific Gas & Electric Company (PG&E) provide electricity services to the Planning Area. SMUD serves a population of 1.4 million users in a 900-square-mile service area. SMUD derives its power from a variety of sources, including biomass, geothermal, solar, wind, hydroelectric, and natural gas (SMUD 2014). SMUD operates the gas-powered Cosumnes Power Plant and the Upper American River Project (SMUD 2015b). In 2013, SMUD generated 10,467 gigawatt-hours of electricity (CEC 2015).

PG&E's power is generated in fossil-fueled plants, hydroelectric powerhouses, geothermal generators, solar energy facilities, and a nuclear power plant.[1] PG&E also buys power from

[1] PG&E's Diablo Canyon Power Plant is planned for closure in 2026.

independent power producers and other utilities. According to its website, PG&E provides service to approximately 5.4 million customers in Northern and Central California and has approximately 18,616 miles of interconnected transmission lines and 141,215 miles of distribution lines (PG&E 2016). PG&E's services are provided in accordance with California Public Utilities Commission rules and regulations. PG&E also supplies natural gas to homes and businesses in the Planning Area.

Kiefer Landfill operates a gas-to-energy plant (which collects gas from decaying garbage and converts it into energy) that powers 8,900 homes in the Sacramento area (Sacramento County 2015).

SMUD and PG&E operate a variety of existing energy facilities within the Urban Development Area (UDA).[2] Expansions to infrastructure and/or construction of new facilities are generally tied to new development.

12.1.2.8 Mosquito Abatement

The Sacramento–Yolo Mosquito and Vector Control District (District) provides mosquito and other vector surveillance and control services in compliance with the state's Mosquito Abatement and Vector Control District Law Act (California Health and Safety Code, Sections 2000–2007). Recognizing that organisms such as mosquitos can serve as vectors of human disease pathogens, the District acts to minimize public health risks by controlling vector populations in Sacramento and Yolo Counties.

Mosquito and vector control is based on an integrated pest management approach, including public information and education, surveillance, biological control, physical control, and microbial and chemical control. Biological control consists of the use of living organisms to reduce pest population levels. Biological control efforts use predators (like mosquitofish (*Gambusia affinis*) or guppy (*Poecilia reticulata*)), parasites, or pathogens to attack the harmful vector. Physical control measures reduce environmental conditions that support vectors, such as standing water, wetlands/irrigated farmland, and contained areas of water. Examples of physical control practices include promoting effective drainage; controlling emergent vegetation; promoting the appropriate timing of irrigation; and encouraging mosquito-reduction best management practices (BMPs) in urban, agricultural, and conservation areas

[2] As discussed in Section 1.1.1, Geographic Scope of the EIS/EIR Planning Area, the term Urban Development Area is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, the term "UDA" means all lands within the County's USB that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within the City of Galt's sphere of influence (see Figure 1-1).

(Sacramento–Yolo Mosquito and Vector Control District 2013). The Ecological Management Department of the District has developed a BMP manual for land-use-specific mosquito reduction activities (Sacramento–Yolo Mosquito and Vector Control District 2008). Microbial and chemical control methods use chemical compounds such as insecticides to reduce mosquito populations. Microbial/chemical control methods are typically applied when other methods have been unsuccessful or when rapid disruption of disease spread is needed (Sacramento–Yolo Mosquito and Vector Control District 2013).

The District makes inspections and responds to customer requests for service. Surveillance research provides information on mosquito and vector dynamics in Sacramento and Yolo Counties to guide effective control practices. The District also conducts regular educational outreach (Sacramento–Yolo Mosquito and Vector Control District 2013).

12.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

12.2.1 Methodology for Assessing Impacts of Each Alternative on Public Services and Facilities

Impacts on public services and facilities were assessed on the basis of the alternatives, and the existing services or facilities provided within the Planning Area. Impacts are identified where the actions or projects associated with the alternative would affect the ability of the service providers to provide necessary services now as well as in the future. As described in Section 3.6.1, EIS/EIR Environmental Baseline, impacts of the No Action/No Project Alternative were determined using a baseline of existing conditions. The impacts of the two Action Alternatives were evaluated using a baseline of the No Action/No Project future condition. Potential ways that alternatives could affect the ability of service providers would be by increasing service demand, encouraging growth in areas where services are not available to accommodate that growth, impeding the ability of service providers to deliver services, impeding development of planned expansion areas, or damaging existing or planned infrastructure. The projects and activities expected under each alternative, including establishment of preserves, are described in Chapter 2, Alternatives, Including the Proposed Action/Proposed Project Alternative.

The locations of future preserves, vernal pools, and wetland waters could require developers to adjust the routes of future public infrastructure within the Mather Core Recovery Area (MCRA). To identify areas where these adjustments might be required, the lead agencies used GIS methodology, described in Section 3.6.5, GIS Methodology Used in Chapters 4–16 to Estimate Direct Impacts of Each EIS/EIR Alternative, to identify where infrastructure related to water

supply, sewer services, and landfill space expected under each alternative could intersect with future preserve locations, vernal pools, or wetlands.

To identify potential impacts of the No Action/No Project Alternative on mosquito abatement programs, for each alternative the lead agencies quantified the acres of vernal pools and other aquatic land cover types that would be protected within preserves or re-established/ established for compensatory mitigation. The lead agencies assumed that mosquito abatement activities would be limited within these protected resources, so that application of pesticides or introduction of predatory species such as mosquitofish would not be allowed.

As discussed in Section 3.7, Cumulative Effects Analysis in Resource Chapters 4 through 16, the Chapter 12 cumulative analyses of impacts to public services and facilities will consider (1) the effects of past and present urban development in the Planning Area (see Section 12.1.2, Planning Area Public Services and Facilities), and (2) future impacts expected from reasonably foreseeable other projects in the Planning Area (see Section 3.7). The cumulative analysis of each EIS/EIR alternative will then consider whether the incremental impacts of the alternative on public services and facilities would be significant (i.e., cumulatively considerable).

As discussed in Section 3.4, Previous Planning Area Environmental Reviews, the EIR documents previously prepared for the General Plans of Sacramento County and Galt and Rancho Cordova (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006b) analyzed direct and cumulative impacts of urban growth planned within their jurisdictions, including impacts to public services and facilities. When the impact analysis or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief summary or description of the incorporated information or analysis is provided in Sections 12.2.2, 12.2.3, and 12.2.4.

However, as discussed in Section 3.4, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2008; Rancho Cordova 2006b) and 2050 (Sacramento County 2010)—and the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3, EIS/EIR Study Period). As discussed in Section 3.4, the EIRs for the Rancho Cordova General Plan and Galt General Plan analyzed full buildout of those jurisdictions. However, additional urban development can be expected to occur in Sacramento County during the 35 years after the General Plan EIR study period ended, and before this EIS/EIR's study period ends in 2065. Consequently, the impact analyses and conclusions incorporated from the *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR) may not have considered all of the future urban development that is included in the Chapter 2 project description of each EIS/EIR alternative. Therefore, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the three General Plan EIRs along

with the effects of all urban development activities and projects that are included in the description of each EIS/EIR alternative.

The lead agencies determined that the study area for determining the cumulative impacts of each alternative on public services and utilities varies depending on the service.

The cumulative study area for each resource area topic is defined below.

- **Fire Protection.** Cumulative study area is the Planning Area, which includes combined service areas for the Sacramento Metropolitan Fire District, Cosumnes Community Services District, Wilton Fire District, Herald Fire District, Walnut Grove Fire Protection District, Courtland Fire District, and CAL FIRE.
- **Law Enforcement.** Cumulative study area is the Planning Area, which includes areas under the jurisdiction of the Sacramento County Sheriff Department, Galt Police Department, and Rancho Cordova Police Department.
- **Water Supply.** Cumulative study area is the combined service areas of SCWA, Galt and Folsom, California American Water Company, Golden State Water Company, Florin County Water District, Fruitvale Vista Water Company, Tokay Park Water District, Omochumne–Hartnell Water District, Galt Irrigation District, Clay Water District, and SMUD Rancho Seco.
- **Wastewater Treatment.** Cumulative study area is the combined service area of SASD and Regional San.
- **Solid Waste.** Cumulative study area is the combined service areas of Kiefer Landfill (Sacramento County); Arvin Sanitary Landfill (Kern County); Foothill Sanitary Landfill, Forward Landfill Inc., and North County Landfill (San Joaquin County); and L&D Landfill (Sacramento County).
- **Parks and Recreation.** Cumulative study area is the Planning Area, which includes the service area of the County's regional park system; Galt's Parks and Recreation Department; County Service Areas 4B (Wilton–Cosumnes), 4D (Galt–Herald), and 4C (Delta); and the Cordova and Southgate Recreation and Park Districts.
- **Energy.** Cumulative study area is the combined service area for SMUD (electricity) and the portion of the PG&E (natural gas and electricity) service area that includes Sacramento County.
- **Mosquito Abatement.** Cumulative study area is the jurisdictional boundary of the Sacramento–Yolo Mosquito and Vector Control District, which includes over 2,000 square miles in Sacramento and Yolo Counties.

As discussed in Section 3.8.1, Significance Thresholds, the criteria used to evaluate the significance of each alternative's impacts on public services and facilities are based on

Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and on typical thresholds used to evaluate impacts in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse impact could occur if the alternative would:

1. Result in substantial adverse physical impacts associated with the provision of law enforcement services or fire protection;
2. Result in substantial adverse physical impacts associated with the provision of emergency services;
3. Result in inadequate water supply for full buildout of the project;
4. Result in inadequate wastewater treatment and disposal facilities for full buildout of the project;
5. Result in substantial adverse physical impacts associated with the construction of new water supply or wastewater treatment and disposal facilities or expansion of existing facilities;
6. Result in substantial adverse physical impacts associated with the provision of park and recreation services, or result in substantial physical deterioration of an existing facility due to increased use;
7. Result in a service demand that cannot be met by existing or reasonably foreseeable future service capacity;
8. Be serviced by a landfill with insufficient permitted capacity to accommodate the project's solid waste disposal needs;
9. Result in substantial adverse physical impacts associated with the provision of electric or natural gas service; or
10. Create new breeding areas for mosquitos or interfere with existing mosquito abatement activities to the extent that public health would be substantially affected.

Appendix G of the CEQA Guidelines does not provide suggested criteria for determining a beneficial effect. The following criteria were developed by the lead agencies. A beneficial impact could occur if the alternative would:

1. Improve or increase provision of law enforcement services or fire protection;
2. Improve or increase provision of emergency services;
3. Increase water supply at full buildout of the project;
4. Improve or increase capacity of wastewater treatment and disposal facilities at full buildout of the project;
5. Reduce adverse physical impacts associated with the construction of new water supply or wastewater treatment and disposal facilities or expansion of existing facilities;

6. Reduce adverse physical impacts associated with the provision of park and recreation services, or reduce physical deterioration of an existing facility that could be caused by increased use;
7. Reduce a service demand that cannot be met by existing or reasonably foreseeable future service capacity;
8. Reduce solid waste disposal needs in an area with served by a landfill with insufficient permitted capacity;
9. Reduce adverse physical impacts associated with the provision of electric or natural gas service; or
10. Reduce breeding areas for mosquitos or improve existing mosquito abatement activities to the extent that public health would be beneficially affected.

The impact analysis for the three EIS/EIR alternatives will consider the context, intensity, and severity of potential impacts to each of these impact criteria and will present a separate determination of significance for each of these criteria.

12.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2.

12.2.2.1 Law Enforcement, Fire Protection, and Emergency Services

Direct and Indirect Effects of the Alternative

The effects of future urban development and the increased demand for public services and facilities in Sacramento County and Galt and Rancho Cordova, including the Planning Area, were evaluated in the analysis of the EIRs listed in Section 3.4. As discussed in Section 12.2.1, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR; County of Sacramento 2010) determined that within Sacramento County:

- Increased demand on law enforcement and fire and emergency services for the entire County, including portions outside the Planning Area, would result in less than significant impacts through buildout of the general plan (Sacramento County 2010, pp. 4-19 to 4-41). General plan policies direct that law enforcement services maintain a particular ratio of officers to population. Any new proposed development would, under discretion of the Board of Supervisors, be required to pay mitigation fees to fund

adequate fire protection and emergency medical response if existing methods of financing are inadequate.

The impact analysis presented in the *Final Environmental Impact Report for the 2030 Galt General Plan* (Galt General Plan EIR; Galt 2009b), determined that within Galt's sphere of influence (SOI):

- Increased demand for law enforcement would be less than significant with mitigation. Future response times for fire protection and emergency services would be significant and unavoidable with mitigation (Galt 2008, pp. 6-5 to 6-47). The Galt General Plan EIR found this impact significant and unavoidable because addressing staffing and facility needs for fire protection would require cooperation and funding from entities other than Galt.

The impact analysis presented in the *City of Rancho Cordova General Plan Final EIR* (Rancho Cordova General Plan EIR; Rancho Cordova 2006b), determined that within Rancho Cordova:

- Increased demand for fire protection services and law enforcement would be less than significant (Rancho Cordova 2006b, pp.12-28 to 12-109).

As discussed in Section 3.4 and Section 12.2.1, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b; Rancho Cordova 2006b) and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur in Sacramento County and Galt and Rancho Cordova in the years after their General Plan EIR study periods end and until this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs and the Capital Southeast Connector EIR, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

Additional urban development in the Planning Area beyond that considered in the previous EIRs would result in additional demand for law enforcement, fire, and emergency services in the Planning Area. Anticipated future urban development would be consistent with the goals and policies listed in Section 12.1.1, specifically Galt General Plan Policies PFS-7.1 and PFS-6.2, which state that Galt shall continue to support the Cosumnes Community Services District Fire Department, emergency medical services, and police department to meet the needs of the

community; Rancho Cordova General Plan Policy S.9.1, which ensures that Rancho Cordova cooperates with the Sacramento Metropolitan Fire District to reduce fire hazards; and Rancho Cordova General Plan Policy S.8.1, which ensures that the City provides adequate police services to ensure sufficient staffing and resources are available to serve local needs. The lead agencies anticipate that the additional demand in the final 15 (for Rancho Cordova) to 35 years (for Sacramento County) of the EIS/EIR study period would result in less than significant impacts to fire protection and law enforcement in the jurisdictions of Sacramento County and Rancho Cordova. In addition, less than significant impacts would occur to law enforcement in Galt. However, development in Galt and the Galt SOI over the final 35 years of the EIS/EIR study period would add a further burden to the fire protection resources in Galt, incrementally adding to an impact that was identified as significant and unavoidable (Galt 2008).

As explained in Section 2.2, approximately 1,900 acres of planned urban development would be shifted or displaced to locations outside the UDA under the No Action/No Project Alternative. As more development occurs adjacent to open space, the risk of wildfire posing a danger to people and property would increase, as would the likelihood of a human-initiated wildfire. Fire suppression, fuel reduction, and fire planning efforts of local fire departments would continue, and assistance with wildland fires from CAL FIRE would continue (USFS 2015). The presence of additional urban development outside the UDA under the No Action/No Project Alternative would result in increased demand for fire protection services. However, new urban development outside the UDA would, under the discretion of the Board of Supervisors, be required to pay mitigation fees to fund adequate police, fire protection, and emergency medical response if existing methods of financing are inadequate.

As explained in Section 2.2, No Action/No Project Alternative, under the No Action/No Project Alternative, mitigation for impacts to listed species or wetlands from new urban development would continue to include avoidance and compensation, including establishment of on-site or off-site preserves. Preserve management could include a variety of habitat management activities, such as fence repair, transport of livestock for grazing management, and maintenance and monitoring visits from Preserve Managers. These types of activities would not generate an increase in demand for police services. However, many of these preserves established under the No Action/No Project Alternative would be located in the UDA and would eventually be surrounded by urban development. Vandalism, trespassing, and illegal hunting could occur in areas set aside for preserves, especially for preserves near urban development and preserves without active management. However, those same lands could also be subject to vandalism, trespassing, or illegal hunting under existing conditions. Therefore, the presence of preserves would not increase the need for law enforcement and thus would not result in the need to hire new officers or construct new stations.

Because some preserves would likely be established in remote or rural areas, wildland fires could be a concern. Fire suppression, fuel reduction, and fire planning efforts of local fire departments would continue, and assistance with wildland fires from CAL FIRE would also continue (USFS 2015). Preserves established as mitigation for urban development impacts under the No Action/No Project Alternative may also use prescribed fire to manage grassland biomass and improve habitat values. Prescribed burns provide ecological benefits, including nutrient recycling and the removal of weeds and other unwanted species. Unlike wildfire, prescribed burns occur at pre-designated locations and times for maximum control and are intended to reduce the amount of vegetative fuels that could produce a larger, uncontrolled fire with a greater chance of threatening human communities. The Cosumnes Community Services District, Sacramento County, and CAL FIRE issue burn permits that control the scope, location, and timing of prescribed burns. In order to regulate air quality impacts associated with burning activities, the Sacramento Metropolitan Air Quality Management District schedules planned burn days. Prescribed burns would occur on scheduled burn days to minimize air quality impacts. CAL FIRE and other local fire protection agencies would need to oversee these controlled burns in order to maximize safety of human communities and habitat benefits. Adherence to existing controlled burn policies would minimize impacts associated with prescribed burns. The overall increase in demand for fire protection services associated with development analyzed in the General Plan EIRs captures the small increase in fire protection needs from preserve activities. Any prescribed burning activities under the No Action/No Project Alternative would be highly regulated and would not substantially increase demand for local fire departments or CAL FIRE beyond current levels.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, Reasonably Foreseeable Other Actions, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for law enforcement, fire protection, and emergency services. Existing funding mechanisms have ensured that law enforcement, fire protection, and emergency services were expanded to meet that demand.

Reasonably foreseeable other future projects in the cumulative study area that would further increase demand for law enforcement, fire protection, and emergency services include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. This reasonably foreseeable development would be subject to the same, or similar, funding mechanisms to ensure that law enforcement, fire protection, and emergency services are expanded to meet demand. Therefore, the effects of past, present, and reasonably foreseeable other future projects would have a less than significant adverse cumulative effect on law enforcement, fire protection, and emergency services.

Development under the No Action/No Project Alternative would include additional demand for police and fire services after the time frame evaluated in General Plan EIRs of Rancho Cordova and Galt and Sacramento County, ranging from 15 to 35 additional years. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. However, existing funding mechanisms for law enforcement, fire protection, and emergency services would ensure that the new development would also provide new funding for these services. The additional increment of development under the No Action/No Project Alternative to the effects of past, present, and reasonably foreseeable other projects would result in a less than significant adverse cumulative effect on law enforcement, fire protection, and emergency services.

12.2.2.2 Water and Wastewater Services

Direct and Indirect Effects of the Alternative

The effects of future urban development and the increased demand for potable water service and wastewater treatment in Sacramento County and Galt and Rancho Cordova, including the Planning Area, were evaluated in the analysis of the EIRs listed in Section 3.4. As discussed in Section 12.2.1, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the Sacramento County General Plan EIR (Sacramento County 2010) determined that within Sacramento County:

- Increased demand for water supply within Zone 40 and in the California American Water Company's South Area would be significant and unavoidable and the increase in water demand would require new treatment facilities and pipelines that would also result in significant and unavoidable impacts. Impacts to groundwater recharge from increases in impervious surfaces were determined to be significant and unavoidable (Sacramento County 2010, pp. 6-22 to 6-87).
- Increased demand for water supply outside Zone 40 and the California American Water Company's South Area would be less than significant with implementation of a policy that requires that availability of water supply be demonstrated for a new development before building permits are issued (Sacramento County 2010, p. 6-53).
- The increase in demand for sewer treatment would result in significant unavoidable impacts because flows would exceed permitted capacity even with policy compliance (Sacramento County 2010, pp. 5-12 to 5-22). ~~However, this finding was based on pending litigation at the time of the Sacramento General Plan EIR that brought into question the ability of Regional San to expand its wastewater treatment capacity. That~~

~~litigation was resolved and Regional San is now in the process of constructing a tertiary treatment facility that will expand their permitted capacity to accommodate projected development in the Planning Area. With this new information, the lead agencies expect that the previously identified significant unavoidable impact to sewer treatment would be revised to less than significant~~. **At this time, there are no plans to expand the capacity of Regional San facilities beyond the existing permitted capacity, so this impact would remain significant and unavoidable.**

The impact analysis presented in the Galt General Plan EIR (Galt 2009b) determined that within the Galt SOI:

- Increased demand for water supply would be less than significant because with water conservation programs, buildout of the general plan would not in itself trigger the need for new or expanded surface water supply entitlements and future demands would be met through additional groundwater pumping (Galt 2008, pp. 6-5 to 6-47).
- Increased demand for wastewater treatment would result in significant and unavoidable impacts because flows would exceed permitted capacity at the City's wastewater treatment plant, even with compliance with general plan policies, and the City could not identify a timeframe for the needed upgrades to the plant (Galt 2008, pp. 6-5 to 6-47).

The impact analysis presented in the Rancho Cordova General Plan EIR (Rancho Cordova 2006b) determined that within Rancho Cordova:

- Increased demand for adequate water supply and treatment would result in significant and unavoidable impacts because projected development would require additional treatment capacity, storage capacity, and other conveyance facilities to meet the projected water demands (Rancho Cordova 2006b, pp. 12-28 to 12-109).
- Increased demand for wastewater treatment would be significant and unavoidable despite recommended mitigation because projected development would substantially increase wastewater flows and require additional infrastructure and may require additional treatment capacity to accommodate anticipated demands (Rancho Cordova 2006b, pp. 12-28 to 12-109).

As discussed in Section 3.4 and Section 12.2.1, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b; Rancho Cordova 2006b) and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur in Sacramento County and Galt and Rancho Cordova in the years after their General Plan EIR study periods end and until this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban

development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs and the Connector EIR, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

Additional urban development would result in additional demand for potable water service and wastewater treatment in the Planning Area. The lead agencies anticipate that this additional increment of development in the Planning Area through 2065 would increase the severity of the significant and unavoidable impacts to potable water supply and wastewater treatment identified previously for Sacramento County, Rancho Cordova, and Galt.

Additionally, as explained previously in this chapter and in Section 2.2.2, Expected Regulatory Environment Under the No Action/No Project Alternative, approximately 1,900 acres of planned urban development would be shifted or displaced from inside the MCRA to one or more locations outside the current Sacramento County USB boundary under the No Action/No Project Alternative. This displaced urban development may be located in areas that are not currently served by adequate water or wastewater infrastructure and would thus require construction of new water or wastewater infrastructure outside the current USB boundary.

Under the No Action/No Project Alternative, there would be no comprehensive aquatic resource permitting program in place. New water or wastewater infrastructure projects would have to seek individual permits and authorizations to fill or impact wetlands and other waters. The permit requirements may include avoidance of wetlands or waters or preserves that are located within the routes of planned pipelines or other infrastructure. Depending on the other constraints of the infrastructure project, such avoidance could make a planned pipeline or infrastructure project infeasible.

As explained in Section 2.2, projects impacting wetlands and waters under the No Action/No Project Alternative would continue to mitigate those impacts through avoidance, minimization of impacts, and compensatory mitigation, including establishment of on-site or off-site preserves. Preserve management could include a variety of habitat management activities, such as repairing fences, trash removal, and mowing and/or vegetation removal to control thatch and invasive species. Re-establishment and establishment projects implemented as mitigation could require supplemental water, typically for 2–3 years while new plantings are established. This water is often drawn from on-site wells or taken from non-potable recycled water sources. In general, preserves would require very little water and would not require a connection to potable water or sewer lines.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for water and wastewater services from SCWA, Galt and Folsom, California American Water Company, Golden State Water Company, Florin County Water District, Fruitvale Vista Water Company, Tokay Park Water District, Omochumne–Hartnell Water District, Galt Irrigation District, Clay Water District, SMUD Rancho Seco, SASD, and Regional San. Existing funding mechanisms have ensured that water and wastewater services were expanded to meet that demand.

Reasonably foreseeable future projects in the cumulative study area that would further increase demand for water and wastewater services include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. Existing funding mechanisms would also ensure that water and wastewater services are expanded to meet that new demand. New development could not be permitted by local land use authorities unless it could demonstrate availability of an adequate water supply. Therefore, the effects of past, present, and reasonably foreseeable other future projects would have a less than significant adverse cumulative effect on water and wastewater services.

Cumulative effects on water and wastewater services not evaluated in the General Plan EIRs of Rancho Cordova and Galt and Sacramento County would include the additional increment of growth in the Planning Area after the end of their study periods, which range from 15 to 35 years of additional growth and development. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. The additional demand for water and wastewater infrastructure outside the UDA from these projects would be offset through payment of fees by project developers and by rate increases passed on to residents of the Planning Area. Therefore, the additional increment of development under the No Action/No Project Alternative, when added to the effects of past, present, and reasonably foreseeable other projects, would result in a less than significant adverse cumulative effect on water and wastewater services.

12.2.2.3 Solid Waste Disposal

Direct and Indirect Effects of the Alternative

The effects of future urban development and the increased demand for solid waste disposal in Sacramento County and Galt and Rancho Cordova, including the Planning Area, were evaluated in the analysis of the EIRs listed in Section 3.4. As discussed in Section 12.2.1, the relevant

analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the Sacramento County General Plan EIR (Sacramento County 2010) determined that within Sacramento County:

- The increase in demand for solid waste disposal within the entire County, including portions outside the Planning Area, would result in less than significant impacts because buildout of the general plan would not require expansion of Kiefer Landfill. No impacts from construction of new solid waste facilities would occur (Sacramento County 2010, p. 4-21).

The impact analysis presented in the Galt General Plan EIR (Galt 2009b) determined that within Galt and the Galt SOI:

- Increase in solid waste may exceed available landfill capacity by 2030, and the availability of disposal options after that time is unknown, so the EIR concluded that impacts would be significant and unavoidable. The permitted capacities of landfills serving Galt do not appear to have been considered in the analysis (Galt 2008, pp. 6-5 to 6-47).

The impact analysis presented in the Rancho Cordova General Plan EIR (Rancho Cordova 2006b) determined that within Rancho Cordova:

- Available landfill capacity would be available to serve buildout of the General Plan, resulting in a less than significant impact (Rancho Cordova 2006b, pp. 12-28 to 12-109).

As discussed in Section 3.4 and Section 12.2.1, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b; Rancho Cordova 2006b) and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur within Galt and Rancho Cordova and Sacramento County in the years after their General Plan EIR study periods end and until this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs and the Connector EIR, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

That additional urban development would result in additional demand for solid waste disposal in the Planning Area. The lead agencies anticipate that this additional increment of development in the Planning Area through 2065 could result in further exceedance of solid waste disposal

facilities for Galt. However, as noted previously, the analysis of solid waste impacts in the Galt General Plan EIR was very conservative, reaching a conclusion that impacts were significant and unavoidable mostly due to uncertainty. Kiefer Landfill would accommodate solid waste resulting from buildout of the Sacramento County General Plan and Rancho Cordova General Plan. Preserve establishment, management, and monitoring activities under the No Action/No Project Alternative would generate little to no solid waste.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for solid waste disposal. Existing funding mechanisms have ensured that landfills and solid waste handling facilities were expanded to meet that demand.

Reasonably foreseeable future projects in the cumulative study area that would further increase demand for solid waste disposal include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. Existing funding mechanisms would also ensure that solid waste disposal is expanded to meet that new demand.

Cumulative effects to solid waste disposal under the No Action/No Project alternative that were not evaluated in the General Plan EIRs of Rancho Cordova and Galt and Sacramento County would include the additional increment of growth in the Planning Area after the end of their study periods, which range from 15 to 35 years of additional growth and development. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. The additional demand for solid waste disposal from these projects would be offset through payment of fees by project developers and by rate increases passed on to residents of the Planning Area. Therefore, the additional increment of development under the No Action/No Project Alternative, when added to the effects of past, present, and reasonably foreseeable other projects, would result in a less than significant adverse cumulative effect on solid waste disposal.

12.2.2.4 Parks and Recreational Facilities

Direct and Indirect Effects of the Alternative

The effects of future urban development on increased demand for parks and recreational facilities in Sacramento County and Galt and Rancho Cordova, including the Planning Area, were evaluated in the analysis of the EIRs listed in Section 3.4. As discussed previously in Section 12.2.1, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the Sacramento County General Plan EIR (Sacramento County 2010) determined that within Sacramento County:

- Increased demand on parks and recreation within the entire County, including portions outside the Planning Area, would result in less than significant impacts through buildout of the general plan, because general plan policies and ordinances would ensure that funding is available to construct new parks and recreational facilities to meet demand (Sacramento County 2010, pp. 4-19 to 4-41).

The impact analysis presented in the Galt General Plan EIR (Galt 2009b) determined that within the Galt SOI:

- Compliance with general plan policies and implementation programs would ensure that impacts to parks would be less than significant, because new parks and recreational facilities would be constructed as needed to meet demand (Galt 2008, pp. 6-44 to 6-47).

The impact analysis presented in the Rancho Cordova General Plan EIR (Rancho Cordova 2006b) determined that within Rancho Cordova:

- Increased demand on parks and recreation due to urban development would result in a less than significant impact, because general plan policies and ordinances would ensure that funding is available to construct new parks and recreational facilities to meet demand (Rancho Cordova 2006b, pp. 12-28 to 12-109).

As discussed in Section 3.4 and Section 12.2.1, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b; Rancho Cordova 2006b) and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur in Sacramento County and Galt and Rancho Cordova in the years after their General Plan EIR study periods end and until this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs and the Connector EIR, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

Additional urban development under the No Action/No Project Alternative, especially the 1,900 acres of development shifted or displaced outside the UDA, would result in additional demand for parks and recreational areas in the Planning Area. However, the lead agencies anticipate that existing development fee programs in the Planning Area, such as those required under

County Policy PF-123 or Galt Policy PFS-8.1, would allow for establishment of new parks and recreational facilities to meet this additional demand.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the EIS/EIR Planning Area, especially within the UDA, increasing demand for parks and recreational areas. As discussed in Section 12.1.2, a substantial amount of parkland acquisition and development has occurred in the Planning Area along with the urban development. These parks provide diverse recreational opportunities to residents in the Planning Area and surrounding areas. Although some portions of the parks are strictly managed for preservation (e.g., Deer Creek Preserve), most areas are managed for passive and active recreational uses such as hiking, biking, picnicking, boating, camping, and off-road vehicle use.

Reasonably foreseeable future projects in the EIS/EIR Planning Area that would further increase demand for parks and recreational areas include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. The effects of the demand for parks and recreational facilities from past, present, and reasonably foreseeable other projects would not be cumulatively considerable (i.e., significant).

Under the No Action/No Project Alternative, parks and recreational facilities would continue to be developed along with urban development in the cumulative impacts study area, maintaining a similar per capita availability of parks and recreational facilities despite increases in population. Therefore, the additional increment of development under the No Action/No Project Alternative, when added to the effects of past, present, and reasonably foreseeable other projects, would result in a less than significant adverse cumulative effect on parks and recreational facilities.

12.2.2.5 Energy

Direct and Indirect Effects of the Alternative

The effects of future urban development on increased demand for energy and energy infrastructure in Sacramento County and Galt and Rancho Cordova, including the Planning Area, were evaluated in the analysis of the EIRs listed in Section 3.4. As discussed in Section 12.2.1, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the Sacramento County General Plan EIR (Sacramento County 2010) determined that within Sacramento County:

- Increased demand on energy services would result in less than significant impacts through buildout of the general plan because any needed energy infrastructure would be constructed in developed areas (Sacramento County 2010, pp. 4-19 to 4-41).

The impact analysis presented in the Galt General Plan EIR (Galt 2009b) determined that within the Galt SOI:

- Impacts to electricity and natural gas consumption from buildout of the general plan would be less than significant because future development would occur in an area currently served with adequate supplies of both electricity and gas service, and compliance with City policies would improve energy conservation (Galt 2008, pp. 6-5 to 6-47).

The impact analysis presented in the Rancho Cordova General Plan EIR (Rancho Cordova 2006b) determined that within Rancho Cordova:

- Impacts to electricity and natural gas would be less than significant because the City is required to ensure that sufficient capacity for electrical and natural gas service is available, and would coordinate with service providers to ensure that occurs. Construction of needed infrastructure would be located within roadways and other public rights-of-way to minimize construction impacts (Rancho Cordova 2006b, pp. 4.12-28 to 4.12-109).

As discussed in Section 3.4 and Section 12.2.1, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b; Rancho Cordova 2006b) and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur in Sacramento County and Galt and Rancho Cordova in the years after their General Plan EIR study periods end and until this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs and the Connector EIR, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

That additional increment of urban development would result in additional demand for energy in the Planning Area, which the lead agencies anticipate could be met by energy providers. Further, due to improved energy conservation, energy use per capita or per building square

foot would be less than existing levels by 2065. As explained in Section 2.2, approximately 1,900 acres of planned urban development would be shifted or displaced to locations outside the UDA under the No Action/No Project Alternative. That shifted or displaced development would require extension of natural gas and electrical infrastructure to areas that currently support agricultural operations or natural land covers. The construction activities needed to install the necessary electrical and natural gas infrastructure could result in removal of natural land covers.

Under the No Action/No Project Alternative, compliance with the CWA or federal Endangered Species Act may require that new subsurface natural gas and electrical infrastructure avoid areas with high densities of aquatic resources or species habitat. Energy providers would have to develop alternative routing for that energy infrastructure, which would likely be more expensive than if they were able to impact the wetland areas. This additional cost to provide energy infrastructure could increase energy prices in the Planning Area.

Preserve activities would not include development or land uses that consume substantial electrical or natural gas energy resources. Therefore, preserve activities under the No Action/No Project Alternative would not significantly increase demand on the existing energy system.

Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and Section 12.2.1, past and present urban development and associated infrastructure projects and activities have occurred in the EIS/EIR Planning Area, especially within the UDA. Energy demands of these past and present projects and activities have been met by energy providers through additional energy generation and development of new energy transmission infrastructure.

Reasonably foreseeable future projects in the EIS/EIR Planning Area that would further increase energy demand include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the Wilton Rancheria Casino, construction of the high-speed rail, and the California WaterFix projects (Section 3.7.2).

The additional increment of energy demand generated by these reasonably foreseeable other projects would be accommodated by utility providers by purchasing additional electricity or natural gas on the open market and by constructing additional infrastructure. Any additional infrastructure required for these projects would be developed by the utility providers and would generally be located within existing County, city, or utility rights-of-way to minimize impacts. The cumulative effects of the demand for energy and energy infrastructure from past, present, and reasonably foreseeable other projects would not be cumulatively considerable (i.e., significant).

Cumulative effects to energy not evaluated in the General Plan EIRs of Rancho Cordova and Galt and Sacramento County would include the additional increment of growth in the Planning Area after the end of their study periods, which range from 15 to 35 years of additional growth and development. That additional development would include 1,900 acres of urban development displaced or shifted outside the UDA. The additional demand for energy infrastructure outside the UDA from these projects would be offset by rate increases passed on to residents of the Planning Area. Therefore, the additional increment of development under the No Action/No Project Alternative added to the effects of past, present, and reasonably foreseeable other projects would result in a less than significant adverse cumulative effect on energy.

12.2.2.6 Mosquito Abatement

Direct and Indirect Effects of the Alternative

The presence of mosquitos could affect future urban development within the UDA, resulting in potential impacts on demand for mosquito abatement services. Currently the Sacramento–Yolo Mosquito and Vector Control District performs a variety of services to reduce the risk of vector-transferred disease, including the preparation of integrated pest management approaches, public outreach, mosquito and vector surveillance, and vector control activities such as aerial spraying, as described in Section 12.1.2. These activities would continue under the No Action/No Project Alternative, and may be expanded to control mosquito populations in currently undeveloped areas as urban development moves closer to existing wetlands.

Mitigation for the impacts of development on waters and wetlands would include the re-establishment or establishment of vernal pools and other wetlands, especially within or near the MCRA. Healthy vernal pools that have adequate hydrology, native vegetation, and invertebrates are not a breeding ground for mosquitos. In these healthy pools, other invertebrates eat the mosquito larvae and prevent most mosquitos from hatching. Further, vernal pools in the Planning Area that have natural hydrology are typically dry by early June, preventing mosquito breeding in the summer. This means that vernal pools could provide mosquito breeding opportunities in the late spring only when rain events occur and are immediately followed by a warming trend (over 75°F). However, many varieties of mosquitos will reproduce in artificial containers that collect water, such as tires, buckets, flower pots, and bird baths that are not refreshed regularly. Similarly, re-established and established vernal pools and other wetlands could provide breeding habitat for mosquitos if they are not managed to ensure that hydrology, vegetation, and resident fauna are consistent with the characteristics of healthy vernal pools. Because there would not be a comprehensive management plan designed to oversee vernal pool areas (some of which may be located within open space areas in developed communities), there is the potential for existing unhealthy pools and unhealthy

re-established and established vernal pools and other wetlands to provide the right conditions for mosquitos to breed.

To control mosquitos, wetlands are sometimes drained, insecticides are applied to stagnant waters, or aerial spraying is done by the Sacramento–Yolo Mosquito and Vector Control District in areas where mosquitos are particularly abundant. Chemicals applied to kill mosquitos/eggs would likely also kill vernal pool branchiopods. Mosquito-eating fish that are introduced by the Sacramento–Yolo Mosquito and Vector Control District or by private landowners also eat vernal pool branchiopods. Because these traditional control agents would severely impact the health of the vernal pool ecosystems and the listed species that re-established vernal pools are designed to support, it is highly likely that mosquito abatement activities would be restricted in these preserve areas. However, the Sacramento–Yolo Mosquito and Vector Control District's primary goal is to protect public health and welfare by managing mosquito populations so they do not present a risk to the surrounding community. If mosquito populations pose a significant public nuisance or when emergency control measures are needed to rapidly disrupt or terminate the transmission of disease to humans, the District will respond by spraying using either hand sprayers, truck-mounted sprayers, or aircraft for aerial spraying. The District does not include any provisions where spraying would be restricted (Sacramento–Yolo Mosquito and Vector Control District 2009).

Cumulative Effects of the Alternative

Past and present projects and activities in the cumulative study area relevant to mosquito abatement include many decades of urban development within a natural floodplain that contains many seasonal wetlands and other waters. Mitigation for impacts of past and present urban development has included avoidance of wetlands, establishment of on-site preserves, and on-site establishment of wetlands. This development and mitigation pattern has exposed residents of urban development to mosquito populations that breed in wetland areas and in poorly designed or managed stormwater systems.

Reasonably foreseeable other projects such as urban development in the Elk Grove SOI or Rancho Murieta (Section 3.7.2) and elsewhere in the cumulative study area, such as the community of Natomas, the City of Folsom, or the City of Davis, would increase human populations near existing wetlands and vernal pools. In addition, this urban development would increase impermeable surfaces and contribute urban runoff to drainage structures that can stagnate and create breeding habitat for mosquitos. However, this urban development in the cumulative study area would also remove wetlands and vernal pools, potentially reducing existing breeding areas for mosquitos. Under most circumstances, creation or expansion of mosquito breeding habitat can be avoided or minimized through proper planning and design or maintenance elements. Increased demand on the Sacramento–Yolo Mosquito and Vector Control District for mosquito

abatement services would be offset through increased funding of the District. The District is funded through property taxes and other assessments based on property value, and urban development of currently undeveloped land would substantially increase the assessed value of parcels. That increased parcel value would increase property taxes, and thus increase funding for the District. Therefore, less than significant adverse cumulative impacts would result from past, present, and reasonably foreseeable other projects.

Urban development under the No Action/No Project Alternative would contribute to cumulative impacts on mosquito abatement similar to that described under the reasonably foreseeable future projects. As noted previously, existing patterns of development have resulted in avoidance of wetlands, establishment of on-site preserves, and on-site wetland establishment projects, which expose residents and employees to potential mosquito hazards. The lead agencies anticipate that avoidance of wetlands, establishment of on-site preserves, and wetland establishment projects would continue to be a common mitigation strategy under the No Action/No Project Alternative. However, funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so any additional demand for mosquito abatement would be met. Therefore, the incremental contribution of the No Action/No Project Alternative to cumulative impacts would not be considerable, and implementation of this alternative would result in a less than significant adverse cumulative effect.

12.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3.

12.2.3.1 Law Enforcement, Fire Protection, and Emergency Services

Direct and Indirect Effects of the Alternative

Covered Activities under the Proposed Action/Proposed Project Alternative include the types of urban development that are anticipated under the No Action/No Project Alternative. However, the Proposed Action/Proposed Project Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented in a manner consistent with the approved general plans of Sacramento County and Rancho Cordova and Galt, with the only Covered Activity urban development beyond the UDA being road and pipeline projects that would also occur under the No Action/No Project Alternative. This may slightly reduce demand for new fire and police facilities to serve new urban development because new development would be nearer to existing fire stations and police stations. Therefore, urban development under the Proposed Action/Proposed Project

would have a ***Minor Beneficial*** effect on law enforcement, fire protection, and emergency services as compared to the No Action/No Project Alternative baseline condition.

Preserve management under the Proposed Action/Proposed Project Alternative would require a variety of habitat management activities, including grazing management, repairing fences, wildlife or vegetation surveys, trash removal, mowing and/or vegetation removal to control thatch and invasive species, and overall maintenance and monitoring. The preserve management strategy proposed in the SSHCP includes use of prescribed burns. As described for the No Action/No Project Alternative, prescribed burning activities under the Proposed Action/Proposed Project would be highly regulated and would not substantially increase demand for local fire departments or CAL FIRE beyond current levels. Therefore, management of the Preserve System under the Proposed Action/Proposed Project would have ***No Effect*** on fire protection as compared to the No Action/No Project Alternative baseline condition.

SSHCP Preserves would maintain areas of natural land cover that could result in an increase in wildfire hazards. As described for the No Action/No Project Alternative, there could be instances where fire suppression is required due to a wildfire or illegal activities that require law enforcement, but these would be indirect effects of the preserves. Law enforcement, medical, rescue, firefighting, and other emergency service providers would be allowed access to SSHCP Preserves to carry out operations necessary for the health, safety, and welfare of the public. As required by Section 11.4.3.2 of the SSHCP, the Implementing Entity would develop Memoranda of Understanding with all applicable fire agencies to be included with each Preserve Management Plan that identify appropriate response and fire suppression techniques, including access points, priority locations for fire camps, firebreak construction, water uptake, use of chemical retardants, heavy equipment operation, and post-fire cleanup. Firebreaks would be allowed inside Preserve Setbacks when necessary, and would comply with applicable local codes. This coordination and planning with fire, police, and emergency service providers would result in a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- Reduce the potential for adverse physical impacts associated with the provision of law enforcement services, fire protection, or emergency services to meet demands of urban development outside the UDA;

- Reduce demand for law enforcement, fire protection, or emergency services by not resulting in urban development remote from existing concentrations of law enforcement services, fire protection, or emergency services;
- Not change demand for local fire departments or CAL FIRE beyond current levels as a result of preserve management activities; and
- Not impede delivery of fire, police, and emergency services to preserve areas by improving coordination with local and state service providers.

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Project on the impact criteria for law enforcement, fire protection, and emergency services, the Proposed Action/Proposed Project would result in ***Minor Beneficial*** effects on law enforcement, fire protection, and emergency services when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for law enforcement, fire protection, and emergency services. Existing funding mechanisms have ensured that law enforcement, fire protection, and emergency services were expanded to meet that demand.

Reasonably foreseeable other future projects in the cumulative study area that would further increase demand for law enforcement, fire protection, and emergency services include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin.

The Proposed Action/Proposed Project would not include urban development outside the UDA where law enforcement, fire protection, and emergency services are less available. The Proposed Action/Proposed Project would also improve coordination between Preserve Managers and local or state service providers. Therefore, the Proposed Action/Proposed Project would have a smaller incremental contribution to impacts on demand for new facilities or law enforcement services, fire protection, or emergency services as compared to the No Action/No Project alternative. Therefore, because the incremental effect of the Proposed Action/Proposed Project on law enforcement, fire protection, and emergency services would be somewhat less than the incremental effect of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in a ***Minor Beneficial Cumulative*** **effect** (when compared to the future No Action/No Project baseline condition).

12.2.3.2 Water and Wastewater Services

Direct and Indirect Effects of the Alternative

The Proposed Action/Proposed Project Alternative Covered Activities include the urban development that are anticipated under the No Action/No Project Alternative, including the construction, maintenance, and operation of water supply**, recycled water,** and wastewater facilities. Future urban development under the Proposed Action/Proposed Project would be consistent with the goals and policies listed in Section 12.1.1 that require local agencies to design water and wastewater infrastructure to accommodate the increase in demand; ensure that water flow and pressure meet domestic, commercial, industrial and fire suppression needs; and comply with the CWA. However, under the Proposed Action/Proposed Project, urban development would not be shifted or displaced to areas outside the UDA (Section 2.3) that may not be served by existing water or wastewater infrastructure. The Proposed Action/Proposed Project would not result in the impacts associated with expanding infrastructure outside the UDA that would occur under the No Action/No Project Alternative. Therefore, urban development under the Proposed Action/Proposed Project would have a ***Minor Beneficial*** effect on water and wastewater infrastructure needs as compared to the No Action/No Project Alternative baseline condition.

Subsurface sewage disposal systems currently exist within the area proposed as the Laguna Creek Wildlife Movement Corridor. These systems are not Covered Activities under the SSHCP, but would be "grandfathered in" and allowed to remain in the Laguna Creek Wildlife Movement Corridor once the corridor is established. Parcels already entitled for installation of subsurface sewage disposal systems at the time of permit issuance would be allowed in the Laguna Creek Wildlife Movement Corridor. Operation, maintenance, and replacement of existing and entitled subsurface sewage disposal systems are not Covered Activities, but would be allowed in the Laguna Creek Wildlife Movement Corridor (Sacramento County 2016). These septic systems would also be allowed under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Preserve System would have ***No Effect*** on water and wastewater infrastructure as compared to the No Action/No Project Alternative baseline condition.

Under the Proposed Action/Proposed Project, project proponents constructing or expanding water and wastewater pipelines would not necessarily have to develop alternative routes to avoid wetlands and waters in the Preserve System, whereas under the No Action/No Project Alternative, pipelines would be more likely to have to route around wetlands, other waters, and preserves. New ~~water or~~ wastewater facilities could be expanded or extended **within the MCRA under the Proposed Action/Proposed Project Alternative** as envisioned by the ~~2020 SRWTP Master Plan (Regional San 2008) within the MCRA for the Proposed Action/Proposed Project.~~ **Regional San ISS and EchoWater Project**. **New water facilities could be expanded or extended as envisioned in the SCWA Water Supply Master Plans.** Horizontal drilling would be used

where the lines might impact waters and wetlands, which would limit the construction impacts to the entrance and exit locations of the pipeline. Using this method would minimize potential impacts to wetland areas. Specifically, Avoidance and Minimization Measures (AMMs) UTILITY-3 and UTILITY-4 require the use of trenchless construction methods to avoid impacts to preserves, and siting of entry/exit locations to minimize impacts to vernal pool soils, vernal pools, and Riparian Woodland areas (SSHCP Chapter 5). Implementation of new infrastructure could be expanded as envisioned by the Sacramento County and Rancho Cordova General Plans in compliance with AMMs EDGE-1, EDGE-8, BMP-1 through BMP-11, STREAM-1 through STREAM-5, and UTILITY-1 and UTILITY-2. Implementation of the Proposed Action/Proposed Project would not adversely impact the ability of service providers to extend water and wastewater infrastructure, and service would be continued to be provided as outlined in the service district providers' planning documents (Radmacher, pers. comm. 2015). Therefore, the Proposed Action/Proposed Project Alternative would be less likely than the No Action/No Project Alternative to limit planned infrastructure development. The Proposed Action/Proposed Project Preserve System would result in ***Minor Beneficial*** effects on water and wastewater infrastructure when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Preserve management and monitoring activities under the Proposed Action/Proposed Project would not require substantial water, nor would there be a need for any wastewater treatment. The preserve activities would depend on on-site wells or water brought to the site, and would not require any new water or wastewater connections. Therefore, the Proposed Action/ Proposed Project Preserve System would result in ***No Effect*** on demand for water treatment, water supply, and wastewater treatment when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- Reduce the impacts from expanding water and wastewater infrastructure to serve urban development urban development outside the UDA;
- Reduce the potential for existing aquatic resources or future preserves to conflict with planned infrastructure development; and
- Result in similar impacts on adequacy of water supply for full buildout of the project.

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Project on the impact criteria for water and wastewater services, the Proposed Action/ Proposed Project would result in ***Minor Beneficial*** effects on water and wastewater services

when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for water and wastewater services. Existing funding mechanisms, including payment of fees by project developers and rate increases passed on to residents of the Planning Area, have ensured that water and wastewater services were expanded to meet that demand.

Reasonably foreseeable other future projects in the cumulative study area that would further increase demand for water and wastewater services include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. The additional demand for water and wastewater infrastructure from these projects would also be offset through payment of fees by project developers, and by rate increases passed on to residents of the Planning Area. Therefore, the effects of past, present, and reasonably foreseeable other future projects would have a less than significant cumulative effect on water and wastewater services.

The Proposed Action/Proposed Project would not include urban development outside the UDA where water and wastewater infrastructure are less available. Therefore, because the incremental effect of the Proposed Action/Proposed Project on water or wastewater facilities would be somewhat less than the incremental effect of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in **a *Minor Beneficial Cumulative*** effect (when compared to the future No Action/No Project baseline condition).

12.2.3.3 Solid Waste Disposal

Direct and Indirect Effects of the Alternative

The Proposed Action/Proposed Project Alternative Covered Activities include the types of urban development that are anticipated under the No Action/No Project Alternative. The urban development under the Proposed Action/Proposed Project would accommodate the same population increase as the No Action/No Project Alternative, and would generate approximately the same amount of solid waste. Future urban development would be consistent with the goals and policies listed in Section 12.1.1 that require that only compatible land uses be located near solid waste facilities and that recycling programs be developed to educate residents. Therefore, the Proposed Action/Proposed Project would result in ***No Effect*** on demand for solid waste disposal when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Establishment, management, and monitoring of the SSHCP Preserves would not increase demand for solid waste service. Overall, there would be no difference in impacts to landfills from preserve activities when compared to similar preserve activities under the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Preserve System would result in ***No Effect*** on demand for solid waste disposal when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- Be serviced by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs; and
- Result in the same demand for solid waste disposal services.

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Project on the impact criteria for solid waste disposal, the Proposed Action/Proposed Project would result in ***No Effect*** on solid waste disposal when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for solid waste disposal. Existing funding mechanisms such as development fees or usage fees paid to the solid waste service providers have ensured that landfills and solid waste handling facilities were expanded to meet that demand.

Reasonably foreseeable future projects in the cumulative study area that would further increase demand for solid waste disposal include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. Existing funding mechanisms would also ensure that solid waste disposal is expanded to meet that new demand. The effects of the demand for solid waste disposal from past, present, and reasonably foreseeable other projects would not be cumulatively considerable (i.e., significant).

The urban development under the Proposed Action/Proposed Project would accommodate the same population increase as the No Action/No Project Alternative, and would generate approximately the same amount of solid waste. Therefore, because the incremental effect of the Proposed Action/Proposed Project on solid waste disposal would not be discernibly

different from the incremental effect of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative Effect*** (when compared to the future No Action/No Project baseline condition).

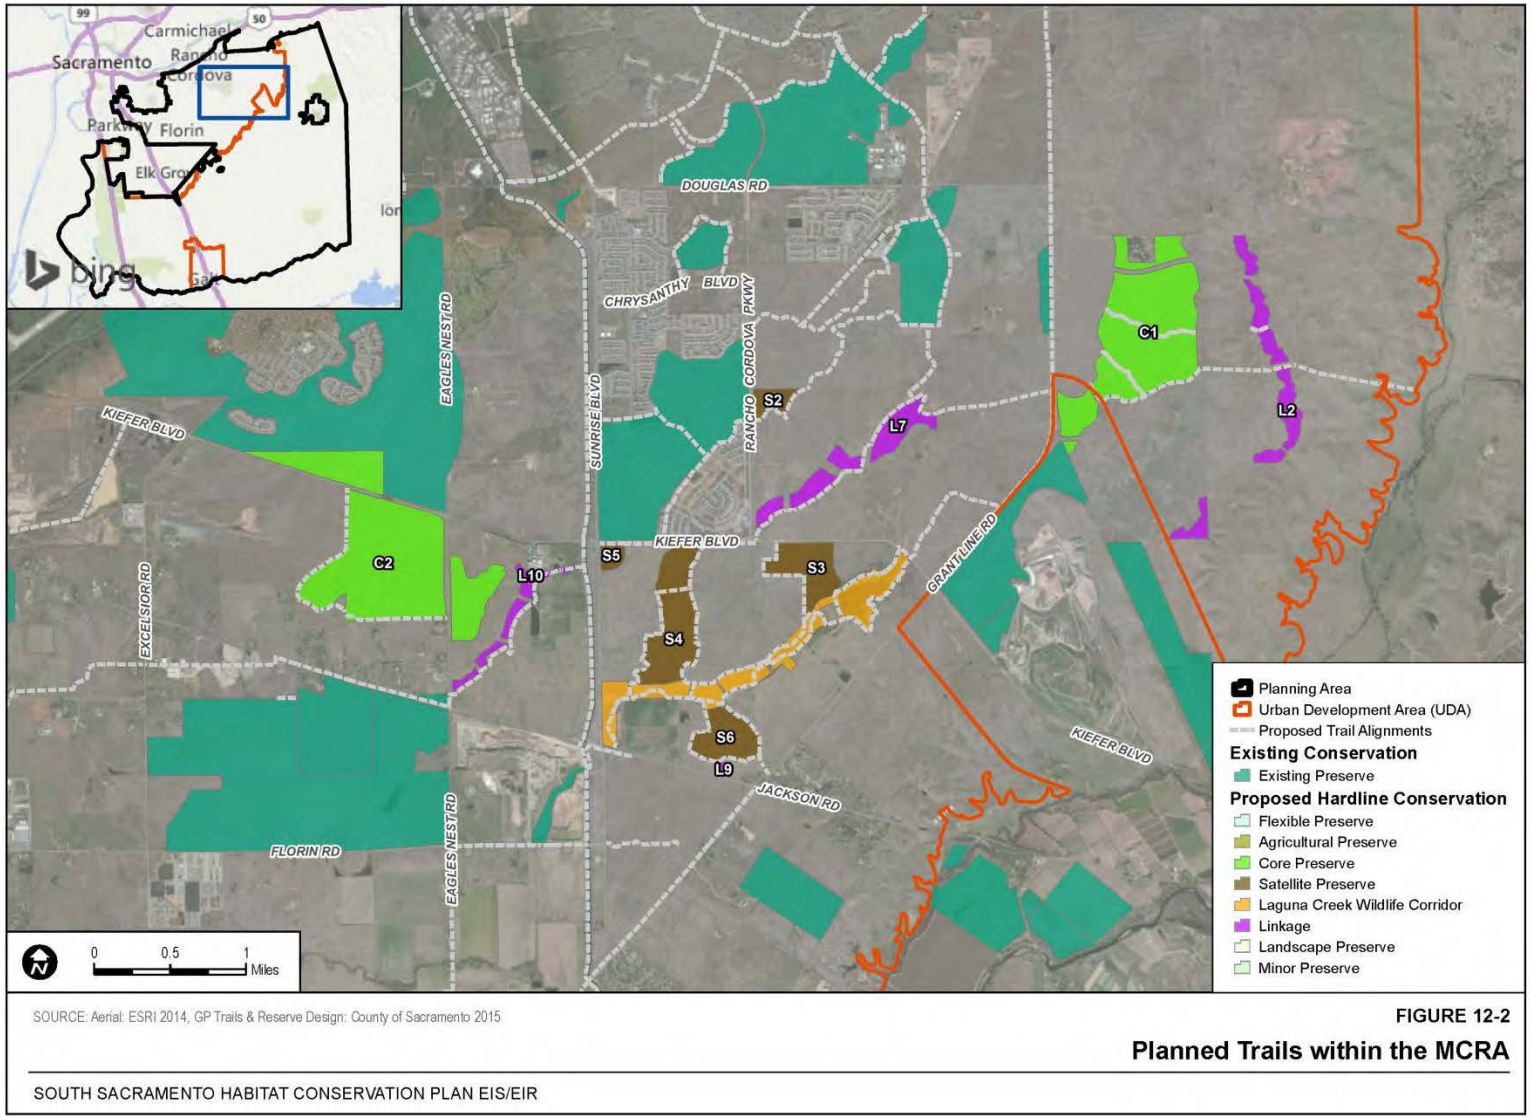
12.2.3.4 Parks and Recreational Facilities

Direct and Indirect Effects of the Alternative

The Proposed Action/Proposed Project Alternative Covered Activities include the types of urban development that are anticipated under the No Action/No Project Alternative. The urban development under the Proposed Action/Proposed Project would accommodate the same population increase as the No Action/No Project Alternative, and would generate approximately the same amount of demand for parks and recreational facilities. The lead agencies anticipate that future urban development would be consistent with the goals and policies listed in Section 12.1.1, including those such as County Policy PF-122 and PF-123, or Galt Policy PFS-8.1, that establish fees that new development projects must pay to support parks and recreational facility development. However, the Proposed Action/Proposed Project Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented in a manner consistent with the approved general plans of Sacramento County and Rancho Cordova and Galt. By not shifting or displacing urban development outside the UDA, the Proposed Action/Proposed Project would reduce the demand for new park and recreational facilities in areas outside the UDA. Therefore, urban development under the Proposed Action/Proposed Project would have a ***Minor Beneficial*** effect on parks and recreational facilities as compared to the No Action/No Project Alternative baseline condition.

Future recreational facilities, including trails, would be permitted in the Preserve Setbacks and in some of the Preserve System. For preserve areas within the USB, a 50-foot setback would be established in accordance with AMM EDGE-3 (Table 2-7) to allow a transition between development and the preserves. AMM NATURE TRAIL-1 through NATURE TRAIL-5 provide requirements for the construction of trails adjacent to preserve areas. Setbacks would also be required around streams and creeks in the UDA (AMM STREAM-1 and STREAM-2), and trails would also be allowed in those Stream Setbacks.

Other trails are proposed as part of developments in the UDA. For example, the Cordova Hills project includes a paved bicycle/pedestrian trail that bisects the preserve area (Core Preserve C1). As shown on Figure 12-2, trails are proposed around most of the SSHCP Preserve areas, with trails crossing the Laguna Creek Wildlife Preserve and the proposed Linkage Preserve L2. Trails adjacent to and crossing any preserves would be required to comply with the AMMs



listed previously to protect the preserve from disturbance due to proximity to developed areas. Provided they comply with those AMMs, new trails and trail extensions that are planned in the Sacramento County, Galt, or Rancho Cordova General Plan Public Facilities or Open Space, Parks, and Trails Elements or in bicycle or pedestrian plans would not be affected by the establishment of an interconnected preserve system. Therefore, the Proposed Action/Proposed Project Preserve System would have ***No Effect*** on parks and recreational facilities as compared to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- Reduce the potential for substantial adverse physical impacts associated with the provision of park and recreation services outside the UDA, or result in substantial physical deterioration of an existing facility due to increased use; and
- Allow for development of trails planned in the Sacramento County, Galt, or Rancho Cordova General Plan.

Figure 12-2 Planned Trails within the MCRA

SOURCE: Aerial: ESRI 2014, GP Trails & Reserve Design: County of Sacramento 2015

FIGURE 12-2

Planned Trails within the MCRA

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN EIS/EIR

INTENTIONALLY LEFT BLANK

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Project on the impact criteria for parks and recreational facilities, the Proposed Action/ Proposed Project would result in ***Minor Beneficial*** effects on parks and recreational facilities when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

Section 12.1.2 describes the substantial amount of parkland acquisition and development that has occurred in the Planning Area. These parks provide diverse recreational opportunities to residents in the Planning Area and surrounding areas. Although some portions of the parks are strictly managed for preservation (e.g., Deer Creek Preserve), most areas are managed for passive and active recreational uses such as hiking, biking, picnicking, boating, camping, and off-road vehicle use.

Reasonably foreseeable other future projects such as urban development in the Elk Grove SOI or expansion of Rancho Murieta, as described in Section 3.7, would increase the population in the Planning Area and increase demand for parks and recreational facilities. However, this development would generate fees and taxes that would pay for additional parks and recreational facilities in the Planning Area to meet these additional needs.

Urban development under the Proposed Action/Proposed Project would also increase the Planning Area population and result in increased demand for parks and recreational facilities, but this new urban development would generate fees and taxes to pay for additional parks and recreational facilities. The Proposed Action/Proposed Project Alternative would provide limited park and recreational facility benefits by providing nature trails in some preserves, designed consistent with AMMs NATURE TRAIL-1 through NATURE TRAIL-5. Therefore, because the incremental effect of the Proposed Action/Proposed Project on parks and recreational facilities would not be discernibly different from the incremental effect of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative Effect*** (when compared to the future No Action/No Project baseline condition).

12.2.3.5 Energy

Direct and Indirect Effects of the Alternative

Covered Activities under the Proposed Action/Proposed Project Alternative include the types of urban development that are anticipated under the No Action/No Project Alternative. However, under the Proposed Action/Proposed Project urban development would not be displaced or shifted to areas outside the UDA (Section 2.3) that may not be served by existing natural gas or electrical infrastructure. Impacts associated with expanding natural gas and electrical supply

infrastructure to serve urban development would be somewhat less under the Proposed Action/Proposed Project Alternative than the No Action/No Project Alternative. Therefore, urban development under the Proposed Action/Proposed Project would have a ***Minor Beneficial*** effect on energy as compared to the No Action/No Project Alternative baseline condition.

Energy infrastructure under the Proposed Action/Proposed Project could be expanded, extended, or located as envisioned by the Sacramento County and Rancho Cordova General Plans' Public Facilities Elements and local energy providers' master plans. The SSHCP Preserve System would not require the construction of energy infrastructure; therefore, the SSHCP would not create any physical impacts associated with construction of new energy infrastructure. The regional energy infrastructure plans follow the growth and land use plans laid out in the general plans, and the Proposed Action/Proposed Project Alternative would be consistent with these general plans. Therefore, urban development under the Proposed Action/Proposed Project would have a ***Minor Beneficial*** effect on planned development of energy infrastructure as compared to the No Action/No Project Alternative baseline condition.

SSHCP Preserve management and maintenance activities under the Proposed Action/Proposed Project would not generate an increase in demand for energy because they would not introduce new urban uses or people. Therefore, the Proposed Action/Proposed Project Preserve System would have ***No Effect*** on energy demand or planned development of energy infrastructure as compared to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- Reduce the potential for impacts associated with building new electric or natural gas infrastructure to meet demands of urban development outside the UDA;
- Reduce the potential for urban development patterns to conflict with regional energy infrastructure plans; and
- Result in similar demand for electricity and natural gas service because total amounts of urban development within the Planning Area would be similar.

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative on the energy impact criteria, the Proposed Action/Proposed Project would result in ***Minor Beneficial*** effects on energy when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and Section 12.2.1, past and present urban development and associated infrastructure projects and activities have occurred in the EIS/EIR Planning Area, especially within the UDA. Energy demands of these past and present projects and activities have been met by energy providers through additional energy generation and development of new energy transmission infrastructure.

Reasonably foreseeable future projects in the EIS/EIR Planning Area that would further increase energy demand include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the Wilton Rancheria Casino, construction of the high-speed rail, and the California WaterFix projects (Section 3.7.2).

The additional increment of energy demand generated by these reasonably foreseeable other projects would be accommodated by utility providers by purchasing additional electricity or natural gas on the open market and by constructing additional infrastructure. Any additional infrastructure required for these projects would be developed by the utility providers and would generally be located within existing County, city, or utility rights-of-way to minimize impacts. The effects of the demand for energy and energy infrastructure from past, present, and reasonably foreseeable other projects would constitute a less than significant cumulative effect.

The additional development from urban development under the Proposed Action/Proposed Project would offset its impacts similarly, through payment of usage fees. Because the Proposed Action/Proposed Project would include an Aquatic Resources Plan and expedited permitting process for aquatic resources, proponents constructing or expanding energy infrastructure would be less likely to have to develop alternative routes to avoid wetlands and waters. Generally, development of utility infrastructure within the Preserve System could occur as long as those projects complied with SSHCP AMMs. Therefore, because the incremental effect of the Proposed Action/Proposed Project on energy would not be discernibly different from the incremental effect of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in ***No Cumulative Effect*** (when compared to the future No Action/No Project baseline condition).

12.2.3.6 Mosquito Abatement

Direct and Indirect Effects of the Alternative

Covered Activities under the Proposed Action/Proposed Project Alternative include the types of urban development that are anticipated under the No Action/No Project Alternative. However, the Proposed Action/Proposed Project Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow

urban development Covered Activities within the MCRA and the rest of the UDA to be implemented consistent with the approved general plans of Sacramento County and Rancho Cordova and Galt, with the only Covered Activity urban development beyond the UDA being road and pipeline projects that would also occur under the No Action/No Project Alternative. Funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so any additional demand for mosquito abatement would be met. There is no reason to expect that urban development under the Proposed Action/Proposed Project would result in greater or less exposure to mosquitos for people than the No Action/No Project Alternative. Impacts associated with the potential for urban development to create breeding areas for mosquitos or increase human populations near mosquito breeding areas would be largely the same as described for the No Action/No Project Alternative (Section 12.2.2.6, Mosquito Abatement). Therefore, urban development under the Proposed Action/Proposed Project would have ***No Effect*** on mosquito abatement as compared to the No Action/No Project Alternative baseline condition.

The Proposed Action/Proposed Project Preserve System would include the re-establishment and establishment of 389 acres of vernal pools, approximately 67 more acres than under the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative would also re-establish and/or establish 387 more acres of seasonal wetland, freshwater marsh, and/or open water within the Planning Area compared to the No Action/No Project Alternative. Re-established and/or established aquatic resources would be closely monitored to ensure that they meet success criteria as agreed on by the U.S. Army Corps of Engineers and that they remain functional as habitat for Covered Species. There is a potential for unhealthy existing or re-established/established aquatic resources to create an environment conducive to mosquito breeding. The coordinated monitoring and management program under the Proposed Action/ Proposed Project would reduce the chances that existing, re-established, or established aquatic resources would be unhealthy and provide breeding habitat for mosquitos by controlling species such as the non-native plant *Glyceria declinata*. Therefore, the Proposed Action/ Proposed Project Preserve System would result in a ***Less Than Significant Adverse*** effect on mosquito abatement when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project would:

- Potentially create more new breeding areas for mosquitos, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health.

- Potentially restrict mosquito abatement activities within preserves, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health.

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative on the mosquito abatement impact criteria, the Proposed Action/Proposed Project would result in ***Less Than Significant Adverse*** effects on mosquito abatement when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

Past and present projects and activities in the cumulative study area relevant to mosquito abatement include many decades of urban development within a natural floodplain that contains many seasonal wetlands and other waters. Mitigation for impacts of past and present urban development has included avoidance of wetlands, establishment of on-site preserves, and on-site establishment of wetlands. This development and mitigation pattern has exposed residents of urban development to mosquito populations that breed in wetland areas and in poorly designed or managed stormwater systems.

Reasonably foreseeable other projects such as urban development in the Elk Grove SOI or Rancho Murieta (Section 3.7.2) and elsewhere in the cumulative study area, such as the community of Natomas, the City of Folsom, or the City of Davis, would increase human populations near existing wetlands and vernal pools. In addition, this urban development would increase impermeable surfaces and contribute urban runoff to drainage structures that can stagnate and create breeding habitat for mosquitos. However, this urban development in the cumulative study area would also remove wetlands and vernal pools, potentially reducing existing breeding areas for mosquitos. Under most circumstances, creation or expansion of mosquito breeding habitat can be avoided or minimized through proper planning and design or maintenance elements. Increased demand on the Sacramento–Yolo Mosquito and Vector Control District for mosquito abatement services would be offset through increased funding of the District. The District is funded through property taxes and other assessments based on property value, and urban development of currently undeveloped land would substantially increase the assessed value of parcels. That increased parcel value would increase property taxes and thus increase funding for the District. Therefore, less than significant adverse cumulative impacts would result from past, present, and reasonably foreseeable other projects.

The Proposed Action/Proposed Project would contribute to cumulative impacts on mosquito abatement by establishing new aquatic resources and potentially making it more difficult to conduct mosquito abatement activities on preserves. However, the Preserve System would be carefully monitored and managed to avoid the aquatic resource conditions conducive to

mosquito breeding. Further, funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so additional demand for mosquito abatement would be met. Therefore, because the incremental effect of the Proposed Action/Proposed Project on mosquito abatement would be somewhat more than the incremental effect of the No Action/No Project Alternative, the Proposed Action/Proposed Project would result in a ***Less Than Significant Adverse Cumulative*** effect (when compared to the future No Action/No Project baseline condition).

12.2.4 Reduced Permit Term Alternative

The Reduced Permit Term Alternative is described in Section 2.4.

12.2.4.1 Law Enforcement, Fire Protection, and Emergency Services

Direct and Indirect Effects of the Alternative

Covered Activities under the Reduced Permit Term Alternative include the types of urban development that are anticipated under the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented in a manner consistent with the approved general plans of Sacramento County and Rancho Cordova and Galt, with the only Covered Activity urban development beyond the UDA being road and pipeline projects that would also occur under the No Action/No Project Alternative. This may slightly reduce demand for new fire and police facilities to serve new urban development because new development would be nearer to existing fire stations and police stations. Therefore, urban development under the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on law enforcement, fire protection, and emergency services as compared to the No Action/No Project Alternative baseline condition.

Preserve management under the Reduced Permit Term Alternative would require a variety of habitat management activities, including grazing management, repairing fences, wildlife or vegetation surveys, trash removal, mowing and/or vegetation removal to control thatch and invasive species, and overall maintenance and monitoring. Preserve management under the Reduced Permit Term Alternative would include use of prescribed burns. As described for the No Action/No Project Alternative, prescribed burning activities under the Reduced Permit Term Alternative would be highly regulated and would not substantially increase demand for local fire departments or CAL FIRE beyond current levels. Therefore, management of the Preserve System under the Reduced Permit Term Alternative would have ***No Effect*** on fire protection as compared to the No Action/No Project Alternative baseline condition.

SSHCP Preserves would maintain areas of natural land cover that could result in an increase in wildfire hazards. As described for the No Action/No Project Alternative, there could be instances where fire suppression is required due to a wildfire or illegal activities that require law enforcement, but these would be indirect effects of the preserves. Law enforcement, medical, rescue, firefighting, and other emergency service providers would be allowed access to SSHCP Preserves to carry out operations necessary for the health, safety, and welfare of the public. As required by Section 11.4.3.2 of the SSHCP, the Implementing Entity would develop Memoranda of Understanding with all applicable fire agencies to be included with each Preserve Management Plan that identify appropriate response and fire suppression techniques, including access points, priority locations for fire camps, firebreak construction, water uptake, use of chemical retardants, heavy equipment operation, and post-fire cleanup. Firebreaks would be allowed inside Preserve Setbacks when necessary, and would comply with applicable local codes. This coordination and planning with fire, police, and emergency service providers would result in a ***Minor Beneficial*** effect when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Reduce the potential for adverse physical impacts associated with the provision of law enforcement services, fire protection, or emergency services to meet demands of urban development outside the UDA;
- Reduce demand for law enforcement, fire protection, or emergency services by not resulting in urban development remote from existing concentrations of law enforcement services, fire protection, or emergency services;
- Not change demand for local fire departments or CAL FIRE beyond current levels as a result of preserve management activities; and
- Not impede delivery of fire, police, and emergency services to preserve areas by improving coordination with local and state service providers.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on the impact criteria for law enforcement, fire protection and emergency services, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects on law enforcement, fire protection, and emergency services when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for law enforcement, fire protection, and emergency services. Existing funding mechanisms have ensured that law enforcement, fire protection, and emergency services were expanded to meet that demand.

Reasonably foreseeable other future projects in the cumulative study area that would further increase demand for law enforcement, fire protection, and emergency services include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin.

The Reduced Permit Term Alternative would not include urban development outside the UDA where law enforcement, fire protection, and emergency services are less available. The Reduced Permit Term Alternative would also improve coordination between Preserve Managers and local or state service providers and therefore would have a smaller incremental contribution to impacts on demand for new facilities of law enforcement services, fire protection, or emergency services as compared to the No Action/No Project alternative. Therefore, because the incremental effect of the Reduced Permit Term Alternative on law enforcement, fire protection, and emergency services would be somewhat less than the incremental effect of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect (when compared to the future No Action/No Project baseline condition).

12.2.4.2 Water and Wastewater Services

Direct and Indirect Effects of the Alternative

Covered Activities under the Reduced Permit Term Alternative include the types of urban development that are anticipated under the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented consistent with the approved general plans of Sacramento County and Rancho Cordova and Galt, with the only Covered Activity urban development beyond the UDA being road and pipeline projects that would also occur under the No Action/No Project Alternative. The Reduced Permit Term Alternative would not result in the impacts associated with expanding infrastructure outside the UDA that would occur under the No Action/No Project Alternative. Therefore, urban

development under the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on water and wastewater infrastructure needs as compared to the No Action/No Project Alternative baseline condition.

Project proponents constructing or expanding water and wastewater pipelines during the 30-year permit term of the Reduced Permit Term Alternative would not necessarily have to develop alternative routes to avoid wetlands and waters. New ~~water or~~ wastewater facilities could be expanded or extended **within the MCRA under the Reduced Permit Term Alternative** as envisioned by the ~~SRWTP Master Plan 2020 (Regional San 2008) within the MCRA and would not be adversely affected by the establishment of preserves under the Reduced Permit Term Alternative.~~ **Regional San ISS and EchoWater Project. New water facilities could be expanded or extended as envisioned by the SCWA Water Supply Master Plans.** Covered Activity water and wastewater infrastructure projects within the MCRA are all planned for completion by the end of year 30. In years 31–50 of the EIS/EIR study period, the SSHCP permits would expire, and there would be no comprehensive plan in place to mitigate potential project impacts to aquatic resources and special-status species associated with construction of new wastewater infrastructure in the Planning Area. Therefore, in years 31–50 of the EIS/EIR study period projects would again be required to mitigate impacts on a project-by-project basis, and CWA 404 and federal Endangered Species Act mitigation for project impacts in the MCRA would require greater levels of avoidance and preservation to be in the MCRA. However, the MCRA and any required wastewater infrastructure would have been largely developed during the 30-year permit term. Construction of any wastewater infrastructure outside the MCRA that would occur during years 31–50 of the EIS/EIR study period would be able mitigate impacts on a project-by-project basis, as described for the No Action/No Project Alternative. This would be a ***Minor Beneficial*** effect on water and wastewater infrastructure, as compared to the No Action/No Project Alternative baseline condition.

The Reduced Permit Term Alternative would assemble a preserve system in the Planning Area during the 30-year permit term, but planned water and wastewater infrastructure could be extended through preserves using horizontal directional drilling in adherence with SSHCP AMMs. Implementation of AMMs EDGE-1, EDGE-8, BMP-1 through BMP-11, STREAM-1 through STREAM-5, and UTILITY-1 through UTILITY-4 during the 30-year permit term could affect design and construction of infrastructure. Relative to the No Action/No Project Alternative, this would be a ***Minor Beneficial*** effect.

Preserve management and monitoring activities under the Reduced Permit Term Alternative would not require substantial water, nor would there be a need for any wastewater treatment. The preserve activities would depend on on-site wells or water brought to the site, and would not require any new water or wastewater connections. Therefore, the Reduced Permit Term Alternative preserve system would result in ***No Effect*** on demand for water treatment, water

supply, and wastewater treatment when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Reduce the impacts from expanding water and wastewater infrastructure to serve urban development urban development outside the UDA;
- Reduce the potential for existing aquatic resources or future preserves to conflict with planned infrastructure development; and
- Result in similar impacts on adequacy of water supply for full buildout of the project.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on the impact criteria for water and wastewater services, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects on water and wastewater services when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for water and wastewater services. Existing funding mechanisms, including payment of fees by project developers and rate increases passed on to residents of the Planning Area, have ensured that water and wastewater services were expanded to meet that demand.

Reasonably foreseeable other future projects in the cumulative study area that would further increase demand for water and wastewater services include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. The additional demand for water and wastewater infrastructure from these projects would also be offset through payment of fees by project developers, and by rate increases passed on to residents of the Planning Area. Therefore, the effects of past, present, and reasonably foreseeable other future projects would have a less than significant cumulative effect on water and wastewater services.

The Reduced Permit Term Alternative would not include urban development outside the UDA where water and wastewater infrastructure are less available, and would have a smaller incremental contribution to impacts on demand for new water or wastewater facilities as compared to the No Action/No Project alternative. Therefore, because the incremental effect of

the Reduced Permit Term Alternative on water or wastewater facilities would be somewhat less than the incremental effect of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect (when compared to the future No Action/No Project baseline condition).

12.2.4.3 Solid Waste Disposal

Direct and Indirect Effects of the Alternative

The Reduced Permit Term Alternative includes the types of urban development that are anticipated under the No Action/No Project Alternative. The urban development under the Reduced Permit Term Alternative would accommodate the same population increase as the No Action/No Project Alternative, and would generate approximately the same amount of solid waste. Future urban development would be consistent with the goals and policies listed in Section 12.1.1 that require that only compatible land uses be located near solid waste facilities and that recycling programs be developed to educate residents. Therefore, the Reduced Permit Term Alternative would result in ***No Effect*** on demand for solid waste disposal when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Establishment, management, and monitoring of the preserves under the Reduced Permit Term Alternative would not increase demand for solid waste service. Overall, there would be no difference in impacts to landfills from preserve activities when compared to similar preserve activities under the No Action/No Project Alternative. Therefore, the Reduced Permit Term Alternative preserves would result in ***No Effect*** on demand for solid waste disposal when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Be serviced by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs; and
- Result in the same demand for solid waste disposal services.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on the impact criteria for solid waste disposal, the Reduced Permit Term Alternative would result in ***No Effect*** on solid waste disposal when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.2, substantial past and present urban development has occurred in the cumulative study area, especially within the USB of Sacramento County, increasing demand for solid waste disposal. Existing funding mechanisms such as development fees or usage fees paid to the solid waste service providers have ensured that landfills and solid waste handling facilities were expanded to meet that demand.

Reasonably foreseeable future projects in the cumulative study area that would further increase demand for solid waste disposal include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the City of Folsom south of US 50, and additional development in the Natomas Basin. Existing funding mechanisms would also ensure that solid waste disposal is expanded to meet that new demand. The effects of the demand for solid waste disposal from past, present, and reasonably foreseeable other projects would not be cumulatively considerable (i.e., significant).

The urban development under the Reduced Permit Term Alternative would accommodate the same population increase as the No Action/No Project Alternative and would generate approximately the same amount of solid waste. Therefore, because the incremental effect of the Reduced Permit Term Alternative on solid waste disposal would not be discernibly different from the incremental effect of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** (when compared to the future No Action/No Project baseline condition).

12.2.4.4 Parks and Recreational Facilities

Direct and Indirect Effects of the Alternative

The Reduced Permit Term Alternative includes the types of urban development that are anticipated under the No Action/No Project Alternative. The urban development under the Reduced Permit Term Alternative would accommodate the same population increase as the No Action/No Project Alternative and would generate approximately the same amount of demand for parks and recreational facilities. However, the Reduced Permit Term Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented in a manner consistent with the approved general plans of Sacramento County and Rancho Cordova and Galt. By not shifting or displacing urban development outside the UDA, the Reduced Permit Term Alternative would reduce the demand for new park and recreational facilities in areas outside the UDA. Therefore, urban development

under the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on parks and recreational facilities as compared to the No Action/No Project Alternative baseline condition.

The Reduced Permit Term Alternative would implement AMMs such as EDGE-1, EDGE-3, EDGE-3a, and NATURE TRAIL-1 through NATURE TRAIL-5 that would provide standards for design and operation of trails within the preserve areas. Public access on trails through preserve areas would be limited by AMMs NATURE TRAIL-1 through NATURE TRAIL-5, and most would not be open to unguided public access. Provided they comply with those AMMs, new trails and trail extensions that are planned in the Sacramento County, Galt, or Rancho Cordova General Plan Public Facilities or Open Space, Parks, and Trails Elements or in bicycle or pedestrian plans would not be affected by the establishment of an interconnected preserve system. Therefore, the Reduced Permit Term Alternative would have ***No Effect*** on parks and recreational facilities as compared to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Not result in substantial adverse physical impacts associated with the provision of park and recreation services, or result in substantial physical deterioration of an existing facility due to increased use; and
- Allow for development of trails planned in the Sacramento County, Galt, or Rancho Cordova General Plan.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on the impact criteria for parks and recreational facilities, the Reduced Permit Term Alternative would result in ***No Effect*** on parks and recreational facilities when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

Section 12.1.2 describes the substantial amount of parkland acquisition and development that has occurred in the Planning Area. These parks provide diverse recreational opportunities to residents in the Planning Area and surrounding areas. Although some portions of the parks are strictly managed for preservation (e.g., Deer Creek Preserve), most areas are managed for passive and active recreational uses such as hiking, biking, picnicking, boating, camping, and off-road vehicle use.

Reasonably foreseeable other future projects such as urban development in the Elk Grove SOI or expansion of Rancho Murieta, as described in Section 3.7, would increase the population in the

Planning Area and increase demand for parks and recreational facilities. However, this development would generate fees and taxes that would pay for additional parks and recreational facilities in the Planning Area to meet these additional needs.

Urban development under the Reduced Permit Term Alternative would also increase the Planning Area population and result in increased demand for parks and recreational facilities, but as with the past, present, and reasonably foreseeable future projects, this new urban development would generate fees and taxes to pay for additional parks and recreational facilities. The Reduced Permit Term Alternative would provide limited park and recreational facility benefits by providing nature trails in some preserves established during the 30-year permit term, designed in a manner consistent with AMMs NATURE TRAIL-1 through NATURE TRAIL-5. Additional trails would likely be constructed within preserves that are established as mitigation for project impacts in years 31–50 of the EIS/EIR study period. Therefore, because the incremental effect of the Reduced Permit Term Alternative on parks and recreational facilities would not be discernibly different from the incremental effect of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** (when compared to the future No Action/No Project baseline condition).

12.2.4.5 Energy

Direct and Indirect Effects of the Alternative

The Reduced Permit Term Alternative includes the types of urban development that are anticipated under the No Action/No Project Alternative. However, under the Reduced Permit Term Alternative, urban development would not be displaced or shifted to areas outside the UDA (Section 2.3) that may not be served by existing natural gas or electrical infrastructure. Impacts associated with expanding natural gas and electrical supply infrastructure to serve urban development would be somewhat less under the Reduced Permit Term Alternative than the No Action/No Project Alternative. Therefore, urban development under the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on energy as compared to the No Action/No Project Alternative baseline condition.

Energy infrastructure under the Reduced Permit Term Alternative could be expanded, extended, or located as envisioned by the Sacramento County and Rancho Cordova General Plans' Public Facilities Elements and local energy providers' master plans. The regional energy infrastructure plans follow the growth and land use plans laid out in the general plans, and the Reduced Permit Term Alternative would be consistent with these general plans. Therefore, urban development under the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on planned development of energy infrastructure as compared to the No Action/No Project Alternative baseline condition.

Similar to the No Action/No Project Alternative, preserve management and maintenance activities would not generate an increase in demand for energy because they do not introduce new urban uses or people. Therefore, the Reduced Permit Term Alternative preserves would have ***No Effect*** on energy demand or planned development of energy infrastructure as compared to the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Reduce the potential for impacts associated with building new electric or natural gas infrastructure to meet demands of urban development outside the UDA;
- Reduce the potential for urban development patterns to conflict with regional energy infrastructure plans; and
- Result in similar demand for electricity and natural gas service due to similar total amounts of urban development within the Planning Area.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on the energy impact criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects on energy when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

As discussed in Section 3.7.1 and Section 12.2.1, past and present urban development and associated infrastructure projects and activities have occurred in the EIS/EIR Planning Area, especially within the UDA. Energy demands of these past and present projects and activities have been met by energy providers through additional energy generation and development of new energy transmission infrastructure.

Reasonably foreseeable future projects in the EIS/EIR Planning Area that would further increase energy demand include expansion of Rancho Murieta development, urban development in the Elk Grove SOI, development of the Wilton Rancheria Casino, construction of the high-speed rail, and the California WaterFix projects (Section 3.7.2).

The additional increment of energy demand generated by those reasonably foreseeable other projects would be accommodated by utility providers by purchasing additional electricity or natural gas on the open market and by constructing additional infrastructure. Any additional infrastructure required for these projects would be developed by the utility providers and would generally be located within existing County, city, or utility rights-of-way to minimize

impacts. The effects of the demand for energy and energy infrastructure from past, present, and reasonably foreseeable other projects would be a less than significant cumulative effect.

The additional development from urban development under the Reduced Permit Term Alternative would offset its impacts similarly, through payment of usage fees. Because the Reduced Permit Term Alternative would include an Aquatic Resources Plan and expedited permitting process for aquatic resources, proponents constructing or expanding energy infrastructure would be less likely to have to develop alternative routes to avoid wetlands and waters. Generally, development of utility infrastructure within the SSHCP preserve system could occur, as long as those projects complied with SSHCP AMMs. Therefore, because the incremental effect of the Reduced Permit Term Alternative on energy would not be discernibly different from the incremental effect of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in ***No Cumulative Effect*** (when compared to the future No Action/No Project baseline condition).

12.2.4.6 Mosquito Abatement

Direct and Indirect Effects of the Alternative

Covered Activities under the Reduced Permit Term Alternative include the types of urban development that are anticipated under the No Action/No Project Alternative. However, the Reduced Permit Term Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented in a manner consistent with the approved general plans of Sacramento County and Rancho Cordova and Galt, with the only Covered Activity urban development beyond the UDA being road and pipeline projects that would also occur under the No Action/No Project Alternative. Funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so any additional demand for mosquito abatement would be met. There is no reason to expect that urban development under the Reduced Permit Term Alternative would result in greater or less exposure to mosquitos for people than the No Action/No Project Alternative. Therefore, impacts associated with the potential for urban development to create breeding areas for mosquitos or increase human populations near mosquito breeding areas would be largely the same as described for the No Action/No Project Alternative (Section 12.2.2.6). Therefore, urban development under the Reduced Permit Term Alternative would have ***No Effect*** on mosquito abatement as compared to the No Action/No Project Alternative baseline condition.

The Reduced Permit Term Alternative includes a preserve system established during the 30-year permit term and a comprehensive preserve management program for those preserves.

The Reduced Permit Term Alternative would include the re-establishment and establishment of 413 acres of vernal pools, approximately 91 more acres than under the No Action/No Project Alternative. The Reduced Permit Term Alternative would also re-establish and/or establish 213 more acres of seasonal wetland, freshwater marsh, and/or open water within the Planning Area compared to the No Action/No Project Alternative. Re-established and/or established aquatic resources would be closely monitored to ensure that they meet success criteria as agreed on by the U.S. Army Corps of Engineers and that they remain functional as habitat for Covered Species. There is a potential for unhealthy existing or re-established/established aquatic resources to create an environment conducive to mosquito breeding. The coordinated monitoring and management program under the Reduced Permit Term Alternative would reduce the chances that existing, re-established, or established aquatic resources would be unhealthy and provide breeding habitat for mosquitos by controlling species such as the non-native plant *Glyceria declinata*. Therefore, the Reduced Permit Term Alternative preserve system would result in a ***Less Than Significant Adverse*** effect on mosquito abatement when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Potentially create more new breeding areas for mosquitos, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health; and
- Potentially restrict mosquito abatement activities within preserves, but would include monitoring and management to ensure that aquatic resources do not generate substantial populations of mosquitos and affect public health.

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on the mosquito abatement impact criteria, the Reduced Permit Term Alternative would result in ***Less Than Significant Adverse*** effects on mosquito abatement when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

Cumulative Effects of the Alternative

Past and present projects and activities in the cumulative study area relevant to mosquito abatement include many decades of urban development within a natural floodplain that contains many seasonal wetlands and other waters. Mitigation for impacts of past and present urban development has included avoidance of wetlands, establishment of on-site preserves,

and on-site establishment of wetlands. This development and mitigation pattern has exposed residents of urban development to mosquito populations that breed in wetland areas and in poorly designed or managed stormwater systems.

Reasonably foreseeable other projects such as urban development in the Elk Grove SOI or Rancho Murieta (Section 3.7.2) and elsewhere in the cumulative study area, such as the community of Natomas, the City of Folsom, or the City of Davis, would increase human populations near existing wetlands and vernal pools. In addition, this urban development would increase impermeable surfaces and contribute urban runoff to drainage structures that can stagnate and create breeding habitat for mosquitos. However, this urban development in the cumulative study area would also remove wetlands and vernal pools, potentially reducing existing breeding areas for mosquitos. Under most circumstances, creation or expansion of mosquito breeding habitat can be avoided or minimized through proper planning and design or maintenance elements. Increased demand on the Sacramento–Yolo Mosquito and Vector Control District for mosquito abatement services would be offset through increased funding of the District. The District is funded through property taxes and other assessments based on property value, and urban development of currently undeveloped land would substantially increase the assessed value of parcels. That increased parcel value would increase property taxes and thus increase funding for the District. Therefore, less than significant adverse cumulative impacts would result from past, present, and reasonably foreseeable other projects.

The Reduced Permit Term Alternative would contribute to cumulative impacts on mosquito abatement by establishing new aquatic resources and potentially making it more difficult to conduct mosquito abatement activities on preserves. However, the preserve system would be carefully monitored and managed to avoid the aquatic resource conditions conducive to mosquito breeding. Further, funding for mosquito abatement would continue to be provided by the additional property taxes and other assessments on new development, so additional demand for mosquito abatement would be met. Therefore, because the incremental effect of the Reduced Permit Term Alternative on mosquito abatement would be somewhat more than the incremental effect of the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in a ***Less Than Significant Adverse Cumulative*** effect (when compared to the future No Action/No Project baseline condition).

INTENTIONALLY LEFT BLANK

CHAPTER 13 – TRAFFIC AND CIRCULATION

This chapter presents the environmental effects of each Environmental Impact Statement/ Environmental Impact Report (EIS/EIR) alternative on traffic and circulation within the Planning Area. The analysis focuses on impacts to transportation systems that support the movement of goods and people. These systems include roads and freeways that support motorized vehicles; railways; public transit; and nonmotorized travel, including bicycles and pedestrians.

Environmental effects on airports are addressed in Chapter 4, Land Use. Environmental effects on recreation trails are discussed in Chapter 12, Public Services and Facilities, as a component of the recreation facilities available in the Planning Area.

13.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

This section describes the regulatory and physical environmental setting for traffic and circulation within the Planning Area.

13.1.1 Regulatory Framework

Several federal, state, and local agency requirements apply to traffic and circulation within the Planning Area. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, issuance of permits, or implementation of the alternatives analyzed in this EIS/EIR. This section also identifies any relevant federal permits or other entitlements that must be obtained prior to implementing the chosen alternative. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 13.2 (40 CFR 1502.25).

13.1.1.1 Federal and State

California Department of Transportation

In California, the Federal Highway Administration has delegated some authority for the federal highway system to the California Department of Transportation (Caltrans). Therefore, Caltrans is responsible for the planning of, operating, and maintaining the federal and state highway systems within the Planning Area (e.g., Interstate [I] 5 and State Route [SR] 99). The role of Caltrans has also evolved to oversee funding and technical assistance for passenger rail and public transit throughout the state. Any potential encroachment by development or infrastructure projects onto the land or the rights-of-way of Caltrans must be reviewed and approved by Caltrans. Planned development or infrastructure projects, such as some SSHCP transportation Covered Activities, must be reviewed by Caltrans to assess potential effects on the operation and safety of the federal or state highway system, as well as to local roads, railroads, public transit, and aeronautics facilities under Caltrans' authority.

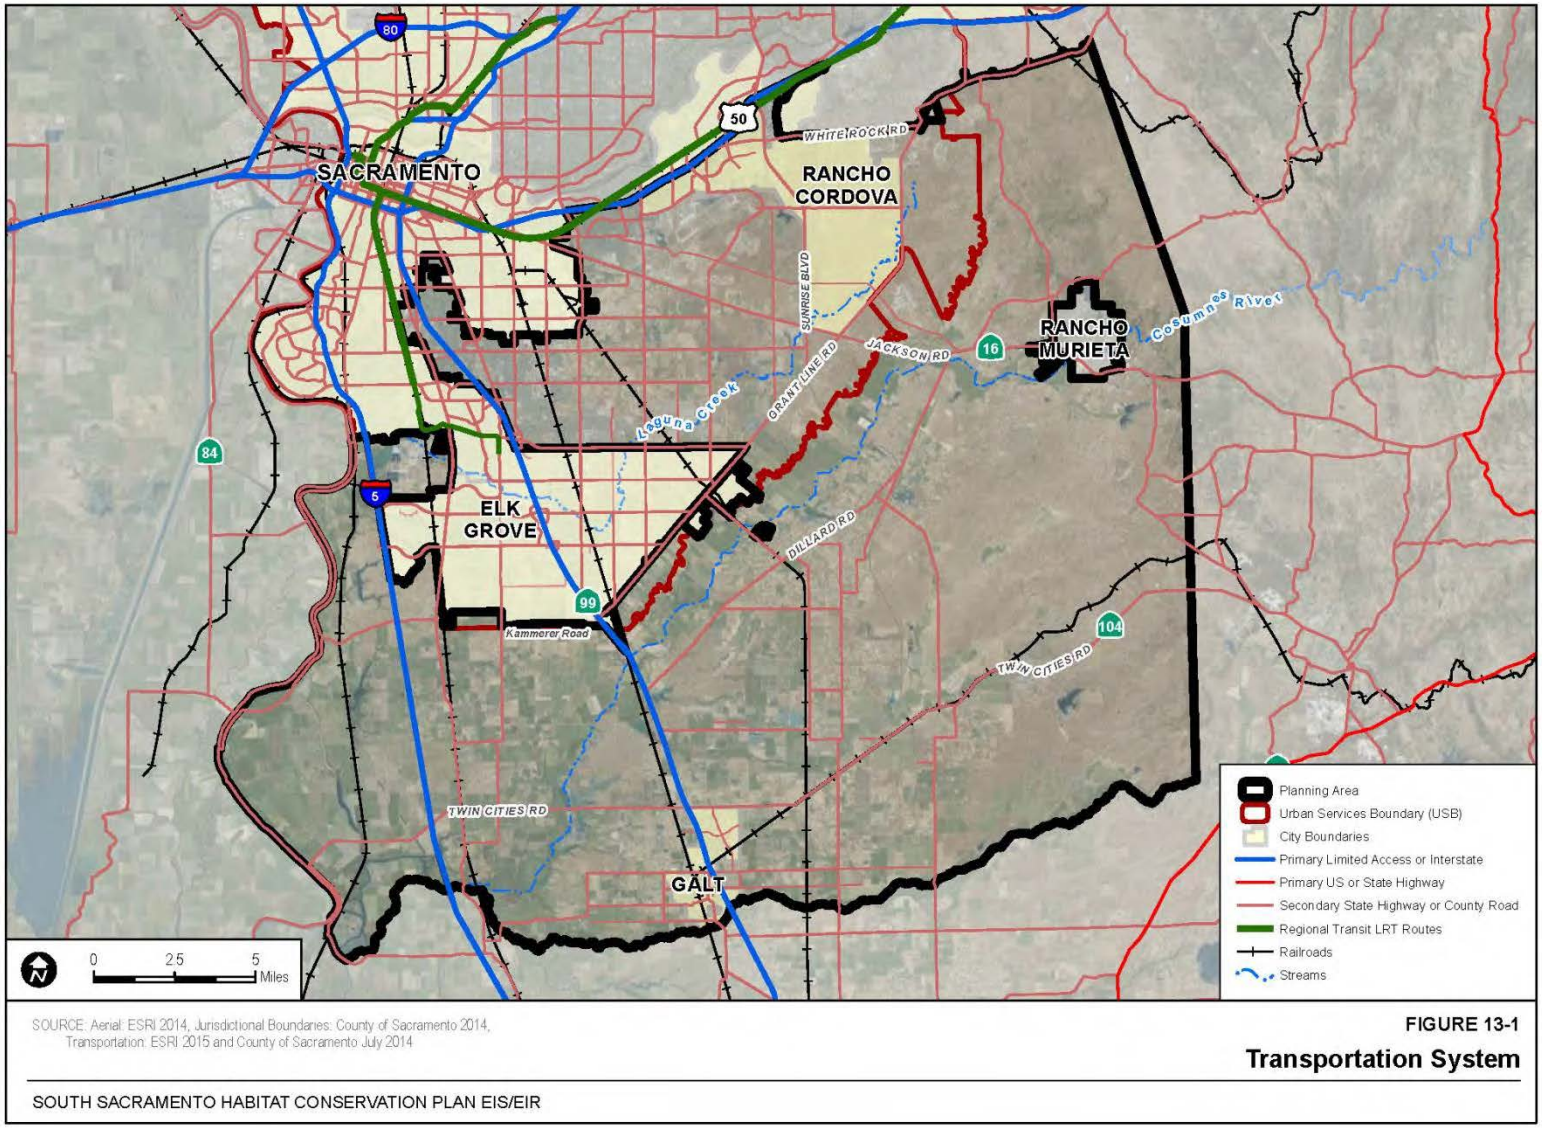
The Caltrans SR-99 and I-5 Corridor System Management Plan (Caltrans 2009) and the SR-99 Transportation Corridor Concept Report (Caltrans 2010) provide long-range planning for SR-99 and I-5 within Sacramento, Sutter, and Butte Counties over the next 20 years.

California Public Utilities Commission

In addition to the role the California Public Utilities Commission plays in overseeing energy facilities in California (see Chapter 12), it also oversees the safety of railroads, rail crossings, and light-rail transit systems, including highway rail crossings, and has permit authority over all new rail crossings.

13.1.1.2 Regional

Sacramento Area Council of Governments



The Sacramento Area Council of Governments (SACOG) is an association that includes the Counties of El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba, as well as 22 cities, including the proposed Plan Permittees of Galt and Rancho Cordova. As a metropolitan transportation organization, SACOG is required to prepare a long-range transportation plan for all modes of transportation—including public transit, automobiles, bicycles, and pedestrians—every 4 years for the six-county area. Refer to Section 3.4.4 for a description of the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) 2035 (SACOG 2016a) and its associated EIR (SACOG 2016b).

Sacramento Regional Transit District

The Sacramento Regional Transit District oversees bus and light-rail transit within the region, covering a 418-square-mile service area that includes Sacramento, Elk Grove, Citrus Heights, Rancho Cordova, and Folsom, as well as unincorporated Sacramento County. The existing passenger light-rail transit system consists of the Blue Line, Green Line, and Gold Line. The Gold Line and Blue Line link the northern, eastern, and southern areas in Sacramento County to downtown Sacramento. The Green Line serves downtown Sacramento. A small portion of the Gold Line is within the Planning Area (running roughly parallel to U.S. Highway 50 within the Urban Services Boundary [USB]) (see Figure 13-1, Transportation System).

In addition, the Sacramento Regional Transit District provides bus service between Sacramento and Rancho Cordova, and recently opened the Blue Line extension from the Meadowview Station south to Cosumnes River College in Sacramento (Sacramento County Regional Transit 2015). See Section 13.1.2 for more detail regarding the existing bus and light-rail transit system within the Planning Area.

Figure 13-1 Transportation System

AGENDA ITEM 11.1
5038

INTENTIONALLY LEFT BLANK

13.1.1.3 Local

Sacramento County

The Sacramento County Department of Transportation is responsible for the planning, construction, maintenance, and operation of streets, roads, and bike trails in the unincorporated areas of Sacramento County.

Sacramento County provides Improvement Standards (Sacramento County 2006) that regulate and guide the design and construction of streets, highways, alleys, and roadway drainage systems. Design parameters include specifications for turning movements, intersections, lighting, sidewalks, landscaping, emergency vehicle access, and clearance. The Improvement Standards provide detailed design specifications to ensure that all Sacramento County roadways meet safety and functionality requirements by roadway type.

Sacramento County's Standard Construction Specifications (Sacramento County 2008) provides specific guidance to ensure safe vehicle, pedestrian, and bicycle access is provided for development projects that affect roadways and public safety. The Standard Construction Specifications also addresses traffic control for construction work that affects roadway access, and requires project proponents to prepare a traffic control plan consistent with the current California Manual on Uniform Traffic Control Devices.

Sacramento County 2030 General Plan Circulation Element. The Sacramento County General Plan Circulation Element (Sacramento County 2011a) outlines a transportation system that will move people and goods in a safe, efficient way that minimizes environmental effects, supports urban land uses, and serves rural needs. The Circulation Element contains goals, policies, and implementation programs that apply to Sacramento County's transportation system.

Pedestrian Master Plan. The Sacramento County Pedestrian Master Plan (SACDOT 2007) identifies methods to improve pedestrian connectivity and pedestrian safety within the public right-of-way within unincorporated Sacramento County.

Bicycle Master Plan. The Sacramento County Bicycle Master Plan (Sacramento County 2011b) identifies existing and planned bicycle routes throughout Sacramento County. The Bicycle Master Plan was developed to serve the recreational and transportation needs of the public, and to reduce the amount of vehicle emissions and therefore improve air quality (Sacramento County 2011b). Class II bikeways are present along some roadways within the Planning Area. The Bicycle Master Plan anticipates that future bikeways would be developed concurrently with planned urban development within the Sacramento County USB.

Galt

Galt follows the guidance of the Sacramento County Improvement Standards and Standard Construction Specifications, as discussed earlier (Galt 2012). However, in some cases, Galt modified these standards to better fit its needs. Galt's Improvement Standards ensure that roadway safety and access for all modes of transportation occur during the design phase and once an improvement project is underway (Galt 2007).

2030 Galt General Plan Circulation Element. The Circulation Element in the Galt General Plan (Galt 2009a) includes goals, policies, and actions designed to guide and implement Galt's future circulation system as it grows. Goals and policies address the roadway network, transit facilities and services, and bicycle and pedestrian facilities, including lands within the Planning Area.

Galt Bicycle Transportation Plan. The Galt Bicycle Transportation Plan encourages development of Galt's future bikeway network, consistent with the Galt General Plan (Galt 2009a). The Galt Bicycle Transportation Plan (Galt 2011) includes planned Class II bike lanes within Galt's sphere of influence and the Planning Area to connect to existing bicycle facilities.

Rancho Cordova

Similar to Galt, Rancho Cordova follows the Sacramento County Improvement Standards and Standard Construction Specifications discussed earlier (Rancho Cordova 2015). In addition, Rancho Cordova has prepared general guidance on the design, width, and geometry of different roadway types, intersections, overpasses, pedestrian and bikeway facilities, and street signs (Rancho Cordova 2015). Chapter 22.110 of the Rancho Cordova Municipal Code also includes design and improvement standards for all types of roadways within Rancho Cordova to ensure that all roads are designed to be functional and to allow the safe passage of all modes of transportation.

Rancho Cordova General Plan Circulation Element. The Rancho Cordova General Plan Circulation Element (Rancho Cordova 2006a) establishes goals, policies, and actions that will guide Rancho Cordova's future circulation system, including the roadway network, transit facilities and services, and bicycle and pedestrian facilities within the USB.

Transit Master Plan. The purpose of the Transit Master Plan (Rancho Cordova 2006b) is to provide a multimodal approach to support mobility as presented in the General Plan. The Transit Master Plan outlines a system of city, neighborhood, and regional services.

Bicycle Master Plan. The Rancho Cordova Bicycle Master Plan (Rancho Cordova 2011) maps a system of bike paths and bike lanes that encourages bicycle commuting and recreational activities. This Bicycle Master Plan focuses on expanding the existing bicycle network (see

Section 13.1.2) in developed areas and outside of existing developed areas within the USB to provide bicycle access to existing and future activity centers, light-rail, and the existing American River Parkway. The Bicycle Master Plan describes and maps future bike routes and regional bicycle trails along Upper Laguna Creek and in the eastern and southern portions of Rancho Cordova, east of Sunrise Boulevard, in coordination with future development plans.

13.1.2 Existing Traffic and Circulation

This section describes the existing roadway network, transit system, and bikeway system that serve the Planning Area. Figure 13-1 shows the major roadways, light-rail transit, and heavy-rail transportation network in and around the Planning Area. (Due to the scale of the map, it does not include local roadways or bikeway facilities in the Planning Area.)

13.1.2.1 Existing Roadway Network in the Planning Area

Major Roadways

Major roadways carry large volumes of vehicle traffic in the Planning Area and typically connect cities and communities. I-5 and SR-99 are the two major highways running north–south in the Planning Area. U.S. Highway 50, serving east–west traffic, is located on the northern edge of the Planning Area. SR-16 (Jackson Road) and SR-104 (Twin Cities Road) cross the Planning Area and also provide east–west connectivity (see Figure 13-2, Existing Roadways within Unincorporated Sacramento County).

Other major roadways within the Planning Area are four-lane thoroughfares or heavily used two-lane arterial roads, including Folsom Boulevard, White Rock Road, Gerber Road, Kiefer Boulevard, Scott Road, Ione Road, Excelsior Road, Bradshaw Road, Vineyard Road, Elk Grove-Florin Road, South Watt Avenue, French Road, Power Inn Road, Stockton Boulevard, Florin Road, Jackson Highway, Grant Line Road, Calvine Road, Wilton Road, Dillard Road, Clay Station Road, Hood-Franklin Road, Bruceville Road, Franklin Boulevard, and Twin Cities Road (see Figure 13-2).

Within Galt, existing major roadways include Twin Cities Road (SR-104), Walnut Avenue, Elm Avenue, Simmerhorn Road, Boessow Road (C Street), A Street, New Hope Road, Lincoln Way, and Carillion Boulevard (see Figure 13-3, Existing Roadways within Galt).

Within the portion of Rancho Cordova located within the Planning Area, existing major streets include Sunrise Boulevard, White Rock Road, International Drive/Mather Field Road, Douglas Road, Grant Line Road, Zinfandel Drive, Rancho Cordova Parkway/Jaeger Road, Folsom Boulevard, Nike Road, and Bradshaw Road (see Figure 13-4, Existing Roadways within Rancho Cordova).

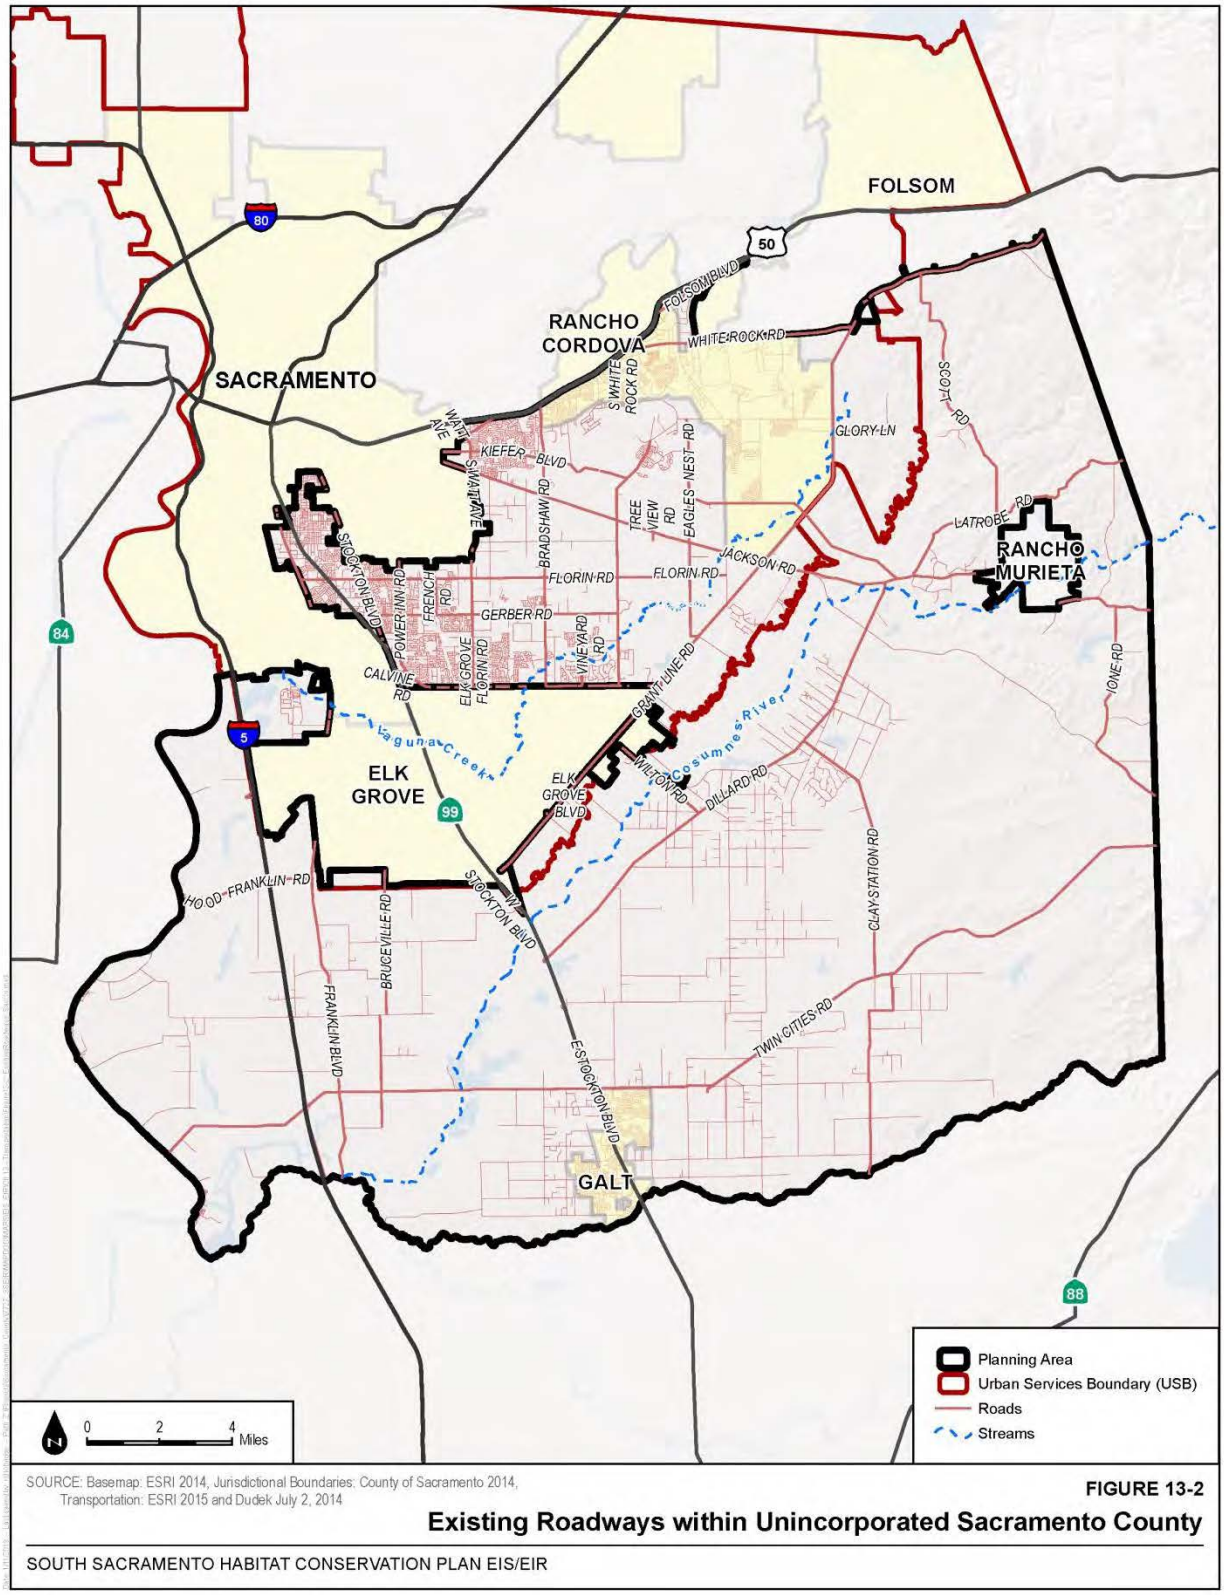
Local Roadways

Local roadways include smaller collector streets, residential streets, and unimproved agricultural roads. Examples of local roadways in the eastern portion of the Planning Area within and outside of the USB include Eagles Nest Road, Latrobe Road, and numerous agricultural roads. Examples of local roadways in Galt include McFarland Street, Pringle Avenue, and F Street. Examples of local roads in Rancho Cordova include Jaeger Road, Nike Road, and Fitzgerald Road.

13.1.2.2 Public Transit in the Planning Area

The Sacramento Regional Transit District operates a bus and light-rail transit system in the Sacramento County area. A short segment of the light-rail system enters and exits the north end of the Planning Area in Rancho Cordova around where Sunrise Avenue crosses U.S. Highway 50. No adopted plans identify additional future light-rail routes within the Planning Area.

Galt and Rancho Cordova both provide bus service that consists of intercity service; connections to light-rail transit system stations; and service to Lodi, Elk Grove, and Sacramento.



13.1.2.3 Bicycle Network in the Planning Area

Existing bicycle facilities within the Planning Area consist of Class I, Class II, and Class III facilities. Class I Bikeways provide a separated right-of-way for the exclusive use of bicycles and pedestrians, with crossflow by motorists minimized. Class II Bikeways (Bike Lanes) provide a striped lane for bicycles on a street or highway. Class III Bikeways (Bike Routes) provide for shared use with pedestrian or motor vehicle traffic.

13.1.2.4 Railroads in the Planning Area

In addition to the existing light-rail transit system operated by the Sacramento Regional Transit District, rail service in the Planning Area is operated by Union Pacific, which provides freight service, and Amtrak, which provides passenger service. Existing major rail lines are shown in Figure 13-1. There are approximately 154 railroad crossings at existing roadways within the Planning Area (CPUC 2012). Of these, more than 100 are at-grade crossings, meaning that the roadway and railroad tracks are not separated by an overcrossing.

13.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

13.2.1 Methodology for Assessing Effects of Each Alternative on Traffic and Circulation

As described in Section 3.6, the Environmental Consequences/Environmental Impacts section describes the potential impacts of the actions and projects associated with each EIS/EIR alternative on transportation and circulation in the Planning Area. As described in Section 3.6, impacts of the No Action/No Project Alternative are described and analyzed relative to the existing conditions (see Section 13.1.2, above). The impacts of the two action alternatives were described and analyzed relative to the expected No Action/No Project Alternative future conditions (see Section 3.6.1).

Potential ways that an EIS/EIR alternative could affect the transportation system would be by increasing overall usage of the system, encouraging growth in areas where the transportation system is not designed to accommodate that growth, impeding development of planned transportation infrastructure, or damaging existing or planned transportation infrastructure.

The locations of vernal pools and other aquatic resources could require adjustments to the routes of planned roadways within the Mather Core Recovery Area (MCRA) under some alternatives. To identify areas where these adjustments might be required, the lead agencies used GIS methodology, described in Section 3.6.5. Potential impacts to existing transportation plans from establishing new preserves (see Sections 2.2.2, 2.3.1, and 2.4.1) were also determined for each alternative using the GIS methods described in Section 3.6.5.

The level of additional vehicle trips assumed for preserve activities under each alternative was estimated, including expected re-establishment/establishment of vernal pools and other aquatic landcovers, and preserve maintenance activities. The lead agencies then qualitatively determined if the transportation infrastructure could accommodate this temporary traffic increase and determined if substantial congestion or safety issues could occur.

Because traffic patterns and transportation facilities are interconnected over a large region, the lead agencies determined that the study area for determining the cumulative effects of each EIS/EIR alternative on traffic and transportation resources should extend beyond the EIS/EIR Planning Area boundary (see discussion in Section 3.6.2). The lead agencies determined that the SACOG six-county region (Sacramento, Yolo, Sutter, Yuba, Placer, and El Dorado Counties) is the appropriate study area for evaluating cumulative effects to traffic and transportation resources. The effects on traffic and circulation of future urban development within the six-county region, including past, present, and reasonably foreseeable future projects, were

evaluated in the analysis of the EIRs mentioned in Section 3.4 (Connector JPA 2012; Galt 2009b; Rancho Cordova 2006c; SACOG 2016b; Sacramento County 2010). The traffic impact analyses included in each of these EIRs used SACOG traffic models, and thus reflected regional traffic impacts. Due to the interconnected nature of the transportation system within the six-county region, planning-level transportation impact analyses take into account vehicle trip generation from land uses within the larger region and, therefore, reflect the cumulative condition. For this reason, the description of existing and future traffic conditions in each alternative is the cumulative condition. Therefore, a separate cumulative effects discussion is not included for any alternative in this chapter.

As discussed in Section 3.8.1, the criteria used to evaluate the significance of each alternative's effects on traffic and circulation are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines, and on typical thresholds used to evaluate effects in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse effect could occur if the alternative would:

1. Result in a substantial increase in traffic compared to baseline traffic volumes and the capacity of the road system;
2. Result in a substantial adverse impact to public safety on area roadways;
3. Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks);
4. Result in a substantial adverse impact to access and/or circulation;
5. Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system;
6. Conflict with an applicable congestion management program;
7. Substantially increase hazards due to design features or incompatible uses; and/or
8. Result in inadequate emergency access.

Appendix G of the CEQA Guidelines does not provide suggested criteria for determining a beneficial effect. The following criteria were developed by the lead agencies. A beneficial effect could occur if the alternative would:

1. Result in a substantial decrease in traffic compared to the baseline traffic volumes and the capacity of the road system;
2. Result in improved public safety on area roadways;
3. Reduce existing conflicts with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks);
4. Result in improved access and/or circulation;

5. Reduce existing conflicts with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system;
6. Reduce an existing conflict with an applicable congestion management program;
7. Substantially reduce hazards due to design features or incompatible uses; and/or
8. Result in improved emergency access.

The impact analysis for the three EIS/EIR alternatives consider the context, intensity, and severity of potential effects to each of the impact criteria above, and present a separate determination of significance for each of these criteria.

13.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2 of Chapter 2.

13.2.2.1 Direct and Indirect Effects of the Alternative

The effects on traffic and circulation of future urban development within the six-county region, including the Planning Area, were evaluated in the analysis of the EIRs mentioned in Section 3.4. As discussed above in Section 13.2.1, the relevant analyses from each of these EIRs are summarized and incorporated by reference into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the Final Environmental Impact Report: Sacramento County General Plan Update[1] (Sacramento County General Plan EIR) (Sacramento County 2010) determined that within Sacramento County:

- Increased traffic and resulting demand on the circulation network would result in significant unavoidable impacts to roadway levels of service and transit, and
- Urban development envisioned in the Sacramento County General Plan and associated traffic would not adversely affect bicycle and pedestrian facilities or transportation-related safety issues, resulting in less-than-significant impacts to public safety (Sacramento County 2010, pp. 1-20 to 1-26, and pp. 9-1 to 9-93).

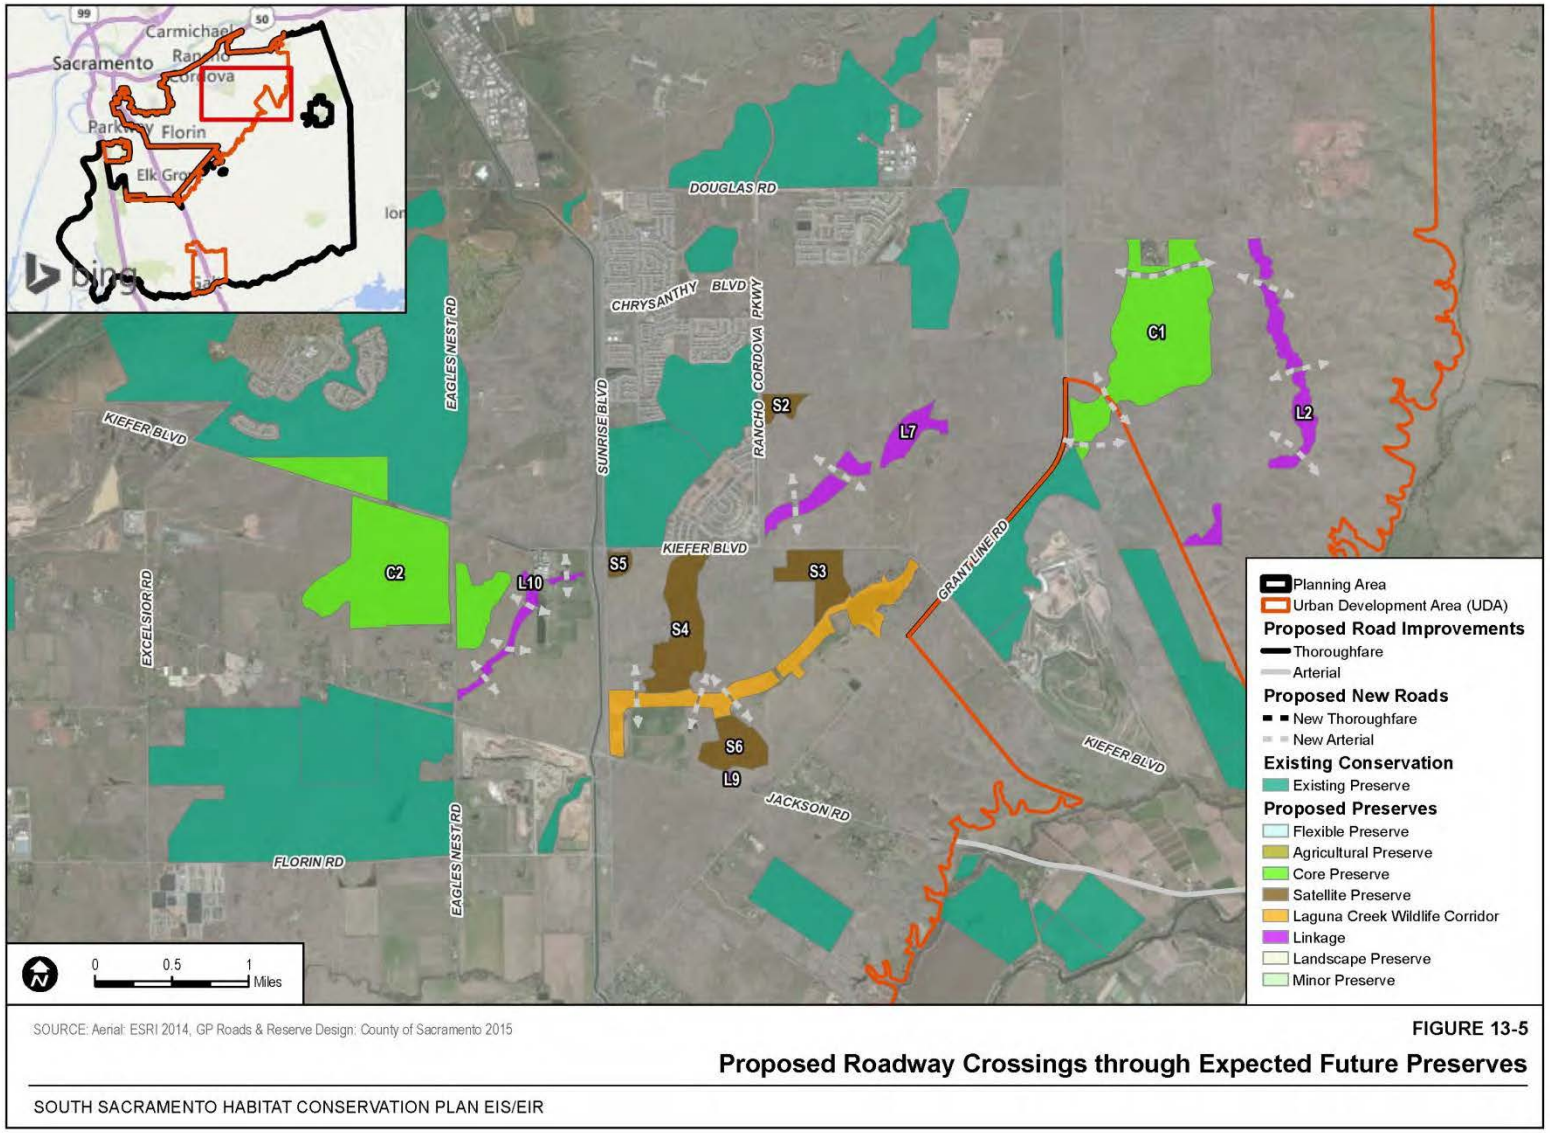
[1] As described further in Section 3.4.1, the proposed project analyzed within the Sacramento County General Plan EIR assumed development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by Sacramento County. However, Sacramento County is currently processing Master Plans in the Jackson Highway Corridor, so the referenced conclusions from the proposed project analysis are relevant to the No Action/No Project Alternative.

The impact analysis presented in the City of Galt General Plan Update: 2030 Final EIR (Galt General Plan EIR) (Galt 2009b), determined that within the Galt sphere of influence:

- Urban development described in the Galt's General Plan would result in significant unavoidable impacts to the existing street system and traffic would exceed Galt's level of service standard through planning horizon year 2030, and
- Urban development would not result in significant impacts to regional transportation facilities through compliance with policies contained in the Land Use, Circulation, and Conservation and Open Space Elements of the Galt General Plan (Galt 2008, pp. 5-17 to 5-25).

The Galt General Plan EIR did not address transportation-related safety issues (Galt 2009a).

The impact analysis presented in the City of Rancho Cordova General Plan Final EIR (Rancho Cordova General Plan EIR) (Rancho Cordova 2006c), determined that within Rancho Cordova:



- New urban development would increase demand on the existing circulation network as well as generate an increase in traffic that would result in significant unavoidable impacts to roadway levels of service through the planning horizon year of 2050, and
- Less-than-significant impacts would occur to transit, pedestrian, and bicycle systems through compliance with General Plan policies and actions. In addition, safety conflicts would be less than significant with Rancho Cordova General Plan policies and actions (Rancho Cordova 2006c, pp. 4.5-6 to 4.5-60).

The type and extent of effects to the existing transportation system of smaller developing communities within the SACOG six-county region are described in the SACOG MTP/SCS EIR as being similar to the impacts identified in the Sacramento County General Plan EIR, Galt General Plan EIR, and Rancho Cordova General Plan EIR, and were also determined to be significant and unavoidable (SACOG 2016b).

The impact analysis presented in the Capital SouthEast Connector Final Program EIR (Connector JPA 2012) determined that the Capital Southeast Connector (shown in Figure 13-5, Proposed Roadway Crossings through Expected Future Preserves) would do the following:

- Result in significant unavoidable impacts to level of service and traffic volumes on nearby roadway segments and intersections during operation.
- Result in less-than-significant impacts on local freeways, pedestrian and bicycle facilities, and transit due to increased traffic volumes, and therefore level of service.
- Not result in transportation-system-related safety impacts (Connector JPA 2012, pp. 16-1 to 16-66).

Figure 13-5 Proposed Roadway Crossings through Expected Future Preserves

INTENTIONALLY LEFT BLANK

As discussed in Section 3.4 and above Section 13.1.1.3, the three General Plan EIRs used different study periods: ending in 2030 (Galt 2009b; Rancho Cordova 2006c) and 2050 (Sacramento County 2010). The 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Additional urban development can be expected to occur within Galt, Rancho Cordova, and Sacramento County in the years after their General Plan EIR study periods end, and until this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in this EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

The additional urban development that would occur after the study periods of the EIRs described above end would result in additional impacts on local and regional circulation systems because the projected increase in vehicle trips would exceed the capacity of the existing and planned roadways.

As explained in Section 2.2, approximately 1,900 acres of planned urban development would be shifted or displaced to locations outside the Urban Development Area (UDA)[2] under the No Action/No Project Alternative. This shifted or displaced development would be remote from commercial and employment centers such as Sacramento and Rancho Cordova, and would result in longer or increased vehicle trips, greater demand on transit to serve outlying areas, and increased overall demand on the local and regional transportation system. Increased vehicle trips and vehicle miles traveled would contribute further to the already significant, unavoidable effects to existing traffic, circulation, transportation facilities, and transit described in the EIRs above (Connector JPA 2012; Galt 2009b; Rancho Cordova 2006c; SACOG 2016b; Sacramento County 2010).

As explained in Section 2.2.2, under the No Action/No Project Alternative, mitigation for effects to listed species or aquatic resources from new urban development would continue to require avoidance, minimization, and compensatory mitigation for effects that cannot be avoided. As discussed in Section 2.2.2, project Clean Water Act 404 compensatory mitigation and/or federal and California Endangered Species Act mitigation under the No Action/No Project Alternative

[2] As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, the term "UDA" means all lands within Sacramento County's Urban Services Boundary that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within Galt's sphere of influence (see Figure 1-1).

could include purchase of credits at existing mitigation banks, payment of in-lieu fees, and/or establishment of on-site or off-site preserves by the permittee. Under the No Action/No Project Alternative, there would be no comprehensive plan in place to mitigate potential project impacts to aquatic resources and special-status species associated with construction or expansion of roadways in the Planning Area. Projects would be required to mitigate impacts on a project-by-project basis, and mitigation for project impacts in the MCRA would require greater levels of avoidance and preservation. If mitigation sites are not available in the MCRA, some road projects in the MCRA may not be able to proceed. If segments of roadways are not expanded or extended as envisioned by Sacramento County's and Rancho Cordova's General Plan Circulation Elements, increased congestion on and reduced functionality of these regional circulation systems may occur. This would be a significant adverse effect to existing transportation and circulation plans.

Management of preserves established under the No Action/No Project Alternative would include a variety of habitat management activities that would cause vehicle trips, such as transporting livestock for grazing management, repairing fences, and visits by preserve managers for maintenance and monitoring. Some habitat re-establishment or establishment activities may also require heavy equipment and the associated crews to use local roadways. These activities would result in localized, temporary effects to the local roadway and bikeway systems. However, vehicle trips associated with preserves would be infrequent and intermittent, would occur throughout the day, and would not be focused on peak traffic periods (i.e., commute hours). In addition, these preserve operation and maintenance activities would be similar in frequency, location, and intensity to the existing agricultural and ranching activities that occur on the lands under existing conditions. The minimal increase in traffic from preserve activity would not add appreciably to the significant and unavoidable effects identified in the General Plan EIRs.

13.2.2.2 Cumulative Effects of the Alternative

As described in Section 13.2.1, the future traffic effects analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative effects of the No Action/No Project Alternative on existing and future traffic and circulation are identical to the direct and indirect effects described in Section 13.2.2.1.

13.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3.

13.2.3.1 Direct and Indirect Effects of the Alternative

Covered Activities under the Proposed Action/Proposed Project Alternative include the types of urban development that are anticipated under the No Action/No Project Alternative. However, the Proposed Action/Proposed Project Alternative would result in more development in the MCRA than the No Action/No Project Alternative (refer to Section 2.2.2). This would allow urban development Covered Activities within the MCRA and the rest of the UDA to be implemented consistent with the approved general plans of Galt, Rancho Cordova, and Sacramento County, with the only Covered Activity urban development beyond the UDA being road and pipeline projects that would also occur under the No Action/No Project Alternative. As a result, vehicle trips, demand on transit to serve outlying areas, and overall demand on the local and regional transportation system would be lower under the Proposed Action/Proposed Project Alternative than under the No Action/No Project Alternative. Urban development under the Proposed Action/Proposed Project Alternative would have a ***Minor Beneficial*** effect on traffic and circulation compared to the No Action/No Project Alternative baseline condition.

The Proposed Action/Proposed Project Alternative includes design requirements for future roadways. Avoidance and Minimization Measure (AMM) ROAD-1 would require transportation Covered Activities to adjust alignment of roadways to avoid aquatic resources and Covered Species habitat to the maximum extent feasible. AMM ROAD-2 would require construction of wildlife crossing structures when roadway projects occur in the vicinity of the Preserve System. Implementation of these AMMs could influence roadway safety, function, or operation. However, all roadway projects would be subject to the design standards of Galt, Rancho Cordova, and Sacramento County (Section 13.1.1). These standards ensure that roadway Covered Activities would be designed to maintain or provide roadway function and operation, and meet all safety requirements for vehicle, transit, and bicycle movement. There would be ***No Impact*** to traffic and circulation compared to the No Action/No Project Alternative baseline condition.

Under the Proposed Action/Proposed Project Alternative, project proponents constructing or expanding roadways in the MCRA would not be required to mitigate effects to aquatic resources or Covered Species habitat within the MCRA, as would occur under the No Action/No Project Alternative (see Sections 2.2.2 and 2.3.1). This difference would make it more likely that road projects in the MCRA under the Proposed Action/Proposed Project Alternative could be implemented consistent with Sacramento County and Rancho Cordova General Plans compared to the No Action/No Project Alternative. This would be a ***Minor Beneficial*** effect on conflicts with adopted transportation plans compared to the No Action/No Project Alternative baseline condition.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include an interconnected and coordinated SSHCP Preserve System. The Preserve System would allow for the passage of planned roadways. In some instances, the roadway would be allowed to bisect an SSHCP Preserve. For example, the proposed Sun Creek Preserve (Linkage Preserve L7), the Laguna Creek Wildlife Movement Corridor Preserve, and Core Preserve C2 would be bisected by the extension of future roadways through each of these planned preserves (Figure 13-5). Therefore, future planned roadways, extensions of existing roadways, and roadway widening and improvements that are planned in the Sacramento County, Galt, and Rancho Cordova General Plan Circulation Elements would not be affected by the establishment of an interconnected Preserve System. Further, by allowing transportation infrastructure to be developed according to adopted plans, the Proposed Action/Proposed Project Alternative would not increase hazards by requiring changes in roadway design features or adversely affect emergency access. As discussed above in Section 13.2.1 under the No Action/No Project Alternative, planned roadways may need to be designed to avoid aquatic resources because those projects could not receive permits or authorizations to fill or remove wetlands and other waters. Therefore, the Proposed Action/No Project Alternative Preserve System would have a ***Minor Beneficial*** effect on conflicts with adopted transportation plans compared to the No Action/No Project Alternative.

Preserve management under the Proposed Action/Proposed Project Alternative would require a variety of habitat management activities, including transporting sheep, goats, or cattle for grazing management; repairing fences; wildlife or vegetation surveys; and other visits by preserve managers for maintenance and monitoring, all of which would entail vehicle trips in or around preserve areas. These trips would be few and intermittent, would occur throughout the day, and would not be focused on peak traffic periods (i.e., commute hours). Preserve management under the Proposed Action/Proposed Project Alternative would be more intensive than under the No Action/No Project Alternative. Therefore, preserve management under the Proposed Action/Proposed Project Alternative would result in a greater increase in vehicle trips compared to management of mitigation preserves expected under the No Action/No Project Alternative. However, the relative increase in trips would be minimal compared to existing traffic volumes, and the Proposed Action/Proposed Project Alternative Preserve System would have a ***Less Than Significant Adverse*** effect on traffic volumes, public safety, access, and circulation compared to the No Action/No Project Alternative baseline condition.

Habitat re-establishment/establishment activities in the Preserve System would generate vehicle trips, including heavy truck trips. Because the Proposed Action/Proposed Project Alternative would include more re-establishment/establishment than the No Action/No Project Alternative baseline condition, more vehicle trips would be generated. These activities could result in localized, temporary impacts to the local roadway and bikeway systems by introducing heavy equipment. However, these activities would be infrequent and short-term, and it is

unlikely that construction-related vehicle trips would occur during peak hours. Re-establishment or establishment of habitat would not result in a substantial increase in traffic; affect public safety on area roads; increase hazards due to design features or incompatible uses; or conflict with adopted plans, policies, or ordinances. Habitat re-establishment/ establishment under the Proposed Action/Proposed Project Alternative would be a ***Less Than Significant Adverse*** effect on traffic and circulation compared to the No Action/No Project Alternative baseline condition.

13.2.3.2 Significance of Direct and Indirect Effects

Compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- Reduce vehicle trips, demand on transit to serve outlying areas, and overall demand on the local and regional transportation system by not resulting in displacement and shifting of urban development outside the UDA;
- Reduce potential conflicts with future planned roadways; extensions of existing roadways; and roadway widening and improvements that are planned in the Sacramento County, Galt, and Rancho Cordova General Plan Circulation Elements;
- Result in a minimal amount of additional vehicle trips for Preserve System management and monitoring; and
- Result in a minimal amount of additional heavy vehicle trips for Preserve System habitat re-establishment/establishment.

Therefore, after considering the significance of effects from the Proposed Action/Proposed Alternative on all of the traffic and circulation criteria, the Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial*** effect to traffic and circulation compared to the effects that would occur under the No Action/No Project Alternative baseline condition.

13.2.3.3 Cumulative Effects of the Alternative

As described in Section 13.2.1, future traffic effects analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative impacts of the Proposed Project/Proposed Action Alternative on existing and future traffic and circulation are identical to the direct and indirect impacts described in Section 13.2.3.1.

13.2.4 Reduced Permit Term Alternative

The Reduced Permit Term Alternative is described in Section 2.4.

13.2.4.1 Direct and Indirect Effects of the Alternative

As described in Section 2.4, the Reduced Permit Term Alternative would include similar types of new urban development as the No Action/No Project Alternative (Section 13.2.2). Under the Reduced Permit Term Alternative, all new urban development would occur inside the UDA, as directed by the general plans of Sacramento County, Rancho Cordova, and Galt, and no new urban development would "shift" or be displaced to areas outside the UDA. As a result, vehicle trips, demand on transit to serve outlying areas, and overall demand on the local and regional transportation system would be lower under the Reduced Permit Term Alternative than under the No Action/No Project Alternative. Urban development under the Reduced Permit Term Alternative would have a ***Minor Beneficial*** effect on traffic and circulation compared to the No Action/No Project Alternative baseline condition.

Covered Activity transportation infrastructure projects within the MCRA are all planned for completion by the end of the 30-year permit term, but their actual completion may not occur until beyond 30 years depending on a number of factors. Some planned Covered Activity transportation infrastructure projects outside the MCRA are anticipated by Sacramento County and other transportation planners after Year 30. However, transportation infrastructure projects in the MCRA are expected to be permitted during the 30-year permit term, and would be able to use the Reduced Permit Term Habitat Conservation Plan to mitigate impacts. Construction or routing of transportation infrastructure projects would not be limited by the acreage of vernal pools in the MCRA that are available for preservation. Expansion or extension of roadways as envisioned by the Rancho Cordova and Sacramento County General Plan Circulation Elements (Rancho Cordova 2006a; Sacramento County 2011a) would not be adversely affected by the establishment of preserves under the Reduced Permit Term Alternative. This would be a ***Minor Beneficial*** effect compared to the No Action/No Project Alternative.

Implementation of AMMs ROAD-1 and ROAD-2 during the 30-year permit term, requiring adjustment of roadway alignments to avoid aquatic resources and construction of wildlife crossing structures, could affect roadway safety, function, and/or operation. However, all roadway projects would be subject to the design standards of Sacramento County, Galt, and Rancho Cordova (Section 13.1.1). These standards would ensure that roadway Covered Activities would be designed to maintain or provide roadway function and operation, and meet all safety requirements for vehicle, transit, and bicycle movement. There would be ***No Impact*** to traffic and circulation compared to the No Action/No Project Alternative baseline condition.

The preserves established during the 30-year permit term would be interconnected but would be designed to allow the completion of planned roadways. Planned roadways in the Planning Area should be mostly completed by the end of the 30-year permit term, so preserves established as mitigation on a project-by-project basis in Years 31–50 of the EIS/EIR study

period would not accommodate future roadways crossing preserves. The Reduced Permit Term Alternative would allow transportation infrastructure to be developed according to adopted plans, and it would not increase hazards due to roadway design features or incompatible uses, or adversely affect emergency access. Therefore, the Reduced Permit Term Preserve System would have ***No Impact*** on conflicts with adopted transportation plans compared to the No Action/No Project Alternative.

Preserve management during the 30-year permit term of the Reduced Permit Term Alternative would be more intensive than under the No Action/No Project Alternative, resulting in a small increase in trips compared to the No Action/No Project Alternative. Management of preserves established after the 30-year permit term would likely undergo less management and monitoring than preserves established during the permit term and would generate fewer trips. Regardless, traffic and circulation impacts from preserve management activities would be minimal in the context of traffic from urban development. Preserve management under the Reduced Permit Term Alternative would have a ***Less Than Significant Adverse*** effect on traffic volumes, public safety, access, and circulation compared to the No Action/No Project Alternative baseline condition.

Habitat re-establishment/establishment activities in the Preserve System would generate vehicle trips, including heavy truck trips. Because the Reduced Permit Term Alternative would include more re-establishment/establishment than the No Action/No Project Alternative baseline condition, more related vehicle trips would be generated. These activities could result in localized, temporary impacts to the local roadway and bikeway systems by introducing heavy equipment. However, these activities would be infrequent and short-term, and it is unlikely that construction-related vehicle trips would occur during peak hours. Re-establishment or establishment of habitat would not result in a substantial increase in traffic; affect public safety on area roads; increase hazards due to design features or incompatible uses; or conflict with adopted plans, policies, or ordinances. Habitat re-establishment/establishment under the Reduced Permit Term Alternative would be a ***Less Than Significant Adverse*** effect on traffic volumes, public safety, access, and circulation compared to the No Action/No Project Alternative baseline condition.

13.2.4.2 Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would do the following:

- Reduce vehicle trips, demand on transit to serve outlying areas, and overall demand on the local and regional transportation system by not resulting in displacement and shifting of urban development outside the UDA;

- Reduce potential conflicts with future planned roadways, extensions of existing roadways, and roadway widening and improvements that are planned in the Sacramento County, Galt, and Rancho Cordova General Plan Circulation Elements;
- Result in a minimal amount of additional vehicle trips for Preserve System management and monitoring; and
- Result in a minimal amount of additional heavy vehicle trips for Preserve System habitat re-establishment/establishment.

Therefore, after considering the significance of effects from the Reduced Permit Term Alternative on all of the traffic and circulation impact criteria, the Reduced Permit Term Alternative would result in a ***Minor Beneficial*** effect to traffic and circulation compared to the effects that would occur under the No Action/No Project Alternative baseline condition.

13.2.4.3 Cumulative Effects of the Alternative

As described in Section 13.2.1, the future traffic effects analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative effects of the Reduced Permit Term Alternative on existing and future traffic and circulation are identical to the direct and indirect effects described in Section 13.2.4.1.

INTENTIONALLY LEFT BLANK

CHAPTER 14 – AIR QUALITY

This chapter presents the potential effects of each alternative on air quality within the Planning Area. General topics addressed include existing air quality conditions and construction and operational air emissions. Air quality impacts are evaluated for emissions of criteria air pollutants, fugitive dust, toxic air contaminants (TACs), and odors. These terms and general effects of various pollutants are described in Section 14.1.2, Planning Area Air Quality Conditions.

14.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

14.1.1 Regulatory Framework

The regulatory responsibilities for the protection of air quality within the Planning Area include several federal, state, regional, and local agencies. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, issuance of permits, or implementation of the alternatives analyzed in this Environmental Impact Statement/Environmental Impact Report (EIS/EIR). This section also identifies any relevant federal permits or other entitlements that must be obtained prior to implementing the alternatives. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 14.2, Environmental Consequences/Environmental Impacts (40 CFR 1502.25).

14.1.1.1 Federal

The primary legislation that governs federal air quality regulations is the Clean Air Act. The Clean Air Act delegates primary responsibility with implementing national air quality programs to the U.S. Environmental Protection Agency (EPA).

The Clean Air Act required the EPA to establish[1] national ambient air quality standards. As shown in Table 14-1, EPA has established primary and secondary national ambient air quality standards for the following criteria air pollutants: ozone, carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), respirable and fine particulate matter (PM_{10} and $PM_{2.5}$), and lead.

If an area does not meet the national ambient air quality standards, federal clean air planning requirements specify that states develop and adopt State Implementation Plans, which are air quality plans showing how air quality standards will be attained. In California, the EPA has delegated authority to prepare State Implementation Plans to the California Air Resources Board (CARB), which has delegated that authority to individual air districts.

14.1.1.2 State

California Air Resources Board

CARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and implementation of the California Clean Air Act. The California

[1] Note that in the context of this Plan, the word "establish" is synonymous with "create."

Clean Air Act required CARB to establish California ambient air quality standards (Table 14-1). CARB has established California ambient air quality standards for sulfates, hydrogen sulfide, vinyl chloride, visibility-reducing particulate matter, and the previously mentioned criteria air pollutants.

In addition to the pollutants described previously, TACs are regulated primarily through the Tanner Air Toxics Act (Assembly Bill 1807, Chapter 1047, Statutes of 1983) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (Assembly Bill 2588, Chapter 1252, Statutes of 1987). Assembly Bill 1807 set a formal procedure for CARB to designate substances as TACs. Research, public participation, and scientific peer review are required before CARB can designate a substance as a TAC. To date, CARB has identified more than 21 TACs and adopted EPA's list of hazardous air pollutants as TACs. Most recently, particulate-matter exhaust from diesel engines (diesel PM) was added to CARB's list of TACs. PM_{10} is considered a surrogate for diesel PM and, therefore, is the pollutant used to describe TAC emissions in this analysis.

CARB has adopted an asbestos Airborne Toxic Control Measure (ATCM) for construction, grading, quarrying, and surface mining operations (17 CCR 93105). This statewide regulation requires use of control measures to minimize emissions of asbestos-laden dust. The ATCM applies to any size construction project although there are more stringent mitigation requirements for projects that exceed 1 acre.

Naturally occurring asbestos is known to be present in eastern Sacramento County (CDOC 2006). See Chapter 5, Soils, Geology, and Mineral Resources, for more information on the locations of naturally occurring asbestos in the Planning Area (Figure 5-4). Further, the Sacramento Metropolitan Air Quality Management District (SMAQMD) has regulatory authority to ensure compliance with the asbestos ATCM.

14.1.1.3 Local

Sacramento Metropolitan Air Quality Management District

At the local level, SMAQMD is the primary agency responsible for planning to meet federal and state ambient air quality standards in the Planning Area. SMAQMD is responsible for establishing and enforcing local air quality rules and regulations that address the requirements of federal and state air quality laws. SMAQMD has jurisdiction over the Planning Area, which is within the Sacramento Valley Air Basin (SVAB).

SMAQMD also enforces air quality regulations, educates the public about air quality, and implements a number of programs to provide incentives for the replacement or retrofit of older diesel engines and to influence land use development in Sacramento County. Other local jurisdictions within the Planning Area include Sacramento County, Galt, and Rancho Cordova. Each jurisdiction currently has adopted General Plans that contain goals and policies relating to the

reduction of air pollution (these are listed in the following text). Generally, the goals and policies require new development within these jurisdictions to comply with SMAQMD California Environmental Quality Act (CEQA) guidance and thresholds of significance (SMAQMD 2014).

Table 14-1. Ambient Air Quality Standards

Pollutant	Averaging Time	California[a,b]	National[c]	
			Primary[b,d]	*Secondary*[b,e]
Ozone	1-hour	0.09 ppm (180 µg/m^3)	—[e]	Same as primary standard
	8-hour	0.070 ppm (137 µg/m^3)	0.070 ppm (137 µg/m^3)	
CO	1-hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	Same as primary standard
	8-hour	9 ppm (10 mg/m^3)[f]	9 ppm (10 mg/m^3)	
NO_2[g]	Annual arithmetic mean	0.030 ppm (57 µg/m^3)	53 ppb (100 µg/m^3)	Same as primary standard
	1-hour	0.18 ppm (339 µg/m^3)	100 ppb (188 µg/m^3)	—
SO_2	24-hour	0.04 ppm (105 µg/m^3)	—	—
	3-hour	—	—	0.5 ppm (1300 µg/m^3)
	1-hour	0.25 ppm (655 µg/m^3)	75 ppb (196 µg/m^3)	—
PM_{10}	Annual arithmetic mean	20 µg/m^3	—	Same as primary standard
	24-hour	50 µg/m^3	150 µg/m^3	
$PM_{2.5}$	Annual arithmetic mean	12 µg/m^3	12.0 µg/m^3	15.0 µg/m^3
	24-hour	—	35 µg/m^3	Same as primary standard
Lead	Calendar quarter	—	1.5 µg/m^3	Same as primary standard
	30-day average	1.5 µg/m^3	—	—
	Rolling 3-month average	—	0.15 µg/m^3	Same as primary standard
Hydrogen sulfide	1-hour	0.03 ppm (42 µg/m^3)	No national standards	
Sulfates	24-hour	25 µg/m^3		
Vinyl chloride[f]	24-hour	0.01 ppm (26 µg/m^3)		
Visibility-reducing particulate matter	8-hour	Extinction of 0.23 per km		

Source: CARB 2017.

Notes: µg/m^3 = micrograms per cubic meter; CO = carbon monoxide; km = kilometers; NO_2 = nitrogen dioxide; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; ppb = parts per billion; ppm = parts per million; SO_2 = sulfur dioxide

a California standards for ozone, SO_2 (1- and 24-hour), NO_2, particulate matter, and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

b Concentration expressed first in units in which it was issued. Equivalent units given in parentheses are based on a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume or micromoles of pollutant per mole of gas.

c National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic means) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over 3 years, is equal to or less than the standard. The PM_{10} 24-hour standard is attained when 99% of the daily concentrations, averaged over 3 years, are equal to or less than the standard. The $PM_{2.5}$ 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact the EPA for further clarification and current federal policies.

d National primary standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

e National secondary standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] CARB has identified lead and vinyl chloride as TACs with no threshold of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

Sacramento County

Sacramento County 2030 General Plan

The *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011) Air Quality Element includes goals, objectives, and policies related to the protection of air quality in the County. Applicable policies include the following (Sacramento County 2011):

> **Policy AQ-1:** New development shall be designed to promote pedestrian/bicycle access and circulation to encourage community residents to use alternative modes of transportation to conserve air quality and minimize direct and indirect emission of air contaminants.
>
> **Policy AQ-3:** Buffers and/or other appropriate mitigation shall be established on a project-by-project basis and incorporated during review to provide for protection of sensitive receptors from sources of air pollution or odor. [C]ARB's "Air Quality and Land Use Handbook: A Community Health Perspective", and SMAQMD's approved Protocol (Protocol for Evaluating the Location of Sensitive Land uses Adjacent to Major Roadways) shall be utilized when establishing these buffers.
>
> **Policy AQ-4:** Developments which meet or exceed thresholds of significance for ozone precursor pollutants as adopted by SMAQMD, shall be deemed to have a significant environmental impact. An Air Quality Mitigation Plan shall be submitted to the County of Sacramento prior to project approval, subject to review and recommendation as to technical adequacy by SMAQMD.
>
> **Policy AQ-10:** Encourage vehicle trip reduction and improved air quality by requiring development projects that exceed the SMAQMD's significance thresholds for operational emissions to provide on-going, cost-effective mechanisms for transportation services that help reduce the demand for existing roadway infrastructure.
>
> **Policy AQ-11:** Encourage contractors operating in the county to procure and to operate low-emission vehicles, and to seek low emission fleet status for their off-road equipment.
>
> **Policy AQ-12:** Minimize air pollutant emissions from Sacramento County facilities and operations.

Policy AQ-13: Use [C]ARB and SMAQMD guidelines for Sacramento County facilities and operations to comply with mandated measures to reduce emissions from fuel consumption, energy consumption, surface coating operations, and solvent usage.

Policy AQ-14: Support SMAQMD's development of improved ambient air quality monitoring capabilities and the establishment of standards, thresholds and rules to more adequately address the air quality impacts of plans and proposals proposed by the County.

Policy AQ-16: Prohibit the idling of on-and off-road engines when the vehicle is not moving or when the off-road equipment is not performing work for a period of time greater than five minutes in any one-hour period.

Policy AQ-17: Promote optimal air quality benefits through energy conservation measures in new development.

Policy AQ-19: Require all feasible reductions in emissions for the operation of construction vehicles and equipment on major land development and roadway construction projects.

Policy AQ-20: Promote Cool Community strategies to cool the urban heat island, reduce energy use and ozone formation, and maximize air quality benefits by encouraging four main strategies including, but not limited to: plant trees, selective use of vegetation for landscaping, install cool roofing, and install cool pavements.

Policy AQ-21: Support SMAQMD's particulate matter control measures for residential wood burning and fugitive dust.

2030 Galt General Plan

The *2030 Galt General Plan: Policy Document* (Galt General Plan) Conservation Element (Galt 2009a) includes goals, objectives, and policies related to the protection of air quality. Applicable policies include the following (Galt 2009a):

Policy COS-5.1: Vehicle Emission Reduction Programs: The City should support land use, transportation management, infrastructure, and environmental planning programs that reduce vehicle emissions and improve air quality.

Policy COS-5.2: Walkable Design: The City shall require subdivision and site plan designs to maximize pedestrian and bicycle circulation and promote street designs that strongly encourage biking and walking.

Policy COS-5.6: SMAQMD Coordination: The City shall coordinate with SMAQMD on the review of proposed development projects. The City shall use SMAQMD Guide to Air Quality Assessment for determining and mitigating project air quality impacts and related thresholds of significance for use in environmental documents.

Policy COS-5.9: Air Quality Mitigation Measures: The City shall enforce construction and operation related air quality mitigation measures adopted through the CEQA process.

Policy COS-5.10: New Development Operational Emission Reductions: The City shall require all new development projects which have the potential to result in significant operational air quality impacts (exceeding SMAQMD adopted thresholds), to incorporate design or operational features that result in a reduction in emissions equal to 15 percent from the level that would be produced by an unmitigated project, based upon feasible mitigation under CEQA.

Policy COS-5.11: Construction Mitigation Measures: The City shall require developers to implement dust suppression measures as well as the applicable standard construction mitigation measures associated with exhaust [oxides of nitrogen] NO_x and PM_{10} reduction in accordance with the current SMAQMD CEQA Guide to Air Quality Assessment.

Policy COS-5.12: Construction Mitigation Fees: The City shall require developers to comply with the current SMAQMD construction mitigation fee offset program.

Policy COS-5.13: Air Pollution Control Technology: The City shall follow the rules and regulations as adopted by the SMAQMD to maintain healthful air quality and high visibility standards. These measures shall be applied to new development approvals and permit modifications as appropriate.

Rancho Cordova General Plan

The *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2013) Air Quality Element includes goals, objectives, and policies related to the protection of air quality. Applicable policies include the following (Rancho Cordova 2013):

Policy AQ.1.2: Evaluate projects for compliance with state and federal ambient air quality standards and the SMAQMD thresholds of significance.

Policy AQ.1.5: Require odor impact analyses be conducted for evaluating new development requests that either could generate objectionable odors that may violate SMAQMD Rule 402 or any subsequent rules and regulations regarding objectionable odors near sensitive receptors or locate new sensitive receptors near existing sources of objectionable odors.

Should objectionable odor impacts be identified, odor mitigation shall be required in the form of setbacks, facility improvements or other appropriate measures.

Policy AQ.2.2: Encourage mixed-use developments that put residences in close proximity to services, employment, transit, schools, and civic facilities/services.

Policy AQ.2.4: Maximize air quality benefits through selective use of landscaping vegetation that is low in emission of volatile organic compounds, and through re-vegetation of appropriate areas.

Policy AQ.2.5: Utilize the guidelines in the [C]ARB Compatibility and Land Use Handbook: A Community Health Perspective when evaluating new development requests that either would generate toxic air contaminant emissions near sensitive receptors or locate new sensitive receptors near existing sources of air toxic emissions or order to minimize health hazards, and implement all feasible best available control technology, as required by SMAQMD.

Policy AQ.4.1: Promote improved air quality benefits through energy conservation measures for new and existing development.

Policy AQ.4.2: Support vehicle improvements and the use of clean vehicles that reduce emissions and improve air quality.

Policy AQ.4.3: Support SMAQMD's program of retrofitting construction equipment to reduce air pollution.

14.1.2 Planning Area Air Quality Conditions

This section provides information on criteria pollutants and the health effects of these pollutants and describes the existing air quality conditions in the Planning Area.

14.1.2.1 Pollutants and Effects

Concentrations of criteria air pollutants are used to indicate the quality of the ambient air. A brief description of key criteria air pollutants in the SVAB is provided in the following text, including emission source types and health effects. For descriptions of health effects, "acute" refers to effects of short-term exposures to criteria air pollutants, usually at fairly high concentrations, whereas "chronic" refers to effects of long-term exposures to criteria air pollutants, usually at lower, ambient concentrations.

Ozone

Ozone is a photochemical oxidant (a molecule whose oxygen combines chemically with another substance in the presence of sunlight) and the primary component of smog. Ozone is not directly emitted into the air but is formed through complex chemical reactions between precursor emissions of reactive organic gasses (ROG) and NO_X in the presence of sunlight. ROGs are volatile organic compounds that are photochemically reactive. ROG emissions result primarily from incomplete combustion and the evaporation of chemical solvents and fuels. NO_X are a group of gaseous compounds of nitrogen and oxygen that result from the combustion of fuels.

Emissions of the ozone precursors ROG and NO_X have decreased over the past several years because of more stringent motor vehicle standards and cleaner burning fuels. Emissions of ROG and NO_x decreased from 2000 to 2010 and are projected to continue decreasing from 2010 to 2035 (CARB 2013).

Acute health effects include increased respiration and pulmonary resistance, including cough, pain, shortness of breath, and lung inflammation. Chronic health effects include permeability of respiratory epithelia and possibility of permanent lung impairment.

Carbon Monoxide

CO is a colorless, odorless gas produced by incomplete combustion of fuels (i.e., motor vehicle exhaust). Acute health effects include headache, dizziness, fatigue, nausea, vomiting, and eventually death. Chronic health effects include permanent heart and brain damage.

Nitrogen Dioxide

NO_2 is a brownish, highly reactive gas that is present in all urban environments. The major human-made sources of NO_2 are combustion devices, such as boilers, gas turbines, and mobile and stationary internal combustion engines. Combustion devices emit primarily nitric oxide (NO), which reacts through oxidation in the atmosphere to form NO_2. The combined emissions of NO and NO_2 are referred to as NO_X and are reported as equivalent NO_2. Because NO_2 is formed and depleted by reactions associated with photochemical smog (ozone), the NO_2 concentration in a particular geographical area may not be representative of the local sources of NO_X emissions (EPA 2017).

Acute health effects include coughing, difficulty breathing, vomiting, headache, eye irritation, chemical pneumonitis (inflammation of the lung tissue) or pulmonary edema (fluid accumulation in the lungs), breathing abnormalities, cough, chest pain, rapid heartbeat, and ultimately death. Chronic health effects include chronic bronchitis and decreased lung function.

Sulfur Dioxide

SO_2 is a gaseous compound of sulfur and oxygen. Sources of SO_2 include coal and oil combustion, refineries, and pulp and paper mills. Acute health effects include irritation of upper respiratory tract and increased asthma symptoms. There is insufficient evidence linking SO_2 exposure to chronic health impacts.

Particulate Matter

PM with an aerodynamic diameter of 10 micrometers or less is referred to as PM_{10}. This size particle is of concern because it is small enough to reach deep into the lungs. PM_{10} consists of particulate matter emitted directly into the air, such as fugitive dust, soot, and smoke from mobile and stationary sources, construction operations, fires and natural windblown dust, and particulate matter formed in the atmosphere by reaction of gaseous precursors (CARB 2013). $PM_{2.5}$ includes a subgroup of smaller particles that have an aerodynamic diameter of 2.5 micrometers or less. PM_{10} and $PM_{2.5}$ emissions in the SVAB are dominated by emissions from area sources, primarily fugitive dust from vehicle travel on unpaved and paved roads, farming operations, construction and demolition, and particles from residential fuel combustion (CARB 2013).

Direct emissions of PM_{10} are projected to remain relatively constant through 2035. Direct emissions of $PM_{2.5}$ have steadily declined in the SVAB between 2000 and 2010 and are projected to increase slightly through 2035.

Acute health risks include breathing and respiratory symptoms, aggravation of existing respiratory and cardiovascular diseases, and premature death. Chronic effects include alterations to the immune system and cancer formation.

Lead

Lead is a relatively soft and chemically resistant metal. Lead is present in small particles as a result of a variety of industrial activities. Acute effects include developmental disruptions in fetuses and children. Chronic effects include neurological, endocrine, and cardiovascular damage.

Toxic Air Contaminants

A TAC is defined as an air pollutant that may cause or contribute to an increase in mortality or in serious illness or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, the high toxicity or health risk of TACs may pose a threat to public health even at low concentrations.

According to the California Almanac of Emissions and Air Quality (CARB 2013), the majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being diesel PM. Diesel PM differs from other TACs in that it is not a single substance but rather a complex mixture of hundreds of substances. Although diesel PM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emissions control system is being used. Unlike the other TACs, no ambient monitoring data are available for diesel PM because no routine measurement method currently exists. However, CARB has made preliminary concentration estimates based on a PM exposure method. This method uses the CARB emissions inventory's PM_{10} database, ambient PM_{10} monitoring data, and the results from several studies to estimate concentrations of diesel PM. In addition to diesel PM, the TACs for which data are available that pose the greatest existing ambient risk in California are benzene, 1 and 3-butadiene, acetaldehyde, carbon tetrachloride, hexavalent chromium, para-dichlorobenzene, formaldehyde, methylene chloride, and perchloroethylene.

Diesel PM poses the greatest health risk among these 10 TACs mentioned. Based on receptor modeling techniques, the CARB estimated its health risk to be 360 excess cancer cases per million people in the SVAB in the year 2000. Since 1990, the health risk associated with diesel PM has been reduced by 52%. Overall, levels of most TACs, except para-dichlorobenzene and formaldehyde, have decreased since 1990 (CARB 2013).

14.1.2.2 Existing Air Quality Conditions

Regional Air Quality

The Planning Area is located within Sacramento County, California, which is within the SVAB. The SVAB also includes all of Butte, Colusa, Glenn, Shasta, Sutter, Tehama, Yolo, and Yuba Counties; the western portion of Placer County; and the eastern portion of Solano County. The ambient concentrations of air pollutants are determined by the amount of emissions released by the sources of air pollutants and the atmosphere's ability to transport and dilute such emissions. Natural factors that affect transport and dilution include terrain, wind, atmospheric stability, and sunlight. Therefore, existing air quality conditions in the area are determined by such natural factors as topography, meteorology, and climate, in addition to the amount of emissions released by existing air pollutant sources, as discussed in the following text.

Climate and Meteorology

The SVAB is a relatively flat area bordered by the northern Coast Ranges to the west and the northern Sierra Nevada to the east. Air flows into the SVAB through the Carquinez Strait, the

only breach in the western mountain barrier, and moves across the Sacramento River–San Joaquin River Delta from the San Francisco Bay area.

The Mediterranean climate type in the SVAB is characterized by hot, dry summers and cool, rainy winters. During the summer, daily temperatures range from 50 degrees Fahrenheit (°F) to more than 100°F. The inland location and surrounding mountains shelter the area from much of the ocean breezes that keep the coastal regions moderate in temperature. Most precipitation in the area results from air masses that move in from the Pacific Ocean, usually from the west or northwest, during the winter months. More than half the total annual precipitation falls during the winter rainy season (November through February); the average winter temperature is a moderate 49°F. Also characteristic of SVAB winters are periods of dense and persistent low-level fog, which is most prevalent between storms. The prevailing winds are moderate in speed and vary from moisture-laden breezes from the south to dry land flows from the north.

The mountains bordering the eastern and western sides of the SVAB create a barrier to airflow, which leads to the entrapment of air pollutants when meteorological conditions are unfavorable for transport and dilution. The highest frequency of poor air movement occurs in the fall and winter when high-pressure cells are present over the SVAB. The lack of surface wind during these periods, combined with the reduced vertical flow caused by a decline in surface heating, reduces the influx of air and leads to the concentration of air pollutants under stable metrological conditions. Surface concentrations of air pollutants are highest when these conditions occur in combination with agricultural burning activities or with temperature inversions, which hamper dispersion by creating a ceiling over the area and trapping air pollutants near the ground.

May through October is ozone season in the SVAB. This period is characterized by poor air movement in the mornings with the arrival of the Sacramento River–San Joaquin River Delta sea breeze from the southwest in the afternoons. In addition, longer daylight hours provide a plentiful amount of sunlight to fuel photochemical reactions between ROG and NO_X, which result in ozone formation. Typically, the Sacramento River–San Joaquin River Delta breeze transports air pollutants northward out of the SVAB; however, a phenomenon known as the Schultz Eddy prevents this from occurring during approximately half of the time from July to September. The Schultz Eddy phenomenon causes the wind to shift southward and blow air pollutants back into the SVAB. This phenomenon exacerbates the concentration of air pollutant emissions in the area and contributes to the area violating the ambient air quality standards.

The local meteorology of the Planning Area is represented by measurements recorded at the Western Regional Climate Center Sacramento 5 ESE station. The normal annual precipitation is approximately 18 inches. January temperatures range from a normal minimum of 40°F to a normal maximum of 53.5°F. July temperatures range from a normal

minimum of 59.2°F to a normal maximum of 92°F (WRCC 2015). The predominant wind direction is from the south (WRCC 2002).

Local Air Quality

The Clean Air Act requires the EPA to classify areas in the country as attainment or nonattainment with respect to each criteria air pollutant, dependent on whether the areas meet the national standards. In addition, the CARB makes area designations within California for state ambient air quality standards. The SVAB is in nonattainment for the national and state ozone standards, the state PM_{10} standard, and the national and state $PM_{2.5}$ standards. The attainment status of each pollutant within the SVAB (which includes the Planning Area) for both the California ambient air quality standards and national ambient air quality standards are shown in Table 14-2.

Table 14-2. Attainment Status Designations for the SVAB

Pollutant	National Standard	State Standard
Ozone	Nonattainment (1-hour)[a] classification = severe	Nonattainment (1-hour) classification = serious[b]
	Nonattainment (8-hour)[c] classification = severe	Nonattainment (8-hour)
	Nonattainment (8-hour)[d] classification = severe	
PM_{10}	Attainment (24-hour)	Nonattainment (24-hour)
		Nonattainment (annual)
$PM_{2.5}$	Nonattainment (24-hour)	(No state standard for 24-hour)
	Unclassified/attainment (annual)	Nonattainment (annual)
CO	Attainment (1-hour)	Attainment (1-hour)
	Attainment (8-hour)	Attainment (8-hour)
NO_2	Unclassified/attainment (1-hour)	Attainment (1-hour)
	Unclassified/attainment (annual)	Attainment (annual)
SO_2	(Attainment pending) (1-hour)	Attainment (1-hour)
		Attainment (24-hour)
Lead (particulate)	Unclassified/attainment (3-month rolling average)	Attainment (30-day average)
Hydrogen sulfide	No national standard	Unclassified (1-hour)
Sulfates		Attainment (24-hour)
Visibility-reducing particles		Unclassified (8-hour)

Source: SMAQMD 2013.

Notes: CO = carbon monoxide; NO_2 = nitrogen dioxide; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SO_2 = sulfur dioxide

[a] Air quality meets federal 1-hour ozone standard (77 FR 64036–64039). The EPA revoked this standard, but some associated requirements still apply. SMAQMD attained the standard in 2009. SMAQMD has requested the EPA recognize attainment to fulfill the requirements.

[b] Per California Health and Safety Code, Section 40921.5(c), the classification is based on 1989–1991 data and, therefore, does not change.

[c] 1997 standard.

[d] 2008 standard.

Criteria air pollutant concentrations are measured at several monitoring stations in the SVAB. In general, the ambient air quality measurements from these stations are representative of the air quality in and around the Planning Area. Table 14-3 summarizes

the air quality data from the last 3 years (2012–2014) for pollutants in nonattainment within the SVAB, including the frequency of exceedances of applicable federal and state air quality standards. CARB and EPA use this type of monitoring data to designate an area's attainment status for criteria air pollutants.

Table 14-3. Summary of Annual Sacramento Valley Air Basin Air Quality for Nonattainment Pollutants (2012–2014)

Averaging Time	2012	2013	2014
Ozone[a]			
Maximum concentration (1-hour/8-hour average ppm)	0.122/0.107	0.12/0.088	0.11/0.085
Number of days national standard exceeded (8-hour)	46	12	23
Number of days state standard exceeded (1-hour /8-hour)	22/75	8/32	12/49
Fine Particulate Matter (PM_{10})[a]			
Maximum concentration (24-hour µg/m^3)	96.7	96.4	125.3
Number of days national standard exceeded (estimates/measured)	0/0	*/0	*/0
Number of days state standard exceeded (estimated/measured[b])	18.7/3	23.3/21	13.2/13
Respirable Particulate Matter ($PM_{2.5}$)[a]			
Number of days national standard exceeded (24-hour measured[b])	3.1	13.0	4.0
High annual state standard designation value	15	14	13
Maximum concentration (24-hour µg/m^3)	123.3	75.6	190.2

Source: CARB 2014.

Notes: µg/m^3 = micrograms per cubic meter; ppm = parts per million; * = insufficient data to determine value

[a] Data for ozone and $PM_{2.5}$ based on Sacramento County summary tables. Data for PM_{10} based on the T Street Site located at 1309 T Street, Sacramento California, 95814.

[b] Measured days are those days that an actual measurement was greater than the level of the state daily standard or the national daily standard. Measurements are typically collected every 6 days. Estimated days are the estimated number of days that a measurement would have been greater than the level of the standard had measurements been collected every day. The number of days above the standard is not necessarily the number of violations of the standard for the year.

14.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

14.2.1 Methodology for Assessing Impacts of Each Alternative on Air Quality

Air quality impacts are typically evaluated in terms of temporary emissions, most commonly associated with construction activities, and operational emissions, such as those resulting from land use development, increased mobile-source emissions, or additional and new stationary emission sources, such as industrial facilities. The alternatives were evaluated in the context of the planned urban development, land use patterns within the Planning Area, and emissions sources associated with them (e.g., stationary, mobile, area). Impacts were identified where the actions associated with the alternative would result in new or additional emissions of concern.

The projects and activities included in each alternative, including the conceptual preserve, are described in Chapter 2, Alternatives, Including the Proposed Action/Proposed Project. Potential temporary and permanent air quality impacts for each alternative were analyzed based on the anticipated development projects and preserve establishment, management, and maintenance over the 50-year EIS/EIR study period, as described in Section 3.6.3.

Specific to emissions from preserve establishment/re-establishment, emissions from construction- and operational-related activities were quantified using the California Emissions Estimate Model. Modeling was for an estimated high-activity day implementing habitat establishment/re-establishment and used conservative assumptions (i.e., assumptions that would lead to higher emissions) so as to not underestimate emissions from this activity. For example, the modeling assumed that approximately 385 acres of habitat establishment/re-establishment would be completed in a single year, which is roughly 20% of the total habitat establishment/re-establishment required for each alternative over the entire 50-year study period. This is above what would actually be expected to occur as each alternative is implemented over time. The modeling included the use of heavy-duty equipment for earth movement and grading and operational-related vehicle use. Model assumptions and parameters are included in Appendix H, Modeling Data and Assumptions for Air Quality and Greenhouse Gas Analyses.

Cumulative effects are analyzed consistently with the methodology described in Section 3.7, Cumulative Effects Analysis in Resource Chapters 4 through 16.

By nature, pollutants emitted into the air are a regional issue since emissions from multiple sources over a large regional area combine to create the overall air quality conditions. However, the types of emissions and sources within each air basin are regulated through local agencies. As described previously, SMAQMD regulates emissions and sources within the SVAB. Further, significance thresholds determined by SMAQMD are designed to ensure compliance with state air quality planning efforts. Thus, the planning framework is structured such that compliance with regional planning efforts and regulations would ensure compliance with state and federal efforts as well. As such, the lead agencies determined that an appropriate geographic scale for evaluating the cumulative impacts of each EIS/EIR alternative on air quality resources should include air emissions occurring within the SVAB as regulated by SMAQMD.

As discussed in Section 3.4, Previous Planning Area Environmental Reviews, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006) analyzed direct and cumulative impacts of urban growth planned within each jurisdiction, including impacts to air quality. When the impact analyses or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief summary or description of the incorporated information or analysis is

provided in Sections 14.2.2, No Action/No Project Alternative; 14.2.3, Proposed Action/Proposed Project Alternative; and 14.2.4, Reduced Permit Term Alternative.

14.2.1.1 Determination of Impact Significance

For the air quality analysis in this chapter, the evaluation of the significance of air quality effects considers both a federal conformity analysis process and more typical specific significance criteria found in other chapters of this EIS/EIR. Both are described in the following text.

Federal Conformity Analysis

A non-transportation project located in a nonattainment or maintenance area must undergo a general conformity analysis in accordance with Title 40 of the Code of Federal Regulations, Section 93, to ensure that the project does not:

- Cause or contribute to new violations or any standard in any area
- Increase the frequency or severity of an existing violation of any standard
- Delay timely attainment of any standard requiring interim emission reduction or other milestones

As a part of the general conformity process, a conformity analysis is required if a federal action satisfies one of the following two conditions:

- The action's direct and indirect emissions have the potential to emit one or more of the six criteria pollutants at or above emission rates in Table 14-4.
- The action's direct and indirect emissions of any criteria pollutant represent 10% of a nonattainment or maintenance area's total emissions inventory for that pollutant.

Table 14-4. Federal *De Minimis* Levels

Pollutant	Federal Attainment Classification	*De Minimis* Level (Tons/Year)
Ozone (VOC[a])	Severe nonattainment	25
Ozone (NO_x)	Severe nonattainment	25
CO	Attainment	NA
PM_{10}	Attainment	NA
$PM_{2.5}$	Nonattainment	100
Lead	Attainment	NA

Notes: CO = carbon monoxide; NA = not applicable; NO_x = oxides of nitrogen; $PM_{2.5}$ = fine particulate matter; PM_{10} = coarse, respirable, or inhalable particulate matter

[a] Volatile organic compounds (VOCs) are similar to ROG; however, VOC is the term used in the federal conformity analysis regulations for this component of ozone precursors.

If the total direct emissions associated with the action are below the *de minimis* levels indicated in Table 14-4, general conformity requirements do not apply; the action is considered in

conformity and would not result in an adverse impact. Because the air basin encompassing the Planning Area is in attainment (based on federal standards) for the criteria pollutants indicated in Table 14-4 except ozone (severe nonattainment status) and $PM_{2.5}$ (nonattainment status), a conformity analysis for ozone and $PM_{2.5}$ must be completed for the alternatives.

Significance Criteria

As discussed in Section 3.8.1, Significance Thresholds, the criteria used to evaluate the significance of each alternative's impacts on air quality are based on Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) and typical thresholds used to evaluate effects on air quality in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse impact could occur if the alternative would:

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Violate any air quality standard or contribute substantially to an existing or projected air quality violation.
3. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.
4. Expose sensitive receptors to pollutant concentrations in excess of standards.
5. Create objectionable odors affecting a substantial number of people.

Thresholds provided by the SMAQMD are used to further define applicable air quality standards. Based on numeric criteria used by the SMAQMD, a significant adverse impact would occur if the alternative would:

1. Cause construction-generated criteria air pollutant or precursor emissions to exceed the SMAQMD-recommended thresholds of 85 pounds/day (lb/day) for NO_X, 80 lb/day and 14.6 tons/year for PM_{10}, and 82 lb/day and 15 tons/year for $PM_{2.5}$.
2. Result in a net increase in long-term operational criteria air pollutant or precursor emissions that exceed the SMAQMD-recommended thresholds of 65 lb/day for ROG and NO_X, 80 lb/day and 14.6 tons/year for PM_{10}, and 82 lb/day and 15 tons/year for $PM_{2.5}$.
3. Result in long-term operational local mobile-source CO emissions that would violate or contribute substantially to concentrations that exceed the 1-hour California ambient air quality standards of 20 ppm or the 8-hour California ambient air quality standards of 9 ppm.
4. Expose sensitive receptors to a substantial increase in TAC emissions that exceed 10 in 1 million for carcinogenic risk (i.e., the risk of contracting cancer) and/or a noncarcinogenic hazard index of 1.0 or greater.

Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial impact could occur if the alternative would:

1. Result in a net reduction in criteria pollutant emissions compared to a baseline environmental condition.
2. Result in a net reduction in TAC emissions compared to a baseline environmental condition.
3. Reduce the exposure of sensitive receptors to pollutants compared to a baseline environmental condition.
4. Prevent or eliminate the generation of objectionable odors affecting a substantial number of people, or reduce the number of people exposed to an objectionable odor.

The impact analysis for the three EIS/EIR alternatives considers the context, intensity, and severity of potential impacts to each of these air quality impact criteria and presents a determination of significance applicable to each of these criteria.

14.2.1.2 Significance Criteria That Will Not be Evaluated Further

This section identifies topics related to air quality and the significance criteria that are not carried forward into the impact analysis and provides the reasoning for this determination.

Naturally occurring asbestos is known to be present in eastern Sacramento County. As previously discussed, CARB adopted an ATCM to control exposure to asbestos from construction, grading, quarrying, and surface-mining operations (17 CCR 93105). Compliance with the requirements of the ATCM would avoid any potential impacts associated with naturally occurring asbestos. Further, the release of naturally occurring asbestos and associated impacts are discussed in Chapter 5. This issue is not discussed further in this chapter.

Controlled burns may be required in habitat preserves under any of the alternatives as a plant-pest management tool. Open burns are regulated through SMAQMD by Rule 407. Controlled burns would be infrequent (typically up to once annually at a limited number of preserves and not every year), and before initiating a controlled burn, an open burn permit must be obtained from SMAQMD. Burn implementation must comply with all permit requirements to limit air emissions. Further, controlled burns would not be a primary plant-pest control method, with other options, such as managed grazing, available. This issue is not discussed further in this chapter.

14.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2, No Action/No Project Alternative, in Chapter 2 of this EIS/EIR.

14.2.2.1 Direct and Indirect Effects of the Alternative

Construction Emissions

Much of the future urban development included in the No Action/No Project Alternative is described in the General Plans of Sacramento County, Galt, and Rancho Cordova (see Section 2.2.1, Future Projects/Activities Likely Under the No Action/No Project Alternative).

Construction associated with future development could result in emissions of criteria air pollutants, TACs, and odors. Activities such as the construction of new urban and rural developments and the required infrastructure (e.g., roads, utilities) to support these developments would generate ozone precursors (NO_x and ROG), particulate matter (PM_{10} and $PM_{2.5}$), and odors and TACs associated with diesel exhaust (i.e., PM_{10}) from the use of heavy-duty construction equipment. Local mobile CO emissions could result from construction vehicle exhaust associated with worker commute vehicles and operations of heavy equipment. Fugitive dust emissions of PM_{10} and $PM_{2.5}$ would occur as a result of grading activities, earth movement, and vehicle movement on unpaved surfaces.

The impact analysis presented in the *Sacramento County General Plan Update Final EIR* (Sacramento County 2010, pp. 11-1 through 11-118) determined the following within Sacramento County:[2]

- Construction-related emissions of criteria air pollutants (ROG, NO_X, PM_{10}, and $PM_{2.5}$) would be considered significant and unavoidable
- Construction-related exposure of sensitive receptors to TACs would be less than significant

The *Sacramento County General Plan Update Final EIR* did not explicitly evaluate odor from construction activities.

The impact analysis presented in the *City of Galt General Plan Update Final EIR* (Galt 2009b, pp. 10-38 to 10-58), determined the following within Galt:

- Construction-related emissions of criteria air pollutants (ROG, NO_X, PM_{10}, and $PM_{2.5}$) would be considered significant and unavoidable
- Construction-related exposure of sensitive receptors to TACs would be significant and unavoidable
- Construction-related odors would be considered less than significant

[2] As described further in Section 3.4.1, the proposed project analyzed within the *Sacramento County General Plan EIR* assumed development within a designated "Jackson Highway Corridor New Growth Area" that was not part of the alternative ultimately selected by Sacramento County. However, Sacramento County is currently processing master plans in the Jackson Highway Corridor; therefore, the referenced conclusions from the proposed project analysis are relevant to the No Action/No Project Alternative.

The impact analysis presented in the *City of Rancho Cordova General Plan Final EIR* (Rancho Cordova 2006, pp. 4.6-1 to 4.6-39), determined the following within Rancho Cordova:

- Construction-related emissions of criteria air pollutants (ROG, NO_X, PM_{10}, and $PM_{2.5}$) would be considered significant and unavoidable
- Construction-related exposure of sensitive receptors to TACs would be significant and unavoidable
- Construction-related odors would be considered less than significant

As discussed in Section 3.4, the three General Plan EIRs used different study periods ending in 2030 (Galt 2008), 2030 (Rancho Cordova 2006), and 2050 (Sacramento County 2010), respectively. However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur within Galt, Rancho Cordova, and Sacramento County in the years after each General Plan EIR study period ends but before this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of all urban development activities and projects that are included in the description of each EIS/EIR alternative.

As explained in Section 2.2.2, Expected Regulatory Environment Under the No Action/ No Project Alternative, the regulatory environment of the No Action/No Project Alternative is expected to restrict the ability of local agencies to permit approximately 1,900 acres of future urban development in the Mather Core Recovery Area (MCRA), and this future urban development would be shifted or displaced to one or more of the areas of undeveloped land outside of the Urban Services Boundary (USB) discussed in Section 2.2.3, Loss of Natural Lands Under the No Action/No Project Alternative.

Development shifted or displaced outside of the USB could result in construction worker commute and vendor haul trips being longer in distance, resulting in higher vehicle miles traveled (VMT), relative to what would be expected if urban development was confined to the USB. An increase in regional VMT associated with construction trips would result in increased exhaust emissions of ROG, NOx, PM_{10}, $PM_{2.5,}$ odor (exhaust odors), and TACs. Construction-related emissions as a result of increased vehicle trips and VMT would contribute further to the already significant unavoidable impacts to existing air quality described in the documents referenced previously.

Regarding emissions of local mobile CO, CO concentrations that could result in significant effects may occur at intersections experiencing extreme delays and congestion, typically over 31,600 vehicles per hour (SMAQMD 2014). However, mobile CO emissions are expected to decrease per VMT over time due to cleaner burning fuels and improved vehicle engine technology. The No Action/No Project Alternative would be expected to result in increases in regional VMT associated with construction worker trips (associated with urban development and mitigation preserve construction) as a result of longer travel distances between construction sites. However, this would not result in substantial increases in congestion at any one intersection because trips would be dispersed throughout the region rather than concentrated in any one area, and construction activity and associated trips would be spread over the 50-year study period because individual projects are constructed over time.

Under the No Action/No Project Alternative, new urban development would continue to include mitigation actions to offset impacts to listed species, wetlands, and other regulated natural resources, including on-site or off-site mitigation preserves (Sections 2.2.1 and 2.2.2). Mitigation for unavoidable impacts could also continue to occur through purchasing credits at a mitigation or conservation bank approved by the applicable resource agencies (e.g., U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers), by payment into an in-lieu fee program, on-site project developer–responsible mitigation, or off-site project developer–responsible mitigation.

Where on-site and off-site project developer responsible mitigation preserves are established (constructed) under the No Action/No Project Alternative, they would typically be established in an uncoordinated project-by-project manner. This would often result in smaller, more isolated preserves predominantly located within the MCRA and elsewhere in the USB since projects would establish on-site mitigation preserves associated with resource avoidance areas and only establish off-site mitigation preserves for resource impacts that could not be avoided. Emissions associated with establishment/construction of mitigation preserves would be evaluated on a project-by-project basis and, therefore, have not been specifically described within the General Plan EIRs.

Activities associated with the establishment of habitat mitigation preserves would vary depending on the type of preserve. A preserve intended solely to protect existing habitat might require little work to shift the existing use to preserve. However, a preserve that includes habitat establishment/re-establishment would include minor construction activities, such as earth movement and grading. Both types of preserves could require fence installation, installation of interpretive features, and other minor work. The use of heavy equipment for grading and earth moving could result in exhaust emissions (ROG, NOx, PM, CO) and mobilization of fugitive dust (i.e., PM_{10} and $PM_{2.5}$).

Although specific details regarding the size of mitigation preserves and types of construction activities under the No Action/No Project Alternative are not known, as stated in Section 14.2.1, Methodology for Assessing Impacts of Each Alternative on Air Quality, an estimate of emissions was conducted based on conservative assumptions of preserve size and likely construction equipment that would be used (e.g., trucks, loaders, backhoes) for a preserve involving habitat establishment/re-establishment. Refer to Appendix H for information on the assumptions entered into the emissions modeling.

Based on the modeling conducted, mitigation preserve establishment during periods of maximum activity could result in emissions of up to 75 lb/day of NO_x, 12.5 lb/day of PM_{10}, and 6.9 lb/day of $PM_{2.5}$ from the use of heavy equipment, worker commute trips, and vendor haul trips. Emissions from ROG were quantified and included in Appendix H of this EIS/EIR, but SMAQMD does not have a construction threshold for ROG; therefore, it is not evaluated here. This level of emissions would not exceed applicable SMAQMD thresholds of significance of 82 lb/day for NO_x. With regards to PM_{10} and $PM_{2.5}$, SMAQMD requires incorporation of all available emissions and dust control measures as a threshold of significance for projects subject to CEQA review. Where establishment of individual on-site and off-site preserves are implemented as mitigation under the No Action/No Project Alternative, preserve establishment would occur on a project-by-project basis, and projects of sufficient scale and impacts to require mitigation preserve establishment would likely also undergo CEQA review. Therefore, all aspects of these projects, including mitigation preserve establishment, would likely be required to include all available dust control measures/best management practices (BMPs) required by SMAQMD for projects subject to CEQA. However, all projects within the SMAQMD jurisdiction, even those not subject to CEQA review, would be subject to SMAQMD rules adopted for the purpose of reducing fugitive dust emissions (e.g., Rules 401, 402, and 403). Nonetheless, based on the conservative emissions modeling, dust emissions would be relatively minor and, therefore, would not contribute significantly to the existing nonattainment status of the SVAB. Thus, based on the relatively low emissions of PM_{10} and $PM_{2.5,}$ because any potential grading or earth moving would be subject to currently adopted rules to reduce dust, and because no emissions thresholds related to criteria pollutants would be exceeded, construction-related emissions associated with mitigation preserve establishment would not result in new or additional impacts to air quality.

Regarding exposure of sensitive receptors to TACs, odors, and local CO, construction activities associated with mitigation preserve establishment would be relatively minor and temporary. As such, exposure would be minimal and would not result in excessive exposure at any one receptor for an extended period of time.

Operational Emissions

Operations associated with future development could result in emissions of criteria air pollutants, TACs, and odors. Emissions of criteria air pollutants would be associated with mobile (on-road and off-road vehicles), area-wide, and stationary sources associated with proposed development. TAC and odor emissions would be associated with operational-related mobile and stationary sources, such as diesel exhaust on roadways and various developments, such as dry cleaners, gas stations, and other industrial or commercial land uses.

The impact analysis presented in the *Sacramento County General Plan Update Final EIR* (Sacramento County 2010, pp. 11-1 through 11-118) determined the following within Sacramento County:

- Operational-related emissions of criteria air pollutants (ROG, NO_x, PM_{10}, and $PM_{2.5}$) would be significant and unavoidable.
- Operational-related (on and off road mobile) emissions of criteria air pollutants (ROG, NO_x, PM_{10}, and $PM_{2.5}$) would be significant and unavoidable.
- Operational-related mobile CO emissions would be less than significant.
- Operational-related emissions of TACs from mobile sources would be significant and unavoidable.
- Operational-related emissions of TACs from stationary sources would be significant and unavoidable.

The Sacramento County General Plan Update Final EIR (Sacramento County 2010) did not explicitly evaluate odor emissions.

The impact analysis presented in the *City of Galt General Plan Update Final EIR* (Galt 2008, pp. 10-38 to 10-58) determined the following within Galt:

- Operational-related (stationary, area-wide) emissions of criteria air pollutants (ROG, NO_x, PM_{10}, and $PM_{2.5}$) would be significant and unavoidable.
- Operational-related (on and off road mobile) emissions of criteria air pollutants (ROG, NO_x, PM_{10}, and $PM_{2.5}$) would be significant and unavoidable.
- Operational-related mobile CO emissions would be less than significant.
- Operational-related emissions of TACs from mobile sources would be significant and unavoidable.
- Operational-related odor emissions would be considered less than significant.
- Operational-related emissions of TACs from stationary sources would be significant and unavoidable.

The impact analysis presented in the *City of Rancho Cordova General Plan Final EIR* (Rancho Cordova 2006, pp. 4.6-1 to 4.6-39) determined the following within Rancho Cordova:

- Operational-related (stationary, area-wide) emissions of criteria air pollutants (ROG, NO_x, PM_{10}, and $PM_{2.5}$) would be significant and unavoidable.
- Operational-related (on and off road mobile) emissions of criteria air pollutants (ROG, NO_x, PM_{10}, and $PM_{2.5}$) would be significant and unavoidable.
- Operational-related mobile-CO emissions would be less than significant.
- Operational-related emissions of TACs from mobile sources would be significant and unavoidable.
- Operational-related emissions of TACs from stationary sources would be less than significant.
- Operational-related odor emissions would be considered less than significant.

As stated previously, the General Plan EIRs analyzed the effects of urban development through a period between 2030 and 2050; however, the lead agencies anticipate that urban development projects would continue through the end of the EIS/EIR 50-year study period (2065). Therefore, the lead agencies extrapolated that the significant and unavoidable air quality impacts identified in the EIRs would continue to be significant and unavoidable as additional urban development is implemented. However, less-than-significant CO and odor impacts would remain less than significance according to the reasons described in the following text.

Operational-related mobile-source emissions would be associated with vehicular exhaust as a function of VMT within the Planning Area. Most VMT would be generated by urban development in the Planning Area. As described previously and in Section 2.2.2, the regulatory environment of the No Action/No Project Alternative is expected to restrict the ability of local agencies to permit approximately 1,900 acres of future urban development in the MCRA, and this future urban development would be shifted or displaced to one or more of the areas of undeveloped land outside of the USB, as described in Section 2.2.3. Urban development shifted or displaced outside of the USB could result in longer or increased vehicle trips and, therefore, increase mobile-source emissions of ROG, NO_x, PM_{10}, $PM_{2.5}$, odor, and TACs relative to what would occur if urban development was confined to the USB. Increased mobile-source emissions would contribute further to the already significant unavoidable impacts to air quality described in the documents listed previously. Regarding emissions of mobile CO, as stated previously, CO concentrations that could result in significant effects may occur at intersections experiencing extreme delays and congestion, typically over 31,600 vehicles per hour (SMAQMD 2014). However, mobile CO emissions are expected to decrease per VMT over time due to cleaner burning fuels and improved vehicle engine technology. Although regional VMT may increase as a result of dispersed development patterns anticipated under the No Action/No Project

Alternative, regional VMT would be spread throughout the region and would not result in increases in congestion at any one intersection of sufficient scale to cause adverse CO concentrations. No substantial increases in mobile CO would be anticipated.

The shifted or displaced urban development under the No Action/No Project Alternative would not result in an overall change in stationary emission sources compared to what is identified in the General Plan EIRs listed previously because it is assumed that, although the location of some urban development might change, the overall types and amounts of development would generally remain the same. Therefore, the emissions of TACs, odors, and criteria air pollutant from stationary sources under the No Action/No Project Alternative would remain similar to the impacts described previously for each jurisdiction.

Operational emissions associated with mitigation preserve management include mobile-source exhaust emissions (i.e., vehicle trips) associated with visits by Preserve Managers/crews for maintenance and monitoring and transporting livestock for grazing management specific to mitigation preserve management activities. Additionally, depending on the specifics of the activities associated with mitigation preserve maintenance, several pieces of heavy equipment and the associated crews may infrequently use local roadways, resulting in on- and off-site exhaust emissions and fugitive dust. These activities could result in localized, temporary emissions. Mitigation preserves may be established on existing grazing or agricultural lands. For impact analysis purposes, maximum day vehicle trips and emissions associated with mitigation preserve operations are estimated as additional to the continuation of existing agricultural operations that are not specific to mitigation preserve management; however, during most days, the level of activity would not be substantially different from typical agricultural and range management occurring on the land prior to being established as a mitigation preserve. The types of activities on existing rangeland and farmland are similar to what would occur on mitigation preserves established on these land types, such as fence installation or repair, access road maintenance, and drainage repairs.

Although specific details regarding the mitigation preserve activities or operational/maintenance trip numbers are not known, an estimate of preserve operational emissions was calculated based on conservative assumptions of preserve numbers, size, activities that would take place, and equipment that would be used for those activities. The emissions modeling represents a maximum day of mitigation preserve operation and maintenance, where an estimated 159 vehicle trips and 32 hours of heavy-duty equipment use would occur, such as a day when heavy maintenance or repairs (e.g., landscape contouring, drainage infrastructure repairs, alteration of graded access roads) are needed along with regular operations. During the majority of days over the 50-year EIS/EIR study period, the amount of mitigation preserve management activity and attendant vehicle trips and heavy-duty equipment operations would be much less and not substantially different from activities

associated with agricultural and rangeland operations and management on lands prior to being established as mitigation preserves. The maximum activity estimate is intended to be conservative to avoid the risk of understating the impacts of the alternative. Refer to Appendix H for more information on the emissions modeling assumptions for the alternatives.

Based on the modeling conducted, preserve maintenance and operations during periods of high activity could result in 19 lb/day of NO_x and up to 3.5 lb/day of ROG emissions. Emissions of PM_{10} would be 2 lb/day and $PM_{2.5}$ 1 lb/day. This level of emissions would not exceed applicable SMAQMD thresholds of significance of 65 lb/day for NO_x or ROG. Regarding PM_{10} and $PM_{2.5}$, emissions from regular mitigation preserve operations and maintenance activities, such as fence repair, firebreak mowing, and management of grazing animals, would be minor, and as shown by the modeling, would not exceed 2 lb/day. Preserve operational- and maintenance-related activities would not result in substantial dust emissions; therefore, they would not contribute to the existing nonattainment status of the SVAB.

With regards to exposure of sensitive receptors to TACs, odors, and local CO, activities associated with mitigation preserve operations and maintenance under this alternative would be relatively minor and temporary and similar to existing rangeland and farmland operations. As such, exposure would be minimal and would not result in excessive exposure at any one receptor for an extended period of time.

14.2.2.2 Cumulative Effects of the Alternative

Emissions from past and present urban development, agricultural activities, and other stationary and mobile emission sources in the SVAB have resulted in the existing air quality conditions described in Section 14.1.2.2, Existing Air Quality Conditions. The existing nonattainment status for ozone, PM_{10}, and $PM_{2.5}$ indicate a significant adverse impact on air quality from these past and present emission sources.

The types of future reasonably foreseeable "other" projects, activities, and actions, described in Section 3.7.2, Reasonably Foreseeable Other Actions, are similar to the types of past and present actions that occurred in the study area. The other reasonably foreseeable future actions in the study area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in the Elk Grove sphere of influence and in Rancho Murieta, development of the Wilton Rancheria Casino, master planned developments inside the Urban Development Area (UDA)[3]

[3] As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, "UDA" means all lands within Sacramento County's USB boundary that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within the City of Galt's sphere of influence (see Figure 1-1).

named “Rio Del Oro” and “Mather South,” further rural residential development outside the UDA, continued urban development of cultivated agricultural lands, major infrastructure projects such as California High-Speed Rail and the California WaterFix, and expansion of the existing National Wild Refuge and the Cosumnes River Preserve (see Section 3.7.2 for details of these projects). Some of these foreseeable projects, such as urban development in the Elk Grove sphere of influence, would result in criteria pollutant emissions during construction and from mobile and stationary sources during operation. Large infrastructure projects would likely have a larger proportion of emissions during construction versus operation, and in the case the California High-Speed Rail Project, could result in a net reduction in emissions during operation. Expansion of refuges and preserves would result in relatively minor emissions compared to other categories of foreseeable projects. However, in total, the reasonably foreseeable future projects would result in increased emissions of criteria pollutants into the SVAB and result in an incremental contribution to significant adverse effects on air quality.

The construction, stationary, and mobile-source air emissions from these foreseeable other projects were generally included in the analysis of cumulative air emissions impacts incorporated from the General Plan EIRs. These General Plan EIRs identified significant and unavoidable air quality impacts from emissions of criteria pollutants during construction and operation. Consequently, the combination of past, present, and reasonably foreseeable future projects would result in continued significant adverse cumulative air quality effects, with the SVAB likely remaining in nonattainment for ozone, PM_{10}, and $PM_{2.5}$.

As discussed previously, the direct and indirect impacts of No Action/No Project Alternative would adversely affect existing air quality through the emissions of criteria pollutants. Therefore, the No Action/No Project Alternative incremental effects are determined to be significant and cumulatively considerable when viewed in connection with the significant cumulative impact of the past, present, and foreseeable other projects in the study area.

14.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3, Proposed Action/Proposed Project.

14.2.3.1 Direct and Indirect Effects of the Alternative

Construction Emissions

The Proposed Action/Proposed Project Alternative includes types of urban development similar to those anticipated under the No Action/No Project Alternative; therefore, the sources and types of emissions associated with construction of this development would also be similar to those described for the No Action/No Project Alternative. However, the Proposed

Action/Proposed Project Alternative does not include the MCRA regulatory requirements of the No Action/No Project Alternative (refer to Section 2.2.2); this provides the opportunity for urban development Covered Activities within the MCRA to be implemented consistent with the Sacramento County and Rancho Cordova General Plans without development occurring outside the USB. As a result, a portion of construction worker commute and vendor haul trips between future construction sites for development could be shorter in distance compared to the No Action/No Project Alternative. This would result in lower VMT and, therefore, reduced exhaust emissions of ROG, NO_x, and PM, under the Proposed Action/Proposed Project Alternative compared to the No Action/No Project Alternative.

Further, the SSHCP includes Avoidance and Minimization Measures (SSHCP AMMs) that would be included in all Covered Activity projects and activities over the 50-year permit term. As summarized in Table 2-6 of this EIS/EIR, SSHCP AMMs BMP-5, BMP-9, and BMP-11 would require implementation of BMPs to control dust emissions by watering disturbance sites, returning disturbed areas to pre-project conditions and limiting vehicle travel speed. Several elements of these SSHCP AMMs would also be implemented under the No Action/No Project Alternative as part of standard best practices or regulatory requirements (see Table 2-6). However, the Proposed Action/Proposed Project Alternative includes additional on-site monitoring and measurement of the effectiveness of each SSHCP AMM implemented and annual reporting of the effectiveness of each SSHCP AMM. The Proposed Action/Proposed Project Alternative includes processes for annual review of SSHCP AMM effectiveness and a process to make adaptive changes to an SSHCP AMM that is not effective for avoiding impacts to air quality. This additional layer of oversight of SSHCP AMM implementation and SSHCP AMM effectiveness under the Proposed Action/Proposed Project Alternative increases avoidance and minimization of impacts to air quality from dust emissions during construction activities.

The potential adverse effects from construction emissions identified previously for the No Action/No Project Alternative future condition without the SSHCP would still occur under the Proposed Action/Proposed Project Alternative but to a lesser extent because of the reduced vehicle trips resulting from not having urban development shifted or displaced outside the MCRA and more effective reductions in dust emissions resulting from SSHCP AMMs BMP-5, BMP-9, and BMP-11. This would result in a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Regarding emissions of localized mobile CO, the potential for individual intersections to experience sufficient vehicle trips per hour to result in adverse CO concentrations is not appreciably different between the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative. Although the Proposed Action/Proposed Project Alternative is expected to result in decreases in regional VMT associated with construction worker trips as a result of shorter travel distances between construction sites, this would not result in changes to

congestion or delays at intersections sufficient to appreciably alter CO concentrations because trips would be dispersed throughout the region and spread over the 50-year EIS/EIR study period; that is, as described previously for the No Action/No Project Alternative, no potential adverse effects from CO emissions are anticipated for the No Action/No Project Alternative future condition without the SSHCP, which would still be the case with implementation of the SSHCP under the Proposed Action/Proposed Project Alternative. Therefore, there would be ***No Impact*** when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include the establishment of an interconnected Preserve System in the Planning Area and a comprehensive preserve management program that would be implemented in perpetuity. The Preserve System under the Proposed Action/Proposed Project Alternative would be more contiguous and more connected than the preserves that would be established under the No Action/No Project Alternative. Preserve establishment could include a variety of activities during construction that would result in emissions. Activities associated with the construction/establishment of preserves under the Proposed Action/Proposed Project Alternative would be the same as those described for the No Action/No Project Alternative. However, under the Proposed Action/Proposed Project Alternative, preserves would often be larger, more frequently linked, and established/constructed by the SSHCP Implementing Entity rather than by different entities on a project-by-project basis. The SSHCP AMMs described above for development would also apply to relevant preserve activities (e.g., grading for vernal pool establishment/re-establishment). Therefore, the Proposed Action/Proposed Project Alternative, through the SSHCP AMMs, provides for more effective reductions in dust emissions during implementation of preserve activities relative to the No Action/No Project Alternative. This would be a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

In addition to on-site emissions associated with heavy equipment and earth movement at preserve sites, construction and worker vehicle trips would also result in mobile-source emissions associated with the establishment of preserves. As a result of a more contiguous and connected Preserve System, construction-related vehicular trips associated with vendor and worker trips for preserve establishment/construction could be fewer because of a smaller number of “job sites” and coordinated preserve activities directed by the SSHCP Implementing Entity. This would result in fewer mobile-source emissions; that is, construction-related mobile-source emissions as identified for the No Action/No Project Alternative future condition associated with mitigation preserve activities without the SSHCP would still occur but potentially to a lesser extent with implementation of the SSHCP under the Proposed Action/Proposed Project Alternative. This

would be a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Operational Emissions

The Proposed Action/Proposed Project Alternative Covered Activities include types of urban development consistent with those anticipated under the No Action/No Project Alternative. However, under the Proposed Action/Proposed Project Alternative, urban development would not be shifted or displaced outside of the USB. Therefore, operational-related vehicular trips associated with development would be shorter, resulting in fewer mobile-source emissions; that is, potential significant adverse effects from operation of development identified previously for the No Action/No Project Alternative future condition without the SSHCP would also occur, but to a lesser extent, with implementation of the SSHCP under the Proposed Action/Proposed Project Alternative. This would be a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

As identified previously, the types of urban development under Proposed Action/Proposed Project Alternative would be consistent with those identified for the No Action/No Project Alternative. Therefore, stationary and area-wide sources of TACs, odors, and criteria air pollutants (e.g., ROG, NO_x, PM_{10}, and $PM_{2.5}$) associated with operation of the Proposed Action/Proposed Project Alternative would be similar to those described for the No Action/No Project Alternative. Adverse effects from emissions of TACs and criteria air pollutants from stationary and area-wide sources described for the No Action/No Project Alternative would also apply to the Proposed Action/Proposed Project Alternative. However, no significant potential adverse effects from generation of odors are anticipated for either alternative. Thus, with respect to TACs, odors, and stationary and area-wide sources of criteria air pollutants, there would be ***No Impact*** when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Regarding emissions of localized mobile CO, for the reasons described for construction emissions associated with the Proposed Action/Proposed Project Alternative (i.e., there would be no changes in operations of individual intersection of sufficient scale to result in harmful CO concentrations), there would be ***No Impact*** when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

As a result of development being confined to the UDA under the Proposed Action/Proposed Project Alternative, regional VMT associated with urban development may be redirected to other roadways throughout the Planning Area relative to the No Action/No Project Alternative. Thus, individual receptors that may be exposed to mobile-source TACs and odors may not be

the same under the two alternatives. However, because the overall duration, types, and numbers of trips past any particular receptor resulting from urban development would be similar, overall mobile-source TAC and odor generation and related exposure impacts in the Planning Area would also be similar; that is, potential adverse effects from operational-related mobile-sources of TACs and odors as described for the No Action/No Project Alternative would also occur for the Proposed Action/Proposed Project Alternative. However, no significant potential adverse effects from generation of, or exposure to, odors are anticipated for either alternative. Thus, with respect to mobile-source TACs and odors, there would be ***No Impact*** when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Activities associated with the operation and maintenance of preserves under the Proposed Action/Proposed Project Alternative would be very similar to those described for the No Action/No Project Alternative. However, under the Proposed Action/Proposed Project Alternative, preserves would often be larger, more frequently linked, and managed by the SSHCP Implementing Entity rather than by different entities on a project-by-project basis. As a result of a more contiguous and connected Preserve System with larger preserves overall, operational-related vehicular trips associated with maintenance and worker trips for preserve maintenance could be fewer because of a smaller overall number of individual preserves to be visited. Trips to multiple preserves could also be consolidated as personnel directed by the SSHCP Implementing Entity would have activities to perform at multiple preserves and could drive to multiple preserves in a single vehicle "trip." However, preserve management under the Proposed Action/Proposed Project Alternative would be more intensive than under the No Action/No Project Alternative, resulting in an increase in trips to implement the more active management strategy compared to the No Action/No Project Alternative. Therefore, overall, operational-related mobile-source emissions associated with preserve activities for the Proposed Action/Proposed Project Alternative would be similar to those identified previously for the No Action/No Project Alternative. This would be a ***Less Than Significant Adverse*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

As identified for the No Action/No Project Alternative, exposure of sensitive receptors to TACs, odors, and local CO from mitigation preserve operations would be relatively minor and temporary. As such, exposure would be minimal and would not result in excessive exposure at any one receptor for an extended period of time. For the same reasons described for mobile-source emissions resulting from Preserve System operations, this conclusion would not change for the Proposed Action/Proposed Project Alternative. Therefore, there would be ***No Impact*** when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

General Conformity

With regards to general conformity *de minimis* levels, the net change in peak annual emissions between the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative would be subject to the General Conformity Rule. These emissions include construction-related mobile sources and operational-related mobile, stationary, and area-wide sources, as described for the Proposed Action/Proposed Project Alternative.

As discussed previously, construction and operational emissions associated with the Proposed Action/Proposed Project Alternative would be similar or reduced compared to the No Action/No Project Alternative. As such, implementation of the Proposed Action/Proposed Project Alternative would not result in a net increase in emissions that would be subject to general conformity. Therefore, the Proposed Action/ Proposed Project Alternative would be exempt from general conformity (i.e., assumed to conform).

14.2.3.2 Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would result in the following:

- Reduced mobile-source criteria pollutant, TAC, and odor emissions and dust emissions from construction of urban development and preserve establishment
- Similar CO emissions during construction of urban development and preserve establishment
- Reduced mobile-source criteria pollutant emissions from operation of urban development
- Similar emissions of criteria pollutants, TACs, and odors from stationary and area-wide sources associated with operation of urban development
- Similar CO emissions during the operation of urban development
- Similar exposure of sensitive receptors to mobile-source TACs and odors from operation of urban development
- Reduced mobile-source emissions from Preserve System operation
- Similar exposure of sensitive receptors to TACs, odors, and CO from Preserve System operation

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative on the air quality impact criteria, the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects to air quality compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

14.2.3.3 Cumulative Effects of the Alternative

The effects of past, present, and reasonably foreseeable other projects on air quality in the SVAB were described in Section 14.2.2.2, Cumulative Effects of the Alternative, and represent a significant adverse cumulative impact on air quality within the SVAB. As discussed in Section 14.2.2.2, the incremental effects of the No Action/No Project Alternative were determined to be significant and cumulatively considerable when viewed in connection with the effects of the past, present, and foreseeable other projects in the SVAB.

Various elements of the Proposed Action/Proposed Project Alternative would reduce emissions of criteria pollutants compared to the No Action/No Project Alternative, including more effective emission reductions from implementation of SSHCP AMMs and the lack of urban development being shifted or displaced outside the USB, reducing VMT. The reduced emissions result in the minor beneficial effects identified previously, and the Proposed Action/Proposed Project Alternative would make a smaller incremental contribution to any cumulative air quality impacts compared to the incremental effects of the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative does not result in a cumulatively considerable (i.e., significant) contribution to the significant adverse cumulative impacts on air quality. The Proposed Action/Proposed Project Alternative would result in a ***Minor Beneficial Cumulative*** effect to air quality compared to the No Action/No Project Alternative baseline condition**.**

14.2.4 Reduced Permit Term Alternative

As described in Section 2.3.3, Covered Activities and Loss of Natural Land Covers Under the Proposed Action/Proposed Project Alternative, the Reduced Permit Term Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative.

Under the Reduced Permit Term Alternative, the core of the Preserve System established inside the UDA would be associated with the development of five large Master Plans, as discussed in Section 2.3.4, Covered Species Under the Proposed Action/Proposed Project Alternative, for the Reduced Permit Term Alternative and Section 2.3.3 for the Proposed Action/Proposed Project Alternative. Because the core of the Preserve System inside the UDA under both EIS/EIR action alternatives is associated with the same five large Master Plans, approximately 70% of the UDA preserves established under the Reduced Permit Term Alternative would have similar sizes, boundaries, and locations as the UDA preserves established under the Proposed Action/Proposed Project Alternative. However, the shorter duration of the Reduced Permit Term Alternative, as well as the smaller amount of urban development and associated development fees collected by the Reduced Permit Term SSHCP, would not allow the SSHCP Implementing Entity to establish as many acres of new preserves in the Planning Area as would occur under the Proposed Action/Proposed Project

Alternative's 50-year permit term. Therefore, fewer new preserves would be established under the Conservation Strategy for the Reduced Permit Term Alternative. This difference would be especially pronounced outside the UDA.

As described in Section 2.4, Reduced Permit Term Alternative, the federal Endangered Species Act and the California Endangered Species Act incidental take permits and the Clean Water Act permit strategy for SSHCP Covered Activities would be valid only during the 30-year permit term of the Reduced Permit Term SSHCP, and the Reduced Permit Term SSHCP Conservation Strategy would be implemented only during this 30-year term. The urban development Covered Activities and Conservation Strategies associated with the five master plans would be implemented inside the UDA during this 30-year period. However, the EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3); therefore, the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, as described in Section 3.6.7.2, Analysis of the Reduced Permit Term Alternative, After the End of the Permit Term (Years 31–50), the EIS/EIR analysis of the Reduced Permit Term Alternative also considers future urban development that is not part of the project description of the Reduced Permit Term Alternative but is still expected to occur within the Planning Area after the end of the permit term (i.e., in Years 31–50 of the EIS/EIR study period).

As described in Section 3.6.7.2, project mitigation preserves established after the end of the 30-year Reduced Permit Term Alternative would be established under a project-by-project process for obtaining individual authorizations under the Clean Water Act, federal Endangered Species Act, California Endangered Species Act, and Section 1600 of the California Fish and Game Code. Consequently, mitigation preserves established in Years 31–50 of the EIS/EIR study period would not be established using a regional, landscape-based approach that balances new urban development with the need for conservation, which would be provided by an HCP. Therefore, much of the Preserve System inside the UDA would be very similar under the two action alternatives, but the Preserve System outside the UDA would be substantially different between the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, it is unlikely that mitigation preserves established outside the UDA would be contiguous or interconnected, and it is unlikely that a large, contiguous, 10,500-acre, landscape-sized Vernal Pool Preserve would be established in the southwestern portion of the Planning Area. Likewise, the No Action/No Project Alterative would not result in contiguous, interconnected preserves outside the UDA or establish a 10,500-acre Vernal Pool Preserve in the Planning Area. In these ways, the new mitigation preserves established outside the UDA under the Reduced Permit Term Alternative and the No Action/No Project Alternative would be similar.

14.2.4.1 Direct and Indirect Effects of the Alternative

Construction Emissions

The Reduced Permit Term Alternative includes types of urban development similar to those anticipated under the No Action/No Project Alternative; therefore, the sources and types of emissions associated with construction of this development would also be similar to those described previously for the No Action/No Project Alternative. However, the Reduced Permit Term Alternative does not include the MCRA regulatory requirements of the No Action/No Project Alternative (refer to Section 2.2.2). This provides the opportunity for urban development Covered Activities within the MCRA to be implemented consistently with the Sacramento County and Rancho Cordova General Plans without development occurring outside the USB. As a result, a portion of construction worker commute and vendor haul trips between future construction sites for development could be shorter in distance compared to the No Action/No Project Alternative. This would result in lower VMT and, therefore, reduced mobile-source emissions of ROG, NO_x, and PM under the Reduced Permit Term Alternative compared to the No Action/No Project Alternative.

Further, during the 30-year permit term under the Reduced Permit Term Alternative, AMMs like those included in the SSHCP would be included in all Covered Activity projects and activities within the Planning Area. As summarized in Table 2-6 of this EIS/EIR, SSHCP AMMs BMP-5, BMP-9, and BMP-11 would require implementation of BMPs to control dust emissions during construction by watering disturbance sites, returning disturbed areas to pre-project conditions, and limiting vehicle travel speed. Several of the elements of these SSHCP AMMs would also be implemented under the No Action/No Project Alternative as part of standard BMPs or regulatory requirements (see Table 2-6). However, the Reduced Permit Term Alternative would include additional on-site monitoring and measurement of the effectiveness of each SSHCP AMM implemented and annual reporting of the effectiveness of each SSHCP AMM. The Reduced Permit Term Alternative would include processes for annual review of SSHCP AMM effectiveness and a process that makes adaptive changes to an SSHCP AMM that is not effective at avoiding impacts to air quality. This additional layer of oversight of SSHCP AMM implementation and SSHCP AMM effectiveness under the Reduced Permit Term Alternative increases avoidance and minimization of impacts to air quality from dust emissions during construction activities.

The potential adverse effects from construction emissions identified previously for the No Action/No Project Alternative future condition would still occur under the Reduced Permit Term Alternative but to a lesser extent because of the reduced vehicle trips resulting from not having urban development shifted or displaced outside the MCRA and more effective reductions in dust emissions resulting from SSHCP AMMs BMP-5, BMP-9, and BMP-11. This

would result in a ***Minor Beneficial*** effect when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Regarding emissions of localized mobile CO, the potential for individual intersections to experience sufficient vehicle trips per hour to result in adverse CO concentrations is not appreciably different between the Reduced Permit Term Alternative and the No Action/No Project Alternative. The Reduced Permit Term Alternative would result in decreases in regional VMT associated with construction worker trips as a result of shorter travel distances between construction sites. However, these reductions in VMT would not result in changes to congestion or delays at intersections sufficient to appreciably alter CO concentrations because trips would be dispersed throughout the region and spread over the 50-year EIS/EIR study period. That is, as described previously for the No Action/No Project Alternative, no potential adverse effects from CO emissions are anticipated for the No Action/No Project Alternative future condition, which would still be the case with implementation of the Reduced Permit Term Alternative. Therefore, there would be ***No Impact*** when comparing the construction CO emissions and concentrations under the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

The Reduced Permit Term Alternative includes an interconnected Preserve System established during the 30-year permit term and a comprehensive preserve management program for those preserves to be implemented in perpetuity. The Preserve System established during the 30-year permit term under the Reduced Permit Term Alternative would be consolidated and linked (similar to the Proposed Action/Proposed Project Alternative). As described in Section 2.4.5, Conservation Strategy Under the Reduced Permit Term Alternative, in Chapter 2, continued establishment of a coordinated preserve management and monitoring program would cease after the end of the 30-year permit term. The interconnected Preserve System established during the permit term would remain intact, whereas future mitigation preserves established during Years 31–50 of the EIS/EIR study period would not be established in an as consolidated manner and would resemble mitigation preserve establishment patterns under the No Action/No Project Alternative. The resulting scenario would be such that a portion of preserves would reflect a more interconnected Preserve System, although with fewer acres compared to the Proposed Action/Proposed Project Alternative, and a portion would reflect an establishment pattern like the No Action/No Project Alternative.

Impacts to air quality from preserve establishment during the 30-year permit term under the Reduced Permit Term Alternative would be similar to those identified previously for the Proposed Action/Proposed Project Alternative; therefore, a minor beneficial effect to air quality (e.g., mobile-source emissions, dust emissions) would occur during this time when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition. During Years 31–50 of the 50-year EIS/EIR study period, project-by-project mitigation for impacts to listed species would resemble the No Action/No Project Alternative. During this

period, impacts to air quality from mitigation preserve establishment under the Reduced Permit Term Alternative would be very similar to those that would occur under No Action/No Project Alternative. Given the reduced emissions resulting from preserve establishment during the 30-year permit term, over the total 50-year EIS/EIR study period, the Reduced Permit Term Alternative would result in an overall ***Minor Beneficial*** effect to air quality resulting from preserve establishment compared to the No Action/No Project Alternative baseline condition.

Operational Emissions

The Reduced Permit Term Alternative includes types of urban development consistent with those anticipated under the No Action/No Project Alternative. However, under the Reduced Permit Term Alternative, urban development would not be shifted or displaced outside of the USB. Therefore, operational-related vehicular trips associated with development would be shorter, resulting in fewer mobile-source emissions. That is, potential significant adverse effects from operation of development identified previously for the No Action/No Project Alternative future condition would also occur but to a lesser extent with implementation of the Reduced Permit Term Alternative. This would be a ***Minor Beneficial*** effect when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

As identified previously, the types of urban development under the Reduced Permit Term Alternative would be consistent with those identified for the No Action/No Project Alternative. Therefore, stationary and area-wide sources of TACs, odors, and criteria air pollutants (e.g., ROG, NO_x, PM_{10}, and $PM_{2.5}$) associated with operation of the Reduced Permit Term Alternative would be similar to those described for the No Action/No Project Alternative. Adverse effects from emissions of TACs and criteria air pollutants from stationary and area-wide sources described previously for the No Action/No Project Alternative would also apply to the Reduced Permit Term Alternative. However, no significant potential adverse effects from generation of odors are anticipated for either alternative. Thus, with respect to TACs, odors, and stationary and area-wide sources of criteria air pollutants, there would be ***No Impact*** when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Regarding emissions of localized mobile CO, for the reasons described previously for construction emissions associated with the Reduced Permit Term Alternative (i.e., there would be no changes in operations of individual intersections of sufficient scale to result in harmful CO concentrations), there would be ***No Impact*** when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

As a result of development being confined to the UDA under the Reduced Permit Term Alternative, regional VMT associated with urban development may be redirected to other roadways throughout the Planning Area relative to the No Action/No Project Alternative. Thus,

individual receptors that may be exposed to mobile-source TACs and odors may not be the same under the two alternatives. However, because the overall duration, types, and numbers of trips past any particular receptor resulting from urban development would be similar, overall mobile-source TAC and odor generation and related exposure impacts in the Planning Area would also be similar. That is, potential adverse effects from operational-related mobile-sources of TACs and odors as described previously for the No Action/No Project Alternative would also occur for the Reduced Permit Term Alternative. However, no significant potential adverse effects from generation of or exposure to odors are anticipated for either alternative. Thus, with respect to mobile-source TACs and odors, there would be a ***No Impact*** when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Impacts to air quality from the management and operation of preserves established during the 30-year permit term under the Reduced Permit Term Alternative would be similar to those identified previously for the Proposed Action/Proposed Project Alternative; therefore, a minor beneficial effect to air quality (e.g., mobile-source emissions, dust emissions) would occur when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition. Management and operation of mitigation preserves established during Years 31–50 of the 50-year EIS/EIR study period would resemble the No Action/No Project Alternative. Impacts to air quality from the operation and management of these mitigation preserves included in the Reduced Permit Term Alternative would be very similar to those that would occur under No Action/No Project Alternative. Given the reduced preserve operations and management emissions resulting from the preserves established during the 30-year permit term, the Reduced Permit Alternative would result in an overall ***Minor Beneficial*** effect to air quality resulting from preserve operation and management compared to the No Action/No Project Alternative baseline condition.

As identified for the No Action/No Project Alternative, exposure of sensitive receptors to TACs, odors, and local CO from mitigation preserve operations would be relatively minor and temporary. As such, exposure would be minimal and would not result in excessive exposure at any one receptor for an extended period of time. For the same reasons described previously in Sections 14.2.2 and 14.2.3 for mobile-source emissions resulting from Preserve System operations, this conclusion would not change for the Reduced Permit Term Alternative. Therefore, there would be ***No Impact*** when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

General Conformity

Regarding general conformity *de minimis* levels, the net change in peak annual emissions between the Reduced Permit Term Alternative and the No Action/No Project Alternative would be subject to the General Conformity Rule. These emissions include construction-related mobile

sources and operational-related mobile, stationary, and area-wide sources, as described previously for the Reduced Permit Term Alternative.

As discussed previously, construction and operational emissions associated with the Reduced Permit Term Alternative would either be similar or reduced compared to the No Action/No Project Alternative. As such, implementation of the Reduced Permit Term Alternative would not result in a net increase in emissions that would be subject to general conformity. Therefore, the Reduced Permit Term Alternative would be exempt from general conformity (i.e., assumed to conform).

14.2.4.2 Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would result in the following:

- Reduced mobile-source criteria pollutant, TAC, and odor emissions and dust emissions from construction of urban development and preserve establishment
- Similar CO emissions and concentrations during construction of urban development and preserve establishment
- Reduced mobile-source criteria pollutant emissions from operation of urban development
- Similar emissions of criteria pollutants, TACs, and odors from stationary and area-wide sources associated with operation of urban development
- Similar CO emissions during the operation of urban development
- Similar exposure of sensitive receptors to mobile-source TACs and odors from operation of urban development
- Reduced mobile-source emissions from Preserve System operation
- Similar exposure of sensitive receptors to TACs, odors, and CO from Preserve System operation

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on the air quality impact criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to air quality compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

14.2.4.3 Cumulative Effects of the Alternative

The effects of past, present, and reasonably foreseeable other projects on air quality in the SVAB were described in Section 14.2.2.2 and represent a significant adverse cumulative impact on air quality within the SVAB. As discussed in Section 14.2.2.2, the incremental effects of the No Action/No Project Alternative were determined to be significant and cumulatively

considerable when viewed in connection with the effects of the past, present, and foreseeable other projects in the SVAB.

Various elements of the Reduced Permit Term Alternative would reduce emissions of criteria pollutants compared to the No Action/No Project Alternative, including more effective emission reductions from implementation of SSHCP AMMs and the lack of urban development being shifted or displaced outside the USB, thereby reducing VMT. The reduced emissions result in the minor beneficial effects identified previously, and the Reduced Permit Term Alternative would make a smaller incremental contribution to any cumulative air quality impacts compared to the incremental effects of the No Action/No Project Alternative. Therefore, the Reduced Permit Term Alternative does not result in a cumulatively considerable (i.e., significant) contribution to the significant adverse cumulative impacts on air quality. The Reduced Permit Term Alternative would result in a ***Minor Beneficial Cumulative*** effect to air quality compared to the No Action/No Project Alternative baseline condition.

INTENTIONALLY LEFT BLANK

CHAPTER 15 – GREENHOUSE GASES AND CLIMATE CHANGE

This chapter presents the potential effects of each alternative on global climate change and impacts of global climate change on the alternatives. General topics addressed include construction- and operational-related greenhouse gas (GHG) emissions. An explanation of what GHGs are, how they contribute to climate change, and how climate change affects the environment is provided in Section 15.1.2, Greenhouse Gas Emissions and Consequences of Climate Change in the Planning Area.

15.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

15.1.1 Regulatory Framework

The regulatory responsibilities for reducing emissions of GHGs and combatting the impacts of climate change include several federal, state, regional, and local agencies. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, permitting, or implementation of the alternatives analyzed in this Environmental Impact Statement/Environmental Impact Report (EIS/EIR). This section also identifies any relevant federal permits or other entitlements that must be obtained prior to implementing the alternatives. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 15.2, Environmental Consequences/Environmental Impacts (40 CFR 1502.25).

15.1.1.1 Federal

Supreme Court Ruling

The U.S. Environmental Protection Agency is the federal agency responsible for implementing the federal Clean Air Act and its amendments. The Supreme Court of the United States ruled on April 2, 2007, that carbon dioxide (CO_2), a GHG contributing to global climate change (see Section 15.1.2), is an air pollutant as defined under the Clean Air Act, and that the U.S. Environmental Protection Agency has the authority to regulate emissions of GHGs. The ruling in this case resulted in the U.S. Environmental Protection Agency taking steps to regulate GHG emissions and lent support for state and local agencies' efforts to reduce GHG emissions.

President's Council on Environmental Quality Guidance

On December 18, 2014, the President's Council on Environmental Quality released draft guidance for public comment that described how federal departments and agencies should consider the effects of climate change and GHG emissions as a result of proposed actions. The guidance explains that agencies should consider both the potential effects of a proposed action on climate change, as indicated by its estimated GHG emissions, and the implications of climate

change for the environmental effects of a proposed action. The draft guidance also provided a numeric emissions level for consideration, identifying that, if emissions from a federal action exceed 25,000 metric tons of carbon dioxide equivalent (MT CO_2e), a qualitative and quantitative assessment of a proposed action would be meaningful to decision makers and the public. For actions where emissions are below the 25,000 MT CO_2e/year reference point, quantitative analysis of GHG emissions is not recommended unless it is easily accomplished based on available tools and data.

The Council on Environmental Quality finalized its nonregulatory guidance on GHG emissions and the effects of climate change in the National Environmental Policy Act reviews in August 2016 (CEQ 2016). The final guidance no longer includes the 25,000 MT CO_2e emissions reference point. The final guidance removes identification of any quantitative emissions limit and instead advises federal agencies to consider the GHG emissions caused by federal actions, adapts the agency's actions to consider climate change effects throughout the process, and addresses these issues in the agency's procedures.

15.1.1.2 State

Executive Order S-3-05

Executive Order S-3-05, which was signed by Governor Schwarzenegger in 2005, proclaims that California is vulnerable to the impacts of climate change. It declares that increased temperatures could reduce the Sierra Nevada snowpack, further exacerbate California's air quality problems, and potentially cause a rise in sea level. To combat those concerns, the Executive Order established[1] total GHG emission targets. Specifically, emissions are to be reduced to the 2000 level by 2010, the 1990 level by 2020, and to 80% below the 1990 level by 2050.

As described below, legislation was passed in 2006 (Assembly Bill [AB] 32) to limit GHG emissions to 1990 levels by 2020 with continued "reductions in emissions" beyond 2020, but no specific additional reductions were enumerated in the legislation. Further, Senate Bill (SB) 375 (sustainable community strategies [SCS]/transportation) established goals for emissions from light-duty truck and automobiles for 2020 and 2035.

A recent California Appellate Court decision, *Cleveland National Forest Foundation v. San Diego Association of Governments* (November 24, 2014), further examined the executive order and whether it should be viewed as having the equivalent force of a legislative mandate for specific emissions reductions. The case has been accepted for review by the California Supreme Court and, therefore, is not currently considered a precedent.

[1] Note that in the context of this Plan, the word "establish" is synonymous with "create."

Assembly Bill 32: Global Warming Solutions Act of 2006

In September 2006, Governor Schwarzenegger signed the California Global Warming Solutions Act of 2006 (AB 32). AB 32 establishes regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and a cap on statewide GHG emissions. AB 32 requires that statewide GHG emissions be reduced to 1990 levels by 2020. AB 32 also requires that these reductions (California Health and Safety Code, Section 38551):

(a) . . . shall remain in effect unless otherwise amended or repealed.

(b) It is the intent of the Legislature that the statewide GHG limit continue in existence and be used to maintain and continue reductions in emissions of GHGs beyond 2020.

(c) The (Air Resources Board) shall make recommendations to the Governor and the Legislature on how to continue reductions of GHG emissions beyond 2020.

Climate Change Scoping Plan

In December 2008, the California Air Resources Board (CARB) adopted its Climate Change Scoping Plan, which contains the main strategies California will implement to achieve reduction of approximately 118 million metric tons (MMT) of CO_2e (further explained in Section 15.1.2) emissions, or approximately 21.7% from the state's projected 2020 emission level of 545 MMT CO_2e under a business-as-usual scenario (this is a reduction of 47 MMT CO_2e, or almost 10%, from 2008 emissions). CARB's original 2020 projection was 596 MMT CO_2e, but the current 545 MMT CO_2e 2020 projection takes into account the economic downturn that occurred in 2008 and associated reductions in statewide GHG emissions (CARB 2011). The Scoping Plan reapproved by CARB in August 2011 includes the Final Supplement to the Scoping Plan Functional Equivalent Document, which further examined various alternatives to Scoping Plan measures. The Scoping Plan also includes CARB-recommended GHG reductions for each emissions sector of the state's GHG inventory. CARB estimates the largest reductions in GHG emissions to be achieved by 2020 will be by implementing the following measures and standards (CARB 2011):

- Improved emissions standards for light-duty vehicles (estimated reductions of 26.1 MMT CO_2e)
- The Low-Carbon Fuel Standard (15.0 MMT CO_2e)
- Energy efficiency measures in buildings and appliances (11.9 MMT CO_2e)
- A renewable portfolio and electricity standards for electricity production (23.4 MMT CO_2e) and the Cap-and-Trade Regulation for certain types of stationary emission sources (e.g., power plants)

In May 2014, CARB released, and has since adopted, the *First Update to the Climate Change Scoping Plan* to identify the next steps in reaching AB 32 goals and evaluate the progress that has been made between 2000 and 2012 (CARB 2014a). According to the update, California is on track to meet the near-term 2020 GHG limit and is well positioned to maintain and continue reductions beyond 2020 (CARB 2014a). The update also reports the trends in GHG emissions from various emission sectors.

The update summarizes sector-specific actions needed to stay on the path toward the Executive Order S-3-05 2050 target. While the update acknowledges certain reduction targets by others (such as in the Copenhagen Accord), it stops short of recommending a specific target for California, instead acknowledging that mid-term targets need to be set "consistent with the level of reduction needed [by 2050] in the developed world to stabilize warming at 2 °C [degrees Celsius] (3.6 °F [degrees Fahrenheit]) [above pre-industrial levels]."

Actions are recommended for the energy sector, transportation (clean cars, expanded zero-emission vehicle program, fuels policies), land use (compliance with regional sustainability planning targets), agriculture, water use (more stringent efficiency and conservation standards, runoff capture), waste (elimination of organic material disposal, expanded recycling, use of Cap-and-Trade Program), green building (strengthening of Green Building Standards), and other sectors. Many of the actions that result in meeting targets will need to be driven by new or modified regulations.

Executive Order B-30-15

On April 20, 2015, Governor Edmund G. Brown Jr. signed Executive Order B-30-15 to establish a California GHG reduction target of 40% below 1990 levels by 2030. California is on track to meet or exceed the current target of reducing GHG emissions to 1990 levels by 2020, as established in the California Global Warming Solutions Act of 2006 (SB 32 discussed previously). California's new emission reduction target of 40% below 1990 levels by 2030 will make it possible to reach the ultimate goal of reducing emissions 80% below 1990 levels by 2050.

Senate Bill 32 of 2016

In August 2016, Governor Brown signed SB 32, which serves to extend California's GHG reduction programs beyond 2020. SB 32 amended the California Health and Safety Code to include Section 38566, which contains language to authorize CARB to achieve a statewide GHG emission reduction of at least 40% below 1990 levels by no later than December 31, 2030. SB 32 codified the targets established by the governor's Executive Order B-30-15 for 2030, which set the next interim step in the state's continuing efforts to pursue the long-term target expressed in Executive Orders S-3-05 and B-30-15 of 80% below 1990 emissions levels by 2050.

Senate Bill 375: Statutes of 2008

SB 375, signed into law by Governor Schwarzenegger in 2008, requires regional transportation plans, developed by metropolitan planning organizations, to incorporate an SCS that will achieve GHG emission reduction targets set by the CARB.

The Sacramento Area Council of Governments (SACOG) serves as the metropolitan planning organization for Sacramento, Placer, El Dorado, Yuba, Sutter, and Yolo Counties, excluding those lands located in the Lake Tahoe Basin. The Planning Area is located within Sacramento County and includes Galt and Rancho Cordova. SACOG adopted its Metropolitan Transportation Plan (MTP)/SCS 2035 in 2016. SACOG was tasked by CARB to achieve a 9% per capita reduction compared to 2012 emissions by 2020 and a 16% per capita reduction by 2035, which CARB confirmed the region would achieve by implementing its SCS (CARB 2013). The 2016 MTP/SCS forecasts land use development by community types: Center and Corridor Communities, Established Communities, Developing Communities, Rural Residential Communities, and Lands Not Identified for Development in the 2016 MTP/SCS study period (SACOG 2016a). CARB is currently in the process of updating the GHG reduction targets pursuant to the provisions of SB 375.

The Planning Area includes Sacramento County, Galt, and Rancho Cordova, which are jurisdictions with areas slated for development in the SCS growth projections.

15.1.1.3 Local

Sacramento Metropolitan Air Quality Management District

The Planning Area is entirely within the jurisdiction of the Sacramento Metropolitan Air Quality Management District (SMAQMD). The SMAQMD's *Guide to Air Quality Assessment in Sacramento County* establishes analysis expectations with regard to GHG emissions in California Environmental Quality Act (CEQA) documents, such as EIRs, for projects in the SMAQMD's jurisdiction (SMAQMD 2016). SMAQMD recommends that an analysis of potential impacts of project-generated GHG emissions should include a description of GHGs, summary of existing regulations, and discussion of GHG emissions sources in the Planning Area. The guidelines further state that the analysis should quantify the mass emissions associated with project construction and operation. SMAQMD has adopted thresholds of significance, which are further described in Section 15.2.1, Methodology for Assessing Impacts of Each Alternative on Greenhouse Gases and Climate Change.

Sacramento County

Sacramento County Climate Action Plan

In 2009, Sacramento County began a multiphase Climate Action Plan to meet the state's targets for GHG reductions. The Climate Action Plan Strategy and Framework Document was adopted

on November 9, 2011, by the Sacramento County Board of Supervisors, and the Government Operations Climate Action Plan was adopted on September 11, 2012. The plan includes a GHG inventory for the entire Sacramento County (discussed further below), a GHG emission reduction target, and goals and implementation measures developed to help Sacramento County reach these targets. Reduction strategies address GHG emissions associated with transportation and land use, energy, water, waste management and recycling, and agriculture and open space. Although parts of the plan encompass countywide emissions issues, the focus of the currently adopted plan is on Sacramento County facilities and operations. Sacramento County is currently working to update and expand the Climate Action Plan to address countywide emissions sources.

Sacramento County 2030 General Plan

The *Sacramento County General Plan of 2005–2030* (Sacramento County General Plan) (Sacramento County 2011) includes the following policy in the Land Use Element related to reducing GHG emissions in Sacramento County:

> **Policy LU-115:** It is the goal of the County to reduce GHG emissions to 1990 levels by the year 2020. This shall be achieved through a mix of State and local action.

2030 Galt General Plan

The *2030 Galt General Plan: Policy Document* (Galt General Plan) (Galt 2009a) contains numerous policies related to GHG emission reduction. However, only the following three are applicable to the analysis in this EIS/EIR:

> **Policy COS-7.1:** Greenhouse Gas Emission Reduction: The City shall reduce GHG emissions from City operations as well as from private development in compliance with the California Global Warming Act of 2006 and any applicable State regulations. To accomplish this, the City will coordinate with SMAQMD and [C]ARB in developing a GHG Emissions Reduction Plan that identifies GHG emissions within the City as well as ways to reduce those emissions. The plan will parallel the requirements adopted by [C]ARB specific to this issue. Specifically, the City will work with the SMAQMD to include the following key items in the plan:
>
> - Inventory all known, or reasonably discoverable, sources (both public and private) of GHG in the City;
> - Inventory estimated 1990 GHG emissions based on available data, the current level, those projected for the 2020 milestone year (consistent with AB 32), and that projected for the year 2030;

- Set a target for the reduction of emissions attributable to the City's discretionary land use decisions and its own internal government operations, and;
- Identify specific actions that will be undertaken by the City to meet the emission reduction targets set by the City.

Policy COS-7.2: Statewide Global Warming Solutions Support: The City should monitor and support the efforts of [C]ARB, under AB 32, to formulate mitigation strategies, if any that may be implemented by local government. If and when any such strategies become available, the City should consider whether to implement them in some form, such as, for example, by imposing new mitigation measures on new development. If the City Council, after seeking public input on the subject, chooses to implement any such measures it considers to be feasible and desirable, the City's commitment may take the form of a new ordinance, resolution, or other type of policy document.

Policy COS-7.3: Motor Vehicle Trip Reduction: The City shall encourage strategic land use patterns for businesses that reduce the number and length of motor vehicle trips and/or encourage alternative modes of travel.

Rancho Cordova General Plan

The *City of Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2006a) does not have any policies related to GHG emissions or global climate change; however, the Rancho Cordova General Plan does include the following policies within the Air Quality Element that would result in reductions in GHG emissions:

Policy AQ.4.1: Promote improved air quality benefits through energy conservation measures for new and existing development.

Policy AQ.4.2: Support vehicle improvements and the use of clean vehicles that reduce emissions and improve air quality.

15.1.2 Greenhouse Gas Emissions and Consequences of Climate Change in the Planning Area

This section provides information on GHGs and their effect on climate change.

Certain gases in the Earth's atmosphere, classified as GHGs, play a critical role in determining the Earth's surface temperature. Solar radiation enters the Earth's atmosphere from space. A portion of the radiation is absorbed by the Earth's surface, and a smaller portion of this radiation is reflected back toward space. This absorbed radiation is then emitted from the Earth as low-frequency infrared radiation. The Earth has a much lower temperature than the Sun;

therefore, the Earth emits lower frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on Earth. Without the greenhouse effect, Earth would not be able to support life as we know it.

Prominent GHGs contributing to the greenhouse effect are CO_2, methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride (SF_6). Different gases have varying global warming potential and therefore are commonly normalized based on each gasses' global warming potential and expressed as CO_2e (i.e., the global warming potential of each gas is converted to the equivalent global warming potential for CO_2). Human-caused emissions of these GHGs in excess of natural ambient concentrations are widely regarded as being responsible for intensifying the greenhouse effect, which has led to a trend of unnatural warming of the Earth's climate, known as global climate change or global warming. It is *extremely unlikely* that global climate change of the past 50 years can be explained without the contribution from human activities (IPCC 2007).

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (approximately 1 day), GHGs have long atmospheric lifetimes (1 year to several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of any particular GHG molecule is dependent on multiple variables and cannot be pinpointed, it is understood that more CO_2 is emitted into the atmosphere than is sequestered (i.e., taken out of gaseous form in the atmosphere and bound into a solid or liquid) by ocean uptake, vegetation, and other forms of sequestration. Of the total annual human-caused CO_2 emissions, approximately 54% is sequestered through ocean uptake, uptake by northern hemisphere forest regrowth, and other terrestrial sinks within a year, whereas the remaining 46% of human-caused CO_2 emissions remains stored in the atmosphere (IPCC 2013).

Similarly, impacts of GHGs are realized globally as opposed to localized air quality effects of criteria air pollutants and toxic air contaminants. The quantity of GHGs that it takes to ultimately result in climate change is not precisely known. However, the quantity is enormous, and no single project alone would measurably contribute to a noticeable change in the global average temperature or to global, local, or micro climates. From the standpoint of a National Environmental Policy Act and CEQA impact analysis, GHG impacts to global climate change are inherently cumulative, and the key question is whether a project's contribution to the impact is "cumulatively considerable" in combination with other sources.

15.1.3 Attributing Climate Change—Greenhouse Gas Emission Sources

Emissions of GHGs contributing to global climate change are attributable in large part to human activities associated with the transportation, industrial/manufacturing, utility, residential, commercial and agricultural emissions sectors (CARB 2014b). In California, the transportation sector is the largest emitter of GHGs followed by electricity generation (CARB 2014b). Emissions of CO_2 are byproducts of fossil fuel combustion. CH_4, a highly potent GHG, results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices, landfills, and wastewater treatment plants. N_2O, an even more potent GHG, is also largely attributable to agricultural practices and soil management. Carbon sinks, or reservoirs, include vegetation and the ocean, which absorb CO_2 through sequestration and dissolution (absorption of the molecules into the liquid medium), respectively, which are two of the most common processes for removing CO_2 from the atmosphere.

15.1.3.1 Existing Emissions Inventory

A GHG emissions inventory was conducted in 2009 for Sacramento County, including Galt and Rancho Cordova (Sacramento County 2009). The inventory was developed based on 2005 data and quantified baseline emissions by sector for the included jurisdictions. Total emissions for each jurisdiction within the Planning Area are shown in Table 15-1.

Table 15-1. 2005 Community GHG Emissions Inventory

Jurisdiction	CO2e (MT)
Sacramento County	13,938,537
Galt	172,428
Rancho Cordova	557,943

Source: Sacramento County 2009.
Notes: CO2e = carbon dioxide equivalent; MT = metric tons

15.1.4 Effects of Climate Change on the Environment

According to the IPCC, global average temperature is expected to increase by 3°F to 7°F by the end of the century, depending on future GHG emission scenarios (IPCC 2007). According to the California Natural Resources Agency, temperatures in California are projected to increase 2°F to 5°F by 2050 and by 4°F to 9°F by 2100 (CNRA 2012).

Other environmental resources could be indirectly affected by the accumulation of GHG emissions and resulting rise in global average temperature. For example, an increase in the global average temperature is expected to result in a decreased volume of precipitation falling as snow in California and an overall reduction in snowpack in the Sierra Nevada. According to

the California Energy Commission (2012), the snowpack portion of the state's water supply could potentially decline 30% to 90% by the end of the twenty-first century. An increase in precipitation falling as rain rather than snow also could lead to increased potential for floods because water that would normally be held in the snowpack of the Sierra Nevada until spring would flow into the Central Valley concurrently with winter storm events. This scenario would place more pressure on California's levee/flood control system.

As the existing climate throughout California changes over time, the ranges of various plant and wildlife species could shift or be reduced depending on the favored temperature and moisture regimes of each species. In the worst cases, some species could become extinct or be extirpated from the state if suitable conditions are no longer available (CNRA 2012).

Changes in precipitation patterns and increased temperatures could also alter the distribution and character of natural vegetation and associated moisture content of plants and soils. An increase in frequency of extreme heat events and drought are also expected. These changes are expected to lead to increased frequency and intensity of wildfires (CNRA 2012).

However, attempting to predict the response of any one particular species, habitat, or ecosystem to climate change, particularly when considering a specific geographic area, would require significant speculation. Assumptions would need to be made regarding the type and extent of changes in climatic conditions in the area of interest (e.g., average maximum temperature, average minimum temperature, volume and timing of precipitation, changes in wind patterns), as well as the response of the organism or ecosystem to these changes. For example, while the Mediterranean climate of mild wet winters and hot dry summers is conducive to the formation of vernal pools, climate may not be integral to vernal pool formation. As defined by Keeley and Zelder (1998), vernal pool habitat is defined by the source of water, duration of inundation, and the timing of these phases. According to Keeley and Zelder (1998), as long as conditions support (1) inundation during periods wherein temperature is sufficient for plant growth, followed by (2) a brief, water-logged terrestrial stage that proceeds (3) extreme, extended soil desiccation, climate type is not integral to the formation of vernal pools. It is unknown to what extent these parameters would need to change to substantially affect the long-term viability of vernal pools in the Planning Area.

The potential effects from climate change on vernal pools in the Planning Area may ultimately prove to be important. However, California has experienced climatic variation throughout geologic time and vernal pool species survived and evolved under these changing conditions. Various paleontological records, including evaluation of tree rings, pollen deposits, and salinity records support these findings. For example, California experienced a dry period between 10,000 and 5,000 years ago that is associated with deglaciation combined with influences from the Milankovitch solar maximum (i.e., a period of intense solar activity when increased solar

energy reached the earth) (Minnich 2007, p. 59; Malamud-Roam et. al. 2006, p. 1,576). Limited growth of bristlecone pine trees (*Pinus longaeva*) during this period, as observed through the study of tree rings, supports the conclusion that water was scarce. Additionally, pollen deposits sampled at an assortment of high elevation meadows indicate a more open forest containing a greater number of shrubs than the current forests of the Sierra Nevada. Records of high salinity within the San Francisco Estuary at this time also correspond with dryer conditions in the watershed because less runoff would allow more salt water intrusion into the estuary.

Following this dry period, California experienced an extended wet period. From 5,000 years ago to 3,500 years ago, paleontological evidence suggests an increase in precipitation coinciding with a reduction in the strength of wind-driven upwelling off the coast of California. During this period, the salinity of the San Francisco Estuary was relatively low, and tree rings within these dates are thicker, which is indicative of higher precipitation rates. Glaciers also began forming in the Sierra Nevada where they had previously been absent during the early Holocene; therefore, temperatures are thought to be cooler (Minnich 2007, p. 61).

A shift back to a drier climate then occurred, extending from approximately 2,050 to 650 years ago (i.e., approximately 1,350 AD), culminating in an additional period of global cooling known as the Little Ice Age from 1,250 to 1,750 AD (Malamud-Roam et. al. 2006, p. 1,584). Tree ring chronologies indicate a moderately cool period extending from the seventeenth century to the early nineteenth century, followed by relatively stable climatic conditions during the twentieth century.

Therefore, while current climate change projections trend towards a generally hotter, drier climate, there is evidence that the state has experienced these conditions before, with vernal pools persisting through these periods. However, other variables, such as stresses from degradation of water quality or human disturbance, could alter how vernal pools respond to future hotter and drier conditions relative to similar past climatic conditions. Given the amount of uncertainty and number of variables involved, it would be speculative to attempt to predict the future effects of climate change on any particular species or ecosystem in the Planning Area.

Another outcome of global climate change is sea-level rise. Sea level rose approximately 7 inches during the last century, and it is predicted to rise an additional 7 to 22 inches by 2100, depending on the future levels of GHG emissions (IPCC 2007). The California Natural Resources Agency projects that sea levels along California will rise 5 to 24 inches by 2050 and 17 to 66 inches by 2100 (CNRA 2012). However, the Planning Area is approximately 90 miles inland, and although some of the southwestern portions of the Planning Area are near sea-level, they are protected by levees and other flood control features.

15.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

15.2.1 Methodology for Assessing Impacts of Each Alternative on Greenhouse Gases and Climate Change

GHG emissions are typically categorized by direct (e.g., emissions directly emitted from a source, such as vehicle tailpipe emissions) and indirect (e.g., emissions that occur off site, such as energy consumption from a local utility). The alternatives were evaluated in the context of the planned urban development, land use patterns within the Planning Area, and emissions sources associated with them (e.g., stationary, mobile). Impacts were identified where the actions or projects associated with the alternative would result in new or additional GHG emissions.

There are multiple ways that alternatives could increase GHG emissions, such as by increasing regional vehicle miles traveled (VMT) and, thus, mobile-source CO_2; increasing other fossil fuel consumption, such as for energy production; and decreasing the amount of CO_2 sequestered in vegetation. GHG emissions would occur during both construction and operations. Construction and operations could also result in the use of heavy duty equipment, which would be a source of exhaust. The projects and activities expected under each alternative, including expected or conceptual preserves, are described in Chapter 2, Alternatives, Including the Proposed Action/Proposed Project. Potential impacts of the alternatives were analyzed using a 50-year study period, as discussed in Section 3.6.3, EIS/EIR Study Period.

Potential impacts from GHG emissions from each alternative were analyzed based on the anticipated development projects and preserve establishment, management, and maintenance over the 50-year study period, as described in Section 3.6.3.

Specific to emissions from preserve establishment, emissions from construction- and operational-related activities were quantified using the California Emissions Estimate Model. Modeling was for an estimated high activity day implementing habitat establishment/re-establishment and used conservative assumptions (i.e., assumptions that would lead to higher emissions) so as not to underestimate emissions from this activity. For example, the modeling assumed that approximately 385 acres of habitat establishment/re-establishment would be completed in a single year, which is roughly 20% of the total habitat establishment/re-establishment required for each alternative over the entire 50-year study period. The parameters of the model represent what would be expected to occur as each alternative is implemented over time. The modeling included the use of heavy-duty equipment for earth movement and grading, as well as operational-related vehicle use. Model assumptions and parameters are included in Appendix H, Modeling Data and Assumptions for Air Quality and Greenhouse Gas Analyses.

As described previously, GHG emissions are global pollutants and, therefore, contribute to a global, not local or regional, problem; however, the regulatory framework in California is such

that SMAQMD regulates local emissions and sources within the Sacramento Valley Air Basin with the intent to achieve the region's fair share of GHG emission reduction such that state GHG reduction targets (i.e., goals set by the Scoping Plan) are met. As such, significance thresholds determined by SMAQMD and other local agencies (e.g., Sacramento County) are designed to ensure compliance with state GHG reduction planning efforts. The emissions attributable to each alternative result from activities that occur in the Planning Area. Therefore, the lead agencies determined that the appropriate geographic scale for evaluating GHG emissions is the Planning Area.

Based on the global nature of GHG emissions, the global climate change analysis is inherently cumulative. No single action or project would emit sufficient GHGs to result in a change in Earth's climate. Therefore, GHG emissions identified for a single action or project are inherently an expression of that action's or project's contribution to the cumulative effect of global climate change. Direct and indirect emissions as a result of any alternative evaluated in this EIS/EIR would be a cumulative contribution to a global issue. For these reasons, the description of direct and indirect effects for each alternative reflects the alternative's contribution to cumulative impacts. A separate cumulative impact discussion is not needed for any alternative in this chapter.

As discussed in Section 3.4, Previous Planning Area Environmental Reviews, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Sacramento County 2010; Galt 2009b; Rancho Cordova 2006b) analyzed direct and cumulative impacts of urban growth planned within the respective jurisdictions. The Sacramento County and Galt General Plan EIRs identified effects related to GHG emissions, while the Rancho Cordova General Plan EIR did not. When the impact analysis or conclusions provided in the General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR Alternatives, a brief summary or description of the incorporated information or analysis is provided in Sections 15.2.2, No Action/No Project Alternative; 15.2.3, Proposed Action/Proposed Project Alternative; and 15.2.4, Reduced Permit Term Alternative.

15.2.1.1 Determination of Impact Significance

Significance Criteria

As discussed in Section 3.8.1, Significance Thresholds, the criteria used to evaluate the significance of each alternative's GHG and climate change impacts are based on Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) and on typical thresholds used to evaluate effects on global climate change in recent EIRs prepared by Sacramento County. Based on these sources, a significant adverse impact would occur if the alternative would:

1. Generate GHG emissions, either directly or indirectly, that may have a significant effect on the environment.

2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

SMAQMD currently recommends that lead agencies use mass emission thresholds of significance for evaluating construction- and operational-related GHG emissions and stationary sources. Projects with GHG emissions that are below the thresholds are considered to be consistent with AB 32 and CARB's Climate Change Scoping Plan goal to reduce GHG emissions. Thus, compliance with these thresholds would ensure compliance with CEQA, Appendix G, thresholds as described previously and will be applied to the South Sacramento Habitat Conservation Plan (SSHCP). These thresholds are the following:

- Construction phase of projects: 1,100 MT CO_2e/year
- Operational phase of projects: 1,100 MT CO_2e/year
- Stationary source projects: 10,000 MT CO_2e/year

Appendix G of the CEQA Guidelines does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial impact could occur if the alternative would:

1. Result in a net reduction in GHG emissions compared to a baseline environmental condition.

The impact analysis for the three EIS/EIR Alternatives considers the context, intensity, and severity of potential impacts to each of these GHG and climate change impact criteria and presents a determination of significance applicable to each of these criteria.

15.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2, No Action/No Project Alternative, of Chapter 2.

15.2.2.1 Direct and Indirect Effects of the Alternative

Construction Emissions

Much of the future urban development included in the No Action/No Project Alternative is described in the General Plans of Sacramento County, Galt, and Rancho Cordova (see Section 3.4).

Construction associated with future development could result in GHG emissions from the use of heavy-duty construction equipment and from construction vehicle (i.e., worker commute vehicles and haul truck trips) exhaust.

The impact analysis presented in the *Final Environmental Impact Report: Sacramento County General Plan Update* (Sacramento County General Plan EIR) (Sacramento County 2010, pp., 12-1 to 12-42) determined the following within Sacramento County:

- Construction-related GHG emissions would be considered significant and unavoidable.[2]

The impact analysis presented in the *City of Galt General Plan Update: 2030 Final EIR* (Galt General Plan EIR) (Galt 2009b) determined the following within Galt:

- Construction-related GHG emissions would be considered significant and unavoidable.

The *City of Rancho Cordova General Plan Final Environmental Impact Report* (Rancho Cordova General Plan EIR) (Rancho Cordova 2006b) did not explicitly evaluate impacts associated with GHG emissions; however, type and character of urban development within Rancho Cordova would be similar to that described for Sacramento County and Galt (e.g., residential, commercial). As such, it is expected that impacts associated with GHG emissions and global climate change in Rancho Cordova would be similar to those described for Sacramento County and Galt.

As discussed in Section 3.4, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b), 2030 (Rancho Cordova 2006b), and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur within Galt, Rancho Cordova, and Sacramento County in the years after each General Plan EIR study period ends but before this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR Alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of all urban development activities and projects that are included in the description of each EIS/EIR Alternative.

As explained in Section 2.2.2, Expected Regulatory Environment Under the No Action/No Project Alternative, the regulatory environment of the No Action/No Project Alternative is expected to restrict the ability of local agencies to permit approximately 1,900 acres of future urban development in the Mather Core Recovery Area (MCRA), and this future urban development would be shifted or displaced to one or more of the areas of undeveloped land

[2] As described further in Section 3.4.1, the proposed project analyzed within the Sacramento County General Plan EIR assumed development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by Sacramento County. However, Sacramento County is currently processing land use entitlements in the Jackson Highway Corridor; therefore, the referenced conclusions from the proposed project analysis are relevant to the No Action/No Project Alternative.

outside the Urban Service Boundary (USB) discussed in Section 2.2.3, Loss of Natural Lands Under the No Action/No Project Alternative.

Urban development shifted or displaced outside of the USB could result in construction worker commute and vendor haul trips being longer in distance, resulting in higher VMT (and associated GHG mobile-source emissions) relative to what would be expected if urban development was confined to the USB. An increase in regional VMT associated with construction trips would result in increased emissions of GHGs. Construction-related GHG emissions as a result of increased vehicle trips and VMT would contribute further to the already significant unavoidable impacts to global climate change described in the EIRs referenced previously.

Under the No Action/No Project Alternative, new urban development would continue to include mitigation actions to offset impacts to listed species, wetlands, and other regulated natural resources, including off-site or on-site mitigation preserves (See Section 2.2.2). Mitigation for unavoidable impacts could also continue to occur through purchasing credits at a mitigation or conservation bank approved by the applicable resource agencies (e.g., U.S. Fish and Wildlife Service or U.S. Army Corps of Engineers), by payment into an in-lieu fee program, on-site project developer–responsible mitigation, or off-site project developer–responsible mitigation.

Under the No Action/No Project Alternative, mitigation preserves would frequently be established (constructed) in an uncoordinated manner by multiple entities. This would often result in smaller, more isolated preserves mostly located within the MCRA and elsewhere in the USB since some projects would establish on-site mitigation preserves for resource impacts that could not be avoided. Emissions associated with establishment/construction of mitigation preserves would be evaluated on a project-by-project basis and, therefore, have not been described within the referenced General Plan EIRs.

Establishment of mitigation preserves would include minor construction activities, such as earth movement and grading, fence installation, and other minor work. The use of heavy equipment for grading and earth moving could result in exhaust GHG emissions. Although specific details regarding the size of mitigation preserves and types of construction activities are not known, an estimate of GHG emissions was conducted based on conservative assumptions of preserve numbers, size, and likely construction equipment that would be used (e.g., trucks, loaders, backhoes). Refer to Appendix H for detailed assumptions. Based on the modeling conducted, preserve establishment and/or re-establishment could result in up to 397 MT CO_2 per year from the use of heavy-duty equipment, worker commute, and vendor haul trips. This level of emissions would not exceed applicable SMAQMD thresholds of significance of 1,100 MT CO_2 per year and, therefore, would not further contribute to already existing significant and unavoidable cumulative GHG impacts.

Operational Emissions

Operational-related GHG emissions associated with future development would originate from mobile and stationary sources (e.g., electricity). To characterize impacts on global climate change resulting from operation of urban development, the same documents described in Section 3.4 are referenced here. Impacts are summarized below.

The impact analysis presented in the Sacramento County General Plan EIR (Sacramento County 2010, pp., 12-1 to 12-42) determined the following within Sacramento County:

- Operational-related GHG emissions would be considered significant and unavoidable.
- Impacts on urban development from climate change would also be significant and unavoidable.

The impact analysis presented in the Galt General Plan EIR (Galt 2009b) determined the following within Galt:

- Operational-related GHG emissions would be considered significant and unavoidable.

The Galt General Plan EIR (Galt 2009b) did not evaluate impacts from climate change on urban development. However, because Galt is located within Sacramento County, the same climate changes and associated effects (e.g., precipitation pattern changes, increases fire, decreases snow pack, sea-level rise) that would occur within Sacramento County would also occur in Galt. As such, impacts to these areas would be the same as those described for Sacramento County.

The Rancho Cordova General Plan EIR (Rancho Cordova 2006b) did not evaluate operational-related impacts from GHG emissions or impacts from climate change on urban development. However, urban development within Rancho Cordova would be similar to that described for Sacramento County and Galt (e.g., residential, commercial). As such, it is expected that impacts associated with to GHG emissions and global climate change in Rancho Cordova would be similar to those described for Sacramento County and Galt. Further, because Rancho Cordova is located within Sacramento County, the same climate changes and associated effects (e.g., precipitation pattern changes, increases fire, decreases snow pack, sea-level rise) that would occur within Sacramento County would also occur in Rancho Cordova. As such, impacts to these areas would be the same as those described for Sacramento County.

The impact analysis presented in the 2016 MTP/SCS Final EIR (SACOG 2016b) determined the following within the SACOG Planning Area:

- The GHG impacts resulting from land use changes and transportation improvements identified in the 2016 MTP/SCS that are associated with achieving the SB 375 GHG emissions reduction targets are considered less than significant.

Implementation of the No Action/No Project Alternative would result in operational-related mobile-source emissions associated with vehicular exhaust as a function of VMT traveled within the Planning Area (e.g., as a result of urban development). As stated previously, the previously referenced EIRs analyzed the effects of urban development through a period between 2030 and 2050; however, the lead agencies anticipate that urban development projects would continue through the end of the EIS/EIR 50-year study period (2065). Therefore, the lead agencies extrapolated that the significant and unavoidable GHG impacts identified in the EIRs would continue to be significant and unavoidable as additional urban development is implemented.

Similar to what was described previously for construction emissions, urban development shifted or displaced outside of the USB could result in resident and employee commute trips being longer in distance, resulting in higher VMT (and associated GHG mobile-source emissions) relative to what would be expected if urban development was confined to the USB. An increase in regional VMT associated with operational trips would result in increased emissions of GHGs. Operation-related GHG emissions as a result of increased vehicle trips and VMT would contribute further to the already significant unavoidable impacts to global climate change described in the EIRs referenced previously.

In addition to mobile-source GHG emissions, urban development would result in the conversion of undeveloped carbon-sequestering terrestrial land covers (e.g., agriculture/cropland land, oak woodlands, grasslands) to developed land, decreasing the total sequestering capacity of land within the Planning Area. This would result in a net increase in GHG emissions. Based on Table 8-4, Acres of Direct Impacts to Each Natural Land Cover Under the No Action/No Project Alternative, in Chapter 8, Natural Land Cover Habitat Types and Associated Plant and Animal Communities, and as shown in Appendix H, expected urban development could result in a loss of 34,352 acres of vegetated carbon-sequestering land. It is estimated that this would amount to approximately 772 MT/year of CO_2e that would have otherwise continued to be sequestered by the undeveloped land. The loss of carbon sequestering land, resulting primarily from urban development, would be part of the already significant and unavoidable impacts in the referenced EIRs. See Appendix H for land coverage and carbon sequestration calculations.

Operational emissions associated with mitigation preserve management include mobile-source exhaust emissions associated with transportation of livestock for grazing management specific to preserve management activities and visits by Preserve Managers/crews for maintenance and monitoring. Additionally, depending on the specifics of the habitat re-establishment or establishment activity, several pieces of heavy equipment and the associated crews may use local roadways, resulting in on- and off-site exhaust emissions. Most days, vehicle trips and heavy equipment use on mitigation preserves under the No Action/No Project Alternative would not be substantially different from the daily vehicle trips and heavy equipment activities associated with typical existing rangeland and farmland uses. The types of activities are similar (e.g., fence installation or repair, access road maintenance, drainage repairs) between the No Action/No Project Alternative and existing conditions on the mitigation preserve lands and rangeland or farmland. However, for extra activities specific to the use of the land as a mitigation preserve, these activities could result in additional GHG emissions throughout the Planning Area.

Although specific details regarding the specific mitigation preserve activities or operational/maintenance trip number are not known, an estimate of emissions was conducted based on conservative assumptions of preserve numbers, size, activities that would take place and equipment that would be used for those activities (e.g., trucks, loaders, backhoes). Refer to Appendix H for detailed assumptions. The emissions modeling represents a maximum day of preserve operation and maintenance, assuming both vehicle maintenance trips and operation of heavy-duty equipment, such as a day when heavy maintenance or repairs (e.g., landscape contouring, drainage infrastructure repairs, alteration of graded access roads) are needed along with regular operations. During the majority of days over the 50-year EIS/EIR study period, the amount of mitigation preserve management activity and attendant vehicle trips and heavy-duty equipment operations would be much less and not substantially different from activities associated with agricultural and rangeland operations undertaken on lands prior to being established as a mitigation preserve. The maximum activity estimate is intended to be conservative to avoid the risk of understating the impacts of the alternative. Based on the modeling conducted, preserve maintenance and operational activities could result in up to 180 MT CO_2 per year. This level of emissions would not exceed applicable SMAQMD thresholds of significance of 1,100 MT CO_2 per year. Operational activities associated with mitigation preserve management would not result in substantial GHG emissions.

15.2.2.2 Cumulative Effects of the Alternative

As described in Section 15.2.1, the GHG emission impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative GHG emission impacts of the No Action/No Project Alternative are identical to the direct and indirect impacts described in Section 15.2.2.1, Direct and Indirect Effects of the Alternative.

15.2.3 Proposed Action/Proposed Project Alternative

The Proposed Action/Proposed Project Alternative is described in Section 2.3.

15.2.3.1 Direct and Indirect Effects of the Alternative

Construction Emissions

As described in Section 2.3.3, the Proposed Action/Proposed Project Alternative Covered Activities include types of urban development similar to those anticipated under the No Action/No Project Alternative; however, under the Proposed Action/Proposed Project Alternative, urban development would not be shifted or displaced outside of the USB.

Construction associated with future development could result in GHG emissions from the use of heavy-duty construction equipment and from construction vehicle (i.e., worker commute vehicles and haul truck trips) exhaust. Because the Proposed Action/Proposed Project Alternative includes types of urban development consistent with those anticipated under the No Action/No Project Alternative, the sources and types of GHG emissions associated with construction of development, such as the operation of heavy-duty construction equipment, would be the same as those described for the No Action/No Project Alternative; however, the Proposed Action/Proposed Project Alternative does not include the MCRA regulatory requirements of the No Action/No Project Alternative (refer to Section 2.2.2). This provides the opportunity for urban development Covered Activities within the MCRA to be implemented consistent with the Sacramento County and Rancho Cordova General Plans without the 1,900 acres of shifted or displaced urban development occurring outside the USB under the No Action/No Project Alternative. As a result, a portion of construction worker commute and vendor haul trips between future construction sites for development could be shorter in distance compared to the No Action/No Project Alternative. This would result in lower VMT and, therefore, reduced exhaust emissions of GHGs under the Proposed Action/Proposed Project Alternative compared to the No Action/No Project Alternative.

The potential adverse effects from construction emissions identified above for the No Action/No Project Alternative future conditions within the Planning Area would still occur under the Proposed Action/Proposed Project Alternative but to a lesser extend under the Proposed Action/Proposed Project Alternative because of the reduced vehicle trip lengths resulting from not having urban development shifted or displaced outside the MCRA. This would result in a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

As discussed in Section 2.3.5, Conservation Strategy Under the Proposed Action/Proposed Project Alternative, the Proposed Action/Proposed Project Alternative would include the

establishment of an interconnected Preserve System in the Planning Area and a comprehensive preserve management program that would be implemented in perpetuity. The Preserve System under the Proposed Action/Proposed Project Alternative would be more contiguous and connected than the mitigation preserves that would be established under the No Action/No Project Alternative. Preserve establishment and management could include a variety of activities during construction that would result in emissions.

Activities that would generate GHG emissions associated with the construction/establishment of individual preserves under the Proposed Action/Proposed Project Alternative would be the same as those described for the No Action/No Project Alternative, such as vehicle trips and operation of heavy equipment for grading. However, under the Proposed Action/Proposed Project Alternatives, overall preserves would be larger and better linked and established/constructed by the SSHCP Implementing Entity rather than by different entities.

In addition to on-site emission associated with heavy equipment at preserve sites, construction and worker vehicle trips would also result in mobile-source emissions associated with the establishment of preserves. As a result of a more contiguous and connected Preserve System, construction-related vehicular trips associated with vendor and worker trips for preserve establishment/construction could be fewer because of a smaller number of "job sites" and coordinated preserve activities directed by the SSHCP Implementing Entity. This would result in fewer mobile-source GHG emissions. Construction-related mobile-source emissions as identified above for the No Action/No Project Alternative future condition associated with mitigation preserve activities would still occur but potentially to a lesser extent under the Proposed Action/Proposed Project Alternative. This would be a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Operational Emissions

As described previously for the No Action/No Project Alternative, potential significant adverse effects from operational GHG emissions from stationary and mobile sources are anticipated for urban development under the No Action/No Project Alternative future condition. These conclusions would still be the case under the Proposed Action/Proposed Project Alternative. However, under the Proposed Action/Proposed Project Alternative, 1,900 acres of urban development would not be shifted or displaced outside of the USB. Therefore, operational related vehicular trips associated with development would be shorter, resulting in fewer mobile-source GHG emissions. Therefore, potential significant adverse effects from operation of development identified previously for the No Action/No Project Alternative future condition would also occur but to a lesser extent under the Proposed Action/Proposed Project Alternative. This would be a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

In addition to mobile-source GHG emissions, urban development would result in the conversion of undeveloped carbon-sequestering terrestrial land covers (e.g., agriculture/cropland land, oak woodlands, grasslands) to developed land, decreasing the total sequestering capacity of land within the Planning Area. This would result in a net increase in GHG emissions. Based on Table 8-8, Expected Direct Impacts to Natural Land Covers – Proposed Action/Proposed Project Alternative, and as shown in Appendix H, expected urban development could result in a loss of 32,348 acres of vegetated carbon-sequestering land under the Proposed Action/Proposed Project Alternative. This would amount to approximately 745 MT/year of CO_2 that would have otherwise continued to be sequestered by the undeveloped land. Compared to the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative would result in approximately 2,004 fewer acres of vegetated land converted to non-carbon sequestering land. Compared to the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative would result in approximately 27 MT/year of CO_2 less emissions from changes in carbon-sequestrating land coverage. The total loss in carbon sequestration (i.e., 745 MT/year of CO_2) would be substantially below applicable GHG thresholds of 1,100 MT CO_2/year. Because net annual GHG emissions associated with the loss of carbon-sequestering land would be slighter lower under the Proposed Action/Proposed Project Alternative relative to the No Action/No Project Alternative, this would be a ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

Activities associated with the operation and maintenance of preserves under the Proposed Action/Proposed Project Alternative, such as monitoring and maintenance, would be similar to those described for the No Action/No Project Alternative; however, under the Proposed Action/Proposed Project Alternative, overall, preserves would be larger and better linked, and managed by the SSHCP Implementing Entity rather than by different entities. As a result of a more contiguous and connected Preserve System with larger preserves overall, operational-related vehicular trips associated with maintenance and work trips for preserve maintenance could be fewer because of a smaller overall number of individual preserves to be visited. Trips to multiple preserves could also be consolidated as personnel directed by the SSHCP Implementing Entity would have activities to perform at multiple preserves and could drive to multiple preserves in a single vehicle “trip.” However, preserve management under the Proposed Action/Proposed Project Alternative would be more intensive than under the No Action/No Project Alternative, with more management and monitoring activities implemented on an annual basis. This would result in an increase in trips as compared to the No Action/No Project Alternative to implement the more active management strategy. Therefore, overall operational-related mobile-source emissions associated with preserve activities for the Proposed Action/Proposed Project Alternative would be similar to those identified above for the No Action/No Project Alternative future condition without the SSHCP. This would be a ***Less***

Than Significant Adverse effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

As discussed previously in Section 15.1.4, Effects of Climate Change on the Environment, climate change may result in various effects to precipitation amounts and patterns, temperature, snow pack, and sea-level rise. These changes may result in effects to Preserve Systems. However, as described previously, given the amount of uncertainty and number of variables involved, it would be speculative to attempt to predict the future effects of climate change on any particular species or ecosystem in the Planning Area. Although, if adverse effects from climate change were to occur in preserves, the typically larger and more interconnected preserves associated with the Proposed Action/Proposed Project Alternative would be more resilient to changing climatic conditions than the often smaller and more isolated mitigation preserves associated with the No Action/No Project Alternative. This would result in ***Minor Beneficial*** effect when comparing the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

15.2.3.2 Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would result in the following:

- A net reduction in GHG emissions resulting from construction of urban development
- Net reduction in GHG emissions resulting from Preserve System construction/establishment
- A net reduction in GHG emissions resulting from operations of urban development
- A net reduction in GHG emissions resulting from the loss of carbon-sequestering terrestrial land covers
- Little difference in GHG emissions resulting from Preserve System management
- A Preserve System that is more resilient to climate change

Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative related to the GHG and climate change impact criteria, the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects to GHG emissions and climate change compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

15.2.3.3 Cumulative Effects of the Alternative

As described in Section 15.2.1, the GHG emission impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative GHG emission impacts of the Proposed

Action/Proposed Project Alternative are identical to the direct and indirect impacts described in Section 15.2.3.1, Direct and Indirect Effects of the Alternative. Therefore, after considering the significance of impacts from the Proposed Action/Proposed Alternative on GHG emissions and climate change, the Proposed Action/Proposed Project Alternative would result in ***Minor Beneficial*** effects compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

15.2.4 Reduced Permit Term Alternative

As described in Section 2.3.3, the Reduced Permit Term Alternative includes the same types of new urban development and infrastructure as those anticipated under the No Action/No Project Alternative.

Under the Reduced Permit Term Alternative, the core of the Preserve System established inside the UDA would be associated with the development of five large land use entitlements, as discussed in Section 2.3.4, Covered Species Under the Proposed Action/Proposed Project Alternative, for the Reduced Permit Term Alternative and in Section 2.3.3 for the Proposed Action/Proposed Project Alternative. Because the core of the Preserve System inside the UDA under both EIS/EIR action alternatives is associated with the same five large land use entitlements, approximately 70% of the UDA preserves established under the Reduced Permit Term Alternative would have similar sizes, boundaries, and locations as the UDA preserves established under the Proposed Action/Proposed Project Alternative. However, the shorter duration of the Reduced Permit Term Alternative—and the smaller amount of urban development and associated development fees collected by the Reduced Permit Term Alternative—would not allow the SSHCP Implementing Entity to establish as many acres of new preserves in the Planning Area as would occur under the Proposed Action/Proposed Project Alternative's 50-year permit term. Therefore, fewer new preserves would be established under the Conservation Strategy of the Reduced Permit Term Alternative. This difference would be especially pronounced outside the UDA.

As described in Section 2.4, Reduced Permit Term Alternative, the ESA and CESA Incidental Take Permits and the CWA permit strategy for HCP Covered Activities would be valid only during the 30-year permit term of the Reduced Permit Term Alternative, and the Reduced Permit Term Alternative's Conservation Strategy would be implemented only during this 30-year term. The urban development Covered Activities and Conservation Strategies associated with the five land use entitlements would be implemented inside the UDA during this 30-year period. However, the EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3); therefore, the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, as described in Section 3.6.7.2, Analysis of the Reduced Permit Term Alternative, After the End of the Permit Term

(Years 31–50), the EIS/EIR analysis of the Reduced Permit Term Alternative also considers future urban development that is not part of the project description of the Reduced Permit Term Alternative but is still expected to occur within the Planning Area after the end of the permit term (i.e., in Years 31–50 of the EIS/EIR study period).

As described in Section 3.6.7.2, mitigation preserves established after the end of the 30-year Reduced Permit Term Alternative would be established under a project-by-project process for obtaining individual authorizations under CWA, ESA, CESA, and Section 1600 of the California Fish and Game Code. Consequently, mitigation preserves established in Years 31–50 of the EIS/EIR study period would not be established using a regional, landscape-based approach that balances new urban development with the need for conservation, as would be provided by an HCP. Therefore, much of the Preserve System inside the UDA would be very similar under the two action alternatives, but the Preserve System outside the UDA would be substantially different between the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, it is unlikely that mitigation preserves established outside the UDA would be contiguous or interconnected, and it is unlikely that a large, contiguous, 10,500-acre, landscape-size Vernal Pool Preserve would be established in the southwestern portion of the Planning Area. Likewise, the No Action/No Project Alterative would not result in contiguous, interconnected preserves outside the UDA and would not establish a 10,500-acre Vernal Pool Preserve in the Planning Area. In these ways, the new mitigation preserves established outside the UDA under the Reduced Permit Term Alternative and the No Action/No Project Alternative would be similar.

15.2.4.1 Direct and Indirect Effects of the Alternative

Construction Emissions

As described in Section 2.4.3, Covered Activities/Projects Under the Reduced Permit Term Alternative, the Reduced Permit Term Alternative Covered Activities include types of urban development similar to those anticipated under the No Action/No Project Alternative; however, under the Reduced Permit Term Alternative, urban development would not be shifted or displaced outside of the USB.

Construction associated with future development could result in GHG emissions from the use of heavy-duty construction equipment and construction-vehicle (i.e., worker commute vehicles and haul truck trips) exhaust. Because the Reduced Permit Term Alternative includes types of urban development consistent with those anticipated under the No Action/No Project Alternative, the sources and types of GHG emissions associated with construction of development, such as the operation of heavy-duty construction equipment, would be the same as described for the No Action/No Project Alternative; however, the Reduced Permit Term

Alternative does not include the MCRA regulatory requirements of the No Action/No Project Alternative (refer to Section 2.2.2). This provides the opportunity for urban development Covered Activities within the MCRA to be implemented consistent with the Sacramento County and Rancho Cordova General Plans without the 1,900 acres of shifted or displaced urban development occurring outside the USB under the No Action/No Project Alternative. As a result, a portion of construction worker commute and vendor haul trips between future construction sites for development could be shorter in distance compared to the No Action/No Project Alternative. This would result in lower VMT and, therefore, reduced exhaust emissions of GHGs under the Reduced Permit Term Alternative compared to the No Action/No Project Alternative.

The potential adverse effects from construction emissions identified above for the No Action/No Project Alternative future conditions within the Planning Area would still occur under the Reduced Permit Term Alternative but to a lesser extent under the Reduced Permit Term Alternative because of the reduced vehicle trip lengths resulting from not having urban development shifted or displaced outside the MCRA. This would result in a ***Minor Beneficial*** effect when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

As discussed in Section 2.4.5, Conservation Strategy Under the Reduced Permit Term Alternative, the Reduced Permit Term Alternative includes a Preserve System established during the 30-year permit term and a comprehensive preserve management program implemented in perpetuity for those preserves. The Preserve System established during the 30-year permit term under the Reduced Permit Term Alternative would be more consolidated and linked than for the No Action/No Project Alternative. As outlined in Section 2.4.5 in Chapter 2, further establishment of a coordinated preserve management and monitoring program would cease after the end of the 30-year permit term; however, the preserves established in a consolidated manner during the permit term would remain intact, whereas future (i.e., beyond the 30-year permit term) mitigation preserves would not be established in such a manner. The mitigation preserves under the Reduced Permit Term Alternative established during Years 31–50 of the 50-year EIS/EIR study period would resemble preserve establishment patterns under the No Action/No Project Alternative.

As described previously for the Proposed Action/Proposed Project Alternative, overall GHG emissions associated with preserve establishment are considered similar for the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative. Because the Reduced Permit Term Alternative implements aspects of both alternatives in the same manner as described previously for each alternative, overall GHG emissions associated with preserve establishment under the Reduced Permit Term Alternative would be similar to emissions from the other two alternatives. Because GHG emissions from preserve establishment under the Reduced Permit Term Alternative would, overall, be similar to those describe for the No

Action/No Project Alternative, a ***Less Than Significant Adverse*** effect to climate change would occur when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Operational Emissions

As described previously for the No Action/No Project Alternative, potential significant adverse effects from operational GHG emissions from stationary and mobile sources are anticipated for urban development under the No Action/No Project Alternative future condition. These conclusions would still be the case under the Reduced Permit Term Alternative. However, under the Reduced Permit Term Alternative, 1,900 acres of urban development would not be shifted or displaced outside of the USB. Therefore, operational related vehicular trips associated with development would be shorter, resulting in fewer mobile-source GHG emissions; that is, potential significant adverse effects from operation of development identified above for the No Action/No Project Alternative future condition would also occur but to a lesser extent under the Reduced Permit Term Alternative. This would be a ***Minor Beneficial*** effect when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

Urban development under the Reduce Permit Term Alternative would also result in the conversion of undeveloped terrestrial carbon-sequestering terrestrial land covers (e.g., agriculture/cropland land, oak woodlands, grasslands) to developed land, decreasing the total sequestering capacity of land within the Planning Area. This would result in a net increase in GHG emissions. Based on Table 8-12, Expected Direct Impacts to Natural Land Covers – Reduced Permit Term Alternative, and as shown in Appendix H, expected urban development could result in a loss of approximately 34,113 acres of vegetated carbon-sequestering land under the Reduced Permit Term Alternative. This would amount to approximately 771 MT/year of CO_2 that would have otherwise continued to be sequestered by the undeveloped land. Compared to the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in 239 fewer acres of vegetated land converted to non-carbon sequestering land. Compared to the No Action/No Project Alternative, the Reduced Permit Term Alternative would result in approximately 1 MT/year of CO_2 fewer emissions from changes in carbon-sequestrating land coverage.

This small difference in emissions resulting from 239 fewer acres of terrestrial carbon-sequestering land being converted is because some land cover types sequester more carbon than others. As shown in Appendix H, riparian woodland habitats are estimated to result in approximately 0.74 MT of carbon sequestered in the woody vegetation per acre per year. However, other land covers, such as annual grasslands, quickly reach an equilibrium between carbon sequestered in the growing vegetation and carbon released back into the atmosphere through decomposition of dead vegetation. Therefore, grassland land covers were assumed to

result in no net increases in carbon sequestration over time. That is, for this analysis, grasslands were assumed to sequester 0 MT of carbon per acre per year. The calculations of carbon sequestration potential reflect these conditions, as shown in Appendix H.

The total loss in carbon sequestration for the Reduced Permit Term Alternative (i.e., 771 MT/year of CO_2) would be below the applicable GHG thresholds of 1,100 MT CO_2/year. Because net annual GHG emissions associated with the loss of carbon-sequestering land would be negligibly lower under the Reduced Permit Term Alternative relative to the No Action/No Project Alternative, there would be ***No Impact*** when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

As described previously for the Proposed Action/Proposed Project Alternative, overall GHG emissions associated with preserve operations are considered similar for the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative. Because the Reduced Permit Term Alternative implements aspects of both alternatives in the same manner as described previously for each alternative, overall GHG emissions associated with preserve operations under the Reduced Permit Term Alternative would be similar to emissions from the other two alternatives. Because GHG emissions from preserve operations under the Reduced Permit Term Alternative would, overall, be similar to those describe for the No Action/No Project Alternative, a ***Less Than Significant Adverse*** effect on climate change would occur when comparing the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

As discussed previously in Section 15.1.4, climate change may result in various effects to precipitation amounts and patterns, temperature, snow pack, and sea-level rise. These changes may result in effects to Preserve Systems. However as described previously, given the amount of uncertainty and number of variables involved, it would be speculative to attempt to predict the future effects of climate change on any particular species or ecosystem in the Planning Area. If adverse effects from climate change were to occur in preserves, the typically larger and more interconnected preserves established during the 30-year permit term under the Reduced Permit Term Alternative would be more resilient to changing climatic conditions than the smaller and more isolated mitigation preserves associated with the No Action/No Project Alternative. This would result in ***Minor Beneficial*** effect compared to the No Action/No Project Alternative baseline condition.

15.2.4.2 Significance of Direct and Indirect Effects

In summary, compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would result in the following:

- A net reduction in GHG emissions resulting from construction of urban development
- A net reduction in GHG emissions resulting from operations of urban development

- A negligible difference in GHG emissions resulting from the loss of carbon-sequestering terrestrial land covers
- Little difference in GHG emissions resulting from Preserve System construction/establishment
- Little difference in GHG emissions resulting from Preserve System management
- A Preserve System that is more resilient to climate change

Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative related to the GHG and climate change impact criteria, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects to GHG emissions and climate change compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

15.2.4.3 Cumulative Effects of the Alternative

As described in Section 15.2.1, the GHG emission impacts analyzed in this EIS/EIR are, by definition, cumulative. Therefore, cumulative GHG emission impacts of the Reduced Permit Term Alternative are identical to the direct and indirect impacts described in Section 15.2.4.1. Therefore, after considering the significance of impacts from the Reduced Permit Term Alternative on GHG emissions and climate change, the Reduced Permit Term Alternative would result in ***Minor Beneficial*** effects compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

CHAPTER 16 – POPULATION AND HOUSING, SOCIOECONOMICS, AND ENVIRONMENTAL JUSTICE

This chapter provides an overview of the existing social and economic conditions, demographics, and the characteristics of minority and low-income populations in the Planning Area that are relevant for the analysis of environmental justice, and presents the potential effects of each Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) alternative on population and housing, socioeconomics, and environmental justice within the Planning Area.

An evaluation of population and housing focuses on the potential for projects and actions to remove or displace existing housing and the availability of, and demand for, housing relative to the size of the population.

Socioeconomics considers how the economic changes resulting from a project or action affect the human population in the area, such as changes in the number or type of jobs or changes in tax generation affecting the provision of government services.

As described in Sections 16.1.1 and 16.1.2, the core of an environmental justice analysis determines whether a project or an action would result in disproportionately high and adverse effects on minority or low-income populations. The adverse effects can be physical or economic.

16.1 AFFECTED ENVIRONMENT/ENVIRONMENTAL SETTING

This section describes the regulatory and environmental setting for population and housing, socioeconomics, and environmental justice.

16.1.1 Regulatory Framework

There are several federal, state, and local agency requirements that apply to the evaluation of population and housing, socioeconomics, and/or environmental justice. This section summarizes the statutes, regulations, policies, and agency planning documents that are relevant to the approval, issuance of permits, or implementation of the alternatives analyzed in this EIS/EIR. To the extent possible, the analyses or studies required by these regulations and policies are integrated into the environmental effects analyses presented in Section 16.2 (40 CFR 1502.25).

16.1.1.1 Federal

National Environmental Policy Act

The National Environmental Policy Act (NEPA) regulations require an effects analysis to consider social and economic effects, whether those effects are direct, indirect, or cumulative (40 CFR 1508.8). However, social and economic effects by themselves do not require preparation of an

EIS document. An EIS is prepared to analyze the natural and physical environment and the relationship of people with that environment. When economic or social effects are interrelated to natural or physical environmental effects, then an EIS must discuss all of those effects on the human environment (40 CFR 1508.14). Therefore, if a lead agency determines that there may be a sufficient effect on the physical or natural environment that an EIS is the proper NEPA document to prepare, then social and economic effects must be quantified and analyzed if the social and economic effects may be interrelated to the effects on the natural or physical environment.

Environmental Justice in Minority Populations and Low-Income Populations

President Clinton signed Executive Order 12898 (Clinton 1994) to underscore that provisions of existing environmental and civil rights statues can help ensure that all communities and persons of the nation live in a safe and healthy environment. Under Executive Order 12898, each federal agency must identify and address, as appropriate and as required by NEPA, any disproportionately high and adverse human health, economic, social, and environmental effects of its programs, policies, or actions on minority or low-income populations. Each federal agency must make achieving environmental justice part of its mission.

The document *Environmental Justice Guidance Under the National Environmental Policy Act* (CEQ 1997) defined the terms minority and low-income to include:

- **A minority** is defined as individual(s) who are members of the following population groups: American Indian or Alaskan Native; Asian or Pacific Islander; Black, not of Hispanic origin; or Hispanic. However, individuals of Hispanic background can also identify themselves as any racial group because Hispanic is an ethnicity based on a shared language, Spanish—not a racial identity.
- **Low-income populations** in an affected area are identified with the annual poverty thresholds from the U.S. Census Bureaus' *Current Population Reports, Series P-60 on Income and Poverty* (CEQ 1997). The *Current Population Reports, Series P-60 on Income and Poverty* is an annual report prepared by the U.S. Census Bureau. The most recent report was published in 2016 (Proctor et al. 2016). The report, among other data, identifies income levels for individuals and different-sized families, and if the individual or family earns below that level, they are considered in poverty. The Council on Environmental Quality identifies that these poverty thresholds should be used to define low-income populations.

Environmental Compliance Memorandum 95-3 (ECM 95-3) describes federal agency responsibilities under the Department of the Interior environmental justice policy. ECM 95-3 states: "Therefore, henceforth all environmental documents should specifically analyze and

evaluate the impacts of any proposed projects, actions or decisions on minority and low-income populations and communities, as well as the equity of the distribution of benefits and risks of those decisions." In addition, ECM 95-3 also states: "If a federal action is expected to have either an insignificant impact or no impact on minority/low-income populations, the NEPA document prepared for the action, under the scoping section in an environmental impact statement, should specifically state that the proposed project or action was considered during scoping and/or planning and is expected to have either insignificant impact or no impact, direct or indirect, with reasons given."

16.1.1.2 State

California Environmental Quality Act

The California Environmental Quality Act (CEQA) Guidelines require analysis of a proposed project's potential effects on population growth and housing supply. However, CEQA does not require a discussion of socioeconomic effects except where they would result in physical changes, and states that economic or social effects "shall not be treated as significant effects on the environment. An EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes. The intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus of the analysis shall be on the physical changes" (CEQA Guidelines, Section 15131).

16.1.1.3 Local

Sacramento County 2030 General Plan

The *Sacramento County 2030 General Plan* (Sacramento County General Plan) (Sacramento County 2011) includes goals, objectives, and policies related to socioeconomics and environmental justice. Applicable policies include the following:

> **Policy CI-23:** Consider the transit needs of senior, disabled, low-income, and transit-dependent persons in making recommendations regarding transit services.
>
> **Policy LU-45:** Mix affordable housing units with market rate units to the extent feasible, as opposed to building segregated affordable housing developments.
>
> **Policy ED-1:** Achieve complete communities that have enough land capacity to accommodate the development of general commercial, industrial, and office uses which support community needs in all areas of the County.

Policy ED-8: Create plans for new growth areas with a mix of land uses, including a balance of residential and employment (jobs-housing balance) as well as providing for neighborhood-oriented services and diverse commercial amenities to serve a broader portion of the population.

Policy ED-10: Revitalize distressed and aging commercial corridors by developing mixed-use centers and urban villages along corridors to improve community quality of life, optimize economic development, balance land uses, and foster the opportunity to accommodate a portion of the anticipated future growth.

Policy ED-19: Support and encourage the maintenance and growth of commercial agricultural businesses in Sacramento County.

Policy ED-29: Strive to further the County's economic base through cooperative efforts of local businesses and agencies.

Policy ED-34: Identify and attract industries that are consistent with the County's goal of economic vitality and providing a high quality of life.

Policy ED-36: Pursue new developments and businesses that add to the County's economic base, particularly those that generate sales tax and property tax revenue.

Policy ED-37: Assist local firms in the trade and service sectors to expand their existing markets.

Policy ED-38: Identify and recruit new firms that supply or otherwise support businesses already located in the Sacramento area.

2030 Galt General Plan

The *2030 Galt General Plan* (Galt General Plan) (Galt 2009a) includes goals, objectives, and policies related to socioeconomics and environmental justice. Applicable policies include the following:

Policy LU-10.1: Environmental Justice. The City shall ensure the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of land use and environmental laws, regulations, and policies. The City shall ensure that no part of the community suffers disproportionately from adverse human health or environmental effects, and all people live in clean, healthy, and sustainable communities.

Policy LU-10.2: Equal Public Participation. The City shall ensure that all community residents have an opportunity for public participation in the decision-making process.

Policy LU-10.3: Equitable Distribution of New Public Facilities and Services. The City shall plan for the equitable distribution of new public facilities and services that increase and enhance the community's quality of life.

Policy LU-10.4: Location of Industrial Facilities. The City shall provide for the location of industrial facilities and uses that pose a significant hazard to human health and safety in a manner that seeks to avoid proximity to schools or residential dwellings.

Policy ED-4.1: Business Retention and Expansion (BRE) Priority. The City should prioritize local business retention by focusing BRE resources on retaining and expanding those businesses that already serve as significant sources for jobs and/or tax revenue for the City.

Policy C-5.3: ADA Compliance. The City shall consider the transit needs of senior, disabled, minority, low-income, and transit-dependent persons in making decisions regarding transit services and in compliance with the Americans with Disabilities Act.

Rancho Cordova General Plan

The *Rancho Cordova General Plan* (Rancho Cordova General Plan) (Rancho Cordova 2006a) includes goals, objectives, and policies related to the socioeconomics and environmental justice. Applicable policies include the following:

Policy H.1.1: Improve the City's jobs-housing balance through ensuring that housing development in Rancho Cordova provides opportunities for all income levels in order to serve the full range of available and projected jobs in the City.

Policy H.2.1: Encourage private investment to increase property values and resale prices.

Policy H.2.7: Preserve housing units at risk of losing affordability status for units that are subsidized with federal, state, or local funds.

Policy H.7.4: Require non-residential development to provide for the affordable housing needs generated or contributed to by their development.

Policy ED.1.5: Heavy industrial uses should include transitions in intensity, buffers, or other methods to reduce potential impacts on residential uses. Buffers may include land designated for other uses, such as light industry, commercial, or open spaces. The ten-acre minimum parcel size shall apply until the land is zoned to an M-1, M-2, MP, or GC designation.

Policy ED.1.8: Provide a variety of housing types in Rancho Cordova to support a diverse economy, including workforce housing, move-up housing, and executive housing.

Policy ED.7.1: Provide support that makes it attractive and profitable for private sector developers to produce infill development. At the same time, encourage infill development that is attractive to potential residents and beneficial to existing residents.

Policy ED.8.1: Increase the number of jobs that go to Rancho Cordova residents by coordinating economic development efforts with employment placements.

16.1.2 Population and Socioeconomic Conditions in the Planning Area

Information on existing population and socioeconomic conditions in this section is based primarily on data published by the U.S. Census Bureau. The U.S. Census Bureau compiles data by county, city, and census tract. A census tract is a permanent geographic area, typically smaller than a city or county, recognized by the U.S. Census Bureau, to allow the collection and analysis of census data at a more refined geographic scale. Once established, census tract boundaries are rarely changed to support the comparison of census data collected in each tract over time. Census tracts that overlap with the Planning Area are shown in Figure 16-1.

The Planning Area is a geographic boundary unique to this EIS/EIR (see Section 1.1.1). The census tracts used by the Census Bureau do not directly correspond to the boundaries of the Planning Area. Therefore, census tract data was used for tracts that are completely, or mostly, within the Planning Area boundary (see Figure 16-1). Because the census tract boundaries do not exactly correspond to the Planning Area boundary, the population and socioeconomic data provided for the Planning Area should be considered as an estimate based on the best available information.

16.1.2.1 Resident Population Size

All of Sacramento County (County) has approximately 1.4 million residents (Table 16-1). The Planning Area portion of the County has approximately 240,000 residents, with most of those individuals living in unincorporated County areas and the other portion in Galt and Rancho Cordova (Table 16-1).

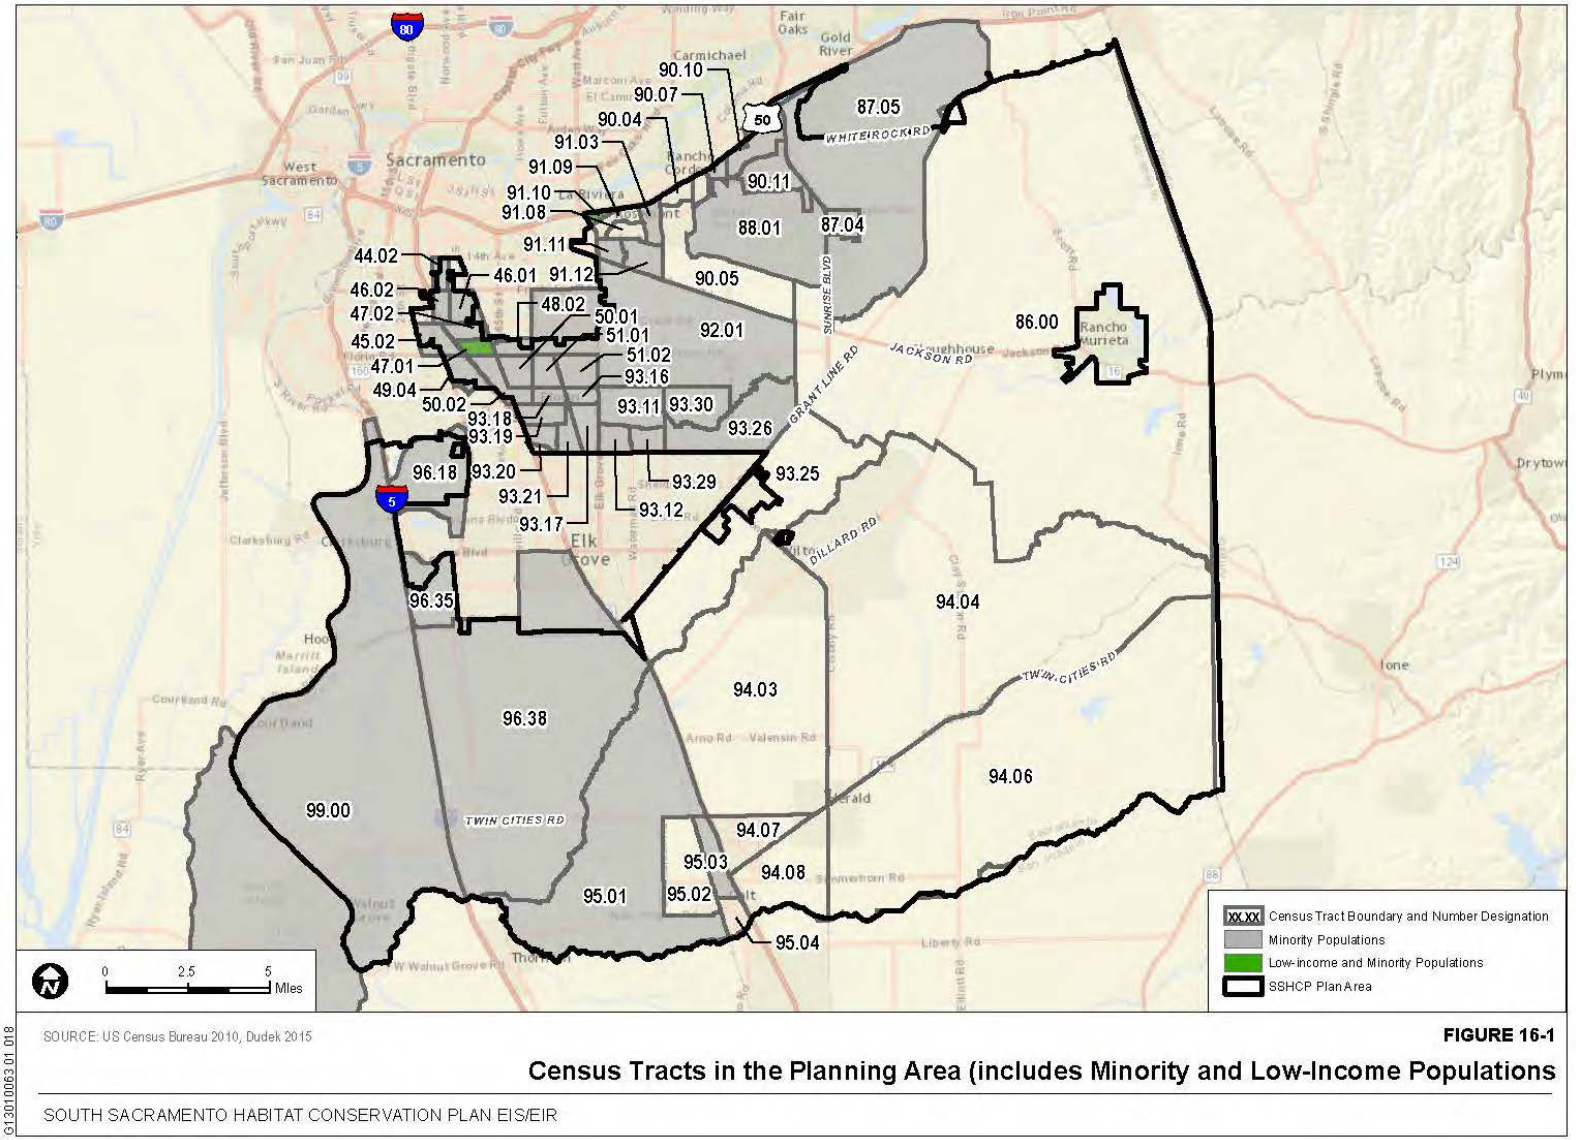

Table 16-1. Existing Populations of the Project Proponents and Inside the Planning Area

Project Proponents with Jurisdiction	Population
Sacramento County	1,435,207
Galt	23,997
Rancho Cordova	66,027
Total for Planning Area*	**242,133**

Source: U.S. Census Bureau 2013a

* Planning Area population was estimated using data from census tracts that were located completely or mostly within the Planning Area and includes Galt and Rancho Cordova and portions of unincorporated Sacramento County.

Figure 16-1 Census Tracts in the Planning Area and Identification of Minority and Low-Income Populations

INTENTIONALLY LEFT BLANK

16.1.2.2 Race and Ethnicity

The term "race" refers to the race categories used by the Census Bureau when collecting data on the U.S. population. The seven race categories used by the Census Bureau are identified in Table 16-2. The Census Bureau also provides individuals the opportunity to identify as Hispanic or Latino, which is an ethnicity or ethnic identity and not a race. A person of any race may also identify as Hispanic or Latino. Hispanic or Latino persons are those of Cuban, Mexican, Puerto Rican, South or Central American, or other Spanish culture or origin. The term "minority" is defined in Section 16.1.1.1. Persons of any race identified by the Census Bureau except for "white alone," and persons identifying as Hispanic or Latino ethnicity are considered a minority. Minorities currently comprise 64.5% of the overall population in the Planning Area, a higher proportion of minority residents relative to the total population in all of Sacramento County (53.1%) (U.S. Census Bureau 2013a). In addition, the Planning Area has a higher proportion of minority residents relative to the overall populations than Galt and Rancho Cordova (48.9% and 47.9%, respectively).

Because individuals can identify as both a race and by Hispanic or Latino ethnicity when providing information to the Census Bureau, there is the potential to count one individual two times when compiling minority population data. In order to show minority populations without double-counting those who identify as both Hispanic or Latino ethnicity and as a particular race on census questionnaires, Table 16-2 shows the percentage of the Planning Area population that identifies themselves as either Hispanic or Latino of any race, or identifies themselves as one or more races not of Hispanic or Latino origin, but does not record any individuals in more than one category.

Within the Planning Area, there is no distinct racial or ethnic majority. In individual census tracts in the Planning Area, 13 out of 52 census tracts have a white majority (not shaded in Table 16-3). Two census tracts have a majority of Hispanic or Latino peoples (shaded in dark grey in Table 16-3). All other census tracts do not have more than 50% of any one racial or ethnic group. Forty census tracts would be considered as minority populations under Executive Order 12898 as "the cumulative percentage of minorities within the affected community is greater than 50 percent." These 40 census tracts are shaded grey in Table 16-3, and as shown in Figure 16-1, are located within Rancho Cordova, portions of Galt, the unincorporated County between the City of Sacramento and Elk Grove, and the area directly south of Elk Grove.

16.1.2.3 Income and Poverty

In 2013, the most recent year for which data is available from the Census Bureau, the nationwide poverty threshold (sometimes referred to as the "poverty line") for a family/household of four people was $23,834 (U.S. Census Bureau 2013b). The median

household income in the County as a whole is well above the poverty line at $55,064; however, 13.4% of families and 17.6% of individuals live below the nationwide poverty line. Most census tracts in the Planning Area have median household incomes above the poverty line. There are two census tracts in the Planning Area with a median household income below the four-person poverty threshold (shaded green in Table 16-4). These are located in unincorporated Sacramento County, near its boundary with the City of Sacramento (see Figure 16-1). These census tracts are also locations where minorities make up more than 50% of the population.

Table 16-2. Race and Ethnicity Population Ratios for the Project Proponent Jurisdictions and Inside the Planning Area (2013)

Place	Hispanic or Latino (of any race)	White Alone	Black or African American Alone	American Indian and Alaska Native Alone	Asian Alone	Native Hawaiian and Other Pacific Islander Alone	Some Other Race Alone	Two or More Races

16.2 ENVIRONMENTAL CONSEQUENCES/ ENVIRONMENTAL IMPACTS

16.2.1 Methodology for Assessing Impacts of Each Alternative on Population and Housing, Socioeconomics, and Environmental Justice

The effects of each EIS/EIR alternative on population and housing, socioeconomics, and environmental justice are described and analyzed qualitatively, as discussed in Section 3.6. The projects and activities expected under each alternative, including expected or conceptual preserves, are described in Chapter 2.

The lead agencies determined that an appropriate geographic study scale for evaluating the effects on population and housing, socioeconomics, and environmental justice of each EIS/EIR alternative is the Planning Area as this is the location where physical changes in the environment resulting from the alternatives could affect these resources. However, as stated in Section 16.1.2, the available data used to support the analysis is sometimes presented for the County as a whole, or by census tract. Therefore, by necessity, the impact analysis considers the data using these geographic boundaries, which, in some cases, extends beyond the boundaries of the Planning Area.

Potential effects from each alternative were analyzed based on the best available information about types and locations of new urban development projects and activities. The impact analyses incorporate by reference relevant impact analyses from the three planning documents and the EIRs discussed Section 3.4.

Environmental justice effects are evaluated using the guidance, methodology, and definitions established by Executive Order 12898, and by the Council on Environmental Quality publications and guidance documents identified in Section 16.1.1. Topics considered under the environmental justice analysis include all the resource topics analyzed in this EIS/EIR (see Section 3.2).

The first step of an environmental justice analysis includes identifying areas where a minority or low-income population exists within the Planning Area. Using census tracts, which are the smallest geographic unit available for this kind of data, these areas were identified using the following criteria:

- The cumulative percentage of minorities within a census tract is greater than 50%; or
- The median household income for a census tract is below the national poverty line established by the Census Bureau (U.S. Census Bureau 2013b).

The second step of an environmental justice analysis requires the identification of a “high and adverse” human health, economic, social, and/or environmental effect. The Council on

Environmental Quality indicates that when determining whether the effects are high and adverse, federal agencies are to consider whether the risks or rates of impact on the human environment "are significant or above generally accepted norms" (CEQ 1997). Typically, a significant adverse effect identified in a NEPA document is treated as a high and adverse effect in an environmental justice analysis.

The final step of an environmental justice analysis requires a finding on whether a minority or low-income population is disproportionately affected by a high and adverse effect. A high and adverse effect is considered to disproportionately affect a minority or low-income population if the effect on that population appreciably exceeds the overall effect, risk of effect, or rate of effect to the general population (CEQ 1997).

Cumulative effects are analyzed consistent with the methodology described in Section 3.7 and consider whether the incremental effects of the alternative on population and housing, socioeconomics, and environmental justice would be significant (i.e., cumulatively considerable).

As discussed in Section 3.4, the EIR documents previously prepared for the General Plans of Sacramento County, Galt, and Rancho Cordova (Galt 2009b; Rancho Cordova 2006b; Sacramento County 2010) analyzed direct and cumulative impacts of urban growth planned within each jurisdiction, including effects to population and housing. When the impact analysis or conclusions provided in these General Plan EIR documents were determined by the lead agencies to be appropriate for use in the analysis of the EIS/EIR alternatives, a brief summary or description of the incorporated information or analysis is provided below. As described further in Section 16.2.1.1, these EIRs, being CEQA documents, did not include an analysis of environmental justice. The evaluation of environmental justice is a NEPA requirement.

16.2.1.1 Determination of Impact Significance

As discussed in Section 3.8.1, the criteria used to evaluate the significance of each alternative's effects on population and housing, on socioeconomics, or on environmental justice are based on Appendix G of the CEQA Guidelines, and on typical thresholds used to evaluate effects to population and housing in recent EIRs prepared by Sacramento County, and typical thresholds used to evaluate effects on socioeconomics and environmental justice in similar EIS/EIRs for habitat conservation plans. Based on these sources, a significant adverse effect could occur if the alternative would:

1. Displace substantial numbers of residences in the Planning Area;
2. Create a substantial demand for additional housing that could not be sustained within the Planning Area;
3. Substantially displace or disrupt businesses;
4. Substantially reduce property tax revenue;

5. Cause a disproportionately high and adverse human health, economic, social, or environmental impact on a minority population; or
6. Cause a disproportionately high and adverse human health, economic, social, or environmental impact on a low-income population.

Appendix G of the CEQA Guidelines does not provide suggested criteria for evaluating a beneficial effect. The following criteria were developed by the lead agencies. A beneficial effect could occur if the alternative would:

1. Displace fewer residences in the Planning Area compared to a baseline environmental condition;
2. Alleviate or reduce an unsustainable housing demand within the Planning Area;
3. Displace fewer businesses, or result in less disruption to businesses compared to a baseline environmental condition;
4. Result in less of a reduction in property tax revenue, or increase property tax revenue, compared to a baseline environmental condition; or
5. Reduce or eliminate a disproportionately high and adverse human health, economic, social, or environmental impact on minority or low-income populations compared to a baseline environmental condition.

The impact analysis for the three EIS/EIR alternatives will consider the context, intensity, and severity of potential effects to population and housing, socioeconomics, and environmental justice, and will present a determination of significance applicable to each of these criteria.

16.2.2 No Action/No Project Alternative

The No Action/No Project Alternative is described in Section 2.2.1 of Chapter 2.

16.2.2.1 Direct and Indirect Effects of the Alternative

Much of the future urban development included in the No Action/No Project Alternative is described in the General Plans of Sacramento County, Galt, and Rancho Cordova (see Section 2.2.1).

Under the No Action/No Project Alternative, grazing land and farmland would be converted to developed land uses. These changes would be accompanied by a transition of jobs and tax revenues from grazing and farming uses to jobs and tax revenues from urban uses. Many of the activities would also result in temporary increases in construction-related employment. Although this is expected to result in an overall benefit to employment and tax revenues, there could be a decline in the businesses associated with agricultural activity.

Under the No Action/No Project Alternative individual urban development projects would continue to provide mitigation to offset effects to listed species, wetlands, and other regulated

natural resources. Mitigation for unavoidable effects to listed species, wetlands, and other regulated natural resources would continue to occur through purchasing credits at a mitigation or conservation bank approved by the applicable regulatory agencies (e.g., U.S. Army Corps of Engineers and/or U.S. Fish and Wildlife Service), when project proponents pay into an existing Clean Water Act (CWA) 404 in-lieu fee program, provide on-site project proponent responsible mitigation, or provide off-site project proponent responsible mitigation (see Sections 2.2.1 and 2.2.2). The CWA 404 in-lieu fee program would need to meet the requirements of the 2008 CWA Compensatory Mitigation Rule. Once the program is established, the in-lieu fee program Implementing Entity would collect funds from project proponents when their projects result in fill of aquatic resources. The funds would then be used by the Implementing Entity to complete required compensatory mitigation (i.e., wetland re-establishment and establishment).

Biological mitigation activities expected under the No Action/No Project Alternative (described in more detail in Section 2.2) are expected to maintain existing land uses, such as continuing grazing or crop production on a mitigation preserve, consistent with existing wildlife habitat on the site. However, farmland could be purchased for a mitigation preserve and a portion converted to wetland or riparian habitat. The labor required to implement re-establishment/ establishment of aquatic resources and aquatic habitat would have short-term economic value. However, once the farmland is converted to another land cover, the labor force needed to operate the remaining farmland could be reduced. Tax revenues could decline because farmland acres could be taken out of production. However, only a relatively small portion of existing farmland in the Planning Area would be taken out of production to support establishment of mitigation preserves. It is more likely that mitigation preserves would be established on properties with lower land values, such as grazing lands. Mitigation preserves for habitats such as vernal pools can continue to support grazing operations, and therefore maintain employment and tax revenues at similar levels and prevent socioeconomic effects.

As discussed in Section 16.1.2, minority individuals make up more than 50% of the total population in many portions of the County, especially within the Urban Development Area (UDA).[1] As seen on Figure 16-1, minority communities reside in the Planning Area within Rancho Cordova, portions of Galt, the unincorporated County between the City of Sacramento and Elk Grove, and the area directly south of Elk Grove. Only two census tracts have a median household income below the poverty line. These are also communities where minorities make up more than 50% of the population.

[1] As discussed in Section 1.1.1, the term Urban Development Area (UDA) is used by the EIS/EIR to discuss all lands where urban development Covered Activity projects or activities could occur under the action alternatives. Therefore, the term "UDA" means all lands within the County's Urban Service Boundary that are also within the Planning Area (including lands within the Rancho Cordova city limits that are within the Planning Area), all lands within Galt's city limits, and all lands within Galt's sphere of influence (see Figure 1-1).

As explained in Section 2.2.2, the regulatory environment of the No Action/No Project Alternative is expected to restrict the ability of local agencies to permit approximately 1,900 acres of future urban development in the Mather Core Recovery Area (MCRA), and this future development would be shifted or displaced to one or more of the areas of undeveloped land outside of the Urban Service Boundary (USB). This development would occur in areas not currently considered as low-income or minority.

Although some urban development would be shifted or displaced from the MCRA to other locations under the No Action/No Project Alternative, the alternative includes a sufficient amount of urban development and associated infrastructure to meet the development objectives ultimately planned/contemplated in the adopted general plans of Sacramento County, Galt, and Rancho Cordova. Therefore, implementation of the No Action/No Project Alternative would not be an impediment to meeting current or future residential development needs.

The No Action/No Project Alternative could have various adverse effects on human health and the environment, as identified in the No Action/No Project Alternative impact discussions in Chapters 4 through 15 of this EIS/EIR. As discussed in Section 16.2.1, resource topics considered under this environmental justice analysis includes all the resource topics analyzed in this EIS/EIR (see Section 3.2). New urban development is planned for areas that intersect where minority and low-income populations reside and with that development comes both the potential for effects on human health and the environment as well as beneficial effects resulting from the proximity of urban services, parks, schools, employment opportunities, and transit. In addition, minority populations are spread across multiple locations in the planning area, indicating that minority populations are not concentrated in particular locations where they are disproportionately exposed to high and adverse human health, economic, social, and or environmental effects. Furthermore, the County and city general plans include policies that consider low-income and minority populations.

Preserves and other activities that would be implemented to mitigate for the negative effects of urban development, typically do not negatively impact human populations. Mitigation preserves provide for natural areas that could have a beneficial effect on individuals living or working near a preserve. Beneficial effects of mitigation preserves could include recreation opportunities, visual relief from urban development, and enjoyment of nature. Benefits of trails and some other positive preserve externalities are discussed in Chapter 12. Under the No Action/No Project Alternative, some mitigation preserves would be included in the UDA as projects are developed and some projects would include on-site preserves as mitigation. This would provide a beneficial effect as these mitigation preserves would be created within the UDA where many of the low-income and minority communities reside. The locations of off-site preserves would be dependent on the type of habitat mitigation required and available land.

The potential effects related to population and housing were analyzed in the general plan EIRs for the County and the cities. As discussed in Section 16.2.1, the relevant conclusions from each of these general plan EIRs are summarized below and incorporated into the analysis of the No Action/No Project Alternative.

The impact analysis presented in the *Sacramento County General Plan Update Final EIR* (Sacramento County 2010), determined that within Sacramento County:

- Impacts associated with division or disruption of an established community and displacement of housing, were considered to be less than significant (Sacramento County 2010, pp. 1-2, 3-60, 3-61, 3-72, 3-76 to 3-78).[2]

The impact analysis presented in the *City of Galt General Plan Update: 2030 Final EIR* (Galt 2009b), determined that within Galt:

- Impacts to social or economic impacts were not found to have a physical impact on the environment nor would the changes in the environment result in adverse impacts on social or economic concerns (Galt 2009b, pp. 6-10 and 7-1).

The impact analysis presented in the *City of Rancho Cordova General Plan Final EIR* (Rancho Cordova 2006b), determined that within Rancho Cordova:

- Impacts potentially contributing to a substantial displacement of housing units or people as a result of implementation of the General Plan were found to be less than significant (Rancho Cordova 2006b, p. 4.3-14).

As discussed in Section 3.4, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009b), in 2030 (Rancho Cordova 2006b), and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Therefore, additional urban development can be expected to occur within Galt, Rancho Cordova, and Sacramento County in the years after each General Plan EIR study period ends, but before this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, when determining the significance of each impact described in the EIS/EIR, the lead agencies considered the impact analysis and the conclusions incorporated by reference

[2] The Sacramento County General Plan EIR analyzed development within a designated "Jackson Highway Corridor New Growth Area" that was not a part of the alternative ultimately selected by the County. However, the County is currently processing Master Plans in the Jackson Highway Corridor, so the referenced conclusions are relevant to the No Action/No Project Alternative.

from the General Plan EIRs, along with the effects of all urban development activities and projects that are included in the description of each EIS/EIR alternative.

The above EIRs, being CEQA documents, did not include an analysis of environmental justice and whether the general plans would result in a disproportionately high and adverse effect on minority or low-income populations. Each of the general plans includes policies that would reduce effects to minority or low-income populations, such as considering low-income populations for transit and housing; providing for affordable housing units; ensuring most residential units are close to amenities; and reducing incompatibilities associated with land use, noise, air quality, and other potential conflicts. Galt included a specific section in the city's general plan to address fair treatment of all persons in the city with an emphasis on ensuring no part of the community "suffers disproportionately from adverse human health or environmental effects" (Galt 2009a, Land Use Element, p. LU-21).

The general plan EIRs also did not address tax revenue or business displacement. However, each of the general plans includes policies that would reduce negative effects to businesses and revenue, including protecting farmland and agricultural uses, addressing property and sales taxes, business retention and attraction, economic development, urban revitalization, and other relevant topics.

16.2.2.2 Cumulative Effects of the Alternative

Past and present urban development projects in Sacramento County and the Planning Area have resulted in the existing population and housing, socioeconomic, and environmental justice conditions described in Section 16.1.2. There are only two census tracts in the planning area identified as containing a low-income population. There are multiple census tracts supporting minority populations. These minority populations are spread across multiple locations in the planning area, indicating that minority populations are not concentrated in any particular location where they are disproportionately exposed to high and adverse human health, economic, social, and or environmental effects. These conditions indicate that there is not an existing significant adverse cumulative environmental justice impact in the Planning Area. There is also no indication of substantial displacements of housing or businesses or other adverse populations and housing effects.

The types of future reasonably foreseeable "other" projects, activities, and actions, described in Section 3.7.2, are similar to the types of past and present actions that have occurred in the Planning Area. The other reasonably foreseeable future actions in the Planning area (see Section 3.7.2) that were not included in the Section 2.2.2 description of the No Action/No Project Alternative include additional new urban development in the Elk Grove sphere of influence and in Rancho Murieta, development of the Wilton Rancheria Casino, master planned

developments inside the UDA named Rio Del Oro and Mather South, further rural residential development outside the UDA, continued urban development of cultivated agricultural lands, major infrastructure projects such as California High-Speed Rail and the California WaterFix, and expansion of the existing National Wild Refuge and the Cosumnes River Preserve (see Section 3.7.2). Population and housing effects from these foreseeable other projects were generally included in the analysis of impacts incorporated from the General Plan EIRs. These General Plan EIRs identified less-than-significant adverse effects related to population and housing. When considered together, the effects of the past, present, and foreseeable other projects on population and housing within this Planning Area are not a significant cumulative impact.

The regional scale analysis provided in the Sacramento Area Council of Governments *2016 Metropolitan Transportation Plan/Sustainable Communities Strategy* (the 2016 MTP/SCS) (SACOG 2016a) (described in Section 3.4.4) provides relevant information for evaluating the cumulative effects of the No Action/No Project Alternative. The 2016 MTP/SCS plans for future transportation projects while considering expected development and population growth in the region. The *Final Environmental Impact Report for the 2016 Metropolitan Transportation Plan/Sustainable Communities Strategy* (MTP/SCS EIR) (SACOG 2016b) found that there would be a less-than-significant effect from implementation of the MTP/SCS on population and housing.

Similar to the General Plan EIRs, the MTP/SCS EIR did not include an analysis on environmental justice or socioeconomics. However, the 2016 MTP/SCS itself did include an analysis of environmental justice (SACOG 2016a). Chapter 8 of the 2016 MTP/SCS discusses how low-income and minority residents were considered in the planning effort, and how the 2016 MTP/SCS would serve those residents. The 2016 MTP/SCS found that 62% of the low income and minority populations lived in transit priority areas and 82% of the jobs were in the transit priority areas, providing minority, and low-income residents with greater opportunities to live and/or work near quality transit and provides for more access to parks and higher education. This supports a conclusion that the combination of past, present, and reasonably foreseeable future projects do not represent a significant cumulative effect on environmental justice.

As discussed in Section 16.2.2.1, the incremental direct and indirect effects of the No Action/No Project Alternative would not have an adverse effect on population and housing, socioeconomics, or environmental justice. Therefore, when the incremental effects of the No Action/No Project Alternative are viewed in connection with the effects of the past projects, current projects, and the effects of foreseeable other actions, the effects of the No Action/No Project Alternative would not cause, or make a considerable contribution, to a significant adverse cumulative effect on population and housing, socioeconomics, or environmental justice. The No Action/No Project Alternative would result in a ***Less Than Significant Adverse Cumulative*** effect to population and housing, socioeconomics, and environmental justice.

16.2.3 Proposed Action/Proposed Project

16.2.3.1 Direct and Indirect Effects of the Alternative

As described in Section 2.3.3, the Proposed Action/Proposed Project Covered Activities include types and intensities of urban development similar to those anticipated under the No Action/No Project Alternative.

Under the Proposed Action/Proposed Project Alternative, urban development would not be shifted or displaced to areas outside of the current Sacramento County USB boundary (Figure 1-1). As described in Section 16.2.2.1, this displacement was shown to not have a negative effect on population and housing, socioeconomics, or environmental justice under the No Action/No Project Alternative. Therefore, impacts as a result of urban development Covered Activities under the Proposed Action/Proposed Project Alternative, which do not include the shifted/displaced development, would be largely the same as those described for urban development under the No Action/No Project Alternative. In addition, like the No Action/No Project Alternative, the Proposed Action/Proposed Project Alternative includes a sufficient amount of urban development and associated infrastructure to meet the development objectives planned/contemplated in the adopted general plans of Sacramento County, Galt, and Rancho Cordova. Therefore, the Proposed Action/Proposed Project Alternative would not be an impediment to meeting current or future residential development needs. Because of the lack of significant adverse population and housing, socioeconomic, and environmental justice impacts from urban development under both the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative, and the overall similarity in effects across both alternatives, there would be ***No Impact*** from the Proposed Action/Proposed Project Alternative relative to the impacts expected under the No Action/No Project Alternative baseline condition.

As discussed in Section 2.3.5, the Proposed Action/Proposed Project Alternative would include the establishment of an interconnected SSHCP Preserve System in the Planning Area, which includes a comprehensive preserve management program that would be implemented in perpetuity. The Preserve System under the Proposed Action/Proposed Project Alternative would be more contiguous and more connected than the mitigation preserves established under the project-by-project regulatory approval process of the No Action/No Project Alternative. The SSHCP Preserve System and Preserve management activities would not have substantial negative impacts on population and housing, socioeconomics, or environmental justice, similar to what was described for the No Action/No Project Alternative. Benefits provided by access to preserves by minority and low-income populations could be slightly greater under the No Action/No Project Alternative because more numerous but less connected preserves are expected to be located in the UDA, closer to census tracts with

minority or low-income populations. Because the large landscape-level preserves would occur outside the UDA under the Proposed Action/Proposed Project Alternative, the benefits to minority and low-income populations could be slightly less because of greater distance between some preserves and these populations. However, this does not constitute a high and adverse effect on minority or low-income populations. Overall, because of the lack of significant adverse population and housing, socioeconomic, and environmental justice impacts from Preserve System establishment and operation under both the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative, and the overall similarity in effects of the Proposed Action/Proposed Project Alternative and the No Action/No Project Alternative, there would be ***No Impact*** when comparing the urban development under the Proposed Action/Proposed Project Alternative to the No Action/No Project Alternative baseline condition.

16.2.3.2 Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Proposed Action/Proposed Project Alternative would:

- Result in similar population and housing impacts;
- Result in similar socioeconomic impacts; and
- Result in similar environmental justice impacts.

Therefore, after considering the significance of effects from the Proposed Action/Proposed Alternative on population and housing, socioeconomics, and environmental justice, the Proposed Action/Proposed Project Alternative would result in ***No Impact*** when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

16.2.3.3 Cumulative Effects of the Alternative

The effects of past, present, and reasonably foreseeable other projects on population and housing, socioeconomics, and environmental justice were described in Section 16.2.2.2, and there is no significant adverse cumulative effect on these issue areas existing in Sacramento County or the Planning Area. As discussed in Section 16.2.2.2, the incremental effects of the No Action/No Project Alternative were determined to be less than significant (individually limited) and not cumulatively considerable, when viewed in connection with the effects of the past projects, other current projects, and the foreseeable other projects.

As identified in Sections 16.2.3.1 and 16.2.3.2, the incremental direct and indirect effects on population and housing, socioeconomics, and environmental justice under the Proposed Action/Proposed Project Alternative are similar to the incremental effects of the No Action/No Project Alternative. Therefore, the Proposed Action/Proposed Project Alternative would result

in no impact when compared to the effects that would occur under the No Action/No Project Alternative baseline condition. Therefore, the incremental effects of Proposed Action/Proposed Project Alternative are individually limited, and do not result in a contribution to an existing cumulative effect. The Proposed Action/Proposed Project Alternative would result in ***No Cumulative Impact*** to population and housing, socioeconomics, and environmental justice, compared to the effects under the No Action/No Project Alternative baseline condition.

16.2.4 Reduced Permit Term

The Reduced Permit Term Alternative would include the same types of new urban development and infrastructure projects and activities as those anticipated under the No Action/No Project Alternative.

Under the Reduced Permit Term Alternative, the core of the Preserve System located inside the UDA would be associated with the development of five large Master Plans, as discussed in Chapter 2 for the Reduced Permit Term Alternative and for the Proposed Action/Proposed Project Alternative. Because the core of the Preserve System inside the UDA under both EIS/EIR action alternatives is associated with the same five large Master Plans, approximately 70% of the UDA preserves established under the Reduced Permit Term Alternative would have similar sizes, boundaries, and locations as the UDA preserves established under the Proposed Action/Proposed Project Alternative. However, the shorter duration of the Reduced Permit Term Alternative—and the smaller amount of urban development and associated development fees collected by the Reduced Permit Term Alternative—would not allow the Habitat Conservation Plan's (HCP's) Implementing Entity to establish as many acres of new preserves in the Planning Area as would occur under the Proposed Action/Proposed Project Alternative's 50-year permit term. Therefore, fewer new preserves would be established under the Conservation Strategy of the Reduced Permit Term Alternative. This difference would be especially pronounced outside the UDA.

As described in Section 2.4, the federal and state Environmental Species Act Incidental Take Permits and the CWA permit strategy for future SSHCP Covered Activities would be valid only during the 30-year permit term of the Reduced Permit Term Alternative, and the Reduced Permit Term Alternative's Conservation Strategy would be implemented only during this 30-year term. The urban development Covered Activities and conservation strategies associated with the five Master Plans would be implemented inside the UDA during this 30-year period. However, the EIS/EIR uses a 50-year analysis study period to evaluate all alternatives (see Section 3.6.3), so the EIS/EIR study period extends beyond the end of the 30-year permit term for the Reduced Permit Term Alternative. Therefore, as described in Section 3.6.7.2, the EIS/EIR analysis of the Reduced Permit Term Alternative also considers future urban development that is not part of the project description of the

Reduced Permit Term Alternative, but is still expected to occur within the Planning Area after the end of the permit term (i.e., in Years 31–50 of the EIS/EIR Study Period).

As described in Section 3.6.7.2, project mitigation preserves established after the end of the 30-year Reduced Permit Term Alternative would be established under a project-by-project process for obtaining individual authorizations under the CWA, federal and state Environmental Species Acts, and Section 1600 of the California Fish and Game Code. Consequently, mitigation preserves established in Years 31–50 of the EIS/EIR study period would not be established using a regional, landscape-based approach that balances new urban development with the need for conservation, as would be provided by an HCP. Therefore, much of the Preserve System inside the UDA would be very similar under the two action alternatives, but the Preserve System outside the UDA would be substantially different between the Reduced Permit Term Alternative and the Proposed Action/Proposed Project Alternative. Under the Reduced Permit Term Alternative, it is unlikely that mitigation preserves established outside the UDA would be contiguous or would be interconnected, and it is unlikely that a large, contiguous 10,500-acre landscape-size vernal pool preserve would be established in the southwestern portion of the Planning Area. Likewise, the No Action/No Project Alterative also would not result in contiguous, interconnected preserves outside the UDA, and would not establish a 10,500-acre vernal-pool preserve in the Planning Area. In these ways, the new mitigation preserves established outside the UDA under the Reduced Permit Term Alternative and the No Action/No Project Alternative would be similar.

16.2.4.1 Direct and Indirect Effects of the Alternative

The Reduced Permit Term Alternative includes types of urban development similar to those anticipated under the No Action/No Project Alternative. However, the Reduced Permit Term Alternative does not include the regulatory requirements within the MCRA portion of the UDA, as expected under the No Action/No Project Alternative (refer to Section 2.2.2). Therefore, future urban development within the MCRA under the Reduced Permit Term Alternative would be implemented consistent with the Sacramento County and Rancho Cordova General Plans, without development being displaced or shifted to locations outside the USB. As described in Section 16.2.2.1 for the No Action/No Project Alternative (where urban development would be shifted or displaced outside the USB), and as described in Section 16.2.3.1 for the Proposed Action/Proposed Project (where all urban development occurs within the USB), the Reduced Permit Term Alternative is expected to have no significant adverse effects on population and housing, socioeconomics, or environmental justice. Because of the lack of significant adverse population and housing, socioeconomic, and environmental justice effects from urban development under both the Reduced Permit Term Alternative and the No Action/No Project Alternative, and the overall similarity in effects in both alternatives, there would be ***No Impact***

of the Reduced Permit Term when comparing the impacts of the Reduced Permit Term Alternative to the No Action/No Project Alternative baseline condition.

The Reduced Permit Term Alternative includes a consolidated and interconnected Preserve System, which would be established during the 30-year permit term, and a comprehensive preserve management program to be implemented in perpetuity. The Preserve System established during the 30-year permit term under the Reduced Permit Term Alternative would be smaller than the SSHCP Preserve System that would be established under the Proposed Action/Proposed Project Alternative, especially outside the UDA. As described in Section 2.4.5, the interconnected Preserve System established during the 30-year permit term of the Reduced Permit Term Alternative would remain intact. However, future mitigation required of new urban development implemented after the end of the permit term would not be established in an organized, consolidated manner, as would occur under the No Action/No Project Alternative.

As described in Section 16.2.2.1 for the No Action/No Project Alternative, and in Section 16.2.3.1 for the Proposed Action/Proposed Project Alternative, the preserves established under both of these alternatives would not result in significant adverse effects on population and housing, on socioeconomics, or on environmental justice. Therefore, the Preserve System established under the Reduced Permit Term Alternative, which would reflect elements of both the No Action/No Project Alternative and the Proposed Action/Proposed Project Alternatives, also would not result in significant adverse effects on population and housing, socioeconomics, or environmental justice. Because the establishment and operation of preserves under Reduced Permit Term Alternative and under the No Action/No Project Alternative would not impact population and housing, socioeconomic, and environmental justice, there would be ***No Impact*** of the Reduced Permit Term Alternative when compared to the No Action/No Project Alternative baseline condition.

16.2.4.2 Significance of Direct and Indirect Effects

In summary, when compared to the No Action/No Project Alternative baseline condition, the Reduced Permit Term Alternative would:

- Result in similar population and housing impacts;
- Result in similar socioeconomic impacts; and
- Result in similar environmental justice impacts.

Therefore, after considering the significance of impacts of the Reduced Permit Term Alternative on population and housing, socioeconomics, and environmental justice, the Reduced Permit

Term Alternative would result in ***No Impact,*** when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition.

16.2.4.3 Cumulative Effects of the Alternative

The effects of past, present, and reasonably foreseeable other projects on population and housing, socioeconomics, and environmental justice were described in Section 16.2.2.2, which determined that there is no significant adverse cumulative effects on these issue areas in Sacramento County or the Planning Area. As discussed, the incremental effects of the No Action/No Project Alternative were determined to be less than significant and not cumulatively considerable, when viewed in connection with the effects of the past, present, and foreseeable other projects.

As identified in Sections 16.2.4.1 and 16.2.4.2, the direct and indirect effects on population and housing, socioeconomics, and environmental justice under the Reduced Permit Term Alternative are similar to the effects under the No Action/No Project Alternative. The similarities in direct and indirect effects are sufficient to conclude that the Reduced Permit Term Alternative would result in No Impact when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition. Consequently, the incremental contribution of the Reduced Permit Term Alternative to cumulative effects on population and housing, socioeconomics, and environmental justice would also be similar to the No Action/No Project Alternative. Therefore, the Reduced Permit Term Alternative does not result in a cumulatively considerable (i.e., significant) contribution to cumulative impacts on population and housing, socioeconomics, and environmental justice. The Reduced Permit Term Alternative would result in ***No Cumulative Impact*** to population and housing, socioeconomics, and environmental justice compared to the No Action/No Project Alternative baseline condition.

CHAPTER 17 – OTHER REQUIRED ANALYSES FOR CEQA AND NEPA

The California Environmental Quality Act (CEQA) and the National Environmental Protection Act (NEPA) require that Environmental Impact Reports (EIRs) prepared under CEQA and Environmental Impact Statements (EISs) prepared under NEPA include certain analyses, in addition to the analyses already presented in the preceding EIS/EIR resource chapters.

The additional analyses required under NEPA and CEQA are in many cases similar; therefore, the additional NEPA and CEQA required analyses presented in this chapter are combined, where appropriate.

17.1 SIGNIFICANT EFFECTS THAT CANNOT BE AVOIDED (CEQA AND NEPA)

Section 15126.2(b) of the CEQA Guidelines requires that an EIR describe any significant impacts that cannot be avoided or minimized to a less-than-significant level with the implementation of feasible mitigation measures. Similarly, Section 40 CFR 1502.16 of the Council on Environmental Quality's NEPA regulations requires an EIS to discuss and disclose any adverse environmental effects that cannot be avoided.

The Executive Summary and Chapters 4 through 16 of this EIS/EIR provide a comprehensive identification of the significant environmental effects of the action alternatives, including the level of significance after mitigation (if needed). When compared to the No Action/No Project baseline condition, there are no significant and unavoidable project-specific or cumulative impacts to any environmental resource studied in the EIS/EIR, for either action alternative.

17.2 POTENTIALLY SIGNIFICANT EFFECTS WHICH COULD BE AVOIDED (CEQA)

Chapters 4 through 16 of this EIS/EIR provide a comprehensive identification and evaluation of the environmental impacts for the Proposed Action/Proposed Project Alternative and Reduced Permit Term Alternative. Cumulative impacts are also evaluated in Chapters 4 through 16, following the approach outlined in Section 3.4 of this EIS/EIR. Each impact included in this EIS/EIR is also listed in the Executive Summary. As compared to the No Action/No Project baseline condition, there are no project-specific or cumulative impacts requiring mitigation for either action alternative.

17.3 EFFECTS FOUND NOT TO BE SIGNIFICANT (CEQA)

The EIS/EIR identified no significant effects for either action alternative, relative to the effects expected under the No Action/No Project baseline condition, for any resource topic studied in Chapters 4 through 16 of the EIS/EIR, including each of the following chapter topics:

- Land Use
- Soils, Geology, and Mineral Resources
- Agriculture
- Hydrology and Water Quality
- Natural Communities, Land Cover Habitat Types, and Common Plant and Animal Species
- Special-Status Species, Including HCP Covered Species
- Aquatic Resources
- Paleontological, Cultural, and Historical Resources
- Public Services and Facilities
- Traffic and Circulation
- Air Quality
- Greenhouse Gases and Climate Change
- Population and Housing, Socioeconomics, and Environmental Justice

17.4 RELATIONSHIP BETWEEN SHORT-TERM USES OF THE ENVIRONMENT AND THE MAINTENANCE AND ENHANCEMENT OF LONG-TERM PRODUCTIVITY (NEPA)

In accordance with NEPA (42 U.S.C. 4332) and NEPA regulations (40 CFR 1502.16 and 43 CFR 46.415), an EIS must include a discussion of the relationship between the short-term uses of man's environment and the maintenance and enhancement of long-term productivity.

This information is provided in each EIS because the agency decision-maker and members of the public must have a clear sense of what they are gaining or losing in the short term, and in the long term. The terms "short term" and "long term" are defined differently for each EIS and each resource area, taking into account the scope of the proposed alternatives and resource-specific information. Therefore, each resource studied has its own definitions of "short term" and "long term" (Freeman 1992). For example, "long term" would be quite different for a project within eastern vs. western U.S. forests—eastern forests can grow to maturity in 80 to 100 years, but western forests would take two or three times as long to reach maturity.

For this EIS, short-term uses of the environment would be those occurring during construction of urban development and other project types described in Sections 2.2.1, 2.3.3, and 2.4.3 of this EIS/EIR. Most of the activities analyzed in the EIS/EIR would have an impact on long-term productivity, either of the built environment or the natural or agricultural environment. In this way, construction of a commercial or residential structure would be a short-term use of the environment, but the occupation of that structure and the removal of natural land cover types by urban development would affect long-term productivity.

In the short-term, a wide range of urban development and infrastructure projects would be constructed under the environmental commitments and requirements of the action alternatives. Urban development under the action alternatives would be as envisioned in the General Plans of Sacramento County, Galt, and Rancho Cordova. These plans consider both short-term uses of the environment as well as long-term maintenance of the built environment like transportation or water infrastructure. As such, the local short-term impacts and use of resources by the action alternatives are consistent with the maintenance and enhancement of long-term productivity of the built environment.

Although some urban development and infrastructure projects would result in a loss of habitat, take of sensitive species, increased air emissions, transportation impacts, as well as other impacts described in Chapters 4 through 16 of this EIS/EIR, these activities would be undertaken pursuant to a Habitat Conservation Plan (HCP). A conservation strategy is included in each action alternative, and is designed to ensure that the long-term productivity in the Planning Area is maintained, even with the short-term uses of the environment that would occur from implementing the Covered Activities of either action alternative. The two action alternatives (Sections 2.3.5 and 2.4.5) include a regional conservation strategy to avoid, minimize, and mitigate for impacts on sensitive species, natural communities, wetlands and waters, and balance environmental and economic development needs on a regional and landscape scale. Implementation of the HCP's comprehensive and balanced approach to natural resource preservation would provide a greater level of landscape- and watershed-scale protection of natural resources than would be possible under the No Action/No Project Alternative's project-by-project individual authorizations under the U.S. Endangered Species Act, California Endangered Species Act, Clean Water Act Sections 404 and 401, and the California Fish and Game Code 1600 programs. The two action alternatives also include "get ahead and stay ahead" provisions for preservation of lands to ensure that the long-term conservation and enhancement measures are in place before the short-term impacts of Covered Activities occur.

17.5 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES (NEPA)/SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES (CEQA)

The CEQA Guidelines (Section 15126.2(c)) mandate EIRs discuss any significant irreversible environmental effects that would be caused by a proposed project. The analysis required under this section must consider whether the project would have primary and secondary impacts that would generally commit future generations to similar uses, involve a large commitment of nonrenewable resources, unjustifiably consume resources (i.e., use energy or water wastefully), or involve the uses in which irreversible damage could result from any potential accidents associated with the project.

In accordance with NEPA Section 102 (42 U.S.C. 4332) and NEPA regulations, an EIS must discuss any irreversible or irretrievable commitment of resources that would be involved in the proposed project, should it be implemented (40 CFR 1502.16, 43 CFR 46.415). In general, "irreversible" commitments of resources are those that cannot be reversed, and "irretrievable" commitment of resources are those that are lost for a period of time. Examples of irreversible commitments include the extinction of a species, the mining of ore, and use of fossil fuels. An example of an irretrievable comment is the establishment of a utility right-of-way where timber productivity on the right-of-way is lost over the time that the right-of-way remains (Freeman 1992). Furthermore, this regulation specifically requires each EIS to discuss the energy requirements and energy conservation potential for each alternative, including mitigation measures (40 CFR 1502.16(e)). Likewise, each EIS must discuss the natural resource and depletable resource requirements of each alternative, and discuss the potential of each alternative to conserve natural and depletable resources, including mitigation measures (40 CFR 1502.16(f)).

Irreversible environmental changes attributable to planned urban development were analyzed in the following sections of the three General Plan EIRs discussed in Section 3.4:

- Chapter 12, Section 12.4, Significant Irreversible Environmental Changes, in the *Galt General Plan Update: 2030 Final Environmental Impact Report* (Galt 2008)
- Chapter 7, Section 7.2 7, Significant Irreversible Environmental Effects, in the *City of Rancho Cordova General Plan Final EIR* (Rancho Cordova 2006b)
- Chapter 17, Irreversible Environmental Changes, in the *Sacramento County General Plan Update Final EIR* (Sacramento County 2010)

The three General Plan EIRs analyzed the potential for urban development to result in the permanent conversion of currently undeveloped open space and agricultural land areas to become residential, commercial, industrial, office, public, and recreational land covers. All three

alternatives would result in additional urbanization of Sacramento County, Galt, and Rancho Cordova, and all three alternatives would result in irreversible and irretrievable commitment of existing agricultural land covers and other natural land covers to urban development, and loss of productive agricultural resources and natural resources. In addition, development under the General Plans would irreversibly commit building materials and energy resources to the construction and maintenance of such development. Finally, construction of new urban development consistent with the three General Plans, under any of the EIS/EIR alternatives would result in the consumption of fossil fuels such as natural gas and gasoline, as well as commit limited renewable resources, such as water.

As discussed in Section 3.4, the three General Plan EIRs used different study periods—ending in 2030 (Galt 2009), in 2030 (Rancho Cordova 2006b), and 2050 (Sacramento County 2010). However, the 50-year study period for this EIS/EIR ends in 2065 (Section 3.6.3). Additional urban development can be expected to occur within Galt, Rancho Cordova, and Sacramento County in the years after their General Plan EIR study periods end, and until this EIS/EIR's study period ends in 2065. Therefore, the impact analyses and conclusions incorporated from the three General Plan EIRs may not have considered all of the future urban development that is included in the project description of each EIS/EIR alternative. Consequently, additional irreversible commitments of resources and significant irreversible environmental changes would occur that were not analyzed in the General Plan EIRs. The lead agencies considered the impact analysis and the conclusions incorporated by reference from the General Plan EIRs, along with the effects of all urban development activities and projects included in the description of each EIS/EIR alternative.

As discussed in Section 3.6.7, only the No Action/No Project Alternative would result in the displacement or shifting of 1,900 acres of planned development to areas located outside the current Sacramento County Urban Services Boundary (USB). Therefore, the two action alternatives would result in fewer vehicle miles traveled (VMT) than the No Action/No Project Alternative (see Chapter 13, Traffic and Circulation). Consequently, the commitment of fossil fuel resources is expected to be slightly lower for each of the two action alternatives when compared to the No Action/No Project Alternative baseline condition, because of the smaller VMT.

As discussed in Chapter 2, new Preserves would be established under each of the alternatives to mitigate the effects of future urban development on species, waters, and the natural environment. Establishment of Preserves, whether purchased in fee title or easements, would not be an irreversible or irretrievable commitment of natural resources. However, establishment of Preserves under each of the alternatives would result in a minor irreversible commitment of fossil fuels to perform surveys and construct relatively small habitat re-establishment/establishment projects. However, the habitat Preserves would

continue existing ranching or farming operations on the preserved lands, so the new Preserve operation and maintenance vehicle trips would be replacing vehicle trips currently occurring under the existing agricultural operations. Therefore, vehicle trips and consumption of fossil fuels would not be discernably different from the new Preserves.

17.6 GROWTH INDUCEMENT AND RELATED EFFECTS (CEQA)

The CEQA Guidelines require the analysis of a project's potential to induce growth. Specifically, Section 15126.2(d) requires that environmental documents "discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." Growth-inducing impacts can occur if a project would induce urban growth either directly or indirectly in the surrounding environment. Furthermore, Section 15126.2(d) of the CEQA Guidelines states that "[i]t must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment."

The action alternatives would not have any direct growth-inducing impacts because no development would be specifically authorized by either action alternative. As discussed previously in Sections 1.6.4 and 3.6.1, the description and scope of each EIS/EIR alternative (Chapter 2) does not include local approvals or entitlements for individual urban development projects or activities. Accordingly, the analysis presented in this EIS/EIR does not provide project-level CEQA or NEPA coverage for the impacts of future Covered Activities on inducement of urban growth. The action alternatives would not directly cause growth to occur, but rather would accommodate growth that is already planned in the urban growth boundaries by the approved General Plans (Sacramento County 2011; Galt 2009; Rancho Cordova 2006a). However, the action alternatives would provide a mechanism for individual future development projects to comply with the federal Endangered Species Act, California Endangered Species Act, and the Clean Water Act. Therefore, the two action alternatives would not remove a barrier to growth, but would expedite the regulatory and local approvals of future individual development projects and activities. This is an indirect growth-inducing effect of each action alternative.

17.7 ENVIRONMENTALLY PREFERABLE ALTERNATIVE (NEPA) AND ENVIRONMENTALLY SUPERIOR ALTERNATIVE (CEQA)

NEPA regulations requires that the Record of Decision (ROD) on a final EIS must identify all alternatives that were considered by the agency in reaching its decision, and specify the alternative or alternatives that were considered to be environmentally preferable (40 CFR 1505.2(b)). Ordinarily, this means the alternative that causes the least damage to the biological and physical environment; it also means the alternative that best protects, preserves, and

enhances historic, cultural, and natural resources (CEQ 1981).The identification of the environmentally preferable alternative may involve difficult judgements, particularly when one environmental value must be balanced against another environmental value. Normally, the lead agency will select and identify the environmentally preferable alternative in the EIS document (CEQ 1981; 43 CFR 46.450). The public and other agencies reviewing a draft EIS can assist the lead agency in identifying the environmentally preferable alternative by providing their views in comments on the draft EIS. However, the lead agency must identify the environmentally preferable alternative in each ROD.

The CEQA Guidelines (Section 15126.6(e)(2)) require that an environmentally superior alternative be identified among the alternatives considered. The CEQA Guidelines do not define "environmentally superior;" however, the environmentally superior alternative is generally defined as the alternative that would result in the least adverse environmental impacts to the project site and surrounding area, based on the analysis included in the EIR.

The impacts of each EIS/EIR alternative on the different elements of the human environment analyzed in Chapters 4 through 16 are compiled and summarized in Tables ES-1 and ES-2 of the Executive Summary. The Proposed Action/Proposed Project Alternative would provide the greatest level of preservation of remaining natural communities in the Planning Area, particularly outside the current USB boundary. Preservation of these natural communities would provide greater preservation of habitat for Planning Area native species, better conservation of Planning Area special-status species, including the Covered Species, and more preservation of aquatic resources. The Proposed Action/Proposed Project Alternative would provide more linkages and wider linkages to existing Preserves, maintaining wildlife movement corridors as well as hydrologic connectivity. For all of these reasons, the benefits to native species, natural communities, and watersheds would therefore be greatest under the Proposed Action/Proposed Project Alternative. In addition, the Proposed Action/Proposed Project Alternative would establish Avoidance and Minimization Measures (AMMs) that would provide new and enhanced methods to avoid and minimize impacts to wetlands and other waters, including requirements that urban development be set back 50–150 feet from the banks of each stream and creek in the Planning Area. These AMMs would better reduce potential direct and indirect impacts to existing stream hydrology, water quality, and downstream habitat as compared to the expected protections under the No Action/No Project Alternative. The Proposed Action/Proposed Project Alternative would also have minor beneficial effects to land use compatibility (Chapter 4), the protection of agricultural resources (Chapter 6), hydrology and water quality (Chapter 7), cultural resources (Chapter 11), demand for expanded public services and facilities (Chapter 12), transportation planning and transportation infrastructure (Chapter 13), air quality (Chapter 14), and greenhouse gases (Chapter 15). Therefore, the Proposed Action/Proposed Project Alternative is the environmentally preferable alternative

under NEPA and the environmentally superior alternative under CEQA. **Consequently, the USFWS has also identified the Proposed Action/Proposed Project Alternative as the USFWS's preferred alternative.**

17.8 CONSISTENCY WITH EXECUTIVE ORDERS

17.8.1 Executive Order 11988 – Floodplain Management

As discussed in Section 7.1.1.1, Executive Order 11988 (Floodplain Management), requires federal agencies to prepare floodplain assessments for proposed federal actions located in or affecting floodplains. An agency proposing to conduct an action in a floodplain must consider alternatives to avoid adverse effects and incompatible development in the floodplain. If the only practicable alternative involves siting in a floodplain, the agency must minimize potential harm to or development in the floodplain and explain why the action is proposed in the floodplain.

Under the two action alternatives, the Implementing Entity would implement stream restoration actions within floodplains and active floodways (see Section 2.3.5 and Section 2.4.5). The Implementing Entity would take appropriate precautions to ensure that stream restoration projects implemented under either action alternative do not have adverse effects to floodplains (see Chapter 7). This would include implementation of AMM LEVEE-1, which would require the Implementing Entity to conduct a hydrologic analysis to ensure that riparian restoration and other habitat restoration activities will not result in an increase in flood stage elevations or flood risk on lands outside the Preserve. Because the lands would be managed consistent with the stated HCP biological goals and objectives, which would not conflict with floodplain management, no floodplain impacts are expected.

17.8.2 Executive Order 11190 – Protection of Wetlands

As discussed in Section 10.1.1, Executive Order 11990 (Protection of Wetlands), requires federal agencies to prepare wetland assessments for federal actions located in or affecting wetlands. Agencies must avoid undertaking new construction in wetlands unless no practicable alternative is available and the proposed action includes all practicable measures to minimize harm to wetlands.

The action alternatives have been designed to avoid and minimize impacts on wetlands and other aquatic resources, and mitigate for impacts that cannot be avoided. As described in Section 2.3.5, the South Sacramento Habitat Conservation Plan (SSHCP) includes specific biological goals and measureable objectives for aquatic resources, and the Conservation Strategy includes a range of specific AMMs to avoid and minimize impacts to these resources (see Section 2.3.5).

17.8.3 Executive Order 12898 – Environmental Justice

As discussed in Section 16.1.1, Executive Order 12898 (Federal Actions to Address Environmental Justice in Minority and Low-Income Populations), requires federal agencies to identify and address disproportionately high and adverse human health or environmental effects of their actions on minority and low-income populations and communities. Potential impacts related to environmental justice are discussed in Chapter 16.

Executive Order 12898 includes the requirement for federal agencies to ensure effective public participation and access to information. Consequently, a key component of compliance with Executive Order 12898 is outreach to potentially affected minority and/or low-income populations to discover issues of importance that may not otherwise be apparent. Outreach to affected communities has been conducted as part of the decision-making process for the SSHCP and alternatives. This outreach is described in Chapter 1 of this EIS/EIR.

CHAPTER 18 – LIST OF PREPARERS

As required by 40 CFR 1502.17, the following individuals prepared a particular analysis, background papers, or were primarily responsible for the preparation of the basic components of the Environmental Impact Statement (EIS)/Environmental Impact Report (EIR).

Name and Professional Title	Qualifications	Years of Professional Experience	Analysis or Content of EIS/EIR
USFWS Sacramento Fish and Wildlife Office *(Lead Agency)*			
Nina Bicknese *Senior Wildlife Biologist*	M.S. Wetland Ecology B.S. Biology	30	Scope of document; oversight of NEPA content; identification of reasonable alternatives; formulation of alternatives; oversight of natural resource content and analysis; review and technical editing
Sacramento County (Lead Agency)			
Catherine Hack *County Environmental Coordinator/Principal Planner*	B.S. Range Management	32	Scope of document; oversight of CEQA content; identification of reasonable alternatives; formulation of alternatives; document review and technical editing; project management.
Marianne Biner *Senior Environmental Analyst/Planner*	B.A. Environmental Studies	16	Scope of document; oversight of CEQA content; identification of reasonable alternatives; formulation of alternatives; technical editing; project management.
USACE Sacramento District (Cooperating Agency)			
Mary Pakenham-Walsh *Senior Project Manager, Regulatory Division*	M.S. Ecology B.S. Biology	21	Review and development of information about waters, other wetlands, or the CWA within Chapters 1, 2, 7, 10, 11; preparation of Appendix C (Draft CWA 404 Permit Strategy); preparation of Appendix A (CWA Cumulative-Impact Report).
Kate Dadey *Chief of California South Branch, Regulatory Division.*	B.S. Civil Engineering; M.S. Ocean Engineering; PhD Geological Oceanography	25	Identification of reasonable alternatives including the No Action Alternative; review and approval of Appendix A (CWA Cumulative-Impact Report).
Dudek (Lead consultant for preparing EIS/EIR Chapters 2, 3, 4, 6, 11, 12, 13, 17, 18, and Executive Summary)			
Sarah Lozano *Principal-in-Charge/Project Manager*	M.R.P., Regional Planning; B.A., Environmental Science and History; American Institute of Certified Planners (AICP)	18	Review of Chapters 2, 3, 4, 6, 11, 12, 13, 17. Oversight of document preparation and production.

Name and Professional Title	Qualifications	Years of Professional Experience	Analysis or Content of EIS/EIR
Mike Henry *Deputy Project Manager*	Ph.D. Ecology, Evolution and Marine Biology; B.S. Aquatic Biology	16	Primary author of Chapters 2, 3, 11, 12, 17. Prepared project description (Chapter 2) and the methods for impact analysis (Chapter 3). Edited description of existing setting and wrote analysis of impacts for public services and facilities (Chapter 12) and traffic/circulation (Chapter 13). Senior review and editing of analysis of impacts to land use (Chapter 4), agriculture (Chapter 6), and cultural resources (Chapter 11). Prepared analysis of other CEQA and NEPA requirements in Chapter 17. Prepared Executive Summary and associated tables. Oversight of document preparation and production.
Christine Kronenberg *Senior Environmental Planner*	M.C.P., City Planning; B.A,. Political Science; AICP	20	Described existing setting and draft impact analysis for land use (Chapter 4), and agriculture (Chapter 6).
Anita Hayworth *Senior Biologist*	Ph.D., Ecology; M.S., Avian Sciences; B.S., Ecology, Ethology, and Evolution	40	Described aircraft bird strike hazard in the existing setting, and identified potential impacts related to bird strike hazard in Chapter 4 (Land Use).
Brian Grattidge *Senior Environmental Planner*	M.A., Political Science; B.A., International Relations	20	Prepared initial drafts of the existing setting and impact analysis for public utilities and services (Chapter 12) and traffic and circulation (Chapter 13).
Micah Hale *Senior Archaeologist*	Ph.D., Anthropology; Register of Professional Archaeologists (RPA)	20	Provided initial drafts of the existing setting and impact analysis for cultural resources (Chapter 11). Provided expert review of chapter revisions.
Tyler Friesen *GIS Technician*	B.A., Geography (Minor: Environment and Society); Specialized training: GPS for GIS, June 2009; LIDAR in ArcGIS 10.1, February 2013	6	Calculations of impact acres and conservation acres for each EIS/EIR Alternative using GIS; prepared figures for Chapter 2, 3, 4, 6, and 13.
Rachel Strobridge *GIS Technician*	B.A., Geography; GIS Vocational Certificate	2	Assisted in preparing figures for Chapter 2, 3, 4, 6, and 13.
Becky Golden-Harrell *Publications Manager*	M.S., Marketing; B.A., English	15	Editorial review..

Michael Bryan *Managing Partner*	Ph.D., Toxicology and Fisheries Biology	30	Oversight of impact analysis for hydrology and water quality (Chapter 7).
Jeff Lafer *Water Quality Specialist*	M.S., Environmental Science	26	Described existing setting and analyzed impacts to hydrology and water quality (Chapter 7).

INTENTIONALLY LEFT BLANK

CHAPTER 19 – SUMMARY OF COMMENTS RECEIVED AND RESPONSES TO COMMENTS ON THE DRAFT DOCUMENTS

INTRODUCTION

As summarized in Chapter 1, the Draft Environmental Impact Statement (EIS) and Environmental Impact Report (EIR) and Draft South Sacramento Habitat Conservation Plan (SSHCP) were released for concurrent public reviews on June 2, 2017, when the U.S. Fish and Wildlife Service (USFWS) published a Notice of Availability (NOA) for both documents (82 FR 25612), and Sacramento County published an NOA for the Draft EIS/EIR with the California State Clearinghouse (control number 2008062030). Separately, the U.S. Army Corps of Engineers (USACE) released their draft Clean Water Act (CWA) Permitting Strategy for the SSHCP.

Pursuant to federal Endangered Species Act (ESA) Section 10 policy, the USFWS provided a minimum 90-day public review and comment period for both draft documents, which ended on September 5, 2017. A total of 26 comment letters were received on the Draft EIS/EIR, the Draft SSHCP, and the Clean Water Act Permitting Strategy.

During the 90-day comment period, the lead agencies and the SSHCP Plan Partners jointly conducted three public meetings in Wilton, Rancho Cordova, and Galt, to provide additional opportunities for the public to provide comments on the Draft SSHCP and the Draft EIS/EIR (see NOAs for locations). A total of two comments letters were submitted at these public meetings.

The Draft SSHCP and the Proposed Action/Proposed Project Alternative in the Draft EIS/EIR describe a proposed multi-tiered approach for permitting future SSHCP Covered Activities under Section 404 of the CWA (CWA Permit Strategy). Therefore, as required by CWA regulations, the USACE also posted a Public Notice on June 2, 2017, to announced a 30-day comment period on the proposed USACE action titled: *Public Notice SPK-1995-00386*: *Proposed Section 404 Clean Water Act Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan, Sacramento, California* (USACE Public Notice). Attachment 2 of the USACE Public Notice is identical to Appendix C of the Draft EIS/EIR.

Public comments were received on the Draft EIS/EIR, the Draft SSHCP, and the USACE Public Notice. Table 19-1 presents a numbered list of all comment letters received, in alphabetical order. Each numbered comment letter is included in this chapter.

Each letter has been annotated to distinguish each comment within the letter. The annotation assigns a number code for each response to comment (RTC). The RTC comment code is the number assigned to the comment letter, followed by the number assigned to the comment within the letter. The RTC code is also labeled as *SSHCP*, *EIS/EIR, or CWA* to indicate if the comment was on the Draft SSHCP, the Draft EIS/EIR, or the USACE Public Notice.

The lead agencies prepared the RTCs on the Draft EIS/EIR, and the Plan Partners prepared RTCs on the Draft SSHCP in collaboration with the USFWS. The USACE prepared the RTCs on their Public Notice. If a response to a comment on the Draft SSHCP resulted in changes to the Final SSHCP, those changes were carried into the project description of the Proposed Action/Proposed Project Alternative in the Final EIS/EIR. Likewise, if the response to comments on the USACE Public Notice resulted in changes to the proposed CWA Permit Strategy, those changes were copied into relevant sections of the Final SSHCP, and into the description of the Proposed Action/Proposed Project Alternative in the Final EIS/EIR, as needed. Using this process, the Proposed Action/Proposed Project Alternative that is described and studied in the Final EIS/EIR is consistent with the Final SSHCP.

Any changes in the Final EIS/EIR are clearly marked. Additions to the Draft EIS/EIR are shown with **bold underline.** Changes from the Draft EIS/EIR resulting in deleted text are shown with ~~strikethrough~~.

A total of 361 comments and responses to comments (RTCs) are presented below in Chapter 19. The number of discrete comments shown in the table below totals to greater than 361 because some discrete comments applied to more than one of the documents. Approximately 125 of the responses resulted in a change to the Final SSHCP or the Final EIS/EIR. However, most of the changes in the Final SSHCP or Final EIS/EIR were confined to minor factual corrections and minor text clarifications. The changes made in response to comments did not alter impact analyses or any of the conclusions presented in Chapters 4 through 16 of the Final EIS/EIR.

LETTER 1 BRYAN PLANT, ON BEHALF OF BROOKFIELD SACRAMENTO HOLDINGS LLC (CWA PERMIT STRATEGY)

From: Brian Plant
To: Pakenham-Walsh, Mary R CIV USARMY CESPK (US)
Cc: John Norman (John.Norman@brookfieldrp.com); Stacey McKinley (stacey.mckinley@gmail.com)
Subject: [Non-DoD Source] SPK - Proposed CWA 404 Permit Strategy - South Sacramento Habitat Conservation Plan
Date: Monday, July 24, 2017 1:50:16 PM

Dear Ms. Pakenham-Walsh: On behalf of Brookfield Sacramento Holdings LLC which owns and develops property in Sacramento and Placer Counties and is a stakeholder in the Natomas Basin Habitat Conservation Plan and the proposed Placer County Conservation Plan, please accept these comments on the proposed Clean Water Act permitting strategy for the South Sacramento Habitat Conservation Plan (Corps Action ID SPK-1995-00386). The proposed permitting strategy describes a three-tiered approach to CWA permitting for the SSHCP covered activities: 1) a programmatic general permit (PGP) to be implemented via local ordinance which includes conditions limiting its use to fill activities that do not exceed either 2 acres or waters or 1.5 acres fill of vernal pools within the Mather Core Recovery Area; 2) a Letter of Permission (LOPs) for "more than minimal" but less than significant effects on the human environment, including aquatic resources; and 3) an "abbreviated" process for issuing standard permits for activities that "may have" a significant impact on the human environment.

The proposed permitting process and the limitations imposed provide little incentive for projects moving forward within the SCCHCP plan area. One of the major benefits of habitat conservation planning and the use of HCPs is to provide certainty for stakeholders and to allow regulatory permit streamlining in addition to the certainty that key resources are preserved in significant quantities. While the Corps District recognizes these benefits, the permit program as currently proposed does not go far enough in reaching the goal of permitting certainty. In particular, the 2-acre limitation for use of the proposed PGP appears arbitrary and is too low for meaningful streamlining of the CWA permit process. The regional conservation planning efforts underpinning the SSHCP and protections afforded the aquatic environment under the SSHCP should ensure that proposed fill greater than 2-acres would have less than minimal individual and cumulative effects. In fact, the District should consider any covered activity that follows the requirements of the SSHCP (avoidance, minimization and compensatory mitigation as part of the conservation strategy) would have less than minimal individual and cumulative impacts on the aquatic environment. All other activities should be covered by the proposed abbreviated process for issuing standard permits. 1.1

Further, the current process as described is unnecessarily vague. Specifically, the description of the process for the LOP and SP process affords little insight into the process envisioned for permitting under those two scenarios. For the SP process, all that is described is the threshold that certain projects that "may" have a significant impact under NEPA would not be entitled to permit treatment under PGP, RGP or LOP. No specifics are given, despite the fact that there is meaningful information prepared under the draft SSHCP to more specifically describe that threshold. Likewise, some description at this point should be possible for how on-site adequate avoidance, minimization and mitigation can be achieved under the SP process. 1.2

Thank you for the opportunity to comment on this critically important component of the SSHCP and by implication ongoing HCP planning efforts such as Placer County Conservation Plan. If you have any questions, please don't hesitate to call me.

Sincerely,

Brian J. Plant

If you received this e-mail message in error, please immediately notify the sender by replying to this message or by telephone. Thank you.

Please consider the environment before printing this email.

RTC 1.1 (CWA Permit Strategy) – With regard to the concern that the permit program "as currently proposed does not go far enough in reaching the goal of permitting certainty," the proposed CWA 404 Permit Strategy substantially increases certainty, based on several anticipated efficiencies noted in the permit strategy, inclusive of explanations of key procedural elements (e.g., no off-site alternatives analysis would be required for standard permits), and the proposed locally driven aquatic permit program that would be authorized under clearly demarcated terms and conditions described in the USACE's (draft) Programmatic General Permit (PGP). Additionally, there is no quantitative threshold for "far enough" in this context; that said, the USACE has sought through the draft CWA 404 Permit Strategy, and is committed to continuing to seek, the highest levels of certainty and streamlining that are practicable while ensuring compliance with the CWA 404 regulations and related laws and policies (e.g., NEPA).

With regard to the concern that a 2-acre threshold for the proposed PGP "appears arbitrary and is too low for meaningful streamlining…," terms and conditions for the USACE's general permits are subject to the best professional judgment of the USACE, in light of their primary function of ensuring minimal individual and cumulative adverse effects to the environment based on use of the general permit they are associated with. For example, USACE headquarters has relied on a 0.5-acre threshold of loss of waters of the U.S. applying to several renditions of the ubiquitously utilized Nationwide Permits; while this threshold does not apply to all Nationwide Permits (NWPs), it is the most common loss of waters threshold across the NWP program. By extension, a regionally applicable proposed threshold of 2 acres for the proposed PGP is four times larger than 0.5 acre, while aquatic resources in this region of California tend to be valuable given the cumulative loss of resources over time, provision of habitat for state- and/or federal-listed species, and other functions and services. The USACE used key documents as the basis for identification of an upper acreage threshold for loss of waters of the U.S. in the proposed PGP, inclusive of its cumulative impact assessment, avoidance, minimization, and compensatory mitigation measures in the SSHCP, the compensatory mitigation outlook (including a proposed in-lieu fee program) for activities that would be authorized under the proposed PGP, the Plan Partners' Aquatic Resources Program (ARP) and (draft) local ARP ordinances, and consideration of what would be a reasonable upper limit of loss of waters of the U.S. to ensure impacts of activities authorized by the PGP would result in no more than minimal individual and cumulative adverse effects to the environment.

With regard to the statement that any Covered Activity should be considered to have "less than minimal individual and cumulative impacts on the aquatic environment," while all Covered Activities would be assumed to follow the avoidance, minimization, and mitigation provisions of the SSHCP per the comment, this would not ensure that the resulting impacts of all Covered Activities could meet this threshold, which applies only to general permits in the USACE's Regulatory Program.

RTC 1.2 (CWA Permit Strategy) – With regard to the statement that the CWA 404 permit "process as described is unnecessarily vague," with specific reference to the description of the Letter of Permission (LOP) and abbreviated standard permit (SP) processes, the LOP process is defined in specifics in the (updated) draft LOP procedure

contained in the Final EIS/EIR. The comment appears to focus more on concerns for more specificity to be provided in the abbreviated SP process outlook. In response to this concern, the USACE is updating the proposed CWA 404 permit process to include more specificity and clarification on the abbreviated SP process (e.g., a new stand-alone document in addition to the summary provided in the CWA 404 Permit Strategy overview document in Appendix C of the EIS/EIR). Clarification provided includes a reference to the Regulatory Program's implementing regulations for NEPA (33 CFR Part 325, Appendix B). Similar to existing practices for evaluating permit applications that do not fit under a general permit authority, the USACE would review the proposed project for its appropriate level of NEPA analysis, in the context of it being a covered project under the SSHCP inclusive of SSHCP-required avoidance, minimization, and compensatory mitigation requirements. If a project "…may have a significant impact on the human environment, and require the preparation of an EIS under NEPA," this case-by-case project-level decision provides a clear threshold (i.e., an EIS is required), triggering the need to evaluate the permit under the abbreviated SP process vs. under the LOP procedure. Wording has been added to the CWA Permit Strategy (Final EIS/EIR Appendix C) to clarify the EIS requirement threshold for the SP process, and case-by-case process of evaluating future permit applications in accordance with Appendix B of the USACE's Public Notice SPK-1995-00386. Lastly, the comment indicates there should be some description of how on-site avoidance, minimization, and mitigation can be achieved under the SP process.

RE: South Sacramento Habitat Conservation Plan
Control Number: 2003-0637
State Clearinghouse Number: 2008062030

On behalf of the Sacramento Valley Chapter of the California Native Plant Society and myself, thank you for the opportunity to review and provide comments upon this important step forward in providing a framework for regional conservation planning in Sacramento County.

The Sacramento Valley Chapter of CNPS has been highly involved in participating in and commenting upon land use decisions at all levels that affect vernal pool ecosystems in Sacramento County. Chapter volunteers serve on the South Sacramento Habitat Conservation Plan (SSHCP) steering committee and biological subcommittee. Chapter volunteers serve on a stakeholders group to determine land use planning for the former Mather Air Force Base and its vernal pool grassland ecosystem. Chapter volunteers serve on local land trust boards, steering committees, and management committees. Chapter volunteers have testified at innumerable planning commission, board of supervisors, and city council meetings on projects that impact vernal pool resources. The Sacramento Valley Chapter of CNPS has long viewed the general area proposed for development under the SSHCP as the "Yellowstone" of vernal pool landscapes in Sacramento County.

I have been personally involved in this planning process since 1996 when I served as chair of an early technical advisory committee. Since then, I have devoted innumerable hours attending meetings of various biological subcommittees and providing comments on draft materials. I have voluntarily provided my expertise on multiple aspects of the vernal pool species and landscapes addressed in this plan. My participation has been both as a representative of the California Native Plant Society and as a recognized expert in vernal pool species ecology and landscape management.

The comments provided below are primarily general in nature and related to the SSHCP document. Detailed comments are not provided as they are too numerous to be compiled into a comment letter. Suffice it to say that there are internal inconsistencies within the document, omitted numerical values, incomplete sentences, and other rather simple errors. Perhaps significant, there are numerous references to the ARP which is not included as an appendix to the SSHCP, and the Orcutt grass in the proposed S-1 of PPU-1 is still listed as the wrong species. 2.1 2.2

SSHCP COMMENTS

The document language needs to be strengthened in order to ensure covered plant species mitigation actually occurs. Important goals, objectives and actions outlined in Table 7-1 (and other tables within Chapter 7) are not carried through the remainder of the document. This is particularly true for implementation of Goal 5 and its related objectives and actions for covered plants. Examples include: 2.3

- While Section 5.4.2 discusses AMMs for covered plant species (PLANTS-1 and PLANTS-2), they are not as specific as the objectives outlined in Table 7-1. Additionally, Tables 6-3 (summary of AMMs), 8-2 (AMM compliance monitoring) and 8-3 (AMM effectiveness monitoring) don't even mention PLANTS-1 and PLANTS-2 and do not include any of the the important conservation information from Goal 5 related to the covered plants. These omissions i) undervalue the importance of doing plant surveys prior to any covered activity approval, and ii) fail to measure success of the conservation objectives. 2.4

- Section 6.6 (effects of covered activities) is confusing because there are no specified limits on take as described in Section 7. Instead it just talks about limiting indirect and temporary effects through AMMs, but again with no mention of PLANTS-1 and PLANTS-2. This section would benefit from a few sentences for each of the covered plant species that spells out the limitations on take and the focus on preserving known occurrences (protect X populations before any take by covered activities). 2.5

On a similar note, the SSHCP document should clearly state that a satellite preserve will be created to protect a covered plant if no other populations can be found to preserve and fulfill the objectives under Goal 5. This may be implied by the information in Table 7-1, but needs to be clearly detailed in the text. This could be modeled after similar requirements for the Orcutt grasses. 2.6

Section 7.6.2.1 and Table 7-18 are inconsistent in the number of populations that must be preserved prior to allowing take of Ahart's dwarf rush (page 7-121). Six populations must be protected before any take can occur. After that, another population needs to be protected for each population proposed for take. This section also fails to recognize that grazing and conservation of populations of Ahart's dwarf rush may be incompatible. 2.7

Section 7.6.2.4 and Table 7-26 (plus the pertinent section of Table 7-1) are confusing about the exact nature of the conservation strategy for Legenere. There is discussion of both a minimum of 14 occurrences (text has 15 occurrences) and preserving one for take of one. Is the plan assuming that the seven within the hard line preserves immediately allows take of seven other populations? 2.8

For Bogg's Lake hedge-hyssop, dwarf downingia, (possibly) legenere, pincushion navarretia and Sanford's arrowhead, it appears that the SSHCP considers 50% preservation of known occurrences to be a satisfactory mitigation ratio. While this will prevent extinction, it is unlikely to contribute toward recovery or prevent the need to list some of these species at a future date. 2.9

Chapter 8 is very disappointing. It defers development of programs, procedures, techniques, criteria and formats to future dates ranging from 6 to 18 months after approval of the SSHCP. These are to be developed by the Implementing Entity and presumably approved by the Agencies. This deferment completely circumvents the public process by implying that the to-be-developed materials will be adequate. It is especially troubling that population studies and the definition of take for the covered plant species are being deferred to a later date and will not be subject to public review. 2.10

Chapter 8 does not sufficiently stress the importance of obtaining information on historic management practices before adding a parcel (or group of parcels) to the Preserve system. More detail on this requirement should be spelled out in both Chapter 8 and Appendix F (as that documentation will be prepared before or at the time of acquisition). Obtaining the historic record should be part of the due diligence process prior to obtaining a parcel for inclusion in the Preserve system. This requirement also needs to be spelled out in sections that discuss land dedication as the mitigation being proposed by third parties. It is important to obtain the historic information as early 2.11

as possible in the land acquisition process while it is still fresh in the mind of the current owner/manager/livestock operator.

DEIS/DEIR COMMENTS

I find the alternatives analysis somewhat baffling. I am not sure that current economics and projected population growth support the assumption that projects and infrastructure development (at the same level as proposed under the SSHCP) would occur under the No Action/No Project Alternative. 2.12

GENERAL COMMENTS

It is unfortunate that the County of Sacramento does not embrace smart growth principals to the extent that they would limit new development to the edges of existing cities. Adhering to this type of growth pattern would allow significantly more habitat to be preserved within the UDA and would reduce many other environmental stressors (e.g. air quality) present in the region. 2.13

After spending 20 years working on this planning process, I am disappointed that during the past several years the entire project has been commandeered to cater to five large-scale, leap-frog developments. It is unfortunate that future projects, many of which will be more economically and environmentally appropriate, will have to fill the gap to complete the SSHCP conservation strategy. 2.14

And finally, while I remain a stanch supporter of regional conservation planning, I am no longer sure that the SSHCP as currently formulated will actually achieve more or better conservation that project-by-project permitting. This is particularly important to consider in light of the USACE Record of Decision for the Sunridge Projects. 2.15

Sincerely,

Carol W. Witham

RTC 2.1 (SSHCP) – We have attempted to identify and correct inconsistencies, omitted numerical values, and incomplete sentences in the Final SSHCP. Without more details regarding these issues, it is not possible to respond further.

RTC 2.2 (SSHCP and EIS/EIR) – The draft Aquatic Resourced Program (ARP) is Appendix I to the EIS/EIR. It was included as an appendix to the EIS/EIR instead of the SSHCP because, though the documents are consistent, they may be subject to different timeframes for revisions, amendments, or other changes. Therefore, it was simplest to separate them in this way. References to the draft ARP have been added to the Final SSHCP where appropriate. In addition, the reference to slender Orcutt grass (*Orcuttia tenuis*) in Satellite Preserve S-1 has been changed in Final SSHCP Section 7.5.1 to correctly identify the species as Sacramento Orcutt grass (*Orcuttia viscida)*.

RTC 2.3 (SSHCP) – The comment states that plant avoidance and minimization measures (AMMs) identified in Chapter 5 of the Draft SSHCP were not appropriately discussed in Chapters 6 and 7. References to AMMs ORCUTT-1 and ORCUTT-2 have been added to the two Orcutt Covered Species analyses in Section 7.6.2 of the Final SSHCP. AMMs PLANT-1 and PLANT-2 have been added to all other plant Covered Species analyses in Section 7.6.2 of the Final SSHCP.

AMMs PLANT-1 and PLANT-2 have been added to Tables 6-3, 8-2, and 8-3 in the Final SSHCP as suggested by the comment. Table 8-3 in the Final SSHCP also now identifies how the compliance and effectiveness of these AMMs will be monitored.

RTC 2.4 (SSHCP) – Refer to response to Comment 2.3. The operational SSHCP will place appropriate importance on plant surveys. By adding the two plant AMMs (PLANT-1 and PLANT-2) to these tables, they are included in the compliance and effectiveness monitoring that will be conducted for the SSHCP.

RTC 2.5 (SSHCP) – Refer to response to Comment 2.3.

The limitations on take are species objectives that first appear in Table 7-1 in Chapter 7 because that is when the effects of the Conservation Strategy are analyzed. Chapter 6 examines the effects of the Covered Activities, without the measurable objectives of the Conservation Strategy.

RTC 2.6 (SSHCP) – Text has been added to Section 7.6.2 clarifying that Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), pincushion navarretia (*Navarretia myersii)*, and legenere (*Legenere limosa*) occurrences would be protected in a minimum satellite-sized preserve. In addition, conservation actions for preservation of Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, pincushion navarretia, and legenere now state that the minimum preserve size to protect an occurrence of these species is satellite-sized.

RTC 2.7 (SSHCP) – The text in Section 7.6.2.1 of the Final SSHCP has been corrected to reflect that prior to take of any occurrence of Ahart's dwarf rush, **six** currently unpreserved and "biologically equivalent or superior" (as defined by the Technical

Advisory Committee [TAC]) occurrences of Ahart's dwarf rush within the Plan Area will be preserved. In addition, text has been added to Section 7.6.2.1 reflecting the text in Objective VPP1:

"After six currently unpreserved occurrences are protected, prior to take of an occurrence of Ahart's dwarf rush, one currently unpreserved and 'biologically equivalent or superior' (as defined by the TAC) occurrence of Ahart's dwarf rush will be preserved within the Plan Area."

As described in Section 8.3.1, each individual Preserve Management Plan (PMP) will outline the activities that can occur in each Preserve. Based on monitoring results, animals used in grazing on Preserves, as well as the timing or patterns of grazing, will be managed for the benefit of the Preserve and Covered Species. Text has been added to Section 7.6.2.1 in the Final SSHCP noting that grazing may be incompatible with Ahart's dwarf rush.

RTC 2.8 (SSHCP) – Section 6.6.4 of the Draft SSHCP indicates that Covered Activities will directly impact two documented occurrences of legenere within the Urban Development Area (UDA) (one in Preserve Planning Unit [PPU] 1 and one in PPU 3) and will indirectly impact three documented occurrences of legenere within the UDA (one in PPU 1 and two in PPU 3).

Objective VPP4 in Table 7-1 of the Final SSHCP has been revised to reflect that 15 occurrences of legenere will be conserved. The comment asks whether 50% preservation of legenere in the Plan Area will achieve the Conservation Strategy for the species. The Plan Preparers took into account the fact that several occurrences of this species are already protected in existing Preserves in the Plan Area. Further, populations outside the UDA will not necessarily be taken, even though they may not be within a Preserve. The Plan Area also does not enclose the entire range of the species. These factors, taken together, support the Conservation Strategy's conclusion that implementation of the SSHCP is mitigation to the maximum extent possible. The comment also asks whether preservation of seven legenere within the Preserve System will allow for take of seven legenere from Covered Activities. That interpretation is correct.

RTC 2.9 (SSHCP) – As described in Section 7.6 of the Draft SSHCP, an occurrence of each of these Covered Species must be conserved prior to take of an occurrence. The SSHCP Conservation Strategy will benefit each of these species by maintaining them within their current distribution in the Plan Area, by maintaining or re-establishing their historical distribution in the Plan Area, and by providing for the re-establishment and establishment of additional habitat for these species in the Plan Area. Moreover, the SSHCP Preserves will maintain connectivity between existing occurrences and modeled habitat. Implementation of the SSHCP will benefit each of these Covered Species. These activities will assist in species recovery.

RTC 2.10 (SSHCP) – Chapter 8 provides the criteria by which each program and procedure and plan shall be prepared, including by whom, and how compliance and success will be assessed. The implementation schedule for these programs is included

in the Draft SSHCP in Section 9.11, Table 9-3. Chapter 8 of the Draft SSHCP includes sufficient detail on the required types, timing, and methods of monitoring to allow the EIS/EIR to analyze its effectiveness. For example, Table 8-2 in the Draft SSHCP identifies for each AMM: (1) what we need to know to assess compliance, (2) how we would monitor what we need to know, (3) when and how often that monitoring would occur, and (4) what protocols or methods need to be developed in order to achieve that required monitoring. Similar tables are presented for compliance monitoring of the Conservation Strategy (Table 8-1), effectiveness monitoring of the AMMs (Table 8-3), and effectiveness of the Conservation Strategy (Table 8-4). This chapter was prepared with direct involvement of an agency committee and representatives of environmental groups such as ECOS, California Native Plant Society, Sierra Club, and the Institute for Ecological Health. It was decided that rather than preparing a detailed program as part of the SSHCP, it was preferable to prepare a programmatic template that could guide development of detailed programs, procedures, and plans within 6 to 18 months following plan adoption. Since potential properties to be incorporated in the Preserve System are not yet known, preparation of detailed plans, programs, and management and monitoring procedures at this stage may not ensure accuracy in measuring Preserve System performance in the future. Thus, the performance standards described above will guide development of the plans and must be met as a requirement of the SSHCP and permit conditions. This will be done in an open public process with full engagement of a Technical Advisory Committee (TAC) made up of plan partners, agency representatives, and stakeholders, including the environmental, landowner, and development community. Further, the programs and procedures will undergo public disclosure and adoption by the Implementation Committee. All meetings of the Implementation Committee will be called, noticed, held, and conducted in compliance with the provisions of the Ralph M. Brown Act, Government Code Section 54950 et seq. Individual Preserve Management Plans based on these programs will also be developed in coordination with the TAC.

RTC 2.11 (SSHCP) – The SSHCP Implementing Entity understands the importance of recording the management history on all properties that will be incorporated into the Preserve System. Management history will be recorded when a Preserve Documentation Report (PDR) is prepared. A PDR is prepared for each property that is being considered for acquisition by the SSHCP Implementing Entity. Table 8-1 in Section 8.2.1 of the SSHCP describes how Objective HAB3 will be implemented. Objective HAB3: “Record management history for Preserve parcels as they are obtained. Consider management history when developing initial preserve management approach.”

Sections 8.3.1 and 8.3.4.2 in the Draft SSHCP also describe the process for preparation of a Preserve Management Plan (PMP) for each Preserve. Each initial PMP must document the management history for each parcel (via records, interviews of ranch managers or landowners, etc.). The importance of documenting existing and historical management of Preserve properties has been noted in several locations in the Final SSHCP, including Section 9.4.2, where the process for acquiring preserve land is described.

RTC 2.12 (EIS/EIR) –The analysis in the EIS/EIR does not generate new estimates of population growth and development within the Plan Area. These estimates are based

on growth assumptions contained in the general plans of Sacramento County, Rancho Cordova, and Galt, plus additional development that might occur within the county's Urban Service Boundary (USB). The USB is the ultimate future growth boundary adopted by the county in its 1993 general plan update. The EIS/EIR alternatives assumptions include similar growth for each alternative using the estimates endorsed by the County and cities through their general planning processes.

RTC 2.13 (SSHCP and EIS/EIR) – The SSHCP and EIS/EIR do not establish new projections or assumptions about population growth in southern Sacramento County. Assumptions about growth projections underlying these documents are made in general plans developed in accordance with the local land use planning process, which includes public comment and which ultimately are approved by local elected officials. The SSHCP Plan Preparers cannot modify or change the County's or the City's land use planning decisions or processes. For example, the Sacramento County General Plan includes a USB that identifies an area where urban development is anticipated to occur. The SSHCP uses the USB as the basis for its UDA. Limiting new development to the edges of a city would not ultimately limit the total amount of development that is anticipated to occur under the County's General Plan and therefore would not result in additional preservation within the UDA.

RTC 2.14 (SSHCP) – The Plan Partners recognize and appreciate the important contributions this commenter has made to the SSHCP planning process over many years. It is assumed that the comment is referring to five large-scale master plans that are within the SSHCP's UDA, two of which are already approved and three of which are in the entitlement approval process. Because these projects were seeking land use entitlements while the SSHCP was being developed, it was necessary to incorporate these five master plans into the SSHCP planning process as SSHCP Covered Activities, even as they each pursued their own permits from the resource agencies. Each of the five master plans was required to set aside significant on-site preserves, which became the "hard-line" preserves of the SSHCP Conservation Strategy. As development of SSHCP progressed, there was opportunity to also apply SSHCP AMMs to the master plans to satisfy the SSHCP's Conservation Strategy. These "hard line preserves" are the only Preserve areas that can be mapped at this time, but are not the only Preserves that SSHCP will create within the UDA.

Where the County or cities were actively working with project applicants that were required to prepare a master plan per County or city General Plan Policy and that Master Plan was within the SSHCP's Plan Area, the County or cities, along with the wildlife agencies, worked with the project applicant to design on-site Preserves consistent with the SSHCP's Conservation Strategy. Project applicants required to provide on-site Preserves will receive credit for their on-site Preserves towards their mitigation obligations.

It is accurate to suggest that future projects will benefit from the SSHCP's streamlined permitting process and will contribute to the establishment of the SSHCP's Conservation Strategy.

RTC 2.15 (SSHCP) – The comment questions whether the SSHCP will achieve more or better conservation than would occur under the project-by-project permitting that currently occurs. While it is not possible to forecast how requirements under project-by-project permitting could change over the permit term (e.g., mitigation ratios), the SSHCP Preserve System would include more consistent and rigorous qualification for Preserve properties, consistent management and monitoring across the Preserve System, a single local agency with oversight and decision-making authority, and many other benefits as laid out in Section 1.1.2 of the Draft SSHCP. As noted in the ARP that is included as Appemdix I to the EIS/EIR, the SSHCP would also be integrated with an ARP that would support watershed-level conservation of aquatic resources.

LETTER 3 CAY C GOUDE AND ERIC S GOUDE (SSHCP AND EIS/EIR)

August 29, 2017

To: Sacramento County Environmental Coordinator and Sacramento Fish and Wildlife Service

From: Cay C. Goude and Eric S. Goude

Subject: South Sacramento HCP and EIR/EIS

These comments pertain both to the South Sacramento HCP and Draft EIR/EIS and must be addressed in both revised documents. First, we find these documents to be inadequate and difficult to understand. This comment letter will identify certain topic areas that are especially concerning. Based on the level of concerns and the documents inadequacies they should be revised and recirculated as new Draft documents. Although we applaud the goal of addressing conservation on a large scale this Plan will not result in overall conservation of the covered species and will NOT mitigate to the maximum extent practicable the impacts to these covered species. 3.1 3.2 3.3

ALTERNATIVES

The Alternatives are inadequate in scope. The documents discounts a larger percentage of preserves within the USB/UDA based on no real analysis. Basically it was discounted because developers own certain parcels within the area. In addition, there is no systematic analysis or alternative that would preclude piece meal and leap frog development within the USB/UDA and no analysis on how this would be precluded. The analysis must be revised to address these concerns. The 50 percent retention of lands to be preserved within the USB/UDA should be the preferred alternative which would allow for greater conservation. However, even this alternative should only allow development within City boundaries, not as part of the County. For example, development should occur systematically from Rancho Cordova City limits on the north or from City of Sacramento on the Plan's western boundary. Sacramento County should not continue to act like they are City. An analysis must be done that identifies the range of development within the greater geographic area and their cumulative impacts. Currently there are large scale development within Natomas, El Dorado Hills, Folsom and Placer County. There is not enough incoming population to sustain this large 3.4 3.5 3.6 3.7

1

demographic growth. This influx of home building again makes the need for this development within the remaining open space of Sacramento County questionable. This development should be addressed within the entire context of this Plan for all impacts including air quality, water availability, potential flooding, loss of open space and agricultural land and natural resources. All documents must be revised to address the concerns provided in this letter. 3.7 cont'd 3.8

PERMIT TERM

The Permit Term proposed is 50 years. This is totally inappropriate since all the County Planning and City Planning documents do not extend for this period of time. In addition, based on climate change and other unforeseen factors having the permit term be so far into the future does not make sense. The Permit Term should be based on the Planning Documents current length. There is no justification for this permit duration and this must be provided in new draft documents. This HCP is not a NCCP and although it tries to mirror a NCCP in terminology it is a mitigation plan which makes the risk to the covered species even more precarious and therefore there is a need for shorter permit term. 3.9

COVERED ACTIVITIES

It appears that the analysis considers everything developed within the USB/UDA except for some preserves. However, the analysis does not include the Jackson Road proposed enlargement which includes both lane enlargement and numerous traffic lights. In fact at the scoping meeting, we were told this road enlargement was not being considered by the County, but a month later it was being discussed by the County, as reported in the Sacramento Bee. The proposed Jackson Road modifications are only being considered because of the proposed development within this HCP. Therefore, the impacts to the local communities that will be adversely impacted, loss of economic development for towns within Amador County, traffic time, air quality and other factors must be addressed. Jackson Road enlargement is an interrelated and an interdependent impact that must be considered as part of the HCP and EIR/EIS. Also, there is no analysis of the adverse impacts to the listed salmonid species or delta smelt. Although water to support this large level of development may have been considered as part of the "Fazio" water deal, much has changed since the time of that analysis and since the conclusion of the biological opinion for this water contract. Numerous new developments are relying on this limited resource that were never 3.10 3.11 3.12 3.13 3.14 3.15 3.16 3.17

2

envisioned and since the development of the "Fazio" biological opinion the status of the species has also declined. This analysis did not even consider climate change and adverse effects to all the covered species as well as salmonids and delta smelt. In essence, if you have a one gallon bucket of water that was enough for one person to use that same bucket will not support 100 people. Therefore, the revised documents must consider the impacts to salmonid species and the delta smelt. The covered activities states that there will be a need for additional wells and pipelines and that these the details will be analyzed in future environmental documents. But there is no analysis of the impact to the already depleted ground water aquifer. There are numerous ranches, nurseries and homeowners that would be adversely impacted from these wells. For example, three wells were developed as a "temporary" use for the Sunrise Douglas development along Excelsior roads. These wells are still being used although they were expected not to be in used in the future. How will these wells be used and is there truly adequate water supply for the large development proposed. The impacts to ground water resources must be evaluated and more details analyzed on the locations and potential impacts. The Mather development is stated that it is being developed independently but it seems you are relying on their proposed conservation. Is this a covered activity or not? In addition, within your EIS/EIR you state the following, "For this EIS/EIR, the lead agencies determined that using the existing condition as the baseline to describe and determine the significance of each action alternative's expected impacts would be misleading. This determination was made because the two action alternatives include, as Covered Activities, future urban development and infrastructure projects that are also reasonably expected to occur under the No Action/No Project Alternative. Although the details of this future development are not completely known at this time, it is anticipated that new urban development under all of the EIS/EIR alternatives would accommodate the same population and development growth, and that this urban growth would occur in areas where public infrastructure and services are planned for the 50-year EIS/EIR study period (i.e., within the spheres of influence for the Cities of Galt and Rancho Cordova and within Sacramento County's USB). As a result, the types of new urban development and associated infrastructure would be the same, and the general locations and the acres of new urban development would be very similar for all alternatives. Therefore, using existing conditions as the baseline for describing the effects of each action alternative and for determining the significance of those effects would misrepresent the impacts of the action alternative because that development

3.19
3.20
3.21
3.22
3.23
3.24
3.25

3

would occur whether or not an HCP is approved and implemented in south Sacramento County. Further, the future urban development and infrastructure Covered Activity projects and activities are not part of the "project" under CEQA that is subject to approval by the CEQA lead agency and by the other HCP Permit Applicants (see Section 1.5), are not part of the "project" under CEQA that would be subject to permitting by the California Department of Fish and Wildlife (CDFW) (see Section 1.5), and are not part of the "action" under NEPA that would be subject to permitting by the U.S. Fish and Wildlife Service (USFWS) (see Section 1.5). The EIS/EIR "project" (under CEQA) and "action" (under NEPA) consists of the approval and implementation of the HCP, SSHCP Aquatic Resources Plan (ARP), and issuance of associated take permits, but not the actual construction of or the discretionary entitlements of urban development projects and activities. Thus, the future environmental impacts of new urban development in the Planning Area would not result from the decisions to be made about the Proposed Action/Proposed Project (Section 1.5). For these reasons, the EIS/EIR basis of comparison (the EIS/EIR baseline) for describing the environmental impacts of each action alternative is the future condition of the Planning Area expected to occur under the No Action/No Project Alternative." It appears that your analysis does not address individual impacts under CEQA nor any infrastructure. We are confused how your EIS can be sufficient without this analysis. We do not agree that you can conclude that existing condition is the same as your baseline. If individual projects were proposed outside of this proposed HCP they would be developed as economics allowed, infrastructure developed and have detailed site specific mitigation proposal that would have details of site-specific conditions. It is our belief that over time this most likely would result in greater conservation or avoidance due to various factors some economic and some environmental. The revised Documents must analyze the baseline separately from the existing condition.

3.27

COVERED SPECIES

Many of the covered plant species and the tadpole shrimps known occurrences are only within the USB/UDA or significantly so, but most of the mitigation is proposed outside their known occurrences. It is unclear how your proposed preserves match with the needs of the Vernal Pool Recovery Plan and designated critical habitat. An analysis for each species where applicable should be done to demonstrate how you will not preclude recovery or have adversely modified

3.28

3.29

4

critical habitat. This type of analysis should also be done for all the species where it is unclear that there are known occurrences outside the USB/UDA. All covered species must be treated as a listed species, so simply doing preconstruction surveys for example for burrowing owls or tri-colored blackbirds without assurance that you have mitigated for their occurrence in not acceptable. How will you ensure that you have mitigate for each of these covered species to the maximum extent practicable? It is not sufficient to simply say you are acquiring preserves within modeled habitat without knowledge if they occur on site. Again this is not a NCCP. In addition, your mapping is inadequate for emergent marshes along Jackson road where there is a large known tri-colored blackbird colony. Your mapping needs to be revised with more recent information and this occurrence noted. It seems that your modeled habitat is overly broad when it comes to various covered species due to the lack of known occurrences. The Plan could result in preservation of vernal pool grasslands without the species occurring within these preserves and ultimately the destruction of the known occurrences. Again the Plan must be revised to address this concern. 3.30 3.31 3.32

MITIGATION

We are totally baffled what the actual mitigation is for a project that is proposed within the USB/UDA. It appears where there are known developers you simply used their proposed preserve designs as their mitigation. However, what if a future project is proposed that has vernal pools and listed species, what is the mitigation? It is totally confusing to determine if this Plan has sufficient funding mechanisms to meet the mitigation requirements. Many of the properties within the USB/UDA will not be developed but the Plans treat all lands within this area as lands to be developed. This is an erroneous assumption, any individual's lands that are currently not owned by a developer should NOT be considered as developed within these revised documents. We have not found any information on how you plan to fund the plan, how fees are collected or other information on how you would actually propose to stay-ahead and how the funds increase over time. Do you actually have a mechanism for jump-start? Possibly this is in some appendix within the EIE/EIS but it must be within the overall information presented within the HCP. The mitigation plan for a HCP is the heart of the document and should be treated with sufficient depth and understanding for each species. It is important that the public understand and interpret the intent 3.33 3.34 3.35 3.36 3.37

5

and ramifications of the proposed Plan and draft EIR/EIS. The Plan includes vague Biological Goals and Objectives but by definition they are Goals and Objectives without sufficient detail to determine how you will pay for their implementation and with language that allows discretion if they will be implemented. The connections of the various preserves within the Hard Scale preserves are insufficient and there are numerous large vernal pool complexes that were not avoided. What was your basis for the lines for the Hard Scale preserves? The Hard Scale preserves must be enlarged and interconnected and where feasible attached to a stream corridor. The stream corridors are also inadequate, each stream especially Elder and Morrison Creeks must have a corridor and setback similar to Laguna Creek. In addition, the preserves proposed on Mather should be shown to see if they are connected to any of the Hard Scale Preserves. We are not going to individually address each biological goal and objective since without an overall understanding of the actual mitigation for the proposed project it would be useless.

3.44

We could have provided additional specific comments but there are so many glaring deficiencies it did not seem prudent. Again, we are very supportive of good conservation efforts and large scale planning, however this plan and the draft EIR/EIS are insufficient.

3.45

Sincerely,

Cay C. Goude and Eric S. Goude

RTC 3.1 (SSHCP and EIS/EIR) – Each comment in the letter has been reviewed for its applicability to the SSHCP and the EIS/EIR. If a change is needed to one or both documents, those changes have been made in the documents and noted in the response to the comment.

RTC 3.2 (SSHCP and EIS/EIR) – This comment makes a general statement that the SSHCP and EIS/EIR are inadequate and difficult to understand, and that the documents should be recirculated. Please refer to responses to specific concerns in subsequent comments in this comment letter. Based on the responses to comments and analysis contained in the SSHCP and EIS/EIR, no new information has been identified that would result in substantial changes or revisions to the conclusions of the documents that may necessitate recirculation.

RTC 3.3 (SSHCP) – As pointed out in the comment, the SSHCP does address conservation on a large scale. Based on the analysis contained in Chapter 7 of the SSHCP, the Plan Preparers believe that the SSHCP would mitigate to the maximum extent practicable the impacts to Covered Species. Please refer to responses to specific concerns in subsequent comments in this comment letter.

RTC 3.4 (EIS/EIR) – The process used to screen potential alternatives is described in Chapter 2 and Appendix E of the Draft EIS/EIR. Each potential alternative was assessed for its ability to satisfy the purpose, need, and objectives identified for the project in Section 1.3 of the Draft EIS/EIR. Please refer to the response to Comment 5.3 regarding the range of alternatives analyzed in the Draft EIS/EIR.

RTC 3.5 (EIS/EIR) –The comment requests that the EIS/EIR analyze how “piecemeal” or “leap-frog” development patterns during the permit term would affect resources. The EIS/EIR did not examine the effects of this development pattern because each of the alternatives assumes that the USB and UDA would be fully “built out” by the end of the proposed 50-year permit term. With that assumption, all of the resources within the UDA that are not already preserved or proposed to be preserved under the SSHCP are assumed to be impacted, and would need to be mitigated. The comment also requests that an alternative be analyzed that would preclude that pattern of development. The growth and development that is anticipated under the SSHCP is governed not by the SSHCP itself, but by the current and future General Plans of Sacramento County, Rancho Cordova, and Galt. The growth pattern described in the comment, with most development occurring within the UDA, is the pattern that was planned for in those General Plans. Actual development under the SSHCP will proceed in accordance with general and specific plans that have or will be circulated for public review and comment and accepted or rejected by local elected officials. Please refer to response to Comment 5.6 regarding the range of alternatives analyzed in the EIS/EIR.

RTC 3.6 (EIS/EIR) – Any alternative studied in the EIS/EIR cannot supersede or replace the general plan planning process, nor provide the local land use entitlements required to construct or implement the Covered Activities. The boundaries of the USB and UDA were decided by Sacramento County through the general plan planning process and other planning efforts that involve public comment and approval by local elected

officials, and the SSHCP and the EIS/EIR alternatives must be consistent with those plans. Therefore, consistency with the general plan of the land use authority permittees was used as a screening criterion for alternatives, as shown in Appendix E of the Draft EIS/EIR. Please refer to Section 3.4 of the Draft EIS/EIR for a summary of the general plans that are relevant to the Plan Area, and from which analyses were incorporated by reference in the Draft EIS/EIR resource area sections. Refer also to response to Comment 3.5 regarding the growth and development projections used in the EIS/EIR.

RTC 3.7 (SSHCP and EIS/EIR) – Cumulative impacts of development in the County, and when appropriate within larger study areas, including Folsom and other counties within the Sacramento Area Council of Governments (SACOG) five-county region, were analyzed in the Draft EIS/EIR and incorporated by reference in the EIS/EIR from the General Plan EIRs of Sacramento County, Rancho Cordova, and Galt. Some of the key sections where this more regional study area were considered, include Agriculture (refer to Section 6.2.2.2 in the Draft EIS/EIR), and Population, Housing, and Socioeconomics (refer to Section 16.2.2.2 in the Draft EIS/EIR). The SSHCP relies on general plan growth boundaries as opposed to population projections. The County uses the USB to identify their ultimate area of urbanization. The USB was established in the 1993 General Plan and was largely based on geographic limits to growth, such as floodplains. Further, the lead agencies are not aware of any studies that demonstrate regional development is exceeding projected population growth.

RTC 3.8 (SSHCP and EIS/EIR) – Development within the region, when relevant to the resource area being analyzed, is included in the analysis of cumulative impacts provided in Chapters 4, 6, 7, 9, 10, 12, 13, 14, and 15 of the Draft EIS/EIR. Refer to response to Comment 3.6 regarding the cumulative study area used for the EIS/EIR.

RTC 3.9 (SSHCP) – Justification for the 50-year permit term is provided in Chapter 1, Section 1.2.3, of the Draft SSHCP.

The Plan Preparers reviewed comparable HCPs within the State of California and found that a 50-year permit term is not uncommon. For instance, HCPs currently being prepared in Yolo and Placer Counties are also seeking a 50-year permit term. Approved plans in Santa Clara County and San Joaquin County, as well as the Natomas Basin HCP and the North County Multiple Habitat Conservation Program in San Diego County, were granted 50-year permits. Moreover, the Western Riverside County Multiple Species Habitat Conservation Plan and Coachella Valley Multiple Species Habitat Conservation Plan were both granted a 75-year permit term.

Nonetheless, the Draft SSHCP EIS/EIR analyzes an alternative with a 30-year permit term, the Reduced Permit Term Alternative. Refer to Section 2.4 of the Draft EIS/EIR for a detailed description of that assumption. As stated in Section 17.7 of the Draft EIS/EIR, the SSHCP (Proposed Action/Proposed Project Alternative) was determined to be the environmentally preferable alternative under NEPA, and the environmentally superior alternative under CEQA.

RTC 3.10 (SSHCP and EIS/EIR) – Modifications to Jackson Highway are Covered Activities in the SSHCP and the direct and indirect effects of that and other rural transportation projects are analyzed in the Draft EIS/EIR for all resource areas. As with other rural transportation project Covered Activities, modifications to Jackson Highway are approved pursuant to the circulation element of Sacramento County's 2030 General Plan. These improvements were proposed and vetted through a public participation process and approved by local elected officials. The SSHCP does not replace or supercede the local land use planning process. Refer to the list of rural transportation projects in Section 5.2.3 of the SSHCP, and shown on Figure 5-5 in the Draft SSHCP.

RTC 3.11 (SSHCP and EIS/EIR) – Refer to response to Comment 3.10. The Plan Preparers are not aware of why the Jackson Highway modifications would have been presented in that scoping meeting as not part of the SSHCP Covered Activities.

RTC 3.12 (SSHCP and EIS/EIR) – Refer to response to Comment 3.10.

RTC 3.13 (SSHCP and EIS/EIR) – Refer to response to Comment 3.10 regarding Jackson Highway modifications as Covered Activities. As noted in response to Comment 3.10, these modifications are approved pursuant to the circulation element of Sacramento County's 2030 General Plan. The cumulative impacts of those Covered Activities were analyzed in the Sacramento County General Plan EIR, and the analyses were incorporated by reference in the Draft EIS/EIR, as appropriate. Therefore, whether or not the SSHCP goes forward, such modifications are expected to occur.

RTC 3.14 (SSHCP and EIS/EIR) – Refer to response to Comment 3.10.

RTC 3.15 (SSHCP and EIS/EIR) – The potential for the action alternatives to affect listed fish species was considered in Table 1.2.2 of Appendix F to the Draft EIS/EIR. As identified in the table, although habitat for some listed fish species may exist in the Planning Area, there is low likelihood of take from the alternatives because these areas are outside of the UDA. For some species, there is also a very low probability for individuals to be present in the habitat available in the Planning Area. Regarding the delta smelt (*Hypomesus transpacificus*) and listed salmonids in the Delta, the County of Sacramento will use water from its Central Valley Project (CVP) contract in Zone 40, which includes the majority of the SSHCP Plan Area, in accordance with schedules and limits imposed through Bureau of Reclamation's annual CVP water allocation process. Effects on listed fishes in the Delta, including delta smelt and listed salmonids, of diverting that water for use in Zone 40 are addressed in other environmental documents and biological opinions on CVP and State Water Project water operations and are outside the scope of this proposed action.

RTC 3.16 (SSHCP and EIS/EIR) – The Draft EIS/EIR discusses the implications of the Zone 40 Memorandum of Understanding (MOU) in Section 2.2.2. Completion of the SSHCP fulfills a commitment of Sacramento County in their Freeport/Fazio Biological Opinion to address the cumulative impacts of development supported by that new water supply. If a project's water use might impact anadromous fish or delta smelt, the project proponent would have to receive separate incidental take coverage for those species. Effects on listed fishes in the Delta, including anadromous fish, of diverting that water

for use in Zone 40, are addressed in other environmental documents and biological opinions on CVP and State Water Project water operations and are outside the scope of this proposed action. Refer also to response to Comment 3.15.

RTC 3.17 (SSHCP and EIS/EIR) – Refer to response to Comment 3.15 regarding impacts on listed fish species, and refer to response to Comment 3.16 regarding the Freeport/Fazio Biological Opinion.

RTC 3.18 (SSHCP and EIS/EIR) – The SSHCP and the Draft EIS/EIR considered the potential future impacts of climate change in the analysis of impacts and the Conservation Strategy. For example, SSHCP Section 11.3 describes how climate change was accounted for in the measurable objectives, and Section 11.4.3 identifies how the Conservation Strategy would be adjusted for climate change changed circumstances. The EIS/EIR presents the effects of climate change on the Planning Area in Section 15.1.2, and the effects of the alternatives on greenhouse gases and climate change throughout Section 15.2. Refer also to response to Comment 3.16.

RTC 3.19 (SSHCP and EIS/EIR) – Future development in the North Service Area (NSA) is planned to take surface water from the Freeport Regional Water Authority (FRWA) intake on the Sacramento River. This water will be diverted at the intake, treated at the Vineyard Surface Water Treatment Plant, and distributed throughout Zone 40. Sacramento County Water Agency has rights to the surface water supply and planned and existing infrastructure to be able to run the conjunctive use program. The 2016 Water Storage Investment Program (WSIP) describes an “NSA Phase A” water line from the Vineyard Surface Water Treatment Plant that connects to the NSA. This line could serve future new development if and when the development occurs up to the unused capacity in the pipeline itself. To serve existing and future planned development, the Sacramento County Water Agency (SCWA) has the capability to deliver surface water in the NSA in place of using the well field termed the “Excelsior Well Field” that is described in the comment. While the well field is still there to provide conjunctive use for the NSA as our surface water contracts and rights are perfected, surface water can be delivered to existing customers in the NSA.

Conjunctive-use reliance on the well field will diminish over time as water rights and contracts are perfected and the well field will no longer serve groundwater to the NSA. Growth in the NSA service area will require another pipeline from the surface water treatment plant. This pipeline will deliver surface water in the NSA.

The SSHCP does not propose to change the water allocations included in the Freeport/Fazio Biological Opinion; therefore, there is no need for new analysis of the effects from that agreement. Refer to response to Comment 3.15 regarding impacts on listed fish species, and refer to response to Comment 3.16 regarding the Freeport/Fazio Biological Opinion. SCWA’s current water situation is described in the 2016 WSIP (http://www.waterresources.saccounty.net/Zone%2040/WSIP%202016%20Final%20Report%20Website.pdf), as well as in the 2015 Urban Water Management Plan (http://www.waterresources.saccounty.net/Documents/2015%20UWMP.pdf#search=uwmp). Both of these documents describe the implementation of the preferred alternative

of the vineyard surface water treatment plant described in the 2005 Zone 40 Water Supply Master Plan (http://www.waterresources.saccounty.net/Zone%2040/Z40_WSMP.pdf).

RTC 3.20 (SSHCP) –Construction of water pipelines is a Covered Activity and is analyzed in the EIS/EIR. Groundwater wells, water pipelines in the UDA, and new recycled water pipelines outside the UDA are included in all alternatives studied in the EIS/EIR, including the No Action/No Project Alternative. Therefore, the SSHCP is not requiring these actions and this future water infrastructure is not caused by either action alternative.

RTC 3.21 (EIS/EIR) – Covered Activity impacts to groundwater hydrology, as they relate to issuance of the take permits, are analyzed in Sections 7.2.2.1, 7.2.3.1, and 7.2.4.1 of the Draft EIS/EIR. Extensive discussion of the future No Action/No Project baseline condition for groundwater and surface water hydrology in the Planning Area was provided in Section 7.2.2.1 of the Draft EIS/EIR. That future condition takes into account the existing impacts of past and present projects in the Planning Area, which are further considered in the cumulative analysis of the action alternatives in Sections 7.2.3.2 and 7.2.4.2 of the Draft EIS/EIR.

RTC 3.22 (EIS/EIR) – Refer to response to Comment 3.21. The commenter notes wells on Excelsior Road that are being used for longer or more intensely than expected. The Plan Preparers appreciate this information. However, use of groundwater wells in this area is consistent with the Freeport/Fazio Biological Opinion, was part of the No Action/No Project baseline condition for the Draft EIS/EIR as described in Section 7.2.2.1, as well as the cumulative analysis of groundwater use in the Draft EIS/EIR (Section 7.2.3.2).

RTC 3.23 (EIS/EIR) – Refer to response to Comment 3.21.

RTC 3.24 (SSHCP) – The Mather Field Specific Plan is not a Covered Activity. Essentially, the SSHCP treats that area as neither impacted nor preserved. As stated in the SSHCP in Chapter 5 in the footnote on page 5-3, “The Mather Field Specific Plan is still pursuing its own Endangered Species Act (ESA) consultation with the U.S. Fish and Wildlife Service and a Clean Water Act Section 404 permit from the U.S. Army Corps of Engineers; however, the SSHCP Chapter 6 effect analysis treats parcels within the boundary of the Mather Field Specific Plan the same as parcels with existing ESA incidental take authorization and other entitlements.”

RTC 3.25 (EIS/EIR) – The comment largely repeats the justification for the use of the No Action/No Project baseline condition as the CEQA baseline for the action alternatives, which was provided in Section 3.6.1 of the Draft EIS/EIR. The comment also states that the EIS/EIR does not evaluate the impacts of individual projects. The SSHCP EIS/EIR, as with all environmental documents analyzing regional HCPs, is a program-level document. Nonetheless, it does evaluate the impacts of individual Covered Activity project footprints, such as the Capital Southeast Connector, other road projects outside the UDA, and known development projects within the UDA. For other development expected to occur over the permit term, the EIS/EIR made assumptions

regarding the locations, types, and intensities of development based on the adopted general plans of the land use jurisdictions.

RTC 3.26 (EIS/EIR) –The No Action/No Project Alternative describes the effects of a future condition without an HCP, relative to the existing conditions at the time the Notice of Preparation (NOP) was issued. That is, CEQA provides that the environmental setting as it exists when the NOP is issued should "normally" be treated as the baseline for gauging the changes to the environment that will be caused by the project (CEQA Guidelines, Section 151259[a]). However, a lead agency may elect to use a different baseline if there is a reasonable basis for doing so. (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.App.4th 439, 447). In most NEPA analyses, the action alternatives are compared to those future No Action/No Project conditions so that the effects of the alternatives can be determined. The justification for using the future conditions under the No Action/No Project Alternative as the CEQA baseline is provided in Section 3.6.1 of the Draft EIS/EIR.

RTC 3.27 (EIS/EIR) – Refer to response to Comment 3.26 regarding the CEQA baseline. The comment also questions whether the SSHCP will achieve more or better conservation than would occur under the project-by-project permitting that currently occurs. While it is not possible to forecast how requirements under project-by-project permitting could change over the permit term (e.g., mitigation ratios), the SSHCP Preserve System would include more consistent and rigorous qualification for Preserve properties, consistent management and monitoring across the Preserve System, a single local agency with oversight and decision-making authority, and many other benefits as laid out in Section 1.1.2 of the Draft SSHCP. As noted in the ARP that is included as Appendix I to the EIS/EIR, the SSHCP would also be integrated with an ARP that would support watershed-level conservation of aquatic resources.

RTC 3.28 (SSHCP) – Analyses of impacts to Critical Habitat and recovery plan implementation for each vernal pool species are included in the Draft SSHCP, Chapter 6. Chapter 7 of the Draft SSHCP describes the amount of preservation proposed in each Critical Habitat Unit and Core Recovery Area, as well as the consistency of the SSHCP with the Recovery Plan For Vernal Pool Ecosystems of California and Southern Oregon (USFWS 2005). If appropriate, findings of jeopardy and adverse modification will be part of the USFWS Endangered Species Act consultation and findings that must be completed before a permit for SSHCP can be issued.

RTC 3.29 (SSHCP) – Refer to response to Comment 3.28.

RTC 3.30 (SSHCP) – Covered Species occupancy will be a critical factor used when assessing a potential Preserve parcel for acquisition. The Conservation Strategy also includes specific requirements to preserve known tricolored blackbird (*Agelaius tricolor*) colonies and occupied burrowing owl (*Athene cunicularia*) burrow sites. Refer to Table 7-1 in the SSHCP and the biological goals, measurable objectives, and conservation actions therein and species-specific avoidance and minimization measures in Chapter 5.

RTC 3.31 (SSHCP) – The measurable objectives for each species include preservation of modeled habitat, re-establishment/establishment of habitat, and in many cases, preservation of known occurrences. For example, for tricolored blackbird, objective TB5 requires any project impacting a tricolored blackbird colony to preserve a colony of at least 200 individuals in an SSHCP Preserve. Objective TB7 requires that at least one large colony (>1,500 individuals) be preserved in the SSHCP Preserve System. For burrowing owl, objective BO1 requires that seven occupied western burrowing owl sites be preserved within the SSHCP Preserve System, including at least 200 acres around each occupied burrow site, and with preserved modeled foraging habitat within at least 0.4 mile of the preserved burrow site. Regarding alleged omissions in the mapping, there are limitations to mapping an area as large as the SSHCP Plan Area including limited access to many parcels of land and limited resources available with which to ground truth the entire SSHCP plan area. The SSHCP maps are intended to serve as a general representation of what is actually on the ground. Updates to the map will be made as site-specific surveys are prepared as part of a land use application and acquisition of habitat for conservation. Please refer to Chapter 10, section 10.4.2 of the Draft SSHCP *"Components of the SSHCP Permit Application Package"* for a description of maps that must be prepared for each project.

RTC 3.32 (SSHCP) – The broadness of species habitat modeling will be to the benefit of covered species, because impacts to modeled habitat will require mitigation even if covered species are not detected. Any project proposing to use the SSHCP will need to conduct species surveys and wetland delineations, as appropriate for the property, and the Implementing Entity will compile a biological resources letter report based on the site-specific surveys to document the resources present on the project site. The presence of covered species will also be used to identity and evaluate potential preserves. For example, the presence of vernal pool invertebrates will be one of the criteria used when evaluating potential preserve acquisitions (refer to Conservation Action VPI1.1 in the Draft SSHCP). In addition, a Preserve Documentation Report (PDR) must be prepared for each potential land acquisition. The PDR will include species occurrence information obtained from site surveys conducted by the SSHCP Implementing Entity and will include species occurrence information from database searches. The information contained in the PDR will be used to help decide which parcels will be acquired.

RTC 3.33 (SSHCP) – It is assumed that the comment is referring to five large scale master plans that are within the SSHCP's Urban Development Area, two of which are already approved and three of which are in the entitlement approval process. Because these projects were seeking land use entitlements while the SSHCP was being developed it was necessary to incorporate these five master plans into the SSHCP planning process as SSHCP Covered Activities, even as they each pursued their own permits from the resource agencies. Each of the five master plans was required to set aside significant on-site preserves, which became the "hard-line" preserves of the SSHCP Conservation Strategy. As development of SSHCP progressed there was opportunity to also apply SSHCP avoidance and minimization measures to the master plans to satisfy the SSHCP's Conservation Strategy. These "hard line preserves" are

the only preserve areas that can be mapped at this time, but are not the only preserves that SSHCP will create within the UDA.

Where the County or cities were actively working with project applicants that were required to prepare a master plan per County or city General Plan Policy and that Master Plan was within the SSHCP's Plan Area, we along with the wildlife agencies worked with the project applicant to design on-site preserves consistent with the SSHCP's Conservation Strategy. Project applicants required to provide on-site preserves will receive credit for their on-site preserves towards their mitigation obligations. Additional consideration of avoidance of resources on-site will come through the Clean Water Act permitting process for the SSHCP plan area.

For the scenario described in the comment, projects that wish to use SSHCP take coverage for their covered activities will have to conduct specific studies on their site, pay development fees and potentially dedicate land. This process is described in Section 10 of the Draft SSHCP.

RTC 3.34 (SSHCP) – The comment questions whether the SSHCP has adequate funding mechanisms to meet mitigation requirements. A complete funding analysis that demonstrates the feasibility of implementing the Conservation Strategy is provided in Chapter 12 *Economic Analysis and Funding Program.* Please note that the SSHCP does not treat all lands within the UDA as developed. The effects analysis (See Chapter 6, Section 6.4.2) excludes the following lands that are within the UDA: 1) existing preserves; 2) planned SSHCP Preserves; 3) stream and preserve setbacks; 4) proposed projects with existing ESA Incidental Take authorization and other required entitlements; and 5) properties within 8,660 acres of the approximately 9,160 acres of already-subdivided parcels (defined as large lot sizes of 0.5 to 4.5 acres for the purposes of this effect analysis) primarily west of Excelsior Road in the UDA. The comment also requests that the SSHCP not assume properties within the UDA will be developed unless they are proposed for development or are owned by a developer. The SSHCP was designed to be consistent with the general plans and urban service boundaries of Sacramento County, Rancho Cordova, and Galt, and the land uses that were adopted through those extensive public processes. By assuming that the UDA would be largely built out during the permit term, the EIS/EIR also analyzed a "worst case" scenario for most resource areas.

RTC 3.35 (SSHCP) – Chapter 12 *Economic Analysis and Funding Program* provides information on how the plan will be funded, Chapters 9 *Implementation* and 10 *SSHCP Permit Application Process* provide details on how fees are calculated and collected. A detailed explanation of the Jump-Start and Stay-Ahead Program is explained in Chapter 9, Section 9.4.6 *Jump-Start and Stay Ahead Provisions.* A detailed description for how fees are adjusted can be found in Chapter 12, Section 12.4.3.2 *Development Fee Adjustment Program.*

RTC 3.36 (SSHCP) – A detailed description of the Jump-Start and Stay-Ahead Program can be found in Chapter 9, Section 9.4.6 *Jump-Start and Stay Ahead Provisions.* Additional references to this section have been added to Section 7 of the Final SSHCP.

RTC 3.37 (SSHCP) – A detailed explanation of the Conservation Strategy is provided in SSHCP Chapter 7.

RTC 3.38 (SSHCP) – The biological goals are indeed broad by design, and measurable objectives represent the next level with quantifiable conservation targets (see 65 FR 35242). The way the objectives will be implemented is described in the Conservation Actions shown in Table 7-1. Implementation and funding of the HCP is described in Sections 9, 10, and 12 in the Draft SSHCP. Additional references to these sections have been added to Section 7 of the Final SSHCP.

RTC 3.39 (SSHCP) – Linkage Preserves are designed to maintain connectivity between existing preserves and SSHCP Preserves, providing for wildlife movement and, in many cases, hydrological connections between Preserves. Their ultimate size and dimensions (i.e., width and length of the linkage) will depend on several factors, including habitat types in the linkage, the ecological function(s) the linkage is designed to serve (e.g., overland wildlife movement, drainage), and adjacent land uses. The Linkage Preserves will need to be wide enough to support the suite of species expected to use the linkage, including movement habitat for more mobile species and "live-in" habitat for more sedentary species, and to provide adequate setbacks from adjacent land uses and potential edge effects, including invasive species, runoff, pollutants, lighting, and noise. Pursuant to Objective L2, the Linkage Preserves inside the UDA will have minimum widths of approximately 600 feet, except where this minimum width is not possible due existing physical constraints such as adjacent existing land uses or ownership constraints.

RTC 3.40 (SSHCP) – The boundaries of the "hardline" preserves were determined through analysis of the biological resources available on the properties, and were adjusted and refined over several years through discussions between the landowners, the land use authority jurisdictions, the Wildlife Agencies, and other responsible agencies such as USACE. Refer to Response to Comment 3.41 regarding the widths of linkage preserves in the UDA.

RTC 3.41 (SSHCP) – Refer to response to Comment 3.40 regarding the boundaries of the hardline preserves. The comment also requests that hardline preserves be connected by linkages and connected to stream corridors. The SSHCP Conservation Strategy recognizes the value of habitat linkage, and thus all of the hardline preserves will be connected by linkages (Chapter 7, see Objective L2). Connections were made to stream corridors when that was feasible, but based on the covered species for the SSHCP and their limited use of stream corridors that was not a primary consideration in preserve design.

RTC 3.42 (SSHCP) – The setback width for Laguna Creek was determined using different parameters than the setback widths for other creeks. The SSHCP implementing Entity anticipates that species will continue to occur within the Laguna Creek Corridor. Setback widths are typically much larger along creeks when species protection is an objective of the setback. In contrast, the setbacks for Elder and Morrison Creeks have been established for purposes of protecting water quality.

Setbacks for water quality are typically smaller than setbacks that have been established for species protection.

RTC 3.43 (SSHCP) – There are several maps contained within the SSHCP that show the preserve on Mather in relation to “hardline” preserves. Chapter 7, Figure 7-2 Existing Preserves and SSHCP Planned Hardline Preserves is one such map.

RTC 3.44 (SSHCP) – The Conservation Strategy for the SSHCP is summarized in page 7-1 and 7-2 of the Draft SSHCP, and would be accomplished through implementation of the measurable objectives in Table 7-1 of the Draft SSHCP, which includes detailed conservation actions directing how the measurable objectives would be achieved. The bulk of the Conservation Strategy involves assembling a Preserve System, as described in Sections 7.4 and 7.5 of the Draft SSHCP. Development fees would be collected from entities using the SSHCP permits, and those development fees would fund property acquisition and other parts of the Conservation Strategy.

RTC 3.45 (SSHCP) – The comment does not provide any additional specific comments and thus no further responses are feasible.

LETTER 4 CITY OF ELK GROVE (SSHCP)

ELK GROVE

September 5, 2017

VIA USPS and EMAIL

Richard Radmacher
Senior Planner
County of Sacramento
827 7th Street, Room 225
Sacramento, CA 95814

RE: Draft South Sacramento Habitat Conservation Plan

Dear Mr. Radmacher,

The City of Elk Grove (City) has reviewed the draft South Sacramento Habitat Conservation Plan (SSHCP). City staff has also had the opportunity to meet with you to discuss our understanding the SSHCP and the City's concerns. The following outlines these concerns and requested changes to the SSHCP that the City believes will improve the Plan and make it more clear for the County, the City, and other parties and agencies to implement if the Plan is adopted. These items are in addition to the comments on the draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR), which are provided under separate cover, with this letter as an attachment. 4.1

1. Applicability to Areas Outside of the Urban Development Area

The SSHCP is very clear on its applicability to Covered Activities within the designated Urban Development Area (UDA), providing a streamlined process for Incidental Take, Section 404 permitting, Section 401 permitting, and 1602 permitting. However, the document could be more direct in stating that proposed activities outside of the UDA, while subject to the standard permitting process, are not precluded by the HCP. The City suggests adding the following discussion as a new Section 1.2.5, along with similar language in an appropriate location in Chapter 9 (Implementation): 4.2

1.2.5 Areas Outside the UDA
As discussed, the SSHCP provides a streamlined permitting process for Covered Activities within the Urban Development Area identified in the Plan. This does not preclude activities from occurring outside of the Urban Development Area, provided they obtain the legally required local, State, and Federal permits and approvals otherwise and customarily required, including mitigation for impacts to the environment caused by those activities. In other words, development outside of the Urban Development Area is not provided any direct benefits from this HCP. Any required mitigation should also include a consult with the HCP's Implementing Entity for maximum species benefit, but to the final decision shall be made by the applicable Lead Agency to complete pursuant to their thresholds and regulations.

The City also suggests that Section 1.2.1 (Geographic Scope of the Plan Area) be updated to read: 4.3

The Plan Area is functionally divided into two components: inside and outside of an Urban Development Area (UDA). Inside the UDA is predominately where ~~all proposed urbanization will occur~~ Covered Activities under this Plan will occur, and therefore, where most incidental take will occur. There will also be some habitat preservation within the UDA. The "inside the UDA" component totals 67,618 acres within the Plan Area. Geographically, the UDA is the portion of the Sacramento County Urban Services Boundary (USB), the incorporated Cities of Rancho Cordova and Galt, and Galt's Sphere of Influence that are also within the Plan Area (see Figure 1-1) as these are the Plan Partners for the SSHCP. The Plan Area component located outside of the UDA totals 250,038 acres. No urban development is covered under

the SSHCP outside of the UDA. A limited amount of incidental take is requested for specific infrastructure projects and for species conservation activities proposed outside of the UDA.

4.3 cont'd

2. Implementation After Annexation

As Sacramento County is aware, there are multiple Sphere of Influence Amendment applications pending before the Sacramento Local Agency Formation Commission (LAFCo) relative to Elk Grove. Some of these are within the HCP's UDA, while others are not. For those that are within the UDA, the City's understanding is that Covered Activities would still benefit from the HCP after annexation.

Chapter 1 implies that an annexing agency would become a Third Party Participating Special Entity, availing themselves of the mitigation benefits of the HCP. However, in the definition of Third Party Participating Special Entities the City of Elk Grove is not specifically listed as a covered entity. However, it is also not under the jurisdiction of a Land Use Authority Permittee which may be the intent for the Third Party Participating Special Entity. The HCP gives examples of school districts, reclamation districts, irrigation or water districts, utilities or other organizations that are not subject to the regulatory authority of a local jurisdiction. The City of Elk Grove technically qualifies under the definition but the definition needs clarification.

4.4

City staff also found a separate but related discussion on this matter in Section 15.13 of Appendix C (Implementing Agreement), which states that when a jurisdiction that is not a Plan Permittee is annexed land within the UDA they would work with the Implementing Entity and the USFWS to become a Plan Permittee. This appears to be a more valid approach than the Third Party Participating Special Entity as it recognizes the City as a land use agency like the County and other cities. Therefore, the City requests that:

- Sections 9.2 and 9.2.1 be updated to reflect the language in Section 15.13 of the Implementing Agreement, identifying that other land use agencies can become Plan Permittees as a result of annexation upon executing of the Implementing Agreement by the annexing agency.
- Chapter 1 and Section 10.2.3 be updated to identify that other agencies may become Plan Permittees as a result of annexation.
- Section 15.13 of the Implementing Agreement needs to be simplified such that the annexing agency shall sign the Implementing Agreement and become a member of the Implementing Entity Joint Powers Authority.

4.5

3. Biological Resources Analysis Contains Errors and Establishes a Bad Precedence

Major sections of the Biological Resources Setting in Chapter 3 are based upon habitat modeling that relies on inaccurate or incomplete species information. For example, the giant garter snake (GGS) habitat map indicates habitat south of Kammerer Road, when prior analysis of this area determined that it is not GGS habitat and the ditches relied upon in the analysis are not connected to known populations. Technical information on this matter was sent to you by our staff on August 17, 2017 and is attached for your reference. The City appreciates that you are working with our technical staff to address these issues.

4.6

The City is concerned that the lack of detailed species studies as the foundation for the habitat models is resulting in overly broad models that site the species in areas where they just do not occur. As a result, it appears that the preservation targets are not biologically defensible. As a conservation plan, the SSHCP could be misunderstood as a definitive resource habitat and could set an improper precedent for projects not covered by the HCP. More should be added to the draft HCP, particularly in Chapter 3, to clarify the intent of this information and that it is only applicable within the SSHCP and is not a resource in determining potential impacts outside the HCP.

4.7

4. Laguna Creek Wildlife Corridor

Section 7.5.1.6 describes a wildlife movement corridor along Laguna Creek that would be extended from PPU 3 to Elk Grove. The City is interested in learning more about this concept and what benefits and impacts there may be from extending the corridor into the City. I invite you to provide City staff with any additional information on this topic, and, thereafter, a meeting with City and County staff may be appropriate to further explore this matter.

4.8

5. Preserve System Outside the UDA

Based on recent discussion between City and County staff, the City understanding of Section 7.5.2 is that the planned preserve system outside of the UDA is not precisely defined and will instead be determined by the Implementing Agency as mitigation lands are acquired. Given the presence of existing preserves along the Cosumnes River, the City understands that the expansion of preserves from this framework will be the overall objective, within the Biological Goals and Measurable Objectives. Ultimately, the preservation acreages by Preserve category by Preserve Planning Unit (PPU) must be achieved; unless a shifting of acreage between PPUs is specifically approved and within the 15% rule outlined in Section 7.5.2.

The target preserve acreage within each PPU needs to be clarified, specifically identifying the percentage of the total available land (unencumbered by an existing preserve). For example, PPU 6 identifies a target of 9,750 SSHCP preserve acres, which appears to be 14.5% of the total 67,120 acres available. However, the City understands from our meeting on August 16, 2017 and Table 7-84 that for some species, such as sandhill crane, lands that are below sea level are not to be used for mitigation. Therefore, the target preserve acreage may actually be closer to 30% of the total available land. This kind of disclosure would be beneficial. 4.9

Additionally, the City believes that an additional discussion to Chapter 7 relative to non-SSHCP preserves should occur. This discussion should address the intent and objectives of the Implementing Entity in coordinating with others that are acquiring preserves inside the various PPUs for the common benefit of the species. For example, should the City annex lands south of Kammerer Road, the SSHCP would not provide a mitigation process and this project would have to obtain its own permits and mitigation. The City is supportive of a consultation process to ensure that the City and HCP are not competing cross interests. 4.10

6. Plan Amendments

As you are aware, the City's existing General Plan contemplates development south of Kammerer Road and outside of the UDA. The pending General Plan Update will include more details on the City's vision for these areas, as well as outline the City's approach to considering development and annexation applications. Included in this discussion, the City is considering a draft policy/program that, in concept, is as follows:

> *Identify an advance mitigation program for critical habitat for special-status species known to occur within the Study Areas. A proposed project determined to have a significant impact to habitat for special-status species must implement applicable mitigation measures established in the program, including but not limited to land dedication (which may be located either inside or outside the Study Area) or fee payment.* 4.11

Given this, the City is interested in what future opportunities there are to incorporate these study areas into the SSHCP through a future amendment. While the SSHCP cannot provide guarantees that an amendment would occur, the City is interested in understanding the interest in the Plan Permittees and the Permitting Agencies in engaging in this dialogue once the HCP is adopted. In that context, the SSHCP should provide more details on the process for amendment and how amendments are considered in the context of the conservation strategy and preserve system.

The City encourages the County to reevaluate the SSHCP in light of the comments made herein, and to revise the SSHCP accordingly.

Thank you for considering the City's concerns. We are available to answer any questions or discuss these issues in more detail. The City reserves the right to provide further information, comment, and analysis on the SSHCP prior to its approval. 4.12

Sincerely,

Laura S. Gill

Laura S. Gill, City Manager

Attachment: Biological Resource Data

RTC 4.1 (SSHCP) – The comments provided in this letter from the City of Elk Grove are acknowledged and have been carefully considered. Responses to these comments are provided below and changes considered warranted resulting from the comments are referenced in the SSHCP text.

RTC 4.2 (SSHCP) – New language has been inserted in to Section 1.2.1 *"Geographic Scope of the Plan Area"* (page 1-8) in the Final SSHCP to explain that the SSHCP does not preclude non-SSHCP activities from occurring outside of the UDA.

Language was not included regarding how decisions will be made concerning required mitigation outside of the SSHCP as this is beyond the scope of the SSHCP. However information has been added in response to comment 4.5 below on how such areas outside the UDA may eventually be amended in to the plan.

RTC 4.3 (SSHCP) – Section 1.2.1 *"Geographic Scope of the Plan Area"* has been modified in the Final SSHCP to include edits similar to those suggested.

RTC 4.4 (SSHCP) – Language has been added to Section 9.3.1, page 9-13 of the Final SSHCP to make it clear that land use jurisdictions (e.g. City of Elk Grove) that are not local Land Use Authority Permittees can participate in the SSHCP as Participating Special Entities if their projects are otherwise consistent with the requirements set forth in the SSHCP, especially as described in Section 10.4 of the Final SSHCP.

RTC 4.5 (SSHCP) – Unincorporated (i.e., currently County land) within the UDA is covered under the SSHCP, and the SSHCP and EIS/EIR assumed that covered activities would cause take in those areas. If the City of Elk Grove annexes those lands, they could apply to use the SSHCP take coverage as a Participating Special Entity. An area outside the UDA (e.g., areas south of Kammerer Road) is not assumed in the SSHCP or EIS/EIR to be impacted by the SSHCP and the City of Elk Grove would need to seek a major amendment to the SSHCP to become a Plan Permittee in order to get take coverage through the SSHCP permits if they were to annex those lands. Section 15.13 of the Implementing Agreement (Appendix C to the Final SSHCP) has been revised to read: "If an agreement can be reached, that jurisdiction shall become a Plan Permittee after executing an addendum to this Agreement and complying with Section 9.10.3 of the SSHCP."

RTC 4.6 (SSHCP) –The species models presented in the SSHCP are based on the best scientific information available at the time the models were developed and all species models, including the giant gartersnake model, were vetted with the wildlife agencies and an advisory group made up of local species experts.

In regards to the specific comment concerning the giant gartersnake species model, it must be noted that the species model section of the SSHCP (Chapter 3, Section 3.4) clearly states that the models were developed to identify suitable habitat for the species, and not to indicate current species occupancy. The Biological Opinion (BO) and the Biological Assessment (BA) attached to the BO on the proposed Kammerer Road

Extension Project were offered as evidence that the area south of the current Elk Grove City limits is not suitable habitat.

While both the Kammerer Road Extension Project BO and BA conclude that giant gartersnakes are not likely to occupy the area, both the BO and the BA suggest that the area in question is suitable habitat for giant gartersnake, which is the main purpose of the species model. Therefore we do not see this example as evidence to support the assertion that the SSHCP species models are inaccurate.

RTC 4.7 (SSHCP) – See response to Comment 4.6. The purpose of the species models is to identify suitable habitat, not occupied habitat. Habitat does not have to be occupied to be suitable. The species habitat models were developed as part of the SSHCP Conservation Strategy to help the Plan Preparers quantify impacts to covered species from implementation of Covered Activities, and the models are intended to be used in conjunction with SSHCP implementation. It is outside the purview of the SSHCP to speculate how other parties might view the habitat models outside of the context of SSHCP. Regarding the defensibility of the preservation targets, Chapter 7 of the SSHCP analyzes the effectiveness of the proposed preservation targets and whether they would effectively mitigate for the effects of Covered Activities.

RTC 4.8 (SSHCP) – The Plan Partners welcome interagency collaboration and would be happy to discuss the Laguna Creek Wildlife Corridor with the City of Elk Grove.

RTC 4.9 (SSHCP) – The city's understanding of SSHCP Section 7.5.2 is correct. The precise location of preserves, other than hardline preserves, is not identified in the SSHCP. This is intentional because only the proponents of hardline preserves have currently committed their lands to the SSHCP Conservation Strategy. Showing lands held by private owners who have not confirmed their intent to enroll in the SSHCP Preserve System would not be appropriate, and similar restrictions on mapping have been followed in other regional HCPs (e.g., Santa Clara HCP). The comment also requests that the SSHCP present the amount of available land in each PPU in terms of the unencumbered land (those lands without an existing preserve, and above sea level). The City is correct that none of the preserves in the SSHCP Preserve System will be below sea level. This was accounted for in the maps of modeled habitat for each species. Tracking the inventory of available lands as directed in the comment is something the Implementing Entity will do during monitoring and reporting of the permitted SSHCP. The Implementing Entity, following the criteria as set forth in the SSHCP, will acquire habitat for the Preserve System. The SSHCP will attempt to build from existing preserves where possible, but is not restricted to only acquiring lands that are adjacent to existing preserves.

RTC 4.10 (SSHCP) – Refer to response to comment 4.11 below regarding the process to be followed if the City wished to use the SSHCP to mitigate impacts from developing south of Kammerer Road. The Plan Preparers agree that coordination between the City and Implementing Entity when acquiring preserve lands will be useful, and look forward to future discussions about how to ensure that coordination occurs. However, those

types of discussions will be on a case-by-case basis and the plan preparers chose not formalize that process in the SSHCP.

RTC 4.11 (SSHCP) – Language has been added to Chapter 9 of the SSHCP to make it clear that land use jurisdictions (e.g. City of Elk Grove) that are not local Land Use Authority Permittees can participate in the SSHCP as Participating Special Entities assuming that their projects are otherwise consistent with the permitting process for covered activities in the SSHCP. Please refer to Section titled “Implementing Entity Responsibility in Reviewing Participating Special Entities Requests for Take Authorization” in Section 9.3.1 of the Final SSHCP.

However, an area outside the UDA (e.g., areas south of Kammerer Road) is not assumed in the SSHCP or EIS/EIR to be impacted and the City of Elk Grove would need to seek a major amendment to the SSHCP to become a Plan Permittee in order to get take coverage through the SSHCP permits if they were to annex those lands. The County welcomes open dialog regarding the City’s potential future participation in the SSHCP and encourages the City to contact the County and the SSHCP Implementing Entity when they are ready to discuss such opportunities. As noted, the SSHCP Plan Permittees cannot provide a guaranteed outcome, but nonetheless welcome the dialog.

RTC 4.12 (SSHCP) – The comment requests that the County evaluate the SSHCP to determine whether or not it is sufficient. The comment also notes the City’s availability to discuss the issues noted in the comment letter in greater detail. The lead agencies have determined that the SSHCP is sufficient, and will not be recirculated.

LETTER 5 CITY OF ELK GROVE (SSHCP AND EIS/EIR)

ELK GROVE

September 5, 2017

VIA USPS and EMAIL

Jan C. Knight

County of Sacramento
827 7th Street, Room 225
Sacramento, CA 95814

RE: South Sacramento Habitat Conservation Plan Draft EIS/EIR

Dear Ms. Knight and Mr. Radmacher,

The City of Elk Grove (City) has reviewed the draft South Sacramento Habitat Conservation Plan (SSHCP) and accompanying draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR). While the SSHCP may be an important plan for the mitigation of habitat of protected species under State and Federal regulations, the City has many concerns with both the Plan and the accompanying EIS/EIR. The following summarizes our concerns on the environmental analysis, and attached are comments we have provided directly to Sacramento County on the content of the Plan. Our hope is that these concerns can be addressed in a timely and effective manner for the benefit of both the SSHCP and the City. 5.1

1. **The Definition of the Project Area should be clarified.**
The EIR/EIS makes use of the term "Planning Area" (Section 1.1.1), defined as "the area in which all SSHCP Covered Activities (projects and activities) and all SSHCP habitat conservation actions, projects, and activities would be implemented, and where all associated incidental take of species would occur. .., The Planning Area encompasses approximately 317,655 acres within south Sacramento County, as shown on Figure 1-1, South Sacramento Habitat Conservation Plan Area." However, Figure 1-1, and other figures throughout the EIS/EIR, do not use the term Planning Area, rather referring to the term "SSHCP Plan Area." It appears the two are synonymous. The City recommends that this terminology be clarified throughout both the EIS/EIR and the SSHCP. Any suggestion that the Planning Area is limited to just the Urban Development Area, or some other lesser area, should be clarified and corrected. 5.2

2. **The Project Objectives Improperly Seek to Constrain Local Land Use Authority.**
Section 1.3.3 of the EIS/EIR identifies objectives for the Project. Specifically, objective 16 states:

> *Allow an adequate amount of urban development within the currently adopted spheres of influence for Rancho Cordova and Galt, and the currently adopted USB for Sacramento County, to discourage expansion beyond these boundaries and maintain the sound land use planning principles these boundaries encourage (e.g., preventing sprawl outside the USB and leap-frog development; consolidating development* 5.3

to support the efficient provision of utilities and infrastructure; promoting compact mixed use development that supports viable transit and walkable areas; creating communities with a variety of housing types that support different income levels and socioeconomic conditions; and maintaining compliance with air quality laws and regulations that influence or are influenced by land use decisions such as Assembly Bill 32, Senate Bill 375, and the Clean Air Act).

The City objects to inclusion of this objective. As stated in the Plan, the HCP is not a land use plan and cannot be a land use plan. The establishment of this objective appears to contradict this central tenant by "discouraging" and limiting development beyond the boundaries of the member jurisdictions and other local agencies. It is not the HCP's place to limit growth. Rather, the HCP creates a streamlined process towards mitigating impacts within the HCP's Urban Development Area (see Draft SSHCP, page 1-6, third paragraph, where it is stated "It should be noted that the SSHCP is not a land use document."). Asserting this objective makes a statement suited for a land use authority contrary to the authority of an HCP. 5.3 cont'd

For the HCP to reflect future limits of growth, it would need to incorporate additional analysis, such as the City's 2003 General Plan, which includes opportunities for future development south of Kammerer Road. The City's pending 2018 General Plan Update will refine this discussion, focusing on the area between Kammerer Road and Eschinger Road, and will include programmatic concepts for future development capacity and the organizing principles for future land use planning. The SSHCP must factor in the City's General Plan and the forthcoming updated policies. As noted below, the EIS/EIR excludes valuable information from the City's General Plan, including future growth policies, making the document insufficient.

3. The EIR/EIS Makes Improper Development Assumptions.

Section 1.5 discusses the permit issuance criteria for the applicable resource agencies under an HCP. Section 1.5.1 specifically lists the permit criteria for the U.S. Fish and Wildlife Service, including criteria 7, which states "The USFWS has received assurances that the HCP will be implemented by the applicants." The EIS/EIR appears to rely on the assumption that all developable lands within the Urban Development Area will be developed within the timeframe of the HCP permit (50-years), providing sufficient revenue to allow for the establishment of the targeted preserve acreage within the various Preserve Planning Units. However, the City is unable to identify any justification within the EIS/EIR that this will occur. Therefore, the EIS/EIR should be updated to include the necessary discussion to disclose what would occur if not all lands within the Urban Development Area were developed and contributed towards the SSHCP financing plan. 5.4

4. The EIS/EIR Ignores the City's Planning Efforts.

Section 1.6.4 states that "The SSHCP EIS/EIR provides regional scale comprehensive analyses of environmental impacts of all planned urban development within the Planning Area over a 50-year period." Similar language is also present in Section 1.6.5. These statements are simply not true. Since 2003, the City of Elk Grove's General Plan has identified future development potential south of Kammerer Road and Grant Line Road. Additionally, the Sacramento Area Council of Governments Blueprint shows some development occurring south of Kammerer Road in a post-2050 condition. The SSHCP ignores these facts and excludes areas south of Kammerer Road from the Urban Development Area. Thus, basing the analysis solely on the Sacramento County General Plan and/or the General Plan of Rancho Cordova or Galt does not provide a complete analysis of the cumulative condition and potentially sets the EIS/EIR up for failure. See additional discussion below. 5.5

5. Clarification of Status of an Entity upon Annexation

It is not clear if an entity becomes a Third Party Participating Special Entity or a Plan Permittee upon annexation. As provided in our comments to Sacramento County (attached), the discussion in both the SSHCP and the EIS/EIR regarding Third Party Participating Special Entities needs to be clarified. Specifically, page 1-39 and 1-40 discuss the concept of Participating Special Entities and how they are not under the jurisdiction of a Land Use Authority Permittee. Given the potential for areas in Preserve Planning Unit 4 to be annexed into the City of Elk Grove, the list of potential Participating Special Entities should be expanded to specifically identify "other land use agencies through approved annexations." The list that is present now is very limiting even though there is some implication that it was intended to be inclusive. The SSHCP's ability to successfully meet its goal of conserved property within a given PPU would require a definition of any public agency not currently 5.6

a Participating Permittee to be included if it becomes the land use authority for a given area and how that inclusion would specifically occur.

5.6 cont'd

6. The EIS/EIR Does Not Adequately Analyze a Reasonable Range of Project Alternatives.
A key component of an EIR is a discussion of a reasonable range of project alternatives. (Pub. Res. Code § 21002.1(a) & § 21100(b)(4).) An EIR must "describe a range of reasonable alternatives to the project, which would feasibly attain most of the basic objectives of the project . . . and evaluate the comparative merits of the alternatives." (14 Cal. Code Regs. § 15126.6.) CEQA requires that one of the alternatives to the proposed project be the "no project" alternative. (14 Cal. Code Regs. § 15126.6(e).)

An adequate alternatives analysis is necessary to foster meaningful public participation. (*Laurel Heights Improvement Ass'n v. Regents of the University of California* (1988) 47 cal.3d 376, 403 "*Laurel Heights I.*") As to any project alternatives, "it is the project proponent's responsibility to provide an adequate discussion of alternatives. That responsibility is not dependent in the first instance on a showing by the public that there are feasible alternatives." (*Id.* at 405.) A "scant" and abbreviated discussion of alternatives is inadequate. (*Id.*)

The discussion of alternatives is not limited solely to those deemed "feasible" by the project proponents. (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 737.) "Even if alternatives are rejected, an EIR must explain why each suggested alternative either does not satisfy the goals of the proposed project, does not offer substantial environmental advantages or cannot be accomplished." (*Ibid.*) The fact that the project proponent hopes to adopt a particular alternative, and even perhaps made substantial investments in hopes of a particular alternative, is not determinative. (*Kings County Farm Bureau v. City of Hanford, supra*, 221 Cal.App.3d at 736.) "If the agency finds certain alternatives to be infeasible, its analysis must explain in meaningful detail the reasons and facts supporting that conclusion." (*Marin Municipal Water District v. KG Land California Corporation* (1991) 235 Cal.App.3d 1652, 1664.) A discussion of alternatives which omits relevant, crucial information, "subvert[s] the purposes of CEQA and is legally inadequate." (*San Joaquin Raptor, supra*, 27 Cal.App.4th at 739.)

5.7

The EIS/EIR purports to present three alternatives for detailed analysis. (EIS/EIR at ES-5, §§ 2.2-2.4.) In reality, however, the EIS/EIR only presents one project alternative for analysis. This is because one of the alternatives is the Proposed Project itself, and one of the alternatives is the CEQA-mandated "no project" alternative. The only true alternative is the Reduced Permit Term alternative. Analyzing only one true project alternative violates the CEQA principle of analyzing a "range of reasonable alternatives," making the EIS/EIR legally deficient.

Section 2.1.3 of the EIS/EIR contains a scant discussion of other potential alternatives, including "Different Planning Area boundary," Different types of Covered Activities," and "Different amounts or frequency of Covered Activities." Section 2.1.4 purports to describe the screening process for consideration of alternatives, and Section 2.1.5 identifies alternatives considered and not carries forward for detailed analysis. Nowhere, for instance, in Section 2.1.5 is an alternative with a larger Urban Development Area discussed. The introduction to the section discusses that alternatives that did not meet the project objectives were rejected. However, CEQA does not require that all project objectives be achieved for all alternatives. Moreover, the detailed set of 18 project objectives set forth at section 1.3.3, including objective 16 discussed above, improperly constrained the alternatives analysis and had the effect of causing certain otherwise potentially feasible alternatives to be rejected from further consideration. Where, as here, the EIS/EIR provides an "artificially narrow" set of objectives prejudicing meaningful consideration of alternatives, the alternatives analysis is deficient. (*North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 657, 667-670.)

7. The EIS/EIR ignores the City's General Plan.
Section 3.4 discusses information presented in prior documents that may be incorporated in the EIS/EIR. This section identifies the General Plans and accompanying Environmental Impact Reports for the County of Sacramento and the Cities of Rancho Cordova and Galt, as well as the SACOG Metropolitan Transportation Plan/Sustainable Communities Strategy and the Capital Southeast Connector JPA. However, the section neglects to include the City of Elk Grove General Plan and its EIR, which do address portions of the Planning

5.8

Area. The City's policies identify future development south of Kammerer Road and these potential actions should have been considered as part of the EIS/EIR. 5.8 cont'd

8. Improper Assumptions are Made Concerning Development Occurring Outside of the Urban Development Area.

Various sections of the EIS/EIR, including 2.2.2, 3.6, and 3.7, discuss assumptions used in the No Project and Project alternatives. Specifically, the EIS/EIR states that under the No Project Alternative 1,900 acres outside of the Urban Development Area would be developed. The basis for this assumption is that under the permit process provided under the No Project there would be development pressures elsewhere in the Planning Area (likely Elk Grove) that extend the footprint of development. However, the assumption ignores the policies of the City's General Plan and pending Sphere of Influence Amendment requests for Elk Grove. A more reasonable and justifiable assumption is that the 1,900 acres described would be in addition to the City's General Plan. Otherwise, the assumption would need to be justified by a market analysis and alternative land use assumptions, which are beyond the scope and authority of an HCP. 5.9

The EIS/EIR also mentions that the pending Sphere of Influence Amendment in Elk Grove is part of the basis for other Reasonably Foreseeable Actions (Section 3.7.2). The list is, however, incomplete as it neglects to include the City's larger policy framework for expansion beyond the pending applications. A more reasonable assumption would be to include all lands from Kammerer Road to Eschinger Road, consistent with the City's 2013 SOI application, which was based upon the 2003 General Plan policies.

9. The EIS/EIR Contains Flawed Methodology for Assessing Impacts.

Section 4.2.1 describes the assumptions used for the cumulative analysis in the EIS/EIR and includes that statement "The study area used in Chapter 4 for the cumulative analysis of each EIS/EIR alternative on land use is the EIS/EIR Planning Area plus lands within the City of Elk Grove, the City of Elk Grove's SOI, and the community of Rancho Murieta." Because the City's SOI is currently coterminous with the City limits (though amendments are pending before the Local Agency Formation Commission) and based upon other discussions in Chapters 1, 2, and 3, the City must conclude that the reference in this section is to the 2013 SOI application. With that being the case, the Project and the EIS/EIR are flawed in that they do not identify the areas between Kammerer Road and Eschinger Road as part of the Urban Development Area. In order to maintain consistency with the City's General Plan, the documents must be modified to reflect this land use policy direction. 5.10

10. The EIS/EIR Contains an Incomplete Discussion of the Regulatory Framework.

Section 4.1.1 describes the regulatory framework under which the Project is being considered. Section 4.1.1.4 identifies relevant Local Regulations, Policies, and Plans. The agencies listed in this section are limited to the County of Sacramento and the Cities of Rancho Cordova and Galt. Elk Grove is noticeably absent. The City's adopted General Plan includes a General Plan Planning Area that extends beyond the existing City limits to the Cosumnes River. To ignore this policy framework and the potential annexation of lands that are within the Project area into the City is short-sighted and does not provide the appropriate level of disclosure obligated under CEQA. Given that the General Plan is adopted City policy and that the City has previously pursued SOI amendments in this area, it is reasonable to assume that annexations may occur within the timeframe of the HCP permit. The relationship of the Elk Grove General Plan and the SSHCP must be discussed in the EIS/EIR. 5.11

11. The EIR/EIS Should Contain SB-5 and 200-year Floodplain Analysis.

Chapter 7 (Hydrology and Water Quality) should be updated to include an analysis of consistency with State Senate Bill 5 (Machado), looking at the impact of flooding that has a 1-in-200 chance of occurring in any given year (i.e., a 200-year storm event). State law limits the ability of local land use agencies in approving new development within the 200-year floodplain. This legislation could impact the development areas within the Morrison and Laguna Creek corridors (among others), potentially requiring additional impacts to waterways in constraining the 200-year floodplain beyond those analyzed in the Project, or limiting the potential development area. If the development area becomes further constrained this could create pressure for development outside the Urban Development Area within the timeframe of the SSHCP. This goes back to the viability of the range of alternatives considered in the EIS/EIR as potentially being inadequate. 5.12

12. The EIS/EIR Lacks a Basis for its Conclusions on Transportation Impacts.
Chapter 13 addresses potential transportation impacts of the proposed Project, concluding that the proposed Project would result in reduced impacts when compared to the No Project. This conclusion appears to be based upon the assumed relocation of 1,900 acres of development from the Urban Development Area to areas outside of the Urban Development Area. However, no assumptions are presented on the types of land uses projected to occur in this area. Transportation impacts can only be fully understood in the context of the planned land uses. According to the City's Traffic Engineer, Ryan Chapman, TE, the mix of uses, densities, and distances between destinations can significantly influence the potential impacts on Level of Service and Vehicle Miles Traveled. Because the EIS/EIR lacks this information the conclusions presented are without evidence and are therefore unjustified.

5.13

13. The Greenhouse Gas (GHG) Emissions Impacts Analysis is Deficient.
Similar to the Transportation Impacts, the EIS/EIR provides a very broad discussion of potential GHG impacts and concludes that simply because more land is developed under the Project alternative within the County's Urban Service Boundary than under the No Project Alternative the Project is superior. However, no technical analysis is presented to justify this statement. Because of the interrelationships between land uses and the role they play on transportation system requirements it is possible that, depending upon location, development within the Urban Development Area under the Project has a greater impact on GHG. A technical analysis is required to substantiate these claims.

5.14

Conclusion

The City encourages the lead agencies to reevaluate the sufficiency of the EIS/EIR in light of the comments made herein, to revise the EIS/EIR to correct the identified deficiencies, and, as necessary to recirculate a revised EIS/EIR.

Thank you for considering the City's concerns. We are available to answer any questions or discuss these issues in more detail. The City reserves the right to provide further information, comment, and analysis on the EIS/EIR prior to the approval of the project.

5.15

Sincerely,

Laura S. Gill

Laura S. Gill, City Manager
City of Elk Grove

Attachments: Comments on the Draft SSHCP, to: Richard Radmacher, Senior Planner, County of Sacramento

RTC 5.1 (EIS/EIR) – The comment contains introductory statements expressing concern about the SSHCP and EIS/EIR. No responses are necessary.

RTC 5.2 (EIS/EIR) –The term Plan Area refers to the SSHCP Plan Area in the Proposed Action Alternative. As described in Chapter 2, Section 2.1, Approach to Developing Alternatives, the lead agencies considered alternatives that might have smaller or different Planning Area boundaries. Therefore, the same term could not be used for some of the other alternatives considered, and could not be used for the No Action/No Project Alternative as there would be no "Plan"; therefore an alternative term "Planning Area" was used to refer to the same area in other alternatives studied in the EIS/EIR. Typically the two terms are intentionally used in different scenarios; for example, if a figure is conveying information about the Proposed Action Alternative, it will identify the "SSHCP Plan Area"; and where a figure is conveying information applicable to one of the other alternatives studied in the EIS/EIR, the term "Planning Area" is used. However, Figures in the Final EIS/EIR have been reviewed and revised as necessary to more consistently use the proper term based on the EIS/EIR alternative described by the Figure. Sentences containing the term "Planning Area" were also reviewed to ensure they did not suggest that the term "Planning Area" is limited to just the UDA.

RTC 5.3 (EIS/EIR) – The referenced objective is intended to reflect the policies and spirit of the land use plans for the local land use authority permittees. One of the key purposes of the SSHCP is to provide incidental take coverage for urban development within an area commonly accepted by the land use authority permittees as the appropriate limit of urban development.

RTC 5.4 (EIS/EIR) – The EIS/EIR analyzes the effects of the Proposed Action and alternatives in compliance with NEPA and CEQA, and is not the document that presents all permit issuance criteria for the USFWS permitting process. The SSHCP funding assurances required to satisfy the permit issuance criteria are provided in Section 12 of the Draft SSHCP. Regarding the development assumptions for full buildout of the UDA, the SSHCP and EIS/EIR do not establish new projections or assumptions about population growth in southern Sacramento County. Assumptions about growth projections underlying these documents are made in general plans developed in accordance with the local land use planning process, which includes public comment and which ultimately are approved by local elected officials. The SSHCP Plan Preparers cannot modify or change the County's or the City's land use planning decisions or processes. For example, the Sacramento County General Plan includes an Urban Service Boundary that identifies an area where urban development is anticipated to occur. The SSHCP uses the USB as the basis for its Urban Development Area.

RTC 5.5 (EIS/EIR) – The areas referenced lie outside the current city of Elk Grove limits and Sphere of influence (SOI) of Elk Grove, although they have been the subject of a previous 2013 SOI application to LAFCO, and a current smaller SOI application to LAFCO. While the City currently holds no legal land use jurisdictional authority over these properties (which are currently under the jurisdiction of the County), it is recognized that all or a portion of the area contained in the current SOI application could

become part of the City of Elk Grove depending on the ultimate decision made by LAFCO on the existing application Despite this uncertainty, and the fact that the City of Elk Grove is not a proposed permittee under the SSHCP, nor is the area south of Kammerer Road within the County's Urban Service Boundary or the SSHCP's Urban Development Area, the Draft EIS/EIR did assume in its analysis of cumulative effects that areas south of Kammerer Road and other portions of Elk Grove's SOI request could be annexed into the City of Elk Grove and developed during the 50-year study period. This is described in Section 3.7.2.1 of the Draft EIS/EIR.

RTC 5.6 (SSHCP and EIS/EIR) – Language has been added to Chapter 9 of the SSHCP to make it clear that land use jurisdictions (e.g. City of Elk Grove) that are not local Land Use Authority Permittees can participate in the SSHCP as Participating Special Entities assuming that their projects are otherwise consistent with the permitting process for covered activities in the SSHCP. As detailed below, unincorporated (i.e., currently County land) within the UDA is covered under the SSHCP, and the SSHCP and EIS/EIR assumed that covered activities would cause take in those areas. If the City of Elk Grove annexes those lands, they could apply to use the SSHCP take coverage as a Participating Special Entity. An area outside the UDA (e.g., areas south of Kammerer Road) is not assumed in the SSHCP or EIS/EIR to be impacted and the City of Elk Grove would need to seek a major amendment to the SSHCP to become a Plan Permittee in order to get take coverage through the SSHCP permits if they were to annex those lands. New text has been added to Section 9.10 explaining how a new Permittee could be added to the SSHCP permits.

RTC 5.7 (EIS/EIR) – As required by both CEQA and NEPA, the Draft EIR/EIS discusses a range of reasonable alternatives in Chapter 2 of the EIR/EIS. (See CEQA Guidelines, Section 15126(a); 40 CFR 1502.14.) The County and the USFWS, as lead agencies, have the discretion to determine how many alternatives constitute a reasonable range. (See *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal.App.4th 214, 256 ["[I]f a reasonable basis for the choices the agency makes is found in the EIR or elsewhere in the record, a reviewing court will defer to the agency's selection of alternatives." (citations omitted)]; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 556; 43 CFR 46.420(b) [noting that reasonable alternatives are those that are both technically and economically practical and feasible and meet the stated purposes and needs of the proposed action].) Although an infinite number alternatives and variations could be identified, neither EIRs nor EISs are required to evaluate ***all*** possible alternatives or "consider an alternative whose effect cannot be reasonably ascertained and whose implementation remote and speculative." (CEQA Guidelines, Section 15126.6(f)(3); see also 40 CFR 1502.14(a).)

For these reasons, the alternatives analysis in the Draft EIR/EIS focuses on those options that could feasibly be implemented and which, if implemented, would have the potential to reduce or avoid any significant adverse environmental effects associated with implementation of the SSHCP, met most of the basic SSHCP objectives, and are potentially feasible. The selection of alternatives is discussed in Chapter 2, summarized in section 2.1.4 of the Draft EIR/EIS, and more fully analyzed in Appendix E. In addition to considering a No Action/No Project Alternative, the Draft EIR/EIS analyzed the

Proposed Action/Proposed Project Alternative (section 2.3), through which the Permit Applicants (future Plan Permittees) would implement categories of Covered Activities and a Conservation Strategy over a 50-year permit term. In addition, under the Reduced Permit Term Alternative (section 2.4), the Permit Applicants would seek Take coverage for the same Covered Activities but for a shorter 30-year incidental-take permit term.

Contrary to the suggestion in the comment, the three alternatives identified in the Draft EIR/EIS were chosen to foster informed decision-making and public participation, and thus constituted a "reasonable range" within the meaning of CEQA. In addition to analyzing two EIS/EIR Action Alternatives, the Draft EIS/EIR analyzed a No Action/No Project Alternative. The Two Action alternatives were carried forward for detailed analysis in the EIS/EIR because they are practicable, include provisions to reduce impacts, address the existing issues and underlying needs present in the Planning Area, and will achieve the purposes and objectives presented in Section 1.3 of the Draft EIR/EIS.

As analyzed in section 2.3, under Proposed Action/Proposed Project Alternative, the Permit Applicants (future Plan Permittees) would implement categories of Covered Activities and a Conservation Strategy over a 50-year permit term. This was described in the SSHCP document that was prepared by the Permit Applicants and will be included in the ESA and CESA incidental-take permit application packages submitted to the USFWS and CDFW. Under the second Reduced Permit Term Alternative, the Permit Applicants would implement the same categories of HCP Covered Activities as in the proposed SSHCP but over a shorter 30-year incidental-take permit term. The Permit Applicants would implement a similar HCP Conservation Strategy, but this strategy would result in a smaller, less comprehensive preserve system in the Planning Area (relative to the interconnect SSHCP Preserve System described in the Conservation Strategy of the Proposed Action/Proposed Project Alternative). After a thorough analysis of these options, the Draft EIR/EIS concludes that the Proposed Action/Proposed Project is the environmentally preferable alternative under NEPA and the environmentally superior alternative under CEQA. (See Draft EIR/EIS, Section 17.7.)

The Draft EIR/EIS's alternatives analysis fully complies with CEQA and NEPA. The SSHCP is the culmination of countless revisions and requests from stakeholders and regulators over a multi-decade process. The alternatives carried forward for detailed analysis include a comprehensive Conservation Strategy that endeavors to strike the balance of preservation, avoidance, minimization, and mitigation to reach economically feasible, beneficial outcomes. The NEPA process and identification of alternatives for the SSHCP has been ongoing with the formulation of the SSHCP for over a decade. Several alternatives are described in Section 2.1.3, for example. Many of these alternatives were not carried forward because they were not feasible or did not meet the project objectives. Over time, numerous USFWS-, CDFW-, and USACE-recommended avoidance measures were incorporated into the proposed action, and earlier SSHCP versions (alternatives) were not carried forward in favor of an alternative with less adverse impacts than some of the earlier iterations of the SSHCP. (Draft EIR/EIS, p. 2-14.) For example, over time the currently proposed Stream Setbacks, the protection of micro-watersheds, and different types of utility and road realignments that avoid impacts to species and aquatic resources were added.

The lead agencies screened all potential alternatives following the process outlined in Section 2.1.4. The following sub-sections describe the alternatives considered and not carried forward based on one of the screening criteria outlined previously. These alternatives were organized into two groups: those that were proposed during the multiyear development of the SSHCP, and those that were suggested by commenters during the public scoping of the EIS/EIR (see Section 1.4). Draft EIS/EIR Appendix E presents three tables that provide information regarding the reasons an alternative was not carried forward for detailed study in the EIS/EIR. As this extensive analysis demonstrates, the EIR/EIS fully analyzed a range of reasonable alternatives.

With regard to the Commenter's suggestion in the first sentence of paragraph 3 of section 6 regarding feasible alternatives, a lead agency may exclude from an EIR alternatives that it concludes are not potentially feasible. (See *Save San Francisco Bay Association v San Francisco Bay Conservation & Development Commission* (1992) 10 Cal.App.4th 908, 922 (EIR need not examine alternatives that are so speculative, contrary to law, or economically catastrophic as to exceed realm of feasibility). In many cases, lead agencies include alternatives in an EIR that, after further evaluation, are determined to be infeasible and not meriting detailed analysis. In such a case, CEQA case law provides that the agency should explain the reason for the agency's determination. (*San Joaquin Raptor/Wildlife Rescue Center v County of Stanislaus* (1994) 27 Cal.App.4th 713, 737; see also *Sierra Club v City of Orange* (2008) 163 Cal.App.4th 523, 545, 547 (upholding EIR that explained why three alternatives were eliminated from detailed consideration in EIR).

Here, as discussed in Section 2.1.2 of the Draft EIR/EIS and noted above, a conservation plan for southern Sacramento County has been under development in some form for approximately 20 years. During this time, many alternatives that considered different Planning Area boundaries, protection of different natural resources, different Covered Species, different conservation strategies, and other elements have been considered. During the preparation of the Draft EIR/EIS, the lead agencies screened all potential alternatives following the process outlined in Section 2.1.4 and discussed above. Consistent with CEQA, this analysis sets forth why the County decided not to proceed with these alternatives, and fully complies with CEQA's informational requirements. (See Draft EIR/EIS, pp. 2-14 to 2-19.)

An EIR need not consider all potential alternatives to a project. As set forth above, an EIR need only discuss a "reasonable range" of alternatives (CEQA Guidelines, Section 15126.6[a]). With regard to the comment's suggestion of a specific, larger UDA alternative, we presume, as set forth in other comments (see comments 5.2, 5.4, 5.5, 5.7 and 5.9), the comment is referring to lands south of Kammerer Road that are outside the current city limits and Sphere of influence (SOI) of Elk Grove. A larger UDA related to the 2013 LAFCO SOI application by Elk Grove was considered during preparation of the SSHCP when the City of Elk Grove was a plan permittee. CDFW expressed concerns about feasibility of the larger UDA related to potential impact on habitat inventory for Swainson's hawk and the inability of the City of Elk Grove to guarantee that the mitigation from development in that area could be funded since they did not have land use authority. The City of Elk Grove decided to withdraw from the

SSHCP at that time due to these considerations. Thus, the County is the land use jurisdiction that currently governs land use decisions south of Kammerer Road. Because the area south of Kammerer Road is not within the County's Urban Service Boundary it was not included within the SSHCP's Urban Development Area.

Further, creation of a larger USB would require General Plan revision, public comment, and action by the County Board of Supervisors. It isn't feasible for the EIS/EIR to consider a hypothetical future action that is not reasonably foreseeable and that is not something the County can unilaterally propose outside of its planning process.

With the above considerations, the suggestion of an expanded UDA alternative did not meet the feasibility test required to be considered within the reasonable range of alternatives. Further the alternative would not meet the requirement of reducing impacts in comparison to the proposed action, since it would result in greater impacts to high value Swainson's hawk habitat in comparison to the proposed SSHCP.

Finally, consistent with CEQA's informational purpose, the comment is correct that alternatives must be able to implement most basic project objectives, but they do not have to implement all of them. (*Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477. The EIR's analysis should focus on alternatives that can eliminate or reduce significant environmental impacts even if they would impede attainment of project objectives to some degree or be more costly. 14 Cal Code Regs §15126.6(b). The alternatives discussed must, however, be able to attain most of the basic objectives of the project. 14 Cal Code Regs §15126.6(a). There is no requirement that the alternatives included in an EIR satisfy every basic objective of the project. (*California Native Plant Society v City of Santa Cruz* (2009) 177 CA4th 957, 991.) Moreover, a lead agency has broad discretion to formulate project objectives. *California Oak Found. v Regents of University of California* (2010) 188 Cal.App.4th 227, 276 ("CEQA does not restrict an agency's discretion to identify and pursue a particular project designed to meet a particular set of objectives").

An EIR need not, however, present alternatives that are incompatible with the project's fundamental purpose. (See *In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008) 43 Cal.4th 1143, 1165 [holding that an EIR need not study an alternative that "cannot achieve the project's underlying fundamental purpose"].) Accordingly, an agency may structure the alternatives analysis for an EIR based on a reasonable definition of the project's underlying purpose and need not study alternatives that cannot achieve that fundamental goal. (*Id.* at 1166.) Here, as discussed above and in Section 2.1.1, the EIS/EIR includes action alternatives that satisfy the following three criteria: (1) achieves the stated purposes, needs, and objectives; (2) addresses one or more of the significant issues identified during scoping; avoids or substantially lessens potentially significant impacts; and (3) is feasible, practicable, and reasonable. The EIS/EIR identifies over 18 comprehensive project objectives intended to implement the SSHCP's fundamental purpose of providing for development while conserving the environment. (See Draft EIS/EIR, Section 1.3.3.) That is, in response to receiving a request for authorization of species incidental take that is expected to result from future housing construction, other new urban development, and new supporting

infrastructure within the Planning Area, the USFWS proposes to issue an ITP to the Permit Applicants. Therefore the Project objectives were properly drafted in order to obtain the ITP and are not overly broad.

RTC 5.8 (EIS/EIR) – Refer to response to Comment 5.5.

RTC 5.9 (EIS/EIR) – One of the areas that is identified as potentially receiving a portion of the "displaced development" under the No Action/No Project Alternative is the area south of the existing City of Elk Grove jurisdiction. Whether that area is under County jurisdiction or Elk Grove jurisdiction at the time of development is not relevant to the impact analyses, which look at effects on the ground to the examined resource areas. Regarding the remainder of the City of Elk Grove's 2013 SOI application, that application was not approved and the City does not have a pending SOI application for those areas. Therefore, the EIS/EIR did not include City annexation of those lands as reasonably foreseeable. Refer also to responses to Comments 5.5 and 5.10.

RTC 5.10 (EIS/EIR) – Refer to response to Comment 5.5.

RTC 5.11 (EIS/EIR) – The regulatory environment includes only those that have regulatory authority or land use planning authority over the Planning Area. Therefore, entities that are adjacent to the Planning Area but outside it, such as the City of Sacramento, the City of Folsom, and the City of Elk Grove are not included in the regulatory environment. The City of Elk Grove's potential future sphere of influence modifications and other projects are considered appropriately in the cumulative analyses throughout the document.

RTC 5.12 (EIS/EIR) – At the time the Draft EIS/EIR was prepared, the impact assessment criteria provided in Appendix G of the State CEQA Guidelines identified the 100-year flood hazard area as a suitable criteria. The current State CEQA Guidelines retain this 100-year flood hazard criteria. As stated in Section 7.2.1 of the EIS/EIR;

> "The significance criteria used to evaluate the significance of each alternative's impacts on hydrology and water quality are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.), and on typical thresholds used to evaluate hydrology and water quality effects in recent EIRs prepared by the County."

This approach to identifying significance criteria is used consistently in each impact analysis chapter in the EIS/EIR and is consistent with the requirements of CEQA and NEPA.

The comment describes a potential scenario where lack of a 200-year level of flood protection in some areas could limit future development, and therefore adversely affect implementation of the SSHCP. This scenario requires significant speculation given that multiple jurisdictions and agencies are actively improving flood protection systems to support future planned development, and in some cases, individual project proponents can provide their own flood protection improvements.

RTC 5.13 (EIS/EIR) – The mix of uses can certainly affect transportation options, mode selection, vehicle trips, and vehicle miles traveled. As explained in Section 2.2 of the EIS/EIR, the approximately 1,900 acres of urban development that is estimated to be

displaced outside the UDA would provide housing for projected population growth within the County. The mix of commercial and other land uses that would accompany the residential development are not critical to determine that regional transportation impacts would be greater, with this additional residential development remote from the existing employment centers within the UDA as described in Section 13.2.2.1 of the EIS/EIR. This level of analysis is suitable for a programmatic analysis like the subject EIS/EIR.

RTC 5.14 (EIS/EIR) – As stated in response to Comment 5.13, the mix of land uses can certainly affect transportation options, mode selection, vehicle trips, and vehicle miles traveled (VMT). All of these transportation issues, and in particular VMT, affect mobile source GHG emissions, one of the primary sources of GHG emissions. As explained in Section 2.2 of the EIS/EIR, the approximately 1,900 acres of urban development that is estimated to be displaced outside the UDA would provide housing for projected population growth within the County. The mix of commercial and other land uses that would accompany the residential development are not critical to determine that regional VMT would be greater with this additional development remote from the existing employment centers within the UDA as described in Section 15.2.2 of the EIS/EIR. As stated in Section 15.2.2 for both mobile source construction emissions and mobile source operational emissions;

> "Development displaced outside of the USB could result in construction worker commute and vendor haul trips being longer in distance, resulting in higher VMT (and associated GHG mobile-source emissions), relative to what would be expected if urban development was confined to the USB. An increase in regional VMT associated with construction trips would result in increased emissions of GHGs. Construction-related GHG emissions as a result of increased vehicle trips and VMT would contribute further to the already significant, unavoidable impacts to global climate change described in the EIRs referenced above."
>
> "Similar to what is described above for construction emissions, development displaced outside of the USB could result in resident and employee commute trips being longer in distance, resulting in higher VMT (and associated GHG mobile-source emissions), relative to what would be expected if urban development was confined to the USB. An increase in regional VMT associated with operational trips would result in increased emissions of GHGs. Operation-related GHG emissions as a result of increased vehicle trips and VMT would contribute further to the already significant, unavoidable impacts to global climate change described in the EIRs referenced above."

This level of analysis is suitable for a programmatic analysis like the subject EIS/EIR.

RTC 5.15 (EIS/EIR) – The comment requests that the lead agencies evaluate the EIS/EIR to determine whether or not it is sufficient, and to recirculate if necessary. The comment also notes the City's availability to discuss the issues noted in the comment letter in greater detail. The lead agencies have determined that the EIS/EIR is sufficient, and will not be recirculated.

Re: Draft Environmental Impact Statement and Environmental Impact Report for the South Sacramento Habitat Conservation Plan (SCH# 2008062030)

Dear Ms. Biner and Ms. Knight:

Thank you for providing the Delta Protection Commission (Commission) the opportunity to review the Draft Environmental Impact Statement and Environmental Impact Report for the South Sacramento Habitat Conservation Plan (Project EIS/EIR). The Project is a regional approach to conserving species and issuing incidental take permits under the federal and State Endangered Species Acts while implementing new urban development and associated infrastructure projects within southern Sacramento County.

The Commission is a state agency charged with ensuring orderly, balanced conservation and development of Delta land resources and improved flood protection. Proposed local government projects within the Primary Zone of the Legal Delta must be consistent with the Commission's *Land Use and Resource Management Plan* (LURMP). Proposed US Fish and Wildlife Service (USFWS) actions are not subject to consistency requirements with the LURMP since the Project is sponsored by a federal agency. However, the Commission reviewed the project for possible impacts on the resources of the Primary Zone. 6.1

The Commission is supportive of projects that protect the natural resources of the Delta while preserving agriculture as a critical part of the region's economy. We appreciate the USFWS's and County's efforts to review the Project for compliance with LURMP policies, particularly those related to agriculture, flood protection, natural resources, and recreation. We urge the USFWS and County to prioritize use of existing public lands for habitat and to consider incentives for private landowners to provide habitat where possible. 6.2

The Draft EIR/EIS provides a thorough and mostly accurate description of the Commission and the LURMP. However, there is one instance where there appears to be confusion regarding the overlapping jurisdiction of the Commission and the Delta Stewardship Council. In a section called "Delta Protection Act and the Land Use and Resource Management Plan for the Primary Zone of the Delta", the Draft EIR/EIS states that:

> *...The Delta Protection Act identifies a Primary Zone of approximately 500,000 acres where a comprehensive resource management plan, the Delta Plan (Delta Stewardship Council 2013), is applied (see the discussion under the heading "Delta Reform Act of 2009 and the Delta Plan" below)... (p. 4-2)* 6.3

The Delta Protection Act, originally enacted in 1992, established the Commission and the LURMP as a comprehensive resource management plan for the Primary Zone. The Delta Reform Act of 2009 created the Delta Stewardship Council and required the preparation of the *Delta Plan*, which applies to the Primary Zone as well as the Secondary Zone and Suisun Marsh. The Commission's authority over "development" projects in the Primary Zone (Public Resources Code Section 29723(a)) is based on the Delta Protection Act and is enforced through consistency with the LURMP.

Thank you for the opportunity to provide input. Please contact Blake Roberts, Senior Environmental Planner, at (916) 375-4237 for any questions regarding the comments provided.

Sincerely,

Erik Vink
Executive Director

cc: Don Nottoli, Sacramento County Board of Supervisors

RTC 6.1 (EIS/EIR) –The County appreciates the Commission's thoughtful comments.

RTC 6.2 (EIS/EIR) – The SSHCP includes mechanisms for preservation of existing public lands and private lands. Incentives for landowners to preserve habitat would be provided through purchase of conservation easements, as explained in Section 9 of the SSHCP.

RTC 6.3 (EIS/EIR) –The text from Section 4.1.1.2 of the Final EIS/EIR has been revised as follows:

> The Delta Protection Act, **originally enacted in 1992, established the Delta Protection Commission and designated the Land Use and Resource Management Plan as a comprehensive resource management plan for the approximately 500,000-acre Primary Zone.** ~~identifies a Primary Zone of approximately 500,000 acres where a comprehensive resource management plan, the Delta Plan (Delta Stewardship Council 2013), is applied (see the discussion under the heading "Delta Reform Act of 2009 and the Delta Plan" below).~~

RE: Draft Environmental Impact Statement/Environmental Impact Report for the South Sacramento Habitat Conservation Plan, SCH#2008062030

Dear Mr. Smith:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR) for the South Sacramento Habitat Conservation Plan (SSHCP). The Delta Stewardship Council (Council) applauds Sacramento County's (County) efforts to improve certainty and efficiencies in environmental permitting and protection of open space, habitat, and agriculture. We support the intent to develop a comprehensive plan to ensure the long-term viability of 28 plant and wildlife species. 7.1

The Council appreciates and recognizes many of the additions made in response to our previous comment letter, dated December 2013. Below we offer additional information on the Delta Plan Consistency Certification process that we hope will be useful. We also highlighted several Delta Plan regulatory policies that are commonly relevant to habitat restoration projects and provided a few recommendations. We anticipate that this work can be a foundation upon which the County prepares a Delta Plan consistency certification. As the SSHCP is implemented over the 50-year permit term, the Council recommends that any covered activities located within the Legal Delta or the Preserve Planning Unit (PPU 6) are consistent with the Delta Plan. These activities should consider the guidance provided below with regard to Consistency Determination. 7.2

"Coequal goals" means the two goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem. The coequal goals shall be achieved in a manner that protects and enhances the unique cultural, recreational, natural resource, and agricultural values of the Delta as an evolving place."
– CA Water Code §85054

Comments on the Draft EIS/EIR

The Draft EIS/EIR identifies that SSHCP overlaps with roughly 40,980 acres of the Legal Delta. Although the majority of covered activities will be implemented within the Urban Development Area (UDA), the Draft EIS/EIR also defines two categories of covered activities (Rural Transportation projects and Recycled Water projects) that will be constructed outside the UDA, as well as covered activities related to the management and improvement of species habitats within the proposed Preserve Systems.

We appreciate that the Draft EIS/EIR (Appendix D) defines mitigation and avoidance measures for covered species and habitat that will be affected by the covered activities identified in the SSHCP. Table 8-8 displays the direct impacts of covered activities for each natural land cover type outside the UDA, totaling 1,438 acres. Section 7.2.3.2 states that outside the UDA, associated infrastructure and transportation improvement projects would directly impact the natural land cover in parts of the Lower Cosumnes River. 7.3

The Delta Plan established six habitat restoration areas in the Delta, of which the Cosumnes-Mokelumne Confluence, is located within the SSHCP Plan Area. Delta Plan Policy ER P3 calls for protecting opportunities to restore habitat in these areas. We recommend that the Final EIR analysis include the impact of any urbanization or permanent agricultural easements on the opportunity to restore priority habitat areas within the Delta Plan's Consumnes-Mokelumne Confluence area. Potential mitigation measures could include elevating facilities so that water can flow underneath to allow for future restoration of habitats depended on tides or periodic flooding, or locating facilities at the edge of the restoration area, rather than in the middle, to improve opportunities for restoring habitat connectivity. For more information, please refer below to the section "Restore Habitat in a Manner Consistent with the Delta Plan." 7.4

We appreciate that the Draft EIS/EIR quantifies the areal extent of the proposed UDAs and discusses any potential impacts to agricultural resources. We recognize that under the Proposed Actions/Proposed Project Alternative that 1,900 acres of urban development would not be "displaced" outside the UDA. However, as discussed in section 4.2.3.1, "both inside and outside of the UDA, other preserves are needed to complete the Preserve System and would be acquired by preserving under-developed or agricultural lands." Additionally, Elk Grove's Sphere of Influence, as part of the UDA, slightly overlaps with the Legal Delta. Please review the Delta Plan land use policies discussed in more detail below in the section "Land Use Conflicts". 7.5

Under 7.2.3.2 of the Draft EIS/EIR, "Outside the UDA, associated infrastructure and transportation improvement projects would directly impact 1,438 acres of natural land cover types, primarily parts of Lower Cosumnes River." The Delta Plan contains three polices that relate to flood protection, encroachment in floodways, and encroachment on floodplains, which should be considered in this analysis. Please refer below to the section "Hydrology" for more detail on these policies. 7.6

In addition, while we appreciate that the Delta Reform Act's regulatory framework is added under the *Affected Environmental/Environmental Setting 4.1.1.2 State Regulations and Policies*, we recommend that you include the Delta Plan Policies that reflect the sections below in the forthcoming final EIS/EIR as part of the "Affected Environmental/Environmental Setting" sections for:

- Chapter 6 – Agriculture
- Chapter 7 – Hydrology
- Chapter 8 – Natural Land Cover Habitats, and Associated Plant and Animal Communities
- Chapter 9 – Special Status Species Including HCP Covered Species
- Chapter 10 – Aquatic Resources

7.7

Delta Plan Covered Actions and Consistency Certification

The mission of the Council is to promote the coequal goals of water supply reliability and ecosystem restoration in a manner that protects and enhances the unique values of the Delta as an evolving place (Water Code section 85054). The Council has a legally enforceable management framework for the Delta and Suisun Marsh called the Delta Plan, which applies a common sense approach based on the best available science to achieve the coequal goals. The Council was granted specific regulatory and appellate authority under the Delta Reform Act over certain actions that take place in whole or in part in the Delta or Suisun Marsh. The Council exercises that authority through the development and implementation of the Delta Plan.

According to the Delta Reform Act, state or local agencies approving, funding or carrying out projects, plans, or programs, upon determining their project is a "covered action" subject to regulations of the Delta Plan, must certify consistency of the project with the Delta Plan policies (Water Code section 85225). Based on the plan description, Council staff believes your plan meets the definition of a covered action. Generally, the California Environmental Quality Act (CEQA) lead agency, which in this case would be Sacramento County, would complete the Certification of Consistency.

7.8

Again as projects under the SSHCP are further developed and implemented over the 50-year permit term, future project activities should consider the guidance provided in this document with regard to Consistency Determination. Council staff looks forward to working with, and providing early consultation to, project proponents as these projects are developed.
As previously stated, the Council appreciates that the Draft EIS/EIR appears to address many of the policies highlighted from the December 2013 comment letter. To better support your Certification of Consistency, we encourage you to review our recommendations and revisit the following Delta Plan policies before filing:

7.9

Mitigations Measures: Delta Plan Policy **G P1** (23 Cal. Code Regs. section 5002) requires that actions not exempt from CEQA and subject to Delta Plan regulations must include applicable feasible mitigation measures consistent with those identified in the Delta Plan Program EIR or substitute mitigation measures that are equally or more effective. Mitigation Measures in the Delta Plan's Mitigation and Monitoring Report Program is available at: (http://deltacouncil.ca.gov/sites/default/files/documents/files/Agenda%20Item%206a_attach%202.pdf) 7.10

Best Available Science and Adaptive Management: Delta Plan Policy **G P1** also states that actions subject to Delta Plan regulations must document use of best available science as relevant to the purpose and nature of the project. The regulatory definition of "best available science" is provided in Appendix 1A of the Delta Plan (http://deltacouncil.ca.gov/sites/default/files/2015/09/Appendix%201A.pdf). 7.11

Delta Plan Policy **G P1** also requires that ecosystem restoration and water management covered actions include adequate provisions for continued implementation of adaptive management, appropriate to the scope of the action. This requirement is satisfied through A) the development of an adaptive management plan that is consistent with the framework described in Appendix 1B of the Delta Plan (http://deltacouncil.ca.gov/sites/default/files/2015/09/Appendix%201B.pdf) and B) documentation of adequate resources to implement the proposed adaptive management plan. Since the SSHCP will be primarily funded through development fees, then it is expected that funding of monitoring and adaptive management for habitat restoration and creation of projects will be assured. 7.12

We recommend that the County's template for restoration plans require that such projects have an adaptive management strategy consistent with the framework in Appendix 1B of the Delta Plan. This could help to streamline consultation and consistency determination for projects implemented under the SSHCP.

The Delta Science Program's Adaptive Management Liaisons are available to provide further consultation and guidance to help the County with the appropriate application of best available science and adaptive management. Please contact Darcy Austin (Darcy.Austin@deltacouncil.ca.gov) of the Delta Science Program. 7.13

Land Use Conflicts: Policies related to locating new urban development wisely, and respecting local land use when siting water or flood facilities or restoring habitats. Delta Plan Policy **DP P1** (23 Cal. Code Regs. section 5010) states that new residential, commercial, or industrial development is permitted outside the urban boundaries only if it is consistent with the land use designated in the relevant county general plan. It is intended to strengthen existing Delta communities while protecting farmland and open space, providing land for ecosystem restoration needs, and reducing flood risk. Delta Plan Policy **DP P2** (23 Cal Code Regs. 7.14

section 5011) states that plans for ecosystem restoration must be sited to avoid or reduce conflicts with existing uses when feasible. 7.14 cont'd

Restore Habitat in a Manner Consistent with the Delta Plan: As mentioned above, we recommend that the Final EIR analysis include the impact to these types of habitat within the Delta Plan's Consumnes-Mokelumne Confluence area[1]. Delta Plan Policy **ER P2** (23 Cal. Code Regs. section 5006) states that habitat restoration must be consistent with Appendix 3 of the Delta Plan regulations and that restoration will occur at appropriate elevations. Appendix 3, which is an excerpt from the 2011 Draft Ecosystem Restoration Program Conservation Strategy, provides a vision for a mosaic of different habitat types within the Delta including open water, subsided lands, floodplains, and upland areas. It also includes a vision for use of Delta agricultural lands to support special-status wildlife species. (http://deltacouncil.ca.gov/sites/default/files/2015/09/Appendix%203.pdf) 7.15

Further guidance is provided by Delta Plan Recommendation **ER R2**, which states, for the Consumnes-Mokelumne Confluence, "Allow these unregulated and minimally regulated rivers to flood over their banks during winter and spring frequently and regularly to create seasonal floodplains and riparian habitats that grade into tidal marsh and shallow subtidal habitats." 7.16

Delta Plan Policy **ER P3** (23 Cal. Code Regs. section 5007) requires that, within the priority habitat restoration areas (PHRAs) depicted in Appendix 5 of the Delta Plan, significant adverse impacts to the opportunity to restore habitat must be avoided or mitigated. Much of the overlap between the Legal Delta and the SSHCP Plan Area includes the Consumnes-Mokelumne Confluence PHRA. (http://deltacouncil.ca.gov/sites/default/files/2015/09/Appendix%205.pdf) 7.17

Hydrology: As described above, please consider Delta Plan Policy **RR P2** (23 Cal. Code Regs. section 5013) which requires flood protection for residential development in rural areas, Policy **RR P3** (23 Cal. Code Regs. section 5014) restricts encroachment in floodways, and Policy **RR P4** (23 Cal. Code Regs. section 5015) restricts encroachments in floodplains, including the Cosumnes-Mokelumne Confluence[2]. Policy **RR P4** states that "no encroachment shall be allowed or constructed unless it can be demonstrated by appropriate analysis that the encroachment will not have a significant impact on floodplain values and functions." 7.18

Invasive Species: Delta Plan Policy **ER P5** (23 Cal. Code Regs. section 5009) calls for avoiding introductions and habitat improvements for invasive nonnative species or mitigating these potential impacts in a manner that appropriately protects the ecosystem. Analysis on this matter should address both nonnative wildlife species as well as terrestrial and aquatic weeds. To the maximum extent practicable, design of habitat restoration and creation actions should avoid or minimize effects that would lead to the establishment of nonnative invasive species 7.19

[1] The boundaries of the priority habitat restoration areas are depicted in Appendix 5 of the Delta Plan regulations.
[2] RR P4 refers to the "Cosumnes River-Mokelumne River Confluence, as defined by the North Delta Flood Control and Ecosystem Restoration Project (McCormack-Williamson), or as modified in the future by the Department of Water Resources or U.S. Army Corps of Engineers."

populations on site before relying upon mitigation measures. In the event that mitigation is warranted, those mitigation and minimization measure should be equally or more effective with the Delta Plan Mitigation Measures 4-1. http://deltacouncil.ca.gov/sites/default/files/documents/files/Agenda%20Item%206a_attach%202.pdf. 7.19 cont'd

Finally, the level of detail included in the SSHCP certification filing should be consistent with the programmatic nature of the document. As specific projects or proposed activities which fall within whole or part of the Legal Delta are scoped and implemented, they would also seek consistency following the Council's guidelines. A way to better support the process is to include the information needed to support the certification of Delta Plan consistency within the EIS/EIR, as noted above, potentially including a draft certification as an appendix to the Final EIS/EIR. 7.20

Closing Comments

The Council is supportive of the SSHCP and its efforts to promote recovery of listed species and natural landscapes. We would like to work with you to ensure the consistency of the SSHCP with the Delta Plan and we look forward to continued coordination to further our related efforts. We are available to continue discussions about how to ensure that your Plan is consistent with the Delta Plan as you proceed in the next stages of your Plan approval process. I encourage you to contact my staff Ron Melcer (Ronald.Melcer@deltacouncil.ca.gov) or Megan Brooks (Megan.Brooks@deltacouncil.ca.gov) with your questions, comments, or concerns.

Sincerely,

C. Enos-Nobriga

Cassandra Enos-Nobriga
Deputy Executive Officer
Delta Stewardship Council

RTC 7.1 (EIS/EIR) – Comment noted. The County appreciates the Council's thoughtful comments.

RTC 7.2 (EIS/EIR) – Refer to responses to Comments 7.3 through 7.19.

RTC 7.3 (EIS/EIR) – Comment noted. The Draft EIS/EIR does state that Rural Transportation Projects and Recycled Water projects would be constructed outside the UDA. The Rural Transportation Projects are shown in Figure 5-5 of the SSHCP, and Recycled Water projects are shown on Figure 5-6 of the SSHCP. Note that no Recycled Water projects are proposed within the legal Delta.

RTC 7.4 (EIS/EIR) – Comment noted. Although the SSHCP includes the Delta Plan's Cosumnes-Mokelumne Confluence area, the SSHCP does not cover urban development in that area. Rural Transportation Projects within the legal Delta will be subject to the requirements of the Delta Plan, including the policies noted in Section 4 of the Draft EIS/EIR. Section 7.5.2 of the SSHCP describes the expected SSHCP Preserve System in PPU 6, where a portion of the Cosumnes-Mokelumne Confluence area overlaps with the Planning Area. None of the Preserve System concepts considered by the Plan Permittees have included preservation within the Delta Plan's Cosumnes-Mokelumne Confluence area. The Preserve design focus for PPU 6 is preserving existing agricultural lands that provide habitat for several of the broad-ranging Covered Species, most notably Swainson's hawk and greater sandhill crane. Policy ER-P3 has been added to Section 4.1.1.2 of the Draft EIS/EIR as a relevant policy under "Delta Reform Act of 2009 and the Delta Plan":

ER P3. Protect Opportunities to Restore Habitat

a. Within the priority habitat restoration areas depicted in Appendix 5 of the Delta Plan, significant adverse impacts to the opportunity to restore habitat as described in section 5006, must be avoided or mitigated.

b. Impacts referenced in subsection (a) will be deemed to be avoided or mitigated if the project is designed and implemented so that it will not preclude or otherwise interfere with the ability to restore habitat as described in section 5006.

c. Impacts referenced in subsection (a) shall be mitigated to a point where the impacts have no significant effect on the opportunity to restore habitat as described in section 5006. Mitigation shall be determined, in consultation with the California Department of Fish and Wildlife, considering the size of the area impacted by the covered action and the type and value of habitat that could be restored on that area, taking into account existing and proposed restoration plans, landscape attributes, the elevation map shown in Appendix 4, and other relevant information about habitat restoration opportunities of the area.

d. For purposes of Water Code section 85057.5(a)(3) and section 5001(j)(1)(E) of this Chapter, this policy covers proposed actions in the priority habitat restoration areas depicted in Appendix 5 of the Delta Plan. It does not cover proposed actions outside those areas.

RTC 7.5 (EIS/EIR) – The SSHCP would indeed include acquisition of preserves on existing agricultural land or rangeland. The impacts of these preserve acquisitions on agricultural land use, including potential limitations on the types of future agricultural use on those preserves, are analyzed extensively in Section 6 of the Draft EIS/EIR. Regarding Elk Grove's proposed SOI expansion, the Draft EIS/EIR considered those expansions as part of the cumulative environment. The overlap of the UDA with the Legal Delta is noted in the Draft EIS/EIR in Section 4, Land Use. Refer to response to comment 7.14 regarding other Delta Plan land use policies.

RTC 7.6 (EIS/EIR) – Refer to response to Comment 7.18.

RTC 7.7 (EIS/EIR) – Comment noted. The Delta Plan policies noted in the subsequent comments have been added to Chapters 6, 7, 8, 9, and 10 of the Final EIS/EIR, as noted in responses to Comments 7.11, 7.14, 7.15, 7.16, 7.17, 7.18 and 7.19.

RTC 7.8 (EIS/EIR) – Comment noted. The County has communicated with the Delta Stewardship Council and will provide the necessary documentation for a Certification of Consistency regarding the SSHCP.

RTC 7.9 (EIS/EIR) – Comment noted. Future Covered Activity projects will comply with the Delta Plan, taking into account the guidance provided in this comment letter and the description of the regulatory environment provided in the Final EIS/EIR.

RTC 7.10 (EIS/EIR) – Comment noted. Covered Activity projects located within the Delta Plan area that are not exempt from CEQA will be subject to a Certification of Consistency with the Delta Plan, including an analysis of how implementation of the SSHCP AMMs and Conservation Strategy by the project are equally or more effective. Sections 10.2.1 and 10.2.3 of the Final SSHCP have been revised to state that covered activity projects would be subject to consistency determination with the Delta Plan on a project-level basis.

RTC 7.11 (EIS/EIR) –The Draft SSHCP uses the best available science in assessing impacts of future Covered Activities and the mitigation provided by the Conservation Strategy. For example, as described in Section 3.4 of the Draft SSHCP, the Plan Permittees worked with local species experts and wildlife agency biologists to define and map Covered Species suitable habitat in this Plan Area by using the best available information about the life history and biology of each Covered Species and locations in the Plan Area known to support the species or where the species has been observed. The application of the best available science in the development of the SSHCP is consistent with the requirements of Delta Plan Policy G P1. Delta Plan Policy G P1 has been added to Section 4.1.1.2 of the Final EIS/EIR as a relevant policy under "Delta Reform Act of 2009 and the Delta Plan":

> **Delta Plan Policy G P1. Delta Plan Policy G P1 requires that actions not exempt from CEQA and subject to Delta Plan regulations must include applicable feasible mitigation measures consistent with those identified in the Delta Plan EIR or substitute mitigation measures that are equally or**

more effective. Delta Plan Policy G P1 also states that actions subject to Delta Plan regulations must document use of the best available science as relevant to the purpose and nature of the project. Finally, Delta Plan Policy G P1 requires that ecosystem restoration and water management covered actions include adequate provisions for continued implementation of adaptive management, appropriate to the scope of the action. This requirement is satisfied through A) the development of an adaptive management plan that is consistent with the framework described in Appendix 1B of the Delta Plan, and B) documentation of adequate resources to implement the proposed adaptive management plan.

RTC 7.12 (EIS/EIR) – The Proposed Action Alternative (SSHCP) requires adaptive management through implementation of the SSHCP Preserve System Monitoring and Management Program, as described in Section 8.3.4 of the Draft SSHCP. This adaptive management approach is consistent with the requirements of Delta Plan Policy G P1. The funding plan and assurances for implementation of the SSHCP, including adaptive management, were described in Section 12.3.3 of the Draft SSHCP.

RTC 7.13 (SSHCP and EIS/EIR) – Comment noted. The Plan Preparers have met with the Delta Stewardship Council during preparation of the SSHCP and were aware of the referenced Delta Plan adaptive management framework. The SSHCP Preserve System Monitoring and Management Program (described in Chapter 8 of the SSHCP) would be consistent and complimentary.

RTC 7.14 (EIS/EIR) – The Proposed Action Alternative (SSHCP) is intended to facilitate location of new urban development in accordance with local land use authority planning. Delta Plan Policies DP P1 and DP P2 have been added to Section 4.1.1.2 of the Draft EIS/EIR as relevant policies under “Delta Reform Act of 2009 and the Delta Plan”:

Delta Plan Policies DP P1 and DP P2. Delta Plan Policy DP P1 states that new residential, commercial or industrial development is permitted outside the urban boundaries only if it is consistent with the land use designated in the relevant county general plan. It is intended to strengthen existing Delta communities while protecting farmland and open space, providing land for ecosystem restoration needs, and reducing flood risk. Delta Plan Policy DP P2 states that plans for ecosystem restoration must be sited to avoid or reduce conflicts with existing uses when feasible.

RTC 7.15 (SSHCP and EIS/EIR) – Comment noted. The SSHCP Conservation Strategy in the EIS/EIR Proposed Action Alternative does not envision habitat restoration projects within the Cosumnes-Mokelumne Confluence Area because the lands within that area are not consistent with the Conservation Actions that guide habitat establishment/ reestablishment in the SSHCP (refer to Table 7-1 in the Final SSHCP). However, the Implementing Entity will ensure that if habitat re-establishment/ establishment projects do occur within that area, they will consistent with the Delta Plan regulations. Sections 10.2.1 and 10.2.3 of the Final SSHCP have been revised to state that covered activity projects would be subject to consistency determination with the

Delta Plan on a project-level basis. Delta Plan Policy ER P2 been added to Section 4.1.1.2 of the Final EIS/EIR as a relevant policy under "Delta Reform Act of 2009 and the Delta Plan":

> **Delta Plan Policy ER P2. Delta Plan Policy ER P2 states that habitat restoration must be consistent with Appendix 3 of the Delta Plan regulations and that restoration will occur at appropriate elevations.**

RTC 7.16 (EIS/EIR) – Delta Plan Policy ER R2 has been added to Section 4.1.1.2 of the Draft EIS/EIR as a relevant policy under "Delta Reform Act of 2009 and the Delta Plan":

> **Delta Plan Policy ER R2. This policy states, for the Cosumnes-Mokelumne Confluence: "Allow these unregulated and minimally regulated rivers to flood over their banks during winter and spring frequently and regularly to create seasonal floodplains and riparian habitats that grade into tidal marsh and shallow subtidal habitats."**

RTC 7.17 (EIS/EIR) – Delta Plan Policy ER P3 has been added to Section 4.1.1.2 of the Draft EIS/EIR as a relevant policy under "Delta Reform Act of 2009 and the Delta Plan":

> **Delta Plan Policy ER P3. This policy requires that, within the priority habitat restoration areas depicted in Appendix 5 of the Delta Plan, significant adverse impacts to the opportunity to restore habitat must be avoided or mitigated. Much of the overlap between the Legal Delta and the SSHCP Plan Area includes the Cosumnes-Mokelumne Confluence PHRA.**

RTC 7.18 (EIS/EIR) – Delta Plan Policies RR P2, RR P3, and RR P4 have been added to Section 4.1.1.2 of the Final EIS/EIR as relevant policies under "Delta Reform Act of 2009 and the Delta Plan":

> **Delta Plan Policies RR P2, RR P3, and RR P4. Policy RR P2 requires flood protection for residential development in rural areas. Policy RR P3 restricts encroachment in floodways. Policy RR P4 restricts encroachment in floodplains, including the Cosumnes-Mokelumne Confluence. Policy RR P4 specifically states that "no encroachment shall be allowed or constructed unless it can be demonstrated by appropriate analysis that the encroachment will not have a significant impact on floodplain values and functions."**

RTC 7.19 (EIS/EIR) – Preserve Management Plans under the SSHCP, as described in Chapter 8 of the Final SSHCP, would include specific prescriptions to avoid introduction of non-native species and remove those that are already present. Delta Plan Policy ER P5 has been added to Section 4.1.1.2 of the Final EIS/EIR as a relevant policy under "Delta Reform Act of 2009 and the Delta Plan":

> **Delta Plan Policy ER P5. Policy ER P5 calls for avoiding introductions and habitat improvements for invasive nonnative species or mitigating these potential impacts in a manner that appropriately protects the ecosystem.**

Analysis on this matter should address both nonnative wildlife species as well as terrestrial and aquatic weeds. To the maximum extent practicable, design of habitat restoration and creation actions should avoid or minimize effects that would lead to the establishment of nonnative invasive species populations on site before relying on mitigation measures. In the event that mitigation is warranted, those mitigation and minimization measures should be equally or more effective than the Delta Plan mitigation measure 4-1

RTC 7.20 (EIS/EIR) –The Plan Permittees have not included a draft certification as an appendix to the Final EIS/EIR. However, during SSHCP preparation the requirements of the Delta Plan were taken into consideration, and EIS/EIR Proposed Alternative (SSHCP) is generally consistent with the Delta Plan. Therefore, for those few SSHCP Covered Activities that would occur with the Legal Delta, consistency should not require substantial additional effort beyond that specified in the SSHCP Conservation Strategy.

LETTER 8 EARL SEABERG (SSHCP)

SSHCP South Sacramento Habitat Conservation Plan

Comment Card

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the proposed South Sacramento Habitat Conservation Plan. The space below may be used to provide comments on the Draft EIS/EIR. Please focus your review on the sufficiency of the document regarding the identification of environmental impacts and methods to avoid or mitigate those impacts.

WETLAND EXCHANGE REMOVES HABITAT & SPECIES FROM LOCAL NEIGHBORHOODS WHEN IN-FILL PROJECTS OCCUR. THIS REDUCES LOCAL BIO-DIVERSITY. 8.1

WOULD YOU LIKE TO BE ADDED TO THE SSHCP MAILING LIST? ☒ Yes ☐ No

If so, please provide your contact information.

Please submit your comments to a project representative or fold this form in half, seal with tape, and mail to: County of Sacramento, Office of Planning and Environmental Review, ATTN: Environmental Coordinator, 827 7th Street, Room 225, Sacramento, CA 95814

RTC 8.1 (SSHCP) –The SSHCP would allow planned urban development in the UDA and infrastructure projects outside the UDA to proceed, while preserving in perpetuity key habitats in the UDA and extensive areas outside the UDA. This balance was identified by the plan preparers as the most effective way to conserve the covered species while allowing the development planned in the General Plans of Sacramento County, Rancho Cordova, and Galt to proceed. Some take of wetlands will occur within the SSHCP's UDA and some of this take will occur as a result of infill projects. However, the SSHCP Conservation Strategy is designed to maintain species and habitat biodiversity. See Chapter 7 of the SSHCP.

LETTER 9 ENVIRONMENTAL COUNCIL OF SACRAMENTO, HABITAT 2020, THE SIERRA CLUB, THE INSTITUTE FOR ECOLOGICAL HEALTH, AND SAVE OUR SANDHILL CRANES (SSHCP AND EIS/EIR)

September 5, 2017

Attention: Rich Radmacher, Senior Planner
Sacramento County Planning Department
827 7th Street, Sacramento, CA 95814
Delivered via email to: radmacherr@saccounty.net

Comments on the public draft of the South Sacramento Habitat Conservation Plan

These comments are presented on behalf of the Environmental Council of Sacramento (ECOS), Habitat 2020, the Sierra Club, the Institute for Ecological Health, and Save Our Sandhill Cranes.

ECOS' mission is to achieve regional and community sustainability and a healthy environment for existing and future residents. Its membership organizations include: 350 Sacramento, Breathe California of Sacramento-Emigrant Trails, Friends of Stone Lakes National Wildlife Refuge, International Dark-Sky Association, Preservation Sacramento (formerly known as Sacramento Old City Association), Resources for Independent Living, Inc. (RIL), Sacramento Audubon Society, Sacramento Housing Alliance (SHA), Sacramento Natural Foods Co-op, Sacramento Valley Chapter of the California Native Plant Society, Sacramento Vegetarian Society, Save Our Sandhill Cranes (SOS Cranes), Save the American River Association (SARA), SEIU Local 1000 (Environmental Committee), Sierra Club Sacramento Group, The Green Democratic Club of Sacramento, and the Wellstone Progressive Democrats of Sacramento.

Habitat 2020 (H2020) is a coalition of environmental organizations collaborating on common issues in and affecting, the Sacramento region. Members of Habitat 2020 include the Sacramento Audubon Society, California Native Plant Society, Friends of the Swainson's Hawk, Save the American River Association, Save Our Sandhill Cranes, Sierra Club Sacramento Group, Friends of Stone Lakes National Wildlife Refuge and the Sacramento Area Creeks Council.

The Institute for Ecological Health promotes the conservation of rural landscapes, regional conservation plans, Smart Growth, an end to urban-suburban sprawl, and a Land Ethic for the 21st Century.

1

The Sierra Club is arguably the preeminent grassroots environmental group in the United States. Its mission is *to explore, enjoy, and protect the wild places of the earth; to practice and promote the responsible use of the earth's ecosystems and resources; to educate and enlist humanity to protect and restore the quality of the natural and human environment; and to use all lawful means to carry out these objectives.*

Save Our Sandhill Cranes (SOS Cranes) is a non-profit organization dedicated to maintaining open-space habitat and the conservation of the California Central Valley's Sandhill Crane populations through education, outreach, and community activism.

Members of ECOS, Habitat 2020, the Institute for Ecological Health, Save Our Sandhill Cranes, and the Sierra Club have participated as stakeholders in the preparation of the SSHCP for many years, some since its inception over two decades ago. This included years of work by the Biological Subcommittee developing major components of the HCP. They were also consistent participants in the Regulatory Agency Working Group meetings during the final years of Plan preparation. These comments on the SSHCP, and all of its appendices, reflect those long years of involvement and participation in the preparation of this HCP. We are grateful to have been included in the process of preparation and for the willingness of the Plan preparers and the regulatory agencies to hear out our concerns and suggestions along the path of Plan preparation. Many of those concerns and suggestions were addressed and are clearly evident within this draft of the Plan. These comments are intended to further strengthen the Plan. And, this letter endorses the comments by the Friends of the Swainson's Hawk. 9.1

All comments pertain to the published draft of the SSHCP, and its appendices, and only share a nexus with the DEIR/S analysis where the DEIR/S might need to be adjusted to accommodate changes in the SSHCP. Efforts have been made to provide accurate pagination citations to aid in locating and addressing the comments. Given the structure of the document, where information is presented with different focuses (e.g. habitat and cover type working down to species specific.), and is also imbedded within multiple different inter related levels of goals, objectives and actions that often overlap (e.g. that pertain to and address impacts to different habitat resources and that are recycled and added to for addressing species impact), efforts were not made to locate every place where a comment or recommendation might pertain. And, the inherent difficulty in working with such an interconnected document is acknowledged. 9.2

The comments included in this letter are not necessarily presented in the order of importance or priority, and they fall into a couple of general categories: large overarching concerns that are not particularly imbedded in one aspect of the Plan or its corresponding environmental documentation (these concerns do not necessarily have explicit pagination locations), and more specific concerns related to language or the lack of language in the Plan. In some instances these categories overlap. 9.3

Efforts were made to house comments within the context of a particular chapter of the Plan where possible and appropriate. Recommendations for changing or adding language will be highlighted by the use of a bold sequentially ordered number in blue, followed by a blue asterisk (*), to clearly identify them. 9.3 cont'd

THE VERNAL POOL COMPROMISE THAT IS THE SSHCP

And a brief little history lesson

At its very root, the SSHCP is a compromise for vernal pools. On the one hand there is the current strategy of trying to milk the maximum project-by-project mitigation out of projects that will take vernal pool resources inside the already constrained landscape inside the UDA. On the other, would be the effort to try and protect entire extant vernal pool landscapes outside the UDA while it is still possible, and before those resources have to contend with the constraints already squeezing those inside the UDA. The SSHCP is constructed on the latter being the better approach, and this was not an arbitrary decision.

When Plan preparation completely stalled out five to six years ago, very frank discussions were held about this compromise, and about which approach made the most sense for the long-term sustainability of vernal pool resources in our region. To no small degree, the environmentalists involved in these discussions helped push the point that the opportunity to save a large intact vernal pool landscape outside the UDA was too important an opportunity to pass up. A compromise was reached whereby additional vernal pools would be saved, beyond those already agreed upon inside the UDA, in hard line and flexible preserves. As well, it was recognized that there has already been some significant degradation outside the UDA of the very vernal pool resources that the Plan was hoping to save in this compromise. It was fairly clear that if the current rate of degradation continued, it might come to pass that there would not be sufficient or adequate vernal pool resources left to have made the compromise worthwhile. And from this emerged the idea of the grading ordinance, which was supposed to dramatically limit the chances that significantly more resources would be destroyed outside the UDA because, for new ground disturbances (basically non-ongoing farming disturbances), it would be necessary to get a grading permit from the County of Sacramento. 9.4

Politics being what they are, the grading ordinance morphed into a wetlands protection ordinance, which is supposed to do three new things: 1.) It requires the County to take a more active role in protecting wetland resources; 2.) It requires landowners to mitigate for any intentional or accidental destruction of wetland resources; 3.) It requires a permit for any disturbance to wetlands or their micro watershed. The ordinance is better than nothing and it is good that the County is taking a larger role in wetlands protection, but the USACE is already responsible for dealing with illegal destruction of wetland resources, and it is not immediately obvious if having the County involved in enforcement will save additional resources. The hope would be that the requirement of a wetlands disturbance permit would 9.5

stop the destruction around vernal pools from deep ripping for vineyards, or other conversions of grasslands to agriculture. As well, it is great that the ordinance spells out that any destruction will have to be mitigated, which is so costly that it should be a decent deterrent. But, again, this is not actually that different from what the eventual outcome would be with enforcement by USFWS or USACE. And, mitigation for those lost resources would further deplete the remaining vernal pool inventory available for mitigating the impacts of covered activities inside the UDA. So, there can be no real expectation that things will be any different than they currently are in terms of ILLEGAL destruction of wetlands resources, and those that want to pursue the legal destruction of wetlands will still have a process available to do so, albeit a very expensive process.

9.5 cont'd

Whereas it is good that the County will be taking on greater responsibility, there is still the problem of whether or not the vernal pool resources are still going to be there when they are needed for mitigation, and for building the vernal pool preserves outside the UDA. This contention was clearly presented to the Plan preparers and to their credit they came up with the intelligent approach of trying to tie up enough of the vernal pool landscape outside of the UDA before implementation of the Plan begins, using temporary conservation easements tied to options agreements, with the hope that this would result in the problem largely receding. But, this would be contingent on robust language in the option agreement/s, such that the option would still be actionable far enough into the future that those vernal pool resources would still be available for mitigation when needed, rather than having lapsed and not much to show for the effort remaining. 1* The option/s language will be critical to the success of the Plan, and it should undergo an intensive and extensive legal review by the permitting agencies and other interested parties to verify that it is adequate to ensure the success of the Plan.

9.6

The Agricultural-Residential issue

Agricultural-residential development outside the UDA is not a covered activity in the Plan. But obviously the entitlement of this type of development has a direct effect on the inventory for the Plan, and potentially on the creation of the Preserves if entitlements are given within a projected Preserve site. The County will be a permit holder for the Incidental Take Permit, which means they have a vested interest in maintaining inventory and not disrupting Preserve creation. But that does not necessarily mean that success of the Plan will be given priority over allowing new entitlements for new Agricultural-Residential or other development. 2* It would be appropriate, as part of rolling the plan out and making the various changes to the general plans of the ITP permit holders, to add language to the Sacramento County General Plan that addresses this concern - "SSHCP inventory concerns and needs, and preserve creation priorities, will take precedence over new entitlement applications for activities not covered by the SSHCP outside the UDA." It would be a perversion if uncovered activities ended up with priority over covered activities and their mandated mitigations.

9.7

4

Effects Assessment and Level of Take (Chapter 6)

Overarching Concerns

Effect of pesticide use on agricultural preserve lands

Consideration was given to the impact of direct application of pesticides on certain specific covered species, but the focus was on timing of application rather than the nature of the pesticides used. As well, sufficient consideration was not given to the ongoing and long term impact of pesticides on prey insects for covered species. Consistent application of pesticides has the undisputed effect of diminishing insect populations in the area of treatment, and if we are relying on agricultural preserves for the sustenance of some of the covered species that routinely consume insects, this is an obvious problem. 9.8

Using label requirements for application of pesticides would not take into account growing evidence of a problem related to a particular pesticide, such as is the current case with neonicotinoids. 3* If preserve management cannot be sufficiently responsive to indications of a potential problem with a specific pesticide being used on an agricultural preserve, then we risk the failure of our agricultural preserves because they might not be able to provide viable functioning habitat for covered species in an increasingly constrained landscape. The game is lost if we cannot rely on the agricultural preserves to provide fully functioning habitat. 9.9

4* Similarly, the effects assessment must consider the ongoing and cumulative impact of pesticide use on the prey insects of the covered species within the agricultural preserves since the vast majority of agricultural preserves will be acquired with conservation easements, which will limit the ability to do more intensive management and directly address the pesticide issue. Looking at the effects of direct pesticide application on covered species, and avoiding that direct application by timing of application, does not address the ongoing and long term impact on the natural insect community that some of the covered species rely on for sustenance. 9.10

A review of the agricultural preserve easement language indicates only language pertaining to timing of application. We fully acknowledge the need to have language in the easements that is flexible enough to allow agriculture to be sustainable on the preserves. But, we also need the flexibility to quickly address potential problems, and not have to wait years before scientific verification proves out an actual problem after real damage was allowed to happen. This somewhat delicate balance needs to be struck if we are going to be able to rely on our agricultural preserves in perpetuity. 9.11

5

5* As well, measure Road-3 needs to have the full suite of vertebrate covered species, that rely on insects for part of their diet added to the covered species list there (Loggerhead Shrike, White Tailed Kite, Tricolored Blackbird, Greater Sandhill Crane, Western Burrowing Owl and Western Red Bat...). 9.12

6*It might also be useful to avoid use of the word "pesticide" altogether in the Effects chapter in preference to the more specific terms of "insecticide" and "herbicide. " This would help to refine what the relevant effects would be for specific covered species. 9.13

Lighting

Consideration was given to the effect of light on certain covered species, but the consideration and analyses did not extend to the insect prey of those species. Night lighting has been well documented to attract insects. Both construction lighting and urban lighting in developments have the potential to lure insects to them, and in many cases this will result in luring insects off of the preserves. 7* Some consideration and measures or actions need to be provided to avoid disruption of insect prey species on the preserves, and the resultant impact to the covered species that rely upon those prey insects. 9.14

General comment on table numbering

8* Where are table 6-94 and 6-95? Would it not be better to have sequential numbering without numerical gaps? 9.15

<u>More Specific Concerns</u>

Night Lighting and Covered Beetle Species

Table 6-2, (Covered Species Vulnerability to Environmental Stressors, page 6-28), indicates that the Ricksecker's Water Scavenger Beetle and the Valley Elderberry Longhorn beetle are both susceptible to the temporary environmental stress of construction lighting, and the permanent environmental stress of lighting. But for EDGE-8, Table 6-3 (Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals, page 6-35), neither of the two covered beetle species are mentioned in the list of covered species affected - only the vertebrates are mentioned. The same holds true for construction lighting in BMP-6 on page 6-37 where again only vertebrate species are considered. We were able to find no scientific literature that indicated that the Ricksecker's Water Scavenger Beetle and the Valley Elderberry Longhorn Beetle are not attracted to night lighting. As well, the insect prey of the Ricksecker's Water Scavenger Beetle would presumably be attracted to night lighting and potentially lured off of the preserves. 9.16

6

In Table 6-51 (Permanent Indirect Effects on Ricksecker's Water Scavenger Beetle, page 6-205), lighting is presented as having no effect on this species and therefore requires no reduction of an effect despite being listed in Table 6-2 as being a stressor for this species. The same is true for the Valley Elderberry Longhorn Beetle in Table 6-54 (Permanent Indirect Effects on Valley Elderberry Longhorn Beetle, page 6-13), despite also being listed in table 6-2 as an environmental stressor for this species. 9.17

9* The two covered beetle species will need to be added to the list of species targeted in EDGE-8, and 10* tables 6-51 and 6-54 need to be updated to reflect lighting effects. 11* And, LIDs should be considered that address the fact that certain lighting frequencies are very powerful attractants for insects, whereas others are not. 12* And, for the Ricksecker's Water Scavenger Beetle, lighting will need to be considered in the context of wildlife community alterations, and the impact of insect prey for this species being lured off of the preserves by night lighting. This will need to be analyzed and mitigated with new conservation measures and actions. 9.18 9.19 9.20 9.21

Western Burrowing Owl

13* There was no discussion or AMMS offered to deal with rodenticide applications on ground squirrel colonies. 9.22

Rodenticides

14* Language is needed to prohibit use of rodenticides on any preserve. This is an important AMM for all of the raptors, the owl, as well as the American badger. And, certain rodenticides are fatal to raptors, which may eat a rodent made sick by consumption of rodenticide. D-Con is one such rodenticide. There are probably others. We have additional concerns that persons applying pesticides and rodenticides often ignore or do not understand the instructions on the product container regarding avoidance of poisoning non-target critters. 9.23 9.24

Loggerhead Shrike

Lighting and Pesticide Concerns

Table 6-92 (Permanent indirect Effects on Loggerhead Shrike 9, page 6-49) discusses potential indirect lighting effects on the shrike, but no mention or consideration is given to the effects of lighting on the insects that they consume. See earlier general discussion on this concern. Table 6-93 (Temporary Effects to Loggerhead Shrike) also does not consider the impact of construction lighting on insect prey species. 15* These will need to be added to table 6-3 and 16* specific AMMs presented, such as LIDs restricting light frequencies that attract insects. 9.25 9.26

7

In table 6-3 (Summary of AMMs that Minimize Effects of Environmental Stressors on Covered Species Modeled Habitats and Individuals, page 6-49), measure TCB-5 (Timing of Pesticide Uses and Harvest Timing on Agricultural Preserves) considers only the effect of pesticides being applied directly onto covered species or its prey insects during the breeding season, and not the overall and long term effects of pesticides on the insect prey base that covered species rely upon in the agricultural preserves. 9.27

In table 6-92 (Permanent Indirect Effects on Loggerhead Shrike, page 6-351) for the environmental stressor of "Pesticides and Fertilizers," the discussion of "Potential Indirect Effect on Species" states that: "Adverse effects on Loggerhead Shrikes, their prey ... from insecticides/pesticides ... will be avoided through the implementation of AMMS." The only AMMs that we were able to locate in Table 6-3 that mention pesticides are ROAD-3 (page 6-36) and TCB-5 (page 6-49), and neither of these AMMs address anything beyond the timing of application of pesticide. As such, the current draft of the SSHCP does not present measures to avoid or minimize the adverse effects associated with pesticide use on Loggerhead Shrike insect prey. 17* A more robust consideration of this issue will need to be added to table 6-3 with specific AMMs to address this issue. 9.28

Tricolored Blackbird

Lighting and Pesticide Concerns

The concerns just mentioned for Loggerhead Shrike are identical for the Tricolored Blackbird. As mentioned, TCB-5 (page 6-49) only addresses timing and 18* this will need to be expanded to address longer term effects on prey species and 19* additional AMMs will need to be added to this table. 9.29

Table 6-99 (Permanent Indirect Effects on Tricolored Blackbird, page 3-373) will need to consider effects of lighting on insect prey, and for pesticides (page 3-376). 20* A more robust consideration of this issue will need to be added to table 6-3 with 21* specific AMMs to address this issue as it pertains to effects on insect prey species. 9.30

Greater Sandhill Crane

The pesticides concerns mentioned for the two passerine species are also relevant for the crane. Table 6-96 (Permanent Indirect Effects on Greater Sandhill Crane, (page 6-364) also mentions relying upon AMMs to deal with pesticides that are not in evidence in the SSHCP beyond timing of application. 22* This will need to be corrected. 9.31

Western Red Bat

23* For this species there are the same issues again with both lighting and pesticides. 9.32

8

American Badger

24* There were no suggested AMMs to deal with rodenticides, which are commonly applied to ground squirrel colonies. 9.33

Conservation Strategy (chapter 7)

Overarching Concerns

Very little regarding specific conservation actions for some species 9.34

It is understood that a major pillar of the conservation strategy for many of the covered species in the SSHCP is to conserve the habitats that they use in order to make up for the habitats that will be taken for urbanization or other projects, which is basically the way most mitigations for CESA and FESA would proceed on a project-by-project basis. The regional approach to Preserve Design in the SSHCP is a significant improvement over project-by-project approaches, though. Given the regional paradigm of the SSHCP, it is also a real opportunity to perform conservation actions that directly benefit individual species. But for many of the covered species presented in Chapter 7, it looks more like the general habitat biological goals and objectives were shoehorned into the species specific biological goals and measureable objectives, whether or not they were exactly relevant, with very little additional added conservation actions that are specific to conserving individual covered species. 25* It would be worthwhile to carefully review the species' specific tables and ensure that all of the habitat goals referred to there are fully relevant, and, where appropriate, 26* add species specific actions to benefit individual species - an example of this might be adding specific perch construction or planting requirements for Loggerhead Shrike as part of Goal 4 (page 7-274). 9.35

Sea level rise and land acquisition priorities in PPU 6

For the southwestern part of the Plan area, PPU 6, we have concerns about the long-term viability of a large percentage of this area because of global climate change and sea level rise. Attached as addenda 1 thru 3 are some draft mapping models that the Nature Conservancy worked on as part of their participation in the Greater Sandhill Crane Technical Advisory Committee (Crane TAC) and the work that committee is doing to craft a conservation strategy for the Sandhill Crane, starting in the geography of the Delta and its immediate surroundings. The Crane TAC is a coalition of state and federal wildlife regulatory agency folks, preserve and refuge managers, crane biologists, environmentalists, and wildlife ecologists. The Crane TAC aims to foster the collaborative long-term conservation and recovery of Greater Sandhill Cranes by: identifying and recommending monitoring and research; providing guidance on habitat protection, restoration, and management; and promoting outreach and education. One priority of the Crane TAC is to develop a Delta region conservation strategy for the Greater Sandhill Crane. The conservation strategy will present recommended actions for private and public landowners to improve 9.36

9

Greater Sandhill Crane habitat in the Delta region. The methods and recommendations described in the strategy will be incorporated into a statewide conservation strategy for Greater Sandhill Crane and ultimately provide a template for developing a Greater Sandhill Crane recovery plan.

9.36 cont'd

The draft mapping models in the first three addenda attempt to present: current crane usage areas, the areas likely to be impacted by very moderate sea level rise, and the resultant change in areas that should be considered for conservation considering both current usage and threat to low lying areas. The draft models were not adjusted for population density, and incorporating this will likely shift some of the lowland priorities, but it should have no effect on priority of upland areas since these were elevated in priority because of their relative safety in terms of sea level rise and their current proximity to active roost sites.

The concern, illustrated by the attached maps, is that over the 50 year permit period there will likely be a marked rise in sea level in at least PPU 6 of the Plan Area. Global Climate Change is considered in Chapter 11 and we will discuss this also in our review of that chapter. But, for the purposes of Chapter 7's conservation strategy, we feel that it is important to highlight this issue. As well, we have concerns that the 1000 acres of upland (outside of the floodplain) habitat acquisitions for the Greater Sandhill Crane may not be adequate given the severity of the potential loss of already conserved habitat for this species in the lowland areas of the North Delta most susceptible to sea level rise. We are heartened by the fact that the specific language for the upland habitat for the crane states that a MINIMUM of 1000 acres will be acquired, but 27* we also feel that some additional verbiage should be included to indicate that: "the effects of sea level rise on low lying areas of PPU 6 may necessitate a shift over time to greater conservation and acquisition focus on the areas elevated outside of the floodplain." These lands will be significantly more expensive because of the speculative price pressure of potential urbanization, but given the potential prognosis for the long-term viability of lowland conservation areas in the North Delta, they may be the only areas that provide suitable habitat in perpetuity.

9.37

Outdated Species Accounts

Because of the extraordinary amount of time that it took to complete the SSHCP, over two decades, the species accounts, that were current when they were written, have become out of date and there were insufficient funds to update them for this public draft. This is an issue that will be discussed further later on in this comment letter. What is germane to the discussion of Chapter 7 is that the species accounts would typically feed into the Conservation Strategy by providing the important natural history basis for individual species that the conservation strategy is then built off of. We note that, though the species accounts were not updated, the Conservation Strategy has taken advantage of up to date scientific literature and species occurrence data in the construction of the strategy. We looked for occurrences where the strategy suffered from outdated resources and have

9.38

10

attempted to point those out. There may well be more occurrences that were missed. 9.38 cont'd

Need to update references

28* Several very important and useful references have become recently available that would be valuable for this Plan and for the Conservation Strategy. A far from exhaustive list would include: The new HCP handbook (Dec. 2016), the revised draft giant garter snake recovery plan, Final California Tiger Salamander recovery plan for central portion of range June 2017), and "Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle (May 2017). It will be important to have the advantage of these resources and others. 9.39

A general comment about organization

29* It might make sense to present the species using current phylogenetic ordering (like in any modern field guide). When searching for Tricolored Blackbirds, one would not expect to see Greater Sandhill Cranes inserted in between the two passerine species (Loggerhead Shrike and Tricolored Blackbird). 9.40

<u>More specific concerns</u>

Preserve Management Plans HAB1.1

In preparing the preserve management plan (page 7-26 Action HAB 1-1, 8-149 etc.) for a conservation easement, 30* it is essential to work closely with the landowner. The benefits from working closely with the owner include access to the landowner's knowledge of the property, as well as their possible ideas for helping species. Also it will build trust in the broader agricultural and ranching community and will hopefully result in more landowners being willing to sell easements. 9.41

On page 7-27 in Table 7-1, for Conservation Action HAB 7-1, 31* the vegetation measurement prescribed for Flexible Preserves should be for all non-agricultural preserves, and not just Flexible Preserves. This measurement used consistently across all non-agricultural preserves would provide essential knowledge for preserve management. 9.42

Greater Sandhill Crane

GS3.1 included in Table 7-1 (Biological Goals. Measurable Objectives, and Conservation Actions, page 7-46) lists the following as a conservation action for the Greater Sandhill Crane: "Replacement of unmodeled agricultural uses such as orchards and vineyards with habitats supporting high prey density (e.g. vole), including grassland, suitable Croplands..." We assume that the reference to voles resulted from an erroneous cutting and pasting from conservation actions from one of the raptor species (Northern Harrier, Swainson's hawk, or White Tailed Kite...). 9.43

11

Voles are hardly a staple for the Greater Sandhill Crane and 32* it would be far more appropriate to focus on replacing orchards and vineyards with "high value foraging habitat" such as corn or rice. 9.44

This brings up a concern about how "high value foraging habitat" for the Greater Sandhill Crane is defined. For GS5.1 in Table 7.1 (page 7-47), alfalfa is offered as a crop preferred by Greater Sandhill Crane. Presumably this preference attribute was taken from the Appendix B species account for Greater Sandhill Crane (Appendix B 539 -540).

> Ivey (pers. Comm.) rated agricultural crops in the Plan Area in order of Importance. Rice and corn were rated the highest, followed by winter wheat and irrigated pasture. Alfalfa was the next highest rated crop, followed by hay, dryland pasture and row crops.

This ranking of alfalfa is somewhat outdated. Ivey, Herzinger, and Hardt prepared a report for the Nature Conservancy in 2014 titled: "Conservation Priorities and Best Management practices for wintering Sandhill Cranes in the Central Valley of California." It is included as addendum 4 to this comment letter. On page 40 to 41 of the report it states:

> Greaters rarely used alfalfa in the Delta, in contrast to Lessers, which often favored alfalfa through the winter season (Ivey 2015). Similarly, Greaters avoided alfalfa in the Sacramento Valley studies (Littlefield 2002, Shaskey 2012). Although alfalfa appears important to Lessers, this crop should not be considered a major food source for Greaters in a conservation-planning context. However, alfalfa should be encouraged in crane landscapes in the San Joaquin Valley, where Lessers dominate the crane flocks. 9.45

We are concerned that, if alfalfa is considered in the Plan as a "high value foraging habitat" for the Greater Sandhill Crane, it will be all too easy to fold conservation action GS5.1 (page 7-47) of maintaining food plots for the crane into alfalfa cover type preservation requirements for the Swainson's hawk. 33* GS5.1 should be changed to state that: "Crops should be corn or rice preferentially, and potentially wheat or other suitable crop types depending on the current crop mosaic in the Plan area."

The last sentence of GS5.1 (SSHCP 7-47) states that: "Crops must not be harvested or removed until March." 34* It would be useful to include some verbiage that crops like corn should be knocked over at a height, and as early as possible in the season, to maximize the benefit and to give access to cranes, while still impeding geese from exploiting the resource. 9.46

For GS6.1 of Table 7-1(SSHCP page 7-47), the fourth bullet point, listed as a criteria to be considered (and we appreciate that this is a criteria to be considered rather than a requirement, and that it is only one of a list to be considered) for selecting Preserve sites for high value foraging habitat outside of the 100 year floodplain, 9.47

includes sites "recorded as supporting greater sandhill crane foraging during previous flood events." We understand the intent of this criteria, but we have three concerns about it. The first concern is that records for crane usage are very limited during flood events and therefore do not necessarily capture where they are foraging during such stochastic events. Secondly, the vast majority of the lands above the floodplain in question are privately held, and it has only been possible to determine if cranes are present in a given area from roadside observations, which would limit the ability to accurately determine if cranes are using a particular parcel. Thirdly, cranes are only likely to use habitat and crop types that are consistent with their natural history regardless of flooding. Parcels that have been planted in crop types that are not suitable for cranes are not going to get usage, and therefore might not be considered even though they would be used for foraging if a more appropriate crop were present.

The easiest answer to these concerns is that the fourth bulleted criteria is only one of six that will be considered, and it is not a strict requirement. And there still remains the difficult assessment of which criteria carry the most weight when making a selection. And arguably, the most important criteria besides, actually being outside of the floodplain, is that it is located within 2 miles of a roost site. But, given the very real likelihood of sea level rise, which is presented in chapter 11, many of the current crane roost sites might not function in perpetuity. If they fail due to sea level rise, presumably a new site will be selected nearby that exhibits the attributes they require for a roost site. This will have the outcome of permanently shifting the Plan area crane population to higher ground which means they would have the options of routinely foraging to the north below the city of Elk Grove, and to the east, continuing past the city of Galt. And this is the real crux of the problem with the fourth bulleted criteria point: how do we address sea level rise using crane natural history and their current usage of the landscape as a guide?

9.47
cont'd

Given that Greater Sandhill Cranes forage within two miles of their roost sites, and that they exhibit extremely high fidelity for their roost sites, immediate individual population range usage adjustments within the Plan area due to roosting loss from sea level rise should be considered in 2-mile increments. What is the nearest suitable viable roost site within two miles and what are its corresponding foraging grounds? If the goal is to shift cranes to habitats they can use in perpetuity as a response to rising sea levels, it would make sense to look at geographic pathways to do that in two-mile increments. The third map attached as an addendum to this comment letter attempts to do that as it highlights upland forage areas within the Plan area that are north as well as east of the current population strongholds for cranes in the north Delta.

It is important to note that the map presents the paradox of the current crane conservation landscape. The historically most important conservation targets for cranes, appropriate habitats within 2 miles of high usage roost sites, are the very same targets that will potentially get the crane into trouble, as sea levels rise, because of their elevations. The map suggests that a balanced approach is

13

potentially going to be the most appropriate going forward, where efforts continue to be made to preserve habitats that become available within that two mile radius of high usage roost sites, while simultaneously focusing on what it will take to secure permanent long term habitat for the crane outside of the north Delta. The 1000 acres action item outside of the floodplain called for in this Plan is something that can begin to address that shift in conservation priorities for the crane. As such, it is important to provide appropriate guidance in this Plan as to how to make that shift. 9.47 cont'd

The Sandhill Crane TAC, that has already been discussed in the context of overarching concerns for this chapter (and it is important to remember that USFWS and CDFW are on this committee), would be an appropriate committee to help the implementers of the SSHCP to formulate and refine a response to the seal level rise issue that can make the most effective and beneficial use of the required MINIMUM 1000 acres of conservation required for the crane outside of the floodplain. 35* As such, we recommend that an additional bullet point be added that reads: "Coordinate with relevant conservation entities, and the wildlife agencies, to determine the most effective acquisitions to deal with potential geographic shifts for the Greater Sandhill Crane population within the SSHCP Plan area in anticipation of, and as a result of, sea level rise." 9.48

A couple of small corrections in the treatment of Greater Sandhill Cranes in section 7.6.2.26 (starting on SSHCP page 7-277): 36* tenth line from the top on page 7-283 – cranes do not nest in the Plan area and this should be changed to "roosting and foraging;" 37* last paragraph discussion of re-establishment and/or establishment (page 7-282) should focus more upon the importance of waste grain than that of invertebrates since those waste grains make up the majority of the food consumed by cranes in the Plan area – invertebrates should be mentioned, but not to the exclusion of waste grains. 9.49

Tricolored Blackbird

For this species in particular we have the concerns already expressed about pesticide use that can have deleterious effects on their prey insects. Reading all of the conservation actions, and knowing that there are, as of now, insufficient AMMS to deal with this issue, it was difficult to see success as an outcome. 38* More robust insecticide AMMs need to be established for the agricultural preserves if this species is to persist in the Plan area. 9.50

The conservation action TB5.1 in Table 7-1 (Biological Goals, Measurable Objectives, and Conservation Actions, page 7-51) states "Protect at least one extant unprotected occurrence of a nesting colony prior to the take of one nesting colony of tricolored blackbird." The first listed criteria for selecting the extant unprotected nesting colony is that it has supported a minimum of 200 individual tricolored blackbirds during one or both of the surveys for the two years preceding the project application. Having a 200-bird minimum is not a bad thing, but as written, a colony of tens of thousands of blackbirds could be taken and then replaced with a colony of 9.51

14

300 birds. 39* This criteria should be reworded to require that the protected colony contain a minimum of 200 individual blackbirds, and contain at least an equivalent number of blackbirds as in the colony taken. If this or an equivalent change is not made, abuses of this conservation action will be possible. Similar corrections need to be made to TB5 in Table 7-787 (page 7-288) and the first paragraph of page 7-291. 9.51 cont'd

In the latest statewide survey for which data is available, there were over 22,000 tricolored blackbirds breeding in Sacramento County, most of which were in the SSHCP Plan area. As a result, 40* we need a sufficiently robust conservation strategy, and no large colonies should be taken until we have substantial conservation of large colonies within the preserve system. 9.52

For Objective TB6 of Table 7-87 (Biological Goals and Measurable Objectives Applicable to Tricolored Blackbird) 41* an experimental study of the effects of pesticides on Tricolored Blackbirds should not be a prerequisite before more stringent requirements for pesticide use on agricultural preserves. For insecticides in particular, it does not take an experiment to conclude that eradication of the main prey of the blackbird will have severe negative effects. Dr. Meese at UC Davis has been sounding the alarm bells for some time about the severity of the insecticide problem for the Tricolored Blackbird. Experiments to determine insecticides that do not have such negative consequences on the blackbird would be merited, but this would take a very long time to establish conclusively and should not predetermine or put off insecticide policies for the agricultural preserves. 9.53

Loggerhead Shrike

On page 7-276 it is stated that: "if large trees are planted in hedgerows, they can provide Loggerhead Shrike perches and potentially nesting habitat." 42* The reference to perching and nesting habitat in large trees should be removed because Shrikes use shrubs and small trees for nesting (nests 2 ½ to 4 feet above ground), including thorny shrubs, and they use low perches, including fence posts, for hunting. 9.54

43* Specific conservation actions should be included for the Loggerhead Shrike, like providing artificial or natural perches. Hoping that the required 10,000 linear feet of hedgerows will resolve or help the problem is quite different than targeted specific actions. The same is true for Loggerhead Shrike nesting habitat. 9.55

Swainson's Hawk

There is no mention of the standing CDFW requirement that Swainson's Hawk mitigation acquisitions are supposed to be above sea level. 44* This requirement should be added to the relevant conservation objectives and their associated conservation actions such as SH1 (page 7-39), SH2, SH3 (page 7-40), and SH6 (page 7-41). 9.56

15

For the 2000 acres of cropland to be preserved in fee title, according to conservation objective SH2 in Table 7-1 (Measurable objectives and Conservation Actions), it is unclear how this interacts with the 200 acres of intensively managed crops required for Greater Sandhill Cranes. Was an assumption made that the alfalfa requirement for Swainson's Hawk (a minimum of 50% of the 2000 acres) would satisfy the crane objective (200 acres of feeding plots) based on an outdated species account that incorrectly identified alfalfa as a suitable crop type for crane foraging? If this was the case, it may be necessary to look at the non alfalfa plantings in that 2000 acres and determine if it is possible to site at least 200 acres of them for the co-benefit of the crane and the Swainson's Hawk, keeping in mind that the ideal crop for the crane (corn and rice) is not the ideal crop for the Swainson's hawk, and vice versa; and keeping in mind that they need to be within acceptable distances for roosting cranes as well as nesting Swainson's hawks. The somewhat disjointed way that the various acreages are presented in Chapter 7 makes it difficult to determine how much of one species' conservation can be satisfied simultaneous to that of another species who relies upon the same habitat. 9.57

It is the contention of some of the long-term stakeholders in the Plan preparation that originally it was going to be 2000 of intensive management acres for Swainson's Hawk and then an additional 200 acres of food plots for the crane. 45* The final SSHCP should include these separate 2000 and 200 acres, with their very different functions. 9.58

White Tailed Kite

In the discussion in 7.6.2.21, starting on page 255 of the SSHCP, there is mention of benefits that would accrue to the species through planting of trees in agricultural settings, as well as the benefit of hedgerows. On page 7-260 it states: 9.59

> Similarly, planting trees in agricultural settings should increase the number of suitable nest and perching sites near foraging habitats, and plant hedgerows should increase habitat for prey species and prey availability. Additionally, if large trees are planted in hedgerows, they will provide white tailed kite nesting habitat in addition to increased prey habitat values.

There seems to be no mention of these underlying biological objectives or goals in table 7-76 (Biological Goals and Measurable Objectives Applicable to White Tailed Kite, page 7-258)." 46* Measurable objectives should have been included on page 7-258 in Goal 4 (Maintain or improve value of natural land covers (including Cropland and Irrigated Pasture-Grassland) that are preserved in the Plan Area). At a minimum AG3 should have been added which contains the 10,000 linear feet of hedgerow requirement. And, 47* a new related biological goal should be added for the planting of a specific number of trees in agricultural settings. Surely, "if" large trees are planted in hedgerows they will provide the aforementioned benefit. But, "if" they are not planted then no benefit will accrue. 48* Measureable objectives are needed here for tree planting to benefit White Tailed Kites, and they should be 9.60

16

included in Table 7-76 on page 7-258. This is another example of where species' specific measures are lacking.	9.60 cont'd
Burrowing Owl	
Burrowing Owl conservation has been a difficult effort to get on top of for the HCPs already in implementation phase in Northern California. As a general note, 49* where Burrowing Owl persist within the UDA, irrespective of whether or not they happen to be in Preserves, efforts need to be made to conserve those occurrences - see attached for addendum 5 which is a PowerPoint that discusses the need to also focus conservation for Burrowing Owls within HCP Plan areas on where they currently persist, which can often be in very unexpected urban settings, rather than where they "should" persist (i.e. expensive preserves featuring enticements for them).	9.61
For BO 2.1 in Table 7-1 on page 7-44, 50* we recommend that an additional conservation action be added to the last bullet point ("Enhance foraging habitat quality through") - namely: "Create rock piles near nest burrows."	9.62
Miscellaneous	
For VPP 1.1, on page 7-28, 51* protecting 6 occurrences of Ahart's Dwarf Rush may require establishing new occurrences.	9.63
On page 7-43, we wonder if NH1 and NH2 should be merged?	9.64
For table 712 on page 7-103, 52* This looks like a John Diddes analysis table, and he must get proper credit if that is the case.	9.65
Monitoring and Management Programs (Chapter 8)	
Monitoring for "how the species is doing"	
Beyond the annual plants and invertebrate status and trends monitoring, there is not much "how is the species doing?" monitoring for the rest of the species (page 8-106). 53* The Plan will need this information for nearly all of the species to ensure that Conservation actions and Preserve Management Actions are working. In some cases it will be possible to tie into larger monitoring efforts such as the statewide Tricolored Blackbird surveys or the extensive Swainson's Hawk nest surveys for Sacramento county area.	9.66
Pesticides/Insecticides	
Consistent with earlier comments regarding pesticide/insecticide use on agricultural preserves, we believe that the reliance on timing of pesticide use, as is presented in TCB-5 (page 8-80), is not adequate to address the effect on insect prey	9.67

17

species. 54*A far more robust AMM is needed, as has been mentioned, and 55* a more thorough assessment will then also be needed to ensure that the agricultural preserves have sufficient insect prey species to support covered species (such as Tricolored Blackbird, Loggerhead Shrike, Greater Sandhill Crane, and Western Red Bat…). 9.68

Miscellaneous

For GSC-3 (page 8-81), 56* for the assessment of the crane roost buffer it is unclear why nesting would be mentioned given that cranes don't nest in the Plan area. What needs to be assessed is compliance with the establishment of a .5-mile roosting setback. 9.69

For Section 8.4: "Data Management and Reporting," 57* it would be useful to include information, or a process, or a contact, for getting access to the data repository for scientific and other uses. 9.70

For section 8.4.1: "Annual Reports," 58* it would also be important to include the available inventory (in acres) remaining for each cover type/habitat type in the Plan Area. This is important because the Plan implementers need to track how much potential inventory is still available for their mitigation purposes, as well as to understand what other land use activities not covered by the SSHCP may do to that inventory. The same holds true for those who might make discretionary entitlement decisions for uncovered activities in the Plan area. 9.71

For Table 8-4, starting with page 8-126, there are several rows, in the column headed "when and how often," where "5 years for surveys including staff observation in annual reports" appears. What does "5 years for surveys mean," every five years or something else? 9.72

Implementation (Chapter 9)

Governing structure and responsibilities

For the second paragraph of "Implementing Entity Responsibilities in Reviewing Third Party Requests for Take Authorization" (page 9-12), 59* it would be prudent to also include inventory as one of the things that the Implementing Entity tracks and provides to Plan Permitees and Land Use Authority Permitees as they process third party applications for take. 9.73

For section 9.3.4 (Technical Advisory Committee/Interagency Review Team, page 9-18), we recommend adding another responsibility for the TAC/IRT, which would be: 60* "review relevant new scientific studies and reports for applicability in Preserve management." It will be important for successful management of the preserves, including adaptive management, to be able to refer to and learn from new developments and studies that are relevant to the covered species and the conservation actions being implemented on the preserves, as well as for priority 9.74

18

considerations for new property acquisitions. 9.74 cont'd

On the same page (9-18), after the bullets detailing the responsibilities and duties of the TAC/IRT, it states:

> As discussed previously in section 9.3.1, the JPA Board or Implementation Committee is ultimately responsible for approving the aforementioned plans and actions, and the Permitting Agencies will have approval authority over those plans and actions with the exception of property transactions for satisfying the Conservation Strategy.

As near as we can make out, no other entity has the ability to veto a property transaction that the Implementing Entity plans to approve. The wildlife agencies (also referred to as Permitting Agencies) have the ability to review "SSHCP land easement acquisitions, land dedications, and acquisition of mitigation or conservation bank credits" (page 9-14, last bullet point of section 9.3.2). But here there is no mention of approval, just review. The TAC/IRT also is tasked with "reviewing SSHCP property transactions for satisfying the Conservation Strategy such as land or easement acquisitions... " (Page 9-18, third bullet point in section 9.3.4). 9.75

We are very concerned about the absence of any balance of power when it comes to approval of acquisitions. We had originally pushed for a completely autonomous Conservancy structure that implemented the Plan to avoid any political interference. As presented we have the opposite, politicians in charge of the implementation of the Plan. We understand the argument that since the Permit Holders are on the line for the implementation of the Plan they need to have ultimate say over Plan implementation. Interestingly, one of the elements that underlies that argument is that the Permit Holders would not necessarily trust a third party conservancy to carry out implementation correctly and they would be liable, and therefore they want that responsibility themselves. Similarly, we do not necessarily trust that the JPA will carry out the implementation of the Plan in a politics free environment and that they will never approve an acquisition for political rather than biological and conservation reasons. 9.76

The only way that conflicts of interest and political maneuvering can be addressed is if there is a robust system of checks and balances within the governing structure. 61* Either, preferably both, the Permitting Agencies (USFWS, CDFW, USACE...) and/or the TAC/IRT needs to have approval authority of acquisitions, and any other property transactions. If only one were given this oversight, it would likely make the most sense to rely upon the TAC/IRT for this since the Permitting Agencies sit on that committee/team. Without this balance of power, and built in checks and balances, the Plan will risk potential political abuse over the next 50 years – such as sub standard habitat being passed off as high quality as a political favor to a particularly generous constituent. We consider this issue to be of the UTMOST importance, and absent an effort to address the concern in the governing structure, 9.77

it will be difficult for us to support the Plan. 9.77 cont'd

It is very important that stakeholder representatives be on the TAC – their active involvement will be essential to the long term success of the HCP- and we appreciate that they have been included. 9.78

Acquisitions

On page 9-23: "Reselling Acquired Lands after Establishing Conservation Easements" is predicated on the Conservation Strategy working effectively with only 15% of Preserve lands outside the UDA being held in fee title. The fee title lands would allow for more intensive management, and more of this might be necessary depending on conditions within the Plan area. Maintaining as much land as possible in agriculture and ranching is important to the success of conservation efforts in the Plan area because a sustainable agricultural and ranching economy helps preserve the important agricultural component in the habitat mosaic of the Plan area, and most of that component will be outside of the confines of the SSHCP conservation strategy. But as important as agriculture and ranching are, it is important to use language in the Plan that allows the flexibility to adjust the ratio of fee title and conservation easement if it is deemed necessary for the conservation of the covered species. 62* The 15% should be considered an important goal, but a goal that is not subservient to successfully implementing the Conservation Strategy. If adaptive management and changes in conditions on the ground in the SSHCP require more intensive management, the Plan should not be limited by prescriptive language that precludes it from adjusting the ratio. 9.79

Early Enrollment Program

For section 9.4.5 63* it would be prudent to discuss how priority of acquisition will proceed for those enrolled. The early enrollment program is a very clever and effective way to get landowners to participate early in the life of the Plan, and it will help to conceptually build the Preserves on the landscape before there is adequate money to buy the needed parcels. In order for the enrollees to have a reasonable experience, and not lose heart while they wait for their property to be paid for, it is imperative that a very clear and a very fair and transparent process is laid out for how and when enrolled properties will be paid for. For the purposes of the success of the Plan, it will be very important to prioritize individual properties within the context of the overall Conservation Strategy to maximize the conservation benefit that will accrue to the Plan. But, for the enrollees, it is important that, whatever that prioritization scheme ends up being, it is enforced consistently and without bias or prejudice. The only way that it will be clear to enrollees, if that is actually the case, is if the process is transparently laid out at the time of enrollment. 9.80

Gifts of Land

Section 9.4.7: "Gifts of Land" 64* does not explicate if a gift of land that fits into the SSHCP Conservation Strategy and Preserve creation strategy could be accepted and 9.81

20

then used for mitigation for a third party application. Also, 65* there is no discussion or explanation of how or if there would be the same level of monitoring, operation and management activities as found on preserves in the SSHCP, 66* or how long term management would be paid for. 67* It would be very important to consider any gift of land in the context of Appendix J (Additional Voluntary Conservation) and make sure that any gift of land did not satisfy the goals found there before it was denied. As well, land that did not come with an endowment could conceivably get a grant to cover that cost through Appendix J efforts.

9.81 cont'd

Preserve Setbacks

The Plan dispatches with any requirement for preserves outside of the UDA to consider setbacks because it states that those preserves currently exist in an open space context and don't need them, which is true for now. It seems to be a missed opportunity, though, not to consider the potential impacts of agricultural residential projects that could easily crop up immediately adjacent to a preserve. 68* Would it not be prudent to include some language detailing what an acceptable buffer/setback would be for the preserves outside the UDA? As well, 69* language in the General Plan would also be appropriate for delineating such buffers/setbacks for preserves within the county. The language needs to require a restriction for county approval of AG RES to include 200 foot no human activity buffer next to any preserve lands.

9.82

Setbacks that are outside the preserves per-se will be owned and managed by various entities, including home-owners associations. In order to ensure that the setbacks are properly managed according to the HCP requirements, 70* there also need to be conservation easements that restrict usage of setbacks and require necessary management measures. The HCP implementing entity must have enforcement power over the setbacks to ensure proper management.

9.83

What is not a problem today can be solved much more easily than when it is a problem tomorrow.

9.84

Data Repository Development and Maintenance

For section 9.8 (Data Repository Development and Maintenance, page 9-40) 71* it would be good to refer to our comment for Section 8.4 (Data Management and Reporting) which suggested that it would be useful to include information, or a process, or a contact, for getting access to the data repository for scientific and other uses. A huge amount of expense will go into collecting the data within the repository and it would be appropriate and beneficial to allow that data to be made available for scientific study, conservation management, and other purposes.

9.85

21

Future Land Use Planning Changes

Section 9.10.4 (Future Land Use Planning Changes, page 9-47) states: "changes in land use designations or regulations do not trigger preparation of a minor modification or an amendment to the SSHCP, if the changes would not directly or indirectly effect completion of the SSHCP Conservation Strategy." This section instills confusion rather than clarity and relies on the interpretation of "directly or indirectly." A definite result of future land use planning changes will be the loss of inventory for the SSHCP. 72* This section should explain at what point the loss of inventory becomes a problem for the SSHCP. At a minimum, this section should provide a minimum feasibility for acquisition bar for understanding "directly or indirectly." As an example: "If the land use policy changes will result in the loss of inventory such that the feasibility of acquisition, for the SSHCP for the lands it needs in the same PPU as the proposed land use planning changes, is higher than 15%, then a modification or amendment will be required." The issue of feasibility for acquisition has already been a contentious one in the SSHCP plan area for attempted changes in land use planning. 9.86

Implementation Schedule and Deadlines

For section 9.11, (Implementation Schedule and Deadlines, page 9-48) and Table 9-3 (Schedule for Major Implementation Tasks, page 9-49), 73* it would be appropriate to add "Update Species Accounts" to the tasks, and to do so in the "prior permit" time period if money can be secured. Those accounts will be very important for providing the important natural history background for the species covered in the Plan and will aid in many of the Conservation actions required. 9.87

Changed and Unchanged Circumstances – Assurances (Chapter 11)

Public Notification of Land Acquisitions

For 11.1.6 (Public Notification of Land Acquisitions), it is quite confusing to read about the private nature of negotiations, between landowners and the SSHCP Implementing Entity etc., and find absolutely nothing about public notification in this section. It is appropriate for such negotiations to be private and it is heartening to see that "the Technical Advisory Committee must approve the transaction (see Chapter 9, Section 9.3.4)" despite the fact the section referred to only stipulates that the TAC/IRT would be reviewing the transaction. This approval language should be kept, and Chapter 9, section 9.3.4 should be changed to reflect that the TAC/IRT will also be tasked with approving the transaction, as suggested in an earlier comment on that section. And, given the title of 11.1.6 74* there should be discussion about the public notification of land acquisitions. The maximum amount of transparency is obviously appropriate after the transactions have been approved, and the more information available to the public, the better for the Plan as it will have yet another level and layer of scrutiny and watchdogging. 9.88

22

Projected Climate Change Impacts in California

In section 11.3.1 the changed circumstance assumed for sea level rise is 12 to 18 inches by 2050, and 21 to 55 inches by 2100 in the SSHCP Plan area. As mentioned in earlier comments, this sea level rise will be most problematic for PPU6. And as also mentioned previously, the MINIMUM of 1000 acres of upland forage (foraging grounds outside of the 100 year floodplain) in and near PPU6 is a good start in addressing the need for Sandhill Cranes and other species to shift their populations to higher ground. Given the severity of the anticipated sea level rise, and the fact that much of the Delta is at or below sea level, it will be important to consider the need to secure enough suitable habitat above the higher sea level elevation that will be established as the ocean rises, and not rely completely on the Delta's existing levees which are aging and likely far too extensive to replace. There is no need to adjust the PPU specific acquisition targets to contend with sea level rise, but 75* there will likely need to be a shift over the Plan's 50-year implementation period towards prioritizing less vulnerable areas for acquisition. It would also seem reasonable to expect some species in the broader Delta ecosystem, including huge amounts of territory outside the Plan area, to abandon areas that become permanently inundated as a result of sea level rise, and that at least a portion of those species and individuals may well have to squeeze into the remaining upland areas of PPU 6 and other nearby PPUs. 9.89

In Table 11-1: Evaluation and Ranking of Covered Species Sensitivity to Climate Change (page 11-19) it is hard to rectify the sensitivity ranking for Greater Sandhill Crane sensitivity determinations with their natural history. The Greater Sandhill crane is extremely philopatric to its roost and foraging sites when it winters in the SSHCP Plan area, and this is exactly why conservation priorities for the crane are within 2 miles of their roost sites in the Conservation Strategy of this Plan. The table correctly ranks the crane's sensitivity to habitat specialization/habitat changes as high. Physiological tolerance is ranked as unknown, and for dispersal activity, and changes in food availability; it is given a low sensitivity. This is surprising because the sea level rise numbers presented have the ability to wipe out the vast majority of the existing preserved lands for the crane – refer to the map in addendum number 2 for a depiction of this. This means that an extremely philopatric species will potentially be uprooted and the closest available upland forage areas (and Greater Sandhill Cranes definitely prefer areas that they are familiar with, e.g. within two miles of their roost sites), of which the Plan is preserving 1000 acres, also just happen to be some of the most desired for urbanization in the region, which means agricultural production may well be quite constrained. So, despite the omnivorous nature of the crane, food could be a very serious problem if the abundant waste grains they have become accustomed to are largely gone in the Plan area. 9.90

We would argue that the overall sensitivity ranking for the Greater Sandhill Crane to sea level rise is extremely high. And given that the other manifestations of climate change will present additional difficulties on top of sea level rise, overall sensitivity 9.91

23

would increase even further. 76* As such the overall sensitivity should be changed to "high." Dealing with where Greater Sandhill Cranes are going to persist in the Plan area is likely going to be one of the big implementation challenges of the SSHCP. 9.91 cont'd

Economic Analysis and Funding Program

The Home Price Index (HPI) that will be used to adjust inflation annually for the acquisition category of fees (page 12-20, Automatic Adjustment of Development Fees to Account for Inflation) is not going to be the best benchmark to adjust inflation in land prices. During the huge market downturn that hit the real estate markets particularly hard last decade, raw land prices were not tracking anywhere near that of the plummeting residential market. 9.92

A general comment for both the annual adjustment of acquisition fees, and the periodic audit and adjustment, is that at any given point in the Plan there would be better information available on the ground as a result of the recent land appraisals and purchases than would ever be available using what becomes a quickly irrelevant reliance on an annual adjustment or even potentially older periodic adjustment. It does not make a lot of sense to rely solely on these predetermined adjustment timeframes when the market can fluctuate dramatically in between those timeframes. This Plan has a very robust Get Ahead Stay Ahead (GASA) component such that at no point in the implementation process should there be any mystery as to what the land acquisition costs actually are because that land is already available in the Plan as part of GASA, or it is in the early enrollment program, or it is being dedicated. In all of these cases the cost of the land either is (enrollment) or was (GASA) the cost of the land, and that value will or should be verified through an appraisal. 77* It would seem a whole lot more efficient to go with what is known, than to make a guess and then adjust that guess every year automatically based on a loosely associated market indicator, and then conduct an audit every three or five years to concretize a market picture at the time of the audit. 9.93

Appendices

Appendix B, species accounts.

As has already been suggested, the species accounts are woefully outdated and desperately need to be updated. 78* The accounts should be updated as soon as money, allows, ideally prior to permit issuance, and they should particularly focus on new knowledge about species ecology that is pertinent to management, as well as new management ideas and new knowledge of species occurrences. 79* The species accounts should be updated periodically during the 50 year permit period. 9.94

80* Specific biologists, such as John Diddes, developed the existing accounts in this appendix and it is essential that they receive credit. 9.95

24

This 588-page document needs a navigation system for individual species. The present system (pops up along left hand margin) is individual pages and of no use. 9.96

Appendix D1

Some thought should be given as to whether subordinating a mortgage or other interest to the Conservation Easement is adequate protection. There seems to be presupposition that lenders, whether institutional or personal, are going to act rationally, and that is potentially a mistake given the extraordinarily irrational things that lenders have done in recent history (things that dragged down the entire global economy). 81* As such it might be worth considering, at least for the initial purchase, that proceeds from the easement sale be used first and foremost by the seller to pay down any liens such that the total debt on the property is not greater than the residual value of the property after the easement is recorded. This could easily be done during, and be a requirement of, escrow. 9.97

Appendix J

This is a very important addition to the overall conservation effort embodied in the SSHCP. What is not clear is if changes to the voluntary conservation actions and targets laid out in this appendix would need to go through the same "modification" or "amendment "process as those for the mandatory conservation actions. Ideally, increases to the voluntary targets as a result of successful implementation of the voluntary goals would be embraced as beneficial to the overall success of the SSHCP and would require no "process" beyond review by the TAC/IRT. Would the JPA be able to veto changes in the voluntary conservation? Some guidance here would be appropriate. 9.98

CONCLUSION

Thank you for the opportunity to share these comments and concerns and we look forward to working with you to address them in the language of the SSHCP, and to help make this important Plan a conservation success for our region. 9.99

Sincerely,

Sean Wirth, Conservation Chair, Mother Lode Chapter, Sierra Club

Brandon Rose, president, Environmental Council of Sacramento

Mike Savino, president, Save Our Sandhill Cranes

Rob Burness, co-chair Habitat 2020

RTC 9.1 (SSHCP) – The plan preparers recognize the contributions of the commenters to the development of the SSHCP. We appreciate your further comments. Please refer to responses to specific comments below.

RTC 9.2 (SSHCP and EIS/EIR) – The SSHCP and EIS/EIR have been revised as appropriate in response to the comments provided in the letter. Please refer to responses to specific comments below.

RTC 9.3 (SSHCP and EIS/EIR) – Reponses to comments assign the same importance to comments regardless of their position in the comment letter. We appreciate the effort to organize comments.

RTC 9.4 (SSHCP) – The comment provides the commenters view on the history of the SSHCP and discussions surrounding the "grading ordinance."

RTC 9.5 (SSHCP) – The comment describes the proposed wetlands protection ordinance and expresses concern that the new ordinance will not stop illegal removal of vernal pools.

RTC 9.6 (SSHCP) – The Plan Partners acknowledge the importance of option agreements or similar legal instruments in achieving the biological goals and measurable objectives of the SSHCP. The Plan Partners have been actively engaged in securing conservation easements with willing sellers prior to plan adoption. The partners are also employing legal instruments similar to option agreements such as successive Purchase and Sale Agreements to secure commitments from willing sellers for potential purchase of additional conservation easements in the future. Such instruments are undergoing thorough legal review, and are designed to provide commitments that important resources are protected while giving the SSHCP Implementing Entity enough time to generate fees with which to acquire these resources. The goal of this process is to allow funding to become available to complete the purchase before the agreements lapse.

RTC 9.7 (SSHCP) – Comment noted. The County and other permittees will take into account the SSHCP and its Conservation Strategy in their future land use planning efforts and will require SSHCP consistency for development. However, the County does not intend to modify the General Plan out of cycle.

RTC 9.8 (SSHCP) – Section 5.2.7 of the Draft SSHCP states that pesticides are to be used for purposes of land management only:

> "Pesticide use for SSHCP Preserve management is covered under the CESA Incidental Take Permit, but not the ESA Incidental Take Permit. Pesticide use is allowed only when necessary to achieve the SSHCP Biological Goals and Measurable Objectives (e.g., exotic plant or exotic animal control). When necessary, pesticide use is allowed within SSHCP Preserves, within Preserve Setbacks, and within road ROWs that border SSHCP Preserves. As discussed in Chapter 8, Preserve Management Plans will be prepared for each SSHCP Preserve. Each Preserve Management Plan will identify processes to identify,

> document, evaluate, and then control invasive and other exotic target species by combining biological, cultural, physical, and chemical tools in a way that will minimize environmental risks. Pesticide use as part of a Preserve management strategy is not expected to adversely affect Covered Species over the Permit Term because pesticide use will be limited, and pesticide use will strictly comply with the pesticide label and all other applicable federal, state, and local laws pertaining to the use, safety, storage, disposal, and reporting of pesticides."

SSHCP Section 8.3 describes the monitoring and management requirements of the SSHCP, including adaptive management feedback loops for achieving the Biological Goals and Measurable Objectives of the SSHCP. Based on the adaptive management feedback loops of monitoring and management, when pesticide use for purposes of land management is allowed by an individual Preserve Management Plan, the activity will be monitored and will be adaptively modified on a preserve-by-preserve basis. We welcome the involvement of the TAC in developing an effective way to track the effects of the minimal pesticide use that may occur on certain SSHCP preserves, and to ensure that this pesticide use does not further contribute to the ongoing cumulative impacts of Plan Area pesticide use on the insect prey base, which you discussed in your comments.

RTC 9.9 (SSHCP) – See the response to Comment 9.8.

RTC 9.10 (SSHCP) –See the response to Comment 9.8.

RTC 9.11 (SSHCP) – Also see the response to Comment 9.8.

RTC 9.12 (SSHCP) – Measure ROAD-3 provides examples of where road signs might be posted to provide a warning to applicators of pesticides that they are near sensitive habitat for covered plant or other covered species occurrences that could be impacted by pesticide use. AMM ROAD-3 has been revised in Final SSHCP Section 5.4.1 to include reference to areas that provide habitat for vertebrates that rely on insects for part of their diet.

RTC 9.13 (SSHCP) – The term pesticide includes the more specific terms insecticide and herbicide. It has been retained in the Final SSHCP because the specific meaning is clear based on the context.

RTC 9.14 (SSHCP) – Lighting from new development is noted as an indirect effect to many covered species in the effects analysis of Section 6 in the Draft SSHCP (e.g., Table 6-63 for western spadefoot). For measures that would reduce the effects of lighting from new development in the UDA, see Section 5.4.1 of the Draft SSHCP; urban lighting is addressed by AMM EDGE-8:

> **"EDGE-8 (Outdoor Lighting):** All outdoor lighting in Urban Development Covered Activity projects will be designed to minimize light pollution into existing and planned Preserves, except where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g.,

> shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target SSHCP Covered Species (e.g., western spadefoot (*Spea hammondii*) and Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i))."

The Draft SSHCP assumed that EDGE-8 would be effective at reducing lighting effects to an acceptable level, considering the width of UDA preserve setbacks, but would not eliminate all lighting effects on covered species in the UDA, including insect prey of covered species. Also, most of the SSHCP preserve acres will be in rural areas of Sacramento County, so few of the SSHCP preserves would be impacted by artificial lighting from UDA development. Temporary effects of construction lighting, including effect on insect prey of covered species, are addressed by AMM BMP-6 in the Draft SSHCP:

> **"BMP-6 (Construction Lighting):** Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas."

RTC 9.15 (SSHCP) – Tables 6-94 and 6-95 are provided on pages 6-358 and 6-359 respectively in the Draft SSHCP, and are in sequential order.

RTC 9.16 (SSHCP) – The list of covered species in Table 6-3, for Conditions EDGE-8 and BMP-6 has been amended in the Final SSHCP to include Ricksecker's water scavenger beetle and valley elderberry longhorn beetle. Refer also to response to Comment 9.14 regarding effects on insect prey of covered species.

RTC 9.17 (SSHCP) – Tables 6-51, 6-52, 6-54 and 6-55 have been updated in the Final SSHCP to reflect that lighting could cause mortality to Ricksecker's water scavenger beetle and valley elderberry longhorn beetle as a result of exhaustion, attraction of predators, or disruption of biological cycles.

RTC 9.18 (SSHCP) – Valley elderberry longhorn beetle has been added to the list of species identified in EDGE-8 in the Final SSHCP. Ricksecker's water scavenger beetle was already listed in EDGE-8.

RTC 9.19 (SSHCP) – See response to Comment 9.17.

RTC 9.20 (SSHCP) – See response to Comment 9.15.

RTC 9.21 (SSHCP) – See responses to Comments 9.14 and 9.17.

RTC 9.22 (SSHCP) – Refer to response to Comment 9.23 regarding usage of rodenticides in general. Text has been added to Final SSHCP Table 6-89 regarding effects of rodenticides on western burrowing owl, and how those impact might be avoided or minimized.

RTC 9.23 (SSHCP) – The comment requests that the SSHCP prohibit all use of rodenticides on SSHCP preserves, due to their adverse secondary effects on Swainson's hawk and other raptors. Section 5.2.8 of the Draft SSHCP describes pesticide use as a Covered Activity is to be used for purposes of land management only:

> "Pesticide use is allowed in Preserves only to achieve the SSHCP Biological Goals and Measurable Objectives (e.g., exotic plant or exotic animal control). Preserve Management Plans (see Chapter 8) will prescribe an integrated pesticide use process as a Preserve management tool, modeled after the California Department of Fish and Wildlife's pesticide use approval process (CDFW Forms 679 and 680). At a minimum, this will include compliance with pesticide label instructions and state and local laws. Use must also comply with existing injunctions related to the use of pesticides."

If the Implementing Entity determines that rodenticide use is necessary and appropriate on a preserve parcel, the rodenticide use will be included in the parcel's proposed Preserve Management Plan. As discussed in Section 9.3.4 of the SSHCP, each Preserve Management Plan is subject to review and approval by the TAC, which would include members from the environmental community and wildlife agencies. In general, the Plan Preparers expect that usage of rodenticides will not be warranted or allowed on SSHCP preserves. However, in order to maintain a pool of willing sellers of conservation easements on Plan Area agricultural lands, the Plan Preparers could not completely prohibit their use within all of the SSHCP Preserve System. If the TAC does approve an individual Preserve Management Plan that allows use of rodenticides, that usage would be subject to limitations described in the PMP on timing and area of application, amounts to be used, and acceptable rodenticides. If appropriate, those restrictions could be incorporated into the conservation easement.

RTC 9.24 (SSHCP) – See the response to Comment 9.23.

RTC 9.25 (SSHCP) – Text has been added to Table 6-92 noting that lighting could attract insects upon which the loggerhead shrike preys. See response to Comment 9.14. Within Section 5.4.1 of the SSHCP, urban lighting is addressed by EDGE-8:

> **"EDGE-8 (Outdoor Lighting):** All outdoor lighting in Urban Development Covered Activity projects will be designed to minimize light pollution into existing and planned Preserves, except where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target SSHCP Covered Species (e.g., western spadefoot (*Spea hammondii*) and Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i))."

And construction lighting is addressed by BMP-6 in the SSHCP:

> **"BMP-6 (Construction Lighting):** Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas."

Refer also to response to Comment 9.14 regarding effects on insect prey of Covered Species.

RTC 9.26 (SSHCP) – Text has been added to Table 6-93 noting that lighting could attract insects upon which the loggerhead shrike preys. Table 6-93 of the Draft SSHCP includes BMP-6 for lighting. Refer also to response to Comment 9.14 regarding effects on insect prey of covered species.

RTC 9.27 (SSHCP) – See the response to Comments 9.8 and 9.28.

RTC 9.28 (SSHCP) – The comment requests changes to Table 6-3, which lists the SSHCP AMMs and the environmental stressors that would be reduced by each of the AMMs. The specific request is for new AMMs that would reduce impacts of pesticide use on insect prey for loggerhead shrike. Refer to response to Comment 9.63 regarding use of pesticides on Preserves, and how they might be controlled during SSHCP implementation. The text in Final SSHCP Table 6-92 regarding potential indirect effects on loggerhead shrike have been revised to state that the AMMs would minimize, rather than avoid those impacts.

RTC 9.29 (SSHCP) – See the response to Comment 9.30.

RTC 9.30 (SSHCP) – Text has been added to Final SSHCP Table 6-99 noting that lighting could attract insects upon which the tricolored blackbird preys. The text in Table 6-99 regarding potential indirect effects on tricolored blackbird from pesticides have been revised to state that the AMMs would minimize, rather than avoid those impacts.

RTC 9.31 (SSHCP) – See the response to Comment 9.68.

RTC 9.32 (SSHCP) – Text has been added to Final SSHCP Table 6-105 noting that lighting could attract insects upon which the western red bat preys. The text in Final SSHCP Table 6-105 regarding potential indirect effects on western red bat from pesticides have been revised to state that the AMMs would minimize, rather than avoid those impacts. See also response to Comments 9.68 below.

RTC 9.33 (SSHCP) – See the response to Comment 9.23.

RTC 9.34 (SSHCP) – See the response to Comment 9.35.

RTC 9.35 (SSHCP) – As described in Section 7.6 of the Draft SSHCP, the SSHCP will benefit each of the Covered Species by maintaining their current distribution in the Plan

Area, by maintaining or re-establishing their historical distribution in the Plan Area, and by providing for the re-establishment and establishment of additional habitat for these species in the Plan Area. Moreover, the SSHCP Preserves will maintain connectivity between existing occurrences and suitable existing habitat. Implementation of the SSHCP will benefit each of these Covered Species. Regarding the specific example of adding perches or specific plantings for loggerhead shrike, the Plan Preparers believe this should be included as part of an adaptive management program developed during the first 6 to 18 months of the SSHCP permit, but do not need to be included as measurable objectives because they are not necessary for species habitat.

RTC 9.36 (SSHCP) – Comment noted, and thank you for providing the attached materials. Please refer to responses to comments below that relate to the Crane TAC's draft mapping models.

RTC 9.37 (SSHCP) – Comment noted. However, the circumstance that is described in the comment is considered an "Unforeseen Circumstance" in the SSHCP. As stated in Section 11.4.3.1: "If sea level rise and flooding exceeds SSHCP projections such that preserved lands acquired for benefit of greater sandhill crane can no longer provide suitable roosting habitat for greater sandhill cranes, that sea-level rise or flooding would constitute an unforeseen circumstance." The sea level rise projections and other climate change-related projections were those currently in use by the state of California at the time of SSHCP preparation, as described in Section 11.3.1 of the Draft SSHCP. Exceedance of these projections, such as that described in the comment, was reasonably considered to be an "Unforeseen Circumstance" in the SSHCP.

RTC 9.38 (SSHCP) – Section 3.4 of the Draft SSHCP describes the process of developing habitat models for all 28 Covered Species. The purpose of the models is to define and map suitable habitat for each Covered Species in the Plan Area. The Plan Permittees, wildlife agency biologists and local species experts used the best available information to define and map Covered Species suitable habitat.

Updating the Species Accounts is not necessary to achieve the Conservation Goals and Objectives of the SSHCP. The information in the Species Accounts provides useful and detailed background for the Conservation Strategy, but was not relied upon in isolation when preparing the Conservation Strategy. In addition to the Species Accounts in Appendix B, the species models and the Conservation Strategy took into account the best available information available during SSHCP preparation related to: "species' needs for breeding, feeding, and sheltering at each life history stage; information from Plan Area species-surveys; documented species-occurrences within the Plan Area; and information on species range, including soil type associations and elevation limits."

RTC 9.39 (SSHCP) – The documents referenced in the comment were published after the Notice of Preparation as issued and the SSHCP was drafted. The USFWS 2016 HCP Handbook is a guidance document for the USFWS and the SSHCP is the applicant's document. The USFWS will consider the other documents and recovery plans mentioned prior to making their decision on the issuance of the ITP.

RTC 9.40 (SSHCP) – The species are presented alphabetically by common name within their taxonomic groups. We do not believe it would be worth the cost to reorganize the contents of the HCP by phylogenetic ordering.

RTC 9.41 (SSHCP) – Table 8-1 in Section 8.2.1 of the Draft SSHCP describes how Objective HAB3 will be implemented. Objective HAB3: "Record management history for Preserve parcels as they are obtained. Consider management history when developing initial preserve management approach."

Section 8.3.1 of the Draft SSHCP describes the process for preparation of a PMP for each Preserve. Each initial PMP must document the management history for each parcel (via records, interviews of ranch managers or landowners, etc.).

RTC 9.42 (SSHCP) – For Conservation Action HAB7.1, text has been revised in the Final SSHCP to require that vegetation biomass be measured for all non-agricultural preserves.

RTC 9.43 (SSHCP) – For Conservation Action GS3.1, text has been revised as suggested in the Final SSHCP. "Invertebrates" has been inserted in place of "voles".

RTC 9.44 (SSHCP) – Refer to response to Comment 9.43.

RTC 9.45 (SSHCP) – For Conservation Action GS5.1, text has been revised in the Final SSHCP to indicate a preference for corn and rice.

RTC 9.46 (SSHCP) – For Conservation Action GS5.1, text in the Final SSHCP has been revised as suggested.

RTC 9.47 (SSHCP) –Balancing the importance of the various Conservation Actions during selection of parcels for acquisition, or re-establishment/establishment sites, will be one of the most important roles of the TAC. We appreciate the expertise of the commenters and hope that they will continue to be closely involved with the Implementing Entity throughout implementation of the SSHCP.

RTC 9.48 (SSHCP) – Refer to response to Comments 9.37 and 9.47.

RTC 9.49 (SSHCP) – Section 9.3.4 of the Draft SSHCP describes the membership, formation and responsibilities of the SSHCP TAC. As the comment points out, USFWS and CDFW staff will be members of the SSHCP TAC. In addition, "Other entities with expertise in any of the topics to be discussed by the TAC, including representatives of the building industry, the agricultural community, the scientific community, and the environmental community, may also be invited to participate in TAC meetings." The Sandhill Crane TAC is encouraged to reach out to the SSHCP TAC upon formation to express their interest in participating. The requested text has been regarding accounting for sea level rise in preserve acquisitions for greater sandhill crane has been added to the conservation actions for measurable objectives GS1, GS2, GS5, and GS6 in the Final SSHCP.

RTC 9.50 (SSHCP) – Text in Section 7.6.2.25 of the Final SSHCP has been revised to change nesting to roosting and foraging. The importance of managing the re-established/established habitat to allow access to waste grains has also been noted in Section 7.6.2.25 of the Final SSHCP.

RTC 9.51 (SSHCP) – See the response to Comment 9.68.

RTC 9.52 (SSHCP) – Colony sizes vary widely in Sacramento County from year-to-year. Although the example of 10,000 birds provided in the comment was a hypothetical case, note that none of the 16 colonies detected as occupied in Sacramento County in 2017 exceeded 4,000 individuals (Meese 2017). The tricolored blackbird survey does tend to underrepresent Sacramento Valley populations because it is taken early in the breeding season (and misses re-nesting attempts which are more common Sacramento County). However, the survey results will often demonstrate that a colony has 1,000+ individuals one year, then just a few hundred, then none, then back to hundreds. For example, the site at Bradshaw Christian had 1 bird observed in 2011, then 12,000 in 2014, then none in 2017. This extreme variability means that it is very difficult to confidently identify “large” colonies. However, setting a minimum threshold of 200 individuals would ensure that the sites that only hosted transient, unsuccessful nesting attempts would be unlikely to be considered appropriate for preservation. In addition, the Conservation Strategy would require that colonies be preserves where foraging habitat would remain available, which is critical for this species. Colonies generally have multiple nesting habitat sites available in any given year, and will select the site with the least ongoing disturbance and best access to foraging habitat with large insects available. Preserving colonies without preserving their foraging habitat will likely lead to the nesting habitat being abandoned. The Conservation Strategy will also be re-establishing/establishing both aquatic and upland nesting habitat on Preserves (biological objective TB8), with an emphasis on doing so near high-quality foraging habitat. The Plan Preparers believe that the Conservation Strategy for tricolored blackbird will be effective as presented in the Draft SSHCP, and have therefore not made the requested changes to the Final SSHCP.

RTC 9.53 (SSHCP) – The comment states that no large colonies should be taken by covered activities until several large colonies are preserved in the Preserve System. It is highly likely that early enrollment and the jump start provision of the Conservation Strategy will result in additional preservation of existing colonies in the Preserve System before colonies are impacted. . Also note the response to Comment 9.52.

RTC 9.54 (SSHCP) – See the responses to Comments 9.25 through 9.28 and 9.68.

RTC 9.55 (SSHCP) – Section 7.6.2.24 has been revised in the Final SSHCP to remove the word “large” referenced in the comment.

RTC 9.56 (SSHCP) – Section 7.6.2.24 in the Draft SSHCP addresses the creation and preservation of nesting and foraging habitat through Conservation Objectives LS1 through LS5. Regarding the specific example of adding perches or specific plantings for loggerhead shrike, the Plan Preparers believe this should be included as part of an

adaptive management program developed during the first 6 to 18 months of the SSHCP permit, but does not need to be included as a measurable objective. Measurable objectives consist of broader targets for habitat preservation or establishment, rather than requiring that specific features be present.

RTC 9.57 (SSHCP) – Language has been added to table 7-1, under (Objective L1 conservation actions) in the Final SSHCP to state that "Acquisitions of land below sea level are prohibited". Language has also been added to Section 9.4.2 *Process for Acquisition of Preserve Land* to state that land below sea level will not be considered for acquisition.

RTC 9.58 (SSHCP) – The 2,000 acres of cropland to be preserved in accordance with Conservation Objective SH2 is in addition to the 200 acres to be managed for greater sandhill cranes.

RTC 9.59 (SSHCP) – Measurable objective SH2 in the Draft SSHCP includes 2,000 acres of intensively managed high-value habitat for Swainson's hawk. Measurable objective GS5 includes 200 acres of food plots, which would be a subset of the 2,000 acres preserved under measurable objective AG2, not those under objective SH2.

RTC 9.60 (SSHCP) – Conservation Objectives AG2 and AG3 have been added to Table 7-76 in the Final SSHCP.

RTC 9.61 (SSHCP) – Conservation Objective AG3 requires the planting of 10,000 linear feet of hedgerows. This is not an optional activity but a required objective.

> **"Objective AG3.** Maintain or increase raptor prey availability and improve raptor foraging habitat by strategically planting 10,000 linear feet of shrub or other substrate that provides cover and refugia for fossorial mammals and other prey species."

This existing objective has been added to the list of objectives in Table 7-76 of the Final SSHCP. Regarding planting of trees in hedgerows, that will be at the discretion of the TAC based on the conservation measures associated with AG3. Conservation measure AG3.1 states" Acceptable hedgerow plants include native trees, shrubs, and grasses as approved by the TAC."

RTC 9.62 (SSHCP) – Burrowing owl occurrences will be conserved in accordance with the Biological Goals and Objectives described in Chapter 7 of the Draft SSHCP as part of a larger preserved landscape. Additional burrowing owl occurrences may be avoided in the UDA (i.e., not impacted by development) by individual projects, but these will not be incorporated into the SSHCP Preserve System.

RTC 9.63 (SSHCP) – This text has been added to Conservation Action BO2.1 in the Final SSHCP.

RTC 9.64 (SSHCP) – The comment notes that there may not be six known occurrences of Ahart's dwarf rush present in the Plan Area to be preserved, and that implementation of Objective VPP1 may require establishment of at least one new occurrence.

RTC 9.65 (SSHCP) – Conservation Objective NH1 in the Draft SSHCP identifies a conservation goal of 1,245 acres of modeled foraging habitat for northern harrier. Conservation Objective NH2 identifies a conservation goal of 30,048 acres of modeled nesting/foraging habitat for northern harrier. Modeled foraging habitat for norther harrier is different than modeled nesting/foraging habitat. Therefore these conservation goals remain identified in two Conservation Objectives (NH1 and NH2) in the Final SSHCP.

RTC 9.66 (SSHCP) – John Dittes and Josephine Guardino are responsible for developing the unique and creative method of classifying vernal pools within the SSHCP Plan Area using a vernal pool acre/density index. Credit for this innovative approach is given on page 7-9. While Table 7-12 was created using information derived from the methodology that John and Josephine developed, the table is not from their work.

RTC 9.67 (SSHCP) – The monitoring is tied to the Conservation Goals and Objectives, which focus more on preservation, management and monitoring of modeled habitat. The SSHCP will benefit each of the Covered Species by maintaining their current distribution in the Plan Area, by maintaining or re-establishing their historical distribution in the Plan Area, and by providing for the re-establishment and establishment of additional habitat for these species in the Plan Area. Moreover, the SSHCP Preserves will maintain connectivity between existing occurrences and suitable existing habitat. Implementation of the SSHCP will benefit each of these Covered Species.

RTC 9.68 (SSHCP) – The comment requests additional restrictions on pesticide used on SSHCP preserves, and that insect prey populations be monitored to ensure that preserved foraging habitat remains suitable for covered species such as tricolored blackbird, loggerhead shrike, greater sandhill crane, and western red bat. Section 5.2.8 of the Draft SSHCP describes pesticide use as a Covered Activity is to be used for purposes of land management only:

> "Pesticide use is allowed in Preserves only to achieve the SSHCP Biological Goals and Measurable Objectives (e.g., exotic plant or exotic animal control). Preserve Management Plans (see Chapter 8) will prescribe an integrated pesticide use process as a Preserve management tool, modeled after the California Department of Fish and Wildlife's pesticide use approval process (CDFW Forms 679 and 680). At a minimum, this will include compliance with pesticide label instructions and state and local laws. Use must also comply with existing injunctions related to the use of pesticides."

If the Implementing Entity determines that pesticide use is appropriate on a preserve parcel, it will include that allowance within a proposed Preserve Management Plan. The Preserve Management Plan is subject to review and approval by the TAC, which would include members from the environmental community and wildlife agencies. The Implementing Entity expects that usage of pesticides will not be warranted or allowed on most SSHCP preserves. However, in order to maintain a pool of willing sellers of conservation easements on agricultural lands, the Plan Preparers could not completely prohibit their use within the SSHCP Preserve System. If the TAC does approve a Preserve Management Plan that includes use of pesticides, that usage would be subject to limitations in the PMP on timing

and area of application, amounts to be used, and acceptable pesticides. If appropriate, those restrictions could be incorporated into the conservation easement. This clarification has been added to Section 5.3 of the Final SSHCP.

RTC 9.69 (SSHCP) – Table 8-2 has been revised in the Final SSHCP to change nest to roost for GSC-3.

RTC 9.70 (SSHCP) – Section 9.8 of the Draft SSHCP states that "the data repository will allow for future expansion and integration with an external database (e.g., linkage to agency or other GIS map libraries)." Thus, outside users may contact the Implementing Entity with data requests. This clarification has been added to Section 9.8 of the Final SSHCP.

RTC 9.71 (SSHCP) – The comment requests that the Implementing Entity track the available inventory of SSHCP land covers remaining in the Plan Area. Many of the objectives in Table 8-1 of the Draft SSHCP require monitoring of inventory on an ongoing and annual basis (e.g., Objective AG2, Objective VPI1). New text is provided in the Final SSHCP (Sections 8.2.1 and 9.8) clarifying that the SSHCP monitoring program will track the inventory of each SSHCP land cover type remaining in the Plan Area, and that the data repository will make that data available.

RTC 9.72 (SSHCP) – Five years for surveys means surveys will be conducted every 5 years.

RTC 9.73 (SSHCP) – See response to Comment 9.71.

RTC 9.74 (SSHCP) – This text has been added to Section 9.3.4.

RTC 9.75 (SSHCP) – If the TAC/IRT does not approve the plans and actions, the individual property cannot be acquired and incorporated into the Preserve System. This is reflected in the TAC responsibilities described in the Draft HCP in Section 9.3.4.

RTC 9.76 (SSHCP) – See response to Comment 9.75.

RTC 9.77 (SSHCP) – See response to Comment 9.75. The TAC/IRT will have approval authority over preserve property acquisitions. The wildlife agencies will be a part of the TAC/IRT and will exercise their authority through those entities. This will provide a powerful "check and balance" to ensure that preserve acquisitions are driven by the Conservation Strategy and not by political or other considerations that do not benefit the covered species.

RTC 9.78 (SSHCP) – Comment noted. The Plan Preparers recognize the importance of stakeholder representation and authority on the TAC. This structure is described in SSHCP Section 9.3.4 and is critical for the success of the SSHCP.

RTC 9.79 (SSHCP) – Comment noted. The text on page 9-23 of the Draft SSHCP allows for flexibility with respect to the 15%, and applies to lands outside the UDA. The percent held in fee title could be higher than 15% in the UDA. If there is a future need to

provide more species management, the TAC would have to consider, with full participation from the agricultural community, whether an increase in fee title ownership is appropriate.

RTC 9.80 (SSHCP) –.New text has been added to Section 9.4.5 of the Final SSHCP clarifying how early enrollment properties will be prioritized for acquisition by the Implementing Entity.

RTC 9.81 (SSHCP) – Language has been added in Section 9.4.7 of the Final SSHCP to clarify that gifted land can be incorporated in the Preserve System consistent with the SSHCP Conservation Strategy and can be used to meet Conservation Strategy requirements. Gifted lands cannot, however be used to offset the mitigation needs of a project applicant. Language has also been added to clarify that gifted lands must be monitored and managed consistent with the SSHCP's monitoring and management protocols and guidelines, and that funding for a long-term endowment must be identified prior to accepting gifted lands. Language has also been added in Section 9.4.7 of the Final SSHCP suggesting that gifted land could be considered in the context of Appendix J, but that the Implementing Entity must identify a funding source for long-term management and monitoring of gifted lands prior to accepting them.

RTC 9.82 (SSHCP) – The comment requests that the SSHCP include a 200-foot setback between existing SSHCP preserves and new AG/RES development outside the UDA. AG/RES development is not a SSHCP Covered Activity, so the HCP has no mechanisms to require setbacks within those projects. Preserves outside the UDA would be primarily acquired through conservation easements, and that conservation easement cannot extend onto adjacent properties. When a conservation easement is acquired and no development is existing or planned nearby, there is no mechanism that would allow the Implementing Entity to establish a 200-foot setback or any other sized setback. There is a process for the TAC to determine whether an internal buffer area should be established in a preserve outside the UDA, depending on adjacent land uses and other considerations.

RTC 9.83 (SSHCP) – Chapter 9, page 9-34, provides language that requires that a Preserve Setback easement and management plan be recorded for each preserve setback inside the UDA. The language also specifies that the easement give the SSHCP Implementing Entity the ability to enforce restrictions within the UDA Preserve Setbacks. Regarding the request for setbacks between new AG/RES projects and existing SSHCP preserves outside the UDA, refer to response to Comment 9.82.

RTC 9.84 (SSHCP) – Comment noted.

RTC 9.85 (SSHCP) – See response to Comment 9.70. Section 9.8 of the Final SSHCP has been revised to clarify that outside entities such as scientists or conservation groups will be able to request monitoring data from the Implementing Entity. As discussed in Section 9.8 of the Final SSHCP, the Implementing Entity expects to develop a simple form that can be completed for each request and sent electronically to

the Implementing Entity. Depending on the request, access could be granted to the data repository or data from a specific time period could be provided.

RTC 9.86 (SSHCP) – The terms “directly” and “indirectly” have been removed from the text in Section 9.10.4. Language has been inserted in Section 9.10.3.4 of the Final SSHCP to clarify that the SSHCP TAC will be responsible for deciding when changes in land use designations or regulations would result in impacts to SSHCP Covered Species modeled habitat or when changes would affect completion of the SSHCP Conservation Strategy. Also see response to Comment 9.71 regarding Plan Area land cover inventories.

RTC 9.87 (SSHCP) – Section 3.4 of the Draft SSHCP describes the process of developing habitat models for all 28 Covered Species. The purpose of the models is to define and map suitable habitat for each Covered Species in the Plan Area. The Plan Permittees, wildlife agency biologists and local species experts used the best available information to define and map Covered Species suitable habitat.

Updating the Species Accounts is not necessary to achieve the Conservation Goals and Objectives of the SSHCP. The information in the Species Accounts provides useful and detailed background for the Conservation Strategy, but was not relied upon in isolation when preparing the Conservation Strategy. In addition to the Species Accounts in Appendix B, the species models took into account the best available information related to: “species’ needs for breeding, feeding, and sheltering at each life history stage; information from Plan Area species-surveys; documented species-occurrences within the Plan Area; and information on species range, including soil type associations and elevation limits.”

RTC 9.88 (SSHCP) – Language has been added to Section 11.1.6 of the Final SSHCP that clarifies the notification process. In addition language has been added to Section 9.3.4 in the Final SSHCP that clarifies the SSHCP TAC’s role for approving land acquisitions. Also see response to Comment 9.75.

RTC 9.89 (SSHCP) – Comment noted. SSHCP priorities for preserve acquisition will be determined through the TAC. That process will allow the Implementing Entity to incorporate the best available information about flood sensitivity of potential preserve acquisitions. If Preserve locations are no longer providing suitable upland forage for greater sandhill cranes, new preserve lands will need to be acquired so that the measurable objective can be achieved.

RTC 9.90 (SSHCP) – The sensitivity ratings for dispersal ability and changes in food availability for greater sandhill crane have been updated to be consistent with the natural history information presented in the comment. As a result, the overall sensitivity rating for the species has been increased to “High”. Refer to Table 11-1 in the Final SSHCP. As noted in the comment, the Conservation Strategy already accounted for these factors, so the changes in the table did not result in any changes to Conservation Strategy.

RTC 9.91 (SSHCP) – Refer to response to Comment 9.90.

RTC 9.92 (SSHCP) – The HPI index was selected as an inflation index because it was "a well-regarded public data source with relevant geographic coverage." (SSHCP p. 12-20) The SSHCP also includes a comprehensive development fee audit every three years during the first 15 years of SSHCP implementation, and following completion of each of those audits the development fees can be adjusted to reflect refined cost estimates. Therefore, it is not necessary to assemble a separate private inflation index for the Plan Area.

RTC 9.93 (SSHCP) – Refer to response to Comment 9.92.

RTC 9.94 (SSHCP) – Section 3.4 of the Draft SSHCP describes the process of developing habitat models for all 28 Covered Species. The purpose of the models is to define and map suitable habitat for each Covered Species in the Plan Area. The Plan Permittees, wildlife agency biologists and local species experts used the best available information to define and map Covered Species suitable habitat.

Updating the Species Accounts is not necessary to achieve the Conservation Goals and Objectives of the SSHCP. The information in the Species Accounts provides useful and detailed background for the Conservation Strategy, but was not relied upon in isolation when preparing the Conservation Strategy. In addition to the Species Accounts in Appendix B, the species models used the best available scientific information related to: species' needs for breeding, feeding, and sheltering at each life history stage; information from Plan Area species-surveys; documented species-occurrences within the Plan Area; information on species range, including soil type associations and elevation limits, and the expertise of the wildlife agencies.

RTC 9.95 (SSHCP) – The authors of the species accounts are credited in a new introduction leading into Appendix B of the Final SSHCP. Thank you for bringing this oversight to our attention.

RTC 9.96 (SSHCP) – The species are presented alphabetically by common name within their taxonomic groups. The PDF for Appendix B has been revised to be navigable by species, as suggested.

RTC 9.97 (SSHCP) – Comment noted. However, the suggestion provided in the comment would be onerous for landowners, and the Plan Permittees have determined that it would limit the pool of willing sellers to an unacceptable level.

RTC 9.98 (SSHCP) – The voluntary additional conservation laid out in preliminary form in SSHCP Appendix J would not be a condition of the Incidental Take Permit conditions or the SSHCP. Voluntary additional conservation will be adopted separately by the Plan Permittees, and as such will not be bound by the same requirements for modification and amendment as the HCP and ITPs.

RTC 9.99 (SSHCP) – Thank you for your cooperation in development of the SSHCP.

LETTER 10 EUGENE ROSE (SSHCP)

SSHCP South Sacramento Habitat Conservation Plan

Comment Card

Thank you for your interest in the Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the proposed South Sacramento Habitat Conservation Plan. The space below may be used to provide comments on the Draft EIS/EIR. Please focus your review on the sufficiency of the document regarding the identification of environmental impacts and methods to avoid or mitigate those impacts.

Would be great if there was a Conservation Interpretive Center. A perfect site would be the undeveloped "Nature Area" at C.W. Dillard Elementary School.

A partnership with the Elk Grove Unified School District would be beneficial to Conservation/Habitat Agencies, the Region as well as an educational component to the Community and School Districts. The site located at C.W. Dillard Elementary School is a little under 10 Acres and has been neglected over recent years. I suggest the Sheriff's work detail could be part of development of Trails & Such. 10.1

WOULD YOU LIKE TO BE ADDED TO THE SSHCP MAILING LIST? ❑ Yes ❑ No

If so, please provide your contact information.

Name: Eugene Rose

Title and Organization/Business (if applicable): Wilton Resident

Email address: rosaranch@ frontiernet.net

Mailing address: 12217 Keating Rd Wilton, California 95693

Phone: (916) 687-6349

Please submit your comments to a project representative or mail to: Office of Planning and Environmental Review, ATTN: Environmental Coordinator, 827 7th Street, Room 225, Sacramento, CA 95814

RTC 10.1 (SSHCP) – Thank you for the suggestion. The Implementing Entity will retain this information for use in future planning.

LETTER 11 FRIENDS OF SWAINSON'S HAWK (SSHCP AND EIS/EIR)

Friends of the Swainson's Hawk
www.swainsonshawk.org 8867 Bluff Lane, Fair Oaks, CA 95628 swainsonshawk@sbcglobal.net 916-769-2857

September 5, 2017

Attention: Rich Radmacher, Senior Planner
Sacramento County Planning Department
827 7th Street, Sacramento, CA 95814
Delivered via email to: radmacherr@saccounty.net

Comments, public draft of the South Sacramento Habitat Conservation Plan and EIS/EIR

Friends of the Swainson's Hawk is a citizen advocacy group for this state listed species, and we support habitat conservation planning as a preferred method for mitigating the impacts of development on multiple species. We have been engaged in habitat conservation planning and evaluation of mitigation for impacts of development on California's Swainson's Hawk population since 1995. We fully endorse the letter submitted by Habitat 2020 and partners on this plan. We have additional comments below.

FOSH prepared "Swainson's Hawk Mitigation Evaluation Project Phase 1 Executive Report – South Sacramento County and Elk Grove, California," (2010) and "A Review of the City of Rancho Cordova Swainson's Hawk CEQA Mitigation Program," (2011) both studies by Melinda Bradbury, to evaluate and present recommendations regarding the mitigation programs in South County for impacts to the Swainson's Hawk. These evaluations help set the context of current project by project mitigation efforts and also identify some problems in implementation that hopefully will be corrected with the adoption of the proposed South Sacramento County HCP. It is essential that the HCP avoid the problems identified in these studies, specifically, 11.1

- Not all mitigation properties meet the criteria of the program;
- Not all projects required to mitigate do mitigate;
- Not all requirements are enforceable;
- Not all funding is guaranteed.

In particular, the guarantees and quality standards in the HCP program must be enforceable and the enforcement path should be clear and unambiguous.

1. SSCHCP Approval of Mitigation Properties Lacks Fundamental Biological Integrity; No Enforcement Mechanism for Biological Criteria for Mitigation Land Acquisition; Assure CDFW Role.

At present, the California Department of Fish and Wildlife (formerly CDFG) plays an important role in the approval of mitigation lands under the County ordinance (Sacramento County Code Chapter 16.130 SWAINSON'S HAWK IMPACT MITIGATION FEES). Specifically, 11.2

1

". . . the Board of Supervisors deems it necessary to restrict the scope of possible mitigation sites to parcels that are located within the geographical foraging area of the Swainson's Hawk in the unincorporated County outside the Urban Services Boundary, and that are owned and/or managed by a conservation organization at locations that are acceptable to DFG." And

"ii. The land to be preserved shall be deemed suitable Swainson's Hawk foraging habitat by DFG and the County, which shall make all reasonable efforts to either accept or reject the proposed land as suitable within fifteen (15) business days. However, failure to act within such time shall not be deemed as acceptance or rejection of the proposed land. For each request for approval by the County and DFG, there must be an approved rezone or development project and corresponding MMRP identified for which the proposed mitigation site is to be used.

iii. The project applicant shall transfer said easement(s) or title to the County, DFG and a third party conservation organization as acceptable to the County and DFG. The County may, at its discretion, waive the requirement for a third party conservation organization to be party to the easement or fee title. Such third party conservation organizations shall be characterized by non-profit 501(c)(3) status with the Internal Revenue Service and be acceptable to both the County and DFG."

11.2 cont'd

Under the SSCHCP, the wildlife agencies are not given the authority to approve or disapprove mitigation land acquisitions. They will not be able to enforce the biological criteria for land acquisition in the implementation of the plan. This is a very big mistake and inconsistent with both past practice in the County and in the Natomas Basin HCP. We cannot support a plan that does not rely on acquisition approval by the wildlife agencies as a core implementation principle.

We also believe that all acquisitions should be include a conservation easement to CDFW to ensure continuity of preservation in the event that the HCP governance fails.

11.3

2. Consistency of SSHCP with USFWS 2016 HCP Handbook and CDFW 2016 Swainson's Hawk Status Report

a) There should be a finding of consistency of the document with the USFWS 2016 HCP Handbook. We are surprised to find that this is not part of the EIR/EIS review of relevant policy documents.

b) The species account for Swainson's Hawk is seriously out of date. In 2016 the CDFW and Fish and Wildlife Commission adopted a new status report for Swainson's Hawk. This report provides a firm basis for an up to date Swainson's Hawk species account for the SSHCP. We are attaching this report to our comment letter and recommend that it be included in the HCP and that the policies in the HCP be consistent with this status report. We have pointed out some inconsistencies below.

11.4

3. Effects Analysis and Biological Effectiveness Monitoring Lack Fundamental Scientific Soundness and Guarantees. (Effects Analysis, Chapter 6 and Monitoring, Chapter 8)

a) The HCP does not establish a baseline for the Swainson's Hawk breeding population for the monitoring program, nor does it establish an adequate monitoring program. Appendix G-3 Species Account, Swainson's Hawk is both out of date and fails to appropriately utilize the data available to estimate the nesting sites inside and outside the UDA.

11.5

We do disagree with the Species Account – Appendix B of SSCHCP 22.4.3, which says ". . . it is not possible to estimate the number of nesting Swainson's hawk pairs is in the Plan Area based on the available data. Therefore, population trends for the area cannot be assessed at this time."

While the HCP claims it cannot estimate nesting population, numerous nesting studies have been conducted and are included in the HCP graphic of SWHA occurrences. Clearly the nesting population can be estimated and a baseline established for the monitoring program. We believe this is required for a scientifically sound implementation and enforcement program for the HCP.

"Monitoring distribution and abundance of nesting Swainson's hawks in the Sacramento Valley and Sacramento River Delta, California" (Dan L. Gifford, Paul S. Hofmann, Adrienne A. Truex, and David H. Wright* California Department of Fish and Game, North Central Region, 1701 Nimbus Road, Suite A, Rancho Cordova, CA 95670) identified 707 active nesting sites in the core territory bounded by Chico and Tracy, including Sacramento, San Joaquin, Yolo and Solano Counties and demonstrated that nesting sites are clustered. These sites were added to the California Natural Diversity Database. The authors noted that "Subsequent surveys (Estep 2007a, b, 2008, 2009; Anderson et al. 2007) have established the Central Valley's significance to the species and established its importance to the conservation of Swainson's hawk in California." (p. 8) Sites identified in those surveys are also in the database used in preparation of the SSCHCP. While the CNDDB contains duplicate nesting sites (known as alternative nesting sites for a pair), multiple sites for one pair can be identified by the close proximity of the alternative nest sites. The preparers of the HCP have the duty to make a good faith estimate of the baseline of nesting pairs in the study area. 11.6

The HCP also does not establish a monitoring program, deferring this important implementation element to future decisions by the governing body of the HCP. We support an annual monitoring program, such as that conducted by the Natomas Basin Conservancy, to be able to separate short term from long term trends.

CDFW found that:

> "Raptors may experience year-to-year changes or fluctuations in their population numbers due to a variety of factors including changes in prey abundance, habitat, and weather. In order to detect long-term changes over time (i.e. trends) in California's Swainson's Hawk population, it is necessary to collect data over a sufficient number of years to span any short-term population fluctuations or cycles (Hatfield et al. 1996; Newton 1998; Lewis and Gould 2000)." (p. 18, Status Report, 2016) 11.7

b) We object to the estimate of take based on high value habitat only when many nest sites inside the USB are not located in high quality habitat and will ultimately fail because of urbanization and the loss of adequate foraging habitat. (Section 6.4.2.1 Page 6-58) The HCP is intended to mitigate for impacts on species and to support sustaining threatened species in the wild. The HCP should be clear about the expected loss of nesting habitat inside the UPA, including within the City of Elk Grove which is not part of the HCP but is part of the nesting and foraging habitat of the South Sacramento population of Swainson's Hawks. 11.8

c) The HCP is deficient in its estimate of take of Swainson's Hawk nesting sites, nesting habitat and in its mitigation for loss of nesting habitat. After 50 years, what is the expected breeding population, number of active nest sites, and fledglings expected in the Plan area? 11.9

While the HCP states that most nesting habitat is in riparian areas, clearly from Figure 3-25, most nesting sites are not in riparian areas. CDFW 2016 Status Report states that "Swainson's Hawks often nest peripheral to riparian systems. They will also use lone trees in agricultural fields or pastures and roadside trees when available and adjacent to suitable foraging habitat.: The data available to preparers contains nesting site locations so that a more definitive statement could be made about nesting habitat in South Sacramento County. 11.10

The HCP ignores the loss of nesting habitat due to road maintenance and expansion. For example, on Page 6-301, the HCP seems to ignore the fact that nesting trees are often along roadways and maintenance and expansion of rural roadways will have significant unrecognized impact on nest sites and nesting habitat. It fails to identify existing roadside nest sites and the expected loss of these sites. 11.11

The HCP mitigation program does not provide for mitigation of loss of nesting habitat along roadsides. Relying solely on preservation of riparian areas will not sustain the nesting habitat in the Plan area. 11.12

3. The HCP presents ambiguous representations of high quality habitat and fails to exclude land below sea level from eligible mitigation lands. We have pointed out previously to staff that graphics representing high quality habitat for Swainson's Hawk could be misinterpreted and requested more definitive graphics in the final plan. Likewise, we failed to find a specific prohibition of land below sea level for mitigation for upland species, a prohibition that has long been the practice by CDFW in approving mitigation parcels. 11.13

Upland mitigation lands should not only not be located below sea level, they should be distant from anticipated sea level rise to ensure permanent availability as quality foraging habitat. Why is not all Swainson's Hawk foraging habitat preservation required to be above the 100 year floodplain? 11.14

4. EIR/EIS does not address direct and cumulative impacts adequately. 11.15

a. Four counties account for 70-80 percent of the Central Valley population of the Swainson's Hawk (CDFW, Status Report, 2016, p. 17): Sacramento, Yolo, San Joaquin and Solano. The cumulative impact of this HCP and other conservation plans and mitigation programs in that range should be addressed in the environmental review document. 11.16

b. EIS 9-21 addresses the issue of conflict with other HCPs. It does not address compatibility with the City of Elk Grove Swainson's Hawk Mitigation Program. The two programs have the same receiving area for mitigation land. Nor were we able to find the discussion of the cumulative impacts of the two mitigation programs on the ability of each to meet its required mitigation objectives. The SSCHCP does not include data on the Swainson's Hawk population in the approved development area of the City of Elk Grove and the required Swainson's Hawk mitigation land that will be preserved to mitigate for this development by the City of Elk Grove. Therefore there is no opportunity to assess whether the feasibility of acquisition for both programs jointly. 11.17

c. 8.1.2.5 Wildlife Nursery Sites (Page 8-35) does not acknowledge the key role of Swainson's Hawk nesting in SSHCP planning area for the survival of the species in California. 11.18

d. What assurances are there that the South Sacramento County Swainson's Hawk breeding population can be sustained with less than 10,000 acres of preserved agricultural land? 11.19

5. The HCP lacks some fundamental guarantees for the quality of the mitigation program. 11.20

a. All HCP conservation easements should be approved by California Department of Fish and Wildlife to assure consistency with the Department's guidance and current practice for mitigating impacts on listed species. 11.21

b. Conservation easements should prohibit the use of rodenticides on mitigation properties.

Application of anticoagulant rodenticide (AR) is a known threat to raptors due to ingestion of poisoned prey. Numerous field monitoring studies on raptor species indicate lethal and sublethal impacts of AR exposure (Stone et al. 2003, Murray 2011, Thomas et al. 2011, Christensen et al. 2012). Pesticide use throughout the Swainson's Hawk's range, specifically targeting ground squirrels, may also impact Swainson's Hawks and cause secondary poisoning. (CDFW Status Review of Swainson's Hawk in California, April 11, 2016, pp. 12-13) 11.22

c. Mitigation lands should not be located near wind energy facilities if they preserve foraging or nesting habitat for raptors. See CDFW Status Review of Swainson's Hawk in California, 2016, p. 12. The permittees should also agree not to approve wind energy facilities next to preserves where foraging or nesting of raptors is expected. 11.23

d. There needs to be required buffers to protect mitigation lands from negative impacts of neighboring residential development (AG/RES development). If mitigation lands are located adjacent to AG/RES, the HCP should require a 200 foot offset of the mitigation property from the residential property to be included in the easement. While normal agricultural operations are expected in neighboring properties, County approval of residential uses next to preserve areas will downgrade their mitigation value to the species being protected. There needs to be a provision in the Implementation Agreement that no permittee will allow residential development outside the UPA without providing a 200 foot buffer easement to protect adjacent properties from impacts on wildlife of residential uses. 11.24

Please keep us informed regarding review of our comments, future public review of the proposed HCP and EIS/EIR, and public hearings. We prefer to receive email notification of public review documents and hearings at swainsonshawk@sbcglobal.net. 11.25

Thank you for this opportunity to comment.

Judith Lamare, Ph.D. Co-Chair, James P. Pachl, Co-Chair

RTC 11.1 (SSHCP) – The comment notes several factors that could affect the effectiveness of the SSHCP Conservation Strategy in mitigating covered activity impacts to Swainson's hawk. Section 9.3 of the Final SSHCP identifies all of the participants involved in implementation of the SSHCP, and provides an overview of each participant's responsibilities and duties. The Implementing Entity is responsible for ensuring that preserves containing habitat for Swainson's hawk and other covered species meet the criteria of the program, that each covered activity's impacts on Swainson's hawk and other covered species will be mitigated in accordance with the requirements of the SSHCP, that all requirements are enforced, and that funding requirements for conservation of Swainson's hawk and the other covered species are met through the fee program. The Implementing Entity would prepare annual reports for the Wildlife Agencies demonstrating how each of these critical factors are being met. In the event that any of these factors are not being met, the Implementing Entity would involve the TAC, including members of the environmental community, in determining how the issues can be resolved.

RTC 11.2 (SSHCP) – The comment notes that the Draft SSHCP was unclear about the role of the Wildlife Agencies is approving property acquisitions for the SSHCP Preserve System. Section 9.3.4 of the Final SSHCP has been revised to make it clear that the TAC, which in addition to members of the environmental community would also include all Permitting Agencies (e.g., U.S. Fish and Wildlife Service and California Department of Fish and Wildlife), have approval authority over preserve acquisitions.

RTC 11.3 (SSHCP) – The comment requests that CDFW hold a conservation easement on all SSHCP preserves. Section 9.4.3 of the Final SSHCP contains language that states the following "The Implementing Entity will hold in perpetuity all conservation easements it purchases or accepts from a landowner. In addition, all conservation easements will have a third-party enforcement beneficiary (CDFW and/or USFWS)." This provides a superior alternative to CDFW holding the conservation easement since it allows both Wildlife Agencies to enforce the conservation easement, If the Implementing Entity were to fail, the conservation easements would be transferred to the successor agency.

RTC 11.4 (SSHCP and EIS/EIR) – The comment suggests that the SSHCP and EIS/EIR should account for consistency with the NOAA and USFWS December 2016 HCP Handbook. The NOAA and USFWS December 2016 HCP Handbook and CDFW 2016 Swainson's Hawk Status Report were published after the Draft SSHCP and Draft EIS/EIR was completed. As part of their permit decision process, the USFWS will review the Final SSHCP in detail to assure that it contains all necessary HCP content, and that it meets each of the ESA Section 10 permit issuance criteria, as described in the 2016 HCP Handbook.

The comment also states that the habitat models for Swainson's hawk is out of date and should be checked for consistency with the CDFW 2016 Swainson's Hawk Status Report. That report was published after the Draft SSHCP and Draft EIS/EIR was completed. Section 3.4 of the SSHCP describes the process of developing habitat models for all 28 Covered Species. The purpose of the models is to define and map

potential habitat for each Covered Species in the Plan Area. The Plan Permittees, wildlife agency biologists and local species experts used the best available information to define and map Covered Species potential habitat, including Swainson's hawk nesting information provided by the commenter. In addition to the Species Accounts in Appendix B, the species models took into account the best available information related to: species' needs for breeding, feeding, and sheltering at each life history stage; information from Plan Area species-surveys; documented species-occurrences within the Plan Area; information on species range, including soil type associations and elevation limits, and the expertise of CDFW staff. This information included information relating to the Swainson's hawk. Examples of this information include newer data received from Jim Estep regarding locations of Swainson's hawk nest trees, expert input from Todd Gardner of CDFW regarding both the habitat requirements and recommended conservation measures for Swainson's hawk. Nonetheless, as new information becomes available regarding the needs of Swainson's hawk and the effectiveness of the proposed Conservation Strategy, monitoring results will be used to adaptively manage the preserves for maximum benefit to the species. In summary, the species models and species accounts were adequately up-to-date to serve their purpose in the SSHCP, and implementation of the SSHCP will adequately account for new information as it becomes available.

RTC 11.5 (SSHCP) – The comment states that the SSHCP does not establish a baseline for the Swainson's hawk breeding population. Although useful baseline data is available for Swainson's hawk and would be incorporated into the SSHCP Preserve Management and Monitoring programs, many covered species have scant data available on their population sizes or distributions within the Plan Area. Therefore, as described in Section 8.3.3.2.1 of the Draft SSHCP, the first 10 years of SSHCP implementation would include intensive surveys within the Preserve System to establish a solid record of baseline conditions for each covered species in the Preserve System. As new properties are acquired, surveys would be conducted to establish baseline conditions for covered species on those properties. Regarding the age of the information in the species accounts, please refer to response to Comment 11.4.

RTC 11.6 (SSHCP) – The comment requests that the SSHCP include a baseline for nesting Swainson's hawk pairs in the Plan Area. Such a baseline would be necessary if the SSHCP monitoring program proposed to directly monitor the nesting population. However, the SSHCP monitoring program does not include directly monitoring the nesting population, as this can vary from year to year. Rather, the SSHCP incorporates goals and objectives that focus on preserving Swainson's hawk breeding and foraging habitat in an integrated regional manner, consistent with the SSHCP Mission Statement (Section 1.1.1). Therefore, the SSHCP does not include a baseline for nesting Swainson's hawk pairs.

Table 8-1 in Section 8.2.1 of the Final SSHCP provides a framework for compliance monitoring for the Covered Species, including Swainson's hawk. The table outlines the monitoring activities that will assess compliance with and progress towards the measurable conservation objectives for Swainson's hawk. The measurable objectives for Swainson's hawk are focused on preserving, managing, and monitoring sufficient

breeding and foraging habitat for the species (see Chapter 7 of the Final SSHCP for more information on the SSHCP biological goals and objectives for Swainson's Hawk).

With respect to the Swainson's hawk Species Account, see the response to Comment 11.4. The Species Accounts were one of many sources used to develop species habitat models.

RTC 11.7 (SSHCP) – The comment states concern about the lack of a comprehensive monitoring and management plan in the Draft SSHCP. As stated in Section 8.1 of the Draft SSHCP, Chapter 8 describes the framework for the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program. The chapter outlines "the monitoring and management protocols and standards that the Implementing Entity will use to prepare Individual Preserve Management Plans (PMPs) and SSHCP Annual Reports." The SSHCP Implementing Entity, Plan Permittees, the Permitting Agencies, and the future SSHCP Technical Advisory Committee (TAC) will provide input on the development of the SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program. As stated in Section 9.11, the Implementing Entity will finalize these two Programs in the first 18 months after permit issuance. These programs, procedures and plans will be developed in full coordination with the TAC and will undergo public disclosure and adoption by the Implementation Committee. All meetings of the Implementation Committee will be called, noticed, held and conducted in compliance with the provisions of the Ralph M. Brown Act, Government Code section 54950 et seq. Individual Preserve Management Plans based on these programs will also be developed in coordination with the TAC. The intent is to maintain SSHCP Compliance and AMM Monitoring Program and the SSHCP Preserve System Monitoring and Management Program as "living" documents, to be periodically reviewed and updated to reflect the most current scientific and agency consensus. Certainly components of both monitoring programs will be conducted on an annual basis as well as on both shorter and longer timeframes, depending on the nature of the monitoring.

RTC 11.8 (SSHCP) – The comment objects to only considering impacts to Swainson's hawk nesting trees within high-value habitat. The SSHCP does not do this. Rather the goal of the SSHCP is to emphasize preservation of high-value habitat and to minimize impacts to high-value habitat. Impacts to Swainson's hawk are analyzed and would be mitigated regardless of whether the impact occurred in high-value habitat or other modeled Swainson's hawk habitat. The referenced text in Section 6.4.2.1 of the Draft SSHCP discusses how high-value habitat was determined, but does not state that impacts to high-value habitat are the only ones considered. For example, refer to Table 6-78 and Table 6-79 in the Draft SSHCP. Table 6-78 shows impacts to all Swainson's hawk modeled habitat, while Table 6-79 shows impacts to only the high-value Swainson's hawk modeled habitat (a subset of the impacts shown in Table 6-78).

The comment also requests that the SSHCP include discussions of potential take of Swainson's hawk nest trees outside the Plan Area. The SSHCP evaluates the impacts of the Covered Activities. These Covered Activities do not extend in the City of Elk Grove. Section 9.2.3.11 of the Draft EIS/EIR does address cumulative impacts to

Swainson's hawk, and the scope of the cumulative analysis includes habitat within the City of Elk Grove.

RTC 11.9 (SSHCP) – Regarding the adequacy of the SSHCP impact analysis and mitigation, the impacts analysis in Section 6.6.20 of the Draft SSHCP describes impacts to 373 acres of nesting habitat, as well as individual nest sites. Section 7.6.2.20 describes biological objectives SH3, SH4, and SH5 for the conservation of 746 acres of modeled nesting habitat, 373 acres of modeled riparian nesting habitat, and a replacement ratio of 10:1 for nesting trees removed within the UDA.

The comment also requests that the SSHCP estimate the effects of the Conservation Strategy on Swainson's hawk at the end of the 50-year permit term. See the responses to Comments 11.6 and 11.7 regarding monitoring. 1

RTC 11.10 (SSHCP) –The comment requests that the SSHCP broaden its description of nesting habitat for Swainson's hawk to include isolated trees in agricultural landscapes, as well as roadside trees. Section 3.4.5, page 3-107 of the Draft SSHCP does state: "Swainson's hawk's nests are also found well away from waterways in lone trees in fields and pastures, in trees along roadside edges, in small groves, around farm buildings, and in some urban areas. Nest trees can also be found in proximity to farm buildings (Bloom 1980; Swolgaard 2004), often in large, well-established, exotic tree species or relict natives." The comment also states that Figure 3-25 demonstrates that most nesting trees in the Plan Area are not in riparian areas. However, at the scale of Figure 3-25, it is not possible to draw the conclusion that most nesting sites are associated within riparian areas.

As shown in Figure 3-25 the density of nesting locations within the UDA is much lower than the density of nesting locations outside the UDA. In addition, the HCP takes into account the loss of individual trees with Species Objective SH5, which requires a replacement ratio of 10:1 for each nesting trees removed within the UDA. The analysis of the Conservation Strategy determined that the overall strategy for Swainson's hawk, including this replacement ratio, coupled with the minimal removal of roadside and other trees associated with covered activities outside the UDA, should ensure that Swainson's hawk maintains its general distribution and population within the Plan Area.

RTC 11.11 (SSHCP) – The SSHCP is a regional habitat conservation plan, and cannot feasibly map and quantify individual trees within the Plan Area. However, at the time of individual Covered Activity project development and/or road maintenance and expansion within the UDA, the loss of individual trees is addressed by Objective SH5, which requires a replacement ratio of 10:1 for nesting trees removed within the UDA (see Table 7-1 of the Final SSHCP).

Outside the UDA, the loss of nesting trees would only be associated with road maintenance and expansion covered activities. The SSHCP Conservation Strategy will preserve large expanses of valley grassland and agricultural landscapes outside the UDA, many of which would contain existing or suitable Swainson's hawk nest trees. Therefore, although quantifying preservation of a certain number of nest trees outside

the UDA is not a stated SSHCP measurable objective for the Swainson's hawk conservation strategy, many nest trees outside the UDA will be preserved through the SSHCP Conservation Strategy. The Final SSHCP has been revised in Section 7.6.2.20 to better explain how the SSHCP Conservation Strategy will mitigate impacts to Swainson's hawk nesting habitat to the maximum extent practicable. Occupied Swainson's hawk nesting trees within the Plan Area, including outside the UDA, would be avoided through implementation of AMMs that include survey and setback requirements for nesting trees adjacent to development and road Covered Activities: SWHA-1 (Swainson's Hawk Surveys), SWHA-2 (Swainson's Hawk Pre-Construction Surveys), SWHA-3 (Swainson's Hawk Nest Buffer), and SWHA-4 (Swainson's Hawk Nest Buffer Monitoring). These AMMs are described in Section 5.4.2, pages 5-104 to 5-105 of the Final SSHCP. The setback requirements in SWHA-3 and SWHA-4 will generally avoid potential adverse edge effects from development by minimizing the contact zone between construction activities and habitat used for nesting and foraging by Swainson's hawk.

RTC 11.12 (SSHCP) – The comment notes that the SSHCP does not require planting of new trees for each Swainson's hawk nest tree removed by roadway Covered Activities outside the UDA. See responses to Comments 11.11 and 11.2. The SSHCP Conservation Strategy will preserve large expanses of intact valley grassland and high quality agricultural landscapes outside the UDA, many of which contain existing and suitable Swainson's hawk nest trees. Although the number of nest trees to be preserved outside the UDA is not included as a SSHCP measurable objective, many nest trees outside the UDA will be preserved by the SSHCP Conservation Strategy. The Final SSHCP has been revised to include this discussion in Section 7.6.2.20.

The SSHCP also provides mitigation at a ratio of 10:1 for the loss of any nesting trees within the UDA, including nesting trees along roadways. This mitigation ratio is set at a high level to offset the impacts of temporal loss, because the new trees will require several years to reach a size to be suitable as Swainson's hawk nest trees. The replacement trees would be planted outside the UDA, so that nest tree availability would be increased within preserved foraging habitat.

RTC 11.13 (SSHCP) – The comment states that it is difficult to identify high-quality habitat for Swainson's hawk in SSHCP figures. At the regional scale of the SSHCP, it is neither feasible nor necessary to show highly detailed versions of these figures. Individual covered activity applications and parcels proposed for acquisition will be subject to detailed surveys and analysis, and it is during those times that high-quality habitat would be definitively identified.

The comment also notes difficulty in locating language prohibiting preserve acquisitions that are below sea level. Language has been added to Final SSHCP Table 7-1, under (Objective L1 conservation actions) to state that "Acquisitions of land below sea level are prohibited." Because Objective L1 applies to all preserve acquisitions, this clarifies the requirements. Language has also been added to Final SSHCP Section 9.4.2 *Process for Acquisition of Preserve Land* to state that land below sea level will not be considered for acquisition.

RTC 11.14 (SSHCP) – The comment requests that all preserve land for Swainson's hawk be located above the 100-year floodplain. The SSHCP Implementing Entity will pursue land acquisitions that would persist as foraging habitat. When potential land acquisitions are identified, they will be vetted by the SSHCP Technical Advisory Committee. This Committee will take the long-term viability of property into consideration prior to acquisition. Areas that are within the 100-year floodplain provide valuable foraging habitat for Swainson's hawk. Swainson's hawks generally use the Plan Area from March to September when risk of flooding is low to non-existent. In addition, requiring all Swainson's hawk foraging habitat to be above the 100-year floodplain would severely constrain the Preserve System and would reduce habitat heterogeneity.

RTC 11.15 (EIS/EIR) – Detailed responses to this comment are provided in response to Comments 11.16 through 11.19.

RTC 11.16 (EIS/EIR) – The comment requests that the EIS/EIR analyze the cumulative effects of the SSHCP and other conservation plans and mitigation plans on Swainson's hawk in Sacramento, Yolo, San Joaquin, and Solano counties. As indicated in Draft EIS/EIR Section 1.1.1, *Geographic Scope of the EIS/EIR Planning Area*, the term "Planning Area" is used in the EIS/EIR and indicates the geographic area for which the EIS/EIR provides analysis. In other words, the evaluation of direct, indirect, and cumulative effects of the alternatives considered in the EIS/EIR focusses on the defined Planning Area as shown in Figure 1-1 and described in Section 1.1.1. The list of reasonably foreseeable other actions provided in Section 3.7, *Cumulative Effects Analysis in Resource Chapters 4 Through 16*, maintains this approach and includes projects and actions either within the Planning Area, or surrounded or almost surrounded by the Planning Area (Rancho Murieta and City of Elk Grove). A lead agency is given discretion under NEPA and CEQA to define the geographic limits of the cumulative impact analysis. A lead agency does not need to always consider every potential future action that might in some way contribute to a cumulative effect. For example, for the cumulative effect of climate change, an EIS/EIR need list every global project or action that may emit greenhouse gases. Rather, CEQA provides that an agency has discretion to apply its expertise in selecting an appropriate assessment area. (See *City of Long Beach v. Los Angeles Unified School District* (2009) 176 Cal.App.4th 889.) That is, CEQA states that an EIR should provide an explanation supported by evidence for the geographic area used in the analysis. (See State CEQA Guidelines, § 15130(b)(3).) An analysis of cumulative impacts under NEPA is similar, in that the decision and extent and effect of cumulative effects "and particularly identification of the geographic area within which they may occur, is a task assigned to the special competency of the appropriate agencies." (See *Kleppe v. Sierra Club* (1976) 427 U.S. 390; *Selkirk Conservation Alliance v. Forsgren* (9th Cir. 2003) 336 F.3d 944.) Here, the Planning Area provides a sufficient geographic area to identify and disclose cumulative impacts and conduct the cumulative impact analysis at a level of detail sufficient for the lead agencies to use as a reasonable basis for decision making in selecting between the alternatives. With this established geographic limit for the reasonably foreseeable other actions, actions in surrounding counties, including other conservation plans and mitigation programs, are appropriately not considered in the cumulative impact analysis in the EIS/EIR.

RTC 11.17 (EIS/EIR) – The comment considers a scenario where the SSHCP and City of Elk Grove Swainson's Hawk Mitigation Program (Elk Grove Program) might "compete" for Swainson's hawk mitigation lands in the Planning Area. Multiple entities seeking mitigation or conservation lands in the same area is a common occurrence. Under existing conditions, these entities include various local jurisdictions, project proponents, and conservation organizations that seek and establish mitigation and conservation programs in the Planning Area. This would continue under the No Action/No Project Alternative. Under the No Action/No Project Alternative, the Elk Grove Program would continue to "compete" with the various entities for conservation/ mitigation lands. If the available supply of conservation/mitigation lands declines under the No Action/No Project, there are various market responses that may occur, for example; supply and demand principles may result in the price for conservation/ mitigation lands going up, resulting in more willing sellers and an increase in supply; some entities seeking conservation/mitigation lands (e.g., mitigation banks, conservation organizations) may expand their search area to locations with more available land; or development and other actions that result in the need for mitigation lands may be limited. Given the multiple possible market responses to "competition" for mitigation lands, it would require significant speculation to attempt to project, with any specificity, the future results of the Elk Grove Program competing with the various other conservation/mitigation programs for Swainson's hawk conservation/mitigation lands under the No Action/No Project Alternative. It would also be very speculative for the No Action/No Project to attempt to determine whether any entities' conservation actions would result in acquisition of conservation/mitigation lands becoming infeasible for another entity.

RTC 11.18 (EIS/EIR) – The comment requests that Section 8.1.2.5 of the Final EIS/EIR acknowledge the importance of the Plan Area for Swainson's hawk nesting and survival. However, the referenced section is focused on species that are colonial nesters, which does not apply to Swainson's hawk.

RTC 11.19 (SSHCP) – The comment questions whether the SSHCP can assure a sustained population of Swainson's hawk in southern Sacramento County with the level of proposed preservation of agricultural lands (approximately 10,000 acres). The Swainson's hawk habitat preserved under the SSHCP would be in addition to the several thousands of acres of habitat already preserved, as well as the substantial areas of habitat that are expected to remain in agricultural production. Note that the SSHCP does not cover urban development outside the UDA, so even though much of the agricultural land would not be SSHCP preserve, that does not mean it would be developed. The conservation analysis in Section 7.6.2.20 of the Draft SSHCP concludes that Swainson's hawk populations would remain sustainable and that the species distribution in the Plan Area would be maintained.

RTC 11.20 (SSHCP) – Please refer to response to Comment 11.7.

RTC 11.21 (SSHCP) – The comment states that all conservation easements should be approved by CDFW. Template SSHCP conservation easements are provided in SSHCP Appendix D. These easements have been approved by the USFWS and

CDFW. SSHCP Section 9.4.3 Conservation Easements provides that "Reasonable variations from the template may be allowed to address site-specific constraints. CDFW and USFWS, along with the Implementing Entity, must review and approve any modifications to the template easement."

RTC 11.22 (SSHCP) – The comment requests that the SSHCP prohibit all use of rodenticides on SSHCP preserves, due to their adverse secondary effects on Swainson's hawk and other raptors. Section 5.2.8 of the Draft SSHCP describes pesticide use as a Covered Activity that is to be used for purposes of land management only:

> "Pesticide use is allowed in Preserves only to achieve the SSHCP Biological Goals and Measurable Objectives (e.g., exotic plant or exotic animal control). Preserve Management Plans (see Chapter 8) will prescribe an integrated pesticide use process as a Preserve management tool, modeled after the California Department of Fish and Wildlife's pesticide use approval process (CDFW Forms 679 and 680). At a minimum, this will include compliance with pesticide label instructions and state and local laws. Use must also comply with existing injunctions related to the use of pesticides."

If the Implementing Entity determines that rodenticide use is necessary and appropriate on a preserve parcel, the rodenticide use will be included in the parcel's proposed Preserve Management Plan. As discussed in Section 9.3.4 of the SSHCP, each Preserve Management Plan is subject to review and approval by the TAC, which would include members from the environmental community and wildlife agencies. In general, the Plan Preparers expect that usage of rodenticides will not be warranted or allowed on SSHCP preserves. However, in order to maintain a pool of willing sellers of conservation easements on Plan Area agricultural lands, the Plan Preparers could not completely prohibit their use within all of the SSHCP Preserve System. If the TAC does approve an individual Preserve Management Plan that allows use of rodenticides, that usage would be subject to limitations described in the PMP on timing and area of application, amounts to be used, and acceptable rodenticides. If appropriate, those restrictions could be incorporated into the conservation easement.

RTC 11.23 (SSHCP) – The comment requests that the SSHCP prohibit establishment of Swainson's hawk mitigation areas adjacent to existing wind energy facilities. This has been added to Table 7-1 in the Final SSHCP as one of the conservation actions associated with measurable objectives SH1, SH3, and SH6. Note also that SSHCP Section 5.3 specifies that wind energy facilities are not Covered Activities under the SSHCP; however, the SSHCP cannot impose requirements on the plan permittees regarding non-covered activity projects. The CEQA document for a future wind energy project would be required to analyze project impacts on existing SSHCP preserves when the CEQA document is prepared.

RTC 11.24 (SSHCP) – The comment requests that a 200-foot buffer be required between preserves outside the UDA and any agricultural/residential development. Please see response to Comments 9.77 and 9.78.

RTC 11.25 (SSHCP) – The comment requests that FOSH be kept updated regarding review of the comments and future public review of the HCP, EIS/EIR, and public hearings. An email address for correspondence is also provided. These preferences have been noted. The Plan Preparers and Wildlife Agencies also thank FOSH for their engagement and careful review of the SSHCP over many years.

Re: Public Notice SPK-1995-00386. Proposed Section 404 Clean Water Act Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan, Sacramento County, CA

Dear Mary Pakenham-Walsh:

Thank you for providing the various materials and an opportunity to comment.

Thank you also for the Corps' ongoing commitment to permit alignment and streamlining with respect to the South Sacramento HCP and all the work that the Corps has done over many years to make this outcome possible.

Overall these are excellent permitting approaches which we support strongly.

One suggestion for The Letters of Permission Submittal Material Criteria (page 2)

Please add a requirement that the project complies with any applicable terms and conditions contained in the SSHCP. This is more comprehensive than "ratios specified in the *Compensatory Mitigation Standards* specified in the local ARP ordinance" and mirrors the requirement in the PGP document (terms of authorization, item 3). 12.1

Sincerely

John Hopkins
President.

Land, People, and Nature — New Solutions for a New Century

RTC 12.1 (CWA Permit Strategy) – The comment regarding support for the proposed approach to CWA 404 permitting is noted.

The comment regarding a suggestion for adding a qualification criterion to the LOP procedure (pg. 2 of draft LOP procedure) "…that the project complies with any applicable terms and conditions in the SSHCP…" is noted. However, the prior section of the LOP procedure, "Proposed Categories of Activities," states that activities authorized under a LOP must comply with the SSHCP's terms and conditions, including implementation of "…applicable and appropriate avoidance and minimization measures contained in Chapter 5 of the SSHCP, and other applicable terms and conditions as contained in the SSHCP." Therefore, modifications to the qualification criteria section of the LOP procedure are not required.

RE: South Sacramento Habitat Conservation Plan

Dear Coordinator:

This office represents Cordova Hills, LLC ("Cordova Hills"). Consistent with the June 2, 2017 Notice of Availability of the Proposed Habitat Conservation Plan for South Sacramento, County, California ("SSHCP"), we submit the following limited comments. Our comments are set forth in the order in which the matters appear within the text of the SSHCP.

CHAPTER 8 – SSHCP MONITORING AND MANAGEMENT PROGRAMS

Habitat Re-Establishment/Establishment Plans (p. 8-151)

This limited section of the SSHCP acknowledges that a stand-alone Habitat Re-Establishment/Establishment Plan will be developed and "will be consistent with the requirements of the ARP (Appendix J)." The reference to Appendix J is in error and confusing. The ARP (Aquatic Resources Plan) is actually Appendix I (not Appendix J) to the Draft EIS/Draft EIR – it is not an appendix of the SSHCP. We also noticed that Table 8-4 (p. 8-110, *et seq.*) includes several references to the ARP as Appendix J). In all cases, we believe the reference should be to "Appendix I of the Draft EIS/EIR." We also suggest that a detailed review of all references to appendices, figures and tables be made to confirm that any changes in numbering of these matters is properly reflected. 13.1 13.2

CHAPTER 12 – ECONOMICS ANALYSIS AND FUNDING PROGRAM

Table 12-3: Habitat Re-establishment/Establishment Costs (p. 12-8)

This table reflects the estimated success rates for various forms of re-establishment and establishment of land-cover types. Cordova Hills is especially concerned that the 65% success rate estimate for vernal pools is artificially low, which results in higher fees than would otherwise be 13.3

required. While we acknowledge that this rate appears to be based upon John Zanzi's experience over thirty years (see fn. 5 on p. 12-8), there is no actual explanation of what the 65% number is based on. If this success rate is based on an average success rate of projects over the last thirty years, it will vastly understate the success rates of more recent efforts. Re-establishment and establishment of vernal pools has become much more successful over the last ten years, due to advances in technology and understanding of the science behind vernal pool success. Experts with whom we have consulted place the success rate for the re-established and established vernal pools in more recent times at well above 65%. Cordova Hills recommends that the success rate estimates for vernal pool re-establishment/establishment be carefully reviewed to assure accuracy and, thereby, better reflect per-acre costs as set forth in Table 12.3. 13.3 cont'd

Related to this issue is the corresponding text in the paragraph immediately preceding Table 12-3. The text includes the following incomplete sentence when referencing Table 12-3:

"In particular, re-established/established vernal pool habitat projects (see Table 12-3 for assumed success rates)." 13.4

This incomplete textual reference should be corrected so that the reader might better understand the reference and the relationship between the textual discussion and the ensuing Table 12-3.

Table 12-5: Development Fees Used in the SSHCP Economic Model (p. 12-19)

This table identifies the Preservation Fee and Re-Establishment/Establishment Fee related to each land cover type, but neglects to identify the various components that make up this fee, including land acquisition, endowment, monitoring, changed circumstances, agricultural enhancement and SSHCP plan development. Without this information, it is not possible for applicants to estimate how much they may owe when they are conveying already purchased land that has been re-established/established, endowed, and already monitored. This additional information should be contained in Table 12-5 or, perhaps, in a separate table breaking down the components of Table 12.5. 13.5

12.4.3.1: Land Dedication in Lieu of Development Fees (p. 12-19)

The missing information from Table 12-5 (see previous comment) is compounded by the limited text in this Section, which immediately follows Table 12-5 and fails, again, to identify how land dedication will impact the amount of the fee owed. While this section does state that "development fees will be adjusted by excluding some portion of the land acquisition component of the development fee," it does not quantify the amount of this adjustment. Moreover, there is no explanation of why only "some portion of the land acquisition component" will be adjusted. It appears that, with no land acquisition necessary with respect to land that is dedicated, there should be no land acquisition component left to pay. 13.6

APPENDIX K: Project-Specific Avoidance and Minimization Measures (p. K-3)

SSHCP Appendix K discusses project specific Avoidance and Minimization Measures for five separate Master Plans/Specific Plans, one of which is Cordova Hills. The Cordova Hills discussion is taken from Appendix A of the Cordova Hills biological opinion. While the biological opinion confirms that any discrepancy between Appendix A of that opinion and the SSHCP will be controlled by Appendix A (thus superseding any conflicting language in Appendix K of the SSHCP), a simple correction of a minor error in Appendix K of the SSHCP would render both appendices consistent. On Page K-3, there is a minor error in the last sentence of **BAT-1 (Winter Hibernaculum Surveys)**. The sentence should be revised to read as follows (new text in *italics*; deleted text in ~~strikeout~~): 13.7

"No further surveys for ~~tri-colored blackbirds~~ *bat hibernaculum* are required."

On behalf of Cordova Hills, we thank you for the opportunity to comment on the SSHCP and look forward to continuing dialogue as this project moves toward consideration and approval by the various agencies involved.

Very truly yours,

Gregory D. Thatch

RTC 13.1 (SSHCP) – The proposed corrections have been made to Final SSHCP Chapter 8.

RTC 13.2 (SSHCP) – The Final SSHCP document has been reviewed to ensure that all references to appendices, figures, and tables are correct.

RTC 13.3 (SSHCP) – The SSHCP preparers reviewed a range of literature (e.g., Schlatter et al. 2016[1]) and discussed with other area experts before settling on the 65% value for the success rate of vernal pool re-establishment/establishment. While we recognize that some recent efforts may appear to be performing well, we have noticed a lack of consistent performance standards across vernal pool re-establishment/ establishment projects that make it difficult to assess whether the projects have truly been "successful" by the standards of the SSHCP. Therefore, we have retained the likely conservative 65% success rate listed in the SSHCP, which has been vetted by the Wildlife Agencies and USACE. However, if experience during implementation of the SSHCP or from other area projects suggests that this rate is too low, the re-establishment/establishment fee could be adjusted following one of the fee audits, which would be conducted every three years during the first 15 years of the SSHCP and less frequently thereafter.

RTC 13.4 (SSHCP) – The sentence has been completed in the Final SSHCP to read as follows: "In particular, re-established/established vernal pool habitat projects **have historically been challenging relative to other wetland projects** (see Table 12-3 for assumed success rates).[2]

RTC 13.5 (SSHCP) – Additional detail has been provided in Table 12-5 of the Final SSHCP clarifying which portion of the fee relates to land acquisition (for preserve establishment) or re-establishment/establishment (for habitat re-establishment/ establishment projects) versus what portion of the fee is for other expenses. Further detailed breakdowns are also provided in the revised Appendix I to the SSHCP.

RTC 13.6 (SSHCP) – New text in Section 12.4.3.1 of the Final SSHCP explains how the mitigation fee will be adjusted to reflect land dedication by a project proponent.

RTC 13.7 (SSHCP) – The proposed corrections to Appendix K have been made in the Final SSHCP.

---

LETTER 14 MICHAEL MAHON (SSHCP)

Michael D. Mahon Comment
on South Sacramento Habitat Conservation Plan

The South Sacramento Habitat Conservation Plan (HCP) calls for a joint powers authority (JPA) to administer a complex, expensive 50-year monitoring and habitat management plan for the benefit of the people of Sacramento County. It also claims the alleged benefits of simplifying the application process with federal agencies for incidental take permits under the ESA and NEPA, speeding up development. The proponents claim it is a novel structure, among the first of its kind in the country. It is fundamentally flawed for several reasons. 14.1

First, **it is an unconstitutional tax**. The HCP sets about creating an extraordinary, expensive, perpetual wildlife preserve and bureaucratic complex, theoretically at the expense of only those who choose to develop parcels in the area and the subsequent owners of that property. If potential developers are to be required to set aside land for habitat, the purchase and dedication of that land should be separate from the extraordinary scheme in the HCP, conducting periodic studies, and preparing bureaucratic reports in perpetuity. **The HCP sets out uncommon and unreasonable burdens for a longer time period compared to other mitigation plans, which have common and reasonable burdens for less time.** It is also highly speculative what the values associated with property, especially mitigation property, will be in the future, and it is *per se* not reasonable to make assumptions of land value on a 50+ year time horizon, so any plan based upon such assumptions is also *per se* not reasonable. 14.2 14.3 14.4

The present funding mechanism for the South Sacramento Habitat Conservation Plan agency constitutes a tax, not merely a development fee *per se*, as it funds items which go beyond that which are normally considered related to development. The recent 6-1 California Supreme Court case, *Jacks v. City of Santa Barbara*, 3 Cal. 5th 248; 2017 Cal. LEXIS 4769, is highly instructive on which local charges are to be considered taxes. Since 2010 and Proposition 26, the California Constitution has been amended to provide the definition of a tax: "'tax' means any levy, charge, or exaction of any kind imposed by a local government" (Cal. Const., art. XIII C, § 1, subd. (e)), except (1) a charge imposed for a specific benefit or privilege received only by those charged, **which does not exceed its reasonable cost**, (2) a charge for a specific government service or product provided directly to the payor and not provided to those not charged, **which does not exceed its reasonable cost**, (3) charges for **reasonable regulatory costs** related to the issuance of licenses, permits, investigations, inspections, and audits, and the enforcement of 14.5 14.6

agricultural marketing orders, ... (6) **charges imposed as a condition of developing property**, and (7) property-related assessments and fees as allowed under article XIII D. **The local government bears the burden of establishing the exceptions.** (Cal. Const., art. XIII C, § 1, subd. (e), emphasis added.)

14.6 cont'd

Jacks follows and affirms the reasoning of *Sinclair Paint*, 15 Cal.4th 866. "Although [Sinclair Paint], focused on restrictions imposed by Proposition 13, its analysis of the characteristics of fees that may be imposed without voter approval remains sound... **According to Proposition 218's findings and declarations, "Proposition 13 was intended to provide effective tax relief and to require voter approval of tax increases. However, local governments have subjected taxpayers to excessive tax, assessment, fee and charge increases that ... frustrate the purposes of voter approval for tax increases ...** ." (Prop. 218, § 2, reprinted at Historical Notes, 2B West's Ann. Cal. Const. (2013) foll. art. XIII C, § 1, p. 363, italics added [in *Jacks*].) As relevant here, this finding reflects a concern with excessive fees, not fees in general." *Jacks* continues, citing the Historical Notes of Proposition 26, "**to ensure the effectiveness of these constitutional limitations, [Proposition 26] defines a 'tax' ... so that neither the Legislature nor local governments can circumvent these restrictions on increasing taxes by simply defining new or expanded taxes as 'fees.'**"

14.7

The Court in *Jacks* summarized three categories of charges that are fees rather than taxes, and therefore are not subject to the voter approval requirements of Proposition 13: first, special assessments may be imposed "in amounts reasonably reflecting the value of the benefits conferred by improvements." (*Sinclair Paint*, at p. 874); second, development fees, which are charged for building permits and other privileges, are not considered taxes "**if the amount of the fees bears a reasonable relation to the development's probable costs to the community and benefits to the developer**." (*Sinclair*, at p. 875, emphasis added.) The Court echoes the Constitution and applies the standard of reasonable relationship to development fees, just as is provided for special benefits, government products, and various investigations charged by the local governments. The Court continues, citing to the historical record of Proposition 218 which provides that "**[Proposition 218] shall be liberally construed to effectuate its purposes of limiting local government revenue and enhancing taxpayer consent**," and later concludes, "**To the extent fees exceed a reasonable amount in relation to the benefits or costs underlying their imposition, they are taxes.**" *Jacks* at p. 268, citing *Sinclair Paint*, at p. 881.

14.8

My position, simplified, is that a significant portion of the fees charged under the HCP are beyond the reasonable amount chargeable as development fees, and are therefore to be considered taxes. *Sinclair* at p. 875 cites a string of cases concerning development fees. None of these involves a permanent, comprehensive environmental preserve and permanent bureaucracy the likes of which is detailed in the HCP. The present HCP goes too far. **As its proponents maintain, it is a novel approach**, without significant precedent, and in my view it is **therefore ripe for constitutional scrutiny**. Specifically, the perpetual cycles of measurement and verification, with unlimited potential for expansion in scope, are not reasonable. 14.9

Second among its fundamental flaws, **the Plan provides funding for activities outside the 50-year Permit Term**. To the extent it does so, some $62 million or more for the non-plan years, at least, can only be seen as a tax. Section 12.3.7 of the HCP provides, "The development fees include a contribution to a non-wasting endowment designed to generate sufficient interest to cover the ongoing annual costs beyond the 50-year Permit Term." In other words, **the Plan wants to fund similar activities outside the permit term, but will charge during the permit term** to fund those activities indefinitely, and it is unclear how that is reasonably related to the permitting activity; *ergo* it is a tax. 14.10

Third, the HCP protects more species than are currently listed by the federal and state endangered species acts (ESAs). **Of the 28 species chosen as "Covered Species," three-fifths are not threatened or endangered on either the federal or state ESA**. In a very straightforward way, three fifths of the HCP is not for purposes beyond what has been agreed nationally and statewide to be reasonable, i.e., protection of listed species under the federal and state endangered species acts. In various presentations, **proponents of the HCP have stressed they have narrowed the list of species from initial wish lists of more than 100 species down to 28, but the fact remains the list is still 255% as large as it would be had the list been kept to the ordinary, reasonable boundaries of the ESAs**. Any margin of expense beyond protecting listed species would be an unconstitutional tax, and the burden should be on the proponents to delineate how much expense is required for protecting the listed endangered and threatened species only versus the gamut of "Covered Species." 14.11

It is also unclear from the published materials what the economic effect of mitigating for particular species that may be on particular parcels would be versus the aggregating plan, covering all 28 species. It is unclear why a developer of parcels that may have, for example, only one species should pay to protect 28 species, 17 of which are not listed, 14.12

and also to endow a permanent bureaucracy theoretically protecting all 28. It is unclear what the marginal cost or benefit would be for protecting 27 additional species when that developer could otherwise mitigate simply with the dedication of a similar one-species parcel and no permanent bureaucracy. **Why, theoretically obligated to shield one species under current regulation, is a developer required to purchase the panoply for all 28 species?** 14.12 cont'd

It is unclear why future developers of parcels, thirty years down the line, let us imagine, with one protected species, in a very different part of the county should inherit the bills linked to a vast and extensive preserve, decades of M&V reports, new plans, updates, a half dozen or so full-time JPA executives, dozens of expensive scientific contractors, etc. Why do developers and speculators in Rancho Cordova and the land immediately around highly sensitive, multi-species habitat who want to develop or to collect a windfall right now benefit, and others not situated in the current, immediate wave of development suffer unknown burdens under a new bureaucracy when they might otherwise have been able to mitigate inexpensively? 14.13

In summary of the first three reasons why the HCP is an unconstitutional tax: the Plan is too large in scope of work; the Plan covers too much time; the Plan covers too many species. Each is a fatal, unconstitutional flaw, and since each is vital to the Plan, the Plan cannot be saved by amendment. However, the list of objections continues, several of which are also likely fatal to the Plan: 14.14

Fourth, the **50-year term is outside the authority provided by Government Code §50060.5(a)** "a local agency may, by ordinance or by resolution adopted after notice and hearing, establish a district to provide for the improvement or maintenance of natural habitat. The local agency may perform those functions or contract with the state, another local agency, or a special district to perform those functions. ***If a local agency establishes a district, it may provide for the levy of assessments for not more than 30 years*** to pay the cost and incidental expenses of implementing a long-term natural habitat maintenance plan approved by the Department of Fish and Game pursuant to Section 2901 of the Fish and Game Code." (Emphasis added.) If there is other authority for the SSHCP and its 50-year fee authority, I would be interested in specifics. However, this JPA looks like a §50060 *et seq*. entity, walks like one, quacks like one... **If there is some other theory of the JPA, it is an artificial taxonomy to be disregarded** by the Court, whereas the real purpose of the JPA is to establish a habitat maintenance district contemplated and restrained by the cited Government Code. 14.15

Fifth, **any unconstitutional tax threatened by the County of Sacramento, and particularly the HCP as proposed, has takings implications under the United States Constitution's 5th Amendment jurisprudence, especially *Dolan v. City of Tigard*, 512 US 374 (1994), and *Nollan v. California Coastal Commission*, 483 U.S. 825 (1987)**. The clear line of cases establishes the principal that any unfair burden placed upon taxpayers or applicants for a permit can cross the line into a federally unconstitutional taking, apart from a California unconstitutional tax. 14.16

Sixth, **insufficient detail of the financial planning and development assumptions, on a year-by-year basis, have been provided to the public**. It imposes long-term financial and development consequences without allowing careful review of the details. Despite being over 1400 pages long, the document is heavy on the biology and conservation measures and light on the financial implications. As development encroaches, the viability of certain uses changes over time, as do values, and the highest and best use of parcels. **The nexus study, referenced in the primary materials, has not been made available**. 14.17

Seventh, it appears that a great portion of **mitigation land** in the Urban Services Boundary, based on critical habitat, **is in Rancho Cordova and/or the immediate vicinity** (with the largest actual portion in the southern extreme portion of the county, not at all in the path of development), and it is **unclear why property in other areas should be burdened** by the enormous scheme contemplated in the HCP. Why not just limit the HCP to Rancho Cordova and the large preserve area there, plus the giant area outside the path of growth in the southern extreme part of the county? If there is a locus of costs and benefits, it should be right there in Rancho Cordova, not the whole South County. 14.18

Eighth, **the plan does not provide protection against incidental take for agricultural activities in the non-developed / agricultural area**. A handful of **powerful developers and land speculators are getting incidental take permits, essentially being excused** from real harm to endangered species, but farmers–engaged in activities which have been carried out on their lands for upwards of 150 years, and which clearly benefit some protected species, such as the Swainson's hawk–**farmers are still subject to incredible fines and penalties which only stand to increase in likelihood because of the developers' use of lands and the subsequent concentration of remaining habitat. The public has a right to know all of the past and present negotiations with the developers and land speculators which has been conducted by the plan proponents**, especially Rancho Cordova and the County of Sacramento, including exactly how much these few 14.19

insiders stand to profit from their developments and especially the mitigation land sale windfall. 14.19 cont'd

Ninth, it is unclear why Elk Grove, Folsom, and Rancho Murieta are not included. **Elk Grove is as populous today as Sacramento was in 1960, and its continued growth is at least as relevant to most of the South County as anything in Rancho Cordova. The community deserves a clearly stated reason for Elk Grove's non-inclusion and the anticipated effects**, published directly alongside the Plan documents, from both the HCP proponents as well as the City of Elk Grove. The same could be said for Folsom, Rancho Murieta, and even the City of Sacramento. 14.20

Finally, it is unclear the benefit of trying to adopt the plan and actually creating a new government entity will benefit the citizens more than the county and cities themselves proceeding without the new JPA and without the perpetual funding mechanism. **The HCP will potentially burden at least three generations of owners of agricultural land in the future, but it appears geared to benefit primarily others, namely those who are set to develop right now, the permanent bureaucracy, and the critter constituency that would like an extraordinary, local expansion to the federal and state ESAs to include 17 non-endangered, non-threatened species.** 14.21

Michael D. Mahon
9951 Grant Line Road
Elk Grove, California 95624
(916) 539-1226; mdmahon@mdmahon.com

RTC 14.1 (SSHCP) – This comment is introductory in nature and contains the commenter's characterization of the South Sacramento Habitat Conservation Plan (the "Plan" or "SSHCP"). The plan preparers do not believe the SSHCP or its structure are "fundamentally flawed." Without any additional detail supporting this claim, no further response is feasible.

RTC 14.2 (SSHCP) – The Development Impact Fees (the "Fees") required under the Plan fall under an exemption to the definition of a "tax" under Article XIII C, section 1(e)(6) of the California Constitution, which exempts fees "imposed as a condition of property development." While such Fees must still comply with the Mitigation Fee Act, set forth in Government Code Section 66000 et seq., Sacramento County (the "County") has provided evidence through the nexus study ("Study") demonstrating that each condition required for imposition of mitigation fees or development impact fees under the Mitigation Fee Act has been met.

RTC 14.3 (SSHCP) –The Plan Preparers reviewed regional habitat conservation plans (incorrectly termed mitigation plans in the comment) within the state of California and found that a 50-year permit term is not uncommon. For instance, habitat conservation plans currently being prepared in Yolo and Placer County are also seeking a 50-year permit term. Approved plans in Santa Clara County and San Joaquin County, as well as the Natomas Basin Habitat Conservation Plan and the North County Multiple Habitat Conservation Program in San Diego County, were granted 50-year permits. Moreover, the Western Riverside County Multiple Species Habitat Conservation Plan and Coachella Valley Multiple Species Habitat Conservation Plan were both granted a 75-year permit term.

RTC 14.4 (SSHCP) – In addition to completing an economic analysis of Plan implementation (see Chapter 12 of the Draft SSHCP), the County commissioned a fee nexus study (Study) analyzing the proposed Fees. As explained in more detail in the Study, the Fees would be adopted in accordance with the SSHCP, which is a habitat conservation plan that is "specifically adopted to ensure that new development mitigates for its impacts under the federal Endangered Species Act, the California Endangered Species Act, the Clean Water Act, and other associated environmental regulations." The nature of the development in question will necessarily affect the environment upon which it is constructed, and the Study provides for this connection as well as an allocation of costs based on expected impact.

The Study also describes the method that would be used to allocate Fees to various covered activities. Because the cost to preserve or re-establish/establish land covers vary, the schedule provides different Fees based on where the development is located (e.g., land covers present, wetland types present). The Fees are calculated on a per-acre basis, to ensure that the total Fees are proportional to the impact of the individual development project. Thus, the Fees are structured to ensure that no developer pays more than their development's specific impact, taking into account the land cover and size of development.

The Study further provides details on compliance with the specific findings that are required under the Mitigation Fee Act. As a result of allowing for development on the property subject to the Plan, the County is required to ensure that adequate funding for the Plan will be provided. (16 U.S.C. 1539(a)(2)(B)(iii).) The funding will be used to provide for conservation actions required to be undertaken by Plan participants, and to fund mitigation actions identified under the Plan, including habitat acquisition, habitat re-establishment/establishment, habitat management and monitoring, and program administration costs.

The fees are necessary because in order to obtain an incidental take permit under the ESA, the applicant must demonstrate that it will ensure adequate funding for implementation of the program. One of the ways to ensure funding is to apply fees to development that will affect the species covered under the Plan.

Moreover, Chapter 12 of the Draft SSHCP includes a detailed economic analysis of SSHCP implementation. The SSHCP economic analysis and associated cost estimates were based on the best information available. Information used in the cost analysis includes, but is not limited to, the estimated acres of impact of future Covered Activities (Chapter 6), estimated costs of the HCP habitat preservation and implementing re-establishment/establishment requirements, costs of land by location of the proposed SSHCP Preserve System (Chapter 7), estimated costs of anticipated Preserve System management and monitoring activities (Chapter 8), the staffing and overhead costs of the proposed HCP implementation structure (Chapter 9), and estimated costs of addressing any future changed circumstances (Chapter 11).

The SSHCP cost analysis relies on a detailed financial spreadsheet model (see Appendix I of the Draft SSHCP) to track costs and funding requirements associated with SSHCP implementation. The model assesses SSHCP conservation requirements and generates a set of cost estimates, organized by SSHCP land cover type categories. The cost analysis relies on many data sources. Key steps taken were as follows:

1. The analysis of SSHCP costs considered a hypothetical “Preferred SSHCP Preserve System” that indicated the approximate location and SSHCP land cover type that could be acquired by the SSHCP.
2. A land valuation exercise identified estimated per-acre land costs based on the land’s location within the Plan Area, and the SSHCP land cover type anticipated for acquisition.
3. A review of cost assumptions for habitat re-establishment/establishment, management, monitoring, and other costs yielded additional cost estimates by SSHCP land cover type.
4. Costs were aggregated to identify the total funding needed for implementation of the SSHCP Preserve System.
5. Development fees were derived by determining the total cost of mitigation per acre impacted by Covered Activities for each SSHCP land cover type.

Generally, estimates were informed by literature reviews, independent research, and input from land managers experienced with habitat preservation and re-establishment/ establishment in Northern California, as well as a review of cost models in similar "regional" habitat conservation plans that have already been permitted by the U.S. Fish and Wildlife Service (See Draft Plan, p. 12-2.) The values presented in the analysis represented the best available cost estimates based on the information currently available. (See Draft Plan, p. 12-2.) Shortly after Plan implementation begins and actual cost data is available, the Implementing Entity proposes to compare the cost assumptions made in this economic analysis with the cost of implementing the SSHCP. (Id.) If actual costs of Plan implementation are inconsistent with the economic analysis, development fees will be adjusted to bring the development fees in line with the observed cost of implementing the SSHCP. (Id.) The development fees will be reviewed on a regular and ongoing basis, and updated if necessary to reflect actual implementation costs. Refer also to response to Comment 9.87.

RTC 14.5 (SSHCP) – The Fee is not a tax. In 2010, largely as a response to the holding in Sinclair Paint Co. v. State Bd. Of Equalization (1997) 15 Cal.4th 866, which is discussed further below in Comment 5.7, Proposition 26 was adopted by the voters. Among other things, Proposition 26 provided clarity to the definition of a "tax" under the State Constitution by adding subdivision (e) to Article XIII C, section 1. Specifically, Proposition 26 states that any fee, exaction, charge, or otherwise, imposed by a local government, is a "tax" requiring voter approval, unless such levy meets one of seven specifically enumerated exemptions. The exemption that relates to the SSHCP is subsection 6:

> (6) A charge imposed as a condition of property development.

RTC 14.6 (SSHCP) – The referenced decision is not relevant to the issue of development impact fees. The comment cites to the Supreme Court's decision in Jacks v. City of Santa Barbara (2017) 3 Cal.5th 248. Jacks addresses whether charges imposed for entrance to or use of local government property are exempt from the definition of a "tax" under Cal. Const. art. XIII C, sec. 1(e)(4). Jacks does not provide any meaningful discussion of development impact fees exempt under Cal. Const. art. XIII C, sec. 1(e)(6) and thus is not applicable here.

RTC 14.7 (SSHCP) – See response to Comment 14.6. Moreover, Articles XIII C and XIII D were added to the California Constitution pursuant to Proposition 218, and reinforce the requirement that general and special taxes require voter approval (as well as providing special requirements for property related fees, charges and assessments). What was missing from this legislation, however, was the definition of what constitutes a "tax." This became a significant issue in Sinclair Paint Co. v. State Bd. Of Equalization (1997) 15 Cal.4th 866, upon which the Comment heavily relies. As the comment correctly states, the types of fees and charges that are generally exempt from classification as a "tax" include development impact fees "if the amount of the fees bears a reasonable relation to the development's probable costs to the community and benefits to the developer." (Id. at 874.)

In Sinclair Paint, Sinclair Paint Company argued that a fee imposed pursuant to the Childhood Lead Poisoning Prevention Act of 1991 for services relating to children suffering from lead poisoning, was a "tax" because the revenues do not reimburse the state for special benefits conferred on manufacturers of lead-based products, nor compensate it for government privileges or services to those manufacturers. The Supreme Court rejected Sinclair Paint's argument, holding instead that the challenged fee fell within a "third recognized category" of fee that did not depend on government conferred benefits or privileges: a regulatory fee. A regulatory fee requires the fee payer to bear a fair share of the cost of mitigating the adverse effects their products created in the community. (Id. at 875-76.) As a result, the comment's discussion of Sinclair Paint is not relevant to the imposition of the Fees.

RTC 14.8 (SSHCP) – See responses to Comments 14.6 and 14.7.

RTC 14.9 (SSHCP) – See responses to Comments 14.6 and 14.7. Moreover, the imposition of mitigation fees is not a novel approach. With the passage of Proposition 13, the limits on general revenues for new infrastructure have resulted in new development being held responsible for its share of public improvements, and both the use and levels of impact fees have grown substantially.

The comment references several cases that are referenced on page 875 of the Sinclair Paint Co. v. State Bd. Of Equalization (1997) 15 Cal.4th 866 decision. As the Sinclair court noted, each of these cases stands for the proposition that "development fees exacted in return for . . . government privileges are not special taxes if the amount of the fees bears a reasonable relation to the development's probable costs to the community and benefits to the developer." (Sinclair, supra, 15 Cal.4th at 875 [citing Shapell Industries, Inc. v. Governing Board 1991) 1 Cal.App.4th 218; Bixel Associates v. City of Los Angeles (1989) 216 Cal.App.3d 1208; California Building Industry Association v. Governing Bd. of the Newhall School District of Los Angeles (1988) 206 Cal.App.3d 212; Russ Building Partnership v. City & County of San Francisco (1987) 199 Cal.App.3d 1496; Beaumont Investors v. Beaumont-Cherry Valley Water District (1985) 165 Cal.App.3d 227; Mills v. County of Trinity (1980) 108 Cal.App.3d 656; Ehrlich v. City of Culver City (1996) 12 Cal.4th 854, 898.) As these cases illustrate, and as demonstrated here through the Study and as discussed further in detail in response to Comment 14,4, the development impact fee fully complies with the Mitigation Fee Act and long-accepted means of mitigating for the impacts of proposed projects.

RTC 14.10 (SSHCP) – The SSHCP entails much more than the Permit. The Permit is granted to provide Endangered Species Act compliance for projects on lands within the Plan Area. However, the purpose of the SSHCP is to mitigate the impacts on Covered Species. In order to accomplish this goal, funds acquired through the Fee will be used to fund an endowment to ensure that conserved lands continue to provide the habitat and ecological processes necessary to support Covered Species in perpetuity, and that the funds collected are sufficient for such purposes. Importantly, as stated, mitigation is only necessary because of the Covered Activities occurring within the Plan Area, and those Covered Activity proponents are thus required under the Plan to pay their proportional share to mitigate such impacts. Nothing about ensuring that the impacts of

Covered Activities are mitigated in the future would otherwise render legally adopted mitigation fees as “taxes.”

RTC 14.11 (SSHCP) – The comment questions why the SSHCP includes as covered species several species that are not listed under the ESA. Permit applicants can choose to include unlisted species in an HCP. For the SSHCP, the Plan Permittees wished to develop a robust conservation plan that provides benefits to the key species, habitats, and landscapes that will be permanently impacted by planned development in the Plan Area. Under Section 10 of the ESA, there are also important advantages to including currently unlisted species. For example, the Plan Permittees will be entitled to “No Surprises” protection; should one of those currently unlisted species become listed in the future, no additional mitigation requirements would be imposed during the permit term. The unlisted species covered by the SSHCP are also typically the subject of local or state requirements for mitigation under CEQA for other local policies, and the robust mitigation provided by the SSHCP can satisfy these requirements without the need for additional mitigation. The SSHCP can address threats to unlisted species before a listing is needed and the other provisions of the ESA take effect. Additionally, some species have overlapping habitat needs and thus can benefit from “economies of scale” provided by an HCP, without increasing an applicant’s mitigation obligations. Regarding the comment’s statement that the SSHCP development fees are an “unconstitutional tax”, please refer to responses to Comments 14.2 to 14.10.

RTC 14.12 (SSHCP) – The impacts that the SSHCP are mitigating are regional in nature. For that reason, habitat conservation planning requires a regional solution, with a regional fee, rather than an individual project-by-project permitting solution. The concept of purchasing small, unattached piecemeal properties located throughout the participating agencies’ jurisdictions in order to provide habitat located near to each and every development project would not be conducive to the survival of most endangered species. As documented in the SSHCP, it is a basic principal of conservation biology that large habitat blocks be conserved and that these blocks and other Conservation Area areas must be contiguous and connected. (See Draft SSHCP, Chapter 7.) Habitat fragmentation reduces in size and isolates areas of habitat for species. As habitats become increasingly isolated, species migration, immigration, and dispersal become less common or impossible, thereby limiting or preventing opportunities for populations to exchange individuals and genetic information, escape inhospitable habitats, and recolonize areas. Ultimately, these effects can result in disappearance of the species in the fragmented habitat patches. Habitat fragmentation can also alter natural ecosystem functions such as pollination as well as how habitat recovers from fires, flooding, or other r stochastic environmental events (e.g., pest outbreaks) that species have adapted to over their evolutionary history. The SSHCP Conservation Strategy minimizes habitat fragmentation by focusing on the establishment of large Preserves, on a region-wide basis by linking existing preserves and SSHCP Preserves together to allow wildlife movement. Only by accruing financial resources such as impact fees on a regional-wide basis and utilizing these monies to purchase those critical sites throughout the region that are best suited (or most appropriately priced) for habitat purposes can the region's endangered species be best protected with the limited funding sources available.

The provisions of the SSHCP will provide mitigation for future impacts of planned urban, rural, and regional infrastructure development on the species identified in the SSHCP. (See Draft SSHCP, 9.2.1.)The SSHCP will allow participating jurisdictions to "take" the plant and animal species identified in the SSHCP through the agencies' local land use planning and development review processes. These take authorizations would be granted in recognition of the mitigating effects of the coordinated conservation system planned by the SSHCP.

RTC 14.13 (SSHCP) –It is the County's view that the key benefit to future development within the boundary of the Plan is the availability of assurances to SSHCP participants about the level of mitigation that will be expected over the life of the Plan. In other words, the HCP permittees are provided with long-term assurances, through the No Surprises Rule, that the terms of the SSHCP will be adhered to and that no further mitigation requirements will be imposed.

Regarding comments about the cost of the plan, please refer to Chapter 12 of the SSHCP and Appendix E which provide detailed analysis of the costs and fee structure.

RTC 14.14 (SSHCP) – See responses to Comments 14.2 through 14.13.

RTC 14.15 (SSHCP) – California Government Code section 50060.5 provides limitations specifically applicable to special benefit assessment districts, empowered with the authority to levy assessments on real property for the special benefit conferred. This authority relates to special benefits associated with improvement or maintenance of natural habitat. Such assessments would be subject to the limitations under Article XIII D, section 4 of the California Constitution governing assessments, and would be levied on an ongoing basis to pay for ongoing improvements.

However, the Fees are not being charged as a part of the formation of such a District, nor is such a District being proposed. There is no assessment being proposed on property owners of land subject to the SSHCP, and the SSHCP does not call for an ongoing special benefit assessment to be charged. As such, this Article of the Government Code, including the 30 year time limitation for the levy of assessments, has no applicability to the Plan or the Fees, which are one-time charges levied as a condition to develop property on land subject to the SSHCP.

RTC 14.16 (SSHCP) – Through the Study, the County has provided evidence demonstrating that the requirements under Dolan v. City of Tigard (1994) 512 U.S. 374, and Nollan v. California Coastal Commission (1987) 483 U.S. 825, have been met. The Mitigation Fee Act was enacted in large part as a response to Nollan, and requires various findings to demonstrate a nexus between the mitigation fee and the impact of the particular development, as well as proportionality of the mitigation fee to the impact. As explained in detail above, the County has provided evidence demonstrating that both of these nexuses have been met. No taking occurs where the Fees are related both in nature and extend to the impact of the proposed development. (Dolan, 512 U.S. at 390.)

RTC 14.17 (SSHCP) – As explained in response to Comment 14.4, the County commissioned a Study analyzing the Fees and the SSHCP. An analysis of the economic impacts associated with the Plan can be found in Chapter 12 of the Draft SSHCP as well.

RTC 14.18 (SSHCP) – The SSHCP was prepared by five local agencies, including the County, City of Galt, City of Rancho Cordova, Sacramento County Water Agency, and the Southeast Connector Joint Powers Authority. These five local agencies, plus the future SSHCP Implementing Entity (to be named the South Sacramento Conservation Agency), are collectively applying for Incidental Take Permits and are referred to in the Plan as "Plan Permittees". It is these entities that worked collectively to establish the boundaries of the Plan, and it is these entities that want the protections it would provide. The growth and development that is anticipated by the SSHCP is governed not by the SSHCP itself, but by the General Plans of the Sacramento County, Rancho Cordova, and Galt. The growth pattern described in the comment, with most development occurring within the UDA, is the pattern that was planned for in those General Plans. For certain resources that are not found outside the UDA, such as rare plants and vernal pool tadpole shrimp habitat, preserves must be established within the UDA. In general, however, establishing preserves outside the UDA will ensure that the General Plans can be effectively implemented by the land use authority permittees.

RTC 14.19 (SSHCP) – As provided for in Section 5.2.7 of the Draft SSHCP, certain agricultural activities, such as tilling fields, harvesting crops, and grazing are covered activities when they are consistent with provisions of an SSHCP Conservation Easement (see Section 9.4.3 of the Draft SSHCP) and are consistent with an SSHCP Preserve Management Plan (see Chapter 8). Incidental take coverage for agricultural practices on public or private land inside or outside the UDA, if needed, may require an amendment to the SSHCP and its permits, or require individually and independently acquired Incidental Take Permits. (Draft SSHCP, Section 5.3.) Specifically, all agricultural practices on public or private land inside or outside the UDA are not covered by the SSHCP permits unless such actions (1) occur on an SSHCP Preserve and are an SSHCP Covered Activity (as described in Section 5.2.7, SSHCP Preserve System Covered Activities), or (2) occur on a property under an SSHCP Conservation Easement and are an SSHCP Covered Activity described in Section 5.2.7. (Draft SSHCP, Section 5.3.)

The County provides information to the public regarding property negotiations with landowners when an agreement is ready for action by the Board of Supervisors. Negotiations may include a non-disclosure agreement that prohibits the County from making certain information public until a negotiated agreement is scheduled to be presented to the Board of Supervisors in a public hearing. The terms of any negotiated agreement will be made available to the public prior to the County Board of Supervisors approval of agreements to purchase property or easements. These procedures for publishing agendas and providing public notice of Board hearings provides interested parties time to review and comment on the proposed agreement.

RTC 14.20 (SSHCP) – As discussed in Response 14.18, the SSHCP was developed and prepared by five local agencies. These agencies, plus the future SSHCP Implementing Entity, make up the proposed "Plan Permittees." These are also the agencies that have voluntarily agreed to participate in the Plan if and when it is approved. The City of Elk Grove was formerly included as a Plan Permittee but elected to leave the SSHCP. The cities of Folsom and Sacramento were not considered as Plan Permittees because their City boundaries are either largely built out or do not have the need for the ESA and CESA permitting provided by the SSHCP. The community of Rancho Murieta would also not have need of the permits associated with the SSHCP and the County determined it did not make sense to include it in the Plan Area.

RTC 14.21 (SSHCP) – This comment contains the commenter's characterization of the regulatory composition of the Plan, as well as underlying policy recommendations related to the Plan, to which no response is required. (See responses to Comments 14.11, 14.12, 14.13, 14.18, and 14.19.)

LETTER 15 PACIFIC LEGAL FOUNDATION (SSHCP)

PACIFIC LEGAL FOUNDATION

Re: Comments on South Sacramento Habitat Conservation Plan

To Whom It May Concern:

Pacific Legal Foundation submits the following comments on the proposed South Sacramento Habitat Conservation Plan (HCP), for the Plan Proponents' consideration in determining if and how to proceed. Pacific Legal Foundation is a national non-profit public interest law firm, providing pro bono representation in state and federal courts to property owners and others whose constitutional and other rights are impaired by government action. Based on our review of the Plan and readily available related documents, we are pleased to provide the following comments. These comments primarily focus on federal Endangered Species Act issues and related constitutional limits.

The Plan imposes development fees, and appears to impose land use restrictions on at least some ongoing activities, in order to prevent possible take of species that are federally listed only as threatened, *i.e.* Vernal Pool Fairy Shrimp, Valley Elderberry Longhorn Beetle, California Tiger Salamander, Giant Garter Snake, and Slender Orcutt Grass. The Endangered Species Act only applies the take prohibition categorically to species listed as endangered. 16 U.S.C. § 1538(a)(1)(B). The Act allows the Service to apply the take prohibition to threatened species only on a case by case basis. 16 U.S.C. § 1538(a)(1)(G). The Service illegally extended the take prohibition to all threatened species by regulation. 50 C.F.R. § 17.31(a). The Plan therefore illegally imposes development fees and land use restrictions to address take concerns that are improper under the ESA. *See generally*, Jonathan Wood, *Take It to the Limit: The Illegal Regulation Prohibiting the Take of Any Threatened Species under the Endangered Species Act*, 33 Pace Envtl. L. Rev. 23 (2015). 15.1

E-MAIL: plf@pacificlegal.org
WEB SITE: www.pacificlegal.org

The Plan imposes conditions and restrictions for the protection of Valley Elderberry Longhorn Beetle and its designated habitat. That species was proposed for delisting as the result of a Service status review concluding that ESA protection was no longer warranted. 77 Fed. Reg. 60238 (Oct. 2, 2012). The Service withdrew its proposed rule to delist the Beetle based on concerns that the information on which the status review was based was stale, and lack of funds to update that information. 79 Fed. Reg. 55874 (Sept. 17, 2014). Rather than dedicating development fees to protection of habitat for a species that still likely warrants delisting, the Plan should dedicate funding to completing the necessary update to the Service's available information, with a view to allowing the Service to delist the species. 15.2

The Plan works through the acquisition of conservation easements on existing farmlands in the Plan area, some of which are within existing designated critical habitat for some of the federally listed species covered by the plan. The Act imposes only a prohibition against removal of listed endangered plant species from areas under federal jurisdiction. Some have claimed in previous litigation that areas protected by the Clean Water Act are within the Endangered Species Act's term "areas under Federal jurisdiction." 16 U.S.C. § 1538(a)(2)(B). The Plan Proponents and the Service should disclose the Service's position on whether conservation easements acquired to provide incidental take protection under the Act are "under Federal jurisdiction" for purposes of whether the removal prohibition for endangered plants will then apply to farms whose owners sell conservation easements. 15.3

The Plan does not appear to permit any incidental take from ongoing farming and other activities, and appears to provide no explanation for this omission. Subsequent iterations of the draft should address this oversight and consideration should be given for providing such protection. This is especially true given that the basic mechanism of the plan is to use development fees to buy conservation easements that will lock in current land uses and operations, seemingly without Incidental Take Protection for most if not all of those land uses. 15.4

The Plan does not appear to yield any benefits for property owners whose land is currently designated as critical habitat. Have the plan proponents addressed this issue with the Service, and if not, then why not? What is the benefit of the Plan to anyone not seeking a development permit or engaging in a covered project if the Plan will not result in meaningful reform of existing critical habitat? 15.5

The Plan documents appear to state that projects which require discretionary approvals from the County or the Cities of Galt and Rancho Cordova, are not necessarily provided incidental take permission as the result of the Plan. The Plan Proponents should explain why this is so, and what the benefit of the Plan actually is to anyone within the Plan area other than the proponents of those projects specifically listed as covered actions under the Plan. If the Service is not even bound to the illusory "no surprises" commitment of an HCP as to these project proponents, then there seems 15.6

to be little if any value to the Plan for anyone but the proponents of the specifically listed public projects. 15.6 cont'd

Have the Plan Proponents advised the public or covered project proponents that the Ninth Circuit has held the "no surprises assurances" of an HCP to be non-binding on the Service? *See Bear Valley Mut. Water Co. v. Jewell*, 790 F.3d 977 (9th Cir. 2015). If the no surprises assurance is the primary benefit of the Plan, how will the Proponents ensure that Service keeps its end of the commitment? Conversely, have the Plan Proponents considered or discussed with the Service any changed circumstances provisions for the Plan that would relieve either the Plan Proponents or individual project proponents of the Plan's obligations if the Service exercises its current legal authority to impose new requirements in excess of the Plan? Will project proponents have any recourse against the Plan Proponents if the Service does not honor the Plan? 15.7

The Plan appears to impose a suite of potential land use restrictions (*i.e.* for protection of streams and other environmental resources outside of the Plan's proposed Preserve system) that may be imposed on existing, conforming, and vested land uses, in potential violation of the Due Process Clause of the United States Constitution. Under the Fifth Amendment's Due Process Clause, vested conforming land uses cannot be restricted without compliance with the land owners' right to fair notice and an adjudicatory hearing. Interference with existing conforming uses may also result in the obligation to pay just compensation under the same Amendment's Takings Clause. 15.8

The Plan imposes development fees without clearly disclosing the relationship between the fees and those species for whose habitat the fees will be spent. While the Nexus Study (not locatable on the website) referenced in the economic analysis may address this issue, the available plan documents do not appear to make any detailed allocation of fees based on which species any given project would impact. Thus, it appears that a general per acre fee is being imposed, which is then used to acquire habitat protections for more than 2 dozen species, regardless of which species (or their habitat) is actually impacted by the project on which the uniform fee is charged. For example, if a project has elderberry beetle impacts but no vernal pool species impacts, is the project still charged the full development fee? If this is the case, then at least some portion of the fee lacks an essential nexus with the project, and violates *Nollan v. Cal. Coastal Comm'n*, 483 U.S. 825 (1987). Further, the development fee also appears to violate *Dolan v. City of Tigard*'s requirement of an individualized (*i.e.*, project by project) assessment of whether the fee is roughly proportional to the project's impacts. 512 U.S. 374 (1994). The Plan proponents should also recall that they will bear the burden in court of demonstrating both the essential nexus and rough proportionality required by *Nollan* and *Dolan*. 15.9

Thank you for the opportunity to submit these comments. If you have any questions, please feel free to contact Anthony L. Francois at Pacific Legal Foundation, at TFrancois@pacificlegal.org or (916) 419-7111.

Sincerely,

Email: TFrancois@pacificlegal.org

RTC 15.1 (SSHCP) – The Plan is a streamlined process for complying not only with the federal ESA, but also CESA, CEQA, and NEPA. As the EIS/EIR describes, the SSHCP has been designed to complement and help implement the goals and polices of, among other local regulatory structures, the Sacramento County General Plan (Draft EIS/EIR, page 4-45). The Joint Powers Authority (JPA) formed in connection with the Plan is part of a cooperative organizational structure for implementing the SSHCP. As analyzed in the EIS/EIR, the Plan does not limit member agencies' land use authority. Land use decisions are made through the local planning processes of the Land Use Authority Permittees. The JPA will not have the authority to prevent a Permittee from approving a discretionary project. The JPA will provide the primary policy direction for implementing the SSHCP, for public participation in the decision-making process, and staff assistance to help Permittees with Plan compliance. As a result, implementation of the Plan will have no impact upon existing, conforming, or vested land uses.

Moreover, as explained in response to Comment 5.12, by its very nature, habitat conservation planning usually requires a regional solution. Only by accruing financial resources, such as impact fees on a regional-wide basis and utilizing these monies to purchase those critical sites throughout the region that are best suited (or most appropriately priced) for habitat purposes can the region's endangered species be best protected with the limited funding sources available.

Additionally, for the reasons set forth in responses to Comments 5.2 through 5.10, the fees associated with implementing the SSHCP do not amount to an unconstitutional tax.

Please also see response to Comment 15.2.

RTC 15.2 (SSHCP) – The comment notes that VELB was proposed for delisting. However, it is not appropriate to address the listing/delisting process under 16 U.S.C. 1533 within the scope of the SSHCP and its supporting documents. As noted in the USFWS and NOAA Fisheries' *Habitat Conservation Planning and Incidental Take Permit Processing Handbook*, "The Service requires applicants to include as HCP covered species all ESA-listed wildlife species for which incidental take is reasonably certain to occur, unless take is addressed through a separate ESA mechanism (e.g., section 7 consultation with another Federal agency, separate incidental take permit, etc.), or to explain or demonstrate in the HCP why take is not anticipated or will be avoided during implementation of covered activities (e.g., inclusion of measures that will avoid potential for take)" (USFWS and NOAA Fisheries 2016, page 7-2).

There are also important advantages to implementing the provisions of Section 10 of the ESA in a manner that encourages the development of plans that benefit a variety of species, including both listed and other rare and vulnerable unlisted species within a selected habitat area. As explained in the USFWS and NOAA Fisheries' *Habitat Conservation Planning and Incidental Take Permit Processing Handbook*, multispecies planning can increase the biological value of HCPs by providing early, proactive consideration of the needs of both listed and unlisted species (USFWS and NOAA Fisheries 2016, page 1-2). HCPs are often used to address threats to many species

before a listing is needed and the other provisions of the ESA take effect (USFWS and NOAA Fisheries 2016).

RTC 15.3 (SSHCP) – The commenter is correct that all lands acquired for the SSHCP Preserve System will require the recordation of a conservation easement, even lands that are held in fee title by the Implementing Entity (Draft SSHCP, Section 9.4.3). Within the UDA, most of the SSHCP Preserve System is expected to be held in fee title by the Implementing Entity. Outside the UDA, the Implementing Entity intends to minimize the amount of fee title acquisition for the SSHCP Preserve System. Therefore, most of the SSHCP Preserve System outside the UDA will be in the form of conservation easements where the land is not owned by the Implementing Entity.

Importantly, the terms of the easements and prices paid for easements will vary depending on the purpose of the easement and the degree to which the easement restricts land uses (Draft SSHCP, Section 9.4.3). The Implementing Entity, as opposed to the USFWS, will hold in perpetuity all conservation easements it purchases or accepts from a landowner. In addition, all conservation easements will have a third-party enforcement beneficiary (CDFW and/or USFWS). Conservation easements will contain provisions that allow the Implementing Entity to manage the encumbered property if it becomes necessary, such as if a property is abandoned by the owner.

With regard to 16 U.S.C. 1538 a (2)(B), USFWS' current policy is explained in the USFWS and NOAA Fisheries' *Habitat Conservation Planning and Incidental Take Permit Processing Handbook*, which states the ESA "prohibits damage or destruction of plants listed as endangered on Federal property or on non-Federal lands when doing so in knowing violation of any State law or regulation, or in the course of any violation of State criminal trespass law" (USFWS and NOAA Fisheries 2016, page 1-8).

RTC 15.4 (SSHCP) – See response to Comment 14.19.

RTC 15.5 (SSHCP) – The SSHCP provides a process under which the Permittees and third parties receiving incidental take authorization can fully comply with the federal ESA requirements for species covered in the Plan. The ITP itself does not address designated Critical Habitat. Designated Critical Habitat is addressed through the federal action of issuing the ITP by the intra-service Section 7 consultation. Prior to issuance of the ITP, the USFWS will conduct an intra-service Section 7 consultation to determine how the SSHCP will affect the designated Critical Habitat in the Plan Area. To issue an ITP, the USFWS must ensure that SSHCP proposed activities would not destroy or adversely modify species' designated Critical Habitat (range-wide), meaning that the designated Critical Habitat would no longer remain functional to service its intended recovery role. (Draft SSHCP, p. 6-3.) It is possible for the USFWS to permit an HCP that authorizes land use or development activities within an area designated as Critical Habitat, provided the HCP proposed activities will not appreciably diminish the capability of the designated Critical Habitat to fulfill its intended role in the recovery of listed species.

This comment also contains the commenter's opinions as to why the Plan may not be beneficial. The Plan will benefit any party that seeks take authorization. The key benefit to future development within the boundary of the Plan, including in areas already designated as Critical Habitat, is the availability of assurances to SSHCP participants about the level of mitigation that will be expected over the life of the Plan. In other words, the SSHCP permittees are provided with long-term assurances, through the No Surprises Rule, that the terms of the Plan will be adhered to and that no further mitigation requirements will be imposed.

RTC 15.6 (SSHCP) – The commenter is incorrect (see Draft SSHCP Section 9.2.1). The three Land Use Authority Permittees are the County of Sacramento, City of Galt, and City of Rancho Cordova. Upon issuance of the SSHCP and Section 2081 permit by the Wildlife Permitting Agencies, the Plan Permittees will be issued federal ESA and CESA permits for incidental take of Covered Species (Draft SSHCP Section 9.2.1). The benefit of such an approach is that these entities are able to retain their land use authority, while also ensuring that the Plan is appropriately implemented.

For Covered Activities conducted by a Land Use Authority Permittee, the Land Use Authority Permittee will be responsible for ensuring that the Covered Activity conforms to the requirements of the SSHCP and the ITPs, following the process for using take authorization, as described in SSHCP Chapter 10, SSHCP Permit Application Process.

The Land Use Authority Permittee will be responsible for determining when a Covered Activity that occurs within its jurisdiction, including one of its own projects, is eligible to use the SSHCP. If the Land Use Authority Permittee determines that a Covered Activity is eligible to use the SSHCP, the Land Use Authority Permittee can extend incidental take coverage provided by the Plan's ESA and CESA ITPs to the Covered Activity within its jurisdiction.

RTC 15.7 (SSHCP) – This comment contains the commenter's characterization of the Ninth Circuit Court of Appeals' decision in Bear Valley Mutual Water Company v. Jewel (9th Cir. 2015) 790 F.3d 977. As explained by the court in that opinion, "[t]he 'No Surprises Rule' provides that once a permit has been issued pursuant to a habitat conservation plan, and assuming that the terms of the underlying plan are being implemented, the permittee 'may remain secure regarding the agreed upon cost of conservation and mitigation.' [Citations omitted]. In other words, the [USFWS] may not require permittees to pay for additional conservation and mitigation measures absent 'unforeseen circumstances.'" (Id. at 992 [citations omitted].) The court did not hold that the No Surprises Rule was not binding on the USFWS, as the critical habitat designation at issue in that case did not contain additional measures beyond those covered by the relevant HCP. Thus, the County respectfully disagrees with the commenter's characterization of the Ninth Circuit's decision.

RTC 15.8 (SSHCP) – As stated in response to comment 15.1, the HCP does not subject existing land owners to new regulatory restrictions. The Plan is a streamlined process for complying with the mandates of ESA, CESA, CEQA, and NEPA. As the

EIR/EIS describes, the SSHCP has been designed to complement and help implement the goals and polices of, among other local regulatory structures, the Sacramento County General Plan. (Draft EIS/EIR page 4-45.) As a result, implementation of the plan will have no impact upon existing, conforming, or vested land uses.

RTC 15.9 (SSHCP) – The County has provided ample evidence demonstrating that the requirements under Dolan v. City of Tigard (1994) 512 U.S. 374, and Nollan v. California Coastal Commission (1987) 483 U.S. 825, have been met. The Mitigation Fee Act was enacted in large part as a response to Nollan, and requires various findings to demonstrate a nexus between the mitigation fee and the impact of the particular development, as well as proportionality of the mitigation fee to the impact. As explained in detail in response to Comments 14.2 through 14.4, the County has provided evidence demonstrating that both of these nexuses have been met. No taking occurs where the fees are related both in nature and extend to the impact of the proposed development (Dolan, 512 U.S. at 390).

Subject: Draft Environmental Impact Statement and Draft Environmental Impact Report for the South Sacramento Habitat Conservation Plan

Dear Ms. Biner:

Sacramento Regional County Sanitation District (Regional San) has the following comments regarding the subject document:

- Fig 1-2: Regional San has preserved 205 acres in the southwest portion of the Bufferlands through a conservation easement with Sac Valley Conservancy. 16.1
- Figures 2-1, 2-2, and 2-3: Label the portion of PPU-4 east of Grant Line Road. 16.2
- 2.3.5 Page 2-120, PPU 4: The majority of PPU 4 is comprised of the Regional San property including the Bufferlands surrounding the Sacramento Regional Wastewater Treatment Plant (SRWTP). Fig 2-2 and the textual description envisions PPU 4 including approximately 530 acres of preserves consisting primarily of Valley Grasslands. Regional San desires to utilize its Bufferlands to participate in the SSHCP and has currently identified 59 acres of riparian forest habitat and 25 acres of non-vernal pool wetland to support the SSHCP Jumpstart program. Regional San has further identified a variety of habitat types on the Bufferlands that are not currently protected in perpetuity. Regional San believes that this acreage could be used as preserve for the SSHCP, but must not allow this use to impact the operations and maintenance of the SRWTP. A conservation easement on District property should not preclude the District's ability to temporarily disturb the subject property with maintenance and construction activity (i.e. underground utility maintenance, repair, and installation) that does not permanently alter the habitat protected by the easement. Minor permanent impacts (i.e. manholes, blow off valves, utility poles, etc.) should also be permissible in the conservation easement area so long as the impact does not significantly alter the protected habitat. To ensure compatibility with Plant operations, any future encumbrance of Regional San property for the SSHCP will be subject to approval by the Regional San Board of Directors. 16.3 16.4

SSHCP Draft EIS/Draft EIR Comment Letter
Page 2

- 2.4.5: The preserved acreage in PPU 4 depicted in Figure 2-3 does not match the text description of PPU 4 on page 2-138 (747 acres versus 530 acres). The HCP identified PPU 4 to be comprised of 445 acres of valley grassland, 34 acres of wetland waters, 6 acres of non-wetland waters, and 42 acres of riparian (527 total acres). If the acreage is increased under this alternative, please explain the rationale. 16.5
- 3.7.1.4: Define Sacramento Regional County Sanitation District as Regional San. The listed acreage for the Bufferlands of 2,650 has been cited in many planning documents but is not consistent with Regional San's current key statistics which describes the Bufferlands as 2,150 acres. 16.6
- 3.7.2.7: The assumption that the Stone Lakes National Wildlife Refuge (SLNWR) will have preserved its entire 18,000 acre project boundary area within 50 years should be checked with the refuge and appropriately cited. 16.7
- Fig. 6-2: While at one time enrolled in the Williamson Act, the parcels in the southern portion of the Regional San Bufferlands have been removed from the Williamson Act. The effort to remove these parcels occurred in 2016. 16.8
- 7.1.2.1: The Regional San South County Ag Recycled Water Project will have a significant effect on ground water in the Central Basin and warrants discussion within Ground Water Hydrology section. 16.9

  7.1.2.3: Change "Beech Lake" to "Beach Lake". 16.10
- 8.1.1: The NCCP is directed by the California Department of Fish and Wildlife. 16.11
- 8.1.2.4: Change "Sacramento Regional Sanitation District Buffer Lands" to "Regional San Bufferlands". 16.12
- 8.1.2.5: Change "Nicholas" to "Nicolaus". 16.13
- Table 12.1: SLNWR is listed as 18,000 of existing preserve. The footnote should more accurately qualify this as acreage within the project boundary. Chapter 3 denotes 6,420 acres of land within the refuge as currently preserved. 16.14
- 12.1.1: This section does not present any regulatory information related to the provision of recycled water. Construction, operation, and maintenance of recycled water infrastructure is a covered activity in the SSHCP document and should be covered in the EIS/EIR. 16.15
- 12.1.1.4, page 12-6: A portion of the information in this section is outdated and should be revised to reflect the following:
  - The Sacramento Regional Wastewater Treatment Plant Master Plan 2020 has been superseded by the Regional San EchoWater Project. As a result of permit requirements adopted by the Central Valley Regional Water Quality Control Board (CVRWQCB) in 2010, as amended by orders of the CVRWQCB and the State Water Resources Control Board (SWRCB) in 2011, 2012, 2013, and 2014, the District is required to reduce total nitrogen and ammonia levels in its effluent substantially below existing concentrations. Biological nutrient removal (BNR) is under construction to meet ammonia and nitrate effluent limitations. The District is also required to install tertiary filtration treatment for pathogen removal. Full compliance with the adopted and amended permit is required by 16.16

May 2021 for ammonia and nitrate removal and May 2023 for filtration-related requirements. 16.16 cont'd

- The Interceptor System Master Plan 2000 has been superseded by the Regional San Interceptor Sequencing Study (ISS). The Interceptor Sequencing Study (ISS) was prepared to determine Regional San's long term needs to provide sanitary sewer service to a growing Sacramento region. The ISS evaluated proposed interceptor facilities identified in Regional San's previous planning document, the SRCSD Interceptor System Master Plan 2000, to determine if there were other alternatives including delaying, realigning, or eliminating proposed interceptors. The ISS performed the following six tasks; 1) re-evaluated planning area growth predictions, 2) identified alternative flow generation criteria based on projected population densities and anticipated future flow per household, 3) developed additional modeling capabilities to evaluate conservative and realistic flow conditions, 4) prepared multiple interceptor sewer service alternatives, 5) evaluated recycled water alternatives including satellite treatment and scalping facilities, 6) prepared a cost analysis for the top interceptor alternatives. 16.17

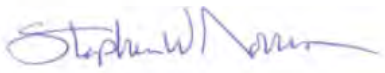
  The ISS provides a high level evaluation of interceptor alternatives and identifies interceptor alignment corridors as well as anticipated capacity needs and interceptor pipe sizes. Proposed projects will be further evaluated through the District's asset management program and must be approved by the Project Authorization Committee before requesting approval from the Regional San Board of Directors to begin environmental review and project implementation. The Regional San Board of Directors adopted the ISS in February 2013. The ISS is located on the Regional San website at http://www.regionalsan.com/ISS.

- 12.1.2.3: Regional San currently owns and operates a 5-mgd Water Reclamation Facility (WRF) that has been producing Title 22 tertiary recycled since 2003. The WRF is located within the SRWTP property in Elk Grove. Regional San uses a portion of the recycled water at the SRWTP and the rest is wholesaled to the Sacramento County Water Agency (SCWA). SCWA retails the recycled water, primarily for landscape irrigation use, to select customers in the City of Elk Grove. Regional San is not a water purveyor and any potential use of recycled water in the project area must be coordinated between the key stakeholders, e.g. land use jurisdictions, water purveyors, users, and the recycled water producers. 16.18

- 12.1.2.4, page 12-18: Information in this section is outdated and should be revised to reflect the following:

  - The Sacramento Regional Wastewater Treatment Plant Master Plan 2020 has been superseded by the Regional San EchoWater Project. The SRWTP provides secondary treatment using an activated sludge process. The design of the SRWTP and interceptor system was balanced to have SRWTP facilities accommodate some of the wet weather flows while minimizing idle SRWTP facilities during dry weather. Regional San designed the SRWTP to accommodate some wet weather flows with the storage basins and interceptors designed to accommodate the remaining wet weather flows. 16.19

    The Central Valley Regional Water Quality Control Board (Water Board) issued an NPDES Discharge Permit to Regional San in December 2010. In adopting the new Discharge Permit, the Water Board required Regional San to meet significantly more



restrictive treatment levels over its current levels. Regional San began the necessary activities, studies, and projects to meet the permit conditions in August of 2014. Regional San must complete construction of the new treatment facilities to achieve the permit and settlement requirements by May 2021 for ammonia and nitrate and May 2023 to meet these pathogen requirements. 16.19 cont'd

- The SASD Sewerage Facilities Expansion Master Plan and 2008 SASD Sewerage Facilities Expansion Master Plan Update have been superseded by the 2010 SASD System Capacity Plan Update. Please remove any references to the superseded master plans. 16.20

- 12.2.2.2, page 12-34, 3rd bullet: Regional San was in litigation with the CVRWQCB and the SWRCB over aspects of the NPDES permit that result in the need for tertiary filters. On August 8, 2014, CVRWQCB adopted an order that modified the permit filtration-related requirements and the litigation was dismissed and resolved. The permitted capacity of the SRWTP was not required to be increased and remains at 181 mgd. 16.21
- 12.2.3.2: The Proposed Action/Proposed Project Alternative Covered Activities also include construction, maintenance, and operation of recycled water activities. 16.22
- 12.2.3.2, 3rd paragraph: Reference to 2020 SRWTP Master Plan should be removed. The Regional San ISS and EchoWater Project would guide the extension of new wastewater facilities. The SCWA Water Supply Master Plans would guide new water facilities. 16.23
- 12.2.4.2, 2nd paragraph: Reference to 2020 SRWTP Master Plan should be removed. The Regional San ISS and EchoWater Project would guide the extension of new wastewater facilities. The SCWA Water Supply Master Plans would guide new water facilities. 16.24

If you have any questions or require additional information, please contact me at (916) 876-6053 or norriss@sacsewer.com.

Sincerely,

Stephen Norris
Senior Civil Engineer

RTC 16.1 (EIS/EIR) – Comment noted. However, because the referenced conservation easement was not recorded until 2016, it is not part of the baseline used for analysis in the EIS/EIR. That baseline was set at issuance of the Notice of Preparation for the EIS/EIR in 2014. Nonetheless, a note has been added to Figure 1-2 that references the 205 acres of additional existing preservation in PPU 4.

RTC 16.2 (EIS/EIR) – Figures 2-1, 2-2, and 2-3 have been revised to show that the small areas east of Grant Line Road are part of PPU 4.

RTC 16.3 (EIS/EIR) – Comment noted. The Implementing Entity will ensure that the referenced property is considered for early enrollment in the Preserve System, provided it meets the necessary criteria.

RTC 16.4 – (SSHCP and EIS/EIR) – It is possible that all or a portion of the referenced property could be enrolled as preserve in the SSHCP Preserve System. However, the activities described in the comment are not covered activities in preserves. Therefore, if the property is enrolled in the future Preserve System the boundaries may exclude the locations that Regional San needs to disturb for maintenance and construction. Each Conservation Easement would be negotiated independently and may include conditions or allowances that would not be in place on another preserve property.

RTC 16.5 (EIS/EIR) – The acreage shown on Figure 2-3 in the Draft EIS/EIR was in error. The value for PPU 4 has been corrected to 520 acres in the Final EIS/EIR, consistent with the text description of PPU 4 preserves in the Draft EIS/EIR.

RTC 16.6 (EIS/EIR) – The referenced text in Section 3.7.1.4 has been edited as shown below in the Final EIS/EIR:

> In addition, the ~~2,650~~**2,150** acres of preserved lands at the ~~Sacramento Regional County Sanitation District~~ **Regional San** Bufferlands, located in the western part of the UDA, have “termed” conservation easements, meaning those acres are currently preserved, but might not be preserved in perpetuity.

RTC 16.7 (EIS/EIR) – Comment noted. The EIS/EIR preparers were unable to get confirmation from Stone Lakes NWR on the feasibility of acquiring the remaining acreage to complete the approved NWR boundaries. Therefore, Section 3.7.2.7 of the Draft EIS/EIR assumed that Stone Lakes NWR would enroll properties at the same rate that it has since its creation. Since the adoption of the approximately 18,000-acre refuge boundary in 1992, Stone Lakes NWR has enrolled 6,550 acres. That amounts to an average rate of acquisition of 262 acres per year. Extending that same rate of acquisition over the proposed 50-year permit term of the SSHCP, Stone Lakes NWR would acquire an additional 13,100 acres. That amount would more than complete the approximately 18,000-acre approved refuge boundary. These assumptions have been added to the text in Section 3.7.2.7 with the following text:

> **The Draft EIS/EIR assumes that Stone Lakes NWR would enroll properties at the same rate that it has since its creation. Since the adoption of the approximately 18,000-acre refuge boundary in 1992, Stone Lakes NWR has**

enrolled 6,550 acres. That amounts to an average rate of acquisition of 262 acres per year. Extending that same rate of acquisition over the proposed 50-year permit term of the SSHCP, Stone Lakes NWR would acquire an additional 13,100 acres. That amount would more than complete the approximately 18,000-acre approved refuge boundary.

RTC 16.8 (EIS/EIR) – Comment noted. However, the existing conditions evaluated in the EIS/EIR were based on the date of the NOP issuance, which was 2014. Nonetheless, the removal of the subject parcels from Williamson Act contract has been noted and would be included in the SSHCP data repository.

RTC 16.9 (EIS/EIR) – Construction, operation, and maintenance of recycled water pipelines is an SSHCP Covered Activity. The adverse and beneficial effects of the South County Ag Program were analyzed in the Draft EIS/EIR for the EIS/EIR action alternatives that are described in EIS/EIR Chapter 2 (as well as in the No Action Alternative).

As described in the No Action Alternative in EIS/EIR Chapter 2, the South County Ag Program would have a beneficial effect on groundwater relative to the existing conditions. We commend Regional San for taking action to improve groundwater conditions in South Sacramento County, and therefore, much of the SSHCP Plan Area. The analysis in Section 7.2.2.1 of the Final EIS/EIR has been revised to include the potential beneficial effects of the South County Ag Program to groundwater supplies.

RTC 16.10 (EIS/EIR) – The requested correction has been made in Section 7.1.2.3 of the Final EIS/EIR:

> The north (largest) UDA portion of the Planning Area is primarily located within the Morrison Creek Watershed, which drains west through the City Elk Grove to ~~Beech~~ **Beach** Lake and the Sacramento River.

RTC 16.11 (EIS/EIR) – The requested correction has been made in Section 8.1.1 of the Final EIS/EIR:

> The Natural Communities Conservation Planning (NCCP) Act was established by the California Legislature, is directed by the Department of Fish and ~~Game~~ **Wildlife**, and is being implemented by the state, and public and private partnerships to protect habitat in California.

RTC 16.12 (EIS/EIR) – The requested correction has been made in Section 8.1.2.4 of the Final EIS/EIR:

Within the Planning Area, the existing wetland and riparian natural land covers on the Stone Lakes National Wildlife Refuge, the existing Cosumnes River Preserve, and the ~~Sacramento Regional Sanitation District Buffer Lands~~ **Regional San Bufferlands** provide foraging and sheltering habitats for migratory water birds using the Pacific Flyway.

RTC 16.13 (EIS/EIR) – The requested correction has been made in Section 8.1.2.4 of the Final EIS/EIR:

> Known locations of nest and nursery sites from the California Natural Diversity Database (CNDDB) (CDFW 2014b) within the Planning Area consist of: two bank swallow cavity congregations found on the bank of the Cosumnes River near Rancho Murieta; three black-crowned night heron rookeries (at Fishhead Lake and ~~Nicholas~~ **Nicolaus** Pond within the UDA, and along a tributary of Badger Creek outside the UDA); three double-crested cormorant (*Phalacrocorax auritus*) rookeries (one at Stone Lake, and two in the UDA along lower Morrison Creek and at Black Crown Lake); and, four great blue heron (*Ardea herodias*) and great egret (*Ardea alba*) rookeries (North Stone Lake, along the North Fork of Badger Creek, along lower Morrison Creek in the UDA, and along the Cosumnes River near Rancho Murieta).

RTC 16.14 (EIS/EIR) – A new table note has been added to Final EIS/EIR Table 12-1 that reads as follows:

> **[c] Stone Lakes NWR has an approved boundary of approximately 18,000 acres within the planning area. At the time of EIS/EIR preparation, approximately 6,420 acres within that boundary have been acquired for the NWR.**

In addition, table note references have been added to “Stone Lakes National Wildlife Refuge” in Final EIS/EIR Table 12-1.

RTC 16.15 (EIS/EIR) – The comment is correct that construction, operation, and maintenance of recycled water pipelines is an SSHCP Covered Activity and was analyzed in the Draft EIS/EIR. Information regarding regulation of recycled water has been added to Section 12.1.1.3 of the Final EIS/EIR:

> **California Department of Public Health. Recycled water regulations are administered by both San Francisco Bay RWQCB and the California Department of Public Health (CDPH). The regulations governing recycled water are found in a combination of sources, including the Health and Safety Code, Water Code, and Titles 22 and 17 of the California Code of Regulations (CCR). Issues related to the treatment and distribution of recycled water are generally under the permitting authority of RWQCB, while issues related to use and quality of recycled water are the responsibility of CDPH.**
>
> **Title 22 of the CCR, Division 4, Environmental Health, Chapters 1 through 3 outline California’s health laws related to recycled water. The intent of these regulations is to ensure protection of public health associated with the use of recycled water. The regulations establish acceptable levels of constituents in recycled water for a range of uses and assurance of reliability in the production of recycled water. The SWRCB has jurisdiction over the distribution of recycled wastewater and the enforcement of Title 22**

regulations. Chapter 3, Article 3 of Title 22 indicates that disinfected tertiary recycled water can be used for surface irrigation of food crops (including edible root crops, where the recycled water comes into contact with the edible portion of the crop), parks and playgrounds, school yards, residential landscaping, and unrestricted-access golf courses. Orchards and vineyards where the recycled water does not come into contact with the edible portion of the crop must be treated at least to undisinfected secondary level for surface irrigation (CCR Section 60304).

RTC 16.16 (EIS/EIR) – The referenced text in Section 12.1.1.4 of the Draft EIS/EIR has been updated in the Final EIS/EIR as follows:

~~Sacramento Regional Wastewater Treatment Plant Master Plan 2020.~~ ~~The *Sacramento Regional Wastewater Treatment Plant Master Plan 2020* (2020 SRWTP Master Plan; Regional San 2008) identifies wastewater treatment facility needs for a 20-year planning period through the year 2020. The 2020 SRWTP Master Plan provides a phased program of recommended facilities to accommodate planned growth while at the same time maintaining treatment reliability, meeting future regulatory requirements, and optimizing costs. To meet this goal, the 2020 SRWTP Master Plan integrates overall strategies for wastewater treatment, effluent management, and biosolids disposal into an effective wastewater treatment management program. The 2020 SRWTP Master Plan proposes that treatment facility expansion occur in stages or phases as the sewage generated by the population increases (Regional San 2008).~~

Sacramento Regional County Sanitation District EchoWater Project. As a result of permit requirements adopted by the Central Valley RWQCB in 2010, as amended by orders of the Central Valley RWQCB and the SWRCB in 2011, 2012, 2013, and 2014, Sacramento Regional County Sanitation District (Regional San) is required to reduce total nitrogen and ammonia levels in its effluent substantially below existing concentrations. Biological nutrient removal is in progress to meet ammonia and nitrate effluent limitations. Regional San is also required to install tertiary filtration treatment for pathogen removal. Full compliance with the adopted and amended permit is required by May 2021 for ammonia and nitrate removal and May 2023 for filtration-related requirements.

RTC 16.17 (EIS/EIR) – The referenced text in Section 12.1.1.4 of the Draft EIS/EIR has been updated in the Final EIS/EIR as follows:

~~Interceptor System Master Plan 2000.~~ ~~The *Interceptor System Master Plan 2000* (Interceptor System Master Plan; Regional San 2000) identifies existing and future capacity needs in the regional interceptor system and provide a strategic approach to plan for near-term and long-term improvements needed for the regional wastewater conveyance system. The Interceptor System Master Plan updates and refines regional conveyance facilities, service area, growth projections, and the existing system's response to rainfall; provides dynamic modeling; estimates the~~

~~cost of facilities; identifies right-of-way acquisition needs; and identifies near- and long-term improvements required for regional wastewater conveyance. The Interceptor System Master Plan uses land use and population projections based on the Sacramento Area Council of Governments Blueprint criteria and the land use plans of the member jurisdictions. The Interceptor System Master Plan also provides wastewater flow estimates, information on hydraulic modeling, and interceptor design criteria, and identifies conveyance systems and policies to accommodate planned growth (Regional San 2000).~~

Regional San Interceptor Sequencing Study (ISS). The Interceptor Sequencing Study (ISS) was prepared to determine Regional San's long term needs to provide sanitary sewer service to a growing Sacramento region. The ISS evaluated proposed interceptor facilities identified in Regional San's previous planning document, the SRCSD Interceptor System Master Plan 2000, to determine if there were other alternatives including delaying, realigning, or eliminating proposed interceptors. The ISS performed the following six tasks; 1) re-evaluated planning area growth predictions, 2) identified alternative flow generation criteria based on projected population densities and anticipated future flow per household, 3) developed additional modeling capabilities to evaluate conservative and realistic flow conditions, 4) prepared multiple interceptor sewer service alternatives, 5) evaluated recycled water alternatives including satellite treatment and scalping facilities, 6) prepared a cost analysis for the top interceptor alternatives.

The ISS provides a high level evaluation of interceptor alternatives and identifies interceptor alignment corridors as well as anticipated capacity needs and interceptor pipe sizes. Proposed projects will be further evaluated through the District's asset management program and must be approved by the Project Authorization Committee before requesting approval from the Regional San Board of Directors to begin environmental review and project implementation. The Regional San Board of Directors adopted the ISS in February 2013.

RTC 16.18 (EIS/EIR) – The following text has been added to Section 12.1.2.3 of the Final EIS/EIR:

Regional San currently owns and operates a 5 mgd Water Reclamation Facility (WRF) that has been producing Title 22 tertiary recycled since 2003. The WRF is located within the SRWTP property in Elk Grove. Regional San uses a portion of the recycled water at the SRWTP and the rest is wholesaled to the Sacramento County Water Agency (SCWA). SCWA retails the recycled water, primarily for landscape irrigation use, to select customers in the City of Elk Grove outside the Planning Area. Regional San is not a water purveyor and any potential use of recycled water in the project area must be coordinated between the key stakeholders, e.g. land use jurisdictions, water purveyors, users, and the recycled water producers.

RTC 16.19 (EIS/EIR) – The referenced text in Section 12.1.2.4 of the Draft EIS/EIR has been updated in the Final EIS/EIR as follows:

> Regional San operates the SRWTP. **The SRWTP provides secondary treatment using an activated sludge process. The design of the SRWTP and interceptor system was balanced to have SRWTP facilities accommodate some of the wet weather flows while minimizing idle SRWTP facilities during dry weather. Regional San designed the SRWTP to accommodate some wet weather flows with the storage basins and interceptors designed to accommodate the remaining wet weather flows. The SRWTP is located in the westernmost portion of the Planning Area, just south of the community of Freeport.**
>
> **The Central Valley Regional Water Quality Control Board RWQCB issued an NPDES Discharge Permit to Regional San in December 2010. In adopting the new Discharge Permit, the RWQCB required Regional San to meet significantly more restrictive treatment levels over its current levels. Regional San began the necessary activities, studies, and projects to meet the permit conditions in August of 2014. Regional San must complete construction of the new treatment facilities to achieve the permit and settlement requirements by May 2021 for ammonia and nitrate and May 2023 to meet these pathogen requirements.**
>
> ~~The SRWTP is a high-purity oxygen-activated sludge facility; it is permitted to treat an average dry weather flow of 181 million gallons per day (mgd) and a daily peak wet weather flow of 392 mgd (Sacramento County 2010). The majority of the treated wastewater is dechlorinated and discharged into the Sacramento River. The SRWTP is located in the westernmost portion of the Planning Area, just south of the community of Freeport.~~ The main SASD collection system includes over 2,800 miles of sewer pipelines ranging in size from 4 to 75 inches in diameter. Regional San interceptors are a large system of pipes up to 10 feet in diameter, which carry wastewater directly to the SRWTP (Sacramento County 2010).
>
> ~~Regional San adopted the 2020 SRWTP Master Plan to identify wastewater treatment and facility needs. The Master Plan identifies treatment facilities, conveyance, and storage facilities necessary to serve anticipated population growth within the Sacramento metropolitan area and meet regulatory requirements related to discharge quality (Regional San 2008).~~ Regional San has also adopted the Interceptor Master Plan 2000, which specifies regional conveyance facility improvements (Regional San 2000) **that were further investigated in the Regional San Interceptor Sequencing Study (ISS) adopted in 2013.**

RTC 16.20 (EIS/EIR) – The referenced text in Section 12.1.2.4 of the Draft EIS/EIR has been updated in the Final EIS/EIR as follows:

> ~~In October 2008, SASD adopted the Sewerage Facilities Expansion Master Plan Update (SASD 2008), which operates as a companion document to the SASD's Sewerage Facilities Expansion Master Plan (SASD 2004).~~ **The 2010 SASD System Capacity Plan Update (SASD 2010) also contains** ~~I~~**i**mprovements ~~are~~

~~proposed in these documents~~ to meet the demand of development anticipated within the USB (Sacramento County 2011).

RTC 16.21 (EIS/EIR) – The referenced text in Section 12.2.2.2 of the Draft EIS/EIR has been updated in the Final EIS/EIR as follows:

- The increase in demand for sewer treatment would result in significant unavoidable impacts because flows would exceed permitted capacity even with policy compliance (Sacramento County 2010, pp. 5-12 to 5-22). **At this time there are no plans to expand the capacity of Regional San facilities beyond the existing permitted capacity, so this impact would remain significant and unavoidable.** ~~However, this finding was based on pending litigation at the time of the Sacramento General Plan EIR that brought into question the ability of Regional San to expand its wastewater treatment capacity. That litigation was resolved and Regional San is now in the process of constructing a tertiary treatment facility that will expand their permitted capacity to accommodate projected development in the Planning Area. With this new information, the lead agencies expect that the previously identified significant unavoidable impact to sewer treatment would be revised to less than significant~~.

RTC 16.22 (EIS/EIR) – The referenced text in Section 12.2.3.2 of the Draft EIS/EIR has been revised in the Final EIS/EIR as follows:

> The Proposed Action/Proposed Project Alternative Covered Activities include the urban development that are anticipated under the No Action/No Project Alternative, including the construction, maintenance, and operation of water supply**, recycled water,** and wastewater facilities.

RTC 16.23 (EIS/EIR) – The referenced text in Section 12.2.3.2 of the Draft EIS/EIR has been revised in the Final EIS/EIR as follows:

> New ~~water or~~ wastewater facilities could be expanded or extended **within the MCRA under the Proposed Action/Proposed Project Alternative** as envisioned by the ~~2020 SRWTP Master Plan (Regional San 2008)~~ **Regional San ISS and EchoWater Project**. **New water facilities could be expanded or extended as envisioned in the SCWA Water Supply Master Plans.** ~~within the MCRA for the Proposed Action/Proposed Project.~~

RTC 16.24 (EIS/EIR) – The referenced text in Section 12.2.4.2 of the Draft EIS/EIR has been revised in the Final EIS/EIR as follows:

> New ~~water or~~ wastewater facilities could be expanded or extended **within the MCRA under the Reduced Permit Term Alternative** as envisioned by the ~~SRWTP Master Plan 2020 (Regional San 2008)~~ **Regional San ISS and EchoWater Project**~~within the MCRA and would not be adversely affected by the establishment of preserves under the Reduced Permit Term Alternative.~~ **New water facilities could be expanded or extended as envisioned by the SCWA Water Supply Master Plans.**

LETTER 17 SACRAMENTO COUNTY AGRICULTURAL COMMISSIONER (EIS/EIR)

Agricultural Commissioner/
Director of Weights & Measures
Juli D. Jensen, Agricultural Commissioner

County of Sacramento

County Executive
Nav Gill

Assistant County Executive
Nancy Newton

August 31, 2017

Jan C. Knight
Deputy Field Supervisor

Sacramento Fish & Wildlife Office
2800 Cottage Way, Room W-2605
Sacramento, CA 95825

Leighann Moffitt
County of Sacramento
Office of Planning and Environmental Review
827 7th Street, Room 225
Sacramento, CA 95814

RE: Comments on the South Sacramento Habitat Conservation Plan Draft Environmental Impact Statement/ Draft Environmental Impact Report

Dear Ms. Knight and Ms. Moffitt,

The following comment letter is based upon the information contained in the South Sacramento Habitat Conservation Plan (SSHCP) Draft Environmental Impact Statement (DEIS)/Environmental Impact Report (DEIR), dated March 2017. Most of the content in this letter will be referring to Chapter 6 – Agriculture, of the SSHCP DEIS/DEIR, which contains information regarding existing agricultural protections, conditions and potential impacts to agricultural resources and activities within the SSHCP Planning Area. Items mentioned below are areas of the DEIS/DEIR that may need more clarification and/or analysis for a more comprehensive and transparent environmental document.

The California Right to Farm Act (Civil Code Section 3482.5) is an existing agricultural protection.
One of the County's existing protective measures for agriculture is the Sacramento County Code Chapter 14.05, the Right to Farm Ordinance, as described in Chapter 6 [page 6-7]. The DEIS/DEIR fails to mention California's agricultural protection act, California Civil Code Section 3482.5, "The Right to Farm Act". Similar to the County's Code, Civil Code Section 3482.5(a)(1) helps protect agricultural operations, activities, facilities, etc. from nuisance complaints. Unlike the County Code, Civil Code Section 3482.6 (a) has a broader sweep of protections with the intention of shielding agricultural processing activities, operations, and facilities, such as the processing of dairy products, the production of wine, the processing of meat and egg products, the drying of fruits and grains, the packing and cooling of fruits and vegetables, and the processing for wholesale or retail markets of agricultural products. Sacramento has many of these processing facilities and operations among its agricultural resource lands. The State Right to Farm Act prevails over contrary provisions of any city or county ordinance (Civil Code in Sections 3482.5(d) and 3482.6(d)). This act warrants mentioning in the DEIS/DEIR as an existing agricultural protection. 17.1

4137 Branch Center Rd. • Sacramento, California 95827-3823 • phone (916) 875-6603 • fax (916) 875-6150 •
www.agcomm.saccounty.net

The SSHCP Preserve System should be analyzed further, in lieu of existing land conservation policies and existing land conservation programs.

The DEIS/DEIR mentions Rancho Cordova's General Plan Policy LU.1.10 as an existing agricultural protection policy. It states, "The City shall ensure that the following standards are met regarding agricultural conservation easement content: provisions of an accurate legal document that prohibits any activity that substantially impairs or diminishes the agricultural productivity of the land..." How is this policy affected by the Proposed Action/Proposed Project Alternative? The DEIS/DEIR states that approximately 9,642 acres of Cropland and Irrigated Pasture-Grassland would be conserved as part of the SSHCP Preserve System. These conservation easements would limit the types of crops that could be grown, when crops could be harvested, and specific farming activities based on the specific habitat being preserved. On grazing lands, a Preserve Management Plan would determine the specificity of the grazing operation and may limit or restrict historical grazing activities. Some of these restrictions could be in direct conflict with Rancho Cordova's GP Policy LU.1.10 and depending on the agricultural operation, historical use of the land, and other factors, the SSHCP Preserve System could have beneficial impacts to agriculture, no impact to agriculture, or negative impacts to agriculture. The DIES/DEIR states that the establishment of preserves would not prevent farmers/ranchers from using their agricultural land for agricultural purposes and therefore would have a *Minor Beneficial* effect to agriculture resources and activities. Other existing land trust programs and the County's Williamson Act Contract program (supported by Sacramento County General Plan Policy AG-25) currently function as conservation programs and help protect agricultural lands from development pressures. The DEIS/DEIR does not contemplate possible restrictions on agricultural land as a negative impact and should conduct further analysis of this scenario. Sacramento County General Plan Policy AG-14 states, "The County shall initiate intergovernmental agreements with state and federal wildlife management authorities in order to mitigate loss of Prime, Statewide Importance, Unique, and Local Importance farmlands or land with intensive agricultural investment due to natural habitat conversion." If the SSHCP Preserve System converts these important agricultural lands to native habitat, has the DEIS/DEIR contemplated a mitigation measure according to GP Policy AG-14? 17.2 17.3

Current, existing FMMP data should be used in the DEIS/DEIR analysis.

Chapter 6, Section 6.1.2.1 refers to important farmland data from the California Department of Conservation, dated 2014 and refers to it as "current". The analysis should be using 2016 FMMP data, as it is the most current data available. 17.4

The DEIS/DEIR uses the entire SACOG area to determine project impacts to agricultural land. The only agricultural land that will be impacted by the SSHCP project will be those lands within Sacramento County.

Section 6.2.1 explains the methodology used in determining the Project impacts to agriculture. Although the SSHCP encompasses a well-defined area and the area to be used as mitigation for development within the Urban Development Area (UDA) is well defined, the agricultural area being assessed for agricultural impacts includes the entire SACOG region (the counties of Sacramento, Placer, El Dorado, Sutter, Yolo, and Yuba). According to the SSHCP, agricultural lands outside of the SSHCP area, will not be targeted for mitigation purposes. Only those lands, the majority of which are agricultural lands in the southern portion of Sacramento County, will be considered for preservation/conservation easement purposes. By including the entire SACOG region for impact considerations, the impacts to agricultural lands within the SSHCP area will be diluted. 17.5

4137 Branch Center Rd. • Sacramento, California 95827-3823 • phone (916) 875-6003 • fax (916) 875-6150

A more comprehensive analysis of existing Williamson Act contracted lands would enhance the accuracy of the DEIS/DEIR.

One of the Significant Thresholds identified by the DEIS/DEIR, used to evaluate an impact to agriculture, is whether the activity would conflict with an existing Williamson Act Contract [page 6-14]. The DEIS/DEIR states that many of the areas protected under conservation easement or in fee-title preserves would be under a Williamson Act Contract. The DEIS/DEIR needs to conduct further analysis on existing Williamson Act contracted lands. There may be a few contracts that allow open space uses, but the majority of the contracts may state that open space, as defined in California Government Code Section 51201(o) is not a compatible use. Whether or not a Williamson Act Contract would allow open space uses would be relevant information for this analysis, as the SSHCP depends on the use of these lands for mitigation of development within the UDA. 17.6

Avoidance and Minimization Measure (AMM) EDGE-1 may have a negative impact on agricultural lands.

Agricultural lands encumbered by Williamson Act Contracts with intensive agricultural activities may be affected by neighboring preserves by Avoidance and Minimization Measure (AMM) EDGE-1, which would prioritize compatible adjacent uses next to SSHCP Preserves, such as parks, nature trails, roads, or other uses. The DEIS/DEIR states that these uses would not convert or introduce incompatible land uses or conflict with existing Williamson Act contracted land [page 6-23]. This may or may not be the case and would depend on the Williamson Act Contract and the use of the land. The DEIS/DEIR assumes that nature trails, parks, roads, etc. are compatible uses adjacent to agricultural lands, but agricultural activities can be negatively affected by adjacent or nearby parks, nature trails, roads, etc. These uses can limit the use of the agricultural land by restricting normal farming practices, such as the application of pesticides. Sacramento County General Plan Policy AG-23 further supports this concept, "The County seeks to minimize agricultural/trail-user conflicts by recommending and seeking buffer zones between trails and nearby agricultural land..." 17.7

The DEIS/DEIR needs a more comprehensive analysis in regards to the impacts of the SSHCP on Sacramento County's agricultural lands.

Lastly, the DEIS/DEIR concludes that the Proposed Action/Proposed Project Alternative would result in *Minor Beneficial* effects to agriculture when compared to the impacts that would occur under the No Action/No Project Alternative baseline condition. The DEIS/DEIR, bases this statement on a couple of conclusions; one is the implementation of AMM EDGE-1, which, as discussed above could have a negative effect on agricultural operations. It also bases this analysis on a conclusion that the Proposed Action/Proposed Project Alternative would prevent 1,900 acres of agricultural land from being plowed under by new urban development outside of the UDA. How does the SSHCP prevent jurisdictions like the Cities of Elk Grove and Galt from expanding their Sphere of Influence? Does the SSHCP prevent private developers from proposing development outside of the UDA? To make the statement that these two items would result in beneficial effects to agriculture is misleading. It is the opinion of the Agricultural Commissioner's Office that the DEIS/DEIR discussion needs to be more encompassing of all scenarios. Under varying circumstances the SSHCP could have positive effects on agriculture, as it could offer another tool for preserving agricultural lands in perpetuity, especially grazing lands; the SSHCP could have no effect on agriculture, if the Plan's Preserves conserved existing natural habitat in areas buffered from intensive agricultural operations; and the SSHCP could have negative effects on agriculture, by significantly limiting a farmer's ability to make decisions or act in a timely fashion, in regards to their agricultural operation. The Agricultural Commissioner's Office respectfully requests that further, in-depth analysis occurs regarding the environmental impacts of the SSHCP on Sacramento County's agricultural lands, existing agricultural operations and future agricultural opportunities. 17.8 17.9 17.10

RTC 17.1 (EIS/EIR) – The California Right to Farm Act (California Civil Code 3482.5) has been added to the Final EIS/EIR in Section 6.1.1.2.

The following text has been inserted in Final EIS/EIR Section 6.1.1.2 to address Comment 17.1.

> **California Right to Farm Act**
>
> **The "Right to Farm Act" (California Civil Code Sections 3482.5, 3482.6, 3483, and 3484 collectively) is a statewide agricultural protection act. Similar to Sacramento County Code Chapter 14.05 (the Right to Farm Ordinance, discussed below), the Right to Farm Act helps protect agricultural operations, activities, facilities, etc. from nuisance complaints. Unlike the County Code, the Right to Farm Act has a broader sweep of protections with the intention of shielding agricultural processing activities, operations, and facilities, such as the processing of dairy products, the production of wine, the processing of meat and egg products, the drying of fruits and grains, the packing and cooling of fruits and vegetables, and the processing for wholesale and retail markets of agricultural products. The Planning Area has many of these processing facilities and operations. The Right to Farm Act prevails over contrary provisions of any city or county ordinance.**

RTC 17.2 (EIS/EIR) – Comment noted. However, the spirit of Rancho Cordova General Plan Policy LU.1.10 was to ensure that agricultural lands with conservation easements would remain agriculturally productive. As described in the Rancho Cordova General Plan EIR Section 4.2, very little of Rancho Cordova is underlain by soils of high value for row crops or other intensive agriculture. Most of the agricultural activity in Rancho Cordova consists of dry crop farming or grazing. Management of SSHCP agricultural preserves would ensure that agricultural lands could remain in production, while pursuing parallel goals of maximizing habitat value within the constraints of the agricultural operations allowable under the easement. Preserve management plans would be developed with landowners and would be periodically reviewed, which could provide landowners the opportunity to adaptively manage land management activities. The conservation easement for agricultural lands will also make farmers eligible for monetary payments for the purpose of agricultural enhancement (Draft SSHCP, page 9-23, "Agricultural Enhancements on Easements"). Therefore, we do not believe the conservation easements proposed by the SSHCP would "substantially impair or diminish the agricultural productivity of the land…". For grazed grasslands, the SSHCP recognizes that responsible grazing practices, as used by most ranchers in the Plan Area, provide benefits to the covered species and should be allowed to continue on SSHCP Preserves. As part of Preserve establishment, the SSHCP Implementing Entity will collect information from ranchers on the historic and existing grazing practices on the land, and will ensure that beneficial grazing will continue on the subject property in perpetuity.

RTC 17.3 (EIS/EIR) – The SSHCP does not propose conversion of important agricultural lands to native habitat. As stated on page 6-24 of the Draft EIS/EIR, a small

amount of Cropland or Irrigated Pasture-Grassland may be converted to an aquatic resource land cover type from the re-establishment or establishment of Riparian Woodland, Vernal Pools, or Seasonal Wetlands under the Proposed Action/Proposed Project Alternative. Although these changes in land cover type are not considered agricultural conversion under the Sacramento County, Galt, or Rancho Cordova General Plans, under the Proposed Action/Proposed Project Alternative, the change in land cover would be mitigated as a loss of species habitat. Conservation easements would be placed on agricultural land cover types to ensure that agricultural production continues on the subject properties, consistent with the biological goals and objectives of the HCP (Table 7-1 in the SSHCP). As stated on page 6-23 of the Draft EIS/EIR, each Williamson Act contract is unique, and some may restrict the possible terms allowed for a conservation easement. If a conservation easement were proposed for land that is in a Williamson Act contract, the future Permittees would review the specifics of the Williamson Act contract to ensure that the establishment of a conservation easement is allowable.

RTC 17.4 (EIS/EIR) – At the time that section of the document was prepared, the 2014 FMMP data was the most current available. Since that analysis was completed, the 2016 FMMP data became available. While CEQA states that the existing conditions described in the EIR reflect the conditions at the time of NOP issuance (Title 14 California Code of Regulations, Chapter 3, Article 9, Section 15125(a)), the EIR preparers have nonetheless reviewed the 2016 FMMP dataset and found that the changes in agricultural uses within the planning area from the 2014 FMMP dataset are not substantial, and would not result in changes in the analysis or conclusions.

RTC 17.5 (EIS/EIR) – The study area of the SACOG six-county region described in Section 6.1.2.1 of the Draft EIS/EIR was only used to establish the cumulative conditions. The analysis of each alternative's impacts on agriculture in Sections 6.2.2.1, 6.2.3.1, and 6.2.4.1 describes only the impacts to agriculture within the planning area. The text in Section 6.2.1 of the Final EIS/EIR has been corrected to make that clear. The text changes are shown below:

> ~~It is appropriate to consider impacts to certain environmental resources within the context of other impacts occurring in the surrounding landscape, community, or region (see Section 3.6.2, Geographic Study Area of Resource Topics Analyzed in Chapters 4 through 16).~~ **The study area used to analyze direct and indirect effects of the alternatives on agriculture is the Planning Area.** The lead agencies determined that an appropriate geographic scale for evaluating the **cumulative** impacts of each EIS/EIR alternative on agriculture lands and activities should include all agricultural resources and activities within the Sacramento Area Council of Government's six-county region (SACOG 2016), which includes all of Sacramento, Placer, El Dorado, Sutter, Yolo, and Yuba Counties.

RTC 17.6 (EIS/EIR) – The Draft EIS/EIR bases its conclusion of Minor Beneficial effect on the following: "Some of the land included within the Preserve System may include Important Farmland or land currently enrolled in a Williamson Act contract; however, establishment of preserves would not convert Important Farmland to developed uses or

prevent farmers/ranchers from using their agricultural land for agricultural purposes." (page 6-23). The operating agricultural preserves would not be maintained as "open space" as defined by California Government Code 51201(o)[3], because the SSHCP would not seek to "preserve its natural characteristics, beauty, or openness" but rather would keep the lands in active agricultural production. Further, as stated in Section 6.1.2.3 of the Draft EIS/EIR, "approximately 139,890 acres within the Planning Area is currently under active Williamson Act contracts (CDOC 2016). Approximately 10,400 acres of these active contracts is identified for nonrenewal." The SSHCP would provide an additional incentive for active contracts to be renewed, because the lands would be able to draw benefits from both the Williamson Act contract and the SSHCP conservation easement.

RTC 17.7 (EIS/EIR) – As stated on page 5-68 of the SSHCP, the AMMs of Condition 2, include AMM EDGE-1 referred to in the comment, would only apply to UDA Covered Activities that border existing preserves or planned preserves. Because the SSHCP would not seek conservation easements on agricultural lands in the UDA, this AMM would not affect agricultural operations in the Planning Area. References to AMM EDGE-1 in Chapter 6 have been removed from the Final EIS/EIR.

RTC 17.8 (EIS/EIR) – Refer to response to Comment 17.7. References to AMM EDGE-1 in Chapter 6 have been removed from the Final EIS/EIR.

RTC 17.9 (EIS/EIR) – The SSHCP does not prevent urban development outside the UDA, as it is not a land use plan and has no such authority. However, urban development project proponents outside the UDA would not be able to use the coverage provided under the SSHCP Incidental Take Permits, nor any of its expedited permitting processes for impacts to waters or aquatic resources. This would be true for private developers, for non-permittees like the City of Elk Grove, or even for permittees like the City of Galt. However, the SSHCP EIS/EIR does predict that by allowing greater density of development within the UDA, the SSHCP would reduce the likelihood that urban development would occur outside the UDA. The EIS/EIR assumes that the planning area would accommodate the same amount of urban development under any of the alternatives, so the variable would be where that development would occur.

RTC 17.10 (EIS/EIR) – Please refer to the responses to comment 17.7 and comment 17.9. These explain much of the basis for the EIS/EIR's conclusion that impacts to agricultural operations outside the UDA would be reduced as compared to the No Action/No Project Alternative. The EIS/EIR acknowledges the uncertainty inherent in its long-term analysis (Section 3.6.4 in the Draft EIS/EIR) but makes a good-faith effort to describe future conditions in the planning area based on adopted general plans and policy direction from planning area jurisdictions. With regard to the effects of the

[3] "Open-space use" is the use or maintenance of land in a manner that preserves its natural characteristics, beauty, or openness for the benefit and enjoyment of the public, to provide habitat for wildlife…" (California Government Code 51201(o))

conservation easements on agricultural landowners, it would be entirely up to each farmer/landowner to choose to sell a conservation easement on their property to the Implementing Entity. If the farmer/landowner believes that they would be better served by not doing so, the SSHCP does not contain any instruments that would enable a permittee to force them to place a conservation easement on their land. Therefore, the Plan Preparers do not believe that additional analysis of HCP impacts to Sacramento County's agricultural lands, operations or opportunities is required.

LETTER 18 SACRAMENTO COUNTY FARM BUREAU (SSHCP AND EIS/EIR)

SACRAMENTO COUNTY FARM BUREAU

PUTTING THE FOOD ON YOUR FORK SINCE 1917

Sacramento, C A95814

RE: Comments on the Draft Environmental Impact Statement (DEIS) and Environmental Impact Report (DEIR) for the South Sacramento Habitat Conservation Plan (SSHCP).

Dear Ms. Knight and Ms. Biner;

On behalf of the Board of Directors of the Sacramento County Farm Bureau (Farm Bureau), we are providing the following comments to the Draft SSHCP EIR/EIS. Farm Bureau has been engaged in the development of the SSHCP for over 10 years and has provided numerous comments and many hours of stakeholder involvement during those years.

Farm Bureau is a non-governmental, non-profit grassroots organization with a purpose of protecting and promoting Sacramento County agriculture and the farmers and ranchers who steward and contribute nearly $470 million in farm gate sales to a larger food and agriculture economy. Sacramento County contributes to a region in which is noted as America's Farm to Fork Capital. This regional distinction is well deserved as the Region has the climate and soils that are only found in a few other places in the world. To have a viable and productive working landscape, farmers and ranchers must have the flexibility to manage their farming operations for market conditions, weather, soil, water availability, regulations, etc. When a farmer sees a diminution in his ability to operate for optimal food and fiber production, then the farming business model is compromised leading to reduced economic returns. Habitat conservation programs can adversely impact agricultural productivity by limiting the farmer's ability to make decisions and respond to changing conditions over time. 18.1

The SSHCP provides very little benefit or assurances to agriculture and places a disproportionate burden of habitat mitigation on working agricultural lands, that in many cases already provide significant habitat, species conservation, and watershed benefits. The SSHCP DEIR/DEIS fails to acknowledge and 18.2

responsibly address the SSHCP's far-reaching negative impact on agriculture in the larger, long-term context of the County's urbanizing landscape for the following reasons: 18.2 cont'd

The DEIR/DEIS uses three criteria to evaluate agricultural impacts for the Significance Thresholds [Page 6-14]—yet none of these criteria address the most devastating impact on agriculture with respect to conservation easements and in-fee-title agricultural land acquisition. The Proposed Action/Proposed Project Alternative suggests establishment of preserves would not convert Important Farmland to developed uses or prevent farmers/ranchers from using their agricultural land for agricultural purposes [page 6-23]. 18.3

However, the objectives of the SSHCP, as enforced through the Agriculture Conservation Easement, places responsibility to identity, preserve, protect, enhance, monitor and restore in perpetuity the Conservation Values of the Property entirely on the farmer/rancher. 18.4

Under the SSHCP, the farmer/rancher would be prohibited from converting any annual crop not historically planted on the property or approved in writing. In addition, various crops and agricultural activities—including feedlots, orchard, vineyards, artichokes, asparagus, sod, rice, safflower, or cotton—are specifically prohibited. The Conservation Easement would also limit the farmer's ability to use biocides that have not been 'historically used.' The Conservation Easement would identify the timing for harvest, crop rotations, and other measures to benefit the targeted species. 18.5

It is also unclear if routine and ongoing agricultural practices are allowed under the SSCHP. For example, routine agricultural activities whose status is thrown into limbo by the Conservation Easement include, without limitation, discing, chiseling, ripping, landplaning, laser leveling, harrowing, spraying, planting, seeding, etc. 18.6

The DEIR/DEIS suggests that there is no Impact on agriculture as the Proposed Action/Proposed Project Alternative would not prevent farmers/ranchers from using their agriculture land for agriculture purposes. Farm Bureau strongly disagrees in light of all of the many significant, restrictions associated with the Conservation Easement as described. While a narrow view of the SSHCP when compared to the No Action/No Project Alternative might conclude that there is some minor benefit to agriculture, as the plan might in theory limit some of the conversion of agriculture land to urban development. However, Farm Bureau submits that any supposed "minor benefit" of the SSHCP when compared to the No Action Alternative is far outweighed, in a negative sense, by the overall loss of agricultural use, operational flexibility, crop choice, and long-term economic viability. 18.7

Policy AG-5 in the Sacramento County General Plan was established to mitigate for the impacts to farmland. However, as interpreted in the SSHCP, the objective of that policy is taken to mean mitigation for habitat impacts that just happens to have some incidental agricultural use as farmland/cropland. This does not satisfy Policy AG-5 and development activities that impact farmland should be mitigated for solely in relation to the loss of farmland. Moreover, such application of Policy AG-5 fails to fulfill the spirit of Policy AG-5 in terms of land quality and productivity, as SSHCP reserve lands will, by definition, be more constrained and less economically productivity lands when compared to conventional farmland. 18.8

Similarly, Farm Bureau renews its objection to the SSHCP proposed allowance of out-of-County mitigation. Specifically, to address project impacts in reasonable proximity to the environmental where they occur, and to maintain proper controls on proposed in-county development, farmland those impacts must be mitigated for within the County boundary. Biological mitigation must not be out-sourced to outside areas as a way to reduce market costs of land acquisition and protection, while artificially clearing the way for unbridled in-county farmland conversion and habitat degradation. 18.9

Because the SSHCP would not shift or displace contemplated development to areas outside the UDA, such as south of the Elk Grove SOI, the DEIR/DEIS concludes the SSHCP's effect on agriculture will be a minor beneficial cumulative effect. However, this conclusion ignores the fact the City of Elk Grove has withdrawn from the SSHCP, while the City's General Plan update independently identifies several, 18.10

extensive areas of consideration for future development outside of their SOI and outside of the County UDA. The DEIR/DEIS therefore overstates and mischaracterizes this supposed benefit of reduced urban development outside of the UDA, south of Elk Grove as proven by the City of Elk Grove's General Plan update. Left unaddressed, this omission constitutes a major flaw in the SSHCP, legally, biologically and in terms of actual plan implementation. 18.10 cont'd

The 50-year permit exceeds the County's General Plan Update 2030 by 20 years. As a result, the SSHCP becomes a *de facto* land use planning document by prejudging covered projects that have not been publicly vetted through the county's normal land use planning process. This improperly short-circuits the transparency, oversight, accountability, deliberative process that this process normally provides. Instead, the SSHCP should limit its term to the known planning horizon with potential option revisit as that planning horizon moves gradually into the future. 18.11

Turning to the EIR/S, Farm Bureau was very disappointed to discover that the SSHCP's Alternative Screening process looked only at the pros and cons from a biological/species conservation standpoint without in any way considering other impacts, including agriculture. 18.12

Moreover, the DEIR/DEIS fails to disclose and analyze the true impact of the SSHCP on agriculture under the No Project, Proposed Action/Proposed Project Alternative, or Reduced Permit Term Alternatives. 18.13
Instead, the whole brunt and burden of the responsibility to recover species is placed on the rural, working landscapes already significantly impaired by regulatory stresses, market volatility and the high cost of doing business. The SSHCP is a vehicle that allows developers to have a streamlined and cost effective process to advance development projects while at the same time places 100% of the habitat responsibility on farmers and ranchers. All of this makes the SSHCP an extremely unattractive proposition for the County's once thriving, but now greatly challenged remaining agriculture industry. 18.14
Instead of the SSHCP, Farm Bureau recommends pursuing on slow-growth compact pattern of development, with full and transparent public engagement, within the context of the County's and Cities traditional land use planning and permitting authorities. In contrast to the SSHCP, which is in fact a fast-track approval for unbridled development in the guise of a species protection plan, such a go-it-slow traditional elected official- and stakeholder-driven approach would *actually* protect and preserve the South County's remaining natural habitats and open space lands, within the rural and agricultural landscape within which they exist. If species protection is the actual goal, Farm Bureau believes this and not the SSHCP is the responsible and effective approach. 18.15

Thank you for the opportunity comment on the SSHCP EIR/S. While we object to the SSHCP as a effective vehicle and long-term vision for our County, Farm Bureau looks forward to continuing opportunities to engage in the County's process. 18.16

Sincerely,

Virginia Hemly Chabbra
President

Bill Bird
Executive Director

cc. Sacramento County Supervisor, Don Nottoli
Sacramento County Ag Commissioner, Juli Jensen

RTC 18.1 (SSHCP) – The SSHCP provides assurances that land will only be acquired by the Implementing Entity for the SSHCP Preserve System from willing sellers. In addition the Implementing Entity will not use condemnation or eminent domain to acquire property. Should farmers or ranchers determine that selling an easement to the SSHCP Implementing Entity is not in their best interest then they will not be required to do so.

The SSHCP Plan preparers do not agree that conservation easements are so restrictive that they will adversely impact agricultural operations. It is estimated that there is over 60,000 acres of land already protected under conservation easements within the SSHCP Plan Area, much of which is active agricultural land including grazing and farming.

Management of SSHCP agricultural preserves would ensure that agricultural lands remain in production, while pursuing parallel goals of maximizing habitat value within the constraints of the agricultural operations allowable under the easement. Preserve management plans would be developed with landowners and would be periodically reviewed, which could provide landowners the opportunity to adaptively manage land management activities. The conservation easement for agricultural lands will also make farmers eligible for monetary payments for the purpose of agricultural enhancement (Draft SSHCP, page 9-23, "Agricultural Enhancements on Easements," and page 12-13 "Agricultural Enhancement Funding"). For grazed grasslands, the SSHCP recognizes that responsible grazing practices, as used by most ranchers in the Plan Area, provide benefits to the covered species and should be allowed to continue on SSHCP Preserves. As part of Preserve establishment, the SSHCP Implementing Entity will collect information from ranchers on the historic and existing grazing practices on the land, and will ensure that beneficial grazing will continue on the subject property in perpetuity.

RTC 18.2 (SSHCP) – Agricultural lands are a vital component of the SSHCP Conservation Strategy because working agricultural lands do provide valuable habitat for many species as well watershed benefits, as your comment states. Refer to Final SSHCP Section 11.1, *Assurances for Private Landowners*. The SSHCP would not have negative impacts on agriculture in Sacramento County for the reasons discussed in the response to Comment 18.1, as well as responses to comments 18.3 through 18.15 below.

RTC 18.3 (EIS/EIR) – The significance criteria used in the Draft EIS/EIR are the same as those used in other County CEQA documents, and are derived from State guidance (CEQA Guidelines, Appendix G).

RTC 18.4 (SSHCP) – The statement made that the SSHCP "places responsibility to identity (sic), preserve, protect, enhance, monitor and restore in perpetuity the Conservation Values of the Property entirely on the farmer/rancher" is not correct. As stated in SSHCP Section 9.4.3 and in the sample Conservation Easement on Agricultural Lands (Appendix D2 of the Final SSHCP), the grantor of a conservation easement will be responsible for managing the land in accordance with the conservation easement, but assessment, enhancement, or monitoring will be the responsibility of the grantee. In the case of conservation easements for agricultural lands, the management of the property will consist of continuing to conduct agricultural activities on the property that are consistent with the requirements of the easement.

RTC 18.5 (SSHCP) – The comment is correct that in agreeing to sell a conservation easement on their property, an agricultural landowner may agree to continue historic practices or use practices that are approved in advance by the Implementing Entity. The alternative approved practices can be either those listed in the conservation easement document, or those approved on a case-by-case basis. If an agricultural landowner does not wish to be bound by these restrictions, they are under no obligation to sell a conservation easement on their property. The SSHCP does not include any means by which a permittee could force them to place a conservation easement on their land, and cannot use eminent domain (Final SSHCP Sections 11.1.1 and 11.1.3).

RTC 18.6 (SSHCP) – The comment is correct that in exchange for payment for the Conservation Easement, an agricultural landowner must agree to certain restrictions on the activities that will occur on that property. These few restrictions have been carefully selected because they are those known to significantly impact the habitat value of agricultural lands, the preservation of which is the purpose of the Conservation Easement. The intent of a Conservation Easement would be that most routine historical agricultural activities could continue on the parcel, because those parcels selected for easements would be those that have good habitat value because they have not been extensively subjected to the restricted practices in the past. Nonetheless, it is possible that the Conservation Easement could disallow some activities that have previously occurred on the property. As stated in response to Comment 18.5, selling a Conservation Easement is entirely voluntary and if a landowner does not wish to be subject to these restrictions, they are under no obligation to be.

RTC 18.7 (SSHCP) – The comment is correct that agricultural landowners who choose to sell a Conservation Easement on their property may have less operational flexibility and crop choice than those who do not. The amount paid to the agricultural landowner for the Conservation Easement is intended to offset this, and to allow these continuing agricultural activities to remain economically viable over the long-term. As stated in response to Comment 18.5, selling a Conservation Easement is entirely voluntary and if a landowner does not wish to be subject to these restrictions, they are under no obligation to be.

RTC 18.8 (SSHCP and EIS/EIR) – General Plan Policy AG-5 makes no mention of the specific agricultural activities occurring on preserved or impacted farmlands, and relies strictly on their classification as prime, statewide importance, unique, local importance, and grazing. Policy AG-5 reads as follows:

“Projects resulting in the conversion of more than fifty (50) acres of farmland shall be mitigated within Sacramento County, except as specified in the paragraph below, based on a 1:1 ratio, for the loss of the following farmland categories through the specific planning process or individual project entitlement requests to provide in-kind or similar resource value protection (such as easements for agricultural purposes):

- Prime, statewide importance, unique, local importance, and grazing farmlands located outside the USB;

- Prime, statewide importance, unique, and local importance farmlands located inside the USB.

The Board of Supervisors retains the authority to override impacts to Unique, Local, and Grazing farmlands, but not with respect to Prime and Statewide farmlands.

However, if that land is also required to provide mitigation pursuant to a Sacramento County endorsed or approved Habitat Conservation Plan (HCP), then the Board of Supervisors may consider the mitigation land provided in accordance with the HCP as meeting the requirements of this section including land outside of Sacramento County[4].

Note: This policy is not tied to any maps contained in the Agricultural Element. Instead, the most current Important Farmland map from the Department of Conservation should be used to calculate mitigation."

As provided for in Policy AG-5 the stacking of agriculture and conservation easements is permissible. In addition, the SSHCP requires that impacts to farmland be mitigated by protecting farmland at a 1:1 ratio. We believe that this does comply with Policy AG-5.

RTC 18.9 (SSHCP) – Sacramento County General Plan Policy AG-5 does allow for farmland mitigation outside the County when it is part of a County-adopted HCP. However, the comment incorrectly states that the SSHCP proposes out-of-County mitigation. As stated in Section 1.2.1 of the Final SSHCP, the SSHCP Plan Area is limited to the south part of Sacramento County. Preservation of agricultural lands outside the SSHCP Plan Area would not meet the requirements of the SSHCP, and is neither proposed nor expected to occur under the SSHCP. All SSHCP mitigation and conservation actions must occur inside the SSHCP Plan Area.

RTC 18.10 (EIS/EIR) – The Draft EIS/EIR does consider development in proposed Elk Grove SOI expansions totaling 1,710 acres in its analysis of cumulative effects, as described in Section 3.7.2.1. The Draft EIS/EIR also analyzes, as part of the No Action/No Project Alternative, development within County jurisdiction outside the UDA just south of Elk Grove. That development would be in addition to the City of Elk Grove's SOI development and is assumed to occur in response to the No Action/No Project Alternative's increased difficulty in permitting development in the Mather Core Recovery Area. Therefore, it is incorrect to state that the EIS/EIR ignores the effects of development south of the City of Elk Grove. The benefits to agriculture identified in the EIS/EIR analysis of the Proposed Action/Proposed Project are the reduced likelihood of scattered development in predominantly agricultural areas, outside the UDA.

RTC 18.11 (SSHCP and EIS/EIR) – The full justification for the proposed 50-year ITP permit terms is provided in Section 1.2.3 of the SSHCP, and repeated in the description of

---

[4] Note that the SSHCP permit will not accommodate mitigation land outside the Plan Area (e.g., outside Sacramento County) without amendment and additional environmental review.

the Proposed Action/Proposed Project Alternative in Section 2.3.2 of the EIS/EIR. However, Section 2.4.2 of the Draft EIS/EIR also analyzes the effects of an HCP with a 30-year permit term, the Reduced Permit Term Alternative.

The SSHCP would not supersede or replace the general plan planning process, nor provide the local land use entitlements required to construct or implement the covered activities. Therefore, it is incorrect to state that the SSHCP becomes the de facto land use planning document for the Plan Area. Refer also to response to Comment 3.6.

RTC 18.12 (EIS/EIR) – The alternatives screening process examined the ability of each potential alternative to meet the direction of the Purpose and Need Statement and the Project Objectives listed in EIS/EIR Sections 1.3.1 and 1.3.3. These specifically state that alternatives should "maintain the existing richness of agricultural lands", and should "protect the long-term viability of ranching and farming operation in the Planning Area". Draft EIS/EIR Appendix E).

RTC 18.13 (EIS/EIR) – The Draft EIS/EIR analyzes impacts on agriculture in a manner consistent with CEQA, using the significance criteria suggested in the CEQA guidelines and commonly used by Sacramento County. Please refer to responses to comments 18.1, 18.4, 18.5, 18.6, 18.7, and 18.10 for responses to the comments on the Draft EIS/EIR analysis of agricultural resources.

RTC 18.14 (SSHCP) – While it is acknowledged that much of the SSHCP Conservation Strategy would take place on working grazing lands and working farmlands, these would only be with willing sellers of conservation easements. Establishment of SSHCP conservation easements will focus on maintaining the viability of the existing ranching and farming activities while conserving the habitat value of the property's working landscape. The SSHCP provides a mechanism by which farmers and ranchers can be financially compensated for continuing the existing agricultural practices that are maintaining habitat for covered species. As stated in response to Comment 18.5, selling a Conservation Easement to the SSHCP is entirely voluntary and if a landowner does not wish to be part of the SSHCP, they are under no obligation to be. As discussed in response to Comment 18.1, a SSHCP conservation easement on working agricultural lands will also make farmers eligible for monetary payments for the purpose of agricultural enhancement on their properties. Examples of what the payments can be used for include the installation of repair of wells, fences, barns, drainage/irrigation system; demolition of structures, and clearing of land that does not impact wetland or riparian habitats.

RTC 18.15 (SSHCP/EIS-EIR) – The Draft EIS/EIR estimated the future land development without the SSHCP (the No Action/No Project Alternative), and compared it to expected land development with the SSHCP in place (Proposed Action/Proposed Project). The SSHCP would result in a pattern of development and habitat preservation that would cause fewer and less significant impacts than maintaining the status quo. Please also note the following:

- The SSHCP will not increase the acres of development in the County— the same acres of development will are projected to occur even if the SSHCP is not approved and implemented (i.e. the No Action/No Project condition).

- The SSHCP does not have the ability to affect or change the existing County and City policies on slow-growth, or change existing County and City policies on compact pattern of development.
- The SSHCP would not change existing CEQA and local requirements to have a full and transparent public engagement prior to County or City decisions on individual future land development projects—the existing public engagement processes will still happen under the SSHCP.
- The development of the proposed SSHCP was entirely driven by stakeholders that own land, work, and live in the Plan Area. The entities representing every Plan Area stakeholder and all relevant regulatory agencies negotiated the proposed SSHCP over approximately 15 years to reach this effective and responsible approach to conservation in south Sacramento County.
- The SSHCP will protect and preserve much of south Sacramento County's remaining natural habitat and open space lands and protect and preserve the rural working agricultural landscapes within which they exist.

RTC 18.16 (SSHCP) – Thank you for your comment. The SSHCP Plan Partners welcome the Farm Bureau's continued participation in the SSHCP process.

LETTER 19 SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

August 18, 2017

SENT VIA EMAIL

Todd Smith, Acting Environmental Coordinator
Office of Planning and Environmental Review
County of Sacramento
827 7th Street, Room 225
Sacramento, CA 95814

Sacramento, CA 95825

RE: Draft Environmental Impact Statement/Environmental Impact Report for the South Sacramento Habitat Conservation Plan

Dear Mr. Smith and Ms. Knight:

Thank you for providing an opportunity for the Sacramento Metropolitan Air Quality Management District (SMAQMD) to review and comment on the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the South Sacramento Habitat Conservation Plan (SSHCP). We review and provide comments through the lead agency planning, environmental and entitlement processes with the goal of reducing adverse air quality impacts and ensuring compliance with the California Environmental Quality Act (CEQA). We offer the following comments to ensure air quality impacts are adequately analyzed, disclosed and mitigated.

1. Consistency with Existing Plans
The SMAQMD appreciates the work done by the SSHCP staff on the Draft EIS/EIR to evaluate the SSHCP with existing plans, especially those that reduce criteria air pollutants and greenhouse gases (GHG). 19.1

2. Short-term Construction Emissions of Criteria Air Pollutants and Precursors
Based on the modeling conducted, short-term construction related emissions are not expected to exceed the SMAQMD thresholds of significance for criteria pollutants and ozone precursors for any of the three alternatives that were analyzed. SMAQMD appreciates the discussion in the Draft EIS/EIR regarding best management practices for reducing PM_{10} and $PM_{2.5}$ emissions and SMAQMD rules, even for projects not subject to CEQA review. 19.2

3. Greenhouse Gases and Vehicle Miles Traveled
Vehicle miles traveled (VMT) is directly linked to both GHG emissions and criteria air pollution. Reducing VMT is an important component toward meeting clean air and greenhouse gas reduction goals. SMAQMD commends SSHCP staff on analyzing the potential impacts of future urban development being shifted to areas of undeveloped land outside the urban services boundary, which could result in longer commuter trips and higher VMT. Based on the modeling conducted, construction and operational emissions of GHG are not expected to exceed the SMAQMD thresholds of significance for the creation and maintenance of mitigation preserves for any of the three alternatives. 19.3

Thank you for your consideration of these comments. If you have any questions, please contact me at 916-874-6267 or JChan@airquality.org.

Regards,

Joanne Chan
Air Quality Planner/Analyst

916/874-4800 ▪ 916/874-4899 Fax
www.airquality.org

RTC 19.1 (EIS/EIR) – The comment expresses appreciation for the Draft EIS/EIR evaluating the SSHCP in the context of existing plans, particularly those that reduce criteria air pollutants and greenhouse gases (GHGs).

RTC 19.2 (EIS/EIR) – The comment is correct in its description of short-term construction related emissions impacts. The comment expresses appreciation for the inclusion of emission reduction rules and best management practices (BMPs) in the EIS/EIR.

RTC 19.3 (EIS/EIR) – The comment is correct in its description of the GHG emissions analysis in the EIS/EIR. The comment expresses appreciation for the evaluation of urban development location and VMT provided in the EIS/EIR.

LETTER 20 SACRAMENTO METROPOLITAN UTILITY DISTRICT (SMUD) (SSHCP)

Powering forward. Together.

SMUD

Subject: South Sacramento Habitat Conservation Plan Draft Environmental Impact Statement/ Environmental Impact Report
(Control No: 2003-0637/ Clearinghouse No. 2008062030)

To Whom It May Concern:

The Sacramento Municipal Utility District (SMUD) appreciates the opportunity to provide comments on the South Sacramento Habitat Conservation Plan (Project) Draft Environmental Impact Statement/ Environmental Impact Report (DEIS/EIR). SMUD is the primary energy provider for Sacramento County and the proposed Project area. SMUD's vision is to empower our customers with solutions and options that increase energy efficiency, protect the environment, reduce global warming, and lower the cost to serve our region. As a Responsible Agency, SMUD aims to ensure that the proposed Project limits the potential for significant environmental effects on SMUD facilities, employees, and customers.

It is our desire that the Project DEIS/EIR will acknowledge any Project impacts related to the following:

- Overhead and or underground transmission and distribution line easements. Please view the following links on smud.org for more information regarding transmission encroachment:
  - https://www.smud.org/en/business/customer-service/support-and-services/design-construction-services.htm
  - https://www.smud.org/en/do-business-with-smud/real-estate-services/transmission-right-of-way.htm
- Utility line routing

20.1

SMUD has existing overhead/underground facilities on or adjacent to the Project Planning Area. Based on our review of the DEIS/EIR and our understanding of the proposed Project, SMUD encourages the County to consider the following:

1. SMUD is also preparing a habitat conservation plan, the permit area for which overlaps with the Project Planning Area. It doesn't appear that the two HCPs will conflict with each other though the plans have similar Covered Activities, as it

20.2

relates to utility infrastructure. SMUD may explore opportunities to participate in the South Sac HCP as a Participating Special Entity, as appropriate. 20.2 cont'd

2. As it relates to rural transportation projects and covered activities, SMUD asks that the permitting agencies consider any impacts associated with relocating SMUD facilities to accommodate the project, as part of the project. 20.3
3. Additionally, as it relates to preserve development, SMUD may have existing infrastructure within or along the preserve areas. SMUD has a requirement to maintain its facilities and would need to continue to access these areas and maintain its facilities in accordance with our easements. Any new conservation easements placed on preserve areas will need to accommodate SMUD's easements. 20.4

SMUD would like to be involved with discussing the above areas of interest as well as discussing any other potential issues. We aim to be partners in the efficient and sustainable delivery of the proposed Project. Please ensure that the information included in this response is conveyed to the Project planners and the appropriate Project proponents. 20.5

Environmental leadership is a core value of SMUD and we look forward to collaborating with you on this Project. Again, we appreciate the opportunity to provide input on this DEIS/EIR. If you have any questions regarding this letter, please contact Emily Bacchini at emily.bacchini@smud.org or (916)732-6334.

Sincerely,

Angela C. McIntire
Regional & Local Government Affairs
Sacramento Municipal Utility District
6301 S Street, Mail Stop A313
Sacramento, CA 95817
angela.mcintire@smud.org

Cc: Emily Bacchini, SMUD

RTC 20.1 (SSHCP) – Each individual project that uses permit coverage under the SSHCP will need to ensure that they analyze and appropriately mitigate any impacts to utility line easements or utility line routing. Refer to response to Comment 20.4 regarding utility line easements and routing on SSHCP preserves.

RTC 20.2 (SSHCP) – We agree that there appears to be no conflict between the HCP that SMUD is developing and the SSHCP. The SSHCP Plan Partners welcomes SMUD to participate in the SSHCP as a Participating Special Entity.

RTC 20.3 (SSHCP) – Chapter 5 of the Final SSHCP has been revised to clarify that utility relocation associated with road projects is a covered activity. Any utility relocations would be in the right-of-way outside Preserves, so this would be a Covered Activity only outside Preserves.

RTC 20.4 (SSHCP) – Chapter 5 of the Draft SSHCP identifies maintenance of existing infrastructure on SSHCP preserves as a SSHCP Covered Activity. Section 5.2.7 of the SSHCP includes the following language: "Repair and maintenance of existing utility facilities within planned SSHCP Preserves, including electrical, natural gas, water, wastewater, and cell tower facilities, are SSHCP Covered Activities, when implemented consistent with the utility's existing ROW easements." This language would apply to SMUD easements, and demonstrate that SMUD activities in Preserves would be not only accommodated but could be SSHCP Covered Activities if SMUD desires.

RTC 20.5 (SSHCP) – This comment letter has been provided to all SSHCP Plan Partners. In addition, the comment letters and responses are published in the Final EIS/EIR so that they can be reviewed by the general public and all stakeholder groups. The County looks forward to working with SMUD in the future to ensure the compatibility of resource protection and provision of energy service to the region.

Re: Comments on Draft South Sacramento Habitat Conservation Plan and Environmental Impact Report/Environmental Impact Statement

To whom it may concern:

On behalf of Tsakopoulos Investments, we commend Sacramento County and its partners for their work developing the Draft South Sacramento Habitat Conservation Plan (Plan). We believe that the Plan offers a streamlined approach to permitting which has the potential to result in more expeditious permit decisions and better assurances for the regulated community, while protecting the highest quality habitat in an ecologically beneficial manner.

We offer one comment for the record based upon our review of the Draft Plan. From the perspective of the development community, an essential component of the SSHCP is the associated Section 404 Clean Water Act Permit Strategy (404 Strategy) drafted by the U.S. Army Corps of Engineers (Corps). The 404 Strategy would include an abbreviated process for issuing standard Section 404 permits (SPs) for activities which may have a "significant impact on the human environment and require the preparation of an EIS under NEPA." However, neither the SSHCP nor the 404 Strategy—as those documents are currently drafted—provides detail about the anticipated requirements for projects utilizing the SP. It is our understanding, based upon conversations with the County and the Corps, that the 404 Strategy will require that any projects utilizing the SP be designed consistent with the SSHCP Conservation Strategy, including the dedication of "hard line" preserves, and that, if this occurs, no substantial additional on-site avoidance/preserve dedication will be required of these projects. Based upon this understanding, we are supportive of the Plan and 404 Strategy. 21.1

Very truly yours,

Kate A. Wheatley

cc: Angelo G. Tsakopoulos

RTC 21.1 (SSHCP and CWA Permit Strategy) – Please see the response to Comment 1.2. In addition the fundamental processing requirements of SPs would follow the USACE's regulations (primarily found in 33 CFR Part 325), inclusive of the content requirements for a complete application, public noticing, and additional content and procedural elements of permit evaluation. Distinguishing aspects of the SSHCP-aligned abbreviated SP process are provided in the form of the USACE's most informed-to-date outlook (see Appendix C), and formalized commitments to the process outlook would be provided in the USACE's ROD for the SSHCP EIS. The ROD, for example, would formally document the USACE's outlook provided in Appendix C with regard to requiring only on -site alternatives analysis of project alternatives as part of the abbreviated SP process.

In response to the question regarding on-site avoidance/preserve dedication for projects evaluated under the abbreviated SP process designed consistent with the SSHCP's Conservation Strategy, the CWA 404 permit strategy assumes all projects authorized under CWA 404 in alignment with the SSHCP would need to be designed consistent with the SSHCP's Conservation Strategy, and in this context the USACE would not require substantial additional on-site avoidance/preserve dedication. The hard line preserve requirements are consistent with the SSHCP Conservation Strategy's requirements. The CWA 404 abbreviated SP process looks to the SSHCP's requirements to help support justification of key CWA 404 compliance elements such as avoidance and minimization of impacts to aquatic resources at a plan-wide level, consistent with the US EPA's Section 404(b)(1) Guidelines in a regional conservation planning framework. In the case of the hard line preserves, the preserves are a key requirement of the SSHCP Conservation Strategy, and are also consistent with the requirements of other regulatory agencies (including the USACE) involved with the SSHCP and project-level reviews for the projects associated with the hard line preserves. For proposed hard line preserves and other types of SSHCP preserves, the USACE may request minor adjustments in preserve and/or setback (e.g., stream setbacks as required by the SSHCP and ARP) boundaries in support of project-level compliance with the Section 404(b)(1) Guidelines. For example, a stream setback of 25 ft. may encompass all but a 5-foot-wide swath of adjacent wetland to the subject stream. The USACE envisions in this type of situation the potential to request a slightly wider setback (at least where the adjacent wetland occurs), consistent with the avoidance and minimization guidance contained in the Section 404(b)(1) Guidelines. Due to site- and project-specific considerations in applying the Section 404(b)(1) Guidelines, this example is provided not as a decision rule, but as just an example of a type of minor adjustment that may be sought in association with project evaluations under the abbreviated SP process.

Clarification regarding analysis of on-site project alternatives required to comply with the provisions of EPA's Section 404(b)(1) Guidelines has been added to the updated CWA 404 permit strategy (Final EIS/EIR Appendix C). The on-site alternatives analysis must support a project-specific determination of the Least Environmentally Damaging Practicable Alternative (LEDPA) to support compliance with the Section 404(b)(1) Guidelines at the project-specific level. As described in Appendix C, the USACE's abbreviated SP permit decisions would be tiering from the SSHCP EIS, inclusive of recognition of plan-level avoidance, minimization, and mitigation.

LETTER 22 TAYLOR & WILEY, REPRESENTING TSAKOPOULOUS INVESTMENTS (CWA PERMIT STRATEGY)

From:	Kate Wheatley
To:	Pakenham-Walsh, Mary R CIV USARMY CESPK (US)
Cc:	agtesq@tsakvest.com
Subject:	[Non-DoD Source] Comments on Public Notice SPK-1995-00386: Proposed Section 404 Clean Water Act Permit Strategy Aligned with SSHCP
Date:	Friday, June 30, 2017 7:19:16 PM

Dear Ms. Pakenham-Walsh:

Thank you for the opportunity to comment on the Proposed Section 404 Clean Water Act Permit Strategy Aligned with the South Sacramento Habitat Conservation Plan (Proposed Permit Strategy), posted June 2, 2017. On behalf of Tsakopoulos Investments, we commend the Sacramento District for its work developing a more streamlined approach to permitting under the Clean Water Act. This Proposed Permit Strategy, coupled with the South Sacramento HCP (SSHCP), has the potential to result in more expeditious permit decisions and better assurances for the regulated community, while better protecting the highest quality aquatic resources in an ecologically beneficial manner.

We offer one comment for the Corps' consideration: the Proposed Permit Strategy mentions an abbreviated process for issuing standard permits (SPs) for activities which may have a "significant impact on the human environment and require the preparation of an EIS under NEPA." However, unlike the programmatic general permit (PGP) and letter of permission (LOP) that are also described in the Proposed Permit Strategy, no details are provided about the anticipated process and requirements for this SP (e.g., how will the Corps decide which projects qualify for use of an LOP, as opposed to a SP? What type of alternatives analysis will be required for projects utilizing this SP?) The Proposed Permit Strategy indicates that the final EIS for the SSHCP will include more details on process and timelines for the SP abbreviated process, but this does not allow interested parties a meaningful opportunity to provide input about the Strategy as it pertains to these SPs. The Corps should provide these details now so that members of the public can review and provide comments for the Corps' consideration prior to the Corps' adoption of its Record of Decision and implementation of the Proposed Permit Strategy.

22.1

Thank you, again, for the opportunity to comment on the Proposed Permit Strategy. Please feel free to contact me with any questions.

Kate Wheatley

RTC 22.1 (CWA Permit Strategy) – With regard to the question concerning level of detail provided for the proposed abbreviated SP process, including distinguishing criteria for LOPs vs. abbreviated SP permits, and anticipated requirements associated with conducting alternatives analyses, please see response to comments 1.2 and 21.1. The CWA 404 Permit Strategy (Appendix C to the Draft EIS/EIR) discloses as much detail and certainty on specifications, processes and timing goals for the various permit types as is known to the USACE, prior to finalizing the permit strategy in response to public input on the EIS and referral to the SSHCP Plan Partners' final draft ARP and ARP ordinance.

LETTER 23 U.S. ARMY CORP OF ENGINEERS (EIS/EIR)

DEPARTMENT OF THE ARMY
U.S. ARMY CORPS OF ENGINEERS, SACRAMENTO DISTRICT
1325 J STREET
SACRAMENTO CA 95814-2922

August 30, 2017

Regulatory Division (SPK-1995-00386)

Ms. Jan C. Knight
Deputy Field Supervisor
Sacramento Fish and Wildlife Office
2800 Cottage Way, Room W-2605
Sacramento, CA 95825

Dear Ms. Knight:

We have reviewed the U.S. Fish and Wildlife Service (USFWS) Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the proposed South Sacramento Habitat Conservation Plan (SSHCP). The Corps has jurisdiction within the proposed range of alternatives under the authority of Section 404 of the Clean Water Act (CWA 404) for the discharge of dredged or fill material into waters of the United States. Per 40 CFR 1501.6, the Corps is a cooperating agency on the EIS under the National Environmental Policy Act (NEPA), and, as described in the Draft EIS document, has provided consistent and substantive input on the Draft EIS and associated documents assessed by the Draft EIS (e.g., draft SSHCP).

Although our office was able to review prior administrative draft version of the Draft EIS, our review of the public Draft EIS identified the opportunity to clarify a limited number of key procedural and/or regulation- or guidance-based portions of the document. These clarification opportunities are primarily related to new and/or revised text (since the time of our last administrative draft review of a subject chapter) in areas of the document that describe complex existing and/or proposed CWA 404-related matters. The clarifications identified below are substantive in nature, and we believe changes to the Draft EIS and/or a response to these comments should be included in the Final EIS. Additional, minor clarifications will be provided by submittal of edits under our role as a cooperating agency, by the end of September. Thank you for the opportunity to provide the following comments on the Draft EIS.

Chapter 1:

1. Section 1.6.5 (pg. 1-42, first full paragraph): In our most recent administrative draft review of Chapter 1, we recommended deletion of three paragraphs, within which the subject of this comment occurs. We noted in our review that the passage had been previously commented on in a prior draft review and remained inaccurate. Therefore, we request the following clarification be added, and are available to work with the USFWS to address any questions in this regard. 23.1

As described in Appendix C to the DEIS, proposed projects reviewed under our draft standard permit (SP) abbreviated process are anticipated to be those that have potentially significant impacts and require the preparation of an EIS, rather than an environmental assessments (as currently stated in the subject text of the Draft EIS). Prior to finalization of the CWA 404 permit strategy, it would be pre-decisional for us to determine whether certain SP applications would not require the preparation of an EIS, however it is anticipated that the majority of SP applications for SSHCP covered projects would require an EIS. Lastly, we retain discretion to determine the appropriate level of NEPA analysis (environmental assessment, or EIS) based on a case-by-case review, consistent with NEPA regulations (40 CFR 1500) and our NEPA implementing regulations (33 CFR 230 and 33 CFR Part 325, Appendix B). As accurately described in the subject paragraph, key efficiencies would be operative since the Corps would be able to refer to programmatic-level approaches to compliance with NEPA, the 404(b)(1) Guidelines, and the Corps' public interest review requirements within the SSHCP EIS, and determinations related to these documented in our (future) Record of Decision for the EIS. 23.1 cont'd

Therefore, please revise the subject paragraph to read: *"NEPA requirements for future Covered Activity projects requiring permits under the SP abbreviated process would realize greater efficiencies. For future Covered Activity urban development* projects *proposing potentially significant effects on the human environment, for which the Corps determines requires preparation of an EIS, the SP abbreviated process would be reduced in terms of process, information requirements, and timing. Please refer to Appendix C for additional description of the SP abbreviated process."*

Chapter 2:

2. Section 2.1.1 (pg. 2-2, last paragraph): Some activities that result in a discharge of dredged and/or fill material into waters of the U.S. are exempt under CWA 404(f). Therefore, we request the paragraph be revised to state: "Activities that would result in the discharge of dredged or fill material into wetlands and other waters of the United States *may* require authorization..." 23.2

3. Section 2.1.1 (pg. 2-3, second full paragraph): Please add a new sentence after the first sentence ending in "...where applicable" to align with the information in Chapter 1 of the Draft EIS (Section 1.5.4, second paragraph of pg. 1-29) regarding the Corps' intention to review additional information outside the purview of NEPA to support a determination of compliance with the Section 404(b)(1) Guidelines in our future Record of Decision for the EIS, as follows: "However, on a case-by-case basis, additional information may be necessary. For this project, as part of its compliance documentation with EPA's 404(b)(1) Guidelines, the USACE will also consider additional information outside the purview of the NEPA process." While our NEPA implementing regulations guide that the alternatives analysis in an EIS should be thorough enough to support the Corps' compliance determinations with the 404(b)(1) Guidelines, case-by-case determinations still apply. We notified the lead agency and SSHCP plan proponents of the need for additional supporting information for a compliance determination with the 404(b)(1) Guidelines in discussions and electronic mail in early 2016, and feel it is important to clearly and consistently disclose this outlook in the NEPA document. 23.3

4. Section 2.1.4 (pg. 2-12, last paragraph): Please refer to Comment #3, above, and add the same sentence after the existing sentence ending in "…where applicable." 23.4

5. Section 2.2.2 (pg. 2-31, second full paragraph): Please edit for accuracy the last sentence to read "…a minimum one-to-one acreage or one-to-one linear foot ratio (i.e., a 1:1 mitigation ratio) required by the 2008 Compensatory Mitigation Rule would be assumed to be required." It is pre-decisional to indicate that a specific mitigation ratio "would be used." 23.5

6. Section 2.2.2 (pg. 2-31, third/last full paragraph [and general comment]): We recommended in prior administrative draft reviews that several compensatory mitigation-related areas of text use rule citations for increased clarity. We formally request that specific areas of the Federal Mitigation Rule (33 CFR Part 332; "rule") referred to in the Draft EIS text be cited. In the subject paragraph, we recommend the final sentence starting with "The 2008 Mitigation…" cite the applicable part of the rule (33 CFR Part 332.3(b)), and condense the compensatory mitigation options into the three general types described in the rule (mitigation bank credits, in-lieu fee program credits and permittee-responsible mitigation). Lastly, we request that the following portion of sentence in the same paragraph be deleted, as it is inaccurate due to the rule's requirements (e.g., financial assurance provisions) for any type of proposed compensatory mitigation project: "and they provide financial planning and scientific expertise (which is often not practical for permittee-responsible mitigation projects)…" 23.6

7. Section 2.3.1 (pg. 2-43, second full paragraph): This paragraph indicates that the SSHCP would eliminate the need for project-level Section 7 Endangered Species Act consultations. Prior to the Corps' request of, and the USFWS's (future envisioned) programmatic biological opinion (BO) associated with the Corps' CWA 404 permit strategy, notification requirements are as of yet unknown. As a federal action agency, the Corps is obligated to initiate consultation under Section 7 of the ESA, unless an ESA instrument (e.g., programmatic BO) explicitly negates the requirement to do so for proposed CWA 404 actions under the authority of the subject instrument. We request a clarification be made in the Final EIS of notification/non-notification options in alignment with the USFWS's anticipated outlook for the programmatic BO. 23.7

8. Section 2.3.1 (pg. 2-43, third full paragraph): This paragraph as currently written is inaccurate in terms of saying the SSHCP's Conservation Strategy would "address cumulative impacts to vernal pool wetlands within the Mather Core Recovery Area (MCRA)." The Corps is available to work with the USFWS to modify the existing wording in this paragraph to ensure accuracy. The wording needs to be amended to focus on the SSHCP's envisioned ability to address the ROD's vernal pool mitigation-related requirements in a distinct yet adequate manner than the existing regulatory environment. 23.8

9. Section 2.3.1 (pg. 2-44, first full paragraph): Please see Comment #7, above, in regard to future envisioned Section 7 ESA consultation requirements. 23.9

10. Section 2.3.1 (pg. 2-44, third full paragraph): There are a few inaccurate statements in the paragraph as currently written. We request the text be modified to read as follows, deleting a few inaccurate passages: "...watershed scale. Under the Proposed Action/Proposed Project Alternative, implementation of the SSHCP Conservation Strategy and the Aquatic Resource Program's (ARP's) mitigation approach (avoidance, minimization and compensation) would be assumed to assure CWA 404 mitigation (avoidance, minimization and compensation) is considered from a watershed-based perspective. The above-mentioned provisions, combined with a proposed in-lieu fee program (ILF); as discussed further below), would also systematically prioritize..." 23.10

11. Section 2.4.1 (pg. 2-126, sixth paragraph): Please see Comment #7, above, in regard to future envisioned Section 7 ESA consultation requirements. 23.11

12. Section 2.4.1 (pg. 2-127, second full paragraph): Please see Comment #7, above, in regard to future envisioned Section 7 ESA consultation requirements. Recommend addressing wording as per Comment #7, with option to add "..., and consultation, if required under the terms of a programmatic BO, would be highly streamlined" within the second sentence of the paragraph after "...would be in compliance with the ESA..." 23.12

13. Section 2.4.1 (pg. 2-127, fourth full paragraph): There are two inaccurate statements in this paragraph regarding individual project impact and/or mitigation assessment, and the role of the proposed ILF should be identified alongside the SSHCP and ARP at the beginning of the paragraph. Please delete "...evaluate individual project impacts, and..." and replace "...to determine if individual projects are adequately mitigation for aquatic resource impacts..." with "to plan for and manage/monitor appropriate compensatory mitigation for aquatic resource impacts..." 23.13

Chapter 10:

14. Section 10.1.1 (pg. 10-2, third paragraph): To obtain accuracy please add the words "may be" instead of "is" in the third line of the paragraph reading "compensatory mitigation [may be] required..." Compensatory mitigation requirements are assessed on a case-by-case basis in accordance with CWA 404 regulations and implementation guidance. 23.14

15. Section 10.1.1 (pg. 10-3, starting with first full paragraph): To obtain accuracy please delete the beginning of the first sentence ("In addition to setting minimum compensatory mitigation amounts..."). Similar to the request provided in Comment #6, please ensure accuracy of the three mitigation type definitions with wording in the 2008 Federal Mitigation Rule, such that there is reduced risk of paraphrasing a regulatory definition, and add the applicable citations from the "definitions" section of the rule (33 CFR Part 332.2). For example, the rule's definitions do not contain the term "CWA Permittee-Responsible Mitigation," but rather "permittee-responsible mitigation." Lastly, in the last paragraph on pg. 10-3, please see Comment #6 regarding the three main types of compensatory mitigation and a related rule citation. In past reviews, we have recommended using language and citations that are as close as possible to that contained in the rule itself. We reiterate this recommendation in this letter. 23.15

16. Section 10.1.2 (pg. 10-13, first paragraph): Please delete the phrase "...be isolated features that..." in the sentence reading "Seasonal Wetlands in the Planning Area..." There are CWA 404 jurisdictional authority implications associated with the word "isolated" that could be misconstrued from usage of the word in the context of an ecological type of description. 23.16

17. Section 10.1.2 (pg. 10-14, first paragraph, second line from top of page): Please add the phrase "may flow into" after the word "ultimately." Similar to Comment #16, this not only provides flexibility for various ecological/hydrological scenarios that exist on the ground, but avoids making a rigid statement regarding hydrologic connectivity of vernal pools to downstream waters. Hydrological connectivity is assessed on a case-by-case basis, and similar to Comment #16, has implications for CWA 404 jurisdictional authority. 23.17

18. Section 10.1.2 (pg. 10-23, first paragraph): This paragraph was newly added since our most recent review of the administrative draft Chapter 10 (and draft ARP, which the paragraph refers to). The text discusses that that ARP contains approximately 232 acres fewer aquatic resources than the SSHCP, due to three factors. The first two factors are mechanistic (e.g., digital mapping techniques, rounding). The third factor described is "[S]ome of the acreage of riparian land cover types reported in the SSHCP are considered non-jurisdictional as they are mitigation sites comprised of created or restored riparian habitat. Non-jurisdictional resources are not discussed in the ARP." Please note we will review the draft ARP as contained in the Draft EIS and provide comments to the SSHCP Plan Partners. The ARP's project-level implementation relies upon case-by-case verification of the amount, type, and boundary of aquatic resources and/or completion of a jurisdictional determination by our office when covered projects are proposed under the SSHCP. Without a case-specific determination by our office, we believe it is inappropriate to eliminate over 200 acres of potential aquatic resources from the ARP. 23.18

19. Section 10.2.2.1 (pg. 10-38, second-to-last paragraph): The EIS uses the term "aquatic resources" for the most part, to describe three types of resources (wetlands, streams, riparian). In this paragraph regarding the Sacramento County General Plan Update Final Environmental Impact Report (EIR), a determination of less than significant impacts to "wetland and riparian resources" as made in the Final EIR is described. It is unclear whether the Final EIR addressed streams. We recommend, if the Final EIR does address streams, the Final EIS is updated to include this information, and if the Final EIR does not address streams, the Final EIS assess the effects of the proposed action and other alternatives on streams, and determine the significance of those effects. 23.19

20. Section 10.2.2.1 (pg. 10-42, first paragraph): The paragraph discusses appropriate compensatory mitigation ratios for CWA 404, which previously in the document have been described as a minimum of 1:1. The No Action/No Project Alternative is described as compliant with the 2008 Federal Mitigation Rule. However, Table 10-4 indicates there would be 1,607 acres of loss of aquatic resources under this alternative, and Table 10-6 indicates there would be 1,424 acres of aquatic resources re-established or established. Including, for instance, 821 acres of wetland waters lost, yet only 691 acres of this same cover type "gained" (Tables 10-4 and 10-6, respectively). Please clarify how the 23.20

No Action/No Project Alternative would meet minimum compensatory mitigation ratio requirements (i.e., 1:1 ratio, unless there is a functional/condition assessment).

21. Section 10.2.2.2 (pgs. 10-44 to 10-45): There was a substantial editing of this section (Cumulative Analysis of the No Action/No Project) since our most recent review of the administrative draft Chapter 10. The Draft EIS identifies that impacts to wetlands within the SSHCP have been and are significant. However, the Draft EIS identifies that for the No Action and Proposed Action, past, present, and reasonably foreseeable future actions would not contribute to these significant effects. However, insufficient rationale has been provided for this determination. We recommend the Final EIS provide specific rationale regarding the cumulative effects of past, present, and reasonably foreseeable future actions on wetlands, taking into account any mitigation measures included as part of the No Action or Proposed Action, or added as mitigation measures of the EIS. 23.21

22. Section 10.2.3.1 (pg. 10-51, first paragraph): We note the preservation of non-wetland types of waters of the U.S. for the No Action/No Project Alternative has been substantially reduced since our previous review of the EIS, including the expectation stated in this paragraph that there would be no preservation of riparian land cover under the No Action/No Project Alternative. We request that the Final EIS clarify assumptions supporting this expectation. 23.22

23. Section 10.2.3.1 (pg. 10-52, bottom paragraph): Please see Comment #20 in regard to the statement made in this paragraph on the 1:1 compensatory mitigation ratio question for the No Action/No Project Alternative. Also, it may be recommended to add the phrase "at least" before "...one acre of establishment/re-establishment" in the paragraph, since the Proposed Action/Proposed Project's mitigation acreage is higher than the loss acreage (1,740 vs. 1,613 acres, respectively). 23.23

24. Section 10.2.3.2 (pg. 10-55, first paragraph): The cumulative effects discussion cites the No Action/No Project Alternative vs. the Proposed Action/Proposed Project Alternative in the header. Similar to Comment #21, the basis for the cumulative effects determination on pg. 10-45 is not fully clear from the rationale provided. 23.24

25. Section 10.2.4 (pg. 10-57, second full paragraph): The Reduced Permit Term Alternative is indicated to impact 1,097 acres of aquatic resources, citing Table 10-10; however, the total impact in Table 10-10 is 1,728 acres, which appears inconsistent. Also, the estimate for 758 acres of additional aquatic resources lost in the "remaining 20 years" of the 50-year EIS study period would be helpful to display in tabular form in the Final EIS, so that it can be better understood which types of aquatic resources may be impacted at what "rates" (e.g., by year 30, and in years 31-50). 23.25

26. Section 10.2.4 (pgs. 10-63 to 10-64). Please see Comment #24; this comment is repeated for the Reduced Permit Term Alternative. 23.26

We take our role as a cooperating agency on the SSHCP EIS very seriously, and appreciate the opportunity to provide the above comments. As specified in the comments, the requested clarifications in the EIS will result in a Final EIS that more accurately

describes the regulatory framework (and certain more specific mechanisms within) that the Corps would be operating under, for all three alternatives considered in the EIS. We would be glad to assist with any remaining questions as regards existing and/or proposed CWA 404 regulatory frameworks in relation to the SSHCP.

If you have any questions or wish to arrange to meet and discuss these comments, please contact Mary Pakenham-Walsh at 1325 J Street, Room 1350, Sacramento, California 95814, by email at *Mary.R.Pakenham-Walsh@usace.army.mil*, or telephone at (916) 557-7718. Please refer to identification number SPK-1995-00386 in any correspondence concerning this project. For more information regarding our program, please visit our website at *www.spk.usace.army.mil/Missions/Regulatory.aspx*.

Sincerely,

Michael S. Jewell
Chief, Regulatory Division

Mr. Jason Gerdes, U.S. Environmental Protection Agency, Region 9, Gerdes.Jason@epamail.epa.gov

RTC 23.1 (EIS/EIR) – The edit has been made as requested in the comment. The referenced paragraph in Section 1.6.5 of the Final EIS/EIR now reads as shown below:

> NEPA requirements for future Covered Activity projects requiring permits under the abbreviated SP process **would realize greater efficiencies.** ~~may be satisfied with a smaller Environmental Assessment-level of review, rather than the EIS-level of review that is typical under the current project-by-project CWA permit process. Even~~ f**F**or future Covered Activity urban development projects proposing potentially significant effects on the human environment**, for which the Corps determines requires** ~~and requiring the~~ preparation of an EIS, the ~~proposed~~ SP **abbreviated** process would be **reduced in terms of process, information requirements, and timing. Please refer to *Appendix* C for additional description of the SP abbreviated process.** ~~greatly abbreviated by relying on the regional, programmatic, and comprehensive analysis in the EIS/EIR.~~

Similar text discussing the USACE's proposed Permit Strategy in Sections 1.5.4, 1.6.1, and Chapter 2 of the Final EIS/EIR was also edited in response to this comment.

RTC 23.2 (EIS/EIR) – The edit has been made as requested in the comment. The referenced paragraph in Section 2.1.1 of the Final EIS/EIR now reads as shown below:

> Consideration of alternatives is also required under the Section 404 of the Clean Water Act (CWA 404). Activities that would result in the discharge of dredged or fill material into wetlands and other waters of the United States **may** require authorization…

RTC 23.3 (EIS/EIR) – The edit has been made as requested in the comment. The referenced paragraph in Section 2.1.1 of the Final EIS/EIR now reads as shown below:

> Per the USACE's NEPA implementing regulations (33 CFR 325, Appendix B(9)(b)(5)), the alternatives analysis conducted in an EIS should be thorough enough to use for both the public interest review and the Section 404(b)(1) guidelines, where applicable**; however, on a case-by-case basis, additional information may be necessary. As discussed in Section 1.5.4, as part of its compliance documentation with EPA's 404(b)(1) Guidelines, the USACE will also consider additional information outside the purview of the NEPA process for this project.** Under the USACE public interest review, for activities in which there are unresolved conflicts as to resource use, USACE must evaluate the practicability of using reasonable alternative locations and methods to accomplish the objective of the proposed structure or work (33 CFR 320.4(a)(2)(ii)). As explained in Section 2.1.1, under the Section 404(b)(1) Guidelines, USACE must evaluate the practicability of alternatives in light of the overall project purpose (40 CFR 230.10(a)).

RTC 23.4 (EIS/EIR) – The edit has been made as requested in the comment. The referenced paragraph in Section 2.1.4 of the Final EIS/EIR now reads as shown below:

In addition to the previously described CEQA and NEPA considerations, alternatives to adverse effects on the aquatic ecosystem must be evaluated by USACE pursuant with the requirements of the Section 404(b)(1) Guidelines. The alternatives analysis conducted in an EIS should be thorough enough to use for both the public interest review and the Section 404(b)(1) guidelines, where applicable**; however, on a case-by-case basis, additional information may be necessary. As discussed in Section 1.5.4, as part of its compliance documentation with EPA's 404(b)(1) Guidelines, the USACE will also consider additional information outside the purview of the NEPA process for this project**.

RTC 23.5 (EIS/EIR) – The edit has been made as requested in the comment. The referenced text in Section 2.2.2 of the Final EIS/EIR now reads as shown below:

In cases where functional or condition assessments or other suitable metrics are not used to determine loss of functions and services, a minimum one-to-one acreage or one-to-one linear foot compensation ratio (i.e., a 1:1 mitigation ratio) required by the 2008 Compensatory Mitigation Rule would be **assumed to be required** ~~used~~.

RTC 23.6 (EIS/EIR) – The edit has been made as requested in the comment. The edits also reflect input provided on similar text in Comment 23.15. The referenced paragraph in Section 2.2.2 now reads as shown below. Instances of similar text elsewhere in the Final EIS/EIR have been edited in a similar manner.

~~In addition to setting minimum compensatory mitigation amounts,~~ t**T**he 2008 Mitigation Rule establishes equivalent standards for types of compensatory mitigation ~~projects~~ **(33 CFR Part 332.2(b))**. The three **general options**~~types of~~ **for** compensatory mitigation ~~projects~~ are: ~~use of~~ mitigation bank~~s~~ **credits**, ~~use of~~ in-lieu fee program~~s~~ **credits**, **and** ~~or~~ permittee-responsible mitigation ~~projects~~. Use of mitigation bank~~s~~ **credits** and use of in-lieu fee program~~s~~ **credits** are the preferred forms of CWA 404 compensatory mitigation under the 2008 Mitigation Rule, as they usually involve consolidating compensatory mitigation projects in ecologically appropriate locations using a watershed approach, they consolidate resource~~s, and they provide financial planning and scientific expertise (which often is not practical for permittee-responsible mitigation projects)~~, they reduce temporal losses of functions, and they reduce uncertainty over mitigation project success. The 2008 Mitigation Rule would continue to require the USACE to consider compensatory mitigation options in the following order: 1) credits from a mitigation bank; 2) credits from an in-lieu fee program; 3) permittee-responsible mitigation under a watershed approach; 4) permittee-responsible mitigation through on-site and in-kind mitigation and; 5) permittee-responsible mitigation through off-site and/or out of kind mitigation.

RTC 23.7 (EIS/EIR) – The text referenced in the comment has been edited in Section 2.3.1 of the Final EIS/EIR as shown below:

> The SSHCP would provide real streamlining for project proponents by significantly reducing timeline for obtaining local approvals and entitlements, ESA and CESA authorizations, and CWA 404 authorizations. **It is also anticipated project level consultation** with CDFW under CESA **would be reduced or eliminated for Covered Species and Covered Activities**.

Text was also added to Section 1.5.4 of the Final EIS/EIR as shown below:

> **As the final EIS/EIR was prepared, the USFWS continued to coordinate with USACE to discuss the most efficient approach to achieving ESA section 7 compliance for the Corps' section 404 CWA permit strategy for future SSHCP covered activities. This approach will be described and documented prior to the Service's completion of the Record of Decision and issuance of the SSHCP ITP. The intent of USFWS is to provide the Corps with one biological opinion that will reflect compliance with ESA section 7(a)(2) for section 404 CWA permitting of SSHCP Covered Activities, and preclude the need for project level consultations on individual SSHCP covered activities.**

RTC 23.8 (EIS/EIR) – Discussion of the Sunridge ROD in the referenced paragraph was misplaced under the section heading Project ESA and CESA Compliance. The paragraph in Section 2.3.1 of the Final EIS/EIR was edited as shown below to focus on ESA rather than CWA compliance.

> The ~~Reduced Permit Term Alternative's~~ **SSHCP** Conservation Strategy would address cumulative impacts to vernal pool~~s~~ **species** within the MCRA. ~~Cumulative impacts within the MCRA as defined in the Sunridge ROD (see Section 2.2.2) would be addressed through implementation of the SSHCP Conservation Strategy (described below in Section 2.3.5).~~

The comment letter does not identify that the same text is repeated in Section 2.4.1 in reference to the Reduced Permit Term Alternative. Similar edits were made in that section to provide a consistent description of both action alternatives.

RTC 23.9 (EIS/EIR) – See the response to Comment 23.7.

RTC 23.10 (EIS/EIR) – The edit has been made as requested in the comment. The referenced paragraph in Section 2.3.1 of the Final EIS/EIR now reads as shown below:

> As discussed in Section 2.2.2, the existing approach to permitting under CWA 404 provides the regulatory agencies little opportunity to evaluate individual project impacts or proposed mitigation within a regional or a watershed scale~~; thus, the wetland regulatory agencies often have difficulty determining if projects are adequately mitigating for aquatic resource impacts~~. Under the Proposed Action/Proposed Project Alternative, implementation of the SSHCP

Conservation Strategy and the ARP's **mitigation approach (avoidance, minimization and compensation) would be assumed to** ~~measures to avoid and minimize impacts to aquatic resources, the Proposed Action/Proposed Project would~~ assure CWA 404 ~~compensatory~~ mitigation **(avoidance, minimization and compensation)** ~~for unavoidable impacts to aquatic resources~~ is considered from a watershed-based perspective~~,~~**. These provisions, combined with a proposed in-lieu fee program (ILF); as discussed further below),** ~~and~~ would **also** systematically prioritize compensatory mitigation projects based on anticipated impacts to aquatic resources, considering both watershed- and function-based factors.

RTC 23.11 (EIS/EIR) –. Compliance with ESA Section 7(a)(2) for USACE's 404 CWA permitting of Covered Activities under the Reduced Permit Term Alternative would be achieved in the same manner as described for the Proposed Action/Proposed Project. See response to Comment 23.7.

RTC 23.12 (EIS/EIR) – The text in Section 2.4.1 of the Final EIS/EIR referenced in the comment now reads as shown below. Also see responses to Comments 23.7 and 23.9.

During the 30-year permit term, Covered Activity compliance with CWA 404 would be similar to the process described in Section 2.3.1 for the Proposed Action/Proposed Project Alternative. Each Covered Activity that meets the requirements of the HCP would be in compliance with the ESA, and any incidental take of federally listed species would be covered by the 30-year ESA incidental take permit. Therefore, **it is envisioned that in most cases** during the 30-year permit term, the USACE would not be required to initiate ESA Section 7 consultation with the USFWS before authorizing a Covered Activity project under CWA 404. This will shorten project timelines and reduce project costs, as was described for the Proposed Action/Proposed Project Alternative.

RTC 23.13 (EIS/EIR) – The edit has been made as requested in the comment. The referenced paragraph in Section 2.4.1 of the Final EIS/EIR now reads as shown below:

Because the HCP Conservation Strategy**,** ~~and the~~ ARP, **and proposed In Lieu Fee program** will allow the USACE and RWQCB the ability to evaluate~~individual project impacts, and evaluate~~ proposed locations for compensatory mitigation using a watershed and regional-scale approach, wetland regulatory agencies would be better able to **plan for adequate compensatory mitigation** ~~determine if individual projects are adequately mitigating~~ for aquatic resource impacts in ecologically appropriate locations, as was described for the Conservation Strategy of the Proposed Action/Proposed Project Alternative.

RTC 23.14 (EIS/EIR) – The edit has been made as requested in the comment. The referenced text in Section 10.1.1 of the Final EIS/EIR now reads as shown below:

> For discharge of dredged or fill material authorized under CWA 404, adverse impacts to waters of the United States (WOUS) must be avoided and minimized to the extent practicable. For unavoidable impacts, compensatory mitigation ~~is~~ **may be** required to replace the loss of WOUS functions. In 2008, the USACE and the U.S. Environmental Protection Agency (USEPA) jointly issued regulations for compensatory mitigation titled *Compensatory Mitigation for Losses of Aquatic Resources: Final Rule, 33 CFR Parts 325 and 332* (USACE and USEPA 2008).

RTC 23.15 (EIS/EIR) – The edit has been made as requested in the comment. The edits also reflect input provided on similar text in Comment 23.6. The referenced text in Section 10.1.1 of the Final EIS/EIR now reads as shown below. Instances of similar text elsewhere in the EIS/EIR have been edited in a similar manner.

> ~~In addition to setting minimum compensatory mitigation amounts,~~ **t**~~T~~**The** 2008 Compensatory Mitigation Rule establishes equivalent standards for **types of** aquatic resource compensatory mitigation ~~projects~~ regardless of whether they are conducted by mitigation banks, in-lieu fee programs, or permittees **(33 CFR Part 332.2(b))**. There are three **general options**~~forms~~ of compensatory mitigation:
>
> 1. **Mitigation Bank:** a site, or suite of sites, where resources (e.g., wetlands, streams, riparian areas) are restored, established, enhanced, and/or preserved for the purpose of providing compensatory mitigation for impacts authorized by Department of the Army permits. In general, a mitigation bank sells compensatory mitigation credits to permittees whose obligation to provide compensatory mitigation is then transferred to the mitigation bank sponsor. The operation and use of a mitigation bank are governed by a mitigation banking instrument.
> 2. **In-Lieu Fee Program:** conducts the restoration, establishment, enhancement, and/or preservation of aquatic resources through funds paid to a governmental agencies or non-profit natural resources management entity by permittees to satisfy compensatory mitigation requirements for their Corps permits. Similar to a mitigation bank, an in-lieu fee program sells compensatory mitigation credits to permittees whose obligation to provide compensatory mitigation is then transferred to the in-lieu program sponsor. The operation and use of an in-lieu fee program are governed by an in-lieu fee program instrument.
> 3. ~~**CWA**~~ **Permittee-Responsible Mitigation:** an aquatic resource restoration, establishment, enhancement, and/or preservation activity undertaken by the permittee (or an authorized agent or contractor) to provide compensatory mitigation for which the permittee retains full responsibility.
>
> Use of mitigation banks and use of in-lieu fee programs are the preferred forms of compensatory mitigation under the 2008 Compensatory Mitigation

Rule as they usually involve consolidating compensatory mitigation projects where ecologically appropriate and use a watershed approach, consolidate resources, ~~provide financial planning and scientific expertise (which often is not practical for permittee-responsible mitigation projects),~~ reduce temporal losses of functions, and reduce uncertainty over mitigation project success. The 2008 Mitigation Rule requires the district engineer to consider compensatory mitigation options in the following order: 1) Credits from a mitigation bank; 2) Credits from an in-lieu fee program; 3) Permittee-responsible mitigation under a watershed approach; 4) Permittee-responsible mitigation through on-site and in-kind mitigation; 5) Permittee-responsible mitigation through off-site and/or out of kind mitigation. However, this preference hierarchy may be overridden in cases where forms of mitigation lower on the preference hierarchy are determined to better serve the aquatic resource needs of a watershed and are documented in the administrative record.

RTC 23.16 (EIS/EIR) – The edit has been made as requested in the comment. The referenced text in Section 10.1.2 of the Final EIS/EIR now reads as shown below:

Seasonal Wetlands in the Planning Area tend to ~~be isolated features that~~ occur within moderate to large depressional features along streams, creeks, and rivers; along the edges of open water, or scattered within the Valley Grassland land cover.

RTC 23.17 (EIS/EIR) – The edit has been made as requested in the comment. The referenced text in Section 10.1.2 of the Final EIS/EIR now reads as shown below:

The movement of surface water between vernal pools can occur in a network of narrow and intermittent surface “swales” (Solomeshch et al. 2007). In many vernal pool landscapes, including those in the Planning Area, surface water flows through integrated ephemeral swales to other vernal pools, and ultimately **may flow in**to a seasonal stream. Consequently, vernal pool landscapes comprise the upper watershed position of many stream systems (Rains et al. 2006).

RTC 23.18 (EIS/EIR) – The comment identifies text in the EIS/EIR that provides an explanation for why the draft ARP contains approximately 232 fewer acres of aquatic resources than the SSHCP. The comment states that USACE will review the ARP and provide comments to the SSHCP Plan Partners regarding this topic. The SSHCP Plan Partners appreciate the opportunity to further coordinate with USACE on the ARP, as well as the SSHCP and the EIS/EIR.

RTC 23.19 (EIS/EIR) – The Sacramento County General Plan Update Final EIR (Sacramento County General Plan EIR) (Sacramento County 2010) appears to use the term “wetland” fairly loosely to encompass a variety of aquatic habitat types. Although not explicitly stated, streams appear included in this “wetland” category as a list of potential impact mechanisms to wetlands includes “alteration of the bed and bank”. The

Draft EIS/EIR text in Section 10.2.2.1 referenced in the comment has been edited to read as shown below:
