In addition, SMAQMD regulates objectionable odors through Rule 402 (Nuisance), which prohibits any person or source from emitting air contaminants that cause detriment, nuisance, or annoyance to a considerable number of persons or the public. Rule 402 is enforced based on complaints. If complaints are received, the SMAQMD is required to investigate the complaint, as well as determine and ensure a solution for the source of the complaint, which could include operational modifications. Thus, although not anticipated, if odor complaints are submitted after the proposed project is approved, the SMAQMD would ensure that such odors are addressed and any potential odor effects reduced to less than significant.

For the aforementioned reasons, implementation of the proposed project would not result in emissions (such as those leading to odors) adversely affecting a substantial number of people, and a ***less-than-significant*** impact would result.

[7] Sacramento Metropolitan Air Quality Management District. *CEQA Guide to Air Quality Assessment* [pg. 7-3]. December, 2007. Available at: http://www.airquality.org/LandUseTransportation/Documents/Ch7Odors%20FINAL6-2016.pdf. Accessed June 24, 2019.

IV. BIOLOGICAL RESOURCES. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	✖	☐	☐	☐
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?	✖	☐	☐	☐
c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	✖	☐	☐	☐
d. Interfere substantially with the movement of any resident or migratory fish or wildlife species or with established resident or migratory wildlife corridors, or impede the use of wildlife nursery sites?	✖	☐	☐	☐
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	✖	☐	☐	☐
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state habitat conservation plan?	✖	☐	☐	☐

Discussion

a. A search of special-status species in the area was conducted for the Buffalo Creek 7.5-minute quadrangle through the California Natural Diversity Database (CNDDB) for the project area.[8] According to the CNDDB, various species of special-status plants and animals occur within the vicinity of the project site. Special-status plants with the potential to occur at the project site include legenere, slender Orcutt grass, Sacramento Orcutt grass, and Sanford's arrowhead. In addition, the potential exists for the following special-status wildlife species to occur on-site: conservancy fairy shrimp, mid-valley fairy shrimp, ricksecker's water scavenger beetle, vernal pool tadpole shrimp, western spadefoot, American badger, burrowing owl, ferruginous hawk, golden eagle, grasshopper sparrow, loggerhead shrike, merlin, northern harrier, western pond turtle, white-tailed kite, Swainson's hawk, tricolored blackbird, special-status bats, and other migratory birds and nesting raptors protected by the Migratory Bird Treaty Act. Therefore, the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations, or by the California Department of Fish and Wildlife, or U.S. Fish & Wildlife Service. Thus, a ***potentially significant*** impact could occur.

[8] California Natural Diversity Database. *Buffalo Creek, California*. 2018

Further analysis of the above impact will be included in the Biological Resources chapter of The Preserve Project EIR.

b,c. A Wetland Delineation prepared for the project site in accordance with the Army Corps of Engineers Wetland Delineation Manual noted that the project site contains potential wetlands and waters of the U.S., including vernal pools, wetland swales, and streams/creeks. The various on-site wetlands are seasonal; however, the wetlands may serve as potential habitats for various species found on the project site. Although a portion of the project site would remain open space, the potential exists that development of the proposed residences would disturb the wetlands and vernal pools located on-site. Furthermore, while the project would include a 100-foot setback from Morrison Creek, the potential to disrupt wildlife in the area still exists. Therefore, the project could have a substantial adverse effect on riparian habitat or other sensitive natural communities identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service, and could have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Biological Resources chapter of The Preserve Project EIR.

d. Wildlife movement corridors link together areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or by areas of human disturbance or urban development. Topography and other natural factors in combination with urbanization can fragment or separate large open-space areas. The fragmentation of natural habitat can create isolated “islands” of vegetation and habitat that may not provide sufficient area to accommodate sustainable populations and can adversely impact genetic and species diversity.

The proposed project site contains Morrison Creek which is located within the northern portion of the site and various riparian habitats are present throughout project site. The riparian vegetation could represent a wildlife movement corridor which could be disturbed with implementation of the project. Moreover, the use of the project site as a wildlife nursery site, although unlikely, is currently unknown. Due to the potential presence of the wildlife movement corridors the project could interfere substantially with the movement of any resident or migratory fish or wildlife species or with established resident or migratory wildlife corridors, or impede the use of wildlife nursery sites. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Biological Resources chapter of The Preserve Project EIR.

e. The project site contains a total of 249 trees greater than six inches in diameter at standard height (dsh) for trees measured at 4.5-feet above natural grade. All of the trees on the project site are nonnative to the region. Of the 249 total trees on the project site, 146 trees are 12-inches or more in dsh and meet the definition of a Protected Tree per the City of Rancho Cordova’s Municipal Code (Chapter 19.12). With implementation of the proposed project, a portion of the existing trees would require removal to accommodate the proposed development. Removal of a substantial number of trees, including protected trees could result in a ***potentially significant*** impact related to conflicting with local

policies or ordinances protecting biological resources, including local tree preservation policies.

Further analysis of the above impact will be included in the Biological Resources chapter of The Preserve Project EIR.

f. The South Sacramento Habitat Conservation Plan (SSHCP) was recently adopted in February of 2018, by the cities of Rancho Cordova and Galt; Sacramento County; the Sacramento County Water Agency; the Sacramento County Regional Sanitation District; and the Capital Southeast Connector Joint Powers Authority. The project site is located within the boundaries of the SSHCP and is subject to the SSHCP requirements. The proposed project would be subject to compliance monitoring to track the status of the SSHCP implementation and provide protection and mitigation for covered species. As such, the potential exists for the proposed project to conflict with applicable standards within the SSHCP, and a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Biological Resources chapter of The Preserve Project EIR.

V. CULTURAL RESOURCES. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?	✖	☐	☐	☐
b. Cause a substantial adverse change in the significance of a unique archaeological resource pursuant to Section 15064.5?	✖	☐	☐	☐
c. Disturb any human remains, including those interred outside of dedicated cemeteries.	✖	☐	☐	☐

Discussion

a,b,c. Historical resources are features that are associated with the lives of historically important persons and/or historically significant events, that embody the distinctive characteristics of a type, period, region or method of construction, or that have yielded, or may be likely to yield, information important to the pre-history or history of the local area, California, or the nation. Examples of typical historical resources include, but are not limited to, buildings, farmsteads, rail lines, bridges, and trash scatters containing objects such as colored glass and ceramics. According to the City's General Plan EIR, the Rancho Cordova Planning Area contains twenty-three historic resources, eight prehistoric sites, and one prehistoric/historic site.[9] The project site has not been formally evaluated for the presence/absence of historic or archaeological resources, nor has the site been evaluated for the presence/absence of human remains. Consequently, the presence or absence of such resources at the project site is currently unknown, and the possibility exists that such resources could occur on-site.

Considering that unknown historical/archaeological resources, including human remains, have the potential to exist on-site, ground-disturbing activity related to the proposed construction activities could encounter such resources. Therefore, the project could cause a substantial adverse change in the significance of historical or archaeological resources, including human remains, and a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Cultural and Tribal Resources chapter of The Preserve Project EIR.

[9] City of Ranch Cordova. *City of Rancho Cordova General Plan Draft Environmental Impact Report*. [Page 4.11-3] March 13, 2006.

VI. ENERGY. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	✖	☐	☐	☐
b. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	✖	☐	☐	☐

Discussion

a,b. The main forms of available energy supply are electricity, natural gas, and oil. A description of the 2019 California Green Building Standards Code (CBSC), with which the proposed project would be required to comply, as well as discussions regarding the proposed project's potential effects related to energy demand during construction and operations is provided below.

The 2019 CBSC, otherwise known as the CAL Green Code (CCR Title 24, Part 11), which will become effective on January 1, 2020.[10] The purpose of the CAL Green Code is to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices. The CBSC standards regulate the method of use, properties, performance, types of materials used in construction, alteration repair, improvement and rehabilitation of a structure or improvement to property. Construction of the proposed project would involve an increase in energy demand and consumption. Construction related work would require the use of oil in the form of gasoline or diesel fuel or construction trips. Hauling and materials truck delivery and operation of off-road construction equipment would be required in the development of the project.

The project is anticipated to receive electricity from SMUD and natural gas from PG&E. Energy use associated with operation of the proposed project would be typical of residential uses requiring electricity and natural gas for interior and exterior building lighting, heating, ventilation, and air condition (HVAC), electronic equipment, machinery, appliances, security systems, and more.

Based on the increased use of energy during project construction and operations, the project could result in a significant impact due to wasteful or inefficient energy as well as conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Air Quality and Greenhouse Gas Emissions (including Energy) chapter of The Preserve Project EIR.

[10] California Building Standards Commission. *California Green Building Standards Code*. 2019.

VII. GEOLOGY AND SOILS. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☐	✖
ii. Strong seismic ground shaking?	✖	☐	☐	☐
iii. Seismic-related ground failure, including liquefaction?	✖	☐	☐	☐
iv. Landslides?	✖	☐	☐	☐
b. Result in substantial soil erosion or the loss of topsoil?	✖	☐	☐	☐
c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	✖	☐	☐	☐
d. Be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	✖	☐	☐	☐
e. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	✖
f. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	✖	☐	☐	☐

Discussion

ai. According to the City's General Plan EIR, the closest fault zone to the project site is the Bear Mountain fault zone. The Bear Mountain fault zone is the primary fault concern in Sacramento County; however, the fault zone is located approximately 24 miles northeast of Rancho Cordova's Planning Area. Given that known surface expressions of fault traces do not exist within the City's Planning Area, including the site, fault rupture hazard is not a significant geologic hazard at the site. In addition, Alquist-Priolo Earthquake Fault Zones are not known to exist near the project site. Therefore, ***no impact*** would occur related to substantial adverse effects, including risk, injury, or death, associated with the rupture of a known fault zone.

aii. Ground shaking is the motion that occurs as energy is released during fault related activity and occurs as a result of seismic activity. According to the General Plan EIR, the greatest geologic potential for injury or property damage in the Planning Area is the result of ground shaking from a nearby earthquake. The Planning Area is located within Seismic Zone 3,

which is a characteristic of the intensity of an earthquake in a given area. Seismic Zone 3 is considered an area of relatively low ground shaking potential. The California Building Code requirements would mitigate the shaking effects of nearby seismic activity. Structures built in compliance with the California Building Code should be able to resist moderate earthquakes although some nonstructural damage may occur, and resist major earthquakes without collapse; however, some structural and nonstructural damage is common.

The project would be built in compliance with the California Building Code requirements. Although the project would adhere to the California Building Code requirements, the proposed project could expose people or structures to substantial adverse effects including the risk of loss, injury, or death involving seismic ground shaking and a ***potentially significant*** impact would occur.

Further analysis of the above impact will be included in the Geology and Soils/Mineral Resources chapter of The Preserve Project EIR.

aiii, aiv,
c. The proposed project's potential effects related to liquefaction, landslides, lateral spreading, and subsidence/settlement are discussed in detail below.

Liquefaction

Liquefaction is the temporary transformation of loose, saturated granular sediments from a solid state to a liquefied state as a result of seismic ground shaking. In the process, the soil undergoes transient loss of strength, which commonly causes ground displacement or ground failure to occur. Because saturated soils are a necessary condition for liquefaction, soil layers in areas where the groundwater table is near the surface have higher liquefaction potential than those in which the water table is located at greater depths. As noted in the General Plan EIR, the depth to the groundwater table and aquifer system is generally greater than 50 feet. While it is not likely that unstable soil is located at the project site, further investigation is necessary to determine the presence/absence of liquefiable soils at the project site.

Landslides

Seismically-induced landslides are triggered by earthquake ground shaking. The risk of landslide hazard is greatest in areas with steep, unstable slopes. Although on-site slopes are relatively minor, the potential for landslides to occur at or affect the site is currently unknown. Therefore, further investigation is necessary to ensure the proposed project would not result in adverse effects.

Lateral Spreading

Lateral spreading is horizontal/lateral ground movement of relatively flat-lying soil deposits towards a free face such as an excavation, channel, or open body of water; typically, lateral spreading is associated with liquefaction of one or more subsurface layers near the bottom of the exposed slope. Because the potential for liquefaction to occur at the site is unknown, the potential for lateral spreading to occur is unknown. Further analysis of the geologic conditions is required to avoid adverse effects.

Subsidence/Settlement

Loose unsaturated sandy soils can settle during strong seismic shaking. The potential for subsidence/settlement at the site is currently unknown, thus, further study is required to ensure that the proposed project would not result in substantial adverse effects related to subsidence or settlement of on-site soils.

Conclusion

Based on the above discussion, further analysis of on-site soil conditions is necessary to ensure that the proposed project would not result in adverse effects related to liquefaction, landslides, lateral spreading, or subsidence/settlement. Thus, a ***potentially significant*** impact could occur related to directly or indirectly causing substantial adverse effects, including the risk of loss, injury, or death, involving liquefaction, due to the sites location on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, potentially resulting in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.

Further analysis of the above impact will be included in the Geology and Soils/Mineral Resources chapter of The Preserve Project EIR.

b. Issues related to erosion and degradation of water quality during construction are further discussed in Section X, Hydrology and Water Quality, of this IS, under question 'a'. During grading activities associated with development of the proposed project, soil may be temporarily exposed. Thus, the potential exists for wind and water to erode portions of the soil on-site, resulting in the loss of topsoil. Impacts related to substantial soil erosion or the loss of topsoil during construction of the proposed project could be ***potentially significant***.

Further analysis of the above impact will be included in the Hydrology and Water Quality (Drainage) chapter of The Preserve Project EIR.

d. Expansive soils can undergo significant volume changes with changes in moisture content. Specifically, such soils shrink and harden when dried and expand and soften when wetted. If structures are underlain by expansive soils, foundation systems must be capable of withstanding the potential damaging movements of the soil. The proposed project would include construction of foundations or development of residential structures that could be subject to potential risks related to expansive soils. Further study of the geologic conditions would be necessary. Therefore, the proposed project would result in a ***potentially significant*** impact related to being located on expansive soil, as defined in Table 18-1B of the Uniform Building Code, thereby creating substantial direct or indirect risks to life or property.

Further analysis of the above impact will be included in the Geology and Soils/Mineral Resources chapter of The Preserve Project EIR.

e. The proposed project would include connection to the County Sanitation District 1 system. Therefore, because the proposed project would use a sewer system, ***no impact*** regarding the capability of soil to adequately support the use of septic tanks or alternative wastewater disposal systems would occur.

f. The potential for paleontological resources/unique geologic features to exist at the site is unknown. Should previously unknown paleontological resources exist within the project

site, ground-disturbing activity such as grading and excavating associated with development of the proposed project would have the potential to disturb or destroy such resources. Therefore, the proposed project could result in the direct or indirect destruction of a unique paleontological resource, and a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Geology and Soils/Mineral Resources chapter of The Preserve Project EIR.

VIII. GREENHOUSE GAS EMISSIONS. *Would the project:*	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	✖	☐	☐	☐
b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gasses?	✖	☐	☐	☐

Discussion

a,b. Emissions of greenhouse gases (GHGs) contributing to global climate change are attributable in large part to human activities associated with the industrial/manufacturing, utility, transportation, residential, and agricultural sectors. Therefore, the cumulative global emissions of GHGs contributing to global climate change can be attributed to every nation, region, and city, and virtually every individual on Earth. An individual project's GHG emissions are at a micro-scale level relative to global emissions and effects to global climate change; however, an individual project could result in a cumulatively considerable incremental contribution to a significant cumulative macro-scale impact. As such, impacts related to emissions of GHG are inherently considered cumulative impacts.

Implementation of the proposed project would cumulatively contribute to increases of GHG emissions. Estimated GHG emissions attributable to the project would be primarily associated with increases of carbon dioxide (CO_2) and, to a lesser extent, other GHG pollutants, such as methane (CH_4) and nitrous oxide (N_2O) associated with area sources, mobile sources or vehicles, and electricity use. As such, the proposed project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, or conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Therefore, impacts related to GHG emissions and global climate change could be cumulatively considerable and considered ***potentially significant***.

Further analysis of the above impact will be included in the Air Quality and Greenhouse Gas Emissions (including Energy) chapter of The Preserve Project EIR.

IX. HAZARDS AND HAZARDOUS MATERIALS. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	✖	☐	☐	☐
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment?	✖	☐	☐	☐
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	✖
d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	✖	☐
e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	✖
f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	✖	☐
g. Expose people or structures, either directly or indirectly, to the risk of loss, injury or death involving wildland fires?	☐	☐	✖	☐

Discussion

a,b. A significant hazard to the public or the environment could result from the routine transport, use, or disposal of hazardous materials. While the proposed project would not be used for industrial purposes, previous uses of the project site may have involved past uses of hazardous materials. Given that the project site is designated for agricultural production uses, the potential exists for on-site soils to be contaminated with herbicides and/or pesticides from past agricultural activities on-site. If present in sufficient concentrations, such chemicals could pose a risk to workers involved in earth-moving activities at the project site.

In addition, the project site contains two single-family residences on the property which may require removal as part of the proposed project. For buildings constructed prior to 1980, the Code of Federal Regulations (29 CFR 1926.1101) states that all thermal system insulation must be designated as “presumed asbestos containing material.” Asbestos is the name for a group of natural occurring silicate materials that are considered “fibrous” and can cause serious illness if inhaled. In addition, lead-based paint is common in structures built prior to 1978. Lead is considered a highly toxic material and caution should be used when removing similar structures. Because the age of the structures on-site is

unknown, the presence or absence of asbestos and lead-based paint cannot be determined at this time.

The project site currently contains septic systems to support the existing residences. The proposed project would include connection to the County Sanitation District 1 system; thus, abandonment of the existing septic systems would be necessary. If not properly abandoned, the on-site septic systems could pose a hazard to construction workers or future residents. Thus, further analysis is needed to determine the potential impacts of the previous septic systems.

Given that the previous uses of the site and current conditions of the on-site structures are unknown, and the need to properly abandon the existing septic system, a ***potentially significant*** impact could occur involving the release of hazardous materials into the public environment.

Further analysis of the above impact will be included in the Hazards and Hazardous Materials chapter of The Preserve Project EIR.

c. The nearest schools relative to the project site are Sunrise Elementary School, located approximately 2.3 miles west of the site, and Robert J. McGarvey Elementary School, located approximately 2.5 miles southwest of the site. Therefore, schools are not located within a quarter mile of the site and the proposed project would result in ***no impact*** related to hazardous emissions or the handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

d. A list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 was accessed through the Envirostor database.[11] Based on Envirostor data, the project site has not been listed as a past or present hazardous materials site. The nearest hazardous materials site is a McDonnell Douglas test site which is located approximately 0.80-mile from the project site. Therefore, the project would have a ***less-than-significant*** impact with respect to the location of the project on a hazardous materials site or creating a significant hazard to the public.

e. The proposed project is not located within an airport land use plan. The closest airport to the project site is Mather Airport, located approximately five miles to the west of the project site. Therefore, the proposed project site is not located within two miles of any public airports and does not fall within an airport land use plan area and ***no impact*** would result related to a safety hazard for people living or working in the area.

f. Sufficient emergency access is determined by a number of factors including site circulation and access points. The project would include two off-site entry points and improvements to Raymer Way, as well as an extension to the existing Camden at Somerset Ranch Subdivision by way of an extension of Edington Drive and a new connection to Thornburg Way. The streets would be between 42 and 69-feet wide which would provide adequate emergency vehicle access meeting a minimum 20-feet street width requirement. The proposed project would not include substantial modifications to the existing roadway system in the project area. The proposed project would not include any changes to the surrounding roadway networks that would impair circulation. Therefore, the proposed

[11] Department of Toxic Substances Control. *Envirostor Database Map*. Available at: https://www.envirostor.dtsc.ca.gov/public/map/?myaddress=Sacramento&tour=True. Accessed July 12, 2019.

project would not impair or physically interfere with any emergency evacuation or response plan, and a ***less-than-significant*** impact would occur.

g. Issues related to wildfire hazards are discussed in Section XX, Wildfire, of this IS. As noted therein, the project site is not located within a Very High or High Fire Hazard Severity Zone (FHSZ).[12] In addition, the site is bordered by an existing residential development to the south which limits the risk of wildland fire to the project site. The area located east of the project site, across Grant Line Road, is designated as a moderate fire hazard zone; the project site is separated from the moderate fire hazard zone by Grant Line Road, and fire protection services are provided to the site by the Sacramento Metropolitan Fire District. Therefore, the nearby moderate fire hazard zone is not considered to pose a substantial hazard to the proposed residences.

The proposed project would not expose people or structures to the risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands, and a ***less-than-significant*** impact would occur.

[12] California Department of Forestry and Fire Protection. *Sacramento County, Fire Hazard Severity Zones in SRA*. November 7, 2007.

X. HYDROLOGY AND WATER QUALITY. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	✖	☐	☐	☐
b. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	✖	☐	☐	☐
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
i. Result in substantial erosion or siltation on- or off-site;	✖	☐	☐	☐
ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;	✖	☐	☐	☐
iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	✖	☐	☐	☐
iv. Impede or redirect flood flows?	✖	☐	☐	☐
d. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	✖
e. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	✖	☐	☐	☐

Discussion

a. During the early stages of construction, topsoil would be exposed due to grading and leveling of the site. Therefore, after grading and leveling and prior to overlaying the ground with imperious surfaces, the potential exists for wind and water erosion to discharge sediment and/or urban pollutants into stormwater runoff, which would adversely affect water quality. In addition, the proposed project would result in the generation of increased urban runoff from the creation of substantial impervious areas, which could contribute urban runoff constituents to downstream surface waters. The proposed project would be subject to regulation by the Central Valley Regional Water Quality Control Board (CVRWQCB) to prevent degradation of water quality.

Based on the above, the proposed project could result in the violation of water quality standards and degradation of water quality, and a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Hydrology and Water Quality (Drainage) chapter of The Preserve Project EIR.

b,e. According to the Sacramento County Water Agency's Urban Water Management Plan (UWMP), the Sacramento Central Groundwater Authority (SCGA) adopted a Groundwater Management Plan in 2006.[13] The SCGA was formed to maintain the long-term sustainable yield of the Sacramento Valley Groundwater Basin groundwater supply. Implementation of the proposed project could potentially deplete groundwater supply from this basin. In addition, the proposed project would require a National Pollutant Discharge Elimination System (NPDES) permit and a Storm Water Control Plan (SWCP) as the project would create over 10,000 sf of impervious surfaces. Thus, the proposed project could result in a ***potentially significant*** impact related to substantially decreasing groundwater supplies or interfering substantially with groundwater recharge such that the project could impede a sustainable groundwater management plan of the basin.

Further analysis of the above impact will be included in the Hydrology and Water Quality (Drainage) chapter of The Preserve Project EIR.

ci-civ. Stormwater runoff from impervious surfaces on the site would be directed toward the proposed bioretention and hydromodification areas in the northwest of corner of the parcel. Water from the bioretention basins would drain into the hydromodification basin through a 12-inch storm drain. An outlet structure would be connected to the hydromodification basin which would then direct the water to an existing pond off site.

Given the substantial drainage modifications that would occur with the proposed project, further study is required to ensure that such modifications would not result in substantial erosion, siltation, or flooding on- or off-site, create or contribute runoff water which would provide substantial additional sources of polluted runoff. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Hydrology and Water Quality (Drainage) chapter of The Preserve Project EIR.

d. The project site is not located near the ocean and, thus, would not be subject to tsunami hazards. The site is not located within the vicinity of a large closed body of water such as a lake or reservoir that could be subject to risks from seiches. In addition, according to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map, the project site is not located within a Special Flood Hazard Area subject to a 100-year flooding.[14] Therefore, the proposed project would result in ***no impact*** related to impeding or redirecting flood flows, or pose a risk related to the release of pollutants due to project inundation due to flooding.

[13] Sacramento County Water Agency. *Urban Water Management Plan.* May, 2016.
[14] Federal Emergency Management Agency. *Sacramento County Flood Insurance Rate Map.* August 16, 2012.

XI. LAND USE AND PLANNING. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Physically divide an established community?	☐	☐	✖	☐
b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	✖	☐	☐	☐

Discussion

a. A project risks dividing an established community if the project would introduce infrastructure or alter land use so as to change the land use conditions in the surrounding community, or isolate an existing land use. Currently, two existing single-family homes are located on the project site. Given that the existing single-family residences do not belong to an established community and would be demolished as part of the proposed project, the project would not have the potential to physically divide an established community. Accordingly, a **less-than-significant** impact would occur.

b. Per the Rancho Cordova General Plan, the project site is currently designated Planning Area. The site is located within the Grant Line West Planning Area and is designated Natural Resources and Residential-Mixed Density. Implementation of the project would require a General Plan Amendment to change the sites land use designation to Low-Density Residential. An additional General Plan Amendment would be required to remove from the Circulation Element Centennial Drive in the project vicinity. In addition, the project would require a rezone of the AG-80 and IR zoning designations to RD-6.

Given that the proposed project would require a General Plan Amendment and rezone, further analysis of the project's consistency with applicable land use policies, plans, and regulations is required to ensure that the project would not cause a significant environmental impact due to conflicts with such standards. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Land Use and Planning/Population and Housing chapter of The Preserve Project EIR.

XII. MINERAL RESOURCES. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	✖	☐	☐	☐
b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	✖	☐	☐	☐

Discussion

a,b. Per the City's General Plan EIR, mineral extraction in the Planning Area primarily consists of fine sand and course gravel, as well as clay. Currently, two mining operations exist near the project site. Teichert aggregates is located northeast of the project site and Union Mine Iron is located southwest of the project site. The proximity of the project site to existing mining operations could signify that the site contains both known significant mineral resources and known mineral deposits that could qualify as mineral resources.[15] Given that the proposed project is located close to an existing mining operation, the proposed project could result in the loss of availability of known mineral resources. Thus, a ***potentially significant*** impact would occur.

Further analysis of the above impact will be included in the Geology and Soils/Mineral Resources chapter of The Preserve Project EIR.

[15] City of Rancho Cordova. *Rancho Cordova General Plan Draft EIR* [pg. 4.8-11]. March 2006.

XIII. NOISE. *Would the project result in:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	✖	☐	☐	☐
b. Generation of excessive groundborne vibration or groundborne noise levels?	✖	☐	☐	☐
c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	✖

Discussion

a. The existing noise environment in the project vicinity is defined primarily by vehicle noise from surrounding streets including Grant Line Road and Raymer Way. The proposed project would increase traffic noise levels on surrounding streets with the introduction of new residential development. In addition, project operations would also result in an increase in stationary noise associated with outdoor and recreational activities in the area. Temporary noise sources would also be produced during construction activities. Construction activities could include earth moving activities, stationary equipment, and construction vehicles would generate noise during demolition, site preparation, excavation, and grading. Noise levels generated by the project may exceed established thresholds in the City's General Plan Noise Element and Noise Ordinance. The project could cause a substantial permanent, temporary, or periodic increase in ambient noise levels in the project vicinity above thresholds. Therefore, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Noise chapter of The Preserve Project EIR.

b. Groundborne vibration generated would be generated during construction of the proposed project. Construction activities would produce groundborne vibrations include drilling, the use of jackhammers, and other high-power or vibratory tools, and heavy-duty equipment. In addition, construction activities may expose the nearby residential development to the south of the project site to groundborne vibrations. In the event that such groundborne vibration occurs within the vicinity of the existing sensitive receptors to the south of the project site, the project could expose people to or generate excessive groundborne vibration or groundborne noise levels, and a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in The Noise chapter of the Preserve Project EIR.

c. The nearest airport to the project site is Mather Airport, located approximately five miles to the west of the project site. Therefore, the proposed project would not expose people residing or working in the project area to excessive noise levels related to air traffic, and ***no impact*** would occur.

XIV. POPULATION AND HOUSING. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (e.g., through projects in an undeveloped area or extension of major infrastructure)?	✖	☐	☐	☐
b. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	✖	☐

Discussion

a. The proposed project would include the development of a 434-unit, single-family residential subdivision. The proposed project requests a General Plan Amendment to remove the Natural Reserve and Residential-Mixed Density designation and introduce Low-Density Residential to the project site. Additionally, the project includes a request to rezone a portion of the site from AG-80 and IR zoning to RD-6. The proposed project would not be consistent with City's current General Plan designations for the project site and would result in direct population growth in the area. Thus, the project would result in a ***potentially significant*** impact related to population and housing.

Further analysis of the above impact will be included in the Land Use & Planning/Population and Housing chapter of The Preserve Project EIR.

b. The project site is currently developed with two single-family residences on the southern portion of the project site. The proposed project would require demolition of the on-site structures. While the project would displace inhabitants of the two single-family residences, considering the small number of current residents that would be displaced, replacement housing would be available from the existing housing stock in Rancho Cordova. Furthermore, the project would add 434 residential units to the site, resulting in a net increase of 432 units to the City's housing stock. Thus, a ***less-than-significant*** impact would occur.

XV. PUBLIC SERVICES. *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Fire protection?	✖	☐	☐	☐
b. Police protection?	✖	☐	☐	☐
c. Schools?	✖	☐	☐	☐
d. Parks?	☐	☐	✖	☐
e. Other Public Facilities?	☐	☐	✖	☐

Discussion

a. Fire protection services within the project area are provided by the Sacramento Metropolitan Fire District. The project site is located close to two fire stations in the City of Rancho Cordova. Station 68 is located approximately four miles south west of the project site and Station 66 is located approximately six miles west of the project site. Station 68 is located at 4381 Anatolia Drive in Rancho Cordova while Station 66 is located at 3180 Kilgore Road in Rancho Cordova. The proposed project would include development of new residential units and parks, which could result in the potential for fire incidents, EMT calls, and create an increase in demand for fire protection services. Therefore, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Public Services and Utilities chapter of The Preserve Project EIR.

b. Police protection services for the project site are currently provided by the Rancho Cordova Police Department, which maintains a staff of 55 sworn police officers and 7 nonsworn staff members.[16] The Police Station is located at 2897 Kilgore Road in the City of Rancho Cordova. The proposed project would increase the number of residents and houses in the area, which could result in an increase in demand for police protection services. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Public Services and Utilities chapter of The Preserve Project EIR.

c. The project site is located with the Folsom Cordova Unified School District, which includes 33 public and private schools. The project site would be served by Navigator Elementary School located at 10679 Bear Hollow Drive, W.E. Mitchell Middle School located at 2100 Zinfandel Drive, and Cordova High School located at 2239 Chase Drive.

The proposed project would include residential development, and, thus, would increase the number of students attending local school facilities. The student generation estimates presented in Table 1 uses the rates provided in the City's General Plan EIR for single-

[16] City of Rancho Cordova. Rancho Cordova Police Department. Available at: http://www.ranchocordovapd.com/about.php. Accessed: July 11, 2019.

family dwelling units.[17] As shown in Table 1, the proposed project could generate approximately 221 students. Therefore, the proposed project would result in an increased number of students in the area, and, thus may result in a ***potentially significant*** impact to school services.

Table 1
Student Generation Estimates

Housing Type	# of Units	Elementary Students		Junior High Students		High School Students	
		Rate	New Students	Rate	New Students	Rate	New Students
Low Density	434	0.299	130	0.104	45	0.107	46
						Total New Students	**221**

Source:
- City of Rancho Cordova. *Rancho Cordova General Plan Draft EIR.* [pg. 4.12-77]. March, 2006.

Further analysis of the above impact will be included in the Public Services chapter of The Preserve Project EIR.

d,e. The proposed project would include the construction of new homes and, thus, would introduce new residents to the project area. As such, the project would result in increased demand for schools, parks, and other public facilities. The Rancho Cordova Recreation and Park District maintains 18 neighborhood parks and six community parks. Hagan Community Park includes approximately 75 acres including the Cordova Community Center, three swimming pools, and additional recreation areas. A section of the American River Parkway is also in Rancho Cordova which includes a 23-mile open space area.

In addition, the City has collected Quimby Act fees since its incorporation in July 2003. The Quimby Act standard for dedication of parkland is 5 acres per 1,000 residents. Per section 22.40 of the City's Municipal Code, the project would be required to dedicate at least 6.4 acres of parkland based on the inclusion of 434 units within the proposed project.[18] The proposed project would satisfy the Municipal Code requirement, as the project would include dedication of a total of 26.12 acres, included in two park areas located at the northern end of the development and community spaces. The parks would be managed by the Cordova Recreation and Park District. The designated community space areas would include bioretention and hydromodification basins. In addition, the project site would include 1.22 acres of green infrastructure to enhance landscape areas and trails connected to surrounding parks.

Currently, other public facilities located in Rancho Cordova include four community swimming pools, the Cordova Senior Center, Mather Sports Complex, the Cordova Shooting Center, and the Cordova Golf Course. The Mather Sports Complex allows residents to participate in a large variety of activities including aerobics, racquetball, and a gym where residents can exercise. Due to the proposed implementation of open space and parks, the project would satisfy the City's parkland dedication requirements and allow access to public facilities throughout the City. Thus, a ***less-than-significant*** impact related to impacts on parks or the need for additional parks would occur.

[17] City of Rancho Cordova. *Rancho Cordova General Plan Draft EIR.* [pg. 4.12-77]. March, 2006.
[18] City of Rancho Cordova. *Rancho Cordova Municipal Code*. [Section 22.40.035]. June 2019

XVI. RECREATION. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	✖	☐
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	✖	☐

Discussion

a,b. Given that the proposed project would include residential development and would generate population growth within the project area, the project would result in increased demand for park and recreation facilities. However, the proposed project would include two on-site parks and open space at the northern end of the site. As stated in Section XV Public Services, the project would designate 26.12 acres and Community Space, and 1.22 acres of green infrastructure which would exceed the City's parkland dedication requirement of 6.4 acres. Per Section 22.40 of the City's Municipal Code, the parks would be managed by the Cordova Parks and Recreation District and subject to park improvement development fees. Therefore, substantial deterioration of any parks or recreational facilities would not occur as a result of the proposed project.

In addition to the development of the proposed parks, the American River Parkway includes C.M. Geothe Park which consists of 444 acres, and has hiking, bicycling, and horseback riding trails as well as picnic areas for residents. Construction of recreation facilities will not be included as part of the proposed project; however, Rancho Cordova offers numerous recreation facilities including the Mills Station Arts and Culture Center and an exhibit of fine art at Rancho Cordova City Hall.[19] The Neil Orchard Senior Activities Center also offers a place for intimate family gatherings and large community meetings. The project would not be required to construct new recreation facilities, as the current facilities, combined with the proposed on-site park areas, would accommodate residents of the proposed project.

With payment of improvement development fees and designated land for parks, the project would not result in substantial physical deterioration of any existing neighborhood or regional parks or other recreational facilities, and would not result in adverse physical effects related to the construction or expansion of new facilities. Consequently, a ***less-than-significant*** impact would occur.

[19] City of Rancho Cordova. *Rancho Cordova General Plan Draft EIR*. [pg. 4.12-84]. March 2006.

XVII. TRANSPORTATION. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	✖	☐	☐	☐
b. Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	✖	☐	☐	☐
c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	✖	☐	☐	☐
d. Result in inadequate emergency access?	✖	☐	☐	☐

Discussion

a. The proposed project would include construction of two entry points and improvements on Raymer Way, as well as connection to the existing Camden at Somerset Ranch subdivision through an extension of Edington Drive and a new connection to Thornburg Way. Increased vehicle trips in the area related to project construction and operations could impact roadway systems by increasing vehicle volumes and congestion at intersections. Thus, further study is required to determine whether implementation of the proposed project would result in substantial impacts related to traffic load and capacity of the roadway system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections). In addition, the project could exceed, either individually or cumulatively, a level of service standard established by the City General Plan for roads affected by project traffic. Therefore, the project could result in a ***potentially significant*** impact related to conflicting with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

Further analysis of the above impact will be included in the Transportation chapter of The Preserve Project EIR.

b. Section 15064.3 of the CEQA Guidelines provides specific considerations for evaluating a project's transportation impacts. Per Section 15064.3, analysis of vehicle miles travelled (VMT) attributable to a project is the most appropriate measure of transportation impacts. Other relevant considerations may include the effects of the project on transit and non-motorized travel. Except as provided in Section 15064.3(b)(2) regarding roadway capacity, a project's effect on automobile delay does not constitute a significant environmental impact under CEQA. It should be noted that currently, the provisions of Section 15064.3 apply only prospectively; determination of impacts based on VMT is not required Statewide until July 1, 2020. It should also be noted that the City does not currently have standards for VMT and relies on level of service standards.

Given that the proposed project would result in increased vehicle trip generation on local roadways, further analysis of VMT attributable to the project is required to ensure that the project would not conflict with Section 15064.3(b) of the CEQA Guidelines. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impact will be included in the Transportation chapter of The Preserve Project EIR.

c,d. An existing residential subdivision is currently located directly south of the project site and agricultural land to the north. The proposed project includes a request for a General Plan amendment and rezone to allow for the proposed 434 single family residences. The proposed project would include construction of two entry points from Raymer Way, as well as connection to the existing Camden at Somerset Ranch subdivision through an extension of Edington Drive and a new connection to Thornburg Way. Raymer Way may also be improved by widening of the roadway. The internal circulation system would consist of multiple roads to all the residences within the subdivision. The proposed increase in development intensity of the site through development of the proposed residences could cause an increase in traffic-related hazards or affect emergency access in the project area. Without further evaluation, the proposed project could result in a ***potentially significant*** impact related to an increase in hazards from design features or incompatible uses, or inadequate emergency access to the project.

Further analysis of the above impact will be included in the Transportation chapter of The Preserve Project EIR.

XVIII. TRIBAL CULTURAL RESOURCES. *Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k).	✖	☐	☐	☐
b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	✖	☐	☐	☐

Discussion

a,b. The proposed project site would include grading and excavation during construction which could lead to encountering previously unknown tribal cultural resources. Tribal resources may exist within the project site due to the site's proximity to Morrison Creek. To aid in the determination of the presence or absence of tribal cultural resources, the City is in the process of conducting tribal outreach per AB 52. Thus, until tribal consultation is complete and further study is completed related to the presence or absence of tribal cultural resources, impact of the proposed project cannot be known. Therefore, further study is required and a ***potentially significant*** impact to tribal cultural resources could occur.

Further analysis of the above impact will be included in the Cultural and Tribal Resources chapter of The Preserve Project EIR.

XIX. UTILITIES AND SERVICE SYSTEMS. *Would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	✖	☐	☐	☐
b. Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	✖	☐	☐	☐
c. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	✖	☐	☐	☐
d. Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	✖	☐	☐	☐
e. Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	✖	☐	☐	☐

Discussion

a,c. Potable water service for the project would be provided by the Sacramento County Water Agency (SCWA). The proposed project would include installation of new eight-inch water mains, which would connect to an existing 10-inch water main located within Edington Drive. Sanitary sewer service is provided to the City by the County Sanitation District 1. The County Sanitation District 1 collects the wastewater flows from individual developments and directs them to the Sacramento Sanitation District Inceptor System. Wastewater would be routed through the eight-inch sanitary sewer pipelines which would ultimately be delivered to the Sacramento Regional Wastewater Treatment Plant north of Elk Grove. Given the size of the proposed residential development, the total quantity of wastewater generated could be substantial.

The proposed project would increase the amount of impervious surfaces at the project site, thus, increasing stormwater runoff at the site. Stormwater would be directed through 12 and 30-inch drainage pipes to the bioretention basins located in the northwest corner of the project site. The stormwater would then be directed to the hydromodification basin and then directed to the pond north of the project site.

The project would require the relocation or construction of new water infrastructure, as new waterlines would be included in the development. In addition, connection to existing natural gas or telecommunications infrastructure would be required for the proposed residential development.

Per the SCWA's 2015 Urban Water Management Plan, water demands within the SCWA Zone 40 North Service Area are approximately 24,403 acre-feet per year (afy). By the year 2030, the Zone 40 North Service Area water demands are expected to reach 56,816 afy. As stated above, water demand projections were based on buildout of the SCWA's UWMP.. Because the proposed project would include a General Plan Amendment, implementation of the proposed project could result in an increase in demand for water that was not previously foreseen. Therefore, further study is necessary to determine the potential effect.

Based on the above, the proposed project would require the relocation or construction of new wastewater treatment, natural gas, or telecommunications facilities. Therefore, the project could result in a ***potentially significant*** impact related to requiring or resulting in the relocation or construction of new or expanded water, storm water drainage, or electric power facilities, the construction or relocation of which could cause significant environmental effects.

Further analysis of the above impact will be included in the Public Services and Utilities chapter of The Preserve Project EIR.

b. As discussed in Section X, Hydrology and Water Quality, of this Initial Study, the proposed project would rely on groundwater supplies. Groundwater would be supplied by the SCWA. The proposed project could potentially deplete supply from the Sacramento Valley Groundwater Basin and have an adverse effect.

According to the 2015 Urban Water Management Plan, the SCWA's ground water is Rancho Cordova's main water supply. While the City uses surface water as a source of water supply, groundwater supplies are more reliable and consistent.[20] The UWMP predicts that the SCWA will be able to meet water demands in normal years, single dry years, and multiple dry years through the year 2040. If multiple dry years were to occur between 2020 and 2040, the first-year supply totals would range from 77,900 afy in 2020 to 90,900 afy in 2040. The water supply would meet demand totals of 48,121 afy to 79,278 afy. In second year, supply and demand totals would remain the same. In the third dry year, supply totals would range from 70,200 afy in 2020 to 83,800 afy in 2040. Again, the water supply would meet demand totals of 48,121 afy to 79,278 afy. While the SCWA could supply the SCWA's service area during drought years, demand projections for the service area were based on land use designations for the SCWA's service area. The proposed project includes a request for a General Plan Amendment to allow for development of a portion of the site with residential uses. Because the proposed project would include a General Plan Amendment, implementation of the proposed project could result in an increase in demand for water that was not previously foreseen.

Further analysis is necessary to ensure that adequate groundwater supplies would be available to serve the project following the General Plan Amendment altering the land use designation to Low-Density Residential. Therefore, the proposed project could result in a ***potentially significant*** impact related to having sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

[20] Sacramento County Water Agency. *Urban Water Management Plan.* May 2016.

Further analysis of the above impact will be included in the Public Services and Utilities chapter of The Preserve Project EIR.

d,e. The Sacramento County Department of Waste Management and Recycling (DWMR) is responsible for maintain waste management for residents. The Sacramento County DWMR also oversees the Sacramento Regional Solid Waste Authority (SWA). Solid waste generated from the proposed project would be disposed of at the Kiefer Road Landfill. The landfill is located at 12701 Kiefer Boulevard, near the intersection of Kiefer Boulevard and Grant Line Road. According to the City's General Plan EIR, the Kiefer Road Landfill has a total capacity of 117 million cubic yards. The Kiefer Road Landfill is operating below permitted capacity and will have the capacity for about 20 additional years. While the landfill has remaining capacity, the proposed project has not been anticipated by the General Plan and could generate solid waste in excess of the capacity of the landfill.

Based on the above, the proposed project could generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. Further study is necessary to determine if the project would comply with federal, State, and local management and reduction statutes and regulations related to solid waste. Therefore, a ***potentially significant*** impact related to solid waste would occur as a result of the proposed project.

Further analysis of the above impact will be included in the Public Services and Utilities chapter of The Preserve Project EIR.

XX. WILDFIRE. *If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:*	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	✖	☐
b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	✖	☐
c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	✖	☐
d. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	✖	☐

Discussion

a-d. According to the California Department of Forestry and Fire Protection (CAL FIRE) Fire and Resource Assessment Program, the project site is not located within a Very High or High FHSZ.[21] The land located to the east of Grant Line Road is designated as Moderate FHSZ in a State Responsibility Area (SRA). Compared to High and Very High FHSZ, the Moderate FHSZ classification defines areas that present a relatively low risk of wildfires.

The area directly south of the proposed project site is occupied with residential development, which would act as a fire break, reducing the potential for fire to spread to the project site from the south. In addition, the currently vacant land to the west of the site is approved for the development of the Rio Del Oro residential community, which, upon completion, would similarly limit the potential for wildfire risk from the west. However, the areas to the north and east of the project site are currently undeveloped and interspersed with ruderal vegetation. The proposed project would preserve 185.3 acres of undeveloped land on the northern parcels. The undeveloped preserve area would be separated from the proposed residences by 26.12 acres of public parks and community spaces north of the proposed residences. The park and community spaces area would be regularly maintained and would provide a buffer between the open space lands and the proposed residential development, providing a fire break and reducing the potential for the spread of wildfire to the proposed residences.

In addition, implementation of the proposed project would include site clearing activities, which would remove much of the on-site vegetation within the developable area and would further create a buffer between lands designated for open space and residential development. Development of the site for residential uses would reduce the risk of wildland fire because site improvements, such as roadways, driveways, and irrigated

[21] California Department of Forestry and Fire Protection. *Sacramento County, Fire Hazard Severity Zones in SRA*. November 7, 2007.

landscaping, would reduce readily combustible vegetation. Furthermore, development of the proposed project would include the installation of fire suppression systems (e.g., fire hydrants, fire sprinklers, smoke detectors) and would be designed in accordance with the latest requirements of the California Fire Code. In accordance with State standards, the project would be required to maintain defensible space to provide a fire break that would prevent the spread of ground fires and protect on-site structures. The proposed project would also be subject to fire safety requirements of the Sacramento Metropolitan Fire District, which would review all plans as part of the City's Building Permit review process. Fire sprinklers, vegetative buffer zones, and other fire-safe measures may be required as part of their review. Compliance with such would ensure that the potential hazards associated with wildand fires to the proposed buildings and structures would be reduced.

Therefore, based on the above, although an SRA is located in proximity to the project site, implementation of the proposed project would not be expected to result in the following wildfire hazards identified in CEQA Guidelines Appendix G: emergency response or evacuation; exacerbation of wildfire or other fire risks; or wildfire related flooding or landslides, slope instability, or drainage changes.Thus, a ***less-than-significant*** impact would occur.

XXI. MANDATORY FINDINGS OF SIGNIFICANCE.	Potentially Significant Impact	Less-Than-Significant with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	✖	☐	☐	☐
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	✖	☐	☐	☐
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	✖	☐	☐	☐

Discussion

a. As discussed in Section IV, Biological Resources, of this IS, the proposed project could potentially result in impacts to special-status plant and wildlife species and other biological resources. Thus, implementation of the proposed project could have the potential to degrade the quality of the environment by potentially reducing the habitat for special-status plant and animal species. In addition, the project could have a substantial adverse effect on riparian habitat or other sensitive natural communities, including the various wetlands on-site. Furthermore, as noted in Section V, the project site has not been formally evaluated for the presence of historical resources, and possibility exists for such resources to be found on-site. As such, and in the absence of further study, the project could eliminate important examples of the major periods of California history or prehistory. Thus, a ***potentially significant*** impact could occur.

Further analysis of the above impacts will be included in The Preserve Project EIR.

b. The proposed project, in conjunction with other development within the City of Rancho Cordova, could incrementally contribute to cumulative impacts in the project area. In particular, the chapters that will discuss project related impacts include Air Quality and Greenhouse Gas Emissions (including Energy), Biological Resources, Cultural and Tribal Resources, Geology and Soils/Mineral Resources, Hazards and Hazardous Materials, Hydrology and Water Quality (Drainage), Land Use and Planning/Population and Housing, Noise, Public Services and Utilities, and Transportation. Thus, a ***potentially significant*** impact could occur with regard to cumulative impacts in the project area.

Further analysis of the above impacts will be included in The Preserve Project EIR.

c. As described in this IS, implementation of the proposed project could result in impacts related to air quality, hazardous materials, and excess noise levels. As such, in the absence of further study, the project could cause substantial adverse effects on human beings, and a ***potentially significant*** impact could occur.

Further analysis of the above impacts will be included in The Preserve Project EIR.

SUBJECT: COMMENTS ON THE NOTICE OF PREPARATION (NOP) FOR THE PRESERVE ENVIRONMENTAL IMPACT REPORT (EIR)

Ms. Whitman:

The County of Sacramento, Department of Transportation has reviewed the NOP for the subject project. We appreciate the opportunity to review these documents.

Our comments are simply that we would expect that if this project has any impacts on the transportation facilities in the County of Sacramento that mitigation measures be included in the EIR that address these impacts. To that end we would request that any county roadways that would experience increased traffic volumes from the development be studied in the EIR. In looking at the plan there appears to be the potential for traffic to come from the proposed project through Raymer Road at Grant Line Road and White Rock Road. We have the following comments to offer at this time.

1. The traffic study for the EIR should evaluate the traffic impacts on the following roadway segments:
   - White Rock Road West of Grant Line Road
   - White Rock Road North of Grant Line Road
   - Grant Line Road North of Raymer Road
   - Grant Line Road South of Raymer Road

2. The following intersections should also be evaluated in the study during the weekday AM and PM peak hour:
   - Grant Line Road and White Rock Road
   - Grant Line Road and Raymer Road
   - Grant Line Road and Douglas Road

Should you have any questions, please feel free to contact me at (916) 874-7052.

Sincerely,

Matthew G. Darrow, PE, TE, PTOE.

Regarding: **Notice of Preparation regarding an Environmental Impact Report**
The Preserve Tentative Subdivision Map (June 10, 2019)
Comment Period: October 25 – November 25
Grant Line West Planning Area
Rancho Cordova, CA

Reviewed by: Cordova Recreation and Park District
Laura Taylor, CRPD Park Planning and Development Manager
Lisbet Gullone, CRPD Contract Planner

As a part of the entitlement process for The Preserve Tentative Subdivision Map, the City of Rancho Cordova circulated a Notice of Preparation regarding an Environmental Impact Report on October 25, 2019. The Cordova Recreation and Park District (CRPD or 'the District') has previously prepared project review comments in a letter dated March 15, 2019 and met with the project team on February 21 and October 17, 2019.

BACKGROUND
After CRPD reviewed the project for Quimby Parkland requirements in May of this year, the application was on hold until the City could determine if the previously planned extension of Centennial Drive (through the northeast corner of the Parkway development) would remain an option. This issue has now been resolved. The City will no longer pursue a road extension through the future open space preserve north of the subdivision.

The Preserve Project Initial Study dated October 2019 contains outdated statistics about the Cordova Recreation and Park District (CRPD) on page 47. The name of the District needs to be corrected in paragraph one. The District currently has 39 parks (10 community parks and 29 neighborhood parks). CRPD also has a golf course, two swimming pools (one is currently being replaced), a senior center and the Mather Sports Complex that includes a gymnasium. CRPD no longer has a shooting center.

TENTATIVE SUBDIVISION MAP
The Preserve subdivision includes 434 single family units and will have a future population of 1,280 individuals (434 x 2.95). The community is required to provide 6.4 acres of Quimby Parkland (5 acres per 1,000 residents), but as shown in the Park Exhibit, the two parks that are designated to CRPD have a combined area of 10.37 acres. CRPD has also noted that the park area is specified as 8.9 acres on page 8 of the NOP.

The current project proposal exceeds the Quimby parkland dedication requirement. The District's acceptance of additional acreage requires an increase to existing funding models for the development and maintenance of the additional park acreage.

The District has met with the applicant to discuss the latest Tentative Map and Park Exhibit (dated June 10, 2019), but written review comments have not yet been prepared. While the proposed Quimby parks are not consistent with CRPD's regular standards regarding size and location, the District is open to some deviations to be approved by the District's General Manager and ultimately the Board of Directors through the mechanism of a Park Development Agreement.

At this time, several options are under consideration. CRPD may consider the larger park in the northeast corner of the subdivision (Park 1) a Community Park and the smaller park at the center of the open space/park corridor (Park 2) a Neighborhood Park. The City of Rancho Cordova staff and CRPD staff have begun discussions about the concept of a trailhead at Park 1 Community Park site to access the proposed trail system. The jurisdictional issues related to City trails and CRPD Quimby parkland have not been detailed should the two agencies pursue a trailhead facility.

ACCESS AND CIRCULATION

District standards state that neighborhood parks should have street frontage on three sides and community parks should have street frontage on two sides. The proposed park layout does not conform to this standard and causes some concern for access, visibility and potential security issues. The District has considered mitigation measures for the access issues created by the non-conformance, suggested below.

The two proposed parks are incorporated with the park/open space corridor close to Morrison Creek, CRPD would like to improve public access to and increase the visibility of the park sites by locating the main loop road (from the North Douglas Neighborhood to Raymer Way) next to Park 2. As a part of this change, Street H would become the main entrance from Raymer Way (in lieu of Street A). In order to further increase the visibility of the two parks, CRPD would also like to place park signs along the assigned loop road.

The proposed trail along Morrison Creek will need to provide access for large maintenance and emergency vehicles. The trail corridor and associated cable fencing along the creek will need to be located in an easement that is separate from the Quimby park sites.

The trail system within The Preserve was presented as connecting to the City of Rancho Cordova trail system. However, adjustments will need to be made to this project proposal and to approved plans for offsite properties to connect the trail system in this project to the City trail system. Because a creek trail was originally envisioned to extend from the west boundary of the Preserve to Americanos Boulevard (along the north side of Morrison Creek), CRPD recommends that the trail within the Preserve (along the south side of Morrison Creek) should extend up to the west subdivision boundary. From this location, a future trail could be extended west through a portion of Rio Del Oro Specific Plan area to Americanos Boulevard. By moving the trail from the north side of the creek, the main part of the wetlands preserve can also remain undisturbed.

Demonstrated ability to connect The Preserve trail system to the larger City system is needed to justify the concept of a trailhead at Park 1 Community Park site.

OPEN SPACE/RECREATION

It is the goal of CRPD to provide an average of 5 acres of improved parkland per 1,000 residents. In addition, the District strives to provide 52% Community Parks and 48% of Neighborhood Parks. It will not be possible to apply these standards to The Preserve. However, CRPD can direct the applicant towards closer compliance. A community asset trailhead area and a parking lot and restroom to service trailhead use (possibly under the jurisdiction of the City of Rancho Cordova) could be set aside in or adjacent to Park 1. This will steer the project towards closer compliance. The location of Park 1 at the end of the subdivision roadway system complicate vehicular access to Park 1 from the broader community. These complications could impact the use of Park 1 as a community park.

The grading plan for Park 2 has significant slopes within the parcel boundary. The slopes reduce the programmable space available and excludes the possibility of off-street parking for this park. Therefore, it can only be considered for neighborhood park use. The grading plan for the Park 1 parcel has significant slopes on the northern portion of the project. These will be difficult to monitor and maintain. CRPD would prefer not to accept maintenance of the slopes off the back side of the park that do not provide a public park use benefit.

CRPD does not consider slopes that exceed 25% (4:1) as Quimby Parkland. The current park sizes shown on the maps should distinguish between that creditable as Quimby parkland (4:1 or less) and portions exceeding 4:1 slope.

Because each park site has a limited amount of street frontage, CRPD recommends that parking should be permitted on each side of streets that front park land, especially for Park 2. As a part of the District's standards, vertical curbs and attached sidewalks are also required for street frontages along park sites.

UTILITIES

Both park sites will need to be provided with standard utility stubs required for park development. CRPD requested the applicant investigate if a gravity-flow sewer line can serve Park 2.

POTENTIAL ENVIRONMENTAL EFFECTS

CRPD recommends that sport field lighting, pedestrian and parking lot lighting, noise, and increased traffic associated with public parks should be considered in the future environmental study. The impacts of Park 1 should consider potential impacts of actively-programmed community parks with the potential for community park amenities.

The environmental study shall also identify soil types, wetlands and biological resources on land designated for parks. If unsuitable soils, wetlands or protected plants and animals are impacting park land, the EIR shall identify appropriate mitigation measures for the removal.

PARK DEVELOPMENT AGREEMENT

As a part of the process to identify a final park system for the Preserve, a Park Development Agreement between the developer and CRPD will be required. If the park system and trail system plan have jurisdictional issues related to trail easements, maintenance, ownership related to a trailhead, parking lot and restroom those issues will be described in a Park Development Agreement and further detailed in an agreement between the City and the Park District.

RECOMMENDATIONS REGARDING THE ENVIRONMENTAL IMPACT REPORT

The Environmental Impact Report for the Preserve should address the following issues:

1. Consider vehicular access to the proposed Park 1 site from the broader community. Improve vehicular access to the Park 1. Consider the option that the main east entrance to the subdivision could be moved from Street A to Street H and Street H could be designated as the wider loop road through the neighborhood. Ideally, the higher volume traffic road should front the proposed community park.

2. Specify that the trail along the south side of Morrison Creek will be designed to accommodate emergency vehicles.

3. Extend the proposed trail to the west subdivision boundary and demonstrate connection to the City-wide Trail System.

4. Suggest erosion control measures for new slopes that are steeper than 4:1 (0.25%).

5. Address lighting, noise, and increased traffic associated with public parks.

6. Identify soil types, wetlands and biological resources on land designated for parks and develop mitigation measures for the removal of unsuitable soils, wetlands or protected plants and animals.

Please contact the District if you have any questions or comments regarding these recommendations.

Doug Sloan, Director

County of Sacramento

Date: November 19, 2019

To: Darcy Goulart, City of Rancho Cordova Planning Department

From: Dave Ghirardelli, County of Sacramento Department of Waste Management & Recycling (DWMR)

SUBJECT: DWMR Comments on The Preserve Environmental Impact Report (EIR) Notice of Preparation (NOP)

Please find below DWMR's comments regarding The Preserve EIR NOP.

Sacramento County's Kiefer Landfill serves the waste disposal needs of residents and businesses throughout Sacramento County and the cities within it. Kiefer Landfill is located approximately three miles from The Preserve. The proximity and pre-existence of Kiefer Landfill and the important role it plays in the Sacramento region should be considered during development of the EIR. DWMR can provide detailed and current information for relevant Sections of the EIR and the City of Rancho Cordova is invited to inquire, specifically when authoring the Land Use chapter, Public Services and Utilities chapter, and the Transportation chapter, among others.

In order to maintain service for citizens and businesses throughout the County, parcels created within The Preserve should be accompanied by Disclosures recorded on deeds acknowledging the pre-existence and proximity of Kiefer Landfill and the waste disposal activities that occur there. Sample disclosures can be provided by DWMR upon request.

Please do not hesitate to contact me if you have any questions or need additional clarification on any points made above. Also, please keep me updated regarding The Preserve as the application process for the project entitlements proceeds.

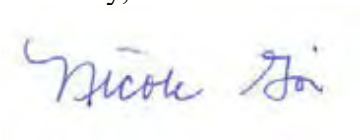
Subject: **The Preserve Project / NOP / 2019100515**

Dear Ms. Goulart:

The Sacramento Municipal Utility District (SMUD) appreciates the opportunity to provide comments on the Notice of Preparation (NOP) for The Preserve Project (Project, SCH 2019100515). SMUD is the primary energy provider for Sacramento County and the proposed Project area. SMUD's vision is to empower our customers with solutions and options that increase energy efficiency, protect the environment, reduce global warming, and lower the cost to serve our region. As a Responsible Agency, SMUD aims to ensure that the proposed Project limits the potential for significant environmental effects on SMUD facilities, employees, and customers.



It is our desire that the Project NOP will acknowledge any Project impacts related to the following:

- Overhead and or underground transmission and distribution line easements. Please view the following links on smud.org for more information regarding transmission encroachment:
  - https://www.smud.org/en/Business-Solutions-and-Rebates/Design-and-Construction-Services
  - https://www.smud.org/en/Corporate/Do-Business-with-SMUD/Land-Use/Transmission-Right-of-Way
- Utility line routing
- Electrical load needs/requirements
- Energy Efficiency
- Climate Change
- Cumulative impacts related to the need for increased electrical delivery
- The potential need to relocate and or remove any SMUD infrastructure that may be affected in or around the project area

SMUD would like to be involved with discussing the above areas of interest as well as discussing any other potential issues. We aim to be partners in the efficient and sustainable delivery of the proposed Project. Please ensure that the information included in this response is conveyed to the Project planners and the appropriate Project proponents.

Environmental leadership is a core value of SMUD and we look forward to collaborating with you on this Project. Again, we appreciate the opportunity to provide input on this NOP. If you have any questions regarding this letter, please contact SMUD's Environmental Management Specialist, Jerry Park, at jerry.park@smud.org or 916.732.7406.

Sincerely,

Nicole Goi

File No.: 260.15702

Darcy Goulart
City of Rancho Cordova
2729 Prospect Park Drive
Rancho Cordova, CA 95670

The East Sacramento Area Office of the California Highway Patrol recently received a "Notice of Preparation," Environmental Impact Report for the proposed Preserve Project in the City of Rancho Cordova, State Clearing House (SCH) #2019100515. After our review, we have concerns with the potential impact this project could have on traffic congestion, and an increase in calls for service within our jurisdiction.

The actual proposed community is within the Rancho Cordova City limits, but the ingress and egress routes our within the jurisdiction of the California Highway Patrol, East Sacramento Area's jurisdiction. Our concerns relate to the proposed construction of a master planned community to include 434 residential units on 71.58 acres, and public parks on 26.12 acres. This project is located north of Grantline Road, south of Sunrise Boulevard between Prairie City Road and Jackson Road. There are several major roadways that will be impacted by the increased traffic congestion. Jackson Road, State Route 16 (SR-16), is a two-lane undivided highway with minimal shoulders, surrounded by agricultural fields. SR-16 already experiences significant traffic delays/congestion during commute hours and heavy commercial vehicle traffic due to the commercial businesses within the area and the County Landfill. These roads are also used as a major commuter thoroughfare for Amador County, and numerous communities within Sacramento, San Joaquin, and El Dorado Counties. SR-16, Sunrise Boulevard, White Rock Road, Prairie City Road and Grantline Road are roadways within our jurisdiction that are significant ingress and egress routes that will be used to access the proposed community from both US Highway 50 and State Route 99 (SR-99). There are numerous cross streets within the vicinity of the planned project that will also see an increase in traffic congestion.

The aforementioned roadways currently experience traffic congestion and significant delays during commute hours, and without proper traffic management engineering prior to the development of the proposed community, traffic congestion will continue to increase. All of the roadways mentioned are two lane roadways that were originally developed for a rural community and were not designed to accommodate the rapid increase in population. This

project will negatively impact our operations due to the increased traffic congestion, which will lead to an increase in traffic collisions, calls for service, and ultimately will significantly increase our response time. The mission of the California Highway Patrol is to provide the highest level of Safety, Service and Security. The delays in service due to the traffic congestion will impact our ability to provide the service the citizens deserve.

If you have any questions regarding these concerns, please contact Lieutenant Johnson at (916) 464-1450.

Sincerely,

R. M. JOHNSON, Lieutenant
Commander

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, THE PRESERVE PROJECT, SCH#2019100515, SACRAMENTO COUNTY

Pursuant to the State Clearinghouse's 25 October 2019 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environmental Impact Report* for the Preserve Project, located in Sacramento County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

The project is located within the South Sacramento Habitat Conservation Plan (SSHCP) boundary. The project must implement all applicable SSHCP Avoidance and Minimization Measures.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically

as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website: http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Total Maximum Daily Load

Morrison Creek is currently 303(d) listed for Diazinon, Pentachlorophenol (PCP), Pyrethroids, and Toxicity. Since the project contains tributaries to Morrison Creek, Central Valley Water Board staff recommends noting the current 303(d) listings for Morrison Creek within the draft Environmental Impact Report and discussing any potential any effects of these pollutants from project activities.

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at: https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

> *Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.*
>
> *This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.*

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities

(Construction General Permit), Construction General Permit Order No. 2009-009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at: http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]

The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process.

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at: http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Risk General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Risk Waiver) R5-2013-0145. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers

seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Risk General Order and the application process, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Risk Waiver and the application process, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2013-0145_res.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at:
https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at:
https://www.waterboards.ca.gov/centralvalley/help/permit/

Subject: The Preserve Initial Study and Notice of Preparation for a Draft Environmental Impact Report

Dear Ms. Goulart,

Thank you for providing the opportunity for the Sacramento Metropolitan Air Quality Management District (SMAQMD) to review and comment on the Initial Study (IS) and Notice of Preparation (NOP) for a Draft Environmental Impact Report (DEIR) for The Preserve. We have reviewed the project in a manner consistent with the California Health and Safety Code Section 40961 requirement that SMAQMD "represent all the citizens of the Sacramento District in influencing the decisions of other public and private agencies whose actions may have an adverse impact on air quality." We offer the following comments.

Thresholds & Analysis
This project's size exceeds SMAQMD's screening threshold for construction analysis for both greenhouse gas (GHG) and criteria pollutant (pollutants covered by state and federal clean air acts) emissions. It exceeds SMAQMD's screening threshold for operational analysis of GHG emissions. SMAQMD's Guide to Air Quality Assessment in Sacramento County (CEQA Guide), available on our website, provides methods to analyze project air quality and climate change impacts, including screening criteria, thresholds of significance, and more, to assist lead agencies in complying with CEQA.

If the construction emissions of criteria pollutants and / or GHGs are determined to be significant, the City should require SMAQMD's standard construction mitigation, available in the CEQA Guide. If operational GHG emissions are determined to be significant, the City should apply all feasible mitigation, as described in the CEQA Guide. Further, as the City of Rancho Cordova does not have a Climate Action Plan (CAP), please note that SMAQMD's CEQA Guide contains guidance for addressing greenhouse gas emissions associated with individual development projects.

Grant Line West Planning Area
The planning area identified in the NOP does not include the entire Grant Line West planning area, and the DEIR should include context for the project within the Grant Line West planning area. This would include projected plans for land use in the rest of the Grant Line West planning area.

Conclusion
We look forward to receiving more project information through the environmental review process, so we can more fully evaluate this project for its effects on air quality. Thank you for

your consideration. All projects are subject to SMAQMD rules and regulations at the time of construction. A list of the most common rules that apply at the construction phase of projects is available on our website. If you have questions about these comments, please contact me at mwright@airquality.org or 916-874-4207

Sincerely,

Molly Wright, AICP
Air Quality Planner / Analyst

Rancho Cordova, CA 95670

The Preserve – Notice of Preparation (NOP) of an Environmental Impact Report

Dear Darcy Goulart,

Thank you for including the California Department of Transportation (Caltrans) in the review process for the project referenced above. Caltrans' new mission, vision, and goals signal a modernization of our approach to California's transportation system. We review this local development for impacts to the State Highway System (SHS) in keeping with our mission, vision, and goals for sustainability/livability/economy, and safety/health. We provide these comments consistent with the State's smart mobility goals that support a vibrant economy, and build communities, not sprawl.

The applicant is proposing to rezone the property from Agriculture 80 and Industrial to Residential 5 (RD-5). The development includes 434 single family lots, parks, preserve area and all necessary infrastructure to support the project. The project applicant has submitted an arborist report, drainage study, sewer report, water study and aquatic resources delineation. Additional studies that are being prepared area biological resources assessment, traffic study, special-status plant surveys, raptor/bat survey and a geotechnical report. The site is located northwest of Raymer Way and Grant Line Road, north of the Sunridge Specific Plan and east of the Rio Del Oro Specific Plan. Based on the information received, Caltrans provides the following comments:

Traffic Forecasting/Operations

This project will have a significant impact to the US 50 interchanges, mainly to Sunrise, Prairie City, Zinfandel and Mather Road. We look forward to the opportunity to review the Traffic Impact Analysis (TIA) as referenced on page 13 of the NOP. Please incorporate the following points in the TIA:

- Trip generation table for each land use for the project including the land use code used and the units for those land uses.
- Trip distribution map
- Existing Traffic Volume
- Project Only Traffic Volume

- Existing Traffic Volume on Opening Day (Construction Completion Year)
- Existing Traffic Volume on Opening Day (Construction Completion Year) + Project Volume
- Cumulative 20-year traffic volume without project
- Cumulative 20-year traffic volume with project
- Analysis at the following interchanges:
    - US 50/Mather Field Road
    - US 50/Zinfandel Drive
    - US 50/Sunrise Blvd
    - US 50/Prairie City Road
- VMT Analysis for the project
- Suggested mitigation measures

Please provide our office with copies of any further actions regarding the Project. We would appreciate the opportunity to review and comment on any changes related to this development.

If you have any questions regarding these comments or require additional information, please contact David Smith at (530) 634-7799 or by email at: david.j.smith@dot.ca.gov.

Sincerely,

DAVID SMITH
Acting Branch Chief, Transportation Planning – South
Planning, Local Assistance, and Sustainability

Appendix C

The Preserve Project

Sacramento Metropolitan AQMD Air District, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Single Family Housing	440.00	Dwelling Unit	73.50	792,000.00	1175

1.2 Other Project Characteristics

Urbanization	Rural	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2023
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	387.09	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor updated per SMUD's RPS reductions

Land Use - Acreage updated per applicant-provided questionnaire

Construction Phase - Timing updated per estimates provided on applicant's construction questionnaire

Demolition -

Grading - Based on applicant-provided questionnaire

Vehicle Trips - Trip rates and trip lengths updated to match project-specific data from Kimley Horn Traffic Study

Mobile Land Use Mitigation -

Energy Mitigation - Title 24 exceedance applied to reflect compliance with the 2019 CBSC.

Water Mitigation - Water conservation strategy applied to reflect compliance with 2019 CalGreen Code and MWELO.

The Preserve Project - Sacramento Metropolitan AQMD Air District, Annual

User Defined Equipment

Equipment Type	Number

11.0 Vegetation

The Preserve Project

Sacramento Metropolitan AQMD Air District, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Single Family Housing	440.00	Dwelling Unit	73.50	792,000.00	1175

1.2 Other Project Characteristics

Urbanization	Rural	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2023
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	387.09	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor updated per SMUD's RPS reductions

Land Use - Acreage updated per applicant-provided questionnaire

Construction Phase - Timing updated per estimates provided on applicant's construction questionnaire

Demolition -

Grading - Based on applicant-provided questionnaire

Vehicle Trips - Trip rates and trip lengths updated to match project-specific data from Kimley Horn Traffic Study

Mobile Land Use Mitigation -

Energy Mitigation - Title 24 exceedance applied to reflect compliance with the 2019 CBSC.

Water Mitigation - Water conservation strategy applied to reflect compliance with 2019 CalGreen Code and MWELO.

The Preserve Project - Sacramento Metropolitan AQMD Air District, Summer

Single Family Housing	440.00	Dwelling Unit	73.50	792,000.00	1175

1.2 Other Project Characteristics

Urbanization	Rural	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2023
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	387.09	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 Intensity Factor updated per SMUD's RPS reductions

Land Use - Acreage updated per applicant-provided questionnaire

Construction Phase - Timing updated per estimates provided on applicant's construction questionnaire

Demolition -

Grading - Based on applicant-provided questionnaire

Vehicle Trips - Trip rates and trip lengths updated to match project-specific data from Kimley Horn Traffic Study

Mobile Land Use Mitigation -

Energy Mitigation - Title 24 exceedance applied to reflect compliance with the 2019 CBSC.

Water Mitigation - Water conservation strategy applied to reflect compliance with 2019 CalGreen Code and MWELO.

The Preserve Project - Sacramento Metropolitan AQMD Air District, Winter

1. Affected age ranges are shown. Other age ranges are available, but the endpoints and age ranges shown here are the ones used by the USEPA in their health assessments. The age ranges are consistent with the epidemiological study that is the basis of the health function.

2. Health effects are shown in terms of incidences of each health endpoint and how it compares to the base (2035 base year health effect incidences, or "background health incidence") values. Health effects are shown for the Reduced Sacramento 4-km Modeling Domain and the 5-Air-District Region.

3. The percent of background health incidence uses the mean incidence. The background health incidence is an estimate of the average number of people that are affected by the health endpoint in a given population over a given period of time. In this case, the background incidence rates cover the 5-Air-District Region (estimated 2035 population of 3,271,451 persons). Health incidence rates and other health data are typically collected by the government as well as the World Health Organization. The background incidence rates used here are obtained from BenMAP.

4. The total number of health incidences across the 5-Air-District Region is calculated based on the modeling data. The information is presented to assist in providing overall health context.

5. The technical specifications and map for the Reduced Sacramento 4-km Modeling Domain are included in Appendix A, Table A-1 and Appendix B, Figure B-2 of the *Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District.*

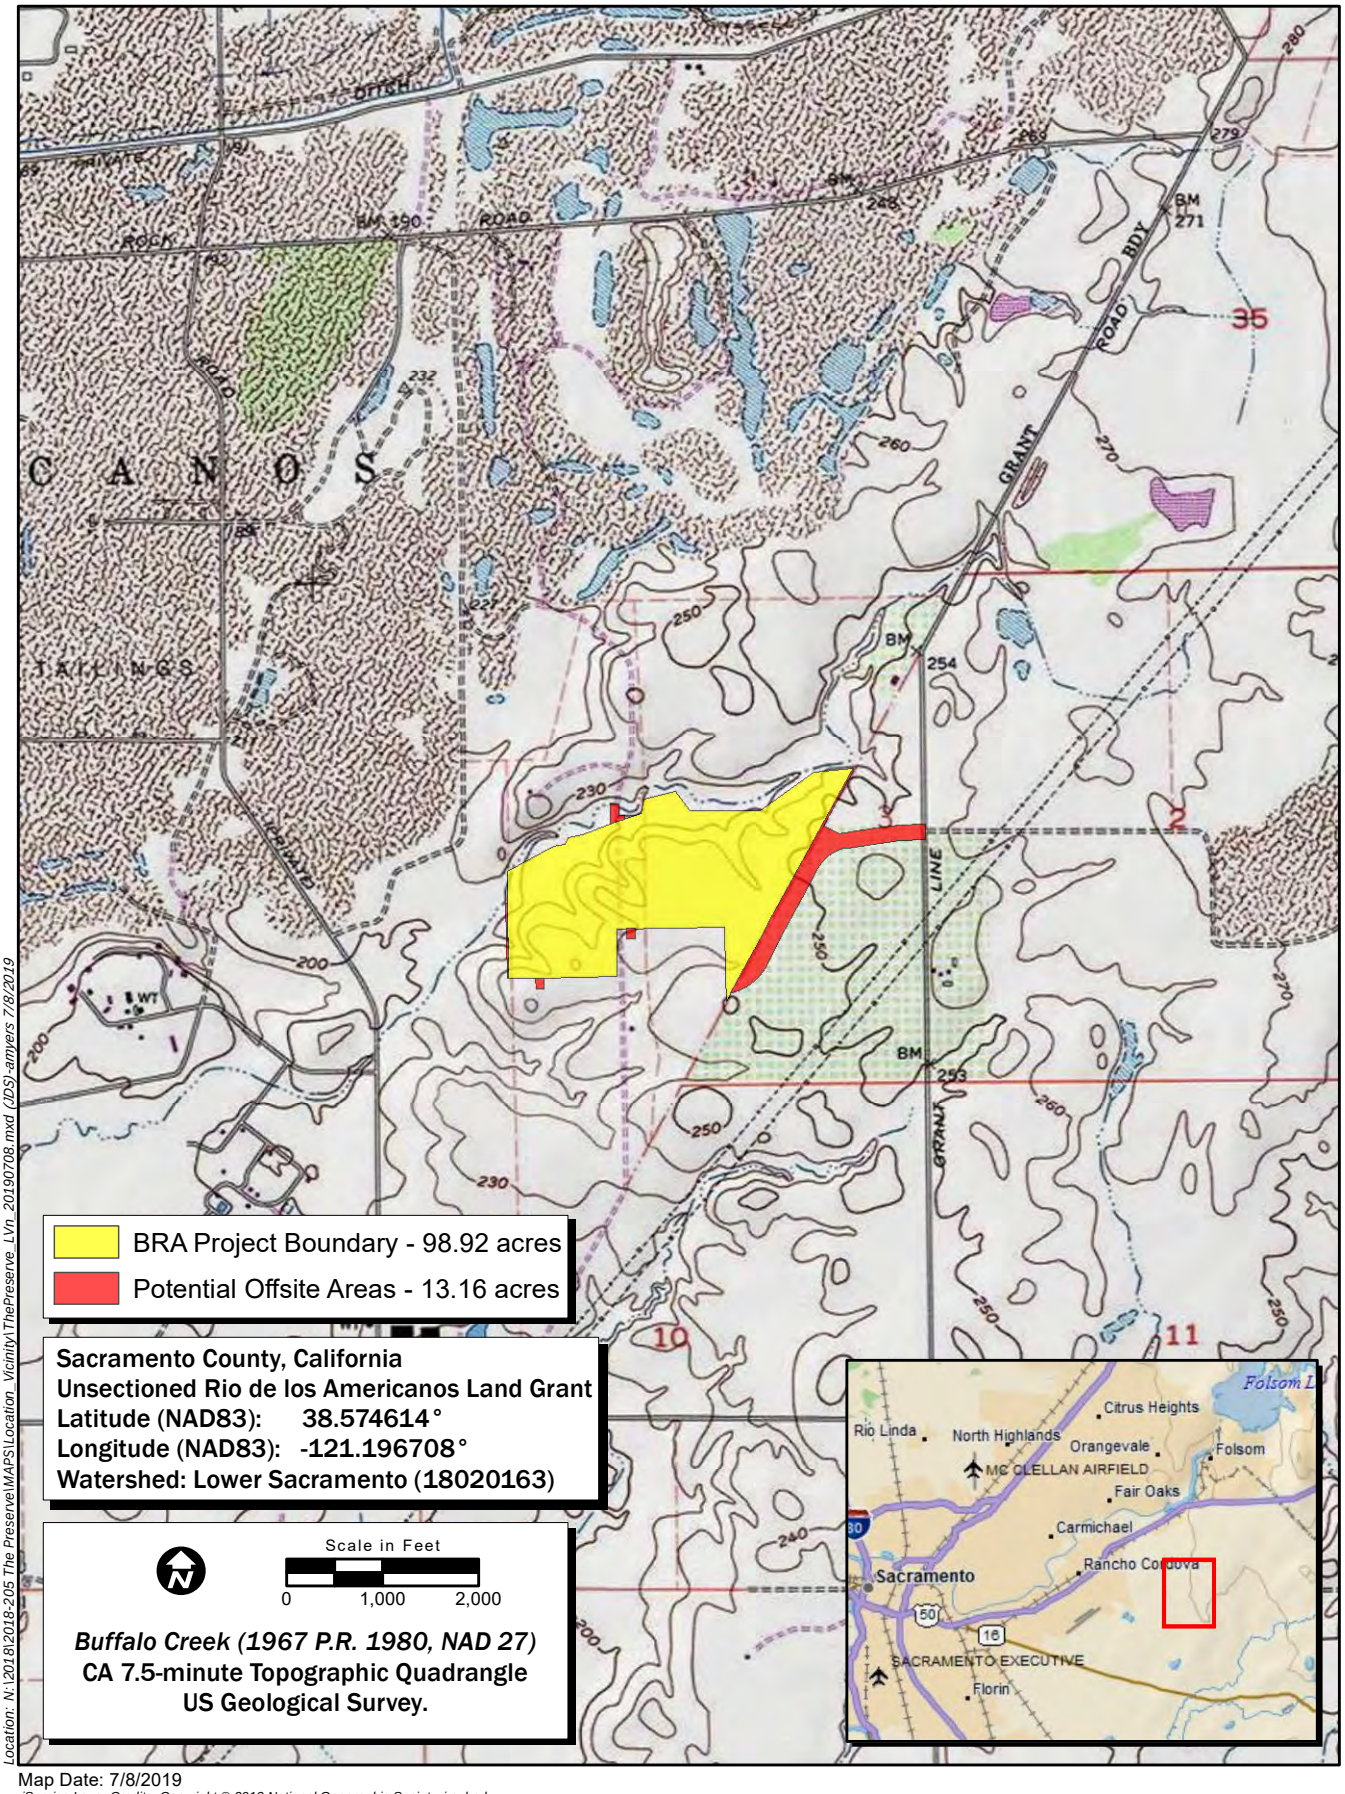
1.0 INTRODUCTION

On behalf of Winn Communities, Inc., ECORP Consulting, Inc. conducted a biological resources assessment (BRA) for a ±112-acre Study Area for The Preserve Development (Project), a proposed project located in Rancho Cordova, Sacramento County, California. The Study Area includes the 98.92-acre Project area, as well as potential Offsite areas totaling 13.16 acres. In this document the Offsite areas are referred to as the Rio del Oro Offsite (located to the west of the Project), the Raymer Way Offsite (located to the east of the Project), the Morrison Creek Offsite (located to the north of the Project around an existing crossing of Morrison Creek), and the North Douglas Offsites (road stubs located to the south of the Project). Representative photographs of the Study Area are provided as Attachment A.

1.1 Study Area Location

The Study Area is located to the west of Raymer Way and Grant Line Road in Rancho Cordova, California. The Study Area corresponds to an unsectioned portion of the Rio de los Americanos Land Grant within the "Buffalo Creek, California" 7.5-minute quadrangle (U.S. Geological Survey [USGS] 1980) (Figure 1. *Study Area Location and Vicinity*). The approximate center of the site is located at 38.574614° North and -121.196708° West within the Lower Sacramento Watershed (Hydrologic Unit Code #18020163, USGS 2016).



1.2 Purpose of this Biological Resources Assessment

The purpose of this BRA was to collect information on the biological resources present or with the potential to occur in the Study Area, to provide an analysis of potential Project impacts on these resources, and to recommend mitigation measures. This BRA is intended to support preparation of an environmental document pursuant to the California Environmental Quality Act (CEQA), and to support an application for a South Sacramento Habitat Conservation Plan (SSHCP) Permit.

1.3 Project Description

The Project is a residential development containing approximately 434 lots, parks, and open spaces including a trail system, residential and collector streets, and stormwater management infrastructure.

An open space trail system and parks are located immediately south of Morrison Creek as a buffer between the creek and the proposed residential neighborhood.

Location: N:\2018\2018-205 The Preserve\MAPS\Location_Vicinity\ThePreserve_LVn_20190708.mxd (JDS)-amyers 7/8/2019

Map Date: 7/8/2019

Figure 1. Study Area Location and Vicinity

ECORP Consulting, Inc.
ENVIRONMENTAL CONSULTANTS

2018-205 The Preserve

The Project will offer a variety of housing choices that will be consistent with the Medium Density Residential General Plan designation, which allows for small lot single-family homes. The Project has a compact urban design that allows for less land to be developed than typical large lot developments, creating a more efficient land use pattern. The Project would build out to the eastern boundary of the City, which was forecasted in the General Plan as the Grant Line West Planning Area. This location allows for connection to existing infrastructure, reducing the impact footprint and need for offsite improvements. The circulation pattern of the project was designed to utilize the aesthetic views of Morrison Creek while keeping safe vehicular patterns in conjunction with inviting and enhanced pedestrian routes. The Project will have four points of access: two points from Raymer Way, one point from Thornberg Way, and one point from the extension of Edington Drive.

1.3.1 Project Offsites

An offsite area along Raymer Way (Raymer Way Offsite) has been included in this assessment in anticipation that future improvements to the roadway may be required to support the Project. In addition, there are four other potential offsite areas described in this assessment as the Morrison Creek Offsite, North Douglas Offsites, and Rio del Oro Offsite. Within the Morrison Creek Offsite, an existing berm to the east of a gravel road crossing Morrison Creek is proposed to be removed to minimize flooding of the adjacent areas during 100-year storms. The North Douglas Offsites are the locations of future roadway connections to the existing North Douglas Project. Within the Rio del Oro Offsite, a small amount of grading may be required in association with the slopes at the western side of the Project. The Rio del Oro Offsite is located entirely within a disced firebreak on the Rio del Oro property.

2.0 REGULATORY SETTING

2.1 Federal Regulations

2.1.1 Endangered Species Act

The Endangered Species Act (ESA) protects plants and animals that are listed as endangered or threatened by U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS). Section 9 of ESA prohibits, without authorization, the taking of listed wildlife, where take is defined as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct" (50 Code of Federal Regulations [CFR] 17.3). For plants, this statute governs removing, possessing, maliciously damaging, or destroying any listed plant under federal jurisdiction and removing, cutting, digging up, damaging, or destroying any listed plant in any other area in knowing violation of state law (16 U.S. Code [USC] 1538). Under Section 7 of ESA, federal agencies are required to consult with USFWS and/or NMFS if their actions, including permit approvals and funding, could adversely affect a listed (or proposed) species (including plants) or its critical habitat. Through consultation and the issuance of a biological opinion (BO), USFWS and NMFS may issue an incidental take statement allowing take of the species that is incidental to an otherwise authorized activity provided the activity will not jeopardize the continued existence of the species. Section 10 of ESA provides for the issuance of incidental take permits where no other federal actions are necessary provided a habitat conservation plan is developed.

Permitting under the SSHCP, which was developed pursuant to Section 10 of the ESA, allows for take authorization of certain Covered Species through a streamlined permitting process. The SSHCP is discussed further in Section 2.5.8.

Critical Habitat

Critical Habitat is defined in Section 3 of ESA as:

1. the specific areas within the geographical area occupied by a species, at the time it is listed in accordance with the ESA, on which are found those physical or biological features essential to the conservation of the species and that may require special management considerations or protection; and

2. specific areas outside the geographical area occupied by a species at the time it is listed, upon a determination that such areas are essential for the conservation of the species.

For inclusion in a Critical Habitat designation, habitat within the geographical area occupied by the species at the time it was listed must first have features essential to the conservation of the species (16 USC 1533). Critical Habitat designations identify, to the extent known and using the best scientific data available, habitat areas that provide essential life cycle needs of the species (areas on which are found the primary constituent elements). Primary constituent elements are the physical and biological features that are essential to the conservation of the species and that may require special management considerations or protection. These include but are not limited to the following:

1. Space for individual and population growth and for normal behavior;

2. Food, water, air, light, minerals, or other nutritional or physiological requirements;

3. Cover or shelter;

4. Sites for breeding, reproduction, or rearing (or development) of offspring; and

5. Habitats that are protected from disturbance or are representative of the historic, geographical, and ecological distributions of a species.

2.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) implements international treaties between the United States and other nations devised to protect migratory birds, any of their parts, eggs, and nests from activities such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit. As authorized under the MBTA, USFWS issues permits to qualified applicants for the following types of activities: falconry, raptor propagation, scientific collecting, special purposes (rehabilitation, education, migratory game bird propagation, and salvage), take of depredating birds, taxidermy, and waterfowl sale and disposal. The regulations governing migratory bird permits can be found in 50 CFR part 13 General Permit Procedures and 50 CFR part 21 Migratory Bird Permits. The State

of California has incorporated the protection of non-game birds in § 3800, migratory birds in § 3513, and birds of prey in § 3503.5 of the California Fish and Game Code.

2.1.3 Clean Water Act

The federal Clean Water Act's (CWA's) purpose is to "restore and maintain the chemical, physical, and biological integrity of the nation's waters." Section 404 of the CWA prohibits the discharge of dredged or fill material into "Waters of the U.S." without a permit from the U.S. Army Corps of Engineers (USACE). The Clean Water Rule (CWR) was published in April 2015, but implementation of the rule was stayed until July 2018. It is currently (2018) in effect for California and a few other states. The CWR defines which features are considered Waters of the U.S. (and thus subject to the CWA). The CWR defines Waters of the U.S. as features having a significant effect on the chemical, physical, or biological integrity of a Traditional Navigable Water (TNW), interstate water, or territorial seas. Wetlands are defined as those areas "that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.3 7b). The U.S. Environmental Protection Agency (USEPA) also has authority over wetlands, including the authority to veto permits issued by USACE under CWA Section 404(c).

Projects involving activities that have no more than minimal individual and cumulative adverse environmental effects may meet the conditions of one of the Nationwide Permits already issued by USACE (Federal Register 82:1860, January 6, 2017). If impacts on wetlands could be substantial, an individual permit is required. A Water Quality Certification or waiver pursuant to Section 401 of the CWA is required for Section 404 permit actions; this certification or waiver is issued by the Regional Water Quality Control Board (RWQCB). The SSHCP includes an Aquatic Resources Program (ARP) to allow for streamlined permitting pursuant to CWA Sections 404 and 401. The SSHCP is discussed further in Section 2.5.8.

2.2 State and Local Regulations

2.2.1 California Endangered Species Act

The California ESA (California Fish and Game Code §§ 2050-2116) protects species of fish, wildlife, and plants listed by the state as endangered or threatened. Species identified as candidates for listing may also receive protection. Section 2080 of the California ESA prohibits the taking, possession, purchase, sale, and import or export of endangered, threatened, or candidate species, unless otherwise authorized by permit. Take is defined in Section 86 of the California Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." The California ESA allows for take incidental to otherwise lawful projects under permits issued by California Department of Fish and Wildlife (CDFW). Permitting under the SSHCP provides take authorization of certain Covered Species through a streamlined permitting process. The SSHCP is discussed further in Section 2.5.8.

2.2.2 Fully Protected Species

The State of California first began to designate species as "fully protected" prior to the creation of the federal and the California ESAs. Lists of fully protected species were initially developed to provide protection to those animals that were rare or faced possible extinction and included fish, amphibians and reptiles, birds, and mammals. Most fully protected species have since been listed as threatened or endangered under the federal and/or California ESAs. Fully protected species are identified in the California Fish and Game Code § 4700 for mammals, § 3511 for birds, § 5050 for reptiles and amphibians, and § 5515 for fish.

These sections of the California Fish and Game Code provide that fully protected species may not be taken or possessed at any time, including prohibition of CDFW from issuing incidental take permits for fully protected species under the California ESA. CDFW will issue licenses or permits for take of these species for necessary scientific research or live capture and relocation pursuant to the permit and may allow incidental take for lawful activities carried out under an approved Natural Community Conservation Plan (NCCP) within which such species are covered. The SSHCP is not an approved NCCP; however, it is consistent with California Fish and Game Code sections related to fully protected species, and SSHCP Covered Species include some fully protected species. The SSHCP is discussed further in Section 2.5.8.

2.2.3 Native Plant Protection Act

The Native Plant Protection Act (NPPA) of 1977 (California Fish and Game Code §§ 1900-1913) was established with the intent to "preserve, protect and enhance rare and endangered plants in this state." The NPPA is administered by CDFW. The Fish and Game Commission has the authority to designate native plants as "endangered" or "rare". The NPPA prohibits the take of plants listed under the NPPA, but the NPPA contains a number of exemptions to this prohibition that have not been clarified by regulation or judicial rule. In 1984, the California ESA brought under its protection all plants previously listed as endangered under NPPA. Plants listed as rare under NPPA are not protected under the California ESA, but are still protected under the provisions of NPPA. The Fish and Game Commission no longer lists plants under NPPA, reserving all listings to the California ESA.

2.2.4 California Fish and Game Code Special Protections for Birds

In addition to protections contained within the California ESA and California Fish and Game Code § 3511 described above, the California Fish and Game Code includes a number of sections that specifically protect certain birds.

Section 3800 states that it is unlawful to take nongame birds, such as those occurring naturally in California that are not resident game birds, migratory game birds, or fully protected birds, except when in accordance with regulations of the California Fish and Game Commission or a mitigation plan approved by CDFW for mining operations.

Section 3503 prohibits the take, possession, or needless destruction of the nest or eggs of any bird.

Section 3503.5 protects birds of prey (which includes eagles, hawks, falcons, kites, ospreys, and owls) and prohibits the take, possession, or destruction of any birds and their nests

Section 3505 makes it unlawful to take, sell, or purchase egrets, ospreys, and several exotic non-native species, or any part of these birds.

Section 3513 specifically prohibits the take or possession of any migratory nongame bird as designated in the MBTA.

2.2.5 Lake or Streambed Alteration Agreements

Section 1600-1616 of the California Fish and Game Code requires individuals or agencies to provide a Notification of Lake or Streambed Alteration to CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." CDFW reviews the proposed actions and, if necessary, proposed measures to protect affected fish and wildlife resources. The final proposal mutually agreed upon by CDFW and the applicant is the Lake or Streambed Alternation Agreement. The SSHCP complies with Sections 1600-1616 of the California Fish and Game Code. The SSHCP is discussed further in Section 2.5.8.

2.2.6 Porter-Cologne Water Quality Act

The RWQCB implements water quality regulations under the federal CWA and the Porter-Cologne Water Quality Act. These regulations require compliance with the National Pollutant Discharge Elimination System (NPDES), including compliance with the California Storm Water NPDES General Construction Permit for discharges of stormwater runoff associated with construction activities. General Construction Permits for projects that disturb one or more acres of land require development and implementation of a Storm Water Pollution Prevention Plan. Under the Porter-Cologne Water Quality Act, the RWQCB regulates actions that would involve "discharging waste, or proposing to discharge waste, with any region that could affect the water of the state" (Water Code 13260(a)). Waters of the State are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (Water Code 13050 (e)). The RWQCB regulates all such activities, as well as dredging, filling, or discharging materials into Waters of the State, that are not regulated by USACE due to a lack of connectivity with a navigable water body. The RWQCB may require issuance of a Waste Discharge Requirements for these activities. The SSHCP's ARP allows for streamlined permitting pursuant to the CWA and complies with the Porter-Cologne Water Quality Act. The SSHCP is discussed further in Section 2.5.8.

2.2.7 California Environmental Quality Act

In accordance with CEQA Guidelines § 15380, a species or subspecies not specifically protected under the federal or California ESAs or NPPA may be considered endangered, rare, or threatened for CEQA review purposes if the species meets certain criteria specified in the Guidelines. These criteria include definitions similar to definitions used in ESA, the California ESA, and NPPA. Section 15380 was included in the CEQA Guidelines primarily to address situations in which a project under review may have a significant effect on a species that has not been listed under ESA, the California ESA, or NPPA, but that may meet the

definition of endangered, rare, or threatened. Animal species identified as species of special concern (SSC) by CDFW, and plants identified by the California Native Plant Society (CNPS) as rare, threatened, or endangered may meet the CEQA definition of rare or endangered. The SSHCP is consistent with CEQA. The SSHCP is discussed further in Section 2.5.8.

Species of Special Concern

SSC are defined by CDFW as a species, subspecies, or distinct population of an animal native to California that are not legally protected under ESA, the California ESA, or the California Fish and Game Code, but currently satisfies one or more of the following criteria:

- The species has been completely extirpated from the state or, as in the case of birds, it has been extirpated from its primary seasonal or breeding role;
- The species is listed as federally (but not state) threatened or endangered, or meets the state definition of threatened or endangered but has not formally been listed;
- The species has or is experiencing serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for state threatened or endangered status;
- The species has naturally small populations that exhibit high susceptibility to risk from any factor that if realized, could lead to declines that would qualify it for state threatened or endangered status; and
- SSC are typically associated with habitats that are threatened.

Depending on the policy of the lead agency, projects that result in substantial impacts to SSC may be considered significant under CEQA.

U.S. Fish and Wildlife Service Birds of Conservation Concern

The 1988 amendment to the Fish and Wildlife Conservation Act mandates USFWS "identify species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under ESA." To meet this requirement, USFWS published a list of birds of conservation concern (BCC) (USFWS 2008) for the United States. The list identifies the migratory and nonmigratory bird species (beyond those already designated as federally threatened or endangered) that represent USFWS's highest conservation priorities. Depending on the policy of the lead agency, projects that result in substantial impacts to BCC may be considered significant under CEQA.

Sensitive Natural Communities

The CDFW maintains the *California Natural Community List* (CDFW 2018a), which provides a list of vegetation alliances, associations, and special stands as defined in the *Manual of California Vegetation* (Sawyer et al. 2009), along with their respective state and global rarity ranks. Natural communities with a

state rarity rank of 1, 2, or 3 are considered sensitive natural communities. Depending on the policy of the lead agency, impacts to sensitive natural communities may be considered significant under CEQA.

California Rare Plant Ranks

The CNPS maintains the *Inventory of Rare and Endangered Plants of California* (CNPS 2018a), which provides a list of plant species native to California that are threatened with extinction, have limited distributions, and/or low populations. Plant species meeting one of these criteria are assigned to one of six California Rare Plant Ranks (CRPRs). The rank system was developed in collaboration with government, academia, non-governmental organizations, and private sector botanists, and is jointly managed by CDFW and the CNPS. The CRPRs are currently recognized in the California Natural Diversity Database (CNDDB). The following are definitions of the CNPS CRPRs:

- Rare Plant Rank 1A – presumed extirpated in California and either rare or extinct elsewhere
- Rare Plant Rank 1B – rare, threatened, or endangered in California and elsewhere
- Rare Plant Rank 2A – presumed extirpated in California, but more common elsewhere
- Rare Plant Rank 2B – rare, threatened, or endangered in California but more common elsewhere
- Rare Plant Rank 3 – a review list of plants about which more information is needed
- Rare Plant Rank 4 – a watch list of plants of limited distribution

Additionally, CNPS has defined Threat Ranks that are added to the CRPR as an extension. Threat Ranks designate the level of threat on a scale of 1 through 3, with 1 being the most threatened and 3 being the least threatened. Threat Ranks are generally present for all plants ranked 1B, 2B, or 4, and for the majority of plants ranked 3. Plant species ranked 1A and 2A (presumed extirpated in California), and some species ranked 3, which lack threat information, do not typically have a Threat Rank extension. The following are definitions of the CNPS Threat Ranks:

- Threat Rank 0.1 – Seriously threatened in California (over 80 percent of occurrences threatened/high degree and immediacy of threat)
- Threat Rank 0.2 – Moderately threatened in California (20-80 percent occurrences threatened/moderate degree and immediacy of threat)
- Threat Rank 0.3 – Not very threatened in California (less than 20 percent of occurrences threatened/low degree and immediacy of threat or no current threats known)

Factors, such as habitat vulnerability and specificity, distribution, and condition of occurrences, are considered in setting the Threat Rank; and differences in Threat Ranks do not constitute additional or different protection (CNPS 2018a).

Depending on the policy of the lead agency, substantial impacts to plants ranked 1A, 1B, or 2, and 3 are typically considered significant under CEQA Guidelines § 15380. Significance under CEQA is typically evaluated on a case-by-case basis for plants ranked 4 and at the discretion of the CEQA lead agency.

California Environmental Quality Act Significance Criteria

Sections 15063-15065 of the CEQA Guidelines address how an impact is identified as significant. Generally, impacts to listed (rare, threatened, or endangered) species are considered significant. Assessment of "impact significance" to populations of non-listed species (e.g., SSC) usually considers the proportion of the species' range that will be affected by a project, impacts to habitat, and the regional and population level effects.

Specifically, § 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study checklist contained in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, state, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant under CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish or result in the permanent loss of an important resource on a population-wide or region-wide basis.

2.2.8 South Sacramento Habitat Conservation Plan

The SSHCP is a regional effort that provides development and infrastructure projects with streamlined federal and state permitting processes while creating a preserve system to protect habitat, open space, and agricultural lands (County of Sacramento et al. 2018). The SSHCP allows project proponents within the Plan Area to simplify and expedite the state and federal ESA permitting process. In addition to streamlining the ESA permitting processes, a parallel ARP has been developed to address permitting pursuant to the Clean Water Act Section 404 and 401 permitting process. The SSHCP will allow Sacramento County, the City of Rancho Cordova, City of Galt, and the Southeast Connector Joint Powers Authority to receive Incidental Take Permits (ITP) for Covered Species from USFWS and CDFW for activities and projects they conduct. In addition, the three local Land Use Authority Permittees (the County, Galt, and Rancho Cordova) can extend incidental take coverage provided by the SSHCP ITPs to activities and projects implemented by Third-Party Project Proponents that are under the jurisdiction of that Land Use Authority Permittee. See www.southsachcp.com for more information.

Table 1 provides a list of the SSHCP Covered Species, adapted from Table 1-2 of the SSHCP (County of Sacramento et al. 2018).

Table 1. SSHCP Covered Species

Scientific Name Common Name	Status

Status Definitions

Federal:
E = Listed as endangered under the federal ESA
T = Listed as threatened under the federal ESA
— = No federal ESA listing
BCC = Bird of Conservation Concern, USFWS 2008.

State:
E = Listed as endangered under state ESA
T = Listed as threatened under state ESA
CFP = Fully protected under the California Fish and Game Code
CSC = Species of special concern in California
WL = Watch List
— = No state status

California Native Plant Society California Rare Plant Rank (CRPR):
1B = Rare, threatened, or endangered in California and elsewhere
2 = Rare, threatened, or endangered in California but more common elsewhere

CRPR Threat Ranks
0.1 = Seriously threatened in California (high degree/immediacy of threat)
0.2 = Fairly threatened in California (moderate degree/immediacy of threat)
0.3 = Not very threatened in California (low degree/immediacy of threats or no current threats known)

2.2.9 City of Rancho Cordova Tree Ordinance

The City of Rancho Cordova Tree Ordinance defines Protected Trees as follows:

- Native oak trees – *Quercus lobata*, valley oak; *Quercus wislizenii*, interior live oak; *Quercus douglasii*, blue oak; or *Quercus* x. *morehus*, oracle oak – having a trunk diameter of at least six inches or greater; or
- Any tree species other than a native oak having a trunk diameter of at least 12 inches or greater on nonresidential property; or
- Any tree species other than a native oak having a trunk diameter of at least 24 inches or greater on residential property; or
- Any tree planted as a requirement tree for site development, tree permit condition, landscape plan removal replacement, or other designated condition by the public works director or planning director.

The City Ordinance defines the methods by which trunk diameter is determined as:

- "Diameter at standard height" or "dsh" means the diameter of a tree measured at four and one-half feet above natural grade, except as specified below. The diameter shall be calculated by using the following formula: diameter equals circumference/3.14.
- For a tree that branches at or below four and one-half feet, dsh means the diameter at the narrowest point between the grade and the branching point.
- For a tree with a common root system that branches at the ground, dsh means the sum of the diameter of the largest trunk and one-half the cumulative diameter of the remaining trunks at four and one-half feet above natural grade.

Trees designated with protected status under the City Ordinance may require additional reporting and planning requirements. The City ordinances require a report, to be prepared by a certified arborist, detailing the preservation, removal, replacement, or relocation of any protected trees prior to the preliminary approval of any parcel map. Protected Trees require a permit from the City of Rancho Cordova if pruning or removal of these trees is necessary.

3.0 METHODS

For the purposes of this assessment, special-status species are defined as plants or animals that:

- are listed, proposed for listing, or candidates for future listing as threatened or endangered under the ESA;
- are listed or candidates for future listing as threatened or endangered under the California ESA;
- meet the definitions of endangered or rare under § 15380 of the CEQA Guidelines;
- are identified as a SSC by the CDFW;
- are birds identified as BCC by the USFWS;

- are considered by the CNPS to be "rare, threatened, or endangered in California", "plants about which more information is needed", or "plants of limited distribution – a watch list" (i.e., species with a CRPR of 1B, 2, 3, or 4);
- are plants listed as rare under the NPPA (California Fish and Game Code, § 1900 et seq.);
- are fully protected in California in accordance with the California Fish and Game Code, §§ 3511 (birds), 4700 (mammals), 5050 (amphibians and reptiles), and 5515 (fishes); or
- are Covered Species as defined by the SSHCP.

Species that are tracked by the CNDDB but having no other special status are not considered to be special-status species.

Two different procedures were used to assess the potential for SSHCP Covered Species and species that are not Covered Species to occur within the Study Area. These are described below.

3.1 Analysis of SSHCP Covered Species

SSHCP Modeled Species Habitat data were used to determine which SSHCP Covered Species are considered to have the potential to occur within the Study Area (SSHCP Covered Species are listed in Table 1). Modeled Species Habitat data were obtained from Dudek and no revisions to the extent of Modeled Species Habitat were made by ECORP. Maps of Modeled Species Habitat are presented in Attachment B.

3.1.1 Field Assessment for Covered Species

Surveys for potential habitat for tricolored blackbird, burrowing owl, Swainson's hawk, other raptors, and western red bat were conducted per requirements of SSHCP Avoidance and Minimization Measures (AMMs) TCB-1, WBO-1, SWHA-1, RAPTOR-1, and BAT-1. The methods used and results of these surveys are described in Attachment C. Information from these surveys was used to determine whether specific potential habitat features (e.g., nesting trees, burrows) for these species were present onsite.

In addition, surveys for special-status plant species were conducted per AMMs PLANT-1 and ORCUTT-1 in spring 2019. The results of these surveys are described in Attachment D.

3.2 Analysis of Other Special-Status Species

3.2.1 Literature Review

The following resources were queried to determine whether any species other than SSHCP Covered Species have potential to occur within the Study Area.

- CDFW CNDDB record search for the "Buffalo Creek, California" 7.5-minute quadrangle and the eight surrounding USGS quadrangles (CDFW 2018b);

- USFWS Information, Planning, and Consultation System Resource Report List for the Study Area (USFWS 2018);
- CNPS' electronic *Inventory of Rare and Endangered Plants of California* was queried for the "Buffalo Creek, California" 7.5-minute quadrangle and the eight surrounding USGS quadrangles (CNPS 2018a).

3.2.2 Field Assessment for Other Species

Several surveys were conducted by ECORP biologists during fall 2018 and spring 2019. During these surveys, the Study Area was walked on foot where accessible, and topographic maps and aerial imagery were referenced. The Raymer Way Offsite was observed from the publicly accessible roadway, and the Rio del Oro Offsite was observed from within the Project.

Biological communities occurring within the Study Area were characterized and the following biological resource information was collected:

- Potential aquatic features (also described separately in the Aquatic Resources Delineation [ECORP 2018]);
- Protected Trees occurring onsite;
- Animal and plant species directly observed;
- Habitat and vegetation communities; and
- Representative photographs of the Study Area, provided as Attachment A.

3.2.3 Evaluation of Special-Status Species

Based on SSHCP modeled species habitat, species occurrence information from the literature review, and field assessments, a list of special-status plant and animal species considered to have the potential to occur within the Study Area was generated. This list is provided in Attachment E and the potentially occurring species are summarized in Section 4.0.

Each of the species that were considered as potentially occurring within the Study Area or vicinity was evaluated based on the following criteria:

- **Present** - Species was observed during field surveys or is known to occur within the Study Area based on documented occurrences within the CNDDB, SSHCP, or other literature.
- **Potential to Occur** - Habitat (including soil and elevation requirements) for the species occurs within the Study Area based on site assessment, literature research, or SSHCP Modeled Species Habitat data.
- **Low Potential to Occur** - Marginal or limited amounts of habitat occur, and/or the species is not known to occur within the vicinity of the Study Area based on CNDDB records and other available documentation. This designation is only used for species that are not SSHCP Covered Species.

- **Absent** - No suitable habitat (including soils and elevation requirements) and/or the species is not known to occur within the vicinity of the Study Area based on CNDDB records and other documentation, or SSHCP Modeled Species Habitat data does not indicate that habitat for the species occurs within the site.

4.0 RESULTS

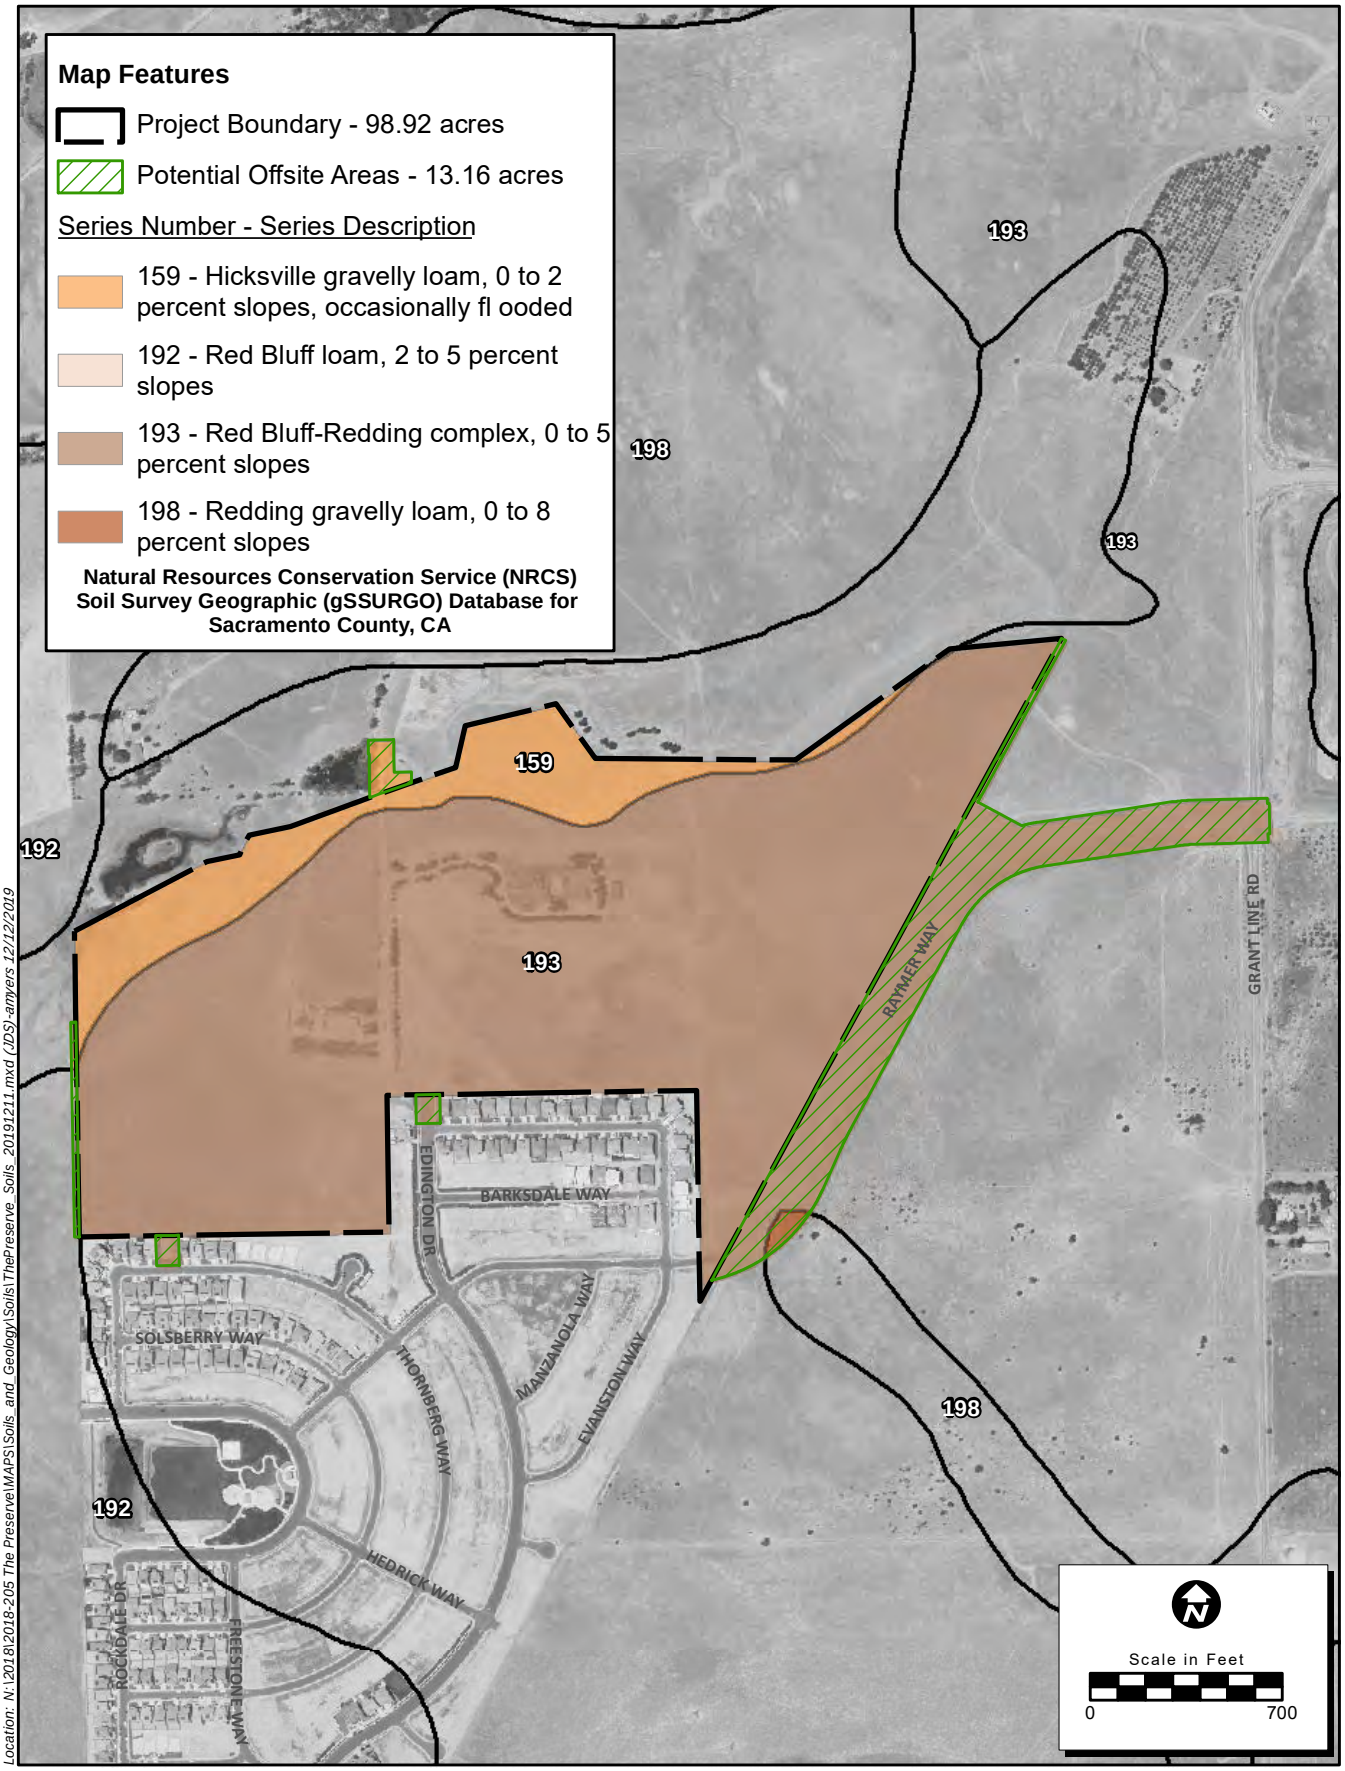
4.1 Site Characteristics and Land Use

The Study Area is situated at an elevation range between approximately 200 and 250 feet above mean sea level (MSL) in Rancho Cordova, California. The Study Area is located in the Great Valley region, Sacramento Valley subregion of the California Floristic Province (Baldwin et al. 2012). This region is characterized by agricultural areas, grasslands, wetlands, and valley oaks (Baldwin et al. 2012). The average annual precipitation for the region is 36.9 inches (with the wettest period during November-March), and average daily temperatures range from 47.7˚F in winter to 73.8˚F in summer (National Oceanic and Atmospheric Administration [NOAA] 2018).

The Study Area is characterized by flat to gently rolling terrain and consists primarily of grazed annual grasslands with two residences and other outbuildings. A private road, sometimes identified as Douglas Road, leads from south of the Study Area into the two residences.

The Study Area is located within the USFWS Mather Core Area (USFWS 2005a). Core Areas are areas prioritized for the conservation and recovery of threatened and endangered vernal pool species.

4.2 Soils



According to the *Web Soil Survey* (NRCS 2018), two soil units, or types, have been mapped within the Study Area (Figure 2. *Natural Resources Conservation Service Soil Types*):

- (159) Hicksville gravelly loam, 0 to 2 percent slopes, occasionally flooded;
- (192) Red Bluff loam, 2 to 5 percent slopes;
- (193) Red Bluff-Redding complex, 0 to 5 percent slopes; and
- (198) Redding gravelly loam, 0 to 8 percent slopes.

Hicksville and Red Bluff soils are formed in alluvium derived from mixed rock sources. Redding soils are formed in gravelly and cobbly alluvium derived from mixed rock sources (NRCS 2018). No soil units derived from serpentinite or other ultramafic parent materials have been reported to occur within the Study Area or its immediate vicinity (NRCS 2018). Furthermore, no apparent inclusions of ultramafic rocks or soils were observed during the June 2018 field survey.

4.3 Land Cover Types

SSHCP Land Cover data within the Study Area were reviewed; however, the type and extent of SSHCP Land Cover types was revised to reflect field conditions based on the onsite assessment. Baseline SSHCP

ECORP Consulting, Inc.
ENVIRONMENTAL CONSULTANTS

Land Cover data is presented in *Figure 3. Original SSHCP Land Cover*, and a revised Land Cover map is provided as *Figure 4. Revised SSHCP Land Cover*.

4.3.1 Terrestrial Land Cover Types

The SSHCP Land Cover data indicated that the Study Area primarily contains the Valley Grassland land cover type, and the reconnaissance vSisit revised the extent of this land cover type on Figure 4. The Study Area also contains Low Density Development and a small amount of Disturbed land cover.

Valley Grassland

The Valley Grassland land cover type is predominantly characterized by non-native (naturalized) annual grasses. Within the Study Area, the common plant species found in Valley Grassland are a mixture of nonnative annual grasses, including medusahead grass (*Elymus caput-medusae*), soft brome (*Bromus hordeaceus*), wild oats (*Avena fatua*), and brome fescue (*Festuca bromoides*). Narrow tarplant (*Holocarpha virgata*), a native perennial forb, is also common in this land cover type within the Study Area.

Low Density Development

The Low Density Development land cover type consists of existing homesteads including buildings/structures and horticultural trees. Trees are described further in Section 4.8.

Disturbed/Major Roads

The Disturbed and Major Roads land cover types consists of disturbed areas, and sections of paved and gravel road within the Study Area.

Major Roads

Major Roads land cover type consists of Grant Line Road and Raymer Way within the Raymer Way Offsite.

4.3.2 Aquatic Land Cover Types

An aquatic resources delineation was conducted for the Project in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008) and is provided as Attachment F-1. The USACE verified this delineation on May 9, 2019 (Attachment F-2). An Addendum to the delineation has been prepared for the Offsites (Attachment F-3), but has not yet been verified by the USACE as of the date of this assessment.

A total of 4.727 acres of aquatic resources have been mapped within the Study Area, consisting of 4.425 acres within the Project area and 0.302 acre within the Offsites. These include Vernal Pool, Swale, and Stream/Creek land cover types. The Morrison Creek and North Douglas Offsites were included in the aquatic resources delineation for the Project (ECORP 2018a). The Rio del Oro Offsite was delineated and verified by the USACE for the Rio del Oro Project (SPK-1999-00590) and per the verified delineation, no Waters of the U.S. lie within this area. The Raymer Way Offsite has not been formally delineated due to inability to access these areas as of the date of this report; however, roadside ditches were delineated

from the publicly accessible roads. A discussion of the aquatic resources found onsite is presented below, and an aquatic resources delineation map is presented in Figure 5. *Aquatic Resources Delineation*.

Vernal Pool

Vernal pools are seasonal ephemeral wetlands that fill and dry each year, forming in shallow depressions within Valley Grassland that are underlaid by an impermeable layer (e.g., a hardpan). Water collects in the depressions during the winter rainy season and recedes during the spring. Soils typically remain moist until late spring before becoming desiccated, and then remain dry throughout the summer. Vernal pools provide habitat for several special-status species, including invertebrates, plants, and amphibians.

Vernal pools occur throughout the Study Area. These features are variously dominated by Great Valley button-celery (*Eryngium castrense*), stalked popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), Mediterranean barley (*Hordeum marinum*), waxy mannagrass (*Glyceria declinata*), hairy hawkbit (*Leontodon saxatilis*), and toad rush (*Juncus bufonius*).

Swale

Swales are shallow ephemeral drainages found in flat to gently rolling Valley Grassland in association with vernal pool complexes, on soils with an impermeable layer. Swales convey runoff as shallow, gently sloping ephemeral wetlands during and shortly after winter rainstorms, but usually maintain soil saturation for longer periods during the growing season. They typically have hydric soils and support hydrophytic vegetation but lack an ordinary high-water mark (OHWM). Roadside ditches that may represent habitat for vernal pool invertebrates may also be classified as swales. Swales serve as habitat for many vernal pool species and provide hydrological connections between vernal pools that allows movement/dispersal of amphibian species, plant seeds, and vernal pool invertebrates (both adults and cysts).

Swales occur throughout the Study Area, and are dominated by Italian ryegrass (*Festuca perennis*), Fitch's spikeweed (*Centromadia fitchii*), and Mediterranean barley. Swale land cover within the Raymer Way Offsite represents roadside ditches.

Stream/Creek

The Stream/Creek land cover type includes intermittent and perennial linear water features such as rivers, streams, creeks, drainages, and roadside and irrigation ditches. These features typically exhibit a bed and bank and an OHWM. Morrison Creek is primarily located outside and to the north of the Study Area, with the exception of one Offsite located around an existing crossing of Morrison Creek.

Several small headwater tributaries to the creek flow through the Study Area into Morrison Creek. These features do not represent habitat for vernal pool invertebrates, due to the fast-moving flow and ephemeral nature of the features. Stream/creek features occur throughout the Study Area, flowing northwest to Morrison Creek, and vary from steep, unvegetated features, to gently sloping features that are sparsely vegetated with creeping spikerush (*Eleocharis macrostachya*).

4.4 Wildlife

Wildlife species observed within and around the Study Area during the 2018 site visits are listed in Attachment G.

4.5 Evaluation of Special-Status Species

Based on SSHCP Modeled Species Habitat data, the Study Area contains habitat for 20 Covered Species. Of these, one species was considered Present based on field observations made during habitat surveys required by SSHCP AMMs and one species was considered Present based on CNDDB data. SSHCP Modeled Species Habitat maps are provided in Attachment B. Eight SSHCP Covered Species were determined to be absent from the Study Area because no SSHCP Modeled Species Habitat existed within the Study Area.

The literature sources described in Section 3.1 were queried for any species other than the SSHCP Covered Species. These queries resulted in an additional seven species that were considered to have Potential to Occur or Low Potential to Occur.

Tabulated results of all species evaluated for the Study Area are presented in Attachment E. Each of the 27 species that were considered to be Present, Potential to Occur, or Low Potential to Occur (according to the definitions in Section 3.3) are listed in Table 2, and descriptions are provided in the following sections. Species that were considered to be Absent from the Study Area due to the lack of suitable habitat, or because the known distribution of the species does not include the Study Area vicinity, are not discussed further in this document.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Plants						
Stinkbells *(Fritillaria agrestis)*	-	-	4.2	Clay and sometimes serpentinite soils in chaparral, cismontane woodland, Pinyon and juniper woodland, and Valley and foothill grassland (33' - 5,102').	March–June	Absent within Project. Special-status plant surveys did not detect this species. Potential to Occur within Raymer Way Offsite; Valley grassland represents suitable habitat.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Boggs Lake hedge–hyssop *(Gratiola heterosepala)*	–	CE	1B.2, SSHCP Covered Species	Marshes, swamps, lake margins, and vernal pools (33'–7,792').	April–August	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Ahart's dwarf rush *(Juncus leiospermus* var. *ahartii)*	–	–	1B.2, SSHCP Covered Species	Mesic areas in valley and foothill grassland. Species has an affinity for slight disturbance such as farmed fields (USFWS 2005a) (98'–751').	March–May	Absent within Project. Special-status plant surveys did not detect this species. Small amounts of SSHCP Modeled Species Habitat present within unsurveyed Raymer Way Offsites.
Legenere *(Legenere limosa)*	–	–	1B.1, SSHCP Covered Species	Various seasonally inundated areas including wetlands, wetland swales, marshes, vernal pools, artificial ponds, and floodplains of intermittent drainages (USFWS 2005b) (3'–2,887').	April–June	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Slender Orcutt grass *(Orcuttia tenuis)*	FT	CE	1B.1, SSHCP Covered Species	Vernal pools, often gravelly (115'–5,774').	May–September	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Sacramento Orcutt grass *(Orcuttia viscida)*	FE	CE	1B.1, SSHCP Covered Species	Vernal pools (98'–328').	April–July	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Sanford's arrowhead *(Sagittaria sanfordii)*	–	–	1B.2, SSHCP Covered Species	Shallow marshes and freshwater swamps (0'–2,133').	May–October	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Invertebrates						
Conservancy fairy shrimp (*Branchinecta conservatio)*	FE	-	-	Vernal pools/wetlands.	November–April	Potential to Occur within vernal pool habitat.
Vernal pool fairy shrimp (*Branchinecta lynchi*)	FT	-	SSHCP Covered Species	Vernal pools/wetlands.	November-April	Potential to Occur. SSHCP Modeled Species Habitat present.
Midvalley fairy shrimp *(Branchinecta mesovallensis)*	-	-	CNDDB, SSHCP Covered Species	Vernal pools/wetlands.	November – April	Potential to Occur. SSHCP Modeled Species Habitat present.
Ricksecker's water scavenger beetle *Hydochara ricksecker*i	-	-	SSHCP Covered Species	Vernal pools/wetlands.	November-April	Potential to Occur. SSHCP Modeled Species Habitat present.
Vernal pool tadpole shrimp (*Lepidurus packardi*)	FE	-	SSHCP Covered Species	Vernal pools/wetlands.	November-April	Present. SSHCP Modeled Species Habitat present and CNDDB occurrence overlaps the site.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Amphibians						
Western spadefoot (*Spea hammondii*)	-	-	SSC, SSHCP Covered Species	California endemic species of vernal pools, swales, wetlands and adjacent grasslands throughout the Central Valley.	March-May	Potential to Occur. SSHCP Modeled Species Habitat present.
Reptiles						
Western pond turtle (*Actinemys marmorata*)	-	-	SSC, SSHCP Covered Species	Requires basking sites and upland habitats up to 0.5 km from water for egg laying. Uses ponds, streams, detention basins, and irrigation ditches.	April-September	Potential to Occur. No SSHCP Modeled Species Habitat present; however, ponded areas in Morrison Creek represent potential habitat.
Birds						
Burrowing owl *(Athene cunicularia)*	-	-	BCC, SSC, SSHCP Covered Species	Nests in burrows or burrow surrogates in open, treeless, areas within grassland, steppe, and desert biomes. Often with other burrowing mammals (e.g. prairie dogs, California ground squirrels). May also use human-made habitat such as agricultural fields, golf courses, cemeteries, roadside, airports, vacant urban lots, and fairgrounds.	February-August	Present. SSHCP Modeled Species Habitat present, and burrowing owls were observed during survey conducted per SSHCP AMM WBO-1.
Ferruginous hawk (*Buteo regalis*)	-	-	BCC, CDFW WL, SSHCP Covered Species	Rarely breeds in California (Lassen County); winter range includes grassland and shrubsteppe habitats from Northern California (except northeast and northwest corners) south to Mexico and east to Oklahoma, Nebraska, and Texas.	September-March (wintering)	Potential to Occur. SSHCP Modeled Species Habitat present.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Golden eagle (*Aquila chrysaetos*)	-	-	BCC, CFP	Nesting habitat includes mountainous canyon land, rimrock terrain of open desert and grasslands, riparian, oak woodland/savannah, and chaparral. Nesting occurs on cliff ledges, river banks, trees, and human-made structures (e.g. windmills, platforms, and transmission towers). Breeding occurs throughout California, except the immediate coast, Central Valley floor, Salton Sea region, and the Colorado River region, where they can be found during Winter.	Nest (February–August); winter CV (October–February)	Potential to Occur. Winter foraging habitat present.
Grasshopper sparrow (*Ammodramus savannarum*)	-	-	SSC	In California, breeding range includes most coastal counties south to Baja California; western Sacramento Valley and western edge of Sierra Nevada region. Nests in moderately open grasslands and prairies with patchy bare ground. Avoids grasslands with extensive shrub cover; more likely to occupy large tracts of habitat than small fragments; removal of grass cover by grazing often detrimental.	May–August	Potential to Occur. Nesting habitat present.
Loggerhead shrike (*Lanius ludovicianus*)	-	-	BCC, SSC, SSHCP Covered Species	Found throughout California in open country with short vegetation, pastures, old orchards, grasslands, agricultural areas, open woodlands. Not found in heavily forested habitats.	March-July	Potential to Occur. SSHCP Modeled Species Habitat present.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Merlin *(Falco columbarius)*	-	-	CDFW WL	Breeds in Oregon, Washington north into Canada. Winters in southern Canada to South America, including California. Breeds near forest openings, fragmented woodlots, and riparian areas. Wintering habitat includes wide variety, open forests, grasslands, tidal flats, plains, and urban settings.	September–April (wintering in the Central Valley); does not breed in California	Potential to Occur. Winter foraging habitat present.
Northern harrier (*Circus hudsonius*)	-	-	SSC, SSHCP Covered Species	Nests on the ground in open wetlands, marshy meadows, wet/lightly grazed pastures, (rarely) freshwater/brackish marshes, tundra, grasslands, prairies, croplands, desert, shrub-steppe, and (rarely) riparian woodland communities.	April-September	Potential to Occur. SSHCP Modeled Species Habitat present.
Swainson's hawk (*Buteo swainsoni*)	-	CT	BCC, SSHCP Covered Species	Nesting occurs in trees in agricultural, riparian, oak woodland, scrub, and urban landscapes. Forages over grassland, agricultural lands, particularly during disking/harvesting, irrigated pastures	March-August	Potential to Occur. SSHCP Modeled Species Habitat present.
Tricolored blackbird (*Agelaius tricolor*)	-	CT	BCC, SSC, SSHCP Covered Species	Breeds locally west of Cascade-Sierra Nevada and southeastern deserts from Humboldt and Shasta Cos south to San Bernardino, Riverside and San Diego Counties. Central California, Sierra Nevada foothills and Central Valley, Siskiyou, Modoc and Lassen Counties. Nests colonially in freshwater marsh, blackberry bramble, milk thistle, triticale fields, weedy (mustard, mallow) fields, giant cane, safflower, stinging nettles, tamarisk, riparian scrublands and forests, fiddleneck and fava bean fields.	March-August	Present. SSHCP Modeled Species Habitat present, evidence of past nesting observed during survey per SSHCP AMM TCB-1; however, species is nomadic and may not be present every year.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
White-tailed kite (*Elanus leucurus*)	-	-	CFP, SSHCP Covered Species	Nesting occurs within trees in low elevation grassland, agricultural, wetland, oak woodland, riparian, savannah, and urban habitats.	March-August	Potential to Occur. SSHCP Modeled Species Habitat present.
Yellow-billed magpie (*Pica nuttallii*)	-	-	BCC	Endemic to California; found in the Central Valley and coast range south of San Francisco Bay and north of Los Angeles County.; nesting habitat includes oak savannah with large in large expanses of open ground; also found in urban parklike settings.	April–June	Potential to Occur. Nesting habitat present.
Mammals						
Pallid bat *(Antrozous pallidus)*	-	-	SSC	Crevices in rocky outcrops and cliffs, caves, mines, trees (e.g. basal hollows of redwoods, cavities of oaks, exfoliating pine and oak bark, deciduous trees in riparian areas, and fruit trees in orchards). Also roosts in various human structures such as bridges, barns, porches, bat boxes, and human-occupied as well as vacant buildings (Western Bat Working Group [WBWG] 2018).	April–September	Potential to Occur. Structures onsite represent potential hibernacula.
Western red bat (*Lasiurus blossevillii*)	-	-	SSC, SSHCP Covered Species	Roosts in foliage of trees or shrubs; Day roosts are commonly in edge habitats adjacent to streams or open fields, in orchards, and sometimes in urban areas. There may be an association with intact riparian habitat (particularly willows, cottonwoods, and sycamores) (WBWG 2017).	April-September	Potential to Occur. SSHCP Modeled Species Habitat present; potential hibernacula habitat identified during survey per SSHCP AMM BAT-1.
American badger *(Taxidea taxus)*	-	-	SSC, SSHCP Covered Species	Drier open stages of most shrub, forest, and herbaceous habitats with friable soils.	Any season	Potential to Occur. SSHCP Modeled Species Habitat present.

Table 2. Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site

0.2	Threat Rank/Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)

4.5.1 Special-Status Plants

Special-status plant surveys were conducted within the Study Area, and accessible areas of the Offsites, for all plant species listed in Table 2 during spring and summer 2019. Attachment D provides the results of the special-status plant surveys. No special-status plants were documented within the Project site. However, there is potential for two species to occur in areas of the Raymer Way Offsite that were inaccessible at the time surveys were conducted. Brief descriptions of these species are presented below.

Stinkbells

Stinkbells (*Fritillaria agrestis*) is not listed pursuant to either the federal or California ESAs, but is designated as a CRPR 4.2 species. This species is a perennial bulbiferous herb that occurs in clay, sometimes serpentine areas in chaparral, cismontane woodland, pinyon and juniper woodland, and Valley and foothill grassland (CNPS 2018a). Stinkbells bloom from March to June and is known to occur at elevations ranging from 33 to 5,102 feet above MSL (CNPS 2018a). The current range of this species in California includes Alameda, Contra Costa, Fresno, Kern, Mendocino, Merced, Monterey, Mariposa, Placer, Sacramento, Santa Barbara, San Benito, Santa Clara, Santa Cruz, San Luis Obispo, San Mateo, Stanislaus, Tuolumne, Ventura, and Yuba counties, and is considered to be extirpated from Santa Cruz and San Mateo counties (CNPS 2018a).

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). However, the grassland within the Study Area provides suitable habitat for this species according to SSHCP Modeled Species Habitat. Stinkbells has potential to occur within the Raymer Way Offsite.

Ahart's Dwarf Rush

Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*) is not listed pursuant to either the federal or California ESAs, but is designated as a CRPR 1B.2 species. This species is an herbaceous annual that occurs in mesic areas in Valley and foothill grasslands (CNPS 2018a). This species also appears to have an affinity for slight disturbance since it has been found on farmed fields and gopher turnings (USFWS 2005a). Ahart's dwarf rush blooms from March through May and is known to occur at elevations ranging from 98 to 751 feet above MSL (CNPS 2018a, USFWS 2005a). Ahart's dwarf rush is endemic to California; the current range of this species includes Butte, Calaveras, Placer, Sacramento, Tehama, and Yuba counties (CNPS 2018a).

There are two documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Ahart's dwarf rush is a SSHCP Covered Species, and the aquatic features and grassland within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Ahart's dwarf rush has Potential to Occur within the Raymer Way Offsite.

4.5.2 Invertebrates

Four Covered Species invertebrates were determined to have the potential to occur within the Study Area based on SSHCP Modeled Species Habitat, and one other species was identified as having the potential to occur within the Study Area based on the literature review (Attachment G). Brief descriptions of these species are presented below.

Conservancy Fairy Shrimp

The Conservancy fairy shrimp (*Branchinecta conservatio*) is listed as endangered pursuant to the federal ESA. Critical Habitat units were designated for this species in the following counties: Butte, Colusa, Mariposa, Merced, Solano, Stanislaus, Tehama, and Ventura (USFWS 2006). This species is usually associated with cool-water pools, which are low to moderate in dissolved solids (Eriksen and Belk 1999). The species appears to be most commonly associated with relatively large, turbid vernal pools (USFWS 1994, Eriksen and Belk 1999, USFWS 2007). Conservancy fairy shrimp have been netted from November to late April, at water temperatures ranging from as low as 41°F (5°C) early in the ponding cycle, to as high as 75°F (24°C) near the end of the season (Syrdahl 1993, *as cited in* Eriksen and Belk 1999). Hatching generally occurs in the week following inundation of the pool at temperatures around 50°F (10°C). Maturation takes at least 19 days; if pool temperatures slowly increase to at least 68°F (20°C); however, the average time to maturity is 49 days (Eriksen and Belk 1999). The distribution of Conservancy fairy shrimp is limited to the northern two-thirds of the Central Valley at an elevation range of approximately 16 – 475 feet (5 – 145 meters) above mean sea level (Eriksen and Belk 1999). Populations of this species have been documented at eight widely separated locations, which include Vina Plains, Butte and Tehama counties; Sacramento National Wildlife Refuge, Glenn County; Yolo Bypass Wildlife Area, Yolo County; Jepson Prairie, Solano County; Mapes Ranch, Stanislaus County; University of California Merced area, Merced County; Grasslands Ecological Area, Merced County; and Los Padres National Forest, Ventura County (CDFG 2003; USFWS 2007).

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). However, the vernal pools within the Study Area provide suitable habitat for this species. Conservancy fairy shrimp has potential to occur within the Study Area.

Mid-Valley Fairy Shrimp

The Midvalley fairy shrimp (*Branchinecta mesovallensis*) is not listed pursuant to either the California or federal Endangered Species Acts, but occurrences of this species are tracked by the CNDDB. The Midvalley fairy shrimp was formally described as a species in 2000 (Belk and Fugate 2000). This species typically occurs in small, shallow vernal pools, swales, and various artificial ephemeral wetland types (e.g., roadside puddles, scrapes and ditches, and railroad toe-drain pools) (Belk and Fugate 2000; USFWS 2004). Midvalley fairy shrimp have been collected from late January to early April (Eriksen and Belk 1999). The cysts typically hatch in the first week of pool filling if water temperatures are near 10°C (50°F) (Eriksen and Belk 1999). This species has been documented in several California counties including: Sacramento, Solano, Contra Costa, San Joaquin, Madera, Merced, Fresno, and Yolo (Belk and Fugate 2000; USFWS 2004).

There are two documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Midvalley fairy shrimp is a SSHCP Covered Species, and the vernal pools and grassland within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Mid-valley fairy shrimp has potential to occur within the Study Area.

Ricksecker's Water Scavenger Beetle

Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i) is not listed and protected under either CESA or FESA but is currently tracked by CDFW in the CNDDB. Ricksecker's water scavenger beetles inhabit ponds in the Coast Range and Central Valley.

There is one documented CNDDB occurrence of this species located within five miles of the Study Area (CDFW 2018a). Ricksecker's water scavenger beetle is a SSHCP Covered Species, and the vernal pools within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Ricksecker's water scavenger beetle has potential to occur within the Study Area.

Vernal Pool Fairy Shrimp

The vernal pool fairy shrimp (*Branchinecta lynchi*) is listed as threatened in accordance with the federal Endangered Species Act. Vernal pool fairy shrimp may occur in seasonal ponds, vernal pools, and swales during the wet season, which generally occurs from December through May. This species can be found in a variety of pool sizes, ranging from less than 0.001 acre to over 24.5 acres (Eriksen and Belk 1999). The shrimp hatch from cysts when colder water (10°C [50°F] or less) fills the pool and mature in as few as 18 days, under optimal conditions (Eriksen and Belk 1999). At maturity, mating takes place and cysts are dropped. Vernal pool fairy shrimp occur in disjunct patches dispersed across California's Central Valley from Shasta County to Tulare County, the central and southern Coast Ranges from northern Solano County to Ventura County, and three areas in Riverside County (USFWS 2003).

There are 16 documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Vernal pool fairy shrimp is a SSHCP Covered Species, and the vernal pools and grassland within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Vernal pool fairy shrimp has potential to occur within the Study Area.

Vernal Pool Tadpole Shrimp

The vernal pool tadpole shrimp (*Lepidurus packardi*) is listed as endangered pursuant to the federal ESA. This species inhabits vernal pools containing clear to highly turbid water, ranging in size from 0.001 to 89.0 acres (USFWS 1994). Vernal pool tadpole shrimp are distinguished from other vernal pool branchiopods discussed in this report by a large, shield like carapace that covers the anterior half of their body (USFWS 2003). Cysts hatch during the wet season and the shrimp reach maturity in a few weeks. This species matures slowly and is long lived, relative to other species. Vernal pool tadpole shrimp will continue to grow as long as the pools they occur in remain inundated, and in some instances can survive for six months or longer (USFWS 2003). The geographic range of vernal pool tadpole shrimp extends from Shasta County to northern Tulare County in California's Central Valley, and in the central coast range from Solano County to Alameda County (USFWS 2003).

There is one documented CNDDB occurrence polygon for this species which overlaps the Study Area, and 32 other documented occurrences of this species located within five miles of the Study Area (CDFW 2018a). Vernal pool tadpole shrimp is a SSHCP Covered Species, and the vernal pools and grassland within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Vernal pool tadpole shrimp is considered Present within the Study Area.

4.5.3 Amphibians

One Covered Species amphibian was determined to have the potential to occur within the Study Area based on SSHCP Modeled Species Habitat. A brief description of this species is presented below.

Western Spadefoot

The western spadefoot (*Spea hammondii*) is not listed pursuant to either the California or federal ESAs; however, it is designated as a CDFW SSC. Necessary habitat components of the western spadefoot include loose, friable soils in which to burrow in upland habitats and breeding ponds. Breeding sites include temporary rain pools, such as vernal pools and seasonal wetlands, or pools within portions of intermittent drainages (Jennings and Hayes 1994). Spadefoots spend most of their adult life within underground burrows or other suitable refugia, such as rodent burrows. In California, western spadefoot toads are known to occur from the Redding area, Shasta County southward to northwestern Baja California, at elevations below 4,475 ft (Jennings and Hayes 1994).

There are three documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Western spadefoot is a SSHCP Covered Species, and the grassland and aquatic areas within the Study Area provide suitable foraging habitat for this species according to SSHCP Modeled Species Habitat. Western spadefoot has potential to occur within the Study Area.

4.5.4 Reptiles

One reptile species were determined to have the potential to occur within the Study Area based on the literature review (Attachment G). A brief description of this species is presented below.

Western Pond Turtle

The western pond turtle (*Actinemys marmorata*) is not listed pursuant to either the California or federal Endangered Species Acts; however, it is designated as a CDFW species of special concern (SSC). Western pond turtles occur in a variety of fresh and brackish water habitats including marshes, lakes, ponds, and slow-moving streams (Jennings and Hayes 1994). This species is primarily aquatic; however, they typically leave aquatic habitats in the fall to reproduce and to overwinter (Jennings and Hayes 1994). Deep, still water with abundant emergent woody debris, overhanging vegetation, and rock outcrops is optimal for basking and thermoregulation. Although adults are habitat generalists, hatchlings and juveniles and hatchlings require shallow edgewater with relatively dense submergent or short emergent vegetation in which to forage.

Western pond turtles are typically active between March and November. Mating generally occurs during late April and early May and eggs are deposited between late April and early August (Jennings and Hayes 1994). Eggs are deposited within excavated nests in upland areas, with substrates that typically have high clay or silt fractions (Jennings and Hayes 1994). The majority of nesting sites are located within 650 ft (200 m) of the aquatic sites; however, nests have been documented as far as 1,310 ft (400 m) from the aquatic habitat.

There are four documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Western pond turtle is a SSHCP Covered Species. While there was no SSHCP Modeled Species Habitat present within the site, the ponded areas along Morrison Creek may provide suitable aquatic habitat and the adjacent grasslands provide suitable upland habitat for this species. Western pond turtle is considered to have potential to occur within the Study Area.

4.5.5 Birds

Seven Covered Species birds were determined to have the potential to occur within the Study Area based on SSHCP Modeled Species Habitat, and three other species were identified as having the potential to occur within the Study Area based on the literature review (Attachment G). Brief descriptions of these species are presented below.

Burrowing Owl

The burrowing owl (*Athene cunicularia*) is not listed pursuant to either the California or federal ESAs; however, it is designated as a bird of conservation concern by the USFWS and a SSC by the CDFW. Burrowing owls inhabit dry open rolling hills, grasslands, desert floors, and open bare ground with gullies and arroyos. They can also inhabit developed areas such as golf courses, cemeteries, roadsides within cities, airports, vacant lots in residential areas, school campuses, and fairgrounds (Poulin et al. 2011). This species typically uses burrows created by fossorial mammals, most notably the California ground squirrel

(*Spermophilus beecheyi*), but may also use man-made structures such as cement culverts or pipes; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement (CDFG 2012). The breeding season typically occurs between February 1 and August 31 (California Burrowing Owl Consortium [CBOC] 1993; CDFG 2012).

There are seven documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Western burrowing owl is a SSHCP Covered Species, and the grassland within the Study Area provides suitable nesting and foraging habitat for this species, and the aquatic features provide suitable foraging habitat, according to SSHCP Modeled Species Habitat. Burrowing owls and occupied burrows were observed along the southeastern boundary of the site during a preliminary survey of potential habitat (Attachment C). Burrowing owl is considered Present within the Study Area.

Ferruginous Hawk

Ferruginous hawks (*Buteo regalis*) are not listed pursuant to either the California or federal ESAs. However, they are a CDFW "watch list" species and USFWS bird of conservation concern. This species typically occurs in open environments and nests from Oregon to Canada, though nesting has recently been documented in Lassen County, California (Small 1994). For the remainder of the state, including the Central Valley, ferruginous hawk occurrences are restricted to the non-breeding season (approximately September through March) (Small 1994). Winter foraging habitat includes a variety of open communities including annual grasslands, agricultural areas, deserts, and savannahs. Ferruginous hawks do not nest in the region but may occasionally forage within grassland and other open vegetation communities on-site during winter or migration.

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). However, ferruginous hawk is a SSHCP Covered Species, and the grassland and aquatic areas within the Study Area provide suitable foraging habitat for this species according to SSHCP Modeled Species Habitat. Ferruginous hawk has potential to occur within the Study Area.

Grasshopper Sparrow

The grasshopper sparrow (*Ammodramus savannarum*) is not listed pursuant to either the California or federal ESAs, but it is designated as a SSC by the CDFW. The grasshopper sparrow is an uncommon and local, summer resident and breeder along the western edge of the Sierra Nevada and most coastal counties south to Baja California (Small 1994; Vickery 1996). This species generally inhabits moderately open grasslands and prairies with patchy bare ground and scattered shrubs (Vickery 1996). Grasshopper sparrows are more likely to occupy large tracts of habitat than small fragments (Samson 1980; Herkert 1994a; Vickery et al. 1994 as cited in Vickery 1996). Breeding generally occurs from early May through August.

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). However, the grassland within the Study Area provide suitable nesting habitat for this species. Grasshopper sparrow has potential to occur within the Study Area.

Loggerhead Shrike

The loggerhead shrike (*Lanius ludovicianus*) is not listed pursuant to either the California or federal ESAs; but is considered a bird of conservation concern by the USFWS and a SSC by the CDFW. Loggerhead shrikes nest throughout California except the northwestern corner, montane forests, and high deserts (Small 1994). Loggerhead shrikes nest in small trees and shrubs in open country with short vegetation such as pastures, old orchards, mowed roadsides, cemeteries, golf courses, agricultural fields, riparian areas, and open woodlands (Yosef 1996). The nesting season extends from March through July.

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Loggerhead shrike is a SSHCP Covered Species, and the grassland within the Study Area provides suitable nesting and foraging habitat for this species, and the aquatic features provide suitable foraging habitat, according to SSHCP Modeled Species Habitat. Loggerhead shrike has potential to occur within the Study Area.

Merlin

The Merlin (*Falco columbarius*) is not listed pursuant to either the California or federal ESAs, but is a CDFW "watch list" species and currently tracked in the CNDDB. This falcon breeds in Canada and Alaska and occurs in California as a migrant and during the non-breeding season (September through April). Foraging habitat in winter includes open forests, grasslands, and tidal flats (Warkentin et al. 2005). Merlin do not nest in the region but may occasionally forage within grassland and woodland communities on-site during winter or migration.

There is one documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). The grassland within the Study Area provides suitable wintering habitat for this species. Merlin has potential to occur within the Study Area.

Northern Harrier

The northern harrier (*Circus cyaneus*) is not listed pursuant to either the California or federal ESAs; however, it is considered to be a SSC by the CDFW. This species is known to nest within the Central Valley, along the Pacific Coast, and in northeastern California. The northern harrier is a ground nesting species, and typically nests in emergent wetland/marsh, open grasslands, or savannah communities usually in areas with dense vegetation (Smith et al. 2011). Foraging occurs within a variety of open environments such as marshes, agricultural fields, and grasslands. Nesting occurs during April through September.

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Northern harrier is a SSHCP Covered Species, and the grassland within the Study Area provides suitable nesting and foraging habitat for this species, and the aquatic features provide suitable foraging habitat, according to SSHCP Modeled Species Habitat. Northern harrier has potential to occur within the Study Area.

Swainson's Hawk

The Swainson's hawk (*Buteo swainsoni*) is listed as a threatened species pursuant to the California ESA. This species nests in North America (Canada, western United States, and Mexico) and typically winters from South America north to Mexico. However, a small population has been observed wintering in the Sacramento-San Joaquin River Delta (Bechard et al. 2010). In California, the nesting season for Swainson's hawk ranges from mid-March to late August. Swainson's hawks nest within tall trees in a variety of wooded communities including riparian, oak woodland, roadside landscape corridors, urban areas, and agricultural areas, among others. Foraging habitat includes open grassland, savannah, low-cover row crop fields, and livestock pastures. In the Central Valley, Swainson's hawks typically feed on a combination of California vole (*Microtus californicus*), California ground squirrel (*Spermophilus beecheyi*), ring-necked pheasant (*Phasianus colchicus*), many passerine birds, and grasshoppers (*Melanopulus* species). Swainson's hawks are opportunistic foragers and will readily forage in association with agricultural mowing, harvesting, disking, and irrigating (Estep 1989). The removal of vegetative cover by such farming activities results in more readily available prey items for this species.

There are seven documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Swainson's hawk is a SSHCP Covered Species, and the grassland and aquatic areas within the Study Area provide suitable foraging habitat for this species according to SSHCP Modeled Species Habitat. In addition, a preliminary survey of potential habitat found several trees within the Survey Area and survey buffers that represent potential nesting habitat. Swainson's hawk has potential to occur within the Study Area.

Tricolored Blackbird

The tricolored blackbird (*Agelaius tricolor*) is listed as threatened pursuant to the California ESA. In addition, it is currently considered a USFWS bird of conservation concern and a CDFW SSC. This colonial nesting species is distributed widely throughout the Central Valley, Coast Range, and into Oregon, Washington, Nevada, and Baja California (Meese et al. 2014). Tricolored blackbirdnest in colonies that can range from several pairs to several thousand pairs, depending on prey availability, the presence of predators, or level of human disturbance. Tricolored blackbird nesting habitat includes emergent marsh, riparian woodland/scrub, blackberry thickets, densely vegetated agricultural and idle fields (e.g., wheat, triticale, safflower, fava bean fields, thistle, mustard, cane, and fiddleneck), usually with some nearby standing water or ground saturation (Meese et al. 2014). They feed mainly on grasshoppers during the breeding season, but may also forage upon a variety of other insects, grains, and seeds in open grasslands, wetlands, feedlots, dairies, and agricultural fields (Meese et al. 2014). The nesting season is generally from March through August.

There are 10 documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). Tricolored blackbird is a SSHCP Covered Species, and the grassland within the Study Area provides suitable nesting and foraging habitat for this species, and the aquatic features provide suitable foraging habitat, according to SSHCP Modeled Species Habitat. In addition, a preliminary survey of potential habitat documented evidence of previous tricolored blackbird nesting within patches of bull

thistle (*Cirsium vulgare*) in the central portion of the site, and a small area of riparian habitat along Morrison Creek was also determined to represent potential nesting habitat (Attachment C). However, tricolored blackbirds were not observed nesting during a site visit on June 13, 2019. This species is nomadic and may or may not return to the site. Tricolored blackbirds are considered to be present within the Study Area.

White-Tailed Kite

White-tailed kite (*Elanus leucurus*) is not listed pursuant to either the California or federal ESAs; however, the species is fully protected pursuant to Section 3511 of the California Fish and Game Code. This species is a common resident in the Central Valley and the entire length of the California coast, and all areas up to the Sierra Nevada foothills and southeastern deserts (Dunk 1995). In northern California, white-tailed kite nesting occurs from March through early August, with nesting activity peaking from March through June. Nesting occurs in trees within riparian, oak woodland, savannah, and agricultural communities that are near foraging areas such as low elevation grasslands, agricultural, meadows, farmlands, savannahs, and emergent wetlands (Dunk 1995).

There are five documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). White-tailed kite is a SSHCP Covered Species, and the grassland and aquatic areas within the Study Area provide suitable foraging habitat for this species according to SSHCP Modeled Species Habitat. White-tailed kite has potential to occur within the Study Area.

Yellow-Billed Magpie

The yellow-billed magpie (*Pica nuttalli*) is not listed pursuant to either the California or federal ESAs but is considered a USFWS bird of conservation concern. This endemic species is a yearlong resident of the Central Valley and Coast Ranges from San Francisco Bay to Santa Barbara County. Yellow-billed magpies build large, bulky nests in trees in a variety of open woodland habitats, typically near grassland, pastures or cropland. Nest building begins in late-January to mid-February, which may take up to 6-8 weeks to complete, with eggs laid during April-May, and fledging during May-June (Koenig and Reynolds 2009). The young leave the nest at about 30 days after hatching (Koenig and Reynolds 2009). Yellow-billed magpies are highly susceptible to West Nile Virus, which may have been the cause of death to thousands of magpies during 2004-2006 (Koenig and Reynolds 2009).

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). However, the grassland and trees within the Study Area provide suitable nesting habitat for this species. Yellow-billed magpie has potential to occur within the Study Area.

4.5.6 Mammals

Two Covered Species mammals were determined to have potential to occur within the Study Area based on SSHCP Modeled Species Habitat, and one other species was identified as having the potential to occur within the Study Area based on the literature review (Attachment G). Brief descriptions of these species are presented below.

American Badger

The American badger (*Taxidea taxus*) is not listed pursuant to either the federal or California ESAs; however, this species is considered a SSC by CDFW. American badger historically ranged throughout much of the state, except in humid coastal forests. American badgers were once numerous in the Central Valley; however, populations now occur in low numbers in the surrounding peripheral parts of the Central Valley and in the adjacent lowlands of eastern Monterey, San Benito, and San Luis Obispo counties (Williams 1986). American badgers occupy a variety of habitats, including grasslands and savannas. The principal requirements seem to be significant food supply, friable soils, and relatively open, uncultivated ground (Williams 1986).

There is one documented CNDDB occurrence of this species located within five miles of the Study Area (CDFW 2018a). American badger is a SSHCP Covered Species, and the grassland and wetland areas within the Study Area provide suitable foraging habitat for this species according to SSHCP Modeled Species Habitat. American badger has potential to occur within the Study Area.

Pallid Bat

The pallid bat (*Antrozous pallidus*) is not listed pursuant to either the California or federal ESAs; however, this species is considered a SSC by CDFW. The pallid bat is a large, light-colored bat with long, prominent ears and pink, brown, or grey wing and tail membranes. This species ranges throughout North America from the interior of British Columbia, south to Mexico, and east to Texas. The pallid bat inhabits low elevation (below 6,000 ft) rocky arid deserts and canyonlands, shrub-steppe grasslands, karst formations, and higher elevation coniferous forest (above 7,000 ft). This species roosts alone or in groups in the crevices of rocky outcrops and cliffs, caves, mines, trees, and in various human structures such as bridges, and barns. Pallid bats are feeding generalists that glean a variety of arthropod prey from surfaces as well as capturing insects on the wing. Foraging occurs over grasslands, oak savannahs, ponderosa pine forests, talus slopes, gravel roads, lava flows, fruit orchards, and vineyards. Although this species utilizes echolocation to locate prey, often they use only passive acoustic cues. This species is not thought to migrate long distances between summer and winter sites (WBWG 2017).

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). However, some of the structures within the Study Area represent potential hibernacula (see Attachment C). Pallid bat has potential to occur within the Study Area.

Western Red Bat

The western red bat (*Lasiurus blossevillii*) is not listed pursuant to either the California or federal Endangered Species Acts; however, this species is considered a SSC by CDFW. The western red bat is easily distinguished from other western bat species by its distinctive red coloration. This species is broadly distributed, its range extending from southern British Columbia in Canada through Argentina and Chile in South America, and including much of the western United States. This solitary species day roosts primarily in the foliage of trees or shrubs in edge habitats bordering streams or open fields, in orchards, and occasionally urban areas. They may be associated with intact riparian habitat, especially with willows,

cottonwoods, and sycamores. This species may occasionally utilize caves for roosting as well. They feed on a variety of insects, and generally begin to forage one to two hours after sunset. This species is considered highly migratory; however, the timing of migration and the summer ranges of males and females may be different. Winter behavior of this species is poorly understood (WBWG 2017).

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2018a). However, western red bat is a SSHCP Covered Species. The grassland and wetland areas within the Study Area provide suitable foraging habitat. The Raymer Way offsite contains roosting-foraging habitat for this species according to SSHCP Modeled Species Habitat; however, site assessment did not find evidence of potential roosting habitat within the Raymer Way Offsite (Attachment C). A preliminary survey of potential habitat identified some of the trees with cavities along Morrison Creek as potential hibernacula (Attachment C). Western red bat has potential to occur within the Study Area.

4.6 Wildlife Movement/Corridors

The Study Area is located in an undeveloped area within the limits of the City of Rancho Cordova, roughly four miles south of U.S. Highway 50. The Study Area does not fall within an Essential Habitat Connectivity area mapped by the CDFW (CDFW 2018a). The upper reach of Morrison Creek runs along the northern boundary of the Study Area. Though Morrison Creek is ephemeral, the permanently ponded open waters and the small patches of riparian habitat along the creek may represent a marginal wildlife movement corridor; however, this area lies outside of the Study Area with the exception of the Morrison Creek Offsite.

4.7 Sensitive Natural Communities

Five sensitive natural communities were initially identified as having the potential to occur within the Study Area based on the literature review (CDFW 2018a). These included Great Valley Valley Oak Riparian Forest, Ione Chaparral, Northern Hardpan Vernal Pool, Northern Volcanic Mudflow Vernal Pool, and Valley Needlegrass Grassland. Valley oaks are not present within the Study Area; therefore, Great Valley Oak Riparian Forest does not occur onsite. Vernal pool communities are present onsite, and are discussed separately in Section 4.3.2. No chaparral vegetation is present within the Study Area and there are no Ione formation soils present; therefore, Ione chaparral is not present. The "Valley Needlegrass Grassland" vegetation alliance name used by the CNDDB is no longer in use, and instead "Needlegrass-Melic Grass Grassland" as well as other associations containing needlegrass (*Stipa* spp.) are now used by the California Vegetation Manual (CNPS 2018b) and the CDFW-maintained list of sensitive natural communities. No needlegrass species were found during special-status plant surveys (Attachment D). Therefore, vernal pool communities are the only sensitive natural community known to occur within the Study Area.

4.8 Trees

An arborist survey was conducted for the Study Area in October 2018 and June 2019 (Attachment H). A total of 247 trees greater than 6 inches dsh were mapped within the Study Area, and all tree species are nonnative to the region. There are 149 trees that have a dsh equal to or greater than 12 inches and therefore meet the definition of a Protected Tree as defined in the City of Rancho Cordova's Tree

Preservation Ordinance. The 149 Protected Trees include redwood (*Sequoia sempervirens*), eucalyptus (*Eucalyptus* spp.), callery pear (*Pyrus calleryana*), American sweetgum (*Liquidambar styraciflua*), Brazilian pepper-tree (*Schinus terabinthifolia*), deodar cedar (*Cedrus deodara*), white mulberry (*Morus alba*).

5.0 IMPACT ANALYSIS

5.1 Special-Status Species

The Project would require mass grading of the site. As such, the Project would have the potential to have a substantial adverse effect, either directly or through habitat modifications, on special-status species identified by CDFW, and/or USFWS. In addition, the Project is located within the USFWS Mather Core Area, an area prioritized for the conservation and recovery of federally threatened and endangered vernal pool species.

Of the 27 species identified as Present or Potential to Occur within the Study Area, 20 species are SSHCP Covered Species and are considered adequately conserved by the SSHCP. Project impacts on special-status species habitat are anticipated to be mitigated through the SSHCP In-Lieu Fee Program, and the Project proponents will comply with SSHCP AMMs as described in Section 6.0. The SSHCP also considers priorities for conservation and recovery of vernal pool species within the Mather Core Area.

The remaining seven species having Potential to Occur or Low Potential to Occur onsite that are not SSHCP Covered Species include one plant, one vernal pool invertebrate, one bat, and four birds. Though not Covered Species, the potential impacts to these species are also anticipated to be mitigated by SSHCP AMMs and by the restoration, enhancement and preservation of habitats accomplished by the SSHCP in-lieu fee program. Section 6.0 provides recommended mitigation measures. Measures BIO-5 through 14 are recommended to be implemented in order to minimize effects on special-status species.

5.2 Sensitive Natural Communities

The Study Area primarily consists of Valley Grassland that supports mostly nonnative grass and forb species, and aquatic features including vernal pool habitat. Project impacts to vernal pool communities are discussed in Section 5.3 and addressed by Mitigation Measures BIO-1 and BIO-5 (Section 6.0).

5.3 Federally Protected Wetlands and Waters of the U.S.

The Project is anticipated to impact (fill) up to roughly 4.727 acres of Waters of the U.S. The Project applicants are anticipated to apply for CWA Section 404 and 401 authorization under the SSHCP ARP, and to mitigate for Project impacts using the SSHCP In-Lieu Fee Program. Mitigation Measures BIO-1, BIO-2, and BIO-5 are recommended to address impacts to wetlands and other Waters of the U.S.

5.4 Wildlife Corridors and Nursery Sites

The Study Area does not fall within an Essential Habitat Connectivity area mapped by the CDFW (CDFW 2018a). In addition, the Project will have minimal impacts to Morrison Creek. Recommended Mitigation Measure BIO-3 requires a 100-foot setback from Morrison Creek for certain development activities that

are considered detrimental to stream/creek corridors. Morrison Creek is the only potential wildlife corridor near the site; therefore, no impacts on wildlife corridors are anticipated as a result of Project development.

5.5 Local Policies and Ordinances

The Project would remove ±142 of the 149 Protected Trees (as defined by the City of Rancho Cordova Tree Preservation Ordinance) from the Project area. The nine trees within the Morrison Creek Offsite will be avoided.

The Protected Trees onsite may provide nesting habitat for birds and roosting habitat for bats; however, none of the trees to be removed are native to the Central Valley, and several of the species are considered potentially invasive according to the California Invasive Plant Council Inventory (i.e., eucalyptus, callery pear, Brazilian pepper-tree).

Per the City of Rancho Cordova Tree Preservation Ordinance Section 19.12.070, the Public Works Director will consider the potential for the trees being removed to be a public nuisance and the overall impact on the environment (among other considerations). Removal of these trees is not anticipated to result in negative impacts on the environment aside from potential effects on nesting habitat, and the invasive tree species may become a public nuisance. For example, invasion by eucalyptus species can lead to increased fire hazard, increased soil erosion, and poor wildlife habitat quality (Rejmanek and Richardson 2011). Eucalyptus trees were planted along roadsides and around buildings within the Study Area, but appear to have invaded the adjacent riparian area along Morrison Creek. Replacement of trees with similar species is not recommended; however, incorporating locally native trees into the Project's landscaping design will maintain habitat for bird species and reduce invasion of nonnative species into adjacent habitats. Recommended Mitigation Measure BIO-14 addresses impacts to Protected Trees.

5.6 Habitat Conservation Plans

The Project is anticipated to apply for permits through the SSHCP and the ARP and the Project will comply with the SSHCP's requirements and AMMs as discussed in the recommended Mitigation Measures in Section 6.0 (full text of AMMs is provided as Attachment I). The Project impacts are anticipated to be mitigated through the SSHCP In-Lieu Fee Program as discussed in BIO-5.

6.0 RECOMMENDATIONS

The following Mitigation Measures are recommended prior to Project implementation in order to mitigate impacts on biological resources. Many of the Mitigation Measures reference SSHCP AMMs, the full text of which can be found in Attachment I.

BIO-1. Obtain Clean Water Act Section 404 Permit and Section 401 Permit and Implement All Permit Conditions:

Before the approval of grading and improvement plans and before any groundbreaking activity associated with the project, the Project applicants shall ensure that authorization pursuant to CWA Section 404 from the USACE and CWA Section 401 from the Central Valley RWQCB is obtained. CWA

Section 404 authorization is anticipated to be obtained through a Letter of Permission issued by USACE under the SSHCP ARP, and CWA Section 401 authorization is anticipated to be obtained through an individual Water Quality Certification issued by the RWQCB under the SSHCP ARP.

The construction contractor shall adhere to all conditions outlined in the permits. The Project applicants shall ensure that the project replaces, restores, or enhances on a "no net loss" basis (in accordance with the USACE and the Central Valley RWQCB) the acreage of all wetlands and other Waters of the U.S. that would be removed, lost, and/or degraded due to project implementation, either through the SSHCP In-Lieu Fee Program or by other methods agreeable to the USACE, the Central Valley RWQCB, and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes.

BIO-2. Obtain and Implement CDFW 1602 Streambed Alteration Agreement:

Before the approval of grading and improvement plans and before any groundbreaking activity associated with the project, the Project applicants shall ensure that a CDFW 1602 Streambed Alteration Agreement has been obtained. The construction contractor shall adhere to all conditions outlined in the Streambed Alteration Agreement.

BIO-3. Setback from Morrison Creek:

The Project applicants shall comply with SSHCP AMM STREAM-2 and a 100-foot setback from Morrison Creek will be established and only allowed compatible uses described in the SSHCP will be sited within the setback.

BIO-4. Best Management Practices:

The Project applicants shall comply with SSHCP AMMs BMP-1 through BMP-11. Per BMP-7, an approved biologist will be onsite during the period of ground disturbance, and will train an individual to act as the onsite construction monitor for the remainder of construction once ground disturbance is complete. "Ground disturbance" shall be defined as the initial disturbance of native soil. Species-specific AMMs requiring certain monitoring practices shall take priority over BMP-7.

BIO-5. Mitigate for Impacts to Aquatic Features and Habitat:

Before the approval of grading and improvement plans and before any groundbreaking activity associated with the project, or timed as required by the applicable permits if the Project is constructed in phases, the Project applicants shall ensure that mitigation for impacts to aquatic features and other habitat for special-status species has been implemented through the SSHCP In-Lieu Fee Program or by other methods agreeable to the USACE, RWQCB, USFWS, CDFW, City, and South Sacramento Conservation Agency as appropriate, depending on agency jurisdiction.

BIO-6. Special-Status Plant Surveys and Protection:

Special-status plant surveys were conducted in spring and summer 2019 within the Study Area but excluding inaccessible portions of the Raymer Way Offsite (Attachment D). No special-status plants or

sensitive natural communities were detected. For the Raymer Way Offsite, Project applicants shall comply with SSHCP AMM PLANT 1 (Rare Plant Surveys) conduct special-status plant surveys prior to construction. Habitat for *Orcuttia* species was determined to be absent from the Raymer Way Offsite; therefore, ORCUTT-1 does not apply. Though stinkbells is not considered an SSHCP Covered Species, special-status plant surveys conducted per PLANT-1 shall identify whether this species is present onsite.

If any SSHCP-covered plants are determined to be present, PLANT-2 (Rare Plant Protection) will be implemented. If stinkbells is determined to be present, a mitigation plan shall be prepared for review and approval by the City of Rancho Cordova and mitigation may include harvesting and transplanting of impacted bulbs into a preserved area with suitable habitat. Avoided areas containing stinkbells shall be fenced with orange construction fencing.

BIO-7. Western Spadefoot:

The Project applicants shall comply with SSHCP AMMs WS-1 through WS-6.

BIO-8. Western Pond Turtle:

There is no SSHCP Modeled Habitat for western pond turtle within the Project; however, the ponded areas along Morrison Creek may provide potential habitat for western pond turtle. Therefore, pre-construction surveys will be conducted per SSHCP AMM WPT-1. If western pond turtles are detected, WPT-2 through WPT-9 will be implemented.

BIO-9. Tricolored Blackbird:

The Project applicants shall comply with SSHCP AMMs TCB-2 through TCB-5. If tricolored blackbirds are found within the survey area during the pre-construction survey conducted per TCB-2, then TCB-3 through TCB-5 will be implemented as required based on the results of surveys conducted per TCB-2.

BIO-10. Swainson's Hawk:

The Project applicants shall comply with SSHCP AMMs SWHA-2 through SWHA-4. If Swainson's hawk nesting is found within the survey area during the pre-construction survey conducted per SWHA-2, then SWHA-3 and SWHA-4 will be implemented as required based on the results of surveys conducted per SWHA-2.

BIO-11. Western Burrowing Owl:

The Project applicants shall comply with SSHCP AMMs WBO-2 through WBO-7. If western burrowing owl is found within the survey area, WBO-3 through 7 shall be implemented as required based on the results of surveys conducted per WBO-2.

BIO-12. Other Raptors:

The Project applicants shall comply with SSHCP AMMs RAPTOR-2 through RAPTOR-4. Raptor surveys conducted per RAPTOR-2 shall include surveying for golden eagle although it is not a SSHCP Covered Species. If raptor species (including golden eagles) are found nesting within the survey area, RAPTOR-3

and RAPTOR-4 shall be implemented as required based on the results of surveys conducted per RAPTOR-2.

BIO-13. Other Nesting Birds:

A qualified biologist shall conduct a preconstruction nesting bird survey of all areas associated with construction activities, and a 100-foot buffer around these areas, within 14 days prior to commencement of construction if construction occurs during the nesting season (February 1 through August 31). If active nests are found for any SSHCP Covered Species, the applicable SSHCP AMM(s) will be implemented (i.e. TCB-3 through -5, SWHA-3 through -4, WBO-3 through -6, and RAPTOR-3 through -4). If active nests are found for any other species, a no-disturbance buffer around the nest shall be established. The buffer distance shall be established by a qualified biologist in consultation with the CDFW. The buffer shall be maintained until the fledglings are capable of flight and become independent of the nest, to be determined by a qualified biologist. Once the young are independent of the nest, no further measures are necessary.

BIO-14. Bat Species:

The Project applicants shall comply with SSHCP AMMs BAT-2 through BAT-5. Winter hibernaculum surveys conducted per BAT-2 shall also include surveying for pallid bat although it is not an SSHCP Covered Species. If winter hibernacula of western red bat or pallid bat are found within the survey area, then BAT-3 through BAT-5 will be implemented as required based on the results of surveys conducted per BAT-2.

BIO-15. American Badger:

A qualified biologist shall conduct a preconstruction survey for American badger within 14 days prior to commencement of construction and results of the survey will be provided to the City's Planning Department. If badgers or dens with signs of recent badger use are detected (i.e., fresh scat, claw marks), CDFW will be consulted and a non-disturbance buffer will be established around any active dens. The den(s) will be monitored daily by the qualified biologist during construction. No work will occur within the non-disturbance buffer until the qualified biologist determines that the badger(s) have left the work area, or as determined in consultation with CDFW.

BIO-16. Protected Tree Removal and Incorporating Native Trees into Landscaping Design:

A tree removal permit shall be procured from the City for removal of any Protected Trees. In addition, tree species that are native to the Central Valley and Sierra Nevada foothills such as interior live oak (*Quercus wislizeni*), valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), Fremont cottonwood (*Populus fremontii*), black walnut (*Juglans hindsii*), and western redbud (*Cercis occidentalis*) shall be incorporated into the planned landscaping design in public spaces such as open space, parks and parkways. Enough plantings of these native trees shall be incorporated into the landscaping such that the number of surviving native trees after five years is equal to or greater than the number of non-native trees removed. Landscaping plans detailing the tree species to be planted will be provided to the City for approval prior to tree planting.

BIO-17. South Sacramento Habitat Conservation Plan

The Project applicants shall comply with SSHCP requirements and all relevant AMMs set forth in the SSHCP Permit obtained for the Project.

Results of SSHCP Habitat Surveys

June 21, 2019

Mr. George Carpenter
Winn Communities
3001 I Street, Suite 300
Sacramento, CA 95816

RE: Bird and Bat Potential Habitat Assessment Surveys – The Preserve Development Project, Rancho Cordova, California

Dear Mr. Carpenter:

At the request of Winn Communities, Inc., ECORP Consulting, Inc. has conducted surveys for bird and bat habitat within the ±98.92-acre The Preserve Development Project (Project) and the ±9.33-acre potential Offsite areas. The Project is located northwest of Raymer Way and Grant Line Road in the City of Rancho Cordova, Sacramento County, California (Figure 1. *Project Location and Vicinity*). This letter supercedes the letter sent on December 10, 2018.

As required by the South Sacramento Habitat Conservation Plan (SSHCP) Avoidance and Minimization Measures (AMMs), surveys for potential habitat were conducted for tricolored blackbird (TRBL, *Agelaius tricolor*), Swainson's hawk (SWHA; *Buteo swainsoni*) and other raptors, burrowing owls (BUOW; *Athene cunicularia*), and western red bats (LABL; *Lasiurus blossevillii*). In addition, potential habitat for pallid bat (ANPA; *Antrozous pallidus*) was also assessed. Each survey also included buffers around the Project and Offsite areas as required by the AMMs for each species, as described below in the *Survey Methods* section.

REGULATORY CONTEXT

South Sacramento Habitat Conservation Plan

The SSHCP is a regional effort that will provide development and infrastructure projects with streamlined federal and state permitting processes while creating a preserve system to protect habitat, open space, and agricultural lands (County of Sacramento et al. 2018). The SSHCP allows project proponents within the Plan Area to simplify and expedite the state and federal ESA permitting process. In addition to streamlining the ESA permitting processes, a parallel Aquatic Resources Program (ARP) has been developed to address permitting pursuant to the Clean Water Act Section 404 and 401 permitting process. In addition, a Master Streambed Alternation Agreement will be requested by the SSHCP Implementing Entities to address Section 1602 of the California Fish and Game Code. The SSHCP will allow Sacramento County, the City of Rancho Cordova, City of Galt, and the Southeast Connector Joint Powers Authority to receive Incidental Take Permits (ITP) for Covered Species from USFWS and CDFW for activities and projects they conduct. In addition, the three local Land Use Authority Permittees (the County, Galt, and Rancho Cordova) can extend incidental take coverage provided by the SSHCP ITPs to activities and

projects implemented by Third-Party Project Proponents that are under the jurisdiction of that Land Use Authority Permittee. See www.southsachcp.com for more information.

SSHCP Covered Species

TRBL, SWHA, BUOW and LABL are SSHCP Covered Species. Habitat surveys for these species were determined to be required for the Project by the following SSHCP AMMs: TCB-1, SWHA-1, RAPTOR-1, WBO-1, and BAT-1.

Pallid Bat

ANPA is not an SSHCP covered species although it is considered a species of special concern by CDFW. A California Natural Diversity Database search revealed a nearby occurrence of ANPA. Therefore, although not an SSHCP-covered species, ANPA was included in the bat habitat assessment for informational purposes.

SURVEY METHODS

Bird Survey

ECORP biologists Keith Kwan and Angela Haas conducted surveys for potential SSHCP-covered bird species habitat within the Project on November 27, 2018. ECORP biologist Matthew Spaulding conducted surveys for potential SSHCP-covered bird species habitat within the potential Offsite areas on June 13, 2019. Inaccessible Offsite areas and surrounding buffers were visually assessed from within the Project or from publicly accessible roads.

Before starting the surveys, the biologists scanned all visible areas of the Project area with binoculars (10X42 magnification). The entire Project Area was visually surveyed on foot, while the surrounding buffers were visually assessed from within the Project or from publicly accessible roads due to private property. During the surveys, all potential nesting habitat were identified and all wildlife species present recorded. The methods below were enacted during surveys as per the SSHCP AMMs.

TCB-1

The biologists walked transects and visually scanned the entire Project area and the accessible portions of the Offsite areas, and visually scanned a 500-foot buffer. All potential TRBL nesting and foraging habitat was recorded and mapped.

SWHA-1 & RAPTOR-1

The biologists walked transects and visually scanned the entire Project and the accessible portions of the Offsite areas. In the surrounding 0.25-mile buffer, accessible public roads were driven, and private property was visually scanned for the presence of SWHA and other raptor nesting habitat. All potential SWHA and raptor nesting trees were recorded and mapped.

WBO-1

The biologists walked transects and visually surveyed the Project area and the accessible portions of the Offsite areas for the presence of burrows and/or evidence of BUOW. Transects were spaced 50 feet apart due to good visibility and a lack of dense vegetation. A 250-foot buffer was also visually scanned but not walked due to inaccessible private property. All potential or occupied burrows were recorded and mapped.

Bat Survey

ECORP biologist Matthew Spaulding conducted a survey for potential LABL and ANPA hibernacula on December 4, 2018 and on June 13, 2019. All potential winter hibernaculum habitat was visually scanned with binoculars (10X42 magnification) and assessed for suitability for these species. External physical features of the trees and structures located within the Project area and the Offsite area, including a 300-foot buffer, were examined for evidence of bat use (e.g., presence of guano, evidence of day roost use, culled insect parts, urine staining, odors associated with bats). Mr. Spaulding also listened for chatter indicative of roosting bats at each tree. Inaccessible Offsite areas and surrounding buffers were visually assessed from within the Project or from publicly accessible roads.

The following methods were enacted during the survey as per the SSHCP AMM BAT-1:

BAT-1

Mr. Spaulding walked and visually scanned the Project area and the accessible portions of the Offsite areas, and visually scanned a 300-foot buffer for the presence of LABL winter hibernaculum habitat. All potential LABL winter hibernaculum trees were recorded and mapped.

In addition, the same methods were used for ANPA, though not an SSHCP Covered Species.

RESULTS

Project Setting

The Project is situated at an elevation of approximately 220-240 feet above mean sea level. The Project site included a mix of rural residential and undeveloped rangeland. Two rural residences and associated outbuildings are present within the Project Area. Some horticultural tree stands occur around the residences, as well as eucalyptus (*Eucalyptus* sp.), cottonwood (*Populus* sp.) and oak (*Quercus* sp.). The remaining area is primarily annual grassland used for cattle grazing. A full list of the wildlife species observed on November 27, 2018 and June 13, 2019 are included as Attachments A and B, respectively.

Bird Survey

Potential nesting habitat for TRBL, SWHA and other raptors, and BUOW occurred within the Project and buffer areas, but not within the Offsites. One BUOW was observed within the Project.

Potential nesting habitat for TRBL was found within the Project and within the associated buffer (Figure 2. *Potential Tricolored Blackbird Nesting Habitat*). The potential nesting habitat features mapped consisted of

patches of bull thistle (*Cirsium vulgare*). Evidence of TRBL nesting during the previous year's (2018) nesting season was present within these patches, and TRBL was observed onsite during the November 27, 2018 survey; however, no evidence of active nesting was observed during the June 13, 2019 survey. Potential foraging habitat for TRBL included the grassland and wetland habitats within the Project and Offsites.

Potential nesting habitat for SWHA and other raptors occurred within the Project and within the associated buffer (Figure 3. *Potential Swainson's Hawk and Raptor Nesting Habitat*). Potential SWHA nesting habitat included large trees, while potential nesting habitat for other raptors included large and medium-sized trees.

Potential nesting habitat for BUOW occurred within the Project. Numerous unoccupied burrows were mapped along the eastern boundary and the southeastern portion of the Project site (Figure 4. *Potential Western Burrowing Owl Burrow Habitat*). Of these, one burrow had an individual BUOW present at the time of the survey (noted as "Burrow, Occupied" on Figure 4) and evidence of BUOW presence (e.g. white wash, pellets) was observed at three other burrow locations (noted as "Burrow, with Evidence"). No potential or occupied burrows could be seen within the 250-foot buffer. However, due to access limitations, the surrounding buffer could not be adequately surveyed to rule out the potential presence of suitable burrows or BUOW presence.

Bat Survey

Potential hibernaculum habitat for LABL occurred within the 300-foot buffer but not within the Project or Offsite areas. Potential hibernaculum occurred in the form of a large snag, two cottonwood trees, large eucalyptus trees all with suitable cavities and/or exfoliating bark (Figure 5. *Potential Western Red Bat and Pallid Bat Hibernacula*). There was no visible sign indicating bats were currently using the habitat.

Potential hibernaculum habitat for ANPA occurred within the Project site, but not within the buffer or Offsite areas. Potential hibernacula for ANPA were present in the form of structures with gaps or vents that could allow access to buildings (Figure 5. *Potential Western Red Bat and Pallid Bat Hibernacula)*. There was no visible sign indicating bats were currently using the habitat.

RECOMMENDATIONS

As per requirements of the SSHCP, subsequent AMMs may need to be implemented based on the results of these surveys. Please refer to Section 5.4.2 of the SSHCP for more information on required AMMs.

If you have any questions, please call me or Taraneh Emam at (916) 782-9100.

Sincerely,

Keith Kwan
Senior Biologist

1.0 INTRODUCTION

ECORP Consulting, Inc. has conducted a special-status plant survey for the proposed The Preserve Development (Project) located in Rancho Cordova, California. The purpose of this survey was to identify and map the locations of special-status plant species observed within the Project.

1.1 Project Location

The Study Area includes the 98.92-acre Project area, as well as five potential Offsite areas totaling 9.33 acres. In this document the Offsite areas are referred to as the Rio del Oro Offsite (located to the west of the Project), the Raymer Way Offsite (located to the east of the Project), the Morrison Creek Offsite (located to the north of the Project around an existing crossing of Morrison Creek), and the North Douglas Offsites (two road stubs located to the south of the Project within the existing North Douglas development).

The Study Area is located to the west of Raymer Way and Grant Line Road in Rancho Cordova, California. The Study Area corresponds to an unsectioned portion of the Rio de los Americanos Land Grant within the "Buffalo Creek, California" 7.5-minute quadrangle (U.S. Geological Survey [USGS] 1980) (Figure 1. *Study Area Location and Vicinity*). The approximate center of the site is located at 38.574614° North and -121.196708° West within the Lower Sacramento Watershed (Hydrologic Unit Code #18020163, USGS 2016).

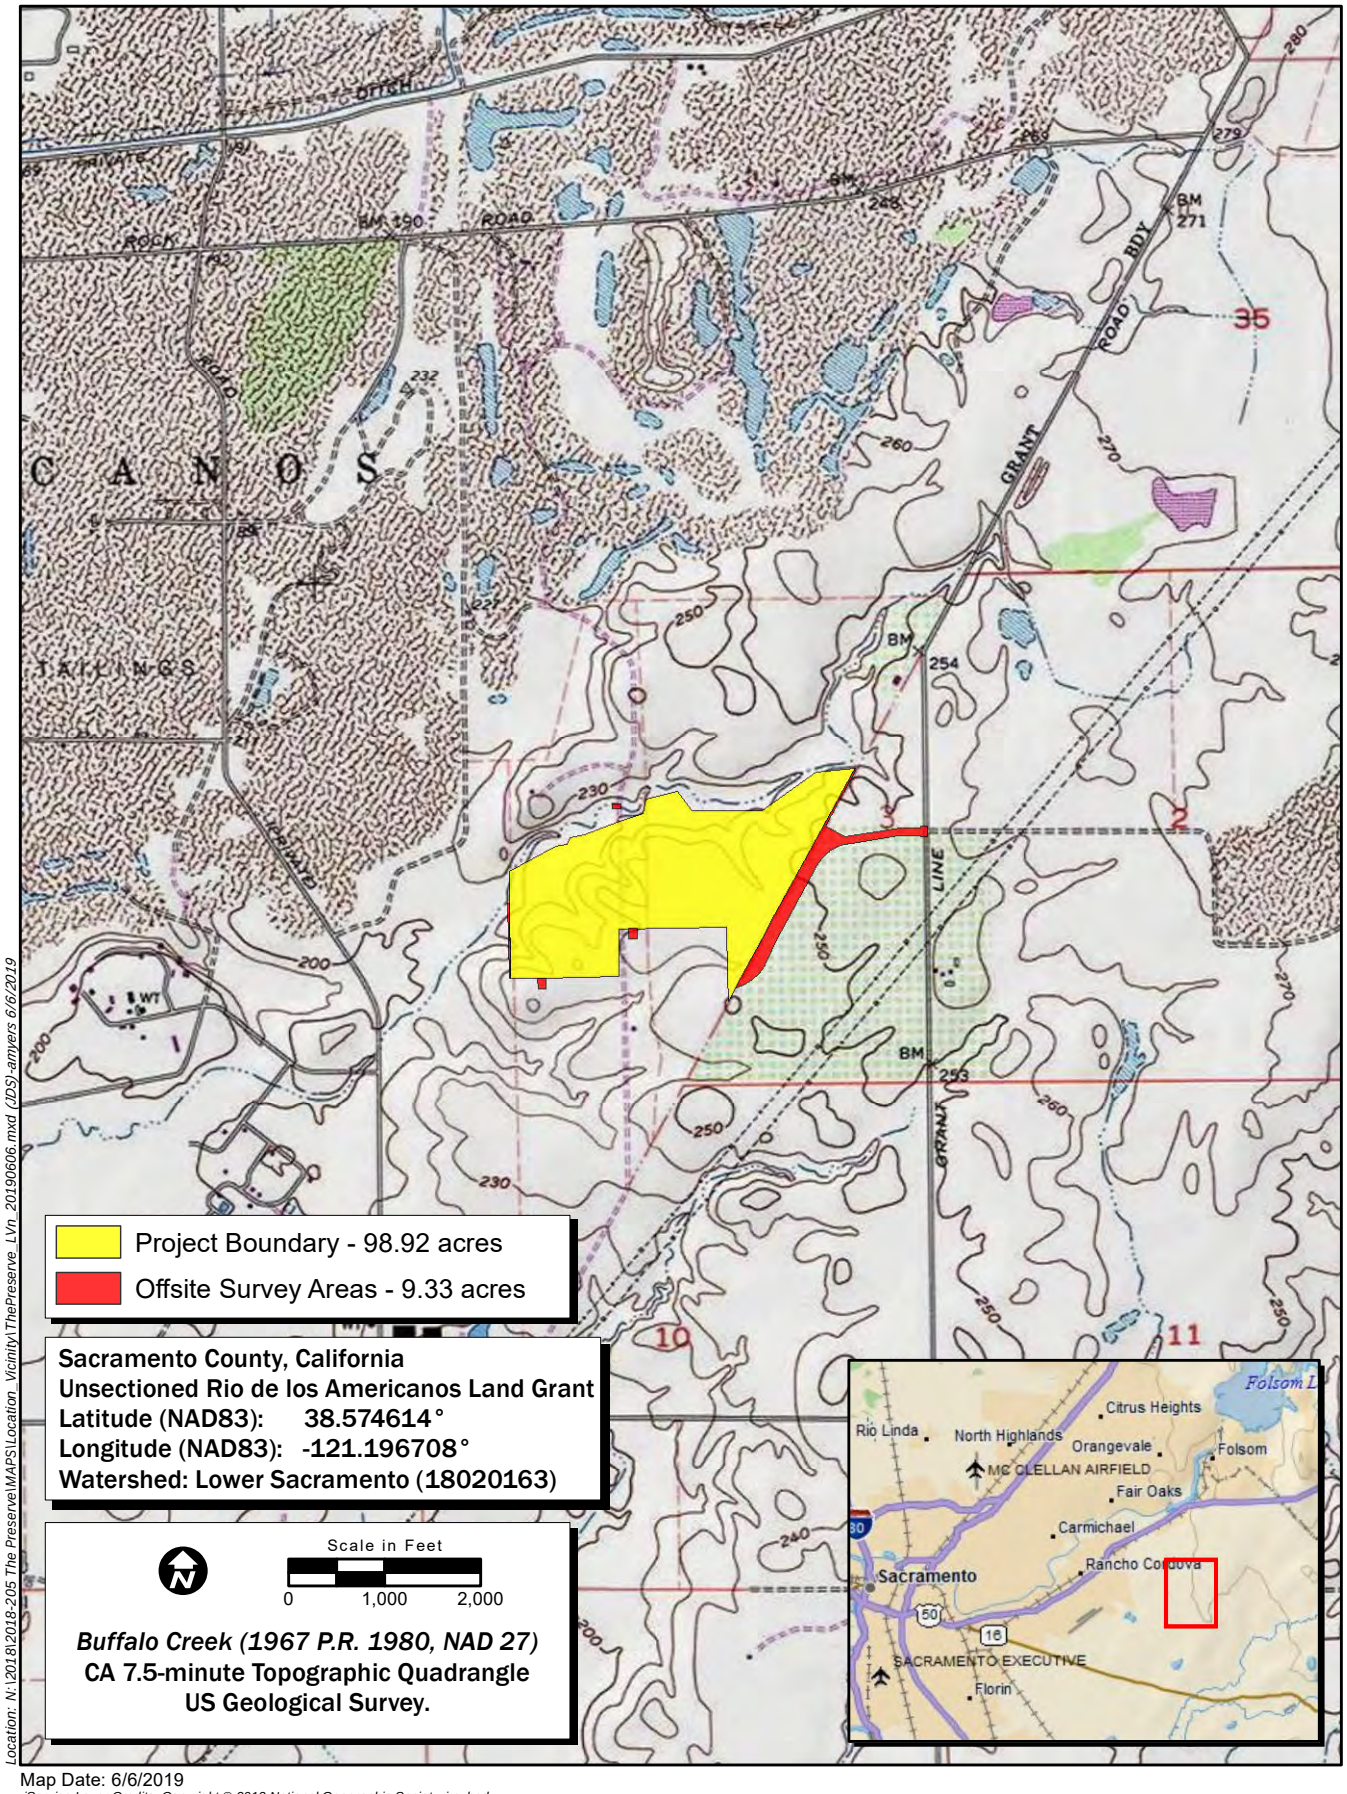
1.2 Definition of Special-Status Plant Species

For the purposes of this report, "special-status plants" are defined as plants which meet one or more of the following:

- Plants listed, proposed for listing, or candidates for future listing as threatened or endangered under the federal Endangered Species Act (ESA);
- Plants listed, proposed for listing, or candidates for future listing as threatened or endangered under the California ESA;
- Plants that meet the definitions of endangered or rare under Section 15380 of the State California Environmental Quality Act (CEQA) Guidelines;
- Plants listed as rare under the California Native Plant Protection Act (California Department of Fish and Game [CDFG] Code of California, Section 1900 et seq.);
- Plants considered by the California Native Plant Society (CNPS) to be "rare, threatened, or endangered in California" [California Rare Plant Rank (CRPR) 1B and 2] (see Section 1.3);
- Plants listed by CNPS as species about which more information is needed to determine their status (CRPR 3), and plants of limited distribution (CRPR 4); and
- Plants that are South Sacramento Habitat Conservation Plan (SSHCP) Covered Species (see Section 1.4).

1.3 California Rare Plant Ranks

CNPS maintains the Inventory of Rare and Endangered Plants of California (CNPS 2019), which provides a list of plant species native to California that are threatened with extinction, have limited distributions, and/or low populations. Plant species meeting one of these criteria are assigned to one of six ranks (i.e., CRPR).



The rank system was developed in collaboration with government, academia, non-governmental organizations, and private sector botanists, and is jointly managed by the California Department of Fish and Wildlife (CDFW) and the CNPS. The ranks are currently recognized in the California Natural Diversity Database (CNDDB). The following are definitions of the CNPS CRPRs:

- CRPR 1A – presumed extirpated in California and either rare or extinct elsewhere;
- CRPR 1B – rare, threatened, or endangered in California and elsewhere;
- CRPR 2A – presumed extirpated in California, but more common elsewhere;
- CRPR 2B – rare, threatened, or endangered in California but more common elsewhere;
- CRPR 3 – a review list of plants about which more information is needed; and
- CRPR 4 – a watch list of plants of limited distribution.

Additionally, the CNPS has defined Threat Ranks that are added to the CRPR as an extension. Threat Ranks designate the level of threat on a scale of 0.1 through 0.3, with 0.1 being the most threatened and 0.3 being the least threatened. Threat Ranks are generally assigned for all plants ranked 1B, 2B, or 4, and for the majority of plants ranked 3. Plant species ranked 1A and 2A (presumed extirpated in California), and some species ranked 3, which lack threat information, do not typically have a Threat Rank extension. The following are definitions of the CNPS Threat Ranks:

- Threat Rank 0.1 – Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat);
- Threat Rank 0.2 – Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat); and
- Threat Rank 0.3 – Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known).

Factors, such as habitat vulnerability and specificity, distribution, and condition of occurrences, are considered in assigning the Threat Rank, and differences in Threat Ranks do not constitute additional or different protection (CNPS 2019). Depending on the policy of the lead agency, substantial impacts to plants listed as CRPR 1A, 1B, 2, and 3 (regardless of threat rank) are typically considered significant under CEQA Guidelines Section 15380. For CRPR 4 species (regardless of threat rank), significance under CEQA is typically evaluated if the lead agency has determined those plants to be of local significance or regional importance. Such plants may be identified in local Habitat Conservation Plans (HCPs) or City or County General Plans.

1.4 South Sacramento Habitat Conservation Plan

The SSHCP is a regional effort that will provide development and infrastructure projects with streamlined federal and state permitting processes while creating a preserve system to protect habitat, open space, and agricultural lands (County of Sacramento et al. 2018). The SSHCP allows project proponents within the Plan Area to simplify and expedite the state and federal ESA permitting process. The SSHCP will allow Sacramento County, the City of Rancho Cordova, City of Galt, and the Southeast Connector Joint Powers Authority to receive Incidental Take Permits (ITP) for 28 Covered Species from U.S. Fish and Wildlife Service and CDFW for activities and projects they conduct. In addition, the three local Land Use Authority Permittees (the County, Galt, and Rancho Cordova) can extend incidental take coverage provided by the SSHCP ITPs to activities and projects implemented by Third-Party Project Proponents that are under the jurisdiction of that Land Use Authority Permittee. The SSHCP provides Modeled Species Habitat data for each Covered Species to determine whether Covered Species have potential to occur within a project site. The SSHCP also sets forth Avoidance and Minimization Measures with which permittees must comply. See www.southsachcp.com for more information.

Table 1 provides a list of all plant species that are considered SSHCP Covered Species, adapted from Table 1-2 of the SSHCP (County of Sacramento et al. 2018).

Table 1. SSHCP Covered Species - Plants

Scientific Name Common Name	Status		
	Federal	State	CRPR

Status Definitions

Federal:
- E = Endangered under the federal ESA
- T = Threatened under the federal ESA
- — = No federal ESA listing

State:
- E = Endangered under state ESA
- T = Threatened under state ESA
- — = No state status

CRPR:
- 1B = Rare, threatened, or endangered in California and elsewhere
- 2 = Rare, threatened, or endangered in California but more common elsewhere

CRPR Threat Ranks
- 0.1 = Seriously threatened in California (high degree/immediacy of threat)
- 0.2 = Fairly threatened in California (moderate degree/immediacy of threat)
- 0.3 = Not very threatened in California (low degree/immediacy of threats or no current threats known)

2.0 METHODS

2.1 Literature Review

Prior to conducting field surveys, background information was collected on the potential presence of special-status plants within or near the survey area from a variety of sources. This included a review of resource agency species lists, literature review, on-line database query, voucher specimen review, and reference population review. The following resources were used as part of the literature review:

- CDFW California Natural Diversity Database (CNDDB) data for the "Buffalo Creek, California" 7.5-minute quadrangle as well as the eight surrounding USGS quadrangles (CDFW 2019);
- USFWS Resource Report List Federal Endangered and Threatened Species that may be affected by the Project (USFWS 2019); and
- CNPS's electronic *Inventory of Rare and Endangered Plants of California* for the "Buffalo Creek, California" 7.5-minute quadrangle as well as the eight surrounding USGS quadrangles (CNPS 2019).
- SSHCP Modeled Species Habitat for the Study Area.

2.2 Special-Status Plants Considered for the Project

Based on species occurrence information from the CNDDB, the literature review, and general site knowledge, a list of special-status plant species that are known to occur or have the potential to occur within the survey area was generated (Attachment A). Only special-status plants as defined in Section 1.2 were included in this analysis. Each of these species' potential to occur within the survey area was assessed based on the following criteria:

- **Present** - Species was previously observed during field surveys or is known to occur within the Study Area based on documented occurrences within the CNDDB, SSHCP, or other literature.
- **Potential to Occur** - Habitat (including soils and elevation requirements) for the species occurs within the Study Area based on site assessment, literature research, or SSHCP Modeled Species Habitat data.
- **Low Potential to Occur** - Marginal or limited amounts of habitat occur, and/or the species is not known to occur within the vicinity of the Study Area based on CNDDB records and other available documentation. This designation is only used for species that are not SSHCP Covered Species.
- **Absent** - No suitable habitat (including soils and elevation requirements) and/or the species is not known to occur within the vicinity of the Study Area based on CNDDB records and other documentation and SSHCP Modeled Species Habitat data does not indicate that habitat for the species occurs within the site.

2.3 Target Species

Based on the analysis of potentially occurring special-status plant species for the survey area, the plants listed in Table 2 were considered to be the Target List for this survey effort. Species determined to be Absent are not included in the target list.

Table 2. Target Species for Special-Status Plant Survey

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Stinkbells (Fritillaria agrestis)	-	-	4.2	Clay and sometimes serpentinite soils in chaparral, cismontane woodland, Pinyon and juniper woodland, and Valley and foothill grassland (33' - 5,102').	March–June	Potential to Occur. Valley grassland represents suitable habitat.
Boggs Lake hedge–hyssop (Gratiola heterosepala)	–	CE	1B.2, SSHCP Covered Species	Marshes, swamps, lake margins, and vernal pools (33'–7,792').	April–August	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Ahart's dwarf rush (Juncus leiospermus var. ahartii)	–	–	1B.2, SSHCP Covered Species	Mesic areas in valley and foothill grassland. Species has an affinity for slight disturbance such as farmed fields (USFWS 2005a) (98'–751').	March–May	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Legenere (Legenere limosa)	–	–	1B.1, SSHCP Covered Species	Various seasonally inundated areas including wetlands, wetland swales, marshes, vernal pools, artificial ponds, and floodplains of intermittent drainages (USFWS 2005b) (3'–2,887').	April–June	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Slender Orcutt grass (Orcuttia tenuis)	FT	CE	1B.1, SSHCP Covered Species	Vernal pools, often gravelly (115'–5,774').	May–September	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Sacramento Orcutt grass (Orcuttia viscida)	FE	CE	1B.1, SSHCP Covered Species	Vernal pools (98'–328').	April–July	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Sanford's arrowhead (Sagittaria sanfordii)	–	–	1B.2, SSHCP Covered Species	Shallow marshes and freshwater swamps (0'–2,133').	May–October	Potential to Occur. SSHCP Modeled Species Habitat present onsite.

Status Codes:

ESA	Endangered Species Act
CESA	California Endangered Species Act
FE	ESA listed, Endangered
FT	ESA listed, Threatened
1B	California Rare Plant Ranks (CRPRs)/Rare or Endangered in California and elsewhere.
2B	CRPR /Rare or Endangered in California, more common elsewhere.
0.1	Threat Rank/Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2	Threat Rank/Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)

2.4 Reference Site Visits

Reference populations, where available, for the seven target species were visited to assess bloom phenology and to observe species morphology. When reference populations were not available, photographs from Calflora (Calflora 2019) and *The Jepson Manual: Vascular Plants of California, Second Edition* (Baldwin et al. 2012) were used as a reference. Attachment B identifies the reference source for each of the target species including the location of the population, dates of visits, and phenological stage of the species at the time of the field visits.

2.5 Field Surveys

Determinate-level field surveys were conducted in accordance with SSHCP Avoidance and Minimization Measures PLANT-1 and ORCUTT-1, as well as guidelines promulgated by USFWS (USFWS 2000), CDFW (CDFW 2018), and CNPS (CNPS 2001). The special-status plant surveys were conducted on April 29, 2019 and June 13, 2019 by ECORP biologist Casey Peters and Benjamin Waitman. A list of field personnel qualifications is included as Attachment C. The surveys coincided with the optimum identifiable periods for each of the target species.

Within the Project, Morrison Creek Offsite, and North Douglas Offsite, the biologists walked meandering transects to ensure complete coverage of all suitable habitat for all target species. The Rio del Oro Offsite and Raymer Way Offsite were assessed to the degree possible from accessible areas (i.e. within the Project and along roads), but transects across these offsites were not surveyed.

A complete plant list of all plants observed during the surveys was generated (Attachment D). All species were identified to the lowest possible taxonomic level required to assess rarity. Plant species identification, nomenclature, and taxonomy followed *The Jepson Manual* (Baldwin et al. 2012). Vegetation community classification was based on the classification systems presented in *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009).

3.0 EXISTING SITE CONDITIONS

The Study Area is situated at an elevation range between approximately 200 and 250 feet above mean sea level (MSL) in Rancho Cordova, California. The Study Area is located in the Great Valley region, Sacramento Valley subregion of the California Floristic Province (Baldwin et al. 2012). This region is characterized by agricultural areas, grasslands, wetlands, and valley oaks (Baldwin et al. 2012). The average annual precipitation for the region is 36.9 inches (with the wettest period during November-March), and average daily temperatures range from 47.7˚F in winter to 73.8˚F in summer (National Oceanic and Atmospheric Administration [NOAA] 2018).

The Study Area is characterized by flat to gently rolling terrain and consists primarily of grazed annual grasslands with two residences and other outbuildings. A private road, sometimes identified as Douglas Road, leads from south of the Study Area into the two residences. The Study Area is located within the USFWS Mather Core Area (USFWS 2005a). Core Areas are areas prioritized for the conservation and recovery of threatened and endangered vernal pool species.

3.1 Land Cover Types

SSHCP land cover data within the Study Area were reviewed and field-revised as needed. Revised land cover types are shown in Figure 2. More information on land cover types is provided in the Biological Resources Assessment for the Project (ECORP 2019).

3.1.1 Terrestrial Land Cover Types

The Study Area primarily contains the Valley Grassland SSHCP land cover type. The Study Area also contains Low Density Development and a small amount of Disturbed and Major Roads land cover.

Valley Grassland

The Valley Grassland land cover type is predominantly characterized by non-native (naturalized) annual grasses. Within the Study Area, the common plant species found in Valley Grassland are a mixture of nonnative annual grasses, including medusahead grass (*Elymus caput-medusae*), soft brome (*Bromus hordeaceus*), wild oats (*Avena fatua*), and brome fescue (*Festuca bromoides*). Narrow tarplant (*Holocarpha virgata*), a native perennial forb, is also common in this land cover type within the Study Area.

Low Density Development

The Low Density Development land cover type consists of existing homesteads including buildings/structures and horticultural trees.

Disturbed/Major Roads

The Disturbed and Major Roads land cover types consists of sections of paved road within the Study Area.

3.1.2 Aquatic Land Cover Types

An aquatic resources delineation was conducted for the Study Area, in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008).

A discussion of the aquatic resources found onsite is presented below, and Figure 2 includes aquatic land cover types (field delineation was used to revise the SSHCP baseline land cover data for aquatic resources).

Vernal Pool

Vernal pools are seasonal ephemeral wetlands that fill and dry each year, forming in shallow depressions within Valley Grassland that are underlaid by an impermeable layer (e.g. a hardpan). Water collects in the depressions during the winter rainy season and recedes during the spring. Soils typically remain moist until late spring before becoming desiccated, and then remain dry throughout the summer. Vernal pools provide habitat for several special-status species, including invertebrates, plants, and amphibians.

Vernal pools occur throughout the Study Area. These features are variously dominated by Great Valley button-celery (*Eryngium castrense*), stalked popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), Mediterranean barley (*Hordeum marinum*), waxy mannagrass (*Glyceria declinata*), hairy hawkbit (*Leontodon saxatilis*), and toad rush (*Juncus bufonius*).

Swale

Swales are shallow ephemeral drainages found in flat to gently rolling Valley Grassland in association with vernal pool complexes, on soils with an impermeable layer. Swales convey runoff as shallow, gently sloping ephemeral wetlands during and shortly after winter rainstorms, but usually maintain soil saturation for longer periods during the growing season. They typically have hydric soils and support hydrophytic vegetation but lack an ordinary high-water mark (OHWM). Swales serve as habitat for many vernal pool species and provide hydrological connections between vernal pools that allows movement/dispersal of amphibian species, plant seeds, and vernal pool invertebrates (both adults and cysts).

Swales occur throughout the Study Area, and are dominated by Italian ryegrass (*Festuca perennis*), Fitch's spikeweed (*Centromadia fitchii*), and Mediterranean barley.

Stream/Creek

The Stream/Creek land cover type includes intermittent and perennial linear water features such as rivers, streams, creeks, drainages, and roadside and irrigation ditches. These features typically exhibit a bed and bank and an OHWM. Morrison Creek is located to the north of the Study Area, and several small headwater tributaries to the creek flow through the Study Area into Morrison Creek. Stream/creek features occur throughout the Study Area, flowing north to Morrison Creek, and vary from steep, unvegetated features, to gently sloping features that are sparsely vegetated with creeping spikerush (*Eleocharis macrostachya*).

3.2 Soils

According to the *Web Soil Survey* (NRCS 2018), two soil units, or types, have been mapped within the Study Area (Figure 2. *Natural Resources Conservation Service Soil Types*):

- (159) Hicksville gravelly loam, 0 to 2 percent slopes, occasionally flooded
- (193) Red Bluff-Redding complex, 0 to 5 percent slopes

Hicksville and Red Bluff soils are formed in alluvium derived from mixed rock sources. Redding soils are formed in gravelly and cobbly alluvium derived from mixed rock sources (NRCS 2018). No soil units derived from serpentinite or other ultramafic parent materials have been reported to occur within the Study Area or its immediate vicinity (NRCS 2018). Furthermore, no apparent inclusions of ultramafic rocks or soils were observed during the field survey.

4.0 SPECIES DESCRIPTIONS

As listed in Section 2.3, seven special-status plants were considered to be target species for this survey. A description of each target species is provided in the following sections.

4.1 Stinkbells

Stinkbells (*Fritillaria agrestis*) is not listed pursuant to either the federal or California ESAs, but is designated as a CRPR 4.2 species. This species is a perennial bulbiferous herb that occurs in clay, sometimes serpentine areas in chaparral, cismontane woodland, pinyon and juniper woodland, and

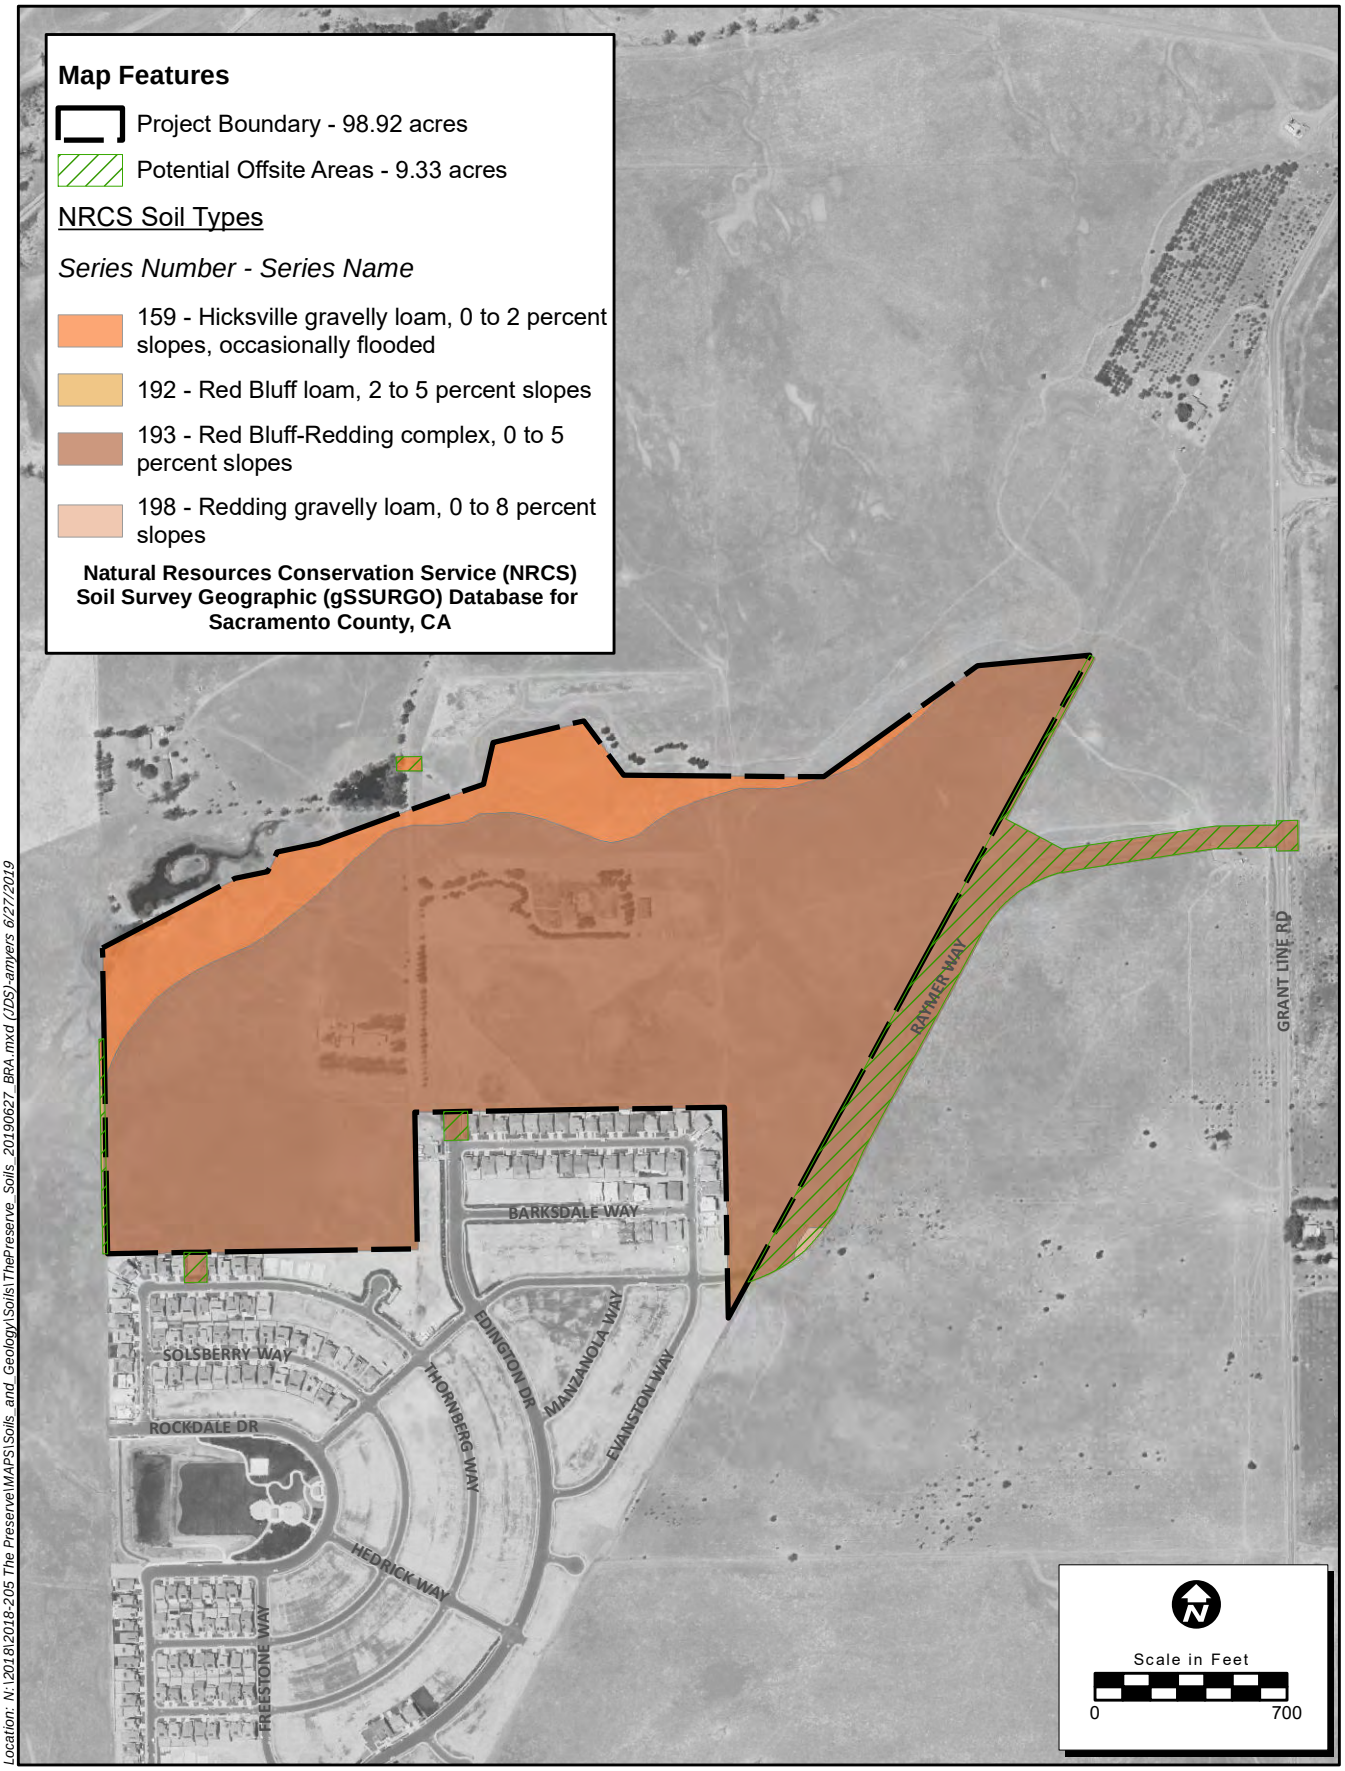
Map Date: 6/21/2019

Valley and foothill grassland (CNPS 2019). Stinkbells bloom from March to June and is known to occur at elevations ranging from 33 to 5,102 feet above MSL (CNPS 2019). The current range of this species in California includes Alameda, Contra Costa, Fresno, Kern, Mendocino, Merced, Monterey, Mariposa, Placer, Sacramento, Santa Barbara, San Benito, Santa Clara, Santa Cruz, San Luis Obispo, San Mateo, Stanislaus, Tuolumne, Ventura, and Yuba counties, and is considered to be extirpated from Santa Cruz and San Mateo counties (CNPS 2019).

There are no documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2019). However, the grassland within the Study Area provides suitable habitat for this species. Stinkbells has potential to occur within the Study Area.

4.2 Ahart's Dwarf Rush



Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*) is not listed pursuant to either the federal or California ESAs, but is designated as a CRPR 1B.2 species. This species is an herbaceous annual that occurs in mesic areas in Valley and foothill grasslands (CNPS 2019). This species also appears to have an affinity for slight disturbance since it has been found on farmed fields and gopher turnings (USFWS 2005a). Ahart's dwarf rush blooms from March through May and is known to occur at elevations ranging from 98 to 751 feet above MSL (CNPS 2019, USFWS 2005a). Ahart's dwarf rush is endemic to California; the current range of this species includes Butte, Calaveras, Placer, Sacramento, Tehama, and Yuba counties (CNPS 2019).

There are two documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2019). Ahart's dwarf rush is a SSHCP Covered Species, and the aquatic features and grassland within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Ahart's dwarf rush has Potential to Occur within the Study Area.

4.3 Boggs Lake Hedge-Hyssop

Boggs Lake hedge-hyssop (*Gratiola heterosepala*) is not listed pursuant to the federal ESA, but is listed as endangered pursuant to the California ESA, and a CRPR 1B.2 species. This species is an herbaceous annual that occurs in marshes, swamps, lake margins, and vernal pools (CNPS 2019). Boggs Lake hedge-hyssop blooms from April through August and is known to occur at elevations ranging from 33 to 7,792 feet above MSL (CNPS 2019). The current range of this species in California includes Fresno, Lake, Lassen, Madera, Merced, Modoc, Placer, Sacramento, Shasta, Siskiyou, San Joaquin, Solano, Sonoma, and Tehama counties (CNPS 2019).

There are five documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2019). Bogg's lake hedge-hyssop is a SSHCP Covered Species, and the grassland and

ENVIRONMENTAL CONSULTANTS

vernal pools within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Boggs lake hedge-hyssop has potential to occur within the Study Area.

4.4 Legenere

Legenere (*Legenere limosa*) is not listed pursuant to either the federal or California ESAs, but is designated as a CRPR 1B.1 species. This species is an herbaceous annual that occurs in a variety of seasonally inundated environments including wetlands, wetland swales, marshes, vernal pools, artificial ponds, and floodplains of intermittent drainages (USFWS 2005b). Legenere blooms from April through June and is known to occur at elevations ranging from 3 feet to 2,887 feet above MSL (CNPS 2019). Legenere is endemic to California; the current range of this species includes Alameda, Lake, Monterey, Napa, Placer, Sacramento, Santa Clara, San Joaquin, Shasta, San Mateo, Solano, Sonoma, Stanislaus, Tehama and Yuba counties and is believed to be extirpated from Stanislaus County (CNPS 2019).

There are 10 documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2019). Legenere is a SSHCP Covered Species, and the grassland and vernal pools within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Legenere has potential to occur within the Study Area.

4.5 Sacramento Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is listed as endangered pursuant to both the federal and California ESAs, and is designated as a CRPR 1B.1 species. This species is an herbaceous annual that occurs in vernal pools (CNPS 2017). The median area of occupied pools discovered prior to 1988 was 0.69 acre and ranged from 0.25 to 2.03 acres (USFWS 2005a). Sacramento Orcutt grass blooms from April through September and is known to occur at elevations ranging from 98 to 328 feet above MSL (CNPS 2017). Sacramento Orcutt grass is endemic to California and to the southeastern Sacramento Valley (Keeler-Wolf et al. 1998, as cited in USFWS 2005a), with all known occurrences restricted to Sacramento County. Known occurrences of this species within the general region are limited to a small area east of Mather Field, Phoenix Field Ecological Reserve, Phoenix Park (introduced population), and an area near Rancho Seco Lake (USFWS 2005a).

There are six documented CNDDB occurrences of this species located within five miles of the Study Area (CDFW 2019). Sacramento Orcutt Grass is a SSHCP Covered Species, and the grassland and vernal pools within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Sacramento Orcutt grass has potential to occur within the Study Area.

4.6 Sanford's Arrowhead

Sanford's arrowhead (*Sagittaria sanfordii*) is not listed pursuant to the federal or California ESAs, but is designated as a CRPR 1B.2 species. This species is a rhizomatous, herbaceous perennial that occurs in shallow marshes and freshwater swamps (CNPS 2019). Sanford's arrowhead blooms from May through November and is known to occur at elevations ranging from sea level to 2,133 feet above MSL (CNPS 2019). Sanford's arrowhead is endemic to California; the current range of this species includes Butte, Del Norte, El Dorado, Fresno, Merced, Mariposa, Marin, Napa, Orange, Placer, Sacramento, San Bernardino, San Joaquin,

Shasta, Solano, Tehama, Tulare, Ventura and Yuba counties; it is believed to be extirpated from both Orange and Ventura counties (CNPS 2019).

There is one documented CNDDB occurrence of this species located within five miles of the Study Area (CDFW 2019). Sanford's arrowhead is a SSHCP Covered Species, and the grassland within the Study Area provides suitable habitat for this species according to SSHCP Modeled Species Habitat. Sanford's arrowhead has potential to occur within the Study Area.

4.7 Slender Orcutt Grass

Slender Orcutt grass (*Orcuttia tenuis*) is listed as threatened and endangered pursuant to both the federal and California ESAs, respectively, and is designated as a CRPR 1B.1 species. This species is an herbaceous annual that occurs in vernal pools (CNPS 2019) primarily on substrates of volcanic origin (Crampton 1959, Corbin and Schoolcraft 1989; as cited in USFWS 2005a). This species is known to occur in the same type of vernal pool complexes as Sacramento Orcutt grass in Sacramento County; however, these species have not been observed co-existing in the same vernal pool (USFWS 2005a). The median area of pools occupied by populations studied by Stone et al. (1988, as cited in USFWS 2005a) was 1.6 acres and ranged from 0.2 to 111.0 acres (USFWS 2005a). Slender Orcutt grass blooms from May through October and is known to occur at elevations ranging from 115 to 5,774 feet above MSL (CNPS 2019). Slender Orcutt grass is endemic to California; the current range for this species includes Butte, Lake, Lassen, Modoc, Plumas, Sacramento, Shasta, Siskiyou, and Tehama counties (CNPS 2019).

There is one documented CNDDB occurrence of this species located within five miles of the Study Area (CDFW 2019). Slender Orcutt grass is a SSHCP Covered Species, and the grassland and vernal pools within the Study Area provide suitable habitat for this species according to SSHCP Modeled Species Habitat. Slender Orcutt grass has potential to occur within the Study Area.

5.0 RESULTS

ECORP conducted special-status plant surveys on April 29, 2019 and June 13, 2019 within the Study Area. The Rio del Oro Offsite and Raymer Way Offsite were assessed to the degree possible from accessible areas, but transects across these offsites were not surveyed. No special-status plant species were observed during the special-status plant surveys. However, the Raymer Way Offsite was not accessible for a complete survey, and the grassland within this offsite may represent potential habitat for stinkbells and Ahart's dwarf rush.

White-headed navarretia (*Navarretia leucocephala*) was observed within the Project. White-headed navarretia is a common species with no special status, but is difficult to distinguish from pincushion navarretia (*Navarretia myersii*), which has a CRPR of 1B.1 and is an SSHCP Covered Species. While pincushion navarretia was not considered a target species for the surveys because no SSHCP Modeled Species Habitat was mapped within the Study Area, ECORP consulted with experts at the University of California, Davis Herbarium, and identification of the species as white-headed navarretia was confirmed based on the following characteristics:

- Stems greater than 2.5cm
- Sparseness of puberulent hairs on the calyx
- Flower tubes shorter than typical for pincushion navarretia

- Inflorescence is a tightly packed cyme, rather than a true head

6.0 CONCLUSION

No special-status plant species were documented within the Project or publicly accessible portions of the Offsites. However, there is potential for stinkbells and Ahart's dwarf rush to occur in unsurveyed areas of the Raymer Way Offsite.

While the SSHCP Modeled Species Habitat was used to determine the target species list for this survey, the survey was comprehensive and included identification of each species encountered.

Attachment D – Plant Species Observed On-Site (April 29 and June 13, 2019)

ATTACHMENT A

Full Species Search Table

Attachment A. Special-Status Plant Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Plants						
Ione Manzanita *(Arctostaphylos myrtifolia)*	FT	-	1B.2	Chaparral and cismontane woodlands associated with very acidic, nutrient-poor, coarse soils typical of the Ione Formation (196'–1,903').	November–March	Absent. Suitable habitat not present onsite.
Brewer's calandrinia *(Calandrinia breweri)*	–	–	4.2	Sandy or loamy soils, disturbed sites, and burns within chaparral and coastal scrub (33'–4,003').	March–June	Absent. Suitable habitat not present onsite.
Pine Hill ceanothus *(Ceanothus roderickii)*	FE	CR	1B.1	Rocky serpentinite or gabbroic soil in chaparral and cismontane woodland (804'–3,576').	April–June	Absent. Suitable habitat not present onsite.
Red Hills soaproot *(Chlorogalum grandiflorum)*	–	–	1B.2	Serpentinite or gabbroic soils in chaparral, cismontane woodland, and lower montane coniferous forest, occasionally on non–ultramafic soils (804'–5,545').	May–June	Absent. Suitable habitat not present onsite.
Brandegee's clarkia *(Clarkia biloba* ssp. *brandegeeae)*	-	-	4.2	Chaparral, cismontane woodlands, and lower montane coniferous forest often along roadcuts (246' - 3,002').	May–July	Absent. Suitable habitat not present onsite.
Bisbee Peak rush–rose *(Crocanthemum suffrutescens)*	–	–	3.2	Often gabbroic or Ione soil or in burned or disturbed areas within chaparral (246'–2,198').	April–August	Absent. Suitable habitat not present onsite.
Dwarf downingia *(Downingia pusilla)*	–	–	2B.2, SSHCP Covered Species	Mesic areas in valley and foothill grassland, and vernal pools. Species appears to have an affinity for slight disturbance (i.e., scraped depressions, ditches, etc.) (Baldwin et al. 2012, CDFW 2018) (3'–1,460').	March–May	Absent. No SSHCP Modeled Species Habitat onsite.
Ione Buckwheat *(Eriogonum apricum* var. *apricum)*	FE	CE	1B.1	Openings in chaparral communities found on Ione soils (197'–476').	July–October	Absent. Suitable habitat not present onsite.
Irish Hill Buckwheat *(Eriogonum apricum* var. *prostratum)*	FE	CE	1B.1	Openings in chaparral communities found on Ione soils (295'–394').	June–July	Absent. Suitable habitat not present onsite.
Jepson's woolly sunflower *(Eriophyllum jepsonii)*	–	–	4.3	Chaparral, cismontane woodland, and coastal scrub, sometimes on serpentinite (656'–3,363').	April–June	Absent. Suitable habitat not present onsite.

Attachment A. Special-Status Plant Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Tuolumne Button–celery *(Eryngium pinnatisectum)*	–	–	1B.2	Vernal pools and other mesic conditions in cismontane woodland and lower montane coniferous forests (230'–3,002').	May–August	Absent. Suitable habitat not present onsite.
Pine Hill flannelbush *(Fremontodendron decumbens)*	FE	CR	1B.2	Serpentine or gabbro rock outcrops in chaparral and cismontane woodland (1,394'–2,493').	April–July	Absent. Suitable habitat not present onsite.
Stinkbells *(Fritillaria agrestis)*	-	-	4.2	Clay and sometimes serpentinite soils in chaparral, cismontane woodland, Pinyon and juniper woodland, and Valley and foothill grassland (33' - 5,102').	March–June	Potential to Occur. Valley grassland represents suitable habitat.
El Dorado bedstraw *(Galium californicum* ssp. *sierrae)*	FE	CR	1B.2	Gabbroic soil in chaparral, cismontane woodland and lower montane coniferous forest communities (328'–1,919').	May–June	Absent. Suitable habitat not present onsite.
Boggs Lake hedge–hyssop *(Gratiola heterosepala)*	–	CE	1B.2, SSHCP Covered Species	Marshes, swamps, lake margins, and vernal pools (33'–7,792').	April–August	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Parry's horkelia *(Horkelia parryi)*	–	–	1B.2	Ione and other soil formations in chaparral and cismontane woodlands (262'–3,510').	April–September	Absent. Suitable habitat not present onsite.
Ahart's dwarf rush *(Juncus leiospermus* var. *ahartii)*	–	–	1B.2, SSHCP Covered Species	Mesic areas in valley and foothill grassland. Species has an affinity for slight disturbance such as farmed fields (USFWS 2005) (98'–751').	March–May	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Legenere *(Legenere limosa)*	–	–	1B.1, SSHCP Covered Species	Various seasonally inundated areas including wetlands, wetland swales, marshes, vernal pools, artificial ponds, and floodplains of intermittent drainages (USFWS 2005) (3'–2,887').	April–June	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Hoary navarretia *(Navarretia eriocephala)*	-	-	4.3	Vernally mesic areas in cismontane woodland and Valley and foothill grassland (345' - 1,312').	May-June	Absent. Suitable habitat not present onsite.
Pincushion navarretia *(Navarretia myersii* ssp. *myersii)*	–	–	1B.1, SSHCP Covered Species	Often acidic soils in vernal pools (66'–1,083').	April–May	Absent. No SSHCP Modeled Species Habitat onsite.

Attachment A. Special-Status Plant Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Slender Orcutt grass *(Orcuttia tenuis)*	FT	CE	1B.1, SSHCP Covered Species	Vernal pools, often gravelly (115'–5,774').	May–September	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Sacramento Orcutt grass *(Orcuttia viscida)*	FE	CE	1B.1, SSHCP Covered Species	Vernal pools (98'–328').	April–July	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Layne's ragwort (*Packera layneae*)	FT	CR	1B.2	Rocky serpentinite or gabbroic soil in chaparral and cismontane woodland communities (656'–3,560').	April–August	Absent. Suitable habitat not present onsite.
Sanford's arrowhead *(Sagittaria sanfordii)*	–	–	1B.2, SSHCP Covered Species	Shallow marshes and freshwater swamps (0'–2,133').	May–October	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
El Dorado County Mule Ears *(Wyethia reticulata)*	–	–	1B.2	Clay or gabbroic soils in chaparral, cismontane woodland, and lower montane coniferous forest communities (607'–2,067').	April–August	Absent. Suitable habitat not present onsite.

Status Codes:

AMM	SSHCP Avoidance and Minimization Measure
ESA	Endangered Species Act
CESA	California Endangered Species Act
FE	ESA listed, Endangered.
FT	ESA listed, Threatened.
CE	CESA or NPPA listed, Endangered.
CR	CESA- or NPPA-listed, Rare.
CT	CESA or NPPA listed, Threatened.
CC	Candidate for CESA listing as Endangered or Threatened.
SSHCP	South Sacramento Habitat Conservation Plan
1B	California Rare Plant Ranks (CRPRs)/Rare or Endangered in California and elsewhere.
2B	CRPR /Rare or Endangered in California, more common elsewhere.
2	CRPR /Rare or Endangered in California, more common elsewhere.
4	CRPR /Plants of Limited Distribution - A Watch List.
0.1	Threat Rank/Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2	Threat Rank/Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3	Threat Rank/Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

ATTACHMENT C

Statement of Qualifications

Attachment C

Statement of Qualifications

Casey Peters, PhD

Associate Biologist, ECORP Consulting, Inc.

Casey Peters is a botanist/biologist with experience in general floristic surveys, special-status plant surveys, and restoration planning, implementation, and monitoring. Dr. Peters holds a PhD in Ecology with an emphasis in plant communities and a certificate in conservation management. He has conducted scientific research in plant communities throughout California including annual grassland, oak savannah, mixed-conifer forest, sub-alpine forest, coastal dune, coastal prairie, annual forbland, and desert plant communities. He has also taught courses in California floristics and plant ecology.

Benjamin Waitman, MS

Staff Biologist, ECORP Consulting, Inc.

Ben Waitman is a botanist/biologist with a wide range of experience conducting research and designing and managing projects throughout California and Nevada. Mr. Waitman received an M.S. in Biology from the University of Nevada and is a PhD candidate in Ecology at the University of California, Davis. He has published and presented on a variety of species of plants, animals and fungi. Mr Waitman has over 10 years of experience conducting plant surveys in California, including surveys in valley grasslands, oak woodlands, riparian woodlands, alpine meadows, and Mojave desert ecosystems. Mr. Waitman is an ISA-certified arborist and has performed numerous tree surveys.

ATTACHMENT D

Plant Species Observed On-Site (April 29 and June 13, 2018)

The Preserve Development
Plant Species Observed on April 29, 2019

Scientific Name	Common Name
ASTERACEAE	SUNFLOWER FAMILY
Agoseris heterophylla	Annual mountain dandelion
Alopecurus saccatus	Goldfields
*Carduus pycnocephalus**	Italian thistle
*Cotula coronopifolia**	Brassbuttons
*Hypochaeris glabra**	Smooth cat's-ear
*Hypochaeris radicata**	Perennial cat's-ear
Lasthenia californica	California goldfields
Lasthenia fremontii	Fremont's goldfields
Lasthenia glaberrima	Smooth goldfields
*Leontodon saxatilis**	Hairy hawkbit
Psilocarphus oregonus	Oregon woolly-heads
Psilocarphus tenellus	Slender woolly-heads
*Silybum marianum**	Milk thistle
BORAGINACEAE	BORAGE FAMILY
Plagiobothrys stipitatus	Slender popcorn-flower
BRASSICACEAE	MUSTARD FAMILY
*Capsella bursa-pastoris**	Shepherd's purse
Cardamine oligosperma	Few-seed bitter-cress
Lepidium latipes	Dwarf pepper grass
*Raphanus sativus**	Purple wild radish
CAMPANULACEAE	BELLFLOWER FAMILY
Downingia bicornuta	Double-horn downingia
CARYOPHYLLACEAE	PINK FAMILY
*Spergularia rubra**	Purple sandspurry
CYPERACEAE	SEDGE FAMILY
Eleocharis macrostachya	Creeping spikerush
CUPRESSACEAE	CYPRESS FAMILY
Sequoia sempervirens	Coast Redwood
FABACEAE	LEGUME FAMILY
Lupinus bicolor	Bicolored lupine
*Medicago polymorpha**	Bur clover
Trifolium ciliolatum	Foothill clover
*Trifolium dubium**	Shamrock clover
*Trifolium hirtum**	Rose clover
*Trifolium repens**	White clover
*Trifolium subterraneum**	Subterranean clover
Trifolium variegatum	White-tip clover
GENTIANACEAE	GENTIAN FAMILY
Cicendia quadrangularis	Oregon timwort
GERANIACEAE	GERANIUM FAMILY
*Erodium botrys**	Broad leaf filaree
*Erodium cicutarium**	Cut leaf filaree
*Geranium dissectum**	Cut-leaved geranium
HAMAMELIDACEAE	WITCH-HAZEL FAMILY
*Liquidambar styraciflua**	Sweetgum
JUNCACEAE	RUSH FAMILY
Juncus bufonius	Toad rush
Juncus effusus	Soft rush

Juncus xiphioides	Iris-leaf rush
LAMIACEAE	MINT FAMILY
*Marrubium vulgare**	Common horehound
LYTHRACEAE	LOOSESTRIFE FAMILY
*Lythrum hyssopifolia**	Hyssop loosestrife
MALVACEAE	MALLOW FAMILY
*Malva parviflora**	Cheeseweed
OROBANCHACEAE	BROOMRAPE FAMILY
Castilleja attenuata	Valley tassels
Castilleja campestris ssp. *campestris*	Field owl's-clover
PHRYMACEAE	LOPSEED FAMILY
Mimulus guttatus	Common large monkey-flower
PLANTAGINACEAE	PLANTAIN FAMILY
Gratiola ebracteata	Bractless hedgehyssop
POACEAE	GRASS FAMILY
*Aira caryophyllea**	Silver hairgrass
Alopecurus saccatus	Pacific foxtail
*Avena barbata**	Slender wild oat
*Briza minor**	Little quaking grass
*Bromus diandrus**	Ripgut brome
*Bromus hordeaceus**	Soft brome
Deschampsia danthonioides	Annual hairgrass
*Festuca myuros**	Rat-tail vulpia
*Festuca perennis**	Italian Ryegrass
*Glyceria declinata**	Mannagrass
Hordeum marinum ssp. *gussoneanum**	Mediterranean barley
Hordeum murinum ssp. *glaucum**	Foxtail barley
*Poa annua**	Annual bluegrass
POLEMONIACEAE	PHLOX FAMILY
Navarretia leucocephala	White-head navarretia
POLYGONACEAE	BUCKWHEAT FAMILY
*Rumex pulcher**	Fiddle dock
RANUNCULACEAE	BUTTERCUP FAMILY
Ranunculus aquatilis	White water buttercup
Ranunculus bonariensis var. *trisepalus*	Carter's buttercup
*Ranunculus muricatus**	Spiny-fruit buttercup
ROSACEAE	ROSE FAMILY
Pyrus calleryana	Callery pear
RUBIACEAE	MADDER FAMILY
Galium aparine	Common bedstraw
THEMIDACEAE	BRODIAEA FAMILY
Brodiaea elegans	Harvest brodiaea
VITACEAE	GRAPE FAMILY
Vitis vinifera	Cultivated grape

An asterisk (*) indicates a non-native species.

The Preserve Development
Plant Species Observed on June 13, 2019

Scientific Name	Common Name
ALISMATACEAE	WATER-PLANTAIN FAMILY
Alisma triviale	Broad-leaf water plantain
ANACARDIACEAE	SUMAC FAMILY
*Schinus terebinthifolius**	Brazilian pepper-tree
APIACEAE	CARROT FAMILY
Eryngium castrense	Button-celery
*Torilis arvensis**	Torilis (hedge parsley)
APOCYNACEAE	DOGBANE FAMILY
Asclepias fascicularis	Narrow-leaf milkweed
ASTERACEAE	SUNFLOWER FAMILY
*Carduus pycnocephalus**	Italian thistle
*Centaurea solstitialis**	Yellow star-thistle
Centromadia fitchii	Fitch's spikeweed
*Cotula coronopifolia**	Brassbuttons
Heliotropium curassavicum	Seaside heliotrope
Holocarpha virgata	Sticky tarweed
*Lactuca serriola**	Prickly lettuce
*Leontodon saxatilis**	Hairy hawkbit
Pseudognaphalium californicum	Everlasting
Psilocarphus oregonus	Oregon woolly-heads
*Senecio vulgaris**	Common groundsel
Stephanomeria virgata	Rod wirelettuce
BRASSICACEAE	MUSTARD FAMILY
*Capsella bursa-pastoris**	Shepherd's purse
*Hirschfeldia incana**	Shortpod mustard
*Raphanus sativus**	Purple wild radish
CARYOPHYLLACEAE	PINK FAMILY
*Spergularia rubra**	Purple sandspurry
CHENOPODIACEAE	GOOSEFOOT FAMILY
*Chenopodium album**	White goosefoot
CONVOLVULACEAE	MORNING-GLORY FAMILY
*Convolvulus arvensis**	Field bindweed
CUPRESSACEAE	CYPRESS FAMILY
Sequoia sempervirens	Redwood
CYPERACEAE	SEDGE FAMILY
Cyperus eragrostis	Tall flatsedge
Eleocharis macrostachya	Creeping spikerush
EUPHORBIACEAE	SPURGE FAMILY
Croton setigerus	Turkey mullein
FABACEAE	LEGUME FAMILY
Acmispon americanus	American bird's foot trefoil
*Medicago polymorpha**	Bur clover
*Trifolium dubium**	Shamrock clover
*Trifolium hirtum**	Rose clover
*Vicia sativa**	Common vetch
*Vicia villosa**	Winter vetch
GENTIANACEAE	GENTIAN FAMILY
Zeltnera muehlenbergii	Muhlenberg's centaury
GERANIACEAE	GERANIUM FAMILY
*Erodium cicutarium**	Cut leaf filaree

*Erodium moschatum**	White stemmed filaree
HAMAMELIDACEAE	WITCH-HAZEL FAMILY
*Liquidambar styraciflua**	Liquidambar
JUNCACEAE	RUSH FAMILY
Juncus bufonius	Toad rush
Juncus effusus	Soft rush
Juncus xiphioides	Iris-leaf rush
LAMIACEAE	MINT FAMILY
Trichostema lanceolatum	Vinegar weed
LYTHRACEAE	LOOSESTRIFE FAMILY
*Lythrum portula**	Broad-leaved loosestrife
MALVACEAE	MALLOW FAMILY
*Malva parviflora**	Cheeseweed
MARSILEACEAE	MARSILEA FAMILY
Marsilea vestita	Hairy water fern
MYRTACEAE	MYRTLE FAMILY
*Eucalyptus polyanthemos**	Silver dollar gum
ONAGRACEAE	EVENING PRIMROSE FAMILY
Epilobium brachycarpum	Panicled willow-herb
Epilobium campestre	Smooth spike primrose
OROBANCHACEAE	BROOMRAPE FAMILY
*Parentucellia viscosa**	Yellow parentucellia
PLANTAGINACEAE	PLANTAIN FAMILY
*Plantago coronopus**	Cut-leaf plantain
*Plantago lanceolata**	English plantain
POACEAE	GRASS FAMILY
*Aegilops triuncialis**	Barbed goatgrass
*Aira caryophyllea**	Silver hairgrass
Alopecurus saccatus	Pacific foxtail
*Avena barbata**	Slender wild oat
*Briza minor**	Little quaking grass
*Bromus tectorum**	Cheatgrass
*Cynodon dactylon**	Bermuda grass
*Elymus caput-medusae**	Medusahead grass
*Festuca myuros**	Rat-tail vulpia
*Festuca perennis**	Italian Ryegrass
Hordeum marinum ssp. *gussoneanum**	Mediterranean barley
*Hordeum murinum**	Foxtail barley
*Polypogon monspeliensis**	Annual rabbit-foot grass
*Triticum aestivum**	Cultivated wheat
POLYGONACEAE	BUCKWHEAT FAMILY
Polygonum aviculare ssp. *depressum*	Prostrate knotweed
*Rumex crispus**	Curly dock
SALICACEAE	WILLOW FAMILY
Salix exigua	Sandbar willow
SOLANACEAE	NIGHTSHADE FAMILY
Datura wrightii	Sacred thornapple
Nicotiana attenuata	Coyote tobacco
Solanum americanum	Nightshade
Solanum rostratum	Buffalobur nightshade
THEMIDACEAE	BRODIAEA FAMILY
Brodiaea elegans	Harvest brodiaea
VITACEAE	GRAPE FAMILY
Vitis vinifera	Cultivated grape
ZYGOPHYLLACEAE	CALTROP FAMILY

*Tribulus terrestris**	Puncture vine

An asterisk (*) indicates a non-native species.

ATTACHMENT E

Special-Status Species Evaluated for the Study Area

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Plants						
Ione Manzanita *(Arctostaphylos myrtifolia)*	FT	-	1B.2	Chaparral and cismontane woodlands associated with very acidic, nutrient-poor, coarse soils typical of the Ione Formation (196'–1,903').	November–March	Absent. Suitable habitat not present onsite.
Brewer's calandrinia *(Calandrinia breweri)*	–	–	4.2	Sandy or loamy soils, disturbed sites, and burns within chaparral and coastal scrub (33'–4,003').	March–June	Absent. Suitable habitat not present onsite.
Pine Hill ceanothus *(Ceanothus roderickii)*	FE	CR	1B.1	Rocky serpentinite or gabbroic soil in chaparral and cismontane woodland (804'–3,576').	April–June	Absent. Suitable habitat not present onsite.
Red Hills soaproot *(Chlorogalum grandiflorum)*	–	–	1B.2	Serpentinite or gabbroic soils in chaparral, cismontane woodland, and lower montane coniferous forest, occasionally on non–ultramafic soils (804'–5,545').	May–June	Absent. Suitable habitat not present onsite.
Brandegee's clarkia *(Clarkia biloba* ssp. *brandegeeae)*	-	-	4.2	Chaparral, cismontane woodlands, and lower montane coniferous forest often along roadcuts (246' - 3,002').	May–July	Absent. Suitable habitat not present onsite.
Bisbee Peak rush–rose *(Crocanthemum suffrutescens)*	–	–	3.2	Often gabbroic or Ione soil or in burned or disturbed areas within chaparral (246'–2,198').	April–August	Absent. Suitable habitat not present onsite.
Dwarf downingia *(Downingia pusilla)*	–	–	2B.2, SSHCP Covered Species	Mesic areas in valley and foothill grassland, and vernal pools. Species appears to have an affinity for slight disturbance (i.e., scraped depressions, ditches, etc.) (Baldwin et al. 2012, CDFW 2018) (3'–1,460').	March–May	Absent. No SSHCP Modeled Species Habitat onsite.
Ione Buckwheat *(Eriogonum apricum* var. *apricum)*	FE	CE	1B.1	Openings in chaparral communities found on Ione soils (197'–476').	July–October	Absent. Suitable habitat not present onsite.
Irish Hill Buckwheat *(Eriogonum apricum* var. *prostratum)*	FE	CE	1B.1	Openings in chaparral communities found on Ione soils (295'–394').	June–July	Absent. Suitable habitat not present onsite.
Jepson's woolly sunflower *(Eriophyllum jepsonii)*	–	–	4.3	Chaparral, cismontane woodland, and coastal scrub, sometimes on serpentinite (656'–3,363').	April–June	Absent. Suitable habitat not present onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Tuolumne Button–celery *(Eryngium pinnatisectum)*	–	–	1B.2	Vernal pools and other mesic conditions in cismontane woodland and lower montane coniferous forests (230'–3,002').	May–August	Absent. Suitable habitat not present onsite.
Pine Hill flannelbush *(Fremontodendron decumbens)*	FE	CR	1B.2	Serpentine or gabbro rock outcrops in chaparral and cismontane woodland (1,394'–2,493').	April–July	Absent. Suitable habitat not present onsite.
Stinkbells *(Fritillaria agrestis)*	-	-	4.2	Clay and sometimes serpentinite soils in chaparral, cismontane woodland, Pinyon and juniper woodland, and Valley and foothill grassland (33' - 5,102').	March–June	Absent within Project. Special-status plant surveys did not detect this species. Potential to Occur within Raymer Way Offsite; Valley grassland represents suitable habitat.
El Dorado bedstraw *(Galium californicum* ssp. *sierrae)*	FE	CR	1B.2	Gabbroic soil in chaparral, cismontane woodland and lower montane coniferous forest communities (328'–1,919').	May–June	Absent. Suitable habitat not present onsite.
Boggs Lake hedge–hyssop *(Gratiola heterosepala)*	–	CE	1B.2, SSHCP Covered Species	Marshes, swamps, lake margins, and vernal pools (33'–7,792').	April–August	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Parry's horkelia *(Horkelia parryi)*	–	–	1B.2	Ione and other soil formations in chaparral and cismontane woodlands (262'–3,510').	April–September	Absent. Suitable habitat not present onsite.
Ahart's dwarf rush *(Juncus leiospermus* var. *ahartii)*	–	–	1B.2, SSHCP Covered Species	Mesic areas in valley and foothill grassland. Species has an affinity for slight disturbance such as farmed fields (USFWS 2005a) (98'–751').	March–May	Absent within Project. Special-status plant surveys did not detect this species. Small amounts of SSHCP Modeled Species Habitat present within unsurveyed Raymer Way Offsites.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Legenere *(Legenere limosa)*	–	–	1B.1, SSHCP Covered Species	Various seasonally inundated areas including wetlands, wetland swales, marshes, vernal pools, artificial ponds, and floodplains of intermittent drainages (USFWS 2005b) (3'–2,887').	April–June	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Hoary navarretia *(Navarretia eriocephala)*	-	-	4.3	Vernally mesic areas in cismontane woodland and Valley and foothill grassland (345' - 1,312').	May-June	Absent. Suitable habitat not present onsite.
Pincushion navarretia *(Navarretia myersii* ssp. *myersii)*	–	–	1B.1, SSHCP Covered Species	Often acidic soils in vernal pools (66'–1,083').	April–May	Absent. No SSHCP Modeled Species Habitat onsite.
Slender Orcutt grass *(Orcuttia tenuis)*	FT	CE	1B.1, SSHCP Covered Species	Vernal pools, often gravelly (115'–5,774').	May–September	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Sacramento Orcutt grass *(Orcuttia viscida)*	FE	CE	1B.1, SSHCP Covered Species	Vernal pools (98'–328').	April–July	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
Layne's ragwort (*Packera layneae*)	FT	CR	1B.2	Rocky serpentinite or gabbroic soil in chaparral and cismontane woodland communities (656'–3,560').	April–August	Absent. Suitable habitat not present onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Sanford's arrowhead *(Sagittaria sanfordii)*	–	–	1B.2, SSHCP Covered Species	Shallow marshes and freshwater swamps (0'–2,133').	May–October	Absent. Special-status plant surveys did not detect this species. Field surveys have determined that there is no habitat present for this species within the unsurveyed Raymer Way Offsite.
El Dorado County Mule Ears *(Wyethia reticulata)*	–	–	1B.2	Clay or gabbroic soils in chaparral, cismontane woodland, and lower montane coniferous forest communities (607'–2,067').	April–August	Absent. Suitable habitat not present onsite.
Invertebrates						
Conservancy fairy shrimp (*Branchinecta conservatio)*	FE	-	-	Vernal pools/wetlands.	November–April	Potential to Occur within vernal pool habitat onsite.
Vernal pool fairy shrimp (*Branchinecta lynchi*)	FT	-	SSHCP Covered Species	Vernal pools/wetlands.	November-April	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Midvalley fairy shrimp *(Branchinecta mesovallensis)*	-	-	CNDDB, SSHCP Covered Species	Vernal pools/wetlands.	November – April	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*)	FT	-	SSHCP Covered Species	Elderberry shrubs.	Any season	Absent. No SSHCP Modeled Species Habitat onsite.
Ricksecker's water scavenger beetle *Hydochara rickseckeri*	-	-	SSHCP Covered Species	Vernal pools/wetlands.		Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Vernal pool tadpole shrimp (*Lepidurus packardi*)	FE	-	SSHCP Covered Species	Vernal pools/wetlands.	November-April	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Fish						
Delta smelt (*Hypomesus transpacificus*)	FT	CE	-	Sacramento-San Joaquin delta		Absent. Suitable habitat not present onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Steelhead (CA Central Valley DPS) (*Oncorhynchus mykiss irideus*)	FT	-	-	Undammed rivers, streams, and creeks		Absent. Suitable habitat not present onsite.
Amphibians						
California tiger salamander (Central California DPS) (*Ambystoma californiense*)	FT	CT	SSC, SSHCP Covered Species	Vernal pools, wetlands (breeding) and adjacent grassland or oak woodland; needs underground refuge (e.g., ground squirrel and/or gopher burrows). Largely terrestrial as adults.	March-May	Absent. No SSHCP Modeled Species Habitat onsite.
California red-legged frog (*Rana draytonii*)	FT	-	SSC	Lowlands or foothills at waters with dense shrubby or emergent riparian vegetation. Adults must have aestivation habitat to endure summer dry down.		Absent. Suitable habitat not present onsite.
Foothill yellow-legged frog (*Rana boylii*)	-	CC	SSC	Foothill yellow-legged frogs can be active all year in warmer locations, but may become inactive or hibernate in colder climates. At lower elevations, foothill yellow-legged frogs likely spend most of the year in or near streams. Adult frogs, primarily males, will gather along main-stem rivers during spring to breed.	May–October	Absent. Suitable habitat not present onsite.
Western spadefoot (*Spea hammondii*)	-	-	SSC, SSHCP Covered Species	California endemic species of vernal pools, swales, wetlands and adjacent grasslands throughout the Central Valley.	March-May	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Reptiles						
Giant garter snake (*Thamnophis gigas*)	FT	CT	SSHCP Covered Species	Freshwater ditches, sloughs, and marshes in the Central Valley. Almost extirpated from the southern parts of its range.	April-October	Absent. No SSHCP Modeled Species Habitat onsite.
Western pond turtle (*Actinemys marmorata*)	-	-	SSC, SSHCP Covered Species	Requires basking sites and upland habitats up to 0.5 km from water for egg laying. Uses ponds, streams, detention basins, and irrigation ditches.	April-September	Potential to Occur. No SSHCP Modeled Species Habitat present; however, ponded areas in Morrison Creek represent potential habitat.
Birds						

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Bald eagle (*Haliaeetus leucocephalus)*	Delisted	CE	CFP, BCC	Typically nests in forested areas near large bodies of water in the northern half of California; nest in trees and rarely on cliffs; wintering habitat includes forest and woodland communities near water bodies (e.g. rivers, lakes), wetlands, flooded agricultural fields, open grasslands	February–September (nesting); October-March (wintering)	Absent. Suitable habitat not present onsite.
Bank swallow (*Riparia riparia*)	-	CT	-	Nests colonially along coasts, rivers, streams, lakes, reservoirs, and wetlands in vertical banks, cliffs, and bluffs in alluvial, friable soils. May also nest in sand, gravel quarries and road cuts. In California, breeding range includes northern and central California.	May–July	Absent. Suitable habitat not present onsite.
Burrowing owl *(Athene cunicularia)*	-	-	BCC, SSC, SSHCP Covered Species	Nests in burrows or burrow surrogates in open, treeless, areas within grassland, steppe, and desert biomes. Often with other burrowing mammals (e.g. prairie dogs, California ground squirrels). May also use human-made habitat such as agricultural fields, golf courses, cemeteries, roadside, airports, vacant urban lots, and fairgrounds.	February-August	Present. SSHCP Modeled Species Habitat present onsite, and evidence of burrow use onsite observed during survey conducted per SSHCP AMM WBO-1.
California black rail (*Laterallus jamaicensis coturniculus*)	-	CT	BCC, CFP	Salt marsh, shallow freshwater marsh, wet meadows, and flooded grassy vegetation. In California, primarily found in coastal and Bay-Delta communities, but also in Sierran foothills (Butte, Yuba, Nevada, Placer counties)	March–September (breeding)	Absent. Suitable habitat not present onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
California spotted owl *(Strix occidentalis occidentalis)*	-	-	BCC, SSC	Found in the southern Cascade Range and northern Sierra Nevada from Pit River, Shasta Co. south to Tehachapi Mountains, Kern Co, in the coastal ranges from Monterey Co. to Santa Barbara Co., in Transverse and Peninsular Ranges south to northern Baja California. At lower elevations, they breed in hardwood forests and coniferous forests at higher elevations. They use forests with greater complexity and structure.	March–September (breeding)	Absent. Suitable habitat not present onsite.
California thrasher (*Toxostoma redivivum*)	-	-	SSC	Resident and endemic to coastal and Sierra Nevada-Cascade foothill areas of California. Nests are usually well hidden in dense shrubs, including scrub oak, California lilac, and chamise.	February–July	Absent. Suitable habitat not present onsite.
Clark's grebe (*Aechmophorus clarkia*)	-	-	BCC	The breeding range of Clark's grebe includes all of California with major breeding areas such as Eagle Lake (Lassen County), Clear Lake (Lake County), Lake Almanor (Plumas County), Bridgeport Reservoir (Butte County), and Goose Lake (Modoc County). Clark's grebe occurs seasonally in suitable wetland habitat with a preference for large lakes. Clarke's grebe is a diving bird that forages primarily under water.	January–December	Absent. Suitable habitat not present onsite.
Cooper's hawk *(Accipiter cooperii)*	-	-	CDFW WL, SSHCP Covered Species	Nests in trees in riparian woodlands in deciduous, mixed and evergreen forests, as well as urban landscapes	March-July	Absent. No SSHCP Modeled Species Habitat onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Double-crested cormorant *(Phalacrocorax auritus)*	-	-	CDFW WL	Nests near ponds, lakes, artificial impoundments, slow-moving rivers, lagoons, estuaries, and open coastlines and typically forages in shallow water. Non-nesters are found in many coastal and inland waters.	April–August	Absent. Suitable habitat not present onsite.
Ferruginous hawk (*Buteo regalis*)	-	-	BCC, CDFW WL, SSHCP Covered Species	Rarely breeds in California (Lassen County); winter range includes grassland and shrubsteppe habitats from Northern California (except northeast and northwest corners) south to Mexico and east to Oklahoma, Nebraska, and Texas.	September-March (wintering)	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Golden eagle (*Aquila chrysaetos*)	-	-	BCC, CFP	Nesting habitat includes mountainous canyon land, rimrock terrain of open desert and grasslands, riparian, oak woodland/savannah, and chaparral. Nesting occurs on cliff ledges, river banks, trees, and human-made structures (e.g. windmills, platforms, and transmission towers). Breeding occurs throughout California, except the immediate coast, Central Valley floor, Salton Sea region, and the Colorado River region, where they can be found during Winter.	Nest (February–August); winter CV (October–February)	Potential to Occur. Winter foraging habitat present.
Grasshopper sparrow (*Ammodramus savannarum*)	-	-	SSC	In California, breeding range includes most coastal counties south to Baja California; western Sacramento Valley and western edge of Sierra Nevada region. Nests in moderately open grasslands and prairies with patchy bare ground. Avoids grasslands with extensive shrub cover; more likely to occupy large tracts of habitat than small fragments; removal of grass cover by grazing often detrimental.	May–August	Potential to Occur. Nesting habitat present.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Great blue heron (*Ardea herodias*)	-	-	CNDDB	Colonial nester; prefers to nest in vegetation on islands or in swamps but may also be found in upland habitats in trees, bushes, on the ground and on artificial structures. Foraging habitat is widely diverse and includes swamps, coastlines, estuaries, beaches, pastures, cultivated fields, and riparian areas.	February–July	Absent. Suitable habitat not present onsite.
Great egret *(Ardea alba)*	-	-	CNDDB	Colonial nester; nests in woody vegetation, shrubs and trees usually near lakes, ponds, marshes estuaries, human-made impoundments, or natural and human-made islands.	March–July	Absent. Suitable habitat not present onsite.
Greater sandhill crane *(Antigone canadensis tabida)*	-	CT	CFP, SSHCP Covered Species	Breeds in NE California, Nevada, Oregon, Washington, and BC, Canada; winters from CA to Florida. In winter, they forage in burned grasslands, pastures, and feed on waste grain in a variety of agricultural settings (corn, wheat, milo, rice, oats, and barley), tilled fields, recently planted fields, alfalfa fields, row crops and burned rice fields.	March-August (breeding); September-March (wintering)	Absent. No SSHCP Modeled Species Habitat onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Lawrence's goldfinch (*Spinus lawrencei*)	-	-	BCC	Breeds in Sierra Nevada and inner Coast Range foothills surrounding the Central Valley and the southern Coast Range to Santa Barbara County east through southern California to the Mojave Desert and Colorado Desert into the Peninsular Range. Nests in arid and open woodlands with chaparral or other brushy areas, tall annual weed fields, and a water source (e.g. small stream, pond, lake), and to a lesser extent riparian woodland, coastal scrub, evergreen forests, pinyon-juniper woodland, planted conifers, and ranches or rural residences near weedy fields and water.	March–September	Absent. Suitable habitat not present onsite.
Lewis' woodpecker (*Melanerpes lewis*)	-	-	BCC	In California, breeds in Siskiyou and Modoc Counties, Warmer Mountains, inner coast ranges from Tehama to San Luis Obispo Counties, San Bernardino Mountains, and Big Pine Mountain (Inyo Co.); nesting habitat includes open ponderosa pine forest, open riparian woodland, logged/burned forest, and oak woodlands. Does not breed on the west side of Sierran crest (Beedy and Pandalfino 2013).	April–September (breeding); September–March (winter in Central Valley).	Absent. Suitable habitat not present onsite.
Loggerhead shrike (*Lanius ludovicianus*)	-	-	BCC, SSC, SSHCP Covered Species	Found throughout California in open country with short vegetation, pastures, old orchards, grasslands, agricultural areas, open woodlands. Not found in heavily forested habitats.	March-July	Potential to Occur. SSHCP Modeled Species Habitat present onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Merlin *(Falco columbarius)*	-	-	CDFW WL	Breeds in Oregon, Washington north into Canada. Winters in southern Canada to South America, including California. Breeds near forest openings, fragmented woodlots, and riparian areas. Wintering habitat includes wide variety, open forests, grasslands, tidal flats, plains, and urban settings.	September–April (wintering in the Central Valley); does not breed in California	Potential to Occur. Winter foraging habitat present.
Northern harrier (*Circus hudsonius*)	-	-	SSC, SSHCP Covered Species	Nests on the ground in open wetlands, marshy meadows, wet/lightly grazed pastures, (rarely) freshwater/brackish marshes, tundra, grasslands, prairies, croplands, desert, shrub-steppe, and (rarely) riparian woodland communities.	April-September	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Nuttall's woodpecker *(Picoides nuttallii)*	-	-	BCC	Resident from northern California south to Baja California. Nests in tree cavities in oak woodlands and riparian woodlands.	April–July	Absent. Suitable habitat not present onsite.
Oak titmouse (*Baeolophus inornatus*)			BCC	Nests in tree cavities within dry oak or oak-pine woodland and riparian; where oaks are absent, they nest in juniper woodland, open forests (gray, Jeffrey, Coulter, pinyon pines and Joshua tree)	March–July	Absent. Suitable habitat not present onsite.
Rufous hummingbird *(Selasphorus rufus)*	-	-	BCC, SSHCP Covered Species	Breeds in extreme northwestern California north into British Columbia and Alaska. Winters in coastal Southern California south into Mexico. Common migrant during March-April in Sierra Nevada foothills and June-August in Lower Conifer to Alpine zone of Sierra Nevada. Nesting habitat includes secondary succession communities and openings, mature forests, parks and residential area.	April–July	Absent. Suitable habitat not present onsite.
Saltmarsh common yellowthroat (*Geothlypis trichas sinuosa*)	-	-	BCC, SSC	Breeds in salt marshes of San Francisco Bay; winters San Francisco south along coast to San Diego Co.	March–July	Absent. Suitable habitat not present onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Song sparrow "Modesto" (*Melospiza melodia heermanni*)	-	-	BCC, SSC	Resident in central and southwest California, including Central Valley; nests in marsh, scrub habitat	April–June	Absent. Suitable habitat not present onsite.
Swainson's hawk (*Buteo swainsoni*)	-	CT	BCC, SSHCP Covered Species	Nesting occurs in trees in agricultural, riparian, oak woodland, scrub, and urban landscapes. Forages over grassland, agricultural lands, particularly during disking/harvesting, irrigated pastures	March-August	Potential to Occur. SSHCP Modeled Species Habitat present onsite.
Tricolored blackbird (*Agelaius tricolor*)	-	CT	BCC, SSC, SSHCP Covered Species	Breeds locally west of Cascade-Sierra Nevada and southeastern deserts from Humboldt and Shasta Cos south to San Bernardino, Riverside and San Diego Counties. Central California, Sierra Nevada foothills and Central Valley, Siskiyou, Modoc and Lassen Counties. Nests colonially in freshwater marsh, blackberry bramble, milk thistle, triticale fields, weedy (mustard, mallow) fields, giant cane, safflower, stinging nettles, tamarisk, riparian scrublands and forests, fiddleneck and fava bean fields.	March-August	Present. SSHCP Modeled Species Habitat present, evidence of past nesting observed during survey per SSHCP AMM TCB-1; however, species is nomadic and may not be present every year.
White-tailed kite (*Elanus leucurus*)	-	-	CFP, SSHCP Covered Species	Nesting occurs within trees in low elevation grassland, agricultural, wetland, oak woodland, riparian, savannah, and urban habitats.	March-August	Potential to Occur. SSHCP Modeled Species Habitat present onsite.

Special-Status Species Evaluated for the Study Area						
Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Wrentit (*Chamaea fasciata*)	-	-	BCC	Resident bird found along the California and Oregon coast and California Central Valley regions. Breeds in many habitats that generally have a relatively dense understory including riparian oak woodlands, Douglas fir and redwood forests, riparian willow scrub, and mixed conifer habitats. This species will also nest in and use manzanita, scrubby oaks, coastal sage scrub, California lilac, coyote bush and blackberry thickets. Wrentit prefer to stay elevated and rarely forage on the ground for sources of food, which are primarily made up of arthropods including insects and spiders as well as fruit and seeds.	March–August	Absent. Suitable habitat not present onsite.
Yellow-billed magpie (*Pica nuttallii*)	-	-	BCC	Endemic to California; found in the Central Valley and coast range south of San Francisco Bay and north of Los Angeles County.; nesting habitat includes oak savannah with large in large expanses of open ground; also found in urban parklike settings.	April–June	Potential to Occur. Nesting habitat present.
Mammals						
Pallid bat *(Antrozous pallidus)*	-	-	SSC	Crevices in rocky outcrops and cliffs, caves, mines, trees (e.g. basal hollows of redwoods, cavities of oaks, exfoliating pine and oak bark, deciduous trees in riparian areas, and fruit trees in orchards). Also roosts in various human structures such as bridges, barns, porches, bat boxes, and human-occupied as well as vacant buildings (Western Bat Working Group [WBWG] 2018).	April–September	Potential to Occur. Structures onsite represent potential hibernacula.

Special-Status Species Evaluated for the Study Area

Common Name (Scientific Name)	Status			Habitat Description	Survey Period	Potential To Occur On-Site
	ESA	CESA	Other			
Western red bat (*Lasiurus blossevillii*)	-	-	SSC, SSHCP Covered Species	Roosts in foliage of trees or shrubs; Day roosts are commonly in edge habitats adjacent to streams or open fields, in orchards, and sometimes in urban areas. There may be an association with intact riparian habitat (particularly willows, cottonwoods, and sycamores) (WBWG 2017).	April-September	Potential to Occur. SSHCP Modeled Species Habitat present; potential hibernacula habitat identified during survey per SSHCP AMM BAT-1.
American badger *(Taxidea taxus)*	-	-	SSC, SSHCP Covered Species	Drier open stages of most shrub, forest, and herbaceous habitats with friable soils.	Any season	Potential to Occur. SSHCP Modeled Species Habitat present onsite.

Status Codes:

AMM	SSHCP Avoidance and Minimization Measure
ESA	Endangered Species Act
CESA	California Endangered Species Act
FE	ESA listed, Endangered.
FT	ESA listed, Threatened.
FPD	Listed under ESA, but formally proposed for delisting.
FC	Candidate for ESA listing as Threatened or Endangered.
CFP	California Fish and Game Code Fully Protected Species
CE	CESA or NPPA listed, Endangered.
CR	CESA- or NPPA-listed, Rare.
CT	CESA or NPPA listed, Threatened.
CC	Candidate for CESA listing as Endangered or Threatened.
BCC	USFWS Bird of Conservation Concern
CDFW WL	CDFW Watch List
Delisted	Formally Delisted (delisted ESA species are monitored for 5 years).
SSC	CDFW Species of Special Concern
SSHCP	South Sacramento Habitat Conservation Plan
1B	California Rare Plant Ranks (CRPRs)/Rare or Endangered in California and elsewhere.
2B	CRPR /Rare or Endangered in California, more common elsewhere.
2	CRPR /Rare or Endangered in California, more common elsewhere.
4	CRPR /Plants of Limited Distribution - A Watch List.
0.1	Threat Rank/Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2	Threat Rank/Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3	Threat Rank/Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

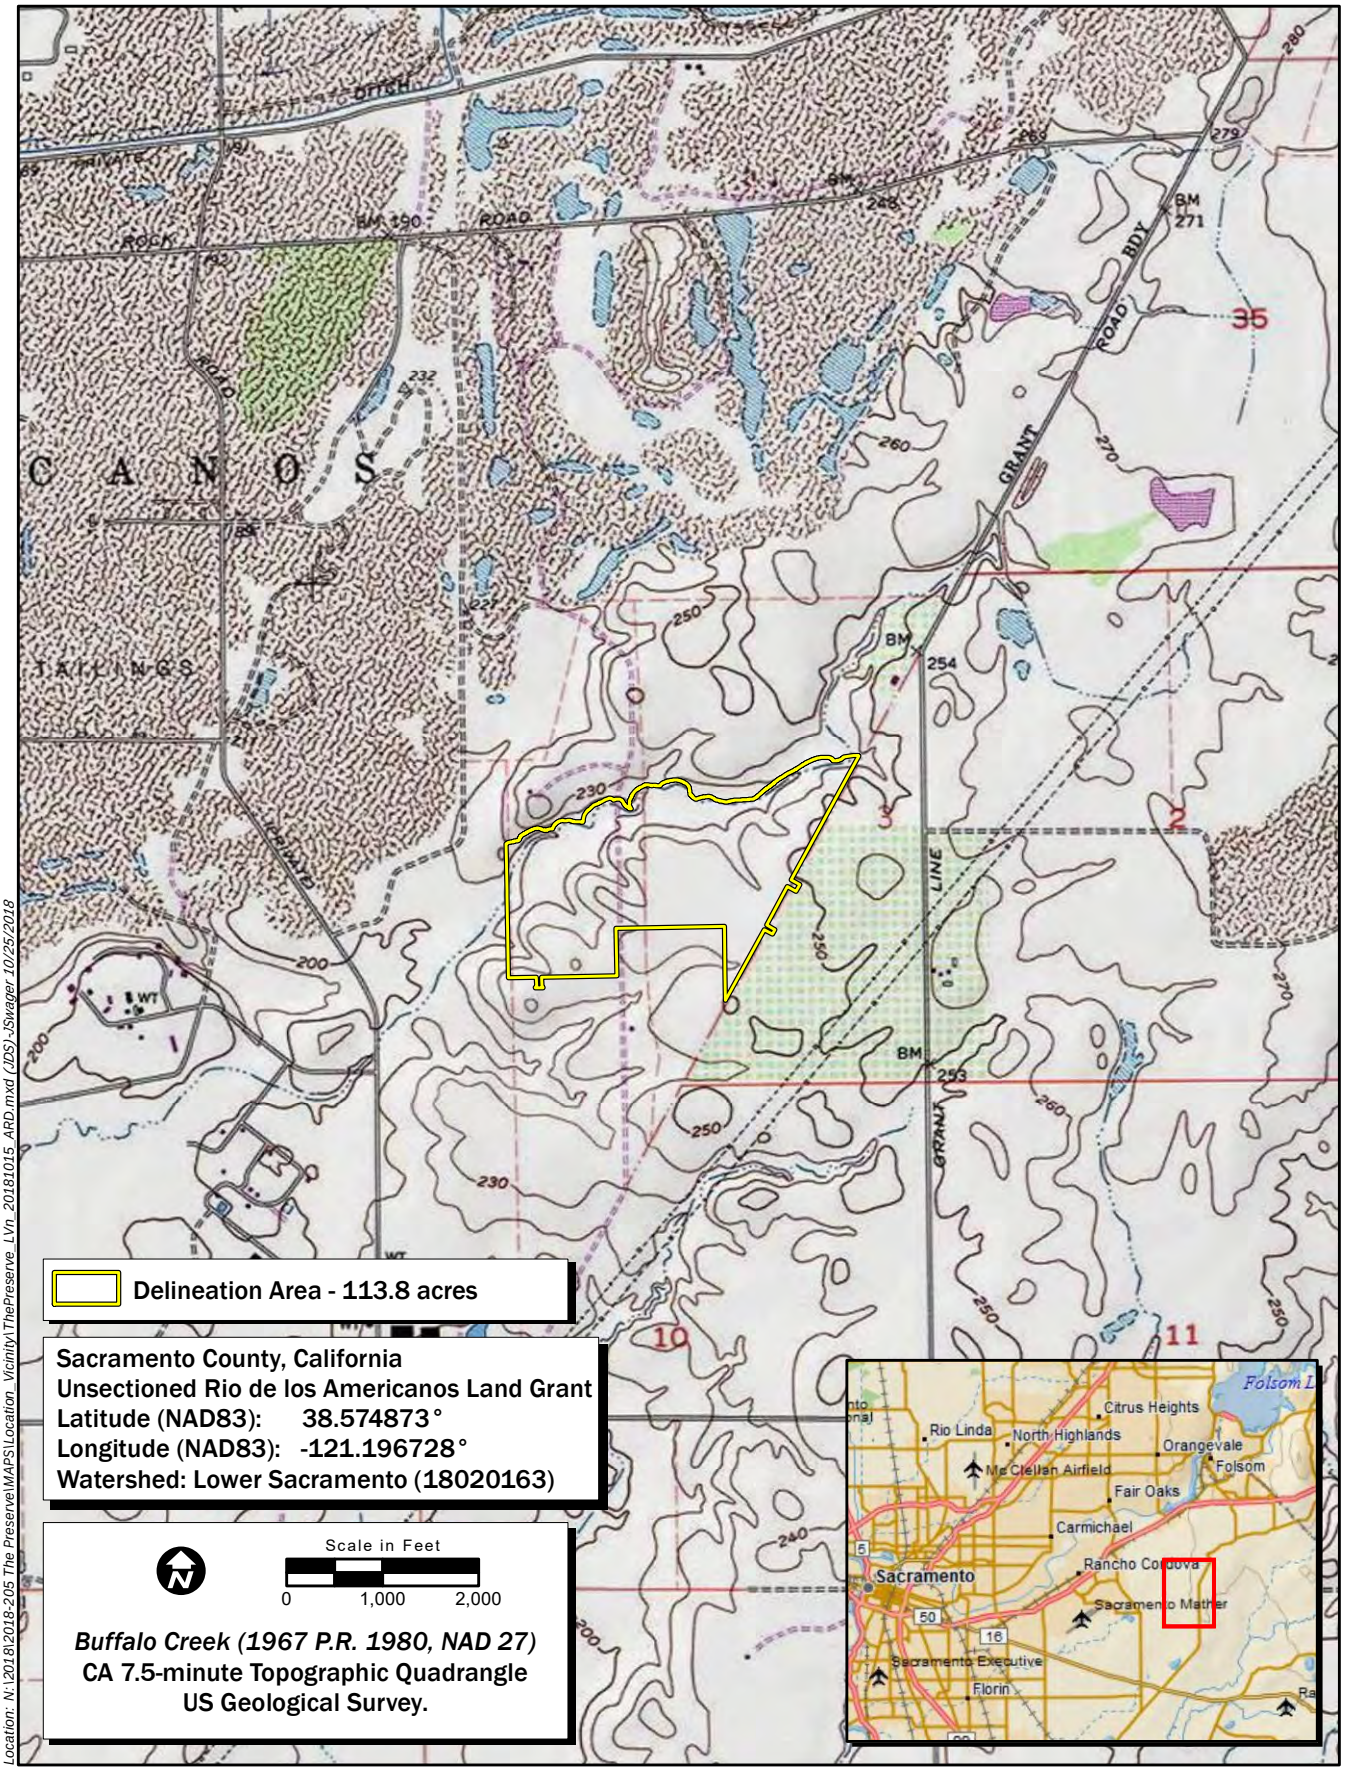
1.0 INTRODUCTION

On behalf of Winn Communities, Inc., ECORP Consulting, Inc. conducted an aquatic resources delineation for the ±113.8-acre Delineation Area encompassing The Preserve Development (Project) located in Rancho Cordova, Sacramento County, California. The Delineation Area is located to the northwest of Raymer Way and Grant Line Road. The Delineation Area corresponds to an unsectioned portion of the Rio de los Americanos Land Grant within the "Buffalo Creek, California" 7.5-minute quadrangle (U.S. Geological Survey [USGS] 1980) (Figure 1. *Project Location and Vicinity*). The approximate center of the Delineation Area is located at 38.574873° latitude and -121.196728° longitude within the Lower Sacramento Watershed (Hydrologic Unit Code #18020163, Natural Resources Conservation Service [NRCS], USGS, and U.S. Environmental Protection Agency [USEPA] 2016). Driving directions to the Delineation Area are included as Attachment A.

This report describes aquatic resources identified within the Delineation Area that may be regulated by the U.S. Army Corps of Engineers (USACE) pursuant to Section 404 of the federal Clean Water Act (CWA). The information presented in this report provides data required by the USACE Sacramento District's Minimum Standards for Acceptance of Aquatic Resources Delineation Reports (USACE 2016a). A Preliminary Jurisdictional Determination (PJD) was issued in 2012 for a ±72.6-acre portion of the Delineation Area, verifying the location and extent of aquatic resources delineated therein (USACE 2012, Attachment B). The aquatic resource boundaries depicted in this report, including those located in the previously verified portion of the Delineation Area, represent a calculated estimation of the jurisdictional area within the Delineation Area, and are subject to modification following the USACE verification process.

The purpose of this report is to provide adequate information to USACE for the issuance of a PJD covering the entirety of the Delineation Area.



2.0 REGULATORY SETTING

2.1 Waters of the United States

This report describes aquatic resources, including wetlands that may be regulated by USACE under Section 404 of the federal CWA. The following sections define these regulations.

2.1.1 Wetlands

Wetlands are "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" [51 Federal Register (FR) 41250, Nov. 13, 1986, as amended at 58 FR 45036, Aug. 25, 1993]. Wetlands can be perennial or intermittent.

ENVIRONMENTAL CONSULTANTS

Figure 1. Project Location and Vicinity

2018-205 The Preserve

2.1.2 Other Waters

Other waters are nontidal, perennial, and intermittent watercourses and tributaries to such watercourses [51 FR 41250, Nov. 13, 1986, as amended at 58 FR 45036, August 25, 1993]. The limit of USACE jurisdiction for nontidal watercourses (without adjacent wetlands) is defined in 33 Code of Federal Register (CFR) 328.4(c)(1) as the "ordinary high-water mark" (OHWM). The OHWM is defined as the "line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" approximation of the lateral limit of USACE jurisdiction. The upstream limits of other waters are defined as the point where the OHWM is no longer perceptible.

2.2 Clean Water Act

The USACE regulates discharge of dredged or fill material into Waters of the U.S. under Section 404 of the CWA. "Discharges of fill material" is defined as the addition of fill material into Waters of the U.S., including, but not limited to the following: placement of fill necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; and fill for intake and outfall pipes, and subaqueous utility lines [33 CFR § 328.2(f)]. In addition, Section 401 of the CWA (33 U.S. Code 1341) requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into Waters of the U.S. to obtain a certification that the discharge will comply with the applicable effluent limitations and water quality standards.

Substantial impacts to wetlands, over 0.5 acre of impact, may require an individual permit. Projects that only minimally affect wetlands, less than 0.5 acre of impact, may meet the conditions of one of the existing Nationwide Permits. A Water Quality Certification or waiver pursuant to Section 401 of the CWA is required for Section 404 permit actions; this certification or waiver is issued by the Regional Water Quality Control Board.

2.3 Jurisdictional Assessment

The Clean Water Rule (CWR) was published in June 2015, but implementation of the rule was stayed until September 2018. It is currently (2018) in effect for 22 states, including California, the District of Columbia, and the U.S. territories. The CWR establishes categories of waters that are jurisdictional, waters that are excluded, and waters that require a case-specific significant nexus evaluation to determine if they are Waters of the U.S. By rule, the CWR defines Waters of the U.S. to include Traditional Navigable Waters (TNW), interstate waters, and territorial seas, impoundments of jurisdictional waters, and tributaries and adjacent (i.e., bordering, contiguous, or neighboring) waters to TNW, interstate waters, or territorial seas (USACE and USEPA 2015).

According to the CWR, neighboring is defined as waters located: within 100 feet of the OHWM of a jurisdictional feature, within the 100-year floodplain of a jurisdictional feature and within 1,500 feet of the

feature, or within 1,500 feet of the high tide line of TNW, interstate water, or territorial sea. Western vernal pools in California and several other location-specific aquatic feature types are evaluated on a case-by-case basis to determine whether they have a significant nexus to TNW, interstate waters, or territorial seas (USACE and USEPA 2015).

Feature types that are categorically excluded from CWA jurisdiction include waste treatment systems, prior converted cropland, ditches with intermittent or ephemeral flow that are not relocated tributaries or excavated in a tributary, ditches that do not flow, directly or indirectly, into a jurisdictional water, artificially irrigated areas that would revert to dry land in the absence of irrigation, artificial, constructed lakes or ponds created by excavating and/or diking dry land, small ornamental waters, artificial reflecting or swimming pools created by excavating and/or diking dry land, water-filled depressions created in dry land incidental to mining or construction activities, erosional features such as gullies, rills, and other ephemeral features that do not meet the definition of tributary, non-wetland swales, and lawfully constructed grassed waterways, and puddles (USACE and USEPA 2015).

3.0 METHODS

This aquatic resources delineation was conducted in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Arid West Region Supplement) (USACE 2008). The boundaries of aquatic resources were delineated through standard field methods (e.g., paired sample set analyses) and aerial photograph interpretation. Field data were recorded on Wetland Determination Data Forms - Arid West Region (Attachment C). A color aerial photograph (1"=200' scale, NAIP 2016) used to assist with mapping and ground-truthing. *Munsell Soil Color Charts* (Kollmorgen Instruments Co. 1990) and the Web Soil Survey (NRCS 2018a) were used to aid in identifying hydric soils in the field. The Jepson Manual, 2nd Edition (Baldwin et al. 2012) was used for plant nomenclature and identification.

Field surveys were conducted on October 12, 2018 by ECORP biologist Clay DeLong. Mr. DeLong walked the entire ±41.2-acre unverified portion of the Delineation Area to determine the location and extent of aquatic resources. Paired locations were sampled to evaluate whether or not the vegetation, hydrology, and soils data supported an aquatic resource determination. At each paired location, one point was located such that it was within the estimated aquatic resource area, and the other point was situated outside the limits of the estimated aquatic resource area. Aquatic resources within the unverified portion of the Delineation Area were recorded in the field using a post-processing capable global positioning system unit with sub-meter accuracy (Trimble GeoXT). The previously verified portion of the Delineation Area was reviewed via aerial photograph interpretation and limited field reconnaissance.

3.1 Routine Determinations for Wetlands

To be determined a wetland, the following three criteria must be met:

- A majority of dominant vegetation species are wetland-associated species;

- Hydrologic conditions exist that result in periods of flooding, ponding, or saturation during the growing season; and
- Hydric soils are present.

3.1.1 Vegetation

Hydrophytic vegetation is defined as the sum total of macrophytic plant life that occurs in areas where the frequency and duration of inundation or soil saturation produce permanent or periodically saturated soils of sufficient duration to exert a controlling influence on the plant species present (Environmental Laboratory 1987). The definition of wetlands includes the phrase "a prevalence of vegetation typically adapted for life in saturated soil conditions." Prevalent vegetation is characterized by the dominant plant species comprising the plant community (Environmental Laboratory 1987). The dominance test is the basic hydrophytic vegetation indicator and was applied at each sampling point location. The "50/20 rule" was used to select the dominant plant species from each stratum of the community. The rule states that for each stratum in the plant community, dominant species are the most abundant plant species (when ranked in descending order of coverage and cumulatively totaled) that immediately exceed 50 percent of the total coverage for the stratum, plus any additional species that individually comprise 20 percent or more of the total cover in the stratum (Headquarters USACE [HQUSACE] 1992, USACE 2008).

Dominant plant species observed at each sampling point were then classified according to their indicator status (probability of occurrence in wetlands, Table 1), *North American Digital Flora: National Wetland Plant List* (Lichvar et al. 2016). If the majority (more than 50 percent) of the dominant vegetation on a site are classified as obligate (OBL), facultative wetland (FACW), or facultative (FAC), the site was considered to be dominated by hydrophytic vegetation.

Table 1. Classification of Wetland-Associated Plant Species[1]

Plant Species Classification	Abbreviation	Probability of Occurring in Wetland
Obligate	OBL	Almost always occur in wetlands
Facultative Wetland	FACW	Usually occur in wetlands, but may occur in non-wetlands
Facultative	FAC	Occur in wetlands and non-wetlands
Facultative Upland	FACU	Usually occur in non-wetlands, but may occur in wetlands
Upland	UPL	Almost never occur in wetlands
Plants That Are Not Listed (assumed upland species)	N/L	Does not occur in wetlands in any region.

[1]Source: Lichvar et al. 2016

In instances where indicators of hydric soil and wetland hydrology were present, but the plant community failed the dominance test, the vegetation was re-evaluated using the Prevalence Index. The Prevalence Index is a weighted-average wetland indicator status of all plant species in the sampling plot, where each indicator status category is given a numeric code (OBL=1, FACW=2, FAC=3, FACU=4, and UPL=5) and

weighting is by abundance (percent cover). If the plant community failed the Prevalence Index, the presence/absence of plant morphological adaptations to prolonged inundation or saturation in the root zone was evaluated.

3.1.2 Soils

A hydric soil is defined as a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (NRCS 2003). Indicators that a hydric soil is present include, but are not limited to, histosols, histic epipedon, hydrogen sulfide, depleted below dark surface, sandy redox, loamy gleyed matrix, depleted matrix, redox dark surface, redox depressions, and vernal pools.

At each sampling point a soil pit was excavated to the depth needed to document an indicator, to confirm the absence of indicators, or until refusal at each sampling point. The soil was then examined for hydric soil indicators. Soil colors were determined while the soil was moist using the *Munsell Soil Color Charts* (Kollmorgen Instruments Co. 1990). Hydric soils are formed predominantly by the accumulation or loss of iron, manganese, sulfur, or carbon compounds in a saturated and anaerobic environment. These processes and the features in the soil that develop can be identified by looking at the color and texture of the soils.

3.1.3 Hydrology

Wetlands, by definition, are seasonally or perennially inundated or saturated at or near (within 12 inches of) the soil surface. Primary indicators of wetland hydrology include, but are not limited to: visual observation of saturated soils, visual observation of inundation, surface soil cracks, inundation visible on aerial imagery, water-stained leaves, oxidized rhizospheres along living roots, aquatic invertebrates, water marks (secondary indicator in riverine environments), drift lines (secondary indicator in riverine environments), and sediment deposits (secondary indicator in riverine environments). The occurrence of one primary indicator is sufficient to conclude that wetland hydrology is present. If no primary indicators are observed, two or more secondary indicators are required to conclude wetland hydrology is present. Secondary indicators include, but are not limited to: drainage patterns, crayfish burrows, FAC-neutral test, and shallow aquitard.

4.0 RESULTS

4.1 Existing Site Conditions

The Delineation Area is located within flat to rolling terrain situated at an elevational range of approximately 210 - 250 feet above mean sea level in the Sacramento Valley Subregion of the Great Central Valley floristic region of California (Baldwin et al. 2012). The average winter low temperature in the vicinity of the Delineation Area is 41.5˚F and the average summer high temperature is 91.2˚F. Average annual precipitation is approximately 20 inches, which falls as rain (National Oceanic and Atmospheric Administration [NOAA] 2018a).

The Delineation Area is composed of a mixture of developed and undeveloped land. Developed areas include two single-family homes and several gravel roads. Rows of redwood (*Sequoia sempervirens*) and blue gum (*Eucalyptus globulus*) are planted at several locations adjacent to the roads and homes. Surrounding land uses include suburban residential developments, aggregate mines, and undeveloped grasslands.

The majority of the Delineation Area is composed of annual grassland, a vegetation community dominated primarily by a mixture of nonnative annual grasses, including medusahead grass (*Elymus caput-medusae*), soft brome (*Bromus hordeaceus*), wild oats (*Avena fatua*), and brome fescue (*Festuca bromoides*). Narrow tarplant (*Holocarpha virgata*), a native perennial forb, was also dominant in grasslands within the Delineation Area. See Section 4.2 for detailed descriptions of the vegetation associated with aquatic resources within the Delineation Area.

This aquatic resources delineation was conducted in late summer, outside the blooming season for most plant species. However, most plants were identifiable to species based upon vegetative or fruit morphology. Hydrologic conditions within the Delineation Area were typical for late summer (i.e., dry), and precipitation totals during the water year preceding the survey were only marginally below normal. During the 2017-2018 water year prior to the field survey (October 1, 2017 to October 1, 2018), approximately 17 inches of precipitation were recorded at the Sacramento 5 ESE reporting station (NOAA 2018b), located approximately 12 miles from the Study Area. The most recent significant precipitation event prior to the surveys occurred on May 25, 2018, resulting in 0.32 inches of rainfall (NOAA 2018b).

4.1.1 California Aquatic Resource Inventory

The California Aquatic Resource Inventory (CARI, San Francisco Estuary Institute [SFEI] 2017) is a statewide map of surface waters and related habitats combining multiple national and regional datasets, including the National Wetlands Inventory, and the National Hydrography Dataset. CARI includes aquatic resource features mapped using a variety of remote sensing and modeling techniques. As such, these aquatic features may or may not exist as represented. In addition, CARI data varies in detail, accuracy, and age, and is meant to be used as a tool to assist with an aquatic resource delineation but not as the only source of information (SFEI 2017).

According to CARI, there are several aquatic features mapped within the Delineation Area (Figure 2. *California Aquatic Resource Inventory Features*). These include stream features mapped as fluvial natural and fluvial unnatural, which roughly correspond to onsite streams and creeks. Figure 2 also shows CARI features mapped as individual vernal pools, depressional seasonal, depressional, and riverine, which roughly correspond to onsite vernal pools, open water features, swales, streams, and creeks.

4.1.2 Soils

According to the Web Soil Survey (NRCS 2018a), three soil units, or types, have been mapped within the Delineation Area (Figure 3. *Natural Resources Conservation Service Soil Types*):

- 159 – Hicksville gravelly loam, 0 to 2 percent slopes, occasionally flooded;

- 192 – Red Bluff loam, 2 to 5 percent slopes; and
- 193 – Red Bluff-Redding complex, 0 to 5 percent slopes.

Hicksville gravelly loam, 0 to 2 percent slopes (159) is partially composed of the Columbia and Cosumnes components, which are considered hydric when occurring on floodplains. Red Bluff loam, 2 to 5 percent slopes (192) and Red Bluff-Redding complex, 0 to 5 percent slopes (193), are partially composed of unnamed components that are considered hydric when occurring in depressions (NRCS 2018b).

4.2 Aquatic Resources

A total of 7.861 acres of aquatic resources have been mapped within the Delineation Area, including 5.107 acres of unverified aquatic resources and 2.755 acres of previously verified aquatic resources (Table 2). The wetland determination data forms are included in Attachment C, and a list of plant species observed within the Delineation Area is included as Attachment D. A discussion of the aquatic resources is presented below, and the aquatic resources delineation map is presented in Figure 4. *Aquatic Resources Delineation*.

Representative site photographs are included as Attachment E. The USACE Operations and Maintenance Business Information Link Regulatory Module (ORM) aquatic resources table of potential Waters of the U.S. is included in Attachment F.

4.2.1 Wetlands

Vernal Pool

Vernal pools are seasonal ephemeral wetlands that fill and dry each year, forming in shallow depressions within grasslands that are underlain by an impermeable layer (e.g., a hardpan). Water collects in the depressions during the winter rainy season and recedes during the spring. Soils typically remain moist until late spring before becoming desiccated, and then remain dry throughout the summer. Vernal pools occur throughout the Delineation Area. These features are variously dominated by Great Valley button-celery (*Eryngium castrense*), stalked popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), Mediterranean barley (*Hordeum marinum*), waxy mannagrass (*Glyceria declinata*), hairy hawkbit (*Leontodon saxatilis*), and toad rush (*Juncus bufonius*). Sampling points 5, 7, and 9 were collected within vernal pools.

Soil matrix colors within the vernal pools at sampling points 5, 7 and 9 ranged from 10YR4/1 to 7.5YR 4/2. Redox concentrations colored 5YR 4/6 were present at each of these sampling points. Soils at sampling points 5, 7, and 9 met the criteria for hydric soil indicators Depleted Matrix (F3) and Redox Depressions (F8). Wetland hydrology indicators observed within the vernal pools included Biotic Crust (B12). While hydric soils were observed at sampling points 6N and 10N, no other wetland parameters were observed at uplands adjacent to vernal pools.

Swale

Swales are generally linear wetland features that convey precipitation runoff and support a predominance of hydrophytic vegetation, but do not exhibit an OHWM. These are typically inundated for short periods during and immediately after rain events, but usually maintain soil saturation for longer periods during the wet season. Swales occur throughout the Delineation Area, and are dominated by Italian ryegrass

(*Festuca perennis*), Fitch's spikeweed (*Centromadia fitchii*), and Mediterranean barley. Sampling Point 1 was collected within a swale.

The soil matrix color within the swale at sampling point 1 was 10YR 4/2 with five percent redox concentrations colored 5YR 4/6. Soils at sampling point 1 were determined to be hydric based on the presence of hydric soil indicator Depleted Matrix (F3). Wetland hydrology indicators observed within on-site swales include Biotic Crust (B12). No wetland parameters were observed at Sampling Point 2N, located in an upland adjacent to Sampling Point 1.

4.2.2 Other Waters

Stream/Creek

Aquatic resources identified as stream/creek within the Delineation Area include ephemeral drainages and a seasonal creek (Morrison Creek). These are linear features that exhibit a bed and bank and an OHWM. They convey runoff seasonally for short to moderate duration, and may or may not be influenced by groundwater sources. Stream/creek features occur throughout the Delineation Area, and vary from steep, unvegetated features, to gently sloping features that are sparsely vegetated with creeping spikerush (*Eleocharis macrostachya*). Sampling points 3 and 13 were collected within stream/creek features.

Sampling Point 3 was collected within a steep, narrow ephemeral drainage along the western boundary of the Delineation Area. The soil matrix color at sampling point 3 was 7.5YR 4/2 with 10 percent redox features colored 5YR 4/6. Soils at sampling point 3 met the criteria for hydric soil indicator Depleted Matrix (F3). Wetland hydrology indicator Water Marks (B1) was observed at Sampling Point 3. No wetland parameters were observed at Sampling Point 4N, located in an upland adjacent to Sampling Point 3.

Sampling Point 13 was collected within Morrison Creek, a broad, gently sloped seasonal creek. The soil matrix color at sampling point 13 was 7.5YR 4/2 with 20 percent redox features colored 5YR 4/6. Soils at sampling point 3 met the criteria for hydric soil indicator Depleted Matrix (F3). Wetland hydrology indicators Water Marks (B1) and Biotic Crust (B12) were observed at Sampling Point 13. Hydric soil indicator Depleted Matrix (F3) was observed at Sampling Point 14N, located in an upland adjacent to Sampling Point 13. However, hydrophytic vegetation and wetland hydrology were absent at Sampling Point 14N.

Open Water

Open water features identified within the Delineation Area include two perennial ponds, which occur in the northwestern portion of the Delineation Area. These features are manmade impoundments of Morrison Creek. These features exhibit an OHWM and support hydrophytic vegetation along their fringes, while deeper portions are unvegetated. The vegetated fringes of the open water features are dominated by creeping spikerush and smartweed (*Persicaria* sp.). Sampling Point 11 was collected within an open water feature.

The soil matrix color at sampling point 11 was 7.5YR 4/1 with 30 percent redox concentrations colored 5YR 4/6. Soils at sampling point 11 met the criteria for hydric soil indicator Depleted Matrix (F3). Wetland

hydrology indicators observed at Sampling Point 11 include Surface Water (A1), Water Marks (B1), Biotic Crust (B12), and Aquatic Invertebrates (B13). No wetland parameters were observed at Sampling Point 12N, located in an upland adjacent to Sampling Point 13.

5.0 JURISDICTIONAL ASSESSMENT

As per Regulatory Guidance Letter 16-01, an applicant may request a PJD "in order to move ahead expeditiously to obtain a Corps permit authorization where the requestor determines that it is in his or her best interest to do so … even where initial indications are that the aquatic resources on a parcel may not be jurisdictional" (USACE 2016b). A significant nexus evaluation is not necessary to obtain a PJD. The following information on connectivity of wetlands and other waters in the Delineation Area to TNW is provided should an Approved Jurisdictional Determination be necessary.

The vernal pools, swales, and several stream/creek features within the Delineation Area flow directly or indirectly into Morrison Creek, or impoundments of Morrison Creek, along the northern boundary of the Delineation Area. Morrison Creek is a tributary to the Sacramento River. The USACE Sacramento District has identified the Sacramento River as TNW. Therefore, the aquatic resources within the Delineation Area likely have a significant nexus (affecting the chemical, physical, or biological integrity) with downstream TNW, and are likely subject to regulation under Section 404 of the CWA.

6.0 CONCLUSION

A total of 7.861 acres of aquatic resources have been mapped within the Delineation Area. This acreage represents a calculated estimation of the extent of aquatic resources within the Delineation Area, and is subject to modification following USACE review and/or the verification process. The placement of dredged or fill material into jurisdictional features would require a permit pursuant to Section 404 of the CWA and certification or waiver in compliance with Section 401 of the CWA.

November 20, 2012

Regulatory Division SPK-2004-00666

Mr. George Carpenter
Tom Winn Communities, Inc.
1130 Iron Point Road
Folsom, California 95630-8308

Dear Mr. Carpenter:

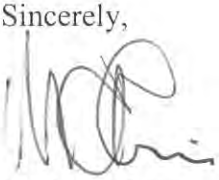
We are responding to your September 25, 2012, request for a preliminary jurisdictional determination (JD), in accordance with our Regulatory Guidance Letter (RGL) 08-02, for the Wong & Wagner or Heritage Falls site. The approximately 237-acre site is located on or near Morrison Creek, Section 2, Township 8 North, Range 7 East, MDBM, Latitude 38.578°, Longitude -121.195°, Rancho Cordova, Sacramento County, California.

Based on available information, we concur with the amount and location of wetlands and/or other water bodies on the site as depicted on the enclosed copy of the September 24, 2012, revised *Delineated Waters of the U.S. Wong & Wagner* drawing prepared by Foothill Associates. The approximately 6.85 acres of wetlands and/or other water bodies present within the survey area are potential waters of the United States regulated under Section 404 of the Clean Water Act and/or Section 10 of the Rivers and Harbors Act.

A copy of our RGL 08-02 Preliminary Jurisdictional Determination Form for this site is enclosed. Please sign and return a copy of the completed form to this office. Once we receive the form with your signature we can accept and process a Pre-Construction Notification or permit application for your proposed project.

You should not start any work in potentially jurisdictional waters of the United States unless you have Department of the Army permit authorization for the activity. You may request an approved JD for this site at any time prior to starting work within waters. In certain circumstances, as described in RGL 08-02, an approved JD may later be necessary.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.



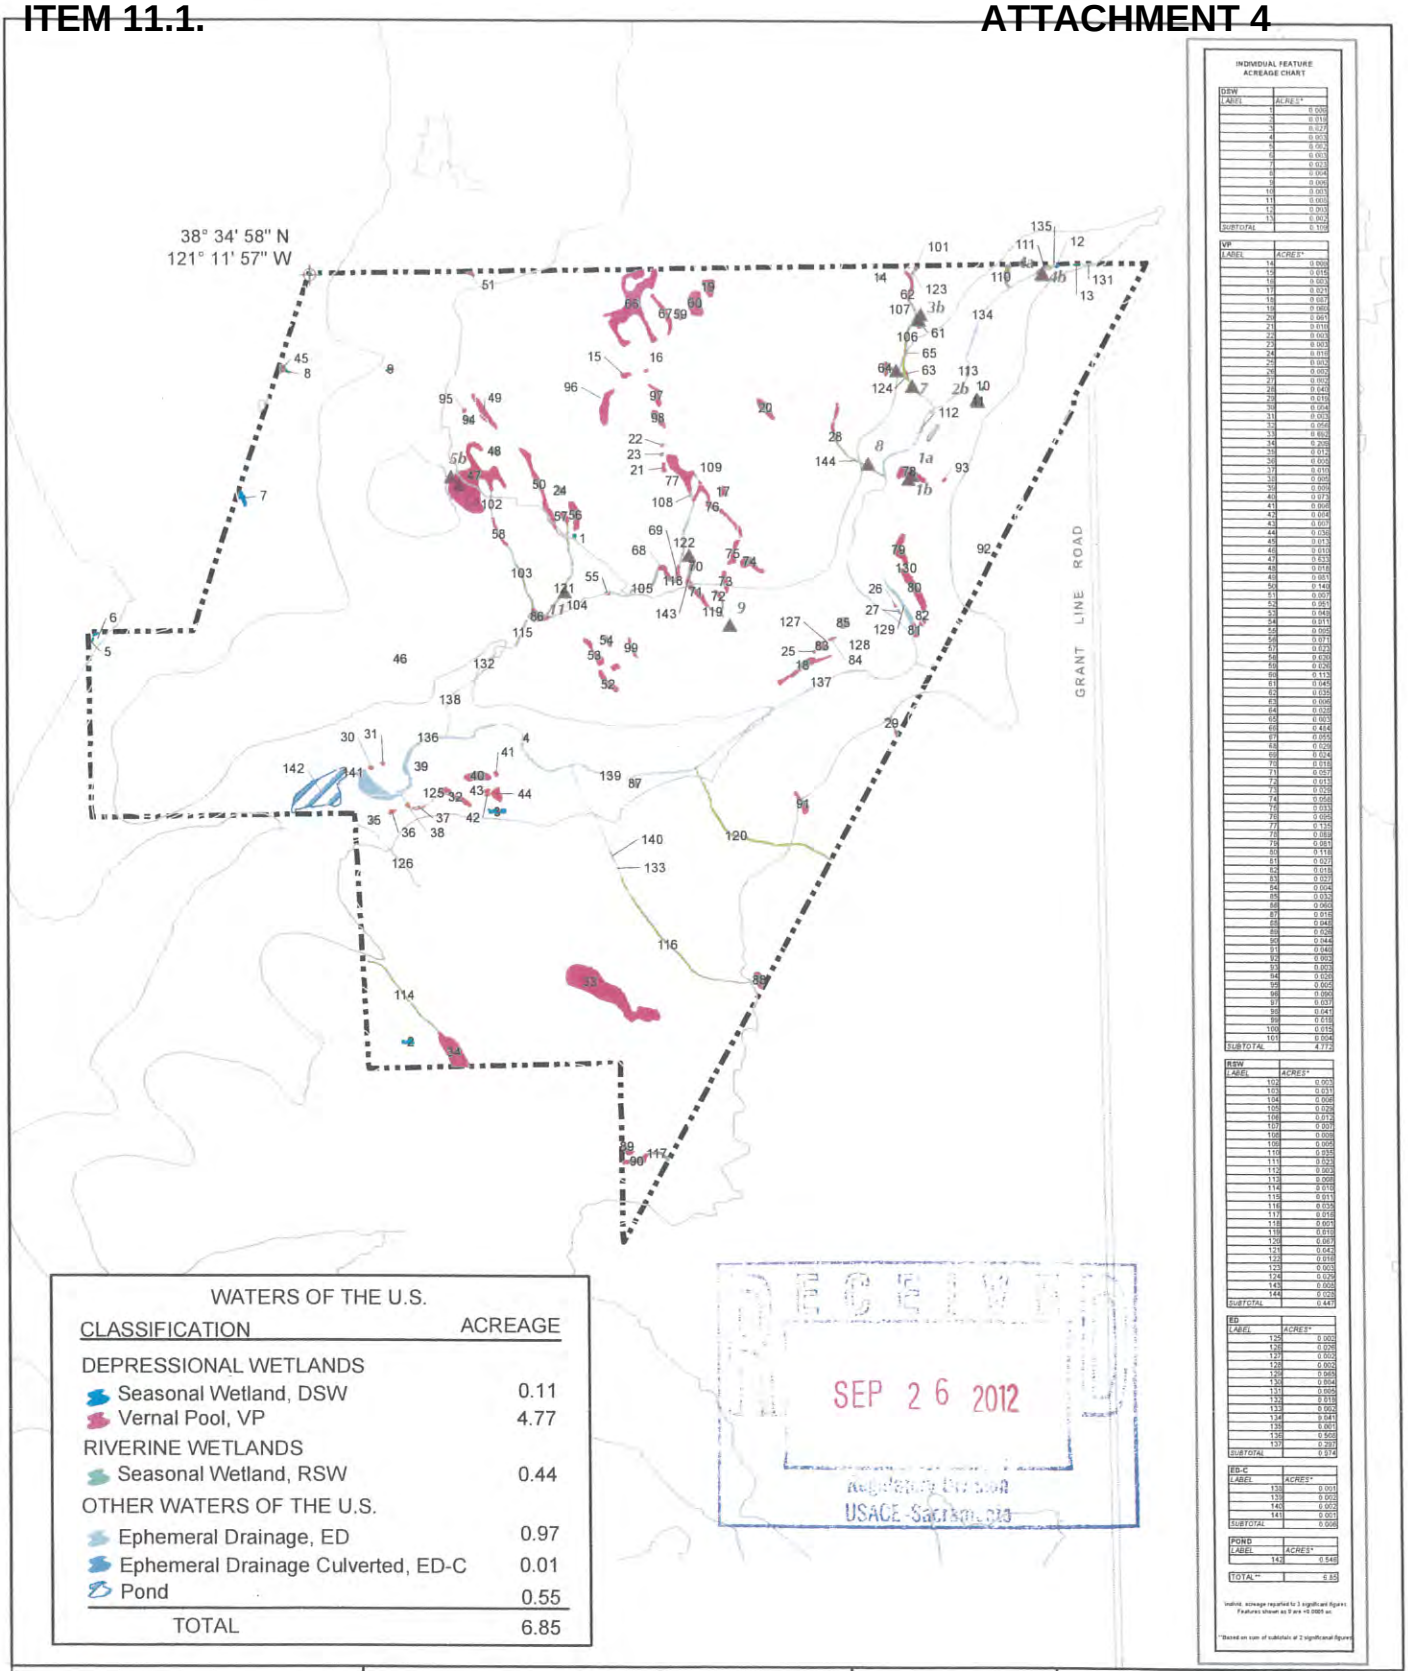
This preliminary determination has been conducted to identify the potential limits of wetlands and other water bodies which may be subject to Corps of Engineers' jurisdiction for the particular site identified in this request. A Notification of Appeal Process and Request for Appeal form is enclosed to notify you of your options with this determination. This

determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are U.S. Department of Agriculture (USDA) program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

We appreciate your feedback. At your earliest convenience, please tell us how we are doing by completing the customer survey on our website under *Customer Service Survey*.

Please refer to identification number SPK-2004-00666 in any correspondence concerning this project. If you have any questions, please contact me at Regulatory Division, 1325 J Street, Room 1350, Sacramento, California 95814-2922, email *Michael.C.Finan@usace.army.mil*, or telephone 916-557-5324. For more information regarding our program, please visit our website at *www.spk.usace.army.mil/Missions/Regulatory.aspx*.

Sincerely,



Michael Finan
Wetland Specialist

NOTIFICATION OF ADMINISTRATIVE APPEAL OPTIONS AND PROCESS AND REQUEST FOR APPEAL

Applicant: George Carpenter, Tom Winn mmunities, Inc.	File No.: SPK-2004-00666	Date: November 20, 2012

Attached is:		See Section below
	INITIAL PROFFERED PERMIT (Standard Permit or Letter of permission)	A
	PROFFERED PERMIT (Standard Permit or Letter of permission)	B
	PERMIT DENIAL	C
	APPROVED JURISDICTIONAL DETERMINATION	D
x	PRELIMINARY JURISDICTIONAL DETERMINATION	E

SECTION I - The following identifies your rights and options regarding an administrative appeal of the above decision. Additional information may be found at *http://www.usace.army.mil/cecw/pages/reg_materials.aspx* or Corps regulations at 33 CFR Part 331.

A: INITIAL PROFFERED PERMIT: You may accept or object to the permit.

- ACCEPT: If you received a Standard Permit, you may sign the permit document and return it to the district engineer for final authorization. If you received a Letter of Permission (LOP), you may accept the LOP and your work is authorized. Your signature on the Standard Permit or acceptance of the LOP means that you accept the permit in its entirety, and waive all rights to appeal the permit, including its terms and conditions, and approved jurisdictional determinations associated with the permit.
- OBJECT: If you object to the permit (Standard or LOP) because of certain terms and conditions therein, you may request that the permit be modified accordingly. You must complete Section II of this form and return the form to the district engineer. Your objections must be received by the district engineer within 60 days of the date of this notice, or you will forfeit your right to appeal the permit in the future. Upon receipt of your letter, the district engineer will evaluate your objections and may: (a) modify the permit to address all of your concerns, (b) modify the permit to address some of your objections, or (c) not modify the permit having determined that the permit should be issued as previously written. After evaluating your objections, the district engineer will send you a proffered permit for your reconsideration, as indicated in Section B below.

B: PROFFERED PERMIT: You may accept or appeal the permit

- ACCEPT: If you received a Standard Permit, you may sign the permit document and return it to the district engineer for final authorization. If you received a Letter of Permission (LOP), you may accept the LOP and your work is authorized. Your signature on the Standard Permit or acceptance of the LOP means that you accept the permit in its entirety, and waive all rights to appeal the permit, including its terms and conditions, and approved jurisdictional determinations associated with the permit.
- APPEAL: If you choose to decline the proffered permit (Standard or LOP) because of certain terms and conditions therein, you may appeal the declined permit under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer (address on reverse). This form must be received by the division engineer within 60 days of the date of this notice.

C: PERMIT DENIAL: You may appeal the denial of a permit under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer (address on reverse). This form must be received by the division engineer within 60 days of the date of this notice.

D: APPROVED JURISDICTIONAL DETERMINATION: You may accept or appeal the approved JD or provide new information.

- ACCEPT: You do not need to notify the Corps to accept an approved JD. Failure to notify the Corps within 60 days of the date of this notice, means that you accept the approved JD in its entirety, and waive all rights to appeal the approved JD.
- APPEAL: If you disagree with the approved JD, you may appeal the approved JD under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer (address on reverse). This form must be received by the division engineer within 60 days of the date of this notice.

E: PRELIMINARY JURISDICTIONAL DETERMINATION: You do not need to respond to the Corps regarding the eliminary JD. The Preliminary JD is not appealable. If you wish, you may request an approved JD (which may be appealed), by ntacting the Corps district for further instruction. Also you may provide new information for further consideration by the Corps to reevaluate the JD.

PRELIMINARY JURISDICTIONAL DETERMINATION FORM
Sacramento District

This preliminary JD finds that there *"may be"* waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

Regulatory Branch: **California Delta** File/ORM #: **SPK-2004-00666** PJD Date: **November 20, 2012**

State: **CA** City/County: **Rancho Cordova, Sacramento County**

IMPORTANT NOTE: The information recorded on this form has not necessarily been verified by the Corps and should not be relied upon for later jurisdictional determinations.

11/20/2012

Signature and Date of Regulatory Project Manager (REQUIRED)

Signature and Date of Person Requesting Preliminary JD (REQUIRED, unless obtaining the signature is impracticable)

EXPLANATION OF PRELIMINARY AND APPROVED JURISDICTIONAL DETERMINATIONS:
1. The Corps of Engineers believes that there may be jurisdictional waters of the United States on the subject site, and the permit applicant or other affected party who requested this preliminary JD is hereby advised of his or her option to request and obtain an approved jurisdictional determination (JD) for that site. Nevertheless, the permit applicant or other person who requested this preliminary JD has declined to exercise the option to obtain an approved JD in this instance and at this time.
2. In any circumstance where a permit applicant obtains an individual permit, or a Nationwide General Permit (NWP) or other general permit verification requiring "preconstruction notification" (PCN), or requests verification for a non-reporting NWP or other general permit, and the permit applicant has not requested an approved JD for the activity, the permit applicant is hereby made aware of the following: (1) the permit applicant has elected to seek a permit authorization based on a preliminary JD, which does not make an official determination of jurisdictional waters; (2) that the applicant has the option to request an approved JD before accepting the terms and conditions of the permit authorization, and that basing a permit authorization on an approved JD could possibly result in less compensatory mitigation being required or different special conditions; (3) that the applicant has the right to request an individual permit rather than accepting the terms and conditions of the NWP or other general permit authorization; (4) that the applicant can accept a permit authorization and thereby agree to comply with all the terms and conditions of that permit, including whatever mitigation requirements the Corps has determined to be necessary; (5) that undertaking any activity in reliance upon the subject permit authorization without requesting an approved JD titutes the applicant's acceptance of the use of the preliminary JD, but that either form of JD will be processed as soon as is practicable; (6) accepting a permit authorization (e.g., signing a ered individual permit) or undertaking any activity in reliance on any form of Corps permit authorization based on a preliminary JD constitutes agreement that all wetlands and other water bodies on the site affected in any way by that activity are jurisdictional waters of the United States, and precludes any challenge to such jurisdiction in any administrative or judicial compliance or enforcement action, or in any administrative appeal or in any Federal court; and (7) whether the applicant elects to use either an approved JD or a preliminary JD, that JD will be processed as soon as is practicable. Further, an approved JD, a proffered individual permit (and all terms and conditions contained therein), or individual permit denial can be administratively appealed pursuant to 33 C.F.R. Part 331, and that in any administrative appeal, jurisdictional issues can be raised (see 33 C.F.R. 331.5(a)(2)). If, during that administrative appeal, it becomes necessary to make an official determination whether CWA jurisdiction exists over a site, or to provide an official delineation of jurisdictional waters on the site, the Corps will provide an approved JD to accomplish that result, as soon as is practicable.

Wetland Delineation Shape File (to be included with USACE submittal only)

May 9, 2019

Regulatory Division (SPK-2019-00197)

Winn Communities
Attn: Mr. George Carpenter
3001 I Street, Suite 300
Sacramento, California 95816
georgemcarpenter@comcast.net

Dear Mr. Carpenter:

We are responding to your consultant's March 20, 2019, request for verification of an Aquatic Resource delineation for the Preserve Development site. The approximately 113.8-acre project site is located northwest of Raymer Way and west of Grant Line Road, Latitude 38.57489°, Longitude -121.19673°, City of Rancho Cordova, Sacramento County, California.

Based on available information, we concur with your consultant's aquatic resources delineation for the site, which consists of approximately 7.861 acres of aquatic resources (consisting of 2.646 acres of vernal pool, 1.841 acres of seasonal wetland swale, 1.015 acres of stream/creek [Morrison Creek, a perennial water, and several ephemeral drainages], and 2.360 acres of open water (pond), as depicted on the enclosed April 24, 2019, *Figure 4a-b Aquatic Resources Delineation* drawings prepared by ECORP Consulting, Inc. (Enclosure 1).

This verification letter does not constitute a determination of jurisdiction (JD). A JD is not required to process an application for a Department of the Army permit. If you do not require a JD for the site, your permit application may be processed sooner.

You may request a JD for this site at any time prior to starting work in aquatic resources, including after a permit decision is made. To request a JD for this site, complete the attached *Request for Jurisdictional Determination Form* (Enclosure 2) and return it to this office at the address listed below.

Please refer to identification number SPK-2019-00197 in any correspondence concerning this project. If you have any questions, please contact me at U.S. Army Corps of Engineers Regulatory Division, California Delta Section, 1325 J Street, Room 1350, Sacramento, CA 95814-2922, by email at *Mary.R.Pakenham-Walsh@usace.army.mil,* or telephone at (916) 557-7718. For program information or to complete our Customer Survey, visit our website at www.spk.usace.army.mil/Missions/Regulatory.aspx.

Sincerely,

Mary R. Pakenham-Walsh
Senior Project Manager

RE: Addendum to Aquatic Resources Delineation for The Preserve Development

Dear Mr. Carpenter:

An Aquatic Resources Delineation was prepared by ECORP Consulting, Inc. for The Preserve Development (Project) on November 26, 2018. The delineation was verified by the U.S. Army Corps of Engineers (USACE) on May 5, 2019 (SPK-2019-00197). This letter provides information on an additional ±8.8-acre area to be included as a potential Offsite work area for the Project, and serves as an addendum to the Aquatic Resources Delineation dated November 26, 2018.

Offsite Assessment

An assessment of potential Waters of the U.S. within the Offsite along Raymer Way was conducted on June 13, 2019 by ECORP biologist Matt Spaulding. Access to the property was not authorized; therefore, Mr. Spaulding walked along Raymer Way and assessed potential aquatic features from the publicly accessible roadway. In addition, historic aerial photos were reviewed. Several roadside ditches were mapped and classified as swales according to land cover definitions within the South Sacramento Habitat Conservation Plan.

Summary

The unverified Offsite was determined to contain 0.215 acre of swale based on the assessment-level survey. Figure 1 provides a revised delineation map for the overall Project area, and Figure 2 provides a detailed view of the unverified Offsite area. If you have any questions, please call me at (916) 782-9100 or email at temam@ecorpconsulting.com.

Sincerely,

Taraneh Emam
Senior Biologist/Project Manager

1.0 INTRODUCTION

On behalf of Winn Communities, Inc., ECORP Consulting, Inc. (ECORP) conducted an arborist survey for The Preserve Project, a planned development within the City of Rancho Cordova, Sacramento County, California. The purpose of this survey was to identify, map, and assess the general condition of trees within according to the Rancho Cordova Ordinance for the Preservation and Protection of Private Trees (Tree Ordinance, Ranch Cordova Municipal Code - Chapter 19.12).

The following are definitions from the Tree Ordinance that guide the methodology and data collection for this survey effort:

- **Protected Tree:**

    1. Native oak – *Quercus lobata*, valley oak; *Quercus wislizenii*, interior live oak; *Quercus douglasii*, blue oak; or *Quercus* x. *morehus*, oracle oak – having a trunk diameter of at least six inches or greater; or

    2. Any tree species other than a native oak having a trunk diameter of at least 12 inches or greater on nonresidential property; or

    3. Any tree species other than a native oak having a trunk diameter of at least 24 inches or greater on residential property; or

    4. Any tree planted as a requirement tree for site development, tree permit condition, landscape plan removal replacement, or other designated condition by the public works director or planning director.

- **Diameter at Standard Height:** The City Ordinance defines the methods by which trunk diameter is determined as:

    1. "Diameter at standard height" or "dsh" means the diameter of a tree measured at four and one-half feet above natural grade, except as specified below. The diameter shall be calculated by using the following formula: diameter equals circumference/3.14.

    2. For a tree that branches at or below four and one-half feet, dsh means the diameter at the narrowest point between the grade and the branching point.

    3. For a tree with a common root system that branches at the ground, DSH means the sum of the diameter of the largest trunk and one-half the cumulative diameter of the remaining trunks at four and one-half feet above natural grade.

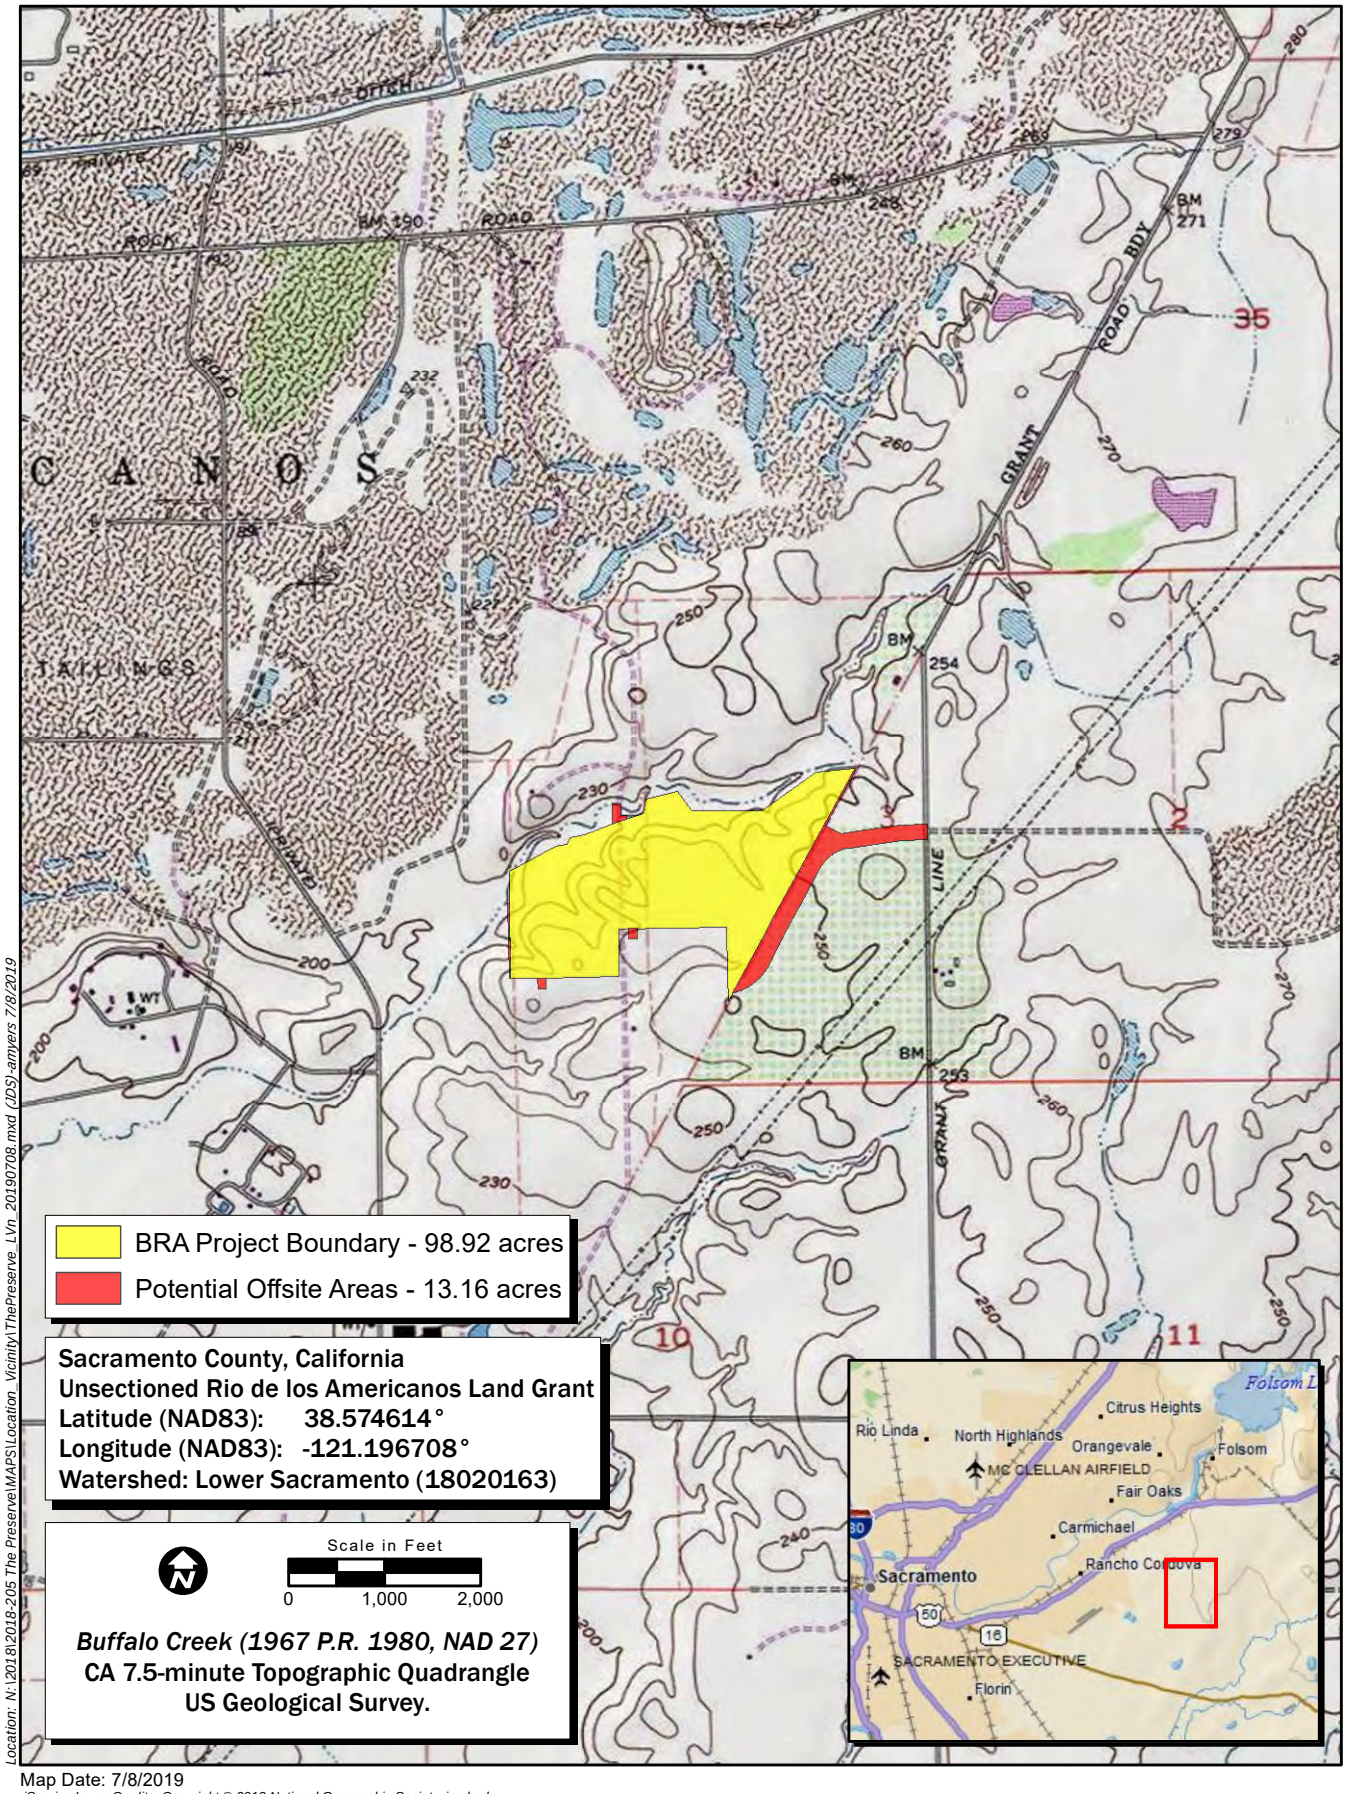
Trees designated with protected status under the City Ordinance may carry additional reporting and planning requirements. The City ordinances requires a report, to be prepared by a certified arborist,

detailing the preservation, removal, replacement, or relocation of any protected trees prior to the preliminary approval of any parcel map.

2.0 SITE DESCRIPTION

The arborist survey was conducted within a 112.08-acre Study Area including the 98.92-acre Project area, as well as potential Offsite areas totaling 13.16 acres. In this document the Offsite areas are referred to as the Rio del Oro Offsite (located to the west of the Project), the Raymer Way Offsite (located to the east of the Project), the Morrison Creek Offsite (located to the north of the Project around an existing crossing of Morrison Creek), and the North Douglas Offsites (road stubs located to the south of the Project).

The Study Area corresponds to a portion of an unsectioned portion of the Rio de los Americanos Land Grant within the "Buffalo Creek, California" 7.5-minute quadrangle (U.S. Geological Survey [USGS] 1980) (Figure 1. *Study Area Location and Vicinity*). The approximate center of the site is located at 38.574614° North and -121.196708° West within the Lower Sacramento Watershed (Hydrologic Unit Code #18020163, USGS 2016).



The current land use within the Study Area is rural residential and agricultural. The Study Area is situated at an elevational range of approximately 220 - 240 feet above mean sea level in the Sacramento Valley Subregion of the Great Central Valley floristic region of California (Baldwin et al. 2012). Two residences and associated outbuildings are present within the Study Area, and the remaining area is used for cattle grazing. The vegetation community present in the Study Area is grazed annual grassland and mainly consists of nonnative annual grasses and horticultural tree plantings around the residences. The land uses to the north, west, and east of the Study Area are primarily agricultural and residential, to the south of the Study Area lies the North Douglas residential development.

3.0 METHODS

ECORP arborist Ben Waitman (ISA Certification #WE-12108), assisted by ECORP biologist Daniel Wong, conducted the field survey of the Study Area on October 9, 2018, June 13, 2019, and July 15, 2019. During the field survey dates, the entire Study Area was walked or viewed across level ground, and data were recorded using an iPad paired with a Global Positioning System unit accurate to less than one meter.

The survey data collection included species, dsh, dripline radius, tree structure, and tree condition. Each surveyed tree was tagged with a permanent numbered aluminum tag at roughly breast height (~4.5 feet). The survey results are intended for general Project planning purposes only and should not be considered a detailed tree analysis (i.e., results do not include hazard assessment, tree health diagnosis, preservation/removal recommendations, or pruning advisement). The following terms define the collected data:

Diameter at standard height (dsh): Trunk diameter as defined by the Tree Ordinance.

Figure 1. Study Area Location and Vicinity

ECORP Consulting, Inc.
ENVIRONMENTAL CONSULTANTS

2018-205 The Preserve

Dripline Radius: The maximum distance from trunk to the edge of the canopy.

Condition: An estimate of the tree's overall health. This includes evaluation of foliage, evidence of wound healing, evidence of fungal infection, and the amount and condition of attached deadwood. Tree condition was rated on a five-point scale (poor, fair to poor, fair, fair to good, and good).

Structure: An estimate of the tree's structural soundness, based on obvious external evidence. This evaluates the obvious potential for structural failure of one or more major branches or trunks, the environment and condition of the root crown, symmetry of the canopy, and any noticeable effects of crowding caused by adjacent trees. Tree structure was rated on a five-point scale (poor, fair to poor, fair, fair to good, and good).

4.0 RESULTS

A total of 247 living trees greater than six inches in dsh were found during the survey, and three dead trees. A map depicting the locations of the inventoried trees is included as Attachment A. Detailed tree survey data for each tree are included as Attachment B. Representative site photographs are included as Attachment C.

Eleven different species of living trees were recorded during the survey. Of the trees present, one species (coast redwood [*Sequoia sempervirens*]) is considered native to California. However, coast redwood does not naturally occur in the Central Valley and is generally planted as horticultural plantings. Sixty-eight coast redwoods were recorded within the study area (including one dead tree).

The remaining trees are not native to California and include 108 gum trees (*Eucalyptus* spp.; including one dead tree), 19 purple leaf plum (*Prunus cerasifera*), 18 Callery pear (*Pyrus calleryana*), 17 American sweetgum (*Liquidambar styraciflua*), six Brazilian pepper-tree (*Schinus terebinthifolius*), five deodar cedar (*Cedrus deodara*), three white mulberry (*Morus alba*), two crepe myrtle (*Lagerstroemia* sp.), two Japanese Maple (*Acer palmatum*), one Chinese tallow (*Triadica sebifera*), and one dead silver birch (*Betula pendula*).

None of the above are protected native species. However, the Tree Ordinance specifically protects trees of any species present on residential property with a dsh greater than 24 inches, or with a dsh of 12 inches or greater on non-residential properties. Because the entire site is proposed for development, it may be considered a non-residential property. By this definition, 149 living trees having a dsh equal to or greater than 12 inches may be considered protected trees by the City of Rancho Cordova (see Attachment B for tree dsh data). Each of these trees was grown in landscaped rows of trees, likely planted for protection from wind or to enhance the view scape. Even though these trees are not native to the survey area, these 149 trees may require a permit from the City of Rancho Cordova if pruning or removal of these trees is necessary.

5.0 CONCLUSIONS

The Study Area contains 247 total trees greater than 6 inches dsh and three dead trees, and all trees are nonnative to the Study Area. There are 149 living trees that have a dsh equal to or greater than 12 inches and therefore meet the definition of a Protected Tree as defined in the City of Rancho Cordova's Tree Preservation Ordinance. Should removal be required, a tree removal permit should be procured from the City and mitigation may be required at the discretion of the City. In addition, the City may require an additional report that details a proposal to avoid, relocate, or replace any protected trees present within the Study Area.

SSHCP Avoidance and Minimization Measures

welfare of the public. Although access to the Preserves will be allowed by the Implementing Entity and Wildlife Agencies, these emergency repairs are not covered by SSHCP permits.

The Permitting Agencies will not obstruct any emergency response decisions regarding Preserves made by the Implementing Entity. However, existing ESA consultation regulations will apply to all emergency activities (50 Code of Federal Regulations 402.05).

5.4 Conditions on Covered Activities

As required by the ESA (Section 10(a)(2)(A)(ii)) and Fish and Game Code Section 2081, this Plan includes measures to avoid and minimize take of Covered Species. This section describes the Avoidance and Minimization Measures that will be implemented as part of each SSHCP Covered Activity to avoid or minimize direct and indirect impacts to Covered Species and their habitats to the maximum extent, including species habitats that are also waters of the state and waters of the United States. AMMs are presented in this chapter as conditions on Covered Activities. Each condition contains several AMMs that are intended to eliminate or reduce direct or indirect effects to species that could result from implementation of a Covered Activity.

Third-Party Project Proponents are responsible for incorporating all SSHCP requirements (including appropriate AMMs) into their project design. The Land Use Authority Permittee with authority over a Covered Activity is responsible for reviewing and ensuring that all applicable AMMs are appropriately incorporated into project design, and is responsible for ensuring that the required AMMs are correctly applied by the Third-Party Project Proponent during implementation of the Covered Activity.

The CEQA process for individual Covered Activities may result in additional conditions for third-party projects that are not related to the ESA, CESA, or Clean Water Act. The SSHCP AMMs described in this chapter do not supersede requirements by other agencies and are not intended to provide a basis for non-compliance with other applicable design guidelines and avoidance measures required by federal, state, and local agencies. Compliance with the SSHCP does constitute full CEQA compliance with regard to mitigation of impacts to Covered Species. Ultimately, the Plan Permittees are responsible for ensuring that implementation of each SSHCP Covered Activity fully complies with the SSHCP, but it remains the Third-Party Project Proponent's responsibility to ensure project compliance with all applicable laws and regulations.

Before construction begins, the Third-Party Project Proponent must demonstrate to the Land Use Authority Permittee that all necessary AMMs will be fulfilled. This is accomplished by having pre-construction AMMs in place prior to construction and by having a plan that shows how all applicable post-construction AMMs will be addressed. During construction, it is the responsibility of the Land Use Authority Permittee to ensure that the AMMs are being

implemented. The Land Use Authority Permittee can compel a Third-Party Project Proponent to stop working if a project is not in compliance with all SSHCP AMMs.[16] Upon construction completion, the Land Use Authority Permittee will monitor and confirm that post-construction conditions are acceptable and consistent with the requirements of the SSHCP permits (e.g., revegetation, soil treatments).[17] Once the constructed project has received final clearance from the Land Use Authority, it is the responsibility of the Land Use Authority to monitor continued operation of installed AMMs (e.g., swales, retention basins) and to monitor compliance with AMMs required for future operations and maintenance of the Covered Activity. The Implementing Entity may also assist with and in some instances may assume responsibility for monitoring continued operation of installed AMMs when those AMMs are part of the Preserve System, Preserve Setbacks, or Stream Setbacks.

On occasion, a local Land Use Authority Permittee may not have authority over a Covered Activity proposed by a Third-Party Project Proponent. In that event, the SSHCP Implementing Entity may develop a Participating Special Entity agreement with the Third-Party Project Proponent (see Chapter 9). As a Participating Special Entity, the Third-Party Project Proponent will incorporate and implement all applicable design and construction AMMs. The Implementing Entity will ensure that AMMs specific to that SSHCP Covered Activity are included in the project's Participating Special Entity agreement and ensure that AMMs are being implemented during construction.

As the SSHCP will be implemented over a 50-year Permit Term, the results of construction monitoring may indicate that certain AMMs are ineffective. Should the Plan Permittees wish to modify or replace an SSHCP AMM, they will follow the modification process outlined in the Adaptive Management Program (see Chapter 8).

5.4.1 General Avoidance and Minimization Measures

General AMMs are designed to avoid or minimize effects of Covered Activities on SSHCP land cover types and Covered Species.

Condition 1. Avoid and Minimize Urban Development Impacts to Watershed Hydrology and Water Quality

National Pollution Discharge Elimination System permits are issued by the Regional Water Quality Control Board to jurisdictions in the region, including the jurisdictions that are also SSHCP Land Use Authority Permittees (i.e., County of Sacramento, and Cities of Rancho

[16] In a situation like this, the Local Land Use Authority Permittee will suspend one or more local permits (e.g., grading permit, building permit) until compliance with terms of all SSHCP requirements is demonstrated.

[17] Post-construction monitoring by the Land Use Authority Permittee could continue for several years.

Cordova and Galt). The National Pollution Discharge Elimination System permit is issued to each of the Land Use Authority Permittees every 5 years, and is referred to as the Municipal Separate Storm Sewer System (MS4) permit. MS4 permits contain specific design measures required for all projects constructed within the region. The Stormwater Quality Design Manual for the Sacramento and South Placer Regions (Stormwater Manual) outlines planning tools and requirements to reduce urban runoff from new development and redevelopment projects within the region (Sacramento Stormwater Quality Partnership 2007). The Stormwater Manual is used as a general guidance document to aid with the selection, siting, design, operation, and long-term maintenance of stormwater quality control measures. The Stormwater Manual contains control measures intended to meet the standard of "reducing pollutants in urban runoff to the maximum extent practicable" set forth in the local agencies' MS4 permits issued by the Central Valley Regional Water Quality Control Board. AMM LID-1 (see below) is designed to ensure compliance with MS4 requirements by requiring Third-Party Project Proponents to minimize increases of peak discharge of stormwater and to eliminate or reduce runoff of pollutants.

Development Covered Activities may adversely alter watershed hydrology and degrade water quality, which, in turn, could diminish or eliminate the conservation benefits provided by the SSHCP Preserve System. Condition 1 is designed to conserve and/or rehabilitate on-site natural creeks and streams. This condition will require the provision of BMPs and low-impact development (LID) drainage control measures to ensure that runoff from developed lands will closely mimic the pre-development hydrograph and retain most pre-development hydrologic functions. Condition 1 will accomplish the hydrograph and hydrologic objectives through application of the listed AMMs to all UDA Covered Activities that occur at the parcel, subdivision, or master plan scale.

LID-1 (Stormwater Quality): When the size of a Covered Activity project exceeds the thresholds established by the State Water Resources Control Board (SWRCB) (see the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions, or future SWRCB-approved design manuals applicable to the Plan Area), incorporate stormwater management into site design to satisfy the requirements outlined in the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions. Stormwater management may include groundwater recharge (LID-2) and natural site features (LID-3).

LID-2 (Groundwater Recharge): When siting SSHCP Preserves containing Riparian, Open Water, or Freshwater Marsh SSHCP land cover types, the Implementing Entity will prioritize locations that are suitable for groundwater recharge.

LID-3 (Natural Site Features): Incorporate preservation of a site's natural aquatic features (such as creeks and streams) into project design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species.

Condition 2. Avoid and Minimize Urban Development Direct and Indirect Impacts to Existing Preserves and SSHCP Preserves

Development Covered Activities adjacent to Preserves may adversely impact species that use the Preserve, and erode or eliminate the conservation benefits provided by the Preserve. Condition 2 seeks to avoid or minimize the following Covered Activity environmental stressors that may result in direct and indirect impacts to the SSHCP Preserve System:

- Alterations to landscape hydrology from new impervious surfaces may adversely affect natural communities in the lower watershed, the ecology of a Preserve, and/or downstream aquatic resources.
- Water runoff from development or from roadways directed into Preserves may introduce harmful substances into Preserves. Unseasonal and/or additional water entering a Preserve may eliminate vernal pools and other seasonal wetlands native to the region by converting them to low-functioning perennial wetlands.
- Development adjacent to Preserves may partially to fully remove the soil's "perched aquifer" (see Chapter 3) and reduce or eliminate the micro-watersheds that support the hydrology of vernal pools within the Preserve boundary. These changes may adversely affect the existing hydrologic regime of vernal pools by changing the timing, depth, and/or duration of vernal pool saturation and/or ponding, causing long-term changes to a suite of vernal pool functions. For example, changes to water chemistry could adversely affect species habitat. Although the vernal pools remain, the environmental conditions of the pools may no longer provide habitat for vernal pool Covered Species, or provide the benefit of other wetland functions (e.g., stormwater attenuation) compared to pre-project conditions.
- Introduction or proliferation of non-native or invasive plant and wildlife species may displace native species.
- Landscaping in the interface of a development and a Vernal Pool–Grassland Preserve often includes native or non-native trees and other plant species that are not found in California grasslands and, therefore, cannot survive on the Vernal Pool–Grassland Preserve border without intensive irrigation and cultivation. In addition to adverse effects from irrigation and landscape maintenance, adult trees may become landscape barriers that inhibit species movement and may act to isolate individual Preserves from the larger SSHCP Preserve System.
- Recreational use of Preserves near developed areas may compact soils, eliminate vegetation, impair hydrologic functions, introduce weeds or invasive plant species, and disturb plants and wildlife.

- Introduction of light, noise, or vibrations may disrupt normal nocturnal and diurnal cycles of native species.

AMMs associated with Condition 2 must be applied to all UDA Covered Activities that border an existing Preserve or planned SSHCP Preserve.

EDGE-1 (Compatible Land Uses): To the maximum extent practicable, development project Covered Activities will locate compatible land uses (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) in areas immediately adjacent to existing or planned Preserve boundaries. The compatible land use will provide additional buffering of Preserves from potential indirect effects of adjacent urban development. The soil surfaces in a compatible land use area may be re-contoured provided that the soil restrictive layer remains undamaged and most of the soil profile above the restrictive layer remains intact. The Land Use Authority will determine when it is not practicable to locate a compatible land use adjacent to existing or planned Preserve boundaries.

EDGE-2 (Single-Loaded Streets): To the maximum extent practicable, the design of Urban Development Covered Activities will locate single-loaded streets adjacent to existing or planned Preserve. The Land Use Authority will determine when single-loaded streets are not practicable.

EDGE-3 (Preserve Setbacks): Urban Development Covered Activities constructed adjacent to existing or planned Preserves must establish a minimum 50-foot-wide setback outward from the boundary of any existing Preserve or planned SSHCP Preserve. This minimum 50-foot-wide setback will function as a transition between Urban Development and the Preserve, and must be managed to maintain the natural community of vegetation present in the adjacent Preserve. As much of the setback as possible should remain in the same natural habitat as the Preserve.

However, as discussed in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA, where an existing or planned Preserve is adjacent to an existing roadway (e.g., collectors, arterials, thoroughfares), the 50-foot Preserve Setback will not be required, and any bicycle or pedestrian trail will be established in the road right-of-way. In addition, where a planned roadway crosses an existing or planned Preserve, no Preserve Setback will be required, and any bicycle or pedestrian trail will be established in the road right-of-way.

EDGE-3a (Setback Recreational Trails): Trails are best suited outside of the setback; however, certain types of recreational trails or facilities (e.g., benches, trash receptacles, shade structures, fencing) that can be constructed with minimum ground disturbance and in compliance with EDGE-7 may be allowed within a Preserve Setback, as specified in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA. Preserve Setback design must locate trails on the side nearest development, away from the Preserve boundary. Trails may be permeable or semi-permeable hiking trails or paved community trials. The maximum trail width will be 16 feet total, including 2-foot-wide shoulders. Post and cable fencing, split rail, or other open fencing will be installed adjacent to recreation trails to keep pedestrians on the trail.

EDGE-3b (Setback Firebreaks): If approved by the local authorities, the Preserve Setback trail may also be used as a firebreak. In instances where a trail cannot act as a firebreak, the firebreak will be located between the trail and the Preserve boundary (see Section 5.2.7). Firebreaks allowed inside the setbacks must be created by methods that will not disturb the soil's restrictive layer, such as mowing, minor scraping of surface vegetation, or shallow tilling, to comply with EDGE-7. Firebreak width within Preserve Setbacks is the minimum width needed to comply with applicable local codes.

EDGE-3c (Setback Shade Trees and Landscaping): To prevent potential impacts from irrigation water or from accumulation of leaf litter onto the grasslands or vernal pools of a Preserve, planting of shade trees or landscaping vegetation will be limited to the area of the Preserve Setback located between the recreation trail and the adjacent urban development (i.e., away from Preserves).

- Only drought-tolerant plant species will be planted. The planting pallet used for Preserve Setback landscaping will not include invasive plant species listed in the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory Database or listed in the Cal-IPC California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/). Any shade trees planted along Preserve Setback trails will be native species that are found in California grasslands and that can survive in the Vernal Pool–Grassland border without long-term irrigation or fertilization (e.g., valley oak, black oak, blue oak, oracle oak). In general, no more than 30% of any 1,000-foot-long segment of a Preserve Setback trail will have canopy cover from tree plantings (to be consistent with maximum tree densities naturally found within native California grasslands and savanna).

- Drip irrigation will be allowed for a maximum of 5 years to establish shade trees or landscape vegetation between the recreation trail and adjacent urban development. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation will not affect the Preserve. Any irrigation systems located within Preserve Setbacks will be inspected quarterly to determine if such systems are affecting soils or vegetation not part of the intended plantings. Irrigation system repairs will be completed immediately if it is determined that the irrigation system is affecting vegetation or soil moisture not part of the intended tree planting.
- If, during annual monitoring of the adjacent Preserve (see Chapter 8), adverse indirect effects (e.g., leaf litter accumulation, irrigation runoff, plant encroachment) of the Preserve Setback's planted vegetation are detected, then the SSHCP Implementing Entity, the Preserve Manager, and the entity responsible for the Preserve Setback will identify appropriate adaptive management of the Preserve Setback tree or landscape plantings in accordance with the Preserve Setback Easement (see Section 5.2.5 and Chapter 9).

EDGE-4 (Locate Stormwater Control Outside Preserves): Roads, sidewalks, and other impermeable surfaces of Urban Development Covered Activities adjacent to existing or planned Preserves will slope away from Preserves and Preserve Setbacks or intercept drainage with swales or curbs and gutters to preclude drainage from entering Preserves and Preserve Setbacks. Stormwater flows must be directed away from Preserves and Preserve Setbacks and directed into stormwater control facilities inside the development (outside Preserves and Preserve Setbacks)[18] (see EDGE-6 for exception to EDGE-4 in certain SSHCP Linkage Preserves).

EDGE-5 (Stormwater Control in Preserve Setbacks): If trails are established in any Preserve Setback in compliance with EDGE-3, the trail must be sloped away from the Preserve, and rainwater leaving the trail surface must flow into an adjacent low-velocity bio-retention swale or cell to keep rainwater runoff and trail contaminants from entering the Preserve. Low-velocity bio-retention swales or cells are typically small linear features placed on one or both sides of a trail. As required by EDGE-3, trails and their adjacent bio-retention swales or cells must be located on the side of the Preserve Setback nearest development.

[18] Detention basins are allowed in some Linkage Preserves consistent with the requirements of EDGE-6. At the time of SSHCP preparation, seven Linkage Preserves with drainages are planned SSHCP Preserves: L1, L2, L4, L7, L8, L9, and L10 (see Section 5.2.7 and Section 7.5). Also see project-specific measures in Section 5.5.1.

EDGE-6 (Detention Basins in Linkage Preserves): Because planned SSHCP Linkage Preserves L1, L2, L4, L7, L8, L9, and L10 (see Section 7.5) surround natural creeks or streams that must receive stormwater from planned adjacent Urban Development Covered Activities, a limited number of stormwater detention basins will be allowed on those Linkage Preserves. Detention basins within Linkage Preserves (see Section 5.2.7) will be designed and constructed with fill material to build up the perimeter of the detention basin so as not to impact the soil restrictive layer (duripan or hardpan) and function of the soil perched aquifer. Detention basins within Linkage Preserves will capture stormwater flows and runoff, and will discharge water to the stream/creek or percolate collected water to the soil perched aquifer. Detention basin structures that collect stormwater entering the basin or convey stormwater leaving the basin must be designed to avoid and minimize effects to Covered Species habitat in the Linkage Preserve.

EDGE-7 (Hardpan/Duripan Protection): To protect the soil perched aquifer and the micro-watersheds supporting existing vernal pool hydrology, activities that have the potential to cut into, disrupt, or remove the soil's restrictive layer (hardpan or duripan) will not occur within Preserves or Preserve Setbacks. However, in certain circumstances, the Covered Activities defined in Section 5.2.6, Covered Activities in Stream Setbacks in the UDA, and Section 5.2.8, Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System, may result in punctures[19] or other minor disruptions of the soil hardpan or duripan if approved by the Implementing Entity and the Technical Advisory Committee according to the process described in Chapter 9 of the SSHCP. If a Covered Activity on a Preserve or Preserve Setback results in a puncture or other disruption to the soil hardpan or duripan, the puncture will be sealed using bentonite clay or other material that maintains the functionality of the soil's restrictive layer and associated perched aquifer.

EDGE-8 (Outdoor Lighting): All outdoor lighting in Urban Development Covered Activity projects will be designed to minimize light pollution into existing and planned Preserves, except where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target SSHCP Covered Species (e.g., western spadefoot (*Spea*

[19] Punctures may include small holes that penetrate the soil hardpan or duripan such as might occur when digging or drilling holes for the installation of fence posts, sign posts, or trees.

hammondii), Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*)).

EDGE-9 (Livestock Access to Preserves): Urban Development Covered Activity projects that include on-site Preserves will include in their design an adequate number of access points and facilities for delivery and pick up of grazing animals (livestock), such that these activities will not significantly alter the Preserve's habitat and are consistent with the protection of livestock and protection of adjacent public property, and include adequate public safety measures.

EDGE-10 (Prevent Invasive Species Spread): Completed Covered Activities (including roads) will be maintained in a manner that avoids the spread of invasive species into Preserve and Open Space areas. Such maintenance measures will include the following:

- To prevent the transport of non-native invasive species onto Preserves, before bringing any equipment onto an SSHCP Preserve or Preserve Setback, equipment must be cleaned of mud, dirt, and plant material. Cleaning will occur in the infested area or another appropriate location as approved by a Plan Permittee.
- Mowing rotation will start in un-infested areas and move to infested areas.
- Invasive plant prevention techniques will be incorporated into maintenance plans.
- The SSHCP Implementing Entity will survey road shoulders, ditches, and rights-of-way that border SSHCP Preserves for invasive weeds or other exotic plant species. Where roadside weed infestations have reached a critical control point, the Implementing Entity or Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment.

Condition 3. Implement Construction Best Management Practices

AMMs associated with Condition 3 must be applied to all UDA Covered Activities.

BMP-1 (Construction Fencing): Orange construction fencing will be installed to ensure that ground disturbance does not extend beyond the allowed construction footprint (i.e., the limit of project construction plus equipment staging areas and access roads). Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will mark the outer boundary of any Preserve Setback or Stream Setback adjacent to or within the project site with orange construction fencing prior to ground disturbance. This fencing will remain in place until project completion, as identified by the Plan Permittee.

BMP-2 (Erosion Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will install temporary control measures for sediment, stormwater, and pollutant runoff as required by the Plan Permittee to protect water quality and species habitat. Silt fencing or other appropriate sediment control device(s) will be installed downslope of any Covered Activity that disturbs soils.

Fiber rolls and seed mixtures used for erosion control will be certified as free of viable noxious weed seed. As discussed in Section 5.4.2, Covered Species Take Avoidance and Minimization Measures, erosion controls installed in or adjacent to Plan Area modeled habitat for giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), California tiger salamander (*California tiger salamander*), or western spadefoot (see Chapter 3) must be of appropriate design and materials that will not entrap the species (e.g., not contain mesh netting). Regular monitoring and maintenance of the project's erosion control measures will be conducted until project completion to ensure effective operation of erosion control measures.

BMP-3 (Equipment Storage and Fueling): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will ensure that equipment storage and staging will occur in the development footprint only (not sited in any existing on-site Preserve, planned on-site Preserve, Preserve Setback, Stream Setback, or aquatic land cover type). Fuel storage and equipment fueling will occur away from waterways, stream channels, stream banks, and other environmentally sensitive areas within the development footprint.

However, certain equipment storage and fueling activities can be allowed on Preserves within habitat re-establishment/establishment sites (refer to Section 5.2.7) if no location outside of the site is available. If a Covered Activity results in a spill of fuel, hydraulic fluid, lubricants, or other petroleum products, the spill will be absorbed and waste disposed of in a manner to prevent pollutants from entering a waterway, Preserve, Preserve Setback, or Stream Setback.

BMP-4 (Erodible Materials): Plan Permittees and Third-Party Project Proponents implementing Covered Activities must not deposit erodible materials into waterways. Vegetation clippings, brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks. Erodible material must be disposed of such that it cannot enter a waterway, Preserve, Preserve Setback, Stream Setback, or aquatic land cover type. If water and sludge must be pumped from a subdrain or other structure, the material will be conveyed to a temporary settling basin to prevent sediment from entering a waterway.

BMP-5 (Dust Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will water active construction sites regularly, if warranted, to avoid or minimize impacts from construction dust on adjacent vegetation and wildlife habitats. No surface water will be used from aquatic land covers; water will be obtained from a municipal source or existing groundwater well.

BMP-6 (Construction Lighting): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas.

BMP-7 (Biological Monitor): If a Covered Activity includes ground disturbance within Covered Species modeled habitat, an approved biologist will be on site during the period of ground disturbance, and may need to be on site during other construction activities depending on the Covered Species affected. After ground-disturbing project activities are complete, the approved biologist will train an individual to act as the on-site construction monitor for the remainder of construction, with the concurrence of the Permitting Agencies. The on-site monitor will attend the training described in BMP-8. The approved biologist and the on-site monitor will have oversight over implementation of Avoidance and Minimization Measures, and will have the authority to stop activities if any of the requirements associated with those measures are not met. If the monitor requests that work be stopped, the Wildlife Agencies will be notified within one working day by email. The approved biologist and/or on-site monitor will record all observations of listed species on California Natural Diversity Database field sheets and submit them to the California Department of Fish and Wildlife. The approved biologist or on-site monitor will be the contact source for any employee or contractor who might inadvertently kill or injure a Covered Species or who finds a dead, injured or entrapped individual. The approved biologist and on-site monitor's names and telephone numbers will be provided to the Wildlife Agencies prior to the initiation of ground-disturbing activities. Refer to species-specific measures for details on requirements for biological monitors.

BMP-8 (Training of Construction Staff): A mandatory Worker Environmental Awareness Program will be conducted by an approved biologist for all construction workers, including contractors, prior to the commencement of construction activities. The training will include how to identify Covered Species that might enter the construction site, relevant life history information and habitats, SSHCP and

statutory requirements and the consequences of non-compliance, the boundaries of the construction area and permitted disturbance zones, litter control training (SPECIES-2), and appropriate protocols if a Covered Species is encountered. Supporting materials containing training information will be prepared and distributed by the approved biologist. When necessary, training and supporting materials will also be provided in Spanish. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all of the Avoidance and Minimization Measures. Written documentation of the training must be submitted to the Implementing Entity within 30 days of completion of the training, and the Implementing Entity will provide this information to the Wildlife Agencies.

BMP-9 (Soil Compaction): After construction is complete, all temporarily disturbed areas will be restored similar to pre-project conditions, including impacts relating to soil compaction, water infiltration capacity, and soil hydrologic characteristics.

BMP-10 (Revegetation): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will revegetate any cut-and-fill slopes with native or existing non-invasive, non-native plants (e.g., non-native grasses) suitable for the altered soil conditions and in compliance with EDGE-2 and EDGE-8, if applicable.

BMP-11 (Speed Limit): Project-related vehicles will observe the posted speed limits on paved roads and a 10-mile-per-hour speed limit on unpaved roads and during travel in project areas. Construction crews will be given weekly tailgate instruction to travel only on designated and marked existing, cross-country, and project-only roads.

Condition 4. Avoid and Minimize Impacts that May Result from Implementation of Covered Transportation Projects

Urban Development transportation project and Rural Transportation Project Covered Activities, including bridge projects, can affect Covered Species. AMMs included for Condition 4 seek to avoid or minimize direct and indirect impacts that may result from construction of roadways or roadway improvements. Condition 4 applies to all transportation-related Covered Activities (see Sections 5.2.1 and 5.2.3).

Plan Permittees and Third-Party Project Proponents implementing Urban Development transportation or Rural Transportation Project Covered Activities must comply with the roadway siting, design, and construction AMMs described below.

ROAD-1 (Road Project Location): Road projects will be located in the least environmentally sensitive area to avoid, to the maximum extent practicable, impacts on Covered Species, Covered Species habitat, and waters of the United States. Road project alignments will follow existing roads, road easements, and rights-of-way, or be sited in disturbed areas to minimize habitat loss and additional habitat fragmentation.

ROAD-2 (Wildlife Crossing Structures): Road projects that are Urban Development Covered Activities (see Section 5.2.1) (including the Capital Southeast Connector, see Section 5.2.1.1) or are Rural Transportation Covered Activities (see Section 5.2.3) will include an adequate number of wildlife crossing structures, as depicted in Figure 5-10. An adequate number of wildlife crossing structures within the Urban Development Area (UDA) and outside the UDA will provide for continued dispersal and movement of native wildlife throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Objectives (see Chapter 7).

The Plan defines "wildlife crossing structure" as a physical structure specifically designed or retrofitted to facilitate undercrossing for target wildlife species. The Plan further classifies wildlife crossings as hydrologic crossings and dry crossings. Hydrologic crossings are built where there is an existing stream, creek, or intermittent drainage to maintain existing hydrologic connectivity within the Plan Area. As described below, hydrologic crossings require specialized features to be built into the crossing structure, such as elevated platforms to allow wildlife to pass under a crossing structure when it is inundated with water. Dry wildlife crossings are built where there is no hydrologic feature but where a crossing is needed to provide for overland connectivity. SSHCP wildlife crossing structures may include structures such as bridges, arches, or box and pipe culverts.

Plan Permittees expect that future wildlife movement and dispersal within the UDA will occur almost entirely within the boundaries of the future interconnected SSHCP Preserve System (see Section 7.5). Therefore, wildlife crossings are needed wherever a roadway crosses (bisects) the conceptual SSHCP Preserve System (see Figure 5-10). Wildlife crossing structures inside the UDA will be sized to accommodate movement of a highly mobile native indicator species (i.e., coyote (*Canis latrans*)). By designing UDA wildlife crossing structures to meet the movement and dispersal requirements of coyote, the Plan Permittees anticipate that the crossing structure will also accommodate most native wildlife species that currently occupy the UDA (see Chapter 3).

The Plan Permittees expect that most of the Plan Area outside of the UDA will remain as Open Space over the 50-year Permit Term (see Chapter 4). Therefore,

the Plan Permittees expect that the Rural Transportation Project Covered Activities proposed outside the UDA will have a relatively small effect on the movement and dispersal of larger or more mobile native wildlife species, including coyote. Consequently, the Plan Permittees anticipate that the design of Rural Transportation Project Covered Activities outside the UDA will need to include wildlife crossing structures primarily where the Rural Transportation Project Covered Activities occur within California tiger salamander modeled habitat (see CTS-3 and also Chapter 3, Figure 3-16).

The design and location of wildlife crossing structures both inside the UDA and outside the UDA will be determined by collaboration between the Third-Party Project Proponent, the Land Use Authority, and the Implementing Entity. Crossing design will use the best available scientific and commercial information for the target species. The design of crossing structures will be based on demonstrated effectiveness of design for the target species when such information is available, or will be designed with a high level of certainty of success based on studies of similar taxa in similar environmental settings. The proposed wildlife crossing structures designs will be reviewed and approved by the Implementing Entity prior to final design.

The Implementing Entity will develop a Wildlife Crossing Maintenance Manual to be provided to the entity responsible for maintaining the wildlife crossing. The Wildlife Crossing Maintenance Manual will identify vegetation management, clearing of obstructions, and other techniques to maintain the desired movement and hydrologic connectivity, and to avoid effects to adjacent Preserves.

All SSHCP wildlife crossing structures in the UDA will include the following design elements:

- Open-bottom bridges or arches where the roadway crosses a river or stream. Where an open-bottom bridge or arch is used, the span of the crossing will be at least 1.2 times the bankfull width of the stream and span the banks to allow for dry wildlife passage along each side of the stream and to avoid or minimize piers or footings within the stream. (Bankfull width refers to the width of a stream channel at the point where over-bank flow begins during a flood event.)
- Any wildlife crossing structure that also maintains hydrologic connectivity will be designed to maintain pre-construction water capacity, depth, and velocity. The crossing structure will not restrict or impede normal flows or flood flows, unless a primary purpose of the structure is to manage such

flow(s). Wildlife crossing structures must be designed to provide a dry passage (e.g., a platform ledge) higher than flows for a 10-year storm event to allow wildlife to pass through an inundated crossing structure.

- Wildlife crossing structures in the UDA will be designed and sized to accommodate movement of at least medium-sized mammals (e.g., coyote). The opening must be at least 3 feet high and the crossing structure must have a minimum openness ratio of at least 0.4.
- Vegetation leading up to the entrance of a crossing structure and the substrate leading into and within the crossing structure will be natural and appropriate to provide for continuity of habitat, attract the target animal species for which the crossing is designed, and facilitate use of the crossing structure.
- A wildlife crossing under six-lane roads or larger will be designed to provide ambient light and temperature in the longer crossing structures (e.g., either by providing a larger opening or a grate at the top of the structure to improve the attractiveness of the crossing to certain Covered Species and wildlife that may hesitate to cross through dark, confined structures or one with a temperature gradient (Jackson and Griffin 2000)). If a road is less than six lanes in width, these designs will be optional.
- Lighting will not be placed at or near the entrance of a wildlife crossing structure to maintain natural ambient light conditions at night and to increase chances of wildlife use. However, a Land Use Authority Permittees may allow lighting if necessary for human health or safety.

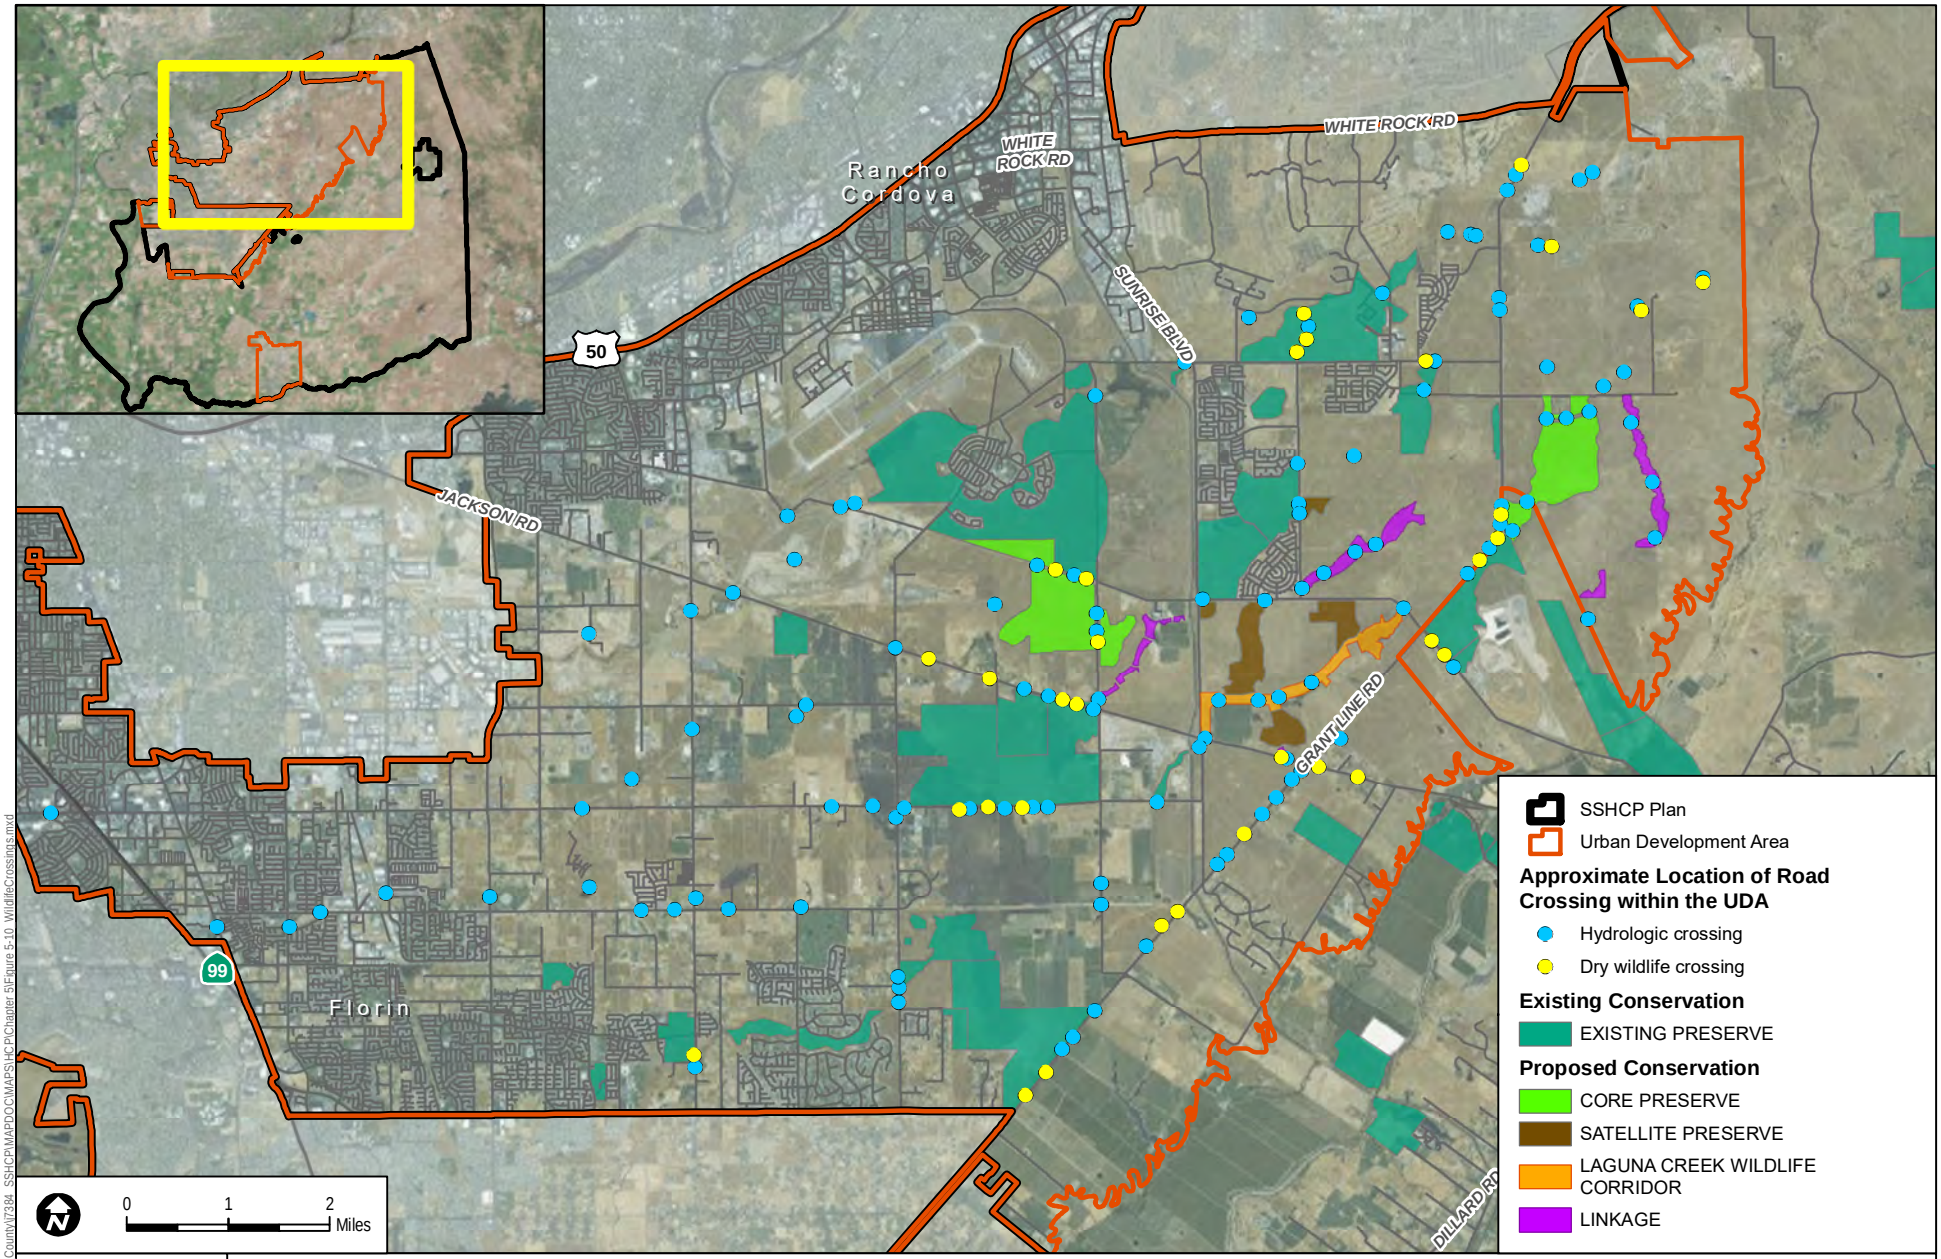
Outside the UDA, wildlife crossing structures may be required for California tiger salamander (refer to CTS-1), and could also be required for other native species.

ROAD-3 (Roadside Pesticide Use[20]): If pesticide use is necessary along roadsides, the appropriate SSHCP Permittee will ensure that the pesticide application strictly complies with the pesticide label and all other applicable federal, state, and local authorities pertaining to the use, safety, storage, disposal, and reporting of the pesticide. Where roadside weed infestations have reached a critical control point, the Implementing Entity or a Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment. In addition, the Implementing Entity or appropriate Land Use Authority Permittee will post signs along road shoulders adjacent to sensitive areas that are within the SSHCP

[20] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and conforms to all conditions in Section 5.4.

Preserve System (e.g., California tiger salamander breeding ponds, endemic plant populations, vertebrates that rely on insects for part of their diet). The signs will identify pesticide use restrictions or other roadside maintenance restrictions.

Condition 5. Avoid and Minimize Impacts that Result from Public Use of Low-Impact Nature Trails in Preserves



Preserves within the UDA are likely to be surrounded by urban development. As discussed in Section 5.2.7, allowing limited use of SSHCP Preserves will help to foster a sense of community ownership and will provide an opportunity to educate the community about the natural resources to be protected within the SSHCP Preserve System.

Low-impact nature trails will be designed following the AMMs outlined below.

NATURE TRAIL-1 (Nature Trail Plan): A nature trail plan must be prepared for each Preserve where a trail is allowed by the Preserve Management Plan. Nature trails will be unpaved trails that vary in width depending on terrain and existing constraints, but will never exceed 4 feet in width. Where a trail crosses a swale, wooden walkways elevated to a height no greater than 2 feet will be installed. Trail improvements may include mowing vegetation to create or maintain a trail, minor grading to remove trip hazards, and signs providing directional and educational information. Public access to land acquired for preservation will be prohibited until a trail plan can be prepared by the Implementing Entity and approved by the Permitting Agencies. A trail plan will include the following:

- Maps identifying areas that contain sensitive habitats or species occurrences.
- Maps that show the location and footprint of proposed trails.
- Methods used to control public access.
- Trail and use monitoring methods, schedules, and responsibilities.
- Trail operation and maintenance guidelines and responsibilities.
- Clear triggers for use restrictions or closure based on sensitive biological indicators (e.g., seasonal closures of some trails on the basis of activity periods of Covered Species or sensitive species).

NATURE TRAIL-2 (Nature Trail Protection of Duripan): Nature trails will be sited and constructed so as not to interfere with existing soil duripan and the perched aquifer that support the existing hydrologic regime of the Vernal Pool–Grassland, and will not interfere with existing pool hydrology. Trails within Preserves will not be paved.

SOURCE: ESRI, County of Sacramento 2014, USFWS 2015

FIGURE 5-10

Wildlife Crossings

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

INTENTIONALLY LEFT BLANK

NATURE TRAIL-3 (Nature Trail Location): Nature trails will be located away from sensitive natural resources (e.g., vernal pools, riparian habitat, woodland habitat, Covered Species occurrences, raptor nesting sites, tricolored blackbird (*Agelaius tricolor*) colony sites). The Wildlife Agencies will determine the distance necessary to avoid impacts to sensitive natural resources.

NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design): Biological studies will be conducted within the area being considered for nature trail construction prior to project design. The studies will include land cover type mapping and focused species surveys and/or wetland delineations. The biological studies will include assessments of potential effects of trail construction on Preserve System resources, and recommendations for avoidance and minimization that may be incorporated into project siting, design, construction, and operation.

NATURE TRAIL-5 (Monitoring of Nature Trail Impacts): Impacts that could result from use of a nature trail within a Preserve will be monitored according to the Preserve Management Plan (Chapter 8) to ensure that uses do not conflict with the individual Preserve Management Plan. If use of a trail is found to conflict with the individual Preserve Management Plan, use of that trail will be discontinued until adjustments in the use can be made to reduce or eliminate conflicts. The Implementing Entity will make decisions about discontinuing or modifying use of a trail in consultation with the Preserve Manager or other applicable Preserve management agency or organization.

Condition 6. Avoid and Minimize Impacts When Re-Establishing or Establishing Wetlands

As discussed in Chapter 7, the Plan Permittees anticipate that 389 acres of Vernal Pool habitat will be re-established or established[21] within the Plan Area as part of the SSHCP Conservation Strategy. Although re-establishment or establishment of vernal pools is a Measurable Objective under this Plan, if not done correctly, the action could have an adverse impact on existing vernal pools.

RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool): Re-establish or establish Vernal Pool Wetland according to the following guidelines:

- Re-establishment will always take priority over establishment of vernal pools. Establishment will be permitted only after it has been determined that sites with the potential to re-establish vernal pools no longer exist in the Plan Area or cannot be acquired through a willing seller/buyer agreement.

[21] In the context of this Plan, "establish" is synonymous with "create."

- When possible, re-established or established sites will be located adjacent to an existing Preserve(s) to maximize connectivity and Preserve area.
- Re-establishment or establishment will not result in direct or indirect adverse impacts to the hydrologic regime of existing vernal pools. Vernal pool re-establishment or establishment actions will not remove more than 10% of any existing vernal pool watershed, as defined by the SSHCP LIDAR analysis (see Section 3.3 and Conservation Action VPI1.2 in Table 7.1).
- Vernal pool re-establishment will attempt to restore the historical density and range of vernal pool sizes to the maximum extent feasible using historical aerial photography of the site, if available. Where aerial photography of the site's historical conditions is not available, vernal pool re-establishment will include a range of pool sizes (area and depth) to accommodate the different habitat needs and life history characteristics of the vernal pool invertebrate Covered Species.
- Established vernal pools must be located on sites with vernal pool soils, defined as any Plan Area soil type where vernal pools currently exist.
- Established vernal pool sites will include a range of pool sizes to accommodate the different habitat needs and life history characteristics of the three vernal pool invertebrate Covered Species.
- The total density of vernal pools will not exceed 10% of the suitable soil areas in any vernal pool re-establishment and/or establishment site, unless it can be shown that the suitable areas of that site historically supported greater densities.
- Re-establishment or establishment may include inoculation when it is likely that no seed or cyst bank of vernal pool species remains at a site. Vernal Pool inocula will come from nearby vernal pools that are on the same geologic formation and soil type.

RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank): Vernal pool re-establishment or establishment may include "soil inoculation" when it is likely that no seed or cyst bank of vernal pool species remains at a re-establishment or establishment site.

- During conversion of Urban Development Area vernal pools to a developed land cover type, project proponents will excavate and retain soil from vernal pools following protocols developed by the SSHCP Technical Advisory Committee (Chapter 9).

- Inocula applied in re-established or established vernal pools must be harvested from a vernal pool that is on the same geologic formation and soil type shown on the County General Soil Map as the re-establishment/establishment site. Geologic formations and soil types will follow U.S. Department of Agriculture Soil Conservation Service's 1993 Soil Survey of Sacramento County, California. Proposed off-site inocula sources must be approved by the Wildlife Agencies.

RE-ESTABLISHMENT/ESTABLISHMENT-3 (Re-Establishment/Establishment of Freshwater Marsh or Open Water Near Airports): During review of proposed re-establishment/establishment projects for freshwater marsh or open water on SSHCP Preserves, the Implementing Entity shall consider the potential for the location of the re-establishment/establishment projects to increase the risk of wildlife strikes or generation of ground fog at airports. If a re-establishment/establishment project would result in (1) a net increase in open water or freshwater marsh acreage over baseline conditions[22] within 5 miles of Mather Field, Sacramento Executive Airport, or Franklin Field; or (2) replacement of open water/freshwater marsh habitat that is located 2 or more miles from Mather Field or Sacramento Executive Airport with open water/freshwater marsh habitat that is located less than 2 miles from those airports, a qualified biologist shall prepare a concise letter report. The letter report shall summarize the biologist's findings regarding (1) the species likely to use the re-established/established habitat, (2) a rough order of magnitude estimate on the peak number of birds that might use the re-established/established habitat, and (3) potential movement patterns for birds using the re-established/established habitat and whether they might cross through the airport safety zones (e.g., to reach foraging habitat or another wildlife attractant). The letter report will also provide recommendations to the Implementing Entity on how they could reduce any of the identified wildlife hazards if there are any feasible means to do so that would not conflict with the biological goals and measurable objectives of the Conservation Plan.

Condition 7. Avoid and Minimize Impacts to Streams and Creeks

AMMs associated with Condition 7 must be applied to all Covered Activities where a stream or creek is located within a project footprint.

[22] For purposes of establishing baseline conditions, Freshwater Marsh and Open Water acreages will be calculated using that version of the SSHCP Land Cover Type Map in existence as of the date that the SSHCP permit was issued to the Plan Permittees by the USFWS.

STREAM-1 (Laguna Creek Wildlife Corridor): A 150-foot setback measured from the top of the bank on both sides of the stream will be applied to Laguna Creek within the Urban Development Area (minimum 300-foot corridor width). If trails are located within the Laguna Creek Wildlife Corridor, the nearest edge of the trail will be located at least 80 feet from the top of the bank.

STREAM-2 (UDA Stream Setbacks): A 100-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all streams listed in Table 5-1 (see also Figure 2-4). If a stream reach supports woody riparian vegetation, the setback will be equal to the riparian edge plus 25 feet or will be the setback defined above, whichever is greater. If trails are located within the Stream Setback, the nearest edge of the trail will be located at least 50 feet from the top of the bank.

Table 5-1
Stream Setback Minimum Requirements in the Urban Development Area

Stream	Minimum Setback (from the Top of Bank Measured in Aerial Perspective) on Both Sides of the Stream
Elder Creek	100 feet
Frye Creek	100 feet or as depicted as part of the NewBridge development project hardline Preserve (see Appendix K)
Gerber Creek	100 feet
Morrison Creek	100 feet
Central Paseo	100 feet or as depicted as part of the Cordova Hills development project hardline Preserve (Appendix K)
Sun Creek	100 feet or as depicted as part of the Sun Creek development project hardline Preserve (see Appendix K)

STREAM-3 (Minor Tributaries to UDA Streams): A 25-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all avoided first and second order tributaries to the streams listed in Table 5-1 and Laguna Creek. Refer to Objective W6 in Chapter 7 (Table 7-1) regarding avoided first and second order tributaries. Trails are not permitted within headwater ephemeral Stream Setbacks.

STREAM-4 (Minimize Effects from Temporary Channel Re-Routing): When an Urban Development Covered Activity temporarily re-routes a stream, creek, or drainage, the re-routing will be completed in a manner that minimizes impacts to beneficial uses and habitat. The following measures will be employed to minimize disturbances that will adversely impact water quality:

- No equipment will be operated in areas of flowing or standing water.
- Construction materials and heavy equipment must be stored outside of the active flow of any waters.

- When work within waters is necessary, the entire stream flow will be diverted around the work area.
- In the event of rain, the disturbed in-water work area will be temporarily stabilized before water body flow exceeds the capacity of the diversion structure. The disturbed water body will be stabilized so that the disturbed areas will not come in contact with the flow.
- Once construction is complete, all project-introduced material (e.g., pipes, gravel, cofferdam, sandbags) must be removed, leaving the water as it was before construction. Excess materials will be disposed of at an appropriate disposal site.
- All work areas will be effectively isolated from stream flows using suitable control measures before commencement of any in-water work. The diverted stream flow will not be contaminated by construction activities. Structures for isolating the in-water work area and/or diverting the stream flow (e.g., cofferdam, geo-textile silt curtain) will not be removed until all disturbed areas are cleaned and stabilized.
- Any flow diversion used during construction will be designed in a manner to prevent pollution and minimize siltation, and will provide flows to downstream reaches. Flows will be maintained to support existing aquatic life, riparian wetlands, and habitat that may be located upstream and downstream from any temporary diversion.
- All surface waters, including ponded waters, will be diverted away from areas undergoing grading, construction, excavation, vegetation removal, and/or any other activity that may result in a discharge to waters.
- All temporary dewatering methods will be designed to have the minimum necessary impacts to waters to isolate the immediate work area. All dewatering methods will be installed such that natural flow is maintained upstream and downstream of the diversion area. Any temporary dams and diversions will be installed such that the diversion does not cause sedimentation, siltation, or erosion upstream or downstream of the diversion area. All dewatering methods will be removed immediately upon completion of diversion activities.
- A method of containment must be used below any bridge, boardwalk, and/or temporary crossing to prevent debris from falling into the waters through the entire duration of a project.

- If temporary surface water diversions and/or dewatering are anticipated, the Third-Party Project Proponent will develop and maintain on site a surface water diversion and/or dewatering plan. The plan(s) must be developed prior to initiation of any water diversions and will include the proposed method and duration of diversion activities. The plan(s) must be made available to Central Valley Water Board staff upon request.
- When work in a flowing stream is unavoidable and any dam or other artificial obstruction is being constructed, maintained, or placed in operation, sufficient water will be allowed at all times to pass downstream to maintain beneficial uses of waters below the dam. Construction, dewatering, and removal of temporary cofferdams will not violate the turbidity, settle-able matter, pH, temperature, or dissolved oxygen requirements of any Water Quality Control Plan.
- Any temporary dam or other artificial obstruction will only be built from clean materials such as sandbags, gravel bags, water dams, or clean/washed gravel that will cause little or no siltation. Stream flow will be temporarily diverted using gravity flow through temporary culverts or pipes, or pumped around the work site with the use of hoses.

STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening): When an Urban Development Covered Activity alters a stream, creek, or drainage by re-routing, widening, or deepening a channel, the project design will include the following:

- The main channel of a re-routed channel will be free to migrate laterally over its active and terrace floodplain.
- Channel geometry (plan, profile, and cross-section) of the site will be appropriate for the watershed location and physical/hydrologic condition.
- Local, native materials will be used as fill material to the extent practicable.
- Bioengineering techniques will be used for construction and maintenance of bank stabilization. Bioengineered bank stabilization structures will use vegetation in combination with bank reshaping; biodegradeable geotextile materials; and, in some cases, a minimal amount of rock or wood to the extent practicable to dissipate erosive energy. Third-Party Project Proponents will consult a professional engineer when considering using bioengineering techniques.
- All re-routed, widened, or deepened streams are required to establish Stream Setbacks with minimum widths required under STREAM-1, STREAM-2, or STREAM-3. All re-routed, widened, or deepened streams must re-establish/

establish and maintain native Woody Riparian land cover and/or native Grassland Riparian land cover in the entire Stream Setback.

Condition 8. Avoid and Minimize Impacts to Covered Species from Utility and Utility Maintenance Covered Activities

AMMs associated with Condition 8 must be applied to all Covered Activities associated with construction and maintenance of infrastructure projects.

UTILITY-1 (Avian Collision Avoidance): Installation of new, or relocation of existing, utility poles, lines, and cell towers located within the Preserve System or within 1,000 feet of a Preserve boundary will be coordinated with the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife. The applicant or relevant utility/service provider will install utility poles, lines, and cell towers in conformance with Avian Powerline Interaction Committee (APLIC) standards for collision-reducing techniques, as outlined in Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012), or any superseding document issued by the APLIC.

UTILITY-2 (Utility Maintenance on Preserves): Utility maintenance inside SSHCP Preserves and SSHCP Preserve Setbacks containing vernal pools will occur only when vernal pools have been dry for 30 days, except in emergency situations related to human health and safety.

UTILITY-3 (Trenchless Construction Methods): Where a pipeline or conduit crosses an existing or planned Preserve or will be located between adjacent Preserves (e.g., under a roadway that has a Preserve on both sides), trenchless construction methods will be used to minimize impacts to the existing soil profile (including impacts to a hardpan or duripan) to maintain the perched aquifer in Vernal Pool Grassland land cover type.

UTILITY-4 (Siting of Entry and Exit Location): The entry and exit locations for the trenchless construction method (see Utility-3) will be sited to avoid impacts to vernal pools and Riparian Woodland, and to avoid direct take of SSHCP Covered Species.

Condition 9. Avoid and Minimize Impacts That Might Result From Removing or Breaching Levees to Establish or Re-establish Riparian Habitat

LEVEE-1 (Preparation of Hydrologic Analysis): Prior to approving a draft Preserve Management Plan that includes (1) modifying or breaching an existing levee, or (2) would place a potential impedance to high-water event flood-flows on the water side of an existing levee (including new riparian vegetation plantings or

other new Preserve facilities), a hydrologic analysis will be conducted. The Preserve activity will only be implemented if the hydrologic analysis concludes that the activity will not result in a substantial increase in flood stage elevations or flood risk on lands outside the Preserve.

Condition 10. Avoid and Minimize Impacts That Might Result From Potential Residual Contamination of Preserves and Related Exposure of People to Such Hazardous Materials

HAZARDOUS MATERIALS-1 (Preparation of Phase I Environmental Site Assessment): Prior to the acquisition of a preserve site or implementation of a stream or riparian restoration project, a Phase I Environmental Site Assessment shall be conducted in general accordance with the American Society for Testing and Materials Standard Practice E1527-05. The purpose of this Environmental Site Assessment is to identify, to the extent feasible pursuant to the American Society for Testing and Materials Standard, recognized environmental conditions in connection with the potential site. The term "recognized environmental condition" means the presence or likely presence of hazardous substances or petroleum products on the property under conditions that may indicate an existing release, a past release, or a material threat of release of these substances to the property. If the Phase 1 Environmental Site Assessment indicates the presence of a recognized environmental condition, the Implementing Entity shall consider the following options.

- Determine that the acquisition/project can proceed on the basis that the Habitat Plan goals and objectives can be met on the site even with the presence of a recognized environmental condition.
- Conduct a Phase II Environmental Site Assessment, including soil and groundwater testing, to further study the potential for contamination to limit the Implementing Entity's management activities.
- If the results of the Phase I (or Phase II) Environmental Site Assessment indicate that the Habitat Plan goals and objectives cannot be met on the site, the Implementing Entity should not acquire the site.

HAZARDOUS MATERIALS-2 (Contingency Plan): As part of each Preserve Management Plan or site restoration plan, a Contingency Plan shall be prepared to address the actions that would be taken during construction in the event that unexpected contaminated soil or groundwater is discovered. The Contingency Plan shall include health and safety considerations, handling and disposal of wastes, reporting requirements, and emergency procedures. The Contingency Plan shall include a requirement that if evidence of contaminated materials is encountered

during construction, construction would cease immediately and applicable requirements of the Comprehensive Environmental Release Compensation and Liability Act and the California Code of Regulations Title 22 regarding the disposal of waste would be implemented.

5.4.2 Covered Species Take Avoidance and Minimization Measures

The following section describes measures to avoid or minimize effects of Covered Activities on specific SSHCP Covered Species. Species-specific AMMs include species surveys, pre-construction surveys, and construction monitoring. Most species-specific AMMs require that species surveys be conducted if Covered Species modeled habitat is within the proposed Covered Activity footprint or within a specified distance of the proposed Covered Activity. Section 3.4 provides maps and descriptions of modeled habitat for each Covered Species. The AMMs described below apply to Covered Activities when Covered Species modeled habitat or a Covered Species occurrence are at a project site. The Implementing Entity and Wildlife Agencies may update specific SSHCP AMMs over the Permit Term to provide the best and most appropriate protective measures for a Covered Species.

General Covered Species Take Avoidance and Minimization Measures

The following AMMs will apply to all Covered Activities that are required to implement Covered Species take AMMs.

SPECIES-1 (Litter Removal Program): A litter control program will be instituted for the entire project site. All workers will ensure that their food scraps, paper wrappers, food containers, cans, bottles, and other trash are deposited in covered or closed trash containers. All garbage will be removed from the project site at the end of each work day, and construction personnel will not feed or otherwise attract wildlife to the area where construction activities are taking place.

SPECIES-2 (No Pets in Construction Areas): To avoid harm and harassment of native species, workers and visitors will not bring pets onto a project site.

SPECIES-3 (Take Report): If accidental injury or death of any Covered Species occurs, workers will immediately inform the approved biologist or on-site monitor and site supervisor. The approved biologist or on-site monitor will phone the appropriate contact person at the Implementing Entity. The Implementing Entity will immediately contact the Wildlife Agencies by telephone. A memorandum will be provided to the Implementing Entity and Wildlife Agencies within 1 working day of the incident. The report will provide the date and location of the incident, number of individuals taken,

the circumstances resulting in the take, and any corrective measures taken to prevent additional take.

SPECIES-4 (Post-Construction Compliance Report): A post-construction compliance report will be submitted to the SSHCP Implementing Entity within 30 calendar days of completion of construction activities or within 30 calendar days of any break in construction activity that lasts more than 30 days. The report will detail the construction start and completion dates, any information about meeting or failing to meet species take Avoidance and Minimization Measures (AMM), effectiveness of each AMM that was applied at the project site, and any known project effects to Covered Species.

Rare Plants

PLANT-1 (Rare Plant Surveys): If a Covered Activity project site contains modeled habitat for Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii)*, Bogg's Lake hedge-hyssop (*Gratiola heterosepala)*, dwarf downingia (*Downingia pusilla),* Legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii),* or Sanford's arrowhead (*Sagittaria sanfordii*), the Covered Activity project site will be surveyed for the rare plant by an approved biologist and following the California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or the most recent CDFW rare plant survey protocols. An approved biologist will conduct the field surveys and will identify and map plant species occurrences according to the protocols. See Chapter 10 for the process to submit survey information to the Plan Permittee and the Permitting Agencies.

PLANT-2 (Rare Plant Protection): If a rare plant listed in AMM PLANT-1 is detected within an area proposed to be disturbed by a Covered Activity or is detected within 250 feet of the area proposed to be disturbed by a Covered Activity, the Implementing Entity will assure one unprotected occurrence of the species is protected within a SSHCP Preserve before any ground disturbance occurs a the project site.

Sacramento and Slender Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is a federally and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Slender Orcutt grass (*Orcuttia tenuis*) is a federally threatened and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Both Orcutt grasses are very rare, and the likelihood of finding new occurrences within the Plan Area is low. Due to their rarity, take of either of these species is not permitted under the SSHCP, with the exception of take related to Preserve management and monitoring (see Section 5.2.7, SSHCP Preserve System Covered Activities).

ORCUTT-1 (Orcutt Grass Surveys): If a Covered Activity project site is located within 1 mile of the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for Sacramento and slender Orcutt grass by an approved biologist following California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or most recent CDFW guidelines to determine if Sacramento and/or slender Orcutt grass is present. An approved biologist will conduct the field investigation to identify and map occurrences. See Chapter 10 for the process to conduct and submit survey information.

ORCUTT-2 (Orcutt Grass Protection): Where known or new Sacramento or slender Orcutt grass occurrences are found, they will be protected within an SSHCP Preserve that is at least 50 acres. The occurrence will be located interior to the Preserve at a distance of no less than 300 feet from the edge of the Preserve boundary. If a Third-Party Project Proponent encounters a previously undiscovered occurrence of Sacramento or slender Orcutt grass on a Covered Activity project site, the Third-Party Project Proponent will contact the Implementing Entity or Land Use Authority Permittee with authority over the project, who will coordinate with the Wildlife Agencies for written concurrence of avoidance to ensure that the project does not cause take of the species.

California Tiger Salamander

To avoid direct and indirect effects of Covered Activities on California tiger salamander (*Ambystoma californiense*), the following AMMs will be implemented.

CTS-1 (California Tiger Salamander Daily Construction Schedule): Ground-disturbing Covered Activities within California tiger salamander modeled habitat (Figure 3-16) will occur outside the breeding and dispersal season (occur after July 31 and before October 15), to the maximum extent practicable. If Covered Activities must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), construction activities will not start until 30 minutes after sunrise and must be complete 30 minutes prior to sunset.

CTS-2 (California Tiger Salamander Exclusion Fencing): If a Covered Activity must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), exclusion fencing will be installed around the project footprint before October 15. Temporary high-visibility construction fencing will be installed along the edge of work areas, and exclusion fencing will be installed immediately outside of the temporary high-visibility construction fencing to exclude California tiger salamanders from entering the construction area or becoming entangled in the construction fencing. Exclusion fencing will be at least 1 foot tall and be buried

at least 6 inches below the ground to prevent salamanders from going under the fencing. Fencing will remain in place until all construction activities within the construction area are complete. No project activities will occur outside the delineated project footprint. An approved biologist must inspect the exclusion fencing and project site every morning before 7:00 a.m. for integrity and for any entrapped California tiger salamanders. If a California tiger salamander is encountered, refer to CTS-5, below. (However, the Implementing Entity may, with approval of the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), determine that it is appropriate for a Covered Activity project to not implement CTS-2 for certain long and linear roadway Covered Activity projects if it appears that the exclusion fencing will likely trap individuals or cause more take of California tiger salamander than it would prevent.)

CTS-3 (California Tiger Salamander Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-16), an approved biologist experienced with California tiger salamander identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site for California tiger salamander every morning before 7:00 a.m., or prior to construction activities. As required by BMP-8 (Training of Construction Staff), the approved biologist will also train construction personnel on the required California tiger salamander avoidance procedures, exclusion fencing, and correct protocols in the event that a California tiger salamander enters an active construction zone. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-4 (Avoid California Tiger Salamander Entrapment): If Covered Activities must be implemented in modeled habitat, all excavated steep-walled holes or trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes or trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within California tiger salamander modeled habitat will be inspected for California tiger salamanders by the approved biologist prior to being moved. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-5 (California Tiger Salamander Encounter Protocol): If a California tiger salamander is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately (California Department of Fish and Wildlife (CDFW)

and U.S. Fish and Wildlife Service (USFWS)). Construction activities will be suspended in a 100-foot radius of the animal until the animal is relocated by an approved biologist with appropriate handling permits from the Wildlife Agencies. Prior to relocation, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the salamander, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to USFWS and CDFW immediately. Any worker who inadvertently injures or kills a California tiger salamander or who finds dead, injured, or entrapped California tiger salamander(s) must immediately report the incident to the approved biologist.

CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat): If erosion control (BMP-2) is implemented within California tiger salamander modeled habitat (Figure 3-16), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that salamanders are not trapped (no monofilament). Coconut coir matting and fiber rolls with burlap are examples of acceptable erosion control materials. This limitation will be communicated to the contractor through use of special provisions included in the bid solicitation package.

CTS-7 (Rodent Control): CTS-7 only applies to projects that are within California tiger salamander modeled habitat (Figure 3-16) and on Covered Activities. Rodent control will be allowed only in developed portions of a Covered Activity project site. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Western Spadefoot

To avoid direct and indirect effects of Covered Activities on western spadefoot (*Spea hammondii*), the following AMMs will be implemented.

WS-1 (Western Spadefoot Work Window): Ground-disturbing Covered Activities within western spadefoot modeled habitat (Figure 3-17) will occur outside the breeding and dispersal season (after May 15 and before October 15), to the maximum extent practicable.

WS-2 (Western Spadefoot Exclusion Fencing): If Covered Activities must be implemented in modeled habitat (Figure 3-17) after October 15 and before May 15, exclusion fencing

will be installed around the project footprint before October 15, and the project site must be monitored by an approved biologist following rain events. Temporary high-visibility construction fencing will be installed along the edge of work areas, and silt fencing will be installed immediately behind the temporary high-visibility construction fencing to exclude western spadefoot from entering the construction area. Fencing will remain in place until all construction activities within the construction area are completed. No project activities will occur outside the delineated project footprint. If a western spadefoot is encountered, refer to WS-6, below.

WS-3 (Western Spadefoot Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-17) in the breeding and dispersal season (after October 15 and before May 15), an approved biologist experienced with western spadefoot identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site daily for western spadefoot prior to construction activities. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western spadefoot enters an active construction zone (i.e., outside the buffer zone). If a western spadefoot is encountered, refer to WS-6, below.

WS-4 (Avoid Western Spadefoot Entrapment): If a Covered Activity occurs in western spadefoot modeled habitat (Figure 3-17), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western spadefoot modeled habitat will be inspected for western spadefoot by the approved biologist prior to being moved. If a western spadefoot is encountered, refer to WS-6, below.

WS-5 (Erosion Control Materials in Western Spadefoot Habitat): If erosion control (BMP-2) is implemented within western spadefoot modeled habitat (Figure 3-17), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that western spadefoots are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WS-6 (Western Spadefoot Encounter Protocol): If Covered Activities must be implemented in modeled habitat (Figure 3-17) during the breeding and dispersal season (after October 15 and before May 15), and a western spadefoot is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the western spadefoot within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife immediately. Any worker who inadvertently injures or kills a western spadefoot or who finds dead, injured, or entrapped western spadefoot(s) must immediately report the incident to the approved biologist.

Giant Gartersnake

To avoid direct and indirect effects of Covered Activities on giant gartersnake (*Thamnophis gigas*), the following AMMs will be implemented.

GGS-1 (Giant Gartersnake Surveys): If the SSHCP giant gartersnake modeled habitat maps (Figure 3-18) show that modeled habitat for giant gartersnake is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate giant gartersnake aquatic habitat within the project footprint and adjacent areas within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-18, giant gartersnake aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, agricultural ditches, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide these maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated giant gartersnake habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as giant gartersnake habitat is identified and fully avoided. Otherwise, Covered Activities must comply with GGS-2 through GGS-8, below. See Chapter 10 for the process to conduct and submit survey information.

GGS-2 (Giant Gartersnake Work Window): Covered Activities that do not fully avoid giant gartersnake modeled habitat (Figure 3-18) will be conducted during the snake's active

season. Construction and ground-disturbing activities will be initiated after May 1 and will end prior to September 15. If it appears that construction activities may go beyond September 15, the Third-Party Project Proponent or Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1. The Local Land Use Permittee and the Implementing Entity will discuss with the Wildlife Agencies additional measures necessary to minimize take.

GGS-3 (Giant Gartersnake Monitoring): If a Covered Activity is occurring in giant gartersnake modeled habitat (Figure 3-18), an approved biologist experienced with giant gartersnake identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for giant gartersnake prior to construction activities. If a giant gartersnake is encountered, refer to GGS-7. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a giant gartersnake enters an active construction zone (i.e., outside the buffer zone).

GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion): If construction activities will occur in giant gartersnake aquatic habitat, aquatic habitat will be dewatered and then remain dry and absent of aquatic prey (e.g., fish and tadpoles) for 15 days prior to initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to giant gartersnake. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent snakes from attempting to move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify the construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Giant gartersnake habitat outside construction fencing will be avoided by all construction personnel. The fencing and the work area will be inspected by the approved biologist to ensure that the fencing is intact and that no snakes have entered the work area before the start of each work day. The fencing will be maintained by the contractor until completion of the project. If giant gartersnake is encountered, refer to GGS-7, below.

GGS-5 (Avoid Giant Gartersnake Entrapment): If a Covered Activity occurs in giant gartersnake modeled habitat (Figure 3-18), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or

provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within giant gartersnake modeled habitat will be inspected for giant gartersnake by the approved biologist prior to being moved. If a giant gartersnake is encountered, refer to GGS-7.

GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat): If erosion control (BMP-2) is implemented within giant gartersnake modeled habitat (Figure 3-18), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure snakes are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

GGS-7 (Giant Gartersnake Encounter Protocol): If a giant gartersnake is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the giant gartersnake within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a giant gartersnake or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

GGS-8 (Giant Gartersnake Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation. Refer to the U.S. Fish and Wildlife Service's (USFWS) Guidelines for the Restoration and/or Replacement of Giant Gartersnake Habitat (USFWS 1997), or the most current USFWS guidelines at the time of the

activity. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Western Pond Turtle

To avoid direct and indirect effects of Covered Activities on western pond turtle (*Actinemys marmorata*), the following AMMs will be implemented.

WPT-1 (Western Pond Turtle Surveys): If the SSHCP western pond turtle modeled habitat maps (Figure 3-19) show that modeled habitat for western pond turtle is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate western pond turtle aquatic habitat within the project footprint and within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-19, western pond turtle aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide those maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated western pond turtle habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as western pond turtle habitat is identified and fully avoided. Otherwise, Covered Activities must comply with WPT-2 through WPT-9. See Chapter 10 for the process to conduct and submit survey information.

WPT-2 (Western Pond Turtle Work Window): Maintenance and improvements to existing structures may occur throughout the year as long as western pond turtle habitat is identified and avoided, and movement of equipment is confined to existing roads. Otherwise, construction and ground-disturbing Covered Activities must be conducted outside of western pond turtle's active season. Construction and ground-disturbing activities will be initiated after May 1 and will commence prior to September 15. If it appears that construction activities may go beyond September 15, the appropriate Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1, to determine if additional measures are necessary to minimize take.

WPT-3 (Western Pond Turtle Monitoring): If a Covered Activity is occurring in western pond turtle modeled habitat (Figure 3-19), an approved biologist experienced with western pond turtle identification and behavior will monitor the project site, including the

integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for western pond turtle prior to construction activities. The approved biologist will also training construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western pond turtle enters an active construction zone (i.e., outside the buffer zone).

WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion): If construction activities will occur in western pond turtle aquatic habitat, aquatic habitat for the turtle will be dewatered and then remain dry and absent of aquatic prey (e.g., crustaceans and other aquatic invertebrates) for 15 days prior to the initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to western pond turtle. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent turtles from attempting to burrow or move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Western pond turtle habitat outside construction fencing will be avoided by all construction personnel. The fencing and work area will be inspected by the approved biologist to ensure that the fencing is intact and that no turtles have entered the work area before the start of each work day. Fencing will be maintained by the contractor until completion of the project. If, after exclusion fencing and dewatering, western pond turtles are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will discuss the next best steps with the Implementing Entity and Wildlife Agencies.

WPT-5 (Avoid Western Pond Turtle Entrapment): If a Covered Activity occurs within western pond turtle modeled habitat (Figure 3-19), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western pond turtle modeled habitat will be inspected for western pond turtle by the approved biologist prior to being moved.

WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat): If erosion control (BMP-2) is implemented within western pond turtle modeled habitat (Figure 3-19), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that turtles are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit): Covered Activity construction and maintenance vehicles will observe a 20-mile-per-hour speed limit within western pond turtle modeled upland habitat (Figure 3-19).

WPT-8 (Western Pond Turtle Encounter Protocol): If a western pond turtle is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the turtle, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a western pond turtle or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

WPT-9 (Western Pond Turtle Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation and placing appropriate artificial or natural basking areas in waterways and wetlands. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Tricolored Blackbird

To avoid direct and indirect effects of Covered Activities on tricolored blackbird (*Agelaius tricolor*), the following AMMs will be implemented.

TCB-1 (Tricolored Blackbird Surveys): If modeled habitat for tricolored blackbird is present within a Covered Activity's project footprint or within 500 feet of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting or foraging sites are present within the project footprint and adjacent areas within 500 feet of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Within the Plan Area, potential tricolor blackbird nest sites are often associated with freshwater marsh and seasonal wetlands, or in thickets of willow, blackberry, wild rose, thistle, and other thorny vegetation. Tricolored blackbirds are also known to nest in crops associated with dairy farms. Foraging habitat is associated with annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields (such as large tracts of alfalfa and pastures with continuous haying schedules and recently tilled fields), cattle feedlots, and dairies. The Third-Party Project Proponent will map all existing or potential nesting or foraging sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

TCB-2 (Tricolored Blackbird Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 500 feet of a project footprint if existing or potential nest sites were found during design surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and within 3 days of ground-disturbing activities, and within the proposed project footprint and 500 feet of the proposed project footprint to determine the presence of nesting tricolored blackbird. Pre-construction surveys will be conducted during the breeding season (March 1 through August 31). Surveys conducted in February (to meet pre-construction survey requirements for work starting in March) must be conducted within 14 days and 3 days in advance of ground-disturbing activities. If a nest is present, then TCB-3 and TCB-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and the Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

TCB-3 (Tricolored Blackbird Nest Buffer): If active nests are found within the project footprint or within 500 feet of any project-related Covered Activity, the Third-Party Project Proponent will establish a 500-foot temporary buffer around the active nest until the young have fledged.

TCB-4 (Tricolored Blackbird Nest Buffer Monitoring): If nesting tricolored blackbirds are present within the project footprint or within 500 feet of any project-related Covered

Activity, then an approved biologist experienced with tricolored blackbird behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place near the disturbance buffer. Work within the nest disturbance buffer will not be permitted. If the approved biologist determines that tricolored blackbirds are exhibiting agitated behavior, construction will cease until the buffer size is increased to a distance necessary to result in no harm or harassment to the nesting tricolored blackbirds. If the biologist determines that the colonies are at risk, a meeting with the Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will be held to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a tricolored blackbird flies into an active construction zone (i.e., outside the buffer zone).

TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves): On SSHCP Agricultural Preserves, pesticides (including herbicides) will not be applied from January 1 through July 15.

Swainson's Hawk

To avoid direct and indirect effects of Covered Activities on Swainson's hawk (*Buteo swainsoni*), the following AMMs will be implemented.

SWHA-1 (Swainson's Hawk Surveys): If modeled habitat for Swainson's hawk (Figure 3-25) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a survey to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Nest sites are often associated with Riparian land cover, but also include lone trees in fields, trees along roadways, and trees around structures. Nest trees may include, but are not limited to, Fremont's cottonwood (*Populus fremontii*), oaks (*Quercus* spp.), willows (*Salix* spp.), walnuts (*Juglans* spp.), eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and Deodar cedar (*Cedrus deodara*). The Third-Party Project Proponent will map all existing and potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

SWHA-2 (Swainson's Hawk Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites were found during initial surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities to determine presence of nesting Swainson's hawk. Pre-construction surveys will be conducted during the breeding season (March 1 through September 15). If a nest is present, then SWHA-3 and SWHA-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

SWHA-3 (Swainson's Hawk Nest Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.25 mile disturbance buffer around the active nest until the young have fledged, with concurrence from the Wildlife Agencies.

SWHA-4 (Swainson's Hawk Nest Buffer Monitoring): If nesting Swainson's hawks are present within the project footprint or within 0.25 mile of any project-related Covered Activity, then an approved biologist experienced with Swainson's hawk behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting Swainson's hawks begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a Swainson's hawk flies into an active construction zone (i.e., outside the buffer zone).

Greater Sandhill Crane

To avoid direct and indirect effects of Covered Activities on greater sandhill crane (*Grus canadensis*), the following AMMs will be implemented.

GSC-1 (Greater Sandhill Crane Surveys): If modeled habitat for greater sandhill crane (Figure 3-22) is present within a Covered Activity's project footprint or within 0.5 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential roosting sites are present within the project footprint and adjacent areas within 0.5 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Roosting sites within the Plan Area are often associated with flooded fields, seasonal wetlands, and freshwater marsh. The Third-Party Project Proponent will map all existing or potential roosting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Roosting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

GSC-2 (Greater Sandhill Crane Pre-Construction Surveys): Pre-construction surveys will be required to determine if active roosting sites are present within a project footprint or within 0.5 mile of a project footprint if existing or potential roosting sites were found during initial surveys and construction activities will occur when wintering flocks are present within the Plan Area (September 1 through March 15). An approved biologist will conduct pre-construction surveys within 15 days of ground-disturbing activities, and within 0.5 mile of a project footprint, to determine presence of roosting greater sandhill cranes. Pre-construction surveys will be conducted September 1 through March 15, when wintering flocks are present within the Plan Area. If birds are present, then GSC-3, GSC-4, and GSC-5 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

GSC-3 (Greater Sandhill Crane Roosting Buffer): If active roosting sites are found within the project footprint or within 0.5 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.5 mile temporary roosting disturbance buffer around the roosting site until the cranes have left.

GSC-4 (Greater Sandhill Crane Visual Barrier): Greater sandhill cranes have low tolerance for human disturbance, and such disturbance has caused cranes to abandon foraging and roosting sites. Repeat disturbance affects their ability to feed and store energy needed for survival. If project-related activities occur within 0.5 mile of a known roosting site as identified by surveys conducted during implementation of GSC-1 or GSC-2, a visual barrier will be constructed.

GSC-5 (Greater Sandhill Crane Roosting Buffer Monitoring): If roosting sites are found within the project footprint or within 0.50 mile of any project-related Covered Activity, an

approved biologist experienced with greater sandhill crane behavior will be retained by the Third-Party Project Proponent to monitor the roosting site throughout the roosting season and to determine when the birds have left. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary disturbance buffer can only occur with the written permission of the Implementing Entity and Wildlife Agencies. If greater sandhill cranes are abandoning their roosting and/or forage sites, the approved biologist will have the authority to shut down construction activities. If roost abandonment occurs, the approved biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid harm and harassment of individuals. The approved biologist will also train construction personnel on the avoidance procedures, buffer zones, and protocols in the event that greater sandhill cranes move into an active construction zone (i.e., outside the buffer zone).

Western Burrowing Owl

To avoid direct and indirect effects of Covered Activities on western burrowing owl (*Athene cunicularia*), the following AMMs will be implemented.

WBO-1 (Western Burrowing Owl Surveys): Surveys within modeled habitat are required for both the breeding and non-breeding season. If the project site falls within modeled habitat, an approved biologist will survey the project site and map all burrows, noting any burrows that may be occupied. Occupied burrows are often (but not always) indicated by tracks, feathers, egg shell fragments, pellets, prey remains, and/or excrement. Surveying and mapping will be conducted by the approved biologist while walking transects throughout the entire project site plus all accessible areas within a 250-foot radius from the project site. The centerline of these transects will be no more than 50 feet apart and will vary in width to account for changes in terrain and vegetation that can preclude complete visual coverage of the area. For example, in hilly terrain with patches of tall grass, transects will be closer together, and in open areas with little vegetation, they can be 50 feet apart. This methodology is consistent with current survey protocols for this species (California Burrowing Owl Consortium 1993). Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If suitable habitat is identified during the initial survey, and if the project does not fully avoid the habitat, pre-construction surveys will be required. Burrowing owl habitat is fully avoided if project-related activities do not impinge on a 250-foot buffer established by the approved biologist around suitable burrows. See Chapter 10 for the process to conduct and submit survey information.

WBO-2 (Western Burrowing Owl Pre-Construction Surveys): Prior to any Covered Activity ground disturbance, an approved biologist will conduct pre-construction surveys in all areas that were identified as suitable habitat during the initial surveys. The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the project site, particularly in areas within 250 feet of construction activities. To maximize the likelihood of detecting owls, the pre-construction survey will last a minimum of 3 hours. The survey will begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total), or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites. A minimum of two pre-construction surveys will be conducted (if owls are detected on the first survey, a second survey is not needed). All owls observed will be counted and their location will be mapped. Surveys will conclude no more than 2 calendar days prior to construction. Therefore, the Third-Party Project Proponent must begin surveys no more than 4 days prior to construction (2 days of surveying plus up to 2 days between surveys and construction). To avoid last-minute changes in schedule or contracting that may occur if burrowing owls are found, the Third-Party Project Proponent may also conduct a preliminary survey up to 15 days before construction. This preliminary survey may count as the first of the two required surveys as long as the second survey concludes no more than 2 calendar days in advance of construction.

WBO-3 (Burrowing Owl Avoidance): If western burrowing owl or evidence of western burrowing owl is observed on the project site or within 250 feet of the project site during pre-construction surveys, then the following will occur:

During Breeding Season: If the approved biologist finds evidence of western burrowing owls within a project site during the breeding season (February 1 through August 31), all project-related activities will avoid nest sites during the remainder of the breeding season or while the nest remains occupied by adults or young (nest occupation includes individuals or family groups foraging on or near the site following fledging). Avoidance is establishment of a minimum 250-foot buffer zone around nests. Construction and other project-related activities may occur outside of the 250-foot buffer zone. Construction and other project-related activities may be allowed inside of the 250-foot non-disturbance buffer during the breeding season if the nest is not disturbed, and the Third-Party Project Proponent develops an avoidance, minimization, and monitoring plan that is approved by the Implementing Entity and Wildlife Agencies prior to project construction based on the following criteria:

- The Implementing Entity and Wildlife Agencies approve of the avoidance and minimization plan provided by the project applicant.

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline nesting and foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl nesting and foraging behavior in response to construction activities.

If there is any change in owl nesting and foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer. Construction cannot resume within the 250-foot buffer until any owls present are no longer affected by nearby construction activities, and with written concurrence from the Wildlife Agencies.

If monitoring by the approved biologist indicates that the nest is abandoned prior to the end of nesting season and the burrow is no longer in use, the non-disturbance buffer zone may be removed if approved by the Wildlife Agencies. The approved biologist will excavate the burrow in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl to prevent reoccupation after receiving approval from the Wildlife Agencies.

The Implementing Entity and Wildlife Agencies will respond to a request from the Third-Party Project Proponent to review the proposed construction monitoring plan within 21 days.

During Non-Breeding Season: During the non-breeding season (September 1 through January 31), the approved biologist will establish a minimum 250-foot non-disturbance buffer around occupied burrows. Construction activities outside of this 250-foot buffer will be allowed. Construction activities within the non-disturbance buffer will be allowed if the following criteria are met to prevent owls from abandoning over-wintering sites:

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities.
- If there is any change in owl foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer.
- If the owls are gone for at least 1 week, the Third-Party Project Proponent may request approval from the Implementing Entity and Wildlife Agencies that an approved biologist excavate usable burrows and install one-way exclusionary

devices to prevent owls from re-occupying the site. After all usable burrows are excavated, the buffer zone will be removed and construction may continue.

Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.

WBO-4 (Burrowing Owl Construction Monitoring): During construction of Covered Activities, 250-foot construction buffer zones will be established and maintained around any occupied burrow. An approved biologist will monitor the site to ensure that buffers are enforced and owls are not disturbed. The approved biologist will also train construction personnel on avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.

WBO-5 (Burrowing Owl Passive Relocation): Passive relocation is not allowed without the express written approval of the Wildlife Agencies. Passive owl relocation may be allowed on a case-by-case basis on project sites during the non-breeding season (September 1 through January 31) with the written approval of the Wildlife Agencies if the other measures described in this condition preclude work from continuing. Passive relocation must be done in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl. Passive relocation will only be proposed if the burrow needing to be removed or with the potential to collapse from construction activities is the result of a Covered Activity. If passive relocation is approved by the Wildlife Agencies, an approved biologist can passively exclude birds from their burrows during the non-breeding season by installing one-way doors in burrow entrances. These doors will be in place for 48 hours to ensure that owls have left the burrow, and then the biologist will excavate the burrow to prevent reoccupation. Burrows will be excavated using hand tools only. During excavation, an escape route will be maintained at all times. This may include inserting an artificial structure into the burrow to avoid having materials collapse into the burrow and trap owls inside. Other methods of passive relocation, based on best available science, may be approved by the Wildlife Agencies over the 50-year Permit Term.

WBO-6 (Burrowing Owl Timing of Maintenance Activities): All activities adjacent to existing or planned Preserves, Preserve Setbacks, or Stream Setback areas will be seasonally timed, when safety permits, to avoid or minimize adverse effects on occupied burrows.

WBO-7 (Rodent Control): Rodent control will be allowed only in developed portions of a Covered Activity project site within western burrowing owl modeled habitat. Where rodent control is allowed, the method of rodent control will comply with the methods of

rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Covered Raptor Species

To avoid direct and indirect effects of Covered Activities on covered raptor species, the following AMMs will be implemented. This measure applies to Cooper's hawk (*Accipiter cooperii*), loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). The following AMMs do not apply to ferruginous hawk (*Buteo regalis*), as they do not nest in the Plan Area. The following AMMs also do not apply to Swainson's hawk or burrowing owl, as specific AMMs have been developed for these covered raptor species.

RAPTOR-1 (Raptor Surveys): If modeled habitat for a covered raptor species (Figures 3-20, 3-23, 3-24, or 3-28) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

RAPTOR-2 (Raptor Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present with a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites are found during initial surveys and construction activities will occur during the raptor breeding season. An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities within the proposed project footprint and within 0.25 mile of the proposed project footprint to determine presence of nesting covered raptor species. Pre-construction surveys will be conducted during the raptor breeding season. If a nest is present, then RAPTOR-3 and RAPTOR-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

RAPTOR-3 (Raptor Nest/Roost Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project

Proponent will establish a 0.25 mile temporary nest disturbance buffer around the active nest until the young have fledged.

RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring): If project-related Covered Activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an approved biologist experienced with raptor behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting raptors begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist/monitor will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a covered raptor species flies into an active construction zone (i.e., outside the buffer zone).

Western Red Bat

To avoid direct and indirect effects of Covered Activities on western red bat (*Lasiurus blossevillii*), the following AMMs will be implemented.

BAT-1 (Winter Hibernaculum Surveys): If modeled habitat (Figure 3-30) for western red bat is present within 300 feet of a Covered Activity's project footprint, then an approved biologist will conduct a field investigation of the project footprint and adjacent areas within 300 feet of a project footprint to determine if a potential winter hibernaculum is present, and to identify and map potential hibernaculum sites. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If potential hibernaculum sites are found, the Third-Party Project Proponent will note their locations on project designs and will design the project to avoid all areas within a 300-foot buffer around the potential hibernaculum sites. Winter hibernaculum habitat is fully avoided if project-related activities do not impinge on a 300-foot buffer established by the approved biologist around an existing or potential winter hibernaculum site. See Chapter 10 for the process to conduct and submit survey information.

BAT-2 (Winter Hibernaculum Pre-Construction Surveys): If the Third-Party Project Proponent elects not to avoid potential winter hibernaculum sites within the project footprint plus a 300-foot buffer, additional surveys are required. Prior to any ground disturbance related to Covered Activities, an approved biologist will conduct a pre-construction survey within 3 days of ground-disturbing activities within the project footprint and 300 feet of the project footprint to determine the presence of winter hibernaculum sites. Pre-construction surveys will be conducted during the winter hibernaculum season (November 1 through March 31). If a winter hibernaculum is present, then BAT-3 and BAT-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

BAT-3 (Winter Hibernaculum Buffer): If active winter hibernaculum sites are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will establish a 300-foot temporary disturbance buffer around the active winter hibernaculum site until bats have vacated the hibernaculum and the Implementing Entity and Wildlife Agencies concur.

BAT-4 (Bat Eviction Methods): An approved biologist will determine if non-maternity and non-hibernaculum day and night roosts are present on the project site. If necessary, an approved biologist will use safe eviction methods to remove bats if direct impacts to non-maternity and non-hibernaculum day and night roosts cannot be avoided. If a winter hibernaculum site is present, Covered Activities will not occur until the hibernaculum is vacated, or, if necessary, safely evicted using methods acceptable to the Wildlife Agencies.

5.5 How Conditions on Covered Activities are Applied to Various Urban Development Permit Types Approved by the Land Use Authority Permittees

Covered Activities can be approved by Land Use Authority Permittees at different scales. For example, master plans (including specific plans, comprehensive plans, and special planning areas) generally include large areas of land, and other permit types (conditional use permits, grading permits, and building permits) can apply over a range of project footprints. The process that Land Use Authority Permittees will use to approve Covered Activities in these planning documents is described in Chapter 10. See Table 5-2 for a list of projects and activities that are considered Covered Activities.

Geology and Soils for Environmental Impact Report

References: (at end of document)

Dear Mr. Carpenter:

With your authorization of 25 April 2019, Youngdahl Consulting Group, Inc. has completed an evaluation of potential impacts detailed on the Geology and Soils section of the California Environmental Quality Act Appendix G Environmental Checklist Form. Section VI of this forms starts with the statement "Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving" and then lists categories ranging from fault rupture to soils inadequate for septic systems. This document addresses each item on this list pertaining to geology and soils as well as mineral resources. This report does not address paleontological resources.

If you have any questions regarding this information, please contact us.

Very truly yours,
Youngdahl Consulting Group, Inc.

1.0 Geology and Soils

This report identifies existing soil and geologic conditions and analyzes the potential for the proposed project to affect these resources. Information presented in the discussion and subsequent analysis was primarily drawn from the following sources:

- Geotechnical Engineering Report, Grantline Properties, (Wallace-Kuhl & Associates, Inc. 2004).
- Regional geologic maps and fault maps prepared by the California Department of Conservation's California Geological Survey (formerly the Division of Mines and Geology), the United States Geological Survey, and the California Department of Water Resources.
- Soil maps and information provided by the United States Department of Agriculture, Natural Resources Conservation Service.

Specific reference information is provided in Section 3 of this report.

1.1 Regional Geologic Framework

The Preserve is located within the northern portion of the Sacramento Valley, which, together with the San Joaquin Valley, comprises the Great Valley geomorphic province (California Geological Survey, 2002). The Great Valley is a forearc basin composed of thousands of feet of sedimentary deposits that has undergone periods of subsidence and uplift over millions of years (USGS, 1990). The Great Valley basin began to form during the Jurassic period as the Pacific oceanic plate was subducted underneath the adjacent North American continental plate (Howard, 1979). The subduction zone and associated trench shifted 80 miles seaward to the present location of the Coast Ranges, and a new trench formed offshore; buckling at the edge of the new continent creating a forearc basin. In the western portion of the Great Valley, Upper Jurassic to Upper Cretaceous rock sequences rest on Upper Jurassic oceanic crust sequences (USGS, 1990). In contrast, the eastern portion of the Great Valley is composed of shallow Pleistocene nonmarine deposits. These deposits overly Cenozoic deposits that cover a layer of Cretaceous marine/deltaic deposits, which in turn rests on the metamorphic and igneous rocks of the Sierra Nevada—the western edge of the continental margin (California Geological Survey, 1987).

During the Jurassic and Cretaceous periods of the Mesozoic era, the area of the Great Valley existed as a marine depositional environment. By the end of the Mesozoic, the northern portion of the Great Valley began to fill with considerable granitic debris as tectonic forces caused uplift of the basin (Howard, 1979).

The following formations were deposited in the Cenozoic Era:

The Ione Formation was deposited in the Eocene Age at the edge of an inland sea. In the Micoene, depositions of the Mehrten Formation (mostly dark andesitic sands, occasional conglomerate lenses, and reworked ash beds) occurred in the Sacramento Valley. Deposition of the Mehrten Formation continued into the early Pliocene era (Howard, 1979).

The Laguna Formation was deposited in the Sacramento Valley starting in the Pliocene era, continuing into the early Pleistocene era (Howard, 1979). The Laguna is composed of tan to brown, volcanic rich sediments, with grain sizes ranging from clay to silt and sand; with minor granitic and metamorphic input. The Fair Oaks Formation is composed of light brown granitic sands rich in quartz and biotite with some silt and clay present north of the American River, deposited from Pliocene into the early Pleistocene eras, on top of the Laguna Formation.

The Arroyo Seco Gravels are rounded gravels with a red matrix derived from granite, and with clasts that are mainly metamorphic and andesitic pebbles and cobbles; this unit was deposited in the Pleistocene era and forms a caprock in the Sacramento area (Department of Water Resources, 1974). The California Geological Survey classifies these materials as Turlock Lake Formation. The Victor Formation, unconsolidated gravel, sand, silt and clay from a granitic source was deposited (DWR, 1974). The Modesto Formation, consisting of unconsolidated gravels, sand, silt, and clay from a granitic source was deposited largely near stream channels in the late Pleistocene Era (Association of Engineering Geologists, 2001).

In the Holocene era, after the last glaciation, stream flows dropped and streams became undersized compared to the valleys, with alluvium consisting of unconsolidated gravel, sand, silt, and clay, deposited along stream channels (Shlemon, et al, 2000).

Most of the surface of the Great Valley is covered with Holocene and Pleistocene-age alluvium. This alluvium is composed of sediments from the Sierra Nevada to the east and the Coast Range to the west, which were carried by water and deposited on the valley floor. Siltstone, claystone, and sandstone are the primary types of sedimentary deposits.

1.2 Geologic Setting

The California Geological Survey has the Preserve area mapped as being underlain by the Pliocene Age Laguna Formation and some Quaternary Age Alluvium (California Geological Survey, 2011).

1.3 Project Area Topography

The topography of the Preserve is generally flat with elevations ranging from approximately 220 feet above mean sea level, where Morrison Creek leaves the property, to approximately 255 feet at the high point along the north boundary.

1.4 Project Area Geology

The Preserve is underlain by the aforementioned Cretaceous Period marine/deltaic deposits, the Ione Formation, the Mehrten Formation, and the Laguna Formation, with some alluvium. The Department of Water Resources (DWR, 1974) provides a geologic cross section just south of the Preserve presenting the aforementioned formations and water bearing zones, with Arroyo Seco Gravels indicated in the topmost 20 to 50 feet. The Arroyo Seco Gravels are not shown on the California Geological Survey Map of 2011.

1.5 Soils

1.5.1 Surface Soils

The soils in the area have been mapped by the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) and are described in their online web-based database (websoilsurvey.sc.egov.usda.gov) accessed on 7 June 2019. Soils in the Preserve are shown on the soil map in Appendix A, which contains the Custom Soil Resource Report. These soil characteristics are summarized on Table 1.

According to the Soil Resource Report, there are four individual soil map units within the Preserve area. These include the Hicksville gravely loam, 0-2 percent slopes comprising approximately 21.4 percent of the project area; the Red Bluff loam, 2 to 5 percent slopes and comprises approximately 7.2 percent of the project area; the Red Bluff-Redding complex, 0 to 5 percent slopes and comprises about 38.3 percent of the project area,; and the Redding gravely loam, 0 to 8 percent slopes and comprises approximately 33.1 percent of the project area.

The Hicksville gravelly loam, 0 to 2 percent slopes, extends to a depth of approximately 65 inches and is moderately well drained. Its parent material is alluvium. Typically, the surface layer is gravely loam about 13 inches thick. The subsoil is gravely clay loam from 13 to 43 inches, and stratified very gravely sandy loam to clay loam, from 43 to 65 inches.

The Red Bluff loam, 2 to 5 percent slopes, extends to a depth of approximately 68 inches and is well drained. Its parent material is alluvium. Typically, the surface layer is loam about 8 inches thick. The subsoil is clay loam from 8 to 43 inches and gravely clay loam from about 43 to 68 inches.

The Red Bluff-Redding complex, 0 to 5 percent slopes, extends to a depth of approximately 68 inches and is well drained. Typically, the surface layer is loam about 8 inches thick. The subsoil is clay loam from approximately 8 to 43 inches, and is gravelly clay loam from about 43 to 68 inches.

The Redding gravelly loam, 0 to 8 percent slopes, extends to a depth of approximately 35 inches and is moderately well drained. The surface layer is typically gravelly loam about 8 inches in thickness. The subsoil is gravelly loam from about 8 to 19 inches, clay from approximately 19 to 22 inches, and cemented gravelly material from around 22 to 35 inches.

Table 1 – Soil Characteristics

Soil Map Unit	Map Unit Symbol	Shrink-Swell Potential[1]	Permeability[2]	Water Erosion Hazard (Factor K)[3]	Wind Erosion Hazard[4]	Runoff Rating[5]	Concrete Corrosivity	Steel Corrosivity	Limitations for buildings and Roads
Hicksville gravely loam, 0 – 2 percent slopes	159	0.31	Moderately High	0.17	7	C/D	Low	High	Very limited, flooding, shrink-swell
Red Bluff Loam, 2 to 5 percent slopes	192	0.50	Moderately High	0.37	6	C	Moderate	High	Somewhat limited, shrink-swell
Red Bluff-Redding complex, 0 to 5 percent slopes	193	0.50	Moderately High	0.37	6	C	Moderate	High	Somewhat limited, shrink-swell
Redding gravelly loam, 0 to 8 percent slopes	198	0.99	Moderately High	0.28	6	D	Moderate	High	Somewhat limited, depth to saturated zone

[1] The NRCS online soil database uses 0 – 1 values to describe factors such as shrink-swell potential with 0 being very low and 1.0 being very high.
[2] NRCS Saturated hydraulic conductivity (Ksat) refers to the ease with which pores in a saturated soil transmit water based on NRCS class limits.
[3] Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and saturated hydraulic conductivity (Ksat). Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.
[4]A wind erodibility group (WEG) consists of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible.
[5] Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms. The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows: Group A soils have a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission. Group B soils have a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission. Group C soils have a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission. Group D soils have a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high-water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission. If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

1.5.2 Subsurface Conditions

Based on a subsurface exploration program conducted by Wallace-Kuhl & Associates (2004), subsurface soil conditions in the Preserve area consisted of a heterogenous mixture of materials. Soils were observed to consist of clayey silty sands, clayey sands, clayey sandy silts, and silty sandy clays (as categorized using the Unified Soil Classification versus the United States Department of Agriculture Classification used by the NRCS) containing varying amounts of gravel from the surface to a depth of about two to four feet below the existing ground surface. In some areas, these soils extended to depths of as much as 10 feet. Underlying these relatively fine-grained soils were clayey and silty, gravel and cobbles to maximum 11-foot depth of exploration.

According to the California Department of Water Resources Water Data Library Web Site, the ground elevation in Well 385707N1211868W001 located approximately ½-mile southeast of the Preserve area was at an elevation of approximately 76 feet above mean sea level, about 185 below the ground surface, in April of 2019.

1.5.3 Soil Corrosion Potential

Wallace-Kuhl & Associates (2004) submitted two soil samples for corrosivity analyses that included determination of the soil pH, minimum resistivity, and chloride and sulfate concentrations. Their findings were that the native soils are not unusually corrosive to steel reinforcement properly embedded within Portland cement concrete but may be potential corrosive to buried metal pipe. They concluded that, based upon the chloride and sulfate concentrations, ordinary Type I/II Portland cement is considered to be suitable for use on this project, assuming minimum concrete cover is maintained over steel reinforcement.

1.5.4 Naturally Occurring Asbestos

The California Code of Regulations, Section 93105, regulates construction and mining in materials containing naturally occurring asbestos. The Sacramento Metropolitan Air Quality Management District has designated parcels in Eastern Sacramento County to be in a zone subject to this regulation based upon geologic mapping by the California Geological Survey. The Preserve area is **not** within one of these mapped zones and is therefore not subject to regulations regarding naturally occurring asbestos.

1.6 Seismicity and Faults

Primary Seismic Hazards

Surface Rupture and Faulting

The purpose of the Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act) is to regulate development near active faults to mitigate the hazard of surface rupture. Faults in an Alquist-Priolo Zone are typically active faults. The Alquist-Act defines an active fault as one that has exhibited surface displacement within the Holocene epoch (the last 11,000 years; a late Quaternary fault as one that has had surface displacement within the past 700,000 years, a Quaternary fault (age undifferentiated) is a fault that has shown surface displacement at some point during quaternary time (the past 1.6 million years); and pre-Quaternary fault is one that has had surface displacement before the Quaternary period (California Geological Survey, 2018).

According to the California Geological Survey (2010), there are no mapped faults within or near the Preserve area. Wallace-Kuhl & Associates, Inc. (2004) did not address the seismicity of the Preserve area.

The nearest mapped potentially active and active faults pertinent to the site are summarized in the following table.

Table 2: Local Active and Potentially Active Faults within a 100-Kilometer Radius of the Preserve Area

Status	Fault Name	Distance, Direction	
Active	Dunnigan Hills	62 km	NW
Active	Green Valley Fault	95 km	W
Active	Cordelia Fault	92 km	W
Late Quaternary	Bear Mountains Fault Zone - West	15 km	E
Late Quaternary	Bear Mountains Fault Zone - East	23 km	E
Quaternary (age undifferentiated)	Maidu Fault	28 km	NE
Late Quaternary	Melones - West	28 km	E
Late Quaternary	Melones - East	31 km	E

km = kilometer, W = west, E = east, NE = northeast

A total of eight faults and/or fault zones were identified as potential seismic sources within a 100-kilometer (km) radius of the Preserve area. The ones expected to have the greatest impact due to their proximity to the Preserve area are faults associated with the Foothills fault system. The foothills Fault System is located along the western flank of the Sierra Nevada. The most recent event on the Foothills fault system was the 1975 Oroville earthquake (magnitude 5.6 on the moment magnitude scale).

1.6.1 Ground Shaking Hazard

The intensity of ground shaking resulting from an earthquake is a function of the size (energy release) of the earthquake, the duration of the energy release, the distance from the subject location, and the ability of the geologic materials to transmit the energy. In general, the greater the energy release and the closer the center of release (epicenter) to the site, the greater the intensity of the ground shaking. Different soils will respond differently ground shaking; with strong enough ground shaking, buildings can be damaged, slopes can fail, and when saturated sands are present, liquefaction can occur.

Earthquake magnitude is generally expressed as Richter Magnitude for earthquakes less than 4.0 magnitude and Moment Magnitude for earthquakes greater than 4.0 magnitude. Earthquake size, as measured by the Richter Scale is a well-known, but not well understood, concept (USGS website, accessed 11 June 2019). The idea of a logarithmic earthquake magnitude scale was first developed by Charles Richter in the 1930's for measuring the size of earthquakes occurring in southern California using relatively high-frequency data from nearby seismograph stations. This magnitude scale was referred to as ML, with the L standing for local. This is what was to eventually become known as the Richter magnitude.

As more seismograph stations were installed around the world, it became apparent that the method developed by Richter was strictly valid only for certain frequency and distance ranges. In order to take advantage of the growing number of globally distributed seismograph stations, new magnitude scales that are an extension of Richter's original idea were developed. These include body wave magnitude (Mb) and surface wave magnitude (Ms). Each is valid for a particular frequency range and type of seismic signal. In its range of validity, each is equivalent to the Richter magnitude.

Because of the limitations of all three magnitude scales (ML, Mb, and Ms), a new, more uniformly applicable extension of the magnitude scale, known as moment magnitude, or Mw, was developed. In particular, for very large earthquakes, moment magnitude gives the most reliable estimate of earthquake size.

Moment is a physical quantity proportional to the slip on the fault multiplied by the area of the fault surface that slips; it is related to the total energy released in the earthquake. The moment can be estimated from seismograms (and also from geodetic measurements). The moment is then converted into a number similar to other earthquake magnitudes by a standard formula. The result is called the moment magnitude. The moment magnitude provides an estimate of earthquake size that is valid over the complete range of magnitudes, a characteristic that was lacking in other magnitude scales.

Ground shaking is described using two methods: ground acceleration as a fraction of the acceleration of gravity, expressed in units of “g”, and the Modified Mercalli scale, which is a descriptive method using 12 levels of intensity denoted by Roman Numerals. Modified Mercalli intensities range from I (shaking that is not felt), to XII (total damage).

The Preserve area is in a region of California characterized by low historical seismic activity and a low ground-shaking hazard. The 2017 amended County of Sacramento General Plan Safety element shows the project to be in an area of nearly the lowest ground shaking potential. The California Office of Statewide Planning and Health Development (OSHPD) online calculator accesses Unite States Geological Survey data to estimate ground motions and provided an estimated maximum credible earthquake (MCE) ground acceleration of 0.161 g for the Preserve area assuming a site class of D for stiff soils (Appendix B).

Secondary Seismic Hazards

Liquefaction and Associated Hazards

Liquefaction is the sudden loss of soil shear strength and sudden increase in porewater pressure caused by shear strains, as could result from an earthquake. Research has shown that saturated, loose to medium-dense sands with a silt content less than about 25 percent and located within the top 40 feet are most susceptible to liquefaction and surface rupture/lateral spreading.

The Preserve area is not in a mapped liquefaction zone. The 2017 Amended County of Sacramento General Plan Safety Element (County of Sacramento, 2017) shows the Preserve to be in an area with a medium to high potential for subsidence, but this includes impacts from groundwater extraction as well as from shaking.

Due to the absence of permanently elevated groundwater table and the relatively low seismicity of the area, the potential for seismically induced damage due to liquefaction, surface ruptures, and settlement is considered minimal.

Seismically induced and Static Slope Failures
The topography of the Preserve Area is gently rolling to flat. The project is not in a mapped landslide zone. There are no significant slopes that could fail.

Other Hazards
Other geologic hazards (volcanic activity, tsunami, seiche, and mudflow) that could be experienced in the larger region are not likely to affect the Preserve.

1.7 Minerals

Under the Surface Mining and Reclamation Act (SMARA), the State Mining and Geology Board may designate certain mineral deposits as being regionally significant to satisfy future needs. The Board's decision to designate an area is based on a classification report prepared by CGS and on input from agencies and the public. The Preserve lies within the designated Sacramento-Fairfield Production-Consumption Region for Portland cement concrete aggregate, which includes all designated lands within the marketing area of the active aggregate operations supplying the Sacramento-Fairfield urban center.

In compliance with SMARA, the California Division of Mines and Geology (CDMG, 1988, 1999) has established the classification system shown in Table 3 to denote both the location and significance of key extractive resources.

Table 3 - California Division of Mines and Geology
Mineral Land Classification System

Classification	Description
MRZ-1	Areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence.
MRZ-2	Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists.
MRZ-3	Areas containing mineral deposits, the significance of which cannot be evaluated from existing data
MRZ-4	Areas where available data are inadequate for placement in any other mineral resource zone
Note: MRZ = Mineral Resource Zone Source: Dupras 1988	

The Preserve area is classified as MRZ-3 for Portland Cement-grade aggregate—an area where the significance of mineral deposits cannot be evaluated from existing data. The California Division of Mines and Geology (1984, 1988, 1999) indicates that the Preserve is classified as either MRZ-3 or MRZ-4 for Placer gold, copper, zinc, and industrial minerals (i.e., carbonate rock, clay, sand, lignite, talc, asbestos). The Preserve is zoned MRZ-1 (no known deposits) for chromite. According to the City of Rancho Cordova General Plan (2006) the Preserve area is not listed as a locally-important mineral resource recovery site.

2.0 Environmental Impacts

Methods of Analysis - Geology, Soils, and Seismicity
Impacts related to geology, soils, and seismicity were evaluated based available data (maps, soil surveys, reports), and professional judgement. This analysis focuses on the proposed project's potential to result in the risk of personal injury, loss of life, and damage to property as a result of existing geologic and geotechnical conditions within the project area.

This analysis of impacts assumes that the project applicant would conform to the latest stormwater pollution prevention requirements, County and other plan policies, standards, and ordinances. This analysis also assumes that geotechnical investigations would be performed to evaluate the potential for the presence of soft and/or loose soils, unstable slopes, surface fault rupture, ground shaking, liquefaction hazard, slope stability, and expansive soils. Additional site-specific analysis would occur prior to final design.

Methods of Analysis - Minerals
The proposed projects potential to affect mineral resources was evaluated by examining the project footprint in comparison to resource locations mapped by the California Geological Survey.

2.1 Thresholds of Significance

In accordance with Appendix G of the State of California's CEQA Guidelines, the proposed project would be considered to have a significant effect if it would result in any of the following conditions:

1) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving: (1) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to division of Mines and Geology Special Publication 42.
2) Result in substantial soil erosion or the loss of topsoil?
3) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?
4) Be located on expansive soil, as defined in Chapter 18 of the California Building Code (2016), creating substantial risks to life and property?
5) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?
6) Result in the loss of availability of a known mineral resource that would be of value to regions and the residents of the state?
7) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

2.2 Impacts and Mitigation Measures

Impact GEO-1: Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving: (1) rupture of a known

earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42; (2) Strong seismic ground shaking; (3) seismic-related ground failure, including liquefaction; and (4) Landslides (less than significant).

The project area is not identified as being within an Alquist-Priolo Zone. There is no evidence of recent (i.e., Holocene) faulting with the project area and no active faults are mapped at or near the project area (California Geological Survey 2010). This impact would be less than significant.

The project area is an area of low ground shaking hazard. However, a large earthquake on a nearby fault could cause minor ground shaking in the vicinity of the project, potentially resulting in an increased risk of structural loss, injury, or death. Liquefaction and related hazards such as lateral spreading and differential settlement have the potential to compromise the structural integrity of proposed new facilities and cause injury. The construction of the project will fall under the requirements of the California Building Code and any additional requirements of the City of Rancho Cordova. A preliminary geotechnical engineering evaluation has been completed (Wallace-Kuhl & Associates, Inc., 2004) but does not meet the requirements of Chapter 18 of the California Building Code for geotechnical investigations. Detailed geotechnical investigations meeting the requirements of the California Building Code will be required. The investigations will provide foundation design recommendations that will mitigate these impacts. Additionally, the design of structures must consider projected ground accelerations due to earthquakes and must follow California Building Code requirements. Therefore, the impact for ground shaking hazard to result in loss, injury, or death due to liquefaction, dynamic compaction, seismically induced settlement, or lateral spreading is considered to be less than significant.

There are no significant natural slopes in the project area. Slopes may be constructed (i.e. stormwater basins). Slopes will be designed according to California Building Code requirements so the potential for seismically induced slope instability is considered to be negligible. This impact would be less than significant.

To summarize, due to the relatively low seismicity of the area, the requirement to design foundations, structures, and embankments according to California Building Code requirements, which takes into account the projected seismicity, and the lack of significant natural slopes, the potential for seismically induced damage is considered negligible.

Impact GEO-2: Result in substantial soil erosion or the loss of topsoil (less than significant).

Grading, excavation, removal of vegetation cover and loading activities associated with construction could temporarily increase erosion, runoff, and sedimentation. Construction activities could also result in soil compaction and wind erosion effects that could adversely affect soils and reduce the revegetation potential at construction sites and staging areas.

However, requirements under Section 402 of the Federal Clean Water Act, the Construction Activities Storm Water Construction General Permit (Order No. 2009-009-DWQ as amended by 2010-0014-DWQ and 2012-006-DWQ), a Stormwater Pollution Prevention Plan (SWPPP) would be developed by qualified stormwater developers and

practitioners and implemented during construction. The SWPPP would be kept onsite during construction activity and made available upon request to representatives of the City or Rancho Cordova, the County of Sacramento, and the Central Valley Regional Water Quality Control Board. The SWPPP would identify pollutant sources that may affect the quality of stormwater associated with construction activity, and identify stormwater pollution prevention measures to be implemented to reduce pollutants in stormwater discharges during and after construction. Therefore, the SWPPP would also include a description of potential pollutants and hazardous materials present on site during construction (including vehicle and equipment fuels). The SWPPP would include details of how the sediment and erosion control practices (best management practices or BMPs) would be implemented. Implementation of the SWPPP would comply with county, state, and federal water quality requirements.

In addition to the SWPPP, adherence to the Sacramento Stormwater Quality Partnership Municipal Stormwater Permit (MS4) would minimize any effects from erosion, runoff, and sedimentation. Accordingly, this impact would be less than significant.

Impact GEO-3: Be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project and potentially result in an onsite or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse (less than significant).

The topography of the project area is gentle, with no significant slopes. The potential for lateral spreading, subsidence, liquefaction, or collapse will be evaluated by geotechnical studies; these studies will make recommendations for engineering design to mitigate these potential conditions. This impact would be less than significant.

Impact GEO-4: Be located on expansive soil, as defined in Chapter 18 of the California Building Code, creating substantial risks to life or property (less than significant).

The preliminary geotechnical evaluation (Wallace-Kuhl & Associates, Inc., 2004), reported the presence of clay with a moderately high expansion potential and recommend that the proper handling of clay soils will be an important aspect of site development. The NRCS reports soil shrink-swell potentials for the project area to range from 0.31 to 0.99 using a scale of 0 to 1.0 where 1.0 represents a high potential. Expansive soils have the potential to compromise the structural integrity of project features, which could be a significant impact. However, in order to meet California Building Code Chapter 18 requirements, the project applicant's geotechnical engineer will be responsible for conducting final geotechnical evaluations of the on-site soils to further determine the extent of soils with adverse-shrink swell properties prior to grading and construction activities. Based on subsurface conditions, the project applicant's geotechnical engineers will make recommendations for project elements designs to accommodate for the effects of expansive soils. Corrective actions may include excavation of potentially problematic soils during construction and replacement with engineered backfill, ground treatment processes, and direction of surface water away from foundation soils. The projected applicants will select one or more of these measures in consultation with qualified engineers before grading activities begin, ensuring that this impact would be less than significant.

Impact GEO-5: Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems in areas where sewers are not available for the disposal of wastewater (no impact).

The project would be connected to sewer lines of the local wastewater systems, not septic systems. Therefore, there would be no impact. No mitigation is required.

Impact GEO-6: Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state (less than significant).

The Preserve area is classified as MRZ-3 for Portland Cement-grade aggregate—an area where the significance of mineral deposits cannot be evaluated from existing data. The California Division of Mines and Geology (1984, 1988, 1999) indicates that the Preserve is classified as either MRZ-3 or MRZ-4 for Placer gold, copper, zinc, and industrial minerals (i.e., carbonate rock, clay, sand, lignite, talc, asbestos). The Preserve is zoned MRZ-1 (no known deposits) of chromite. According to the City of Rancho Cordova General Plan (2006) the Preserve area is not listed as a locally-important mineral resource recovery site. There are no existing or potential mineral resources identified that would be of value to the region or the residents of the state, and the impact would be less than significant.

Impact GEO-7: Result in the loss of availability of a locally important mineral resource site delineated on a local general plan, specific plan, or other land use plan (no impact).

The City of Rancho Cordova General Plan does not identify any locally important mineral resources within the Preserve area. Also, the project area does not contain any mineral resources that have not been considered in the City of Rancho Cordova General Plan. Since there are no locally important mineral resources or recovery sites identified in this plan there would be no impact.

Custom Soil Resources Report for Sacramento County, California

United States Department of Agriculture

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Sacramento County, California

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sacramento County, California
Survey Area Data: Version 17, Sep 14, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Dec 31, 2009—Aug 8, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
159	Hicksville gravelly loam, 0 to 2 percent slopes, occasionally flooded	60.4	21.4%
192	Red Bluff loam, 2 to 5 percent slopes	20.4	7.2%
193	Red Bluff-Redding complex, 0 to 5 percent slopes	108.0	38.3%
198	Redding gravelly loam, 0 to 8 percent slopes, MLRA 17	93.4	33.1%
Totals for Area of Interest		**282.2**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Sacramento County, California

159—Hicksville gravelly loam, 0 to 2 percent slopes, occasionally flooded

Map Unit Setting

National map unit symbol: hhn3
Elevation: 80 to 230 feet
Mean annual precipitation: 17 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 275 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Hicksville and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hicksville

Setting

Landform: Terraces, terraces, hills
Landform position (two-dimensional): Toeslope, summit
Landform position (three-dimensional): Crest, tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 13 inches: gravelly loam
H2 - 13 to 43 inches: gravelly clay loam
H3 - 43 to 65 inches: stratified very gravelly sandy loam to clay loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Moderately well drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): Moderately high (0.20 to 0.57 in/hr)
Depth to water table: About 0 inches
Frequency of flooding: Occasional
Frequency of ponding: None
Available water storage in profile: Moderate (about 7.6 inches)

Interpretive groups

Land capability classification (irrigated): 2w
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: C/D
Ecological site: LOAM STREAM TERRACE (R017XD081CA)
Hydric soil rating: No

Minor Components

Corning

Percent of map unit: 3 percent

Hydric soil rating: No

Creviscreek
Percent of map unit: 3 percent
Hydric soil rating: No

Columbia
Percent of map unit: 2 percent
Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Hydric soil rating: Yes

Cosumnes
Percent of map unit: 2 percent
Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Hydric soil rating: Yes

Pentz
Percent of map unit: 2 percent
Hydric soil rating: No

Redding
Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, hardpan deeper depths
Percent of map unit: 1 percent
Hydric soil rating: No

192—Red Bluff loam, 2 to 5 percent slopes

Map Unit Setting
National map unit symbol: hhp5
Elevation: 200 to 800 feet
Mean annual precipitation: 30 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 250 to 280 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition
Red bluff and similar soils: 80 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Red Bluff

Setting
Landform: Terraces
Landform position (two-dimensional): Toeslope

Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 8 inches: loam
H2 - 8 to 25 inches: clay loam
H3 - 25 to 43 inches: clay loam
H4 - 43 to 68 inches: gravelly clay loam

Properties and qualities

Slope: 2 to 5 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): Moderately high (0.20 to 0.57 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water storage in profile: Moderate (about 7.9 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: C
Ecological site: LOAMY (R017XD045CA)
Hydric soil rating: No

Minor Components

Redding

Percent of map unit: 7 percent
Hydric soil rating: No

Xerorthents

Percent of map unit: 7 percent
Hydric soil rating: No

Unnamed

Percent of map unit: 2 percent
Landform: Depressions
Hydric soil rating: Yes

Unnamed, hardpan soil

Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, steeper slopes

Percent of map unit: 2 percent
Hydric soil rating: No

193—Red Bluff-Redding complex, 0 to 5 percent slopes

Map Unit Setting

National map unit symbol: hhp6
Elevation: 100 to 1,500 feet
Mean annual precipitation: 14 to 30 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 230 to 320 days
Farmland classification: Not prime farmland

Map Unit Composition

Red bluff and similar soils: 45 percent
Redding and similar soils: 40 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Red Bluff

Setting

Landform: Terraces
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 8 inches: loam
H2 - 8 to 25 inches: clay loam
H3 - 25 to 43 inches: clay loam
H4 - 43 to 68 inches: gravelly clay loam

Properties and qualities

Slope: 2 to 5 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): Moderately high (0.20 to 0.57 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water storage in profile: Moderate (about 7.9 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: C
Ecological site: LOAMY (R017XD045CA)
Hydric soil rating: No

Description of Redding

Setting

Landform: Terraces
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Gravelly alluvium

Typical profile

H1 - 0 to 7 inches: gravelly loam
H2 - 7 to 20 inches: gravelly loam
H3 - 20 to 28 inches: gravelly clay loam
H4 - 28 to 66 inches: indurated

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: About 20 inches to abrupt textural change; 28 to 66 inches to duripan
Natural drainage class: Moderately well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Very low (0.00 to 0.00 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water storage in profile: Very low (about 2.5 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4s
Hydrologic Soil Group: C
Ecological site: GRAVELLY LOAMY (R017XD090CA)
Hydric soil rating: No

Hydric soil rating: Yes

Unnamed, hardpan below 40 inches

Percent of map unit: 1 percent
Hydric soil rating: No

198—Redding gravelly loam, 0 to 8 percent slopes, MLRA 17

Map Unit Setting

National map unit symbol: 2w8bl
Elevation: 20 to 420 feet
Mean annual precipitation: 19 to 28 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 230 to 320 days
Farmland classification: Not prime farmland

Map Unit Composition

Redding and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Redding

Setting

Landform: Fan remnants
Landform position (two-dimensional): Summit
Landform position (three-dimensional): Tread, riser
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Loamy alluvium derived from igneous, metamorphic and sedimentary rock over clayey alluvium derived from igneous, metamorphic and sedimentary rock over cemented alluvium derived from igneous, metamorphic and sedimentary rock

Typical profile

A1 - 0 to 8 inches: gravelly loam
A2 - 8 to 15 inches: gravelly loam
A3 - 15 to 19 inches: gravelly loam
Bt - 19 to 22 inches: clay
2Bqm1 - 22 to 24 inches: cemented gravelly material
2Bqm2 - 24 to 35 inches: cemented gravelly material

Properties and qualities

Slope: 0 to 8 percent
Depth to restrictive feature: About 19 inches to abrupt textural change; 20 to 39 inches to duripan
Natural drainage class: Moderately well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low (0.00 in/hr)
Depth to water table: About 15 to 39 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline (0.2 to 0.5 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 2.0

Available water storage in profile: Very low (about 2.7 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: GRAVELLY LOAM (R015XD090CA)
Hydric soil rating: No

Minor Components

Keyes

Percent of map unit: 10 percent
Landform: Depressions
Hydric soil rating: No

Corning

Percent of map unit: 3 percent
Hydric soil rating: No

Unnamed, ponded

Percent of map unit: 2 percent
Landform: Fan remnants
Microfeatures of landform position: Vernal pools
Hydric soil rating: Yes

GRANT LINE ROAD AND RAYMER WAY
RANCHO CORDOVA, CALIFORNIA
GEOTECHNICAL PEER REVIEW

References: *Geology and Soils for The Preserve, Grant Line Road and Raymer Way, Rancho Cordova, California,* prepared by Youngdahl Consulting Group, Inc., dated June 2019 (YCG Project No. E17440.001).

Dear Mr. Stinson:

In accordance with your authorization of our proposal dated April 8, 2019, we have prepared this correspondence to present the results of our geotechnical peer review for the subject residential development in Rancho Cordova.

Our peer review was performed to provide a professional opinion on the appropriateness and adequacy of the referenced geotechnical report with respect to project conditions, regulatory requirements, and industry standards of practice. Our scope of geotechnical services consisted of:

- Performing a site visit to observe current site conditions.
- Reviewing the referenced geotechnical report and published documents, geologic maps and other geological and geotechnical literature pertaining to the site to aid in evaluating soil and geologic conditions.
- Preparing the correspondence.

SITE AND PROJECT DESCRIPTION

The site is comprised of six adjacent parcels (Sacramento County APN 072-0300-001, -002, -005, -008, -010 and -011) totaling approximately 285 acres on the western side of Raymer Way and Grant Line Road. The irregularly shaped site abuts the north and northeastern sides of the Somerset Ranch residential development. WGS 84 (Google Earth) site coordinates are N 38.5766°, W -121.1956°. Site topography generally consists of rolling hills and seasonal drainages. Morrison Creek enters near the northeast corner of the site and flows offsite near the middle of the western boundary. Three residences with associated ancillary structures are present in the southwest portion of the site – two on the southern side of Morrison Creek and one on the northern side.

Geologic mapping by the California Geological Survey (CGS) and United States Geological Survey (USGS) indicates the site is underlain by Tertiary age Laguna formation, an older consolidated alluvial deposit, and is located outside of the mapped area of dredge tailings that covers much of Rancho Cordova. The Morrison Creek drainage is mapped as Quaternary age alluvium. Artificial fills related to development of the existing residential properties, roadways and small stock ponds are also present.

We understand the project will rezone the property from agricultural and industrial land use to residential. The planned development will include 434 single-family lots, parks, 180 acres of nature preserve, and all related infrastructure including a municipal sanitary sewer system. The nature preserve will ultimately be transferred to a third-party conservation entity.

DISCUSSION

The referenced report was prepared to evaluate potential soils and geologic impacts from the planned project, as outlined in the Environmental Checklist Form in California Environmental Quality Act (CEQA) Appendix G for initial studies. The report also evaluates the potential loss of mineral resources based on mapping by the California Division of Mines and Geology (now CGS) and the City of Rancho Cordova General Plan.

We have reviewed the referenced report and conducted a site reconnaissance. Our observations at the site generally supported the above-described geologic conditions and those outlined in the referenced report. Based on our observations at the site and our subsequent review, it is our opinion that the report adequately addresses the soils, geologic and mineral resources items in the Environmental Checklist Form.

LIMITATIONS AND CLOSURE

Our professional services were performed, our findings obtained, and our recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices used in the site area at this time. No warranty is provided, express or implied.

Should you have any questions regarding this correspondence, or if we may be of further service, please contact the undersigned at your convenience.

Sincerely,

GEOCON CONSULTANTS, INC.

Subject: **THE PRESERVE**
Grant Line Road & Raymer Way, Rancho Cordova, California
Phase I Environmental Site Assessment

As requested, Youngdahl Consulting Group, Inc. (Youngdahl) has performed a Phase I Environmental Site Assessment (ESA) for the Preserve project, located west of Grant Line Road and north of Raymer Way in Rancho Cordova, California (Subject Property). Youngdahl identified recognized environmental conditions in connection with the subject property.

The trichloroethylene contamination plume from the Aerojet General Corporation Superfund site located north of the subject property encroaches onto some of the northern parcels of the subject property at a groundwater concentration above maximum contaminant levels creating a potential soil vapor intrusion scenario, which is considered a REC. Two steel pipes were observed protruding out of the ground within parcel 073-0010-011 (3450 Grant Line Road) and have a potential to be connected to an underground storage tank (UST), which is considered a REC. The residence and outbuildings within APN 072-0300-008 (12535 Douglas Road) were built sometime between 1975 and 1980, and the structures and soils adjacent to these structures have potential for containing lead-based paint; this has been identified to be a REC. Also, within APN 072-0300-008, an unknown underground system is present north-adjacent to an old shed which is considered a REC. All residences and major outbuildings of wood construction on the subject property besides within APN 072-0300-002 (12565 Douglas Road, Divine Property) have the potential for termiticides present in adjacent soils and are considered RECs. Furthermore, no historic RECs (HRECs) or controlled RECs (CRECs) were identified in connection with the property.

This Phase I Environmental Site Assessment has been completed in accordance to the ASTM Practice E 1527-13. Youngdahl Consulting Group, Inc. declares that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Very truly yours,
Youngdahl Consulting Group, Inc.

RANCHO CORDOVA, CALIFORNIA 95742

EXECUTIVE SUMMARY

The property description referred to herein is based on a Sacramento Assessor's Parcel Map and on a site reconnaissance performed by representatives of Youngdahl Consulting Group, Inc. (Youngdahl). These were also the basis for the "Vicinity Map" - Figure 1. The subject site is irregular in shape, consists of 283.5 acres of land, and is assigned the following Sacramento County Assessor's Parcel Numbers (APNs):

- 072-0300-001 (12555 Grant Line Road)
- 072-0300-002 (12565 Douglas Road, Divine Property)
- 072-0300-005 (12525 Douglas Road, Whitlow Property)
- 072-0300-008 (12535 Douglas Road)
- 072-0300-010 (No Address)
- 073-0010-011 (3450 Grant Line Road)

The subject property is primarily used for grazing land and residential homes with associated outbuildings within parcels 072-0300-002, -005, -008 and 073-0010-011. An orchard was observed in the northeastern corner of the subject site. The site is also located near known contamination areas associated with the Aerojet General Corporation National Priorities List Superfund Site (Aerojet General Corp.), and a monitoring well associated with the Superfund site was observed within subject property boundaries.

Adjacent Properties
North: Vacant land currently being mined for aggregate.
East: Grant Line Road and Teichert Aggregate Plant.
South: Residential Subdivision.
West: Vacant land.

Site Assessor
A site reconnaissance visit was conducted on 9 May 2019 by Mr. Dennis S. Eck, Youngdahl Consulting Group, Inc., (916) 933-0633, dse@youngdahl.net.

EP Certification
An environmental professional (EP) is defined as a person meeting the education, training, and experience requirements set forth in 40 CFR § 312.10(b). We declare that, to the best of our professional knowledge and opinion, we meet the definition of EP as defined in 40 CFR § 312.10 and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property.

AAI Certification
This Phase I Environmental Site Assessment (ESA) was conducted according to the American Society for Testing and Materials (ASTM) Designation E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM Phase I Standards). The ASTM E1527-13 standard is consistent with the requirement of the All Appropriate Inquiry (AAI) rule in Title 40 of the Code of Federal Regulations (40 C.F.R. § 312.10).

Data Gaps
According to § 3.3.20 of ASTM Standard E 1527-13 a data gap is a lack of or inability to obtain information required by the ASTM Standard despite good faith efforts to gather same. Data gaps may result from incompleteness in any of the activities required by the ASTM Standard. It is our opinion that no significant data gaps were identified.

Summary and Opinion
Recognized environmental conditions (RECs) are defined in the ASTM Phase I Standards to mean "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that post a material threat of a future release to the environment."

A contaminant plume of trichloroethylene (TCE) was discovered to encroach within some of the northern parcels. The 5 parts per billion (ppb) contour of TCE (the maximum contaminant level) extends to onsite and adjacent monitoring wells, but does not extend to any domestic wells identified on the subject property. **Although existing domestic wells aren't necessarily impacted, the presence of TCE within subject property boundaries has potential to create a soil vapor intrusion scenario and is considered a REC.**

Two steel pipes were observed protruding out of the ground within parcel 073-0010-011 (3450 Grant Line Road). An inactive well was also observed, and we understand that is currently permitted as inactive. **It is our opinion that the two protruding pipes have potential to be connected to an underground storage tank (UST), which is considered a REC**. The orchard that occupies a portion of this parcel and parcel 073-0010-010 was planted sometime between 1980 and 1984, as indicated by the historical aerial photography and topographic maps, which means that lead arsenate and organochlorine pesticides were not likely used.

The residence and outbuildings within APN 072-0300-008 (12535 Douglas Road) were built sometime between 1975 and 1980, and **the structures and soils adjacent to these structures have potential for containing lead-based paint; this has been identified to be a REC. Within APN 072-0300-008 is an unknown underground system found adjacent to the shed located north of the residence and a 55-gallon drum northeast from the residence with an unknown liquid inside; these are considered RECs if these vessels were used for fuel storage.**

All residences and major outbuildings of wood construction on the subject property besides within APN 072-0300-002 (12565 Douglas Road, Divine Property) have the potential for termiticides present in adjacent soils and are considered RECs.

Historic recognized environmental conditions (HRECs) is a term used to state that the property only includes a resolved or closed out REC that has been completely resolved ("clean closure") with no restrictions. **No HRECs were identified.** The term controlled REC (CREC) describes closed RECs that are managed under an activity and use limitation (AUL). **No CRECs were identified.**

Recommendations
It is the opinion of the Youngdahl Consulting Group Inc. that the following recommended actions be conducted for the identified RECs:

APN & Address	Identified REC	Recommendation
072-0300-001 (12555 Grant Line Road)	TCE groundwater plume identified by on-site monitoring well.	We recommend that a soil vapor investigation consisting of soil vapor sampling be conducted on the subject property.
072-0300-002 (12565 Douglas Road, Divine Property)	No RECs identified.	No recommendations.
072-0300-005 (12525 Douglas Road, Whitlow Property)	Potential termiticides within soils adjacent to the residence.	We recommend soil sampling near the footprint of the home at a depth of approximately 1 foot to be analyzed for termite pesticides.
072-0300-008 (12535 Douglas Road)	Lead based paint and termiticides in soils adjacent to all buildings. ACBM within all buildings. 55-gallon drum with unknown liquid. Potential underground tank/sump adjacent to shed north of residence. Potential vapor intrusion scenario from the TCE groundwater plume.	We recommend investigation of the potential underground system. Soils adjacent to the buildings should be sampled for total lead in surface soils and termite pesticides at a depth of approximately 1 foot. ACBM should be investigated at the main residence and shed northwest of the residence by a licensed asbestos contractor. Soil vapor sampling as part of a soil vapor intrusion investigation should be conducted.
072-0300-010 (No Address)	No RECs identified.	No recommendations.
073-0010-011 (3450 Grant Line Road)	Two pipes observed protruding from the ground south of the orchard and west from the former residence. Potential vapor intrusion scenario from the TCE groundwater plume.	The pipes are potentially connected to a UST and should be investigated. Soil vapor sampling as part of a soil vapor intrusion investigation should be conducted.

Additionally, all inactive wells that are not planned for future use should be destroyed per Sacramento County requirements. Domestic wells were observed to be within parcels 073-0010-011 (permitted inactive), 072-0300-002, 072-0300-005, and 072-0300-008.

1.0 INTRODUCTION

1.1 Purpose

This Phase I ESA was conducted according to the American Society for Testing and Materials (ASTM) Designation E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM Phase I Standards). The ASTM E1527-13 standards are consistent with the requirement of the All Appropriate Inquiry (AAI) rule in Title 40 of the Code of Federal Regulations (40 C.F.R. § 312.10).

The significant changes included in ASTM 1527-13 (approved December 2013) are as follows:

a) The definition of a recognized environmental condition (REC) has been narrowed to exclude a release inside a building from a source inside a building;
b) The term historic recognized environmental condition (HREC) has been clarified to state that it only includes a resolved or closed out REC that has been completely resolved ("clean closure") with no restrictions;
c) The term controlled REC (CREC) for closed RECs that are managed under an activity and use limitation (AUL) has been added;
d) If the target property or any of the adjoining properties is identified on one or more of the standard environmental record sources, pertinent regulatory files and/or records associated with the listing should be reviewed. Language has been added to Section 8.2.2 Regulatory File Reviews with the intent of having the environmental professional explain in greater detail their rational for when a regulatory file review is not warranted rather than simply stating that it is not a concern. "…the environmental professional must explain within the report the justification for not conducting a regulatory file review."
e) Language has been added to include soil vapor as one of the pathways of contamination to the subject property, along with ground water and soil. The soil vapor contaminant pathway needs to be considered in evaluation of RECs or other environmental concerns.

The ASTM practice is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA liability. The purpose of this Phase I ESA was to identify recognized environmental conditions which may affect the property. Recognized environmental conditions are defined in the ASTM Phase I Standards to mean "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that post a material threat of a future release to the environment". The term "recognized environmental condition" is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. De minimis conditions are not recognized environmental conditions.

Controlled substances (i.e. illegal drugs) are not included within the scope of this standard. Petroleum products are included within the scope of this practice because they are of concern with respect to many parcels of commercial real estate and current custom and usage is to include an inquiry into the presence of petroleum products when doing an ESA of commercial real estate. This practice does not address requirements of any state or local laws or of any federal laws other than the appropriate inquiry provisions of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA)'s landowner liability protection. Users are cautioned that federal, state, and local laws may impose environmental assessment obligations that are beyond the scope of this practice. Users should also be aware that there are likely to be other legal obligations with regard to hazardous substances or petroleum products discovered on the property that are not addressed in this practice and that may pose risks of civil and/or criminal sanctions for non-compliance. The scope of this practice includes research and reporting requirements that support the user's ability to qualify for landowner liability protection. As such, sufficient documentation of all sources, records, and resources utilized in conducting the inquiry required by this practice must be provided in the written report.

1.2 Detailed Scope of Services

This scope of services is site specific in that it relates to assessment of environmental conditions on a specific parcel of commercial real estate. The Phase I ESA will be performed by

an environmental professional. An environmental professional (EP) is defined as a person meeting the education, training, and experience requirements set forth in 40 CFR § 312.10(b). The scope of services for this Phase I ESA is as follows:

Government Records Review: Standard environmental record sources, including Federal, Tribal, and State lists as well as local sources of environmental records were reviewed. We authorized Environmental Data Resources (EDR) to conduct a search of specified government databases and produce a map-based radius search report which would identify sites within the approximate minimum distances pursuant to the ASTM E1527-13 Standard.

Review of Historical Sources: Historical records that may have been reviewed include, but are not limited to, aerial photographs, fire insurance (Sanborn®) maps, building department records, chain-of-title documents, city directory abstracts, land use records, and USGS Topographic Maps. The AAI rule requires that historical documents be reviewed as far back in time as the property contained structures or the property was used for agricultural, residential, commercial, industrial, or governmental purposes. Under the AAI rule, historical sources of information must be reviewed as far back as 1940. The AAI rule does not specify a research interval for reviewing historical records.

Site Reconnaissance: A site reconnaissance visit was conducted on 9 May 2019 by Mr. Dennis S. Eck, dse@youngdahl.net.

Interviews: Prior to the site visit, the Client was asked to identify a person with good knowledge of the property (the key site manager). A Phase I ESA Questionnaire completed by the Owner's representative to facilitate the collection of information is provided in Appendix A. The AAI rule requires interviews be conducted with the current owner(s) and occupant(s) of the subject property. The AAI rule also requires that additional interviews be conducted with current and past facility managers, past owners, operators or occupants of the property, and past employees, as necessary to meet the objectives of the AAI rule. The AAI rule allows the environmental professional to determine whether such interviews are necessary.

Identify Data Gaps: If a data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, the environmental professional will give the reasons for their exclusion. If data failure represents a significant data gap, the report shall comment on the impact of the data gap on the ability of the environmental professional to identify recognized environmental conditions. If the data gaps are found, the environmental professional can and does not warrant nor guarantee that no significant events, releases, or conditions arose during the periods of such data gaps.

Evaluation and Report Preparation: The findings, opinions, and conclusions in the Phase I ESA report are supported by documentation. The report: (1) describes all services performed; (2) has a findings section which summarizes known or suspect environmental conditions associated with the property, and which may include recognized environmental conditions, historical recognized environmental conditions, and de minimis conditions; (3) includes Youngdahl Consulting Group Inc.'s opinion(s) of the impact on the property of the known or suspect environmental conditions identified in the findings section as well as the logic and reasoning used in evaluating information collected during the course of the investigation; and (4) includes a conclusions and recommendations section that summarizes the recognized environmental conditions connected with the property and presents recommendations to address those conditions. The report will include an analysis of the relationship of the purchase price of the subject property to the fair market value of the property, if it were not contaminated.

Report Shelf Life: Under the AAI rule, a prospective property owner may use a Phase I ESA Report without having to update any information collected as part of the inquiry: (1) if the all appropriate inquiries investigation was completed less than 180 days prior to the date of acquisition of the property or (2) if the Phase I ESA report was prepared as part of a previous all appropriate inquiries investigation and was completed less than 180 days prior to the date of acquisition of the property. A prospective property owner may use a previously conducted Phase I ESA Report: (1) if the Phase I ESA report was prepared as part of a previous all appropriate inquiries investigation for the same property; and (2) if the information was collected or updated within one year prior to the date of acquisition of the property; and (3) certain aspects of the previously conducted report are conducted or updated within 180 days prior to the date of acquisition of the property. These aspects include the interviews, on-site visual inspection, the historical records review, the search for environmental liens, and the declaration by the environmental professional responsible for the assessment or update.

1.3 Significant Assumptions, Limitations, and Exceptions

This report and review of the subject property is limited in scope. All appropriate inquiry does not mean an exhaustive assessment of a clean property. There is a point at which the cost of information obtained or the time required to gather it outweighs the usefulness of the information and, in fact, may be a material detriment to the orderly completion of transactions. One of the purposes of the ASTM 1527-13 practice is to identify a balance between the competing goals of limiting the costs and time demands inherent in performing an ESA and the reduction of uncertainty about unknown conditions resulting from additional information. The appropriate level of inquiry will be guided by the type of property subject to assessment, the expertise and risk tolerance of the user, and the information developed in the course of the inquiry. This type of investigation is undertaken with the risk that the presence, full nature, and extent of contamination would not be revealed by visual observation and review of available data alone. The findings presented in this report were based on field observations and review of available data. Therefore, the data obtained is clear and accurate only to the degree implied by the sources and methods used. The information presented herewith was based on professional interpretation and on the data obtained. A review of regional radon values was performed as part of this study. A general discussion of the potential for asbestos-containing building material or lead-based paint to be present on the subject property is also included as part of this study.

1.4 Special Terms and Conditions and/or Additional Services

A Phase I ESA meeting or exceeding the ASTM 1527-13 practice and completed less than 180 days prior to the date of acquisition (the date on which a person acquires title to the subject property) or the date of the intended transaction is presumed to be valid. If within this period the assessment will be used by a different user than the user for whom the assessment was originally prepared, the subsequent user must also satisfy the User's Responsibilities set forth in Section 1.5. Users and environmental professionals may use information in prior environmental site assessments provided such information was generated as a result of procedures that meet or exceed the requirements of ASTM 1527-13.

1.5 User Responsibilities

The user should provide reasonably ascertainable land title records and judicial records for review for the existence of environmental liens or activity and use limitations (AUL), if any, that are currently recorded against the property. AULs are an explicit recognition by a federal, tribal, state, or local regulatory agency that residual levels of hazardous substances or petroleum products may be present on a property, and that unrestricted use of the property may not be acceptable. If the user is aware of any specialized knowledge or experience that is material to recognized environmental conditions in connection with the property, it is the user's

responsibility to communicate any information based on such specialized knowledge or experience to the environmental professional, and before the site reconnaissance is conducted.

In a transaction involving the purchase of a parcel of commercial real estate, the user shall consider the relationship of the purchase price of the property to the fair market value of the property if the property was not affected by hazardous substances or petroleum products. The user should try to identify an explanation for a lower price which does not reasonably reflect fair market value if the property were not contaminated, and make a written record of such explanation. If the user is aware of any commonly known or reasonable ascertainable information within the local community about the property that is material to recognized environmental conditions in connection with the property, it is the user's responsibility to communicate such information to the environmental professional before the site reconnaissance is conducted.

1.6 Reliance

This Phase I ESA has been prepared for and is intended for the use of Winn Communities and their consultants. This report is valid as of the date stated on the document; the report should not be relied upon for information concerning changes in the condition of the property after the report was prepared.

2.0 SITE INFORMATION

2.1 Site Description

The property description referred to herein is based on a Sacramento Assessor's Parcel Map and on a site reconnaissance performed by representatives of Youngdahl Consulting Group, Inc. (Youngdahl). These were also the basis for the "Vicinity Map" - Figure 1. The subject site is irregular in shape, consists of 283.5 acres of land, and is assigned the following Sacramento County Assessor's Parcel Numbers (APNs):

- 072-0300-001 (12555 Grant Line Road)
- 072-0300-002 (12565 Douglas Road, Divine Property)
- 072-0300-005 (12525 Douglas Road, Whitlow Property)
- 072-0300-008 (12535 Douglas Road)
- 072-0300-010 (No Address)
- 073-0010-011 (3450 Grant Line Road)

The subject property is primarily used for grazing land and residential homes with associated outbuildings are within parcels 072-0300-002, -005, -008 and 073-0010-011. An orchard was observed in the northeastern corner of the subject site. The site is also located near known contamination areas associated with the Aerojet General Corporation National Priorities List Superfund Site (Aerojet General Corp.), and a monitoring well associated with the Superfund site was observed within subject property boundaries.

2.2 Legal Description

This report presents the results of the Phase I Environmental Site Assessment (ESA) performed on Sacramento County APNs 072-0300-001, -002, -005, -008, -010 and 073-0010-011.

2.3 Environmental Liens or Activity and Use Limitations

A review of the title reports for each parcel and the completed environmental questionnaires (Appendix A) showed no indication of environmental liens or activity and use limitations for the properties (Appendix A).

2.4 Specialized Knowledge and Commonly Known or Reasonably Ascertainable Information

Mr. Whitlow and Mr. Divine indicated specialized knowledge of their respective properties on the completed questionnaires (Appendix A); Mr. Carpenter did not indicate specialized knowledge of the remaining parcels on his completed questionnaire (Appendix A).

2.5 Valuation Reduction for Environmental Issues

Mr. Divine marked "Unknown" for his parcel to the question regarding valuation reduction on the completed questionnaire (Appendix A). Mr. Whitlow and Mr. Carpenter marked "No" for the remaining parcels on the completed questionnaires (Appendix A).

2.6 Reasons for Performing the Phase I ESA

The user, Winn Communities, requested the completion of the Phase I ESA per ASTM E1527-13.

3.0 INTERVIEWS

3.1 Interviews with Past and Present Owners, Key Site Manager, and/or Occupant

072-0300-005 (12525 Douglas Road, Whitlow Property)
Mr. David Whitlow, property owner, was contacted by phone regarding this parcel. He informed us that they are currently in Missouri and are not full-time residents. A rancher who uses the property for grazing is the only individual currently taking care of the property. He also informed us that no other changes have occurred since the last site reconnaissance by Youngdahl in 2018.

072-0300-002 (12565 Douglas Road, Divine Property)
Mr. David Divine, property owner, was contacted by phone regarding this parcel. Mr. Divine is the current property owner and had mentioned that no changes have occurred since the last site visit by Youngdahl. When asked about the stained soils near the east garage, Mr. Divine mentioned that any staining may be from washing the lawnmower, which occurs near the east garage. Mr. Divine also informed us that the property at 072-0300-008 (12535 Douglas Road) was owned by a Mr. Tony Fagundes until approximately 2009. Mr. Divine mentioned that he helped Mr. Fagundes with some of the buildings on his property and that any 55-gallon drums may have been used for diesel fuel for a tractor. A number for Mr. Fagundes was provided to us.

072-0300-008 (12535 Douglas Road)
Mr. Tony Fagundes, past owner, was contacted by phone regarding this parcel. Mr. Fagundes informed us that he had lived at the property for 27 years prior to moving to the Auburn, CA area. He primarily used the property for raising farm animals and minor agriculture as dry crop wheat near the existing home. The west building was a workshop and garage. He also mentioned having a chicken coop and a stable building, located north of the residence. He had no information about the potential holding tank adjacent to the stable building. The domestic well located east of the home was fitted with a pressure system and filter which was also sampled monthly while Mr. Fagundes resided at the property. This was due to the potential encroachment of the Aerojet property contamination plume. Mr. Fagundes also mentioned that any 55-gallon drums he had on-site would have been used for mineral oil which is used in animal feed.

Mr. George Carpenter, Vice President, Winn Communities
Mr. Carpenter was contacted by phone regarding the remaining parcels. He mentioned that the inactive water well on 3450 Grant Line Road is planned to be destroyed as part of pre-

construction activities once the project is approved; also, the building was demolished due to a problem with vagrants trespassing and dumping at the property. He also was unaware of any activity and use limitations (AULs) for any of the properties regarding the contamination plume from Aerojet General Corp.

4.0 PHYSICAL AND GEOLOGICAL DESCRIPTION

4.1 Physical Setting Source(s)

Geologic maps and a current United States Geologic Society (USGS) 7.5 Minute Topographic Series Map of the Buffalo Creek Quadrangle, as well as observations made during our site reconnaissance were used to make interpretations regarding the physical setting of the subject property and the surrounding area. The elevation at the subject property ranges from approximately 210 to 260 feet above mean sea level and is located in Township 8 North, Range 7 East, Section 3, Mount Diablo Base & Meridian.

4.2 Regional Geology and Soil Description

The site is located in Rancho Cordova, California, which is found within the Great Valley geomorphic province. This province is an alluvial plain that drains via the Sacramento and San Joaquin Rivers into the San Francisco Bay area. According to the Preliminary Geologic Map of the Sacramento 30' x 60' Quadrangle, California (Gutierrez, 2011), the subject property and vicinity are underlain by the Laguna Formation and a thin strip of Quaternary Alluvium along the central drainage. The Laguna Formation consists of Tertiary age fluvial granitic sands and silts (Schlemon, 2000).

According to the Spring 2017 Department of Water Resources (DWR) well records, one irrigation well is located approximately ½ mile to the southeast. The most recent data obtained from the well on 11 October 2018 shows a groundwater depth of 183 feet below the ground surface (bgs). The sitewide groundwater elevation contour maps produced in 2018 by Geosyntec Consultants show each groundwater layer flowing towards the southwest in the vicinity of the subject property.

The United States Department of Agriculture Natural Resources Conservation Service's Web Soil Survey was accessed on 25 April 2019. Soils present on the site include:

- **7.5 Red Bluff Loam, 2 to 5 percent slopes (Map Unit Symbol 192)**
  Parent Material is alluvium, the unit is well drained, has a medium runoff class, and is prime farmland if irrigated.
- **37.8% Red Bluff-Redding Complex, 0 to 5 percent slopes (Map Unit Symbol 193)** Parent material is alluvium, the unit is well drained, has a medium runoff class, and is not prime farmland.
- **21.5% Hicksville Gravelly Loam, 0 to 2 percent slopes, Occasionally Flooded (Map Unit Symbol 159)** Parent material is alluvium, the unit is moderately well drained, has a medium runoff class, and is considered prime farmland if irrigated.
- **33.2% Redding Gravelly Loam, 0 to 8 percent slopes, MLRA 17 (Map Unit Symbol 198)**
  Parent material is Loamy alluvium over clayey alluvium over cemented alluvium all derived from igneous, metamorphic, and sedimentary rock; the unit is moderately well drained; has a very high runoff class; and is not considered prime farmland.

The Department of Conservation Division of Oil, Gas, and Geothermal Resources' Well Finder was accessed and identified no wells within the vicinity of the subject property.

4.3 Regional Radon Values

Elevated radon gas levels in indoor air are a result of radon moving into buildings from the soil, either by diffusion or flow due to air pressure differences. The ultimate source of radon gas in buildings is the uranium naturally present in rock, water, and soil. Some rock types are known to contain more uranium than others. In California, most uranium deposits are relatively small in aerial extent and are located in rural areas. Consequently, the chance of severe radon levels (>200 pCi/L) occurring in buildings in California should be very low. The following rock units in California contain uranium in concentrations above the crustal average: the Monterey Formation, asphaltic rocks, marine phosphatic rocks, granitic rocks, felsic volcanic rocks, and certain metamorphic rocks. According to EPA publication 402-R-93-025, entitled EPA's Map of Radon Zones, California, dated September 1993, Sacramento County is shown to be in Zone 3. Zone 3 has a predicted average radon screening level of less than 2 Pico Curies per Liter, this is considered to be a low value of geologic radon potential.

The California Department of Health Services, California Indoor Radon Levels Sorted by Zip Code was last updated February 2016. The number of tests does not necessarily represent the number of houses tested. A single house may have had several tests conducted. The table contains both long-term and short-term indoor radon measurements. The California Department of Health Services recommends that you take action to reduce radon levels in your house if they are 4pCi/L or greater. Of the 10 tests conducted for Zip Code 95742, 2 were equal to or greater than 4pCi/L.

4.4 Asbestos Containing Building Materials

Asbestos is a set of six naturally occurring silicate minerals used commercially for their desirable physical properties. They all have in common their eponymous, asbestiform habit: long, thin fibrous crystals. The prolonged inhalation of asbestos fibers can cause serious illnesses including malignant lung cancer, mesothelioma, and asbestosis. Asbestos became increasingly popular among manufacturers and builders in the late 19th century because of its sound absorption, average tensile strength, its resistance to fire, heat, electrical and chemical damage, and affordability. It was used in such applications as electrical insulation for hotplate wiring and in building insulation. When asbestos is used for its resistance to fire or heat, the fibers are often mixed with cement (resulting in fiber cement) or woven into fabric or mats.

Most products manufactured today do not contain asbestos. In the industrialized world, asbestos was phased out of building products mostly in the 1970s with most of the remainder phased out by the 1980s. Asbestos containing building materials in residences includes a variety of products, such as: stipple used in textured walls and ceilings; drywall joint filler compound; asbestos contaminated vermiculite, vinyl floor tile; vinyl sheet flooring; window putty; mastic; cement board; furnace tape; and stucco. Asbestos was used a lot in roofing materials, mainly corrugated asbestos cement roof sheets and asbestos shingles. Other sources of asbestos containing materials include fireproofing and acoustic materials. On July 12, 1989, EPA issued a final rule banning most asbestos-containing products. In 1991, this regulation was overturned by the Fifth Circuit Court of Appeals in New Orleans. As a result of the Court's decision, the following specific asbestos-containing products remain banned: flooring felt, roll board, and corrugated commercial, or specialty paper. In addition, the regulation continues to ban the use of asbestos in products that have not historically contained asbestos, otherwise referred to as "new uses" of asbestos. For buildings constructed prior to 1980 (Code of Federal Regulations 29 CFR 1926.11) all thermal system insulation and surface materials must be designated as presumed asbestos-containing building materials (ACBM) unless proved otherwise through sampling. The residences and associated outbuildings within APN 072-0300-008 (12535 Douglas Road) were built sometime between 1975 and 1980; therefore, there is risk that ACBM is present at these structures. All other structures on the subject property were found to have been built after 1980 and are unlikely to contain ACBM.

4.6 Lead-based Paint

Lead is considered to be a harmful environmental pollutant. In late 1991, the Secretary of the Department of Health and Human Services called lead the "number one environmental threat to the health of children in the United States." Humans are exposed to lead through the air, drinking water, food, contaminated soil, deteriorating paint, and dust. Airborne lead enters the body by breathing or swallowing lead particles or dust once it has settled. Old lead-based paint is the most significant source of lead exposure in the U.S. Lead-based paint in the United States resulted in a court case against the Lead Industries Association. Due in great part to studies carried out by Philip J. Landrigan, paint containing more than 0.06% (by weight of dried product) lead was banned for residential use in the United States in 1978 by the U.S. Consumer Product Safety Commission (16 Code of Federal Regulations CFR 1303). Most homes and other buildings built before 1960 contain heavily leaded paint. Some homes built as recently as 1978 may also contain lead paint. The residence and outbuildings within APN 072-0300-008 (12535 Douglas Road) were built sometime between 1975 and 1980 and potentially contain lead-based paint. The Whitlow property (APN 072-0300-005, 12525 Douglas Road) has a residence and associated outbuildings built sometime between 1980 and 1984; and the Divine property (APN 072-0300-002, 12565 Douglas Road) has a residence that was built in 1994; therefore, there is a low potential risk for lead-based paint.

4.7 Termiticides

Termiticides - organochlorine termiticides (OC termiticides) are a group of persistent pesticides that were formerly used for termite control in and around wooden structures from the mid-1940s to the late 1980s. These OC termiticides used in the past include chlordane, aldrin, dieldrin, heptachlor, and DDT. Chlordane and other organochlorine pesticides (OCPs) were commonly used as termiticides around structures until 1988. Above-ground use of chlordane was phased out between 1978 and 1983 by the United States Environmental Protection Agency (USEPA); although chlordane was used as a termiticide for wooden structures until it was prohibited in 1988. In 2004, the California Department of Toxic Substances Control (DTSC) evaluated OCPs in soil for proposed school sites on residential properties; finding chlordane in 98 percent of the samples, DDT in 95 percent, dieldrin in 71 percent, and heptachlor in 17 percent. DTSC implemented an “Interim Guidance Evaluation of School Sites with Potential Soil Contamination as a Result of Lead from Lead-Based Paint, Organochlorine Pesticides from Termiticides, and Polychlorinated Biphenyls from Electrical Transformers” in 2006. Due to the dates of construction, all wooden structures within the subject property except for the Divine Property (APN 072-0300-002, 12565 Douglas Road) are at risk of having termiticides present.

4.8 Pesticides

Prior to 1950, the use of arsenical pesticides and herbicides as lead arsenate (LA) was the most extensively used of the arsenal insecticides. The search for substitutes for LA began when it was discovered in 1919 that contemporary practices for washing produce were failing to adequately remove As residues (Shepard, 1939). Unfortunately, all of the tested alternative materials were found to provide less effective insect control or were more toxic to plants and animals. No adequate substitutes were found until 1947, when the synthetic organic insecticide dichlorodiphenyltrichloroethane (DDT) was introduced. Lead arsenate use in Washington State, USA, effectively terminated in 1948, when DDT became widely available to the public (Benson et al., 1968). Veneman et al. (1983) stated that LA use ceased in Massachusetts, USA, in the early 1950s. All insecticidal uses of LA in the USA were officially banned on 1 August 1988 (USEPA, 1988), with a comment that all registrations for insecticidal use had lapsed before that date.

Organochlorine pesticides (OCPs) were commonly used in the United States between the 1940s and 1970s for public health vector control, agricultural crop production, and pest control around structures. Although most OCPs were banned or withdrawn from use in the 1970s (including DDT), the compounds remain in the environment where surface soils associated with historical agricultural and termite control pesticides are present (DTSC, 2010).

An orchard is visible starting in the 1984 historical aerial photo at the northeast corner of the subject site within APNs 073-0010-011 (3450 Grant Line Road) and 073-0010-010. The orchard is not shown in the 1980 topographic map. Due to the date in which this orchard was created, it is unlikely that lead arsenate pesticides or OCPs are present.

5.0 HISTORICAL SOURCES REVIEW

All obvious uses of the property shall be identified from the present, back to the property's first developed use, or back to 1940, whichever is earlier. The term "developed use" includes agricultural uses and placement of fill dirt. Standard historical sources shall be reviewed at approximately five-year intervals. In an effort to fulfill due diligence requirements, Youngdahl Consulting Group, Inc. employed the services of Environmental Data Resources, Inc. (EDR) to provide the following standard historical sources: aerial photographs, USGS topographic maps, local city directories, and fire insurance maps (Sanborn Maps). Standard historical sources may also include: property tax files, recorded land title records, building department records, and zoning/land use records.

5.1 Aerial Photographic Review

Aerial photographs for the years 1937, 1952, 1957, 1964, 1966, 1972, 1984, 1993, 1998, 2006, 2009, 2012, and 2016 were provided in the EDR Aerial Photo Decade Package (Appendix B). Interpretations were made in an effort to evaluate former uses of the subject property and adjacent areas, and to determine if any significant topographic or cultural changes have occurred. All photographs were provided at a scale of 1" = 500'. A summary of the photographs reviewed is provided below.

Date	Source	Comments
1937	USDA	The entire subject property consists of vacant land with natural vegetation growth, a creek/drainage (Morrison Creek) is observed to be flowing through the center of the site trending generally northeast-southwest. Grant Line Road is adjacent the northeast corner and continues to the south. The north adjacent property appears to have not been cleared or disced and has more vegetation. The south, west, and east adjacent properties are observed to be vacant.
1952	USGS	Portions of land within the property boundary that are not within major drainages and ephemeral ponds are observed to have been disced. Dredge tailings are visible to the northwest of the subject property.
1957	USDA	No significant changes to the subject property are visible. The southeast adjacent property is observed to be transitioning to be used as an orchard.
1964	USDA	No significant changes to the subject property are visible apart from additional discing. The southeast adjacent property is now a large orchard.
1966	USGS	No changes apart from additional discing of the general area is apparent.
1972	USDA	No changes apart from additional discing of the general area is apparent.

Date	Source	Comments	
1984	USDA	072-0300-002 12565 Douglas Rd (Divine Property)	This parcel is vacant with a section of the south observed to be disced. A residence is observed in the south adjacent parcel.
		072-0300-005 12525 Douglas Rd (Whitlow Property)	A residence, at least two outbuildings, and unknown objects are observed in the east-center of this parcel. Standing water is also visible in the northwest corner. An access road trending north-south is visible to the east of the parcel and continues to the north adjacent parcel.
		072-0300-008 12535 Douglas Rd	A residence is observed in the southwest corner of this parcel. A pond with standing water is observed in the north adjacent property of this parcel.
		073-0010-011 3450 Grant Line Rd	A residence with an outbuilding to its west and other smaller objects are observed in the northeast corner of this parcel. An orchard occupies the area north of the residence, east of Morrison Creek.
		072-0300-010 No Address	The orchard within the west adjacent parcel continues into this parcel.
		072-0300-001 12555 Grant Line Rd	This parcel is vacant with an ephemeral pool in the approximate center.
1993	USDA	072-0300-002 12565 Douglas Rd (Divine Property)	No significant changes observed.
		072-0300-005 12525 Douglas Rd (Whitlow Property)	No significant changes observed.
		072-0300-008 12535 Douglas Rd	One residence and an outbuilding to its north are visible. Several smaller structures, possibly sheds, are visible to the northeast of the residence. Two areas to the southeast and southwest of the residence are observed to have a few rows of unknown crop. The southeast corner of the parcel has standing water within the section of drainage.
		073-0010-011 3450 Grant Line Rd	No significant changes observed.
		072-0300-010 No Address	No significant changes observed. A small structure/object is visible in the north adjacent property.
		072-0300-001 12555 Grant Line Rd	No significant changes observed.
1998	USGS/DOQQ	072-0300-002 12565 Douglas Rd (Divine Property)	A single home surrounded by landscaping is now visible in the center of the parcel. Unimproved access roads and trails are visible running throughout the parcel.

Date	Source	Comments	
		072-0300-005 12525 Douglas Rd (Whitlow Property)	No significant changes observed.
		072-0300-008 12535 Douglas Rd	A building is now visible just northwest from the main residence.
		073-0010-011 3450 Grant Line Rd	No significant changes observed.
		072-0300-010 No Address	No significant changes observed. Two structures are now visible in the north adjacent property.
		072-0300-001 12555 Grant Line Rd	No significant changes observed.
2006	USDA/NAIP	072-0300-002 12565 Douglas Rd (Divine Property)	A fire break has been cleared just north of the residence. An additional structure is visible to the east of the residence. The south adjacent parcel is now partially graded.
		072-0300-005 12525 Douglas Rd (Whitlow Property)	No significant changes observed. The south adjacent parcel is now partially graded.
		072-0300-008 12535 Douglas Rd	No significant changes observed.
		073-0010-011 3450 Grant Line Rd	No significant changes observed.
		072-0300-010 No Address	No significant changes observed.
		072-0300-001 12555 Grant Line Rd	No significant changes observed.
2009	USDA/NAIP	072-0300-002 12565 Douglas Rd (Divine Property)	The terrain is observed to be discolored south of the residence within this parcel. The adjacent southern property has been graded into building pads with paved access roads for a future subdivision.
		072-0300-005 12525 Douglas Rd (Whitlow Property)	No significant changes observed. The adjacent southern property has been graded into building pads with paved access roads for a future subdivision.
		072-0300-008 12535 Douglas Rd	No significant changes observed.
		073-0010-011 3450 Grant Line Rd	No significant changes observed.
		072-0300-010 No Address	No significant changes observed.
		072-0300-001 12555 Grant Line Rd	No significant changes observed.
2012	USDA/NAIP	No significant changes to the parcels within the subject property are observed.	
2016	USDA/NAIP	No significant changes to the parcels within the subject property are observed. The south adjacent property now has residential homes within the partially complete subdivision.	

5.2 Review of Historical and Current USGS Topographic Maps

A topographic map is a color-coded line-and-symbol representation of natural and selected artificial features plotted to a scale. Topographic maps show the shape, elevation, and development of the terrain in precise detail by using contour lines and color-coded symbols. The EDR Historical Topographic Map Report (Appendix B) provided maps dated 1891 to 2012. Interpretations were made in an effort to evaluate former uses of the subject property and adjacent areas, and determine if any significant topographic or cultural changes have occurred.

Date	Map Name	Series	Comments
1891	Sacramento, CA	30 Minute	No features are shown within the subject property boundary. Roads and some drainage features are shown in the north and south portions of the map.
1892-1893	Sacramento, CA	30 Minute	No significant changes to the subject and adjacent properties are shown.
1908	Buffalo Creek, CA	7.5 Minute	Topographic information only extends to the area just west of the subject property and does not include the site. A highway in the south is shown trending east-west.
1916	Buffalo Creek, CA	15 Minute	Another topographic map appears to be stitched to the east and does not appear to match this region. The subject site sill lies within areas with no topographic data.
1941	Folsom, CA	15 Minute	Morrison Creek is shown in the central portion of the subject site trending roughly northeast-southwest. Unimproved and light duty roads are shown throughout the area. A boundary or tract depicting a land grant, mining claim, or donation land claim is shown along the east property boundary, trending northeast-southwest. Mine tailings are shown to the west, north, and east from the subject site. A cluster of buildings is shown in the north portion of the map.
1944	Folsom, CA	15 Minute	No significant changes to the subject and adjacent properties are shown.
1954	Buffalo Creek, CA	7.5 Minute	No significant changes to the subject property are shown. Tailings to the north and west appear more extensive.
1967	Buffalo Creek, CA	7.5 Minute	No significant changes to the subject property are shown. Grant Line Road is shown at the northeast property boundary. Douglas Road is shown south of the subject property. A cluster of large buildings is shown at the intersection of Nimbus Road (shown as private) and Douglas Road, southwest from the subject property.
1975	Buffalo Creek, CA	7.5 Minute	No significant changes to the subject and adjacent properties are shown.
1980	Buffalo Creek, CA	7.5 Minute	An unimproved road and single building are shown in the west side of the subject property within 12535 Douglas Road (072-0300-008). Another building is shown near the northeast corner of the subject property (073-0010-011).

Date	Map Name	Series	Comments
2012	Buffalo Creek, CA	7.5 Minute	Only major roadways, topography, and water features are depicted in this map. Roadways within a small subdivision are shown south of the subject site. An additional subdivision is shown in the southwest corner of the map.

5.3 Historical City Directory Abstract Review

EDR provided the EDR-City Directory Image Report for review and a copy is provided in Appendix B. Building directories including city, cross reference and telephone directories were reviewed, if available, at approximately five-year intervals for the years spanning 1970 through 2013.

Date	Address	Directory Listing
2014	12535 Douglas Road (Subject Property)	Antonio V Fagundes
2014	12565 Douglas Road (Subject Property)	Occupant Unknown
2014	3417 Grant Line Road	Teichert & Son Inc.
2014	3450 Grant Line Road (Subject Property)	Tamra Harper

5.4 Certified Sanborn Map Report

No Sanborn Map coverage was identified for the subject property.

5.5 Previously Completed Environmental Assessments

Phase I Environmental Site Assessment of 12565 Douglas Road, prepared by EMG Corp., September 2015

This report included the barn structure and green waste disposal areas in the north and south, but did not include the single-family residence. The report identifies the adjacent Aerojet contamination plume, but notes that the project site would not be investigated as a source of the contamination. They concluded that contamination does not pose immediate health risk to future occupants due to the project building not being serviced by potable water. Additionally, it is mentioned that the plume does not extend to the private well located near the residence adjacent to the west. No further action or investigation was recommended regarding the off-site regulatory review.

Phase I Environmental Site Assessment for Divine Property, prepared by Youngdahl Consulting Group Inc., December 2017

This environmental site assessment was conducted on the Divine property at 12565 Douglas Road (APN 072-0300-002) located at the south-center portion of the subject property of this 2019 report. The conclusions of this report were as follows:

"Buried green waste can generate methane gas that can subsequently become a soil gas intrusion hazard when explosive amounts can accumulate. The observed green waste is not buried and is able to vent methane directly to the atmosphere.

Also, a contaminant plume of trichloroethylene (TCE) was discovered near the subject site. The United States Environmental Protection Agency's (USEPA) maximum contaminant level (MCL) for TCE in drinking water is 5 ppb. Although the 5 ppb contour of TCE is present near the northwest corner of the project site, it does not extend to the private well located west of the existing property; therefore, it is our opinion that it does not pose a human health risk. ***No RECs were identified in connection with the subject property.****"*

Unfinalized Phase I Environmental Site Assessment for Douglas 98, prepared by Youngdahl Consulting Group, Inc., May 2018

This assessment was conducted on the Whitlow property located at 12525 Douglas Road (APN 072-0300-005) which is the southwest corner parcel of the subject property of this 2019 report. The RECs discovered for this assessment included the potential presence of lead-based paint and termiticides to be present near the residence, well house, cattle shed, and shed/shop building. Also, there was potential for ACBM within the residence, shop/shed building, and well house which were also considered RECs. Chromated Copper Arsenate within soils adjacent to wood poles observed on this site were considered to be de minimis. The RECs were concluded based off the historic aerial photography and topographic map data provided during preparation of the 2018 report. RECs identified for this current report differ from the conclusions of the former report due to additional data provided by EDR.

6.0 REGULATORY RECORDS REVIEW

The records review consisted of a review of reasonably ascertainable environmental record sources, physical setting sources, and historical use information that will help identify recognized environmental conditions in connection with the property. Reasonably ascertainable record information must be publicly available, obtainable from its source within reasonable time and cost constraints, and be practically reviewable.

6.1 Commercial Database Search Review

In an effort to fulfill due diligence requirements, Youngdahl Consulting Group, Inc. employed the services of Environmental Data Resources, Inc. (EDR) to identify sites listed on regulatory agency databases within approximate minimum search distances from the subject property with potential of existing environmental problems. The term "approximate minimum search distances" means the distances within the area which government records must be reviewed pursuant to ASTM Phase I Standards. The term "minimum search distance" is used in lieu of radius as to include irregularly shaped properties. A current EDR Radius Map with GeoCheck® (EDR Report) was provided by EDR on 1 May 2019 (Appendix C). Included in the report are the dates the original government sources were updated and the dates the sources were last updated by EDR, as well as a list of acronyms used by EDR.

The EDR Radius Map with GeoCheck® (EDR Report) identified seven (7) sites within minimum search distances listed in multiple databases:

- **Aerojet General Corporation**; Highway 50 and Aerojet Road; within subject property. The Aerojet Site is listed in the following databases:

- NPL
- SEMS
- CORRACTS
- RCRA-TSDF
- RCRA-LQG
- US ENG CONTROLS
- USINST CONTROL
- ENVIROSTOR
- SWEEPS UST
- HIST UST
- CA FID UST
- US FIN ASSUR
- ROD
- PRP
- PADS
- CONSENT

- **North Douglas**; NE of Douglas Road; subject property. Listed in the CIWQS database (stormwater plan permits for construction).
- **American River Asphalt**; 3417 Grant Line Road; 333 feet ENE. Listed in the following databases:
  - AST
  - CERZ HAZ WASTE
  - CERS TANKS
  - EMI
  - ENF
  - Sacramento Co. ML
  - NPDES
  - WDS
  - CIWQS
  - CERS
- **Grantline Plant**; 3417 Grant Line Road; 333 feet ENE. Listed in the AST database.
- **Inactive Rancho Cordova Test Site (IRCT);** Nimbus Road; 2246 feet W. This site is listed in the CSP-SLIC database.
- **Automotive Importing MFG Inc.**; 3920 Security Park Drive; 4256 feet SSW. Listed in the following databases:
  - SEMS-ARCHIVE
  - CORRACTS
  - RCRA-TSDF
  - RCRA-SQG
  - HAZNET
  - FINDS
  - ECHO
- **General Electric Medical Systems**; 3920 Security Park Drive; 4256 feet SSW. Listed in the ENVIROSTOR, HWP, and CERS databases.

According to the EDR Report, the subject property contains several small areas that are designated as a wetland, per the National Wetlands Inventory (1994).

Due to poor or inadequate information, EDR is unable to map certain sites. These sites are referred to by EDR as Orphans. No Orphan sites were identified in the EDR Report.
The Aerojet Corporation site boundary encroaches into the subject property in the north-center area and is visible in the EDR Radius Map as a National Priority List Site.

6.2 Review of State and/or Local Government Records

The Sacramento County NextRequest system was used to request any records pertaining to hazardous materials or well records at each individual parcel within the subject property. Records pertaining to the septic system and private well on the subject site were provided for 12525 Douglas Road (Whitlow property), 12535 Douglas Road, and 12565 Douglas Road (Divine property). Records showing a domestic well at 3450 Grant Line Road (073-0010-011) were provided. The well was permitted to be inactive in February 2015. Past sampling of the well for the Aerojet contamination plume showed that the well had trace level hits of N-Nitrosodimethylamine (NDMA) and no volatile organic compounds or perchlorate. The well was sealed in October 2014 and destruction of the well was mentioned in an email correspondent with a deadline of 26 December 2014; the well has yet to be destroyed.

Records were also provided for the Teichert Aggregates plant located at 3417 Grantline Road. Records show that a number of above-ground storage tank (ASTs) are present at the facility and hold a number of different fuels, oils, and lubricants. Past inspection reports were reviewed and no significant violations were discovered; any spills or violations were found to have been corrected to the satisfaction of Sacramento County.

The State of California Water Resources Control Board's GeoTracker database was researched to identify if sites with groundwater contamination exist within the minimum search distances to the subject property (www.geotracker.swrcb.ca.gov). Also, the Department of Toxic Substance Control's (DTSC) Envirostor database was researched for sites of environmental concern near or at the subject property (https://www.envirostor.dtsc.ca.gov/public/). The subject property was not identified on the GeoTracker or Envirostor web sites.

The Fall 2018 iso-Concentration maps by Geosyntec Consultants depicting the extent of contamination of the Aerojet area for trichloroethylene, perchlorate, and N-Nitroso-dimethylamine (NDMA) were reviewed. The NDMA contours do not intersect the subject property. The maps show that the 5 ppb (parts per billion) contour for TCE in groundwater Layers C and D reach monitoring wells OS-10C1/OS-10C2 located in the southwest of parcel 072-0300-001 (12555 Grant Line Road), partially encroaches into parcel 072-0010-011, and continues west through parcel 072-0300-008 to the west adjacent parcel where extraction well 4757 is located. The 50 ppb contour for Layer C encroaches near the northern part of parcel 072-0300-001, near a monitoring well just outside the north property boundary (well OS-5C). The 4 ppb contour for perchlorate in Layer C intersects the subject property at the northeast corner of the site within parcels 072-0010-010 and -011. The maximum contaminant level (MCL) for groundwater and drinking water established by the Environmental Protection Agency (EPA) is 5 ppb for TCE and 6 ppb for perchlorate. Perchlorate is found to be below the MCL at the subject property. Perchlorate and perchlorate anions do not volatilize from water or soil surfaces to air according to the Agency for Toxic Substances and Disease Registry (ATSDR) "Toxicological Profile for Perchlorates," 2008, and was not found to have values for soil vapor or ambient air in screening level criteria tables produced by the EPA and DTSC; perchlorate does not pose a soil vapor intrusion risk. The 5 ppb TCE contour does not intersect any domestic wells within the subject property, but has potential to create a soil vapor intrusion scenario for future development.

According to the Geotracker Website, two Inactive Rancho Cordova Test Sites associated with the past Aerojet Rocketdyne and Boeing activities are located west of the subject property: The Sigma Debris Area and the Antenna Station. Both sites are currently in remediation stages. The Antenna Station Site, located to the northwest, has been designated that No Further Action is necessary as of February 2005, although monitoring and in situ bioremediation continues. The Sigma Debris Area was designated as a No Further Action site in a Remedial Action Plan

and was investigated for soil vapor and contaminated groundwater between 1992 and 2002. Investigation data shows that the site is not a threat to human health and the environment. Monitoring continues as part of the IRCTS as a whole.

The 3920 Security Park Drive site was listed on the Envirostor database. The former General Electric Company Facility was once known as the Administration Area within the Inactive Rancho Cordova Test Site. GE Medical Systems were given authorization to operate a wastewater treatment system and discharge treated wastewater to the facility's septic system and leach field. The treatment system was moved to the neighboring address adjacent to a hazardous waste storage area. An approval of the Closure Certification for the GE facility was issued on June 28, 1991. A Termination of Corrective Action was also issued in July 2009 which was relied almost entirely upon data in a report titled "Remedial Action Plan for the Unsaturated Zone Administration Area IRCTS" dated August 2000 by ENSR.

6.3 Vapor Encroachment Screening

Vapor intrusion is the term used to describe the migration of volatile organic compounds (VOCs) via soil vapor from the sub-surface soil and/or groundwater upward into buildings, potentially causing unacceptable chemical exposure for building occupants. The vapor intrusion pathway is evaluated using the Conceptual Site Model (CSM) and vapor intrusion pathway screening. Volatilization of petroleum products in the subsurface occurs via the volatilization of constituents that are in the dissolved phase (in pore water or groundwater), volatilization from light nonaqueous phase liquid (LNAPL) (either mobile or residual) directly, and volatilization from impacted soil. Once the individual constituents are in the vapor phase, they can continue to migrate in the vadose zone (soil zone between first groundwater and ground surface). Transport will occur through diffusion caused by concentration gradients. The greatest movement will take place in the most permeable materials. If the soil-moisture content in the vadose zone is high, then relatively soluble compounds such as ethanol and MTBE will tend not to stay in the vapor phase, but rather will stay in the soil moisture.

Soil vapor is one of the pathways of contamination to the subject property, along with ground water and soil. ASTM E1527-13 requires that vapor migration be treated no differently than contaminated groundwater. The soil vapor contaminant pathway needs to be considered in evaluation of RECs or other environmental concerns. The ASTM Standard Guide for Vapor Encroachment Screening (VES) on Property Involved in Real Estate Transactions (ASTM E2600-10) is the industry-accepted guidance for using Phase I ESA information to determine if a vapor encroachment condition (VEC) exists at the subject property. EDR's Vapor Encroachment Worksheet was designed to assist parties seeking to meet the search requirements of the ASTM E 2600-10. **The Aerojet Rocketdyne, Inc. site was identified during our VES on the property to have a potential to create a soil vapor intrusion scenario.** A copy of the EDR VES is provided in Appendix D.

7.0 SITE RECONNAISSANCE

7.1 Purpose

A reconnaissance of the subject property and a windshield survey of the surrounding area were conducted by Youngdahl Consulting Group, Inc. on 9 May 2019. Views of the subject property at the time of the reconnaissance visit are presented as Figures 3 - 28.

7.2 Subject Property

Some features discussed in this section are shown on the Site Plan – Figure 2.

APNs 073-0010-011 & -010 (3450 Grant Line Road)
These parcels are adjoining with 073-0010-010 being a small parcel northeast from 073-0010-011. Collectively, they comprise the east portion of the subject site and together are triangular in shape (Figure 2). The majority of 073-0010-011 is vacant grazing land (Fig. 3), but an orchard of olive trees was observed in the northeastern corner of the parcel (Fig. 4, Photo 3). The orchard also occupies the entirety of APN 073-0010-010. Just south of the orchard is an area once occupied by a residence and was observed to have miscellaneous building debris (Fig. 4, Photo 4); no remnant of the building foundation was observed. Wood poles were also observed near the former residence (Fig. 5, Photo 5). More debris and a dilapidated shed were observed west of the location of the former residence (Fig. 5, Photo 6). A standing wood pole was observed just north of the dilapidated shed (Fig. 6, Photo 7). Near the southwest corner of the orchard, a shallow, rectangular pit (Fig 6, Photo 8) and stockpiled material (Fig. 7, Photo 9) was observed near Morrison Creek. More miscellaneous debris was observed within the orchard (Fig. 7, Photos 10 & 11). An inactive domestic well was observed southwest of the former residence location (Fig. 9, Photo 12). Two steel pipes were seen protruding from the ground to the northwest from the dilapidated shed (Fig. 8, Photo 13).

APN 072-0300-002 (12565 Douglas Road, Divine Property)
This parcel occupies the south-center portion of the subject property (Figure 2) and consists of an existing single-family home, a separate garage structure located east of the home (Fig. 9, Photo 14), a small shed just south of the garage outbuilding (Fig. 9, Photo 15), and vacant grazing land to the north and south of the home (Figure 10). Morrison Creek runs through the northern portion of the property, trends generally east-west, and was observed to be dry at the time of our reconnaissance. A fire break was observed north of the home. Oil staining was observed on the graveled area in the vicinity of the east garage building and near stored farm equipment (Figure 11). No large quantities of chemicals and/or fuel were observed in or around the east garage outbuilding. A drastic vegetation change was observed in the southern grazing land, potentially from the previously identified (Youngdahl, 2017) areas where organics were being dumped (Fig. 12, Photo 21). The existing residence is supplied by a well located west of the home; a propane tank was also observed in this area (Fig. 12, Photo 22).

APN 072-0300-005 (12525 Douglas Road, Whitlow Property)
This property comprises the southwest section of the subject property and is primarily grazing land (Fig. 13, Photo 23) with a residence along the east-center property line (Fig. 13, Photo 24). Near the residence is an associated well house to the west and a shop/shed building to the south of the well house. A corrugated metal cattle shed is just west of the residence and associated outbuildings (Fig. 14, Photo 25). The well house is northwest from the home (Fig. 15, Photo 26) and the interior is used as storage and to contain the water well (Fig. 15, Photo 27). A wood pole, concrete pad with concrete-filled steel drums, and remnant concrete foundation for a pole were observed north of the residence in the grazing field (Fig. 15, Photos 28 & 29). Additional wood poles are located in the north-center portion of the subject site at Morrison Creek (Fig. 16, Photo 30). The portion of Morrison Creek was observed to be artificially leveed and dammed (Fig. 16, Photo 31).

APN 072-0300-001 (12555 Grant Line Road)
This parcel is at the north-center portion of the subject site and consists of vacant grazing land (Figure 17). Standing water in a vernal pool was observed in the approximate center of the parcel. A monitoring well was observed near the southwest corner of the parcel (Figure 18).

APN 072-0300-008 (12535 Douglas Road)
This parcel is primarily vacant grazing land in the north (Fig. 19) with a residence and associated outbuildings in the southwest corner and a pond in the southeast corner.

Miscellaneous debris was found to be dumped inside, around, and to the north of the outbuildings. 55-gallon drums observed among the waste to the north of the buildings were found to be primarily used for trash or empty (Fig. 20, Photo 36) except for one drum which was sealed and contained an unknown liquid (Fig. 20, Photo 37). All automotive tanks and parts were observed to be empty (Fig. 21, Photo 38). A small stockpile with discarded tires was also found in the field (Fig. 21, Photo 39). The interior and exterior of the shed located near the debris in the field was filled with more trash and other solid waste; any fuel or chemical containers were empty (Fig. 22). Several sheds and a chicken coop were observed near the residential home which all contained miscellaneous debris and were in late stages of deterioration (Figs. 23, 24, & 25). The western shed had a storage room with miscellaneous items inside (Fig. 25, Photo 47). Underground utilities were observed around the outside walls of the northmost outbuilding including a storage tank of unknown use (Fig. 26). The residence was observed to be vacant and the windows and doors have been boarded up (Fig. 27, Photo 50). A domestic water well was observed just east of the home; a pressure system and filter were in place as a precaution for the contamination plume from the Aerojet General Corp. site (Fig. 27, Photo 51). A pond is created from a section of Morrison Creek being dammed at the southeast corner of the parcel (Fig. 28).

Reconnaissance Item	Observed	Reconnaissance Observations (9 May 2019)
Structures	Yes	**072-0300-001 (12555 Grant Line Road)** None observed. **072-0300-002 (12565 Douglas Road, Divine Property)** Residential home, garage building, & shed. **072-0300-005 (12525 Douglas Road, Whitlow Property)** Residential home, shop/shed, well house, & cattle shed. **072-0300-008 (12535 Douglas Road)** Residential building and multiple outbuildings. **072-0300-010 (No Address)** None observed. **073-0010-011 (3450 Grant Line Road)** Dilapidated shed.
Liquid Storage Systems (UST/AST)	Yes	**072-0300-001 (12555 Grant Line Road)** None observed. **072-0300-002 (12565 Douglas Road, Divine Property)** Tank associated with domestic well. **072-0300-005 (12525 Douglas Road, Whitlow Property)** Tank associated with domestic well **072-0300-008 (12535 Douglas Road)** Underground tank adjacent to shed north of the residence. **072-0300-010 (No Address)** None observed. **073-0010-011 (3450 Grant Line Road)** Pipes coming out of the ground near dilapidated shed are potentially connected to a UST.

Reconnaissance Item	Observed	Reconnaissance Observations (9 May 2019)
Drums	No	**072-0300-001 (12555 Grant Line Road)** None observed. **072-0300-002 (12565 Douglas Road, Divine Property)** None observed. **072-0300-005 (12525 Douglas Road, Whitlow Property)** Concrete filled drums. **072-0300-008 (12535 Douglas Road)** Drums filled with trash and one 55-gallon drum filled with unknown liquid. **072-0300-010 (No Address)** None observed. **073-0010-011 (3450 Grant Line Road)** None observed.
Other Containers	Yes	Miscellaneous containers throughout subject property observed to be of no concern.
PCBs	No.	All existing pole-mounted transformers observed throughout the property were in good shape with no signs of leaks.
Pits/Ponds/Ditches/Caves/Streams/ Lagoons	Yes	Ephemeral ponds throughout the subject property. Morrison Creek is dammed in 072-0300-008 (12535 Douglas Road) and 072-0300-005 (12525 Douglas Road, Whitlow Property), creating ponds.
Stained Soil/Pavement	No	**072-0300-002 (12565 Douglas Road, Divine Property)** Stained soils (de minimis) near east garage building.
Stressed Vegetation	No	None observed.
Solid Waste (Mounds or depressions)	Yes	**072-0300-001 (12555 Grant Line Road)** None observed. **072-0300-002 (12565 Douglas Road, Divine Property)** None observed. **072-0300-005 (12525 Douglas Road, Whitlow Property)** None observed. **072-0300-008 (12535 Douglas Road)** Stockpile of soil with tires in the field northeast from residence. **072-0300-010 (No Address)** None observed. **073-0010-011 (3450 Grant Line Road)** Stockpiles of soil near southwest corner of the orchard.
Waste Water (Discharge into drain/ditch/injection system/stream/adjacent property)	No	None Observed.

Reconnaissance Item	Observed	Reconnaissance Observations (9 May 2019)
Wells (Dry/irrigation/injection/abandoned)	Yes	**072-0300-001 (12555 Grant Line Road)** A monitoring well associated with Aerojet General Corporation. **072-0300-002 (12565 Douglas Road, Divine Property)** Domestic well west of the residence. **072-0300-005 (12525 Douglas Road, Whitlow Property)** Domestic well in well house northwest from the residence. **072-0300-008 (12535 Douglas Road)** Domestic well east of the residence. **072-0300-010 (No Address)** None observed. **073-0010-011 (3450 Grant Line Road)** Domestic well south of the former residence.
Other underground systems	No	**072-0300-001 (12555 Grant Line Road)** None observed. **072-0300-002 (12565 Douglas Road, Divine Property)** None observed. **072-0300-005 (12525 Douglas Road, Whitlow Property)** None observed. **072-0300-008 (12535 Douglas Road)** PVC lines adjacent to the sheds. **072-0300-010 (No Address)** None observed. **073-0010-011 (3450 Grant Line Road)** Two steel pipes protruding from the ground located west of the dilapidated shed.
Septic Systems	Yes	**072-0300-001 (12555 Grant Line Road)** None observed. **072-0300-002 (12565 Douglas Road, Divine Property)** Septic system in lawn north of the residence. **072-0300-005 (12525 Douglas Road, Whitlow Property)** None observed. **072-0300-008 (12535 Douglas Road)** Possible septic tank adjacent to north shed. **072-0300-010 (No Address)** None observed. **073-0010-011 (3450 Grant Line Road)** None observed.

7.3 Adjacent Properties

North: Vacant land currently being mined for aggregate.
East: Grant Line Road and Teichert Aggregate Plant.
South: Residential Subdivision.
West: Vacant land.

8.0 CONCLUSIONS, OPINION, AND RECOMMENDATIONS

This Phase I Environmental Site Assessment (ESA) was performed for the Preserve, which comprises the following Sacramento County Assessor's Parcel Numbers (APNs):

- 072-0300-001 (12555 Grant Line Road)
- 072-0300-002 (12565 Douglas Road, Divine Property)
- 072-0300-005 (12525 Douglas Road, Whitlow Property)
- 072-0300-008 (12535 Douglas Road)
- 072-0300-010 (No Address)
- 073-0010-011 (3450 Grant Line Road)

This Phase I ESA was conducted for the Winn Communities. Our study consisted of a review of environmental record sources, physical setting sources, review of site related documents, historical use information, and a site reconnaissance. We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitation of ASTM Standard Practice E 1527-13. Any exceptions to, or deletions from, this practice are described in Section 1.0 of this report.

8.1 Summary of Historical Subject Property Use Information

Date	Source	Subject Property Observations
1891-2016	Topographic Maps and Aerial Photos	The property had been primarily vacant grazing land with several residences that were constructed starting sometime between 1980 and 1984 with the last residence being built sometime between 1993 and 1998.

8.2 Recognized Environmental Conditions (RECs)

Recognized environmental conditions (RECs) are defined in the ASTM Phase I Standards to mean "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that post a material threat of a future release to the environment."

A contaminant plume of trichloroethylene (TCE) was discovered to encroach within some of the northern parcels. The 5 parts per billion (ppb) contour of TCE (the maximum contaminant level) extends to onsite and adjacent monitoring wells, but does not extend to any domestic wells identified on the subject property. **Although existing domestic wells aren't necessarily impacted, the presence of TCE within subject property boundaries has potential to create a soil vapor intrusion scenario and is considered a REC.**

Two steel pipes were observed protruding out of the ground within parcel 073-0010-011 (3450 Grant Line Road). An inactive well was also observed, and we understand that is currently permitted as inactive. **It is our opinion that the two protruding pipes have potential to be connected to an underground storage tank (UST), which is considered a REC**. The orchard that occupies a portion of this parcel and parcel 073-0010-010 was planted sometime between 1980 and 1984, as indicated by the historical aerial photography and topographic maps, which means that lead arsenate and organochlorine pesticides were not likely used.

The residence and outbuildings within APN 072-0300-008 (12535 Douglas Road) were built sometime between 1975 and 1980, and **the structures and soils adjacent to these structures have potential for containing lead-based paint; this has been identified to be a REC. Within APN 072-0300-008 is an unknown underground system found adjacent to the shed located north of the residence and a 55-gallon drum northeast from the residence with an unknown liquid inside; these are considered RECs if these vessels were used for fuel storage.**

All residences and major outbuildings of wood construction on the subject property besides within APN 072-0300-002 (12565 Douglas Road, Divine Property) have the potential for termiticides present in adjacent soils and are considered RECs.

8.3 Historic Recognized Environmental Conditions (HRECs)

Historic recognized environmental conditions (HRECs) is a term used to state that the property only includes a resolved or closed out REC that has been completely resolved ("clean closure") with no restrictions. **This assessment did not identify any HRECs in connection with the subject property.**

8.4 Controlled Recognized Environmental Conditions (CRECs)

The new term controlled REC (CREC) describes closed RECs that are managed under an activity and use limitation (AUL). **This assessment did not identify any CRECs in connection with the subject property.**

8.5 Recommendations

It is the opinion of the Youngdahl Consulting Group Inc. that the following recommended actions be conducted for the identified RECs:

APN & Address	Identified REC	Recommendation
072-0300-001 (12555 Grant Line Road)	TCE groundwater plume identified by on-site monitoring well.	We recommend that a soil vapor investigation consisting of soil vapor sampling be conducted on the subject property.
072-0300-002 (12565 Douglas Road, Divine Property)	No RECs identified.	No recommendations.
072-0300-005 (12525 Douglas Road, Whitlow Property)	Potential termiticides within soils adjacent to the residence.	We recommend soil sampling near the footprint of the home at a depth of approximately 1 foot to be analyzed for termite pesticides.
072-0300-008 (12535 Douglas Road)	Lead based paint and termiticides in soils adjacent to all buildings. ACBM within all buildings. 55-gallon drum with unknown liquid. Potential underground tank/sump adjacent to shed north of residence. Potential vapor intrusion scenario from the TCE groundwater plume.	We recommend investigation of the potential underground system. Soils adjacent to the buildings should be sampled for total lead in surface soils and termite pesticides at a depth of approximately 1 foot. ACBM should be investigated at the main residence and shed northwest of the residence by a licensed asbestos contractor. Soil vapor sampling as part of a soil vapor intrusion investigation should be conducted.
072-0300-010 (No Address)	No RECs identified.	No recommendations.

073-0010-011 (3450 Grant Line Road)	Two pipes observed protruding from the ground south of the orchard and west from the former residence. Potential vapor intrusion scenario from the TCE groundwater plume	The pipes are potentially connected to a UST and should be investigated. Soil vapor sampling as part of a soil vapor intrusion investigation should be conducted.

Additionally, all inactive wells that are not planned for future use should be destroyed per Sacramento County requirements. Domestic wells were observed to be within parcels 073-0010-011 (permitted inactive), 072-0300-002, 072-0300-005, and 072-0300-008.

8.6 Data Gaps

According to § 3.3.20 of ASTM Standard E 1527-13 a data gap is a lack of or inability to obtain information required by the ASTM Standard despite good faith efforts to gather same. Data gaps may result from incompleteness in any of the activities required by the ASTM Standard. It is our opinion that no significant data gaps were identified.

Location: **12555 Grant Line Road, Rancho Cordova, CA**
Sacramento County APN 072-0300-001

The ASTM Standards require that you, or your representative who is knowledgeable regarding the use and condition of the property, answer the questions found on the following site assessment questionnaire.

Please answer these questions in good faith and to the extent of your actual knowledge. Circle the appropriate answer. For yes answers please provide additional explanation. We would appreciate it if you would FAX the completed questionnaire as soon as possible to Youngdahl Consulting Group, Inc. FAX: 916-933-6482 or email it to David Sederquist at dcs@youngdahl.net

1.	Currently is, or in the past has, the *property* or any *adjoining* property been used for an industrial use?	(Yes)	No	Unknown
2.	Currently is, or in the past has, the *property* or any *adjoining* property been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?	Yes	No	(Unknown)
3.	Are there currently, or have there been previously, any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of greater than 5 gal (19 L) in volume or 50 gal (208 L) in the aggregate, stored on or used at the *property*?	Yes	No	(Unknown)
4.	Are there currently, or have there been previously, any industrial *drums* (typically 55 gal (208 L)) or sacks of chemicals located on the property?	Yes	No	(Unknown)
5.	Has *fill dirt* been brought on to the property that originated from a contaminated site or that is of an unknown origin?	Yes	No	(Unknown)

6.	Are there currently, or have there been previously, any *pits, ponds, or lagoons* located on the *property* in connection with waste treatment or waste disposal?	Yes	**No**	Unknown
7.	Is there currently, or has there been previously, any stained soil on the *property*?	Yes	No	**Unknown**
8.	Are there currently, or have there been previously, any registered or unregistered storage tanks (above or underground) located on the *property*?	Yes	No	**Unknown**
9.	Are there currently, or have there been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property*?	Yes	No	**Unknown**
10.	Are there currently, or have there been previously, any flooring, drains, or walls located within the facility that are stained by substances other than water or are emitting unusual odors?	Yes	No	**Unknown**
11.	If the *property* is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well been designated as contaminated by any government environmental/health agency?	Yes	No	**Unknown**
12.	Are you aware of any floor drains or sumps on the property?	Yes	No	**Unknown**
13.	Have any *hazardous substances* or *petroleum products,* unidentified waste materials, tires, automotive or industrial batteries or any other waste materials been dumped above grade, buried and/or burned on the *property*?	Yes	No	**Unknown**
14.	Are there any transformers, capacitors, or hydraulic equipment on the property which may contain PCBs?	Yes	No	**Unknown**
15.	Do you have any knowledge of *environmental liens* with respect to the *property*?	Yes	**No**	Unknown

16.	Have you been informed of the past or current existence of environmental violations with respect to the *property*?	Yes	(No)	Unknown
17.	Do you have any knowledge of any *environmental site assessments* of the *property*?	(Yes)	No	Unknown
18.	Do you know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any *hazardous substance* or *petroleum products* involving the *property*?	Yes	(No)	Unknown
19.	Is the purchase price or appraised value of the property significantly less than comparable properties in the vicinity?	Yes	(No)	Unknown

To the best of the undersigned knowledge, the above statements and facts are true and correct and to the best of the undersigned's actual knowledge no material facts have been suppressed or misstated.

The ASTM Standards require that you, or your representative who is knowledgeable regarding the use and condition of the property, answer the questions found on the following site assessment questionnaire.

Please answer these questions in good faith and to the extent of your actual knowledge. Circle the appropriate answer. For yes answers please provide additional explanation. We would appreciate it if you would FAX the completed questionnaire as soon as possible to Youngdahl Consulting Group, Inc. FAX: 916-933-6482 or email it to David Sederquist at dcs@youngdahl.net

1.	Currently is, or in the past has, the *property* or any *adjoining* property been used for an industrial use?	(Yes)	No	Unknown
2.	Currently is, or in the past has, the *property* or any *adjoining* property been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?	Yes	No	(Unknown)
3.	Are there currently, or have there been previously, any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of greater than 5 gal (19 L) in volume or 50 gal (208 L) in the aggregate, stored on or used at the *property*?	Yes	No	(Unknown)
4.	Are there currently, or have there been previously, any industrial *drums* (typically 55 gal (208 L)) or sacks of chemicals located on the property?	Yes	No	(Unknown)
5.	Has *fill dirt* been brought on to the property that originated from a contaminated site or that is of an unknown origin?	Yes	No	(Unknown)

6.	Are there currently, or have there been previously, any *pits, ponds, or lagoons* located on the *property* in connection with waste treatment or waste disposal?	Yes	(No)	Unknown
7.	Is there currently, or has there been previously, any stained soil on the *property*?	Yes	No	(Unknown)
8.	Are there currently, or have there been previously, any registered or unregistered storage tanks (above or underground) located on the *property*?	Yes	No	(Unknown)
9.	Are there currently, or have there been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property*?	Yes	No	(Unknown)
10.	Are there currently, or have there been previously, any flooring, drains, or walls located within the facility that are stained by substances other than water or are emitting unusual odors?	Yes	No	(Unknown)
11.	If the *property* is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well been designated as contaminated by any government environmental/health agency?	Yes	No	(Unknown)
12.	Are you aware of any floor drains or sumps on the property?	Yes	No	(Unknown)
13.	Have any *hazardous substances* or *petroleum products*, unidentified waste materials, tires, automotive or industrial batteries or any other waste materials been dumped above grade, buried and/or burned on the *property*?	Yes	No	(Unknown)
14.	Are there any transformers, capacitors, or hydraulic equipment on the property which may contain PCBs?	Yes	No	(Unknown)
15.	Do you have any knowledge of *environmental liens* with respect to the *property*?	Yes	(No)	Unknown

16.	Have you been informed of the past or current existence of environmental violations with respect to the *property*?	Yes	(No)	Unknown
17.	Do you have any knowledge of any *environmental site assessments* of the *property*?	(Yes)	No	Unknown
18.	Do you know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any *hazardous substance* or *petroleum products* involving the *property*?	Yes	(No)	Unknown
19.	Is the purchase price or appraised value of the property significantly less than comparable properties in the vicinity?	Yes	(No)	Unknown

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Search Results:

Year	Scale	Details	Source

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Youngdahl Consulting Group were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and

identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 03/11/2019 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

Cerclis ID:: 901718				
EPA Id: CAD980358832				

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 03/11/2019 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Site ID: 0901718				
EPA Id: CAD980358832				

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/25/2019 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/25/2019 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
AEROJET ROCKETDYNE I	***US HWY 50 AND AEROJE***	***0 - 1/8 (0.000 mi.)***	***0***	***8***
EPA ID:: CAD000030494				

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/25/2019 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Federal institutional controls / engineering controls registries

US ENG CONTROLS: A listing of sites with engineering controls in place.

A review of the US ENG CONTROLS list, as provided by EDR, and dated 01/31/2019 has revealed that there is 1 US ENG CONTROLS site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
AEROJET ROCKETDYNE I	***US HWY 50 AND AEROJE***	***0 - 1/8 (0.000 mi.)***	***0***	***8***
EPA ID:: CAD980358832				
EPA ID:: CAD980358832				

EXECUTIVE SUMMARY

US INST CONTROL: A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

A review of the US INST CONTROL list, as provided by EDR, and dated 01/31/2019 has revealed that there is 1 US INST CONTROL site within approximately 0.5 miles of the target property.

EPA ID:: CAD980358832				

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/28/2019 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there is 1 CPS-SLIC site within approximately 0.5 miles of the target property.

Summary Details:

Conditions at listing October 1981): The Aerojet General Corp. Site covers 8,500 acres in the eastern portion of Sacramento County, California, adjacent to the Rancho Cordova area population 40,000). The northeast edge of the site is approximately 0.5 mile from the American River. Underlying the site are extensive 50-foot deep) gold dredge tailings, a remnant of past mining operations. The upper aquifer is 80 feet below the surface. Ground water is used extensively throughoutthe Rancho Cordova area to supply municipal, domestic, and industrial water. Since 1953, Aerojet and its subsidiaries have disposed of, on-site, unknown quantities of ha ardous waste, including trichloroethylene, tetrachloroethylene, chloroform, Freon and other chemicals associated with rocket propellants, and various chemical processing wastes. Soil on-site is contaminated. Monitoring data show extensive ground water contamination on- and off-site, primarily with trichloroethylene. In April 1979, Aerojet and its subsidiaries started ground water studies to examine the impact of past disposal practices and to determine the requirements for cleanup. In December 1979, the State filed suit against Aerojet and a subsidiary, Cordova Chemical. Status July 1983): EPA has worked with the State since 1979, providing technical assistance through the Emergency Response Team, the Las Vegas lab, and Region IX. In March 1982, the State requested EPA s assistance in evaluating Aerojet s Proposal for a Ground Water Quality Control Program. EPA found major technical problems in Aerojet s proposal. In the past, a confidentiality

AEROJET ROCKETDYNE INC (Continued) **1000333003**

agreement between Aerojet and the State limited EPA access to the documents that would allow EPA to independently assess the company s progress toward cleanup. The agreement is no longer in effect. On February 25, 1983, Region IX requested information from Aerojet regarding soil and ground water contamination. EPA will soon complete review of the documents received in response.

. Waste name: HYDROFLUORIC ACID (C,T) (OR) HYDROGEN FLUORIDE (C,T)

. Waste code: U223
. Waste name: BENZENE, 1,3-DIISOCYANATOMETHYL- (R,T) (OR) TOLUENE DIISOCYANATE (R,T)

Historical Generators:
Date form received by agency: 02/18/2016
Site name: AEROJET ROCKETDYNE, INC.

AEROJET ROCKETDYNE INC (Continued) **1000333003**

Classification: Large Quantity Generator

. Waste code: 121
. Waste name: Alkaline solution (pH >12.5) with metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc)

. Waste code: 122
. Waste name: Alkaline solution without metals (pH > 12.5)

. Waste code: 123
. Waste name: Unspecified alkaline solution

. Waste code: 132
. Waste name: Aqueous solution w/metals (< restricted levels and see waste code 121 for a list of metals)

. Waste code: 133
. Waste name: Aqueous solution with 10% or more total organic residues

. Waste code: 134
. Waste name: Aqueous solution with <10% total organic residues

. Waste code: 135
. Waste name: Unspecified aqueous solution

. Waste code: 141
. Waste name: Off-specification, aged, or surplus inorganics

. Waste code: 151
. Waste name: Asbestos-containing waste

. Waste code: 181
. Waste name: Other inorganic solid waste

. Waste code: 212
. Waste name: Oxygenated solvents (acetone, butanol, ethyl acetate, etc.)

. Waste code: 213
. Waste name: Hydrocarbon solvents (benzene, hexane, Stoddard, etc.)

. Waste code: 214
. Waste name: Unspecified solvent mixture

. Waste code: 221
. Waste name: Waste oil and mixed oil

. Waste code: 223
. Waste name: Unspecified oil-containing waste

. Waste code: 261
. Waste name: Polychlorinated biphenyls and material containing PCB’s

. Waste code: 331
. Waste name: Off-specification, aged, or surplus organics

. Waste code: 341

AEROJET ROCKETDYNE INC (Continued) **1000333003**

. Waste name: Organic liquids (nonsolvents) with halogens

. Waste code: 343
. Waste name: Unspecified organic liquid mixture

. Waste code: 351
. Waste name: Organic solids with halogens

. Waste code: 352
. Waste name: Other organic solids

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 132357.1

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

AEROJET ROCKETDYNE INC (Continued) **1000333003**

Amount (Lbs): 45750

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Contact country: US
Contact telephone: 916-355-4682
Contact email: JIM.BUEHLER@ROCKET.COM
EPA Region: 09
Land type: Private
Classification: TSDF
Description: Handler is engaged in the treatment, storage or disposal of hazardous waste
Classification: Large Quantity Generator
Description: Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Owner/Operator Summary:

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: Yes

AEROJET ROCKETDYNE INC (Continued) **1000333003**

Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Universal Waste Summary:

Waste type:	E
Accumulated waste on-site:	No
Generated waste on-site:	Yes

Waste type:	Batteries
Accumulated waste on-site:	Yes
Generated waste on-site:	Not reported

Waste type:	Lamps
Accumulated waste on-site:	Yes
Generated waste on-site:	Not reported

. Waste code:	121
. Waste name:	Alkaline solution (pH >12.5) with metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc)

. Waste code:	122
. Waste name:	Alkaline solution without metals (pH > 12.5)

. Waste code:	134
. Waste name:	Aqueous solution with <10% total organic residues

. Waste code:	141
. Waste name:	Off-specification, aged, or surplus inorganics

. Waste code:	181
. Waste name:	Other inorganic solid waste

. Waste code:	212
. Waste name:	Oxygenated solvents (acetone, butanol, ethyl acetate, etc.)

. Waste code:	213
. Waste name:	Hydrocarbon solvents (benzene, hexane, Stoddard, etc.)

. Waste code:	214
. Waste name:	Unspecified solvent mixture

. Waste code:	221
. Waste name:	Waste oil and mixed oil

. Waste code:	223
. Waste name:	Unspecified oil-containing waste

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 132357.1

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 45750

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
Amount (Lbs): 124114.4

Waste code: D005
Waste name: BARIUM

WDS:

Facility ID:	5S 34I003836
Facility Type:	Other - Does not fall into the category of Municipal/Domestic, Industrial, Agricultural or Solid Waste (Class I, II or III)
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number:	CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board
Subregion:	0
Facility Telephone:	9169856370
Facility Contact:	JERRY HANSEN
Agency Name:	AMERICAN RIVER AGGREGATES
Agency Address:	PO BOX 981
Agency City,St,Zip:	FOLSOM 95630
Agency Contact:	JOHN KEMP
Agency Telephone:	9169856370
Agency Type:	Private
SIC Code:	2951
SIC Code 2:	Not reported
Primary Waste Type:	Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and construction wastes, manure, vegetable or animal solid and semisolid waste).
Primary Waste:	STORMS
Waste Type2:	Not reported
Waste2:	Stormwater Runoff
Primary Waste Type:	Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and construction wastes, manure, vegetable or animal solid and semisolid waste).
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	0
Baseline Flow:	0
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The facility is not a POTW.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or

AMERICAN RIVER ASPHALT (Continued) **S102315643**

dischargers having waste storage systems with land disposal such as dairy waste ponds.

Facility ID: 5S 34I016853
Facility Type: Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number: CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board
Subregion: 0

Site Name:	INACTIVE RANCHO CORDOVA TEST SITE - INACTIVE RANCHO CORDOVA TEST SITE - SIGMA DEBRIS AREA
Region:	STATE
Facility Status:	**Open - Remediation**
Status Date:	09/28/2011
Global Id:	T10000003290
Lead Agency:	CENTRAL VALLEY RWQCB (REGION 5S)
Lead Agency Case Number:	Not reported
Latitude:	38.5744743358981
Longitude:	-121.210269927979
Case Type:	Cleanup Program Site
Case Worker:	AMM
Local Agency:	Not reported
RB Case Number:	Not reported
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply, Contaminated Surface / Structure, Indoor Air, Other Groundwater (uses other than drinking water), Sediments, Soil, Soil Vapor, Surface water
Potential Contaminants of Concern:	Arsenic, Copper, Lead, Mercury (elemental), Other Metal, Silver
Site History:	Investigation involving soil vapor and groundwater sampling and analysis was conducted between 1992 and 2002. Designated as a No Further Action site in a Remedial Action Plan. Contaminants of concern were identified as metals, perchlorate, and volatile organics. Metals were found at elevated levels in surface soil, but neither perchlorate or any volatile organics were detected in any of the soil samples. Investigation data shows that the Site is not a threat to human health and the environment. Removal of metal, wooden, and other debris can occur as part of future development.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Next Scheduled EDR Contact: 07/15/2019
Data Release Frequency: Quarterly

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

THE PRESERVE PHASE I ESA
12525 DOUGLAS ROAD
RANCHO CORDOVA, CA 95742

TARGET PROPERTY COORDINATES

Latitude (North):	38.575586 - 38° 34' 32.11''
Longitude (West):	121.196464 - 121° 11' 47.27''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	657109.8
UTM Y (Meters):	4271015.5
Elevation:	243 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5619686 BUFFALO CREEK, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

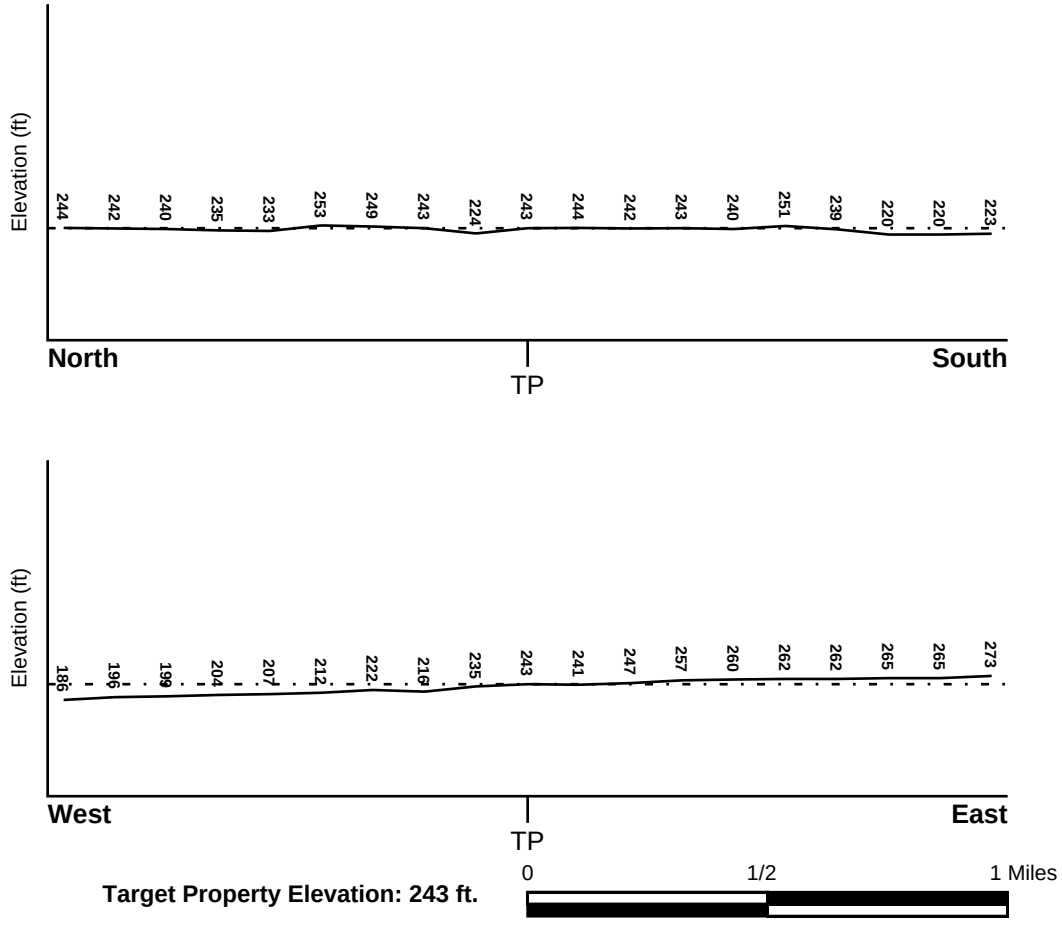
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General West

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06067C0250H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06067C0240H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
BUFFALO CREEK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: RED BLUFF

Soil Surface Texture: loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 6.5 Min: 5.6
2	7 inches	25 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 6.5 Min: 5.6
3	25 inches	42 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 6.5 Min: 5.6
4	42 inches	68 inches	gravelly clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 6.5 Min: 5.6

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 2

Soil Component Name: HICKSVILLE

Soil Surface Texture: gravelly loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	12 inches	gravelly loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 7.8 Min: 6.6
2	12 inches	42 inches	gravelly clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 7.8 Min: 6.6
3	42 inches	64 inches	stratified very gravelly sandy loam to clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 7.8 Min: 6.6

Soil Map ID: 3

Soil Component Name: REDDING

Soil Surface Texture: gravelly loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Moderately well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

Scoring:	1

Summary Details:

Conditions at listing October 1981): The Aerojet General Corp. Site covers 8,500 acres in the eastern portion of Sacramento County, California, adjacent to the Rancho Cordova area population 40,000). The northeast edge of the site is approximately 0.5 mile from the American River. Underlying the site are extensive 50-foot deep) gold dredge tailings, a remnant of past mining operations. The upper aquifer is 80 feet below the surface. Ground water is used extensively throughoutthe Rancho Cordova area to supply municipal, domestic, and industrial water. Since 1953, Aerojet and its subsidiaries have disposed of, on-site, unknown quantities of ha ardous waste, including trichloroethylene, tetrachloroethylene, chloroform, Freon and other chemicals associated with rocket propellants, and various chemical processing wastes. Soil on-site is contaminated. Monitoring data show extensive ground water contamination on- and off-site, primarily with trichloroethylene. In April 1979, Aerojet and its subsidiaries started ground water studies to examine the impact of past disposal practices and to determine the requirements for cleanup. In December 1979, the State filed suit against Aerojet and a subsidiary, Cordova Chemical. Status July 1983): EPA has worked with the State since 1979, providing technical assistance through the Emergency Response Team, the Las Vegas lab, and Region IX. In March 1982, the State requested EPA s assistance in evaluating Aerojet s Proposal for a Ground Water Quality Control Program. EPA found major technical problems in Aerojet s proposal. In the past, a confidentiality agreement between Aerojet and the State limited EPA access to the documents that would allow EPA to independently assess the company s progress toward cleanup. The agreement is no longer in effect. On February 25, 1983, Region IX requested information from Aerojet regarding soil and ground water contamination. EPA will soon complete review of the documents received in response.

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	Yes
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

Used oil transfer facility: No
Used oil transporter: No

Universal Waste Summary:

Waste type: E
Accumulated waste on-site: No
Generated waste on-site: Yes

Waste type: Batteries
Accumulated waste on-site: Yes
Generated waste on-site: Not Reported

Waste type: Lamps
Accumulated waste on-site: Yes
Generated waste on-site: Not Reported

. Waste code: 121
. Waste name: Alkaline solution (pH >12.5) with metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc)

. Waste code: 122
. Waste name: Alkaline solution without metals (pH > 12.5)

. Waste code: 134
. Waste name: Aqueous solution with <10% total organic residues

. Waste code: 141
. Waste name: Off-specification, aged, or surplus inorganics

. Waste code: 181
. Waste name: Other inorganic solid waste

. Waste code: 212
. Waste name: Oxygenated solvents (acetone, butanol, ethyl acetate, etc.)

. Waste code: 213
. Waste name: Hydrocarbon solvents (benzene, hexane, Stoddard, etc.)

. Waste code: 214
. Waste name: Unspecified solvent mixture

. Waste code: 221
. Waste name: Waste oil and mixed oil

. Waste code: 223
. Waste name: Unspecified oil-containing waste

. Waste code: 261
. Waste name: Polychlorinated biphenyls and material containing PCB's

. Waste code: 291
. Waste name: Latex waste

. Waste code: 331
. Waste name: Off-specification, aged, or surplus organics

. Waste code: 341
. Waste name: Organic liquids (nonsolvents) with halogens

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

- Waste code: 343
- Waste name: Unspecified organic liquid mixture

- Waste code: 351
- Waste name: Organic solids with halogens

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs):	132357.1
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs):	45750
Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

RCRA-LQG: Federal RCRA generators list

Date form received by agency:	02/27/2018
Facility name:	AEROJET ROCKETDYNE INC
Facility address:	US HWY 50 AND AEROJET RD RANCHO CORDOVA, CA 95813-6000
EPA ID:	CAD000030494
Mailing address:	PO BOX 13222 SACRAMENTO, CA 95813
Contact:	JIM BUEHLER
Contact address:	PO BOX 13222 SACRAMENTO, CA 95813
Contact country:	US
Contact telephone:	916-355-4682
Contact email:	JIM.BUEHLER@ROCKET.COM
EPA Region:	09
Land type:	Private
Classification:	TSDF
Description:	Handler is engaged in the treatment, storage or disposal of hazardous waste
Classification:	Large Quantity Generator
Description:	Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	Yes
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Universal Waste Summary:

Waste type:	E
Accumulated waste on-site:	No
Generated waste on-site:	Yes
Waste type:	Batteries
Accumulated waste on-site:	Yes
Generated waste on-site:	Not Reported
Waste type:	Lamps
Accumulated waste on-site:	Yes
Generated waste on-site:	Not Reported
. Waste code:	121
. Waste name:	Alkaline solution (pH >12.5) with metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc)
. Waste code:	122
. Waste name:	Alkaline solution without metals (pH > 12.5)
. Waste code:	134

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

- Waste name: Aqueous solution with <10% total organic residues
- Waste code: 141
- Waste name: Off-specification, aged, or surplus inorganics
- Waste code: 181
- Waste name: Other inorganic solid waste
- Waste code: 212
- Waste name: Oxygenated solvents (acetone, butanol, ethyl acetate, etc.)
- Waste code: 213
- Waste name: Hydrocarbon solvents (benzene, hexane, Stoddard, etc.)
- Waste code: 214
- Waste name: Unspecified solvent mixture
- Waste code: 221
- Waste name: Waste oil and mixed oil
- Waste code: 223

- Waste code: D022
- Waste name: CHLOROFORM
- Waste code: D028
- Waste name: 1,2-DICHLOROETHANE
- Waste code: D035
- Waste name: METHYL ETHYL KETONE
- Waste code: D037
- Waste name: PENTACHLOROPHENOL
- Waste code: D038
- Waste name: PYRIDINE
- Waste code: F002

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

. Waste name:	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
. Waste code:	F003
. Waste name:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
. Waste code:	F005
. Waste name:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
. Waste code:	F027
. Waste name:	DISCARDED UNUSED FORMULATIONS CONTAINING TRI-, TETRA-, OR PENTACHLOROPHENOL OR DISCARDED UNUSED FORMULATIONS CONTAINING COMPOUNDS DERIVED FROM THESE CHLOROPHENOLS. (THIS LISTING DOES NOT INCLUDE FORMULATIONS CONTAINING HEXACHLOROPHENE SYNTHESIZED FROM PREPURIFIED 2,4,5-TRICHLOROPHENOL AS THE SOLE COMPONENT.)
. Waste code:	P068
. Waste name:	HYDRAZINE, METHYL- (OR) METHYL HYDRAZINE
. Waste code:	P082
. Waste name:	METHANIMINE, N-METHYL-N-NITROSO- (OR) N-NITROSODIMETHYLAMINE
. Waste code:	P098
. Waste name:	POTASSIUM CYANIDE (OR) POTASSIUM CYANIDE K(CN)
. Waste code:	P105
. Waste name:	SODIUM AZIDE
. Waste code:	U002
. Waste name:	2-PROPANONE (I) (OR) ACETONE (I)
. Waste code:	U133
. Waste name:	HYDRAZINE (R,T)
. Waste code:	U134
. Waste name:	HYDROFLUORIC ACID (C,T) (OR) HYDROGEN FLUORIDE (C,T)
. Waste code:	U223
. Waste name:	BENZENE, 1,3-DIISOCYANATOMETHYL- (R,T) (OR) TOLUENE DIISOCYANATE (R,T)

Historical Generators:

Date form received by agency:	02/18/2016
Site name:	AEROJET ROCKETDYNE, INC.

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

Classification:	Large Quantity Generator
. Waste code:	121
. Waste name:	Alkaline solution (pH >12.5) with metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc)
. Waste code:	122
. Waste name:	Alkaline solution without metals (pH > 12.5)
. Waste code:	123
. Waste name:	Unspecified alkaline solution
. Waste code:	132
. Waste name:	Aqueous solution w/metals (< restricted levels and see waste code 121 for a list of metals)
. Waste code:	133
. Waste name:	Aqueous solution with 10% or more total organic residues
. Waste code:	134
. Waste name:	Aqueous solution with <10% total organic residues
. Waste code:	135
. Waste name:	Unspecified aqueous solution
. Waste code:	141
. Waste name:	Off-specification, aged, or surplus inorganics
. Waste code:	151
. Waste name:	Asbestos-containing waste
. Waste code:	181
. Waste name:	Other inorganic solid waste
. Waste code:	212
. Waste name:	Oxygenated solvents (acetone, butanol, ethyl acetate, etc.)
. Waste code:	213
. Waste name:	Hydrocarbon solvents (benzene, hexane, Stoddard, etc.)
. Waste code:	214
. Waste name:	Unspecified solvent mixture
. Waste code:	221
. Waste name:	Waste oil and mixed oil
. Waste code:	223
. Waste name:	Unspecified oil-containing waste
. Waste code:	261
. Waste name:	Polychlorinated biphenyls and material containing PCB's
. Waste code:	331
. Waste name:	Off-specification, aged, or surplus organics
. Waste code:	341
. Waste name:	Organic liquids (nonsolvents) with halogens
. Waste code:	343
. Waste name:	Unspecified organic liquid mixture

MAP FINDINGS

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

- Waste code: 351
- Waste name: Organic solids with halogens

- Waste code: 352
- Waste name: Other organic solids

- Waste code: 512
- Waste name: Other empty containers 30 gallons or more

- Waste code: 513
- Waste name: Empty containers less than 30 gallons

- Waste code: 541
- Waste name: Photochemicals / photo processing waste

- Waste code: 551
- Waste name: Laboratory waste chemicals

- Waste code: 591
- Waste name: Baghouse waste

- Waste code: 731
- Waste name: Liquids with polychlorinated biphenyls > 50 mg/l

- Waste code: 741
- Waste name: Liquids with halogenated organic compounds > 1000 mg/l

- Waste code: 751
- Waste name: Solids or sludge with halogenated organic comp. > 1000 mg/kg

- Waste code: 791
- Waste name: Liquids with pH < 2

- Waste code: 792
- Waste name: Liquids with pH < 2 with metals

- Waste code: D001
- Waste name: IGNITABLE WASTE

- Waste code: D002
- Waste name: CORROSIVE WASTE

- Waste code: D003
- Waste name: REACTIVE WASTE

- Waste code: D005
- Waste name: BARIUM

- Waste code: D006
- Waste name: CADMIUM

- Waste code: D007
- Waste name: CHROMIUM

- Waste code: D008
- Waste name: LEAD

- Waste code: D009
- Waste name: MERCURY

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

. Waste code:	D010
. Waste name:	SELENIUM
. Waste code:	D011
. Waste name:	SILVER
. Waste code:	D018
. Waste name:	BENZENE
. Waste code:	D022
. Waste name:	CHLOROFORM
. Waste code:	D028
. Waste name:	1,2-DICHLOROETHANE
. Waste code:	D035
. Waste name:	METHYL ETHYL KETONE
. Waste code:	D038
. Waste name:	PYRIDINE
. Waste code:	D040
. Waste name:	TRICHLORETHYLENE
. Waste code:	F002
. Waste name:	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
. Waste code:	F003
. Waste name:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
. Waste code:	F005
. Waste name:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
. Waste code:	P068
. Waste name:	HYDRAZINE, METHYL- (OR) METHYL HYDRAZINE
. Waste code:	P081
. Waste name:	1,2,3-PROPANETRIOL, TRINITRATE (R) (OR) NITROGLYCERINE (R)
. Waste code:	P098
. Waste name:	POTASSIUM CYANIDE (OR) POTASSIUM CYANIDE K(CN)
. Waste code:	U002

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs):	132357.1
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs):	45750
Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

HIST UST: Local Lists of Registered Storage Tanks

File Number:	0001FD2A
URL:	http://geotracker.waterboards.ca.gov/ustpdfs/pdf/0001FD2A.pdf
Region:	STATE
Facility ID:	00000019591
Facility Type:	Other
Other Type:	CONSTRUCTION
Contact Name:	E.L. MEYER
Telephone:	9163554621
Owner Name:	DELTA CONSTRUCTION COMPANY
Owner Address:	AEROJECT RD AND HWY 50
Owner City,St,Zip:	RANCHO CORDOVA, CA 95670
Total Tanks:	0004
Tank Num:	001
Container Num:	DELTA - LA
Year Installed:	1979
Tank Capacity:	00001000
Tank Used for:	PRODUCT
Type of Fuel:	UNLEADED
Container Construction Thickness:	101

AEROJET ROCKETDYNE INC, US HWY 50 AND AEROJET RD, RANCHO CORDOVA, CA (Continued)

Leak Detection:	Not Reported
Tank Num:	002
Container Num:	DELTA-GAS-
Year Installed:	1979
Tank Capacity:	00002000
Tank Used for:	PRODUCT
Type of Fuel:	REGULAR
Container Construction Thickness:	3/16
Leak Detection:	10
Tank Num:	003
Container Num:	DELTA-20
Year Installed:	1982
Tank Capacity:	00008000
Tank Used for:	PRODUCT
Type of Fuel:	DIESEL
Container Construction Thickness:	3/16
Leak Detection:	10
Tank Num:	004
Container Num:	DELTA-3
Year Installed:	1984
Tank Capacity:	00000026
Tank Used for:	WASTE
Type of Fuel:	Not Reported
Container Construction Thickness:	6
Leak Detection:	Visual
